(2) In fresh water tanks, fuel oil tanks or other tanks which may not be kept completely full during navigations, swash bulkheads or deep girders are to be provided in the centreline as well as in positions approximately $B/4$ distant from the ship's sides, except when it can be confirmed by the data on the rolling period of the ship and the inherent period of oscillation of water or oil in the tanks, that they will be unnecessary.

Section 2 Bulkheads of Deep Tank

203. Bulkhead plates

In the provision of h specified in **202.** in the Rules, for side shell plating, a water head corresponding to the minimum draught amidship $d_{\min}$ (m) under all operating conditions of the ship may be deducted therefrom. The deductible water head at the top of keel is to be $d_{\min}$, value at point $d_{\min}$ above the top of keel, 0, and value at an intermediate point is to be obtained by linear interpolation.

203. Bulkhead stiffeners

1. For stiffeners having "strongly connected bracket" the span may be taken as $4l'/3$ for calculating, if the arm length of brackets exceed $l/8$. (See **Fig 3.15.1**).

2. End connection of stiffeners at the top of deep tanks stiffeners of deep tank bulkheads, which are not in line with stiffeners of tween deck bulkheads at the top of the tank, are to have bracket ends.

3. Scantlings of bulkheads stiffeners supporting under deck girders are to be calculated according to **Ch 14, 303. 1** of the Guidance, taking C as 9.81

4. In the provision of h specified in **203.** in the Rules, for side shell plating, a water head corresponding to the minimum draught amidship $d_{\min}$ (m) under all operating conditions of the ship may be deducted therefrom. The deductible water head at the top of keel is to be $d_{\min}$, value at point $d_{\min}$ above the top of keel, 0, and value at an intermediate point is to be obtained by linear interpolation.

204. Girders supporting bulkhead stiffeners

1. Girders fitted to corrugated bulkheads are to be balanced girders. In case it is difficult to form a balanced girder, the neutral axis of the girder is to be brought as close as possible to the bulkhead plate.

207. Corrugated bulkheads

1. For the under of the corrugated bulkheads, solid floors are to be provided like as **Fig 3.15.2** or reinforced by means of brackets.

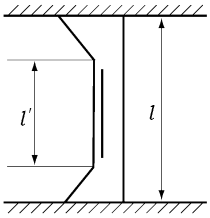

Fig 3.15.1

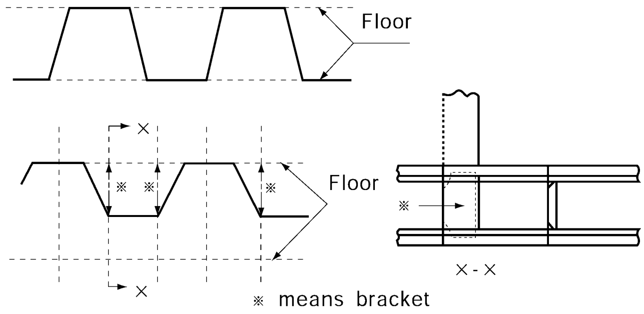

Fig 3.15.2

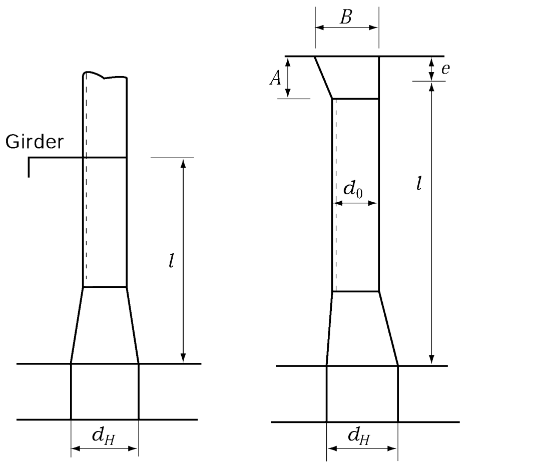
2. Section modulus of corrugated bulkheads

Where the width d_H in the direction of ship's length of stool of a corrugated bulkhead at the inner bottom is less than 2.5 times the web depth d_0 of corrugated bulkhead, the span l between supports is to be measured as shown in **Fig 3.15.3.** Further, the section modulus per half pitch of corrugated bulkhead and the section modulus of lower stool at the inner bottom are to be obtained from the formula in **207. 2** of the Rules, using the value of C specified in **Table 3.15.1.** ⚓



$$e = A - \frac{d_0}{2B} \cdot A$$

Fig 3.15.3 When $d_H/d_0 < 2.5$, Measurements of l

Table 3.15.1 Coefficient C

upper end support	Supported by girder	Connected to deck	Connected to stool
Section modulus of corrugated bulkhead	1.00	0.85	0.78
Section modulus of stool at bottom	1.00	1.50	1.35

CHAPTER 16 SUPERSTRUCTURES

Section 3 Access Opening in Superstructure End Bulkheads

301. Closure for access opening

Where the sill of access opening is to make hindrance to the passage of heavy spare parts, etc., removable sill may be provided subject to approval by the Society. ⚓

CHAPTER 18 MACHINERY SPACES AND ENGINE CASING

Section 2 Main Engine Foundation

202. Double bottom

1. Scantlings of members of double bottom structure in machinery space are based on the following standards.

(1) The thickness of centreline girder is not less than the value obtained from the following formula

$$t = 0.05L + 4.7 \quad \text{(mm)}$$

(2) The thickness of side girders and solid floors is not less than the value obtained from the following formula. If man holes are provided in girder plates, its number is to be minimized as far as possible.

$$L < 100\,m \ : \ t = 0.6\sqrt{L} + 3.0 \quad \text{(mm)}$$
$$L \geq 100\,m \ : \ t = 0.035L + 5.5 \quad \text{(mm)}$$

2. Girder plates beneath seat plates of main engine are in general to be penetrated through inner bottom plates. Where they are unable to be penetrated, inner bottom plates are to be suitably thicker than required and girder plates are to be welded with edge preparation.

3. Where main engines are directly installed on inner bottom plates, the compartments beneath main engine are recommended to be cofferdams. In case they are used as deep tanks, cap nuts, packing, etc. are to be fitted with in order to keep water/oil tightness at foundation bolts. ⚓

CHAPTER 20 STRENGTHENING FOR NAVIGATION IN ICE

Section 1 General

101. Application

1. For ships trading in Northern Baltic in the winter under the control of the Regulations "*Finnish-Swedish Ice Class Rules 2008*", attention is to be paid to the following restrictions :

(1) The administrations of Sweden and Finland (hereafter the Administrations) provide icebreaker assistance to ships bound for ports in respective countries in the winter season. Depending on the ice conditions, restrictions in regard to the size and ice class of ships entitled to icebreaker assistance are enforced.
(2) Ships entitled to assistance under the restrictions of the preceeding (1) are requested to follow the instructions by the icebreakers when operating in icebound waters and will receive assistance when such is needed.
(3) The Administrations can not take responsibility for the safety of ships which enter ice bound waters ignoring the size and ice class restrictions or any instructions by the icebreakers.
(4) Merely the compliance with these regulations must not be assumed to guarantee any certain degree of capability to advance in ice without icebreaker assistance nor to withstand heavy ice jamming.
(5) It should be noted that small ships will have somewhat less ice going capability as compared with larger ships having the same ice class.
(6) If a ship, because of very unconventional proportions, hull form or propulsion arrangements, or any other characteristics, in practice turns out to have exceptionally poor ice going capability, the Administrations may lower its ice class.
(7) It shall be noted that for ships of moderate size (displacement not exceeding 30,000 tons) fork towing in many situations is the most efficient way of assisting in ice.
(8) Ships with a bulb protruding more than 2.5 m forward of the forward perpendicular are often difficult to tow in this way. The Administrations reserve the right to deny assistance to such ships if the situation so warrants.
(9) An ice strengthened ship is assumed to operate in open sea conditions corresponding to a level ice thickness not exceeding h_0. The design height(h) of the area actually under ice pressure at any particular point of time is, however, assumed to be only a fraction of the ice thickness. The values for h_0 and h are given in **Table 3.20.1.**

Table 3.20.1 Values for h_0 and h

Ice Class	h_0(m)	h(m)
IA Super	1.00	0.35
IA	0.80	0.30
IB	0.60	0.25
IC	0.40	0.22

Section 2 Ice Strengthening

201. Classification of ice strengthening

1. The comparison between ice classes specified in **Ch 20, 201.** of the Rules and those in the Finnish-Swedish Ice Class Rules 2008 is given in **Table 3.20.2.**

2. The correspondence of ice classes specified in **Ch 20, 201.** of the Rules with those in the Arctic Shipping Pollution Prevention Regulation is as given in **Table 3.20.3.**

Table 3.20.2 The correspondence of ice classes between the Rules and the Finnish-Swedish Ice Class Rules 2008

Ice Class of the Rules	Ice Class of the Finnish-Swedish Ice Class Rules 2008
IA Super	IA Super
IA	IA
IB	IB
IC	IC
*	II
Note : ID class of the Rules is not equal to II class of the Finnish-Swedish Ice Class rule, because ID class requires strengthening of forward region.	

Table 3.20.3 The correspondence of ice classes between the Rules and the Arctic Shipping Pollution Prevention Regulation

Ice Class of the Rules	Ice Class of the Arctic Shipping Pollution Prevention Regulations

IA	Type B
IB	Type C
IC	Type D
ID	Type D

202. Definitions

1. Ice Class Draught Marking

The ship's sides are to be provided with a warning triangle and with a draught mark at the maximum permissible ice class draught amidships (see **Fig 3.20.2**). The purpose of the warning triangle is to provide information on the draught limitation of the vessel when it is sailing in ice for masters of icebreakers and for inspection personnel in ports.

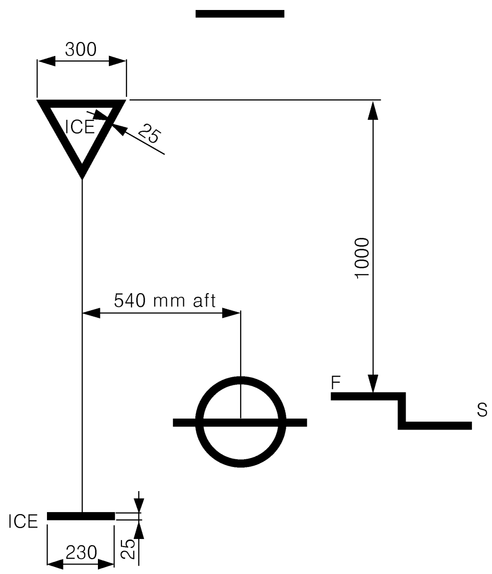

Fig 3.20.1 Ice class draught marking

(1) The upper edge of the Warning Triangle is to be located vertically above the “ICE” mark, 1000 mm higher than the Summer Load Line in fresh water but in no case higher than the deck line. The sides of the triangle are to be 300 mm in length.
(2) The ice class draught mark is to be located 540 mm abaft the centre of the load line ring or 540 mm abaft the vertical line of the timber load line mark, if applicable.
(3) The marks and figures are to be cut out of 5 - 8 mm plate and then welded to the ship's side. The marks and figures are to be painted in a red or yellow reflecting colour in order to make the marks and figures plainly visible even in ice conditions.
(4) The dimensions of all figures are to be the same as those used in the load line mark.

2. "Built" specified in **204.** of the Rules means the keel of ships has been laid or which has been at a similar stage of construction.

Section 4 Hull Structural Design

402. Shell plating

1. With respect to the provisions of **402. 2** of the Rules, value of factor f_2 for the longitudinal framing in larger frame spacing specified in **403. 3** (1) of the Rules, is not to be greater than 1.418.

403. Frames

3. Longitudinal frames

(1) With respect to the provisions of **403. 3** (1) of the Rules, the effective flange used in calculating the section modulus of the longitudinal frame in larger frame spacing is to be taken at most $0.15l$. An attention is to be paid to the provisions of **402.**
(2) With respect to the provisions of **403. 3** (2) of the Rules, boundary condition factor m for frames in conditions deviating from those of continuous beam is to be determined in accordance with the followings:
(A) For conditions deemed as those fixed at both ends : m=12
(B) For conditions deemed as those simple supported at both ends : m=8
(C) For conditions other than (A) or (B), boundary condition factor m is to be determined by calculation using simple beam theory, but in no case that m is not to be greater than 13.3.

404. Ice stringers

1. With respect to the provisions of **404.** of the Rules, boundary condition factor m for ice stringers in conditions deviating from those of continuous beam is to be determined in accordance with **403. 3** (2).

Section 5 Rudder and Steering Arrangements

501. Rudder and steering arrangements

1. The value that given in the **501. 1** of the Rules are following speed.

IA Super	20 kts
IA	18 kts
IB	16 kts
IC	14 kts

Section 6 Propulsion Machinery

605. Design loads

1. In application to **605. 7** of the Rules, for the c, t and r, refer to **Fig 3.20.2.**

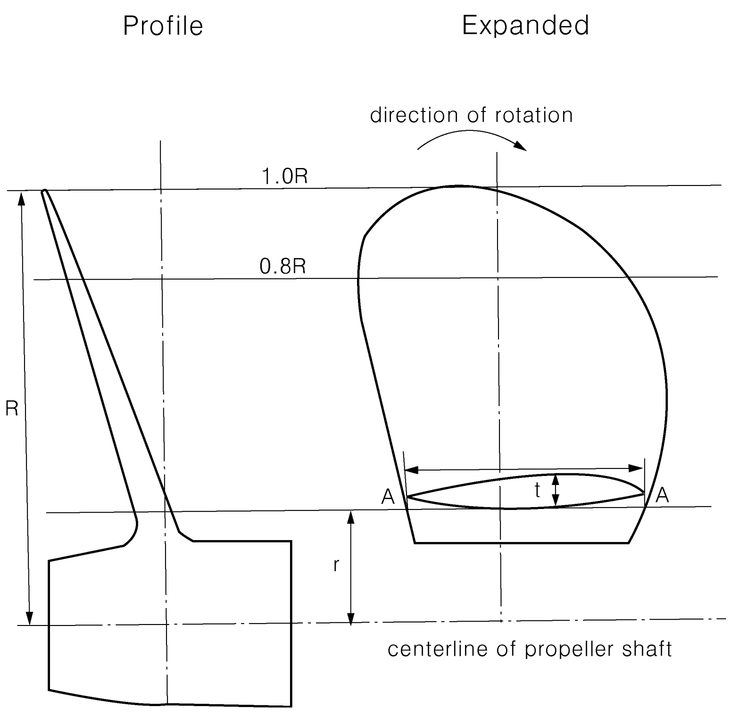

Fig 3.20.2 Dimension of propeller section for calculation of blade failure load

Section 7 Miscellaneous Machinery Requirements

702. Sea inlet and cooling water systems

1. In applying **702. 2** (3) of the Rules, the height of sea chest is not less than the value obtained from the following formula.

$$H = 1.5\sqrt[3]{V}$$

V = volume of sea chest specified in **702. 2** (2) of the Rules and, inlet pipe is to be not located higher than $H/3$ from the uppermost of sea chest.

2. "full capacity of cooling water" in **702. 2** (4) of the Rules is means that the cooling water is used for the following purposes

(1) Main propulsion system(main engine, power train, shafts)
(2) prime movers for generator
(3) main boiler and primary equipments of auxiliary boiler

3. In applying **702. 3** of the Rules, if the volume and height are not comply with **702. 2** (2) and (3) of the Rules, inlet and outlet pipes of cooling water is to be connected to sea chest. ⚓

CHAPTER 21 ADDITIONAL REQUIREMENTS TO SHIPS FOR NAVIGATION IN POLAR WATERS

Section 1 Polar Class Descriptions and Application

101. Application

1. This Guidance for Polar Ships is to apply to ships constructed of steel and intended for navigation in ice-infested polar waters, except ice breakers (see **101. 3**)

2. Ships that comply with the requirements in **Sec 2** and **Sec 3** can be considered for a Polar Class notation as listed in **Table 3.21.1**. The requirements of **Sec 2** and **Sec 3** are in addition to the open water requirements of this Society. If the hull and machinery are constructed such as to comply with the requirements of different polar classes, then both the hull and machinery are to be assigned the lower of these classes in the classification certificate. Compliance of the hull or machinery with the requirements of a higher polar class is also to be indicated in the classification certificate or an appendix thereto.

3. Ships that are also to receive an “Icebreaker” notation may have additional requirements and are to receive special consideration. “Icebreaker" refers to any ship having an operational profile that includes escort or ice management functions, having powering and dimensions that allow it to undertake aggressive operations in ice-covered waters, and having a class certificate endorsed with this notation.

102. Polar classes

1. The Polar Class (PC) notations and descriptions are given in **Table 3.21.1**. It is the responsibility of the Owner to select an appropriate Polar Class. The descriptions in **Table 3.21.1** are intended to guide owners, designers and administrations in selecting an appropriate Polar Class to match the requirements for the ship with its intended voyage or service.

2. The Polar Class notation is used throughout this chapter to convey the differences between classes with respect to operational capability and strength.

Table 3.21.1 Polar class descriptions

Polar Class	Ice Description (based on WMO Sea Ice Nomenclature)
PC 1	Year-round operation in all Polar waters
PC 2	Year-round operation in moderate multi-year ice conditions
PC 3	Year-round operation in second-year ice which may include multi-year ice inclusions.
PC 4	Year-round operation in thick first-year ice which may include old ice inclusions
PC 5	Year-round operation in medium first-year ice which may include old ice inclusions
PC 6	Summer/autumn operation in medium first-year ice which may include old ice inclusions
PC 7	Summer/autumn operation in thin first-year ice which may include old ice inclusions

103. Upper and lower ice waterlines

1. The upper and lower ice waterlines upon which the design of the vessel has been based is to be indicated in the classification certificate. The upper ice waterline (UIWL) is to be defined by the maximum draughts fore, amidships and aft. The lower ice waterline (LIWL) is to be defined by the minimum draughts fore, amidships and aft.

2. The lower ice waterline is to be determined with due regard to the vessel's ice-going capability in the ballast loading conditions(e.g. propeller submergence).

104. Subdivision and stability

1. For the ships to apply this Guidance, the followings are to be examined, considering the navigation features in ice-infested polar waters within approved limitations, in addition to the requirements regarding the stability and subdivision for the ships navigating in open waters.

(1) Intact stability when operated in ice-infested polar waters

(A) Account should be taken of the effect of icing in the stability calculations.

(B) Suitable calculations should be carried out and/or tests conducted to demonstrate the following:

(a) the ship, when operated in ice within approved limitations, during a disturbance causing roll, pitch, heave or heel due to turning or any other cause, should maintain sufficient positive stability; and

(b) ships of Polar Classes 1 to 3 and icebreakers of all classes, when riding up in ice and remaining momentarily poised at the lowest stem extremity, should maintain sufficient positive stability.

(C) Sufficient positive stability in paragraphs (A). (a) and (b) means that the ship is in a positive state of equilibrium with a positive metacentric height of at least 150 mm, and a line 150 mm below the edge of the freeboard deck as defined in the applicable LL Convention, is not submerged.

(D) For performing stability calculations on ships that ride up onto the ice, the ship should be assumed to remain momentarily poised at the lowest stem extremity as follows:

(a) for a regular stem profile, at the point at which the stem contour is tangent to the keel line;

(b) for a stem fitted with a structurally defined skeg, at the point at which the stem contour meets the top of the skeg;

(c) for a stem profile where the skeg is defined by shape alone, at the point at which the stem contour tangent intersects the tangent of the skeg; or

(d) for a stem profile of novel design, the position should be specially considered.

(2) Damage stability to be expected when operated in ice-infested polar waters

(A) All Polar Class ships should be able to withstand flooding resulting from hull penetration due to ice damage of the extent set out in paragraph (B) and location set out in paragraph (C), and the residual stability following ice damage should be such that the factor si, as defined in **SOLAS** regulation II-1/7.2, has si = 1 for all loading conditions.

(B) The dimensions of an ice damage penetration should be taken as:

(a) longitudinal extent 0.045 of deepest ice waterline length if centred forward of the point of maximum beam on the waterline, and 0.015 of waterline length otherwise;

(b) depth 760 mm measured normal to the shell over the full extent of the damage; and

(c) vertical extent the lesser of 0.2 of deepest ice draft, or of longitudinal extent.

(C) The centre of the ice damage may be located at any point between the keel and 1.2 times the deepest ice draft. The vertical extent of damage may be assumed to be confined between the keel and 1.2 times the deepest ice draft. For ships of Polar Classes 6 and 7 not carrying polluting or hazardous cargoes, damage may be assumed to be confined between watertight bulkheads, except where such bulkheads are spaced at less than the damage dimension.

(3) Security of subdivision and watertightness when operated in ice-infested polar waters

(A) Subject to (B) and (C), no Polar Class ship should carry any pollutant directly against the outer shell. Any pollutant should be separated from the outer shell of the ship by double skin construction of at least 760 mm in width.

(B) All Polar Class ships should have double bottoms over the breadth and the length between forepeak and afterpeak bulkheads. Double bottom height should be in accordance with the rules of the Classification Societies inforce. Double bottoms should not be used for the carriage of pollutants except where a double skin construction complying with paragraph (A) is provided, or where working liquids, are carried in way of main machinery spaces in tanks not exceeding 20 m^3 individual volume.

(C) Double bottoms in ships of Polar Classes 6 and 7 may be used for the carriage of any working liquids where the tanks are aft of midships and within the flat of bottom.
(D) All Polar Class ships with icebreaking bow forms and short forepeaks may dispense with double bottoms up to the forepeak bulkhead in the area of the inclined stem, provided that the watertight compartments between the forepeak bulkhead and the bulkhead at the junction between the stem and the keel are not used to carry pollutants.

Section 2 Structural Requirements for Polar Class Ships

201. Application

1. These requirements are to be applied to polar class ships according to **Sec 1.**

202. Hull areas

1. The hull of all polar class ships is divided into areas reflecting the magnitude of the loads that are expected to act upon them. In the longitudinal direction, there are four regions: Bow, Bow Intermediate, Midbody and Stern. The Bow Intermediate, Midbody and Stern regions are further divided in the vertical direction into the Bottom, Lower and Icebelt regions. The extent of each Hull Area is illustrated in **Fig 3.21.1.**

2. The upper ice waterline (UIWL) and lower ice waterline(LIWL) are as defined in **103. 1.**

3. **Fig 3.21.1** notwithstanding, at no time is the boundary between the Bow and Bow Intermediate regions to be forward of the intersection point of the line of the stem and the ship baseline.

4. **Fig 3.21.1** notwithstanding, the aft boundary of the Bow region need not be more than 0.45 L aft of the forward perpendicular (FP).

5. The boundary between the bottom and lower regions is to be taken at the point where the shell is inclined 7° from horizontal.

6. If a ship is intended to operate astern in ice regions, the aft section of ships is to be designed using the Bow and Bow Intermediate hull area requirements.

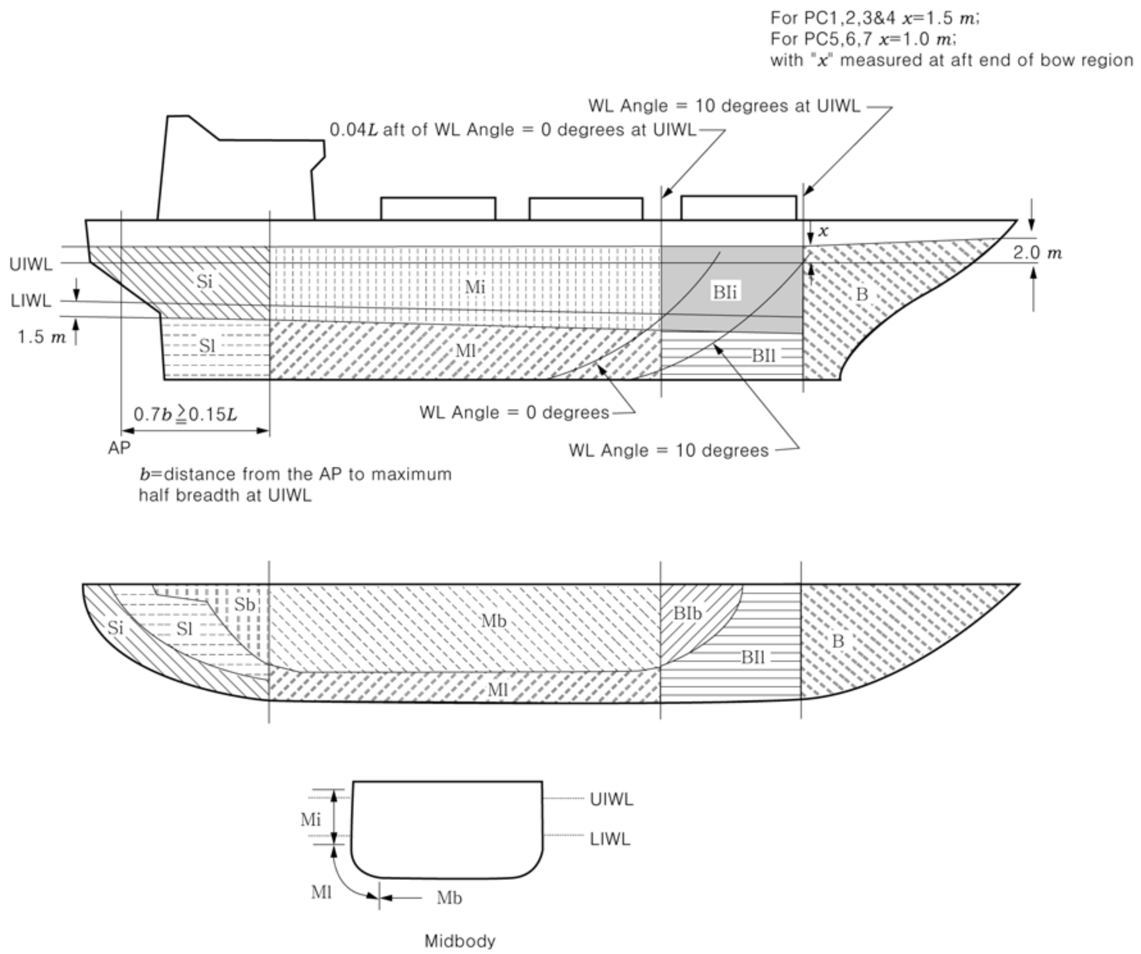

Fig 3.21.1 Hull area extents

203. Design ice loads

1. General

(1) For ships in all Polar Classes, a glancing impact on the bow is the design scenario for determining the scantlings required to resist ice loads.
(2) The design ice load is characterized by an average pressure(P_{avg}) uniformly distributed over a rectangular load patch of height(b) and width(w).
(3) Within the Bow area of all polar classes and within the Bow Intermediate Icebelt area of polar classes PC6 and PC7, the ice load parameters(P_{avg}, b and w) are functions of the actual bow shape. To determine the ice load parameters, it is required to calculate the following ice load characteristics for sub-region of the bow area; shape coefficient (fa_i), total glancing impact force (F_i), line load (Q_i) and pressure (P_i).
(4) In other ice-strengthened areas the ice load parameters (P_{avg}, b_{NonBow} and w_{NonBow}) are determined independently of the hull shape. Accordingly, calculation of the glancing impact force (F_{NonBow}) and line load (Q_{NonBow}) are based on a standard hull shape coefficient ($fa = 0.36$) and a fixed load patch aspect ratio ($AR = 3.6$).
(5) Design ice forces calculated according to **203. 2** are only valid for vessels with icebreaking forms. Design ice forces for any other bow forms are to be specially considered by this Society.
(6) Ship structures that are not directly subjected to ice loads may still experience inertial loads of stowed cargo and equipment resulting from ship/ice interaction. These inertial loads, based on accelerations determined by this Society, are to be considered in the design of these ship structures.

2. Glancing impact load characteristics

The parameters defining the glancing impact load characteristics are reflected in the Class Factors listed in **Table 3.21.2**.

Table 3.21.2 Class factors

Polar Class	Crushing Failure Class Factor (CF_C)	Flexural Failure Class Factor (CF_F)	Load Patch Dimensions Class Factor (CF_D)	Displacement Class Factor (CF_{DIS})	Longitudinal Strength Class Factor (CF_L)
PC1	17.69	68.60	2.01	250	7.46
PC2	9.89	46.80	1.75	210	5.46
PC3	6.06	21.17	1.53	180	4.17
PC4	4.50	13.48	1.42	130	3.15
PC5	3.10	9.00	1.31	70	2.50
PC6	2.40	5.49	1.17	40	2.37
PC7	1.80	4.06	1.11	22	1.81

(1) Bow area

(A) In the Bow area, the force (F), line load (Q), pressure (P) and load patch aspect ratio (AR) associated with the glancing impact load scenario are functions of the hull angles measured at the upper ice waterline. The influence of the hull angles is captured through calculation of a bow shape coefficient (fa). The hull angles are defined in **Fig 3.21.2.**

(B) The waterline length of the bow region is generally to be divided into 4 sub-regions of equal length. The force (F), line load (Q), pressure (P) and load patch aspect ratio (AR) are to be calculated with respect to the mid-length position of each sub-region (each maximum of F, Q and P is to be used in the calculation of the ice load parameters P_{avg}, b and w).

(C) The Bow area load characteristics are determined as follows:

(a) Shape coefficient, fa_i, is to be taken as

$$fa_i = \min(fa_{i,1}\,; fa_{i,2}\,; fa_{i,3})$$

where,

$$fa_{i,1} = (0.097 - 0.68(x/L - 0.15)^2) \times \alpha_i \,/ \sqrt{\beta_i'}$$

$$fa_{i,2} = 1.2 \times CF_F / (\sin\beta_i' \times CF_C \times D^{0.64})$$

$$fa_{i,3} = 0.60$$

i = sub-region considered

L = ship length measured at the upper ice waterline (UIWL) (m)

x = distance from the forward perpendicular (FP) to station under consideration (m)

α = waterline angle (deg), see **Fig 3.21.2**

β' = normal frame angle (deg), see **Fig 3.21.2**

D = ship displacement (kt), not to be taken less than 5 kt

CF_C = crushing failure class factor from **Table 3.21.2**

CF_F = flexural failure class factor from **Table 3.21.2**

(b) Force, F

$$F_i = fa_i \times CF_C \times D^{0.64} \quad \text{(MN)}$$

where

i = sub-region considered

fa_i = shape coefficient at x/L of sub-region i

CF_C = crushing failure class factor from **Table 3.21.2**

D = ship displacement (kt), where $D_{\min} = 5$ kt

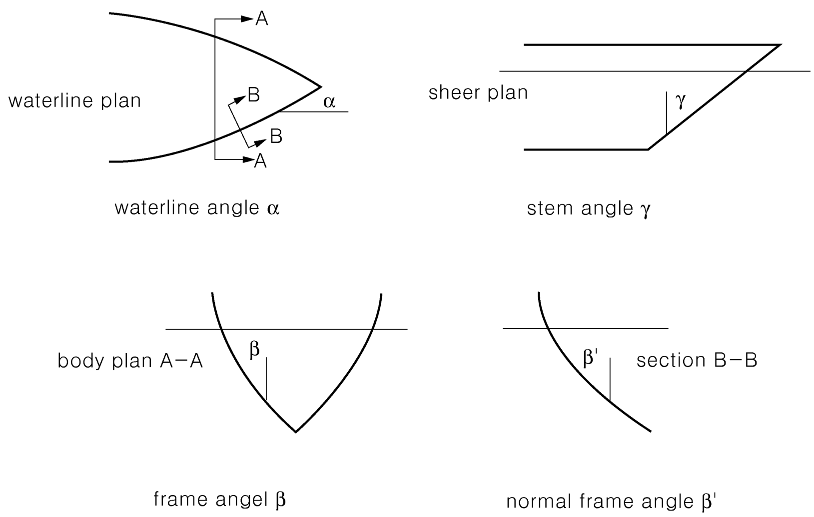
(c) Load patch aspect ratio, AR

$$AR_i = 7.46 \times \sin\beta_i' \geq 1.3$$

where

i = sub-region considered

β_i' = normal frame angle of sub-region i (deg)



Note: β' = normal frame angle at upper ice waterline [deg]

α = upper ice waterline angle [deg]

γ = buttock angle at upper ice waterline (angle of buttock line measured from vertical) [deg]

$\tan\beta = \tan\gamma \tan\alpha$

$\tan\beta' = \tan\beta \cos\alpha$

Fig 3.21.2 Definition of hull angles

(d) Line load, Q

$$Q_i = F_i^{0.61} \times CF_D / AR_i^{0.35} \quad \text{(MN/m)}$$

where

i = sub-region considered

F_i = force of sub-region i (MN)

CF_D = load patch dimensions class factor from **Table 3.21.2**

AR_i = load patch aspect ratio of sub-region i

(e) Pressure, P

$$P_i = F_i^{0.22} \times CF_D^2 \times AR_i^{0.3} \qquad \text{(MPa)}$$

where

i = sub-region considered

F_i = force of sub-region i (MN)

CF_D = load patch dimensions class factor from **Table 3.21.2**

AR_i = load patch aspect ratio of sub-region i

(2) Hull areas other than the bow

(A) In the hull areas other than the bow, the force (F_{NonBow}) and line load (Q_{NonBow}) used in the determination of the load patch dimensions (b_{NonBow}, w_{NonBow}) and design pressure (P_{avg}) are determined as follows:

(a) Force, F_{NonBow}

$$F_{NonBow} = 0.36 \times CF_C \times DF \qquad \text{(MN)}$$

where,

CF_C = crushing failure class factor from **Table 3.21.2**

DF = ship displacement factor

= $D^{0.64}$ if $D \le CF_{DIS}$

= $CF_{DIS}^{0.64} + 0.10(D - CF_{DIS})$ if $D > CF_{DIS}$

D = ship displacement (kt), not to be taken less than 10 kt

CF_{DIS} = displacement class factor from **Table 3.21.2**

(b) Line Load, Q_{NonBow}

$$Q_{NonBow} = 0.639 \times F_{NonBow}^{0.61} \times CF_D \qquad \text{(MN/m)}$$

where,

F_{NonBow} = force from Equation 9 (MN)

CF_D = load patch dimensions class factor from **Table 3.21.2**

3. Design load patch

(1) In the Bow area, and the Bow Intermediate Icebelt area for ships with class notation PC6 and PC7, the design load patch has dimensions of width, w_{Bow}, and height, b_{Bow}, defined as follows:

$$w_{Bow} = F_{Bow} / Q_{Bow} \qquad \text{(m)}$$
$$b_{Bow} = Q_{Bow} / P_{Bow} \qquad \text{(m)}$$

where

F_{Bow} = maximum F_i in the Bow area (MN)

Q_{Bow} = maximum Q_i in the Bow area (MN/m)

P_{Bow} = maximum P_i in the Bow area (MPa)

(2) In hull areas other than those covered by (1), the design load patch has dimensions of width, w_{NonBow}, and height, b_{NonBow}, defined as follows:

$$w_{NonBow} = F_{NonBow} / Q_{NonBow} \qquad \text{(m)}$$
$$b_{NonBow} = w_{NonBow} / 3.6 \qquad \text{(m)}$$

where

F_{NonBow} = force determined using Equation 9 (MN)

Q_{NonBow} = line load determined using Equation 10 (MN/m)

4. Pressure within the design load patch

(1) The average pressure, P_{avg}, within a design load patch is determined as follows:

$$P_{avg} = F/(b \times w) \quad \text{(MPa)}$$

where

F = F_{Bow} or F_{NonBow} as appropriate for the hull area under consideration (MN)

b = b_{Bow} or b_{NonBow} as appropriate for the hull area under consideration (m)

w = w_{Bow} or w_{NonBow} as appropriate for the hull area under consideration (m)

(2) Areas of higher, concentrated pressure exist within the load patch. In general, smaller areas have higher local pressures. Accordingly, the peak pressure factors listed in **Table 3.21.3** are used to account for the pressure concentration on localized structural members.

Table 3.21.3 Peak pressure factors

Structural Member		Peak Pressure Factor (PPF_i)
Plating	Transversely-Framed	$PPF_p = (1.8 - S) \geq 1.2$
	Longitudinally-Framed	$PPF_p = (2.2 - 1.2 \times S) \geq 1.5$
Frames in Transverse Framing Systems	With Load Distributing Stringers	$PPF_m = (1.6 - S) \geq 1.0$
	With No Load Distributing Stringers	$PPF_m = (1.8 - S) \geq 1.2$
Load Carrying Stringers Side and Bottom Longitudinals Web Frames		$PPF_s = 1$ if $S_w \geq 0.5 \times w$ $PPF_s = 2.0 - 2.0 \times S_w / W$ if $S_w < (0.5 \times w)$
where, S = frame or longitudinal spacing (m) S_w = web frame spacing (m) w = ice load patch width (m)		

5. Hull area factors

(1) Associated with each hull area is an Area Factor that reflects the relative magnitude of the load expected in that area. The Area Factor (AF) for each hull area is listed in **Table 3.21.4.**

(2) In the event that a structural member spans across the boundary of a hull area, the largest hull area factor is to be used in the scantling determination of the member.

(3) Due to their increased manoeuverability, ships having propulsion arrangements with azimuthing thruster(s) or “podded” propellers shall have specially considered Stern Icebelt (S_i) and Stern Lower (S_l) hull area factors.

Table 3.21.4 Hull area factors (AF)

Hull Area		Area	Polar Class						
			PC1	PC2	PC3	PC4	PC5	PC6	PC7
Bow (B)	All	B	1.00	1.00	1.00	1.00	1.00	1.00	1.00
Bow Intermediate (BI)	Icebelt	BI_i	0.90	0.85	0.85	0.80	0.80	1.00*	1.00*
	Lower	BI_l	0.70	0.65	0.65	0.60	0.55	0.55	0.50
	Bottom	BI_b	0.55	0.50	0.45	0.40	0.35	0.30	0.25
Midbody (M)	Icebelt	M_i	0.70	0.65	0.55	0.55	0.50	0.45	0.45
	Lower	M_l	0.50	0.45	0.40	0.35	0.30	0.25	0.25
	Bottom	M_b	0.30	0.30	0.25	**	**	**	**
Stern (S)	Icebelt	S_i	0.75	0.70	0.65	0.60	0.50	0.40	0.35
	Lower	S_l	0.45	0.40	0.35	0.30	0.25	0.25	0.25
	Bottom	S_b	0.35	0.30	0.30	0.25	0.15	**	**

Note to Table 3: * See 203.1.(3)
** Indicates that strengthening for ice loads is not necessary.

204. Shell plate requirements

1. The required minimum shell plate thickness, t, is given by:

$$t = t_{net} + t_s \quad \text{(mm)}$$

where

t_{net} = plate thickness required to resist ice loads according to **Ch 21, 204. 2** of the Guidance. (mm)

t_s = corrosion and abrasion allowance according to **Ch 21, 211** of the Guidance. (mm)

2. The thickness of shell plating required to resist the design ice load, t_{net}, depends on the orientation of the framing.

(1) In the case of transversely-framed plating ($\Omega \geq 70°$, see **Fig 3.21.3**), including all bottom plating, i.e. plating in hull areas BI_b, M_b and S_b, the net thickness is given by:

$$t_{net} = 500 \times S((AF \times PPF_p \times P_{avg}) / \sigma_y)^{0.5} / (1 + S/2b) \quad \text{(mm)}$$

(2) In the case of longitudinally-framed plating ($\Omega \leq 20°$), when $b \geq S$, the net thickness is given by:

$$t_{net} = 500 \times S((AF \times PPF_p \times P_{avg}) / \sigma_y)^{0.5} / (1 + S/2a) \quad \text{(mm)}$$

(3) In the case of longitudinally-framed plating ($\Omega \leq 20°$, see **Fig 3.21.3**), when $b < S$, the net thickness is given by:

$$t_{net} = 500 \times S((AF \times PPF_p \times P_{avg}) / \sigma_y)^{0.5} (2b/S - (b/S)^2)^{0.5} / (1 + S/2a) \quad \text{(mm)}$$

(4) In the case of obliquely-framed plating($70° > \Omega > 20°$), linear interpolation is to be used.

where,

Ω = smallest angle (deg.) between the chord of the waterline and the line of the first level framing as illustrated in **Fig 3.21.3**

S = transverse frame spacing in transversely framed ships or longitudinal spacing in longitudinally-framed ships (m)

AF = Hull Area Factor from **Table 3.21.4**

PPF_p = Peak Pressure Factor from **Table 3.21.3**

P_{avg} = average patch pressure according to **203. 4** (1) (MPa)

σ_y = minimum yield stress of the material (N/mm^2)

b = height of design load patch (m), where $b \le (a - S/4)$ in the case of **204. 2** (1)

a = distance between frame supports, i.e. equal to the frame span as given in **205. 1** (5), but not reduced for any fitted end brackets (m). When a load-distributing stringer is fitted, the length a need not be taken larger than the distance from the stringer to the most distant frame support.

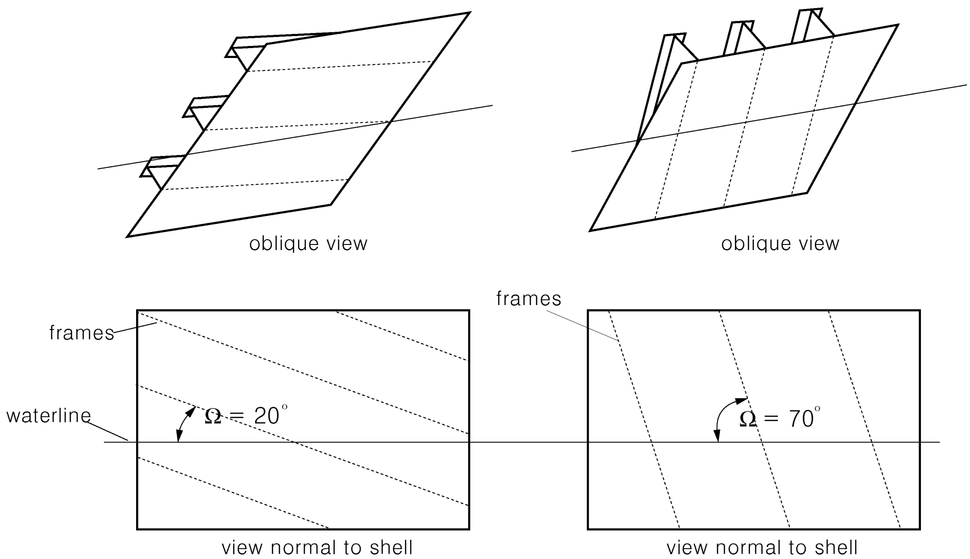


Fig 3.21.3 Shell framing angle Ω

205. Framing

1. General

(1) Framing members of Polar class ships are to be designed to withstand the ice loads defined in **203.**

(2) The term "framing member" refers to transverse and longitudinal local frames, load-carrying stringers and web frames in the areas of the hull exposed to ice pressure, see **Fig 3.21.1.** Where load-distributing stringers have been fitted, the arrangement and scantlings of these are to be in accordance with the requirements of this society.

(3) The strength of a framing member is dependent upon the fixity that is provided at its supports. Fixity can be assumed where framing members are either continuous through the support or attached to a supporting section with a connection bracket. In other cases, simple support is to be assumed unless the connection can be demonstrated to provide significant rotational restraint. Fixity is to be ensured at the support of any framing which terminates within an ice-strengthened area.

(4) The details of framing member intersection with other framing members, including plated structures, as well as the details for securing the ends of framing members at supporting sections are to be in accordance with the requirements of each member society.

(5) The design span of a framing member is to be determined on the basis of its moulded length. If brackets are fitted, the design span may be reduced in accordance with the usual practice of each member society. Brackets are to be configured to ensure stability in the elastic and post-yield response regions.
(6) When calculating the section modulus and shear area of a framing member, net thicknesses of the web, flange (if fitted) and attached shell plating are to be used. The shear area of a framing member may include that material contained over the full depth of the member, i.e. web area including portion of flange, if fitted, but excluding attached shell plating.
(7) The actual net effective shear area, A_w, of a framing member is given by:

$$A_w = h t_{wn} \sin\varphi_w / 100 \quad (\text{cm}^2)$$

h = height of stiffener (mm) (see **Fig 3.21.4**)
t_{wn} = net web thickness (mm)
= $t_w - t_c$
t_w = as built web thickness (mm) (see **Fig 3.21.4**)
t_c = corrosion deduction (mm) to be subtracted from the web and flange thickness (as specified this society, but not less than t_s as required by **207. 3**).
φ_w = smallest angle between shell plate and stiffener web, measured at the midspan of the stiffener. (see **Fig 3.21.4**) The angle may be taken as 90 degrees provided the smallest angle is not less than 75 degrees.

(8) When the cross-sectional area of the attached plate flange exceeds the cross-sectional area of the local frame, the actual net effective plastic section modulus, Z_p, is given by:

$$Z_p = A_{pn} t_{pn} / 20 + \frac{h_w^2 t_{wn} \sin\varphi_w}{2000} A_{fn} (h_{fc} \sin\varphi_w - b_w \cos\varphi_w) / 10 \quad (\text{cm}^3)$$

h, t_{wn}, t_c and w are as given in **205. 1** (7) and S as given in **204. 2**
A_{pn} = net cross-sectional area of attached plate (cm^2) (equal to $t_{pn} * S * 10$, but not to be taken greater than the net cross-sectional area of the local frame)
t_{pn} = fitted net shell plate thickness (mm) (shall comply with t_{net} as required by **204. 2**)
h_w = height of local frame web (mm) (see **Fig 3.21.4**)
A_{fn} = net cross-sectional area of local frame flange (cm^2)
h_{fc} = height of local frame measured to centre of the flange area (mm) (see **Fig 3.21.4**)
b_w = distance from mid thickness plane of local frame web to the centre of the flange area (mm) (see **Fig 3.21.4**)

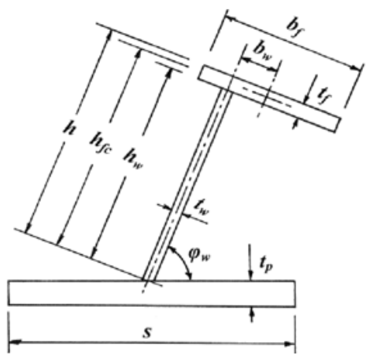

Fig 3.21.4 Stiffener geometry

When the cross-sectional area of the local frame exceeds the cross-sectional area of the attached plate flange, the plastic neutral axis is located a distance z_{na} above the attached shell plate, given by:

$$Z_{na} = (100A_{fn} + h_w t_{wn} - 1000 t_{pn} S)/(2t_{wn}) \quad \text{(mm)}$$

and the net effective plastic section modulus, Z_p, is given by:

$$Z_p = t_{pn} S Z_{na} \sin\varphi_w + \left(\frac{((h_w - Z_{na})^2 + Z_{na}^2) t_{wn} \sin\varphi_w}{2000}\right) + A_{fn}((h_{fc} - Z_{na})\sin\varphi_w - b_w \cos\varphi_w)/10 \quad (\text{cm}^3)$$

(9) In the case of oblique framing arrangement (70 deg > Ω > 20 deg, where Ω is defined as given in **204. 2**), linear interpolation is to be used.

2. Transversely framed side structures and bottom structures

(1) The local frames in transversely-framed side structures and bottom structures (i.e. hull areas B_{fb}, M_b and S_b) are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. Plastic strength is defined as the magnitude of mid-span load that causes the development of a plastic collapse mechanism.

(2) The actual net effective shear area of the frame, A_w, as defined **205. 1** (7), is to comply with the following condition: $A_w \geq A_m$, where:

$$A_m = 100^2 \times 0.5 \times LL \times S \times (AF \times PPF_m \times P_{avg})/(0.577\sigma_y) \quad (\text{cm}^2)$$

where

LL = length of loaded portion of span
= lesser of a and b (m)
a = main frame span (m)
b = height of design ice load patch according to **203. 3** (1) or (2) (m)
S = main frame spacing (m)
AF = Hull Area Factor from **Table 3.21.4**
PPF_m = Peak Pressure Factor from **Table 3.21.3**
P_{avg} = average pressure within load patch according to **203. 4** (1) (MPa)
σ_y = minimum yield stress of the material (N/mm^2)

(3) The actual net effective plastic section modules of the plate/stiffener combination, Z_p, as defined in **205. 1.** (8) is to comply with the following condition: $Z_p \geq Z_{pm}$, where Z_{pm} is to be the greater calculated on the basis of two load conditions: a) ice load acting at the midspan of the main frame, and b) the ice load acting near a support. The A_1 parameter in the equation reflects the two conditions:

$$Z_{pm} = 100^3 \times LL \times Y \times S \times (AF \times PPF_t \times P_{avg})\, a \times A_1/(4\sigma_y) \quad (\text{cm}^3)$$

where

LL, a, b, S, AF, PPF_t, P_{avg} and σ_y, are given in **205. 2** (2)
$Y = 1 - 0.5(LL/a)$
A_1 = maximum of

$$A_{1A} = \frac{1}{\left(1 + \frac{j}{2} + k_w \frac{j}{2}((1 - a_1^2)^{0.5} - 1)\right)}$$

$$A_{1B}= \frac{1-1/(2a_1Y)}{0.275+1.44\,k_z^{0.7}}$$

j = 1 for framing with one simple support outside the ice strengthened areas
= 2 for framing without any simple supports

a_1 = A_t/A_w

A_t : minimum shear area for main frame (cm^2)

A_w : fitted shear area of main frame (cm^2) (calculated according to **205. 1** (7)) (cm^2)

k_w = $1/(1+2A_{fn}/A_w)$ with A_{fn} as given in **205. 1** (8)

k_z = z_p/Z_p in general
= 0.0 when the frame is arranged with end bracket

z_p = sum of individual plastic section modulus of flange and shell plate as fitted (cm^3)

$$= (b_f\frac{t_{fn}^2}{4}+b_{eff}\frac{t_{pn}^2}{4})/1000$$

b_f = flange breadth (mm) (see **Fig 3.21.4)**

t_{fn}= net flange thickness (mm)
= t_f-t_c (t_c as given **205. 1.** (7))

t_f = as-built flange thickness (mm) (see **Fig 3.21.4**)

t_{pn}= the fitted net shell plate thickness (mm) (not to be less than t_{net} as given in **204. 2**)

b_{eff}= effective width of shell plate flange (mm)

Z_p = plastic section modulus of transverse frame (cm^2) (calculated according to **205. 1** (8))

(4) The scantlings of the main frame are to meet the structural stability requirements of **5.**

3. Side longitudinals (longitudinally framed ships)

(1) Side longitudinals are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. Plastic strength is defined as the magnitude of midspan load that causes the development of a plastic collapse mechanism.

(2) The actual net effective shear area of the frame, A_w, as defined **205. 1** (7), is to comply with the following condition: $A_w \geq A_L$, where:

$$A_L= 100^2\times\frac{0.5b_1\times c\times LL\times(AF\times PPF_s\times P_{avg})}{0.577\sigma_y}\quad (\text{cm}^2)$$

where

AF = Hull Area Factor from **Table 3.21.4**

PPF_s = Peak Pressure Factor from **Table 3.21.3**

P_{avg} = average pressure within load patch according to **203. 4** (1) (MPa)

$b_1 = k_0\,b_2$

$k_o = 1-0.3/b'$

$b' = b/S$

b = height of design ice load patch from **203. 3** (1) or (2) (m)

S = main frame spacing (m)

$b_2 = b(1-0.25b')$ if $b' < 2$
$= S$ if $b' \geq 2$

a = longitudinal design span as given **205.1** (5)

σ_y = minimum yield stress of the material (N/mm^2)

(3) The actual net effective plastic section modulus of the plate/stiffener combination, Z_p, as defined in **205. 1** (8) is to comply with the following condition: $Z_p \geq Z_{pL}$:

$$(Z_{pL}) = 100^3 \times \frac{b_1 \times a^2 \times A_4 \times (AF \times PPF_s \times P_{avg})}{8\,\sigma_y} \quad (\text{cm}^3)$$

where

$AF, PPF_s, P_{avg}, b_1, a$, and σ_y are as given in **205. 3** (2)

$$A_4 = \frac{1}{2 + k_{wl}((1-a_4^2)^{0.5} - 1)}$$

$$a_4 = \frac{A_l}{A_{1FIT}}$$

A_l = minimum shear area for longitudinal as given in **205. 3** (2) (cm^2)

A_{iFIT} = net effective shear area of longitudinal (cm^2) (calculated according to **205. 3** (2))

$k_{wl} = 1/(1+2A_{fn}/A_{iFIT})$ with A_{fn} as given in **205. 1** (8)

(4) The scantlings of the longitudinals are to meet the structural stability requirements of **5.**

4. Web frame and load carrying stringers

(1) Web frames and load-carrying stringers are to be designed to withstand the ice load patch as defined in **203.** The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimised.

(2) Web frames and load-carrying stringers are to be dimensioned such that the combined effects of shear and bending do not exceed the limit state(s) defined by each member society. Where these members form part of a structural grillage system, appropriate methods of analysis are to be used. Where the structural configuration is such that members do not form part of a grillage system, the appropriate peak pressure factor (PPF) from **Table 3.21.3** is to be used. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

(3) The scantlings of web frames and load-carrying stringers are to meet the structural stability requirements of **5.**

5. Structural stability

(1) To prevent local buckling in the web, the ratio of web height (h_w) to net web thickness (t_w) of any framing member is not to exceed:

For flat bar sections: $h_w / t_w \leq 282 / \sigma^{0.5}$

For bulb, tee and angle sections: $h_w / t_w \leq 805 / \sigma^{0.5}$

where

h_w = web height

t_w = net web thickness

σ_y = minimum yield stress of the material (N/mm^2)

(2) Framing members for which it is not practicable to meet the requirements of (1) (e.g. load carrying stringers or deep web frames) are required to have their webs effectively stiffened. The scantlings of the web stiffeners are to ensure the structural stability of the framing member. The minimum net web thickness for these framing members is given by the following equation:

$$t_w = \frac{2.63 \times 10^{-3}\, c_1\, \sigma_y}{5.34 + 4(c_1 / c_2)^2} \quad \text{(mm)}$$

where

t_w = net web thickness (mm)

c_1 = $h_w - 0.8h_f$ (mm)

h_w = web height of stringer / web frame (mm) (see **Fig 3.21.5**)

h_f = height of framing member penetrating the member under consideration (0 if no such framing member) (mm) (see **Fig 3.21.5**)

c_2 = spacing between supporting structure oriented perpendicular to the member under consideration (mm) (see **Fig 3.21.5**)

σ_y = minimum yield stress of the material (N/mm^2)

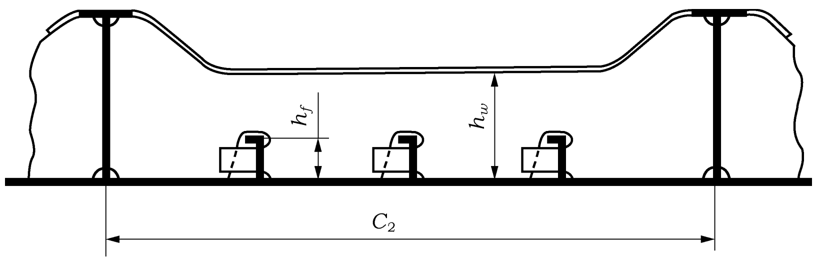

Fig 3.21.5 Parameter definition for web stiffening

(3) In addition, the following is to be satisfied:

$$t_w \geq 0.35\, t_{net} \sqrt{\frac{\sigma_y}{235}}$$

where

σ_y = minimum upper yield stress of the material (N/mm^2)

t_w = net thickness of the web

t_{net} = thickness of the shell plate in way the framing member

(4) To prevent local flange buckling of welded profiles, the following are to be satisfied:

(a) The flange width (b_f) shall not be less than five times the net thickness of the web (t_w).

(b) The flange outstand (b), shall meet the following requirement:

$$\frac{b}{t_f} \leq \frac{155}{\sqrt{\sigma_y}}$$

where

t_f = net thickness of flange

σ_y = minimum upper yield stress of the material (N/mm^2)

206. Plated structures

1. Plated structures are those stiffened plate elements in contact with the hull and subject to ice loads. These requirements are applicable to an inboard extent which is the lesser of:

(1) web height of adjacent parallel web frame or stringer; or

(2) 2.5 times the depth of framing that intersects the plated structure

2. The thickness of the plating and the scantlings of attached stiffeners are to be such that the degree of end fixity necessary for the shell framing is ensured.

3. The stability of the plated structure is to adequately withstand the ice loads defined in **203.**

207. Corrosion/abrasion additions and steel renewal

1. Effective protection against corrosion and ice-induced abrasion is recommended for all external surfaces of the shell plating for all Polar ships.

2. The values of corrosion/abrasion additions, t_s, to be used in determining the shell plate thickness for each Polar Class are listed in **Table 3.21.5.**

3. Polar ships are to have a minimum corrosion/abrasion addition of $t_s = 1.0$ mm applied to all internal structures within the ice-strengthened hull areas, including plated members adjacent to the shell, as well as stiffener webs and flanges.

4. Steel renewal for ice strengthened structures is required when the gauged thickness is less than $t_{net} + 0.5$ mm.

Table 3.21.5 Corrosion/Abrasion additions for shell plating

Hull Area	t_s (mm)					
	With Effective Protection			Without Effective Protection		
	PC1 - PC3	PC4 & PC5	PC6 & PC7	PC1 - PC3	PC4 & PC5	PC6 & PC7
Bow; Bow Intermediate Icebelt	3.5	2.5	2.0	7.0	5.0	4.0
Bow Intermediate Lower; Midbody & Stern Icebelt	2.5	2.0	2.0	5.0	4.0	3.0
Midbody & Stern Lower; Bottom	2.0	2.0	2.0	4.0	3.0	2.5
Other Areas	2.0	2.0	2.0	3.5	2.5	2.0

208. Materials

1. Plating materials for hull structures are to be not less than those given in **Tables 3.21.7** and **3.21.8** based on the as built thickness of the material, the Polar ice class notation assigned to the ship and the Material Class of structural members given in **Table 3.21.6.**

2. Material classes specified in **Ch 2, Table 3.1.4** of the Rules are applicable to polar ships regardless of the ship's length. In addition, material classes for weather and sea exposed structural members and for members attached to the weather and sea exposed shell plating of polar ships are given in **Table 3.21.6.** Where the material classes in **Table 3.21.6**, below, and those in **Ch 2, Table 3.1.4** of the Rules differ, the higher material class is to be applied.

3. Steel grades for all plating and attached framing of hull structures and appendages situated below the level of 0.3 m below the lower waterline, as shown in **Fig 3.21.6**, are to be obtained from **Ch 2, Table 3.1.9** of the Rules based on the Material Class for Structural Members in **Table 3.21.7**, above, regardless of Polar Class.

4. Steel grades for all weather exposed plating of hull structures and appendages situated above the level of 0.3 m below the lower ice waterline, as shown in **Fig 3.21.6**, are to be not less than given in **Table 3.21.8.**

5. Steel grades for all inboard framing members attached to weather exposed plating are to be not less than given in **Table 3.21.8.** This applies to all inboard framing members as well as to other contiguous inboard members (e.g. bulkheads, decks) within 600 mm of the exposed plating.

6. Castings are to have specified properties consistent with the expected service temperature for the cast component.

Table 3.21.6 Material classes for structural members of polar ships

Structural Members	Material Class
Shell plating within the bow and bow intermediate icebelt hull areas (B, BIi)	II
All weather and sea exposed SECONDARY and PRIMARY, as defined in **Ch 2**, **Table 3.1.4**, structural members outside $0.4\,L$ amidships	I
Plating materials for stem and stern frames, rudder horn, rudder, propeller nozzle, shaft brackets, ice skeg, ice knife and other appendages subject to ice impact loads	II
All inboard framing members attached to the weather and sea-exposed plating including any contiguous inboard member within 600 mm of the shell plating	I
Weather-exposed plating and attached framing in cargo holds of ships which by nature of their trade have their cargo hold hatches open during cold weather operations	I
All weather and sea exposed SPECIAL, as defined in **Ch 2**, **Table 3.1.4**, structural members within $0.2\,L$ from FP	II

209. Longitudinal strength

1. Application

Ice loads need only be combined with still water loads. The combined stresses are to be compared against permissible bending and shear stresses at different locations along the ship's length. In addition, sufficient local buckling strength is also to be verified.

2. Design vertical ice force at the bow

The design vertical ice force at the bow, F_{IB}, is to be taken as:

$$F_{IB} = \min(F_{IB,1}\,;F_{IB,2}) \quad \text{(MN)}$$

where

$$F_{IB,1} = 0.534 K_I^{0.15} \sin^{0.2}\gamma_{stern}(DK_h)^{0.5}\, CF_L \quad \text{(MN)}$$

$$F_{IB,2} = 1.2\, CF_F \quad \text{(MN)}$$

K_I = indentation parameter = K_f / K_h

(1) for the case of a blunt bow form

$$K_f = \left(\frac{2CB^{(1-e_b)}}{(1+e_b)}\right)^{0.9} \tan(\gamma_{stem})^{-0.9(1+e_b)}$$

(2) for the case of wedge bow form ($\alpha_{stem} < 80$ deg), $e_b = 1$ and the above simplifies to

$$K_f = \left(\frac{\tan(\alpha_{stem})}{\tan^2(\gamma_{stem})}\right)^{0.9}$$

$K_h = 0.01 A_{wp}$ (MN/m)

CF_L = Longitudinal Strength Class Factor from **Table 3.21.2**

e_b = bow shape exponent which best describes the waterplane (see **Fig 3.21.7** and **3.21.8**)

= 1.0 for a simple wedge bow form

= 0.4 to 0.6 for a spoon bow form

= 0 for a landing craft bow form

An approximate e_b determined by a simple fit is acceptable.

γ_{stem} = stem angle to be measured between the horizontal axis and the stem tangent at the upper ice waterline (deg) (buttock angle as per **Fig 3.21.2** measured on the center-line)

$$C = \frac{1}{2\,(L_B\,/\,B)^{e_b}}$$

B = ship moulded breadth (m)

L_B = bow length used in the equation $y = B/2\ (x/L_B)^{e_b}$ (m) (see **Fig 3.21.7** and **3.21.8**)

D = ship displacement (kt), where $D_{\min}$ = 10 kt

A_{wp} = ship waterplane area (m^2)

CF_F = Flexural Failure Class Factor from **Table 3.21.2**

Where applicable, draught dependent quantities are to be determined at the waterline corresponding to the loading condition under consideration.

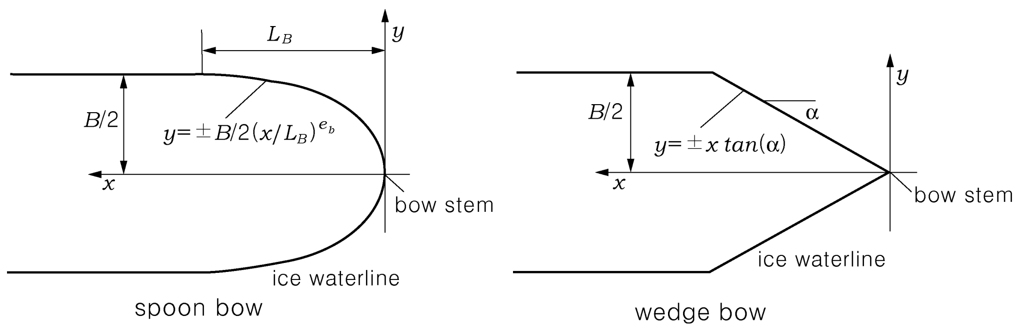

Fig 3.21.7 Bow shape definition

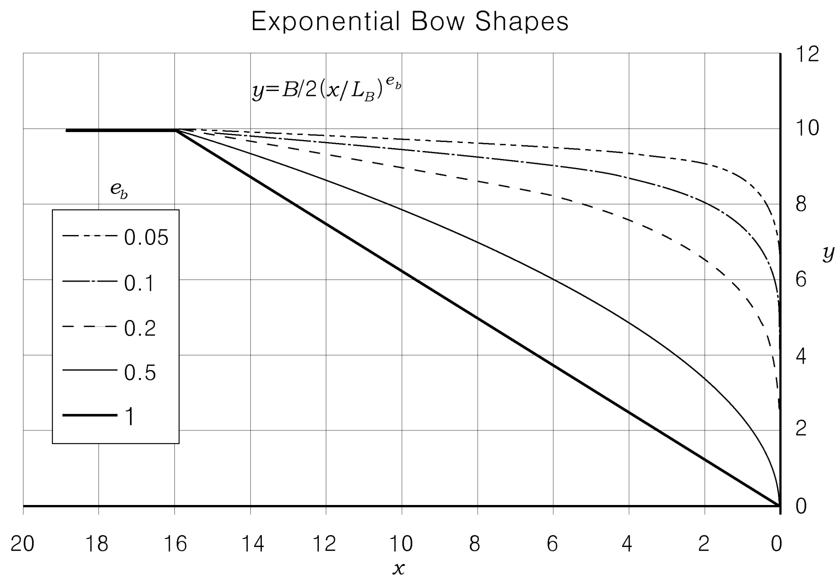

Fig 3.21.8 Illustration of e_b effect on the bow shape for B = 20 and L_B =16

3. Design vertical shear force

(1) The design vertical ice shear force, F_I, along the hull girder is to be taken as:

$$F_I = C_f \, F_{IB} \quad (MN)$$

where

C_f = longitudinal distribution factor to be taken as follows:

(a) Positive shear force

$C_f = 0.0$ between the aft end of L and $0.6\,L$ from aft

$C_f = 1.0$ between $0.9L$ from aft and the forward end of L

(b) Negative shear force

$C_f = 0.0$ at the aft end of L

$C_f = -0.5$ between $0.2L$ and $0.6L$ from aft

$C_f = 0.0$ between $0.8L$ from aft and the forward end of L

Intermediate values are to be determined by linear interpolation

(2) The applied vertical shear stress, τ_a, is to be determined along the hull girder in a similar manner as in **Ch 3, 402. 2** of the Rules by substituting the design vertical ice shear force for the design vertical wave shear force.

4. Design vertical ice bending moment

(1) The design vertical ice bending moment, M_I, along the hull girder is to be taken as:

$$M_I = 0.1 C_m \, L \sin^{-0.2}(\psi) \, F_{IB} \quad \text{(MN-m)}$$

where

L = ship length (Rule Length as defined in **Ch 1, 102.** of the Rules) (m)

ψ = stem angle to be measured between the horizontal axis and the stem tangent at the upper ice waterline (deg)

F_{IB} = design vertical ice force at the bow (MN)

C_m = longitudinal distribution factor for design vertical ice bending moment to be taken as follows:

$C_m = 0.0$ at the aft end of L

$C_m = 1.0$ between $0.5L$ and $0.7L$ from aft

$C_m = 0.3$ at $0.95L$ from aft

$C_m = 0.0$ at the forward end of L

Intermediate values are to be determined by linear interpolation

Where applicable, draught dependent quantities are to be determined at the waterline corresponding to the loading condition under consideration.

(2) The applied vertical bending stress, σ_a, is to be determined along the hull girder in a similar manner as in **Ch 1, 402. 1.** of the Rules, by substituting the design vertical ice bending moment for the design vertical wave bending moment. The ship still water bending moment is to be taken as the maximum hogging moment.

5. Longitudinal strength criteria

(1) The strength criteria provided in **Table 3.21.9** are to be satisfied. The design stress is not to exceed the minimum yield stress.

Table 3.21.9 Longitudinal strength criteria

Failure Mode	Applied Stress	Permissible Stress (when $\sigma_y/\sigma_u \le 0.7$)	Permissible Stress (when $\sigma_y/\sigma_u > 0.7$)
Tension	σ_a	$\eta \times \sigma_y$	$\eta \times 0.41(\sigma_u + \sigma_y)$
Shear	τ_a	$\eta \times \frac{\sigma_y}{\sqrt{3}}$	$\eta \times \frac{0.41(\sigma_u + \sigma_y)}{\sqrt{3}}$
Buckling	σ_a	σ_c for plating and for web plating of stiffeners $\sigma_c/1.1$ for stiffeners	
	τ_a	τ_c	

where

σ_a = applied vertical bending stress (N/mm^2)

τ_a = applied vertical shear stress (N/mm^2)

σ_y = minimum upper yield stress of the material (N/mm^2)

σ_u = ultimate tensile strength of material (N/mm^2)

σ_c = critical buckling stress in compression, according to **Ch 3, Sec 4** of the Rules (N/mm^2)

τ_c = critical buckling stress in shear, according to **Ch 3, Sec 4** of the Rules (N/mm^2)

η = 0.8

210. Stem and stern frames

The stem and stern frame are to be designed according to the requirements of this Society. For PC6/PC7 vessels requiring IA SUPER/IA equivalency, the stem and stern requirements of **Ch 20, 406. 1** and **407.** of the Rules may need to be additionally considered.

211. Appendages

1. All appendages are to be designed to withstand forces appropriate for the location of their attachment to the hull structure or their position within a hull area.

2. Load definition and response criteria are to be determined by each member society.

212. Local details

1. For the purpose of transferring ice-induced loads to supporting structure (bending moments and shear forces), local design details are to comply with the requirements of each member society.

2. The loads carried by a member in way of cut-outs are not to cause instability. Where necessary, the structure is to be stiffened.

213. Direct calculations

1. Direct calculations are not to be utilised as an alternative to the analytical procedures prescribed in this unified requirement.

2. Where direct calculation is used to check the strength of structural systems, the load patch specified in **203.** is to be applied.

214. Welding

1. All welding within ice-strengthened areas is to be of the double continuous type.

2. Continuity of strength is to be ensured at all structural connections.

Section 3 Machinery Requirements for Polar Class Ships

301. Application

The contents of this Section apply to main propulsion, steering gear, emergency and essential auxiliary systems essential for the safety of the ship and the survivability of the crew.

302. Drawings & particulars to be submitted and system design

1. Drawings & particulars to be submitted

(1) Details of the environmental conditions and the required ice class for the machinery, if different from ship's ice class.
(2) Detailed drawings of the main propulsion machinery. Description of the main propulsion, steering, emergency and essential auxiliaries are to include operational limitations. Information on essential main propulsion load control functions.
(3) Description detailing how main, emergency and auxiliary systems are located and protected to prevent problems from freezing, ice and snow and evidence of their capability to operate in intended environmental conditions.
(4) Calculations and documentation indicating compliance with the requirements of this Section.

2. System design

(1) Machinery and supporting auxiliary systems shall be designed, constructed and maintained to comply with the requirements of "periodically unmanned machinery spaces" with respect to fire safety. Any automation plant (i.e. control, alarm, safety and indication systems) for essential systems installed is to be maintained to the same standard.
(2) Systems, subject to damage by freezing, shall be drainable.
(3) Single screw vessels classed PC1 to PC5 inclusive shall have means provided to ensure sufficient vessel operation in the case of propeller damage including CP-mechanism.

303. Materials

1. Materials exposed to sea water

Materials exposed to sea water, such as propeller blades, propeller hub and blade bolts shall have an elongation not less than 15% on a test piece the length of which is five times the diameter.

Charpy V impact test shall be carried out for other than bronze and austenitic steel materials. Test pieces taken from the propeller castings shall be representative of the thickest section of the blade. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at minus 10℃.

2. Materials exposed to sea water temperature

Materials exposed to sea water temperature shall be of steel or other approved ductile material.

An average impact energy value of 20 J taken from three tests is to be obtained at minus 10℃.

3. Material exposed to low air temperature

Materials of essential components exposed to low air temperature shall be of steel or other approved ductile material.

An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at 10℃ below the lowest design temperature.

304. Ice interaction load

1. Propeller ice interaction

These Rules cover open and ducted type propellers situated at the stern of a vessel having controllable pitch or fixed pitch blades. Ice loads on bow propellers and pulling type propellers shall receive special consideration. The given loads are expected, single occurrence, maximum values for the whole ships service life for normal operational conditions. These loads do not cover off-design operational conditions, for example when a stopped propeller is dragged through ice. These Rules apply also for azimuthing (geared and podded) thrusters considering loads due to propeller ice interaction. However, ice loads due to ice impacts on the body of azimuthing thrusters have to be estimated with suitable methods, but ice load formulae are not available in this Section.

The loads given in section **304.** are total loads (unless otherwise stated) during ice interaction and are to be applied separately (unless otherwise stated) and are intended for component strength calculations only. The different loads given here are to be applied separately.

F_b is a force bending a propeller blade backwards when the propeller mills an ice block while rotating ahead.

F_f is a force bending a propeller blade forwards when a propeller interacts with an ice block while rotating ahead.

2. Ice class factors

The Table below lists the design ice thickness and ice strength index to be used for estimation of the propeller ice loads.

Table 3.21.10 Ice class factors

Ice Class	H_{ice} [m]	S_{ice} [-]	S_{qice} [-]
PC1	4.0	1.2	1.15
PC2	3.5	1.1	1.15
PC3	3.0	1.1	1.15
PC4	2.5	1.1	1.15
PC5	2.0	1.1	1.15
PC6	1.75	1	1
PC7	1.5	1	1

H_{ice} : Ice thickness for machinery strength design
S_{ice} : Ice strength index for blade ice force
S_{qice} : Ice strength index for blade ice torque

3. Design ice loads for open propeller

(1) Maximum backward blade force, F_b

when $D < D_{\lim}$, $F_b = -27 \cdot S_{ice} \cdot [nD]^{0.7} \cdot \left[\frac{EAR}{Z}\right]^{0.3} \cdot [D]^2$ (kN)

when $D \geq D_{\lim}$, $F_b = -23 \cdot S_{ice} \cdot [nD]^{0.7} \cdot \left[\frac{EAR}{Z}\right]^{0.3} \cdot [H_{ice}]^{1.4} \cdot [D]$ (kN)

where,

$D_{\lim} = 0.85 \cdot [H_{ice}]^{1.4}$

n is the nominal rotational speed(at MCR free running condition) for CP-propellers and 85% of the nominal rotational speed(at MCR free running condition) for a FP-propeller (regardless driving engine type).

F_b is to be applied as a uniform pressure distribution to an area on the back(suction) side of the blade for the following load cases.

(A) Load case 1 : from 0.6 R to the tip and from the blade leading edge to a value of 0.2 chord length,

(B) Load case 2 : a load equal to 50 % of the F_b is to be applied on the propeller tip area outside of 0.9 R,

(C) Load case 5 : for reversible propellers a load equal to 60% of the F_b, is to be applied from 0.6 R to the tip and from the blade trailing edge to a value of 0.2 chord length.

See load cases 1, 2, and 5 in **Table 1** of **Annex 3-5**

(2) Maximum forward blade force, F_f

when $D < D_{\lim}$, $F_f = 250 \cdot \left[\frac{EAR}{Z}\right] \cdot [D]^2$ (kN)

when $D \geq D_{\lim}$, $F_f = 500 \cdot \left[\frac{1}{(1-\frac{d}{D})}\right] \cdot H_{ice} \cdot \left[\frac{EAR}{Z}\right] \cdot [D]$ (kN)

where,

$D_{\lim} = \left[\frac{2}{(1-\frac{d}{D})}\right] \cdot H_{ice}$ (m)

d = propeller hub diameter (m)

D = propeller diameter (m)

EAR = expanded blade area ratio

Z = number of propeller blades

F_f is to be applied as a uniform pressure distribution to an area on the face(pressure) side of the blade for the following load cases.

(A) Load case 3 : from 0.6 R to the tip and from the blade leading edge to a value of 0.2 chord length,

(B) Load case 4 : a load equal to 50 % of the F_f is to be applied on the propeller tip area outside of 0.9 R,

(C) Load case 5 : for reversible propellers a load equal to 60% of the F_f , is to be applied from 0.6 R to the tip and from the blade trailing edge to a value of 0.2 chord length.

See load cases 3, 4, and 5 in **Table 1** of **Annex 3-5**

(3) Maximum blade spindle torque Q_{smax}

Spindle torque Q_{smax} around the spindle axis of the blade fitting shall be calculated both for the load cases described in (1) & (2) for F_b , F_f. If the spindle torque values are less than the default value given below, the default minimum value shall be used.

Default Value $Q_{smax} = 0.25 \cdot F \cdot c_{0.7}$ (kNm)

where,

$c_{0.7}$ = the length of the blade chord at 0.7 R radius (m)

F is either F_b or F_f which ever has the greater absolute value.

(4) Maximum propeller ice torque applied to the propeller

When $D < D_{\lim}$,

$$Q_{\max} = 105 \cdot \left[1 - \frac{d}{D}\right] \cdot S_{qice} \cdot \left[\frac{P_{0.7}}{D}\right]^{0.16} \cdot \left[\frac{t_{0.7}}{D}\right]^{0.6} \cdot [nD]^{0.17} \cdot D^3 \quad \text{(kNm)}$$

When $D \geq D_{\lim}$,

$$Q_{\max} = 202 \cdot \left[1 - \frac{d}{D}\right] \cdot S_{qice} \cdot [H_{ice}]^{1.1} \cdot \left[\frac{P_{0.7}}{D}\right]^{0.16} \cdot \left[\frac{t_{0.7}}{D}\right]^{0.6} \cdot [nD]^{0.17} \cdot D^{1.9} \quad \text{(kNm)}$$

where,

$D_{\lim} = 1.81 \cdot H_{ice}$

S_{qice} = Ice strength index for blade ice torque

$P_{0.7}$ = propeller pitch at 0.7 R (m)

$t_{0.7}$ = max thickness at 0.7 radius

n is the rotational propeller speed, [rps], at bollard condition. If not known, n is to be taken as follows:

Table 3.21.11 The rotational propeller speed at bollard condition value n

Propeller type	n
CP propellers	n_n
FP propellers driven by turbine or electric motor	n_n
FP propellers driven by diesel engine	$0.85 \cdot n_n$

Where n_n is the nominal rotational speed at MCR, free running condition.
For CP propellers, propeller pitch, $P_{0.7}$ shall correspond to MCR in bollard condition. If not known, $P_{0.7}$ is to be taken as $0.7 \cdot P_{0.7n}$, where $P_{0.7n}$ is propeller pitch at MCR free running condition.

(5) Maximum propeller ice thrust applied to the shaft

$$T_f = 1.1 \cdot F_f \quad \text{(kN)}$$

$$T_b = 1.1 \cdot F_b \quad \text{(kN)}$$

4. Design ice loads for ducted propeller

(1) Maximum Backward Blade Force, F_b

when $D < D_{\lim}$, $F_b = -9.5 \cdot S_{ice} \cdot [EAR/Z]^{0.3} \cdot [nD]^{0.7} \cdot D^2$ (kN)

when $D \geq D_{\lim}$, $F_b = -66 \cdot S_{ice} \cdot [EAR/Z]^{0.3} \cdot [nD]^{0.7} D^{0.6} \cdot [H_{ice}]^{1.4}$ (kN)

where,

$D_{\lim} = 4 \cdot H_{ice}$

n is to be taken as in **304. 3** (1)

F_b is to be applied as a uniform pressure distribution to an area on the back side for the following load cases(See **Table 2** of **Annex 3-5**) :

(A) Load case 1 : On the back of the blade from 0.6 R to the tip and from the blade leading edge to a value of 0.2 chord length,

(B) Load case 5 : for reversible rotation propellers a load equal to 60% of the Fb is applied on the blade face from 0.6 R to the tip and from the blade trailing edge to a value of 0.2 chord length,

(2) Maximum forward blade force, F_f

when $D \le D_{\lim}$, $F_f = 250 \cdot \left[\frac{EAR}{Z}\right] \cdot [D]^2$ (kN)

when $D > D_{\lim}$, $F_f = 500 \cdot [EAR/Z] \cdot D \cdot \frac{1}{\left[1-\frac{d}{D}\right]} \cdot H_{ice}$ (kN)

where,

$D_{\lim} = \frac{2}{\left[1-\frac{d}{D}\right]} \cdot H_{ice}$ (m)

F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side for the following load case (see **Table 2** of **Annex 3-5**):

(A) Load case 3 : On the blade face from 0.6 R to the tip and from the blade leading edge to a value of 0.5 chord length

(B) Load case 5 : a load equal to 60% F_f is to be applied from 0.6 R to the tip and from the blade leading edge to a value of 0.2 chord length.

(3) Maximum propeller ice torque applied to the propeller

$Q_{\max}$ is the maximum torque on the propeller due to ice-propeller interaction.

When $D \le D_{\lim}$,

$$Q_{\max} = 74 \cdot \left[1-\frac{d}{D}\right] \cdot \left[\frac{P_{0.7}}{D}\right]^{0.16} \cdot \left[\frac{t_{0.7}}{D}\right]^{0.6} \cdot [nD]^{0.17} \cdot S_{qice} \cdot D^3 \text{ (kNm)}$$

When , $D > D_{\lim}$

$$Q_{\max} = 141 \cdot \left[1-\frac{d}{D}\right] \cdot \left[\frac{P_{0.7}}{D}\right]^{0.16} \cdot \left[\frac{t_{0.7}}{D}\right]^{0.6} \cdot [nD]^{0.17} \cdot S_{qice} \cdot D^{1.9} \cdot H_{ice}^{1.1} \text{ (kNm)}$$

where,

$D_{\lim} = 1.8 \cdot H_{ice}$ (m)

n is the rotational propeller speed [rps] at bollard condition. If not known, n is to be taken as follows:

Table 3.21.12 The rotational propeller speed at bollard condition value n

Propeller type	n
CP propellers	n_n
FP propellers driven by turbine or electric motor	n_n
FP propellers driven by diesel engine	$0.85 \cdot n_n$

Where n_n is the nominal rotational speed at MCR, free running condition.
For CP propellers, propeller pitch, $P_{0.7}$ shall correspond to MCR in bollard condition. If not known, $P_{0.7}$ is to be taken as $0.7 \cdot P_{0.7n}$, where $P_{0.7n}$ is propeller pitch at MCR free running condition.

(4) Maximum blade spindle torque for CP-mechanism design, Q_{smax}
Spindle torque Q_{smax} around the spindle axis of the blade fitting shall be calculated for the load case described in **304. 1.** If the spindle torque values are less than the default value given below, the default value shall be used.

Default Value $Q_{smax} = 0.25 \cdot F \cdot c_{0.7}$ (kNm)

where,

$c_{0.7}$ = the length of the blade section at 0.7R radius (m)

F is either F_b or F_f which ever has the greater absolute value.

(5) Maximum propeller ice thrust (applied to the shaft at the location of the propeller)

$$T_f = 1.1 \cdot F_f$$

$$T_b = 1.1 \cdot F_b$$

5. Design loads on propulsion line

(1) Torque
The propeller ice torque excitation for shaft line dynamic analysis shall be described by a sequence of blade impacts which are of half sine shape and occur at the blade. The torque due to a single blade ice impact as a function of the propeller rotation angle is then

$$Q(\varphi) = C_q \cdot Q_{\max} \cdot \sin(\varphi(180/\alpha_i)) \quad \text{when } \varphi = 0 ... \alpha_i$$

$$Q(\varphi) = 0 \quad \text{when } \varphi = \alpha_i .....360$$

where C_q and α_i parameters are given in table below.

Table 3.21.13 C_q and α_i parameters

Torque excitation	Propeller-ice interaction	C_q	α_i
Case 1	Single ice block	0.5	45
Case 2	Single ice block	0.75	90
Case 3	Single ice block	1.0	135
Case 4	Two ice blocks with 45 degree phase in rotation angle	0.5	45

The total ice torque is obtained by summing the torque of single blades taking into account the phase shift 360 deg./Z. The number of propeller revolutions during a milling sequence shall be obtained with the formula:

$$N_Q = 2 \cdot H_{ice}$$

The number of impacts is $Z \cdot N_Q$

See **Fig 1** in **Annex 3-5**

Milling torque sequence duration is not valid for pulling bow propellers, which are subject to special consideration. The response torque at any shaft component shall be analysed considering excitation torque $Q_{(\Phi)}$ at the propeller, actual engine torque, Q_e, and mass elastic system

Q_e = actual maximum engine torque at considered speed

Design torque along propeller shaft line

The design torque (Q_r) of the shaft component shall be determined by means of torsional vibration analysis of the propulsion line. Calculations have to be carried out for all excitation cases given above and the response has to be applied on top of the mean hydrodynamic torque in bollard condition at considered propeller rotational speed.

(2) Maximum response thrust

Maximum thrust along the propeller shaft line is to be calculated with the formula below. The factors 2.2 and 1.5 take into account the dynamic magnification due to axial vibration. Alternatively the propeller thrust magnification factor may be calculated by dynamic analysis.

Maximum Shaft Thrust Forwards $T_r = T_n + 2.2 \cdot T_f$ (kN)

Maximum Shaft Thrust Backwards $T_r = 1.5 \cdot T_b$ (kN)

T_n = propeller bollard thrust (kN)

T_f = maximum forward propeller ice thrust (kN)

If hydrodynamic bollard thrust, T_n is not known, T_n is to be taken as follows:

Table 3.21.14 Propeller bollard thrust

Propeller Type	T_n
CP propellers (open)	$1.25 \cdot T$
CP propellers (ducted)	$1.1 \cdot T$
FP propellers driven by turbine or electric motor	T
FP propellers driven by diesel engine (open)	$0.85 \cdot T$
FP propellers driven by diesel engine (ducted)	$0.75 \cdot T$

T = nominal propeller thrust at MCR at free running open water conditions

(3) Blade failure load for both open and nozzle propeller

The force is acting at 0.8 R in the weakest direction of the blade and at a spindle arm of 2/3 of the distance of axis of blade rotation of leading and trailing edge which ever is the greatest. The blade failure load is:

$$F_{ex} = \frac{0.3 \cdot c \cdot t^2 \cdot \sigma_{ref}}{0.8 \cdot D - 2 \cdot r} 10^3 \quad \text{(kN)}$$

where,

$\sigma_{ref} = 0.6 \cdot \sigma_{0.2} + 0.4 \cdot \sigma_u$

where σ_u and $\sigma_{0.2}$ are representative values for the blade material.

c, t and r (See **Ch.20. 605. Fig.3.20.2** of the Guidance) are respectively the actual chord length, thickness and radius of the cylindrical root section of the blade at the weakest section outside root fillet. And typically will be at the termination of the fillet into the blade profile.

305. Design

1. Design principle

The strength of the propulsion line shall be designed for maximum loads in 304. such that the plastic bending of a propeller blade shall not cause damages in other propulsion line components with sufficient fatigue strength.

2. Azimuthing main propulsors

In addition to the above requirements special consideration shall be given to the loading cases which are extraordinary for propulsion units when compared with conventional propellers. Estimation of the loading cases must reflect the operational realities of the ship and the thrusters. In this respect, for example, the loads caused by impacts of ice blocks on the propeller hub of a pulling propeller must be considered. Also loads due to thrusters operating in an oblique angle to the flow must be considered. The steering mechanism, the fitting of the unit and the body of the thruster shall be designed to withstand the loss of a blade without damage. The plastic bending of a blade shall be considered in the propeller blade position, which causes the maximum load on the studied component.

Azimuth thrusters shall also be designed for estimated loads due to thruster body/ice interaction as per **Sec.2 211.**

3. Blade design

(1) Maximum blade stresses
Blade stresses are to be calculated using the backward and forward loads given in section **304. 3** & **4.** The stresses shall be calculated with recognised and well documented FE-analysis or other acceptable alternative method. The stresses on the blade shall not exceed the allowable stresses σ_{all} for the blade material given below.
Calculated blade stress for maximum ice load shall comply with the following:

$$\sigma_{calc} < \sigma_{all} = \sigma_{ref}/S$$

$S = 1.5$

σ_{ref} is reference stress, defined as:

$\sigma_{erf} = 0.7 \cdot \sigma_u$ or

$\sigma_{ref} = 0.6 \cdot \sigma_{0.2} + 0.4 \cdot \sigma_u$ which ever is less

Where σ_u and $\sigma_{0.2}$ are representative values for the blade material.

(2) Blade edge thickness
The blade edge thicknesses t_{ed} and tip thickness t_{tip} are to be greater than t_{edge} given by the following formula:

$$t_{edge} \geq xSS_{ice}\sqrt{\frac{3p_{ice}}{\sigma_{ref}}}$$

x = distance from the blade edge measured along the cylindrical sections from the edge and shall be 2.5% of chord length, however not to be taken greater than 45 mm.
In the tip area (above 0.975 R radius) x shall be taken as 2.5% of 0.975 R section length and is to be measured perpendicularly to the edge, however not to be taken greater than 45 mm.

S = safety factor
= 2.5 for trailing edges
= 3.5 for leading edges
= 5 for tip

S_{ice} = according to **304. 2**

p_{iec} = ice pressure
16 MPa for leading edge and tip thickness

σ_{ref} = according above **Par. 3** (1)

The requirement for edge thickness has to be applied for leading edge and in case of reversible rotation open propellers also for trailing edge. Tip thickness refers to the maximum measured thickness in the tip area above 0.975 R radius. The edge thickness in the area between position of maximum tip thickness and edge thickness at 0.975 radius has to be interpolated between edge and tip thickness value and smoothly distributed.

4. Prime movers

(1) The Main engine is to be capable of being started and running the propeller with the CP in full pitch.
(2) Provisions shall be made for heating arrangements to ensure ready starting of the cold emergency power units at an ambient temperature applicable to the polar class of the ship.
(3) Emergency power units should be equipped with starting devices with a stored energy capability of at least three consecutive starts at the design temperature in (2) above. The source of stored energy shall be protected to preclude critical depletion by the automatic starting system, unless a second independent means of starting is provided. A second source of energy shall be provided for an additional three starts within 30 min., unless manual starting can be demonstrated to be effective.

306. Machinery fastening loading accelerations

1. Essential equipment and main propulsion machinery supports shall be suitable for the accelerations as indicated in as follows. Accelerations are to be considered acting independently.

2. Longitudinal impact accelerations, a_l

Maximum longitudinal impact acceleration at any point along the hull girder,

$$= \left(\frac{F_{IB}}{\triangle}\right)\left\{[1.1\tan(\gamma+\phi)]+\left[7\frac{H}{L}\right]\right\} \quad (\mathrm{m/s^2})$$

3. Vertical acceleration, a_v

Combined vertical impact acceleration at any point along the hull girder,

$$= 2.5\left(\frac{F_{IB}}{\triangle}\right)F_X \quad (\mathrm{m/s^2})$$

F_X = 1.3 at FP
= 0.2 at midships

= 0.4 at AP
= 1.3 at AP for vessels conducting ice breaking astern
intermediate values to be interpolated linearly

4. Transverse impact acceleration, a_t

Combined transverse impact acceleration at any point along hull girder,

$$= 3F_i \frac{F_X}{\triangle} \quad (\mathrm{m/s^2})$$

F_X = 1.5 at FP
= 0.25 at midships
= 0.5 at AP
= 1.5 at AP for vessels conducting ice breaking astern
intermediate values to be interpolated linearly

where,

ϕ : maximum friction angle between steel and ice, normally taken as 10° [deg.]

γ : bow stem angle at waterline [deg.]

$\triangle$: displacement

L : length between perpendiculars (m)

H : distance in meters from the water line to the point being considered (m)

F_{IB}: vertical impact force, defined in **Sec.2 209. 2**

F_I : total force normal to shell plating in the bow area due to oblique ice impact, defined in **Sec.2 209. 3**

307. Auxiliary systems

1. Machinery shall be protected from the harmful effects of ingestion or accumulation of ice or snow. Where continuous operation is necessary, means should be provided to purge the system of accumulated ice or snow.

2. Means should be provided to prevent damage due to freezing, to tanks containing liquids.

3. Vent pipes, intake and discharge pipes and associated systems shall be designed to prevent blockage due to freezing or ice and snow accumulation.

308. Sea chest and cooling water systems

1. Cooling water systems for machinery that are essential for the propulsion and safety of the vessel, including sea chests inlets, shall be designed for the environmental conditions applicable to the ice class.

2. At least two sea chests are to be arranged as ice boxes for class PC1 to PC5 inclusive where. The calculated volume for each of the ice boxes shall be at least 1 m^3 for every 750 kW of the total installed power. For PC6 and PC7 there shall be at least one ice box located preferably near center line.

3. Ice boxes are to be designed for an effective separation of ice and venting of air.

4. Sea inlet valves are to secured directly to the ice boxes. The valve shall be a full bore type.

5. Ice boxes and sea bays are to have vent pipes and are to have shut off valves connected direct to the shell.

6. Means are to be provided to prevent freezing of sea bays, ice boxes, ship side valves and fittings above the load water line.

7. Efficient means are to be provided to re-circulate cooling seawater to the ice box. Total sectional area of the circulating pipes is not to be less than the area of the cooling water discharge pipe.

8. Detachable gratings or manholes are to be provided for ice boxes. Manholes are to be located above the deepest load line. Access is to be provided to the ice box from above.

9. Openings in ship sides for ice boxes are to be fitted with gratings, or holes or slots in shell plates. The net area through these openings is to be not less than 5 times the area of the inlet pipe. The diameter of holes and width of slot in shell plating is to be not less than 20 mm. Gratings of the ice boxes are to be provided with a means of clearing. Clearing pipes are to be provided with screw-down type non return valves.

309. Ballast tanks

1. Efficient means are to be provided to prevent freezing in fore and after peak tanks and wing tanks located above the water line and where otherwise found necessary.

310. Ventilation systems

1. The air intakes for machinery and accommodation ventilation are to be located on both sides of the ship.

2. Accommodation and ventilation air intakes shall be provided with means of heating.

3. The temperature of inlet air provided to machinery from the air intakes shall be suitable for the safe operation of the machinery.

311. Alternative design

1. As an alternative a comprehensive design study may be submitted and may be requested to be validated by an agreed test programme. ⚓

CHAPTER 22 VESSELS FOR POLAR AND ICE BREAKING SERVICE

Section 1 General

101. Classification

1. The requirements in this section apply to ships containing icebreakers and to passenger and cargo vessels intended to operate unassisted in ice-infested waters of sub-Arctic, Arctic and/or Antarctic regions.

2. Vessels intended for ice breaking as their main purpose and built in compliance with the following requirements may be given one of the class notations Icebreaker ICE05 (or 10 or 15) for ICE class vessels, or Icebreaker PL10 (or 20 or 30) for POLAR class vessels, whichever is relevant.
Vessels built for another main purpose, while also intended for ice breaking, may be given the additional class notation ICE05 (or 10 or 15) or the notation PL10 (or 20 or 30).

3. Arctic class vessels intended for special services where intermediate ice condition values are relevant may, upon special consideration, be given intermediate notations (e.g. PL25).

4. For POLAR class vessels the design ambient air temperature on which the classification has been based will be given the special feature notation DAT(-x°C) The highest temperatures to be applied for year round operations are stated in **201.** For Arctic and/or Antarctic operations with area and seasonal restrictions higher design ambient air temperatures may be accepted as basis for the classification.

5. For vessels with the class notation Icebreaker, and for other POLAR class vessels the maximum operational speed on which the ramming design requirements have been based will be stated in the "Appendix to the classification certificate". The operational speed is in no case to be taken as smaller than stated in **103.** for the various class notations.

102. Scope

1. The following matters are covered by the classification:

- materials in structures exposed to low ambient air temperature
- subdivision, intact and damage stability
- hull girder longitudinal and transverse strength
- local hull structures exposed to ice loads
- rudders and steering gears
- propellers and propulsion machinery
- sea suctions for cooling water
- air starting systems

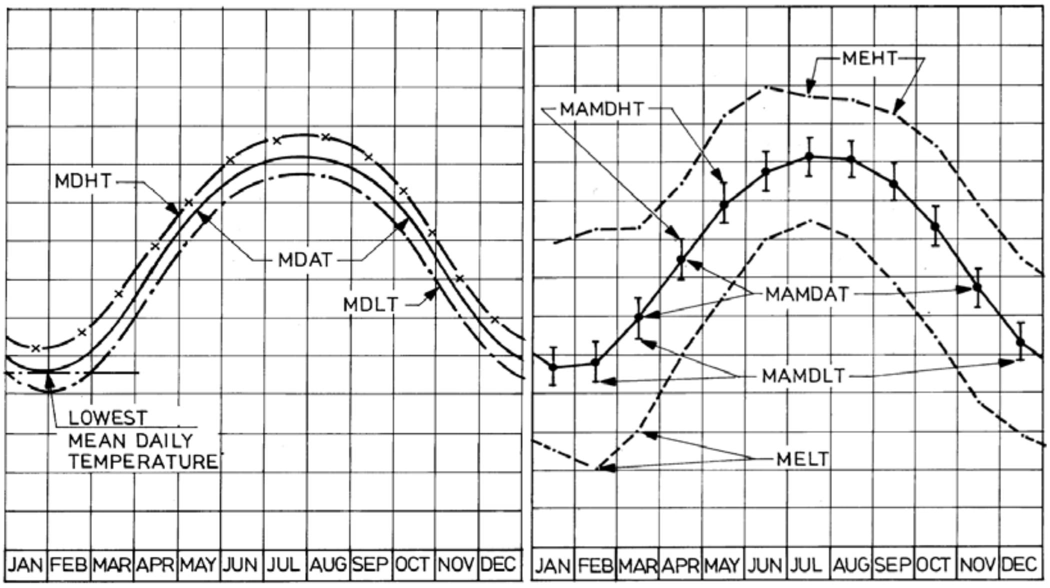

Fig 3.22.1 Commonly used definitions of temperatures

MDHT Mean daily high (or maximum) temperature
MDAT Mean daily average temperature
MDLT Mean daily low (or minimum) temperature
MAMDHT Monthly average of MDHT
MAMDAT Monthly average of MDAT
MAMDLT Monthly average of MDLT
MEHT Monthly extreme high temperature (ever recorded)
MELT Monthly extreme low temperature (ever recorded)
Mean: Statistical mean over observation period (at least 20 years).
Average: Average during one day and night.

103. Design principles and assumptions

1. Each class notation is related to a particular ice condition that the vessel is expected to encounter. Relevant design ice conditions are as given in **Table 3.22.1**. In case intermediate ice conditions are relevant (see **101. 3.**), nominal ice strength is to be related to the selected nominal ice thickness.

2. Vessels with the class notation Icebreaker, and other POLAR class vessels are expected to encounter pressure ridges and other ice features of significantly greater thickness than the average thicknesses specified in **Table 3.22.1**. Vessels with the class notation PL only are assumed not to make repeated ramming attempts if the ice fails to break during the first (accidental) ram unless the vessel's speed is kept well below the design ramming speed. Vessels with class notation Icebreaker may make several consecutive attempts to break the ice at maximum ramming speed. The design speed in ice infested waters when ramming may occur, V_{RAM}, is to be specified by the builder. In general this speed is not to be taken less than:

$$V_{RAM} = V_B + V_H \quad \text{(m/s)}$$

V_B = specified continuous speed, when breaking maximum average ice thickness

V_B = speed addition in thinner ice

= h_{ice} (see **Table 3.22.1**).

In no case the design ramming speed is to be taken less than:

V_{RAM} (minimum)

= 2.0 m/s (3.9 knots) for the notation PL10

= 3.0 m/s (5.8 knots) for the notation PL20

= 4.0 m/s (7.8 knots) for the notation PL30.

For vessels with the class notation Icebreaker the minimum speed is 2 m/s (3.9 knots) but not less than 1.5 times the speed specified above when POLAR class notation is also specified.

104. Definitions

1. General symbols and terms are also given in **Ch. 1.**

2. Symbols

L = rule length in **Ch. 1**

B = rule breadth in **Ch. 1**

D = rule depth in **Ch. 1**

T = rule draught in **Ch. 1**

$\triangle$ = rule displacement in **Ch. 1**

C_B = block coefficient in **Ch. 1**

$\triangle_f$ = displacement in t in fresh water (density 1.0 t/m^3) at ice class draught

P_s = maximum continuous output of propulsion machinery in kW

g_0 = standard acceleration of gravity ($\approx$ 9.81 m/s^2).

V_{RAM} = design speed in m/s when ramming may occur, see also **103. 2.**

σ_{ice} = nominal strength of ice in N/mm^2, see **Table 3.22.1**

h_{ice} = average ice thickness in m, see **Table 3.22.1**

E_{KE} = vessel's kinetic energy before ramming

= $1/2\triangle(V_{RAM})^2$ (kNm)

a, γ = bow shape angles, see **Fig 3.22.2**

C_{WL} = vessel's water line area coefficient on UIWL

s = stiffener spacing in m, measured along the plating.
Stiffener web thickness may be deducted

l = stiffener span in m, measured along the top flange of the member. For determining the section modulus and shear area of the stiffener, the depth of stiffener on crossing panel and 2/3 of the arm length of end bracket(s) (except at simply supported ends) may be deducted when deciding the span.
For curved stiffeners l may be taken as the chord length

S = girder span in m. The web height of in-plane girders may be deducted

t = rule thickness of plating in mm

t_k = corrosion addition in mm

t_w = rule web thickness in mm

Z = rule section modulus in cm^3

A_W = rule web area in cm^2, defined as the web thickness times the web height including thickness of flanges

A = rule cross-sectional area in cm^2

σ_y = minimum upper yield stress of material in N/mm^2. A steel may be taken as having σ_y = 235 N/mm^2

σ = nominal allowable bending stress in N/mm^2 due to lateral pressure

τ = nominal allowable shear stress in N/mm^2

UIWL(upper ice waterline) = the deepest waterline at which the ship is intended to operate in ice irrespective of water salinity.

LIWL(lower ice waterline) = the lowest waterline at which the ship is intended to operate in ice.

All design loading conditions in ice, including trim, shall be within the draught envelop limited by the UIWL and LIWL. The lower ice waterline should further be determined with due regard to the vessel's ice-going capability in the ballast loading conditions (e.g. propeller submergence).

Table 3.22.1 Ice conditions

Class notation	Type of ice encountered	Nominal ice strength σ_{ice}(N/mm^2)	Nominal ice thickness h_{ice}(m)	Limiting impact conditions
ICE-05 ICE-10 ICE-15	Winter ice with pressure ridges	4.2 5.6 7.0	0.5 1.0 1.5	No ramming anticipated
PL10 PL20 PL30	Winter ice with pressure ridges and multi-year ice-floes and glacial ice inclusions	7.0 8.5 10.0	1.0 2.0 3.0	Accidental ramming
Icebreaker	As above	As above	As above	Repeated ramming

3. External structure is defined, with respect to design temperature, as the plating with stiffening to a distance of 0.5 m from the shell plating, exposed decks and exposed sides and ends of superstructure and deckhouses.

4. Temperature terms (see also **Fig 3.22.1**):

Design temperature is a reference temperature used as a criterion for the selection of steel grades. The design temperature for external structures is defined as the lowest mean daily average air temperature in the area of operation. This temperature is considered to be comparable with the lowest monthly mean temperature in the area of operation -2 ℃. If operation is restricted to "summer" navigation the lowest monthly mean temperature comparison may only be applied to the warmer half of the month in question. The corresponding extreme low temperature is generally considered to be 20 ℃ lower than the design temperature.

Mean daily average temperature is the statistical mean average temperature for a specific calendar day, based on a number of years of observations (= MDAT).

Monthly mean temperature is the average of the mean daily temperature for the month in question (= MAMDAT).

Lowest mean daily temperature is the lowest value on the annual mean daily temperature curve for the area in question. For seasonally restricted service the lowest value within the time of operation applies.

Lowest monthly mean temperature is the monthly mean temperature for the coldest month of the year.

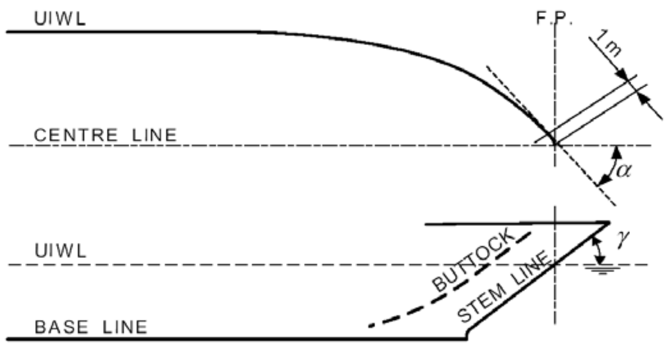

Fig 3.22.2 Bow shape angles

5. The hull structure (shell plating with stiffening) to be reinforced against local ice loads is divided into 7 different areas. The areas are defined as follows (see also **Fig 3.22.4**):

Bow area

Longitudinally from stem to a line parallel to and 0.04 L aft of the border line of flat side of hull forward. If the hull breadth is increased over a limited length forward of the flat side the bow area need normally not extend aftwards beyond the widest section of each waterline.

The bow area need not extend aftwards beyond 0.3 L from the forward perpendicular.

Vertically from a line defined by a distance z_{lm} below LIWL (aft) and the intersection between the keel line and the stem line (forward) to a line defined by the distances z_{ua} (aft) and z_{uf} (forward) above UIWL. For ships with an ice knife fitted, the line of the lower vertical extension may be drawn to a point 0.04 L aft of the upper end of the knife and further down to the base line (see also **Fig 3.22.3**).

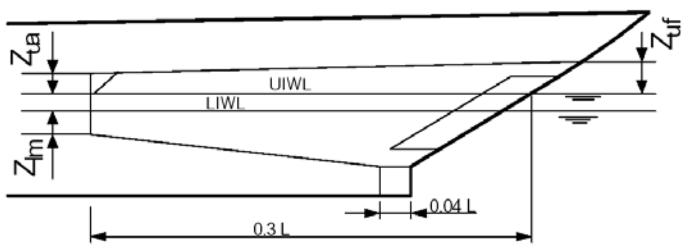

Fig 3.22.3 Extension of bow area

Stem area

The part of the bow area between the stem line and a line 0.06 L aft of the stem line or 0.125 B outboard from the centre line, whichever is first reached.

Vertically from a line defined by a distance z_{la} below LIWL, to a line defined by a distance z_{ua} above UIWL.

Midship area

Longitudinally from the stem area to the bow area.

Vertically from a line defined by a distance z_{lm} below LIWL, to a line defined by a distance z_{ua} above UIWL.

Bottom area

Longitudinally aft of 0.3 L from F.P. and transversely over the flat bottom including deadrise. For ships with bow ice knife, the bottom area may be extended forward to the ice knife.

Lower transition area

Transition area between the bottom area and the adjacent stern and midships areas respectively.

Stern area

Longitudinally from the stern to a line parallel to and 0.04 L forward of the border line of flat side of hull aft, or to a line 0.2 L aft of midships, whichever is the aftermost.

Vertically from a line defined by a distance z_{la} below LIWL, to a line defined by a distance z_{ua} above UIWL.

Lower bow area

The area below the bow area.

Values of z_{la}, z_{lm}, z_{ua} and z_{uf} are given for various class notations in **Table 3.22.2.**

Table 3.22.2 Vertical extent of ice reinforced areas

Class notation	Parameters for vertical extent (m)			
	z_{la}	z_{lm} 1)	z_{ua}	z_{uf}
ICE-05	1.7	1.1	0.8	1.5
ICE-10	2.2	1.6	1.0	2.0
ICE-15	4.6	3.7	1.9	2.5
PL10	2.9	2.3	1.4	2.2
PL20	6.0	4.6	2.8	3.7
PL30	11.9	9.2	4.2	5.2
1) z_{lm} (maximum) =	the vertical distance from the LIWL to the point on the frame contour amidships where the tangent is at 45 degrees.			

105. Documentation

1. UIWL and LIWL as well as the border line of flat side are to be indicated on the shell expansion plan together with the ice reinforced areas as given in **Fig 3.22.4.**

2. Maximum design ramming speed (V_{RAM}) in ice infested waters as well as design speed for continuous ice breaking operations (V_B) are to be stated on the midship section plan for ships with class notations PL or Icebreaker.

3. For documentation in connection with stability and watertight integrity, see **Sec 12.**

4. Applicable special limitations to the operation of the vessel in ice infested waters are to be stated in the ship's loading manual.

Possible limitations are:
- allowable draughts, maximum and minimum
- loading conditions with respect to strength and stability
- ambient temperature
- design speed
- ramming speed
- instruction for filling of ballast tanks
- astern operation in ice.

5. Where ice exposed plating is fitted with a special wear addition, the plate thickness including wear addition is to be given on the shell expansion plan in addition to the net thickness required by the rules.

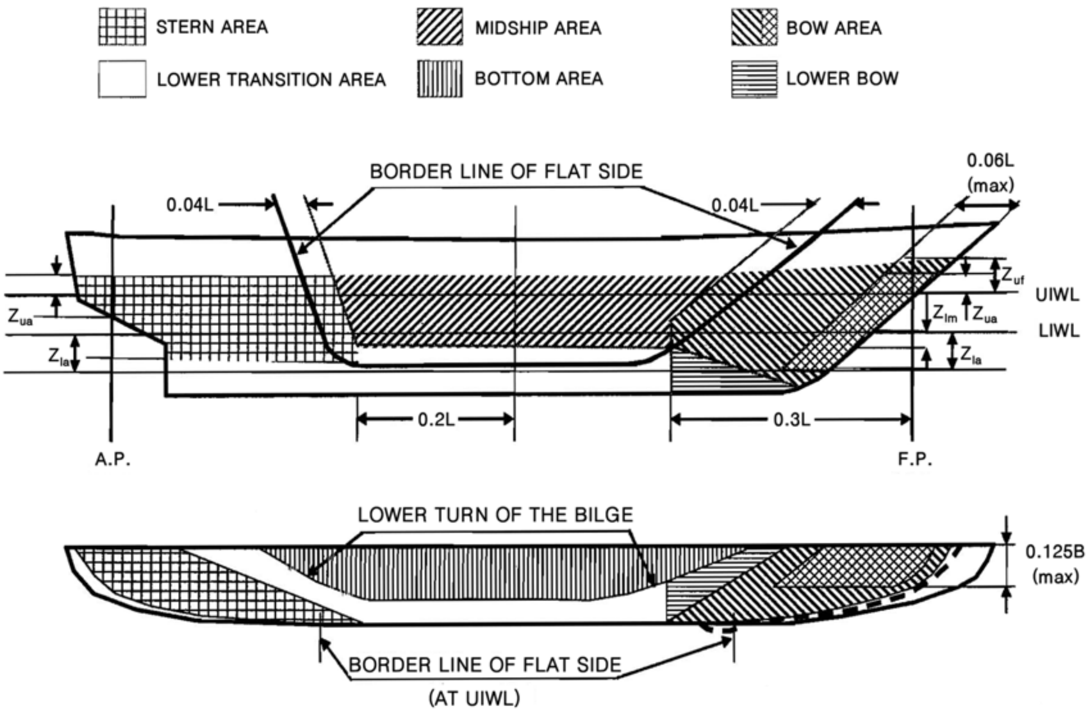

Fig 3.22.4 Ice reinforced areas

106. Marking and on board documentation

1. The maximum and minimum ice class draughts fore, amidships and aft shall be indicated in the 'Classification Certificate'.

2. If the "Summer Load Line" in fresh water is located at a higher level than the UIWL, ice class notation shall explicitly include the maximum amidships draughts. For such ships, the ship sides shall be provided with a warning triangle and with ice class draught marks at maximum permissible amidships draughts, see **Ch 20, Sec 2, 202. 1.**

3. For vessels not having load line markings, the warning triangle and ice draught mark is to be vertically aligned with the draught mark. The warning triangle is to be placed 1,000 mm above the draught mark, but in no case above the deck line.

Section 2 Materials and Corrosion Protection

201. Design temperatures

1. Steel grades to be used in hull structural members are to be determined based on the design temperature for the structure in question.

2. For PL class notation steel grades in exposed structures are to be based on air temperatures lower than those generally anticipated for world wide operation. Unless a service restriction notation is also given, limiting the navigation to specified areas and/or time of year, the design temperature is not to be taken higher than -30 °C (corresponding extreme low temperature -50 °C)

For operation in lower design temperature, this must be clearly specified.

3. For ICE class notation, no special consideration for low ambient air temperature are given unless specified by the builder.

202. Structural categories

1. Structural strength members or areas are classified in 4 different classes for the purpose of selecting required material grades. The classes are generally described as follows:

Class IV:
- Strakes in the strength deck and shell plating amidships intended as crack arrestors.
- Highly stressed elements in way of longitudinal strength member discontinuities.

Class III:
- Plating chiefly contributing to the longitudinal strength amidships.
- Fore ship substructures in vessels with notation Icebreaker and PL.
- Aft ship substructures in vessels equipped with podded propulsors and azimuth thrusters, and intended for continuous astern operation.
- Foundations and support structures for heavy machinery and equipment, including crane pedestals.
- Frames for windlass, emergency towing and chain stopper.

Class II:
- Structures contributing to longitudinal and/or transverse hull girder strength in general.
- Appendages of importance for the main functions of the vessel. Stern frames, rudder, propeller nozzels and shaft bracket. (To be class III for vessels with notations ICE, Icebreaker or PL)
- Gutter bars of oil spill coamings that attached to hull.
- Structures for subdivisions.
- Structures for cargo, bunkers and ballast containment.
- Internal members (stiffeners, girders) on plating exposed to external low temperatures where class III and IV is required.

Class I:
- Local members in general unless upgraded due to special considerations of loading rate, level and type of stress, stress concentrations and load transfer points and/or consequences of failure.
- Deckhouse structure not exposed to longitudinal stresses.
- Cargo hatch covers.

2. Hull girder plating in vessels of conventional design is normally classified as specified in **Table 3.22.3.**

3. The material class requirement may be reduced by one class for:
- laterally loaded plating having a thickness exceeding 1.25 times the requirement according to design formulas,
- laterally loaded stiffeners and girders having section modulus exceeding 1.5 times the requirement according to design formulas

4. Structural materials for stern frames, rudder horns, rudders and shaft brackets are not to be of lower grades than corresponding to class III.

Table 3.22.3 Classification of longitudinal and transverse strength members, plating

Structural member	Within 0.4 L amidships (Within 0.2 L aft of amidships and 0.3 L forward of amidships in vessels with notation Icebreaker or PL)	Elsewhere
Deck plating exposed to weather, in general Side plating Longitudinal bulkhead plating, in general Transverse bulkhead plating	II	I
Bottom plating including keel plate Strength deck plating 2) Continuous longitudinal members above strength deck excluding longitudinal hatch coamings Upper strake in longitudinal bulkhead Upper strake in top wing tank	III 5)	II
Sheer strake at strength deck 6) Stringer plate in strength 6) deck Deck strake at longitudinal bulkhead 1) Bilge strake 3) Continuous longitudinal hatch coamings 7)	IV	III 4)

1) In ships with breadth exceeding 70 m at least three deck strakes are to be class IV amidships.
2) Plating at corners of large hatch openings is to be specially considered. Class IV is to be applied in positions where high local stresses may occur.
3) May be of class III amidships in ships with a double bottom over the full breadth and with length less than 150 m.
4) May be class II outside 0.6 L amidships.
5) May be class II if relevant midship section modulus as built is not less than 1.5 times the rule midships section modulus, and the excess is not credited in local strength calculations.
6) Not to be less than grade E, EH32, EH36 and EH40 within 0.4 L amidships in ships with length exceeding 250 m.
7) Not to be less than grade D, DH32, DH36 and DH40.

(Note) Single strakes required to be of class IV or of grade E, EH32, EH36 and EH40 and within 0.4 L amidships are to have breadths not less than (800+5 L) mm, maximum 1,800 mm, unless limited by the geometry of the ship's design.

203. Selection of steel grades

1. Plating materials for various structural categories as defined in **202.** of exposed members above the ballast waterline of vessels with class notation PL are not to be of lower grades than obtained from **Fig 3.22.5** using the specified design temperatures.
Plating materials of non-exposed members are not to be of lower grade than obtained according to **Rule Ch 1, Table 3.1.5**.

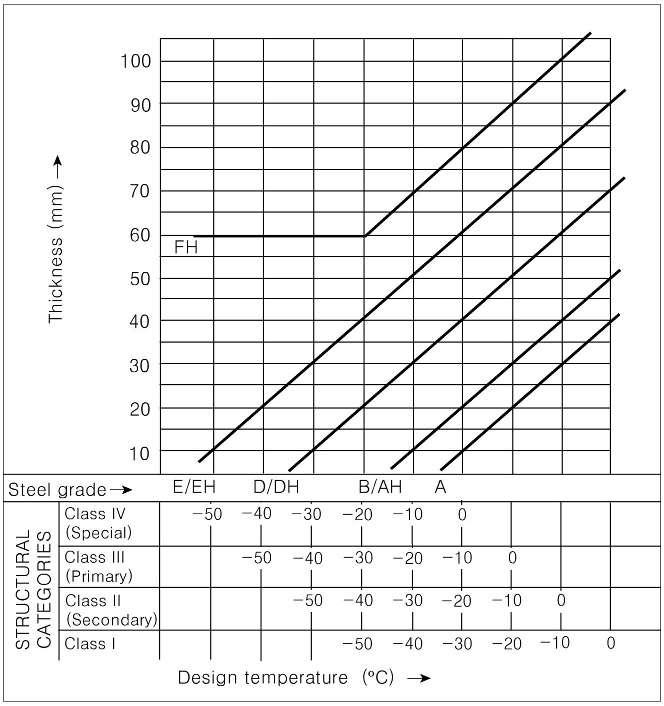

Fig 3.22.5 Required steel grades

Guidance note :

When the structural category is known, the material grade can be selected based on the design temperatures and plate thickness. As an example, when 30 mm plate should be applied for structural category III with a design temperature of -30°C, grade E, EH32, EH36 and EH40 are to be applied.

2. Forged steel or cast steel in structural members subjects to design temperatures lower than -10°C shall be impact tested at 5°C below the design temperature.

204. Coatings

1. Wear resistant coating is assumed used for the external surfaces of plating in ice reinforced areas.

205. Corrosion additions

1. Hull structures are in general to be given a corrosion addition t_k as required by the main class, see **Table 3.22.4**.

Table 3.22.4 Corrosion addition t_k

Compartment	Structure	
	Shell plating (mm)	Internal structure (mm)
Ballast tank	1.0	1.5
Dry cargo hold which may be used as ballast tank	0.5	1.0
Dry compartment	0.0	0.0

206. Equipment

1. Structural materials in windlasses (when exposed) are to be of class III. Design temperature to be

-20°C for PL class notations, 0°C elsewhere.

Section 3 Ship Design and Arrangement

301. Hull form

1. The bow is to be shaped so that it can break level ice effectively and at continuous speed, up to a thickness as indicated in **Table 3.22.1** for the various class notations.

2. Vessels with class notation Icebreaker, and other POLAR class vessels are to have a bow shape so that the bow will ride up on the ice when encountering pressure ridges or similar ice features that will not break on the first ramming.

3. Masts, rigging, superstructures, deck houses and other items on deck are to be designed and arranged so that excessive accumulation of ice is avoided. The rigging is to be kept at a minimum, and the surfaces of erections on deck are to be as even as possible.

4. Weathertight doors are to be suitably designed for use in low temperature environment with respect to:

- strength of cleats and the choice of steel with adequate ductility
- flexibility of packing material
- ease of maintenance, e.g. interior accessible grease fittings
- ease of operations, e.g. low weight and preference to central handwheel operated cleats.

5. Air pipe closures are to be designed so that icing or freezing will not make them inoperable.

6. Freeing ports are to be designed so that blocking by ice is avoided as far as possible and so that they are easily accessible for removal of ice should blocking occur.

302. Appendages

1. In vessels with class notation Icebreaker and in other POLAR class vessels an ice knife may be required forward to avoid excessive beaching and submersion of the deck aft. This requirement will be based on consideration of design speed and freeboard, and may result in additional requirements regarding accelerations and strength.

2. Ice horns are to be fitted directly abaft each rudder in such a manner that:

- the upper edge of the rudder is protected within two degrees to each side of midposition when going astern, and
- ice is prevented from wedging between the top of the rudder and the vessel's hull.

303. Mooring equipment

1. The housing arrangement for anchors is to be designed so that possible icing will not prevent the anchor from falling when released.

Section 4 Design Loads

401. Ice impact forces on the bow

1. The vertical design force component due to head on ramming (not applicable to vessels with class notation ICE only) is given by:

$$P_{ZR} = P_R F_{EL} \quad \text{(kN)}$$

$$P_R = 28\left(\frac{C_R E_{IMP}}{\tan\gamma}\right)^{0.6}(\sigma_{ice}\tan\alpha)^{0.4} \quad \text{in general}$$

For spoon bows :

$$\tan\alpha = 1.2\frac{B^{0.1}}{\sqrt{\cos\gamma}}$$

$$E_{IMP} = E_{KE}\frac{\tan^2\gamma}{\tan^2\gamma + 2.5}$$

$$F_{EL} = \sqrt{\frac{E_{IMP}}{E_{IMP} + C_L P_R{}^2}}$$

$$C_L = \frac{L^3}{3\times 10^{10} I_V}$$

C_R = 1 for the class notation **PL** only

= 2 for the class notation Icebreaker

E_{KE}, σ_{ice} , α and γ as defined in **104.**

L as defined in **104.**

I_V = moment of inertia in m^4 about the horizontal neutral axis of the midship section.

2. The total design force normal to the shell plating in the bow area due to an oblique impact with an ice feature is given by:

$$P_{OI} = \frac{P_{ZR}F_{SIDE}}{\cos\gamma} \quad \text{(kN)}$$

$$F_{SIDE} = \frac{1.9}{(\tan\alpha)^{0.4}}\left(\frac{\sigma_{ice}}{E_{KE}}\right)^{0.05} \quad \text{in general}$$

$$\tan\alpha = 1.2\frac{B^{0.1}}{\sqrt{\cos\gamma}} \quad \text{for spoon shaped bows}$$

P_{ZR} = vertical ramming load as given in **401. 1.**

L, B, E_{KE}, σ_{ice} , α and γ as defined in **104.**

402. Beaching forces

1. The vertical design force resulting from beaching on a large ice feature (not applicable to vessels with class notation ICE only) is in general given by :

$$P_{ZB} = G_B\sqrt{k_b E_{KE} L B} \quad \text{(kN)}$$

$$G_B = \sqrt{\frac{C_{WL}(C_{WL} - 0.5)}{(C_{WL} + 1)}}$$

$k_b = 2g_0(1 - r_{fw})$

r_{fw} = reduction factor due to energy lost in friction and waves

= 0.3.

E_{KE}, σ_{ice}, C_{WL}, γ, α, L, B and g_0 as defined in **104.**

2. For vessels with vertical ram bow the vertical design force in beaching need not be taken larger than :

$$P_{ZB} = \frac{10.6 C_{WL} B L X \tan\gamma}{1 + 15[0.55 - (X/L)]^2} \quad \text{(kN)}$$

X = horizontal distance from FP_{ICE} to centre of vertical ram bow in m

FP_{ICE} = intersection point of stem line and deepest ice-breaking waterline

C_{WL} = waterline area coefficient.

L and B as defined in **104.**

403. Ice compression loads amidships

1. All vessels are to withstand line loads acting simultaneously in the horizontal plane at the water level on both sides of the hull. These loads are assumed to arise when a vessel is trapped between moving ice floes.

2. The design line loads are to be taken as:

$$q = \frac{165}{\sin\beta}(h_{ice})^{1.5} \quad \text{(kN/m)}$$

h_{ice} = average ice thickness as defined in **104.**

β = angle of outboard flare at the waterlevel. Need not to be taken as less than 10 degrees.

404. Local ice pressure

1. All vessels are to withstand local ice pressure as defined for the different ice class notations and as applied to the different ice reinforced areas. The design pressure is to be applied over a corresponding contact area reflecting the type of load in question.

2. The basic ice pressure is in general to be taken as:

$$p_0 = 1{,}000 F_A \sigma_{ice} \quad (\text{kN/m}^2)$$

F_A = correction factor for ice reinforced area in question
= 1.0 for bow and stem area in general
= 0.6 for midship area in general
= 0.5 for midship area if ship breadth in bow area larger than ship breadth in midship area
= 0.2 for bottom area of vessels with notation Icebreaker or PL
= 0.1 for vessels with notation ICE only
= 0.6 for stern area in general
= 0.8 for stern area in ships with class notation Icebreaker
= 1.0 for the stern area in ships with the class notation Icebreaker or PL, 0.8 for ships with ICE notations, fitted with pod and or thruster propulsion units and designed for continuous astern operation. The stern area structure shall in general be dimensioned as outlined for bow structure.

For the transition areas 2/3 of the F_A -value for the adjacent area above may be used in general.

σ_{ice} as defined in **104.**

3. The design pressure is in general to be taken as:

$$p = F_B p_o \quad (\text{kN/m}^2)$$

F_B = correction factor for size of design contact area A_C

= $\frac{0.58}{(A_C)^{0.5}}$ for $A_C \le 1.0$ m^2

= $\frac{0.58}{(A_C)^{0.15}}$ for $A_C > 1.0$ m^2

A_C = h_o w (m^2)

h_o = h in general

= s, maximum for longitudinals

= l, maximum for non-longitudinal frames

= 1.4 l, maximum for connection area of non-longitudinal frames

= S, maximum for girders supporting longitudinals

= l, maximum for stringers supporting non-longitudinal frames

h = effective height of contact area in m

= 0.4 h_{ice} (m) in general

= 0.64 h_{ice} (m) in the stern area; for vessels with notation PL or Icebreaker, with pod or thruster propulsion units, and the assumed capability of continuous operation astern

= 0.8 h_{ice} (m) in stem area in general

= $\left(\frac{P}{645\,\sigma_{ice}}\right)^{0.6}\left(\frac{\tan^2\gamma + \tan^2\alpha}{\tan\alpha}\right)^{0.5}$

in stem area for vessels with class notation PL or Icebreaker

= 0.8 h_{stem}(m) in bow area outside stem area

h_{stem} = h as given for stem area.

For spoon bows : $\tan\alpha = 1.2\frac{B^{0.1}}{\sqrt{\cos\gamma}}$

P = the largest of P_{ZR} and P_{ZB} as given in **401.** and **402.**

w = critical width of contact area in m

= l for longitudinals

= s for non-longitudinal frames

= 1.4 l for connection area for longitudinals

= l for vertical girders supporting longitudinal main frames

= S for stringers supporting vertical main frames.

l, S, α and γ as defined in **104.**

The relations are illustrated in **Fig 3.22.6.**

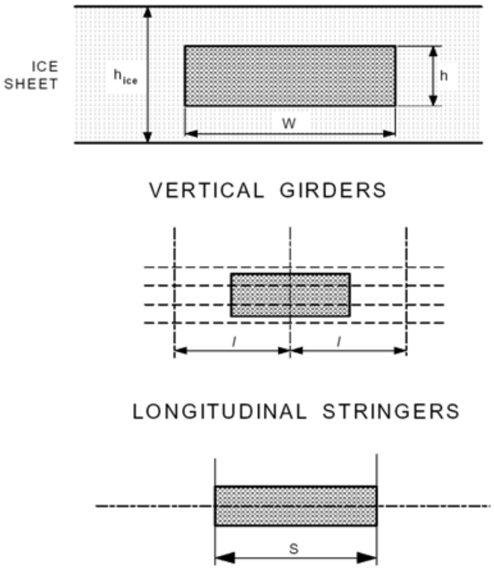

Fig 3.22.6 Design contact areas

405. Accelerations

1. Substructures, equipment and supporting structures are to withstand accelerations arising as a result of impacts with ice features.

2. The combined vertical acceleration at any point along the hull girder (not applicable to vessels with class notation ICE only) may be taken as:

$$a_V = \frac{2.5\,P_{ZR}}{\triangle} F_X \quad (\mathrm{m/s^2})$$

F_X = 1.3 at F.P.
= 0.1 at midships
= 0.4 at AP.

Linear interpolation is to be applied between specified positions.

P_{ZR} as derived in **401.**

$\triangle$ as defined in **104.**

a_v does not include the acceleration of gravity.

3. The combined transverse acceleration at any point along the hull girder may be taken as:

$$a_t = \frac{3\,P_{OI}}{\triangle} F_X \quad (\mathrm{m/s^2})$$

F_X = 1.5 at F.P.
= 0.25 at midships
= 0.5 at AP.

Linear interpolation is to be applied between specified positions

P_{OI} as derived in **401.**

$\triangle$ as defined in **104.**

4. The maximum longitudinal acceleration is taken to be the same at any point along the hull girder.

$$a_l = \frac{1.1 P_{ZR} \tan(\gamma + \phi)}{\triangle} + \frac{7 P_{ZR} H}{\triangle L} \quad (\text{m/s}^2)$$

ϕ = maximum friction angle (between steel and ice), normally taken as 10°

H = distance in m from lowest waterline to position considered.

P_{ZR} as derived in **401.**

$\triangle$, γ as defined in **104.**

Section 5 Global Strength

501. General

1. Hull girder shear forces and bending moments as stipulated in this subsection are to be combined with relevant stillwater conditions as stipulated for the main class. Wave load conditions as stipulated for the main class need not be regarded as occurring simultaneously with the shear forces and bending moments resulting from ramming and beaching.

2. The shear forces and bending moments are to be regarded as the design values at probability level equivalent to the maximum load in a service life of 20 years.

3. In addition to the maximum stress requirements given in this subsection, individual elements are to be checked with respect to buckling under the ramming and beaching load conditions, according to accept criteria as stipulated for the main class.

502. Longitudinal strength

1. The following requirements are applicable to vessels with class notation Icebreaker and other POLAR class vessels(i.e. not to vessels with class notation ICE only).

2. The design vertical shear force at any position of the hull girder due to ramming and/or beaching is given by:

$$Q_{ICE} = k_{iq} P \quad (\text{kN})$$

k_{ip} = 0.4 at F.P.

= 1.0 between 0.05L and 0.1 L from F.P.

= 0.4 between 0.7L and 0.2 L from A.P. 0.0 at AP.

= 0.0 at A.P.

Between specified positions k_{iq} is to be varied linearly. Values of k_{iq} may also be obtained from **Fig 3.22.7**.

P = P_{ZR} as given in **401.** or

= P_{ZB} as given in **402.** whichever is the greater.

The thickness requirements for side shell and possible longitudinal bulkhead platings are to be calculated for different cargo and ballast conditions as stipulated in **Ch 3, Sec 3** replacing Q_W with Q_{ICE} as calculated above.

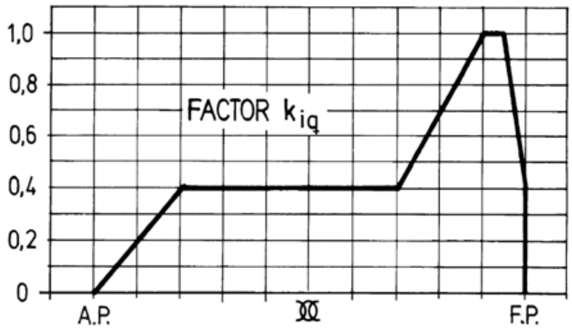

Fig 3.22.7 Distribution of vertical shear force due to ramming and beaching

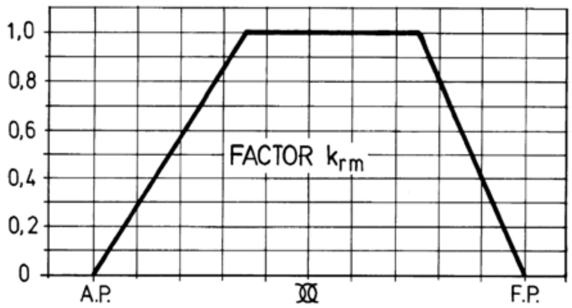

Fig 3.22.8 Distribution of vertical bending moment due to ramming

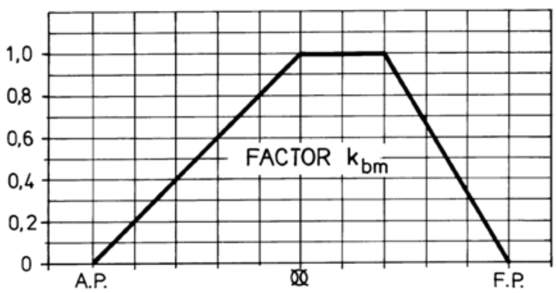

Fig 3.22.9 Distribution of vertical bending moment due to beaching

3. The design vertical sagging bending moment at any position of the hull girder due to ramming and/or beaching is given by:

$M_{ICE\,S} = 0.25\,k_{im}\,P\,L$ (kNm)

k_{im} = 0.0 at F.P. and A.P.

= 1.0 between 0.25 L from F.P. to 0.35 L from A.P. for ramming load condition

= 1.0 between 0.3 Land 0.5 L from F.P. for beaching load condition.

Between specified positions k_{im} is to be varied linearly. Values of k_{im} may also be obtained from **Fig 3.22.8** and **Fig 3.22.9** for ramming and beaching load conditions respectively.

P = P_{ZR} or P_{ZB} as given in **401.** or **402.** for ramming and beaching load conditions respectively.

L as defined in **104.**

4. The design vertical hogging bending moment at any position of the hull girder due to vibration following the initial ramming is given by:

$$M_{ICE\,H} = 0.6\,M_{ICE\,SR} \quad \text{(kNm)}$$

$M_{ICE\,SR}$ = as given in **3.** for ramming load condition.

5. The section modulus requirement about the transverse neutral axis is given by:

$$Z = \frac{M_S + M_{ICE}}{0.7\sigma_y} 10^3 \quad (\text{cm}^3)$$

M_S = design stillwater bending moments according to **Rules Ch 3, Sec 2.**

M_{ICE} design bending moment due to ramming and/or beaching, see **3.** and **4.**

The most unfavourable combinations of stillwater and ramming bending moments are to be applied.

σ_y = yield stress as defined in **104.**

6. The buckling strength of longitudinal strength members in bottom, side and deck as well as longitudinal bulkheads subject to compressive and/or shearing loads is to be checked according to **Rules Ch 3, Sec 4**.

503. Transverse strength amidships

1. The line loads specified in **403.** are to be applied at different water levels including UIWL and LIWL as found necessary depending on the structural arrangement of the vessel.

2. The line loads are to be applied over one full hold/tank length or as found necessary to assess the structural strength of transverse bulkheads and decks supporting the ice reinforced regions.

3. The calculations of transverse strength amidships are to be based on the most severe realistic combination of ice compression loads and static load conditions.

4. Recognised structural idealisation and calculation methods are to be applied. Effects to be considered are indicated in **Annex 3-2.**

5. The calculated stresses are not to exceed allowable stresses as stipulated in **Annex 3-2.**

504. Overall strength of substructure in the foreship

1. The total impact forces as stipulated in D100 may have a decisive effect on primary structural systems in the foreship. The loads are assumed to be evenly distributed in such a manner that local pressures will not exceed those stipulated for local members directly exposed to the load as given in **404. 2.**

2. The design ramming load (not applicable to vessels with class notation ICE only) taken as

$$P_{ZR} / \cos\gamma$$

is to be applied with its center on the stem line at the water line forward. The most unfavourable design draught forward is to be assumed with regard to positioning of the load.

3. The design bow side impact load taken as P_{OI} should be positioned at various positions within bow side area considered critical for the overall strength of the substructure.

Such parts of the bow side area which are aft of the border line of the flat side need normally not be considered with respect to P_{OI}.

4. Recognised structural idealisation and calculation methare to be applied. Effects to be considered are indicated in **Annex 3-2.**

5. The equivalent stress as defined in **Annex 3-2.** is not to exceed σ_y. This is normally achieved for girder type members when the bending stress is not exceeding 0.9 σ_y and the mean shear stress over a web cross-section is not exceeding 0.45 σ_y.

Section 6 Local Strength

601. General

1. The requirements in this subsection apply to members that may be directly exposed to local ice pressure.

2. The buckling strength of web plates and face plates in girders and stringers subject to ice loads is to be checked according to methods given in **Rules Ch 3, Sec 4** or equivalent.

3. In curved regions of ice exposed plating, the stiffening is normally to be in the direction of the maximum curvature.

4. Framing in ice reinforced areas are in general to have symmetrical cross-section with the web to the extent possible positioned at right angle to the plane of the plate. The bending efficiency and tripping capacity of frames are to be documented by calculations according to recognised methods as considered necessary.

5. Ice exposed knuckles are in general to be supported by carlings or equivalent structures.

6. Plate fields adjacent to stem and possible knuckles in the forward shoulder are to be supported so as to be of square shape or otherwise locally strengthened to equivalent standard.

602. Plating

1. The thickness of plating exposed to patch load is generally not to be less than:

$$t = 23k_a \frac{s^{0.75}}{{h_0}^{0.25}} \sqrt{\frac{k_w p_0}{m_p \sigma_y}} + t_k \quad \text{(mm)}$$

k_a = aspect ratio factor for plate field

= 1.1 - 0.25 s/l, maximum 1.0, minimum 0.85

k_w = influence factor for narrow strip of load (perpendicular to s)

= $1.3 - \frac{4.2}{(a/s+1.8)^2}$, maximum 1.0

m_p = bending moment factor

= $f(b/s)$, see **Table 3.22.5** (taking r as b/s)

a = s in general

= h_o for transversely stiffened panels

h_o = h (ee **404.**) or s, whichever is the smaller

b = s in general

= h_o for longitudinally stiffened plating

p_o = basic ice pressure in kN/m^2 as calculated in **404.**

t_k = corrosion addition as given in **205.**

s, l and σ_y as defined in **104.**

Table 3.22.5 Parameters for local strength formulas (general application)

r	m_p	m_e
0.05	27.4	132.3
0.10	14.25	67.9
0.15	9.87	46.5
0.20	7.69	35.8
0.25	6.40	29.5
0.30	5.57	25.3
0.35	4.95	22.3
0.40	4.50	20.2
0.45	4.09	18.5
0.50	3.77	17.2
0.60	3.31	15.4
0.70	3.02	14.1
0.80	2.83	13.4
0.90	2.72	13.0
1.00	2.68	12.9
For intermediate values of r the parameters may be obtained by linear interpolation.		

603. Longitudinal stiffeners

1. Stiffeners in the bow-, midship- and stern ice reinforced areas which are largely parallel to the waterline are defined as longitudinals.

2. The web sectional area of stiffeners in ice reinforced areas is not to be less than:

$$A_W = \frac{3.7(l-0.5s)h_0^{1-\alpha}p_o}{\tau \sin\beta l^\alpha} + A_K \quad (\text{cm}^2)$$

and the web thickness is not to be less than:

$$t_w = 1.5\left(\frac{p_o}{\sigma_y \sin\beta}\right)^{0.67}\left(\frac{h_w h_o}{t_s}\right)^{0.33} + t_k \quad (\text{mm})$$

for flanged profiles.

The section modulus is not to be less than:

$$Z = \frac{41 h_o^{1-\alpha} l^{2-\alpha} p_o w_k}{\sigma \sin\beta} \quad (\text{cm}^3)$$

The stiffener connection area a_o is not to be less than:

$$a_o = \frac{10cP}{\tau \sin\beta} = \frac{6.5\, c h_0^{1-\alpha}(l-0.5s)p_0}{\tau \sin\beta (1.4l)^\alpha} \quad (\text{cm}^2)$$

h_0 = h, see **404.**

= s, whichever is smaller

h_w = height of web in mm

p_o = basic ice pressure in kN/m^2 as calculated in **404.**

τ = 110 f_1

σ = 210 f_1

t_s = shell plate thickness in mm.

s, l and σ_y as defined in **104.**

$A_K = t_k h_w 10^{-2}$ (cm^2)

w_k = section modulus corrosion factor (= 1.2)

c = factor as given in **Table 3.22.6**

α = 0.5 for $A_C \leq 1.0$

= 0.15 for $A_C > 1.0$

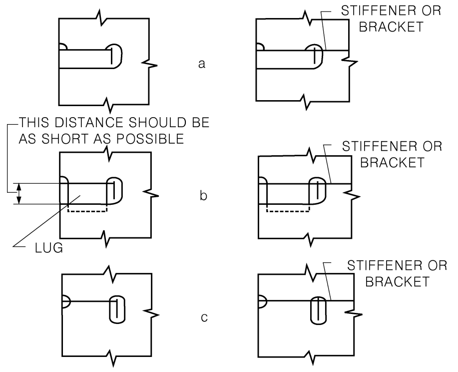
A_C = as defined in **404. 3.**

β = angle of web with shell plating.

= $\tan^{-1}(\frac{\tan\gamma}{\sin\theta})$, γ and θ as shown **Fig 3.22.10**

Table 3.22.6 Value of c

Type of connection (see figure)	Stiffener/bracket on top of stiffener		
	None	Single-sided	Double-sided
a	1.00	1.25	1.00
b	0.90	1.15	0.90
c	0.80	1.00	0.80



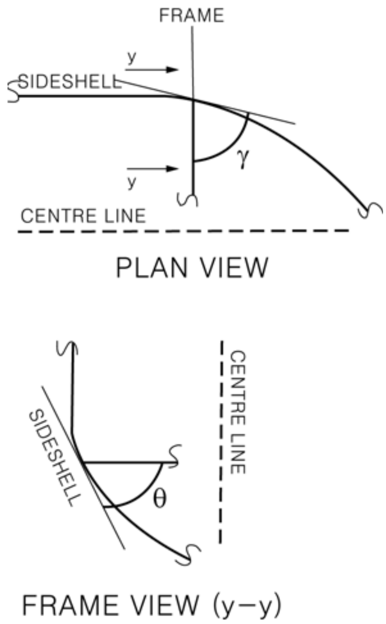


Fig 3.22.10 Determination of β angle

604. Other stiffeners

1. The web sectional area is not to be less than:

$$A_W = \frac{5.8k_s(h_o s)^{1-\alpha}(l-0.5s)p_o}{\tau l \sin\beta} + A_K \quad (\text{cm}^2)$$

and the web thickness is not to be less than:

$$t_w = 1.5\left(\frac{p_o}{\sigma_y \sin\beta}\right)^{0.67}\left(\frac{h_w s}{t_s}\right)^{0.33} + t_k \quad (\text{mm})$$

for flanged profiles.

The section modulus is not to be less than:

$$Z = \frac{520 l^2 s^{1-\alpha} p_o w_k}{m_e \sigma h_o^\alpha \sin\beta} \quad (\text{cm}^3)$$

For end connections with brackets, section modulus including bracket shall be at least 1.2 Z. the bracket thickness shall not be less than t_w.

The connection area a_0 is not to be less than:

$$a_0 = \frac{5.8cs^{1-\alpha}\left(1-0.1\frac{h_1^2}{l^2}\right)(l-0.5s)h_0^{1-\alpha}p_o}{tl\sin\beta} \quad (\text{cm}^2)$$

$$k_s = 1+0.5\frac{(C_1+0.5h_o)^3}{l^3} - 1.5\frac{(C_1+0.5h_o)^2}{l^2}$$

= 0.69 minimum

C_1 = arm length of bracket in m

h_o = h, see **404.**

= l, whichever is the smaller

h_1 = h

= 1.4 l, whichever is the smaller

h_w = web height in mm

m_e = bending moment factor

= $f(h_o/l)$, see **Table 3.22.5** (taking $r = h_o/l$) in general

= $\dfrac{8}{\left(2-\dfrac{h_o}{l}\right)\dfrac{h_o}{l}}$

for stiffener with simply supported ends

p_o = basic ice pressure in kN/m^2, see **404.**

τ = 0.45 σ_y

σ = 0.9 σ_y in general

= 0.8 σ_y when both ends are simply supported

t_s = shell plate thickness in mm.

s, l and σ_y as defined in **104.**

A_K = $t_k h_w 10^{-2}$ (cm^2)

w_k = section modulus corrosion factor, taken as 1.2.

c = factor as given in **Table 3.22.6**

α = 0.5 for $A_C \leq 1.0$

= 0.15 for $A_C > 1.0$

A_C = as given in **404. 3.**

β = angle of web with shell plating.

605. Girders

1. Within ice reinforced areas, girder structures supporting shell stiffeners are to be considered for ice loading. The ice load area to be applied for the girder system will depend on the structure considered, its position and orientation etc. The ice pressure load and load area are generally to be taken as given in **404. 3.**

2. For girders being part of a complex system of primary structures, analysis by direct calculation may be required. For such girder structures in the foreship, the requirements given in **504.** apply.

3. The following requirements apply to evenly spaced girder for which the ends may be considered as fixed, simply supported or constrained due to repetitive continuation of the girder beyond the support. The stiffness of supported members (frames or longitudinals) is assumed to be much smaller than the stiffness of the girder considered.
The web sectional area at any point along a girder is not to be less than:

$$A_W = \frac{5.8 k_s a b p_o}{\tau \sin\beta A_C{}^{\alpha}} + A_K \quad (\text{cm}^2)$$

and the section modulus is not to be less than:

$$Z = \frac{550\,S^2 b\,p_o w_k}{m_e\,\sigma \sin\beta\,{A_C}^{\alpha}}$$

k_s = shear factor, see **Table 3.22.7** (taking r as $(a+s)/S$)

s = spacing of secondary members in m

m_e = bending moment factor

= $f(a/S)$ in case of a continuous member, see **Table 3.22.5** (taking r as a/S)

= $\frac{24}{\left(3-\left(\frac{a}{s}\right)^2\right)\frac{a}{S}}$ in case of fixed ends

= $\frac{8}{\left(2-\left(\frac{a}{s}\right)\right)\frac{a}{S}}$ in case of simply supported ends

a = S in general

= h_o, maximum for girders supporting longitudinals

b = l in general

= h_o, maximum for girders supporting non-longitudinal frames

h_o = h, see **404.**

p_o = basic ice pressure in kN/m^2 as given in **404.**

τ = 0.45 σ_y

σ = 0.9 σ_y in general

= 0.8 σ_y when both ends are simply supported

α = 0.5 for $A_C \leq 1.0$

= 0.15 for $A_C > 1.0$

A_C = as given in **404. 3.**

β = angle of web with shell plating.

l and S as defined in **104.**

A_K and w_k, see **603. 2.**

Table 3.22.7 Shear factor k_s

Section 7 Hull Appendages and Steering Gears

701. General

1. Stemframes, rudders, propeller nozzles and steering gears are in general to be designed according to the rules given in **Pt 3.**

2. Additional requirements for ice reinforced vessels are given in the following. For vessels with-rudders which are not located behind the propeller, special consideration will be made with respect to the longitudinal ice load.

3. Plating materials in rudders, propeller nozzles and rudhorns are to be in accordance with **Sec 2**. Forged or cast materials in structural members subject to lower design temperatures than -10°C according to **201.** are to be impact tested at 5°C below design temperature.

4. The rudder stock and upper edge of the rudder are to be effectively protected against ice pressure.

5. Aft of the rudder an ice knife with depth minimum = 0.8 h_{ice} or an equivalent arrangement is to be arranged.

6. Exposed seals for rudder stock are assumed to be designed for the given environmental conditions such as:

- ice formation
- specified design temperature.

702. Ice loads on rudders

1. An ice load area is defined on the rudder with a length equal to the length of the rudder profile lr and height equal to the effective ice load height (h). The general design rudder force (F_R) is given by the following formula:

$F_R = 0.2(h\,l_r)^{0.85}\,K p_o$ (kN)

$$K = 1 + \frac{z}{z_{bl} - 0.01L}$$

z = distance from rudder bottom to centre of the assumed ice load area in m

z_{bl} = distance from rudder bottom to the ballast waterline in m

L = as defined in **Rules Ch 1, Sec 1**

p_o = as given in **404.**

The rudder force F_R gives rise to a rudder torque (M_{TR}) and a bending moment in the rudder stock (M_B), which both will vary depending on the position of the assumed ice load area, and on the rudder type and arrangement used.

In general the load giving the most severe combination of F_R, M_{TR} and M_B with respect to the structure under consideration is to be applied in a direct calculation of the rudder structure.

The design value of M_{TR} is given by:

M_{TR} = $F_R(0.6\,l_r - X_F)$ (kNm)

= $0.15\ FRl_r$ minimum

X_F = longitudinal distance in m from the leading edge of the rudder to the centre line of the rudder stock.

In lieu of direct calculation design values of M_B and F_R, applicable for the rudder stock diameter at the lower end, may normally be taken as :

Spade rudders :

F_R = $0.2(h\,l_r)^{0.85}p_o$ (kN)

M_B = $F_R H_B$ (kNm)

Semi spade rudders :

F_R = $0.2(h\,l_r)^{0.85}p_o$ (kN)

M_B = $0.5F_R H_P$ (kNm)

Balanced rudders :

F_R = $0.2(h\,l_r)^{0.85}\left(1 + \frac{H_B}{2z_{bl} - 0.02L}\right)p_o$ (kN)

M_B = $0.25F_R H_H$ (kNm)

H_B = distance (m) from lower end of rudder to middle of neck bearing

H_P = distance (m) from lower end of rudder to middle of pintle bearing

H_H = distance (m) from centre of heel bearing to centre of neck bearing

h = as given in **404. 3.**

2. An additional ice load area is defined on the uppermost part of the rudder including ice knife with a length equal to the rudder (including ice knife) (l_r) and height below the hull equal to the nominal ice height (h_{ice}). This gives rise to a force (F) given by:

$F \quad = kph_{ice}l_r$ (kN)

p = design ice pressure in kN/m^2 in stem area as given in **404.**
k = 0.7 in general
= 1.0 for vessels with class notations PL or Ice-breaker

The force F is to be divided between rudder and ice knife according to their support position. The force acting on the ice knife may generally be taken as:

$$F_K = \frac{F(X - X_F)}{(X_K - X_F)}$$

X = distance from leading edge of rudder to point of attack of the force F
= 0.5 l_r (m) minimum
= 0.67 l_r (m) maximum
X_K = distance in m from leading edge of rudder to centre of ice knife.

703. Rudder scantlings

1. The scantlings of rudders, rudder stocks and shafts, pinrudder horns and rudder actuators are to be calculated from the formulae given in **Pt 4, Ch 1**, inserting the rudder torque M_{TR}, bending moments M_B and rudder force F_R as given in **702. 1**, all reduced by factor 0.7.

2. Provided an effective torque relief arrangement is installed for the steering gear, and provided effective ice stoppers are fitted, the design rudder torque need not be taken greater than:

$$M_{TR} = M_{TRO}$$

M_{TRo} = steering gear relief torque in kNm.

3. For rudder plating the ice load thickness is to be calculated as given in **602.** using the design ice pressure as given for the stern area reduced linearly to half value at the lower end of the rudder.

4. Scantlings of rudder, rudder stock, rudder horn, rudder stoppers and ice knife as applicable are also to be calculated for the rudder force given in **702. 2.** acting on the rudder and ice knife, with respect to bending and shear. Allowable stresses as given in **604.**

704. Ice loads on propeller nozzles

1. A transverse ice load area positioned at the level of the nozzle center is defined on the nozzle with a length equal to the nozzle length and a height equal to the ice load height h given by:

h = 0.8 h_{ice} in general
= 0.6 h_{ice} for nozzle directly inside of protecting structures, e.g. other nozzle or propeller.

2. The following two alternative longitudinal ice load areas are to be considered:

- an area positioned at the lower edge of the nozzle with a width equal to 0.65 D and a height equal to the height of the nozzle profile
- an area on both sides of the nozzle at the propeller shaft level, with a transverse width equal to the height of the nozzle profile and with a height equal to 0.35 D. Both symmetric and asymmetric loading are to be checked.
  D = nozzle diameter.

3. The design ice pressure p (kN/m^2) for the stern area as given in **404.** is to be assumed for the ice load areas speciunder **704. 1.** and **704. 2.** giving rise to a force (F) given by:

$$F = kpA \quad \text{(kN)}$$

A = ice load area as defined in **704. 1.** and **704. 2.**

k = 0.7 in general

= 1.0 for vessels with class notations PL or Icebreaker.

705. Propeller nozzle scantlings

1. The scantlings of the propeller nozzle and its supports in the hull are to be calculated for theice loads given in **704,** with stresses not exceeding allowable values given in **604**. For nozzle plating the ice load thickness is to be taken as given in **602.** using the design ice pressure as given for the stern area.

706. Steering gear

1. The main steering gear is to be capable of putting the rudder over from 35° on one side to 30° on the other side in 20 seconds, when the vessel is running ahead at maximum service speed (corresponding to MCR) and at deepest ice draught.

2. For the additional class notation Icebreaker the above time is not to exceed 15 seconds.

3. The effective holding torque of the rudder actuator, at safety valve set pressure, is to be capable of holding the rudder in the preset position, when backing in ice, unless arranged in accordance with **703. 2.** and **706. 4.**
The holding torque means the rudder torque the actuator is cato withstand before the safety valve discharges.
The holding torque need normally not exceed the values given in **Table 3.22.8**.

Table 3.22.8 Values of holding torque

ICE-05 to -15	PL10 to -30	Icebreaker
0.5 M_{TR}	0.75 M_{TR}	M_{TR}

M_{TR} = as given in **702. 1.**

4. The torque relief arrangement, when installed, shall provide protection against excessive rudder ice peak torque, e.g. when backing towards ice ridges.
The arrangement is to be such that steering capability is either maintained or speedily regained after activation of such ar

5. All hydraulic rudder actuators are to be protected by means of relief valves. Discharge capacity at set pressure is not to be less than given in **Table 3.22.9**.

Table 3.22.9 Relief valve discharge capacity

	ICE-OS to -15	PL10 to -30	Icebreaker
Rudder speed (degrees/s)	4.5	5	6.5

6. Where practicable rudder stoppers working on the rudder blade or head are to be fitted.

707. Podded propulsors and azimuth thrusters

1. Vessels operating in ice and equipped with podded propulsor or azimuth thrusters are to be designed according to operational mode and purpose stated in the design specification. If not given, it shall be assumed that the vessel will be intended for continuous astern operation. This information is to be also stated in the ship's documents.

2. Ramming astern is not anticipated

3. The structure(housing, struts, bearings etc) of the pod/azimuth truster shall be dimensioned for basic ice pressures as given in **404.** for stern area in accordance with requested class notation and operational mode.

4. Documents of both local and global strength capacity of the pod/azimuth thruster are to be submitted to Society.

Section 8 Welding

801. General

1. The requirements in this subsection apply to members that may be directly exposed to local ice pressure and support structures for these. Otherwise weld dimensions are to be in acwith the rules for main class.

802. External welding

1. The welding of ice strengthened external plating to stiffand to webs and bulkheads fitted in lieu of stiffeners is in any case to have a double continuous weld with throat thickness which is not less than:

$$t = \frac{0.55\sqrt{s}\,p_o}{\sigma_{fw}} + 0.5t_k \text{ (mm)}$$

σ_{fw} = yield strength in $\mathrm{N/mm^2}$ of weld deposit.

= 355 $\mathrm{N/mm^2}$ for welding of normal strength steel.

= 375 $\mathrm{N/mm^2}$ for welding of high strength steels HT 32 and HT 36

= 390 $\mathrm{N/mm^2}$ for welding of high strength steel HT 40.

Need not be greater than:

= 0.45 x plate thickness for mild steel, and

= 0.50 x plate thickness for high strength steel.

If the welding method leads to deeper penetration than normal, the additional penetration can be included in the throat thickness.

Weld throat shall in no case be less than for main class requirements.

803. Fillet welds and penetration welds subject to high stresses

1. In structural parts where high tensile stresses due to local ice load act through an intermediate plate, the throat thickness of double continuous welds is not to be less than given by **Pt 2, Ch 2** with σ = 0.77 σ_i.

σ_i = calculated maximum tensile stress in abutting plate due to ice load in $\mathrm{N/mm^2}$.

2. Where high shear stresses in web plates due to local ice load, double continuous boundary fillet welds are to have throat thickness not less than given by **Pt 2, Ch 2** with $\tau = 0.77\tau_i$.

τ_i = calculated maximum shear stress due to ice load in $\mathrm{N/mm^2}$.

Section 9 Machinery Systems

901. Pneumatic starting arrangement

1. In addition to the requirements given in **Pt 5, Ch 6, Sec 10** for a vessel having a propulsion engine(s), which has to be reversed for going astern, the compressors are to have the capacity to charge the receivers in half an hour.

902. Sea inlets and discharges

1. The sea cooling water inlet and discharge for main and auxiliary engines is to be so arranged that blockage of strums and strainers by ice is prevented.
In addition, the requirements in **Pt 5, Ch 6, 301. 3** and **704.** are to be complied with.

2. At least one of the sea chests is to be sufficiently high to allow ice to accumulate above the pump suctions and cooling water tank inlet, arranged as follows:

(1) The sea inlet is to be situated near the centre line of the ship and well aft if possible. The inlet grids are to be specially strengthened.
(2) As a guidance for design the volume of the chest is to be about one cubic metre for every 750 kW engine output of the ship including the output of the auxiliary engines necessary for the ship's service.
(3) To allow for ice accumulation above the pump suction the height of the sea chest is not to be less than:

$$h_{\min} \geq 1.5 \sqrt[3]{V_s}$$

V_s = volume of sea chest according to item (2).

The suction pipe inlet is to be located not higher than $h_{\min}/3$ from top of sea chest.

(4) The area of the strum holes is to be not less than four (4) times the inlet pipe sectional area. Heating coils may be installed in the upper part of the chests.

3. A full capacity discharge branched off from the cooling water overboard discharge line is to be connected to the sea chests. At least one of the fire pumps is to be connected to this sea chest or to another sea chest with de-icing arrangement.

903. Sea cooling water arrangements

1. The sea cooling water inlets and discharges for main and auxiliary engines are to be connected to a cooling water double bottom tank having direct supply from the sea chests. The cross-sectional area of the supply line between each sea chest and the cooling water tank is to be twice that of all pump suctions connected to the tank.

2. Vessels with the class notation Icebreaker or PL are to comply with **903. 3** to **903. 7.**

3. The cooling water tank volume in m^3 is to be at least 0.01 times the output in kW of the main and auxiliary engines.

4. The sea water suction line strainers required in **Pt 5, Ch 6, Sec 7** are to be arranged outstream from the cooling water tank.

5. The sea water cooling pumps are to be of the self-priming type or connected to a central priming system.

6. The sea water cooling and ballast piping is to be arranged so that water in the cooling water tank can be circulated through the ballast tanks for the purpose of spare cooling capacity in the case of blocked sea chests.

7. Arrangements providing additional cooling capacity equivalent to that specified in **903. 1** through **903. 6** may be considered.

904. Ballast system

1. Arrangement to prevent freezing is to be provided for ballast tanks where found necessary.

Guidance note:
Double bottom tanks are normally not required to be provided with arrangement to prevent freezing.

Section 10 Propulsion Machinery and Propellers

1001. General

1. Special cold climate environmental conditions are to be taken into consideration in machinery design.

2. Propellers and its parts(propeller blades, blade bolts (if any), propeller hub, pitch control mechanism (if any), etc.) are to be of steel or bronze as specified in **Pt 2, Ch 1** of the Rules. Nodular cast iron of special qualities specified in **Pt 2, Ch 1, Sec 5, Table 2.1.77** of the Rules may be used for relevant parts in CP-mechanism. Other type of nodular cast iron with elongation ≥ 12% may be accepted upon special consideration for same purposes. Propeller shafts are subject to Charpy V-notch impact testing at -10°C and average energy value is to be minimum 27 J.

3. Grey cast iron is normally not accepted for components subject to ice shocks, as e.g. thrust bearing housings.

4. Shafting systems equipped with specially designed mechanical torque limiting devices are subject to special consideration. Such devices, when accepted, are to be provided with redundancy and are to be capable of restoring a lost function in 10 minutes when failure of system in use is occurred.
The torque limit is normally not less than 1.5 $K_{Aice}\ T_O$.
For K_{Aice} and T_O, see **1005.**

5. Ice induced vibrations (repetitive ice shocks) in the shafting system are to be considered.
Forced torsional vibration calculations are to include an evaluation of transient vibrations excited by ice on the propeller.

6. For non-reversible machinery plants, special means are to be provided for reversing the propellers stuck in ice.

7. The propulsion line is to be designed such that the blade failure load F_{ice} given in **1004. 4** is not to cause damage in the blade bolt connection, propeller hub, pitch mechanism, shaft connection, propeller shaft and thruster bearing.

Guidance Note :
Damage, in this context, means when the stresses in the highest loaded part of the considered cross section reaches yield stress. The local effect of stress raisers may be ignored.
Blade failure load(F_{ice}) is the load causing plastic bending of the propeller blade in a section just outside the root fillet.

1002. Engine output

1. The maximum continuous output of propulsion machinery is not to be less than:

$$P = 1.5 c_s c_p I N B \left[1 + 1.6\ T + 27 (0.1 I N / T^{0.25})^{0.5}\right] \quad \text{(kW)}$$

c_s = 1.0 for vessels with conventional «icebreaker stem»
= 0.9 + γ / 200 ; minimum 1.0, but need not exceed 1.2

c_p = 1.0 for controllable pitch propeller
= 1.1 for fixed pitch propeller

IN = ice class number (figure added to class notation)
B = moulded breadth at waterline (m), local increase in way of stem area is normally not to be taken into account
T = load draught (m)
γ = stem angle (see **Fig 3.22.2**).

2. When the vessel is provided with special means which will improve her performance in ice (e.g. air bubbling system), the input rating of machinery used for such purpose may be added to the actual rating of propulsion machinery.
The propeller rating is, however, not to be less than 85% of that required in **1002. 1.**

3. When the vessel is provided with a nozzle of efficient design, a reduction of required engine output corresponding to increase of thrust in ice conditions may be considered. The reduction is, however, not to exceed 20% of required output in **1002. 1** and **1002. 2.**

4. Additional reduction of the required output may be considered for a vessel having design features improving her performance in ice conditions. Such features are to be documented, either by means of model tests or full scale measurements.

1003. Determination of ice torque and loads

1. Ice torque (T_{ICE}), used for determination of scantlings in propellers and shafting systems, is to be taken as follows:

$$T_{ICE} = m\,D^2 \quad \text{(kNm)}$$

The factor m is given in **Table 3.22.10** as function of ice class:

Table 3.22.10 Values of m

Ice class	m	Icebreaker	m
ICE-05	16	ICE-05	21
ICE-10	21	ICE-10	30
ICE-15	27	ICE-15	30
PL	33	PL	40

D = propeller diameter in m.

2. For propellers running in nozzles of satisfactory design, the ice torque will be considered based on submitted documentation, e.g. measurements carried out on similar vessels.
However, if nothing else is documented, the following may be used:

$$T_{ICE} = (0.9 - 0.01\,m\,D^{-0.5})\,m\,D^2 \quad \text{(kNm)}$$

Large fragments of ice are not to have free access into or towards the front of the nozzle.

3. Axial loads in shaftline :

$F = T_H + 1.5F_{LE}$ (axial load, ahead)
$F = 0.8\,T_H + F_{LE}$ (axial load, astern)

The axial load F is to be applied on the propeller side of the thruster bearing.

T_H and F_{LE} according to **1004.** and **1005.**

1004. Propeller

1. The blade scantling requirements given in **Pt 3, Ch 20, 218.** apply, except as given below. In calculations involving the ice torque, T_{ICE} according to **1003.** is to be applied.
Propeller blade scantlings of martensitic - austenitic and ferritic - martensitic stainless steel may be specially considered.

2. Arrangement of propellers in ice classes ICE-15 and PL10 to PL30 is to be such that large fragments of ice do not have free access into the front of the propeller disc within 0.7 radius.

3. When the outer sections of the propeller blade is not subject to special consideration in accordance with **Pt 5, Ch 3, 303. 1** of the Guidance, the blade tip thickness at the radius 0.95 R is not to be less than:

$$t = (m + 2D)\sqrt{\frac{490}{\sigma_b}} \quad \text{(mm)}$$

m = the factor as function of ice class given in **1003. Table 3.22.10**

D and σ_b as given in **1004.4.**

σ_b is not to be taken higher than 2.5 σ_y.

For propellers running in nozzles blade tip thickness smaller than above may be accepted. The tip thickness, however, is not to be less than 3/4 of the above value.

The thickness of the blade edge and the propeller tip is not to be less than 50 % of minimum t as given above, measured at 1.25 t from the edge or tip, respectively. For propellers where the direction of rotation is not reversible, this requirement only applies to the leading edge and propeller tip.

4. The fitting of the propeller blades and the pitch control mechanism is to withstand a design static load not less than:

$$F_{ICE} = 0.3\frac{\sigma_n c_r t_r^2}{D\left[0.9 - R_R/R\right]}10^{-6} \quad \text{(kN)}$$

This load is to be applied on the blade at the radius 0.9 R and at an offset from blade centre axis of 2/3C_{TE} or 2/3C_{LE}, whichever is the greater.

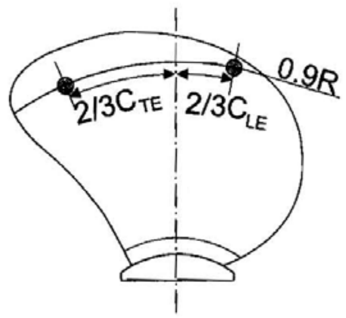

Fig 3.22.11

σ_n = $0.37\sigma_b + 0.6\sigma_y$

σ_b = ultimate tensile strength of the blade (N/mm^2)

σ_y = the blade yield stress or 0.2% offset point (N/mm^2)

c_r = the length of the blade section at R_R radius (mm)

t_r = the corresponding thickness (mm)

D = propeller diameter (m)

R = $D/2$ (m)

R_R = radius to a blade section taken at the termination of the blade root fillet (rounded upwards to the nearest $R/20$), ref. c_r and t_r (m)

C_{TE} = distance from axis of rotation of the blade to the tailing edge, measured along the cylinerical section at 0.9 R

C_{LE} = distance from axis of rotation of the blade to the leading edge, measured along the cylinerical section at 0.9 R

5. Propeller blade bolts are to have a section modulus, referred to an axis tangential to the bolt pitch diameter, not less than:

$$W_{BS} = 0.15 S c_r t_r^2 \frac{\sigma_n}{\sigma_y} \frac{0.9 - R_B/R}{0.9 - R_R/R} \quad (\text{mm}^3)$$

S = 1.0 for CP-propellers

= 1.25 for FP-propellers

σ_y = yield stress of bolt material (N/mm^2)

R_B = radius to bolt plan (m).

c_r, t_r and σ_n as given in **1004. 4.**

The bolts are to have a design which minimises stress concentrations in transition zones to threads and bolt head as well as in way of the threads, and reduces risk for plastic deformations in the threads.

6. For all parts in the pitch control mechanism, which are subject to variable ice loads, stress concentration is to be taken into consideration.

7. The blade fitting and other parts in the pitch control mechanism are to be designed to withstand all forces produced by the pitch control system at its maximum power. The forces are to be assumed to act towards one blade at a time.

Guidance note:
The pitch control mechanism is to be designed for the following dynamic ice loads:

$F_{LE} = T_{ICE}/0.9R$ (kN) at leading edge,

$F_{TE} = -0.5F_{LE}$ at trailing edge,

applied at the 0.9 radius perpendicular to the blade plane at the respective blade edges.
Number of load cycles to be considered is not to be taken less than one million for ice classes ICE-05 to ICE-15 and infinitive for PL10 to PL30 and class notation Icebreaker. The design pressure of the hydraulic system is not to be taken less than twice the pressure needed to produce the blade spindle torque based on the above forces. The forces are assumed to act on one blade at a time only.

8. Fitting of the propeller to the shaft is to be in accordance with the following;
(Considering 0℃ sea water temperature)

If the propeller is bolted to the propeller shaft, the bolt connection is to have at least the same bending stress as the propeller shaft.

(1) Flanged connection

(A) Torque transmission based on combinations of shear or guide pins or expansion devices and pre-stressed friction bolts is to fulfil :

(a) The friction torque T_F is to be at least twice the repetitive vibratory torque T_V, i.e.:

$$T_F = \frac{\mu D F_{bolts}}{2000} \geq 2T_V \quad \text{(Nm)}$$

µ = Coefficient of friction, 0.15 for steel against steel and steel against bronze, and 0.12 for steel against nodular cast iron. Other values may be considered for especially treated mating surfaces.

T_V = Vibratory torque for continuous operation in full speed range(~ 90-100% of rpm at maximum continuous power)

= $(K_{Aice} - 1) T_0$ (Nm)

D = Bolt pitch circle diameter (PCD) (mm)

F_{bolts} = The total bolt pre-stress force of all n bolts (N)

Bolt pre-stress limited as follows;

Bolts may have a pre-stress up to 70% of the yield strength in the smallest section. However, when using 10.9 or 12.9 bolts(refer to regulations for indication of thread strength in ISO) the thread lubrication procedure has to be especially evaluated, and only tightening by twist angle or better is accepted (e.g. by elongation measurement). If rolled threads, the pre-stress in the threads may be increased up to 90% of the yield strength. These percentages are given on the condition that the peak service stresses combined with the pre-stress do not exceed the yield strength.

T_0 = maximum continuous torque (kNm)

K_{Aice} = application factor due to ice shock(see **1005.**)

(b) Twice the peak torque T_{peak} minus the friction torque (see (a), above) is not to result in shear stresses beyond the shear yield strength $\sigma_y/(\sqrt{3})$ of the n ream fitted pins or expansion devices, i.e.:

$$2T_{peak} - T_F \leq \frac{\pi n D d_b^2 \sigma_y}{8 \cdot 10^3 \sqrt{3}} \quad \text{(Nm)}$$

$$T_{peak} = K_{Aice} \cdot T_0 \quad \text{(Nm)}$$

T_{peak} = higher value of $T + T_V$ or $K_{Aice} \cdot T_0$ (Nm)

T = mean torque at resonance

T_V = the highest value of vibratory torque in the entire speed range excluding critical speed range

D = Bolt pitch diameter(PCD) (mm)

d_b = Bolt shear diameter (mm)

(B) Torque transmission based on n flange coupling bolts mounted with a slight clearance (e.g.< 0.1 mm) and tightened to a specified pre-stress σ_{pre} is to fulfil the following requirements:

- the friction torque is to be at least twice the repetitive vibratory torque (including normal transient conditions) T_V (see (A)(a))
- bolt pre-stress limited as in (A)(a)
- the shear stress τ due to twice the peak torque minus the friction torque combined with the pre-stress σ_{pre} is not to exceed the yield strength σ_y, i.e.:

$$\sqrt{\sigma_{pre}^2 + 3\tau^2} \le \sigma_y$$

τ = Shear stress in bolt

$= \dfrac{8(2T_{peak} - T_F)10^3}{D\pi n d_b^2}$

σ_{pre} = Specified bolt pre-stress,

$= \dfrac{4F_{bolts}}{\pi n d_b^2}$

T_{peak} = Peak torque, (see (A)(b))

D = Bolt pitch diameter(PCD) (mm)

d_b = Bolt shear diameter (mm)

(C) Torque transmission based on ream fitted bolts only, is to fulfil the following requirements:
- the bolts are to have a light press fit
- the bolt shear stress due to two times the peak torque, T_{peak}(see (A)(b)) minus the friction torque, T_F(see (A)(a)) is not to exceed 0.58 σy
- the bolt shear stress due to the vibratory torque, T_V(see (A)(a)) for continuous operation is not to exceed σ_y/8.

This means that the diameter of the n fitted bolts is to fulfil the following criteria:

$$d_b \ge 66\sqrt{\frac{2T_{peak} - T_F}{nD\sigma_y}} \quad \text{and} \quad d_b \ge 143\sqrt{\frac{T_V}{nD\sigma_y}}$$

D = Bolt pitch diameter(PCD) (mm)

Ream fitted bolts may be replaced by expansion devices provided that the bolt holes in the flanges align properly.

Guidance note:
Ream fitted bolts with a light press fit means that the bolts when having a temperature equal to the flange, cannot be mounted by hand. A light pressing force or cooling should be necessary.

(2) Shrink fit connections
The friction capacity is to be fulfil the following at a temperature of 35℃.

Required torque capacity(kNm) in the full speed range

$T_{C1} = 2.0 \cdot T_0 + 1.8 \cdot (K_{Aice} - 1) \cdot T_0$

The minimum value for T_{C1} is $2.8 \cdot T_0$

K_{Aice} and T_0 = see (1)(A)(a)

Tangential force(kN) : $F_T = 2 \cdot T_{C1}/D_S$

(D_S is shrinkage diameter (m), mid-length if tapered.)

Axial force (kN) : $F_A = p \cdot \pi \cdot D_S \cdot L \cdot \theta \cdot 10^3 \pm Th_{ice}$

Here,

+ = for propellers with pulling action including thrusters and pods with dual direction of rotation.

\- = for propellers with dual direction of rotation.

p = surface pressure (MPa)

L = effective length (m) of taper in contact in axial direction disregarding (i.e. not subtracting) oil grooves and any part of the hub having a relief groove

θ = half taper, e.g. taper = 1/30, θ = 1/60

Th_{ice} = the highest axial force in the applicable ice rules.

With friction force (kN) $F_{FR} = p \cdot \mu \cdot \pi \cdot D_s \cdot L \cdot 10^3$ the necessary surface pressure p_{35T} (MPa) at 35℃ for safe torque transmission can be determined by :

$$p = \frac{\sqrt{F_T 2 \cdot \left(1 - \frac{\theta^2}{\mu^2}\right) + Th_{ice}^2} \pm Th_{ice} \cdot \frac{\theta}{\mu}}{\mu \cdot \pi \cdot D_S \cdot L \cdot 10^3 \cdot \left(1 - \frac{\theta^2}{\mu^2}\right)}$$

μ = coefficient of friction, (see **Table 3.22.11**)

Table 3.22.11 Static coefficients of friction, μ

Application	Hub material (shaft material = steel)		
	Steel	Cast iron or nodular cast iron	Bronze
Oil injection	0.14	0.12	0.13
Dry fit on taper	0.15	-	0.15
Glycerine injection	0.18	0.16	0.17
Heated in oil	0.13	0.10	-
Dry heated/cooled(part not degreased or protected vs. oil penetration; nor high shrinkage pressure applied)	0.15	0.12	-
Dry heated/cooled(part degreased or protected vs. oil penetration; or high shrinkage pressure applied)	0.20	0.16	-
Special friction coating	To be specially approved		

(3) Keyed connections

(A) For key connections transmitting torque only, there is to be a minimum interference fit (friction torque) that corresponds to the applicable vibratory torque for continuous operation with a safety factor of 2.0. This means a friction torque:

$$T_F \geq 2.0\, T_V = 2(K_{Aice} - 1)\, T_0$$

When calculating shrink fit pressures between cylindrical members with one or two keyways, the real pressure is less than the calculated due to relief caused by the keyways. This influence may be approximated by a reduction factor of 0.8.
With these assumptions and solid shaft with steel hub the necessary amount of shrinkage Δd (mm) is:

$\Delta d = T_F / (128 dL\mu(1-(d/D)^2))$

T_F , T_V, K_{Aice}, T_0 = see (1)(A)(a)

Δd = shrinkage amount (mm) estimated as minimum amount due to specified tolerances or pull-up distance minus $0.8(R_{z-shaft}+R_{z-hub}) \approx 5(R_{a-shaft}+R_{a-hub})$ (mm).

d = shaft diameter (mm)

D = outer diameter of hub (mm)

L = hub length (mm)

μ = coefficient of friction (0.15 may be used)

R_a = "arithmetical mean" surface roughness (mm) as defined in ISO4287/1 for shaft and hub, respectively.

R_z = "ten point height" surface roughness (mm) as defined in ISO4287/1 for shaft and hub, respectively.

For tapered connections the minimum friction torque is to be provided by means of either a specified push up force or a specified pull up length. Te latter is to be consistent with Δd above. However, if test pull-up is carried out, the subtraction of the surface roughness term may be omitted.

(B) The key shear stress and the surface pressures in the shaft and hub keyways, respectively are calculated on the basis of the applied repetitive peak torque T_{peak} (see (1)(A)(a)) minus the actual friction torque T_F according to (A). Furthermore, the uneven distribution of the load along a key with a length beyond $L_{eff}/d = 0.5$ is considered empirically. If $L_{eff}/d < 0.5$ then $L_{eff}/d = 0.5$ is to be used in the formulae below.

Shear stress in key: $\tau = (T_{peak} - T_F/S)2000(1+0.25(L_{eff}/d - 0.5))/(dL_{eff}bi)$

Side pressure of key (for contact with shaft and hub):

$$\sigma = (T_{peak} - T_F/S)2000(1+0.25(L_{eff}/d-0.5))/(dL_{eff}h_{eff}i)$$

L_{eff} = effective bearing length of the key (mm)

b = width of key (mm)

i = number of keys, if 2 keys use i = 1.5

h_{eff} = effective height of key contact with shaft and hub, respectively i.e. key chamfer and keyway edge rounding considered.

S = 2

Permissible shear stress in key: $0.3f_d$ times the yield strength of the key material.

Permissible side pressures: $1f_sf_d$ times the respective yield strengths.

f_d = torque direction factor.

For unidirectional torque : f_d = 1

For dual directional torque with 10^3 to 10^4 reversals : f_d = 2/3

For 10^6 or more reversals : f_d = 1/3

f_s = support factor.

For the key : f_s = 1

For the shaft : f_s = 1.2

For the hub : f_s = 1.5

1005. Propulsion shaft line reinforcement

1. Determination of factors for ice reinforcement of shaft line.

P = rated power (kW)

n_p = propeller speed (rpm) at a rated power

T_O = torque (kNm) in the actual component

T_{ICE} = ice torque (kNm) according to **1003.**

u = gear ratio (if no reduction gear, or for components on the propeller side of a reduction gear use u = 1)

I = equivalent mass moment of inertia in kgm^2 based on torque of all parts on engine side of component under consideration.

Masses rotating with engine speed to be transformed according to :

$I_{equiv} = I_{actual} u^2$

In propulsion system with hydraulic coupling, torque converter or electromagnetic slip coupling, the masses in front of the coupling are not to be taken into consideration

I_t = equivalent mass moment of inertia of propulsion system in kgm^2(Masses in front of hydraulic or electromagnetic slip coupling are not to be taken into consideration.)

f = $560/(\sigma_b + 160)$ material factor

2. Application factor for diesel and/or turbine machinery in general:

$$K_{Aice} = 1 + \frac{T_{ice}\, I}{u\, T_O\, I_T}$$

3. Application factor for electric motor machinery or diesel machinery with hydrodynamic torque converter:

1) Diesel engine with torque converter or hydrodynamic coupling:

$$K_{Aice} = \frac{T_{TCmax}}{T_0} + \frac{T_{ice}\, I}{u\, T_0\, I_t}$$

$T_{TC\max}$ = maximum possible transmittable torque through converter/coupling.

2) Electro motor drive:

$$K_{Aice} = \frac{T_{\max}}{T_O} + \frac{T_{ice}\, I}{u\, T_O I_T}$$

$T_{\max}$ = motor peak torque (steady state condition).

Alternatively to the above criteria, the ice impact load may be documented by simulation of the transient dynamic response in the time domain. For branched system, such simulation is in general recommended.

4. Shaft connections are to be in accordance with following .

(1) Flange connections : see **1004. 8** (1).

(2) Shrink fit connections : to be in accordance with following.

The friction capacity is to be fulfil the following.

Required torque capacity(kNm) in the full speed range $T_{C1} = 1.8 \cdot T_0 + 1.6 \cdot (K_{Aice} - 1) \cdot T_0$
The minimum value for T_{C1} is $2.5 \cdot T_0$

K_{Aice} and T_0 = see **1004. 8** (1)(A)(a)
Tangential force(kN) : $F_T = 2 \cdot T_{C1}/D_S$
(D_S is shrinkage diameter (m), mid-length if tapered.)
Axial force (kN) : $F_A = p \cdot \pi \cdot D_S \cdot L \cdot \theta \cdot 10^3 \pm Th_{ice}$
(in gear boxes, replace Th_{ice} with $K_{Aice}F_{Agear}$)

Here,

+ = for axial forces pulling off the cones such as propellers with pulling action including thrusters and pods with dual direction of rotation and controllable pitch propeller.

- = for axial forces pushing up the cones such as for propellers with pushing actions.

p = surface pressure (MPa)

L = effective length (m) of taper in contact in axial direction disregarding (i.e. not subtracting) oil grooves and any part of the hub having a relief groove

θ = half taper, e.g. taper = 1/30, θ = 1/60

Th_{ice} = the highest axial force in the applicable ice rules.

With friction force (kN) $F_{FR} = p \cdot \mu \cdot \pi \cdot D_s \cdot L \cdot 10^3$ the necessary surface pressure p (MPa) can be determined by :

$$p = \frac{\sqrt{F_T 2 \cdot \left(1 - \frac{\theta^2}{\mu^2}\right) + Th_{ice}^2} \pm Th_{ice} \cdot \frac{\theta}{\mu}}{\mu \cdot \pi \cdot D_S \cdot L \cdot 10^3 \cdot \left(1 - \frac{\theta^2}{\mu^2}\right)}$$

μ = coefficient of friction, (see **1004. 8** (2) **Table 3.22.12**)

(3) Keyed connections : see **1004. 8** (3).

5. The diameter of the propeller shaft in way of aft bearing and at least a length 2.5 times the required diameter forward of propeller flange or hub, is not to be less than:

$$d_p = 1.16\left(\frac{0.9\sigma_n c_r t^2}{[0.9 - (R_R/R)]\sigma_y}\right)^{\frac{1}{3}} \quad \text{(mm)}$$

$c_r t^2$ = actual value of blade section considered at the termination of the blade root fillet (rounded upwards to nearest 1/20 of R).

σ_y refers to the shaft material.

σ_n refers to the blade material, see **1004. 4.**

c_r and t as given in **1004. 4.**

The propeller shaft diameter may be evenly tapered to 1.15 times the required intermediate shaft diameter between the aft bearing and the second aft bearing. Forward of this bearing the propeller shaft diameter may be reduced to 1.05 times the required diameter of the intermediate shaft (using material factor valid for propeller shaft).

The propeller shaft flange thickness (propeller fitting) is to be at least 0.3 times the actual shaft diameter. The fillet radius is to be at least 0.125 times the actual shaft diameter.

6. The diameter of the intermediate shaft is not to be less than:

$$d_m = Fk\left(\frac{P f K_{Aice}}{n_p u}\right)^{\frac{1}{3}} \quad \text{(mm)}$$

F = F as given in **Pt 5, Ch 3, Sec 2**.

k = K1 as given in **Pt 5, Ch 3, Sec 2**.

7. Thrust bearing

(1) Support and construction of the thrust bearing are to be designed to avoid excessive axial shaft movements caused by heavy axial forces when the propeller hits ice.

(2) The thrust bearing is to have static strength designed for not less than the nominal thrust plus the static ice force as defined in **1004. 4**. The ice force is assumed to act in the axial direction. Both forward and astern directions are to be considered.

(3) The basic static load ratings of roller bearings are not to be less than 2 times the load according to (2).

(4) For calculation of the bearing pressures in the ice conditions the following thrust force applies:

$$T_{HI} = 1.1\,T_H + 0.25\,F_{LE} \pm 0.75\,F_{LE} \text{(kN)}$$

F_{LE} = according to **1004. 7.**

T_H = mean «bollard thrust» of the propeller or 1.25 times the mean thrust at maximum continuous ahead speed, in kN.

(5) Calculated lifetime (B_{10}) of roller bearings is to be min 40,000 h, by applying the load T_{HI}.

8. Reduction gear

(1) The reduction gear is to meet the requirements in **Pt 5, Annex 5-4**, utilizing the application factor K_{Aice} in accordance with **1005.** instead of K_A.

(2) Axial ice load according to **7**, when applicable, is to be considered with respect to bearing arrangement and stiffness of the gear housing.

9. Clutches

If the factor K_{Aice} > 1.4, the following torque capacities of clutches are to be increased by the ratio: K_{Aice}/ 1.4.

- static friction torque : at least 1.8T_0 and preferably not above 2.5T_0 (When above 2.5T_0, the doc umentation such as simulation calculation of the engaging process is to be submitted.)
- dynamic friction torque : at least 1.3T_0.

10. Torsional elastic coupling

The coupling is to be designed so that :

(1) $T_{Kmaxl} > T_0 K_{Aice}$

(2) $T_{KN} \geq 0.5\,T_0(K_{Aice}+1)$

(3) As long as the natural frequency of the "propeller versus engine"-mode is much lower than the propeller blade passing frequency(ratio < 50%): $T_{KV} \geq 0.5\,T_0(K_{Aice}-1)$
Otherwise : $T_{KV} > T_0(K_{Aice}-1)$

K_{Aice} = application factor due to ice shock, see **2** and **3**.

T_{KV} = permissible vibratory torque for continuous operation (see **Fig 3.22.12**)

T_{Kmaxl} = permissible maximum torque for repetitive loads as transient vibration, typically during clutching in etc., (see **Fig 3.22.13**)

T_{KN} = permissible mean torque with the corresponding highest nominal shear stress in the elastomer and the bonding stress

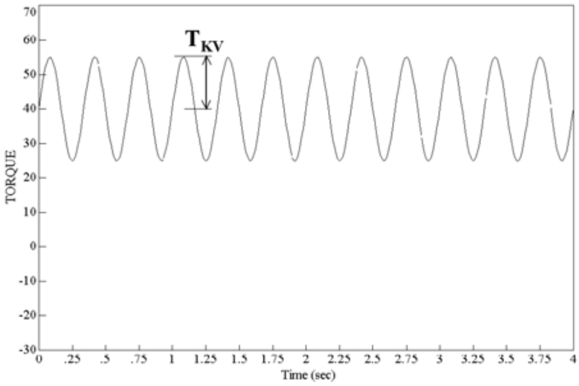

Fig 3.22.12 T_{KV}

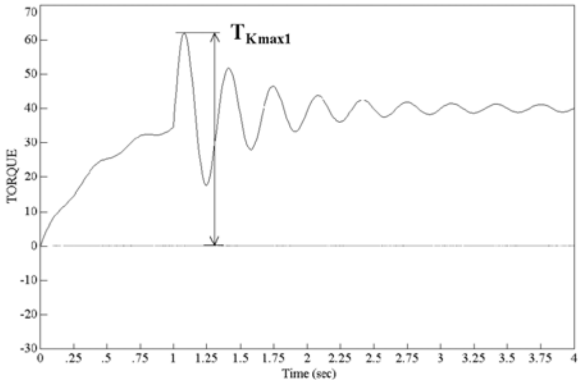

Fig 3.22.13 T_{Kmaxl}

Alternatively to the above criteria, the ice impact loads on the elastic coupling may be documented by simulation of the transient dynamic response in the time domain. For branched systems, such simulation is in general recommended.

Section 11 Thrusters

1101. General

1. Special cold climate environmental conditions are to be taken into consideration in the thruster design.

2. Means of heating and circulation of lubrication hydraulic oil are to be provided.

1102. Propulation thrusters

1. Thrusters, which are used for propulsion purpose, are to comply with the relevant requirements in **Sec 10**.

Guidance Note :
Any thruster intended to be used for propulation in ice, not only the main propulsion thrusters, is defined as propulsion thrusters in this context.

2. Steering gear for azimuth thrusters is to be designed to withstand all relevant ice loads. Both ice loads on propeller nozzle(**704.**) and on propeller blade(**1004.**) are to be considered.

1103. Other thruster

1. For shafting the following applies:

(1) Maximum peak torque, which may occur due to ice in the propeller, is to be taken into consideration.

(2) The load F in **3** is to be considered for the propeller shaft.
Maximum permissible equivalent stress is 80 % of the yield stress or 0.2 % proof stress of materials.

2. For reduction gears the application factor (K_A) is to be taken as minimum 1.2.

3. The propeller blade is to be designed to withstand a peak load, without exceeding 80% of blade material yield or 0.2 % proof stress of:

$$F = \frac{T}{0.85\,R\sin\alpha_{0.85}} \quad \text{(kN)}$$

T = maximum peak torque of prime mover (kNm)
$\alpha_{0.85}$ = pitch angle at radius 0.85 R
R = propeller radius (m)
The load F is assumed to apply at 0.85 R, perpendicular to the blade plane.

Section 12 Stability and Watertight Integrity

1201. Application

1. Vessels with class notation Icebreaker or PL are to comply with the requirements of relevant international conventions as well as the requirements of this subsection.

2. Definitions and general requirements related to damage stability approval for passenger ships are to be applied as far as applicable.

Guidance note;

The requirements contained in this section are based on the **IMO MSC/Cir.1056** "Guidelines for Ships Operating in Arctic ice covered waters" as applicable for POLOR classes 1 to 3.

1202. Definitions

1. Symbols
P_{zb} = vertical beaching force, see **402**.

2. Terms
Beaching lever = beaching moment divided by the vessel's displacement.

3. More definitions are in accordance with relevant international conventions.

1203. Documentation

1. Documentation for approval
- preliminary damage stability calculations
- final damage stability calculations
  (not required in case of approved limit curves, or if approved lightweight data are not less favourable than estimated lightweight data).

2. Documentation for information
- internal watertight integrity plan.

3. Other plans and documents deemed necessary by the Society

1204. Requirements for intact stability

1. The initial metacentric height GM is not to be less than 0.5 m.

2. Account shall be taken of the effect of icing in the stability calculations.

Guidance Note:

The realistic figures for thickness and density of the accumulated ice load may vary with different areas. In the lack of detailed information the following ice loads should be accounted for;

- 30 kg per square metre on exposed weather deck and gangways
- 7.5 kg per square metre for projected lateral area of each side of the vessel above the water plane
- the weight distribution of ice discontinuous structures such as railing, rigging, posts and equipment shall be included by increasing the total area for the projected lateral plane of the vessel's sides by 5 %. The static moment of this area shall be increased by 10 %.

3. Suitable calculations should be carried out and/or tests conducted to demonstrate the following:

(1) the ship, when operated in ice within approved limitations, during a disturbance causing roll, pitch, heave or heel due to turning or any other cause, should maintain sufficient positive stability, and

(2) when riding up in ice and remaining momentarily poised at the lowest stem extremity, should maintain sufficient positive stability.

4. Sufficient positive stability in **Par 3.** (1) and (2) means that the ship is in a positive state of equilibrium with a positive metacentric height of at least 150 mm, and a line 150 mm below the edge of the freeboard deck as defined in the applicable LL-Convention, is not submerged.

5. For performing stability calculations on ships that ride up onto the ice, the ship should be assumed to remain momentarily poised at the lowest stem or extremity as follows:

- for regular stem profile, at the point at which the stem contour is tangent to the keel line
- for a stem fitted with a structurally defined skeg, at the point at which the stem contour meets the top of the skeg
- for a stem profile where the skeg is defined by shape alone, at the point at which the stem contour tangent intersects the tangent of the skeg, or
- for a stem profile of novel design, the position should be specially considered
- the same considerations shall be made for ships designed for breaking ice at the stern.

1205. Requirements for damage stability

1. The damage assumptions in **1205. 2.** to **6.** and the criteria in **1205. 7.** and **8.** are to be the basis of damage stability calculations.

2. The dimensions of an ice damage penetration should be taken as :

- longitudinal extent 0.045 of deepest ice waterline length if centered forward of the point of maximum beam on the waterline, and 0.015 of waterline length otherwise,
- depth 760 mm measured normal to the shell over the full extent of the damage, and
- vertical extent the lesser of 0.2 of deepest ice draft, or of longitudinal extent.

3. The centre of the ice damage may be located at any point between the keel and 1.2 times the deepest draft. The vertical extent of damage may be assumed to be confined between the keel and 1.2 times the deepest ice draft.

4. If damage of lesser extent than that specified above results in a more severe condition, such lesser extent is to be assumed.

5. For pipes, ducts or tunnels situated within the assumed extent of damage, see **1207.**

6. The following permeability factors are to be assumed:

- store rooms : 0.60
- machinery spaces : 0.85
- tanks and other spaces : 0.95
- partially filled ballast tanks : consistent with minimum tank content.

7. Damage criteria at the final stage of flooding:

- the final equilibrium waterline after damage is to be below the edge of any non-watertight opening
- the final equilibrium heel angle after damage is not to exceed 15°. This may be increased to 17° if the deck edge is not submerged
- residual stability criteria at final stage
  · GZ after damage has at least 20° positive range beyond equilibrium
  · maximum GZ of at least 0.10 m within 20° beyond the maximum equilibrium position.

8. Damage criteria at the intermediate stages of flooding:

- the waterline after damage is to be below the edge of any non-weathertight opening
- the heel angle after damage is not to exceed 25°. This may be increased to 30° if the deck edge is not submerged
- residual stability criteria at intermediate stages
  · GZ after damage has at least 10° positive range beyond equilibrium
  · maximum GZ of at least 0.05 m within 10° beyond the maximum equilibrium position.

9. A maximum allowable VCG curve with respect to damage stability is to be included in the stability manual. Otherwise the damage stability approval shall be limited to the presented loading conditions.

1206. Requirements for beaching stability

1. The vessel's stability is to be assessed when beaching on a large ice feature, assuming maximum allowable VCG. The assumptions in **1206. 2.** and **3.** and criteria in **1206. 4.** and **5.** are to be the basis of such assessment.

2. Centric beaching assumption:

The vertical beaching force P_{ZB} in **402.** is to be assumed at the F.P., 1.0 m below the waterline, at the longitudinal centre line of the vessel.

3. Eccentric beaching assumption:

The vertical beaching force P_{ZB} in **402.** is to be assumed at the F.P., 1.0 m below the waterline, 0.125 B off the longitudinal centre line of the vessel.

4. Centric beaching criteria:

- the GM is to be positive
- the aft deck edge is not to be submerged.

However, for vessels built with an ice knife positioned in such a way that the aft deck edge can not be submerged, the latter criterion does not need to be considered.

5. Eccentric beaching criteria:

- the GM is to be positive
- the beaching lever, calculated as 0.125 $B \times P_{ZB}$ /displacement is not to exceed 0.5 times the maximum GZ.

1207. Requirements to watertight integrity

1. As far as practicable, tunnels, ducts or pipes which may cause progressive flooding in case of damage, are to be avoided in the damage penetration zone. If this is not possible, arrangements are to be made to prevent progressive flooding to volumes assumed intact. Alternatively, these volumes are to be assumed flooded in the damage stability calculations.

2. The scantlings of tunnels, ducts, pipes, doors, staircases, bulkheads and decks, forming watertight boundaries, are to be adequate to withstand pressure heights corresponding to the deepest equilibrium waterline in damaged condition. ⚓

Annex 3-1 Guidance for Survey and Composition of Loading Manuals

1. Composition of loading manual

The loading manual is to be composed to the followings;

(1) General
Explanation of guidance for loading which is related to the ship's strength and in aiding of ship's master for its performance and condition.

(2) Standard loading condition
Explanation for the ship's standard loading condition

(3) Strength calculation for other conditions than standard loading condition. (See **5**)
However, the ships relating category 2 of **Ch 3, Table 3.3.3** are not necessary.

2. Contents is to be included in 'General'

(1) General explanatory notes for the arrangements, scantlings, structure and characteristics

(2) Precaution for loading
For the standard loading conditions the results of analysis of structural strength including transverse strength and local strength and operational precautions based on the results of analysis of the strength are to be specified. For loading different from the standard loading conditions, such items of precautions that no excessive stress as viewed from hull strength might be caused are to be specified. And further, precautions relative to weight shifting involving the transfer of ballast water and cargo for making the standard loading conditions or any other arbitrary loading conditions are to be specified. Although specific contents may differ on each ship, precautions must be generally taken on the following points in preparing the Loading Manual;

(A) The minimum bow draught required for the structural strength of the strengthened bottom forward
(B) Limitation to loading height of cargo holds
(C) Acceptability of alternate loading, two-port loading, etc.
(D) Limitation to liquid levels in tanks
(E) Limitation to loading with respect to local strength and transverse strength (e.g. limitations to the maximum design cargo weight on deck or hatch cover)
(F) Limitation to loading with respect to longitudinal hull strength
(G) Precautions for ballasting / deballasting and drydocking

(3) Allowable values for longitudinal still water bending moment and still water shearing force, and allowable stresses
Allowable values of longitudinal still water bending moment and still water shearing force calculated in accordance with the requirements of **4.** are to be prescribed. And, definition of positive (+) and negative (-) symbols of shearing force and longitudinal bending moment are to be prescribed in **5.2.**

(4) For bulk carriers, ore carriers and combination carriers of 150 m in length and above in L_f, the followings are included in addition to the above (1) to (3);

(A) For bulk carriers, envelop results or envelop data and allowable values to shearing force and still water bending moment under the cargo hold flooding.
(B) Where the cargos are fully loaded, empty cargo holds. if the ship is not permitted to remaining empty hold, this is to be noted in loading manual.
(C) Maximum allowable and minimum required mass of cargo and double bottom contents of each hold as a function of draught at mid-hold position.
(D) Maximum allowable and minimum required mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds. This mean draught may be calculated by averaging the draught of the two mid-hold positions. The calculating methods for allowable mass including the mass in (C) above are to be in accordance with **Annex 7-4 "Guidance for calculating the maximum allowable and minimum required mass of cargo and double bottom contents for bulk carriers"**
(E) Allowable loading weight of tank top and characteristic for the cargoes other than bulk cargoes
(F) Allowable loading weight of cargo hatch covers and deck. If cargo is not approved to load on the cargo hatch covers and deck, this is to be noted in loading manual.
(G) Ratio of maximum ballast exchanging and loading plans of ballast. And it is also to be prescribed that these are to be agreed with terminal including the ratio of ballasting exchange.

3. Standard loading condition

(1) In general, the following design cargo and ballast loading conditions, based on amount of bunker, fresh water and stores at departure and arrival, are to be considered for the calculations of still water bending moment and shear force.
Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions.
Also, where any ballasting and/or deballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or deballasting any ballast tank are to be submitted and where approved included in the loading manual for guidance.
(A) Cargo ships, container ships, roll on roll off ships, refrigerated cargo ships, bulk carriers, ore carriers, etc.
(a) Light load condition
(b) Ballast conditions (at arrival and departure)
(c) Homogeneous loading conditions of cargo (at arrival and departure)
(d) All non-homogeneous loading conditions as given in the specifications (at arrival and departure)
(e) Specially approved loading conditions for short voyage or in smooth water, where necessary
(f) Temporary severe loading conditions during cargo loading or unloading, where necessary
(g) Conditions for entering dry dock while afloat
(h) If applicable, Guidance for the ballasting exchange while the ship is at sea.
(i) All loading conditions specified Rule **Pt 7, Ch 3, Sec 2** for bulk carriers with notation BC-A, BC-B or BC-C, as applicable.
(B) Oil tankers
(a) Light load condition
(b) Ballast conditions (at arrival and departure)
(c) Homogeneous loading conditions (at arrival and departure)
(d) All non-homogeneous loading conditions as given in the specifications (at arrival and departure)
(e) Conditions which largely differ from the standard ballast condition due to tank cleaning or other work while the ship is at sea
(f) Temporary severe loading conditions during cargo loading or where necessary, unloading
(g) Conditions for entering dry dock while afloat
(h) If applicable, Guidance for the ballast exchanging while the ship is at sea.
(C) Chemical tankers
(a) The same conditions as specified in (B) for oil tankers
(b) The loading conditions specified in the Operation Manual
(c) Loading conditions for cargo items included in the approved list of cargoes, which are with high density, or require heating or isolated stowage.
(d) If applicable, Guidance for the ballast exchanging while the ship is at sea.
(D) Ships carrying liquefied gas as in bulk
(a) Light load condition
(b) Ballast conditions (at arrival and departure)
(c) Homogeneous loading conditions (at arrival and departure)
(d) Loading conditions involving empty or partially loaded tanks
(e) Loading conditions where two or more kinds of cargoes with largely different specific gravity are loaded in different tanks
(f) Loading in smooth water where an increased vapour pressure is approved
(g) Temporary severe loading conditions during cargo loading or unloading, where necessary.
(h) Conditions for entering dry dock while afloat
(i) If applicable, Guidance for the ballast exchanging while the ship is at sea.
(E) Combination carriers
(a) The same conditions as specified respectively in (A) and (B) above for cargo ships and oil tankers
(b) If applicable, Guidance for the ballast exchanging while the ship is at sea.
(F) For bulk carriers, ore carriers and combination carriers of 150 m length and above in L_f, the following loading conditions are to be included in addition to the above (A) and (E)

loading conditions. However, the following (d) and (e) loading conditions may be followed by the specification agreed between owner and builder, and also if some of the following loading conditions are not included in the Loading Manual a note to this effect is to be given in the Loading Manual.

(a) Alternate light and heavy cargo loading conditions at maximum draught, where applicable.
(b) Homogeneous light and heavy cargo loading conditions at maximum draught.
(c) Ballast conditions, For vessels having ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty. Partial filling of fore peak tank is not acceptable in design ballast conditions, unless effective means are provided to prevent accidental overfilling.
(d) Short voyage conditions where the vessel is to be loaded to maximum draught but with limited amount of bunkers.
(e) Multiple port loading/unloading conditions.
(f) Deck cargo condition, where applicable.
(g) Guidance for typical loading/unloading sequences where the vessel is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, alternate conditions where applicable and relevant part loaded conditions is to be included. When this guidance is composed, precaution must be taken on loading rate, ballast and deballasting rates and applicable strength limitations, and the followings in this guidance are to be included.
   (i) The typical loading sequences as relevant should include the following loading conditions
      ① Loading conditions in above (a), (b), (d), (e) and (f)
      ② Block loading
   (ii) The loading/unloading sequences may be port specific or typical.
   (iii) The sequence is to be built up step by step from commencement of cargo loading to reaching full deadweight capacity. Each time the loading equipment changes position to a new hold defines a step. In addition to longitudinal strength, the local strength of each hold is to be considered.
   (iv) For each load condition above mentioned in (i), the summary for all steps is to include the followings,
      ① How much cargo is filled in each hold during the different steps.
      ② How much ballast is discharged from each ballast tank during the different steps.
      ③ The maximum still water bending moment and shear at the end of each step.
      ④ The ship's trim and bow, stern and mean draught at the end of each step.
      ⑤ The ship's air-draught when necessary.
   (v) The form of guidance for loading/unloading sequences is referred to **Table 4.**

(G) Partially filled ballast tanks in ballast loading conditions

Ballast loading conditions involving partially filled peak and/or other ballast tank at departure, arrival or during intermediate conditions are not permitted to be used as design conditions unless:

(a) design stress limits are satisfied for all filling levels between empty and full, and
(b) for bulk carriers, Rule **Pt 7, Ch 3, Sec 10**, as applicable, is complied with for all filling levels between empty and full.

To demonstrate compliance with all filling levels between empty and full, it will be acceptable if, in each condition at departure, arrival and any intermediate condition, the tanks intended to be partially filled are assumed to be:

(a) empty
(b) full
(c) partially filled at intended level

Where multiple tanks are intended to be partially filled, all combinations of empty, full or partially filled at intended level for those tanks are to be investigated.

However, for conventional ore carriers with large wing water ballast tanks in cargo area, where empty or full ballast water filling levels of one or maximum two pairs of those tanks lead to the ship's trim exceeding one of the following conditions, it is sufficient to demonstrate compliance with maximum, minimum and intended partial filling levels of those one or maximum two pairs of ballast tanks such that the ship's condition does not exceed any of these trim limits. Filling levels of all other wing ballast tanks are to be considered between empty and full.

The trim conditions mentioned above are:

(a) trim by stern of 3% of the ship's length, or

(b) trim by bow of 1.5% of the ship's length, or

(c) any trim that cannot maintain propeller immersion(I/D) not less than 25%, where;

I : the distance from propeller centerline to the waterline

D : propeller diameter (see **Fig 1**)

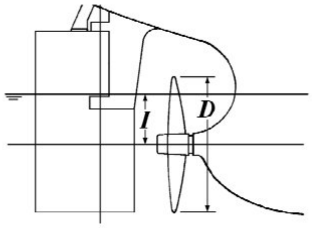

Fig 1 Immersion of propeller

The maximum and minimum filling levels of the above mentioned pairs of side ballast tanks are to be indicated in the loading manual.

(H) Partially filled ballast tanks in cargo loading conditions

In cargo loading conditions, the requirements of (G), applies to the peak tanks only.

(I) Sequential ballast water exchange

Requirements of (G) and (H) are not applicable to ballast water exchange using the sequential method.

(2) Graphical illustration of standard loading conditions

(A) To enable the ship master to readily grasp the relationships between loading conditions and hull strength under the standard loading conditions and to utilize them as guidance for planning the loading, the results of calculation of longitudinal still water bending moment (M_S) and still water shearing force (F_S) at each condition are to be subjected to graphical illustration together with the respective allowable values. In this case, the directions of positive and negative are also to be specified for M_S and F_S.

(B) The above mentioned results of calculation are to be shown on a single page or on two spread pages as far as possible on each condition, together with arrangement plan of compartments (tanks and cargo holds), cargo stowage table and the results of trim and stability calculations. Descriptive examples of these are shown **5.3.** Restrictions imposed for operation of the ship in the standard loading conditions if any, are to be specified.

(3) Additional notation

(A) In addition to the requirements in 3 (1) (F) (g), the additional special feature notation **BLU-1** shall be assigned to ships which for bulk carriers with notation **BC-A** or **BC-B** and Ore carriers satisfied with the average loading rate in accordance with **Table 1** and the following requirements. If average loading rate is specified to be higher than those given in **Table 1**, loading rates are specified in the loading manual and submitted for the approval of the Society.

(a) The de-ballast capacity of the vessel shall meet the requirements for the average loading rates as specified in **Table 1**. If average loading rate is specified to be higher than those given in **Table 1**, the de-ballast capacity of the vessel shall meet the requirements for the higher loading rates. The average loading rate is defined as rate achieved from start to completion of total cargo loading divided by time elapsed.

(b) The vessel shall be designed such that minimum 50% of maximum permissible cargo intake per cargo hold can be loaded in one pour.

(c) Inner bottom strength shall be according to the requirements in **Pt 11, Ch 12, Sec 1** for CSR bulk carriers or **Pt 7, Ch 2, 202. 6** for ore carriers or **Pt 7, Ch 3, 304. 3** for bulk carriers.

(d) Each ballast tank shall be fitted with a separate stripping system to enhance de-ballasting and stripping during the loading/unloading sequences.

(e) Check of local strength for single and adjacent hold loading pattern shall be integrated into the software of the on-board loading computer.

(f) The vessel shall be fitted a remote sounding for water ballast and fuel oil storage tanks and draught reading system with an on-line interface into the software of the onboard loading computer.

(g) Special consideration shall be given if loading with two or more loaders simultaneous is specified.

Table 1 Average loading rate

Deadweight (DWT) (ton)	Average loading rate (ton/h)
30,000 < DWT ≤ 50,000	5,000
50,000 < DWT ≤ 80,000	8,000
80,000 < DWT	12,000

(B) In addition to the requirements in 3 (1) (F) (g), the additional special feature notation **BLU-2** shall be assigned to ships which for bulk carriers with notation **BC-A** or **BC-B** and Ore carriers satisfied with the average loading rate in accordance with **Table 2** and the following requirements. If average loading rate is specified to be higher than those given in **Table 2**, loading rates are specified in the loading manual and submitted for the approval of the Society.

(a) The de-ballast capacity of the vessel shall meet the requirements for the average loading rates as specified in **Table 2**. If average loading rate is specified to be higher than those given in **Table 2**, the de-ballast capacity of the vessel shall meet the requirements for the higher loading rates. The average loading rate is defined as rate achieved from start to completion of total cargo loading divided by time elapsed.

(b) The vessel shall be designed such that minimum 100 % of maximum permissible cargo intake per cargo hold can be loaded in one pour.

(c) The requirements in (A). (c) to (g) are to be satisfied.

Table 2 Average loading rate

Deadweight (DWT) (ton)	Average loading rate (ton/h)
30,000 < DWT ≤ 50,000	6,000
50,000 < DWT ≤ 80,000	9,000
80,000 < DWT ≤ 200,000	13,500
200,000 < DWT ≤ 250,000	14,000
250,000 < DWT	16,000

4. Allowable values for longitudinal strength

The allowable values for longitudinal still water bending moment and still water shearing force which are specified in the Loading Manual are to be determined with the consideration given to the design condition of the ship. Those values, however, are not to exceed the values specified in the following, at positions of transverse section of the hull where deemed necessary by the Surveyor.

(1) Allowable still water longitudinal bending moment (M_S)

For the ships specified in **Ch 3, 104. 1** (1) of the Rules, the values obtained from the following (A) or (B), whichever is smaller, is to be taken as the allowable value for each positive and negative moment at a transverse section of the ship under consideration. However, these values are to be also complied with **Ch 3, Sec 4.**

(A) Value determined by longitudinal bending moment

$$M_S(+) = 175fZ \times 10^{-3} - M_W(+) \quad \text{(kN-m)}$$

$$M_S(-) = 175fZ \times 10^{-3} - M_W(-) \quad \text{(kN-m)}$$

f = for the ships using the value f_B or f_D specified in **Ch 3, 124.** of the Rules, those values is to be used. For the ships not using those values, the value $1/K$ is to be used.

Z = section modulus of transverse section of the ship with respect to the ship's bottom or strength deck at the position under consideration (cm^3)

$M_W(+)$, $M_W(-)$ is to be in accordance with **Ch 3, Table 3.3.1** of the Rules.

(B) Value determined by torsional bending moment
In case where torsional moment is generated in the hull due to uneven cargo stowage, the warping stress value used in applying **Pt 7, Ch 4, 202.** of the Guidance is to be deducted from the value in [ ] in the following formula.

$$M_S(+) = \left[\frac{175}{K} - \sqrt{(0.75\sigma_V(+))^2 + \sigma_H^2 + \sigma_W^2}\right]\frac{Z_V}{1000} \quad \text{(kN-m)}$$

$$M_S(-) = -\left[\frac{175}{K} - \sqrt{(0.75\sigma_V(-))^2 + \sigma_H^2 + \sigma_W^2}\right]\frac{Z_V}{1000} \quad \text{(kN-m)}$$

$\sigma_V(+)$, $\sigma_V(-)$ is to be obtained from the following formula.

$$\sigma_V(+) = \frac{M_W(+)}{Z_V} \times 10^3$$

$$\sigma_V(-) = \frac{M_W(-)}{Z_V} \times 10^3$$

$M_W(+)$, $M_W(-)$ = as specified in **Ch 3, Table 3.3.1** of the Rules.

σ_H, σ_w, Z_V = as specified in **Pt 7, Ch 4, Sec 2** of the Guidance.

(2) For the ships under **Ch 3, 104. 1** (2) and (3) of the Rules and for the ships which are not under (1) and (3), longitudinal still water bending moment at the positions of transverse section of the ship under consideration for each positive and negative moment is to be determined from the preceeding (1) (A) and to satisfy the requirements **Ch 3, Sec 4** of the Rules.

(3) The allowable value for shearing force (F_S)

(A) The allowable value for shearing force is to be obtained from the following formula.

$$F_S(+) = \frac{110}{K} \times \frac{t_S I}{0.5Q} \times 10^{-2} - F_W(+) \quad \text{(kN)}$$

$$F_S(-) = -\frac{110}{K} \times \frac{t_S I}{0.5Q} \times 10^{-2} - F_W(-) \quad \text{(kN)}$$

t_S = thickness of side shell plating at positions under consideration. However, for the ships having longitudinal bulkheads, thickness of the part of longitudinal bulkheads are to be included (mm)

I, Q, $F_W(+)$ and $F_W(-)$ = as specified in **Ch 3, 301.** of the Rules.

(B) When the shearing force of the thickness of side shell plating is directly calculated, the value of preceeding (A) or the value to be obtained from following formula is to be taken, whichever is smaller.

$$F(+) = F\frac{\tau_P}{\tau} - F_W(+) \quad \text{(kN)}$$

$$F(-) = -F\frac{\tau_P}{\tau} - F_W(-) \quad \text{(kN)}$$

F = the shearing force acting on transverse section of the ship used in the direct strength calculation which is in accordance with **Ch 3, 301.** of the Guidance.

$F_W(+)$, $F_W(-)$ = As specified in **Ch 3, 301.** of the Rules

τ_P = allowable shearing force as specified in **Ch 3, 301.** of the Guidance. (N/mm^2)

τ = shearing force acting on transverse section of the ship determined by the direct strength calculation, where the greatest value among those which occur in side shell plating, bilge hopper tanks and top side tanks is to be taken (N/mm^2).

(C) The allowable value for shearing force in still water bending moment determined by the preceeding (A) and (B) is to be also complied with **Ch 3, Sec 4** of the Rules.

(4) Allowable values for still water bending moment and shearing force in harbour water free from the effects of waves may be obtained by taking half the values of the wave induced longitudinal bending moment and shearing force as specified in (1) and (2) respectively.

5. Composition of loading manual

5.1 Method of longitudinal strength for loading conditions different from the standard loading condition

(1) Confirmation items for longitudinal strength
Calculating and checking method of longitudinal strength for loading conditions different from the standard loading condition is to be in accordance with **Fig 2** and the following items are to be included for each point of output.
(A) Still water bending moment (M_S)
(B) Still water shearing force (F_S)
(C) Still water shearing force for alternate loading condition (F_C) (shearing force modified by alternate loading to F_S). However, for the ships designed without consideration of load distribution by double bottom structure, confirmation of still water shearing force for alternate loading condition may be dispensed

(2) Point of output for checking longitudinal strength
(A) At least six points of output of longitudinal still water bending moment are to be properly arranged in the range (including the midship 0.5 L).
(B) The points of output of still water shearing force are to be arranged at a position of fore and aft bulkheads of cargo loaded compartments and/or similar spaces. However, where the distance between transverse bulkheads is small such as cofferdam, checking of strength at either one of the bulkheads may be omitted. Also, where the shearing force is considered to be apparently small, checking of strength may be omitted.

(3) Grouping of loads in calculation
(A) Loads in those tanks symmetrically arranged on both sides of the ship may be summarized in same group in calculation.
(B) In case where two or more hatch openings are provided for one cargo hold, calculations to be made for each such hatch opening. However, where separation according to type of cargo is unnecessary, calculation may be made by hold.

(4) Procedure for checking longitudinal strength
(A) In order to facilitate checking of allowable cargo loading, the relation between loading and longitudinal strength, and the procedure of checking longitudinal strength are to be explained by using flow chart or any other proper means. Descriptive examples are shown in **5.4.**
(B) The following allowable values corresponding to values calculated in (1) above are to be clearly specified so that the shipmaster can judge the adequacy of cargo loading without making mistakes.
(a) Allowable value for longitudinal still water bending moment (allowable value of M_S)
(b) Allowable value for still water shearing force (allowable value of F_S)
(C) Terms and symbols used for describing the calculated values and allowable values are to be

same as used in (1) and (4) (B).

(5) Method of Calculation

(A) Calculations of longitudinal still water bending moment (M_S) and still water shearing force (F_S)
Longitudinal still water bending moment and still water shearing force are to be determined basing upon direct strength calculation.

(B) Calculation of still water shearing force in alternate loading (F_C)
Corrective calculations in case where the adjoining holds are alternately loaded are to be made according to the method as given in **5.6.**

(C) Calculation of these are to be attached to Loading Manual.

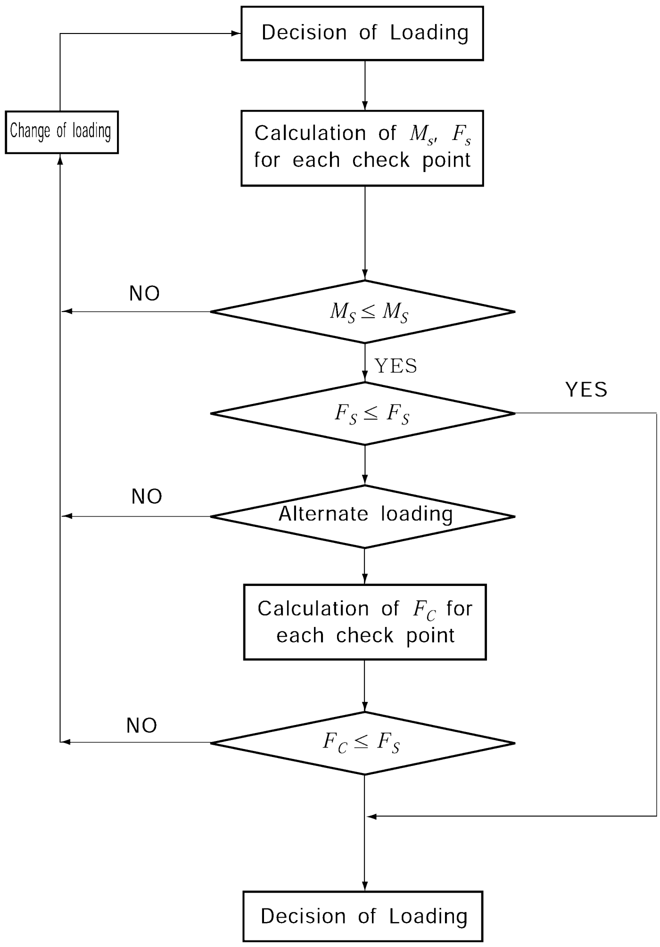

Fig 2 Flow chart of confirmation of longitudinal strength

5.2 Descriptive example for the allowable value for longitudinal bending moment and still water shearing force.

For the permissible value of still water bending moments and shearing forces are to be as follows at sea and in harbor.

At sea

Check Point	Permissible value of still water Bending Moments		Permissible value of still water Shearing forces	
	(+)	(−)	(+)	(−)

In harbor

Check Point	Permissible value of still water Bending Moments		Permissible value of still water Shearing forces	
	(+)	(−)	(+)	(−)

5.4 Descriptive example on the procedure of calculation of longitudinal still water bending moment and still water shearing force

Adjustments in loading and judging procedure

In case where loading different from the standard loading conditions is made, the longitudinal still water bending moment (M_S) and still water shearing force(F_S, F_C) are to be obtained by the procedures stated below and the loading is to be adjusted in such a manner that the values as obtained above do not exceed the respective allowable values. Since the allowable value are set in such a manner that the stresses acting on the hull due to longitudinal bending moment and shearing force predictable while the ship is sailing in the ocean do not exceed the allowable limits to the structural strength of the specific part of the hull under consideration, the strength of the ship during at sea can be ensured so far as the values of M_S, F_S and F_C at each point of output do not exceed the corresponding allowable values.

The longitudinal bending moment and shearing force to be checked are as follows

Still water bending moment (M_S)

Still water shearing force (F_S)

Still water shearing force acting on longitudinal bulkhead (F_C)

Explanatory notes on details of calculation procedures will be given in **5.5** and **5.6,** but calculation and its verification are to be made according to the following flow Chart in **Fig 3.**

(1) Calculate values of M_S and F_S at each point of output through the use of the form as shown **Table 3** in **5.5** by giving the quantities of loading for each cargo hold and tank.

(2) Check if the values of M_S at each point of exceed the allowable value of M_S shown in **Fig 3.** If they are verified to be in the range between the positive and negative allowable proceed to the next step. In case where exceed the allowable values, alternate loading is to be made.

(3) Check if the values of F_S at each point of output obtained in (1) exceed the allowable value of F_S as shown in **Fig 3.** If they are verified to be in the range between the positive and negative allowable values, the loading may be acceptable. In case where they exceed the allowable values, proceed to the next step.

(4) Check if the point of output exceeding the allowable value of F_S falls within the area subjected to alternate loading. In case where the alternate loading is found to be irrelevant, alternation in loading should be made. If alternate loading is found to be irrelevant, proceed to the next step.

(5) On points of output exceeding the allowable value of F_S, F_C is to be calculated in accordance with **Table 5.**

5.5 Method of calculation of longitudinal still water bending moment and still water shearing force

(1) General explanation

In applying this method of calculation of longitudinal strength, the longitudinal still water bending moment and still water shearing force at various locations of the hull under the actual loading condition of the ship can be obtained.

The method of calculation and symbols for longitudinal strength are as follows

ΣW = Integral value of deadweight from the fore end of L to each point of output (shearing force due to dead-weight) (1,000 tons)

SS = Integral value of (buoyancy-light weight) from the fore end of L to each point of output (shearing force due to (buoyancy-light weight)×(1,000 tons)

ΣM_t = Double integral value of deadweight from the fore end of L to each point of output (bending moment due to deadweight)× (1,000 tons-m)

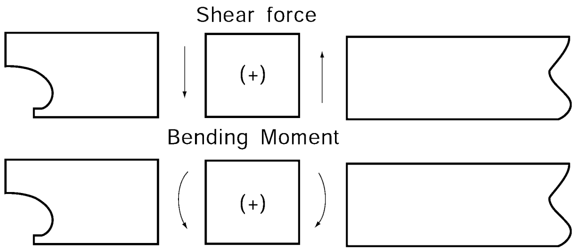
SB = Double integral value of buoyancy and the ship's weight from the fore end of L to each point of output (bending moment due to buoyancy and the ship's light weight) (1,000 tons-m)

The longitudinal still water shearing force(F_S) and still water bending moment (M_S) at each point of output can be calculated by the following formula

$$F_S = (SS - \Sigma W) \times 9800 \quad \text{(kN)}$$

$$M_S = (\Sigma M - SB) \times 9800 \quad \text{(kN-m)}$$

where the sign convention of F_S and M_S is the same of each allowable value, as shown in the following figures



In this method of calculation of longitudinal strength, the shearing forces (SS) and the bending moments (SB) due to buoyancy and the ship's light weight are calculated for every metre of draught and the longitudinal strength data, a list of shearing forces and bending moments for respective set-up draughts are prepared. In **Table 4,** an example of numerical table for one set for the specific draught is given for an example.
Accordingly, by calculating only the shearing force and bending moment due to dead weight, the longitudinal still water shearing force (F_S) and still water bending moment (M_S) for each point of output can easily be obtained on board the ship.

(2) Procedure for calculation of Longitudinal strength
The calculation of longitudinal strength may be proceeded by filling up the spaces given in **Table 3.** The procedure is given as follows

(A) After draught (DA) and trim
The after draught and trim, in the conditions for which the calculation of longitudinal strength is to be made, are to be filled up in the blank spaces. In this case, the trim by the bow is to be noted with negative sign (-).

(B) Base draught (DB) and difference of draught (ΔD)
A draught, closes to but is less than the after draught is to be selected from among the base draughts given in the longitudinal strength data and is to be filled up in the space for the base draught, and the difference between the after draught and the selected base draught is to be entered in the space for the difference (ΔD).

(C) Column for Weight
One-thousandth of the deadweight (ton) in the respective compartments is to be entered in this column.

(D) Column for Wi
This column is for indicating the dead-weight in the respective compartments exerted on points of longitudinal strength output, which is obtained by multiplying the deadweight by the ratio (ratio of compartment to be included in each point of output).

(E) Column for Mi
This column is for indicating the moment around the midship which is created by the deadweight in the respective compartments, and here the value of $W_i \times G$ is to be entered.

(F) ΣWi, ΣMi
The accumulations of Wi and Mi. included between the fore end and each point of output are to be filled up here.

(G) SS and SB
SS and SB indicate the shearing force and the bending moment due to buoyancy and the ship's light weight respectively and they are to be calculated according to the following procedures

(a) Correction factors (CD and CT) in accordance with base value, difference of draught and trim
The base value (column ①) and the respective correction factors (CD and CT) at each point of output is to be transferred from the longitudinal strength data for the draught adopted as the base draught to the corresponding space.

(b) Correction for difference of draught (ΔD) (column ②)
This is to correct the difference between the base draught and the actual draught. The correction is to be made by multiplying the correction factor (CD) by the difference of draught (ΔD).

(c) Correction for trim (column ③)
In case where the ship has any trim, the correction for trim is to be made by multiplying the correction factor (CT) by the value of trim (m).
(d) Summation
The base value 0, corrected value for the difference of draught ② and the corrected value for trim ③ are to be summed up and the sums are to be filled up in the spaces for SS and SB.

(H) ΣW and ΣM
ΣW and ΣM indicate the shearing force and bending moment due to deadweight respectively which are obtained by the following procedure
(a) Column for ΣW
ΣW is the accumulation(ΣWi) of dead-weight at each point of output which is to be transferred in this column.
(b) Column for ΣM
ΣM is the bending moment at each point of output converted from the bending moment (ΣMi) around the midship due to deadweight at each point of output, and the values obtained from the following formula is to be entered.

$$\Sigma W \times \ (corrected\ lever) + \Sigma Mi$$

(I) Still water shearing force
Still water shearing force(F_S) indicated the actual still water shearing force under loading condition at each point of output and is obtained from by the following formula.

$$F_S = (SS \cdot \ \Sigma W) \times 9800 \quad \text{(kN)}$$

(J) Longitudinal still water bending moment (M_S)
Longitudinal still water bending moment indicates the actual longitudinal still water bending moment under loading condition at each point of output, and is obtained from the following formula

$$M_S = (\Sigma M - SB) \times 9800 \quad \text{(kN-m)}$$

5.6 Method of calculation of shearing force in alternate loading

In case where the adjoining holds are loaded alternately, the shearing force is to be corrected in accordance with the calculation form shown in **Table 5.**

(1) Method of calculation (See **Fig 3**)

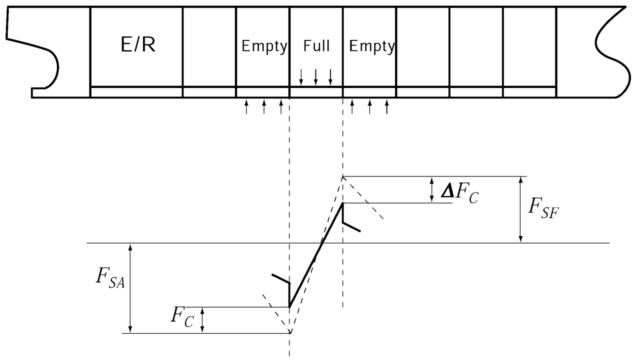

Fig 3 Correction of still water shearing force in alternate loading condition

Table 5 Example of calculation sheets for shearing force (F_C) when alternately loaded.

		-	-28,100	-25,200		-25,200		-27,600		-28,700		-28,500		-30,400

(A) Still water shearing force (F_S) (column ①) (kN)
Still water shearing force obtained in **5.5** is to be transferred to column ①.

(B) Load between transverse bulkheads
($F_{SF}-F_{SA}$) (column ②) (kN)
For each hold, still water shearing force (F_S) at aft end bulkhead of hold is given as F_{SA}, and shearing force (F_S) at fore end bulkhead of hold is given as F_{SF}, and the difference, $F_{SF}-F_{SA}$ is entered in column ②.

(C) Ballast weight of topside tank (column ③) (kN)
Where topside tank is loaded with ballast etc., the weight of the load (tons) is multiplied

by **9.8** and the corresponding value (kN) is entered in column ③.

(D) Ballast weight of topside tank between bulkheads (F_T) (column ⑤) (kN)
This column represents, for each hold, ballast (F_T) of topside tank supported by transverse bulkheads at fore and aft ends of the holds, and a value derived by multiplying the ballast weight of top side tank by the load ratio C in column ④ is recorded.

(E) Load acting on double bottoms($F_{SA}-F_{SF}-F_T$) (column ⑥) (kN)
This column represents, for each hold, the load which acts on the double bottoms of the holds, and (value of column ② − value of column ⑤) is recorded.

(F) Shearing force modifier (ΔF_c) (column ⑧) (kN)
This column represents, for each hold, the shearing force modifier which modifies the shearing force at fore and aft ends bulkhead of the hold, and the value obtained by multiplying the load in column ⑥ by a coefficient C (column ⑦) in accordance with **Ch 3, Table 3.3.6** of the Guidance is recorded.

(G) Shearing force at fore and aft of transverse bulkhead (F_{CA} and F_{CF}) (column ⑨) (kN)
This column represents shearing force at fore side of aft end bulkhead of hold (F_{CA}) or shearing force at aft side of fore end bulkhead of hold (F_{CF}) is given in the following (a) and (b).

(a) The shearing force at the fore side of aft end bulkhead of hold is to be givens F_{CA} as follows.

$$F_{CA}=F_{SA}+\Delta F_c$$

where

F_{SA}= shearing force at aft end bulkhead of hold under consideration, whose value is recorded in column ①.

ΔF_c = shearing force modifier at the hold under consideration whose value is recorded in column ⑧.

(b) the shearing force at the aft side of fore end bulkhead of hold is to be given as F_{CF} as follows.

$$F_{CF}=F_{SF}+\Delta F_c$$

where

F_{SF} = shearing force at fore end bulkhead of hold under consideration, whose value is recorded in column ①.

ΔF_c = as given in the preceding (a).

(H) Allowable value of shearing force (kN)
The allowable values of shearing force are indicated in the column ⑩, and thus the value of shearing force in alternate loading condition (value of column ⑨) is to be in the range between these two allowable values.

Annex 3-2 Guidance for the Direct Strength Assessment

I. General

1. Application

(1) This Guidance deals with procedure of direct structural analysis that is composed of structural modeling, stress calculating, yielding check and buckling check for the primary supporting members of hull.
(2) This Guidance consists of global structural analysis and hold structural analysis according to size of structural model.

2. Classification note

Upon the request of the applicant (i.e., the Owner or the Builder), the class notation **SeaTrust(DSA1)** or **SeaTrust(DSA2)** shall be assigned to ships which have been built to comply with the following requirements.

(1) The ships, which are contracted for construction on or after 1 April 2006 and are to be complied with Rule **Pt 11** or **Pt 12,** are to meet all the requirements of the corresponding parts.
(2) The container ships, bulk carriers and double hull tankers should meet all requirements in **Ⅲ. Hold Analysis** and **SeaTrust(DSA1)** is assigned to those ships. Where, however, it is deemed to be necessary by the Society, the requirements in **Ⅱ. Direct Global Structural Analysis** should be applied additionally, and **SeaTrust(DSA2)** is assigned in this case.
(3) When allowing the classification notation **SeaTrust(DSA1)** or **SeaTrust(DSA2)** for other types of ships not specified in (1) or (2) above, the relevant requirements of this Guidance may be applied as appropriate.

II. Direct Global Structural Analysis

1.General

(1) Application
(A) This Guidance provides overall procedures to be used in the global structural analysis with direct transfer of loads from hydrodynamic and stochastic analysis for the purpose of structural safety assurance. This guidance is only applicable to ships intended for unrestricted service and specified in **Ch 3** of the Rules.
(B) The design of the structure is to be in accordance with **Ch 3** of the Rules regardless of the structural analysis according to this guidance, and the results of the direct global structural analyses cannot be used to reduce the basic scantlings based on the Rules.
(C) It is recommended to use a return period of at least 20 years in North atlantic for design loads, which is equivalent to 10^{-8} probability level.
(D) The seakeeping and hydrodynamic load analysis is to be carried out using computer program recognized by the Society based on linear 2D Strip method or linear 3D panel method. The non-linear effects should be considered if these effects are regarded to be important after initial evaluation of the hull shape.
(E) The structural analysis is to be carried out using computer program which can consider the effects of bending deformation, shear deformation, axial deformation and torsional deformation.
(2) Documentation
The followings should be presented to the Society for approval of the direct global structural analysis in accordance with this Guidance.
- basic input(drawings, loading manual, etc)
- structural model
- hydrodynamic model
- mass model
- assumptions and theory used in analysis
- results of the seakeeping and hydrodynamic analysis

- results of the structural analysis

(3) The flow chart of the direct global structural analysis is shown in **Fig 1**

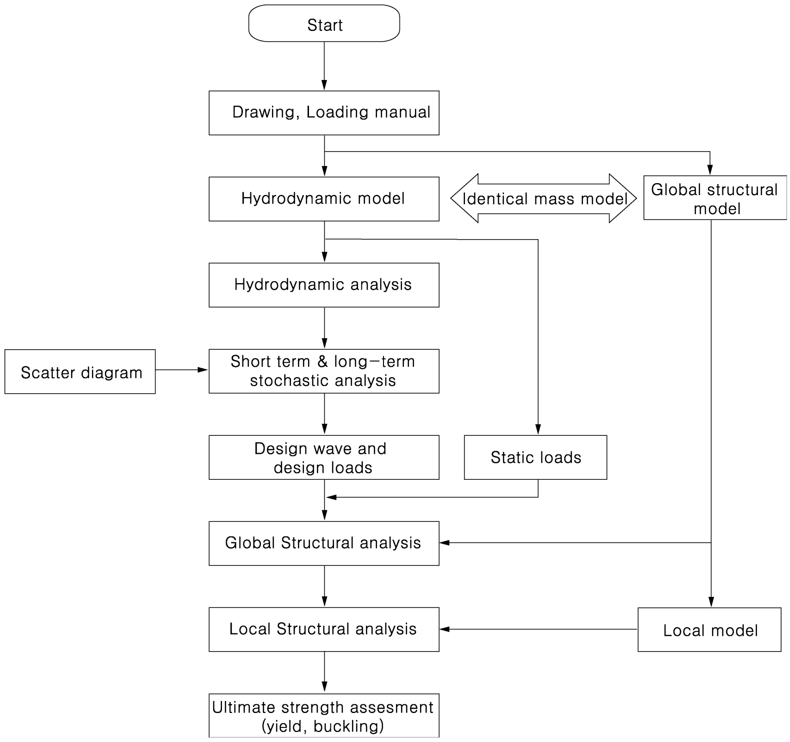

Fig 1 Flow chart of the direct global structural analysis

2. Hydrodynamic model

(1) The hydrodynamic model applied in seakeeping and hydrodynamic load analysis is to represent the geometry and hydrodynamic characteristics of wetted surface exactly as far as possible.

(2) 2D strip model

At least 25 ~ 30 strips should be applied, including at least 10 ~ 14 offsets points on half side. A good representation in areas with large transitions in shape(bow and fore part, bilge) should be ensured using higher density of strips and offsets points. Even areas with constant shape should be divided into several segments to consider the gradient of the hydrodynamic pressure distribution.

(3) 3D Panel model

The element size should be sufficiently small to avoid numerical errors. At least 30 ~ 40 stations, including 15 ~ 20 panels at each station should be applied. This means 500 ~ 800 elements on half side. A good representation in areas with large transitions in shape(bow and fore part, bilge) should be ensured using higher density of panels. Areas with constant shape should be divided into several panels to consider of hydrodynamic pressure distribution.

(4) Hydrodynamic model should be made to coincide with structural model in geometry, displacement and center of buoyancy.

3. Structural model

(1) Modeling of structure

(A) The model of structure to be analysed is to include its surrounding members which are considered to have a material influence on the behaviors of the members.

(B) A proper selection of shell elements, beam elements and truss elements is to be made to represent the global stiffness of the hull precisely.

(C) The scantlings is to be modelled with corrosion addition.

(D) In general, one shell element may be used to model the structures between girders or floors in the global structural analysis. However, if the structural analysis is carried out to get deformation response and nominal stresses of the structural members in the midship hold area, the modelling is to be done in accordance with **III. Hold Analysis.** For the critical areas where the element size is not small enough to get a proper structural response, finer mesh divisions should be used. The finer mesh models may be solved separately in the condition of same boundary conditions as the global structural model.

(E) The proper size of meshes should be selected to consider the stress distribution predicted in the model and to avoid abnormally large aspect ratios of meshes.

(F) If a shell element is stiffened by several stiffeners, two equivalent stiffeners each of which has the half of the total stiffness, may be modelled along the both sides of the element.

(G) The effective cross-section area of a stiffener is to decided according to following **Table 1** which depends on the end connection.

Table 1 Line element effective cross-section area

End connection	Effective cross-section area
sniped both ends	30 % cross-section area of stiffener
sniped one end, connected other end	70 % cross-section area of stiffener
connected both ends	100 % cross-section area of stiffener
Primary member face bars	100 % cross-section area

(H) Model check

In order to confirm the proper modelling of the hull structure, the model is to be checked according to the following methods, or equivalent ones recognized by the Society.

(a) The tolerance between the section modulus obtained from F.E model and that of the midship drawings, is to be less than ±1 %.

(b) The axial bending stresses should be the same value as those obtained from the beam theory as far as possible. The axial bending stresses are M/Z in the beam theory, where M is the sum of the still water bending moment and the wave bending moment and Z is the section modulus of the section of interest.

(2) Boundary conditions

The boundary conditions for the global structure model should reflect simple supporting. This is obtained through the example shown **Table 2** and **Fig 2.** The fixation points should be located far away from the areas of interest.

Table 2 Boundary condition

Location	Displacement		
	δx	δy	δz
Point A	1	1	1
Point B	0	1	1
Point C	0	1	0
(Notes) 1 : constrained 0 : Free			

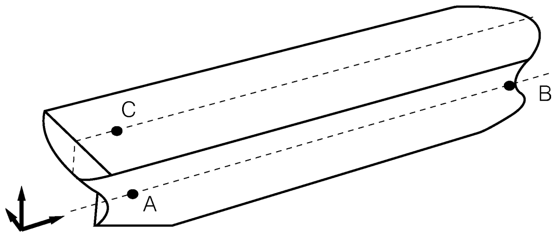

Fig A3.2.2 Boundary condition

4. Mass model

(1) The total weight of the ship structures is the sum of all the individual members. The weight of each member is the product of structure volume by structure density, and the structure density may be increased properly to consider omitted minor structures. The additional weight should be distributed properly over ship length because the weight differences occur all over the ship.
(2) The cargo weight model should have the same longitudinal, vertical and transverse mass distribution in accordance with the loading manual. However, the total weight can be modelled as a point mass at the gravity center of weight.
(3) If there is a slight differences between the mass model used in hydrodynamic analysis and that used in structural analysis, severe unbalance forces may be resulted in. Therefore the amount, the gravity center and the distribution of the total weight used in both of the analysis are to be identical, as far as possible.
(4) The hydrodynamic model and the structure model should be in proper balance and give a good representation of the still water vertical bending moment distribution in the ship loading manual. The displacement, longitudinal gravity center (LCG) and the still water vertical bending moment (SWBM) should be checked to meet following tolerances compared with those from loading manual.

- Displacement : 1 %
- LCG : 0.1 % of length
- SWBM : 3 %

5. Load analysis

(1) Loading condition
The loading conditions are to include both of the ballast condition and the full load condition which are most demanded and also include both of the maximum still water sagging and the hogging condition.
(2) Hydrostatic loads
Hydrostatic loads may be calculated based on hydrodynamic model and weight or structural model and weight. The buoyancy and the weight should be in proper balance. Especially for the ship with significant trim, the unbalance forces should be minimized as far as possible.
(3) Hydrodynamic loads
(A) In general, zero forward speed is recommended for the purpose of hydrodynamic analysis.
(B) Wave heading angles
The hydrodynamic load analysis should consider all heading angles from 0° to 360°, with the heading angle spacing less than 30°.
(C) Wave length
The hydrodynamic load analysis should consider a sufficient number of wave lengths more than 20 including the longest length about 4times of the ship length and the shortest length about 5times of the smallest panels. The range and density of wave lengths should be selected to ensure a good representation of all relevant response transfer functions, including peak values.
(D) Seakeeping and hydrodynamic load analysis
The seakeeping and hydrodynamic load analysis is to be carried out using the program recognized by the Society based on the calculation conditions described in (A), (B) and (C)

above. The results of the analysis should include the transfer functions of motions in 6 degrees of freedom (for 2D strip, surge motion omitted), sectional forces and moments, acceleration and pressure at the places of interest(for 2D strip, the axial forces due to pressures omitted).

(E) Short-term analysis
The short-term analysis is to be carried out based on the transfer functions obtained from the analysis described in (D) above and the wave spectrum which represents the total energy of irregular seaway. The Bretschneider or two parameter Pierson-Moskowitz spectrum is recommended for the North Atlantic, described by the following expression :

$$S(\omega) = \frac{H_s^2}{4\pi}\left(\frac{2\pi}{T_z}\right)^4 \omega^{-5} \exp\left(-\frac{1}{\pi}\left(\frac{2\pi}{T_z}\right)^4 \omega^{-4}\right)$$

where,

H_s : Significant wave height (m)

ω : Angular wave frequency (rad/s)

T_z : Average Zero up-crossing wave period (s)

$$T_z = 2\pi\left(\frac{m_0}{m_2}\right)^{\frac{1}{2}}$$

The spectral moments of order n of the response process for a given heading may be described as

$$m_n = \int_\omega \sum_{\theta_0 - 90^\circ}^{\theta_0 + 90^\circ} f_s(\theta)\omega^n\, S(\omega | H_s, T_z, \theta) d\omega$$

using a spreading function usually defined as $f_s(\theta) = k\cos^2(\theta)$

where k is selected such that :

$$\sum_{\theta_0 - 90^\circ}^{\theta_0 + 90^\circ} f_s(\theta) = 1$$

where,

θ_0 : Main wave heading

θ : Relative spreading around the main wave heading

(F) Long-term analysis
The long-term Sanalysis is to be carried out based on the results of short-term analysis described in above (E) and the wave data of the North Atlantic. The scatter diagram shown in **Table 3**(IACS Rec. No. 34), represents the wave data of the North Atlantic which covers the areas designated as 8, 9, 15 and 16 in **Fig 3.**

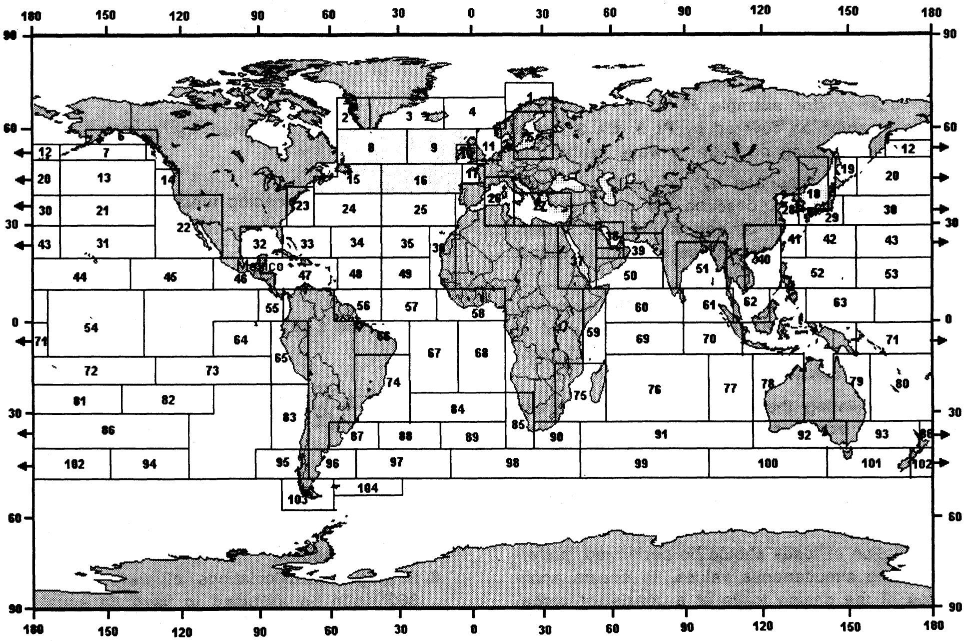

Fig 3 Definition of the extent of the North Atlantic

* The H_S and T_Z are class midpoints.

6. Design waves

(1) The design wave is defined as the regular wave that gives the same response level as the long-term value. The heading angle and the wave length of the design wave are chosen as the values where the relevant transfer function has its maximum and the design wave amplitude is chosen as the long-term value divided by the maximum value of the transfer function. If the wave steepness is too high (wave height/wave length>1/7) it is necessary to choose a slightly longer wave length.

(2) Dominant Load Parameter (DLP), the basis of design wave determination, should be chosen to assure that structural members, where extreme wave loads may act on or severe stresses may occur, are safe. Following DLPs should be considered necessarily .

- Vertical bending moment at midship
- Horizontal bending moment at midship
- Torsional moment at $L/4$, $L/2$ and $3L/4$
- Vertical acceleration at FP
- Roll

It is necessary to chose other DLPs where the structural safety should be assured due to its weak structure like a large opening.

7. Loads transfer

(1) The design waves are to be determined according to each DLP, and the dynamic loads including inertia forces and the hydrodynamic pressures should be transfer to the structural model properly. It should be confirmed that the sectional loads acting on the structural model are the same values as the loads calculated in the hydrodynamic load analysis.

(2) Hydrodynamic pressure transfer
The hydrodynamic pressure calculated in the hydrodynamic load analysis may be transferred in type of force or pressure. The unbalance forces resulted from the difference between hydrodynamic model and the structural model should be minimized as far as possible.

(3) Inertia force transfer

(A) Weight of structure itself
The acceleration at the center of a element is calculated by the combination of motions in 6 degree-of-freedom. The inertia forces are obtained from the product of the acceleration by the mass of the element and are to be distributed on the relevant nodes properly.

(B) Solid cargo
The acceleration of a solid cargo like a container should be calculated at the center of its real position and the inertia forces induced by the cargo should be distributed on the actual supporting nodes, which depend on the direction of the acceleration.

(C) Liquid cargo
The acceleration of a liquid cargo may be calculated at its center of gravity and the internal pressures induced by the acceleration should be distributed on the boundary of the tank in the type of pressure. The reference location of pressure head is top of the tank boundary for the vertical acceleration and mid of the free surface for the axial and the lateral acceleration.

(4) Unbalance force
The unbalance forces may be resulted from a variety of sources such as the differences between the structural model and the hydrodynamic model, the non-consistent mass model, viscous damping forces due to roll motion and etc. These forces, which act on the fixation points of structural model should be documented and presented including the total amount, the sources and the procedures used to resolve.

8. Structural analysis and acceptance criteria

(1) Structural analysis

(A) The structural analysis is to be carried out with the Finite Element Method.

(B) An approved analysis program having adequate accuracy should be used. If deemed necessary, documents related to systems used in the analysis and documents for confirming the accuracy may be required to be submitted to the Society.

(2) Acceptance criteria
The results of global structural analysis is to be assessed for the failure mode of yielding ac-

cording to the allowable stress shown in **Table 4**.

Table 4 Allowable stress

Structural members	Allowable stress		
	σ_e (N/mm^2)	σ (N/mm^2)	τ (N/mm^2)
Side shell, Double bottom	$0.9\sigma_Y/K$	-	-
Double bottom girder	$0.9\sigma_Y/K$	$177/K$	$83/K$
Longitudinal bulkhead	$0.9\sigma_Y/K$	-	$83/K$
Floor	$0.9\sigma_Y/K$	-	$108/K$
Upper deck	$0.9\sigma_Y/K$	$177/K$	-
Transverse bulkhead, Web frame	$177/K$	-	$83/K$
Fine mesh structural analysis			
Mean stress	σ_Y/K	-	-
Stress concentrate region	$< 1.2\sigma_Y$	-	-

(Notes)

1. σ_Y : yield stress
2. The equivalent stress σ_e is to be as follows.

$$\sigma_e = \sqrt{\sigma_x^2 + \sigma_y^2 - \sigma_x \sigma_y + 3\tau^2}$$

σ_x : Normal stress in x-direction of element coordinate system
σ_y : Normal stress in y-direction of element coordinate system
τ : Sheer stress on the face in x-y-direction of element coordinate system

3. σ : σ_x or σ_y

Table A 3.2.5 Material factor

Steel grades	K
A, B, D and E	1.0
$AH32$, $DH32$ and $EH32$	0.78
$AH36$, $DH36$ and $EH36$	0.72
$AH40$, $DH40$ and $EH40$	0.68

III. Guidance for the Hold Analysis

1. General

(1) Application

(A) When determining the scantlings of each structural member by using a direct strength calculation, the scope and the procedure of the direct strength calculation may be defined in consultation with the Society.

(B) Even when the scantlings of each structural members are decided by the hold analysis, the requirements in **Ch 3** of the Rules are to be complied with.

(C) When the thickness of steel plate is decided by the direct strength calculations, the thickness is not to be less than minimum thickness specified in the Rules

(D) Analysis method and analysis program is able to consider the effect of bending deformation, shear deformation, axial deformation and torsional deformation.

(E) Analysis method and analysis program is able to express the movements of 2-D or 3-D structural models under the reasonable boundary conditions.

(F) Where hold analysis is executed, data specifying the conditions of calculations and data summarizing their results are to be submitted to the Society.

(G) When carrying out the hold analysis for other types of ships not specified in this guidance, the relevant requirements of this guidance may be applied as appropriate.

(2) Procedure of hold analysis

A general flow chart of the hold analysis is show in **Fig 4**

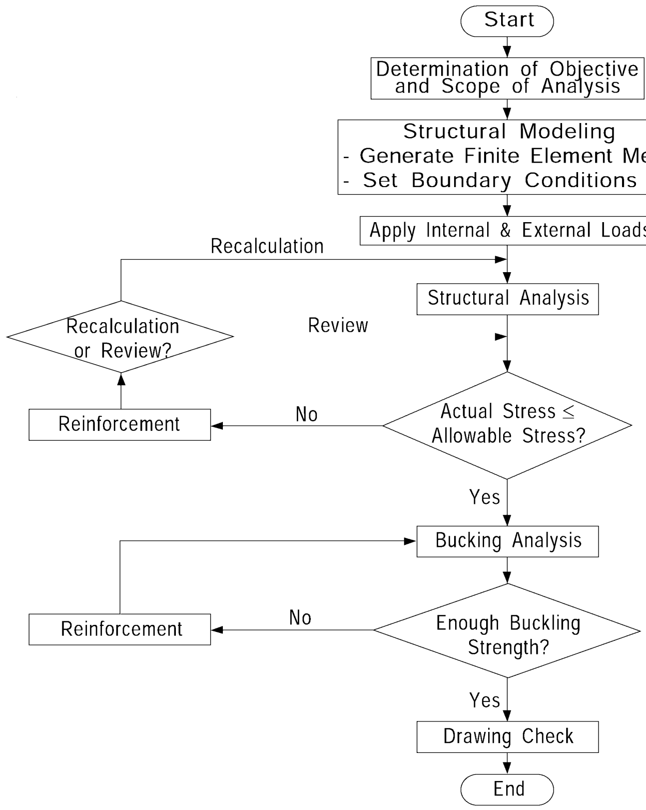

Fig 4 Procedure for hold analysis

(3) Modeling of structure

(A) The model of structure to be analysed is to include its surrounding members considered to have material influences on the behaviors of the members of which the scantlings are to be determined by direct strength calculations.

(B) The modeling is to be such that any proper elements chosen from among plate bending elements, beam elements, bar elements, etc. can reproduce the behaviors of the structure with the highest possible fidelity.
(C) The scantlings including corrosion allowances which are shown on the plans may be used for modelling.
(D) When the degree of division of a member into model elements is insufficient for the determination of scantlings by direct strength calculation, the member concerned is to be subject to the calculation by remeshing with fine meshes to enable further study on the basis of the results of the analysis.
(E) The structural models of bulk carriers, double hull tankers and container ships are to comply with the requirements in **3, 4** and **5** respectively.
(F) The F.E model should be represented using a right handed cartesian co-ordinate system as shown in **Table 6.**

Table 6 Co-ordinate system

	Direction	Remark
x	Longitudinal	Positive forward
y	Transverse	Positive to port
z	Vertical	Positive upwards from the baseline

(G) Side shell, longitudinal bulkheads and other similar members subjected to large shearing force are preferably to be modelled into two or three dimensional structure by using shell elements.
(H) In meshing, proper sizes of meshes are to be selected in accordance with the stress distribution in the model which can be predicted and abnormally large aspect ratios of meshes are to be avoided.
(I) Girders and similar members having stress gradients along their depth are to be so meshed as to enable their discrimination.
(J) In principle, access openings and lightening holes, etc., are to be represented. Where openings are not represented in the structural model, both the mean shear stress and the element shear stress are to be increased in direct proportion to the modelled web shear area divided by the actual web area. But in areas of interest of shear stress, especially in double bottom girders and in floor plates adjacent to the hopper knuckle, etc., representing the opening using a fine mesh is to be required.
(K) When modelling into beam element, the plate of a width equal to 0.1 of span of the member on its each side may, as a rule, be included, provided that the plate to be included is effectively reinforced by other members or is recognized by the Society to have a sufficient thickness, and, in addition, this width equal to 0.1 of the span does not exceed half of the distance to the neighbouring member.
(L) Non-continuous stiffeners are to be represented by line elements with the cross sectional area according to the end connection as shown in **Table 1.**

(4) Model check
(A) In order to confirm the proper modelling of the hull structure, the model is to be verified according to the following methods, or to be in accordance with the discretion of the Society.
(B) The difference between the section modulus calculated from F.E model and the midship drawing, is to be in ±1 % allowance.
(C) The hull girder bending stresses resulting from the finite element analysis are to be in good agreement with those calculated according to the beam theory. The hull girder bending stresses by the beam theory are calculated as M/Z, where M is the sum of still water bending moment and wave bending moment and Z is the section modulus at the considered position.

(5) Boundary conditions
Reasonable boundary conditions are to be applied to describe the behaviour of actual structure. The boundary conditions of bulk carriers, double hull tankers and container ships are to comply with the requirements in **3, 4** and **5** respectively.

(6) Design loads
(A) The loads due to longitudinal bending moment of hull girder at the forward and aft end boundaries of the structure model may, as a rule, not be taken into consideration. When these loads are taken into consideration, however, the allowable stress to be applied to the results of calculations is to be determined at the directions of the Society.
(B) The design loads to be taken into consideration are, as a rule, to be the loads due to cargo and water ballast loaded on board, hydrostatic pressure and wave loads.
(C) The load due to the inertia force of cargo is to be considered in addition to those specified in (B) above, when the Society considers it is necessary.
(D) The cargo holds, where dynamic impact loads such as sloshing loads are predicted, are to be specially considered and proper data in this connection are to be submitted.
(E) The design loads of bulk carriers, double hull tankers and container ships are to comply with the requirements in **3, 4** and **5** respectively.
(7) Loads due to cargo and water ballast
(A) Loads due to Ore Cargo, Grain Cargo, etc.
(a) The density, loading height and surface of the cargo are to be determined by giving reference to the preliminary loading manual, etc.
(b) The density, loading height and repose angle of cargo used in the calculations are to be clearly indicated. If considered necessary, the angle of internal friction of the cargo and the angle of friction between the cargo and wall surface are to be indicated.
(B) Loads due to liquid cargo, water ballast, etc.
(a) The upper end of water head for a tank is to be the mid-point of the distance between the top of tank and the top of overflow pipe.
(b) For the water head of large deep tanks, proper additional water head corresponding to the dynamical influence is to be considered in addition to the water head specified in (a) above.
(c) For the liquid cargo and water ballast to be loaded in harbours or similar quiet waters, the water head corresponding to the actual loading height may be used as the water head.
(d) Except where considered necessary, the loads due to fuel oil, fresh water and similar consumables may not be taken into consideration.
(e) The densities and water heads of cargoes are to be specified.
(8) Hydrostatic pressure
(A) The water head at the scantling draught(m), corresponding to respective loading conditions is to be considered as hydrostatic pressure at the ships bottom and sides.
(B) Load for hydraulic pressure test
(a) The upper end of water head of a tank being subjected to hydraulic pressure test is to be a point at a height of 2.4 m above the top of tank.
(b) The water pressure at the bottom and sides under the condition of hydraulic pressure test is to be the hydrostatic pressure corresponding to a draught equal to 1/3 of the scantling draught.
(9) Wave loads
(A) Wave induced loads
(a) As the wave induced loads corresponding to the wave crest and trough, the water heads(m) corresponding to the variations H_0, H_1 and H_2 from the hydrostatic pressure at the still water draught, according to the following formulae are to be taken into consideration. (See **Fig 5**)

$$H_0 = 0.5 \times H_W \quad (\text{m}), \qquad H_1 = 0.9 \times H_W \quad (\text{m}), \qquad H_2 = 0.25 \times H_W \quad (\text{m})$$

where,

$H_W = 0.61L^{1/2}$ -------------------- $L \leq$ 150 m

$= 1.41L^{1/3}$ --------------------- 150 m $< L \leq$ 250 m

$= 2.23L^{1/4}$ --------------------- 250 m $< L \leq$ 300 m

$= 9.28$ --------------------- 300 m $< L$

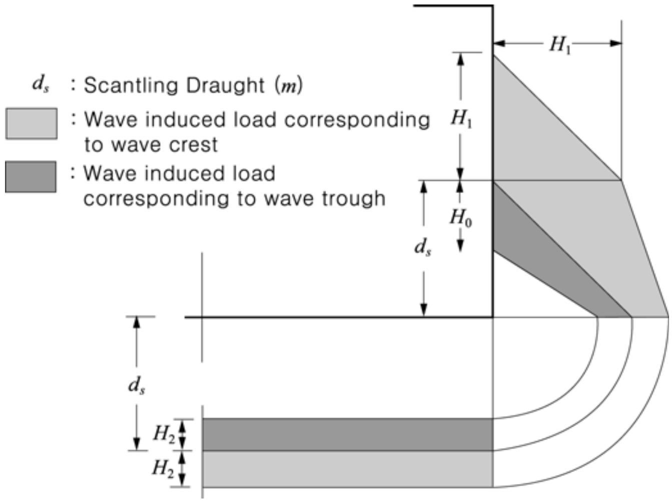

Fig 5 Wave induced load

(b) The wave induced loads in harbours and similar quiet waters may be taken as equal to 1/2 of the values of H_0, H_1 and H_2 specified in (a) above.

(c) The wave induced loads may be assumed to be equally distributed throughout the ship's length.

(10) Allowable stress

When the loads and boundary conditions specified in from (5) to (9), preceding are to be applied to the structural model according to the (3) above, the scantlings of members are to be determined so that the values of stress in each of them may not exceed the values given below.

(A) Allowable stress for mild steel members

For bulk carriers, double hull tankers and container ships, values specified in **3, 4** and **5** respectively, are to be applied. Where nothing particular is provided for, the values are to be left to the Society's directions.

(B) Allowable stress for high tensile steel members

Values according to (1) above divided by the coefficient K in **Table 7** are to be used.

Table 7 Material factor K

Steel grades	K
A, B, D and *E*	1.0
AH 32, *DH* 32 and *EH* 32	0.78
AH 36, *DH* 36 and *EH* 36	0.72
AH 40, DH 40 and *EH 40*	0.68

2. Buckling strength calculation

(1) Application

(A) The buckling strength of each structural member of the hull is to be examined on the basis of the results of direct strength calculations carried out in accordance with **1** preceding.

(B) This guidance can be applied only where the corrosion protection is considered very carefully on the panel of which the buckling strength to be examined. In case where the panel is not appropriately protected against corrosion, the analytical procedure is to be within the discretion of the Society.

(C) The buckling strength can be examined by other analytical procedure instead of the guidance when deemed appropriate by the Society.

(2) Working stress

(A) Stress Components

For the panels which are to be reviewed for the buckling stress, in-plane stresses are to have been determined in element coordinate system as listed below (See **Fig 6**)

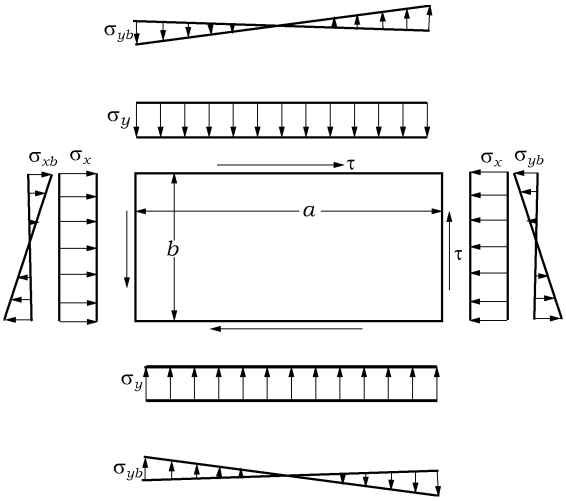

Fig 6 Working stress of panel

σ_x = compressive stress in x-direction (N/mm^2)
σ_{xb}= in-plane bending stress in x-direction (N/mm^2)
σ_y = compressive stress in y-direction (N/mm^2)
σ_{yb} = in-plane bending stress in y-direction (N/mm^2)
τ = shearing stress (N/mm^2)

Here, the stresses σ_x, σ_y are to be taken as positive when they are compressive stresses, while they are set to zero when they are tensile ones.

(B) Consideration for longitudinal bending stress of hull
As the loads due to longitudinal bending moment in still water at the end boundaries of the structure model are not taken into account in determining the working stresses specified in (A) above, the stress due to this longitudinal bending moment of hull girder is to be added for double bottom girders particularly.

(C) Grouping by features of stress distribution
Grouping according to **Table 8** is to be made depending upon the features of distribution of working stresses in the members and panels. In case where the grouping seems difficult, examination is to be done based on each group.

Table 8 Group

Group	Features	Example of members to be considered	λ
A	Relatively small shearing stress and in-plane bending stress in comparison with compressive stress or bi-axial compressive stresses with same order	Decks, bottom and inner bottom shell related to longitudinal strength and longitudinal bulk-head plating forming bi-axial stress field. Transverse bulkhead plating and deep girder, etc., forming bi-axial stress field.	1.2
B	Relatively small in-plane bending stress and large uni-axial compressive stress with shearing stress	Side shell and sloped bulkhead of side tank.,etc, forming uni-axial and shearing stress field; Bulkhead plating under high shearing stress; Girder and floor, etc., forming mono-axial and shearing stress field	1.2
C	Relatively small compressive stress and large in-plane bending stress with shearing stress	Girder and floor,.etc, forming bending and shearing stress field	1.2

(D) Modification of working stresses

(a) The in-plane stresses determined in (A) are to be modified according to **Table 9** for each group. In this case, it is to be performed exchange of coordinate according to necessity.

(b) The stresses modified according to (a) above are to be assumed as the working stresses used for the calculation of buckling strength.

(3) Buckling strength calculation

(A) Procedure of buckling strength calculation (See **Table 10**)

(a) Representative equivalent stress

The representative equivalent stress σ_{eq} is to be calculated as given in **Table 11** from the working stresses of the panel.

(b) Equivalent elastic buckling stress

(i) In this case, it is to be noted that the aspect ratio of Group A is not to be less than 1.0, According to the elastic buckling formula, buckling stresses σ_{xcr}, σ_{ycr}, τ_{cr} may be obtained.

(ii) The equivalent elastic buckling stress is to be calculated from the buckling stresses σ_{xcr}, σ_{ycr}, τ_{cr}.

(c) Equivalent plastic buckling stress

(i) When the equivalent elastic buckling stress σ_{cr} is greater than half of the yield stress σ_y the equivalent plastic buckling stress σ'_{cr} is to be calculated.

(ii) The yield stress σ_y is to be accordance with the following value. (N/mm^2)

$$\sigma_y = \frac{235}{K} \quad (\text{N/mm}^2)$$

Table 9 Modification of In-plane stresses for each group

Group	Stress condition	Modified in-plane stress
A	Where $\sigma_x \geq \sigma_{xb}$ and $\sigma_y \geq \sigma_{yb}$ to be assumed as : $\sigma_x{}' = \sigma_x + \frac{1}{2}\sigma_{xb}$ $\sigma_y{}' = \sigma_y + \frac{1}{2}\sigma_{xb}$	B	Where $\sigma_x \geq \sigma_{xb}$ to be assumed as: $\sigma_x{}' = \sigma_x + \frac{1}{2}\sigma_{xb}$.	C	Where $\sigma_x < \sigma_{xb}$ to be assumed as: $\sigma_c = \sigma_x$ $\sigma_b = \sigma_{xb}$ $\sigma_B = \sigma_c + \sigma_b$	Assumed panel with B : $B = \left(1 + \frac{\sigma_c}{\sigma_b}\right)b = \frac{\sigma_B}{\sigma_b}b$ 
Table 10 Buckling strength calculation

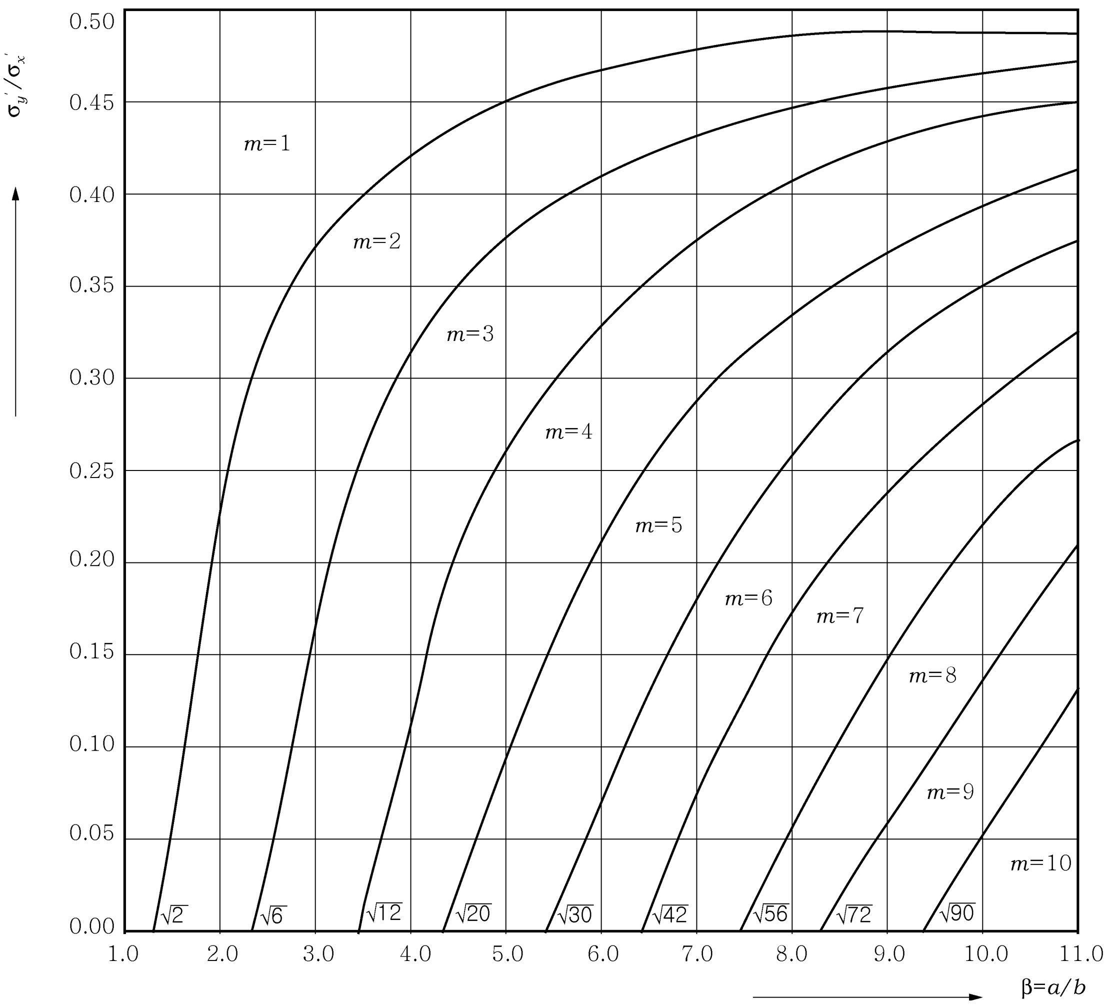

Fig 7 The number of half waves of buckling mode which gives the min. value of buckling stress

(B) Judgement of buckling strength

The results derived from (A) above are to satisfy the following conditions (a) or (b), where λ is the buckling criterion given in **Table 8.**

(a) Where the equivalent elastic buckling stress σ_{cr} is greater than half of the yield stress σ_y

$$\sigma'_{cr} \geq \lambda\,\sigma_{eq}$$

(b) Where the equivalent elastic buckling stress σ_{cr} is smaller than half of the yield stress σ_y

$$\sigma_{cr} \geq \lambda\sigma_{eq}$$

3. Bulk Carrier

(1) General

(A) When determining the scantlings of structural members of cargo hold of a bulk carrier by direct strength calculations, necessary materials and date on the calculation procedure are previously to be submitted to the Society for approval. The procedure is to comply with the following (2) to (5).

(B) Except for those specifically provided for in this part, **Par 1.** is to be applied.

(2) Structural models

(A) Model extent

The range of structure to be analyzed is, one side of the three(1/2+1+1/2) adjacent cargo tanks in the parallel body part, including whole length or half length of each cargo oil tank and transverse bulkhead between these two tanks. However, If there is asymmetry of the ship structure or cargo or ballast loading condition about the ship's centerline. Cargo hold length(l_h) is described in **Pt 7, Ch 3, 301.2** of the Guidance.(See **Fig 8**)

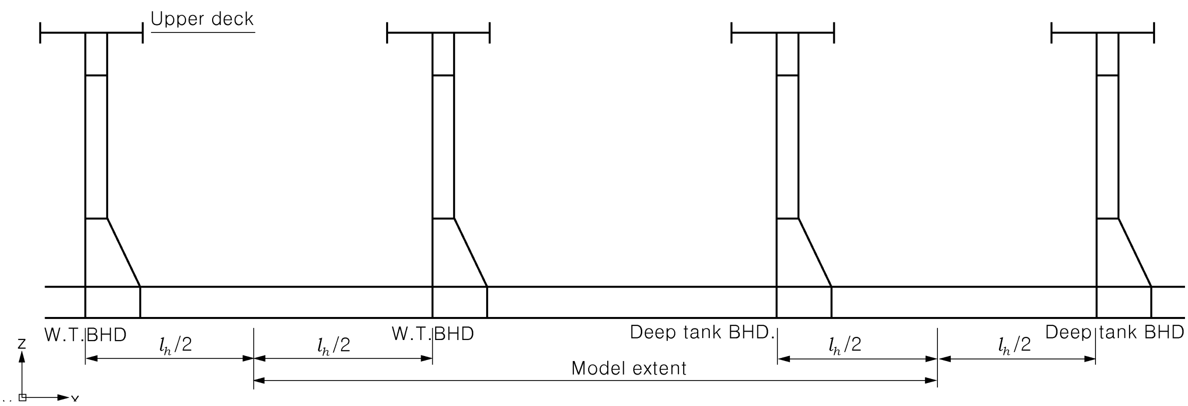

Fig 8 Hold model extent

(B) Structural modeling

(a) The structural modeling with shell elements mesh is : longitudinally, one element between every frame, transversely one element between longitudinal spacing and vertically three or more elements over the depth of double bottom girders and floors. Typical arrangements representing bulk carrier are shown in **Fig 9** to **11**

(b) For the calculation by remeshing with fine meshes, an example of meshing, as a standard, is shown in **Fig 12.** The depth of transverse web is to be meshed into 3 sub depths.

(c) The primary members including side shell, inner bottom, upper deck and corrugated bulkheads, etc. subjected to large shearing shell elements. Shedder plates in corrugated bulkhead are also to be modelled by using shell elements.

(d) Girders and similar members having stress gradients along their depth are to be so meshed as to enable their discrimination.

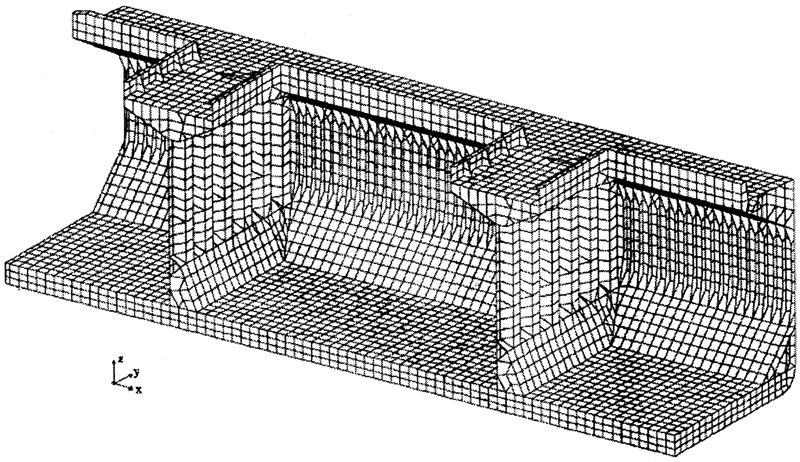

Fig 9 Example of hold model

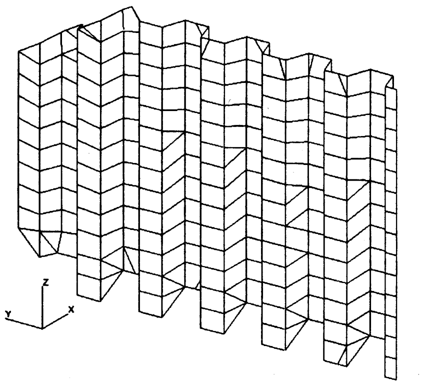

Fig 10 Example of corrugated bulkhead

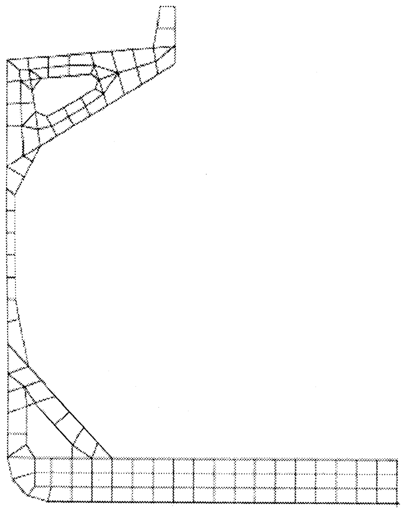

Fig 11 Example of typical web frame

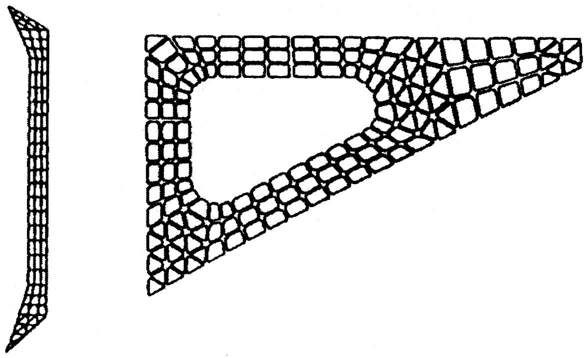

Fig 12 Example of fine-mesh

(3) boundary condition

The following descriptions of boundary conditions are to be applied for half breadth model. For a full breadth model, no constraints are required for the centerline plane. However, a node on the centerline at the keel at the both ends of the model are to be constrained in the transverse direction. The example of boundary conditions are shown in **Table 14** and **Fig 13.**

(A) End planes (①) : Symmetric condition
(B) Centerline plane (②) : Symmetric condition
(C) Vertical counter forces distributed to the side shell nodes at the oil tight BHDs to eliminate reaction at the vertical constraints.(③)

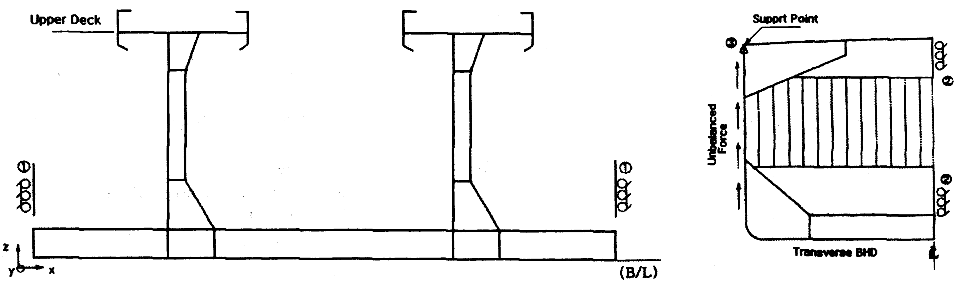

Fig 13 Boundary condition

Remarks 1 : Restrainted 0 : Free						

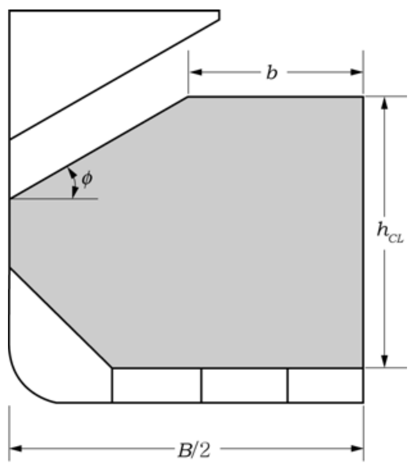

Fig 14 Assumed cargo surface

(4) Load
(A) General
In principle, the cargo and ballast loads, still water loads and wave loads etc. are applied to the F.E model.
(B) Loading conditions
The loading conditions to be taken into consideration are, as a rule, to be the full load condition and the ballast condition. When special loading conditions, such as alternate loading, multi-port loading or loading of cargo of specially high density are predicted, such conditions are to be contained in the calculations. **Table 16** gives an example.
(C) Internal loads
(a) Loads due to ore cargo grain cargo, etc.
(i) The height and surface of the cargo are to be determined in accordance with below as a standard.(See **Fig 14**)

- The shape of cargo surface is assumed to be horizontal longitudinally and transversely in the part near the ship's centreline and sloped down straight to the ship's sides with the angle of repose ϕ.
- The width of the horizontal part b is assumed to be equal to 1/4 of the breadth of the hold.
- The loading height h_{CL} is determined in accordance with the mass, angle of repose and density of the cargo to be loaded. The shape of cargo surface may be assumed to be unchanged for the whole breadth above.
- When the density and angle of repose of the cargo are not specified, they are to be taken as 3.0 (t/m^3) and 30° respectively.

(ii) The loads on the vertical walls of the hold are, in principle, to be determined by the following formula. The cargo load is not to be applied to the side platings.

$9.81\gamma hk^2$ (N/m^2)

where:

γ = density of cargo (kg/m^3)

h = vertical height from the panel in question to the surface of cargo right above the panel (m)

k = values given in **Table 15.**

β = angle between slant plating of bilge hopper and inner bottom plating.(see **Fig 15**)

Table 15 Coefficient k

angle β (degree)	k
$\beta \leq 40°$	1.0
$40° < \beta < 80°$	$1.4 - 0.01\beta$
$\beta \geq 80°$	0.6

T : scantling draught, T_{BDmin} : heavy ballast draught, T_{BDmax} : deepest ballast draught

M_{Full} : the cargo mass in the cargo hold corresponding to cargo with virtual density(homogeneous mass/volume of the hold including its hatchway, minimum 1.0 ton/m^3) filled to the top of the hatch coaming (ton). M_{Full} is in no case to be less than M_H.

M_H : the cargo mass in the cargo hold corresponding to a homogeneously loaded condition at designed maximum load draught (ton)

M_{HD} : the maximum cargo mass allowed to be carried in a cargo hold according to design alternately cargo loaded condition (ton)

M_{Blk} : the cargo mass in the cargo hold corresponding to a condition with high density cargo in two adjacent holds, if applicable (ton)

M_{BW} : the water mass in ballast hold (ton)

M_{DBFO} : the fuel mass in double bottom fuel oil tank (ton)

M_{DBBW} : the water mass in double bottom ballast tank (ton)

i : number of the cargo hold to be investigated

$i-1, i+1$: number of the cargo hold aft of the cargo hold to be investigated and forward of the cargo hold to be investigated

(b) Loads due to liquid cargo, water ballast, etc.
In a cargo hold commonly used as a water ballast tank, the water head at a certain position is to be taken equal to the greater of the value obtained from the following formula and the value of h in the same formula.

$$0.85(h+\Delta h) \quad \text{(m)}$$

where:

h = height from the position in question to the top of hatch coaming (m)

Δh = a value obtained from the following formula

$$\Delta h = \frac{16}{L}(l_t - 10) + 0.25\left(\frac{2}{3}B - 10\right)$$

l_t = length of tank (m), it is to be taken as 10 m, where it is less than 10 (m).

B = breadth of ship (m), it is to be taken as 15 m, where B is less than 15 (m).

(D) External load

(a) Still water load

Still water load is to apply as specified in **1.** (8).

(b) Wave induced load

Wave induced load is to apply as specified in **1.** (9).

(5) Allowable stress for element types

(A) Allowable stress for element types

The permissible values of normal stress σ and equivalent stress σ_e of each member are to be as given in **Table 17.** The allowable stresses in the fine meshes according to the **Table 18.**

Table 17 Allowable stress (N/mm^2)

Structural members considered		σ_l	σ_t, σ_v	σ_e
Longitudinal strength members	Bottom shell plating; inner bottom plating; sloping plate of bilge hopper tanks or topside tanks	$110/K$	$145/K$	$145/K$
	Girder		—	$175/K$
Transverse strength members	Sloping plate of stools, transverse bulkhead plating		$145/K$	$175/K$
	Floor		—	$175/K$

Notes:

1. The equivalent stress σ_e is to be as follows.

$$\sigma_e = \sqrt{\sigma_l^2 - \sigma_l \sigma_t + \sigma_t^2 + 3\tau^2} \quad \text{: (for longitudinal strength members)}$$

$$\sigma_e = \sqrt{\sigma_v^2 - \sigma_v \sigma_t + \sigma_t^2 + 3\tau^2} \quad \text{: (for transverse strength members)}$$

σ_l = normal stress in lengthwise direction

σ_t = normal stress in breadthwise direction

σ_v = normal stress in depthwise direction

τ = shearing stress

2. Openings in floors and girders, if any, are to be taken into consideration in evaluating the stresses.
3. The point of detecting stress is to the centre of the element.
4. K : material factor given in **Table 7.**

(B) Allowable Stress in the case where hull girder section modulus has a fair allowances.

The allowable values of normal stress (N/mm^2) in lengthwise direction in the bottom shell and inner bottom plating may be as determined from the following formula.

- For structural model by using shell elements : $\frac{145}{K} - 35 f_B$

(C) Allowable stress for loading / unloading conditions in the harbour
The allowable stress for loading / unloading conditions in the harbour may be 110 % of the values given in **Table 17** and **Table 18.**.

(6) Buckling strength
Buckling strength assessment to be carried out in accordance with **2.**

(7) Fatigue strength
Fatigue strength assessment may be carried out in accordance with **Annex 3-3 "Guidance for the Fatigue Strength Assessment of Ship Structures".**

Table 18 Allowable stress (N/mm²) (For results of the calculations by remeshing with fine meshes)

Structural members considered		σ_a	τ	σ_e
Transverse rings	Parallel part	—	—	$175/K$
	Corners	$195/K$	—	$195/K$
Side frames	Middle of parallel part	$175/K$	—	$175/K$
	Upper and lower ends of parallel part	$215/K$	$70/K$	$195/K$

Note:
1. σ_a = normal stress of face plate
2. The equivalent stress σ_e is to be as follows.

$$\sigma_e = \sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3\tau^2}$$

(The element coordinate system is to be x-y rectangular coordinate system)
σ_x = normal stress in x-direction of element coordinate system
σ_y = normal stress in y-direction of element coordinate system
τ = shearing stress on the x face in the y-direction of element coordinate system
3. The point of detecting stress is to be the centre of the element.
4. K : material factor given in **Table 7.**

4. Double Hull Oil Tanker

(1) General
(A) In case where scantlings of structural members of cargo oil tank in double hull tanker are determined by the hold analysis, necessary documents and data on the calculation method are to be submitted to the Society for obtaining approval beforehand.
(B) Except for those specifically provided for in this part, **Par 1.** is to be applied.

(2) Structural modeling
(A) The range of analysis
The range of structure to be analyzed is, one side of the three adjacent cargo oil tanks in the parallel body part, including whole length or half length of each cargo oil tank and transverse bulkhead between these two tanks. However, this range is to be extended if necessary so that every condition can be reproduced considering the arrangement of ballast tanks in double hull structures, loading patterns of cargo oil and ballast, and longitudinal and transverse symmetries of the bulkheads and girders attached thereto.
(B) Structural modelling
The structural modelling with shell element mesh is : longitudinally two or more elements between every web frame, transversely one element between longitudinal spacing and vertically three or more elements over the depth of double bottom girders an floors. Typical arrangements representing double hull tanker are shown in **Fig 16** to **Fig 17.**

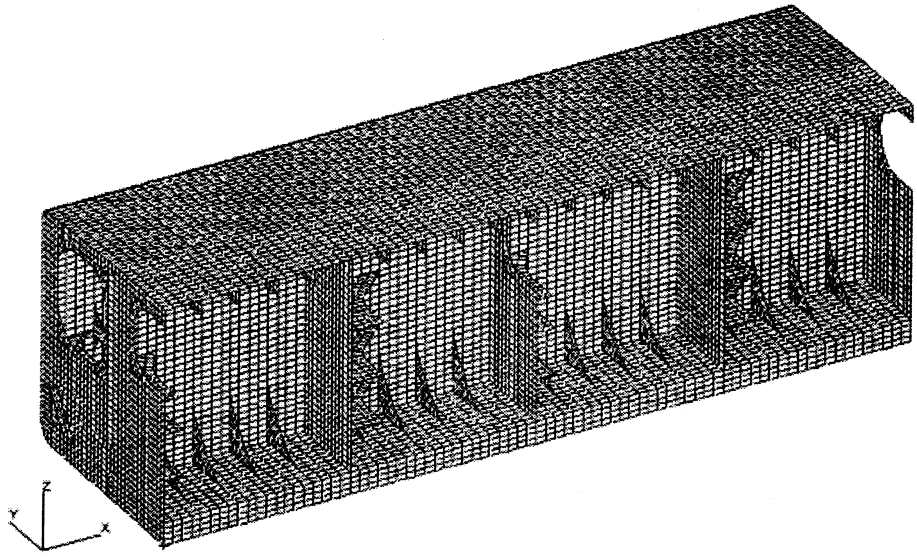

Fig 16 Example model for cargo oil tank structures

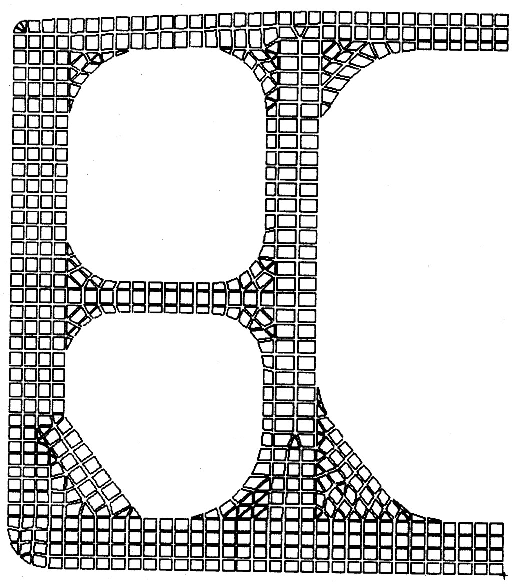

Fig 17 Example of model for side transverse structure

(3) Boundary conditions

The boundary conditions described in this section are to be applied to the F.E model for symmetric load case, as shown in **Fig 18** and **Table 19.**

- End planes (①) : Symmetric condition
- Centerline plane (②) : Symmetric condition
- Vertical counter forces distributed to the side shell nodes at the oil tight BHDs to eliminate reactions at the vertical constraints.(③)

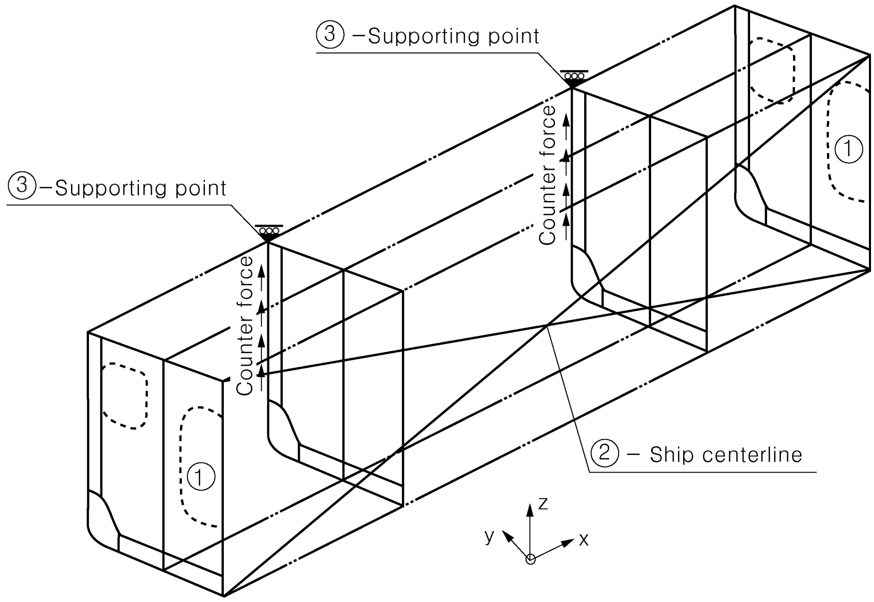

Fig 18 Boundary condition

Table 19 Boundary conditions

Position \ Coord.	Displacement			Rotation		
	U_x	U_y	U_z	θ_x	θ_y	θ_z
① Both ends of model	1	0	0	0	1	1
② Centerline	0	1	0	1	0	1
③ Top of side shell at the oil tight bulkheads	0	0	1	0	0	0
Remark ; 1 : Fixed 0 : Free						

(4) Applied load

Load to be applied to structural models are to be a combination of internal loads and external loads specified below. In case where, however, another combination of loads is clearly severer than that specified, the latter may be omitted.

(A) Internal loads

(a) Hydrostatic test condition

The water head is to be the vertical distance (m) from each point to a point 2.4 m above the deck at side (m). Examples relating to ship types are shown in **Table 20** to **24.**

(b) Navigating condition

The loading conditions for consideration are, in principle, to be the full load condition and ballast condition. In case where special loading condition such as two-ports loading is predicted, such a special case is to be included. Examples relating to ship's types are shown in **Table 20** to **24.**

(i) Water head h' at each position in cargo oil tanks is to be obtained from the following formula:

$$h' = \rho(h + \Delta h) \quad \text{(m)}$$

where :

ρ = maximum designed specific gravity of cargo as given in the loading manual.

h = vertical distance measured from the position under consideration to the top of hatch (m). But, for lower cargo oil tanks in tankers having mid-decks, vertical distance measured from the position under consideration on the level of mid-deck (m).

Δh = Additional water head given by the following formula; For L-type, U-type of tanks, h is to be determined as deemed appropriate by the Society (m)

$$\Delta h = \frac{16}{L}(l_t - 10) + 0.25(b_t - 10)$$

l_t = tank length (m). however, where it is less than 10 (m), it is to be taken as 10.

b_t = tank breadth (m). however, where it is less than 10 (m), it is to be taken as 10.

(ii) Water head h' at each position in ballast tanks is to be obtained from the following formula:

$$h' = \rho h \quad \text{(m)}$$

where :

ρ = sea water gravity (=1.025)

h = vertical distance measured from the position under consideration to the mid-point of distance between the top of tanks and the top of overflow pipes (m).

(iii) Requirements prescribed in (b) also apply to cargo oil tanks which possibly utilized as ballast tanks at sea.

(iv) For water head h' in ships in harbour or similar quiet waters, Δh may not be considered.

(B) External loads

(a) Hydrostatic test condition

The water pressure at the bottom and sides under the condition of hydraulic pressure test is to be the hydrostatic pressure corresponding to a draught equal to 1/3 of the designed maximum load draught. (9)

(b) Navigating condition

(i) The water heads (m) of outer bottom and side shell are to apply as specified in **1.** (9).

(ii) In case where cargo oil tanks are empty under the navigation condition and the wave induced load assumes wave crests, deck loads are to be taken into account. Deck loads in this case are to be of values given by the following formula referred to as deck girders(see **Ch 10, Table 3.10.1** of the Rules).

$$h = a(bf - y) \quad \text{(kN/m}^2\text{)}$$

where :

α = 2.25 (In case of longitudinal deck girders outside the line of hatchway opening of the strength deck for midship part) or 3.45 (In case of the other deck girders)

b = 1.0

f = as given in the following table

Ship Length	f
$L <$ 150 m	$\frac{L}{10}e^{-\frac{L}{300}} + \left(\frac{L}{150}\right)^2 - 1.0$
150 m $\leq L <$ 300 m	$\frac{L}{10}e^{-\frac{L}{300}}$
300 m $\leq L$	11.03

y = vertical distance from the load line to weather deck at side (m).

(C) Loading condition

Table 20 to **24** gives the standard load cases which are to be considered in the assessment.

(5) Allowable stress

Allowable stress for the modelling by using shell elements are shown in **Table 25.**

(6) Deflection of transverses

In case where the results of the hold analysis show that relative deformations on transverses and vertical web supporting longitudinals, longitudinal beams or bulkhead stiffeners or between bulkheads are large, the added stress due to their effects is to be considered by detail analysis.

(7) Buckling Strength

Buckling strength assessment to be carried out in accordance with **Par. 2.**

(8) Fatigue strength

Fatigue strength assessment may be carried out in accordance with **Annex 3-3 "Guidance for the Fatigue Strength Assessment of Ship Structures".**

Table 20 Load case of two or three rows of longitudinal bulkhead

Load Case	Case	External load		Internal load	
		Static	Wave induced load	Caro oil tank	Ballast tank
Hydrostatic test condition	T-1	$1/3\ d_s$ 1)	-	D+2.4 m	-

Table 25 Allowable stress for plate structure

	Structural members considered		σ_l	σ_t, σ_v	σ_e
primary members in double hull structure	Longitudinal strength members	Shell plating, Longitudinal bulkhead	$135/K-35f$ max. $125/K$	$145/K$	$145/K$
		Girder, stringers		–	$175/K$
	Floor, transverse			–	$175/K$

1. σ_e is as follows

horizontal longitudinal strength member :

$$\sigma_e = \sqrt{\sigma_l^2 - \sigma_l \sigma_t + \sigma_t^2 + 3\tau^2}$$

vertical longitudinal strength member :

$$\sigma_e = \sqrt{\sigma_l^2 - \sigma_l \sigma_v + \sigma_v^2 + 3\tau^2}$$

transverse strength member :

$$\sigma_e = \sqrt{\sigma_v^2 - \sigma_v \sigma_t + \sigma_t^2 + 3\tau^2}$$

σ_l : normal stress in lengthwise direction
σ_t : normal stress in breadthwise direction
σ_v : normal stress in depthwise direction
τ : shearing stress

2. Openings in floors and girders, if any, are to be taken into consideration in evaluating the stresses.
3. The point of detecting stress is to be the center of the element.
4. f is to be 0 at the position of the horizontal neutral axis of the cross sectional area of hull, f_D on upper deck, and f_B on bottom shell plating, and to be determined by linear interpolation according to height from the neutral axis.

Structural members considered			σ_a	$\sigma_e(F)$
Primary members outside double hull structure	Face plate	Parallel part	$175/K$	–
		Corners	$195/K$	–
	Web plate	Parallel part	–	$175/K$
		Corners	–	$195/K$

1. σ_a : normal stress of face plate
2. σ_e is as follows

$$\sigma_e = \sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3\tau^2}$$

σ_x : normal stress in x-direction of element coordinate system
σ_y : normal stress in y-direction of element coordinate system
τ : shearing stress on the x face in $y$direction of element coordinate system

3. The point of detecting stress is to be the center of the element.

5. Container ship

(1) General

(A) In case where scantlings of structural members of cargo hold in container ship are determined by the hold analysis, necessary documents and data on the calculation method are to be submitted to the Society for obtaining approval beforehand.

(B) Except for those specifically provided for in this part, **Par 1.** is to be applied.

(2) Structural modeling

(A) Model extent

The extent of finite element model is to include four 40 ft container bays (2-holds length) located at amidship. The model is to represent the full depth of the ship and the half breadth. However if there is asymmetry about the ship's centerline for the primary structure and cargo loading, then full breadth model need to be represented. (see **Fig 19**)

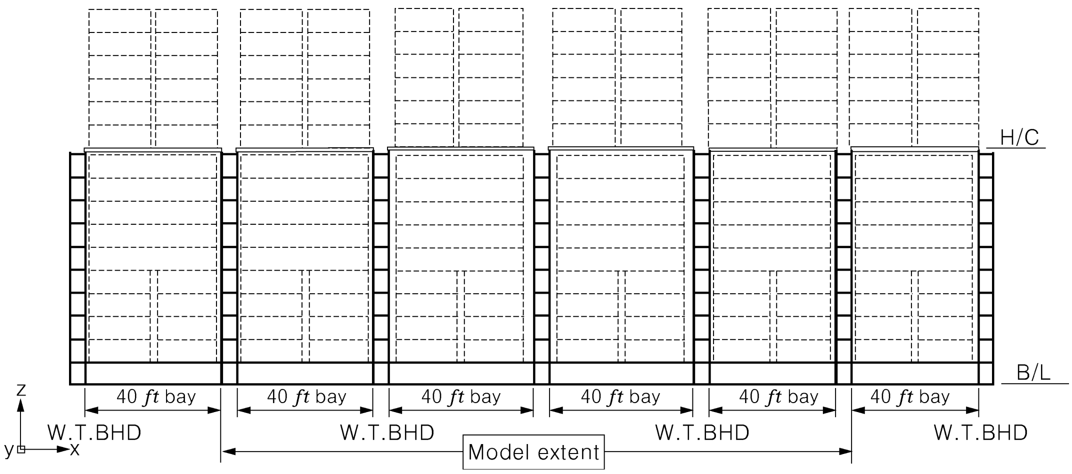

Fig 19 Model extent

(B) Structural modelling

The structural modelling with shell element mesh is : longitudinally two or more elements between every web frame, transversely one element between longitudinal spacing and vertically three or more elements over the depth of double bottom girders and floors. Typical arrangements representing container ship are shown in **Fig 20** to **23.**

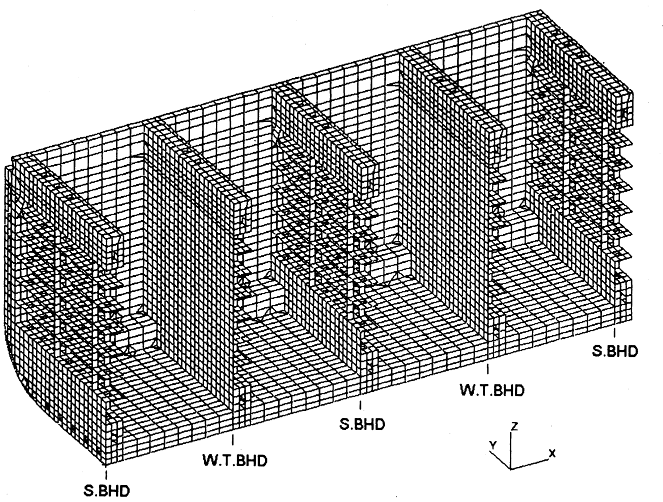

Fig 20 Hold model

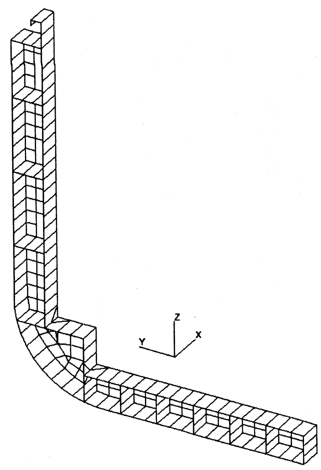

Fig 21 Web frame model

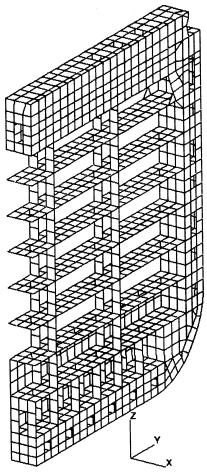

Fig 22 Support BHD model

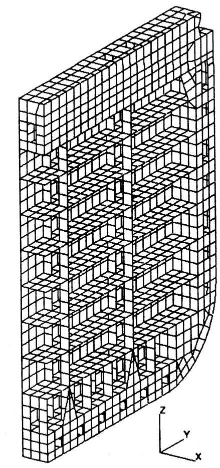

Fig 23 W.T.BHD. model

(3) Boundary condition
The boundary conditions described in this section are to be applied to the analysis model for symmetric load case, as shown in **Fig 24** and **Table 26**

- End planes (①) : symmetric condition
- Centerline plane (②) : symmetric condition
- Vertical counter forces distributed to the side shell nodes at the oil tight BHDs to eliminate reactions at the vertical constraints.(③)

Table 26 Boundary conditions (Symmetric)

Position \ Coord.	Displacement			Rotation		
	U_x	U_y	U_z	θ_x	θ_y	θ_z
① Both ends of the model	1	0	0	0	1	1
② Centerline plane	0	1	0	1	0	1
③ Top of side shell at the oil tight bulkheads P	0	0	1	0	0	0
(Notes) 1 : Fixed 0 : Free						

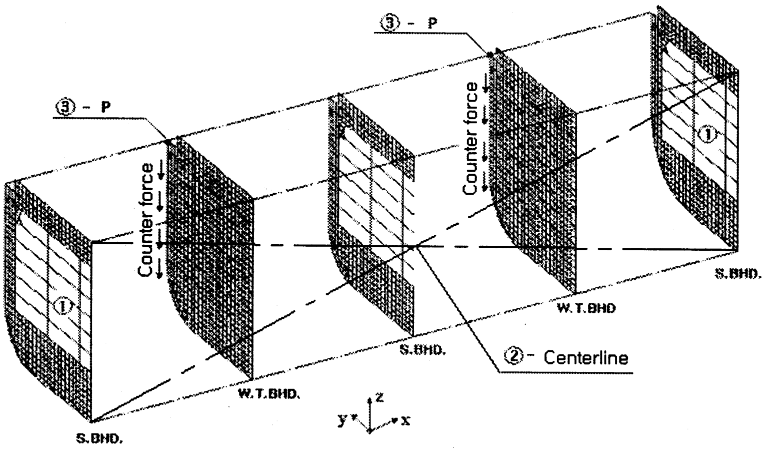

Fig 24 Boundary conditions (Symmetric)

The boundary conditions described in this section are to be applied to the analysis model for asymmetric load case, as shown in **Fig 25** and **Table 27.**

- Both ends of the model (①) : symmetric condition
- Connection line of bottom shell and watertight bulkhead to be restrained in horizontal displacement (②)
- Connection line of side shell and watertight bulkhead to be restrained in vertical displacement(③)

Table 27 Boundary conditions (Asymmetric)

Position \ Coord.	Displacement			Rotation		
	U_x	U_y	U_z	θ_x	θ_y	θ_z
① Both ends of the model	1	0	0	0	1	1
② Line L	0	1	0	0	0	0
③ Line S	0	0	1	0	0	0
(Notes) 1 : Fixed 0 : Free						

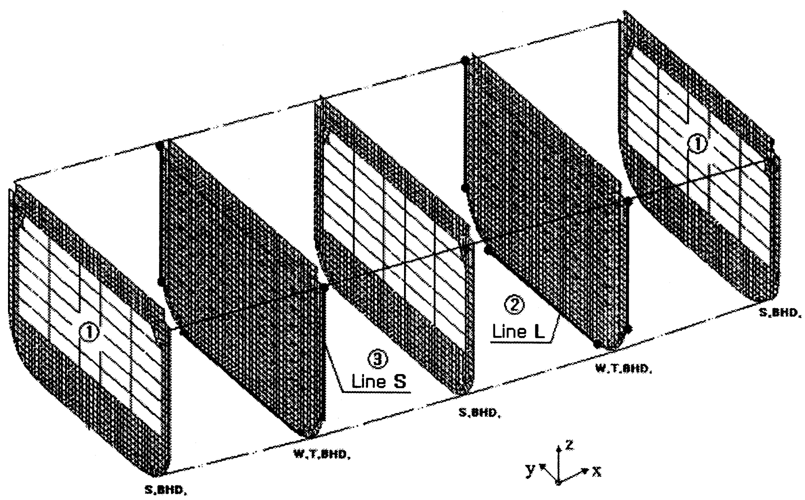

Fig 25 Boundary conditions (Asymmetric)

(4) Load

(A) Applied load

The following load components are be considered : container load, hydrostatic pressure, wave loads and ballast loads etc..

(a) Container load

(i) Container loads according to design load are to be applied as point loads to the hull structure grid points nearest to the base of the container stacks. On hatch cover container stack load should be considered properly in account for actual force transfer to hull structure through girder system of hatch cover and support arrangement on hatch coaming.

(ii) According to the load case, acceleration components due to ship motion are to be considered. The formulas of acceleration factors are to be applied in accordance with the method deemed appropriate by the Society.

(b) Still water load

Still water load is to apply as specified in **1.** (8)

(c) Wave induced load

Wave induced load is to apply s specified in **1.** (9)

(d) Ballast load

Ballast load is to apply as specified in **1.** (7)

(B) Loading conditions

Table 28 and **Table 29** gives the standard load cases which are to be considered in the assessment.

(a) One bay empty condition (F-1)

(i) One 40 ft bay to be empty of containers. The remaining bays and hatch covers over to be filled with 20 ft containers.

(ii) The external pressure is to be taken scantling draft and wave induced loads corresponding to the wave crest.

(b) One bay empty condition (F-2)

(i) One 40 ft bay to be empty of containers. The remaining bays to be filled with 40 ft containers and hatch covers over to be filled with 20 ft containers.

(ii) The external pressure is to be taken scantling draft and wave induced loads corresponding to the wave crest.

(c) One bay empty condition (F-3)

(i) One 40 ft bay and hatch covers over to be empty of containers. The remaining bays to be filled with 40 ft containers and hatch covers over to be filled with 20 ft containers.

(ii) The external pressure is to be taken scantling draft and wave induced loads corresponding to the wave crest.

(d) Homogeneous loading condition (F-4)

(i) All container bays in hold and hatch covers over to be filled with 20 ft containers.

(ii) The external pressure is to be taken scantling draft and wave induced loads corresponding to the wave trough.

(e) Heeled condition (H-1)

(i) All container bays in hold and hatch covers over to be filled with 20 ft containers. External sea pressure in the heeling condition are to be taken at the moment of freeboard deck immersion and no wave induced load to be applied.

(ii) Transverse loads caused by ship acceleration are to be calculated by the method deemed appropriate by the Society.

(f) Heeled condition (H-2)

(i) All container bays in hold to be filled with 40 ft containers and hatch covers over to be filled with 20 ft containers. External sea pressure in the heeling condition are to be taken at the moment of freeboard deck immersion and no wave induced load to be applied.

(ii) Transverse loads caused by ship acceleration are to be calculated by the method deemed appropriate by the Society.

(g) Surge loading condition (S-1)

(i) All container bays in hold to be filled with 40 ft containers and hatch covers over to be filled with 20 ft containers. The external pressure is to be taken scantling draft and wave induced loads corresponding to the wave crest.

(ii) The container loads to be considered longitudinal acceleration factor due to ship motion. The longitudinal force acting on containers within hold is to be calculated at the center of each container and is to be suitably distributed to the bulkhead primary members in way of the cell guides. The longitudinal force action on containers on hatch covers is to be calculated at the midheight of the stack. The following assumptions are to be made:
- · Wind load may be neglected
- · The moment about the stack base caused by the longitudinal force may be ignored
- · Container load of hatch cover over to be applied properly on the hatch coming.

(h) Flooded condition (A-1)

(i) This loading case is to ensure that the structural integrity of the transverse watertight bulkhead and stringers when the container hold is flooded as a result of collision or other accidental occurrence.

(ii) The external pressure may be taken at a draught equal to the scantling draught and internal pressure in damaged hold may be taken at a draught equal to 90 % of freeboard deck level.

Table 28 Load cases

Load case description	Case	External load		Container load			
		Still water load	Wave induced load	Cargo hold		Hatch cover over	
One bay empty condition	F-1	d_s[1]	W_C[2]	empty bay	-	empty bay above	20 ft
				other bays	20 ft	other covers	20 ft
	F-2	d_s[1]	W_C[2]	empty bay	-	empty bay	20 ft
				other bays	40 ft	other bays	20 ft
	F-3	d_s[1]	W_C[2]	empty bay	-	empty bay	-
				other bays	40 ft	other bays	20 ft
Homogeneous loading condition	F-4	d_s[1]	W_T[3]	all bays	20 ft	all covers	20 ft
Heeled condition	H-1	[4]	-	all bays	40 ft	all covers	20 ft
	H-2	[4]	-	all bays	20 ft	all covers	20 ft
Surge loading condition	S-1	d_s[1]	W_C[2]	all bays	40 ft	all covers	20 ft
Flooded condition	A-1	d_s[1]	-	flooded hold	-	all covers	20 ft
				non-flooded hold	20 ft		

Notes :
1) d_s : scantling draught
2) W_C : wave induced load for wave crest
3) W_T : wave induced load for wave trough
4) Draft at the moment of freeboard deck immersion

Table 29 Load case

Load case		Loading pattern	Center tank
One bay empty condition	F-1			F-2			F-3		Homogeneous loading condition	F-4		Heeld condition	H-1			H-2		Surge loading condition	S-1		
Table 29 Load case (continued)

Load case		Loading pattern	Center tank
Flooded condition	A-1		
(5) Allowable stress
Allowable stress for the modelling by using shell elements are shown in **Table 30.** But, The stresses resulting from Load case A-1 are given in **Table 31.**
(6) Buckling strength calculation
Buckling strength assessment to be carried out in accordance with **2.** However, For LCA-1, buckling safety factor to be applied 1.0.

Table 30 Allowable stress

Structural member considered \ Stress	σ_l	σ_t , σ_v	σ_e	τ
Bottom shell, Inner bottom	$110/K$	$145/K$	$145/K$	-
Longitudinal bulkhead, Side shell	-	$145/K$	-	$83/K$
Girder	-	-	$175/K$	$83/K$
Stringer	$110/K$	-	$175/K$	$83/K$
Water tight bulkhead	-	$145/K$	$175/K$	-
Transverse web frame, floor	-	-	$175/K$	-

(Notes)
1. The equivalent stress σ_e is to be as follows.

$$\sigma_e = \sqrt{\sigma_l^2 - \sigma_l \cdot \sigma_t + \sigma_t^2 + 3\tau^2}$$ (for longitudinal strength members)

$$\sigma_e = \sqrt{\sigma_v^2 - \sigma_v \cdot \sigma_t + \sigma_t^2 + 3\tau^2}$$ (for transverse strength members)

σ_l : normal stress in lengthwise direction
σ_t : normal stress in breadthwise direction
σ_v : normal stress in depthwise direction
τ : shear stress
2. Opening in floors and girders, if any, are to be taken into consideration in evaluating the stresses.
3. The point detection stress is to the center of the element.

Table 31 Allowable stress (A-1)

Structural members considered	Steel grades	σ_v	τ
Trans. water tight bulkhead, side transverse web frame, stringer and girder	*A*, *B*, *D* and *E*	235	136
	AH 32, *DH* 32 and *EH* 32	315	182
	AH 36, *DH* 36 and *EH* 36	355	205

Annex 3-3 Guidance for the Fatigue Strength Assessment of Ship Structures

1. General

(1) This Annex is the Guidance which assesses the fatigue strength of a ship structure. This guidance provides a guideline for a simplified fatigue analysis method and a direct fatigue analysis method (See **Fig 1**)

(2) The ships, which are contracted for construction on or after 1 April 2006 and are to be complied with Rule **Pt 11** or **Pt 12,** are to meet all the requirements of the corresponding parts. For other ships deemed necessary by the Society in consideration of the ship's kind, size and configuration, the requirements in this Annex are to be applied.

(3) For ships which were checked based on the above fatigue analysis method, following class notation are assigned.

(A) The method of simplified fatigue analysis

(a) The method using stress concentration factor of Annex 3-3 2 (3) : **SeaTrust(FSA1)**

(b) The method using FEM of Annex 3-3 2 (2) : **SeaTrust(FSA2)**

(B) The method of direct fatigue analysis : **SeaTrust(FSA3)**

(4) In case of special purpose ships, new type of ships or ships requiring more precise fatigue strength assessment, the direct fatigue analysis method is to be applied to assess the fatigue strength. A spectral fatigue analysis method or a transfer function method may apply to the direct fatigue analysis.

(5) Other equivalent methods may be applied to assess the fatigue strength when deemed appropriate by the Society.

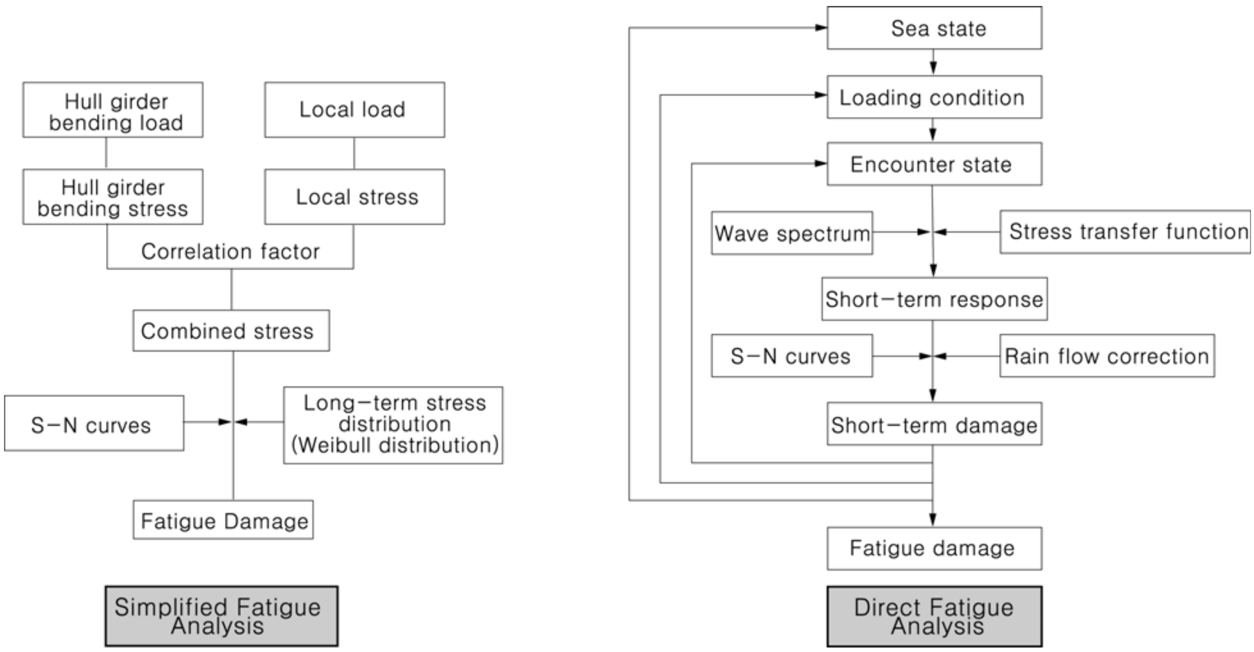

Fig 1 Fatigue analysis method

2. Stress analysis

In the fatigue analysis, three kinds of stresses; i. e. the nominal stress, the hot spot stress and notch stress can be used. The hot spot stress approach is to be employed in this Guidance.

(1) Definition of stress

(A) Nominal stress

The Nominal stress is global stress calculated in a sectional area, disregarding the local stress-raising effects of the structural discontinuities, weld bead shape, etc.

(B) Hot spot stress

(a) The hot spot stress includes all stress-raising effects by a structural discontinuity. It does not include the stress peak effect caused by the local notch and the weld bead shape. The hot spot stress in plate structure is divided into the membrane stress and the bending stress. It is linearly distributed in thicknesswise. In general, hot spot stress is greater than the nominal stress, but hot spot stress is equal to nominal stress at the position far enough from the discontinuity of structures.

(b) For the calculation of the hot spot stress, the three dimensional finite element analysis is to be performed. Then, it can be determined by extrapolating maximum principal stresses outside the region affected by the weld geometry. The stress range near welding toe is to be used consistently depending on the effect by type and size of the finite element.

(C) Notch stress

Hot spot region is the location where occurs a fatigue crack as the welding toe. The total stress at the location is defined as the notch stress.

(D) Edge stress

Edge stress on plate members includes the nominal stress of the plates and stress-raising effects on the edge of plates. It is calculated by using the finite element method.

(2) Finite element analysis

The finite element model of the structure is to consist of shell elements. At the hot spot region, the 4-noded quadrilateral shell elements of the size $t \times t$ are used, where t is the plate thickness. The weld bead is not included in the finite element model. In order to determine the surface stress distribution of the shell element, fictitious beams without stiffness are put on the connection line of shell element. In the structural analysis, FE models are to be based on as built scantlings and the beam element stresses are calculated taking account of shear flexibility.

(A) Calculation of hot spot stress

The hot spot stress is to be calculated by means of the surface stress distribution from the FE analysis. The hot spot stress approach at weld toe in accordance with the connection types is shown in **Fig 2.** In order to eliminate the notch effect and to consider the weld leg length, the hot spot stress at the weld toe is obtained by a linear extrapolation of the stresses determined at the locations $0.5t$ and $1.5t$ from the weld toe.

$$\sigma_{hot} = \frac{3\sigma(0.5t) - \sigma(1.5t)}{2}$$

$\sigma(x)$: Using the Lagrange interpolation method, the stress at a location x from the weld toe is to be generally calculated as follows

$$\sigma(x) = c_1(x)\sigma_1 + c_2(x)\sigma_2 + c_3(x)\sigma_3 + c_4(x)\sigma_4$$

$$c_1(x) = \frac{(x-x_2)(x-x_3)(x-x_4)}{(x_1-x_2)(x_1-x_3)(x_1-x_4)}$$

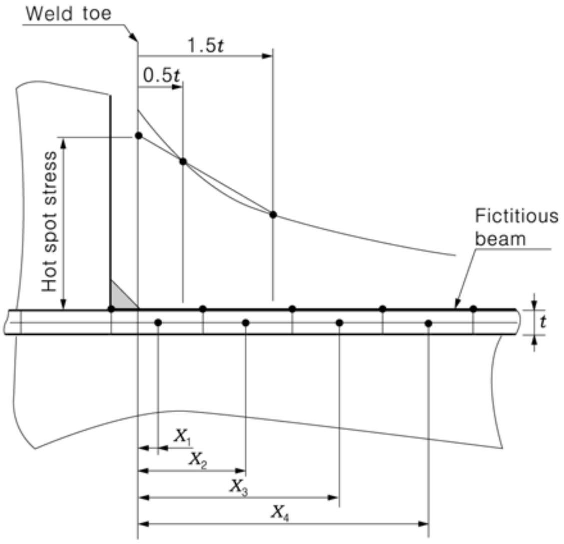
$$c_2(x) = \frac{(x-x_1)(x-x_3)(x-x_4)}{(x_2-x_1)(x_2-x_3)(x_2-x_4)}$$

$$c_3(x) = \frac{(x-x_1)(x-x_2)(x-x_4)}{(x_3-x_1)(x_3-x_2)(x_3-x_4)}$$

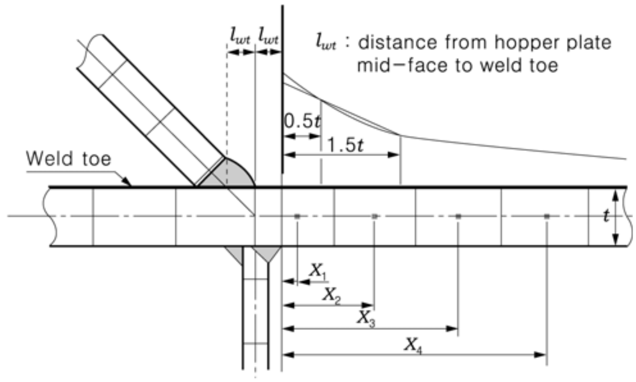
$$c_4(x) = \frac{(x-x_1)(x-x_2)(x-x_3)}{(x_4-x_1)(x_4-x_2)(x_4-x_3)}$$

(B) Calculation of edge stress

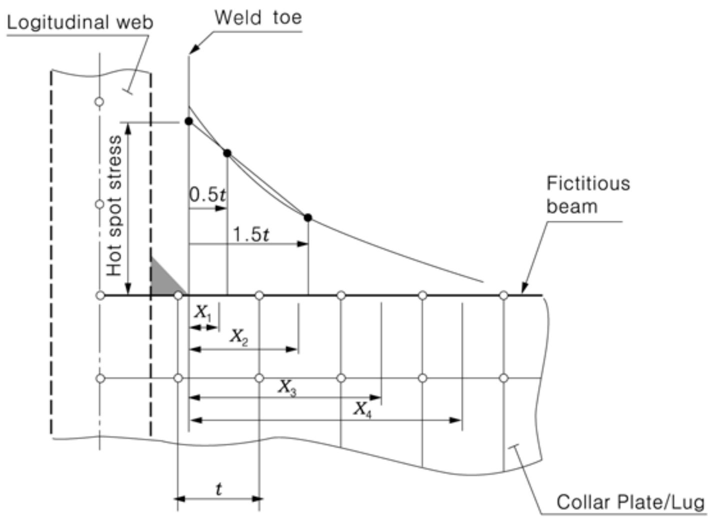
The FE model of the plate structure is to consist of 4-noded quadrilateral shell elements of size $t \times t$ in the vicinity of the edge, where t is the plate thickness. In order to calculate the edge stress, fictitious beams without stiffness are put on the edge of the plate. In the structural analysis, the edge stresses are obtained from these beam element stresses.



(a) Connection of longitudinal and transverse stiffener (or BKT)



(b) Bilge Knuckle Part



(c) Connection of longitudinal and collar plate (or lug)

Fig 2 Determination of hot spot stress

(3) Stress concentration factor

(A) The stress concentration factor is defined as the ratio of the hot spot stress σ_{hot} to the nominal stress σ_{nom}. In the weld connection of the longitudinal and transverse (or trans. BHD) stiffeners, the hot spot stress may be calculated using the stress concentration factors $K_{s,l}$, $K_{s,a}$ in **Table 1** as follow:

$$\sigma_{hot,l} = K_{s,l}\,\sigma_{nom,l}$$

$$\sigma_{hot,g} = K_{s,a}\,\sigma_{nom,g}$$

where,

$K_{s,l}$ = the stress concentration factor by lateral load

$K_{s,a}$ = the stress concentration factor by axial load

$\sigma_{nom,l}$ = nominal stress as specified in **Par 4** (2) (A) (b)

$\sigma_{nom,g}$ = nominal stress as specified in **Par 4** (2) (A) (a) (iii)

(B) For end structures of longitudinals, the stress concentration factor due to relative deflection is considered to be the same value as the stress concentration factor due to lateral load.

Table 1 Stress concentration factors $K_{s,l}$ and $K_{s,a}$

No	Model		$K_{s,l}$		$K_{s,a}$	
			Point A	Point B	Point A	Point B
LF-1		Single hull	1.71	0.87	1.37	1.27
		Double hull	1.54	1.11	1.35	1.29
LF-2		Single hull	0.75	1.42	1.31	1.48
		Double hull	0.74	1.47	1.31	1.48
LF-3		Single hull	1.03	0.98	1.51	1.52
		Double hull	0.98	1.04	1.51	1.52
LF-4		Single hull	1.75	0.69	1.40	1.42
		Double hull	1.65	0.79	1.40	1.42
LF-5		Single hull	0.78	0.81	1.40	1.34
		Double hull	0.74	0.85	1.40	1.34
LF-0			1.20	1.20	1.20	1.20

No	Model		$K_{s,l}$		$K_{s,a}$	
			Point A	Point B	Point A	Point B
Mod. LF-1		Single hull	1.72	0.90	1.34	1.28
		Double hull	1.53	1.15	1.36	1.30
Mod. LF-4		Single hull	1.75	0.69	1.45	1.36
		Double hull	1.63	0.79	1.44	1.38
LB-1		Single hull	1.72	0.23	1.49	1.45
LB-2		Single hull	1.70	0.09	1.49	1.22
LB-3		Single hull	0.56	0.31	1.12	1.08

3. Fatigue life assessment

(1) Hot spot stress approach

It is not easy to calculate the nominal stresses nor to select the corresponding S-N curves for complex ship structure. Therefore, for the fatigue strength assessment of a ship structure, the hot spot stress by geometrical discontinuity of the structure is to be calculated using the finite element method or the stress concentration factors. The S-N curve which is not including the stress concentration effect is to be applied the hot spot stress approach. In this case, only the structural geometry effects are accounted for, while local notch effects like the weld geometry are considered to be implicitly included in the S-N curve.

(2) Design S-N curve

(A) In order to assess the fatigue strength of ship structure, S-N curves as shown in **Fig 3** are to be used where D curve is to be used for welded structures, C curve for the edge of plate and B curve for the grounded edge of plate.

(B) The design S-N curves are defined as the mean(the curves of (A) above) minus two standard deviations and thus correspond to survival probability of 97.6 %. The slopes of these curves are changed beyond $N=10^7$ cycles considering Haibach effect. (see **Fig 3**)

$$\log N = \log c - m log \sigma \quad \text{for } N \le 10^7$$
$$\log N = \log c' - m' \log \sigma \quad \text{for } N > 10^7$$

where,

$\log c$ and $\log c'$ = the life intercepts of the S-N curve (See **Table 2**)

m and m' = the negative inverse slopes of the S-N curve (See **Table 2**)

Table 2 Value of $\log c, \log c'$ and m, m'

curves	$N \le 10^7$		$N > 10^7$	
	$\log c$	m	$\log c'$	m'
B	15.006	4.0	17.006	5.0
C	13.626	3.5	16.466	5.0
D	12.182	3.0	15.625	5.0

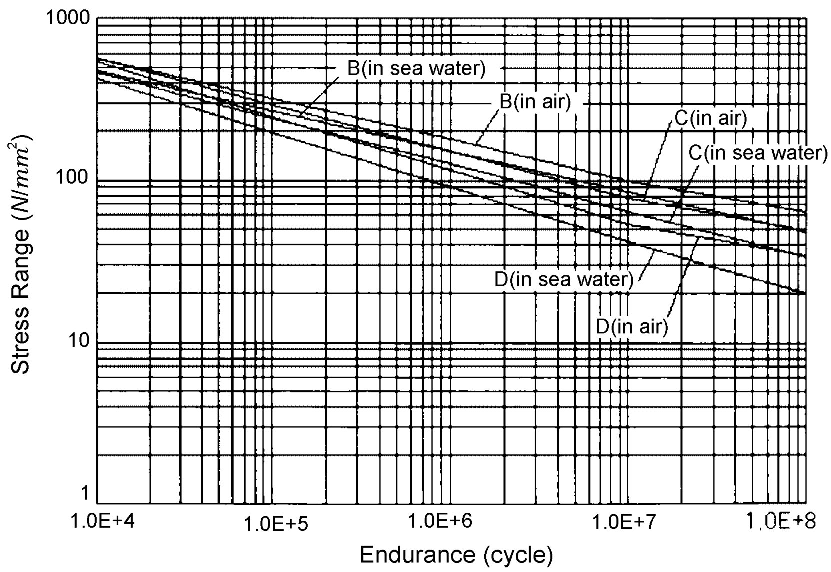


Fig 3 Design S-N curve[*1]

[*1] "Basic Design" S-N Curves for Non-nodal Joint" given in "Offshore Installation; Guidance on Design, Construction and Certification, Sec. 21, 4th ed. London January, U.K Department of Energy"

(C) Corrosion effect

For unprotected joints exposed to sea water, the design S-N curve is to be modified with half life time of S-N curve in air. However, no slope change is incorporated in the S-N curve at 10^7 cycles:

$$\log N = \log c_1 - m \log \sigma$$

where,

$\log c_1 = \log c - \log 2$, the values of $\log c$ and m are to be as given in **Table 2.** However, in case that the hull structure members in ballast tanks are protected against the corrosion by effective means, the design S-N curve in air is to be applied for the first half of the design life and the free-corrosion S-N curve for the remainder of the design life. In calculation, the stresses are determined with as-built scantlings.

(D) Mean stress effect

(a) Since most fatigue tests are conducted under pulsating tension loading, the effect of mean tensile stresses, which tend to reduce the fatigue life, is accounted for in the S-N curves. The beneficial effect of compressive stresses is to be considered when these S-N curves are used for the fatigue strength assessment.

(b) The correction of stress range with the consideration of mean stress effect is to follow **Annex C 1.4.5.11.** of Rule **Pt 12**.

(3) Calculation of fatigue life

According to the Miner-Palmgren linear cumulative damage rule, the fatigue damage ratio D is calculated. The fatigue life is given by L/D (years) where L is design life (years).

4. Simplified fatigue analysis

For the fatigue strength assessment of longitudinals, the simplified fatigue analysis is to be applied and the hull girder bending load and the local load are taken into account in this analysis. The former accounts for the vertical wave bending moment and the horizontal wave bending moment, and the latter for the wave load. In this guidance, the loads are determined at the probability level of exceedance 10^{-4}.

(1) Fatigue design load

(A) Hull girder bending load

(a) Vertical wave induced bending moment

The vertical wave induced bending moments are obtained from the following formulae.

$$M_w(+) = 0.19 f C_1 C_2 L^2 B C_b \quad \text{(kN-m)}$$

$$M_w(-) = -0.11 f C_1 C_2 L^2 B (C_b + 0.7) \quad \text{(kN-m)}$$

where,

f = factor to transform the load from 10^{-8} to 10^{-4} probability level, and to be calculated as follows.

$$f = 0.5^{1/\xi}$$

ξ = Weibull shape parameter as specified in **Par 4** (2) (B) (b).

C_b = the block coefficient. However, it is to be taken as 0.6, where it is less than 0.6.

C_1 = wave coefficient as specified in **Ch 3, 201. Table 3.3.1** of the Rules

C_2 = distribution factor as presented respectively in **Ch 3, 201. Tables 3.3.1** of the Rules.

(b) Horizontal wave induced bending moment

The horizontal wave bending moment is obtained from the following formula:

$M_H = 0.18 f C_1 C_H L^2 d (C_b + 0.7)$ (kN-m)

where,
f = factor as specified in (a)
C_1 and C_b = as specified in (a)
C_H = as specified in **Pt 7, Ch 4, 202.** of the Guidance

(B) Local wave load
(a) Local wave pressure
The wave pressure on the ship's side is to be taken as follows:

(i) For the load point on and above the waterline:

$$p_T = p_T^f K_1 \left(1 - \frac{h}{a_w}\right) \quad (\text{kN/m}^2)$$

(ii) For the load point below the waterline:

$$p_T = p_T^f K_1 \left(1 - \frac{K_2 h}{d}\right) \quad (\text{kN/m}^2)$$

where,
$p_T^f = 0.095L + 34.0$ (kN/m^2)
K_1 = Coefficient as specified in the following formulae

for 0.4L amidships = 1.0
afterward of AP = 1.5
forward of FP = $\dfrac{5.5(0.85 - C_b)}{1 - C_b^2} + 2.0$
For intermediate longitudinal positions, K_1 is to be obtained by interpolation.

K_2 = Coefficient as specified in the following formulae
for 0.4L amidships = 0.5
at the ends of ship = 1.0
For intermediate longitudinal positions, K_2 is to be obtained by interpolation.

a_w = as specified in (b)
h = vertical distance from the waterline to the load point
C_b = block coefficient. Where, however, when C_b exceeds 0.85, C_b is to be taken as 0.85.

(b) Local wave pressure range
The local wave pressure range P_d is to be calculated as follows. (See **Fig 4**)

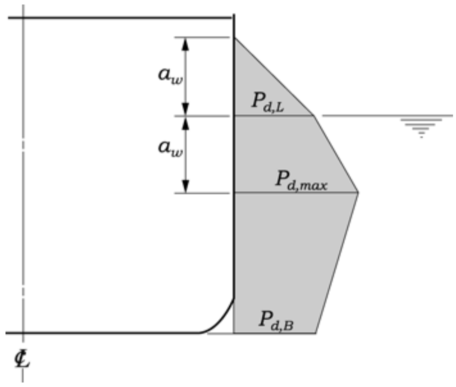

Fig 4 Local wave pressure range p_d

(i) For the load point on and above the waterline:

$$p_d = p_T^f K_1 \left(1 - \frac{h}{a_w}\right) \quad (\text{kN/m}^2)$$

(ii) For the load point between the waterline and $p_{d,\max}$:

$$p_d = 10h + p_T^f K_1 \left(1 - \frac{K_2 h}{d}\right) \quad (\text{kN/m}^2)$$

(iii) For the load point on and below $p_{d,\max}$:

$$p_d = 2 p_T^f K_1 \left(1 - \frac{K_2 h}{d}\right) \quad (\text{kN/m}^2)$$

a_w : the vertical distance from the waterline to the point of the maximum pressure range, $p_{d,\max}$, given as:

$$a_w = \frac{1}{\dfrac{1}{2d} + \dfrac{10}{p_T^f}}$$

(C) Internal pressure loads due to ship motion

(a) Dynamic internal pressure loads

The dynamic internal pressure, p_i in kN/m^2, from liquid cargo or ballast water is not to be less than that obtained from the following formulas, which is the greater:

$$p_i = 2f\rho_c a_v h_s \quad (\text{kN/m}^2)$$
$$p_i = 2f\rho_c a_t |y_s| \quad (\text{kN/m}^2)$$

f = as specified in (A) (a) above

ρ_c = density of liquid cargo and density of sea water, 1.025

h_s = vertical distance from point considered to surface inside tank (m)

y_s = horizontal distance from center of free surface of liquid in tank to point considered (m)

a_v or a_t = accelerations in vertical or horizontal direction as specified in (b) (vi)

(b) Accelerations due to ship motion

(i) Acceleration due to heave motion

The acceleration due to heave motion of a ship is given by the following formula.

$$a_z = \frac{V^{1.2}}{2\sqrt{L}} + \frac{361}{L} + 0.49 \quad (\text{m/sec}^2)$$

V : ship design speed (knots)

(ii) Accelerations due to sway motion

The acceleration due to sway motion of a ship is given by the following formula.

$$a_y = \frac{178}{L} + 0.36 \quad (\text{m/sec}^2)$$

(iii) Accelerations due to pitch motion

The acceleration due to pitch motion is given by the following formula.

$$a_\theta = \theta \times \left(\frac{2\pi}{T_\theta}\right)^2 \times l_\theta \quad (\text{m/sec}^2)$$

θ = maximum pitch angle (single amplitude) given by the following formula

$$\theta = \frac{19.62}{L} + 0.022 \quad (\text{rad})$$

T_θ = period of pitch given by the following formula

$$T_\theta = 1.86\sqrt{\frac{L}{g}} \quad (\text{sec})$$

l_θ = distance from axis of rotation for pitching to center of tank/mass (m), and the axis of rotation may be taken as the smaller of $(D/4 + d/2)$ and $D/2$ above the base line at 0.45L from A.P.

(iv) Accelerations due to roll motion

The acceleration due to roll motion is given by the following formula.

$$a_\phi = \phi \times \left(\frac{2\pi}{T_\phi}\right)^2 \times l_\phi \quad (\text{m/sec}^2)$$

ϕ = maximum roll angle (single amplitude) given by the following formula

$$\phi = kC_s f_0 \sqrt{0.131 - 0.005\,T_\phi} \quad (\text{rad})$$

k = 1.0 for ships without bilge keel
= 0.8 for ships with bilge keel (including ships with anti-rolling tank)
C_s = 0.82 for bulk carriers and tankers
= 0.96 in generals
f_0 = values obtained from the following formula.

$$f_0 = 0.86 + 2.72C_b - (B/d) \times (0.11 + 0.34C_b)$$

Where C_b is under 0.45, C_b is to be taken as 0.45, and where C_b is 0.7 and over, C_b is to be taken as 0.7. And where B/d is under 2.4, B/d is to be taken as 2.4, and where B/d is 3.5 and over, B/d is to be taken as 3.5.

T_ϕ = period of roll given by the following formula.

$$T_\phi = \frac{4C_f B}{\sqrt{GM_T}} \quad \text{(sec)}$$

Where T_ϕ is under 6.0, T_ϕ is to be taken as 6.0, and where T_ϕ is 20.0 and over, T_ϕ is to be taken as 20.0.

C_f = values obtained from the following formula.

$$C_f = 0.373 - 0.023(B/d) - 0.043(L/100)$$

Where B/d is under 2.4, B/d is to be taken as 2.4, and where B/d is 3.5 and over, B/d is to be taken as 3.5.

GM_T = metacentric height (m). Where, however, the values of the GM_T have not been calculated for relevant loading condition, the following approximate values may be used:

$0.07B$ in general
$0.12B$ for single skin tankers, bulk carriers and fully loaded double hull tankers
$0.25B$ for bulk carriers in the ballast condition
$0.33B$ for double hull tankers in the ballast condition

l_ϕ = distance from axis of rotation for rolling to center of tank/mass (m), and the axis of rotation may be taken as the smaller of $(D/4 + d/2)$ and $D/2$ above the base line at 0.45L from A.P.

(v) Accelerations due to yawing
The acceleration due to yawing is given by the following formula.

$$a_{\psi} = \left(\frac{6.95}{L} - 0.017\right) l_{\psi} \quad (\text{m/sec}^2)$$

l_{ψ} = distance from axis of rotation for yawing to center of tank/mass (m), and the axis of rotation may be taken as stipulated in (iii).

(vi) Combined accelerations

① Combined vertical acceleration

$$a_v = \sqrt{a_z^2 + a_{\phi z}^2 + a_{\theta z}^2} \quad (\text{m/sec}^2)$$

a_z = as specified in (i)

$a_{\phi z}$ = vertical component of roll acceleration given by the following formula

$$a_{\phi z} = \phi \left(\frac{2\pi}{T_{\phi}}\right)^2 l_{\phi y} \quad (\text{m/sec}^2)$$

ϕ and T_{ϕ} = as specified in (iv)

$l_{\phi y}$ = transverse distance from axis of rotation for rolling to center of tank/mass (m), and the axis of rotation may be taken as stipulated in (iii).

$a_{\theta z}$ = vertical component of pitch acceleration given by the following formula

$$a_{\theta z} = \theta \left(\frac{2\pi}{T_{\theta}}\right)^2 l_{\theta x} \quad (\text{m/sec}^2)$$

θ and T_{θ} = as specified in (iii)

$l_{\theta x}$ = longitudinal distance from axis of rotation for pitching to center of tank/mass (m), and the axis of rotation may be taken as stipulated in (iii).

② Combined horizontal acceleration

$$a_t = \sqrt{a_y^2 + a_{\phi y}^2 + a_{\psi y}^2} \quad (\text{m/sec}^2)$$

a_y = as specified in (ii)

$a_{\phi y}$ = horizontal component of roll acceleration given by the following formula

$$a_{\phi y} = \phi \left(\frac{2\pi}{T_{\phi}}\right)^2 l_{\phi z} \quad (\text{m/sec}^2)$$

ϕ and T_{ϕ} = as specified in (iv)

$l_{\phi z}$ = vertical distance from axis of rotation for rolling to center of tank/mass (m), and the axis of rotation may be taken as stipulated in (iii).

$a_{\psi y}$ = horizontal component of yaw acceleration given by the following formula

$$a_{\psi y} = \left(\frac{6.95}{L} - 0.017\right) l_{\psi x} \quad \text{(m/sec}^2\text{)}$$

$l_{\psi x}$ = longitudinal distance from axis of rotation for yawing to center of tank/mass (m), and the axis of rotation may be taken as stipulated in (iii).

(2) Stress calculation

(A) Nominal stress

(a) Nominal stress due to axial load

(i) The wave induced vertical hull girder bending stress range for the structural member is to be calculated as follows:

① For the structural member above the neutral axis:

$$\sigma_{nom,V} = \frac{M_w(+) - M_w(-)}{Z_D} \frac{z - z_{NA}}{D - z_{NA}} \times 10^3 \quad \text{(N/mm}^2\text{)}$$

② For the structural member below the neutral axis:

$$\sigma_{nom,V} = \frac{M_w(+) - M_w(-)}{Z_B} \frac{z_{NA} - z}{z_{NA}} \times 10^3 \quad \text{(N/mm}^2\text{)}$$

where,

Z_D = the section moduli at the strength deck about the horizontal neutral axis (cm^3)

Z_B = the section moduli at the bottom about the horizontal neutral axis (cm^3)

z = the vertical distances from the bottom to the structural member under consideration (m)

z_{NA} = the vertical distances from the bottom to the horizontal neutral axis (m)

(ii) The wave induced horizontal hull girder bending stress range for the structural member is calculated as follows:

$$\sigma_{nom,H} = \frac{2\,M_H}{Z_H} \frac{y}{B/2} \times 10^3 \quad \text{(N/mm}^2\text{)}$$

where,

Z_H = the section modulus at the ship's side about the ship's centerline (cm^3)

y = the horizontal distance from the ship's centerline to the structural member under consideration (m)

(iii) Hull girder wave bending stress range

The hull girder wave bending stress range is not to be less than that obtained from the following formula, whichever is the greater:

$$\sigma_{nom,g} = 0.5\,\sigma_{nom,V} + \sigma_{nom,H} \quad \text{(N/mm}^2\text{)}$$

$$\sigma_{nom,g} = \sigma_{nom,V} \quad (\text{N/mm}^2)$$

(b) Nominal stress due to lateral load
Nominal stress on the flange of a longitudinal, at the connection with a transverse web, can be analyzed by using a uniformly loaded beam with both ends fixed in consideration of the effective breadth of the shell plating. In addition, nominal stress is to account for the increased stress due to the asymmetrical section of the longitudinal. Then, the nominal stress on the flange of the longitudinal is defined as

$$\sigma_{nom,l} = \sqrt{\sigma_e^{\ 2} + \sigma_i^{\ 2} + 2\rho_c \sigma_e \sigma_i}$$

ρ_c = the correlation factor between the wave load and internal load, being taken as $\rho_c = -0.6$

σ_e = nominal stress due to external sea pressure load is determined according to the following formula.

$$\sigma_e = (1 + C_t)\frac{p_d S l^2}{12 Z_f} \times 10^3 \quad (\text{N/mm}^2)$$

σ_i = nominal stress due to liquid cargo or ballast water is determined according to the following formula.

$$\sigma_i = (1 + C_t)\frac{p_i S l^2}{12 Z_f} \times 10^3 \quad (\text{N/mm}^2)$$

p_d = wave pressure (N/mm^2) as specified in **Par 4** (1) (B) (b).

p_i = internal pressure load (kN/m^2) due to liquid cargo or ballast water as specified in **Par 4** (1) (C) (a).

S = spacing of longitudinal (m)

l = spacing of transverse web (m)

Z_f = section modulus of longitudinal (cm^3)

C_t = the stress increasing factor due to the asymmetrical section of a longitudinal is to be calculated as follows:

$$C_t = 1.68(0.38 + A_f/A_w)(e^2 + 0.28e)$$

$$e = \frac{b}{b_f}$$

A_f = flange area (cm^2)

A_w = web area (cm^2)

b = distance from the flange center to the web center (cm) (See **Fig 5**)

b_f = breadth of the flange (cm) (See **Fig 5**)

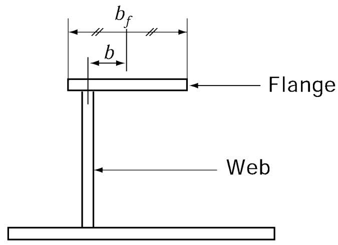

Fig 5 b **and** b_f

(c) Nominal stress due to relative deflection

(i) At the connection of a longitudinal to a transverse bulkhead, the additional bending stress, due to the relative deflection between the transverse bulkhead and the adjacent transverse web, is to be considered and defined as

$$\sigma_{nom,r} = \frac{6EI\delta}{Z_f l^2} \times 10^{-5} \quad (\text{N/mm}^2)$$

where,

δ = relative deflection between transverse bulkhead and transverse web (m)

I = moment of inertia of longitudinal (cm^4)

E = elastic modulus, 2.06×10^5 (N/mm^2) for steel.

Z_f = section modulus of longitudinal (cm^3)

l = spacing of transverse web (m)

The relative deflection between the transverse bulkhead and the transverse web can be determined by the three dimensional hold analysis. However, when the relative deflection is not known, the nominal stress due to the relative deflection is assumed to be 50% of the nominal stress due to the lateral load as follows:

$$\sigma_{nom,r} = 0.5\sigma_{nom,l}$$

Where the longitudinal is fitted with soft toe brackets on both sides of the transverse bulkhead, the additional bending stress due to the relative deflection may not be considered in the fatigue analysis.

(ii) In case of double side skin construction, nominal stress due to relative deflection may be calculated according to the Rule **Pt 12 Annex C 1.4.4.11.**

(B) Combined stress range

(a) The combined stress used to calculate the fatigue life of a ship structure is the hot spot stress, which is to be determined from multiplying the nominal stress in (A) above by stress concentration or FE analysis. The combined stress is to be complied with the following formulae as the combination of the stress component due to the local load, the hull girder bending load and the relative deflection.

$$\sigma_0 = f_E \times \max\begin{cases}\sigma_{hot,l} + \sigma_{hot,r} + 0.6\sigma_{hot,g} \\ 0.6(\sigma_{hot,l} + \sigma_{hot,r}) + \sigma_{hot,g}\end{cases}$$

where,

f_E : Reduction factor on derived combined stress range accounting for the long-term sailing routes of a ship, the following values may be used:

f_E = 1.0 for shuttle tankers and vessels that frequently operate in the North Atlantic or in other harsh environments

Elsewhere : f_E = 0.8

σ_0 = combined stress range is to be determined at the probability level of 10^{-4} (N/mm^2)

(b) The long-term distribution of the stress range may be represented by the two parameter Weibull distribution. The Weibull shape parameter depends on ship type, location of structural member, sea environment, etc. In this guidance, however, the Weibull shape parameter ξ for a longitudinal may be taken as

$$\xi = 1.1 - 0.35\frac{L-100}{300}$$

(c) The Weibull shape parameter of the combined stress range is assumed to be the same value as the local stress range.

(3) Calculation of fatigue damage ratio

(A) According to the Miner-Palmgren linear cumulative damage rule, the fatigue damage ratio D is calculated using numerical integration as follows:

$$D = \Sigma\frac{n_i}{N_i}$$

where,

n_i = number of stress cycles in stress block i for long-term distribution of the combined stress range

N_i = number of cycles to failure at the i-th constant stress range.

If the long-term distribution of the stress range follows a Weibull one, the damage ratio D_{air} is given by the following formula:

$$D_{air} = \frac{N_t}{c'}\frac{\sigma_0^{m'}}{(\ln N_0)^{m'/\xi}}\gamma(1+\frac{m'}{\xi},t_7) + \frac{N_t}{c}\frac{\sigma_0^{m}}{(\ln N_0)^{m/\xi}}\Gamma(1+\frac{m}{\xi}) - \frac{N_t}{c}\frac{\sigma_0^{m}}{(\ln N_0)^{m/\xi}}\gamma(1+\frac{m}{\xi},t_7)$$

where,

ξ = Weibull shape parameter

Γ = complete Gamma function given by the following formula

$$\Gamma(z) = \int_0^\infty t^{z-1}e^{-t}dt$$

γ = incomplete Gamma function given by the following formula.

$$\gamma(z,x) = \int_0^x t^{z-1}e^{-t}dt$$

c, c' and m, m' = as specified in **Table 2**

t_7 = as specified in the following formula

$$t_7 = \left(\frac{\sigma_7}{\sigma_0}\right)^{\xi} \ln N_0$$

σ_7 = stress range of the design S-N curve at $N = 10^7$ cycles

N_t = the total number of stress cycles for a design life of ships and considering voyage days of 85% for the design life of Y(years), the total number of stress cycles is given by the following formula.

$$N_t = \frac{2.68 \times 10^7}{4 \log L} \times Y$$

(B) For unprotected joints exposed to sea water, the damage ratio D_{cor} is given by

$$D_{cor} = \frac{N_t}{c_1} \frac{\sigma_0^m}{(\ln N_0)^{m/\xi}} \Gamma(1 + \frac{m}{\xi})$$

However, for the structural members protected by effective means in ballast tanks, the damage ratio D is to be calculated as follows:

$$D = 0.5 D_{air} + 0.5 D_{cor}$$

(C) In case of considering the full loaded condition and the ballast condition as the load condition, the relevant draft is to be applied in the calculation of the local wave pressure range and the fatigue damage ratio at each condition (D_{Full} and $D_{Ballast}$) is to be calculated. Therefore, the formula for calculating the total fatigue damage can be expressed as follow:

$$D = p_{lF} D_{Full} + p_{lB} D_{Ballast}$$

p_{lF} and p_{lB} = probability at the full loaded condition and the ballast condition, where, however, the values are not given, 0.6 and 0.4 may be used respectively

(4) Locations of member subjected to fatigue strength assessment
Structural members for which the fatigue strength assessment is to be required in accordance with the simplified fatigue analysis are longitudinals and locations of the members are given in **Table 3.**

Table 3 Locations to be assessed for fatigue analysis

	Locations
1	Intersection of bottom or inner bottom longitudinals and floor or transverse bulkhead
2	Intersection of side shell or inner skin bulkhead longitudinals and transverse or transverse bulkhead
3	Intersection of deck longitudinals and transverse or transverse bulkhead

5. Spectral fatigue analysis

(1) General

For assessment of the spectral fatigue analysis, the Short-term closed-form method is to be applied in this Guidance. The part fatigue damage from each cell in the wave scatter diagram can be calculated using the closed-form expressions by incorporating a S-N curve and the Miner-Palmgren rule. The fatigue damage for a life time of a ship is a sum of all the part fatigue damage considering.

(2) Short-term response

(A) Since the wave is assumed to be stationary in a short-term sea state, its statistical properties are specified by the wave spectrum. The wave spectrum for the different sea states can be given by the following Pierson-Moskowitz wave spectrum.

$$S_\eta(\omega|H_s,T_z) = \frac{H_s^2}{4\pi}\left(\frac{2\pi}{T_z}\right)^4\omega^{-5}\exp\left[-\frac{1}{\pi}\left(\frac{2\pi}{T_z}\right)^4\omega^{-4}\right]$$

where,

ω = wave frequency (rad/sec)

H_s = significant wave height

T_z = wave period

(B) Using the stress transfer function $H(\omega|\theta)$, the response spectrum of the ship can be calculated as follows.

$$S(\omega|H_s,T_z,\theta) = |H(\omega|\theta)|^2 S_\eta(\omega|H_s,T_z)$$

where

θ = wave heading angle

$H(\omega|\theta)$ = stress response to a regular wave with unit amplitude for different frequencies and wave heading angles

(C) The area under the response spectrum and the second moment of the response spectrum can be calculated as follows.

$$m_0 = \int_0^\infty \sum_{\theta-90}^{\theta+90}\left(\frac{2}{\pi}\right)\cos^2\theta\, S(\omega|H_s,T_z,\theta)\,d_\omega$$

$$m_2 = \int_0^\infty \sum_{\theta-90}^{\theta+90}\left(\frac{2}{\pi}\right)\cos^2\theta\,\omega^2 S(\omega|H_s,T_z,\theta)\,d_\omega$$

(3) Short-term fatigue damage

(A) Referring to the cell (i,j) in the wave scatter diagram associated with a significant wave height H_{si} and a zero up-crossing wave period T_{zj}, if the stress range distribution is represented by a probability density function g_{ij}, the number of stress cycles within s and $s+ds$ is obtained from the following formulae.

$$n_{ij} = T\, f_{ij}\, p_{ij}\, g_{ij}\, ds$$

T = design life of a ship

p_{ij} = probability of occurrence of H_{si} and T_{zj}

f_{ij} = Zero up-crossing frequency of stress response in the sea state.

$$f_{ij} = \frac{1}{2\pi}\sqrt{\frac{m_{2ij}}{m_{0ij}}}$$

m_{0ij}, m_{2ij} = area under the response spectrum and the second moment of the response spectrum as specified in (2) (C) above

g_{ij} = probability density function as specified in (B)

(B) The part fatigue damage D_{ij} for a sea state (i,j) can be calculated from,

$$D_{ij} = \frac{n_T}{c}\, r_{ij}\, p_{ij} \int_0^\infty s^m\, g_{ij}\, ds$$

n_T = total stress cycles for a life time of a ship given by the following formula

$$n_T = fT$$

c, m = life intercepts and negative inverse slopes of the S-N curve as specified in **Table 2**, respectively

p_{ij} = as specified in (A) above

r_{ij} = ratio of the response zero up-crossing frequency in a given sea state to the average crossing frequency given by the following formula

$$r_{ij} = \frac{f_{ij}}{f}$$

f = average frequency given by the following formula

$$f = \sum_i \sum_j p_{ij} f_{ij}$$

g_{ij} = probability density function of the stress range for a sea state (i,j) expressed as follows

$$g_{ij} = \frac{s}{4m_{0ij}} \exp\left(-\frac{s^2}{8m_{0ij}}\right)$$

m_{0ij}, m_{2ij} = as specified in (A) above

where a bi-linear S-N curve is used to consider Haibach effect, the short-term fatigue damage ratio may be calculated from,

$$D_{ij} = 2^{\frac{3m}{2}} \frac{n_T}{c}\, \Gamma\left(\frac{m}{2}+1\right) \lambda_{ij}\, \mu_{ij}\, r_{ij}\, p_{ij}\, m_{0ij}^{\frac{m}{2}}$$

where,

μ_{ij} = as specified in the following formula

$$\mu_{ij} = 1 - \frac{\gamma\left(\frac{m}{2}+1,\, t_{ij}\right) - t_{ij}^{\frac{m-m'}{2}}\,\gamma\left(\frac{m'}{2}+1,\, t_{ij}\right)}{\Gamma\left(\frac{m}{2}+1\right)}$$

$m, m', c, n_T, r_{ij}, p_{ij}, m_{0ij}$ = as specified in (B)

$$t_{ij} = \frac{s_7^2}{8\,m_{0ij}}$$

s_7 = the stress range of the design S-N curve at $N = 10^7$ cycles

Γ and γ = complete Gamma function and incomplete Gamma function, respectively

λ_{ij} = Rain flow correction factor in a given sea state

$$\lambda_{ij} = a + (1-a)(1-\epsilon_{ij})^b$$

$$a = 0.926 - 0.033\,m$$
$$b = 1.587\,m - 2.323$$
$$\epsilon_{ij} = \sqrt{1 - \frac{m_{2ij}^2}{m_{0ij}\,m_{4ij}}}$$

(4) Long-term cumulative fatigue damage

(A) Taking account of all heading directions and loading conditions, the long-term cumulative fatigue damage ratio in air is calculated as follows.

$$D_{air} = 2^{\frac{3m}{2}}\,\frac{n_T}{c}\,\Gamma\left(\frac{m}{2}+1\right)\sum_i\sum_j\sum_k\sum_l \lambda_{ijkl}\,\mu_{ijkl}\,r_{ijkl}\,p_{ijkl}\,m_{0ijkl}^{\frac{m}{2}}$$

p_{ijkl} = combined probability given by the following formula

$$p_{ijkl} = p_{ij}\,p_k\,p_l$$

p_k, p_l = probability for the heading angle and the loading condition, respectively

(B) For unprotected joints exposed to sea water, the damage ratio D_{cor} is given by

$$D_{cor} = 2^{\frac{3m}{2}}\,\frac{n_T}{c_1}\,\Gamma\left(\frac{m}{2}+1\right)\sum_i\sum_j\sum_k\sum_l \lambda_{ijkl}\,\gamma_{ijkl}\,p_{ijkl}\,m_{0ijkl}^{\frac{m}{2}}$$

However, for the structural members protected by effective means in ballast tanks, the damage ratio D is to be calculated as follows:

$$D = 0.5\,D_{air} + 0.5\,D_{cor}$$

(5) Structural members to be assessed for fatigue strength

(A) General

(a) Structural members subject to fatigue strength assessments are selected considering the structural system of the ship, and the importance, functions, etc of the members.

(b) Structural members in which fatigue cracks are likely to initiate because of stress concentration due to structural discontinuities, and structural members at locations where watertightness problems are likely to occur due to cracks in the compartments, are selected for the fatigue assessment on priority.

(B) Structural members subject to the fatigue strength assessment according to ship type

(a) Structural members being of possible assessment for the fatigue strength according to ship type

(i) Tankers : as specified in **Table 4, Fig 6** and **Fig 7**

(ii) Bulk carriers : as specified in **Table 5** and **Fig 8**

(iii) Container carriers : as specified in **Table 6**

(b) Locations with high stresses are selected from the locations mentioned in (a) above and the fatigue strength is assessed.

Table 4 Structural members of tankers for fatigue strength assessment

Symbol	Members	Locations
a	Inner bottom plating, slant plating	Intersection of double bottom floor and bilge hopper slant plating
b	Side longitudinal bulkhead plating, slant plating	Intersection of side longitudinal bulkhead and bilge hopper slant plating
c	Inner bottom plating, longitudinal bulkhead	Intersection of double bottom floor and transverse on longitudinal bulkhead
d	Side longitudinal bulkhead plating, Longitudinal bulkhead plating	Intersection of deck transverse and side longitudinal bulkhead
		Intersection of deck transverse and longitudinal bulkhead
e	Side longitudinal bulkhead plating	Intersection of cross tie and side longitudinal bulkhead
f	Side longitudinal bulkhead plating, Longitudinal bulkhead plating	Intersection of horizontal girder and side longitudinal bulkhead
		Intersection of horizontal girder and longitudinal bulkhead
g	Side longitudinal bulkhead plating, Longitudinal bulkhead plating	Intersection of swash bulkhead and side longitudinal bulkhead
		Intersection of swash bulkhead and longitudinal bulkhead

Table 5 Structural members of bulk carriers for the fatigue strength assessment

Members	Locations
Inner bottom plating	Intersection of sloping plate of lower stool, girder, floor plate and inner bottom plating
	Intersection of sloping plate of bilge hopper tanks, girder, floor plate and inner bottom plating
Sloping plate of bilge hopper tanks	Intersection of lower end of hold frame and sloping plate of bilge hopper tank
	Intersection of inner bottom plating and sloping plate of bilge hopper tanks
Transverse bulkhead	Intersection of sloping plate of lower stool and transverse bulkhead
	Intersection of sloping plate of upper stool and upper part of transverse bulkhead
	Intersection of slant plating of topside tanks and upper part of transverse bulkhead
Sloping plate of topside tanks	Intersection of upper end of hold frame and sloping plate of topside tanks
	Intersection of end of hatch coaming and sloping plate of topside tanks
Sloping plate of lower stool	Intersection of inner bottom plate and sloping plate of lower stool

Table 6 Structural members of container carriers for the fatigue strength assessment

Members	Locations
Hatch	Typical hatch coaming and corner in the midship
	After hatch coaming and corner in the after cargo hold (in front of engine room forward bulkhead)
	Hatch coaming and corner within the forward part of the cargo area

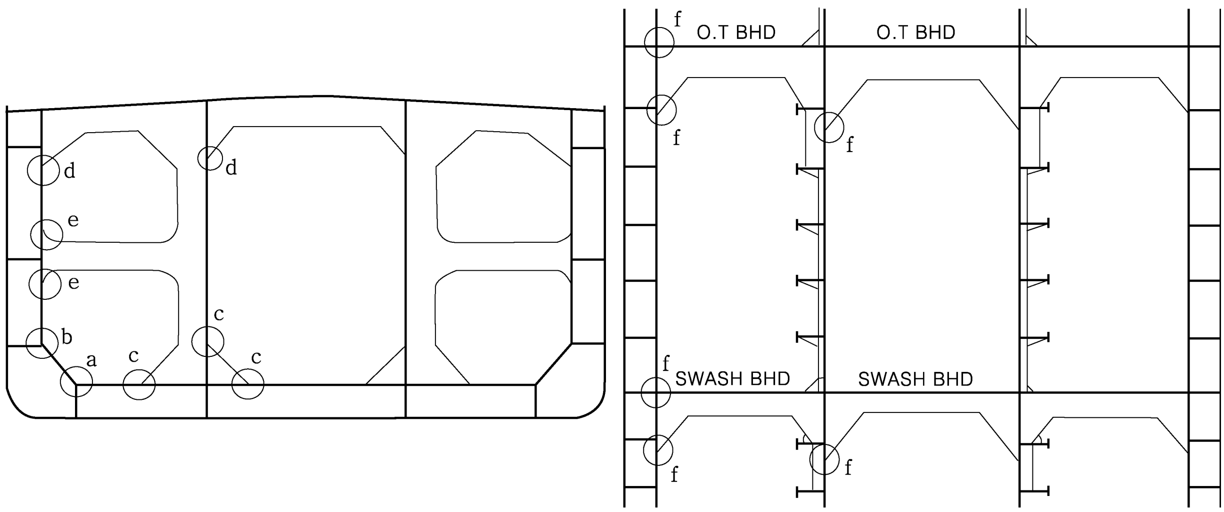

Fig 6 Locations for the fatigue strength assessment(Tankers)

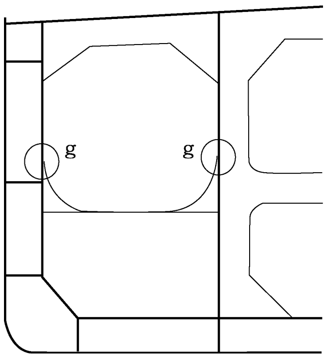

Fig 7 Locations for the fatigue strength assessment(Tankers)

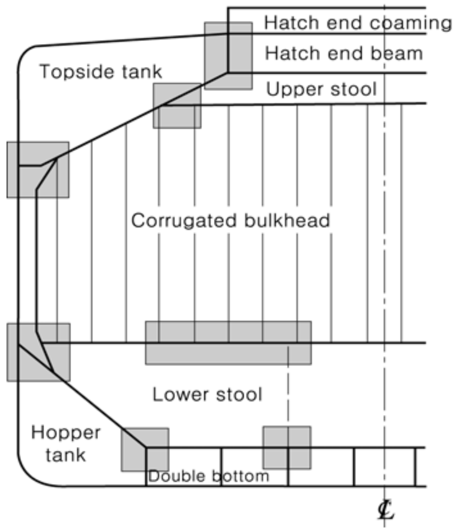

Fig 8 Locations for the fatigue strength assessment(Bulk carriers)

6. Transfer function method

(1) General

In order to perform the spectral fatigue assessment, structural analyses for all wave loads calculated for all heading directions and frequencies have to be carried out to obtain stress transfer functions. However, in the transfer function method, a discrete unit load approach is used. The loads acting on the hull are divided into several load components. The transfer functions for the each load component are determined using a seakeeping software for each wave condition and the influence coefficients for structure are computed by finite element analysis for each unit load. The non-linear effect of the wave induced load at the waterline region can also be considered in the transfer function method.

(2) Stress transfer function

The stress transfer function may be obtained by multiplying the load transfer function by the stress influence coefficient which means the stress value due to the unit load. The combined stress transfer function is to be obtained by a linear summation of each stress transfer function as follows:

$$H(\omega,\theta) = 2\left[\sum_{i=1}^{3} A_i F_i(\omega,\theta) + \alpha \sum_{i=1}^{n_{st}} \sum_{ji=1}^{6} B_{ij} P_{ij}(\omega,\theta) + \sum_{i=1}^{n_{st}} \sum_{ji=1}^{2} C_{ij} W_{ij}(\omega,\theta)\right]$$

(A) Hull girder load

A_i = stress influence coefficient due to unit hull girder load

A_1 = stress influence coefficient due to unit vertical bending moment

A_2 = stress influence coefficient due to unit horizontal bending moment

A_3 = stress influence coefficient due to unit torsional moment

$F_i(\omega,\theta)$ = transfer function of hull girder load

$F_1(\omega,\theta)$ = transfer function of vertical bending moment

$F_2(\omega,\theta)$ = transfer function of horizontal bending moment

$F_3(\omega,\theta)$ = transfer function of torsional moment

(B) Wave pressure

$P_{ij}(\omega,\theta)$: transfer function for pressure coefficient of 5th order power function, P_j, at the i-th station of a ship is given by the following formula.

$$P(b) \cong \sum_{j=1}^{6} P_j \, bj^{j-1}$$

$P(b)$ = external pressure distribution with the girth-wise coordinate

b = girth-wise coordinate, $b = 0$ at keel

P_j = coefficient of the power function is to be determined by the regression analysis for the calculated hydrodynamic pressures at the i-th station of a ship

B_{ij} = stress influence coefficient due to the j-th unit pressure distribution at the i-th station of a ship and the j-th unit pressure distribution is as follows:

$j = 1$ for uniform pressure (1)
$j = 2$ for linear distributed pressure(b)
$j = 3$ for quadratic distributed pressure(b^2)
$j = 4$ for cubic distributed pressure(b^3)
$j = 5$ for forth order distributed pressure(b^4)
$j = 6$ for fifth order distributed pressure(b^5)

(C) Cargo load

C_{ij} = stress influence coefficient due to unit inertia force at the i-th station of a ship

C_{i1} = stress influence coefficient due to unit vertical inertia force at the i-th station of a ship

C_{i2} = stress influence coefficient due to unit horizontal inertia force at the i-th station of a ship

$W_{ij}(\omega,\theta)$ = transfer function due to the inertia force of cargo weight at the i-th station of a ship

$W_{i1}(\omega,\theta)$ = transfer function due to vertical inertia force at the i-th station of a ship

$W_{i2}(\omega,\theta)$ = transfer function due to horizontal inertia force at the i-th station of a ship

(D) In order to consider the non-linear effect of the stress range in the waterline region, the reduction factor, α, is to be used as follows:

$\alpha = 0.5\left(1 - \frac{h}{a_w}\right)$: above the waterline

$\alpha = 0.5$: at the waterline

$\alpha = 1.0$: below a_w

h and a_w = as specified in **Par 4** (1) (B) (a)

For intermediate location between the waterline and a_w, α is to be obtained by interpolation

(3) Using stress transfer function obtained from (2) above, the short-term response spectrum is to be calculated according to **Par 5** (2). The short-term fatigue damage ratio and the long-term cumulative fatigue damage ratio are to be obtained according to **Par 5** (3) and (4), respectively. ⚓

Annex 3-4 Guidance for the Hull Construction Monitoring Procedure

1. General

(1) Introduction

(A) The general quality of a vessel is enhanced by superior structural design, improved construction procedures and effective through life monitoring. In structural terms, the performance of structural elements or connections between members is dependent on the adoption of adequate quality control measures relating to both the quality of detail design and the construction. The detail design, the methods of manufacture and the degree of quality control significantly affect the fatigue performance of a structure. This is particularly evident at locations within the structure identified as 'critical'.

(B) Misalignment, inappropriate edge preparation, excessive gap, weld sequence and weld quality alters the fatigue properties of these joints. Setting appropriate controls on the key factors affecting fatigue performance at the design stage and utilising enhanced monitoring procedures at critical locations ensures that a high degree of workmanship is achieved and avoids unnecessary remedial action in the later stages of the build process.

(C) The links to Direct Strength Assessment (DSA) and Direct Fatigue Assessment (DFA) within the Hull Construction Monitoring (HCM) procedure ensure that a seamless transition of quality monitoring is achieved throughout the life of the vessel.

(D) The SeaTrust HCM procedure forms an element of an integrated approach to the design, construction and monitoring of the critical areas of ship structures. The application of the HCM procedure enhances not only the confidence of the Owner and this Society in the hul1 construction but also quality control procedures employed by the Shipyard at the structurally critical locations.

(2) Objective

(A) The main objective of the SeaTrust HCM procedure is to ensure that the locations within the ship structure, that have been identified as critical, are built to both an acceptable quality standard and approved construction procedures.

(B) The HCM procedure is applied in addition to the requirements for vessels built under special survey, and is based on the application of enhanced controls on alignment, fit-up, edge preparation and workmanship to the critical areas of the relevant hul1 structures to attain the required structural performance.

(C) A secondary objective is that during the service life of the vessel, the Hull Construction Monitoring Plan(HCMP) is used to focus the attention of any future classification survey to the critical locations.

(3) Outline of the procedure

(A) The pre-construction meeting includes advice to the Builder's representatives and owners site manager on the specific application of the Hull Construction Monitoring procedure.

(B) At the plan development and approval stage, the application of the HCM procedure identifies the areas and locations within the ship structure that may experience high levels of stress or fatigue damage assessed on the basis of DSA and DFA results and procedures. The critical areas are those areas of the ship structure that have been shown by structural analysis and service experience to have a higher probability of failure than the surrounding ship structure. The critical locations are specific points identified within the critical areas that are prone to fatigue, and where detail design improvement may have to be undertaken. Particular emphasis is placed on those primary structural locations specified as having enhanced fatigue life specifications within the DFA procedures.

(C) In order to promote a satisfactory level of strength and fatigue performance, detailed construction tolerances are agreed between this Society and the Shipbuilder for each ship considered for the HCM notation in accordance with the Hull Construction Monitoring Standards. The HCMP is prepared by the builder as a catalogue of the critical locations together with the required construction tolerances and an outline of the quality control and quality assurance procedures to be applied. The completed HCMP is sent to this Society for review and subsequent approval.

(D) The Shipyard quality personnel are responsible for the inspection and recording of results during the construction of the ship in accordance with approved yard procedures and the requirements of this society. This site Surveyor provide third party inspection to confirm that the alignment, fit-up, workmanship and construction tolerances conform to the agreed standard specified in the HCMP. Where the approved construction tolerances are exceeded, the Shipbuilder undertakes corrective action to the satisfaction of the requirements of the HCMP.

(E) On satisfactory completion of the HCM requirements, this Society assigns the "**SeaTrust (HCM)**" notation. Upon completion of the ship, the site Surveyor sends a copy of the approved HCMP to head office.

(F) During the lifetime of the vessel, the HCMP is maintained on board and is used to focus periodical surveys on the critical locations in order to monitor the structural integrity and performance.

(G) The Construction Monitoring Procedure has been subdivided into three phases to be applied sequentially as shown in **Table 1** and **Fig 1.**

Table 1 Hull construction monitoring phases

Phase I	Plan approval	Analysis to determine the critical locations
Phase II	Survey during Construction	Survey to ensure satisfactory construction standards
Phase III	Lifetime application of HCMP	Monitor the structural integrity using the HCMP

(4) Scope of application

(A) In cases where the DSA and/or DFA procedures have been applied on a voluntary basis, the Construction Monitoring Procedure shall be applied.

(B) This procedure is applied to areas of the structure that have been identified as being critical locations through the application of the SeaTrust procedures for Direct Structural Assessment (DSA) and Direct Fatigue Assessment (DFA).

(C) The procedure is adopted in association with requirements of this Society for vessels constructed under Special Survey.

(D) Any subsequent modifications or repairs to the ship's structure are, where applicable, to be in accordance with this procedure.

(5) Classification notation

(A) Upon satisfactory application of this procedure, the vessels may be eligible to be assigned the Hull Construction Monitoring notation "**SeaTrust (HCM)**".

2. Hull Construction Monitoring Standard

(1) Hull Construction Monitoring Standard

(A) The Hull Construction Monitoring Standard (HCMS) sets down the Construction Monitoring tolerances to be achieved at the critical locations in order that the requirements for the HCM notation are met. The HCMS covers such aspects of construction such as:

. Alignment
. Fit-up
. Remedial Measures

(B) When identifying the critical locations, particular consideration should be given to critical locations identified by DSA or DFA that constitute a unit joint and critical joints assembled in areas where environmental controls are difficult to apply such as in the erection area or building dock.

(C) In all cases, the construction standards and tolerances not indicated in this standard are to be at least equivalent to the approved yard, national or international ship construction standards in use.

(D) The quality standards for the alignment, fit-up and repair of critical structural components during new construction are shown in **Table 2** to **Table 5.**

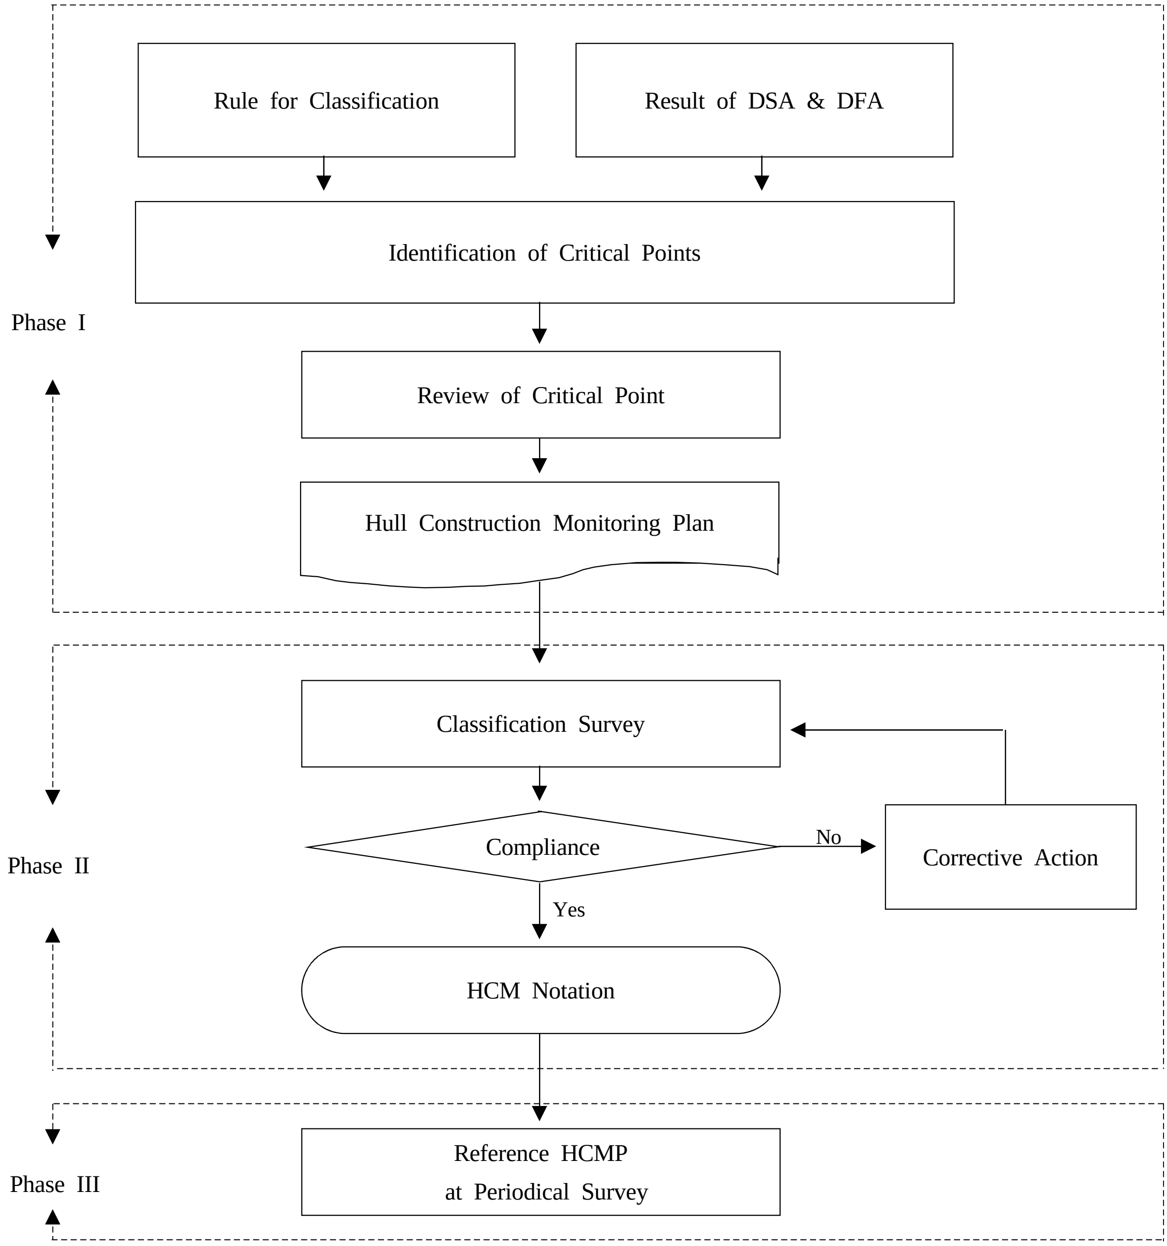

Fig 1 Hull construction monitoring procedure

(2) Scope of the Hull Construction Monitoring Standard

(A) The HCMS does not replace the shipbuilding construction standard employed by the shipyard and accepted by this society. It is a supplementary standard supported by a survey procedure to promote a higher level of structural performance throughout the life of the ship.

(B) The construction and manufacture of the structural details in way of the identified critical areas shall be carried out in accordance with the following:

. Rules and Regulations for the Classification of Ships.

. The approved construction tolerances contained within the Hull Construction Monitoring Plan.

. The associated non-destructive examination (NDE) requirements, if necessary, at the discretion of the attending Surveyor.

(3) Structural Alignment Considerations

(A) The consistent application of remedial measures to correct poor fit-up and alignment is one of the key indicators that a problem may exist in the construction procedures.

(B) Any inaccuracy in the welding of blocks into erection units will have an amplified effect at the erection stage. If adequate dimensional control has not been exercised it will be necessary to cut away edges to align the units being erected. This has the effect of causing further misalignments in adjacent units that will also require modification.

(C) The most critical types of welded structural connection are angled cruciform joints such as the sloping hopper plate connection with the inner bottom plating and the outer longitudinal girder of double hull tankers. At these locations, adequate dimensional control is a prerequisite to ensure good alignment.

(D) The application and maintenance of a suitable alignment method such as 100 mm offset lines is recommended to aid accurate fit up and alignment. For critical structural members it is recommended that any reference marks are indicated in a permanent manner, on both sides of the plate and the actual misalignment checked using jigs/templates, if necessary.

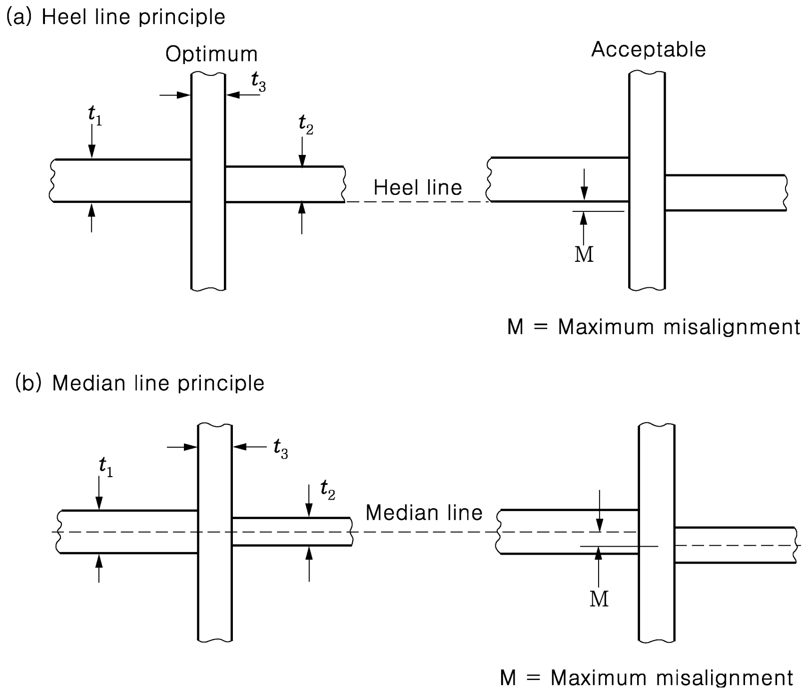

Fig 2 Recommended alignment of primary members

(E) In general, there are two types of alignment method in use ; the median line principle and the heel or moulded principle. These principles are outlined in **Fig 2.** While both alignment methods are generally acceptable, in cases where a more onerous trading pattern is specified or enhanced service life expectations are required, consideration should be given to the application of a suitable alignment method appropriate to the design criteria in order to achieve a preferable level of alignment. In addition to alignment considerations it may also be preferable to apply a more stringent tolerance beyond those detailed in this procedure. In order to eliminate difficulties associated with alignment, a prudent consideration by the shipyard would be to ensure, where practicable, that the thickness of all structural members is reasonably compatible within regions where critical locations are likely to be identified.

(F) In addition to the basic design criteria, certain joints may be identified as requiring an enhanced level of alignment through the application of service experience. The joints identified may depend upon the ship type and the structural configuration but in general the following joints may require additional consideration:
. Lower hopper knuckle on bulk carriers and oil tankers.
. Lower stool connection to floors in way of longitudinal girders in bulk carriers.
. Lower cofferdam bulkhead cruciform joint on membrane type gas carriers.

. Upper hopper knuckle on membrane type gas carriers.
. Aft end cargo area transition zone on membrane type gas carriers.
. Fore end cargo area transition zone on membrane type gas carriers.

(G) When verifying the alignment of structural members, it should be noted that it is often impractical to directly measure the median line alignment and a heel line approach is used in lieu of direct measurement of alignment at median lines. Where the heel line approach is used, the maximum median line tolerances maybe converted into heel line values using the equations given in **Fig 3.**

(H) In cases where two or more critical locations are connected by a secondary stiffening arrangement i.e. double bottom/inner bottom longitudinals, it may be considered prudent to ensure that the alignment is maintained.

(4) Construction considerations

(A) At the sub-assembly stage, a high degree of accuracy may be obtained using methods such as 'backmarking' prior to fit-up.

(B) It is generally found that a consistently higher degree of accuracy is achieved within the assembly shop where the conditions are controlled since blocks and pre-erection units are generally of a smaller size. This makes it easier to meet the specified construction tolerances during fit-up and alignment.

(C) If the critical connections are part of much larger erection joints in the building dock or berth it is much harder to control the alignment and fit-up of the interface and weld quality due to the size of the units and other external factors.

During all stages of construction, but particularly when fabrication and erection takes place external to the construction hall, measures are to be taken to screen and pre-warm, as necessary, the general and local weld areas. Surfaces are to be dry and rapid cooling of welded joints is to be prevented.

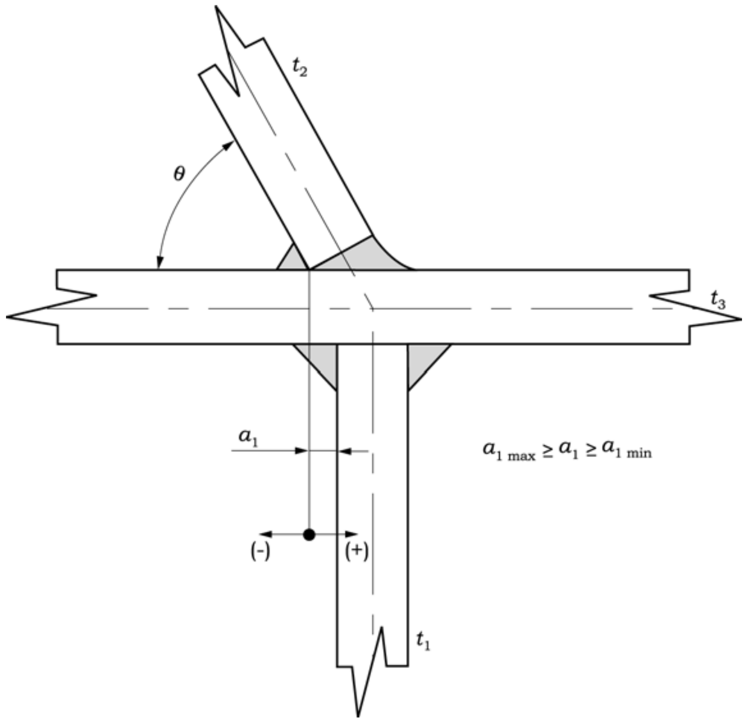
(5) Quality control and quality assurance

(A) The construction standards are to be received general approval as part of the certification procedures and their application is included with the quality plan submitted to this Society for approval.

(B) The construction standards and tolerances to be applied to the critical areas are to be agreed between this Society and the shipbuilder.

(C) In all cases the applied tolerances and standards are not to be less than those specified in the IACS "Shipbuilding and Repair Quality Standard".

(D) Any deviation from the approved structural configuration and/or approved procedures is to be submitted to this Society for consideration.



$$a_{1max} = \frac{1}{2}\left(\frac{t_2}{\sin\theta} + \frac{t_3}{\tan\theta} - t_1\right) + M \qquad M = \frac{t_{min}}{3}(\max\ 5mm)$$

$$a_{1min} = \frac{1}{2}\left(\frac{t_2}{\sin\theta} + \frac{t_3}{\tan\theta} - t_1\right) - M \qquad t_{min} = \min[t_1, t_2, t_3]$$

a_{1max} = max heel line tolerance measured in the direction of the acute angle
a_{1min} = max heel line tolerance measured in the direction of the abuse angle
θ = angle of sloping plate to the horizontal
t_1 = thickness of girder or transverse member
t_2 = thickness of sloping plate
t_3 = thickness of table member

Comparison of equivalent tolerances

t_1	t_2	t_3	θ	a_{1max}	a_{1min}	Med. Line
12	22	20	60	16.5	8.5	4
12	26	20	60	18.8	10.8	4
14	22	20	45	23.2	13.9	4.7
14	26	20	45	26.0	16.7	4.7

Fig 3 Equivalent heel line tolerances

3. Phase 1 – Plan Development and Approval

(1) Objectives

(A) The first objective of this stage is to identify the critical locations as defined in l.2.3 of this document.

(B) The second objective is to compile the HCMP prior to submission to this Society for approval.

(2) Identification of the critical locations

(A) Experience with ships in service has enabled this Society to provide information to assist the Shipbuilder in determining the critical locations that may be vulnerable to fatigue. Particular emphasis is placed on are as where high stress magnitudes may be anticipated and for which correct alignment is important.

(B) The critical locations are to be clearly identified and labelled on the appropriate structural drawings contained within the HCMP and submitted to this Society for approval.

(3) Hull construction monitoring plan

(A) The hull construction monitoring plan (HCMP) is a document compiled by the shipyard to provide a record of the enhanced quality standards and procedures employed by the Shipbuilder to ensure that an increased level of construction quality control is employed at those areas of the structure that have been identified as critical to the vessel.

(B) The HCMP is submitted to Head Office of this Society for formal approval as soon as possible prior to steel cutting. The HCMP is reviewed by both this society's site Surveyor and Plan Approval Surveyor in order that the findings of practical construction, structural analysis and fatigue analysis are uniquely reflected in the plan. Once approval is given, this society's site Surveyors maintain efficient contact between all interested parties to ensure that the requirements of the HCMP are fully understood and are complied with.

(C) The HCMP is supplemental to and does not replace the Quality Plan provided by the Shipbuilder.

(D) On receipt of the approved HCMP, the Shipbuilder, in association with this Society's Surveyor, ensures that all of the requirements contained within the HCMP are met in addition to any shipbuilding standards used.

(E) A typical HCMP is to contain the following information:

. Appropriate structural plans with the critical locations clearly marked.
. Details of appropriate construction tolerances including any 'design offset' at the critical locations are to be included on the appropriate structural plans for approval.
. Summary table of all critical locations indicating tolerances applied.
. Alignment verification methods used, i.e. Offset marking.
. Outline of quality controls in place during block construction, pre-erection and erection.
. Outline of Q.A procedures used.
. Methods for recording and reporting of inspection results.
. Details of standard remedial measures to be employed where required.
. Non destructive testing plan

(F) A copy of the approved HCMP is maintained on board either in electronic or hard copy format through-out the life of the vessel. The HCMP is to be used to focus survey on those areas of the structure identified during the design process as being critical to the operational effectiveness of the vessel.

4. Phase 2 - Construction Monitoring

(1) Fabrication and pre-erection

(A) The attending Surveyor and the Shipbuilder's quality control personnel agree a satisfactory inspection routine that embodies both the Shipbuilders Quality Control and the Construction Monitoring requirements. The Owner's Representatives shall be notified of the agreed inspection routine.

(B) Measures are, in general, to be taken to screen and pre-warm, as necessary, the general and local weld areas. Surfaces are to be dry and rapid cooling of welded joints is to be prevented. For any given welding method, the welding procedures are to be approved by this society. In addition, the Shipbuilder ensures that all welding operators employed on that process are qualified as approved by this society.

(C) The fabrication plans and other appropriate specifications, procedures and work instructions necessary for each phase of the fabrication process are to be made available at the appropriate inspection locations. The Shipbuilder maintains the inspection status of the critical structural components at appropriate stages in the fabrication process. This may include the direct marking of individual components. The marking method used is to be discussed and agreed with the attending Surveyor.

(D) Prior to the welding of critical joints, the Shipbuilder liaises with the attending Surveyor with respect to arranging appropriate 'fit-up' inspection, if necessary. Records of inspection and measurements are to be easily referenced against the relevant structural components and be accessible to this society.

(E) The workmanship employed throughout the stages of material preparation and assembly of pre-fabricated units is to conform to the relevant standards defined in the HCMP. Faulty workmanship or non-compliance with the specified tolerances noted by the Surveyor is to be rectified to the Surveyors satisfaction before progressing to the next stage of production.

(2) Assembly of units

(A) The assembly welding sequences, in general, are to be agreed prior to construction and to the satisfaction of the attending Surveyor. At each stage of assembly, particular attention is to be paid to ensure that the fit-up, alignment and welding of units is in accordance with the approved plans and to the approved HCM tolerances.

(B) Where a critical connection is also an erection joint, the attending Surveyor is to liaise with the Shipyard to provide adequate inspection to ensure that the required construction tolerances are achieved. During unit erection it is common for plates to be released and material cropped to allow acceptable fit-up and alignment. This process often results in damage to the surrounding plating detrimental to the strength of the structure. It is recommended that where such practices have been employed, full penetration welding is specified for the re-welding of the structure. Where insert plates have been used, it is recommended that these plates are left loose until such time that acceptable fit-up and alignment has been achieved.

(3) Inspection of welds

(A) Regular examination of the NDE records, in conjunction with the Shipbuilder, verifies that the quality of welding operations is satisfactory. Any departure from acceptable standards is to be investigated, including additional tests as considered desirable.

(B) Finished welds are to undergo a visual inspection by the attending Surveyor. The Shipbuilder shall ensure that all welds presented for visual inspection are clean, having all rust and weld slag removed and be free of coatings that may impair the inspection. The inspection is to verify that all welds are sound, free from cracks, undercut, notches, substantially free from lack of fusion, incomplete penetration, slag inclusion and porosity. The surface of all finished welds shall be inspected to ensure that they are reasonably smooth, substantially free of overlap and undercut. Fillet welds are to be inspected to ensure that they are continuous around scallops, brackets, stiffeners, etc. thus avoiding craters and incipient cracks at points of stress concentration.

(C) Weld sizes shall be inspected to ensure they are consistent over their entire length and are of the correct dimensions. Finished weld profile characteristics can have a marked effect upon joint fatigue. The approved dimensional requirements are to be verified using a suitable gauge and shall meet the criteria specified in the HCM Standard.

(D) In addition to visual inspection, the critical locations are to be subjected to the NDE requirements. Welds may be examined using approved methods such as Ultrasonic, Magnetic Particle, Radiographic, Eddy Current, Dye Penetrant or other acceptable methods appropriate to the configuration of the weld.

(E) The Shipyard production personnel involved in the fabrication joints to undergo NDE are not to be informed of the exact locations of the NDE prior to welding. Similarly, the proposed location of NDE is not to be marked or indicated on the plates prior to welding.

(F) The quality of a finished weld often varies with the method used due to factors such as heat input and the process itself. When specifying an NDE procedure, full consideration is to be given to the weld process employed to ensure that the method of NDE is suitable for the type of weld under consideration.

(G) Where defects are observed, additional NDE is to be carried out to determine the full extent. Unacceptable weld defects detected by NDE inspection are to be repaired or completely removed and re-welded as appropriate using approved procedures and consumables.

(H) Prior to any repair or re-welding at critical locations, the joint is to be inspected by the attending Surveyor to ensure that the alignment and gap comply with the specified tolerances.

(I) In critical areas where repairs and rewelds have been undertaken, the Surveyor is to ensure that excessive welding leading to distortion, stress concentration has not taken place. Re-inspection using the appropriate method of NDE shall be carried out until no further defects are discovered.

(J) The Surveyor may request additional or random NDE inspections where it is considered necessary.

(K) Only where absolutely necessary should methods for fatigue strength improvement be considered at the fabrication stage and then only as remedial measures. In these cases, strict quality control procedures are to be applied.

(4) Departure from the approved arrangements

(A) Modifications or alterations to the design or construction of a particular structural arrangement or detail in way of an identified critical area are to be approved by this society.

(B) In this case, the Shipbuilder is to re-submit to this society, the appropriate plans indicating all of the required changes. Reassessment of the structure may be a requirement along with the submission of a revised HCMP. Any reassessment carried out by this Society with regard to post-approval modifications or alterations may be chargeable to the Shipbuilder.

5. Construction Monitoring Compliance

(1) Compliance

(A) The attending Surveyor shall ensure that during the various stages of the construction process, all structure in way of fatigue critical locations has been examined in accordance with the inspection plan.

(B) The attending Surveyor is to ensure that, where applicable, all of the requirements of the HCMP have been met in addition to any rules and standards applied.

(C) On satisfactory completion of all inspections, the Surveyor shall confirm that the structure complies with the approved HCM tolerances and assign the appropriate notation "SeaTrust (HCM)".

(2) Non-Compliance

(A) Throughout the various stages of construction, the attending Surveyor shall inform the Shipbuilder immediately, upon completion of an inspection, of any defined critical joint or location that does not comply with the approved HCMP.

(B) Where the Shipbuilder is to utilize remedial measures or corrective action not stated in the HCMP, an agreement should be reached on an approved remedial plan to ensure that compliance is reached through discussions between this Society and the Shipbuilder. The proposal shall contain details of any modifications to the structural arrangement, scantlings, welding processes to be employed and NDE to be performed.

(C) Through discussions between this Society and the Shipbuilder an agreement shall be reached on an approved remedial plan. Repairs, re-work and inspection shall be carried out in accordance with the approved remedial plan until compliance is granted.

6. Phase 3 - Lifetime Application

(1) Through life monitoring

(A) The Surveyor attending future classification surveys shall identify, from the HCMP, those structural locations that will require special consideration and extended examination during survey.

(B) The nature of the critical locations requires that the Surveyor pay particular attention to defects such as corrosion, local damage, evidence of cracking, and local coating breakdown.

(C) All repairs undertaken at the critical locations identified in the HCMP are to be undertaken in accordance with these procedures.

(2) Structural alterations

(A) In cases where a vessel has undergone significant structural alteration, any locations subsequently identified as being critical to the structural integrity are to be constructed to the tolerances specified in the original HCMP. A revised HCMP is to be produced as early as practicable in the design process in accordance with these procedures and submitted for approval.

(B) Joints not previously identified but subsequently found to be critical are to be examined in detail to ensure that no construction irregularities such as severe misalignment and weld imperfections exist.

Table 2 Principle alignment

Detail	Heel	Median
	$a_{1max} \geq a_1 \geq a_{1min}$ where, $a_{1max} = \frac{1}{2}(t_1 - t_2) + M$ $a_{1min} = \frac{1}{2}(t_1 - t_2) - M$	$a \leq M$
	Median line tolerances may be converted to an equivalent heel line tolerance using the equations given below. $a_{1max} \geq a_1 \geq a_{1min}$ where, $a_{1max} = \frac{1}{2}\left(\frac{t_2}{\sin\theta} + \frac{t_3}{\tan\theta} - t_1\right) + M$ $a_{1min} = \frac{1}{2}\left(\frac{t_2}{\sin\theta} + \frac{t_3}{\tan\theta} - t_1\right) - M$	
$M = \frac{t_{min}}{3}$ (max 5 mm) where, t_{min} = min (t_1, t_2, t_3)

CONTENTS

CHAPTER 1 RUDDERS

Section 1 General

101. Application

1. The requirements in this Chapter apply to single plate rudders and double plate rudders of stream line section and ordinary shape, being divided into the following types ;

(1) Type *A* : Rudders with upper and bottom pintles. (See **Fig 4.1.1** Type *A*)
(2) Type *B* : Rudders with the neck bearing and the bottom pintle. (See **Fig 4.1.1** Type *B*)
(3) Type *C* : Rudders having no bearing below the neck bearing. (See **Fig 4.1.1** Type *C*)
(4) Type *D* : Mariner type rudders with neck bearing and pintle, of which lower end is fixed. (See **Fig 4.1.1** Type *D*)
(5) Type *E* : Mariner type rudders with two pintles, of which lower ends are fixed. (See **Fig 4.1.1** Type *E*)

2. The construction of rudders with three or more pintles and of those with special shape or sectional form are to be in accordance with the discretion of the Society.

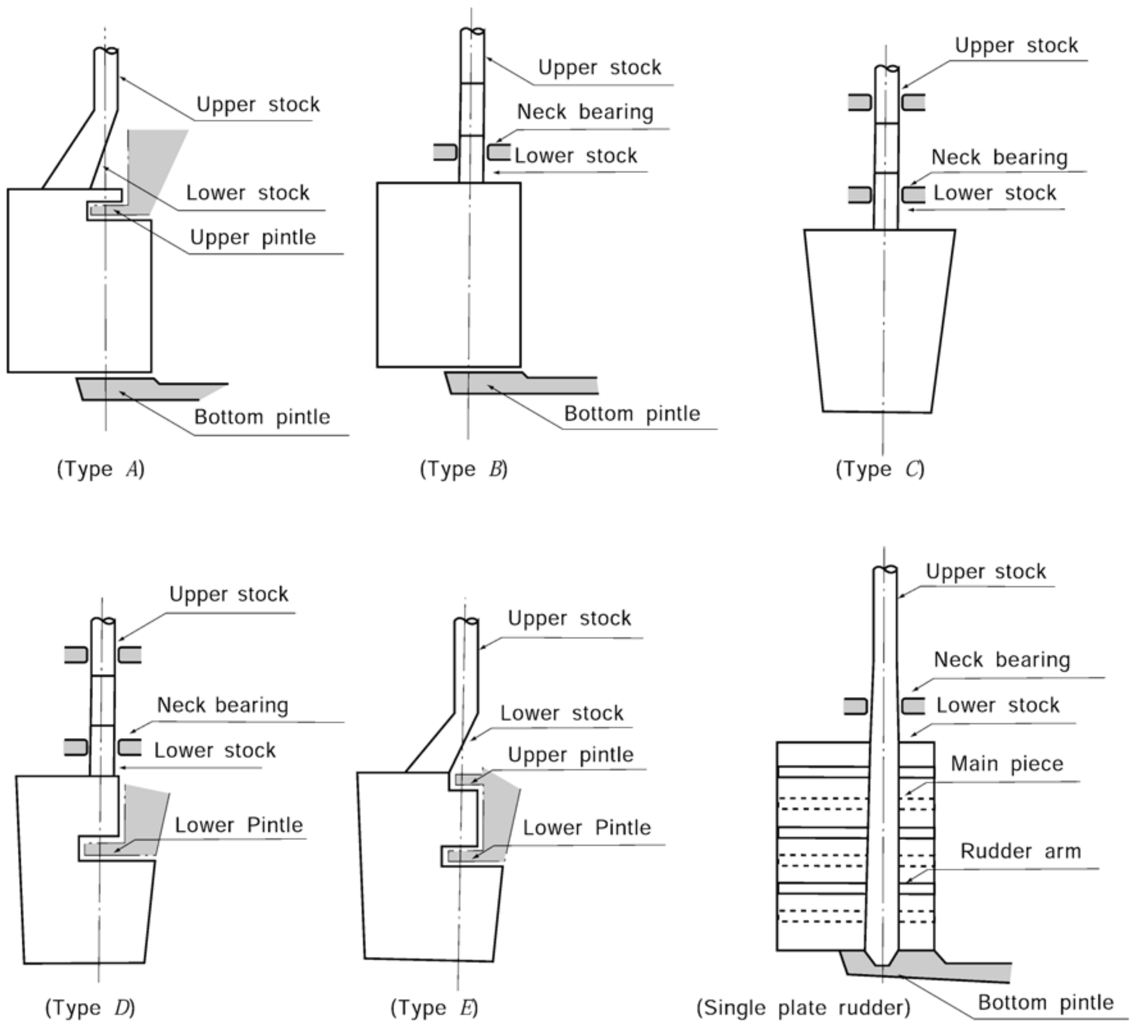

Fig 4.1.1 Types of rudders

3. The construction of rudders designed to move more than 35 *degrees* on one side is to be in accordance with the discretion of the Society.

102. Materials

1. Rudders stocks, pintles, coupling bolts, keys and cast parts of rudders are to be made of rolled steel, steel forging or carbon steel casting conforming to the requirements in **Pt 2, Ch 1** of the Rules. For rudder stocks, pintles, coupling bolts and keys, the minimum yield stress is not to be less than 200 (N/mm^2). The requirements in this Chapter are based on a material's yield stress of 235 (N/mm^2). If material is used having a yield stress differing from 235 (N/mm^2) the material factor K is to be determined by **Table 4.1.1.**

Table 4.1.1 Material factor K (for steel forging and carbon steel casting)

σ_y (N/mm^2)	K
$\sigma_y > 235$	$K=\left(\frac{235}{\sigma_y}\right)^{0.75}$
$\sigma_y \le 235$	$K=\left(\frac{235}{\sigma_y}\right)^{1.0}$
σ_y = yield stress(N/mm^2) of material used, and is not to be taken greater than 0.7 σ_T or 450(N/mm^2), whichever is smaller value. σ_T = minimum tensile strength of material used (N/mm^2).	

2. When the rudder stock diameter is reduced because of the application of steels with yield stresses exceeding 235 (N/mm^2), special consideration is to be given to deformation of the rudder stock to avoid excessive edge pressures at edge of bearings.

3. Welded members of rudders such as rudder plates, rudder frames, rudder main pieces, and edge bars are to be made of rolled steels for hull conforming to the requirements in **Pt 2, Ch 1** of the Rules. The required scantlings may be reduced when high tensile steels are applied. When reducing the scantling, the material factor K is to be as **Table 4.1.2.**

Table 4.1.2 Material factor K (for rolled steel)

Material	K
A, B, D or E	1.0
AH 32, DH 32 or EH 32	0.78
AH 36, DH 36 or EH 36	0.72

103. Increase in diameter of rudder stocks for special cases

1. The diameters of rudder stocks for ships exclusively engaged in towing services are not to be less than 1.1 times those required in this Chapter.

2. In ships which may be frequently steered at a large helm angle when sailing at their maximum speed, such as fishing vessels, the diameters of rudder stocks and pintles, as well as the section modulus of main pieces, are not to be less than 1.1 *times* those required in this Chapter.

3. In ships which might require quick steering, the diameters of rudder stocks are to be properly increased beyond the requirements in this Chapter.

4. The rudders for ships classified for ice strengthening are to be in accordance with the requirements of **Pt 3, Ch 20, 216.** in addition to the requirements of this Chapter.

104. Sleeves and bushes

Bearings located from the bottom of rudder to well above the load line are to be provided with sleeves and bushes.

Section 2 Rudder Force

201. Rudder force

The rudder force F_R upon which the rudder scantlings are to be based is to be obtained from the following formula, for each of going ahead or astern. However, when the rudder is arranged behind the propeller that produces an especially great thrust, the rudder force is to be appropriately increased.

$$F_R = 132 K_1 K_2 K_3 A V^2 \quad \text{(N)}$$

where :

A = area of rudder plate (m^2).

V = speed of ship(Kt) as defined in **Pt 3, Ch 1** of the Rules. When the speed is less than 10 *knots*, V is to be replaced by $V_{\min}$ obtained from the following formula ;

$$V_{\min} = \frac{V+20}{3} \quad \text{(Kt)}$$

For the astern condition, the astern speed V_a is to be obtained from the following formula. However, when the maximum astern speed is designed to exceed V_a the design maximum astern speed is to be used.

$$V_a = 0.5 V \quad \text{(Kt)}$$

K_1 = factor depending on the aspect ratio Λ of the rudder area, obtained from the following formula.

$$K_1 = \frac{\Lambda + 2}{3}$$

Λ = as obtained from the following formula. However, Λ is not required to be greater than 2.

$$\Lambda = \frac{h^2}{A_t}$$

h = mean height of rudder (m), which is determined according to the coordinate system in **Fig 4.1.2.**

A_t = sum of rudder plate area A (m^2) and area of rudder post or rudder horn, if any, within the mean height of rudder h.

K_2 = factor depending on the rudder profile (See **Table 4.1.3**).

Table 4.1.3 Factor K_2

Profile type	K_2	
	Ahead condition	Astern condition
NACA-00 Göttingen profiles 	1.1	0.80
Hollow profiles 	1.35	0.90
Flat side profiles 	1.1	0.90

K_3 = factor depending on the location of rudder (See **Table 4.1.4**).

Table 4.1.4 Factor K_3

Location of rudder	K_3
for rudders outside the propeller jet	0.8
for rudders behind a fixed propeller nozzle	1.15
otherwise	1.0

Section 3 Rudder Torque

301. Rudder torque of Type B and Type C rudders (Rudder without cut-outs)

The rudder torque T_R of Type B and C rudders is to be obtained for ahead and astern conditions, respectively, according to the following formula.

$$T_R = F_R \times r \quad \text{(N-m)}$$

where :

F_R = as specified in **201.**

r = distance from the centre of rudder force on the rudder to the centreline of the rudder stock, determined by the following formula.

$$r = b(\alpha - e) \quad \text{(m)}$$

For the ahead condition, however, r is not to be less than $r_{\min}$ obtained from the following formula.

$$r_{\min} = 0.1b \quad \text{(m)}$$

b = mean breadth(m) of rudder determined by the coordinate system in **Fig 4.1.2.**

α = to be as **Table 4.1.5.**

Table 4.1.5 Factor α

Course of rudder	α
Ahead condition	0.33
Astern condition	0.66

e = balance factor of the rudder obtained from the following formula.

$$e = \frac{A_f}{A}$$

A_f = portion of the rudder plate area situated ahead of the centreline of the rudder stock (m^2).

A = as specified in **201.**

302. Rudder torque of Type *A*, *D* and *E* rudders (Rudder with stepped contours)

The rudder torque T_R of Type A, D and E rudders is to be obtained for the ahead and astern conditions, respectively, according to the following formula :

$$T_R = T_{R1} + T_{R2} \quad \text{(N-m)}$$

For the ahead condition, however, T_R is not to be less than $T_{R\min}$ obtained from the following formula :

$$T_{R\min} = 0.1\, F_R \frac{A_1 b_1 + A_2 b_2}{A} \quad \text{(N-m)}$$

where :

T_{R1} and T_{R2} = rudder torque(N-m) of portion of A_1 and A_2, respectively, obtained from the following formulae, respectively.

$$T_{R1} = F_{R1} \times r_1 \quad \text{(N-m)}$$
$$T_{R2} = F_{R2} \times r_2 \quad \text{(N-m)}$$

A_1 and A_2 = areas of respective rectangulars (m^2) determined by dividing the rudder area into two parts so that $A = A_1 + A_2$ (A_1 and A_2 include A_{1f} and A_{2f} respectively), as specified in **Fig 4.1.3.**

b_1 and b_2 = mean breadth (m) of portions A_1 and A_2, determined by applying **Fig 4.1.2** correspondingly.

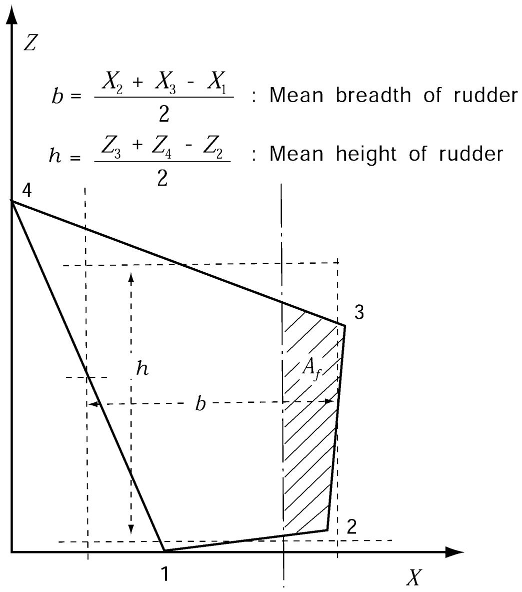

Fig 4.1.2 Coordinate system o rudders

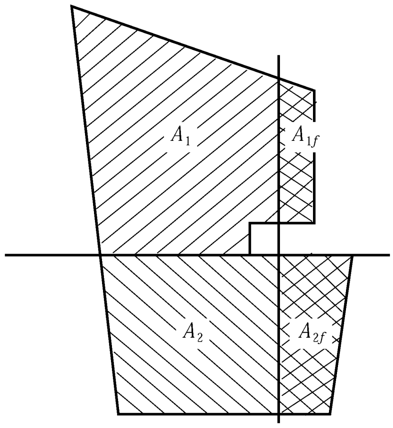

Fig 4.1.3 Division of rudder area

F_R and A = as specified in **201.**

F_{R1} and F_{R2} = the rudder force of portions A_1 and A_2, obtained from the following formulae, respectively.

$$F_{R1} = F_R \frac{A_1}{A} \quad \text{(N)}$$

$$F_{R2} = F_R \frac{A_2}{A} \quad \text{(N)}$$

r_1 and r_2 = the distances from each centre of rudder force of portions A_1 and A_2 to the centre-line of the rudder stock, determined by the following formulae, respectively.

$$r_1 = b_1(\alpha - e_1) \quad \text{(m)}$$
$$r_2 = b_2(\alpha - e_2) \quad \text{(m)}$$

e_1 and e_2 = the balance factors of portions A_1 and A_2, obtained from the following formulae, respectively.

$$e_1 = \frac{A_{1f}}{A_1}, \quad e_2 = \frac{A_{2f}}{A_2}$$

α = to be as **Table 4.1.6.**

Table 4.1.6 Factor α

Locations of rudder parts		α
For parts of a rudder not behind a fixed structure such as rudder horn	for ahead condition	0.33
	for astern condition	0.66
For parts of a rudder behind a fixed structure such as rudder horn	for ahead condition	0.25
	for astern condition	0.55

Section 4 Rudder Strength Calculation

401.Rudder strength calculation

1. The rudder strength is to be sufficient against the rudder force and rudder torque as given in **Sec 2** and **Sec 3.** When the scantling of each part of a rudder is determined, the following moments and forces are to be considered.

For rudder body : bending moment and shear force

For rudder stock : bending moment and torque

For pintle bearing and rudder stock bearing : supporting force

2. The bending moments, shear forces and supporting forces to be considered are to be determined by a direct calculation or an approximate simplified method as deemed appropriate by the Society.

Section 5 Rudder Stocks

501. Upper stocks

The upper stock diameter d_u required for the transmission of the rudder torque is to be determined so that the torsional stress not exceed 68/Kg(N/mm^2). In dimensioning, the upper stock diameter may be determined by the following formula:

$$d_u = 4.2\sqrt[3]{T_R K_S} \quad \text{(mm)}$$

T_R = as specified in **301.** and **302.**

K_S = material factor for rudder stock, as given in **102.**

502. Lower stocks

The diameter d_l of the lower stock subjected to combined forces of torque and bending moment is to be determined so that the equivalent stress in the rudder stock not exceed 118 K_s (N/mm^2). The equivalent stress σ_e is to be obtained from the following formula :

$$\sigma_e = \sqrt{\sigma_b^2 + 3\tau_t^2} \quad \text{(N/mm}^2\text{)}$$

where :

σ_b and τ_t = the bending stress and torsional stress acting on the lower stock, determined as follows respectively :

$$\sigma_b = \frac{10.2M}{{d_l}^3} \times 10^3 \quad (\text{N/mm}^2)$$

$$\tau_t = \frac{5.1\,T_R}{{d_l}^3} \times 10^3 \quad (\text{N/mm}^2)$$

M = bending moment(N-m) at the section of the rudder stock considered.

T_R = as specified in **301.** and **302.**

When the horizontal section of the lower stock forms a circle, the lower stock diameter d_l may be determined by the following formula :

$$d_l = d_u \sqrt[6]{1 + \frac{4}{3}\left(\frac{M}{T_R}\right)^2} \quad (\text{mm})$$

where :

d_u = upper stock diameter(mm) as given in **501.**

Section 6 Rudder Plates, Rudder Frames and Rudder Main Pieces

601. Rudder plate

The rudder plate thickness t is not to be less than that obtained from the following formula :

$$t = 5.5S\beta\sqrt{\left(d + \frac{F_R \times 10^{-4}}{A}\right)K_{pl}} + 2.5 \quad (\text{mm})$$

where :

A and F_R = as specified in **201.**

K_{pl} = material factor for the rudder plate as given in **102.**

d = as specified in **Pt 3, Ch 1, 111.**

β = to be obtained from the following formula :

$$\beta = \sqrt{1.1 - 0.5\left(\frac{S}{a}\right)^2} \quad \text{max : } 1.0\left(\frac{a}{S} \geq 2.5\right)$$

S = spacing of horizontal or vertical rudder frames, whichever is smaller (m).

a = spacing of horizontal or vertical rudder frames, whichever is greater (m).

602. Rudder frames

1. The rudder body is to be stiffened by horizontal and vertical rudder frames enabling it to act as bending girder.

2. The standard spacing of horizontal rudder frames, S_f is to be obtained from the following formula :

$$S_f = 0.2\left(\frac{L}{100}\right) + 0.4 \quad (\text{m})$$

3. The standard distance from the vertical rudder frame forming the rudder main piece to the adjacent vertical rudder frame is to be 1.5 *times* the spacing of horizontal rudder frames.

4. The thickness of rudder frames is not to be less than 8 mm or 70 % of the thickness of the rudder plates as given in **601.** whichever is greater.

603. Rudder main pieces

1. Vertical rudder frames forming the rudder main piece are to be arranged forward and afterward of the centreline of rudder stock at a distance approximately equal to the thickness of the rudder where the main piece consists of two rudder frames, or at the centreline of the rudder stock where the main piece consists of one rudder frame.

2. The section modulus of the main piece is to be calculated in conjunction with the vertical rudder frames specified in **Par 1** and rudder plates attached thereto. The effective breadth of the rudder plates normally taken into calculation are to be as follows :

(1) Where the main piece consists of two rudder frames, the effective breadth is 0.2 *times* the length of the main piece.
(2) Where the main piece consists of one rudder frame, the effective breadth is 0.16 *times* the length of the main piece.

3. The section modulus and the web area of a horizontal section of the main piece are to be such that bending stress, shear stress and equivalent stress will not exceed the following stress values, respectively.

$$\sigma_b = \frac{110}{K_m} \quad (\mathrm{N/mm^2}), \qquad \tau = \frac{50}{K_m} \quad (\mathrm{N/mm^2}), \qquad \sigma_e = \sqrt{\sigma_b^2 + 3\tau^2} = \frac{120}{K_m} \quad (\mathrm{N/mm^2})$$

In the cases of Type A, D, and E rudders, however, the section modulus and the web area of a horizontal section of the main piece in way of cut-outs are to be such that bending stress, shear stress and equivalent stress not exceed the following stress values, respectively.

$$\sigma_b = \frac{75}{K_m} \quad (\mathrm{N/mm^2}), \qquad \tau = \frac{50}{K_m} \quad (\mathrm{N/mm^2}), \qquad \sigma_e = \sqrt{\sigma_b^2 + 3\tau^2} = \frac{100}{K_m} \quad (\mathrm{N/mm^2})$$

where :

K_m = material factor for the rudder main piece as given in **102.**

4. The upper part of the main piece is to be so constructed as to avoid structural discontinuity.

5. Maintenance openings and cut-outs of rudder plates in Type A, D, and E rudders are to be rounded off properly.

604. Rudder plates, rudder arms and rudder main pieces of single plate rudders

1. The rudder plate thickness t is not to be less than that obtained from the following formula :

$$t = 1.5SV\sqrt{K_{pl}} + 2.5 \quad (\mathrm{mm})$$

where :

S = spacing (m) of rudder arms, not to exceed 1 m.

V = speed of ship (Kt) as specified in **201.**

K_{pl} = material factor for rudder plate as given in **102.**

2. Rudder arms are to comply with the following requirements.

(1) The thickness of rudder arms is not to be less than that of rudder plates.

(2) The section modulus of rudder arms is not to be less than the value obtained from the following formula. This section modulus, however, may be reduced gradually toward the edge of the rudder plate.

$$Z = 0.5\, S C_1^2\, V^2 K_a \quad (\mathrm{cm}^3)$$

where :

C_1 = horizontal distance (m) from the aft edge of the rudder plate to the centre of the rudder stock.

K_a = material factor for the rudder arm as given in **102.**

S and V = as specified in **Par 1.**

3. The diameters of main pieces are not to be less than those of lower rudder stocks. In rudders having no bearing below the neck bearing, however, the main piece diameter may be reduced gradually within the lower 1/3 area of the rudder, and may be 75 % of the specified diameter at the bottom part.

605. Connections

Rudder plates and frames are to be effectively connected and free from defects, cautions being taken to the workmanship.

606. Paintings and drainings

The internal surface of rudder is to be coated with effective paint, and means for draining are to be provided at the bottom of rudder.

Section 7 Couplings between Rudder Stocks and Main Pieces

701. Horizontal flange couplings

1. Coupling bolts are to be reamer bolts and at least 6 reamer bolts are to be used in each coupling.

2. Couplings are to comply with the requirements in **Table 4.1.7.**

702. Vertical flange couplings

1. Coupling bolts are to be reamer bolts and at least 8 reamer bolts are to be used in each coupling.

2. Couplings are to comply with the requirements in **Table 4.1.7.**

703. Cone couplings

1. Cone couplings without hydraulic arrangements (oil injection and hydraulic nut, etc.) for mounting and dismounting the coupling are to comply with the following requirements.

(1) The couplings are to have a taper on diameters of 1 : 8 ~ 1 : 12 and be secured by the slugging nut. (*See* **Fig 4.1.4**)

(2) The taper length l of rudder stocks fitted into the rudder plate is generally not to be less than 1.5 *times* the rudder stock diameter d_0 at the top of the rudder.

(3) For the couplings between stock and rudder, a key is to be provided. And the scantling of the key is to be to the discretion of the Society.

(4) The dimensions of the slugging nut as specified in the preceding (1) are to be as follows (*See* **Fig 4.1.4**) :

$d_g \geq 0.65 d_0$ (mm)

$h_n \geq 0.6 d_g$ (mm)

$d_n \geq 1.2 d_e$ or $1.5 d_g$ (mm), whichever is greater.

where :

d_g = external thread diameter(mm).

h_n = length of nut(mm).

d_n = outer diameter of nut(mm).

(5) The nuts fixing the rudder stocks are to be provided with efficient locking devices such as lock nut, nut stopper, etc.

(6) Couplings of rudder stocks are to be properly protected from corrosion.

Table 4.1.7 The minimum requirements for rudder couplings to stock

Parameter	Requirement	
	Horizontal flange coupling	Vertical flange coupling
d_b	$0.62\sqrt{\dfrac{d^3 K_b}{n e_m K_s}}$	$\dfrac{0.81d}{\sqrt{n}} \times \sqrt{\dfrac{K_b}{K_s}}$
M	-	$0.00043d^3$
t_f	$d_b\sqrt{\dfrac{K_f}{K_b}}$ (not less than $0.9d_b$)(1)	d_b
w_f	$0.67d_b$	$0.67d_b$

n = total number of bolts.
d_b = bolt diameter (mm).
d = stock diameter (mm), the greater of the diameters d_u or d_l according to **501.** and **502.**
M = the first moment of area of the bolts about the centreline of the coupling flange (cm^3)
e_m = mean distance (mm) of the bolt axes from the centre of the bolt system.
K_s = material factor for the rudder stock as given in **102.**
K_b = material factor for the bolts as given in **102.**
K_f = material factor for the coupling flange as given in **102.**
t_f = the thickness (mm) of the coupling flanges.
w_f = the width (mm) of the material outside the bolt holes of the coupling flanges.

NOTE :
(1) In way horizontal flange couplings, t_f is to be calculated from d_b determined by a number of bolts not exceeding 8.

2. Cone couplings with hydraulic arrangements (oil injection and hydraulic nut, etc.) for mounting and dismounting the coupling are to comply with the following requirements.

(1) Couplings are to have a taper on diameters of 1 : 12 ~ 1 : 20. The push-up force and push-up length are to be at the discretion of the Society.

(2) The nuts fixing the rudder stocks are to be provided with efficient locking devices. However, a securing plate for securing nut against the rudder body is not to be provided.

(3) Couplings of rudder stocks are to be properly protected from corrosion.

(4) The dimensions of the securing nuts are to be as specified **Par 1,** (4).

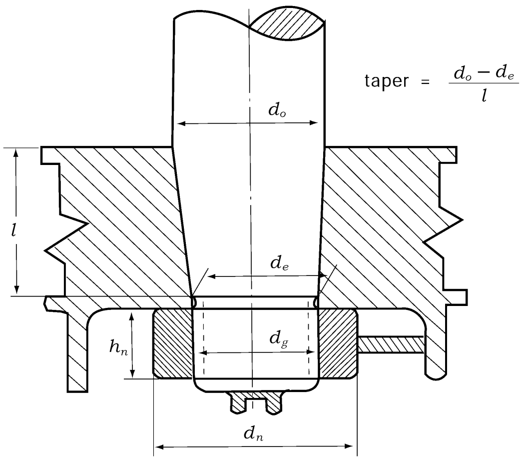

Fig 4.1.4 Cone coupling without hydraulic arrangements

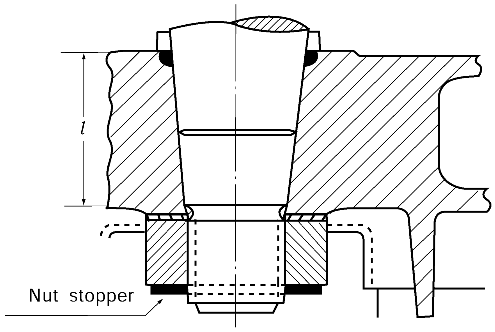

Fig 4.1.5 Cone coupling with hydraulic arrangements

Section 8 Pintles

801. Diameters of pintles

The diameters of pintles d_p are not to be less than the dimension obtained from the following formula.

$$d_p = 0.35\sqrt{BK_p} \quad \text{(mm)}$$

where :

B = reaction force in bearing (N)

K_p = material factor for pintles as given in **102.**

802. Construction of pintles

1. Pintles constructed as taper bolts are to have a taper on the diameter not exceeding the following values, and capable of being fitted to the gudgeons. The nuts fixing the pintles are to be provided with efficient locking devices.

(1) For keyed pintles to be assembled and locked with slugging nuts : 1 : 8 ~ 1 : 12

(2) For pintles mounted with hydraulic arrangements (oil injection and hydraulic nut, etc.) : 1 : 12 ~ 1 : 20

2. The minimum dimensions of the threads and the nuts of pintles are to be determined by applying the requirements in **703. 1** (4) correspondingly.

3. The length of the pintle housing in the gudgeon (*tapered length*) is not to be less than the maximum pintle diameter.

4. Pintles are to be properly protected from corrosion.

Section 9 Bearings of Rudder Stocks and Pintles

901. Minimum bearing surface

The bearing surface A_b (defined as the projected area : *Bearing length* × *outside diameter of sleeve)* is not to be less than the value obtained from the following formula.

$$A_b = \frac{B}{q_a} \quad (\mathrm{mm}^2)$$

where :

B = as specified in **801.**

q_a = allowable surface pressure(N/mm^2). The allowable surface pressure for the various bearing combination is to be taken from **Table 4.1.8.** When verified by tests, however, different values from those in this Table may be taken.

Table 4.1.8 Allowable surface pressure q_a

Bearing material	q_a (N/mm^2)
Lignum vitae	2.5
White metal (oil-lubricated)	4.5
Synthetic materials with hardness between 60 and 70, Shore D (1)	5.5
Steel (2), bronze and hotpressed bronze-graphite materials	7.0

NOTES :
(1) Indentation hardness test at the temperature of 23°C and humidity of 50 %, according to a recognized standard. Synthetic bearings are to be of approved type.
(2) Stainless and wear-resistant steel in an approved combination with a stock liner.

902. Length of bearings

The length / diameter ratio of the bearing surface is not to be greater than 1.2.

903. Bearing clearances

With metal bearings clearances are not to be less than d_{bs}/1000+1.0 (mm) on the diameter.

where :

d_{bs} = the internal diameter of bush (mm).

If non-metallic bearing material is applied, the bearing clearance is to be specially determined considering the material's swelling and thermal expansion properties. This clearance in no way is to be taken less than 1.5 mm on bearing diameter.

904. Thickness of bush and sleeve

The thickness of any bush or sleeve t is not to be less than that obtained from the following formula.

$$t = 0.01\sqrt{B} \quad (\mathrm{mm})$$

where :

B = as specified in **801.**

However, t is not to be less than $t_{\min}$ as follows ;

$t_{\min}$ = 8 mm for metallic materials and synthetic materials

$t_{\min}$ = 22 mm for lignum vitae

Section 10 Rudder Accessories

1001. Rudder carriers

Suitable rudder carriers are to be provided for supporting the weight of rudder according to the form and the weight of the rudder, and care is to be taken to provide efficient lubrication at the support.

1002. Jumping stoppers

Suitable arrangements are to be provided to prevent the rudder from jumping due to wave shocks.

Section 11 Propeller Nozzles

1101. Application

1. The following requirements are applicable to propeller nozzles having an inner diameter of up to 5 m. Nozzles with larger diameters will be specially considered.

2. Special attention is to be given to the support of fixed nozzles at the hull structures.

1102. Design pressure

1. The design pressure for propeller nozzles is to be determined by the following formula:

$$P_d = cP_{do} \quad (\text{kN/m}^2)$$

$$P_{do} = \epsilon \frac{N}{A_p} \quad (\text{kN/m}^2)$$

N = maximum shaft power in (kW)

A_p = propeller disc area in (m^2)

$$A_P = D^2 \frac{\pi}{4}$$

D = propeller diameter in (m)

ϵ = factor according to the following formula:

$$\epsilon = 0.21 - 2 \times 10^{-4} \frac{N}{A_P}$$

$$\epsilon_{\min} = 0.1$$

c = 1.0 in zone 2 (propeller zone)

= 0.5 in zone 1 & 3

= 0.35 in zone 4

1103. Plate thickness

(1) The thickness of the nozzle shell plating is not to be less than:

$$t = 5a\sqrt{P_d} + 2.5 \quad (\text{mm})$$

$$t_{\min} = 7.5 \text{ mm}$$

a = spacing of ring stiffeners in (m)

(2) The web thickness of the internal stiffening rings shall not be less than the nozzles plating for zone 3.

1104. Section modulus

(1) The section modulus of the cross section shown in **Fig 4.1.6** around its neutral axis is not to be less than:

$$W = n \cdot d^2 \cdot b \cdot v_0^2 \quad (\mathrm{cm}^3)$$

d = inner diameter of nozzle in (m)

b = length of nozzle in (m)

n = 1.0 for rudder nozzles

= 0.7 for fixed nozzles.

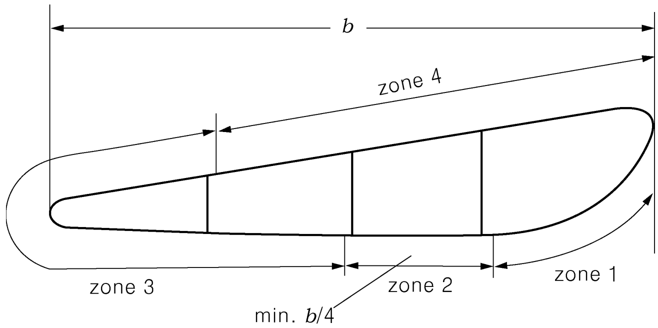

Fig 4.1.6

1105. Welding

The inner and outer nozzle shell plating is to be welded to the internal stiffening rings as far as practicable by double continuous welds. Plug welding is only permissible for the outer nozzle plating. ⚓

CHAPTER 2 HATCHWAYS AND OTHER DECK OPENINGS

Section 1 General

101. Application

1. The requirements apply to steel hatch covers and coaming in position Ⅰ and Ⅱ on weather decks. The requirements in **Ch 9** apply to steel hatch covers of small hatches fitted on the exposed fore deck.

2. Relaxation from the requirements in this Chapter will be specially considered where the ship has an unusually large freeboard.

3. The construction and means for securing the weathertightness of cargo and other hatchways in position I and II as defined **102.** shall be equivalent to the requirements of hatchways closed by weathertight covers of steel or other equivalent materials, unless the application of portable covers and secured weathertight by tarpaulins and battening devices is granted by the Administration.

102. Position of exposed deck openings

For the purpose of this Chapter, two positions of exposed deck openings are defined as follows:

Position I = Upon exposed freeboard and raised quarter decks, and upon exposed superstructure decks situated forward of a point located $0.25L_f$ from the for ward perpendicular.
Position II= Upon exposed superstructure decks situated abaft $0.25L_f$ from the forward perpendicular and upon exposed superstructure decks situated forward of a point located $0.25L_f$ from the forward perpendicular and located at least two standard heights of superstructure above the freeboard deck.

103. Material

The formulae for scantlings given in this Chapter are applicable to steel hatch covers and coaming. The use of materials other than steel is considered by checking that criteria adopted for scantlings are such as to ensure strength and stiffness equivalent to those of steel hatch covers.

104. Net scantlings

The gross scantlings are obtained by the net scantlings adding the corrosion additions. All scantlings referred to in this Chapter, except otherwise specified, are net, i.e. they do not include any margin for corrosion. When calculating the stresses σ and τ in **503.** and **504**, the net scantlings are to be used. The gross scantlings are obtained by the net scantlings adding the corrosion additions.

105. Corrosion additions

1. The corrosion addition for both sides to be considered for the plating and internal members of hatch covers, hatch coamings and coaming stays except stainless steel is equal to the value specified in **Table 4.2.1**.

For structural members made of stainless steel and aluminium alloys, the corrosion addition t_c is to be taken equal to 0 mm.

2. Renewal thickness

Structural drawings for hatch covers and hatch coamings complying with this Chapter are to indicate the renewal thickness ($t_{renewal}$) for each structural elements, given by the following formula in addition to the as built thickness ($t_{as-built}$). If the thickness for voluntary addition is included in the as built thickness, the value may be at the discretion of the Society.

$$t_{renewal} = t_{as-built} - t_c + 0.5 \quad \text{(mm)}$$

where,

t_c : Corrosion addition according to **Table 4.2.1**
In case that corrosion addition t_c is 1.0 mm, renewal thickness may be given by the following formula.

$$t_{renewal} = t_{as-built} - t_c \quad \text{(mm)}$$

Table 4.2.1 Corrosion additions t_c for steel hatch covers and hatch coamings

Corrosion addition t_c (mm)		
Member	Bulk carriers Ore carriers Combination carriers	Others except left column
Plating and stiffeners of single skin hatch cover	2.0	2.0 *
Top and bottom plating of double skin hatch cover	2.0	1.5 *
Internal structures of double skin hatch cover	1.5	1.0
Hatch coamings structures and coaming stays	1.5	1.5
* Corrosion addition t_c=1.0 mm for the hatch covers in may of cellular cargo holds intended for containers.		

106. Allowable stresses

The allowable stresses σ_a and τ_a, in N/mm^2, are to be obtained from **Table 4.2.2**.

Table 4.2.2 Allowable stresses (N/mm^2)

Members of:	σ_a (N/mm^2)	τ_a (N/mm^2)
Weathertight hatch cover	0.80 σ_y	0.46 σ_y
Pontoon hatch cover	0.68 σ_y	0.39 σ_y
Hatch coaming	0.95 σ_y	0.50 σ_y

σ_y : Yielding Stresses

107. External pressures on hatch covers

1. The wave pressure acting on hatch cover plate is as following **Table 4.2.3**. When the loads due to uniform cargoes or containers, etc. other than the weave loads are acting on hatch covers, the loads are to be considered additionally.

Table 4.2.3 Wave pressures on hatch covers

Ware Pressure P_W (kN/m²)			
Length for freeboard, L_f	Location	Position I	Position II
$L_f \geq 100$ m	$0.75 < x/L_f < 1$	$34.3+(14.8+a(L_f-100))(4\frac{x}{L_f}-3)$	
	$0 \leq x/L_f \leq 0.75$	34.3	25.5
$L_f < 100$ m	$0.75 < x/L_f < 1$	$12.2+\frac{L_f}{9}(5\frac{x}{L_f}-2)+3.6\frac{x}{L_f}$	
	$0 \leq x/L_f \leq 0.75$	$14.9+0.195L_f$	$11.3+0.142L_f$

Note :
a : coefficient taken equal to :
a = 0.0726 for Type B freeboard ships
a = 0.356 for Ships assigned reduced freeboard.
L_f : Length for freeboard defined in **Pt 3, Ch 1, Sec 1** (m). But need not be taken greater than 340 m.
x(m) : Distance from the end of stern to the center of hatch cover that should be considered.

Section 2 Arrangements

201. Height of hatchway coamings

1. The height of coamings above the upper surface of deck is to be at least 600 mm in Position I and 450 mm in Position II.

2. For hatchways closed by steel weathertight hatch covers fitted with gaskets and clamping devices, the height of coamings may be reduced from those prescribed in the preceding paragraph or omitted entirely subject to the satisfaction of the Society.

3. The height of hatchway coamings other than those provided in exposed portions of the freeboard or superstructure decks is to be to the satisfaction of the Society having regard to the position of hatchways or the degree of protection provided.

202. Hatch covers

1. Hatch covers on exposed decks are to be weathertight.

Hatch covers in closed superstructures need not be weathertight. However, hatch covers fitted in way of ballast tanks, fuel oil tanks or other tanks are to be watertight.

2. The ordinary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

3. The spacing of primary supporting members parallel to the direction of ordinary stiffeners is to be not greater than 1/3 of the span of primary supporting members.

4. The breadth of the primary supporting member flange is to be not less than 40 % of their depth for laterally unsupported spans greater than 3 m. Tripping brackets attached to the flange may be considered as a lateral support for primary supporting members. The flange outstand is not to exceed 15 times the gross flange thickness.

5. The ends of hatch covers are normally to be protected by efficiently secured galvanised steel strips.

6. Efficient retaining arrangements are to be provided to prevent translation of the hatch cover under the action of the longitudinal and transverse forces exerted by cargoes and stacks of containers on the cover. These retaining arrangements are to be located in way of the hatch coaming side brackets.

- Solid fittings are to be welded on the hatch cover where the corners of the containers are resting. These parts are intended to transmit the loads of the container stacks onto the hatch cover on which they are resting and also to prevent horizontal translation of the stacks by means of special intermediate parts arranged between the supports of the corners and the container corners.
- Longitudinal stiffeners are to stiffen the hatch cover plate in way of these supports and connect at least the nearest three transverse stiffeners.

7. The width of each bearing surface for hatch covers is to be at least 65 mm.

8. Steel hatchway covers of deep tanks are to be to the satisfaction of the Society.

9. In the case of sand carriers and dredgers, hatchway covers may be omitted at the discretion of the Society.

10. The arrangements for securing weathertightness are to be ensured that the tightness can be maintained in any sea conditions. For this purpose, tests for the tightness of covers are to be required to a water pressure of not less than 0.2 MPa at the initial survey and may also be required at periodical surveys and at annual surveys at the discretion of the Surveyor.

203. Hatch coamings

1. Coamings, stiffeners and brackets are to be capable of withstanding the local forces in way of the clamping devices and handling facilities necessary for securing and moving the hatch covers as well as those due to cargo stowed on the latter.

2. Special attention is to be paid to the strength of the fore transverse coaming of the forward hatch and to the scantlings of the closing devices of the hatch cover on this coaming.

3. Longitudinal coamings are to be extended at least to the lower edge of deck beams.

- Where they are not part of continuous deck girders, longitudinal coamings are to extend for at least two frame spaces beyond the end of the openings.
- Where longitudinal coamings are part of deck girders, their scantlings are to be as requirements of deck girder.

4. A web frame or a similar structure is to be provided below the deck in line with the transverse coaming. Transverse coamings are to extend below the deck and to be connected with the web frames.

Section 3 Width of attached plating

301. Ordinary stiffeners

The width of the attached plating to be considered for the check of ordinary stiffeners is to be obtained, in m, from the following formulae:

Where the attached plating extends on both sides of the stiffener : $b_r = S$

Where the attached plating extends on one side of the stiffener : $b_r = 0.5S$

S : Length, in mm, of the shorter side of the elementary plate panel.

302. Primary supporting members

The effective width of the attached plating to be considered for the yielding and buckling checks of primary supporting members analysed through isolated beam or grillage model is to be obtained, in m, from the following formulae:

Where the plating extends on both sides of the primary supporting member : $b_p = b_{p1} + b_{p2}$

Where the plating extends on one side of the primary supporting member : $b_p = b_{p1}$

where :

$b_{p1} = \min(0.165 l_p, S_{p1})$ (m)

$b_{p2} = \min(0.165 l_p, S_{p2})$ (m)

l_p : Span, in m, of the considered primary supporting member

S_{p1}, S_{p2} : Half distance, in m, between the considered primary supporting member and the adjacent ones, S_{p1} for one side, S_{p2} for the other side.

When a isolated beam or a grillage analysis is used, the ordinary stiffeners are not to be included in the attached flange area of the primary members.

Section 4 Load Model

401. Lateral pressures and concentrated loads

1. General

The lateral pressures and concentrated loads to be considered as acting on hatch covers are indicated in **2.** to **6.** When two or more panels are connected by hinges, each individual panel is to be considered separately. In any case, the sea pressures defined in **2.** are to be considered for hatch covers located on exposed decks. Additionally, when the hatch cover is intended to carry uniform cargoes, special cargoes or containers, the pressures and forces defined in **3.** to **6.** are to be considered independently from the sea pressures.

2. Sea pressures

The still water and wave lateral pressures are to be considered and are to be taken equal to:

still water pressure : $P_s = 0$

wave pressure P_w is equal to the value specified in **Table 4.2.3.**

3. Internal pressures due to liquid cargo or ballast tanks

If applicable, the still water and wave lateral pressures are to be considered and to comply with the applicable provisions of the Society.

4. Pressures due to uniform cargoes

If applicable, the still water and wave lateral pressures are to be considered and to comply with the applicable provisions of the Society.

5. Pressures due to special cargoes

In the case of carriage on the hatch covers of special cargoes (e.g. pipes, etc.) which may temporarily retain water during navigation, the lateral pressure to be applied is considered by the Society on a case by case basis.

6. Forces due to containers

In the case of carriage of containers on the hatch covers, the concentrated forces under the containers corners are to be determined in accordance with the applicable requirements of the Society.

402. Load point

1. Wave lateral pressure for hatch covers on exposed decks

The wave lateral pressure to be considered as acting on each hatch cover is to be calculated at a point located :

longitudinally, at the hatch cover mid-length

transversely, on the longitudinal plane of symmetry of the ship
vertically, at the top of the hatch coaming.

2. Lateral pressures other than the wave pressure

The lateral pressure is to be calculated :

- in way of the geometrical centre of gravity of the plate panel, for plating
- at mid-span, for ordinary stiffeners and primary supporting members.

Section 5 Strength Check

501. General

1. Application

The strength check is applicable to rectangular hatch covers subjected to a uniform pressure, designed with primary supporting members arranged in one direction or as a grillage of longitudinal and transverse primary supporting members. In the latter case, the stresses in the primary supporting members are to be determined by a grillage or a finite element analysis. It is to be checked that stresses induced by concentrated loads are in accordance with the criteria in **504. 4.**

2. Hatch covers supporting containers

The scantlings of hatch covers supporting container stacks are to comply with the applicable provisions of the Society.

3. Hatch covers subjected to concentrated loads

For hatch covers supporting concentrated loads, ordinary stiffeners and primary supporting members are generally to be checked by direct calculations, taking into account the stiffener arrangements and their relative inertia. It is to be checked that stresses induced by concentrated loads are in accordance with the criteria in **503.** & **504.**

4. Covers of small hatchways

The gross thickness of covers is to be not less than 8 mm. This thickness is to be increased or an efficient stiffening fitted to the Society's satisfaction where the greatest horizontal dimension of the cover exceeds 0.6 m.

502. Plating

1. Net thickness

The net thickness of steel hatch cover top plating, in mm, is to be not less than the value obtained from the following formula :

$$t = 15.8 F_p S \sqrt{\frac{P_s + P_w}{0.95\sigma_y}} \quad \text{(mm)}$$

F_p : Factor for combined membrane and bending response, equal to :

F_p = 1.5 in general, for $\frac{\sigma}{\sigma_a} < 0.8$, for the attached plating of primary supporting members

$F_p = 1.9\frac{\sigma}{\sigma_a}$, for $\frac{\sigma}{\sigma_a} \geq 0.8$, for the attached plating of primary supporting members

S : Spacing of stiffeners. (m)

P_s : Still water pressure. (kN/m^2)

P_w : Wave pressure. (kN/m^2)

σ : Normal stress (N/mm^2) in the attached plating of primary supporting members, calculated according to **504. 3** or determined through a grillage analysis or a finite element analysis, as the case may be.

σ_a : Allowable stress (N/mm^2)

σ_y : The yield stress of material (N/mm^2)

2. Minimum net thickness

The net thickness, in mm, of hatch cover plating is to be not less than the greater of the following values :

$t = 0.01S$

$t = 6$

3. Critical buckling stress check

The compressive stress σ in the hatch cover plating, induced by the bending of primary supporting members, either parallel or perpendicular to the direction of ordinary stiffeners, calculated according to **504. 3** or determined through a grillage analysis or a finite element analysis, as the case may be, is to comply with the following formula:

(1) The compressive stress, σ, in the hatch cover plate panels, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, and the critical buckling stress, σ_{CP}, are to be evaluated as defined below :

$$\sigma \le 0.8\sigma_{CP}$$

$$\sigma_{CP} = \sigma_{E1} \quad \text{when } \sigma_{E1} \le \frac{\sigma_y}{2}$$

$$= \sigma_y\left[1 - \frac{\sigma_y}{4\sigma_{E1}}\right] \quad \text{when } \sigma_{E1} > \frac{\sigma_y}{2}$$

σ_y : Minimum upper yield stress or proof stress of the material (N/mm^2)

$$\sigma_{E1} = 3.6E\left(\frac{t}{1000S}\right)^2$$

E : Modulus of elasticity of the material to be assumed equal to for steel 2.06×10^5 (N/mm^2)

t : Net thickness of plate panel (mm)

S : Spacing of secondary stiffeners (m)

(2) The mean compressive stress, σ, in each of the hatch cover plate panels, induced by the bending of primary supporting members perpendicular to the direction of secondary stiffeners, and the critical buckling stress, σ_{CP}, to be evaluated as defined below :

$$\sigma \le 0.8\sigma_{CP}$$

$$\sigma_{CP} = \sigma_{E2} \quad \text{when } \sigma_{E2} \le \frac{\sigma_y}{2}$$

$$= \sigma_y\left[1 - \frac{\sigma_y}{4\sigma_{E2}}\right] \quad \text{when } \sigma_{E2} > \frac{\sigma_y}{2}$$

σ_y : Minimum upper yield stress or proof stress of the material (N/mm^2)

$$\sigma_{E2} = 0.9mE\left(\frac{t}{1000S_s}\right)^2$$

$$m = C\left[1+\left(\frac{S_s}{l_s}\right)^2\right]^2 \frac{2.1}{\Psi+1.1}$$

E : Modulus of elasticity of the material to be assumed equal to for steel 2.06×10^5 (N/mm^2),

t : Net thickness of plate panel (mm)

S_s : Length of the shorter side of the plate panel (m)

l_s : Length of the longer side of the plate panel (m)

Ψ : Ratio between smallest and largest compressive stress

C : Coefficients obtained according to the kind of stiffeners at compressive side, which are given by the followings :

1.30 when plating is stiffened by primary supporting members

1.21 when plating is stiffened by secondary stiffeners of angle or T type

1.10 when plating is stiffened by secondary stiffeners of bulb type

1.05 when plating is stiffened by flat bar

(3) The biaxial compressive stress in the hatch cover panels, when calculated by means of FEM shell element model, is to be at the Society's discretion.

503. Ordinary stiffeners

1. For flat bar ordinary stiffeners, the ratio h_W/t_W is to comply with the following formula :

$$\frac{h_W}{t_W} \le 15\sqrt{\frac{235}{\sigma_y}}$$

where:

h_W : Web height, in mm, of the ordinary stiffener.

t_W : Net thickness, in mm, of the ordinary stiffener.

2. Net section modulus and net shear sectional area

The net section modulus Z, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of an ordinary stiffener subject to lateral pressure are to be not less than the values obtained from the following formulae :

$$Z = \frac{(P_s+P_w)S l_s^2 10^3}{m\sigma_a} \quad (\text{cm}^3)$$

$$A_{sh} = \frac{5(P_s+P_w)S l_s}{\tau_a} \quad (\text{cm}^2)$$

where:

m : Boundary coefficient for ordinary stiffeners and primary supporting members, taken equal to :

- m = 8 in the case of ordinary stiffeners and primary supporting members simply supported at both ends or supported at one end and clamped at the other end
- m = 12 in the case of ordinary stiffeners and primary supporting members clamped at

both ends

l_s : Ordinary stiffener span, in m, to be taken as the spacing, in m, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all ordinary stiffener spans, the ordinary stiffener span may be reduced by an amount equal to 2/3 of the minimum brackets arm length, but not greater than 10 % of the gross span, for each bracket.

3. Critical buckling stress check

(1) The compressive stress σ in the top flange of secondary stiffeners, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, and the critical buckling stress σ_{CS}, to be evaluated as defined below :

$$\sigma \le 0.8\sigma_{CP}$$

$$\sigma_{CS} = \sigma_{ES} \quad \text{when} \quad \sigma_{ES} \le \frac{\sigma_y}{2}$$

$$= \sigma_y\left[1-\frac{\sigma_y}{4\sigma_{ES}}\right] \quad \text{when} \quad \sigma_{ES} > \frac{\sigma_y}{2}$$

where,

σ_y = minimum upper yield stress, in N/mm^2, of the material

σ_{ES} = ideal elastic buckling stress, in N/mm^2, of the secondary stiffener

= minimum between σ_{E3} and σ_{E4}

$$\sigma_{E3} = \frac{0.001\,EI_a}{Al^2}$$

E = modulus of elasticity, in N/mm^2

= 2.06×10^5 for steel

I_a = moment of inertia, in cm^4, of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners

A = cross-sectional area, in cm^2, of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners

l = span, in m, of the secondary stiffener

$$\sigma_{E4} = \frac{\pi^2 EI_w}{10^4 I_p l^2}\left(m^2+\frac{K}{m^2}\right)+0.385\,E\frac{I_t}{I_p}$$

$$K = \frac{Cl^4}{\pi^4 EI_w}\times 10^6$$

m = number of half waves, given by the following table :

	$0<K\le 4$	$4<K\le 36$	$36<K\le 144$	$(m-1)^2 m^2 < K \le m^2(m+1)^2$
m	1	2	3	m

I_w = sectorial moment of inertia, in cm^6, of the secondary stiffener about its connection with the plating

$= \dfrac{h_w^3\ t_w^3}{36} \times 10^{-6}$ for flat bar secondary stiffeners

$= \dfrac{t_f\ b_f^3\ h_w^2}{12} \times 10^{-6}$ for "Tee" secondary stiffeners

$= \dfrac{b_f^3\ h_w^2}{12(b_f + h_w)^2}\left[t_f\,(b_f^2 + 2b_f\,h_w + 4h_w^2) + 3t_w\,b_f\,h_w\right] \times 10^{-6}$ for angles and bulb secondary stiffener

I_p = polar moment of inertia, in cm^4, of the secondary stiffener about its connection with the plating

$= \dfrac{h_w^3\ t_w}{3} \times 10^{-4}$ for flat bar secondary stiffeners

$= \left(\dfrac{h_w^3\ t_w}{3} + h_w^2\ b_f\ t_f\right) \times 10^{-4}$ for flanged secondary stiffeners

I_t = St Venant's moment of inertia, in cm^4, of the secondary stiffener without top flange

$= \dfrac{h_w\ t_w^3}{3} \times 10^{-4}$ for flat bar secondary stiffeners

$= \dfrac{1}{3}\left[h_w\ t_w^3 + b_f\ t_f^3\left(1 - 0.63\dfrac{t_f}{b_f}\right)\right] \times 10^{-4}$ for flanged secondary stiffeners

h_w, t_w = height and net thickness, in mm, of the secondary stiffener, respectively

b_f, t_f = width and net thickness, in mm, of the secondary stiffener bottom flange, respectively

C = spring stiffness exerted by the hatch cover top plating

$$= \frac{k_p\ E\,t_p^3}{3S\left(1 + \dfrac{1.33k_p\ h_w\ t_p^3}{1000\,St_w^3}\right)} \times 10^{-3}$$

k_p = $1 - \eta_p$, to be taken not less than zero for flanged secondary stiffeners, k_p need not be taken less than 0.1

$\eta_p = \dfrac{\sigma}{\sigma_{E1}}$

σ = as defined in **502. 1**

σ_{E1} = as defined in **502. 3** (1)

t_p = net thickness, in mm, of the hatch cover plate panel

(2) For flat bar secondary stiffeners and buckling stiffeners, the ratio h / t_w is to be not greater than $15\ k^{0.5}$,

where:

h, t_w = height and net thickness of the stiffener, respectively

k = $235 / \sigma_y$

σ_y = minimum upper yield stress, in N/mm^2, of the material.

504. Primary supporting members

1. Application

The requirements in **3** to **5** apply to primary supporting members which may be analysed through isolated beam models. Primary supporting members whose arrangement is of a grillage type and which cannot be analysed through isolated beam models are to be checked by direct calculations, using the checking criteria in **4**.

2. Normal and shear stress for isolated beam

In case that grillage analysis or finite element analysis are not carried out, according to the requirements in **1**, the maximum normal stress σ and shear stress τ in the primary supporting members are to be obtained, in N/mm^2, from the following formulae:

$$\sigma = \frac{S(P_s + P_w) l_m^2 10^3}{mZ} \quad (\text{N/mm}^2)$$

$$\tau = \frac{5S(P_s + P_w) l_m}{A_{sh}} \quad (\text{N/mm}^2)$$

m : Boundary coefficient for ordinary stiffeners and primary supporting members, taken equal to :

- m = 8 in the case of ordinary stiffeners and primary supporting members simply supported at both ends or supported at one end and clamped at the other end
- m = 12 in the case of ordinary stiffeners and primary supporting members clamped at both ends

l_m : Span of the primary supporting member, in m

S : Spacing of secondary stiffener, in m

A_{sh} : Net shear sectional area, in cm^2

Z : Net section modulus, in cm^3

3. Checking criteria

The normal stress σ and the shear stress τ, calculated according to 3. or determined through a grillage analysis or finite element analysis, as the case may be, are to comply with the following formulae :

$$\sigma \le \sigma_a$$

$$\tau \le \tau_a$$

4. Deflection limit

The net moment of inertia of a primary supporting member is to be such that the deflection does not exceed

$$\mu_{\max}$$

where:

μ : Coefficient taken equal to :

$0.0056\, l_{\max}$ for weathertight hatch covers

$0.0044\, l_{\max}$ for pontoon hatch covers

$l_{\max}$: Greatest span, in m, of primary supporting members.

5. Critical buckling stress check of the web panels of the primary supporting members.

(1) This check is to be carried out for the web panels of primary supporting members, formed by web stiffeners or by the crossing with other primary supporting members, the face plate (or the bottom cover plate) or the attached top cover plate.

(2) The shear stress τ in the web panels of the primary supporting members, calculated according to [5.4.3] or determined through a grillage analysis or a finite element analysis, as the case may be, is to comply with the following formulae :

$$\tau \le 0.8\tau_C$$

$$\tau_C = \tau_E \qquad \text{when } \tau_E \le \frac{\tau_F}{2}$$

$$= \tau_F\left[1 - \frac{\tau_F}{4\tau_E}\right] \qquad \text{when } \tau_E > \frac{\tau_F}{2}$$

where,

$\tau_F = \dfrac{\sigma_y}{\sqrt{3}}$

σ_y = minimum upper yield stress, in N/mm^2, of the material

$\tau_E = 0.9\, k_t\, E \left[\dfrac{t_{pr,n}}{1000\, d}\right]^2$

E = modules of elasticity, in N/mm^2

= 2.06 × 105 for steel

$t_{pr,n}$ = net thickness, in mm, of primary supporting member

$k_t = 5.35 + \dfrac{4.0}{(a/d)^2}$

a = greater dimension, in m, of web panel of primary supporting member

d = smaller dimension, in m, of web panel of primary supporting member.

(3) For primary supporting members parallel to the direction of secondary stiffeners, the actual dimensions of the panels are to be considered.

(4) For primary supporting members perpendicular to the direction of secondary stiffeners or for hatch covers built without secondary stiffeners, a presumed square panel of dimension d is to be taken for the determination of the stress τ_C. In such a case, the average shear stress τ between the values calculated at the ends of this panel is to be considered.

6. Primary supporting members of variable cross-section

The net section modulus of primary supporting members with a variable cross-section is to be not less than the greater of the value obtained from the following formulae and the use of these formulae is limited to the determination of the strength of primary supporting members in which abrupt changes in the cross-section do not occur along their length. :

$$Z = Z_{CS} \quad (\text{cm}^3)$$

$$Z = \left(1 + \frac{3.2\alpha - \psi - 0.8}{7\psi + 0.4}\right) Z_{CS} \quad (\text{cm}^3)$$

Z_{CS}: Net section modules calculated with considering the net thickness, in cm^3, for a constant cross-section, complying with the checking criteria in **504. 4.**

$\alpha = \dfrac{l_1}{l_0}$

$\psi = \dfrac{Z_1}{Z_0}$

l_1 : Length of the variable section part, in m (see **Fig 4.2.1**)

l_0 : Span measured, in m, between end supports (see **Fig 4.2.1**)

Z_1 : Net section modulus calculated with considering the net thickness at end, in cm^3 (see **Fig 4.2.1**)

Z_0 : Net section modulus calculated with considering the net thickness at mid-span, in cm^3 (see **Fig 4.2.1**)

Moreover, the net moment of inertia of primary supporting members with a variable cross-section calculated with considering it's net thickness is to be not less than the greater of the values obtained, in cm^4, from the following formulae :

$$I = I_{CS} \quad (cm^4)$$

$$I = (1 + 8\alpha^3 (\frac{1-\phi}{0.2 + 3\sqrt{\phi}})) I_{CS} \quad (cm^4)$$

I_{CS} : Net moment of inertia with a constant cross-section calculated with considering the net thickness, in cm^4, complying with **504. 5.**

$$\phi = \frac{I_1}{I_0}$$

I_1 : Net moment of inertia calculated with considering the net thickness at end with considering the net thickness, in cm^4 (see **Fig 4.2.1**)

I_0 : Net moment of inertia calculated with considering the net thickness at mid-span with considering the net thickness, in cm^4 (see **Fig 4.2.1**)

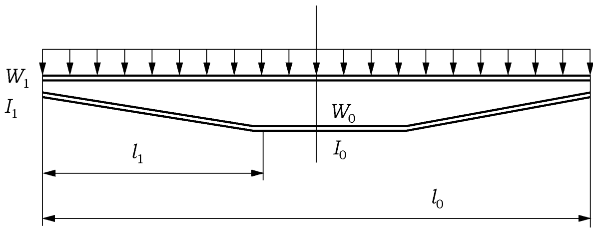

Fig 4.2.1 Variable cross-section stiffener

7. Buckling stiffeners on webs of primary supporting members

For buckling stiffeners on webs of primary supporting members, the ratio h_w / t_w is to comply with the following formulae :

$$\frac{h_w}{t_w} \le 15\sqrt{\frac{235}{\sigma_y}}$$

h_w : Web height of the stiffener (mm)

t_w : Net thickness of the stiffener (mm)

Section 6 Hatch Coamings

601. Stiffening

1. The ordinary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

2. Coamings are to be stiffened on their upper edges with a stiffener suitably shaped to fit the hatch cover closing appliances. Moreover, when covers are fitted with tarpaulins, an angle or a bulb section is to be fitted all around coamings of more than 3 m in length or 600 mm in height; this stiffener is to be fitted at approximately 250 mm below the upper edge. The width of the horizontal flange of the angle is not to be less than 180 mm.

3. Where hatch covers are fitted with tarpaulins, coamings are to be strengthened by brackets or stays with a spacing not greater than 3 m. Where the height of the coaming exceeds 900 mm, additional strengthening may be required. However, reductions may be granted for transverse coamings in protected areas.

4. When two hatches are close to each other, underdeck stiffeners are to be fitted to connect the longitudinal coamings with a view to maintaining the continuity of their strength. Similar stiffening is to be provided over 2 frame spacings at ends of hatches exceeding 9 frame spacings in length. In some cases, the Society may require the continuity of coamings to be maintained above the deck.

5. Where watertight metallic hatch covers are fitted, other arrangements of equivalent strength may be adopted.

602. Load model

1. The lateral pressure P_c to be considered as acting on the hatch coamings are as follows.

(1) The pressure on the forward transverse hatch coaming of the foremost cargo hold is given by P_c = 290 (kN/m^2)
Where a forecastle deemed appropriate by the Society is fitted, however, this pressure may be reduced to 220 (kN/m^2).

(2) The pressure on the other coamings is given by P_c = 220 (kN/m^2)

(3) For cargo holds intended for the carriage of liquid cargoes, the liquid internal pressures applied on hatch coaming is also to be determined.

2. Where forward transverse hatch coaming of ships other than Bulk Carrier is protected by the adjacent forward cargo hold hatch or other structures effectively against the green sea forces the pressure may be suitably reduced in accordance with the discretion of the Society.

603. Scantlings

1. Plating

(1) The net thickness of the forward and side hatch coaming plate is not to be less than that obtained from the following formulae. The net thickness is not to be less than 9.5 mm.

$$t = 15.98S\sqrt{\frac{P_c}{0.95\sigma_y}}$$

S : The spacing of ordinary stiffener (m)

(2) For aft hatch coamings
- Where L is 100 m and under : $t = 4.5 + 0.05L$ (mm)
- Where L is greater than 100 m : $t = 9.5$ (mm)

2. Ordinary stiffeners

The net section modulus of the longitudinal or transverse ordinary stiffeners of hatch coamings is to be not less than the value obtained, in cm3, from the following formulae :

$$Z = 1.21 \frac{P_c S l^2 10^3}{m c_p \sigma_y}$$

l = span, in m

m = 16 in general

= 12 for the end span of stiffeners sniped at the coaming corners

c_p = Ratio of the plastic section modulus to the elastic section modulus of the ordinary stiffeners with an attached plate breadth, in mm, equal to 40 t, where t is the plate net thickness.

= 1,16 in the absence of more precise evaluation.

3. Coaming stays

The net section modulus, in cm^3, and the net thickness t_w, in mm, of the coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (examples shown in **Fig 4.2.2** and **Fig 4.2.3**) are to be not less than the values obtained from the following formulae :

$$Z = \frac{S_c P_c H_c^2 10^3}{2\sigma_a} \text{ (cm}^3\text{)}$$

$$t_w = \frac{S_c P_c H_c 10^3}{h \tau_a} \text{ (cm}^3\text{)}$$

where, H_c : Stay height, in m

S_c : Stay spacing, in m

h : Stay depth, in mm, at the connection with deck.

For calculating the section modules of coaming stays, their face plate area is to be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it.

For other designs of coaming stays, such as, for example, those shown in **Fig 4.2.4** and **Fig 4.2.5**, the stress levels determined through a grillage analysis or finite element analysis, as the case may be, apply and are to be checked at the highest stressed locations. The stress levels are to comply with the following formulae :

$\sigma \leq \sigma_a$

$\tau \leq \tau_a$

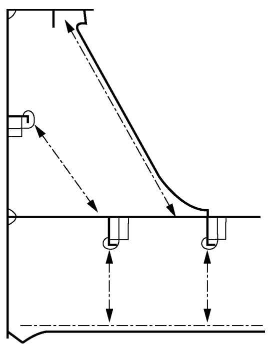

Fig 4.2.2 Coaming stay #1

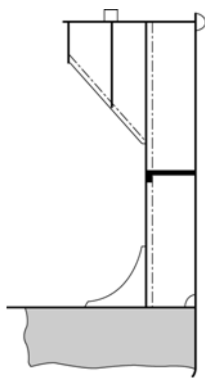

Fig 4.2.3 Coaming stay #2

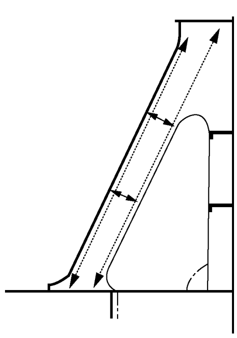

Fig 4.2.4 Coaming stay #3

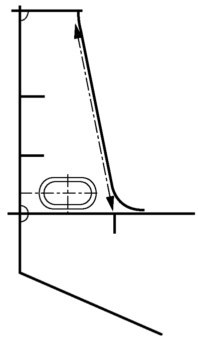

Fig 4.2.5 Coaming stay #4

4. Local details

(1) The design of local details is to comply with the requirements in this section for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below.
(2) Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.
(3) The normal stress σ and the shear stress τ, in N/mm^2, induced in the underdeck structures by the loads transmitted by stays are to comply with the following formulae :

$$\sigma \le \sigma_a$$

$$\tau \le \tau_a$$

(4) Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the Society's requirements.
(5) Double continuous fillet welding is to be adopted for the connections of stay webs with deck plating and the weld throat thickness is to be not less than 0.44 t_w, where t_w is the gross thickness of the stay web.
(6) Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15% of the stay width.

5. Coamings of small hatchways

The coaming plate thickness is to be not less than the lesser of the following values:

- the thickness for the deck inside line of openings calculated for that position, assuming as spacing of stiffeners the lesser of the values of the height of the coaming and the distance between its stiffeners, if any,
- 10 mm.

Coamings are to be suitably strengthened where their height exceeds 0.8 m or their greatest horizontal dimension exceeds 1.2 m, unless their shape ensures an adequate rigidity.

Section 7 Weathertightness, Closing Arrangement, Securing Devices and Stoppers

701. Weathertightness

1. Where the hatchway is exposed and closed with a single panel, the weathertightness is to be ensured by gaskets and clamping devices sufficient in number and quality. Weathertightness may also be ensured means of tarpaulins.

702. Gaskets

1. The weight of hatch covers and any cargo stowed thereon, together with inertia forces generated by ship motions, are to be transmitted to the ship's structure through steel to steel contact. This may be achieved by continuous steel to steel contact of the hatch cover skirt plate with the ship's structure or by means of defined bearing pads.

2. The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements. Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and to be made of a corrosion-resistant material.

3. The gasket and the securing arrangements are to maintain their efficiency when subjected to large relative movements between the hatch cover and the ship's structure or between hatch cover elements. If necessary, suitable devices are to be fitted to limit such movements.

4. The gasket material is to be of a quality suitable for all environmental conditions likely to be encountered by the ship, and is to be compatible with the cargoes transported. The material and form of gasket selected are to be considered in conjunction with the type of hatch cover, the securing arrangement and the expected relative movement between the hatch cover and the ship's structure. The gasket is to be effectively secured to the hatch cover.

5. Coamings and steel parts of hatch covers in contact with gaskets are to have no sharp edges.

6. Metallic contact is required for an earthing connection between the hatch cover and the hull structures. If necessary, this is to be achieved by means of a special connection for the purpose.

7. In case of container ship with unusually large freeboard, gaskets may be omitted and clamping devices for steel hatchway covers may be suitably dispensed with at the discretion of the Society.

703. Closing arrangement, securing devices and stoppers

1. General

Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements. The securing and stop arrangements are to be fitted using appropriate means which cannot be easily removed. In addition to the requirements above, all hatch covers, and in particular those carrying deck cargo, are to be effectively secured against horizontal shifting due to the horizontal forces resulting from ship motions. Towards the ends of the ship, vertical acceleration forces may exceed the gravity force. The resulting lifting forces are to be considered when dimensioning the securing devices according to **5.** to **7.** Lifting forces from cargo secured on the hatch cover during rolling are also to be taken into account. Hatch coamings and supporting structure are to be adequately stiffened to accommodate the loading from hatch covers. Hatch covers provided with special sealing devices, insulated hatch covers, flush hatch covers and those having coamings of a reduced height (see **201**) are considered by the Society on a case by case basis. In the case of hatch covers carrying containers, the scantlings of the closing devices are to take into account the possible upward vertical forces transmitted by the containers.

2. Arrangements

The securing and stopping devices are to be arranged so as to ensure sufficient compression on gaskets between hatch covers and coamings and between adjacent hatch covers. Arrangement and spacing are to be determined with due attention to the effectiveness for weathertightness, depending on the type and the size of the hatch cover, as well as on the stiffness of the hatch cover edges between the securing devices. At cross-joints of multipanel covers, (male/female) vertical guides are to be fitted to prevent excessive relative vertical deflections between loaded/unloaded panels. The location of stoppers is to be compatible with the relative movements between hatch covers and the ship's structure in order to prevent damage to them. The number of stoppers is to be as small as possible.

3. Spacing

The spacing of the securing arrangements is to be generally not greater than 6 m.

4. Construction

Securing arrangements with reduced scantlings may be accepted provided it can be demonstrated that the possibility of water reaching the deck is negligible. Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or hatch covers. Individual securing devices on each hatch cover are to have approximately the same stiffness characteristics.

5. Area of securing devices

The gross cross area of each securing device is not to be less than the value obtained, in cm^2, from the following formula :

$$A = 1.4 S_S \left(\frac{235}{\sigma_y} \right)^{\alpha}$$

where,

S_S : Spacing, in m, of securing devices

α : Coefficient taken equal to: (0.75 for $\sigma_y > 235$ N/mm^2,
1.00 for $\sigma_y \leq 235$ N/mm^2)

In the above calculations, σ_y may not be taken greater than $0.7\sigma_t$.

Between hatch cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by securing devices. For packing line pressures exceeding 5 N/mm, the net cross area A is to be increased in direct proportion. The packing line pressure is to be specified. In the case of securing arrangements which are particularly stressed due to the unusual width of the hatchway, the net cross area A of the above securing arrangements is to be determined through direct calculations.

6. Inertia of edges elements

The hatch cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia of edge elements is to be not less than the value obtained, in cm^4, from the following formula :

$$I = 6 P_L S_S^4$$

where:

P_L : Packing line pressure, in N/mm, to be taken not less than 5 N/mm

S_S : Spacing, in m, of securing devices

7. Diameter of rods or bolts

Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

8. Stoppers

Hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure 175 kN/m^2. With the exclusion of No.1 hatch cover, hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.

No.1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m^2. This pressure may be reduced to 175 kN/m^2 when a forecastle is fitted.

The equivalent stress in stoppers, their supporting structures and calculated in the throat of the stopper welds is to be equal to or less than the allowable value, equal to 0.8 σ_y.

704. Tarpaulins

1. Where weathertightness of hatch covers is ensured by means of tarpaulins, at least two layers of tarpaulins are to be fitted. Tarpaulins are to be free from jute and waterproof and are to have adequate characteristics of strength and resistance to atmospheric agents and high and low temperatures. The mass per unit surface of tarpaulins made of vegetable fibres, before the waterproofing treatment, is to be not less than :

- for waterproofing by tarring : 0.65 kg/m^2
- for waterproofing by chemical dressing : 0.60 kg/m^2
- for waterproofing by dressing with black oil : 0.55 kg/m^2

In addition to tarpaulins made of vegetable fibres, those of synthetic fabrics or plastic laminates may be accepted by the Society provided their qualities, as regards strength, waterproofing and resistance to high and low temperatures, are equivalent to those of tarpaulins made of vegetable fibres.

705. Cleats

1. Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

2. Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

706. Wedges, battens and locking bars

1. Wedges

Wedges are to be of tough wood, generally not more than 200 mm in length and 50 mm in width. They are generally to be tapered not more than 1 in 6 and their thickness is to be not less than 13 mm.

2. Battens and locking bars

For all hatches steel bars or equivalent means shall be provided in order efficiently and independently to secure each section of hatch covers after tarpaulins are battened down. Hatch covers of more than 1.5 m in length shall be secured by at least two securing appliances. Acceptable equivalent means to steel bars shall consist of devices and materials which will provide strength equivalent to, and elasticity not greater than that of, steel. Steel wire rope cannot be regarded as satisfactory equivalent means.

Section 8 Additional Requirements

801. Portable beams

1. Carriers and sockets for portable beams are to be of substantial construction, having a minimum beaming surface of 75 mm, and are to be provided with means for efficient fitting and securing of the beams.

2. Coamings are to be stiffened in way of carriers and sockets by providing stiffeners from these fittings to the deck or equivalent strengthening.

3. Where sliding type of beams is used, the arrangement is to ensure that the beams remain properly in position where the hatchway is closed.

4. The depth of portable beams and the width of their face plates are to be suitable to ensure lateral stability of the beams. The depth of beams at their ends is not to be less than 0.4 times the depth at mid-span or 150 mm, whichever is greater.

5. The upper face plates of portable beams are to extend to the extreme ends of the beams. The web plates, for at least 180 mm at each ends, are to be increased in thickness to at least twice that at mid-span or to be reinforced with doubling plates.

6. Portable beams are to be provided with suitable gear for lifting on and off without getting upon them.

7. Portable beams are to be clearly marked to indicate the deck, hatchway and position to which they belong.

802. Steel pontoon cover

1. The depth of steel pontoon covers at supports is not to be less than one-third the depth at mid-span or 150 mm, whichever is greater.

2. The width of bearing surface for steel pontoon covers is not to be less than 75 mm.

3. Steel pontoon covers are to be clearly marked to indicate the deck, hatchway and position to which they belong.

803. Tarpaulins and securing arrangements for hatchway closed by portable covers

1. Battens are to be efficient for securing the tarpaulins and not to be less than 65 mm in width and 9 mm in thickness.

2. Wedges are to be fit the regulations of **706. 1.**

3. Cleats are to be set to fit the taper of the wedges. They are to be at least 65 mm wide and to be spaced not more than 600 mm from centre to centre. The cleats along each side are to be arranged not more than 150 mm apart from the hatch corners.

Section 9 Drainage

901. Arrangement

1. Drainage is to be arranged inside the line of gaskets by means of a gutter bar or vertical extension of the hatch side and end coaming.

2. Drain openings are to be arranged at the ends of drain channels and are to be provided with efficient means for preventing ingress of water from outside, such as non-return valves or equivalent.

3. Cross-joints of multi-panel hatch covers are to be arranged with drainage of water from the space above the gasket and a drainage channel below the gasket.

4. If a continuous outer steel contact is arranged between the cover and the ship's structure, drainage from the space between the steel contact and the gasket is also to be provided.

Section 10 Miscellaneous Openings

1001. Companionways

1. All openings in freeboard decks other than hatchways are to be protected by an enclosed superstructure, or by a deckhouse or companionway of equivalent strength.

2. In Position I the height above the deck of sills at the doorways in companionways is to be at least 600 mm. In Position II it is to be at least 380 mm.

1002. Protection of machinery space openings

Machinery space openings are to be efficiently enclosed by steel casings of ample strength. Machinery openings provided on freeboard deck are to be placed in superstructures or deckhouses as far as possible. Where the casings are not protected by other structures, the sills of access openings are not to be less than 600 mm in height above the deck in Position I and not to be less than 380 mm in Position II. The access openings are to be provided with permanent closures.

1003. Closures for access openings or openings

1. Annular spaces around funnels and all other openings in the machinery casings are to be provided with closing means capable of being operated from outside the machinery space in case of fire.

2. Access openings in the machinery spaces are to be provided with steel doors and to be located in enclosed positions as far as possible. Access openings above freeboard deck not within an enclosed superstructure are to be provided with doors capable of being closed and secured from both sides. Doors to exposed access openings on freeboard and sunken poop decks are to be of the outward opening type.

3. Exposed openings on tops of machinery casings are to be provided with covers capable of being readily closed and secured. ⚓

CHAPTER 3 BOW DOORS, SIDE AND STERN DOORS

Section 1 Bow Doors and Inner Doors

101. General

1. Application

(1) These requirements apply to the arrangement, strength and securing of bow doors and inner doors leading to a complete or long forward enclosed superstructure or to a long non-enclosed superstructure, where fitted to attain minimum bow height equivalence.

(2) The requirements apply to all ro-ro passenger ships and ro-ro cargo ships engaged on international voyages and also to ro-ro passenger ships and ro-ro cargo ships engaged only in domestic (noninternational) voyages, except where specifically indicated otherwise herein.

(3) The requirements are not applicable to high speed, light displacement craft as defined in the IMO Code of Safety for High Speed Craft.

(4) The bow door and inner door of all existing ro-ro passenger ships constructed before or on 30 June 1996 are to be deemed appropriate by the Society.

2. Kinds of bow doors

The kinds of bow doors which are applied by this Chapter are generally two types as follows. However, other types of bow doors will be specially considered in association with the applicable requirements of these rules by the Society, except for following (1) and (2).

(1) Visor door
Visor doors opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms.

(2) Side-opening door
Side-opening doors opened either by rotating outwards about a vertical axis through two or more hinges located near the outboard edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the ship. It is anticipated the side-opening bow doors are arranged in pairs.

3. Arrangement

Arrangements for the bow door and inner door are to comply with the following (1) to (5)

(1) Bow doors are to be situated above the freeboard deck except that where a watertight recess fitted for arrangement of ramps or other related mechanical devices is located forward of the collision bulkhead and above the deepest waterline, the bow doors may be situated above the recess.

(2) An inner door which is to be part of the collision bulkhead is to be fitted. The inner door does not need to be fitted directly above the bulkhead. Where the vehicle ramp is arranged as a part of collision bulkhead, and its position complies with requirements of **Pt 3, Ch 14, 201.**, the vehicle ramp may be regarded as an inner door. If this is not possible, a separate inner weather door is to be installed.

(3) Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a separate inner weathertight door is to be installed, as indicated in **Pt 3, Ch 14, 201.**

(4) Bow doors are to be so fitted as to ensure tightness consistent with operational conditions and to give effective protection to inner doors. Inner doors forming part of the collision bulkhead are to be weathertight over the full height of the cargo space and arranged with fixed sealing supports on the aft side of the doors.

(5) The requirements for inner doors are based on the assumption that vehicle are effectively lashed and secured against movement in stowed position.

4. Definitions

The definitions which are used in this Chapter are as follows.

(1) Securing device

A device used to keep the door closed by preventing it from rotating about its hinges or its pivoted attachments to the ship.

(2) Supporting device
A device used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed devices, that transmits loads from the door to the ship's structure.

(3) Locking device
A device that locks a securing device in the closed position.

(4) Ro-ro passenger ship
Passenger ship with ro-ro spaces or special category spaces.

(5) Ro-ro spaces
Ro-ro spaces are spaces not normally sub-divided in any way and normally extending to either a substantial length or the entire length of the ship, in which motor vehicles with fuel in their tanks for their own propulsion and/or goods (packaged or in bulk, in or on rail or road cars, vehicles (including road or rail tankers), trailers, containers, pallets, demountable tanks or in or on similar stowage units or, other receptacles) can be loaded and unloaded normally in a horizontal direction.

(6) Special category spaces
Special category spaces are those enclosed vehicle spaces above or below the bulkhead deck, into and from which vehicles can be driven and to which passengers have access. Special category spaces may be accommodated on more than one deck provided that the total overall clear height for vehicles does not exceed 10 m.

102. Strength criteria

1. Primary structure and securing and supporting devices

Scantlings of the primary members, securing and supporting devices of bow doors and inner doors are to be determined to withstand the design loads defined in **103.**, using the following permissible stresses of **Table 4.3.1.**

Table 4.3.1 Permissible stress for primary members, securing and supporting devices

Stress	Permissible stress (N/mm^2)
Shear stress (τ)	$\tau = 80/K$
Bending stress (σ)	$\sigma = 120/K$
Equivalent stress $\left(\sigma_e = \sqrt{\sigma^2 + 3\tau^2}\right)$	$\sigma_e = 150/K$
K = material factor as specified in **Table 4.3.2**	

2. The buckling strength of primary members is to be verified as being adequate.

3. Stress of steel bearings in securing and supporting devices

For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed $0.8\sigma_y$.

σ_y = the yield stress of the bearing material

4. Tensile stress on threaded bolts

The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tension in way of bolts not carrying support forces is not to exceed $125/K$ (N/mm^2).

K = material factor as specified in **Table 4.3.2.**

103. Design loads

1. Bow doors

(1) External pressure

Design external pressure P_e, to be considered for the scantlings of primary members, securing and supporting devices of bow doors is to be taken as indicated by the following formula.

$$P_e = 2.75\lambda C_H(0.22 + 0.15\tan\alpha)(0.4V\sin\beta + 0.6\sqrt{L})^2 \quad (\text{kN/m}^2)$$

where :

V = contractual ship's speed, in knots

L = ship's length, in m, as specified in **Pt 3, Ch 1, 102.**, but need not be taken greater than 200 m.

λ = coefficient depending on the area where the ship is intended to be operated :

for sea going ships $\lambda = 1.0$

for ships operated in coastal waters $\lambda = 0.8$

for ships operated in sheltered waters $\lambda = 0.5$

C_H = coefficient that obtained from ship length as specified in **Table 4.3.3.**

α = flare angle at the point to be considered, defined as the angle between a vertical line and the tangent to the side shell plating measured in a vertical plane normal to the horizontal tangent to the shell plating (See **Fig 4.3.1**).

β = entry angle at the point to be considered, defined as the angle between a longitudinal line parallel to the centerline and the tangent to the shell plating in a horizontal plane (See **Fig 4.3.1**).

Table 4.3.2 Material factor K

Material	K
A, B, D or E	1.0
AH 32, DH 32 or EH 32	0.78
AH 36, DH 36 or EH 36	0.72

Table 4.3.3 Coefficient C_H

L	C_H
$L < 80m$	$L/80$
$L \geq 80m$	1.0

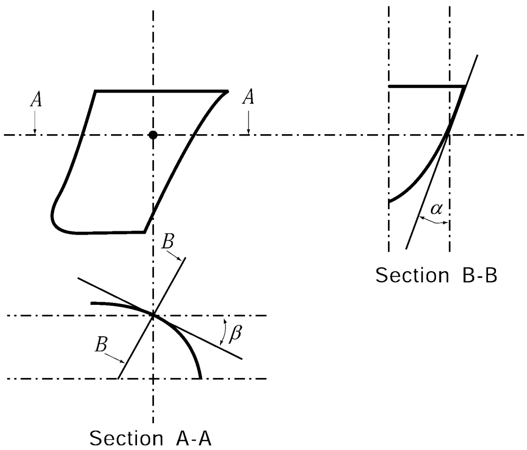

Fig 4.3.1 Entry and flare angle

(2) External forces

The design external forces considered in determining scantlings of securing and supporting devices of bow doors are not to be taken less than those given by the following formulae.

$F_x = P_{em} A_x$

$F_y = P_{em} A_y$

$F_z = P_{em} A_z$

F_x = the design external force (kN) in the longitudinal direction.

F_y = the design external force (kN) in the horizontal direction.

F_z = the design external force (kN) in the vertical direction.

A_x = area, in m^2, of the transverse vertical projection of the door between the levels of the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser. (see **Fig 4.3.2**)

Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded.

A_y = area, in m^2, of the longitudinal vertical projection of the door between the levels of the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser. (see **Fig 4.3.2**)

Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser.

A_z = area, in m^2, of the horizontal projection of the door between the levels of the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser. (see **Fig 4.3.2**)

Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser.

h = height(m) of the door between the levels of the bottom of the door and the upper deck, or between the bottom of the door and the top of the door, whichever is lesser.

l = fore and aft length(m^2) of the door at a height $h/2$ above the bottom of the door.

P_{em}= external pressure, in kN/m^2, as given in **103.1** (1) with angles α_m and β_m defined as follows :

α_m = flare angle measured at a point on the bow door $l/2$ aft of the stem line on a plane $h/2$ above the bottom of the door (See **Fig 4.3.3**).

β_m = entry angle measured at a point on the bow door $l/2$ aft of the stem line on a plane $h/2$ above the bottom of the door (See **Fig 4.3.3**).

For doors, including bulwark, of unusual form or proportions, e.g. ships with a rounded nose and large stem angles, the area and angles used for determination of the design values of external forces may require to be specially considered.

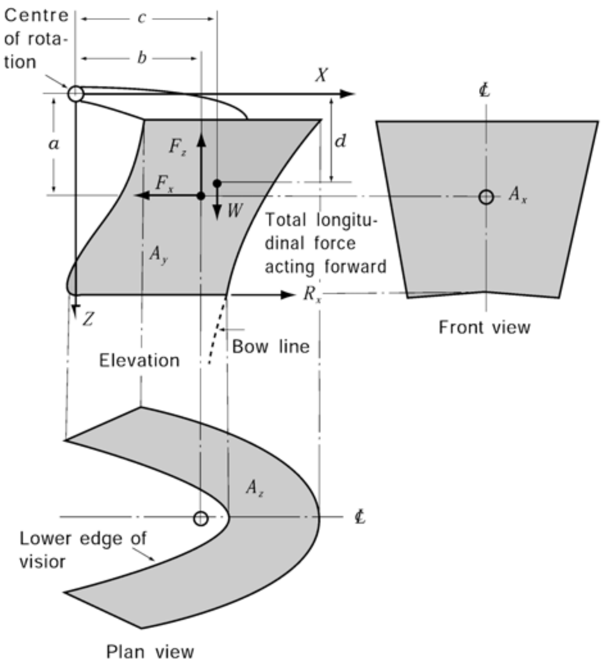

Fig 4.3.2 Visor type bow door

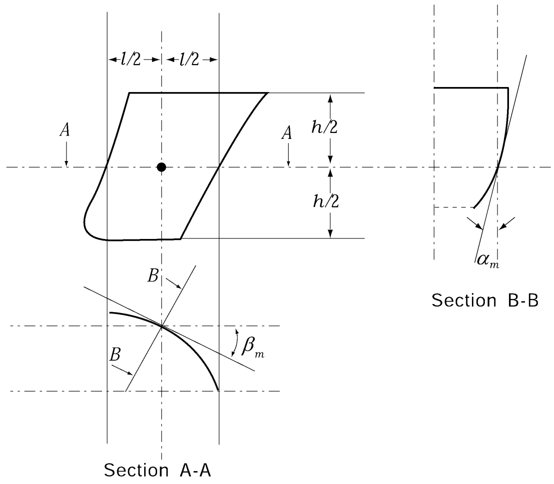

Fig 4.3.3 α_m **and** β_m

(3) For visor doors the closing moment M_y under external loads, in kN-m, is to be taken as the following formula.

$$M_y = F_x a + 10Wc - F_z b \quad \text{(kN-m)}$$

F_x and F_z = as specified in above (2).

W = mass of the visor door (ton)

a = vertical distance from visor pivot to the centroid of the transverse vertical projected area of the visor door (m)

b = horizontal distance from visor pivot to the centroid of the horizontal projected area of the visor door (m)

c = horizontal distance from the visor pivot to the center of gravity of the visor mass (m)

(4) Moreover, the lifting arms of a visor door and its supports are to be dimensioned for the static and dynamic forces applied during the lifting and lowering operations, and a minimum wind pressure of 1.5 kN/m^2 is to be taken into account.

2. Inner door

(1) External pressure

The design external pressure, in kN/m^2, considered for the scantlings of primary members, securing and supporting devices and surrounding structure of inner doors is to be taken as the greater of P_{e1} or P_{e2} as given by the following formulae.

$$P_{e1} = 0.45L \quad (\text{kN/m}^2), \qquad P_{e2} = 10h \quad (\text{kN/m}^2)$$

h = the distance from the load point to the top of the cargo space (m).

L = ship's length, as defined in **Pt 3, Ch 1, 102.** (m). But need not be taken greater than 200 m.

(2) Internal pressure
The design internal pressure, P_i, considered for the scantlings of securing devices of inner doors is not to be less than 25 kN/m^2.

104. Scantlings of bow doors

1. General

(1) The strength of bow doors is to be commensurate with that of the surrounding structure.
(2) Bow doors are to be adequately stiffened and means are to be provided to prevent lateral or vertical movement of the doors when closed. For visor doors adequate strength for the opening and closing operations is to be provided in the connections of the lifting arms to the door structure and to the ship structure.

2. Primary structure

Scantlings of the primary members are generally to be supported by direct strength calculations in association with the external pressure given in **103. 1** (1) and permissible stresses given in **Table 4.3.1**. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections.

3. Secondary stiffeners

Secondary stiffeners are to be supported by primary members constituting the main stiffening of the door. The section modulus of secondary stiffeners is not to be less than that required for end framing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and bow doors stiffeners. In addition, stiffener webs are to have a net sectional area, A, not less than that obtained from the following formula.

$$A = \frac{QK}{10} \quad (\text{cm}^2)$$

Q = shear force (kN) in the stiffener calculated by using uniformly distributed external pressure P_e

P_e = as specified in **103. 1** (1)

K = material factor as specified in **Table 4.3.2**

4. Plating

The thickness of bow door plating is to be not less than that required for the side shell plating, using bow door stiffener spacing, but in no case less than the minimum required thickness of fore end shell plating.

105. Scantlings of inner doors

1. General

(1) Scantlings of the primary members are generally to be supported by direct strength calculations in association with the external pressure given in **103. 2** (1) and permissible stresses given in **Table 4.3.1.** Normally, formulate for simple beam theory may be applied.
(2) Where inner doors also serve as a vehicle ramps, the scantlings are not to be less than those required for vehicle decks.

106. Securing and supporting of bow doors

1. General

(1) Bow doors are to be fitted with adequate means of securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure.
(2) The hull supporting structure in way of the bow doors is to be suitable for the same design loads and design stresses as the securing and supporting devices.
(3) Where packing is required, the packing material is to be of a comparatively soft type, and the

supporting forces are to be carried by the steel structure only. Other types of packing may be considered.

(4) Maximum design clearance between securing and supporting devices is not generally to exceed 3 mm.

(5) A means is to be provided for mechanically fixing the door in the open position.

(6) Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices.

(7) Small and/or flexible devices such as cleats intended to provide load compression of the packing material are not generally to be included in the calculations.

(8) The number of securing and supporting devices are generally to be the minimum practical whilst taking into account the requirements for redundant provision given in **Par 2** (6), (7) and the available space for adequate support in the hull structure.

(9) For opening outwards visor doors, the pivot arrangement is generally to be such that the visor is self closing under external loads, that $M_y > 0$. Moreover, the closing moment M_y as given in **103. 1,** (3) (A) is to be not less than:

$$M_{yo} = 10\,Wc + 0.1\sqrt{a^2+b^2} \times \sqrt{F_x^2+F_z^2} \quad \text{(kN-m)}$$

W, a, b, c, F_x and F_z = as specified in **103.**

2. Scantlings

(1) Securing and supporting devices are to be adequately designed so that they can withstand the reaction forces within the permissible stresses given in **Table 4.3.1.**

(2) For visor doors the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body are determined for the following combination of external loads acting simultaneously together with the self weight of the door :

(A) Case 1 F_x and F_z

(B) Case 2 0.7 F_y acting on each side separately together with 0.7 F_x and 0.7 F_z
where F_x, F_y and F_z are determined as indicated in **103. 1** (2) and applied at the centroid of projected areas.

(3) For side-opening doors the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body are determined for the following combination of external loads acting simultaneously together with the self weight of the door:

(A) Case 1 F_x, F_y and F_z

(B) Case 2 0.7 F_x and 0.7 F_z acting on both doors and 0.7 F_y acting on each door separately.
where F_x, F_y and F_z are determined as indicated in **103. 1** (2) and applied at the centroid of projected areas.

(4) The support forces as determined according to above (2) (A) and (3) (A) shall generally give rise to a zero moment about the transverse axis through the centroid of the area A_x. For visor doors, longitudinal reaction forces of pin and/or wedge supports at the door base contributing to this moment are not to be of the forward direction.

(5) The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports.

(6) The arrangement of securing and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable to withstand the reaction forces without exceeding by more than 20 percent the permissible stresses as given in **Table 4.3.1.**

(7) For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reaction force required to prevent opening of the door within the permissible stresses given in **Table 4.3.1.** The opening moment M_0, in kN-m, to be balanced by this reaction force, is not to be taken less than:

$$M_0 = 10\,Wd + 5A_x a \quad \text{(kN-m)}$$

where :

A_x = as specified in **103.1** (2)

a = as specified in **103.1** (3)

d = vertical distance from the hinge axis to centre of gravity of the door (m)

W = as specified in **103.1** (3)

(8) For visor doors, the securing and supporting devices excluding the hinges should be capable of resisting the vertical design force ($F_z - 10W$), in kN, within the permissible stresses given in **Table 4.3.1.**

(9) All load transmitting elements in the design load path, from door through securing and supporting devices into the ship structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices. These elements include pins, supporting brackets and back-up brackets.

(10) For side-opening doors, thrust bearing has to be provided in way of girder ends at the closing of the two leaves to prevent on leaf to shift towards the other one under effect of unsymmetrical pressure (See **Fig 4.3.4**). Each part of the thrust bearing has to be kept secured on the other part by means of securing devices.

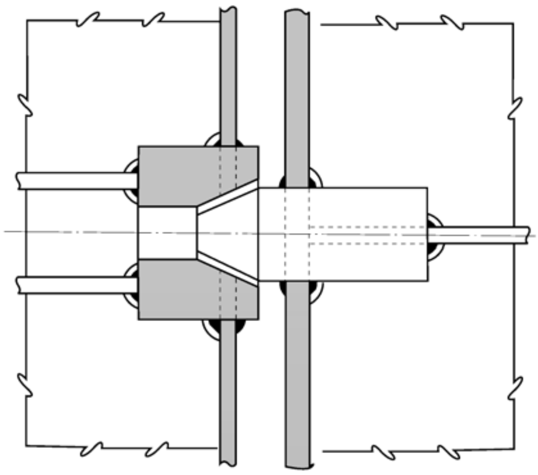

Fig 4.3.4 Example of thrust bearing

107. Securing and locking arrangement

Securing devices are to be equipped with mechanical locking arrangement (self locking or separate arrangement), or to be of the gravity type. Those devices are to comply with the requirements of the following **Par 1**. and **2.**

1. Operation

Securing devices are to be simple to operate and easily accessible. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in the proper sequence.

(1) Hydraulic securing devices
Where hydraulic securing devices are applied, the system is to be mechanically lockable in closed position. This means that, in the event of loss of the hydraulic fluid, the securing devices remain locked. The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits, when in closed position.

(2) Bow doors and inner doors giving access to vehicle decks are to be provided with an arrangement for remote control, from a position above the freeboard deck, of
(A) the closing and opening of the doors, and
(B) associate securing and locking devices for every door.

(3) Remote control
Indication of the open/closed position of every door and every securing and locking device is to be provided at the remote control stations. The operating panels for operation of doors are to

be inaccessible to unauthorized persons. A notice plate, giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour, is to be placed at each operating panel and is to be supplemented by warning indicator lights.

2. Indication and monitoring

(1) Separate indicator lights and audible alarms are to be provided on the navigation bridge and on the operating panel to show that the bow door and inner door are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. It shall not be possible to turn off the indicator light.
(2) The indicator system is to be designed on the fail safe principle and is to show by visual alarms if the door is not fully closed and not fully locked and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system for operating and closing doors is to be independent of the power supply for operating and closing the doors and is to be provided with a back-up power supply from the emergency source of power or other secure power supply e.g. UPS. The sensors of the indicator system are to be protected from water, ice formation and mechanical damage.
(3) The indication panel on the navigation bridge is to be equipped with a mode selection function “harbour/sea voyage”, so arranged that audible alarm is given on the navigation bridge if the vessel leaves harbour with the bow door or inner door not closed or with any of the securing devices not in the correct position.
(4) A water leakage detection system with audible alarm and television surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of leakage through the inner door.
(5) Between the bow door and the inner door a television surveillance system is to be fitted with a monitor on the navigation bridge and in the engine control room. The system is to monitor the position of the doors and a sufficient number of their securing devices. Special consideration is to be given for the lighting and contrasting colour of objects under surveillance.
(6) A drainage system is to be arranged in the area between bow door and ramp or where no ramp is fitted between the bow door and inner door. The system is to be equipped with an audible alarm function to the navigation bridge being set off when the water levels in these areas exceed 0.5m or the high water level alarm, whichever is lesser.
(7) The indicator system is considered designed on the fail - safe principal in above (2) to (6) when:
  (A) The indication panel is provided with:
    - a power failure alarm
    - an earth failure alarm
    - a lamp test
    - separate indication for door closed, door locked, door not closed and door not locked.
  (B) Limit switches electrically closed when the door is closed (when more limit switches are provided they may be connected in series).
  (C) Limit switches electrically closed when securing arrangements are in place (when more limit switches are provided they may be connected in series).
  (D) Two electrical circuits (also in one multicore cable), one for the indication of door closed / not closed and the other for door locked / not locked.
  (E) In case of dislocation of limit switches, indication to show : not closed / not locked / securing arrangement not in place - as appropriate.
(8) For ro-ro passenger ships on international voyages, the special category spaces and ro-ro spaces are to be continuously patrolled or monitored by effective means, such as television suveillance, so that any movement of vehicles in adverse weather conditions or unauthorized access by passengers thereto, can be detected whilst the ship is underway.

108. Operating and maintenance manual

1. An Operating and Maintenance Manual for the bow door and inner door is to be provided on board and is to contain necessary information after approval of this society.

(1) main particulars and design drawings
  (A) special safety precautions
  (B) details of vessel, class, statutory certificates
  (C) equipment and design loading (for ramps)

(D) key plan of equipment (doors and ramps)
(E) manufacturer’s recommended testing for equipment
(F) description of equipment
(a) bow doors
(b) inner bow doors
(c) bow ramp/doors
(d) side doors
(e) stern doors
(f) central power pack
(g) bridge panel
(h) engine control room panel
(2) service conditions
(A) limiting heel and trim of ship for loading/unloading
(B) limiting heel and trim for door operations
(C) doors/ramps operating instructions
(D) doors/ramps emergency operating instructions
(3) maintenance
(A) schedule and extent of maintenance
(B) trouble shooting and acceptable clearances
(C) maufacturer’s maintenance procedures
(4) register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

This Manual has is to be submitted for approval that the above mentioned items are contained in the OMM and that the maintenance part includes the necessary information with regard to inspections, trouble-shooting and acceptance / rejection criteria.

2. Documented operating procedures for closing and securing the bow door and inner door are to be kept on board and posted in appropriate place.

Section 2 Side and Stern Doors

201. General

1. Application

(1) These rules give requirements for the arrangement, strength and securing of side shell doors, abaft the collision bulkhead, and stern doors leading into enclosed spaces.
(2) The side shell door and stern door of all existing ro-ro passenger ships constructed before or on 30 June 1996 are to be as deemed appropriate by the Society.

2. Arrangement

(1) Stern doors for passenger vessels are to be situated above the freeboard deck. Stern doors for ro-ro cargo ships and side shell doors may be either below or above the freeboard deck.
(2) The side and stern doors are to be so fitted as to ensure tightness and structural integrity commensurate with their location and the surrounding structure.
(3) In general, the lower edge of door openings is not to be below a line drawn parallel to the freeboard deck at side, which has at its lowest point the upper edge of the uppermost load line.
(4) Where side door and stern door are unavoidably provided below the line as stipulated in above (3), the following conditions are to be satisfied.
(A) Compartment being equivalent to watertight-bulkhead in strength and watertightness is to be provided and the second door is to be fitted for the compartment.
(B) Detecting device for sea water leakage is to be provided in the compartment and drainage means of the compartment with a screw-down stop valve capable of being controlled from easily accessible position is to be provided.
(5) Doors are generally to be arranged to open outwards.

3. Definitions

The definitions specified in this Section are to be in accordance with **101.4.**

202. Strength criteria

1. Primary structure and securing and supporting devices

Scantlings of the primary members, securing and supporting devices of doors are to be determined to withstand the design loads defined in **203.**, using the following permissible stresses of **Table 4.3.1.**

2. The bucking strength of primary members is to be verified as being adequate.

3. Steel of steel bearings in securing and supporting devices

For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed $0.8\sigma_y$.

σ_y = the yield stress of the bearing material.

4. Tensile stress on threaded bolts

The arrangements of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tension in way of threads bolts not carrying support forces is not to exceed $125/K$ (N/mm^2).

K = material factor as specified in **Table 4.3.2.**

203. Design Loads

The design forces considered for the scantlings of primary members, securing and supporting devices are not to be less than the following **Par 1** to **3.**

1. Design forces for securing or supporting devices of doors opening inwards :

External force : $F_e = AP_e + F_p$ (kN)

Internal force : $F_i = F_0 + 10W$ (kN)

2. Design forces for securing or supporting devices of doors opening outwards :

External force : $F_e = AP_e$ (kN)

Internal force : $F_i = F_0 + 10W + F_p$ (kN)

3. Design forces for primary members is to be taken as the greater of the following two formulae :

External force : $F_e = AP_e$ (kN)

Internal force : $F_i = F_0 + 10W$ (kN)

where :

A = area, in m^2, of the door opening

W = mass of the door (ton)

F_p = total paking force in kN, packing line pressure is normally not to be taken less than 5 N/mm.

F_0 = the greater of F_c and $5A$ (kN)

F_c = accidental force, in kN, due to loose of cargo etc., to be uniformly distributed over the area A and not to be taken less than 300 kN. For small doors such as bunker doors and pilot doors, the value of F_c may be appropriately reduced. However, the value of F_c may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental forces due to loose cargoes.

P_e = external design pressure, in kN/m^2, determined at the centre of gravity of the door opening and not taken less than the value obtained from the following formulae.

for $Z_G < T$, $10(T - Z_G) + 25$

for $Z_G \geq T$, 25

However, for stern doors of ships fitted with bow doors, P_e is not to be taken less than:

$$P_e = 0.6 \lambda C_H (0.8 + 0.6 \sqrt{L})^2 \quad (\text{kN/m}^2)$$

where :

C_H = coefficient that obtained from ship's length as specified in **Table 4.3.3.**

L = ship's length, in m, as specified in **Pt 3, Ch 1, 102.** but need not be taken greater than 200 m

Z_G = height of the center of area of the door, in m, above the baseline

λ = coefficient depending on the area where the ship is intended to be operated :

for sea going ships λ = 1

for ships operated in coastal waters λ = 0.8

for ships operated in sheltered waters λ = 0.5

T = draught, in m, at the highest subdivision load line

204. Scantlings

1. General

(1) In general the strength of side and stern doors is to be equivalent to the strength of the surrounding structure.

(2) Side and stern door openings in the side shell are to have well rounded corners and adequate compensation is to be arranged with web frames at sides and stringers or equivalent above and below.

(3) Side and stern doors are to be adequately stiffened, and means are to be provided to prevent movement of the doors when closed. Adequate strength is to be provided in the connections of the lifting/maneuvering arms and hinges to the door structure and to the ship structure.

(4) Where side and stern doors also serve as vehicle ramps, the design of the hinges should take into account the ship angle of trim which may result in uneven loading on the hinges.

2. Plating

(1) The thickness of the side and stern door plating is not to be less than the side shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum shell plate thickness.

(2) Where side and stern doors also serve as vehicle ramps, the plating is not to be less than required for vehicle decks.

3. Stiffeners

(1) The section modulus of horizontal or vertical stiffeners is not to be less than required for side framing. Consideration is to be given, where necessary, to differences in fixity between ship's frame and door stiffeners.

(2) Where side and stern doors also serve as vehicle ramps, the stiffener scantlings are not to be less than required for vehicle decks.

(3) Where necessary, side and stern door stiffeners are to be supported by girders or stringers.

4. Primary members

(1) Scantlings of primary members are generally to be supported by direct calculations in association with the design forces given in **203. 3** and permissible stresses given in **Table 4.3.1.** Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections.

(2) The webs of girders and stringers are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

(3) The girder system is to be given sufficient stiffness to ensure integrity of the boundary support

of the door.

(4) Edge stiffeners/girders should be adequately stiffened against rotation and are to have a moment of inertia, I, not less than that obtained from following formula.

$$I = 8 P_I d^4 \quad (\text{cm}^4)$$

d = distance (m) between closing devices.

P_I = packing line pressure along edges, not to be taken less than 5 N/mm.

(5) For edge girders supporting main door girders between securing devices, the moment of inertia is to be increased in relation to the additional force.

205. Securing and supporting

1. General

(1) Side shell doors and stern doors are to be fitted with adequate means of securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure.
(2) A means is to be provided for mechanically fixing the door in the open position.
(3) The hull supporting structure in way of the doors is to be suitable for the same design loads and design stresses as the securing and supporting devices.
(4) Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered.
(5) Maximum design clearance between securing and supporting devices is not generally to exceed 3 mm.
(6) Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices.
(7) Small and/or flexible devices such as cleats intended to provide local compression of the packing material are not generally to be included in the calculations.
(8) The number of securing and supporting devices are generally to be the minimum practical whilst taking into account the requirement for redundant provision given in **Par 2,** (3) and the available space for adequate support in the hull structure.

2. Scantlings

(1) Securing and supporting devices are to be adequately designed so that they can withstand the reaction forces within the permissible stresses given in **Table 4.3.1.**
(2) The distribution of the reaction forces action on the securing devices and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position of the supports.
(3) The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable to withstand the reaction forces without exceeding by more than 20 percent the permissible stresses as given in **Table 4.3.1.**
(4) All load transmitting elements in the design load path, from the door through securing and supporting devices into the ship's structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices. These elements include pins, supporting brackets and back-up brackets.

206. Securing and locking arrangement

Securing devices are to be equipped with mechanical locking arrangement (self locking or separate arrangement), or to be of the gravity type. Those devices are to comply with the requirements of the following **Par 1** and **2.**

1. Operation

Securing devices are to be simple to operate and easily accessible. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in the proper sequence.

(1) Doors which are located partly or totally below the free board deck with a clear opening area greater than 6 m^2 are to be provided with an arrangement for remote control, from a position above the freeboard deck, of
(A) the closing and opening of the doors,
(B) associated securing and locking devices.
(2) Remote control
For doors which are required to be equipped with a remote control arrangement, indication of the open/closed position of the door and the securing and locking device is to be provided at the remote control stations. The operating panels for operation of doors are to be inaccessible to unauthorized persons. A notice plate, giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour, is to be placed at each operating panel and is to be supplemented by warning indicator lights.
(3) Hydraulic securing devices
Where hydraulic securing devices are applied, the system is to be mechanically lockable in closed position. This means that, in the event of loss of the hydraulic fluid, the securing devices remain locked. The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits, when closed position.

2. Systems for indication/monitoring

The following requirements apply to doors in the boundary of special category spaces or ro-ro spaces. For cargo ships, where no part of the door is below the uppermost waterline and the area of the door opening is not greater than 6 m^2, then the requirements of this section need not be applied.

(1) Indicators
The indicator system is to be designed on the fail safe principle and in accordance with the following (A) to (D).
(A) Location and type
Separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned. The indication panel on the navigation bridge is to be equipped with mode a section function "harbour/sea voyage", so arranged that audible alarm is given if vessel leaves harbor with side shell or stern doors not closed or with any of the securing devices not in the correct position.
(B) Indicator lights
Indicator lights are to be designed so that they cannot be manually turned off. The indication panel is to be provided with a lamp test-function
(C) Power supply
The power supply for the indicator system is to be independent of the power supply for operating and closing the doors and is to be provided with a backup power supply.
(D) Protection of sensors
The sensors of the indicator system are to be protected from water, ice formation and mechanical damage.
(2) Water leakage protection
(A) For passenger ships, a water leakage detection system with audible alarm and television surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of leakage through the side shell and stern doors.
(B) For cargo ships, a water leakage detection system with audible alarm is to be arranged to provide an indication to the navigation bridge of leakage through the side shell and stern doors.

207. Operating and maintenance manual

1. An Operating and Maintenance Manual for the side shell and stern doors is to be submitted for the approval of the Society before providing it on board and contain the following (1) through (4).

(1) main particulars and design drawings,
(2) service conditions(e.g. service restrictions, emergency operations, acceptable clearances for supports)
(3) maintenance and function testing,
(4) register of inspections and repairs.

2. Documented operating procedures for closing and securing side shell and stern doors are to be kept on board and posted at the appropriate places. ⚓

CHAPTER 4 BULWARKS, FREEING PORTS, SIDE SCUTTLES, RECTANGULAR WINDOWS, SKYLIGHTS VENTILATORS AND PERMANENT GANGWAYS

Section 1 Bulwarks and Guardrails

101. Arrangements

Bulwarks or guardrails are to be provided on all exposed parts of the freeboard and superstructure decks and on top of all other exposed deck houses. The height of bulwarks and guardrails is to be at least 1 *metre* from the top of deck. Where this height is considered to interfere with the normal operation of the ship and where deemed necessary by the Society, a lesser height may be permitted subject to the Society's approval.

102. Strength of bulwarks

1. The bulwarks are to be strongly constructed and effectively stiffened on their upper edge.

2. The thickness of bulwarks on the freeboard decks is not to be less than 6 mm.

3. Bulwarks are to be supported by strong stays attached to deck in way of the beams and spaced not more than 1.8 *metres* apart on freeboard deck.

4. Stays are to be made of bulb plates or flanged plates and effectively attached to deck and bulwark.

103. Bulwarks of timber carriers

Decks which are designed to carry timber deck cargoes are to be provided with bulwarks more than 1 *metre* in height or with specially strong guardrails. The upper edges of the bulwarks are to be well stiffened and supported by specially strong stays spaced not more than 1.5 *metres* and attached to deck in way of the beams. Necessary freeing ports are to be provided in the bulwarks.

104. Reinforcement of bulwarks

1. Gangways and other openings in bulwarks are to be well clear of the breaks of superstructures.

2. Where bulwarks are cut to form gangways or other openings, stays of increased strength are to be provided at the ends of the openings.

3. The plating of bulwarks in way of mooring pipes or eye plates for cargo handling is to be doubled or increased in thickness.

4. At the ends of superstructures, the bulwark rails are to be bracketed either to the superstructure end bulkheads or to the stringer plates of the superstructure decks, or other equivalent arrangements are to be made so that the abrupt change of strength is avoided.

105. Expansion joint

Long bulwarks are to be so arranged that they are not affected as far as possible by the stress of the main hull structures and expansion joints are to be provided all suitable locations.

106. Guardrails

1. Guard rails fitted on superstructure and freeboard decks shall have at least three courses. The opening below the lowest course of the guard rails shall not exceed 230 mm. The other courses shall be not more than 380 mm apart. In the case of ships with rounded gunwales the guard rail supports shall be placed on the flat of the deck. In other locations, guardrails with at least two courses shall be fitted.

2. Fixed, removable or hinged stanchions shall be fitted about 1.5 m apart. Removable or hinged stanchions shall be capable of being locked in the upright position. At least every third stanchion shall be supported by a bracket or stay.

3. Where necessary for the normal operation of the ship, steel wire ropes may be accepted in lieu of guard rails. Wires shall be made taut by means of turnbuckles. And chains fitted between two fixed stanchions and/or bulwarks are acceptable in lieu of guard rails.

Section 2 Freeing Ports

201. General

1. Where bulwarks on the weather portions of freeboard or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of water and for draining them.

2. Ample freeing ports are to be provided for clearing any space other than wells, where water is liable to be shipped and to remain.

3. In ships having superstructures which are open at either or both ends, adequate provision for freeing the space within superstructures is to be provided.

4. In ships having a reduced freeboard, guardrails are to be provided for at least a half of the length of the exposed parts of weather deck or other effective freeing arrangements are to be considered, as required by the Society.

202. Freeing port area

1. The freeing port area on each side of the ship for each well on the freeboard and raised quarter decks is not to be less than that obtained from **Table 4.4.1.**

Table 4.4.1 Total area of freeing port

Length of bulwarks	Total area of freeing ports (m^2)	
	Freeboard and raised quarter decks	Superstructure decks
$l \le 20$ m	$A = 0.035l + 0.7 + a$	$A = \dfrac{0.035l + 0.7 + a}{2}$
$l > 20$ m	$A = 0.07l + a$	$A = \dfrac{0.07l + a}{2}$

l = length of bulwark (m), but need not be taken as greater than $0.7L_f$
a = as obtained from the following table

Height of bulwarks (m)	Correction value (m^2)
$h < 0.9$	$a = -0.04l(0.9 - h)$
$0.9 \le h \le 1.2$	$a = 0$
$1.2 < h$	$a = 0.04l(h - 1.2)$

h = average height of bulwalks above the deck (m)

2. In ships either without sheer or with less sheer than the standard, the minimum freeing port area obtained from the formulae in **Par 1** is to be increased by multiplying the factor obtained from the following formula :

$$a_0 = 1.5 - \frac{S}{2S_0}$$

where:

S = average height of actual sheer (mm)

S_0 = average height of the standard sheer given by the International Convention on Load Lines, 1966 (mm)

3. Where a ship is provided with a trunk or a hatch side coaming which is continuous or substantially continuous between detached superstructures, the area of freeing port opening is not to be less than that given by **Table 4.4.2.**

Table 4.4.2 Area of freeing ports

Breadth of hatchway of trunk	Area of freeing ports in relation to the total area of bulwark
$0.4B_f$ or less	0.2
$0.75B_f$ or more	0.1
NOTE : The area of freeing ports at intermediate breath is to be obtained by interpolation.	

4. Notwithstanding the requirements in **Pars 1** to **3,** where deemed necessary by the Society in ships having trunks on the freeboard deck, guardrails are to be provided instead of bulwarks on the freeboard deck in way of trunks for more than half of the length of trunk.

203. Arrangement of freeing ports

The lower edges of the freeing ports are to be as near the deck as possible and two-thirds of the freeing ports area required by **202.** is to be provided in the half of the well near the lowest point of the sheer curve.

204. Construction of freeing ports

1. Where both the length and the height of freeing ports exceed 230 mm respectively, freeing ports are to be protected by rails spaced approximately 230 mm apart.

2. Where shutters are provided to freeing ports, ample clearance is to be provided to prevent jamming. Hinge pins or bearings of the shutters are to be of non-corrodible metal. Shutters are not to be provided with securing appliances.

Section 3 Side Scuttles, Rectangular Windows and Skylights

301. General

1. The requirements in this chapter apply to side scuttles and rectangular windows on the side shell, superstructure and deckhouse up to the third tier above the freeboard deck. The requirements for the side shell, superstructure and deckhouse above the third tier are to be as deemed appropriate by the Society.

2. Notwithstanding the above **1.** windows on the deckhouse up to the third tier above the freeboard deck may be as deemed appropriate by the Society subject that such windows do not interfere with watertightness of a ship and are deemed as necessary for the ship's operation such as those on a navigation bridge.

302. Position of side scuttles

1. No side scuttle is to be provided in such a position as its sill is below a line drawn parallel to the freeboard deck at side and having its lowest point $0.025B_f$ or 500 mm, above the summer load line(or timber load line), whichever is the greater. All side scuttles sill of which is below the freeboard deck and which are of hinged type are to be provided with locking arrangements.

2. No side scuttle is to be provided to any space solely engaged in carriage of cargoes.

303. Application of side scuttles

1. Side scuttle inboard are to be class A, class B, class C side scuttles complying with the requirements in **Ch 8, Sec. 8.**

2. Class A, class B and class C side scuttles are to be so arranged that their design pressure is less than the maximum allowable pressure determined to their grades and nominal diameters.

3. Side scuttle to spaces below the freeboard deck and those provided to sunken poop are to be class A side scuttle, class B side scuttle or equivalent thereto.

4. Side scuttles to spaces below freeboard deck, within the first tier of superstructure, those fitted up to the first tier of the deckhouse on the freeboard deck which have unprotected deck openings leading to spaces below the freeboard deck inside, deckhouses considered buoyant in stability calculations and those exposed to direct blow of seas are to be class A, class B side scuttle with dead light or equivalent thereto.

5. Side scuttles fitted in spaces which give direct access to an open stairway and provided in deckhouse and companion which protect the openings specified in below, are to be class A, class B side scuttle with dead light or equivalent thereto. Where cabin bulkhead or doors separate side scuttles from a direct access leading below the freeboard deck, application of side scuttle is to be as deemed appropriate by the Society.

6. Side scuttles to the spaces in the second tier on the freeboard deck, protecting direct access below or considered buoyant in stability calculations, are to be class A, class B side scuttles or equivalent thereto.

7. In ships with specially reduced freeboard, side scuttles located below the waterline after flooding into compartments are to be of fixed type.

8. Side scuttles shall be of non-opening type in ships subject to damage stability regulations, if calculations indicate that they would become immersed by any intermediate stage of flooding or the final equilibrium waterplane in any required damage case.

9. Deckhouses situated on a raised quarter deck or on the deck of a superstructure of less than standard height or on the deck of a deckhouse of less than standard height, may be regarded as being in the second tier as far as the provision of deadlights is concerned, provided the height of the raised quarter deck, superstructure or deckhouse is equal to, or greater than, the standard quarter deck height.

304. Protection of side scuttles

All side scuttles in way of the anchor housing and other similar places where they are liable to be damaged are to be protected by strong gratings.

305. Design pressure and maximum allowable pressure of side scuttles.

1. The design pressure of side scuttle is to be less than the maximum allowable pressure determined to their nominal diameters and classes. The design pressure P is to be determined using the following equation.

$$P = 10ac(bf - y) \quad (kPa)$$

a, b, c and f: As specified **Pt 3, Ch 17, 201.**

y : Vertical distance from summer load line to sill of side scuttle(m). Where timber load line is given, vertical distance from timber load line to sill of side scuttle.

2. Notwithstanding the provision of **1.** above, the design pressure is not to be less than minimum design pressure as given in **Table 4.4.4.**

Table 4.4.3 Maximum allowable pressure of side scuttles

class	Nominal diameter(mm)	Glass thickness(mm)	Max. allowable pressure(kPa)
A	200	10	328
	250	12	302
	300	15	328
	350	15	241
	400	19	297
B	200	8	210
	250	8	134
	300	10	146

	450	10	65

Table 4.4.4 Minimum design pressure

Ship's length	$L \leq 250$ m	$L > 250$ m
Exposed front bulkhead of the first tier superstructure(kPa)	$25 + L/10$	50
Othe places(kPa)	$12.5 + L/20$	25

306. Position of rectangular windows

No rectangular window is to be provided to spaces below the freeboard deck, the first tier of superstructure and the first tier of the deckhouse considered buoyant in stability calculations or which protect deck openings leading to spaces below the freeboard deck.

307. Application of rectangular windows

1. Rectangular windows inboard are to be class F, class E rectangular windows complying with the requirements in **Ch. 8, Sec. 9** or equivalent thereto.

2. Class E and class F rectangular windows are to be so arranged that those design pressure is less than the maximum allowable pressure determined to their nominal sizes and classes.

3. Rectangular windows to the spaces in the second tier on the freeboard deck which gives direct access to a space within the first tier of enclosed superstructure or below the freeboard deck, are to be provided with hinged deadlight or fixed shutter. Where cabin bulkhead or door separate the space within the second tier from spaces below the freeboard deck or spaces within the first tier of enclosed superstructure, application of rectangular windows to the spaces within the second tier is to be as deemed appropriate by the Society.

4. Rectangular windows to the space in the second tier on the freeboard deck considered buoyant in stability calculations are to be provided with hinged deadlight or fixed shutter.

308. Design pressure and maximum allowable pressure of rectangular windows.

1. The design pressure of rectangular window is to be less than the maximum allowable pressure determined to their nominal diameters and classes. The design pressure P is to be determined using the following equation.

$$P = 10ac(bf - y) \quad \text{(kPa)}$$

a, b, c and f : As specified **Pt 3, Ch 17, 201.**

y : Vertical distance from summer load line to sill of rectangular window(m). Where timber load line is given, vertical distance from timber load line to sill of rectangular window.

2. Notwithstanding the provision of **1.** above, the design pressure is not to be less than minimum design pressure as given in **Table 4.4.4.**

Table 4.4.5 Maximum allowable pressure of rectangular window

Class	Nominal size Width(mm) × Height(mm)	Glass thickness (mm)	Maximum allowable pressure(kPa)
E	300 × 425	10	99
	355 × 500	10	71
	400 × 560	12	80
	450 × 630	12	63
	500 × 710	15	80
	560 × 800	15	64
	900 × 630	19	81
	1000 × 710	19	64
F	300 × 425	8	63
	355 × 500	8	45
	400 × 560	8	36
	450 × 630	8	28
	500 × 710	10	36
	560 × 800	10	28
	900 × 630	12	32
	1000 × 710	12	25
	1100 × 800	15	31

309. Skylights

Fixed or opening skylights shall have glass thickness appropriate to their size and position as required for side scuttles and windows. Skylight glasses in any position shall be protected from mechanical damage and where fitted in position 1 or 2, shall be provided with robust deadlights or storm covers permanently attached.

Section 4 Ventilators

401. Construction of coamings

1. Ventilators placed in Position I or II, for spaces below the freeboard deck or decks of enclosed superstructures are to have coamings of steel or other equivalent material and be efficiently connected to the deck. All ventilator coamings exceeding 900 mm in height are to be specially strengthened at the support.

2. Ventilators passing through superstructures other than enclosed superstructure are to have substantially constructed coamings of steel or equivalent at the freeboard deck.

3. Small hatches, fittings and equipment on the fore deck are to be comply with the provisions of **Ch 9.**

402. Height of coamings

The height of ventilator coamings above the upper surface of the deck is to be at least 900 mm in Position I, and 760 mm in Position II. Where the ship has an unusually large freeboard or where the ventilator serves spaces within unenclosed superstructures, the height of ventilator coamings may be suitably reduced.

403. Thickness of coamings

1. The thickness of ventilator coamings in Position I and II leading to spaces below the freeboard deck or within enclosed superstructures is not to be less than given by Line 1 in **Table 4.4.6.** Where the height of the coamings is reduced by the provisions in **402.** the thickness may be suitably reduced.

2. Where ventilators pass through superstructures other than enclosed superstructures, the thickness of ventilator coamings in the superstructures is not to be less than that given by Line 2 in **Table 4.4.6.**

Table 4.4.6 Thickness of ventilator coamings

Outside diameter of ventilator (mm)		80 and under	160	230 and over but less than 330
Thickness of coaming plate (mm)	Line 1	6	8.5	8.5
	Line 2	4.5	4.5	6

NOTES:
1. For intermediate values of outside diameter of ventilator, the thickness of coaming plate is to be obtained by linear interpolation.
2. Where the outside diameter of ventilator is over 330 mm, the thickness of coaming plate is to be in accordance with the discretion of the Society.

404. Connection

Where no steel deck exists, a steel plate is to be fitted in way of the coaming and efficiently stiffened between the beams as may be required

405. Length of cowl head housing

Ventilator cowls are to be fitted up closely to the outer surface of the coamings and are to have housing not less than 380 mm in length, except that a less housing may be permitted for ventilators not greater than 200 mm in diameter.

406. Closing appliances

1. Ventilators to machinery and cargo spaces are to be provided with means for closing openings capable of being operated from outside the spaces in case of a fire.

2. All ventilator openings in exposed positions on the freeboard and superstructure decks are to be provided with efficient weathertight closing appliances. Where the height of coaming of any ventilator exceeds 4.5 *metres* in Position I or 2.3 *metres* in Position II, such closing appliances may be omitted unless required in **Par 1.**

3. In ships not more than 100 *metres* in length for freeboard, the closing appliances mentioned in **Par**

2 are to be permanently provided; where not so provided in other ships, they are to be conveniently stowed near the ventilators to which they are to be fitted up.

407. Ventilators for deckhouses

The ventilators for the deckhouses which protect the companionways leading to spaces below the freeboard deck are to be equivalent to those for the enclosed superstructures.

Section 5 Permanent Gangways

501. General

Satisfactory means (in the form of guardrails, life lines, gangways or under deck passages, etc.) are to be provided for the protection of the crew in getting to and from their quarters, the machinery space and all other parts used in the necessary work of the ship.

502. Ships having reduced freeboard

In ships having a reduced freeboard, a fore and after permanent gangway is to be provided at the level of the Superstructure deck between the poop or after deckhouse and the midship bridge or deckhouse, or equivalent means of access is to be provided to carry out the purpose of gangway, such as a passage below deck. Safe and satisfactory access from the gangway level is to be available between separate crew accommodations and the machinery space.

503. Construction of gangways

The gangway specified in **502.** is to be efficiently constructed and situated as near the centre line of ship as practicable. The gangways are to be in general at least 600 mm wide and to be provided on their both sides with guardrails which are at least 1 *meter* high and comply with the requirements in **106. 1.** ⚓

CHAPTER 5 MASTS AND DERRICK POSTS

Section 1 Masts without Cargo Gear

101. Outside diameter

The outside diameter of steel masts which are not equipped with cargo derricks and are stayed with shrouds as specified in **104.** is not to be less than those obtained from the following formulae:

Outside diameter at the uppermost deck at which the mast is supported (hereinafter referred to as "**base**"):... $3.3H$ (cm)
Outside diameter at the outrigger or at the part to which the upper end of shrouds is connected (hereinafter referred to as "**top**"):.. $2.5H$ (cm)

where:
H = height of mast from the base to the top (m).

102. Thickness of plating

The thickness of plating of masts at each part is not to be less than that obtained from the following formula or 5 mm, whichever is the greater:

$$t = 0.1D_m + 2.5 \quad \text{(mm)}$$

where:
D_m = outside diameter of masts at each part (cm).

103. Reinforcement

The base and top of masts are to be properly strengthened.

104. Rigging

The rigging for masts is not to be less effective than would be obtained from two steel wire shrouds on each side of the ship, of the sizes given in **Table 4.5.1**, so placed that each distance from the forward and after chain plates to the base is not less than one-fourth of the height of mast from base to top or $B/4$, whichever is the greater.

Table 4.5.1 Diameter of steel wire for shrouds

Height of masts from base to top(m)	9	12	15	18
Diameter of steel wire(mm)	20	22	24	26
NOTE: The wire rope is to be No.1 or No. 3 wire rope specified in **Ch 8, Sec 5**				

Section 2 Derrick Posts

201. Application

The materials, construction and scantlings of masts, derrick posts and stays used for cargo handling will be considered in accordance with the requirements in **Pt 9, Ch 2.** ⚓

CHAPTER 6 CEILINGS AND SPARRINGS

Section 1 Bottom Ceilings

101. Ships with single bottoms

1. In ships with single bottoms, close ceilings are to be provided on the floors up to the upper turn of bilge.

2. The thickness of ceilings is to be as **Table 4.6.1.**

3. The ceilings on the flat on the floors are to be laid in portable sections, or other convenient arrangements are to be made for easy removal where required for cleaning, painting or inspection of the bottom.

Table 4.6.1 Thickness of ceiling

L	Thickness of ceiling(mm)
$L < 61$ m	50
61 m $\leq L \leq$ 76 m	57
$L > 76$ m	63

102. Ships with double bottoms

1. In ships with double bottoms, close ceilings are to be laid from the margin plate to the upper turn of bilge so arranged as to be readily removable for inspection of the limbers.

2. Ceilings are to be laid on the inner bottoms under hatchways, unless the requirements in **Pt 3, Ch 7, 501. 3** or **Pt 7, Ch 3, 204. 2** are applied.

3. Ceilings on the top of double bottom are to be laid on battens not less than 13 mm in thickness, or to be bedded on the covering required in **Ch 7, 104.**

4. The thickness of ceilings is to be as required in **101. 2.**

Section 2 Sparrings

201. Arrangements

In all cargo spaces where it is intended to carry general cargo, sparrings not less than 50 mm in thickness and 150 mm in breadth are to be provided not more than 230 mm apart above the bilge ceiling, or equivalent arrangements are to be provided for the protection of framing.

202. Special protections

Where it is intended normally to carry such cargoes as timbers which are liable to cause damage to the hull, special protection arrangements are to be provided.

203. Exemptions

1. Sparring may be omitted in cargo holds of ships such as coal carriers, bulk carriers, ore carriers and similar ships.

2. General cargo ships may omit sparring only subject to the approval of the Society at the request of Owner, in which case the ship is distinguished with the notation "*n.s.*" in the Register Book. ⚓

CHAPTER 7 CEMENTING AND PAINTING

Section 1 Cementing

101. General

The bottom in ships with single bottoms, the bilges in all ships and the double bottoms in the boiler spaces of all ships are to be efficiently protected by Portland cement or other equivalent materials which cover the plates and frames as far as the upper turn of bilge. However, cement protection may be dispensed with in the bottom of the space solely used for carriage of oil.

102. Portland cement

Portland cement is to be mixed with fresh water and sand or other satisfactory substances, in the proportion of about one part of cement to two of sand.

103. Thickness of cement

The thickness of cement is not to be less than 20 mm at the edges.

104. Special consideration

The top plating of tanks, where ceiled directly, is to be covered with good tar put on hot and well sprinkled with cement powder, or with other equally effective coatings.

Section 2 Painting

201. General

1. All steel works are to be coated with a suitable paint. Special requirements may be additionally made by the Society in accordance with the kind of ships, purpose of spaces, etc.
2. Notwithstanding the requirements in **Par 1,** where it is recognized by the Society that the spaces are effectively protected against corrosion of steel works by the means other than painting or due to quality of cargoes, etc., painting may be omitted.

202. Wash cement

Steelworks in tanks intended for water may be coated with wash cement in lieu of paint.

203. Cleaning before painting

The surface of steelworks is to be thoroughly cleaned and loose rust, oil and other injurious adhesives are to be removed before being painted. At least the outer surface of shell plating below the load line is to be sufficiently free from rust and mill scale before painting. ⚓

CHAPTER 8 EQUIPMENT NUMBER AND EQUIPMENT

Section 1 General

101. General and application

1. All ships, according to their equipment number of provisions in **Sec 2,** are to be provided with anchors, chain cables, ropes, etc. which are not less than given in **Table 4.8.1.**

2. Anchors, chain cables, ropes, etc. for ships having equipment number not more than **205** or more than 16,000 are to be as determined by the Society.

3. The bower anchors given in **Table 4.8.1** are to be connected to their cables and stored on board ready for use.

4. The anchors, chain cables and ropes (hereinafter referred to as "equipment") which are required to be tested and inspected to be used for ships classed with the Society are to comply with the requirements of this Chapter.

5. The equipment other than those prescribed in this Chapter may be used where specially approved in connection with the design and use. In such case, the detailed data relating to the process of manufacture of the equipment are to be submitted for approval.

6. All ships are to be provided with suitable appliances for handling of anchors

7. The inboard end of chain cable is to be secured to the hull through a strong eye plate by means of shackle or by other equivalent means.

102. Materials

1. The materials for equipment specified in this Chapter are to comply with the requirements in each Section and **Pt 2, Ch 1.**

2. The test pieces and testing procedures for materials of equipment are to comply with the requirements in each Section and **Pt 2, Ch 1.**

103. Process of manufacture

The process of manufactures for equipment specified in this Chapter is to comply with the requirements in each Section.

104. Tests and inspections

1. All equipment prescribed in this Chapter are to be tested and inspected in the presence of the Society's Surveyor in accordance with the requirements of this Chapter and are to comply with the requirements for the tests and inspections.

2. Where equipment having characteristics differing from those prescribed in this Chapter are to be tested and inspected according to the approved specification for the testing.

3. The tests and inspections for equipment may be dispensed with, where these equipment have appropriate certificates accepted by the Society.

105. Execution of tests and inspections

1. The manufacturers shall afford the Surveyor all necessary facilities and access to all relevant parts of the works to enable him to verify that the approved process is adhered to.

2. All tests and inspections of equipment are to be carried out at the place of manufacturer prior to delivery.

106. Marking for accepted equipments

Equipment which have satisfactory complied with the required in this Chapter are to be stamped in accordance with the provisions in each Section.

Section 2 Equipment Number

201. Equipment number

Equipment number is the value obtained from the following formula:

$$E = \Delta^{\frac{2}{3}} + 2.0Bh + 0.1A$$

where:

Δ = molded displacement in *tonnes* to the summer load waterline.

h, A = values specified in the following (1), (2) and (3).

(1) h is the value obtained from the following formula:

$$h = f + h' \quad \text{(m)}$$

where:

f = vertical distance, at the midship, from the load line to the top of uppermost continuous deck beam at side (m).

h' = height from the uppermost continuous deck to the top of uppermost superstructures or deckhouses having a breadth greater than $B/4$ (m), In the calculation of h', sheer and trim may be ignored. Where a deckhouse having a breadth greater than $B/4$ is located above a deckhouse with a breadth of $B/4$ or less, the narrow deckhouse may be ignored.

(2) A is the value obtained from the following formula:

$$A = fL + \Sigma h'' l \quad (\text{m}^2)$$

where:

f = value specified in (1)

$\Sigma h'' l$ = summing up of the products of the height h'' (m) and length l (m) of superstructures, deckhouses or trunks which are located above the uppermost continuous deck within the length of ship and also have a breadth greater than $B/4$ and a height greater than 1.5 *metres*.

(3) In the application of (1) and (2), screens and bulwarks more than 1.5 *metres* in height are to be regarded as parts of superstructure or deckhouses.

202. Mass of anchors

1. The mass of individual bower anchors may vary by ±7 % of the mass given in **Table 4.8.1** provided that the total mass of stipulated number of bower anchors is not less than obtained from multiplying the mass per anchor by the number given in **Table 4.8.1.** Where, however, an approval by the Society is obtained, the anchors which are increased in mass by more than 7 % may be used.

2. Where stock anchors are used, the mass excluding the stock, is not to be less than 0.80 times the mass specified in **Table 4.8.1** for ordinary stockless bower anchors.

3. Where high holding power anchors are used, the mass of each anchor may be 0.75 times the mass specified in **Table 4.8.1.**

4. Where super high holding power anchors are used, the mass of each anchor may be 0.5 times the mass specified in **Table 4.8.1.** However, the mass of super high holding anchor is generally not to exceed 1500 kg.

203. Chain cables and stream lines

1. Chain cables for bower anchors are to be stud link chains of Grade 1, 2 or 3 specified in **Sec 4.** However, Grade 1 chains made of Class 1 chain bars (*RSBC* 31) are not to be used in association with high holding power anchors.

2. As for chain cables or wire ropes for stream lines, the breaking test load specified in **Sec 4** or **5** is not to be less than the breaking load given in **Table 4.8.1** respectively.

3. Steel wire rope instead of stud link chain cable are to be in accordance with the Guidance relating to the Rules specified by the Society for vessels of special design or operation such as crane barges.

204. Tow lines and mooring lines

1. As for wire ropes and hemp ropes used as tow lines and mooring lines, the breaking test load specified in **Sec 5** or **6** is not to be less than the breaking load given **Table 4.8.1** respectively.

2. For ships having the ratio A/E above 0.9, the following number of ropes should be added to the number required by **Table 4.8.1** for mooring lines.

$\frac{A}{E}$	Number of mooring line
$0.9 < \frac{A}{E} \leq 1.1$	1
$1.1 < \frac{A}{E} \leq 1.2$	2
$\frac{A}{E} > 1.2$	3

NOTES:
A = value specified in **201.** (2)
E = equipment number.

3. For individual mooring lines with required breaking load above 490 kN according to **Table 4.8.1** the required strength may be reduced by the corresponding increase of the number of mooring lines and vice versa, provided that the total breaking load of all mooring lines aboard the ship is not less than the value obtained from multiplying the required breaking load in **Table 4.8.1** by the sum of number required in **Table 4.8.1** and **Par 1,** irrespective of the requirements in **Par 1.** However, the number of mooring lines is not to be less than 6 in any case, and any one of the lines is not to have a breaking load less than 490 kN.

4. The requirements for synthetic fibre ropes used as tow lines or mooring lines are to be as stipulated elsewhere.

5. The length of individual mooring lines may be reduced up to 7 % of the length given in **Table 4.8.1** provided that total length of the stipulated number of mooring lines is not less than obtained from multiplying the length by the number given in **Table 4.8.1.**

NOTES :
1. Where steel wire ropes are used, the following wire ropes corresponding to the marks shown in the Table, ● (6×12), ⊕ (6×24), ⊞ (6×37), are to be provided.
2. Length of chain cables may be that including shackles for connection
3. Tow line is not a condition of Classification, but is listed in this table only for guidance.

6. For mooring lines connected with powered winches where the rope is stored on the drum, steel cored wire ropes of suitable flexible construction may be used instead of fibre cored wire ropes subject to the approval by the Society.

205. Emergency towing arrangements on tankers

1. For tankers which operate in international service area, emergency towing arrangements shall be fitted at both ends on board every tanker of not less than 20,000 *tonnes* deadweight.

2. Tankers constructed on or after 1 July 2002 are to be in accordance with the requirements in the following Sub-paragraphs.

(1) The arrangements shall, at all times, be capable of rapid deployment in the absence of main power on the ship to be towed and easy connection to the towing ship. At least one of the emergency towing arrangements shall be pre-rigged ready for rapid deployment.

(2) Emergency towing arrangements at both ends shall be of adequate strength taking into account the size and deadweight of the ship, and the expected forces during bad weather conditions. The design, construction and prototype testing of emergency towing arrangement are to be in accordance with **Ch 3, Sec 7-1.** in **"Guidance for Approval of Manufacturing Process and Type Approval, etc".**

3. For tankers constructed before 1 July 2002, the design, construction and prototype testing of emergency towing arrangements are to be in accordance with **Ch 3, Sec 7-1.** in **"Guidance for Approval of Manufacturing Process and Type Approval, etc".**

Section 3 Anchors

301. Application

Anchors to be equipped on ships in accordance with the provisions in this Chapter are to be in compliance with the requirements in this Section or to be of equivalent quality.

302. Kinds

The kinds of anchors are as follows:
(1) Ordinary anchors
(A) Stocked anchors
(B) Stockless anchors
(2) HHP anchors
(3) SHHP anchors, not exceeding 1,500kg in mass

303. Materials

1. Cast steel anchor flukes, shanks, swivels and shackles are to be manufactured and tested in accordance with the requirements in **PT 2, Ch 1, 501.** of the Rules and comply with the requirements for castings for welded construction. The steel is to be fine grain treated with Aluminium. If test programme B is selected in **309. 1** then Charpy V notch (CVN) impact testing of cast material is required.

2. Forged steel anchor pins, shanks, swivels and shackles are to be manufactured and tested in accordance with the requirements in **PT 2, Ch 1, 601.** of the Rules. Shanks, swivels and shackles are to comply with the requirements for carbon and carbon-manganese steels for welded construction.

3. Rolled billets, plate and bar for fabricated steel anchors are to be manufactured and tested in accordance with the requirements in **PT 2, Ch 1, 301.** of the Rules.

4. Rolled bar intended for pins, swivels and shackles are to be manufactured and tested in accordance with the requirements in **PT 2, Ch 1, 301.** and **601.** of the Rules.

5. Cast steels for super high holding power anchor are to be subjected to the impact test according to the followings.
(1) One set of three V notch impact test specimens specified in **Pt 2, Ch 1** are to be taken.
(2) The average absorbed energy is not to be less than 27 J at 0 °C. However, when the average absorbed energy of two or more test specimens among a set of test specimens is less than 27 J or when the average absorbed energy of a single test specimen is less than 19 J, the test is to be considered to have failed.
(3) Anchor rings of super high holding power anchor are to comply with the requirements of impact test for Grade 3 chain in **Ch 8, Table 4.8.10.**

304. Constructions and dimensions

1. The construction and form of anchors are to comply with the KS V 3311 (Anchors) or equivalent to this, the special forms of anchors are to be approved by the Society.

2. The high holding power anchors and super high holding anchors, except in accordance with the provision in the above **Par 1,** are to be tested by the holding power indicated by the Society and are to comply with the test requirements.

3. Welded construction of fabricated anchors is to be done in accordance with procedures approved by the Society. Welding is to be carried out by qualified welders, following the approved welding procedures, using approved welding consumables.

4. Assembly and fitting are to be done in accordance with the design details. Securing of the anchor pin, shackle pin or swivel nut by welding is to be done in accordance with an approved procedure.

305. Heat Treatment

1. Components for cast of forged anchors are to properly heat treated in accordance with the requirements in **Pt 2. Ch 1.**

2. The welding for rolled steel fabricated anchors may require stress relief after welding depending upon weld thickness. The manufacturers are to obtain approval by the Society in advance concerning stress relief after weld. Stress relief temperature are not to be exceed the tempering of the base material.

306. Quality and Repair of Defects

1. Anchors are to be free from cracks, notches, inclusions and other defects impairing the performance of the products.

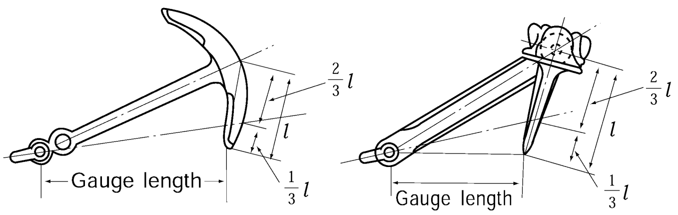
2. Any necessary repairs to forged and cast anchors are to be agreed by the Surveyor and carried out in accordance with the repair criteria indicated in **PT 2, Ch 1, 501.** and **601.** of the Rules. Repairs to fabricated anchors are to be agreed by the Surveyor and carried out in accordance with qualified weld procedures, by qualified welders, following the parameters of the welding procedures used in construction.

307. Dimensions and Forms

1. Length of the arm is as follows.

(1) Length of the arm is the distance from the centre of the pin in case of anchors having the head pin and from the top of the crown in case of anchors of the other types to the tip of the flukes. (See **Fig 4.8.1**)

(2) Where the crown is of concave form, the intersection of the centre line of the shank with the plane in contact with the top of the arms is considered as the top of the crown.



Stock Anchor Stockless Anchor

Fig 4.8.1 Anchors

2. Assembly and fitting of anchors are as follows unless specially approved by the Society.

(1) The clearance either side of the shank within the shackle jaws is to be given in **Table 4.8.2** in accordance with the anchor mass.

(2) The shackle pin is to be a push fit in the eyes of the shackle, which are to be chamfered on the outside to ensure a good tightness when the pin is clenched over on fitting. The shackle pin to hole tolerance is to be given in **Table 4.8.3** in accordance with diameter of the shackle pins.

(3) The trunnion pin is to be a snug fit within the chamber and be long enough to prevent horizontal movement. The gap is to be no more than 1% of the chamber length.

(4) The lateral movement of the shank is not exceed 3 degrees. (See **Fig 4.8.2**)

3. The dimensional inspections of anchors are to be performed by the manufacture. The manufacture is to show the data of measurement to the surveyor.

Table 4.8.2 The clearance either side of the shank within the shackle jaws

Anchor mass(t)	over up	- 3	3 5	5 7	7 -
Tolerance(mm)	up to	3	4	6	12

Table 4.8.3 The shackle pin to hole tolerance

The diameter of shackle pin(mm)	57 up	57 over
Hole tolerance(mm)	0.5 up	1.0 up

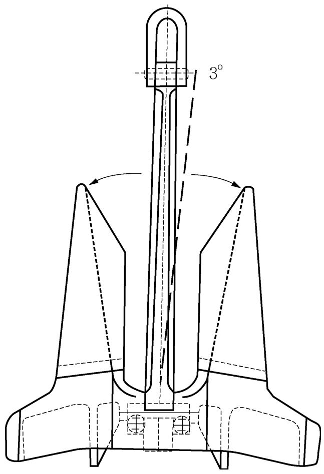


Fig 4.8.2 Allowable range of the lateral movement of the shank

308. Mass

1. The mass of the stock of a stock anchor is not to be less than one-fourth of the mass of anchor excluding stock.

2. The mass of stockless anchor excluding shank is not to be less than three-fifths of the total mass of the anchor.

3. The mass of the anchor is to exclude the mass of the swivel, unless this is an integral component.

4. The mass inspections of anchors are to be performed by the manufacture before executing proof test. The manufacture is to show the data of measurement to the surveyor.

5. In case of stock anchors, the mass of the anchor excluding stock and the mass of the stock are to be measured separately. In case of stockless anchors the total mass of anchor and the mass of shank are to be measured.

309. Testing and certification

1. Test programme

(1) The Society can request that either programme A or programme B be applied.

Programme A	Programme B
Drop test Hammering test Proof load test Visual inspection General NDE -	Drop test - Proof load test Visual inspection General NDE Extended NDE

(2) Applicable programmes for each product form are as belows.

Product test	Product form		
	Cast components	Forged components	Fabricated/Welded components
Programme A	O	X	X
Programme B	O(1)	O	O

Notes
(1) A. CVN impact tests are to be carried out to demonstrate at least 27 joules average at 0ºC.
B. The Drop test requirement in Programme B is intended for tankers applicable for Cast Components.

2. Drop and hammering tests

In case of test programme A, Cast steel anchors are to be subjected to the following tests prior to the execution of the proof tests and are to comply with the test requirements.

(1) *Drop tests*

(a) Each piece of the cast steel anchor is to be lifted to 4 *metres* in height and dropped on an steel slab on the hard ground without any crack or other defects.

(b) Where shank and arms are cast in one piece in stock anchors, the anchor is first to be lifted to the specified height with its shank and arms in a horizontal position and then dropped on the steel slab, and to be lifted once more to the specified height with the crown downwards and dropped on two steel blocks on the slab arranged to enable the anchor to give shock at the middle of each arm without making the crown touch the slab, and are to be found free from cracks, deformation or other defects.

(c) Where the slab is broken by the impact, the anchor is to be retested with a new slab.

(2) *Hammering tests*

After the drop test specified in (1), the anchor is to be slung clear of the ground and thoroughly hammered with a hammer which the mass is 3 kg and over, and is to be found free from cracks or other defects.

(3) For fracture and unsoundness detected in a drop test or hammering test, repairs are not permitted and the components is to be rejected.

3. Proof tests

(1) Anchors are to be tested in accordance with the requirements in **Table 4.8.4,** applying the required load corresponding to the mass of anchor (excluding the mass of stock for stock anchor) at the position of one-third of the length of the arm from the tip of the fluke, for every arm or for both arms simultaneously or for each position in case of the anchor having the head pin, and to be found free from cracks, deformation or other defects. In every test, the difference between the gauge lengths, where one-tenth of the required load was applied first and where the load has been released to one-tenth of the required load from the full load, may be permitted not to exceed 1 % of the gauge length. (See **Fig 4.8.1**)

(2) The proof test load, however, for high holding power anchors is to be the load specified for an ordinary anchor of which mass is equal to 4/3 times the actual total mass of high holding power anchor.

(3) The proof test load for super high holding power anchors is to be the load specified for an ordinary anchor of which the mass is 2 times the actual mass of super high holding power anchor.

Table 4.8.4 Proof test load for anchors

Mass of anchor (kg)	Proof test load (kN)	Mass of anchor (kg)	Proof test load (kN)	Mass of anchor (kg)	Proof test load (kN)	Mass of anchor (kg)	Proof test load (kN)
25	12.6	1000	199	4500	622	10000	1010

950	191	4400	613	9800	998	46000	2650

NOTE ;
Where mass of anchor is intermediate in this Table, proof test load is to be determined by linear interpolation

4. Visual inspection

After proof loading visual inspection of all accessible surfaces is to be carried out.

5. General non-destructive examination

(1) For ordinary anchors and HHP anchors, after proof loading, general non-destructive examination is to be carried out as indicated in the following Table.

Location	Method of NDE
Feeders of castings	PT or MT
Risers of castings	PT or MT
Weld repairs	PT or MT
Forged components	Not required
Fabrication welds	PT or MT

(2) For SHHP anchors, after proof loading, general non-destructive examination is to be carried out as indicated in the following Tables.

Location	Method of NDE
Feeders of castings	PT or MT and UT
Risers of castings	PT or MT and UT
All surfaces of castings	PT or MT
Weld repairs	PT or MT
Forged components	Not required
Fabrication welds	PT or MT

(3) The NDE methods and acceptance criteria are to comply with the **Pt 2, Annex 2-2** and **Annex 2-7** of the Guidance relating to the Rules

(4) If defects are detected by non-destructive test, repairs are to be carried out in accordance with **306. 2.**

6. Extended non-destructive examination

(1) In case of programme B, after proof loading, extended non-destructive examination is to be carried out as indicated in the following Table.

Location	Method of NDE
Feeders of castings	PT or MT and UT
Risers of castings	PT or MT and UT
All surfaces of castings	PT or MT
Random areas of castings	UT
Weld repairs	PT or MT
Forged components	Not required
Fabrication welds	PT or MT

(2) The NDE methods and acceptance criteria are to comply with the **Pt 2, Annex 2-2** and

Annex 2-7 of the Guidance relating to the Rules

(3) If defects are detected by non-destructive test, repairs are to be carried out in accordance with **306. 2.**

310. Retests

Where the result of the impact test is unsatisfactory, retest is to be in accordance with the requirements in **Pt 2, Ch 1, 109.** of the Rules.

311. Marking

1. Where anchors have satisfactorily passed the tests and inspections, they are to be stamped with the mass of anchor (excluding the mass of stock in stock anchors), at the middle position of the shank and the Society's brand and the test number at the position two-thirds of the length of arm from the tip of the fluke on the same side. Where the anchor is formed with separate shank and arms, the Society's brand and the test number are also to be stamped on the shank in the neighbourhood of the head pin, and in case of stock anchor, the mass of stock, the Society's brand and the test number are also to be stamped on the stock.

2. In case of high holding power anchors, alphabet H is to be stamped in front of the Society's brand in addition to the stamps specified in the above **Par 1.**

3. In case of super high holding power anchors, alphabet SH is to be stamped before the Society's brand in addition to the stamps specified in the above **Par 1.**

312. Painting

Anchors are not to be painted until the tests and inspections are finished.

Section 4 Chains

401. Applications

1. The materials, design, manufacture and testing of stud link anchor chain cables to be equipped on ships, steering chains (hereinafter referred to as "chain"), shackles and swivels (hereinafter referred to as "accessories") are to comply with the requirements in this Section or to be of equivalent quality. Where, in exceptional cases, studless short link chain cables are used with the consent of this Society, they must comply with recognized national or international standards. Chafing chain for Emergency Towing Arrangements (ETA) are to be in accordance with the Guidance relating to the Rules specified by the Society.

2. Offshore mooring chains and chafing chain for Emergency Towing Arrangements (ETA) are to be in accordance with the Guidance relating to the Rules specified by the Society.

402. Chain cable grades

Depending on the nominal tensile strength of the chain cable steel used for manufacture, stud link chain cables are to be subdivided into Grades 1, 2 and 3.

403. Materials

1. Chains are to be made of the materials given in **Table 4.8.5** according to their grades and manufacturing processes, respectively.

2. The studs are to be made of steel corresponding to that of the chain or from rolled, cast or forged mild steels. The use of other materials, e.g. grey or nodular cast iron is not permitted.

Table 4.8.5 Mechnical properties of rolled steel bars

Chain cable grades \ Manufacturing Process \ Materials	Materials for Chain Links[1]			Materials for Accessories[2]	
	Flash butt welded	Cast	Forged	Cast	Forged
Grade 1 chain	Grade 1 chain bar (RSBC 31)	-		Grade 2 cast steel for chain (RSCC 50)	Grade 2 steel forging for chain (RSFC 50)
Grade 2 chain	Grade 2 chain bar (RSBC 50)	Grade 2 cast steel for chain (RSCC 50)	Grade 2 steel forging for chain (RSFC 50)		
Grade 3 chain	Grade 3 chain bar (RSBC 70)	Grade 3 cast steel for chain (RSCC 70)	Grade 3 steel forging for chain (RSFC 70)	Grade32 cast steel for chain (RSCC 70)	Grade 2 steel forging for chain (RSFC 70)

NOTE :
(1) Materials for Grade 2 chains may be used for Grade 1 chains.
(2) Materials for Grade 2 chains may be used for accessories for Grade 2 chains.

404. Design

1. Chains and accessaries must be designed according to a standard recognized by the Society, such as ISO 1704.

2. There is to be an odd number of links in each length of chains, except where swivels are fitted.

3. Where designs do not comply with this and where accessories are of welded construction, drawings giving full details of the design, the manufacturing process and the heat treatment are to be submitted to the Society for approval.

405. Manufacturing Process

1. Chains should preferably be manufactured by flash butt welding using Grade 1, 2 or 3 bar material. Manufacture of the links by drop forging or castings is permitted. Their manufactures are to obtain approval by the Society in advance concerning their manufacturing methods.

2. On request, pressure butt welding may also be approved for studless Grade 1 and 2 chain cables, provided that the nominal diameter of the chain cable does not exceed 26 mm.

3. Studs are to be securely fastened by press fitting or welding with an approved procedure. Inserted studs are to be pressed completely to the centre position of the link and at right angles to the sides of the link and welding of studs is to satisfy the requirements specified in **408.** of the Rules.

4. Accessories such as shackles, swivels and swivel shackles are to be forged or cast in steel of at least Grade 2. The welded construction of these parts may also be approved.

406. Heat treatment

1. According to the grade of steel, chains and accessories are to be supplied in one of the conditions specified in **Table 4.8.6**. However Grade 2 flash butt welded chains subjected to sufficient preheating may not be required heat treatment on the approval by the Society.

2. The heat treatment shall in every case be performed before the proof load test, the breaking load test, and all mechanical testing.

Table 4.8.6 Condition of supply of chains and accessories

Grade	Chains	Accessories
1	As welded or Normalized	NA
2	As welded or Normalized(1)	Normalized
3	Normalized, Normalized and tempered or Quenched and tempered	Normalized, Normalized and tempered or Quench and tempered
NOTE : (1) Grade 2 chain cables made by forging or casting are to be supplied in the normalized condition.		

407. Quality and repair of defects

1. Chains and accessories must have a clean surface consistent with the method of manufacture and be free from cracks, notches, inclusions and other defects imparing the performance of the product. The flashes produced by upsetting or drop forging must be properly removed.

2. Minor surface defects other than preceding **Par 1,** can be partly removed by grinder. In this case the grinding is so as to leave gentle transition to the surrounding surface and, in principle, local grinding up to 5 % of the nominal link diameter may be permitted.

408. Welding of studs

The welding of studs is to be in accordance with an approved procedure subject to the following conditions:

1. The studs must be of weldable steel

2. The studs are to be welded at one end only, i.e., opposite to the weldment of the link. The stud ends must fit the inside of the link without appreciable gap.

3. The welds, preferably in the flat position, shall be executed by qualified welders using suitable welding consumables.

4. All welds must be carried out before the final heat treatment of the chain cable.

5. The welds must be free from defects liable to impair the proper use of the chain. Under-cuts, end craters and similar defects shall, where necessary, be ground off.

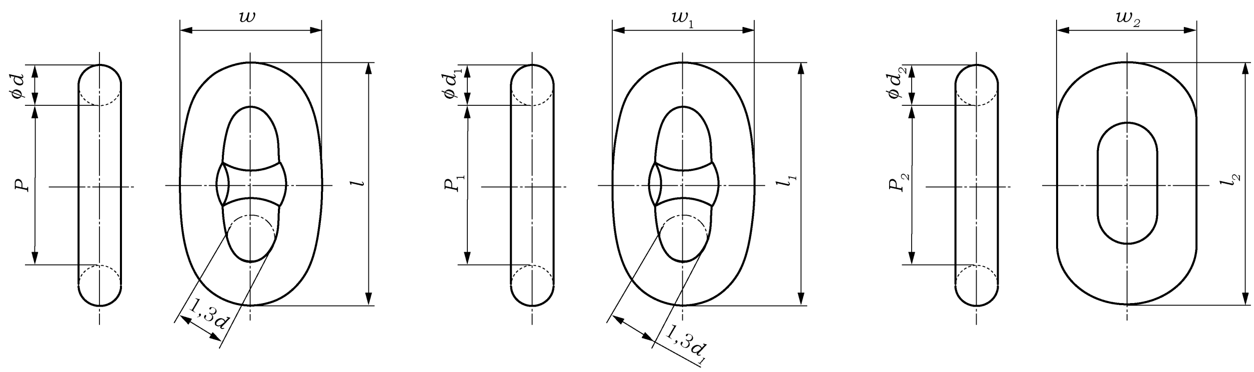
409. Shape and proportions

1. The shape and proportions of links and accessories must conform to a recognized standard, such as ISO 1704 or the designs specially approved, and are generally to be as given in **Fig 4.8.3.** and **4.8.4.**

2. The nominal diameter of chains is to be denoted by the diameter of the common link.

3. One length of chains is the distance from the outer end of the internal bent portion of the link at one end of the chain to that at the other end of the chain. The standard length of anchor chains is 27.5 m.

4. Links of every kind, shackles and swivels are to be of uniform shape and their bent portions are to be sufficient to allow each link to work smoothly.



d = nominal diameter of common link
l = 6 d
p = 4 d
w ≈ 3.6 d

(a) Common link

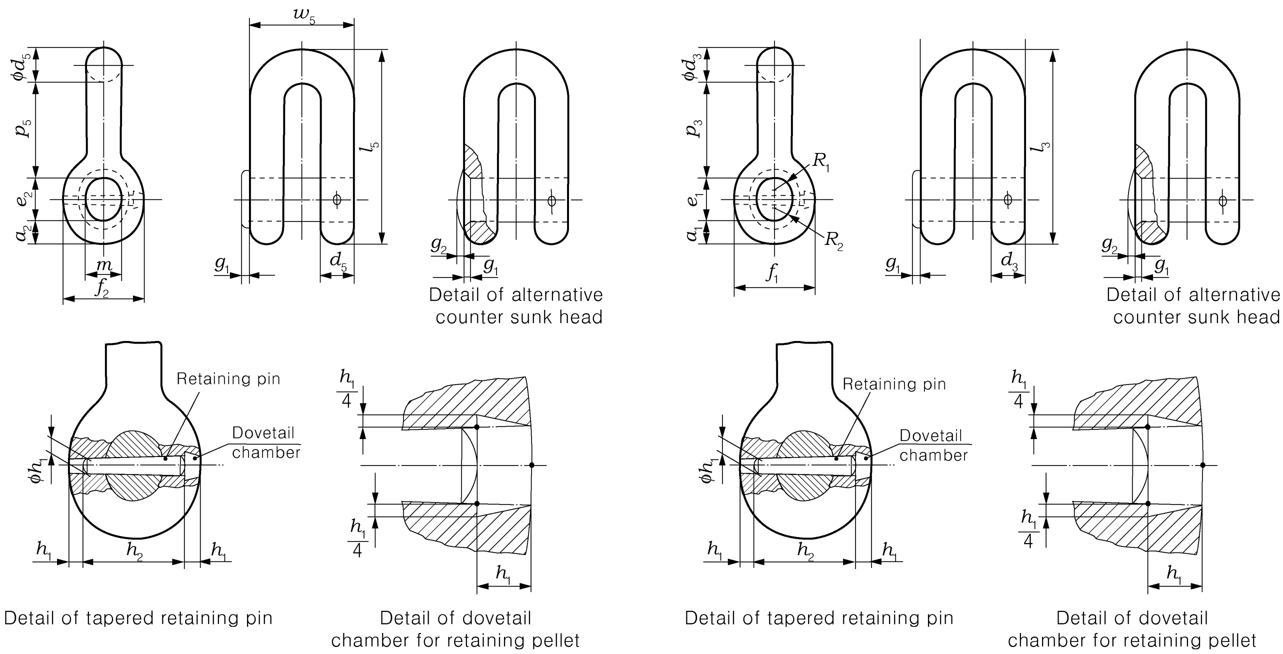
d = nominal diameter of common link
d_1 = diameter of enlarged link ≈ 1.1d
l_1 = 6 d_1
p_1 = 4 d_1
w_1≈ 3.6 d_1

(b) Enlarged link

d = nominal diameter of common link
d_2 = diameter of end link ≈ 1.2d
l_2 = p_2 + 2d_2 ≈ 6.75d
p_2 = 4.35 d
w_2 ≈ 4 d

(c) End link

Fig 4.8.3 Shape and proportions of links



d = nominal diameter of common link
d_5 = diameter of anchor shackle ≈ 1.4 d
l_5 ≈ 8.7 d
p_5 = $l_5 - (d_5 + a_2 + e_2)$ ≈ 4.6 d
$w_5$5 = 5.2 d
a_2 ≈ 0.9 d
e_2 ≈ 1.8 d
f_2 ≈ 3.1 d
g_1 ≈ 0.2 d
g_2 ≈ 0.1 d
h_1 = nominal diameter of taper pin
h_2 = nominal length of taper pin
m ≈ 1.4 d

(a) Anchor shackle

d = nominal diameter of common link
d_3 = diameter of joining shackle ≈ 1.3 d
l_3 ≈ 7.1 d
p_3 = $l_3 - (d_3 + a_1 + e_1)$ ≈ 3.4 d
w_3 = 4 d
a_1 ≈ 0.8 d
e_1 ≈ 1.6 d
f_1 ≈ 2.8 d
g_1 ≈ 0.2 d
g_2 ≈ 0.1 d

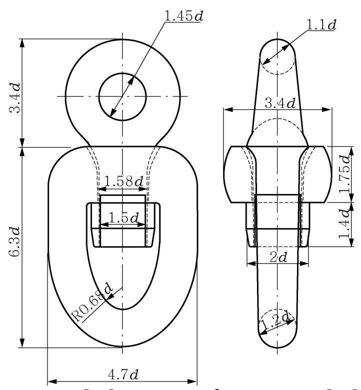
R_3 ≈ 0.67d
R_4 ≈ 1.83d

(c) Kenter shackle



d = nominal diameter of common link

(d) Swivel

Fig 4.8.4 Shape and proportions of accessories

410. Dimension tolerances

The tolerances for chains and accessories are to comply with the following requirements in **Par 1** and **2** and the dimensions thereof are to be measured after the execution of a proof test.

1. Chain

(1) Two measurements are to be taken at the same location of each kind of link : one in the plane of the link (see d_p in **Fig 4.8.5**) and one perpendicular to the plane of the link. The negative tolerance at the crown part of each kind of link is to comply with the requirements in accordance with its nominal diameter as given in **Table 4.8.7** and the plus tolerance may be up to 5% of the nominal diameter. The cross sectional area of the crown must have no negative tolerance.

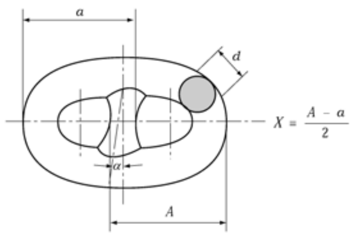


Fig 4.8.5 the position of studs

Table 4.8.7 Negative tolerances of diameters

Nominal Diameter (mm)	over		40	84	122
	up to	40	84	122	
Negative Tolerances (mm)		1	2	3	4

(2) The tolerances other than the crown part of each kind of link are to be up to +5 % of the nominal diameter, but are not to be negative. The approved manufacturer's specification is applicable to the plus tolerance of the diameter at the flush-butt weld.

(3) The maximum allowable tolerance on assembly measured over a length of 5 links are to be ±2.5 %, but not to be negative.(measured with the chain under tension after proof load test)

(4) The tolerances except for the requirements specified in (1) to (3) above are to be ±2.5 %.

(5) The tolerances of stud positions are to comply with the standard as follows, except the final link at each end of one length of chain.
(A) Maximum off-centre distance X : 10 % of the nominal diameter(d)
(B) Maximum deviation "α" from the 90° position : 4°
where, X and α are as specified in **Fig 4.8.5.**

2. Accessories

The tolerance of the diameter at the bent portions of center shackles are to be equal +5 %, but may not be negative. All other dimensions are subjected to manufacturing tolerances of ±2.5 %

411. Mass

The mass of chains is to comply with the standard mass given in **Table 4.8.8** in accordance with their kind, and to be measured after the execution of proof tests.

Table 4.8.8 Breaking and proof test loads for chains

Nominal dia. d (mm)	Grade 1 chain		Grade 2 chain		Grade 3 chain		Mass of chain per metre (kg)

162	7991	5588	11185	7991	15975	11185	574.7

NOTE :

Where nominal diameter is less than 12.5 mm or intermediate in this Table, breaking test loads, proof test loads and mass of chain per metre are to be determinated by the following table :

Kind	Breaking test load (kN)	Proof test load (kN)	Mass (kg)
Grade 1 chain	$0.00981d^2(44-0.08d)$	$0.00686d^2(44-0.08d)$	$0.0219d^2$
Grade 2 chain	$0.01373d^2(44-0.08d)$	$0.00981d^2(44-0.08d)$	$0.0219d^2$
Grade 3 chain	$0.01961d^2(44-0.08d)$	$0.01373d^2(44-0.08d)$	$0.0219d^2$

where :

d = Nominal diameter (mm)

412. Test and inspection of chain

1. General

(1) Finished chain cables are to be subjected to the proof load test and the breaking load test in the presence of the Surveyor, and shall not fracture or exhibit cracking.
(2) Special attention is to be given to the visual inspection of the flash-butt weld, if present. For this purpose, the chain cables must be free from paint and anti-corrosion media.

2. Breaking load tests

(1) For the breaking load test, one sample comprising at least of three links is to be taken from every four lengths or fraction of chain cables However, where one length of chain is short and the total length of two lengths of chain is less than 27.5 metres, such two lengths may be regarded as one length.
(2) The test specimens are to withstand satisfactorily the breaking test loads specified in **Table 4.8.8** according to their grades. The breaking load is to be maintained for a minimum of 30 seconds
(3) Where the capacity of the testing machine does not reach the breaking test loads specified in **Table 4.8.8**, the breaking test may be substituted by a method approved by the Society.
(4) The links concerned shall be made in a single manufacturing cycle together with the chain cable and must be welded and heat treated together with it. Only after this they may be separated from the chain cable in the presence of the Surveyor.

3. Proof load tests

The proof tests are to be carried out for each length of the chains which satisfactorily complied with the breaking tests, and the chains are to withstand the proof test loads specified in **Table 4.8.8** without cracking, breakage or any other defects. The test is to be carried out after the chains were heat treated where necessary.

4. Retest

(1) Breaking load tests

(A) Where the test is not satisfactory, the chain may be retested by taking out another set of test specimens from the same length of chain, and where the test specimens comply with the requirements, the remaining three lengths of chain may be accepted. Where the retest fails, the length of chain from which the test specimen have been taken is rejected, and the remaining three chains are to be subjected to the breaking tests individually. If one of such test fails to meet the requirements, all the remaining three lengths of the chain are rejected.

(B) Where the missing chain links due to the preparation of the retest of **Par 5** above are replaced by new chain links, the test specimens manufactured by the same procedure are to be subjected to the breaking test, and are to comply with the requirements.

(2) Proof load tests
Where the test is not satisfactory, the chain may be retested only once more by link of same manufacturing process after replacing the defective link. Where, however, more than 5 % of the total links are found defective, the retest is not permitted. In addition, an investigation is to be made to identify the cause of the failure.

5. Mechanical tests on grade 2 and 3 chain cable

(1) Grade 2 and grade 3 chain cables are to be subjected to the mechanical tests, and are to comply with the requirements.

(2) Mechanical test specimens are to be taken from every four lengths in accordance with **Table 4.8.9.** For forged or cast chain cables where the batch size is less than four lengths, the sampling frequency will be by heat and heat treatment charge.

(3) An additional link (or where the links are small, several links) for mechanical test specimen removal is (are) to be provided in a length of chain cable not containing the specimen for the breaking test. The specimen link must be manufactured and heat treated together with the length of chain cable. Mechanical tests are to be carried out in the presence of the Surveyor.
Mechanical properties of chain links are to comply with requirements given in **Table 4.8.10.**

(4) Test procedure and forms of test specimens are to comply with the requirements in **Pt 2, Ch 1, Sec 2**.

(5) Where the test results of mechanical properties of chain links do not conform to the requirements, additional tests are to be carried out in accordance with the requirements specified in **Pt 2, Ch 1, 306. 9.**

413. Test and inspection of accessories

1. Proof load test

Each kind of accessory is to be tested to the proof test loads specified in **Table 4.8.8,** in accordance with the kinds and diameters of the chains to be connected therewith, and they are to withstand the test without crack, breakage or any other defect. This test may be carried out simultaneously with the proof test for the chains or together with any chains of the same diameter with which shackles and swivels are connected.

2. Breaking load test

(1) From each manufacturing batch (same accessory type, grade, size and heat treatment charge, but not necessarily representative of each heat of steel or individual purchase order) of 25 units or less of detachable links, shackles, swivels, swivel shackles, enlarged links, and end links, and from each manufacturing batch of 50 units or less of kenter shackles, one unit is to be subjected to the breaking load test at the break load specified for the corresponding chain given by **Table 4.8.8.** Enlarged links and end links need not be tested provided that they are manufactured and heat treated together with the chain cable.

(2) Where the test of Par (1) above is not satisfactory, the accessories may be retested by taking

out two units from the same lot. If one such test fails to meet the requirements, the entire unit test quantity is rejected.

(3) Accessories used for the breaking load test must not be put into further use. However, the accessories, which have been successfully tested in accordance with Par (1) of the above and are manufactured with the following (A) or (B) may be used in service at the discretion of the Society.

(A) the material having higher strength characteristics than those specified for the part in question(e.g. grade 3 materials for accessories for grade 2 chain).

(B) the same grade materials as the chain but with increased dimensions subject to the successful procedure tests that such accessories are so designed that the breaking strength is not less than 1.4 times the breaking load of the chain which they are intended

(4) When the accessories are in accordance with the following requirements in (A) to (C), no impact testing is required subject to the approval by the Society.

(A) The breaking load test has been demonstrated on the occasion of the approval testing of parts of the same design.

(B) The tensile test and impact test have been demonstrated by each manufacturing lot.

(C) Non-destructive testing has been demonstrated before forwarding the products.

3. Mechanical properties and tests

(1) Unless otherwise specified, the forging or casting must at least comply with the mechanical properties given in **Table 4.8.10**, when properly heat treated. For test sampling, forgings or castings of similar dimensions originating from the same heat treatment charge and the same heat of steel are to be combined into one test unit.

(2) Mechanical tests are to be carried out in the presence of the Surveyor depending on the type and grade of material used. From each test unit, one tensile test specimen and three Charpy V-notch impact test specimens are to be taken in accordance with **Table 4.8.9.**

(3) Test procedure and forms of test specimens are to comply with the requirements in **Pt 2, Ch 1, Sec 2.**

(4) Where the test results do not conform to the requirements, additional tests are to be carried out in accordance with the requirements specified in **Pt 2, Ch 1, 306. 9.**

Table 4.8.9 Number of mechanical test specimens for finished chain cables and accessories

Grade	Manufacturing method	Condition of supply	Number of test specimens		
			Tensile test for base metal	Charpy V-notch impact test	
				Base metal	Weldment
2	Flush-butt welded	As welded	1	3	3
		Normalized	-	-	-
	Forged or Cast	Normalized	1	3[(1)]	-
3	Flush-butt welded	Normalized, Normalized and tempered, Quenched and tempered	1	3	3
	Forged or Cast	Normalized, Normalized and tempered, Quenched and tempered	1	3	-

NOTE :
(1) For chain cables, Charpy V-notch impact test is not required.

Table 4.8.10 Mechanical properties of finished chain cables and accessories

Grade	Tensile test				Impact test[1][2][3]		
	Yield point or proof stress (N/mm^2)	Tensile strength (N/mm^2)	Elongation ($L=5d$) (%)	Reduction of area (%)	Testing temperature (°C)	Minimum mean absorbed energy(J)	
						Base Metal	Weldment
2	295 min.	490~690	22 min.	-	0	27	27
3	410 min.	690 min.	17 min.	40 min.	0	60	50

NOTE :
(1) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified minimum mean absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified minimum mean absorbed energy, the test is considered to have failed.
(2) For grade 3 chain, impact test can be carried out at -20℃ with the consent of the Society. The minimum mean absorbed energy to be not less than 27 J for weldment and 35 J for base metal
(3) For Grade 2 chain heat treated, no impact testing is required.

414. Marking and certification

1. Marking

Where chains and accessories have satisfactorily passed the tests and inspections, they are to be stamped with the Society's brand, kind of chain and certificated numbers. Chain cables which meet the requirements are to be stamped at both ends of each length at least with the following marks; cf. **Fig 4.8.6.**

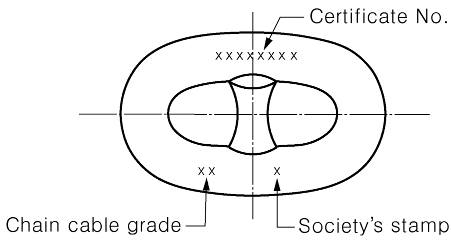

Fig 4.8.6 Marking of chain cables

2. certification

chains and accessories which meet the requirements are to be certified by the Society at least with the following items:
- Manufacturer's name
- Grade
- Chemical composition (including total aluminum content)
- Nominal diameter/weight
- Proof/break loads
- Heat treatment
- Marks applied to chain
- Length
- Mechanical properties, where applicable

415. Painting

Chains and accessories are not to be painted until the tests and inspections are finished.

Section 5 Steel Wire Ropes

501. Application

1. The steel wire ropes used for steering ropes, mast riggings, stream wires, tow lines or mooring lines (hereinafter referred to as "steel wire rope") to be equipped on ships in accordance with the provisions in **Sec 2** are to comply with the requirements in this Section or to be of equivalent quality.

2. The provisions in this Section are applicable to the wire ropes constructed with fibre rope core and from individual wires having the tensile strength level of 1470 N/mm^2 [150 kgf/mm^2]. However, wire ropes constructed from other individual wires than those described above or steel wire ropes constructed with an independent wire rope core may be used where specially approved in connection with their manufacture.

502. Kinds

1. Steel wire ropes are classified by Composition, lay direction as specified in **Table 4.8.11.**

2. Generally, steel wire ropes having a great number of individual wires are used for running riggings since they provide more flexibility while ropes with fewer individual wires are used for standing riggings since they provide less elongation and greater wear-resistant.

Table 4.8.11 Designation system, Composition Mark, Sectional view of steel wire ropes

Designation system	7wires 6strands	12wires 6strands	19wires 6strands	24wires 6strands	30wires 6strands	37wires 6strands	Warrington seals 36wires 6strands
Composition mark	6 × 7	6 × 12	6 × 19	6 × 24	6 × 30	6 × 37	6 × WS(36)
Sectional view							Lay direction	 Ordinary Z twisting(O/Z) Ordinary S twisting(O/S) Lang Z twisting(L/Z) Lang S twisting(L/S)						

503. Processes of manufacture

1. The individual wires composing the strands of steel wire ropes are to consist of wires of KS D 3559 (hard steel wires) or equivalent thereto or heat treated materials.

2. The individual wires are to have no joint for the whole length of a steel wire rope. However, in an unavoidable case in the manufacturing process, they may be jointed by welding, brazing or twisting at only one position for each 10 *metre* length of strand.

3. The individual wires are to be galvanized after being drawn or to be drawn after being galvanized.

4. Synthetic fabrics or natural fibres of good quality which suitably contains grease are to be used for fibre core of steel wire ropes and strands. The grease is to be free from acid or heavy alkali.

5. Steel wire ropes are to be left-hand lay and the strands are to be right-hand lay (called as "ordinary Z twisting").

6. Diameter, degree of twist, etc. are to be finished uniformly for the whole length of the steel wire ropes.

7. If not specified, basically grease is to be applied to steel wire rope.

504. Diameter of individual wires and steel wire ropes

1. The difference between the maximum and minimum diameters of the individual wires composing the strand of steel wire ropes is not to exceed the limits given in **Table 4.8.12.**

Table 4.8.12 Permissible variation in diameter of individual wires

Diameter of individual wire (mm)	Difference between maximum and minimum diameters (mm)
$0.20 < d \le 1.00$	0.06
$1.00 < d \le 2.24$	0.08
$2.24 < d \le 3.75$	0.12
$3.75 < d \le 4.50$	0.14

2. The diameter of steel wire ropes is the diameter of the circumscribed circle of ropes; cf. **Fig 4.8.7** and it is taken as an average diameter measured at any two or more positions except within 1.5 metres from the ends of ropes. In this case, the tolerance for the diameter less than 10 mm of ropes is to be within +10 % and 0 %, the tolerance for the diameter more than 10mm of ropes is to be within +7 % and 0 %.

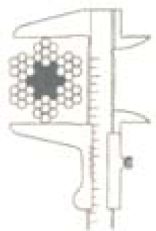

Fig 4.8.7 How to measure diameter of steel wire ropes

505. Mass

The mass of steel wire ropes is as given in **Table 4.8.13** according to the kind and diameter for the reference.

506. Breaking tests

1. Steel wire ropes are to be subjected to the breaking tests for each one length.

2. Where steel wire ropes are continuously manufactured by the same machine with the same wires and divided into several lengths, the test may be carried out on one length selected by the Surveyor at random. Where this test is satisfactory, the tests for the other lengths may be dispensed with.

3. The tests for steel wire ropes are to be carried out in accordance with the follows:

(1) Diameters and finished construction

(A) Diameter of steel wire ropes is to satisfy 504.

(B) Through the entire length, wire ropes should be free from defects such as dent, scratch which are detrimental to practical use.

(2) Breaking load tests

(A) The test piece of which both ends are either loosened and solidified to cone with suitable metal alloy or gripped by other suitable methods, is to be set to the testing machine and gradually pulled until breaks down.

(B) One test piece is to be taken from each length of steel wire ropes.

(C) The distance between the grips is taken table below. However, in case of exceeding 2 metres, the distance between the grips should be 2 metres.

Diameter of steel wire ropes	The distance between the grips
up to 6 mm	not less than 300 mm
over 6 mm 20 mm or less	not less than 600 mm
20 mm over	not less than 30 times of diameter of steel wire ropes

(D) The test pieces are to withstand the breaking test loads specified in **Table 4.8.13** according to the grade and diameter of steel wire rope.

(E) Where the test piece has broken down at the parts of the grips before reaching the required breaking load, one more test piece taken from the steel wire rope may be retested.

Table 4.8.13 Masses and breaking test loads for steel wire ropes

63											1960	14.3		

NOTES:
(1) The diameter of steel wire ropes not included in **Table 4.8.13** may be in accordance with the Guidance relating to the Rules specified by the Society.

507. Individual wire tests

1. Individual wire tests are to be carried out each one length.

2. Where steel wire ropes are continuously manufactured by the same machine with the same wires and divided into selected lengths, the test may be carried out on one length selected by the Surveyor at random. Where this test is satisfactory, the tests for the other lengths may be dispensed with.

3. For tests on the individual wires, a suitable length of a strand is to be cut off the rope and unstranded. The number of wires to be taken therefrom for tests is to be as specified in **Table 4.8.14.**(except for the core of the strand) Any straightening of test pieces which may be needed is to be done at the room temperature by a suitable method without injuring the test pieces.

4. In each of the individual wire tests, if some parts of the test results do not meet the requirements and the number of failed test pieces is not more than permissible number of failed test pieces given in **Table 4.8.15**, it may be considered as passed the tests. (except for Mass of Zinc Coating)

Table 4.8.14 Number of test pieces for individual wires tests

Composition mark	Number of test Pieces
6 × 7	3
6 × 12	6
6 × 19	6
6 × 24	8
6 × 30	10
6 × 37	12
6 × WS (36)	19

Table 4.8.15 Permissible number of failed test pieces in individual wire test

Composition mark	Permissible number of failed test pieces
6 × 7	0
6 × 12	1
6 × 19	1
6 × 24	1
6 × 30	1
6 × 37	1
6 × WS (36)	2

5. The individual wire tests are to be carried out in accordance with the following requirements:
(1) Inspection of diameter and appearance
(A) Diameter of individual wire is to meet the requirement specified in **504.**
(B) The full length of individual wire, very smooth at its surface and circular at the cross section, shall have no detrimental defects even for a scratch when use.
(2) Breaking tests
(A) The distance between grips is to be 100 mm where the diameter of test piece is less than 1.0 mm, or 200 mm where the diameter of test piece is 1.0 mm and over.
(B) The test piece is to be set to the testing machine and gradually pulled until broken down. The difference between individual breaking load and average value is to be within ±8 %.
(C) Where the test piece has broken down at the parts of the grips before reaching the required breaking load, one more test piece taken from the steel wire rope may be retested.
(3) Twisting Tests
(A) In twisting tests, the test piece with the length 100 times the diameter of the test piece is to be gripped hard at the ends, and then one end is to be revolved in twisting speed specified in **Table 4.8.16** until the test piece is broken down. The number of twisting is to be not less than minimum number of twisting specified in **Table 4.8.16.**

Table 4.8.16 Number of minimum twisting

Diameter of individual wire (mm)	Number of minimum twisting
$0.20 \leq d \leq 1.00$	21
$1.00 < d \leq 2.24$	20
$2.24 < d \leq 3.75$	18
$3.75 < d \leq 4.50$	17

NOTES:

1. Where it is necessary to modify the interval of the grips, the number of times of twisting is to be increased or decreased in direct proportion to the interval of the grips.
2. Twisting speed of individual wires is to be as table below.

Diameter of individual wire (mm)	Twisting speed(1 rpm)
$0.20 \leq d \leq 1.00$	up to 180
$1.00 < d \leq 3.60$	up to 60
$3.60 < d \leq 4.50$	up to 30

(B) Where the test piece has been broken down at the parts of the grips, and the results of the test do not comply with minimum number of twisting of the requirements, one more test piece taken from the steel wire rope may be retested.

(4) Wrapping Tests

(A) The test pieces are to be wrapped at least eight times around the wire with the same diameter as the test piece. Where they are unwrapped, the number of broken test pieces is to be measured.

508. Inspection

Steel wire ropes will be accepted, where the results of the breaking and individual wire tests and the inspection of the dimensions and appearance of each length are satisfactory.

509. Marking

The steel wire ropes which have satisfactorily passed the tests and inspections are to be sealed with lead and affixed with the Society's brand, the test number and grade number on the lead.

Section 6 Fibre Ropes

601. Application

1. Hemp ropes and synthetic fibre ropes used for tow lines and mooring lines to be equipped on ships in accordance with the provisions in **Section 2** (hereinafter referred to as "fibre rope") are to comply with the requirements in this Section.

2. Filaments and fibre ropes having characteristics differing from those specified in this Section are to comply with the requirements in **101. 4.**

602. Kinds of fibre ropes

Fibre ropes are classified into 9 kinds as shown in **Table 4.8.17.**

Table 4.8.17 Kinds of fibre rope

<table>
<tr><th colspan="3">Kind of fibre rope</th><th>Filament (material)</th></tr>
<tr><td colspan="3">Hemp rope</td><td>Manila hemp</td></tr>
<tr><td rowspan="5">Synthetic fibre rope</td><td>Vinylon rope</td><td>Grade 1
Grade 2</td><td>Vinylon</td></tr>
<tr><td>Polyethylene rope</td><td>Grade 1
Grade 2</td><td>Polyethylene</td></tr>
<tr><td colspan="2">Polyester rope</td><td>Polyester</td></tr>
<tr><td>Polypropylene rope</td><td>Grade 1
Grade 2</td><td>Polypropylene</td></tr>
<tr><td colspan="2">Polyamide rope</td><td>Polyamide</td></tr>
</table>

603. Processes of manufacture

Synthetic fibre ropes are to be manufactured by approved processes at approved works.

604. Materials

1. Hemp ropes are to be made of pure manila hemp not containing any other similar fibre.

2. Synthetic fibre ropes are to be made of pure filaments not containing any other filaments, which are not to be restored

605. Construction of fibre ropes and others

1. Hemp ropes are, in general, to be composed of three strands and synthetic fibre ropes are to be composed of three or eight strands.

2. Three strand ropes are, in general, to be made of strands twisted together with a *Z* lay, these strands themselves being made with an *S* lay. Eight strand ropes are, in general, to be formed of four pairs of strands, the pairs being constituted successively of two strands twisted in the *S* direction and than of two strands twisted in the *Z* direction.

3. The number of the yarns of a strand is to be same, and the dimensions and laying of the yarns composing ropes are to be uniform for the whole length of the rope.

4. The lead for the strand is, in general, to be below 3.2 times the nominal diameter for three strand rope and below 3.5 times the nominal diameter for eight strand rope.

5. Polyamide ropes are to be suitably heat treated by induction furnace or others to set the lay and obtain dimensional stability. Vinylon and polypropylene ropes may be subjected to suitable heat treatment, if necessary.

6. Synthetic fibre ropes may be subjected to resin treatment and dye treatment subject to the approval by the Society.

7. Oil of good quality is to be used in manufacturing hemp ropes. Ropes are not to contain excessive quantity of oil.

606. Diameter

The diameter of fibre ropes is to be measured on circumscribed circle of the ropes under the load equal to 5 % of the breaking test load specified in **Table 4.8.18** Its tolerance is to be ±3 % of its nominal diameter.

607. Breaking tests

Breaking tests for fibre ropes are to be carried out in accordance with the following requirements:

(1) One specimen is to be taken from each coil of the fibre ropes. Where fibre ropes are continuously manufactured by the same machine with the yarns of the same type and divided into several coils, one specimen may be taken from one coil of the ropes selected by the Surveyor at random.

(2) The length of the specimen is not to be less than 30 times the diameter of the hemp rope, but need not exceed one *metre*.

(3) Specimens for polyethylene and polypropylene ropes are to be subjected to breaking tests in as wet condition immediately after having been immersed in warm water at 35 ± 2 °C for more than 30 *minutes*. For other fibre ropes than the above ropes, specimens are to be subjected to breaking tests in as dry condition at room temperature.

(4) The load at the time of breaking is not to be less than given in **Table 4.8.18.**

Table 4.8.18 Breaking test loads for fibre ropes (kN)

Diameter of rope (mm)	Hemp rope[1]	Synthetic fibre rope							Polyamide[1]
		Vinylon[1]		Polyethylene[2]		Polyester[1]	Polypropylene[2]		
		Grade 1	Grade 2	Grade 1	Grade 2		Grade 1	Grade 2	
10	7.06	9.32	15.7	9.71	12.7	15.6	10.8	12.7	18.1

100	525	694	1080	721	897	1140	772	897	1410

(Note)
(1) Breaking load at room temperature in dried condition.
(2) Breaking load at room temperature after having been immersed in warm water at 35 ± 2 °C for more than 30 minutes.

608. Inspection of appearance and dimensions

Fibre ropes are to be inspected on the appearance and dimensions and they are to be in good order.

609. Marking

The fibre rope which has satisfactorily passed the tests and inspections is to be sealed with lead and affixed with the Society's brand indicating compliance with the rule requirements and the test number. Furthermore, diameter, mass, kind of ropes, coil length, manufacturing number and manufacturer are to be marked in proper way.

Section 7 Hatch Tarpaulins

701. Application

1. Hatch tarpaulins to be equipped on ships in accordance with the provisions in **Ch 2** are to comply with the requirements in this Section or to be of equivalent quality.

2. The tests and inspections for hatch tarpaulins made of synthetic materials are to be to the discretion of the Society.

702. Grades

The grades of tarpaulins are as follows:
Grade *A* tarpaulins (Mark, *TA*)
Grade *B* tarpaulins (Mark, *TB*)

703. Materials

Tarpaulins are to be made from cloths woven with flax yarn or cotton yarn of good quality.

704. Sewing

The overlapping, sewing threads and method of sewing for the purpose of joining the cloths used for tarpaulins are to be to the satisfaction of the Surveyor.

705. Mass

The mass of cloths used for tarpaulins before waterproof treatment is not to be less than 650 g/m^2 for Grade *A* tarpaulins and 490 g/m^2 for Grade *B* tarpaulins. Where, however, the waterproof mediums other than tar are used, the minimum mass may be reduced to 85 % of the above mass according to the characteristics of the mediums.

706. Tensile Tests

The strength of cloths used for tarpaulins before the waterproof treatment is not to be less than 80 kg for Grade *A* tarpaulins and 60 kg for Grade *B* tarpaulins in warp and woof, being tested with test pieces 30 mm wide and 200 mm long. Where, however, the waterproof mediums other than tar are used, the minimum strength may be reduced to 85 % of the above value according to the characteristics of the mediums.

707. Waterproof treatments

1. Waterproof mediums are to be made of suitable tar, grease or chemicals.

2. Tarpaulins are to pass the waterproofness tests which the Surveyor considers appropriate.

3. The waterproof medium applied to the tarpaulin is to prove free from adhesion, cracking or any other defect on its surface where it is folded at the temperature which is appropriate to this society.

708. Making

For the hatch tarpaulins which have been satisfactorily tested and inspected, the Society‘s brand, manufacturer, test number and grade identification of the hatch tarpaulins are to be marked on suitable places of the hatch tarpaulins.

Section 8 Side Scuttles

801. Application

The side scuttles to be fitted up on ships according to the requirements in **Ch 4** (hereinafter referred to as side scuttle) are to comply with the requirements in this Section or to be of equivalent quality.

802. Classes

Side scuttles are classified into following three classes and divided into "fixed type" and "hinged type" according to the types of glass holders of the scuttles, and divided into "bolted type" and

"welded type" according to the method of fastening the scuttles.
(1) Class A scuttle (Mark *RPA*)
(2) Class B scuttle (Mark *RPB*)
(3) Class C scuttle (Mark *RPC*)

803. Construction and dimensions

The construction and dimensions of the main parts of the side scuttles are to be in accordance with the requirements in the followings and **Table 4.8.19** through **Table 4.8.21** according to their nominal diameters and classes. And the area of opening of side scuttles is not to exceed $0.16\,m^2$, and those of other parts are to be determined at the discretion of the Surveyor.

(1) Maximum allowable pressure
The maximum allowable pressure for standard side scuttle is to be in accordance with the requirements as given **Table 4.8.19** through **Table 4.8.21**.

(2) Glazing
(A) An appropriate glazing material resistant to sea water and ultraviolet light is to be used.
(B) Mounting
When glazing, glass pane is to be centralized in the glass holder of hinged side scuttles or in the main frame of non-opening side scuttles so that there is the same clearance all round.

(3) Fasteners (closing devices and hinges)
(A) The minimum number of fasteners comprising closing devices and hinges with round hole for glassholders and deadlights of class A, B and C scuttles is to be in accordance with the requirements as given in **Table 4.8.19** through **Table 4.8.21**.
(B) The total number of the fasteners and their construction is to be such that the side scuttle meets the strength and weathertight test requirements according to **805.**
(C) Where the hole for the hinge of the glassholder and deadlight is oval, the hinge is not regarded as a fastener.

(4) Gaskets for glassholder and deadlight
(A) For ensuring watertightness between the glassholder and main frame and also between the deadlight and glassholder, gaskets type A or B according to ISO3902 are to be used.
(B) The gaskets are to be secured in the grooves by means of a suitable adhesive.

Table 4.8.19 Class A side scuttle

Main parts of side scuttle		Nominal dia. of scuttle (mm)				
		200	250	300	350	400
Max. allowable pressure (kPa)		328	302	328	241	297

804. Materials

1. Main components of the side scuttle

The materials used for the main components of side scuttles (main frame, glassholder, glass retaining ring and deadlight) are to be in accordance with the requirements as given in **Table 4.8.22.** These materials are to have the following properties.

(1) Resistant corrosion

(2) Mechanical properties as given in **Table 4.8.23.**
One tensile test specimen is to be taken from each cast. Where the number of casting from one cast exceed 50, an additional specimen is to be taken from each 50 castings of fraction thereof.

Table 4.8.23 Tensile strength and elongation for main components

Class	Minimum tensile strength (N/mm^2)	Minimum elongation (%)
A	300	15
B	180	10
C	140	3

2. Closing devices

The materials used for bolts, pins and nuts of closing devices and hinge pins for glassholder are to have the following properties. For aluminum alloy side scuttle, the swingbolts of closing device and the hinge pins of glassholder are to be made of non-corrodible steel, stainless steel or such alloy which are not likely to cause corrosion of side scuttle bolts or pins.

(1) Resistant corrosion

(2) Mechanical properties as given in **Table 4.8.24.**
One tensile test specimen is to be taken from each cast. Where the number of casting from one cast exceed 50, an additional specimen is to be taken from each 50 castings of fraction thereof.

3. Glass panes

Toughened safety glass panes according to ISO21005 or glass panes of equivalent quality are to be used. For fire resistant glass panes, glass panes according to ISO5797 or glass panes of equivalent quality are to be used.

4. Where steel or iron is used, the side scuttles are to be galvanized.

Table 4.8.24 Tensile strength and elongation for the closing devices

	Minimum tensile strength (N/mm^2)	Minimum elongation (%)	Minimum tensile strength (N/mm^2)	Minimum elongation (%)
A	350	20	250	14
B	350	15	250	14
C	250	14	180	8

805. Testing

1. Watertightness test

The side scuttles are to be tested by being subjected to the hydraulic pressure given in **Table 4.8.25.** An equivalent hydraulic test is to be carried out by means of batch tests (approximately 10% of the delivery patch, with a minimum of two side scuttle) with glass pane and open deadlight, and without glass pane and closed deadlight.

2. Mechanical strength test

(1) A prototype side scuttle without glass pane and with closed deadlight is to be subjected to a mechanical strength test by a punch method according to the test pressures given in **Table 4.8.26.** For this test, ISO614 is to be used as a guide.

(2) The punch is to be placed on that side of the deadlight which could be subjected to direct contact with the sea. Where the construction of the deadlight makes it necessary, a plate of 100 mm diameter and 10 mm thickness may be placed between the punch and the deadlight.

(3) When subjected to the pressure given in **Table 4.8.26**, the permanent deformation of the deadlight is not to exceed 1% of the normal size of the side scuttle.

3. Fire-resistant test

Side scuttles for fire-resistant constructions are to be subjected to prototype testing as given in

ISO5797.

Table 4.8.25 Test pressure for watertightness

Class	Test pressure (kPa)	
	With glass pane, deadlight open	Without glass pane, deadlight closed

B	75	50
C	35	-

Table 4.8.26 Test pressure of mechanical test

Class	Test pressure (kPa)
A	240
B	120

806. Dispensation with tests

The tensile test specified in **804.** and fire-resistance test specified in **805. 3.** for side scuttles may be dispensed with, where these scuttles have appropriate certificates accepted by the Society.

807. Marking

For the side scuttles which have been satisfactorily tested and inspected, the Society's brand, test number and grade identification of the side scuttles are to be stamped on suitable places of the side scuttles.

Section 9 Rectangular Windows

901. Application

The rectangular windows to be fitted up on ships according to the requirements in **Ch 4** are to comply with the requirements in this chapter or to be of equivalent quality.

902. Classes

Rectangular windows are classified into the following two classes, divided into "fixed type" and "hinged type" according to the types of glassholders of the windows and divided into "bolted type" and "welded type" according to the method of fastening the windows.

(1) Class E window(Mark RPE) (See **Table 4.8.27**)
(2) Class F window(Mark RPF) (See **Table 4.8.28**)

903. Construction and dimensions

The construction and dimensions of the main parts of the rectangular windows are to be in accordance with the requirements in the following Sub-paragraphs and are determined in **Table 4.8.27** and **Table 4.8.28** in accordance with their nominal diameters and classes. Other parts are to be determined at the discretion of the Surveyor.

(1) Maximum allowable pressure

The maximum allowable pressure for rectangular window is to be in accordance with the requirements as given in **Table 4.8.27** and **Table 4.8.28.** Where one or both dimensions(width and height) of a window are different from above, maximum allowable pressure(p) is to be determined using the following formula.

$$p = \frac{40000t^2}{\beta b^2} \quad \text{(kPa)}$$

t : glass thickness (mm)
β : factor obtained from the graph of **Fig 4.8.8**
b : minor dimension of the window (mm)

Table 4.8.27 Class E rectangular window

Items	Nominal size, width (mm) × height (mm)							
	300×425	355×500	400×560	450×630	500×710	560×800	900×630	1000×710

Minimum number of fasteners	4	4	4	4	6	6	6	8	8

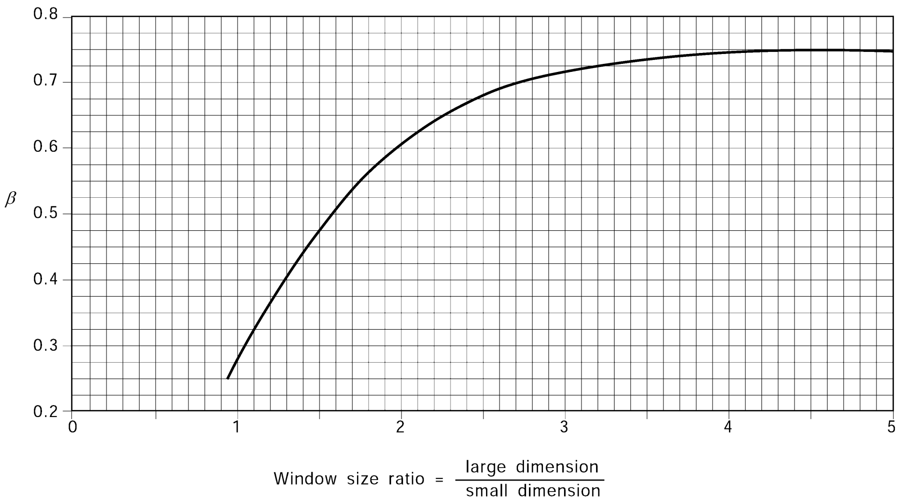

Fig 4.8.8 Curve for determination of β based on window size ratio

(2) Glazing
(A) Appropriate glazing material resistant to sea water and ultraviolet light is to be used.
(B) Mounting
When glazing, glass pane is to be centralized in the glassholder of hinged type rectangular windows or in the main frame of fixed type rectangular windows so that there is the same clearance all round.
(3) Fasteners (closing device and hinge)
(A) The fasteners of glassholders and deadlights of grade *E* and *F* windows are to be made up of the closing devices and hinges with round hole, and the number should be not less than that in the **Table 4.8.27** and **Table 4.8.28**.
(B) The total number of the fasteners and their construction is to be such that the rectangular window meets the strength and watertightness requirements in **905.**
(C) Where the hole for the hinge of the glassholder and deadlight is oval, the hinge is not regarded as a fastener.
(4) Gaskets for glassholder and glass retaining frame
(A) For ensuring watertightness between the glassholder and main frame, gaskets type A, B and C according to ISO3902 are to be used.
(B) The gaskets are to be secured in the grooves by means of a suitable adhesive.
(5) Fixing device
All sidewards opening rectangular windows are to be provided with a fitted fixing device like hook.

904. Materials

1. Main frame, glassholder and glass retaining frame

The materials used for the main components of the rectangular windows(such as main frame, glassholder and glass retaining frame) are to be in accordance with the requirements as given in **Table 4.8.29** and these materials are to have the following properties.

Table 4.8.29 Material

Class *E*	180	10
Class *F*	140	3

2. Closing device and hinge pin

The materials used for bolts, pins and nuts of closing devices and hinge pins for glassholder are to have the following properties.

For aluminum alloy rectangular windows, the bolts (screw-in bolt or swingbolt) of closing device and the hinge pin of the glassholder are to be made of non-corrodible steel, stainless steel or such alloy which are not likely to cause corrosion of rectangular windows, bolts and pins.
(1) resistant to corrosion
(2) no effect on the corrosion resistance of other parts
(3) minimum mechanical properties as given in **Table 4.8.31**(One tensile test specimen is to be taken from each cast. Where the number of casting from one cast exceeds 50, an additional specimen is to be taken from each 50 castings of fraction thereof. For aluminum extruded shapes of aluminum alloy, the extruded shapes of the same dimensions, made from same cast and heat treated simultaneously, are treated as one lot and one tensile test specimen is to be taken from every lot. Where the number of extruded shapes from every lot exceeds 50, an additional specimen is to be taken from each 50 lots of fraction thereof.)

	Minimum tensile strength (N/mm^2)	Minimum elongation (%)	Minimum tensile strength (N/mm^2)	Minimum elongation (%)
Grade *E*	350	15	250	14
Grade *F*	250	14	180	8

3. Glass panes

Toughened safety glass panes according to ISO21005 of glass panes of equivalent quality are to be used. For fire resistant glass panes, glass panes according to ISO5797 or glass panes of equivalent quality are to be used. For heated glass panes, glass panes according to ISO3434 or glass panes of equivalent quality are to be used.

4. Where steel or iron is used, the rectangular windows are to be galvanized.

905. Testing

1. Watertightness test

An equivalent hydraulic test is to be carried out by means of batch tests(approximately 10% of the delivery batch, with a minimum one window) at a test pressure 25 kPa.

2. Mechanical strength test

A prototype rectangular window is to be subject to a mechanical strength test by a suitable test method, applying a load equivalent to the pressures in **Table 4.8.32.**

Table 4.8.32 Mechanical strength test pressure

Classes	Test pressure (kPa)
E	75
F	35

3. Fire-resistant test

Rectangular windows for fire-resistant constructions are to be subjected to prototype testing as given in ISO5797.

4. Test for heated windows

Heated rectangular windows are to be subjected to the electrical testing as given in ISO3434 clause 6.

906. Dispensation with tests

The tensile test specified in **904.** and fire-resistant test specified in **905. 3.** may be dispensed with, where these windows have appropriate certificates accepted by the Society.

907. Marking

For the rectangular windows which have been satisfactorily tested and inspected, the Society's brand, test number and grade identification of the rectangular windows are to be stamped on suitable. ⚓

CHAPTER 9 STRENGTH AND SECURING OF SMALL HATCHES, FITTINGS AND EQUIPMENT ON THE FORE DECK

Section 1 Application and Implementation

101. Application

1. For ships that are contracted for construction on or after 1 January 2004 on the exposed deck over the forward $0.25L$, applicable to:

All ship types of sea going service of length 80 m or more, where the height of the exposed deck in way of the hatch is less than $0.1L$ or 22 m above the summer load waterline, whichever is the lesser.

2. For ships that are contracted for construction prior to 1 January 2004 only for hatches on the exposed deck giving access to spaces forward of the collision bulkhead, and to spaces which extend over this line aft-wards, applicable to:

Bulk carriers, general dry cargo ships (excluding container vessels, vehicle carriers, Ro-Ro ships and woodchip carriers), and combination carriers (e.g. OBO ships, Ore/Oil Carriers, etc.), of length 100 m or more.

102. Implementation

The detail requirements for implementation of this chapter, refer to **Pt 1, Ch 2, Sec 15, 501.**

Section 2 Strength and Securing of Small Hatches on the Exposed Fore Deck

201. General

1. The strength of, and securing devices for, small hatches fitted on the exposed fore deck are to comply with the requirements of this Section.

2. Small hatches in the context of this Section are hatches designed for access to spaces below the deck and are capable to be closed weather-tight or watertight, as applicable. Their opening is normally 2.5 square meters or less.

3. Hatches designed for use of emergency escape are to comply with the requirements of this Section, excepting **203. 1.** (1) and (2) **204. 3.** and **205.**

202. Strength

1. For small rectangular steel hatch covers, the plate thickness, stiffener arrangement and scantlings are to be in accordance with **Table 4.9.1**, and **Fig 4.9.1**. Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points, required in **204. 1.** (see **Fig 4.9.1.**) Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener, see **Fig 4.9.2.**

2. The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, normally not more than 170 to 190 mm from the upper edge of the coamings.

3. For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement is to be in accordance with the requirement specified by the Society.

4. For small hatch covers constructed of materials other than steel, the required scantlings are to provide equivalent strength.

203. Primary securing devices

1. Small hatches located on exposed fore deck subject to the application of this section are to be fitted with primary securing devices such that their hatch covers can be secured in place and weather-tight by means of a mechanism employing any one of the following methods:

(1) Butterfly nuts tightening onto forks (clamps),
(2) Quick acting cleats, or
(3) Central locking device.

2. Dogs (twist tightening handles) with wedges are not acceptable.

204. Requirements for primary securing

1. The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with **Fig 4.9.1** and of sufficient capacity to withstand the bearing force.

2. The primary securing method is to be designed and manufactured such that the designed compression pressure is achieved by one person without the need of any tools.

3. For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimize the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is not to be less than 16 mm. An example arrangement is shown in **Fig 4.9.2**.

4. For small hatch covers located on the exposed deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green sea will cause the cover to close, which means that the hinges are normally to be located on the fore edge.

5. On small hatches located between the main hatches, for example between Nos. 1 and 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

205. Secondary securing device

Small hatches on the fore deck are to be fitted with an independent secondary securing device e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

Table 4.9.1 Scantlings for small steel hatch covers on the fore deck

Nominal size (mm x mm)	Cover plate thickness (mm)	Primary stiffeners	Secondary stiffeners
		Flat Bar (mm x mm) ; number

1330×1330	8	150×12 ; 2	100×10 ; 2

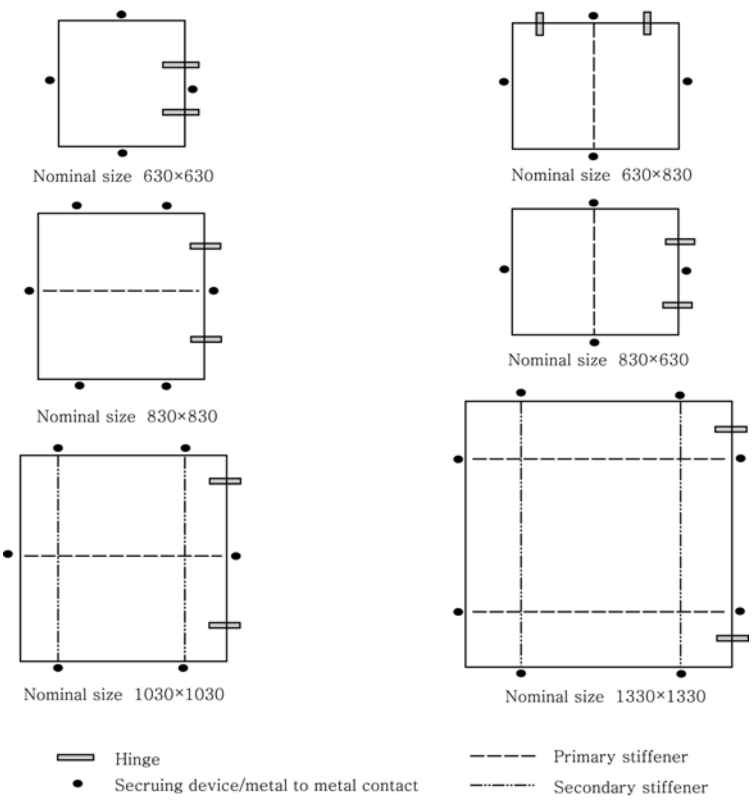

Fig 4.9.1 Arrangement of stiffeners

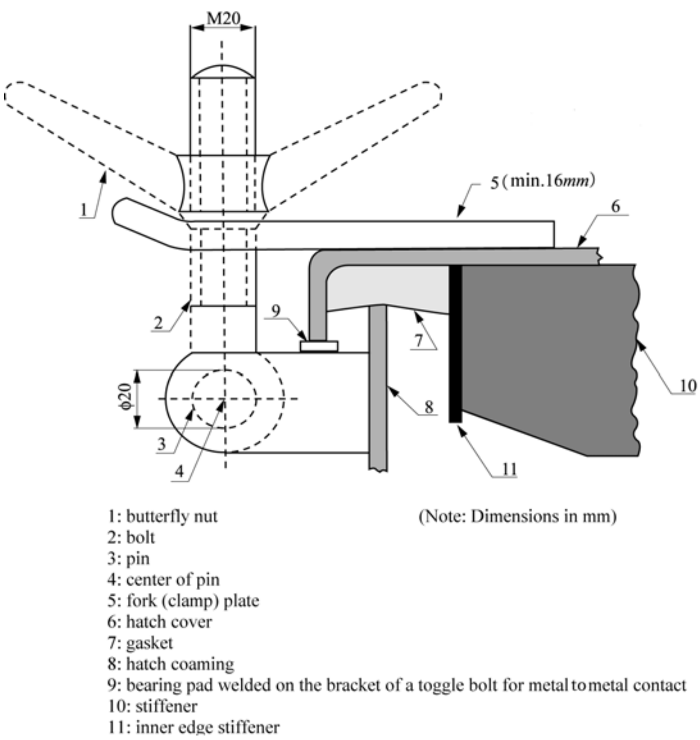

Fig 4.9.2 Example of a primary securing method

Section 3 Strength Requirements for Fore Deck Fittings and Equipment

301. General

1. This section provides strength requirements to resist green sea forces for the following items : air pipes, ventilator pipes and their closing devices, the securing of windlasses.

2. For windlasses, these requirements are additional to those appertaining to the anchor and chain performance criteria of **Pt 5, Ch 8.**

3. Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.

302. Applied loading

1. Air pipes, ventilator pipes and their closing devices

(1) The pressures p, in kN/m^2 acting on air pipes, ventilator pipes and their closing devices may be calculated from:

$$p = 0.5\rho V^2 C_d C_s C_p \quad (\text{kN/m}^2)$$

where :

ρ = density of sea water (1.025 t/m^3)

V = velocity of water over the fore deck (13.5 m/sec)

C_d = shape coefficient

= 0.5 for pipes,

= 1.3 for air pipe or ventilator heads in general,

= 0.8 for an air pipe or ventilator head of cylinderical form with its axis in the vertical direction.

C_s = slamming coefficient (3.2)

C_p = protection coefficient:

= 0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle,

= 1.0 elsewhere and immediately behind a bulwark.

(2) Forces acting in the horizontal direction on the pipe and its closing device may be calculated from (1) using the largest projected area of each component.

2. Windlasses

(1) The following pressures and associated areas are to be applied (see **Fig 4.9.3**):

- 200 kN/m^2 normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction,
- 150 kN/m^2 parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of f times the projected area in this direction,

where f is defined as:
$f = 1 + B/H$, but not greater than 2.5

where:
B = width of windlass measured parallel to the shaft axis,
H = overall height of windlass.

(2) Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by N bolt groups, each containing one or more bolts, see **Fig 4.9.4.**

(3) The axial force R_i in bolt group (or bolt) i, positive in tension, may be calculated from:

$$R_{xi} = \frac{P_x h x_i A_i}{I_x}, \quad R_{yi} = \frac{P_y h y_i A_i}{I_y}, \quad R_i = R_{xi} + R_{yi} - R_{si}$$

where:

P_x = force (kN) acting normal to the shaft axis

P_y = force (kN) acting parallel to the shaft axis, either inboard or outboard whichever gives the greater force in bolt group i

h = shaft height above the windlass mounting (cm)

x_i, y_i = x and y coordinates of bolt group i from the centroid of all N bolt groups, positive in the direction opposite to that of the applied force (cm)

A_i = cross sectional area of all bolts in group i (cm^2)

I_x = $\Sigma A_i x_i^2$ for N bolt groups

I_y = $\Sigma A_i y_i^2$ for N bolt groups

R_{si} = static reaction at bolt group i, due to weight of windlass.

(4) Shear forces F_{xi}, F_{yi} applied to the bolt group i, and the resultant combined force F_i may be calculated from:

$$F_{xi} = \frac{P_x - \alpha g M}{N}, \quad F_{yi} = \frac{P_y - \alpha g M}{N}, \quad F_i = \sqrt{F_{xi}^2 + F_{yi}^2}$$

α = coefficient of friction (0.5)

M = mass of windlass (tonnes)

g = gravity acceleration (9.81 m/s^2)

N = number of bolt groups.

(5) Axial tensile and compressive forces in (3) and lateral forces in (4) are also to be considered in the design of the supporting structure.

303. Strength Requirements

1. Air pipes, ventilator pipes and their closing devices

(1) These requirements are additional to **Pt 5, Ch 6, Sec 2.**

(2) Bending moments and stresses in air and ventilator pipes are to be calculated at critical positions: at penetration pieces, at weld or flange connections, at toes of supporting brackets. Bending stresses in the net section are not to exceed $0.8\sigma_y$, where σ_y is the specified minimum yield stress or 0.2% proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2.0 mm is then to be applied.

(3) For standard air pipes of 760 mm height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in **Table 4.9.2** Where brackets are required, three or more radial brackets are to be fitted. Brackets are to be of gross thickness 8 mm or more, of minimum length 100 mm, and height according to **Table 4.9.2** but need not extend over the joint flange for the head. Bracket toes at the deck are to be suitably supported.

(4) For other configurations, loads according to **302.** are to be applied, and means of support determined in order to comply with the requirements of (2). Brackets, where fitted, are to be of suitable thickness and length according to their height. Pipe thickness is not to be taken less than as indicated in **Pt 5, Ch 6, 102.**

(5) For standard ventilators of 900 mm height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in **Table 4.9.3** Brackets, where required are to be as specified in (3).

(6) For ventilators of height greater than 900 mm, brackets or alternative means of support are to be fitted according to the requirements of each Society. Pipe thickness is not to be taken less

than as indicated in **Pt 5, Ch 6, 102.**

(7) All component parts and connections of the air pipe or ventilator are to be capable of withstanding the loads defined in **302. 1.**

(8) Rotating type mushroom ventilator heads are unsuitable for application on the exposed deck over the forward $0.25L$

2. Windlass mounts

(1) Tensile axial stresses in the individual bolts in each bolt group i are to be calculated. The horizontal forces F_{xi} and F_{yi} are normally to be reacted by shear chocks. Where "fitted" bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses in the individual bolts are to be calculated, and compared to the stress under proof load. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations. The safety factor against bolt proof strength is to be not less than 2.0.

(2) The strength of above deck framing and hull structure supporting the windlass and its securing bolt loads as defined in **302. 2** is to be according to the requirements of the Society.

3. Chain stoppers

(1) A chain stopper is generally to be fitted between the windlass and the hawse pipe in order to relieve the windlass of the pull of the chain cable when the ship is at anchor. A chain stopper is to be capable of withstanding a load equal to 80% of the breaking load of the chain cable without undergoing permanent deformation.

(2) A chain stopper deemed appropriate by the Society, National Standards, internationally recognized Codes or Standards considered as equivalent for those may be applied instead of requirements of this Section. ⚓

Table 4.9.2 760 mm air pipe thickness and bracket standards

400A	8.5(2)	4500	300(2)

(1) Brackets (see **303. 1.** (3)) need not extend over the joint flange for the head.
(2) Brackets are required where the as fitted (gross) thickness is less than 10.5 mm, or where the tabulated projected head area is exceeded.
(3) Not permitted for new ships. Reference **Rules Pt 5 Ch 6**
Note: For other air pipe heights, the relevant requirements of **303. 1.** are to be applied.

Table 4.9.3 900 mm Ventilator pipe thickness and bracket standards

Nominal pipe diameter (mm)	Minimum fitted gross thickness (mm)	Maximum projected area of head (cm2)	Height of bracket (mm)
80A	6.3	-	460
100A	7.0	-	380
150A	8.5	-	300
200A	8.5	550	-
250A	8.5	880	-
300A	8.5	1200	-
350A	8.5	2000	-
400A	8.5	2700	-
450A	8.5	3300	-
500A	8.5	4000	-

Note: For other ventilator heights, the relevant requirements of **303. 1** are to be applied.

CHAPTER 10 SHIPBOARD EQUIPMENT, FITTINGS AND SUPPORTING HULL STRUCTURES ASSOCIATED WITH TOWING AND MOORING

Section 1 Definitions and Scope of Application

101. Application

1. This Chapter is to be applied to new displacement ships of 500GT and above, except high speed craft, special purpose vessels and offshore units, which were keeling after 1 Jan. 2007.

2. This Chapter is to be applied to shipboard fittings and supporting hull structures used for the normal towing and mooring operations. For the emergency towing arrangements, ships subject to **Ch 8, Sec 2** are to comply with that regulation and Resolution MSC.35 (63) as may be amended.

3. The mooring equipment of single point moorings which fitted on ships such as oil tanker the delivery of which is after 1 January 2009 are to be in accordance with the Guidance relating to the Rules specified by the Society.

102. Definitions

1. Shipboard fittings mean bollards and bitts, fairleads, stand rollers and chocks used for the normal mooring of the ship and similar components used for the normal towing of the ship.

2. Other components such as capstans, winches, etc. are not covered by this requirement.

3. Any weld or bolt or other fastening connecting the shipboard fitting to the supporting hull structure is part of the shipboard fitting and subject to the industry standard applicable to such fitting.

4. Supporting hull structures means that part of the ship structure on/in which the shipboard fitting is placed and which is directly submitted to the forces exerted on the shipboard fitting.

The net minimum scantlings of the supporting hull structure are to comply with the requirements given **201. 5** and **202. 5**. The required gross thickness is obtained by adding the total corrosion additions given in **201. 6** and **202. 6**. And the hull structure supporting capstans, winches, etc. used for the normal towing and mooring operations mentioned above should be also be subjected to this chapter.

5. Industry standard means international standard(ISO etc.) or standards issued by national association(KS, DIN, JMSA etc.) which are recognized in the country where the ship is built.

Section 2 Towing and Mooring

201. Towing

1. Strength

The strength of shipboard fittings used for normal towing operations at bow, sides and stern and their supporting hull structures are to comply with the requirements of this chapter.

2. Arrangement

Shipboard fittings for towing are to be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the towing load. Other equivalent arrangements may be accepted (for Panama chocks, etc.) provided the strength is confirmed adequate for the intended service.

3. Load considerations

Shipboard fittings and supporting hull structures for towing are to be complied with the following requirements.

(1) Unless greater safe working load (SWL) of shipboard fittings is specified, the minimum design load to be used is the following value of (A) or (B), whichever is applicable.
   (A) For normal towing operation (e.g. harbour/manoeuvring)
      1.25 times the intended maximum towing load (e.g. static bollard pull) as indicated on the towing and mooring arrangement plan.
   (B) For other towing service (e.g. escort)
      The normal breaking strength of the tow line based on the equipment number. Side projected area including maximum stacks of deck cargoes is to be taken into account for calculation of equipment number.
(2) The design load should be applied through the tow line according to the arrangements shown on the towing and mooring arrangements plan, the method of application of the design load to the fittings and supporting hull structure should be taken into account such that the total load need not be more than twice the design load specified in (A), (B), i.e. no more than one turn of one line. (See **Fig 4.10.1**)
(3) When a specific SWL is applied for a shipboard fitting at the request of the applicant, by which the design load will be greater than the above minimum values, the strength of the fitting is to be designed using this specific design load.

4. Shipboard fittings

The selection of shipboard fittings is to be made by the shipyard in accordance with an Industry standard (e.g. ISO 3913: 1977 Shipbuilding-Welded steel bollards) accepted by the society. When the shipboard fitting is not selected from an accepted Industry standard, the design load used to assess its strength and its attachment to the ship should be in accordance with **3.**

5. Supporting hull structure

(1) Arrangement
   Arrangement of the reinforced members (carling) beneath shipboard fittings should consider any variation of direction (laterally and vertically) of the towing forces (which should be not less than the design load as per **3.**) acting through the arrangement of connection to the shipboard fittings.
(2) Acting point of towing force
   The acting point of towing force on shipboard fittings should be taken at the attachment point of a towing line or at a change in its direction.
(3) Allowable stresses
   Allowable stresses under the design load conditions are as follows, and no stress concentration factors being taken into account.
   Normal stress : 100 % of the specified minimum yield point of the material;
   Shearing stress : 60 % of the specified minimum yield point of the material;

6. Corrosion addition of supporting hull structures

The scantling of supporting hull structures is not to be less than the value of net thickness plus the following values (1) through (3).

(1) For bulk carriers specified in **Pt. 11**, corrosion addition specified in **Pt 11, Ch 3, Sec 3**
(2) For double hull oil tankers specified in **Pt. 12**, corrosion addition specified in **Pt 12, Ch 6, Sec 3**
(3) For other ships, the value will be considered by the Society, but not to be less than 2 mm.

7. Safe Working Load (SWL)

(1) The SWL used for nomal towing operations (harbour/manoeuvring) should not exceed 80 % of the design load as given in **Sec 2, 201. 3** (1) and the SWL used for other towing operations (e.g. escort) should not exceed the design load as given in **Sec 2, 201. 3** (2).
   For fittings used for both harbour and escort purposes, the greater of the design loads of **201. 3** (1) and **201. 3** (2) should be used.
(2) The SWL of each shipboard fitting should be marked (by weld bead or equivalent) on the deck fittings used for towing.
(3) The above provisions on SWL apply for a single post basis (no more than one turn of one line).
(4) The towing and mooring arrangements plan described in **203.** should define the method of use of towing lines.

202. Mooring

1. Strength

The strength of shipboard fittings used for mooring operations and their supporting hull structures are to comply with the requirement of this Chapter.

2. Arrangements

Shipboard fittings for mooring should be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the mooring load. Other equivalent arrangements may be accepted (for Panama chocks, etc.) provided the strength is confirmed adequate for the service.

3. Load considerations

Shipboard fittings and supporting hull structures for mooring are to be complied with the following requirements.

(1) Unless greater safe working load(SWL) of shipboard fittings is specified, the design load applied to shipboard fittings and supporting hull structures should be 1.25 times the breaking strength of the mooring line based on the equipment number.
Side projected area including maximum stacks of deck cargoes is to be taken into account for calculation of equipment number.

(2) According to the requirements of **Ch 8, 204. 8**, above (1) breaking strength may be reduced with corresponding increase of number of the mooring lines. But the number of mooring lines is not to be less than 6 and no one line is to have a strength less than 490 kN.

(3) The design load applied to supporting hull structures for winches, etc. is to be 1.25 times the intended maximum brake holding load and, for capstans, 1.25 times the maximum hauling force.

(4) The design load should be applied through the mooring line according to the arrangement shown on the towing and mooring arrangement plan. The method of application of the design load to the fittings and supporting hull structures should be taken into account such that the total load need not be more than twice the design load specified in (1), i.e. no more than one line. (See **Fig 4.10.1**)

(5) When a specific SWL is applied for a shipboard fitting at the request of the applicant, by which the design load will be greater than the above minimum values, the strength of the fitting is to be designed using this specific design load.

4. Shipboard fittings

The selection of shipboard fittings is in accordance with **201. 4**.

5. Supporting hull structures

(1) Arrangements
Arrangement of the reinforced members (carling) beneath shipboard fittings should consider any variation of direction (laterally and vertically) of the towing forces (which should be not less than the Design Load as per **3.**) acting through the arrangement of connection to the shipboard fittings.

(2) Acting point of mooring force
The acting point of the mooring force on shipboard fittings should be taken at the attachment point of a mooring line or a change in its direction.

(3) Allowable stresses
Allowable stresses under the design load conditions are as follows, and no stress concentration factors being taken into account.
Normal stress : 100 % of the specified minimum yield point of the material;
Shearing stress : 60 % of the specified minimum yield point of the material;

6. Corrosion addition of supporting hull structures

Corrosion addition are to be followed **201. 6.**

7. Safe working load (SWL)

(1) The SWL should not exceed 80 % of the design load given in **202. 3.**

(2) The SWL of each shipboard fitting should be marked (by weld bead or equivalent) on the deck fittings used for mooring.

(3) The above provisions on SWL apply for a single post basis (no more than one turn of one line).
(4) The towing and mooring arrangements plan described in **203.** should define he method of use of mooring lines.

203. Towing and mooring arrangements plan

1. The SWL for the intended use for each shipboard fitting should be noted in he towing and mooring arrangements plan available on board for the guidance of the Master.

2. Information provided on the plan is to include in respect of each shipboard fitting.

(1) Location on the ship
(2) Fitting type
(3) SWL
(4) Purpose (mooring / harbour towing / escort towing)
(5) Method of applying load of towing or mooring line including limiting fleet angles

3. Where the arrangements and details of deck fittings and their supporting hull structures are designed based on the mooring arrnagements as permitted in **202. 3.** (2), the following information is to be clearly indicated on the plan.

(1) The arrangement of mooring lines showing number of lines (N)
(2) The breaking strength of each mooring line (BS)

4. This information is to be incorporated into the pilot card in order to provide the pilot proper information on harbour/escorting operations. ⚓

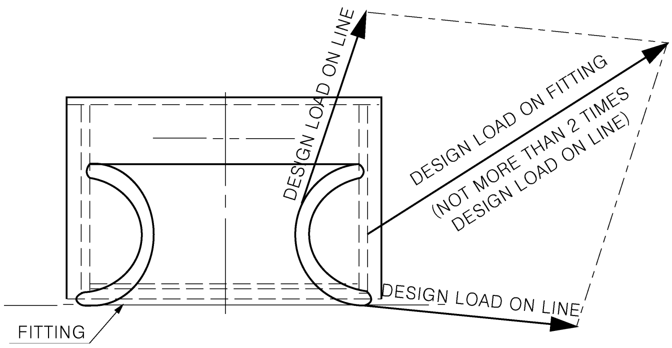

Fig 4.10.1 Application of design load

CHAPTER 11 ACCESS TO AND WITHIN SPACES IN, AND FORWARD OF, THE CARGO AREA OF OIL TANKERS AND BULK CARRIERS

Section 1 General

101. Application

1. This applies to oil tankers of 500 gross tonnage and over and bulk carriers, as defined in SOLAS Reg. II/1, of 20,000 gross tonnage and over, constructed on or after 1 January 2005.

2. This do not apply to the cargo tanks of combined chemical/oil tankers complying with the provisions of the IBC Code.

102. Means of access to cargo and other spaces

1. Each space shall be provided with means of access to enable, throughout the life of a ship, overall and close-up inspections and thickness measurements of the ship's structures to be carried out by this Society as necessary. Such means of access shall comply with the requirements of paragraph **105. and section 2.**

2. Where a permanent means of access may be susceptible to damage during normal cargo loading and unloading operations or where it is impracticable to fit permanent means of access, this Society may allow, in lieu thereof, the provision of movable or portable means of access, as specified in the **section 2**, provided that the means of attaching, rigging, suspending or supporting the portable means of access forms a permanent part of the ship's structure. All portable equipment shall be capable of being readily erected or deployed by ship's personnel.

3. The construction and materials of all means of access and their attachment to the ship’s structure shall be to the satisfaction of this Society. The means of access shall be subject to survey prior to, or in conjunction with, its use in carrying out surveys in accordance with SOLAS I/10.

103. Safe access to cargo holds, cargo tanks, ballast tanks and other spaces

1. Safe access to cargo holds, cofferdams, ballast tanks, cargo tanks and other spaces in the cargo area shall be direct from the open deck and such as to ensure their complete inspection. Safe access to double bottom spaces or to foreward ballast tanks may be from a pump-room, deep cofferdam, pipe tunnel, cargo hold, double hull space or similar compartment not intended for the carriage of oil or hazardous cargoes.

2. Tanks, and subdivisions of tanks, having a length of 35 m or more, shall be fitted with at least two access hatchways and ladders, as far apart as practicable. Tanks less than 35 m in length shall be served by at least one access hatchway and ladder. When a tank is subdivided by one or more swash bulkheads or similar obstructions which do not allow ready means of access to the other parts of the tank, at least two hatchways and ladders shall be fitted.

3. Each cargo hold shall be provided with at least two means of access as far apart as practicable. In general, these accesses should be arranged diagonally, for example one access near the forward bulkhead on the port side, the other one near the aft bulkhead on the starboard side.

104. Ship structure access manual

1. A ship's means of access to carry out overall and close-up inspections and thickness measurements shall be described in a Ship structure access manual approved by this Society, an updated copy of which shall be kept on board. The Ship structure access manual shall include the following for each space ;

(1) plans showing the means of access to the space, with appropriate technical specifications and dimensions

(2) plans showing the means of access within each space to enable an overall inspection to be car-

ried out, with appropriate technical specifications and dimensions. The plans shall indicate from where each area in the space can be inspected

(3) plans showing the means of access within the space to enable close-up inspections to be carried out, with appropriate technical specifications and dimensions. The plans shall indicate the positions of critical structural areas, whether the means of access is permanent or portable and from where each area can be inspected

(4) instructions for inspecting and maintaining the structural strength of all means of access and means of attachment, taking into account any corrosive atmosphere that may be within the space

(5) instructions for safety guidance when rafting is used for close-up inspections and thickness measurements

(6) instructions for the rigging and use of any portable means of access in a safe manner

(7) an inventory of all portable means of access and

(8) records of periodical inspections and maintenance of the ship's means of access.

2. For the purpose of this regulation critical structural areas are locations which have been identified from calculations to require monitoring or from the service history of similar or sister ships to be sensitive to cracking, buckling, deformation or corrosion which would impair the structural integrity of the ship.

105. General technical specifications

1. For access through horizontal openings, hatches or manholes, the dimensions shall be sufficient to allow a person wearing a self-contained air-breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening shall not be less than 600 mm × 600 mm. When access to a cargo hold is arranged through the cargo hatch, the top of the ladder shall be placed as close as possible to the hatch coaming. Access hatch coamings having a height greater than 900 mm shall also have steps on the outside in conjunction with the ladder.

2. For access through vertical openings, or manholes, in swash bulkheads, floors, girders and web frames providing passage through the length and breadth of the space, the minimum opening shall be not less than 600 mm × 800 mm at a height of not more than 600 mm from the bottom shell plating unless gratings or other foot holds are provided.

3. For oil tankers of less than 5,000 tonnes deadweight, this Society may approve, in special circumstances, smaller dimensions for the openings referred to in above **1.** and **2**, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of this Society.

Section 2 Technical Provisions for Means of Access for Inspections

201. Definitions

1. Rung means the step of a vertical ladder or step on the vertical surface.

2. Tread means the step of an inclined ladder or step for the vertical access opening.

3. Flight of an inclined ladder means the actual stringer length of an inclined ladder. For vertical ladders, it is the distance between the platforms.

4. Stringer means:

(1) the frame of a ladder; or

(2) the stiffened horizontal plating structure fitted on the side shell, transverse bulkheads and/or longitudinal bulkheads in the space. For the purpose of ballast tanks of less than 5 m width forming double side spaces, the horizontal plating structure is credited as a stringer and a longitudinal permanent means of access, if it provides a continuous passage of 600 mm or more in width past frames or stiffeners on the side shell or longitudinal bulkhead. Openings in stringer plating utilized as permanent means of access shall be arranged with guard rails or grid covers to provide safe passage on the stringer or safe access to each transverse web.

5. Vertical ladder means a ladder of which the inclined angle is 70° and over up to 90°. A vertical ladder shall not be skewed by more than 2°.

6. Overhead obstructions mean the deck or stringer structure including stiffeners above the means of access.

7. Distance below deck head means the distance below the plating.

8. Cross deck means the transverse area of the main deck which is located inboard and between hatch coamings.

202. Technical provisions

1. Structural members subject to the close-up inspections and thickness measurements of the ship's structure referred to ESP, except those in double bottom spaces, shall be provided with a permanent means of access to the extent as specified in **Table 4.11.1** and **Table 4.11.2**, as applicable. For oil tankers and wing ballast tanks of ore carriers, approved alternative methods may be used in combination with the fitted permanent means of access, provided that the structure allows for its safe and effective use.

2. Permanent means of access should as far as possible be integral to the structure of the ships, thus ensuring that they are robust and at the same time contributing to the overall strength of the structure of the ship.

3. Elevated passageways forming sections of a permanent means of access, where fitted, shall have a minimum clear width of 600 mm, except for going around vertical webs where the minimum clear width may be reduced to 450 mm, and have guard rails over the open side of their entire length. Sloping structures providing part of the access shall be of a non-skid construction. Guard rails shall be 1,000 mm in height and consist of a rail and an intermediate bar 500 mm in height and of substantial construction. Stanchions shall be not more than 3 m apart.

4. Access to permanent means of access and vertical openings from the ship.s bottom shall be provided by means of easily accessible passageways, ladders or treads. Treads shall be provided with lateral support for the foot. Where the rungs of ladders are fitted against a vertical surface, the distance from the centre of the rungs to the surface shall be at least 150 mm. Where vertical manholes are fitted higher than 600 mm above the walking level, access shall be facilitated by means of treads and hand grips with platform landings on both sides.

5. Permanent inclined ladders shall be inclined at an angle of less than 70° There shall be no obstructions within 750 mm of the face of the inclined ladder, except that in way of an opening this clearance may be reduced to 600 mm. Resting platforms of adequate dimensions shall be provided, normally at a maximum of 6 m vertical height. Ladders and handrails shall be constructed of steel or equivalent material of adequate strength and stiffness and securely attached to the structure by stays. The method of support and length of stay shall be such that vibration is reduced to a practical minimum. In cargo holds, ladders shall be designed and arranged so that cargo handling difficulties are not increased and the risk of damage from cargo handling gear is minimized.

6. The width of inclined ladders between stringers shall not be less than 400 mm. The treads shall be equally spaced at a distance apart, measured vertically, of between 200 mm and 300 mm. When steel is used, the treads shall be formed of two square bars of not less than 22 mm by 22 mm in section, fitted to form a horizontal step with the edges pointing upward. The treads shall be carried through the side stringers and attached thereto by double continuous welding. All inclined ladders shall be provided with handrails of substantial construction on both sides, fitted at a convenient distance above the treads.

7. For vertical ladders or spiral ladders, the width and construction should be in accordance with international or national standards accepted by this Society.

8. No free-standing portable ladder shall be more than 5 m long.

9. Alternative means of access include, but are not limited to, such devices as :

(1) hydraulic arm fitted with a stable base;
(2) wire lift platform;
(3) staging;

(4) rafting;
(5) robot arm or remotely operated vehicle (ROV);
(6) portable ladders more than 5 m long shall only be utilized if fitted with a mechanical device to secure the upper end of the ladder;
(7) other means of access, approved by and acceptable to this Society.
Means for safe operation and rigging of such equipment to and from and within the spaces shall be clearly described in the Ship Structure Access Manual.

10. For access through horizontal openings, hatches or manholes, the minimum clear opening shall not be less than 600 mm × 600 mm. When access to a cargo hold is arranged through the cargo hatch, the top of the ladder shall be placed as close as possible to the hatch coaming. Access hatch coamings having a height greater than 900 mm shall also have steps on the outside in conjunction with the ladder.

11. For access through vertical openings, or manholes, in swash bulkheads, floors, girders and web frames providing passage through the length and breadth of the space, the minimum opening shall be not less than 600 mm × 800 mm at a height of not more than 600 mm from the passage unless gratings or other foot holds are provided.

12. For oil tankers of less than 5,000 tonnes deadweight, this Society may approve, in special circumstances, smaller dimensions for the openings referred to in paragraphs **10.** and **11**, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of this Society.

13. For bulk carriers, access ladders to cargo holds and other spaces shall be :
(1) Where the vertical distance between the upper surface of adjacent decks or between deck and the bottom of the cargo space is not more than 6 m, either a vertical ladder or an inclined ladder.
(2) Where the vertical distance between the upper surface of adjacent decks or between deck and the bottom of the cargo space is more than 6 m, an inclined ladder or series of inclined ladders at one end of the cargo hold, except the uppermost 2.5 m of a cargo space measured clear of overhead obstructions and the lowest 6 m may have vertical ladders, provided that the vertical extent of the inclined ladder or ladders connecting the vertical ladders is not less than 2.5 m. The second means of access at the other end of the cargo hold may be formed of a series of staggered vertical ladders, which should comprise of one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. Adjacent sections of ladder should be laterally offset from each other by at least the width of the ladder. The uppermost entrance section of the ladder directly exposed to a cargo hold should be vertical for a distance of 2.5 m measured clear of overhead obstructions and connected to a ladder-linking platform.
(3) A vertical ladder may be used as a means of access to topside tanks, where the vertical distance is 6 m or less between the deck and the longitudinal means of access in the tank or the stringer or the bottom of the space immediately below the entrance. The uppermost entrance section from deck of the vertical ladder of the tank should be vertical for a distance of 2.5 m measured clear of overhead obstructions and comprise a ladder linking platform, unless landing on the longitudinal means of access, the stringer or the bottom within the vertical distance, displaced to one side of a vertical ladder.
(4) An inclined ladder or combination of ladders should be used for access to a tank or a space where the vertical distance is greater than 6 m between the deck and a stringer immediately below the entrance, between stringers, or between the deck or a stringer and the bottom of the space immediately below the entrance.
(5) In case of (4) above, the uppermost entrance section from deck of the ladder should be vertical for a distance of 2.5 m clear of overhead obstructions and connected to a landing platform and continued with an inclined ladder. The flights of inclined ladders should not be more than 9 m in actual length and the vertical height should not normally be more than 6 m. The lowermost section of the ladders may be vertical for a distance of not less than 2.5 m.
(6) In double-side skin spaces of less than 2.5 m width, the access to the space may be by means of vertical ladders that comprise of one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. Adjacent sections of ladder should be laterally offset from each other by at least the width of the ladder.
(7) A spiral ladder is considered acceptable as an alternative for inclined ladders. In this regard, the

uppermost 2.5 m can continue to be comprised of the spiral ladder and need not change over to vertical ladders.

14. The uppermost entrance section from deck of the vertical ladder providing access to a tank should be vertical for a distance of 2.5 m measured clear of overhead obstructions and comprise a ladder linking platform, displaced to one side of a vertical ladder. The vertical ladder can be between 1.6 m and 3 m below deck structure if it lands on a longitudinal or athwartship permanent means of access fitted within that range.

203. Protective coating

Permanent means of access in dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers shall be coated in accordance with the Guidance relating to the Rules specified by the Society.

Table 4.11.1 - Means of access for ballast and cargo tanks of oil tankers (Access to the underdeck and vertical structure)

1. Water ballast tanks, except those specified in 2., and cargo oil tanks

1.1 For tanks of which the height is 6 m and over containing internal structures, permanent means of access shall be provided in accordance with .1 to .6:
- .1 continuous athwartship permanent access arranged at each transverse bulkhead on the stiffened surface, at a minimum of 1.6 m to a maximum of 3 m below the deck head;
- .2 at least one continuous longitudinal permanent means of access at each side of the tank. One of these accesses shall be at a minimum of 1.6 m to a maximum of 6 m below the deck head and the other shall be at a minimum of 1.6 m to a maximum of 3 m below the deck head;
- .3 access between the arrangements specified in .1 and .2 and from the main deck to either .1 or .2;
- .4 continuous longitudinal permanent means of access which are integrated in the structural member on the stiffened surface of a longitudinal bulkhead, in alignment, where possible, with horizontal girders of transverse bulkheads are to be provided for access to the transverse webs unless permanent fittings are installed at the uppermost platform for use of alternative means, as defined in **202. 9.** of the Technical provisions, for inspection at intermediate heights;
- .5 for ships having cross-ties which are 6 m or more above tank bottom, a transverse permanent means of access on the cross-ties providing inspection of the tie flaring brackets at both sides of the tank, with access from one of the longitudinal permanent means of access in .4; and
- .6 alternative means as defined in 202. 9. of the technical provisions may be provided for small ships as an alternative to .4 for cargo oil tanks of which the height is less than 17 m.

1.2 For tanks of which the height is less than 6 m, alternative means as defined in 202. 9. of the technical provisions or portable means may be utilized in lieu of the permanent means of access.

Fore peak tanks

1.3 For fore peak tanks with a depth of 6 m or more at the centre line of the collision bulkhead, a suitable means of access shall be provided for access to critical areas such as the underdeck structure, stringers, collision bulkhead and side shell structure.

1.3.1 Stringers of less than 6 m in vertical distance from the deck head or a stringer immediately above are considered to provide suitable access in combination with portable means of access.

1.3.2 In case the vertical distance between the deck head and stringers, stringers or the lowest stringer and the tank bottom is 6 m or more, alternative means of access as defined in 202. 9. of the Technical provisions shall be provided.

2. Water ballast wing tanks of less than 5 m width forming double side spaces and their bilge hopper sections

2.1 For double side spaces above the upper knuckle point of the bilge hopper sections, permanent means of access are to be provided in accordance with .1 to .3:
- .1 where the vertical distance between horizontal uppermost stringer and deck head is 6 m or more, one continuous longitudinal permanent means of access shall be provided for the full length of the tank with a means to allow passing through transverse webs installed at a minimum of 1.6 m to a maximum of 3 m below the deck head with a vertical access ladder at each end of the tank;
- .2 continuous longitudinal permanent means of access, which are integrated in the structure, at a vertical distance not exceeding 6 m apart but permitted to exceed 6 m by a maximum of 10 %; and
- .3 plated stringers shall, as far as possible, be in alignment with horizontal girders of transverse bulkheads.

2.2 For bilge hopper sections of which the vertical distance from the tank bottom to the upper knuckle point is 6 m and over, one longitudinal permanent means of access shall be provided for the full length of the tank. It shall be accessible by vertical permanent means of access at each end of the tank.

2.2.1 The longitudinal continuous permanent means of access may be installed at a minimum 1.6 m to maximum 3 m from the top of the bilge hopper section. In this case, a platform extending the longitudinal continuous permanent means of access in way of the webframe may be used to access the identified structural critical areas.

2.2.2 Alternatively, the continuous longitudinal permanent means of access may be installed at a minimum of 1.2 m below the top of the clear opening of the web ring allowing a use of portable means of access to reach identified structural critical areas.

2.3 Where the vertical distance referred to in 2.2 is less than 6 m, alternative means as defined in 202. 9. of the technical provisions or portable means of access may be utilised in lieu of the permanent means of access. To facilitate the operation of the alternative means of access, in-line openings in horizontal stringers shall be provided. The openings shall be of an adequate diameter and shall have suitable protective railings.

Table 4.11.2 Means of access for bulk carriers

1. Cargo holds

Access to underdeck structure

1.1 Permanent means of access shall be fitted to provide access to the overhead structure at both sides of the cross deck and in the vicinity of the centreline. Each means of access shall be accessible from the cargo hold access or directly from the main deck and installed at a minimum of 1.6 m to a maximum of 3 m below the deck.

1.2 An athwartship permanent means of access fitted on the transverse bulkhead at a minimum 1.6 m to a maximum 3 m below the cross-deck head is accepted as equivalent to 1.1.

1.3 Access to the permanent means of access to overhead structure of the cross deck may also be via the upper stool.

1.4 Ships having transverse bulkheads with full upper stools with access from the main deck which allows monitoring of all framing and plates from inside do not require permanent means of access of the cross deck.

1.5 Alternatively, movable means of access may be utilized for access to the overhead structure of the cross deck if its vertical distance is 17 m or less above the tank top.

Access to vertical structures

1.6 Permanent means of vertical access shall be provided in all cargo holds and built into the structure to allow for an inspection of a minimum of 25 % of the total number of hold frames port and starboard equally distributed throughout the hold including at each end in way of transverse bulkheads. But in no circumstance shall this arrangement be less than 3 permanent means of vertical access fitted to each side (fore and aft ends of hold and mid-span). Permanent means of vertical access fitted between two adjacent hold frames is counted for an access for the inspection of both hold frames. A means of portable access may be used to gain access over the sloping plating of lower hopper ballast tanks.

1.7 In addition, portable or movable means of access shall be utilized for access to the remaining hold frames up to their upper brackets and transverse bulkheads.

Access to vertical structures

1.8 Portable or movable means of access may be utilized for access to hold frames up to their upper bracket in place of the permanent means required in 1.6. These means of access shall be carried on board the ship and readily available for use.

1.9 The width of vertical ladders for access to hold frames shall be at least 300 mm, measured between stringers.

1.10 A single vertical ladder over 6 m in length is acceptable for the inspection of the hold side frames in a single skin construction.

1.11 For double-side skin construction no vertical ladders for the inspection of the cargo hold surfaces are required. Inspection of this structure should be provided from within the double hull space.

Table 4.11.2 Means of access for bulk carriers (continued)

2. Ballast tanks
Top side tanks 2.1 For each topside tank of which the height is 6 m and over, one longitudinal continuous permanent means of access shall be provided along the side shell webs and installed at a minimum of 1.6 m to a maximum of 3 m below deck with a vertical access ladder in the vicinity of each access to that tank. 2.2 If no access holes are provided through the transverse webs within 600 mm of the tank base and the web frame rings have a web height greater than 1 m in way of side shell and sloping plating, then step rungs/grab rails shall be provided to allow safe access over each transverse web frame ring. 2.3 Three permanent means of access, fitted at the end bay and middle bay of each tank, shall be provided spanning from tank base up to the intersection of the sloping plate with the hatch side girder. The existing longitudinal structure, if fitted on the sloping plate in the space may be used as part of this means of access. 2.4 For topside tanks of which the height is less than 6 m, alternative means as defined in paragraph 202. 9. of the technical provisions or portable means may be utilized in lieu of the permanent means of access.
Bilge hopper tanks 2.5 For each bilge hopper tank of which the height is 6 m and over, one longitudinal continuous permanent means of access shall be provided along the side shell webs and installed at a minimum of 1.2 m below the top of the clear opening of the web ring with a vertical access ladder in the vicinity of each access to the tank. 2.5.1 An access ladder between the longitudinal continuous permanent means of access and the bottom of the space shall be provided at each end of the tank. 2.5.2 Alternatively, the longitudinal continuous permanent means of access can be located through the upper web plating above the clear opening of the web ring, at a minimum of 1.6 m below the deck head, when this arrangement facilitates more suitable inspection of identified structurally critical areas. An enlarged longitudinal frame can be used for the purpose of the walkway.
Bilge hopper tanks 2.5.3 For double-side skin bulk carriers, the longitudinal continuous permanent means of access may be installed within 6 m from the knuckle point of the bilge, if used in combination with alternative methods to gain access to the knuckle point. 2.6 If no access holes are provided through the transverse ring webs within 600 mm of the tank base and the web frame rings have a web height greater than 1 m in way of side shell and sloping plating, then step rungs/grab rails shall be provided to allow safe access over each transverse web frame ring. 2.7 For bilge hopper tanks of which the height is less than 6 m, alternative means as defined in paragraph 202. 9. of the technical provisions or portable means may be utilized in lieu of the permanent means of access. Such means of access shall be demonstrated that they can be deployed and made readily available in the areas where needed.
Double-skin side tanks 2.8 Permanent means of access shall be provided in accordance with the applicable sections of **Table 4.11.1**.
For Fore peak tanks 2.9 For fore peak tanks with a depth of 6 m or more at the centreline of the collision bulkhead, a suitable means of access shall be provided for access to critical areas such as the underdeck structure, stringers, collision bulkhead and side shell structure. 2.9.1 Stringers of less than 6 m in vertical distance from the deck head or a stringer immediately above are considered to provide suitable access in combination with portable means of access. 2.9.2 In case the vertical distance between the deck head and stringers, stringers or the lowest stringer and the tank bottom is 6 m or more, alternative means of access as defined in paragraph 202. 9. of the Technical provisions shall be provided.

* For ore carriers, permanent means of access shall be provided in accordance with the applicable sections of **Table 4.11.1** and **Table 4.11.2**. ⚓

Guidance Relating to the Rules for the Classification of Steel Ships

Part 4

Hull Equipment

GA-04-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance Relating to the Rules for the Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.

As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF PART 4 "HULL EQUIPMENT"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date : 18 January 2011 (based on the application date for classification survey)

Chapter 10 SHIPBOARD EQUIPMENT, FITTINGS AND SUPPORTING HULL STRUCTURES ASSOCIATED WITH TOWING AND MOORING

Section 1 Definitions and Scope of Application
- 101. has been amended.

Effective Date : 1 July 2011

Chapter 8 EQUIPMENT NUMBER AND EQUIPMENT

Section 2 Equipment Number
- 203. has been newly added.

Section 4 Chains
- 401. has been amended.

Section 5 Steel Wire Ropes
- 506. has been newly added.

CONTENTS

<ANNEX>

CHAPTER 1 RUDDERS

Section 1 General

101. Application

1. Rudders having three or more pintles

The scantling of each member of rudders having three or more pintles is to be determined in accordance with the requirements in the **Pt 4, Ch 1** of the Rules correspondingly. However, the moment and the force acting on each member are to be determined by the direct calculation method, in accordance with the requirements in **Sec 4** of the Guidance.

2. Rudders having a special shape or sectional form

Rudders with flaps, fish tail rudders and nozzle rudders are to be as specified in (1) and (2) below respectively, unless the rudder force and rudder torque are required to be determined by tests or detailed theoretical calculation.

In other rudders, the scantling of each member is to be determined by obtaining the rudder force and rudder torque through tests or detailed theoretical calculations, and correspondingly applying the requirements in **Pt 4, Ch 1** of the Rules. Results of tests or theoretical calculations are to be submitted to the Society.

(1) Nozzle rudders with flaps and fish tail rudders
The scantling of each member of a nozzle rudder with flaps and fish tail rudders is to be determined in accordance with the requirements in **Pt 4, Ch 1** of the Rules. In applying the Rules, however, values of factor K_2 in **Sec 2** and values of factor α in **Sec 3** are to be read as specified in **Table 4.1.1.**

Table 4.1.1 The value of factor K_2 and α in accordance with special sectional form of rudder

Sectional form	K_2		α	
	Ahead	Astern	Ahead	Astern
Nozzle rudder	1.9	1.5	(1)	(1)
Rudder with flaps 	1.7	1.3	0.45	0.55
Fish tail rudder 	1.4	0.8	0.45	0.55

NOTE :
(1) For the nozzle rudder, the value of α is to be in accordance with the discretion of the Society.

(2) Nozzle rudder area
In applying the Rules, the total rudder area and the rudder area ahead of the centreline of the rudder stock are to be calculated as follows:

Total rudder area (A) : $2h(b_1+b_2)+\Sigma h'(a_1+a_2)$ (m^2)

Rudder area ahead of the centreline of the rudder stock (A_f) : $2hb_2$ (m^2)

a_1, a_2, b_1, b_2, h and h' = as specified in **Fig 4.1.1**

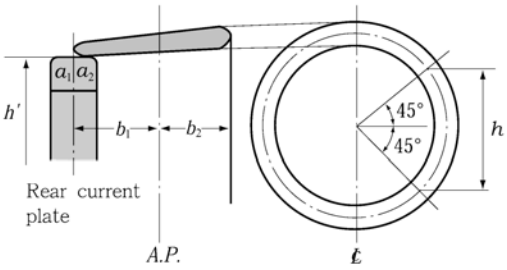

Fig 4.1.1 Nozzle rudder area

3. Rudders designed for helm angle exceeding 35°

The scantling of each member of a rudder designed for helm angle exceeding 35° is to be determined in accordance with the requirements in **Pt 4, Ch 1** of the Rules correspondingly, on the basis of the rudder force and rudder torque obtained through tests or detailed theoretical calculations. The results of tests and theoretical calculations are to be submitted to the Society.

4. For the single plate rudder, 1.0 may be taken as a coefficient K_2 for the ahead and astern conditions.

102. Materials

1. If the diameter of rudder stock is small, cast carbon steel is not to be used.

2. Rolled bar steel (*RSFB* 45) may be treated in the same way as forging steel (*RSF* 45)

Section 4 Rudder Strength Calculation

401. Rudder strength calculation

1. General

The bending moment, shear force, and supporting force acting on the rudder and rudder stock may be evaluated using the basic rudder models shown in **Fig 4.1.2** to **Fig 4.1.6.**

2. Moments and forces to be evaluated

The bending moment M_R and the shear force Q_1 acting on the rudder body, the bending moment M_b acting on the bearing, and the bending moment M_s acting on the coupling between the rudder stock and rudder main piece and the supporting force B_1, B_2, B_3 are to be obtained and to be used for analyzing the stresses in accordance with the **Pt 4, Ch 1** of the Rules.

3. Method of evaluating moments and forces

(1) General data
The data on the rudder basic models shown in **Fig 4.1.2** to **Fig 4.1.6** are as follows:

$l_{10} \sim l_{50}$ = Lengths of the each member of model (m)
$I_{10} \sim I_{50}$ = Moments of inertia of each member (cm^4)

For rudders supported by a shoe piece the length l_{20} is the distance between lower edge of rudder body and centre of shoe piece and I_{20} the moment of inertia of the pintle in the shoe piece. h_c is the vertical distance (m) from the mid-point of the length of that pintle to the centroid of the rudder area.

(2) Direct calculation
The standard data to be used for direct calculation are as follows :

Load acting on rudder body (Type B and C rudders) : $P_R = \dfrac{F_R}{1000\,l_{10}}$ (kN/m)

Load acting on rudder body (Type A rudder) :

$$P_{R10} = \frac{F_{R2}}{1000\,l_{10}} \quad \text{(kN/m)}, \qquad P_{R30} = \frac{F_{R1}}{1000\,l_{30}} \quad \text{(kN/m)}$$

Load acting on rudder body (Type D and E rudders) :

$$P_{R10} = \frac{F_{R2}}{1000\,l_{10}} \quad \text{(kN/m)}, \qquad P_{R20} = \frac{F_{R1}}{1000\,l_{20}} \quad \text{(kN/m)}$$

F_R , F_{R1} and F_{R2} is specified in **Pt 4, Ch 1, Sec 2.**

k = spring constant of the supporting point of the shoe piece or the rudder horn respectively, as shown below

For the supporting point of the shoe piece : $k = \dfrac{6.18 I_{50}}{l_{50}^3}$ (kN/m)(See the **Fig 4.1.2** and **4.1.3**)

I_{50} = the moments of inertia of shoe piece around Z-axis (cm^4)
l_{50} = effective length of shoe piece (m)

For the supporting point of rudder horn : $k = \dfrac{1}{f_b + f_t}$ (kN/m)(See the **Fig 4.1.2, 4.1.5** and **4.1.6**)

f_b = unit displacement of rudder horn due to a unit force of 1 kN acting in the centre of support as shown below.

$$f_b = 1.3 \frac{d^3}{6.18 I_n} \quad \text{(m/kN)}$$

I_n = the moments of inertia of rudder horn around the X-axis(cm^4)

f_t = unit displacement due to torsion, as shown below

$$f_t = \frac{dc^2 \Sigma u_i / t_1}{3.14 F_T^2} \times 10^{-8} \quad \text{(m/kN)}$$

F_T = mean sectional area of rudder horn (m^2)
u_i = breadth of individual plates forming the mean sectional area of rudder horn (mm)
t_i = plate thickness within the individual breadth u_i (mm)
c and d = See the **Fig 4.1.5** and **4.1.6** (For the rudder horn of Type A rudders, the same values are to be also applied correspondingly)

(3) Simplified method

The moments and forces for rudders of each type may be obtained from the following formula

(A) Type A rudders

$$M_R = \frac{B_1^2(l_{10}+l_{30})}{2F_R} \quad \text{(N-m)}$$

$$M_b = \frac{B_3(l_{30}+l_{40})(l_{10}+l_{30})^2}{l_{10}^2} \quad \text{(N-m)}$$

$$M_s = B_3 l_{40} \quad \text{(N-m)}$$

$$B_1 = \frac{F_R h_c}{l_{10}} \quad \text{(N)}$$

$$B_2 = F_R - 0.8B_1 + B_3 \quad \text{(N)}$$

$$B_3 = \frac{F_R l_{10}^2}{8 l_{40}(l_{10}+l_{30}+l_{40})} \quad \text{(N)}$$

(B) Type B rudder

$$M_R = \frac{B_1^2 l_{10}}{2F_R} \quad \text{(N-m)}$$

$$M_b = B_3 l_{40} \quad \text{(N-m)}$$

$$M_s = \frac{3M_R l_{30}}{l_{10}+l_{30}} \quad \text{(N-m)}$$

$$B_1 = \frac{F_R h_c}{l_{10}+l_{30}} \quad \text{(N)}$$

$$B_2 = F_R - 0.8B_1 + B_3 \quad \text{(N)}$$

$$B_3 = \frac{F_R(l_{10}+l_{30})^2}{8 l_{40}(l_{10}+l_{30}+l_{40})} \quad \text{(N)}$$

(C) Type C rudder

$$M_b = F_R h_c \quad \text{(N-m)}$$

$$B_2 = F_R + B_3 \quad \text{(N)}$$

$$B_3 = \frac{M_b}{l_{40}} \quad \text{(N)}$$

(D) Type D rudder

$$M_R = \frac{F_{R2} l_{10}}{2} \quad \text{(N-m)}$$

$$M_b = \frac{F_R l_{10}^2}{10(l_{20}+l_{30})} \quad \text{(N-m)}$$

$$M_s = \frac{2M_R l_{10} l_{30}}{(l_{20}+l_{30})^2} \quad \text{(N-m)}$$

$$B_1 = \frac{F_R h_c}{l_{20}+l_{30}} \quad \text{(N)}$$

$$B_2 = F_R - B_1, \quad \min B_2 = F_R/4 \quad \text{(N)}$$

$$B_3 = \frac{M_b}{l_{40}} \quad \text{(N)}$$

$$Q_1 = F_{R2} \quad \text{(N)}$$

(E) Type E rudder

$$M_R = \frac{F_{R2} l_{10}}{2} \quad \text{(N-m)}$$

$$M_b = \frac{F_R l_{10}^2}{10 l_{20}} \quad \text{(N-m)}$$

$$B_1 = \frac{F_R h_c}{l_{20}} \quad \text{(N-m)}$$

$$B_2 = F_R - B_1, \quad \min B_2 = F_R/4 \quad \text{(N)}$$

$$B_3 = \frac{M_b}{l_{40}} \quad \text{(N)}$$

$$Q_1 = F_{R2} \quad \text{(N)}$$

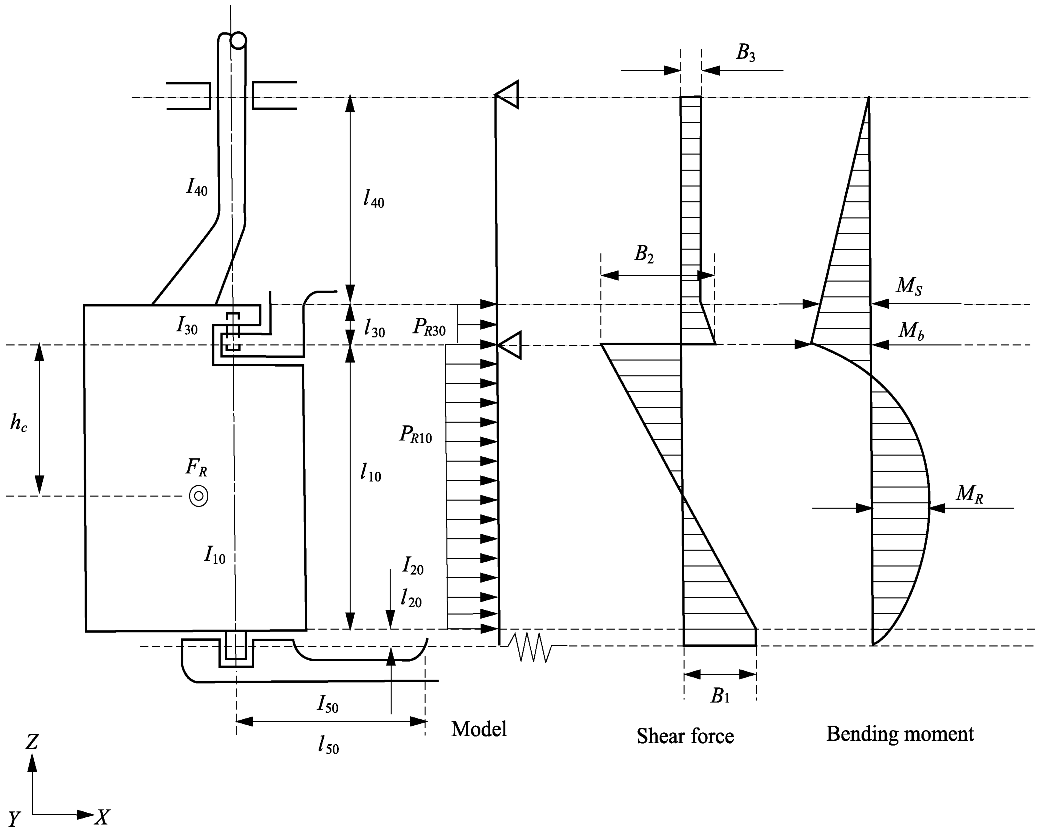

Fig 4.1.2 Type A rudder

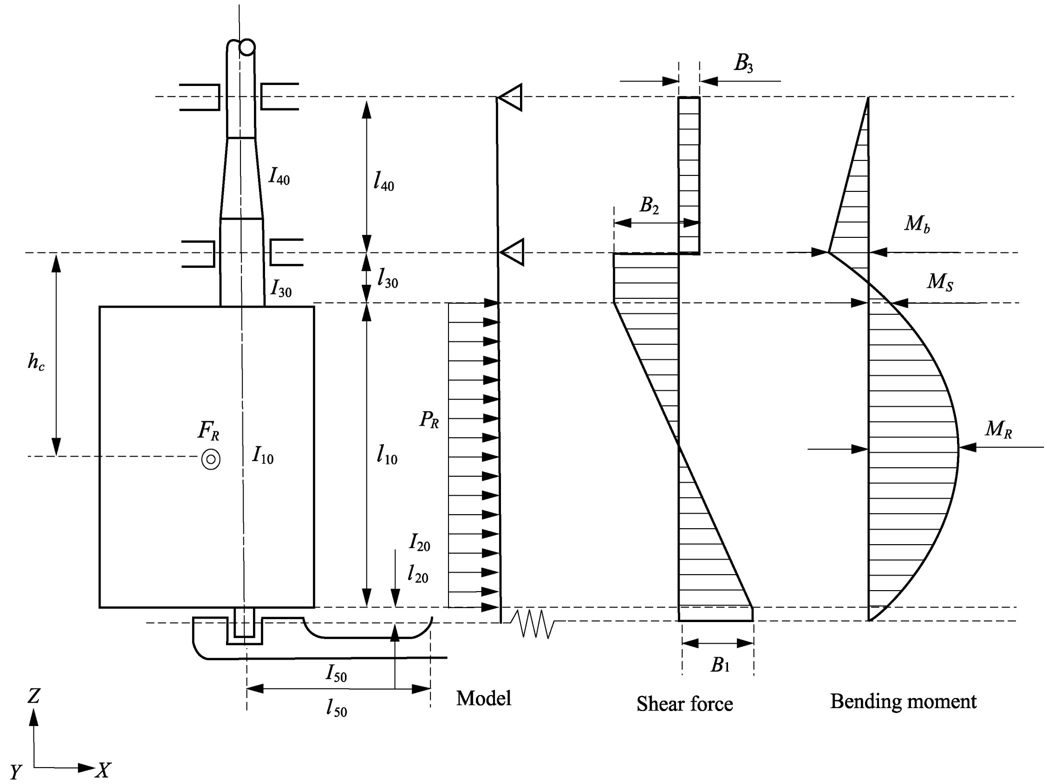

Fig 4.1.3 Type *B* rudder

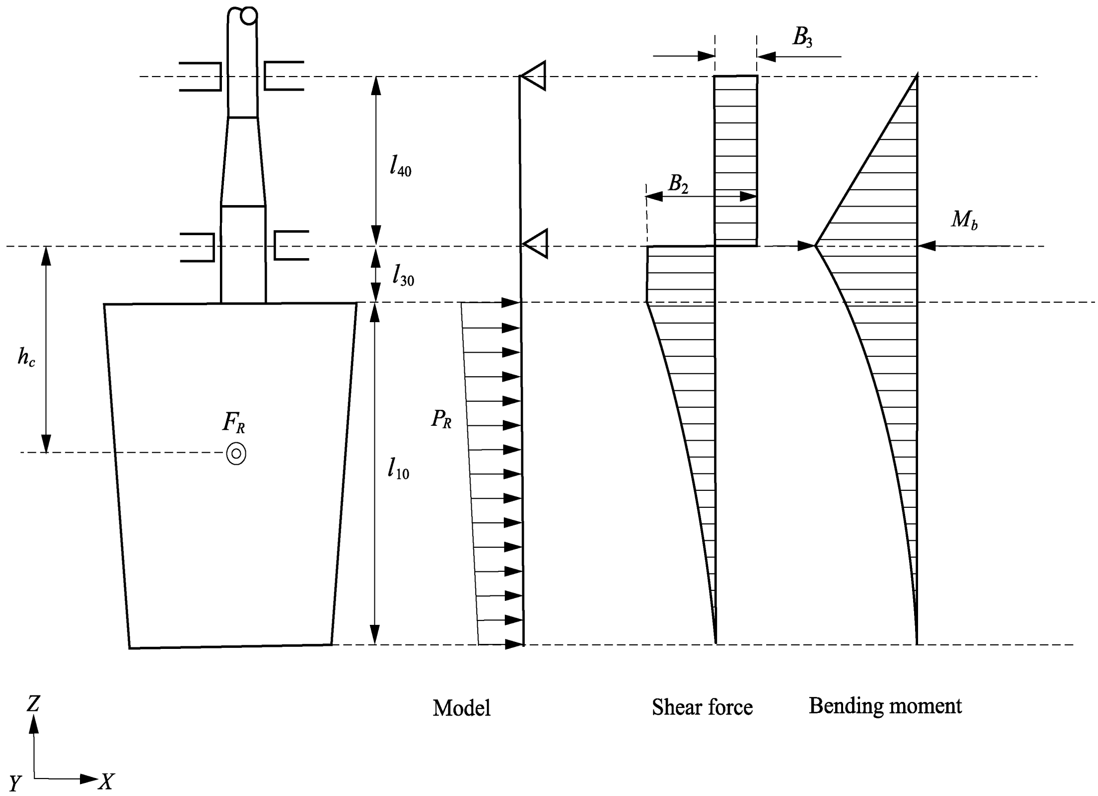

Fig 4.1.4 Type *C* rudder

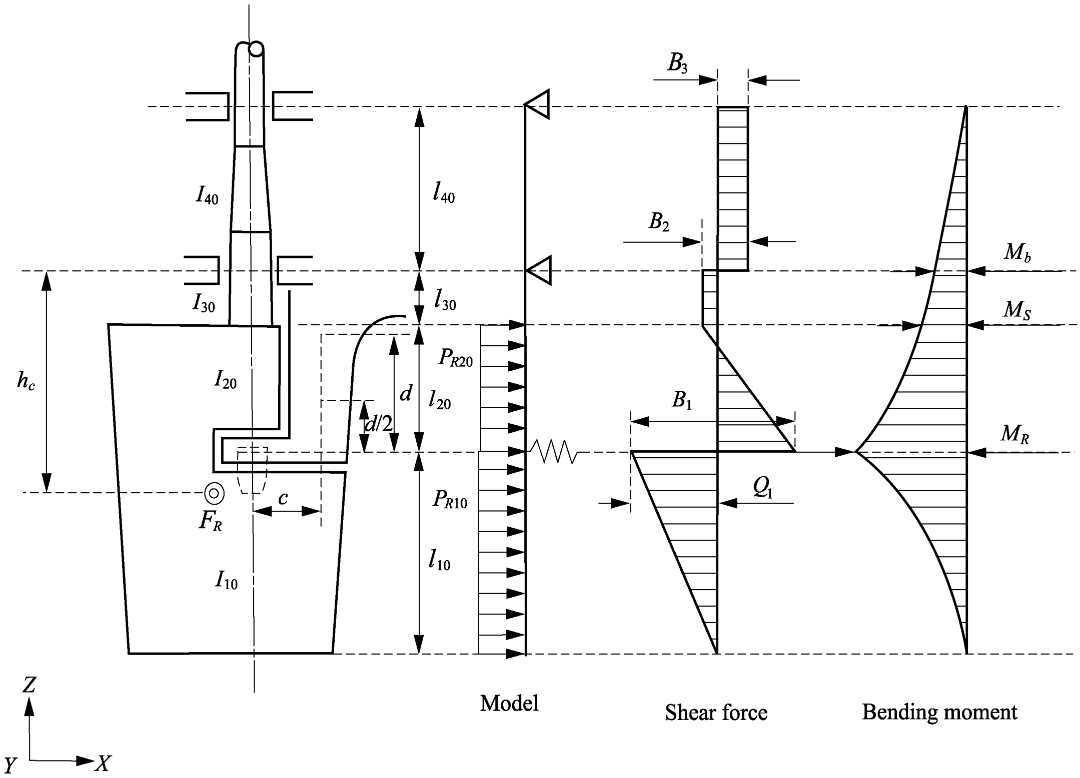

Fig 4.1.5 Type *D* rudder

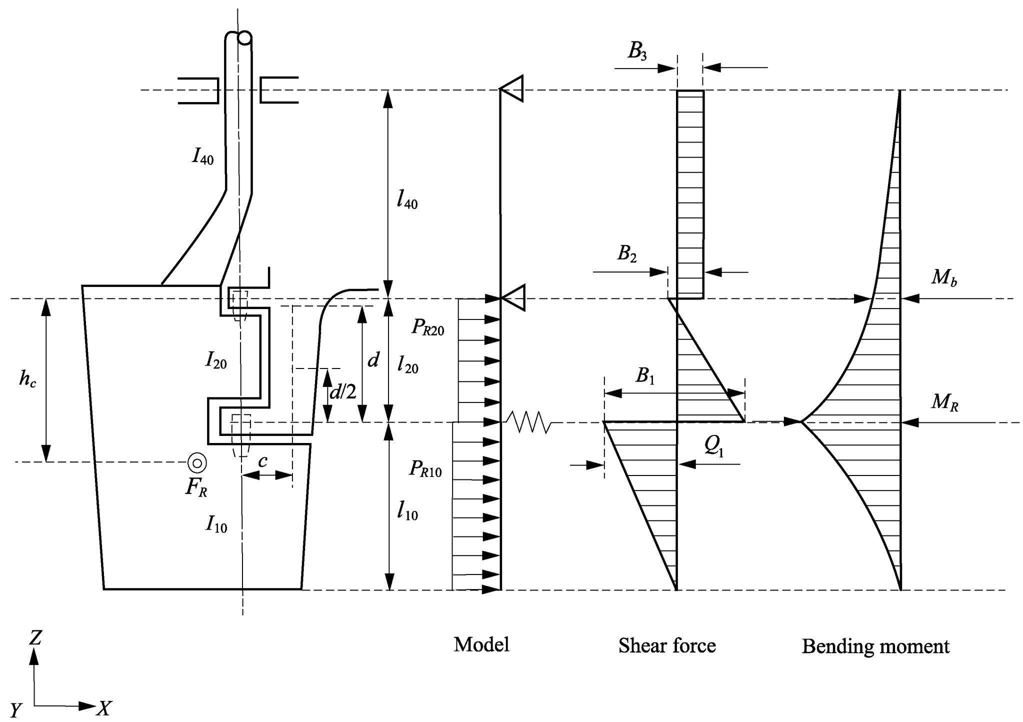

Fig 4.1.6 Type *E* rudder

Section 5 Rudder Stocks

501. Upper stocks

1. Taper of upper stock at joint with tiller

Where the upper stocks are tapered for fitting the tiller, the taper is not to exceed 1/12.5 in diameter.

2. Keyways

(1) The depth of the keyway may be neglected in determining the diameter of the rudder stock.
(2) All corners of keyways are to be properly rounded.

3. Each part of the rudder stocks of Type B, C and D rudders is to be so constructed as shown **Fig 4.1.7.**

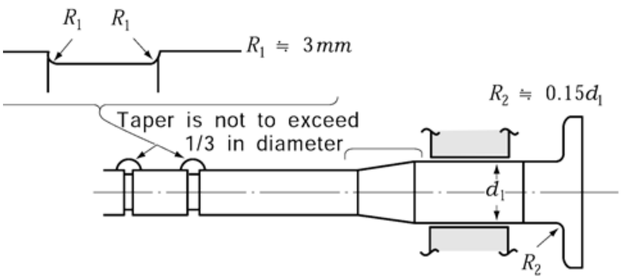

Fig 4.1.7 Rudder stock of type B, C and D rudder

Section 6 Rudder Plates, Rudder Frames and Rudder Main Pieces

603. Rudder main pieces

1. In Type D and Type E rudders, the effective breadth of rudder plate B_e to be as shown in **Fig 4.1.8.** However, the cover plate which is removed to lift up the rudder is not to be included into the section modulus. These requirements also apply to Type A rudders correspondingly.

2. Material factor K_m is to be for the lowest strength material among the materials used in the section considered.

605. Connections

1. The rudder plate is to be connected to rudder frames by spot welding as far as is practicable. **Fig 4.1.9** is to be referred to as the standard for spot welding.

2. In principle, edge bars are to be fitted to the aft end of the rudder. However, considering the size and form of the rudder, weld ability, etc., edge bars and or chill plates may be omitted. (See **Fig 4.1.10**)

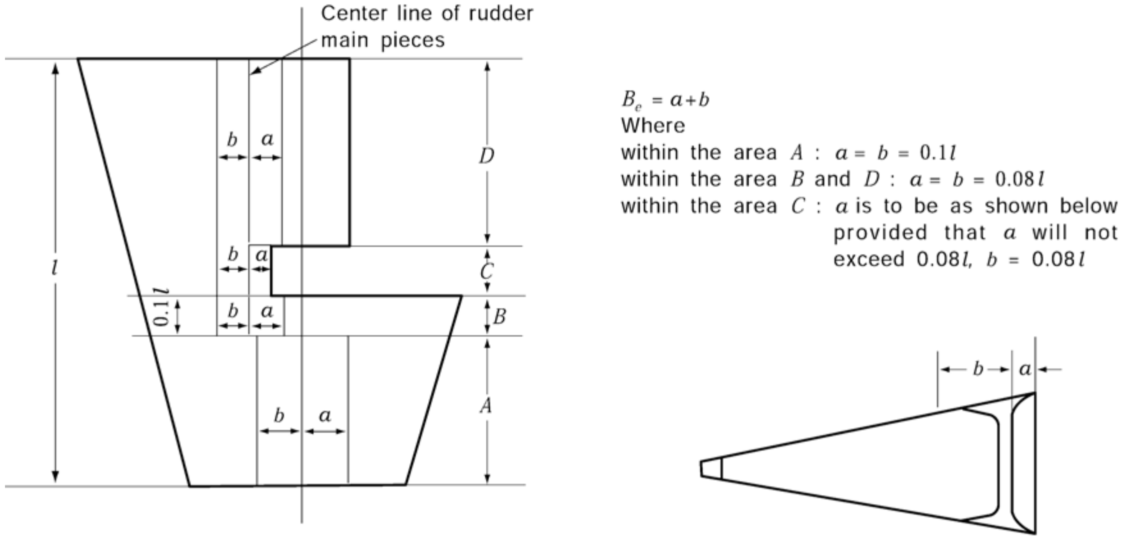

Fig 4.1.8 Effective breadth of rudder plate B_e

Section 7 Couplings between Rudder Stocks and Main Pieces

701. Horizontal flange coupling

1. Diameters of coupling bolts in Type A and Type E rudders

In appling to **Pt 4, Ch 1, 701.** of the Rules, the diameters of coupling bolts d_b in Type A and Type E rudders are to be determined in accordance with the requirements in **Pt 4, Ch 1, 502.** of the Rules, assuming that the lower stock is cylindrical.

2. Locking device for nuts of coupling bolts

The nuts of coupling bolts are to have locking devices. They may be split pins.

702. Vertical flange couplings

1. Diameter of coupling bolt in Type A and E rudders

In appling to **Pt 4, Ch 1, 701.** of the Rules, the diameter of the coupling bolt d_b in Type A and E rudders are to be determined in accordance with **Pt 4, Ch 1, 502.** of the Rules, assuming that the lower stock is cylindrical.

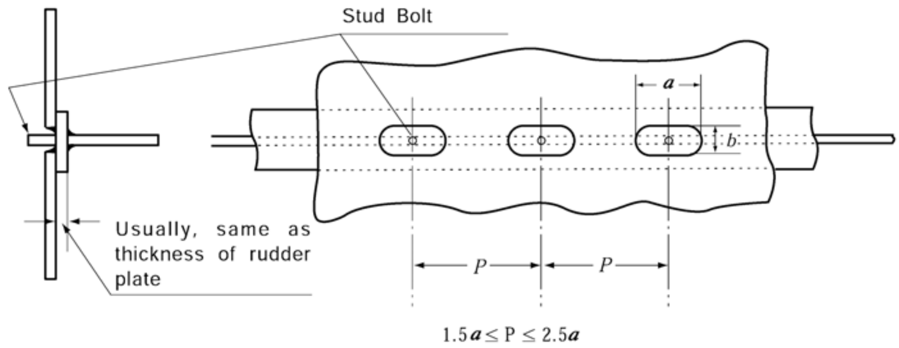
2. Locking devices for nuts of coupling bolts

The nuts of coupling bolts are to have locking devices. They may be split pins.

703. Cone coupling

1. General

(1) The lower stock is to be securely connected to the rudder body with slugging nuts or hydraulic arrangements. Shipbuilders are to submit data on this connection to the Society.
(2) Special attention is to be paid to corrosion of the lower stock.
(3) The minimum thickness t_b is of the cast steel part of rudder body (See **Fig 4.1.11**) not to be less than 0.25 times the required diameter of the lower stock.



Thickness of rudder plate(mm)	dimension (mm)		lag length
	a	b	
$t \le 6$	65	35	F_1
$7 \le t \le 18$	75	40	
$t \ge 19$	85	45	

Fig 4.1.9 Slot welding of rudder plate

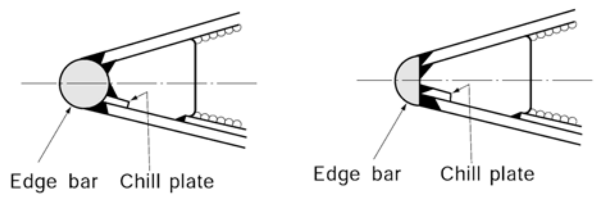


Fig 4.1.10 Structure of end part of rudder

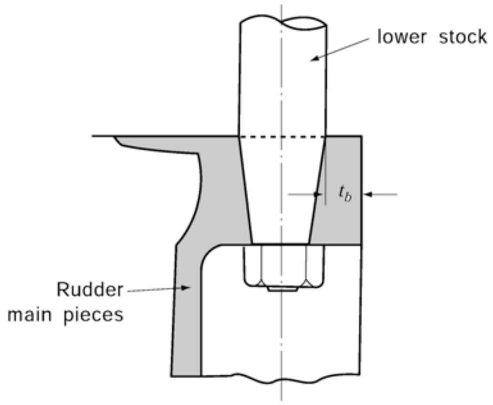

Fig 4.1.11 Coupling between rudder lower stock and rudder main pieces

2. Keys provided on the cone coupling for rudder stocks fitted into the rudder body and secured by a nut:

(1) The shear area A_k of keys is not to be less than:

$$A_k = \frac{30\, T_R K_k}{d_k} \quad (\mathrm{mm}^2)$$

d_k = rudder stock diameter at the mid-point of length of the key (mm)
K_k = material factor for the key as given in **Pt 4, Ch 1, 102.** of the Rules
T_R = rudder torque obtained from **Pt 4, Ch 1, Sec 3** of the Rules

(2) The abutting surface area A_c between key and rudder stock or between key and rudder body, respectively, is not be less than:

$$A_c = \frac{10\, T_R K_{\min}}{d_k} \quad (\mathrm{mm}^2)$$

where:

K_{min} = material factor for key, rudder stock, or rudder body as given in **Pt 4, Ch 1, 102.** of the Rules, whichever is smaller in comparison between the factors for key and rudder stock, and for key and rudder body in contact.

d_k and T_R = as specified in (1).

704. Coupling flange

In principle rudder stock and coupling flange consist with one body. However, for the ships which are not exceeding 60 m in length, if rudder stock constructed with full penetration weld with inserting coupling, it may be acceptable.

Section 8 Pintles

802. Construction of pintles

1. Locking device for pintle nut

Split pins are not recommendable as the locking device for the pintle nuts. Locking rings or other equivalent devices(Nut stopper or Nut lock, etc,.) are to be used, as shown in **Fig 4.1.12.**

2. Preventing corrosion of pintles

To prevent corrosion of pintles, the end of the sleeve is to be filled with red lead, grease packing, bituminous enamel, rubber(Neoprene) etc., as shown in **Fig 4.1.12.**

3. Combination of pintle and rudder frame in monoblock

In ships exceeding 80 m in length, combination of pintle and rudder frame into a monoblock is not recommended.

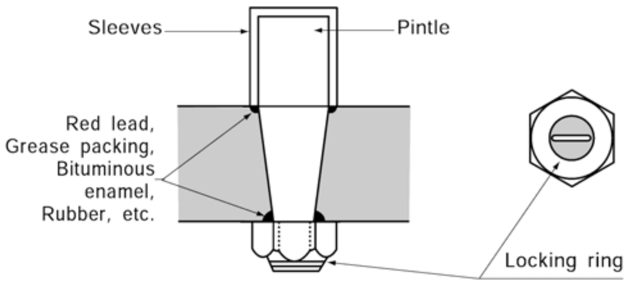

Fig 4.1.12 Locking device and preventing device of corrosion of pintle nut

Section 9 Bearings of Rudders Stock and Pintles

901. Minimum bearing surface

Where a metal bush is used, the sleeve is to be a different material from the bush (for example, sleeve : BC_3 and bush : BC_2).

902. Bearing clearances

Where a bush is non-metal, the standard bearing clearances is to be 1.5 ~ 2.0 mm in diameter.

Section 10 Rudder Accessories

1001. Rudder carriers

1. Materials of rudder carriers and intermediate bearings

Rudder carriers and intermediate bearings are to be of steel. They are not to be of cast iron.

2. Thrust bearing of rudder carrier

(1) The bearing is to be provided with a bearing disc made of bronze or other equivalent materials.
(2) The calculated bearing pressure is not to exceed 0.98 MPa(0.1 kg/mm^2) as a standard. In calculating the weight of rudder, its buoyancy is to be neglected.
(3) The bearing part is to be well lubricated by dripping oil, automatic grease feeding, or a similar method.
(4) The bearing is to be designed to be structurally below the level of lubricating oil at all times. (See **Fig 4.1.13**)

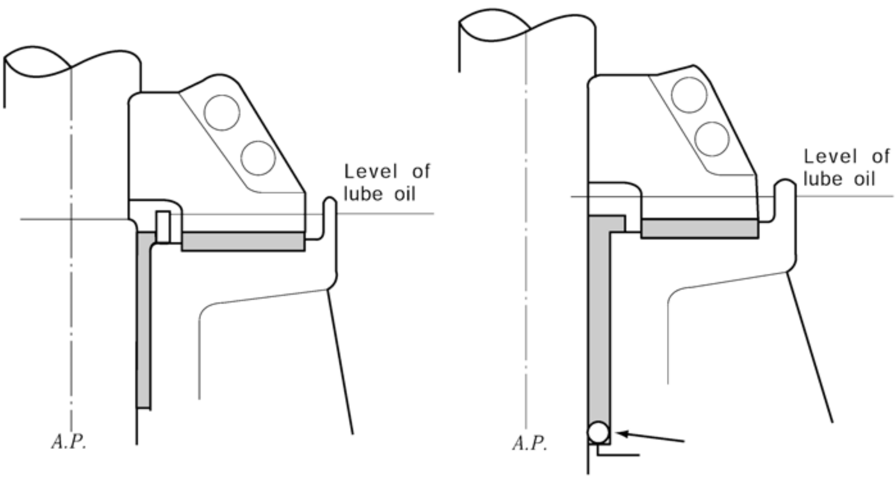

Fig 4.1.13 Rudder carrier

3. Watertightness of rudder carrier part

(1) In rudder trunks which are open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If the top of the rudder trunk is below the deepest waterline two separate stuffing boxes are to be provided.
(2) It is recommended that the packing gland in the stuffing box have an appropriate clearance from the rudder stock corresponding to the position of the stuffing box. The standard clearance is to be 4 mm for the stuffing box provided at the neck or intermediate bearing, and 2 mm for the stuffing box at the upper stock bearing.

4. Assembling of rudder carriers

In split type rudder carriers, at least two bolts are to be used on each side of the rudder for assembling.

5. Installation of rudder carriers

(1) In ships exceeding 80 m in length, it is recommended that the rudder carrier is directly installed on the seat on a deck.
(2) A spigot type seat is not recommended to be installed on the deck.
(3) The hull construction in way of the rudder carrier is to be suitably reinforced.

6. Bolts fixing rudder carriers and intermediate bearing

(1) As a standard, at least one half of the bolts fixing the rudder carrier and the intermediate bearing are to be reamer bolts. If stoppers for preventing the rudder carrier from moving are to be fitted on the deck, all bolts may be of ordinary bolts. In using chocks as stoppers, all of them are to be carefully arranged not to be driven in the same direction. (See **Fig 4.1.14**)
(2) (A) In ships provided with electro hydraulic steering gears, the total sectional area of the bolts fixing the rudder carriers or the bearing just under the tiller to the deck is not to be less than that obtained from the following formula:

$$A = 0.1 d_u^2 \quad (\text{mm}^2)$$

d_u = required diameter of upper stock(mm)

(B) Where the arrangement of steering gear is such that each of two filler arms is connected with an actuator and two actuators function simultaneously, or is of any other type where the rudder stock is free from horizontal force, the total sectional area of bolts fixing the rudder carrier to the deck may be reduced to 60 % of the area required in (A).
(C) Where all the bolts fixing the rudder carrier to the deck are reamer bolts, the total sectional area of bolts may be reduced to 80 % of the area required by (A) and (B).

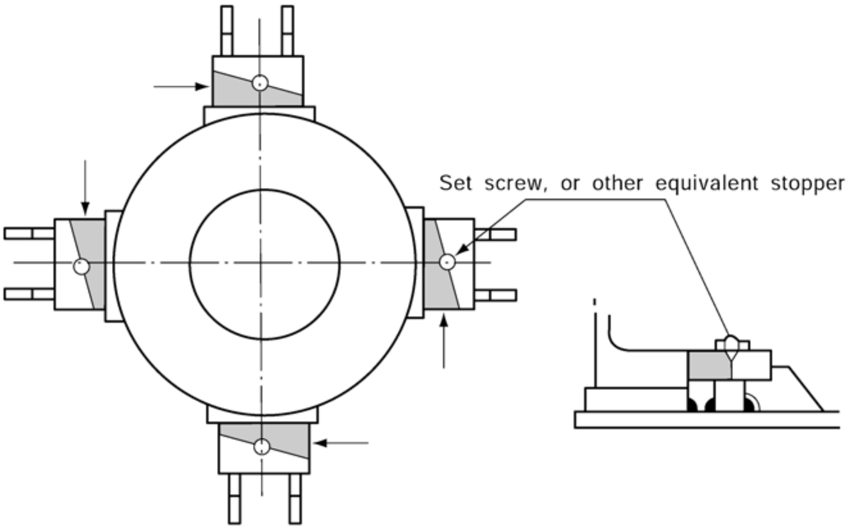

Fig 4.1.14 Fixing arrangement of rudder carrier on deck

1002. Jumping stoppers

The clearance between the jumping stopper and the rudder carrier is to be 2 mm as a standard. In ships provided with power-operated steering gears, this clearance is not to be exceed 2 mm. ⚓

CHAPTER 2 HATCHWAYS AND OTHER DECK OPENINGS

Section 1 General

101. Application

1. The regulation of 101.3 of the Rules is not to be applied to the vessel which engaged in domestic service only.

102. Position of exposed deck openings

1. Exposed superstructure deck of the Rules is in general exposed deck up to superstructure of second tier above freeboard deck. However, where actual deck height is less than standard height of superstructure(h_s), it is to be of exposed deck of nearest superstructure from the point above freeboard deck by $2\,h_s$.

2. Exposed deck of superstructure above the deck defined in 1. may be regarded as deckhouse or its exposed deck.

Section 2 Arrangements

201. Height of hatchway coamings

1. Where the openings of hatchways are comparatively small and weathertight steel hatch covers are provided with, height and thickness of their coamings are to be as follows.

(1) Coamings height is to be not less than the value given in **Table 4.2.1** according to the location and opening area of the hatchways.

(2) Thickness of coamings is to be not less than the value calculated in following formula.

$$L < 100\text{ m}: \quad 4 + 0.05L \text{ (mm)}$$
$$L \geqq 100\text{ m}: \quad 9.0 \text{ (mm)}$$

Table 4.2.1 Height of small hatchway coamings (mm)

Hatch Area (m^2) / Position of Hatchway	$A < 1.5$ Other type than stated in column of right side	$A < 0.45$, Which are fitted with hinge type closing means capable of opening and closing
Position I	450 mm	380 mm
Position II	380 mm	230 mm

2. Construction and scantlings of hatchway coamings for deep tanks are also to comply with the requirements of **Ch 2** of the Rules as well as **Pt 3, Ch 15** of the Rules.

202. Hatch covers

1. Steel hatchway covers provided on exposed upper deck in way of cargo holds used as deep water ballast tanks for bulk carrier, etc, and similar ones are to comply with the following requirements in addition **Ch 2** of the Rules.

(1) The thickness of top plating is not to be less than the obtained from the following formula. However, in case of double plating type hatch covers, the plates actually loaded are only to comply with.

$t = 1.15S\sqrt{h} + 3.0$ (mm)

S = Spacing of stiffeners(m)
h = As obtained from the following formula(m)

$h = 9.81 \times 0.85(16a/L + 0.25b + h')$ (kN/m^2)

a = Length of hatchways(m)
b = Breadth of hatchways(m)
h' = Vertical distance to the highest point of top plates from the highest points of hatch covers when ships are inclined angles of rolling 15°, pitching $(900/L)$°. However, h' is 0 when the h' has negative(-) value. (See **Fig 4.2.1**)

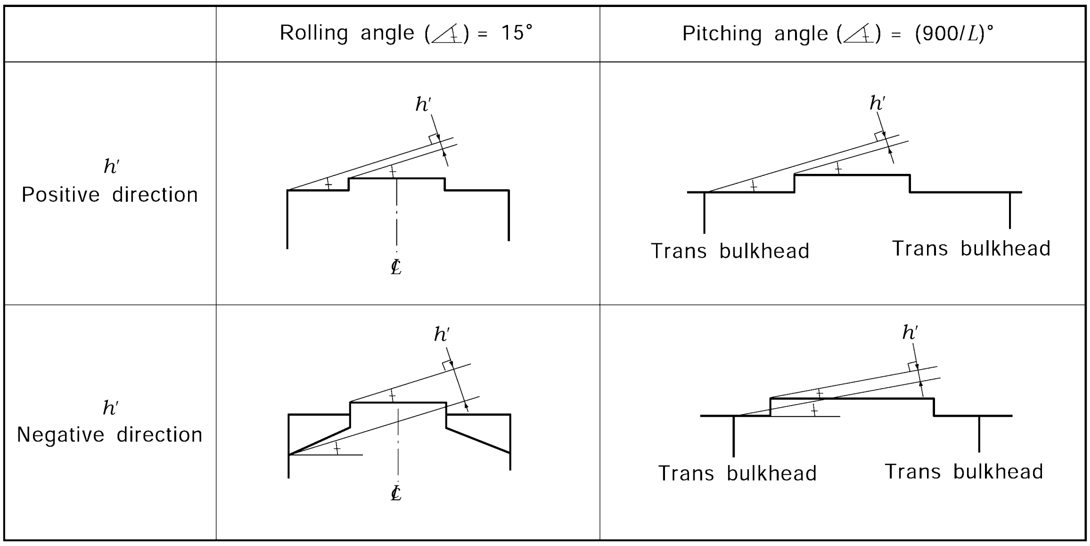

Fig 4.2.1 The direction of h'

(2) The scantlings of stiffeners are to comply with the following formulae.

- Section modulus at mid-span $C_1Kk_1Shl^2$ (cm^3)
- Moment of inertia at mid-span $C_2k_2Shl^3$ (cm^4)
- Cross sectional area of web plates at the ends of stiffeners C_3KShl (cm^2)

Where,
S : Spacing of stiffeners (m)
l : Distance between supported stiffeners (m)
K : Material factor
k_1, k_2 : Coefficient given by **504. 6** of the Rules is as follows.

$$k_1 = 1 + \frac{3.2\alpha - \psi - 0.8}{7\psi + 0.4}$$

$$k_2 = 1 + 8\alpha^3 \frac{1-\phi}{0.2+3\sqrt{\phi}}$$

C_1, C_2 and C_3 : Coefficients given by **Table 4.2.2**

h : As given by the following formulae according to the arranged direction of stiffeners, and a, b, h' are to be followed by (1)

- Transverse direction (in case hatch covers are opened/closed in the longitudinal direction)

  $h = 9.81 \times 0.85(12a/L + 0.125b + h')$ (kN/m^2)

- Longitudinal direction (in case hatch covers are opened/closed in the transverse direction)

  $h = 9.81 \times 0.85(8a/L + 0.188b + h')$ (kN/m^2)

Table 4.2.2 Coefficient C_1, C_2, C_3

C_1	C_2	C_3
1.07	1.81	0.064

(3) Thickness and depth of web of girders are not to be less than 7 mm and l/25. The girders are to be provided with tripping brackets at the intervals of about 3 m.

(4) The section modulus of stiffeners supported by girders and subjected to a uniformly distributed loads may be obtained from the direct strength calculations, or obtained from the following formulae in accordance with the type of covers as considered.

$0.71CKShl^2$ (cm^3)

Where,

K, S, h and l : As specified in the preceding (2)

C : Coefficient given below according to the type of end connections of stiffeners

In case of lug at both ends : 1.0

In case of snip at both ends or one end snip and another end lug : 1.5

2. Steel hatch covers in way of tanks loading cargo oil of flash point below 60 °C are to be paid enough attention in order to keep oil-tightness and air-tightness and to prevent occurring sparks due to striking of the surrounding metal fittings. And their gaskets are to be of materials certified as oilproof and fireproof by the relative standard.

3. In principle, double plating hatch covers are not to be used in way of oil tanks. However, if they are to be used, their construction is to be easily drained out and vented by air.

4. In this article sand carrier and dredger mean that the ships are be engaged in gathering, transporting, dredging or reclamation etc. for sand, soil, gravel etc. and are to be as follows

(1) For the ship which operates in domestic-costal service area, the requirement for exemption of hatchway covers of sand carrier and dredger is as follows.

(A) Barge and Ship having hopper door

Ships which is fitted with a buoyancy tank in each side and hopper door in bottom should have sufficient reserved buoyancy and stability in assumed the worst flooded condition of cargo hold.

(B) Barge not having a hopper door

Barge which is fitted with a buoyancy tank in each side and operates within 20 nautical miles out of the Korean peninsula(excluding those intend to sail to Che-ju Island) should have sufficient reserved buoyancy and stability in assumed the worst flooded condition of cargo hold.

(C) For the exemption of hatchway cover installation, it should be met with the following conditions in assumed the worst flooded condition.

(a) The upper deck side line should be not flooded

(b) For self-propelled ship : $G_0M \geq 0.15$ m

For non self-propelled ship : $G_0M \geq 0.095B$ m

(where, B = Breadth)

(2) For the ship which operates in international service area and is fitted with door or valve in bottom, the requirement for exemption of hatchway cover installation of sand carrier and dredger is as follows.

(A) The intact stability is to be met with the requirement of **Pt 1, Annex 1-2** of the Guidance. In this case, the calculation is to include the homogeneous full load condition of cargo in each cargo hold loaded up to the top of the hatchway coaming.

(B) When the wetted cargo with the design bulk density of minimum 2.2 ton/m^3 is homogeneously loaded to the assigned freeboard in each hold and assuming that the void space of the cargo hold above the cargo surface is filled with the sea water induced by the flooding, the stability of the above (A) is to be satisfied.

(C) The damage stability is to be met with **SOLAS Ch. II-1, B-1**

(D) The doors or valves on bottom area are to be met with following requirements.

(a) The opening of the bottom dump doors should be effective in less than one(1) minute.

(b) In the case of bottom door not to be opened by gravity, the opening should be possible even after the main power source or the ram mechanism actuating the bottom dump doors have been put out of order.

In this case, it should be possible to operate both systems from bridge, and the cargo releasing arrangements should be such that asymmetrical jettisoning of the cargo should not be possible even partially.

(E) Draft indicator is to be fitted on the bridge.

(F) Where the additional requirements other than described above are necessary, the ship is to be met with those requirements also.

Section 4 Load Model

401. Lateral pressure and concentrated loads

1. In addition to the above provisions, hatch covers for ships carrying deck cargoes are to be in accordance with the following (1) to (5)

(1) Hatch covers carrying deck cargo are to be effectively secured against the horizontal and vertical forces arising from ship motion.

(2) To prevent damage to hatch covers and ship structure, the location of stoppers is to be compatible with the relative movements between hatch cover and ship structure. The number should be as small as practically possible.

(3) Hatchway coamings and supporting structure are to be adequately stiffened to accommodate the loading from hatch covers.

(4) It is to be designed for preventing excessive relative vertical deflection between loaded/ unloaded panel.

(5) When the cargoes loaded on hatch covers of exposed parts and lower deck, the construction and scantlings are to be applied in the following requirements in addition to **Ch 2** of the Rules.

(A) The loading height, loading condition, etc, is to be clearly shown in the drawings for approval. In case of loading freight containers, the kind of them and loading position are to be additionally described.

(B) Girders or stiffeners are to be provided for reinforcement beneath the corner fittings of freight containers.

(C) Top plates of hatch covers, upon which wheeled vehicles are loaded, are to comply with **Pt 7, Ch 7** of the Rules.

(D) For the construction of hatch covers, stress and deflection of planed loading is to be calculated by calculation method which is to be to the discretion of the Society. Each calculated permissible stress and permissible deflection value is to be complied with **Table 4.2.3.** However when the high tensile steel is used, permissible stress is the values which are divided permissible stress in **Table 4.2.3** with material factor in K in **Table 4.1.2**

Table 4.2.3 Permissible stress and deflection

	Bending stress (N/mm^2)	Shear stress (N/mm^2)	Deflection (mm)
During the berthing, in case of using a vehicle for unloading as a pork lift and etc., (For the vehicles)	147	98	0.0035 times to hatch beam
Other than above column	118	78	

2. It is recommended that ships with steel weathertight covers are supplied with an operation and maintenance manual including following (1) to (5)

(1) Opening and closing instructions
(2) Maintenance requirement for packings, securing devices and operating items,
(3) Cleaning instruction for drainage system
(4) Corrosion prevention instructions.
(5) Lists of spare parts.

Section 5 Strength Check

501. General

1. Where scantlings of structural members of steel hatch covers are determined based upon the direct calculations, following requirements are to be applied. Those other than as specified in this paragraph are to comply with the requirements in **Pt 3, Annex 3-2** of the Rules.

(1) Loads
The design wave loads imposed on steel hatch covers are to comply with the requirements of **Table 4.2.3** of the Rules.

(2) Modelling of structure
(A) The modelling is to be such that the structural model can reproduce the behaviour of the structure with the highest possible fidelity.
(B) The net scantlings are to be used for modelling.
(C) When modelling into beam element, the plate of a width equal to 0.165 l on its each side may, as a rule, be in cluded, provided that the plate to be included is effectively reinforced by other members or is recognized by the Society to have a sufficient thickness, and, in addition, this width equal to 0.165 l does not exceed half of the distance to the neighbouring member, where l is the span of members.
(D) The structural model is to be supported at pads. If the arrangement of pads differs from the arrangement of stiffeners, the edge elements of steel hatch covers are also to be modelled.

(3) Allowable values
When the loads specified in (1) act the structural model specified above, the scantlings are to be determined so that the stress and deflection generated in each structural member satisfy the allowable values specified in **Table 4.2.3** and **504. 4** of the Rules.

2. Steel hatch covers intended to carry cargoes on them

(1) General
(A) The scantlings of steel hatch covers, steel pontoon covers, steel weathertight covers (hereinafter steel hatch covers) and portable beams intended to carry cargoes on them in exposed positions are to comply with the requirements **Ch 2** of the Rules in addition to the requirements of this paragraph.
(B) The values obtained from the requirements of this paragraph are including corrosion

addition.

(C) In case where cargo loads and wave loads act jointly due to the cargo loading height and cargo shapes, special consideration is to be required.

(2) Design cargo load h (kN/m^2) is not to be less than that obtained from following (A) or (B).

(A) h is to be equivalent to the standard by the 7 times the height from the upper surface of hatch covers to the above deck at side of the space (m), or 7 times the height from the deck concerned to the upper edge of hatchway coaming of the above deck (m). However, h may be specified as the maximum design cargo weight per unit area of hatch covers (kN/m^2). In this case, the value of h is to be determined by considering the loading height of cargo.

(B) Where cargoes are intended to be carried on the hatch covers in weather decks, h is to be the maximum design cargo weight per unit area of hatch covers (kN/m^2).

(3) For hatch covers on which cargoes are carried, the thickness of top plating t is not to be less than that obtained from following formula.

$$t = 1.25S\sqrt{Kh} + 2.5 \quad \text{(mm)}$$

Where,

S : Spacing of stiffeners (m)

h : Design cargo load specified in the preceding (2) (kN/m^2)

K : Material factor given in **Pt 3, Ch 1, Table 3.1.3** of the Rules.

(4) The section modulus of stiffeners supported by girders and subject to a uniformly distributed loads may be obtained from the direct strength calculations, or obtained from the relevant formulae of **202. 1** (4). And h is design cargo load specified in the preceding (2).

(5) The scantlings of primary supporting members of steel hatch covers, which are simply supported between hatch coamings with uniformly distributed loads imposed thereupon, and of portable beams are to comply with the relevant formulae of **202. 1** (2). For steel hatchway covers, S and l are to read as b and S, respectively. Where h is design cargo load specified in the preceding (2), and coefficient C_3 of **Table 4.2.2** is not to be applied to steel hatch covers.

(6) Compressive buckling stress for steel hatch covers are to satisfy the following formula. However, in case of double plating type steel hatch covers, the plate actually loaded the compressive stress are only to be complied with.

$$\sigma_{cr} / \sigma \geqq 1.2$$

σ_{cr} : Critical compressive buckling stress and given as follows.

$$\sigma_{cr} \leqq \frac{\sigma_y}{2} \quad : \sigma_{cr}'$$

$$\sigma_{cr}' > \frac{\sigma_y}{2} \quad : \sigma_y (1 - \sigma_y / 4\sigma_{cr}')$$

$$\sigma_{cr}' = 0.74(t/S)^2 \text{ (N/mm}^2\text{)}$$

t : Thickness of steel plate(mm)

S : Spacing of stiffeners(m)

σ_y : Yield stress of the material(N/mm^2)

(7) The vertical deflection of primary supporting members and portable beams are to be not more than 0.0035 l, where l is the greatest span of primary supporting members or portable beams.

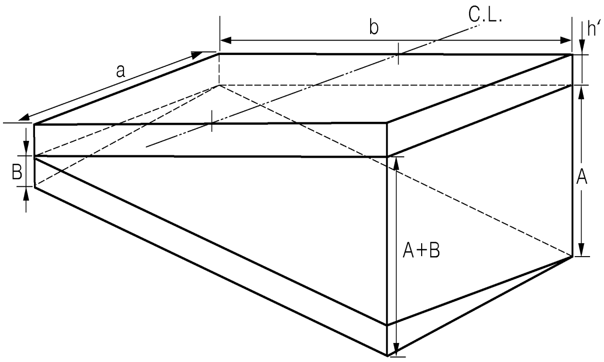
3. The direct calculations for steel hatch covers intended to carry cargoes on them are to be applied following requirements. Those other than as specified in this paragraph are to comply with the requirements in **Pt 3, Annex 3-2** of the Rules.

(1) Loads
The loads imposed on steel hatch covers are to comply with the followings according to the type of load. Except for the case **2** (1) (C), no loads are to be assumed to act jointly.
(A) The loads to be carried (excluding (B)), in case of a uniformly distributed load, is to be h specified in **2** (2), and in case of concentrated load, it is to be maximum design cargo load at each loading point.
(B) The load due to liquid cargo or water ballast, etc. is to be 0.85 times the values specified in **Fig 4.2.2**. However, the corner on which the maximum load acts is to be at an arbitrary place. In case of girders are only modelled and Society deems it to be appropriate, the values according to **202. 1** (2) may be used.

(2) Modelling of structure
(A) The modelling is to be such that the structural model can reproduce the behaviour of the structure with the highest possible fidelity.
(B) The scantlings including corrosion allowances which are shown on the plans may be used for modelling.
(C) When modelling into beam element, the plate of a width equal to 1/10 of a span of the member on its each side may, as a rule, be included, provided that the plate to be included is effectively reinforced by other members or its recognized by the Society to have a sufficient thickness, and, in addition, this width equal to 1/10 of the span does not exceed half of the distance to the neighboring member.
(D) The structure model is to be supported at pads(cleats in case of loads due to liquid cargo or water ballast, etc.) differs from the arrangement of stiffeners, the edge elements of hatch covers are also to be modelled.

(3) Allowable values
When the loads specified in (1) act the structural model specified above, the scantlings are to be determined so that the stress and deflection generated in each structural member safisfy the allowable values specified **Table 4.2.3**.

(4) Elsewhere
(A) The thickness of top plate of steel hatch covers is to comply with the requirements **2** (3) above and **202. 1** (1).
(B) The section modulus of stiffeners supported by girders and subjected to a uniformly distributed loads may be obtained from the direct strength calculations, or obtained from the requirements in **2** (4) above.



(Note)
A : Additional water head due to the rolling motion obtained from 0.25 b.
B : Additional water head due to the pitching motion obtained from 16 a/L.
h', a, b and L : As specified in **202. 1** (1).

Fig 4.2.2 Modelling of structure

Section 6 Hatch Coamings

602. Load models

1. In application with **Ch 2, 201** of the Rules, the pressure may be reduced by an amount equal to 25 % in case the hatchway covers concerned may be fitted to hatchways located on weatherdecks which are at least two standard superstructure heights above an actual freeboard deck or an as-

sumed freeboard deck from which the form freeboard can be calculated which will result in a draught not less than that corresponding to the freeboard actually assigned. Where any part of a hatchway is forward of a point located one quarter of the ship's length 0.25 L_f from the forward perpendicular, that hatchway is to be located on a weatherdeck at least three standard superstructure heights above the actual or assumed freeboard deck.

Section 7 Weathertightness, Closing Arrangement, Securing Devices and Stopper

702. Gaskets

In case of applying the requirement of **702.** of the Rules, "at the discretion of the Society" means the following (1) through (7).

(1) The vertical distance between the imaginary freeboard deck and the assigned load line is not to be less than the form freeboard in which the imaginary freeboard deck should be assumed to be situated at two or more of the standard height of superstructure (as per **Reg. 33** of the "**International Convention on Load Line, 1966**") below the deck the deck with the hatchway covers concerned. Here, in the calculation of the from freeboard, the ship should be assumed to have superstructure of one standard height above the above mentioned imaginary freeboard deck.

(2) Hatch openings of the hatchway covers concerned are to be located abaft the forward 0.25L_f. However, where any part of a hatchway is forward of a point located one quarter of the ship's length(0.25L_f) from the forward perpendicular, that hatchway is to be located on a weatherdeck at least three standard superstructure heights above the actual or assumed freeboard deck.

(3) The non-weathertight gaps between hatch cover panels should be considered as unprotected openings with respect to the requirements of intact and damage stability calculations. They should be as small as possible commensurate with the capacity of the bilge system and expected water ingress, and the capacity and operational effectiveness of the fire-fighting system and, generally, should not exceed 50 mm.

(4) The hatchway coamings should be not less than 600 mm in height.

(5) Labyrinths, gutter bars, or equivalents should be fitted proximate to the edges panel in way of the gaps to minimize the amount of water that can enter the container hold from the top surface of each panel.

(6) Scantlings of the hatch cover panels as well as details on the securing arrangements to the vessel's support structure and coamings are to be equivalent to those for weathertight covers and in accordance with the requirements of the Society.

(7) Bilge alarms should be provided in each hold fitted with non-weathertight cover.

703. Closing arrangement, securing devices and stoppers

6. Inertia of edge elements

(1) When calculating the moment of inertia ($I = 6 P_L S_S^4$) as specified in **703. 6** of the Rules, the spacing between securing devices S_S (m) is maximum of the distance between two consecutive devices, measured along hatch cover periphery(m), not to be taken as less than 2.5 S_c.

Where,
S_c = max ($S_{1.1}, S_{1.2}$) (m) (Refer to **Fig 4.2.3**)

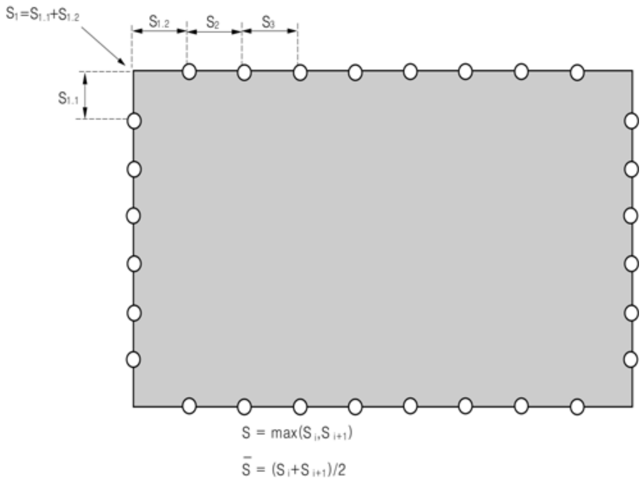


Fig 4.2.3 Spacing of securing devices

(2) When calculating the actual gross moment of inertia of the edge element, the effective breadth of the attached plating of the hatch cover is to be taken equal to the lesser of the following values.
(A) $0.165\,S_S$
(B) Half the distance between the edge element and the adjacent primary member

Section 8 Additional Requirements

801. Portable beam

1. The diameter of lighting holes provided in portable beams is to be smaller than one third of depth of portable beams in the section. Where the loading of lumber is planned, lighting holes are recommended not to provided.

2. The thickness of web plates is not to be less than the value obtained from the following formula.

$$10h + 4 \quad \text{(mm)}$$

Where,

h : Depth of web plates at mid-span of portable beams (m)

3. The width of upper face plates of portable beams supporting hatchboard is to be over 135 mm.

4. In applying regulations of **Sec 5** of the Rules, distance between inner sides of hatchway coamings may be used as the span of the portable beams.

Section 10 Miscellaneous Openings

1001. Companionways

1. Grouping into deckhouse and companionway

(1) A structure is regarded as a deckhouse where its inside is always accessible through access openings provided on the top of the structure or through under-deck passageways, even when all access openings in the boundary walls are closed
(2) A structure is regarded as a companionway where its inside is not accessible through any other way, when all access openings in the boundary walls are closed. ⚓

CHAPTER 3 BOW DOORS, SIDE AND STERN DOORS

Section 1 Bow Doors and Inner Doors

101. General

1. Application

(1) The following measures are to be complied with by all existing ro-ro passenger ships with the date of building before or on the 30th June 1996, including, when not differently deliberated by the competent flag Administrations, ships only engaged on domestic sea voyages.

(A) The structural condition of bow doors and inner doors, especially the primary structure, the securing and supporting arrangements and the hull structure alongside and above the doors, are to be specially examined and any defects rectified.

(B) The operating procedures of the bow door and inner door are to comply with the requirements of **Pt 4, Ch 3, 108.**

(C) The location and arrangement of inner doors are to comply with the applicable requirements of the **SOLAS** Convention and with **Pt 4, Ch 3, 101. 3.** (3) of the Rules.

(D) Ships with visor door are to comply with **Pt 4, Ch 3, 106. 2.** (7) requiring redundant provision of securing devices preventing the upward opening of the bow door. In addition, where the visor door is not self closing under external loads (i. e. the closing moment M_y calculated in accordance with **Pt 4, Ch 3, 103. 1.**(3)(A) is less than zero) then the opening moment M_0 is not to be taken less than $-M_y$. If drainage arrangements in the space between the inner and bow doors are not fitted, the value of M_0 is to be specially considered. Where available space above the tanktop does not enable the full application of **Pt 4, Ch 3, 106. 2.** (7), equivalent measures are to be taken to ensure that the door has positive means for being kept closed during seagoing operation.

(E) For visor doors, the securing and supporting device excluding the hinges to be capable of bearing the vertical design force ($F_z - 10W$), in kN, within the permissible stresses given in **Table 4.3.1** of the Rules.

(F) For side-opening doors, the structural arrangements for supporting vertical loads, including securing devices, supporting devices and, where applicable, hull structure above the door, are to be re-assessed in accordance with the applicable requirements of **Pt 4, Ch 3, 106.** and modified accordingly.

(G) The securing and locking arrangements for bow doors and inner doors which may lead to the flooding of a special category space or Ro-Ro cargo space as defined in the **Pt 4, Ch 3, 101. 4** of the rules, are to comply with the following requirements:

(a) Separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. It shall not be possible to turn off the indicator light.

(b) The indication panel on the navigation bridge is to be equipped with a mode selection function harbour / sea voyage, so arranged that audible alarm is given if the vessel leaves harbour with side shell or stern doors not closed or with any of the securing devices not in the correct position.

(c) A water leakage detection system with audible alarm and television surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of any leakage through the doors.

Section 2 Side Shell Doors and Stern Doors

201. General

1. Application

(1) The following measures are to be complied with by all existing ro-ro passenger ships with the date of building before or on the 30th June 1997, including, when not differently deliberated by the competent flag Administrations, ships only engaged on domestic sea voyages.

(A) The structural condition of side shell doors and stern doors, especially the primary structure, the securing and supporting arrangements and the hull structure alongside and above the doors, are to be specially examined and any defects rectified.
(B) The structural arrangement of securing devices and supporting devices of inwards opening doors in way of these securing devices and, where applicable, of the surrounding hull structure is to be reassessed in accordance with the applicable requirements of **Pt 4, Ch 3, 205.** and modified accordingly.
(C) The securing and locking arrangements for side and stern doors which may lead to the flooding of a special category space or Ro-Ro cargo space as defined in the **Pt 4, Ch 3, 101. 4** of the rules, are to comply with the following requirements:
 (a) Separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. It shall not be possible to turn off the indicator light.
 (b) The indication panel on the navigation bridge is to be equipped with a mode selection function harbour / sea voyage, so arranged that audible alarm is given if the vessel leaves harbour with side shell or stern doors not closed or with any of the securing devices not in the correct position.
 (c) A water leakage detection system with audible alarm and television surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of any leakage through the doors.
(D) Documented operating procedures for closing and securing side shell and stern doors are to be kept on board and posted at the appropriate places. ⚓

CHAPTER 4 BULWARKS, FREEING PORTS, SIDE SCUTTLES, RECTANGULAR WINDOWS, VENTILATORS AND PERMANENT GANGWAYS

Section 1 Bulwarks and Guardrails

101. Arrangements

1. The term "where deemed necessary by that Society" means when the ship is recognized adequate protection is equipped, the height of bulkwark may be more than 600 mm and may be provided with stormrail on the wall which is located with 1 m height in deckhouse on upperdeck.

106. Guardrails

1. At least every third stanchion shall be supported by a bracket or stay. In lieu of this, flat steel stanchions shall be of increased breadth as given in **Fig 4.4.1**, and aligned with member below deck unless the deck plating thickness exceeds 20 mm.

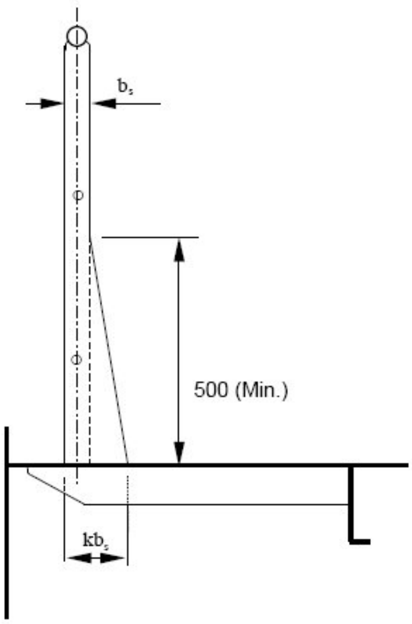

Fig 4.4.1 Guardrail stanchion of increased breadth

(1) At least every third stanchion : kbs = 2.9 bs
(2) At least every second stanchion : kbs = 2.4 bs
(3) Every stanchion : kbs = 1.9 bs
where, bs : breadth of normal stanchion according to the design standard.

2. Stanchions with increased breadth to be aligned with member below deck, min. 100 × 12 flat bar. The member below deck are to be welded to deck by double continuous fillet weld with leg size of min. 7 mm or as specified by the design standard.

3. In application of **106. 3.** of the Rules, wire ropes may only be accepted in lieu of guard rails in special circumstances and then only in limited lengths.

Section 2 Freeing Ports

201. General

1. The adequate provision for freeing the spaces which are open at either or both ends within superstructure referred to in **Ch 4, 201. 3** of the Rules is subject to the (1) through (3).

(1) The minimum freeing port area on each side of the ship for the open superstructure is not less than that obtained from the following formula.

$$A_s = \frac{A_1 b_0 h_s}{2 l_t h_w}\{1-(\frac{l_w}{l_t})\} \qquad (m^2)$$

Where,

A_1 = $0.7+0.035 l_t$ (m^2) l_t is not more than 20 m

= $0.07 l_t$ (m^2) l_t is more than 20 m

l_t : $l_w + l_s$ (m)

l_w : Where bulwark forms a well, the length of bulwark in well(m)

l_s : Length of the common space within the open superstructure(m)

b_0 : Breadth of the openings in the end bulkhead of the enclosed superstructure(m)

h_s : One standard superstructue height(m)

h_w : The distance of the well deck above the freeboard deck(m)

(2) The minimum freeing port area on each side of the ship for the open well is not less than that obtaibed fron the following formula.

$$A_w = \frac{A_2 h_s}{2 h_w} \qquad (m^2)$$

Where,

A_2 = $0.7+0.035 l_w + a$ (m^2) l_w is not more than 20 m

= $0.07 l_w + a$ (m^2) l_w is more than 20 m

a = $0.04 l_w (h-1.2)$ (m^2) h is moe than 1.2 m

= 0 h is not more than 1.2 m, but not less than 0.9 m

= $-0.04 l_w (0.9-h)$ (m^2) h is less than 0.9 m

h : Average height of bulwark above the deck (m)

(3) In ships either without sheer or with less sheer than the standard, the minimum freeing port area obtained from the above (1) and (2), is increased by multiply the factor obtained from **202. 2** of the Rules.

2. The requirements in **201. 4** of the Rules are applied to type A or B-100 ships with specially reduced freeboards.

3. The requirements in **202. 4** of the Rules are applied to type A or B-100 ships with specially reduced freeboard having trunks.

202. Freeing port area

1. A flush-decker having an effective deckhouse is to be considered to have two wells afore and abaft the deckhouse, and each of these wells is required to have freeing port area as prescribed in **202.** of the Rules. The term "effective deckhouse" means a structure having a breadth not less than 80 % of the breadth of ship and the width of passageways at its sides does not exceed 1.5 m.

2. Where a divisional bulkhead extending from side to side is provided at the forward end of deckhouse, the ship is to be considered to have two wells afore and abaft the bulkhead, irrespective of the breadth of deckhouse, and each of these wells is required to have the freeing port area as prescribed in **202.** of the Rules.

3. In ships which correspond to the requirements **201. 2**, the guardrails installed at both sides for more than half of the length of the exposed parts of the freeboard deck, and in ships which correspond to the requirements in **201. 3**, the guardrails installed at both sides for more than half of the length of trunks on the freeboard deck may be replaced by freeing ports of a total area not less than 33 % of the total area of bulwark in the lower parts of bulwarks.

4. In type B-60 ships, freeing ports in the lower parts of bulwarks are to have an area not less than 25 % of the total area of bulwark.

5. Where freeing ports are fitted with rails, etc., projected area of them is to be excluded from actual freeing port area in calculations.

6. Where set-in structure of side shell or superstructure from a well in pure car carrier, etc., adequate freeing ports are to be provided in accordance with the requirements of **202. 3** of the Rules.

7.

(1) The case where a ship is provided with a trunk or a hatch side coaming which is continuous or substantially continuous between detached superstructure specified in **202. 3** of the Rules means the case where F_0 is equal to, or less than F_1, where F_0 and F_1 are shown in the following.

F_0 : Free flow area through which water runs across the deck given by the following formula(m^2)

$$\Sigma(l_i h_i - a_i)$$

Where,

l_i : Distance between hatchways, and between hatchways and superstructures and deckhouse(m)

h_i : Height of bulwarks(m)

a_i : Projected area of structure which prevent free flow in $l_i \cdot h_i$.

F_1 : As specified in **202. 1** and **2** of the Rules.(m^2)

(2) Where F_0 is greater than F_1, but not greater than F_2, freeing port area (F) is increased by the following formula with the value obtained from **202. 1.** and **2.** of the Rules.
F_0 and F_1 are shown in the above (1), F_2 is specified in **202. 3** of the Rules.

$$F = F_1 + F_2 - F_0 \ (\text{m}^2)$$

(3) Where F_0 is greater than F_2, F is equal to F_1.

204. Arrangement of freeing ports

1. In ships having very small shear or without shear, the area of freeing ports is to be distributed throughout the whole length of the well.

2. Specially, for the ships having reduces freeboard, freeing ports having not less than 25 % of total area of bulwarks is to be provided in lower part of bulwarks.

205. Structure

In case fishing vessels etc. which are accepted to this Society are fitted securing and locking devices, its structure are to be of an approved one.

Section 3 Side Scuttles, Rectangular Windows and Skylights

301. General Application

1. With respect to the provisions of **Ch 4, 301.** of the rules, the term as deemed as appropriate by the Society means that the side scuttles and rectangular windows is to be in conformity corresponding to the position and to have appropriate weathertightness.

2. With respect to the provisions of **Ch 4, 301.** and **302.** of the rules, windows on a navigation bridge within the third tiers above the freeboard deck, which is granted to be of rectangular window in accordance with the provisions of **306.** of the rules, may be of rectangular window other than of class E or F subject to the following (1) and (2)

(1) The navigation bridge is to be separated from spaces below the freeboard deck and spaces within superstructures by the following

(A) Weathertightness closing devices

(B) Two or more cabin bulkheads or doors. In such case, the height of sills of the doorway to the navigation bridge are not to be less than those required for closing devices at the position of such doorway.

(2) The design pressure of such windows is not to be less than the value specified in **308.** of the rules and construction of frames, etc. for such windows is to be in conformity to those required for the class E, F rectangular window corresponding to the position of such windows and to have appropriate weathertightness.

303. Application of side scuttle

The wording as deemed as appropriate by the Society in **303. 5.** of the rules means that the side scuttles may be class A or class B side scuttles without deadlight.

305. Design pressure and maximum allowable pressure of side scuttle.

With respect to provisions of **305. 1.** of the rules, the value of coefficient "a" for the side scuttles for spaces below the freeboard deck or spaces within the superstructures may be determined in applying the provisions of **Pt 3, Ch 17, 201.** of the rules as the first tier deckhouse.

307. Application of rectangular window

The wording as deemed as appropriate by the Society in **307. 3.** of the rules means that the rectangular windows may be rectangular windows without shutter or deadlight.

Section 5 Permanent Gangways

501. General

1. Protection of crew provided in exposed freeboard deck, superstructure deck, crew accommodation area and machinery space and other area locations in question is to be in accordance with **Table 4.4.1.**

Table 4.4.1 Protection of crew

</table>

Table 4.4.1 Protection of crew(continue)

1. A_f^* and H_s^{**} is to be as following.
   A_f^* : The minimum summer freeboard calculated as Type A ship regardless of the type freeboard actually assigned.
   H_s^{**} : the standard height of superstructure as defined in **ICLL Regulation 33.**
2. Protection methods are to be as following (a) to (f)
   (a) A well lighted and ventilated under-deck passageway (clear opening 0.8 m wide, 2.0 m high) as close as practicable to the freeboard deck, connecting and providing access to the locations in question.
   (b) A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the center line of the ship, providing a continuous platform at least 0.6 m in width and a non-slip surface, with guard rails extending on each side throughout its length. Guard rails shall be at least 1 m high with courses as required in Load Line Regulation 25(3), and supported by stanchions spaced not more than 1.5 m ; a foot-stop shall be provided.
   (c) A permanent walkway at least 0.6 m in width fitted at freeboard deck level consisting of two rows of guard rails with stanchions spaced not more than 3 m. The number of courses of rails and their spacing are to be as required by Regulation 25(3). On Type B ships, hatchway coamings not less than 0.6 m in height may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.
   (d) A 10 mm minimum diameter wire rope lifeline supported by stanchions about 10 m apart, or A single hand rail or wire rope attached to hatch coamings, continued and adequately supported between hatchways.
   (e) A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the center line of the ship:
   - located so as not to hinder easy access across the working areas of the deck;
   - providing a continuous platform at least 1.0 m in width;
   - constructed of fire resistant and non-slip material;
   - fitted with guard rails extending on each side throughout its length; guard rails should be at least high with courses as required by Regulation 25(3) and supported by stanchions spaced not more than 1.5 m;
   - provided with a foot stop on each side;
   - having openings, with ladders where appropriate, to and from the deck. Openings should not be more than 40 m apart;
   - having shelters of substantial construction set in way of the gangway at intervals not exceeding 45 m if the length of the exposed deck to be traversed exceeds 70 m. Every such shelter should be capable of accommodating at least one person and be so constructed as to afford weather protection on the forward, port and starboard sides.
   (f) A permanent and efficiently constructed walkway fitted at freeboard deck level on or as near as practicable to the center line of the ship having the same specifications as those for a permanent gangway listed in (e) except for foot-stops. On Type B ships (certified for the carriage of liquids in bulk), with a combined height of hatch coaming and fitted hatch cover of together not less than 1 m in height the hatchway coamings may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.
3. Alternative transverse locations for (c),(d) and (f) above, where appropriate:
   (1) At or near center line of ship; or Fitted on hatchways at or near center line of ship.
   (2) Fitted on each side of the ship.
   (3) Fitted on one side of the ship, provision being made for fitting on either side.
   (4) Fitted on one side only.
   (5) Fitted on each side of the hatchways as near to the center line as practicable

2. Where the access way(gangway, walkway may be included in access way) is provided, it is to be complied with the followings.
   (1) Wire rope may only be accepted in lieu of guard rails in special circumstances and then only in limited length.
   (2) In all cases where wire ropes are fitted, adequate devices are to be provided to ensure their tautness.
   (3) Lengths of chain may only be accepted in lieu of guard rails if fitted between two fixed stanchions.

(4) Where stanchions are fitted, every 3rd stanchion is to be supported by a bracket or stay.
(5) Removable or hinged stanchions shall be capable of being locked in the upright position.
(6) A means of passage over obstructions. if any, such as pipes or other fittings of permanent nature should be provided.
(7) Generally, the width of gangway or deck-level walkway should not exceed 1.5 m.

3. For oil tankers, chemical tankers and gas carriers constructed before 1st July 1998, existing arrangements which complied with (b) or (c) may be accepted in lieu of (e) or (f) provided such existing arrangements are fitted with shelters and means of access to and from the deck as required for the arrangements (e) or (f) as defined in **Table 4.4.1.**

4. For tankers less than 100 m in length (L_f), the minimum width of the gangway platform or deck level walkway fitted in accordance with arrangements (e) or (f), respectively, may be reduced to 0.6 m. ⚓

CHAPTER 7 CEMENTING AND PAINTING

Section 2 Painting

201. General

1. Limitation of using aluminium paint

In ships carrying oil of a flash point not exceeding 60°C chemical carrier, paints containing aluminium must not be used in cargo oil tanks, pump rooms, cofferdams, cargo tank deck area, or any other area where cargo vapour may accumulate, except that the paint concerned have been proven by tests to have no nature of increasing the danger of ignition which may lead to explosions.

Aluminized pipes may be permitted in hazardous areas on open deck provided they are protected from accidental impact, and in inerted cargo tanks and ballast tanks.

2. Special requirements

The cases that "Special requirements may be additionally made by the Society" stated in **Pt 4, Ch 7, 201.** of the Rules are as follows.

(1) The requirements **Pt 7, Ch 3, 107.** of the Rules
(2) The requirements **Pt 3, Ch 1, 803.** of the Rules

3. Omission of painting

In accordance with **Pt 4, Ch 7, 201.** of the Rules, the cases that painting may be omitted are as follows.

(1) Where ships are applied the requirements **Pt 7, Ch 3** of the Rules and their cargoes are intended to be regularly handled by grabs or similar mechanical appliances, painting for cargo holds may be omitted subject to the following (A) and (B)
  (A) Omission of painting is to be limited to those members such as inner bottom plates, slant plates of bilge hoper tanks and slant plates of lower stool transverse bulkheads whose thickness is increased in accordance with the requirements **Pt 7, Ch 3, 304. 2** and **3, 302. 2** or **502. 1** of the Rules. However, omission of painting is not accepted for areas within the extent of painting prescribed in above mentioned **2.**
  (B) The reason and area of omission of painting are to be prescribed in the plans submitted for the approval (for example : Midship Section, etc.)
(2) Where ships are specified in (1) above and intended to carry exclusively chips of wood, the area which are expected to be effectively protected against corrosion of steel by the secretion of chips of wood(the area except where has normally no touch with the cargoes such as inside of upper deck) may be added to the area of omission of painting specified in above item (1) (B) notwithstanding the requirements of the above item **2** (1). The salt beaten structural members in cargo holds used as ballast water tanks is to be thicker by 1.0 mm than the requirements of **Pt 7, Ch 3** of the Rules. However, those which are in cargo holds used as ballast water tanks only in port need not be thicker.
(3) Where tanks are exclusively loaded oils, painting for inside of them may be omitted in spite of kind of ships. ⚓

CHAPTER 8 EQUIPMENT NUMBER AND EQUIPMENT

Section 1 General

101. General and application

1. Consideration for restricted navigation area

(1) Ships assigned with class notation "Smooth water service" may be provided the equipment in accordance with the equipment letter of equipment number which is one grade lower class of equipment letter.

(2) In case of the above (1), the provisions of the used material may not be considered.

2. Due to be assigned scantling draft(d_s), if draft(d_f) for designed ship and draft assigning is smaller than designed draft(d), equipment number and equipment are to be as follows:

(1) For scantling draft(d_s), equipment number and equipment corresponded with scantling draft (d_s) is to be equipped. In this case, if $d_s - d$ is not less than 300 mm, ship length (L_s) corresponded with d_s is to be used.

(2) If d_f is not less than d (for ship assigned d_s, $d_f > d_s$), equipment number and equipment are to be decided by the scantling which is corresponded with d_f. If $d_f - d$ is not less than 300 mm, equipment number is to be calculated with ship length which is corresponded with d_f

3. Superstructure which is not regarded as a deckhouse due to strength

Even though superstructure is not regarded as a deckhouse due to strength, if side wall is extended to side shell and deck is provided, it may be regarded as a superstructure. However, for the superstructure having unusually short end parts of deckhouse may be regarded as a deckhouse.

Section 2 Equipment Number

201. Equipment number

1. The equipment number of tug boat is to be following formula;

$$E = \Delta^{\frac{2}{3}} + 2(B \times f + \Sigma bh) + 0.1A$$

b = maximum breadth of superstructure or deck house at each floor(m)

h = each height of superstructure having breadth greater than $B/4$ or each deckhouse(m).

2. Significant figures

(1) The scantling unit(m) of length, height, breadth has two significant figures and third figure is raised to a unit.

(2) Δ has a only positive number.

(3) Each item of formula

($\Delta^{\frac{2}{3}}, 2.0Bh, 0.1A$) has a only positive number with raising to unit from first figure.

3. Δ, f

(1) The values of Δ, f is to be in accordance with designed summer load line. However, ships assigned scantling draft d_s use the value d_s.

(2) When the principle dimensions(L, B and D) is changed (for example, L is changed when $d_f - d$ is greater than 300 mm), equipment number may be recalculated.

(3) When draft is changed, it is in accordance with the regulation **101. 2** of this chapter.

4. Extents of structures to be included in the second term ($2.0Bh$) of formula

(1) The following items are to be included into the calculation of h'.

(A) superstructures

(B) deckhouses having a breadth greater than $B/4$

(C) screens or bulwarks higher than 1.5 m and in continuation to deckhouse, the total breadth of which exceeds $B/4$ (See **Fig 4.8.4**)

(2) The structures specified in (1) above are to be treated as divided at the intermediate deck into the upper and lower structures, the breadths of which are to be measured as respective tiers.

5. Measurement of breadth of superstructures

(1) A continuous superstructure or deck-house situated on one tier is to be treated as a single structure irrespective of the mode of variation of their breadth and height-continuous or discontinuous, and the breadth is to be the largest one as shown in **Fig 4.8.1.**

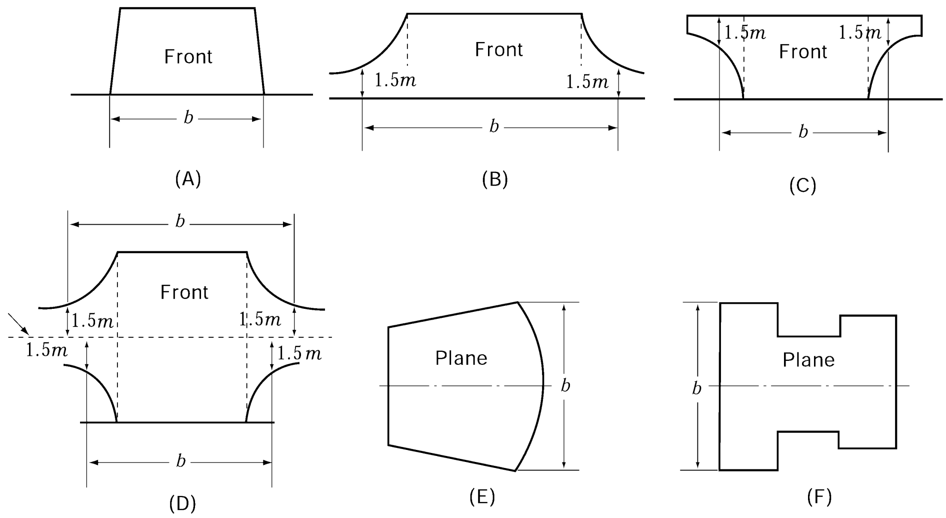

Fig 4.8.1

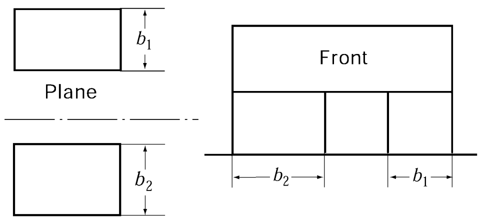
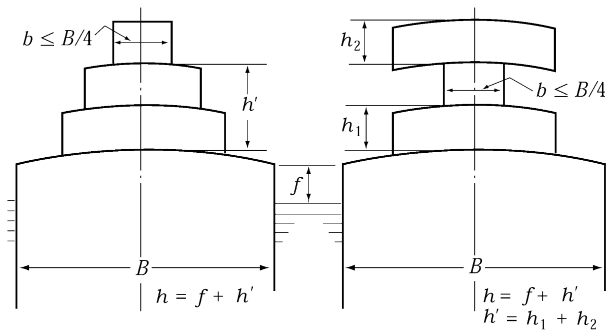


When b_1, $b_2 < B/4$ (regardless of b_1+b_2), it is not included.

Fig 4.8.2



f is to be measured from transverse section of ship

Fig 4.8.3

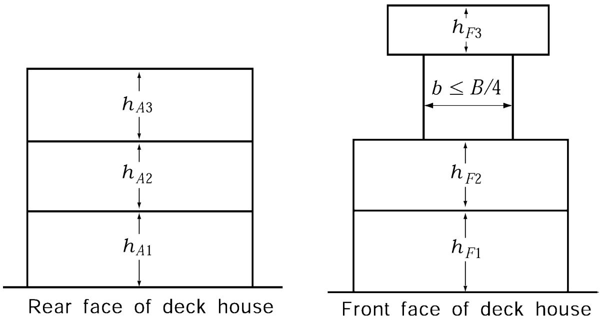
(2) As for detached independent deck-houses on one tier, breadths of respective deckhouses are to be measured separately to determine whether they should be included or not. (See **Fig 4.8.2**)

6. Measurement of heights(h') of structures

(1) h' is to be the height at the ship centreline and is to be measured as shown in **Fig 4.8.3.**

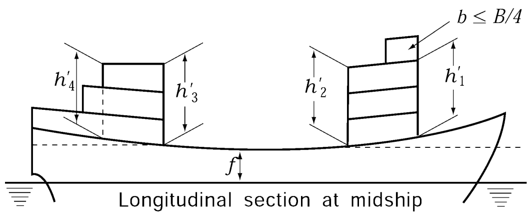
(2) Where there are detached structures, h' is to be determined for respective structures independently and the maximum value is to be taken as the height. (See **Fig 4.8.4**)

(3) Where the between deck height varies longitudinally, h' is to be the maximum value measured from the uppermost continuous deck in the longitudinal section along the ship centreline (See **Fig 4.8.5**)



$h' = h_{A1} + h_{A2} + h_{A3}$ / $h_{F1} + h_{F2} + h_{F3}$ whichever is greater

Fig 4.8.4



$h = f + h'$
h' : h'_1, h'_2, h'_3 and h'_4 whichever is greater

Fig 4.8.5

7. Extents of structures to be included in the third term (0.1A) of the formula.

(1) The following items are to be included in $\Sigma h'' l$.
 (A) Superstructures
 (B) Deckhouses and trunks having breadth exceeding $B/4$ and heights exceeding 1.5 m (See the above item **5**, as to measurement of breadth)
 (C) Screens and bulwarks higher than 1.5 m in continuation to superstructure or to deck- houses having breadth exceeding $B/4$ (See **Fig 4.8.7**)
 (D) The following items may be excluded from the calculation of $\Sigma h'' l$
  (a) portions outside the fore and aft ends of L
  (b) derrick posts, ventilators, etc. in continuation to superstructures or deckhouses
  (c) hatch coamings and hatch covers
  (d) funnels
  (e) cargoes on decks
(2) The structures specified in (1) above are to be treated as divided into the upper and lower structures at the intermediate deck, and the values of $\Sigma h'' l$ are to be calculated for respective tiers.

8. Measurement of length of structures

(1) A continuous superstructure or deck house situated on one tier to be treated as a single superstructure or deckhouse even when its breadth and/or height vary discontinuously. The length is to be the maximum extreme length of the structure. However, where the height is changeable of deckhouse, the end parts or deckhouse having less than 1.5 m height to the middle of deckhouse height may be neglected.(See **Fig 4.8.6**)
(2) Bulwarks in continuation to superstructures or deckhouses are to be treated in a the same manner as (1) above. (See **Fig 4.8.7**)

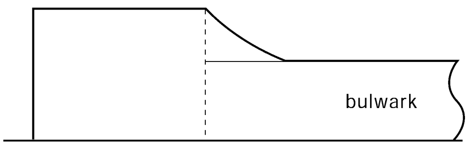


Fig 4.8.7

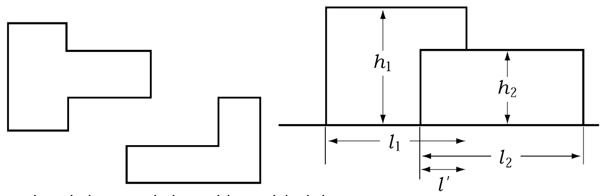

It is restricted that each breadth and height of deck house is over $B/4$ and 1.5 m.

$h'' l = h_1 l_1 + h_2 (l_2 - l')$

Fig 4.8.9

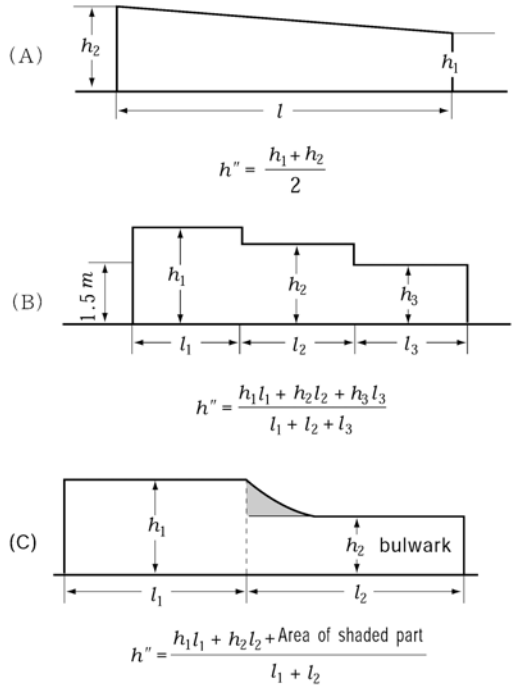

Fig 4.8.8

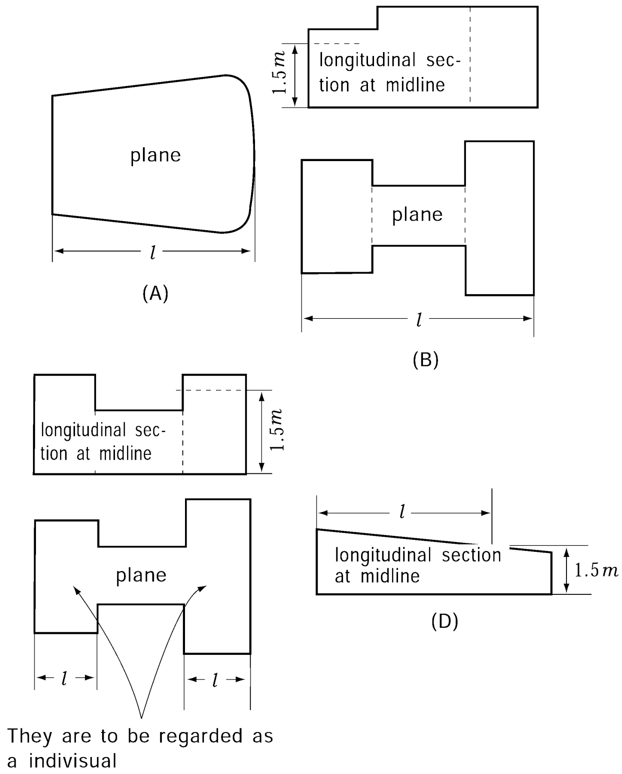

Fig 4.8.6

9. Measurement length to height(h'') of structures

(1) The height of structures (h'') covering the ship's centreline, such as super structures, deckhouse, etc. is to be the between deck height of respective tiers of structure at the centreline.

(2) Where the deck height varies longitudinally, h'' is to be determined as shown in **Fig 4.8.8.**

(3) The height of structures not covering the ship's centreline is to be measured at the side facing to the centreline.

10. Where structure stand side by side

(1) Where two or more deckhouse stand side by side transversely, $h''l$ may be the projected plane of longitudinal section. (See **Fig 4.8.9**)

(2) Screens and bulwark are to be treated in a same manner as (1) above.

11. Calculation $h''l$ of pressured LPG tanks

The $h''l$ of the upper portions of LPG tanks above the upper deck which is included into $h''l$ according to above **8.** is to be the projected area on the longitudinal section along the ship's centreline.

203. Chain cables and stream lines

1. Steel wire rope instead of stud link chain cable may be accepted for vessels of special design or operation such as crane barges if recognized by the Society. The acceptance will be based on a case-by-case evaluation, including consideration of operational and safety aspects. If steel wire rope is accepted, the following to be fulfilled.

(1) The steel wire rope shall have at least the same breaking strength as the stud link chain cable.

(2) The length of the steel wire rope shall be at least 50 % above the table value for the chain cable.

(3) The anchor weight shall be increased by 25 %.

(4) A length of chain cable shall be fitted between the anchor and the steel wire rope. The length shall be taken as the smaller of the follows.

(A) 12.5 m
(B) The distance between the anchor in stowed position and the winch

2. The Society may consider the acceptance if the effect of mooring equipment for operating condition is equivalent to the Rules to the satisfaction to the Society.

Section 3 Anchors

304. Constructions and dimensions

In the Rules, "holding power indicated by the Society" means 2 times of holding power to stockless anchor having same mass in case of high holding power anchors and 4 times of holding power to stockless anchor having same mass in case of super high holding power anchors by the results of holding power test by the type approval tests in **Ch 3, Sec 6** of the ″**Guidance for Approval of Manufacturing Process and Type Approval, etc.**″

Section 4 Chains

401. Application

1. "Chafing chain for Emergency Towing Arrangements (ETA)" specified in **Pt 4, Ch 8, 401. 2** of the Rules are as follows.

(1) Scope
These requirements apply to the chafing chain for chafing gear of two types of Emergency Towing Arrangements (ETA) with specified safe working load (SWL) of 1,000kN (ETA1000) and 2,000kN (ETA2000). Chafing chains other than those specified can be used subject to special agreement with the Society.

(2) Approval of manufacturing
The chafing chain is to be manufactured by works approved by the Society.

(3) Materials
The materials used for the manufacture of the chafing chain are to satisfy the requirements in **403.** of the Rules.

(4) Design, manufacture, testing and certification of chafing chain

(A) The chafing chain is to be designed, manufactured, tested and certified in accordance with the requirements in **Pt 4, Ch 8, Sec 4** of the Rules.

(B) The arrangement at the end connected to the strongpoint and the dimensions of the chafing chain are determined by the type of ETA. The other end of the chafing chain is to be fitted with a pear-shaped open link allowing connection to a shackle corresponding to the type of ETA and chain cable grade. A typical arrangement of this chain end is shown in **Fig 4.8.10.**

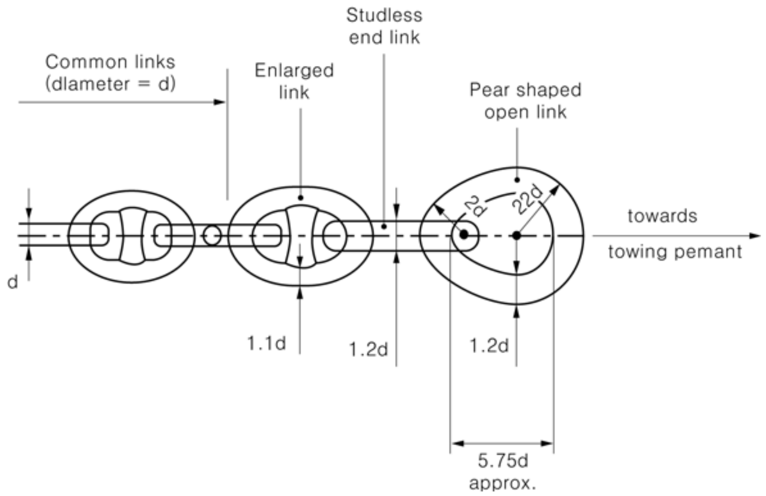

Fig 4.8.10 Typical outboard chafing chain end

(C) The common link is to be of stud link type grade 2 or 3.
(D) The chafing chain is to be able to withstand a breaking load not less than twice the SWL. For each type of ETA, the nominal diameter of common link for chafing chains is to comply with the value indicated in **Table 4.8.1.**

Table 4.8.1. Nominal diameter of common link for chafing chains

Type of ETA	Nominal diameter of common link, d min.	
	Grade 2	Grade 3
ETA1000	62mm	52mm
ETA2000	90mm	76mm

2. "The Offshore mooring chains deemed appropriate by the Society" specified in **Pt 4, Ch 8, 401. 2** of the Rules are as follows.

(1) Application
Offshore mooring chains (hereinafter referred to as "offshore chain") and shackles and swivels which are connected to the offshore chain (hereinafter referred to as "accessories for offshore chain") are to comply with these requirements or to be of equivalent quality. Where, offshore structure mean mobile offshore unit, fixed offshore structure and work vessel.

(2) General
(A) Offshore chains are to be manufactured in continuous length by flash butt welding and are to be heat treated in a continuous furnace.
(B) The connecting common links may be used in order to replace defective links which does not comply with tests and examinations required by these requirements. However, the use of connecting common links is restricted to 3 links in each 100 m of offshore chain.
(C) Notwithstanding the requirement of (B), the joining shackles may be used in order to replace defective links which does not comply with tests and examinations required by this Section. In this case, Number and type of joining shackles used are to be subject to the approval of the Society.

(3) Kinds of offshore chains
Depending on the nominal tensile strength of the steels used for manufacture, chains are to be subdivided into five grades, i.e.: *R* 3, *R* 3S, *R* 4, *R* 4S and *R* 5.

(4) Materials
(A) Offshore chains are to be made of the materials given in **Table 4.8.2** according to their grades and manufacturing processes, respectively.

Table 4.8.2 Materials for offshore chain link

Kind of offshore chain	Materials	Grade of material
Grade *R* 3	Grade *R* 3 offshore chain bar	*RSBCR* 3
Grade *R* 3S	Grade *R* 3S offshore chain bar	*RSBCR* 3S
Grade *R* 4	Grade *R* 4 offshore chain bar	*RSBCR* 4
Grade *R* 4S	Grade *R* 4S offshore chain bar	*RSBCR* 4S
Grade *R* 5	Grade *R* 5 offshore chain bar	*RSBCR* 5

(B) The studs are to be made of steel whose the carbon content is in general less than 0.25 %. If the studs are welded in place however, the studs may be made of steel bars corresponding to that of the offshore chain or of equivalent thereto considered by the Society.
(C) Accessories for offshore chains are to be made of the materials given in **Table 4.8.3** corresponding to the grades of the connected offshore chain.

Table 4.8.3 Materials for accessories of offshore chains

Kind of connected offshore chain	Manufacturing process			
	Casting	Grade of material	Forging	Grade of material
Grade *R* 3	Grade *R* 3 steel casting	*RSCCR* 3	Grade *R* 3 steel forging	*RSFCR* 3
Grade *R* 3S	Grade *R* 3S steel casting	*RSCCR* 3S	Grade *R* 3S steel forging	*RSFCR* 3S
Grade *R* 4	Grade *R* 4 steel casting	*RSCCR* 4	Grade *R* 4 steel forging	*RSFCR* 4
Grade *R* 4S	Grade *R* 4S steel casting	*RSCCR* 4S	Grade *R* 4S steel forging	*RSFCR* 4S
Grade *R* 5	Grade *R* 5 steel casting	*RSCCR* 5	Grade *R* 5 steel forging	*RSFCR* 5

(5) Processes of manufacture
(A) The manufacturers of offshore chains including connecting common links are to obtain approval of the Society in advance concerning their manufacturing methods.
(B) Records of bar heating, flash welding and heat treatment shall be made available for inspection by the Surveyor.
(C) For electric resistance heating, the heating phase shall be controlled by an optical heat sensor. For furnace heating, the heat shall be controlled and the temperature continuously recorded using thermocouples in close proximity to the bars. The controller shall be checked at least once every 8 hours and records made.
(D) The following welding parameters shall be controlled during flash welding of each link and the controls shall be checked at least every 4 hours and records made.
(a) Platen motion
(b) Current as a function of time
(c) Hydraulic pressure
(E) In cases where the studs for Grade *R*3 offshore chains and Grade *R*3S offshore chains are welded, they are to comply with following (a) to (d):
(a) Both ends of the stud are to be a good fit into the link and are not to be fitted on the flash butt weld of the link as far as practicable, and the full periphery of the stud end is to be welded. Welding of both ends of the stud is not permitted unless specially approved by the Society.
(b) Welding position is to be as flat as possible.
(c) All welds are to be carried out before the final heat treatment of offshore chains
(d) The welds are to be made by qualified welders using an approved procedure and low-hydrogen approved consumables.
(F) Welding of studs in Grade *R* 4 offshore chain, Grade R4S offshore chain and Grade *R*5 offshore chain is not permitted unless specially approved by the Society.
(G) Accessories of offshore chains are to be made by casting or forging. Their manufacturers are to obtain approval by the Society in advance concerning their manufacturing methods.
(H) Connecting common links are to comply with following (a) to (d):
(a) Single links to substitute for test links or defective links without the necessity for re-heat treatment of the whole length are to be made in accordance with an approved procedure. Separate approvals are required for each grade of chain and the tests are to be made on the maximum size of chain for which approval is sought.
(b) Manufacture and heat treatment of connecting common link is not to affect the properties of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C. However, an alternative procedure may be applied to this joining method where specially approved by the Society.
(c) Each link is to be subjected to the appropriate proof load and non-destructive examination.
(d) Each connecting common link is to be marked on the stud in accordance with **401. 2**

(16) plus a unique number for the link. The adjoining links are also to be marked on the studs.

(6) Manufacturers

Manufacturers which manufacturer the offshore chains and accessories of them are to obtain approval by the Society

(7) Heat treatment

(A) Offshore chains are to be heat treated as normalized, normalized and tempered or quenched and tempered in a continuous furnace. In principle, batch heat treatment is not permitted. Where length of offshore chains is shorter than 55 m and the heat treatment can be conducted for whole of them at the same time, batch heat treatment may be permitted.

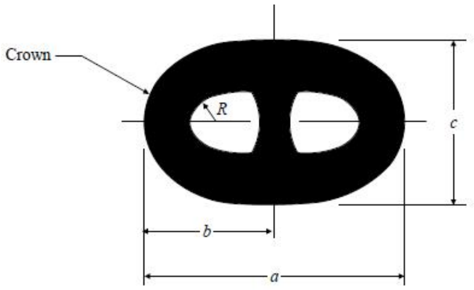
(B) Accessories of offshore chains are to be heat treated as normalized, normalized and tempered or quenched and tempered.

(C) Temperature and time or temperature and chain speed shall be controlled and continuously recorded.

(8) Dimension and forms

(A) The standard dimensions and forms of each kind of link and accessory are to be as given in **Fig 4.8.11**

Stud link - The internal link radii (R) and external radii should be uniform



Designation(1)	Description	Nominal Dimension of the Link	Minus Tolerance	Plus Tolerance
a	Link Length	$6d$	$0.15d$	$0.15d$
b	Link Half Length	$a^*/2$	$0.1d$	$0.1d$
c	Link Width	$3.6d$	$0.09d$	$0.09d$
e	Stud Angular Misalignment	0 degrees	4 degrees	4 degrees
R	Inner Radius	$0.65d$	0	-----

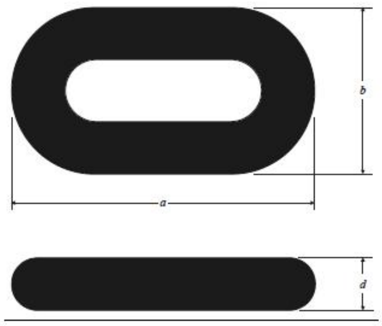
Notes:

(1) Dimension designation is shown in above figure.

d = Nominal diameter of chain

a^* = Actual link length

Studless - The internal link radii (R) and external radii should be uniform.



Designation(1)	Description	Nominal Dimension of the Link	Minus Tolerance	Plus Tolerance
a	Link Length	$6d$	$0.15d$	$0.15d$
b	Link Width	$3.35d$	$0.09d$	$0.09d$
R	Inner Radius	$0.65d$	0	-----

Notes:
(1) Dimension designation is shown in above figure.
d = Nominal diameter of chain
(2) Other dimension ratios are subject to special approval.

Fig 4.8.11 Stud link and studless common link, proportions dimensions and tolerances

(B) The nominal diameter of offshore chains is to be denoted by the diameter at the crown of the common link.
(C) Every kind of link and accessories is to be of uniform shape and their bent portions are to be sufficient to allow each link to work smoothly.
(D) Drawings showing the detailed design of the stud shall be submitted for information. The stud shall give an impression in the chain link which is sufficiently deep to secure the position of the stud, but the combined effect of shape and depth of the impression shall not cause any harmful notch effect or stress concentration in the chain link.
(E) Machining of Kenter shackles shall result in fillet radius min. 3 % of nominal diameter.

(9) Dimensional tolerances
(A) The dimensions of offshore chains are to be measured at least 5 % of all links after the execution of a proof test. If link diameter, length, width and stud alignment do not conform to the required dimensions, these shall be compared to the dimensions of 40 more links; 20 on each side of the affected link. If a single particular dimension fails to meet the required dimensional tolerance in more than 2 of the sample links, all links shall be examined.
(B) The tolerances of following (a) to (e) are to be applied to links
(a) The negative tolerance for nominal diameter measured at the crown is to be complied with the requirements in accordance with the nominal diameter as given in **Table 4.8.7** of the Rules. The plus tolerance may be up to 5 % of the nominal diameter. The cross sectional area of the crown is to be no negative tolerance.
(b) The diameter measured at locations other than the crown is to have no negative tolerance. The plus tolerance may be up to 5% of the nominal diameter.
(c) The plus tolerance of the diameter measured at the flash butt weld is to be left to the discretion of the Society.
(d) All other dimensions except (a) to (c) are subjected to a manufacturing tolerances of ± 2.5 %, provided always that all parts fit together properly.
(e) Tolerances with regard to the location of stud set are to comply with the requirements in **Pt 4, Ch 8, 401. 1** (5) of the Rules.
(C) For all offshore chain, a length of 5 common links which are connected is to be measured. The measurement of a length of 5 links are to be carried out in accordance with the following procedures while the offshore chain is loaded to 5~10 % of the minimum proof load.
(a) The first five links is to be measured
(b) The next set of five links, at least two links from the previous five links are to be included, is to be measured.
(c) The measurement procedure specified in (B) is to be followed for the entire offshore chain length.
(d) The five links held in the end blocks may be excluded from this measurement.
(D) The allowable manufacturing tolerance on a length of five links by measuring procedure specified in (C) is to comply with the requirements as given in **Table 4.8.4**. The allowable manufacturing tolerance on a length of five links is + 2.5 %, but may not be negative.
(E) If a length of five links is shorter than allowable value, offshore chain may be stretched by tensile loading. In this case, however, tensile load is not to exceed 110 % of minimum proof load required.
(F) If links are found to be defective or not to meet the dimensional tolerance requirement

specified in (A), defective links may be cut off and a connecting common link or joining shackle inserted in their place. In this case, proof tests are to be carried out again after insertion of a connecting common link or a joining shackle, and dimensions of a connecting common link or a joining shackle are to be measured.

(G) At least one accessory (of the same type, size and nominal strength) out of 25 is to be measured for dimensions after proof load testing. Dimensions are subjected to a manufacturing tolerance of the following (a) and (b). These tolerances do not apply to machined surface.

(a) The tolerance of the nominal diameter is to be equal +5 % but may not be negative.

(b) Other dimensions are subjected to a manufacturing tolerance of ±2.5 %.

(10) Testing and inspection of finished chain and accessaries

(A) All chain and accessaries are to be subjected to proof load tests, break load tests and mechanical tests after final heat treatment in the presence of a Surveyor. Where the manufacturer has a procedure to record proof loads and the Surveyor is satisfied with the adequacy of the recording system, he need not witness all proof load tests.

(B) The Surveyor is to satisfy himself that the testing machines are calibrated and maintained in a satisfactory condition.

(C) Prior to test and inspection the chain is to be free from scale, paint or other coating. The chain shall be sand- or shot blasted to meet this requirement.

(D) Mass The mass of offshore chains is to comply with the standard mass given in **Table 4.8.4,** in accordance with their kind, and to be measured after the execution of proof tests.

Table 4.8.4 Breaking and proof test loads, mass and length over 5 links for offshore chains

Test Load	Grade $R3$ Stud Link	Grade $R3S$ Stud Link	Grade $R4$ Stud Link	Grade $R4S$ Stud Link	Grade $R5$ Stud Link
Proof test load (kN)	$0.0148d^2(44\text{-}0.08d)$	$0.0180d^2(44\text{-}0.08d)$	$0.0216d^2(44\text{-}0.08d)$	$0.0240d^2(44\text{-}0.08d)$	$0.0251d^2(44\text{-}0.08d)$
Breaking test load (kN)	$0.0223d^2(44\text{-}0.08d)$	$0.0249d^2(44\text{-}0.08d)$	$0.0274d^2(44\text{-}0.08d)$	$0.0304d^2(44\text{-}0.08d)$	$0.0320d^2(44\text{-}0.08d)$
Test Load	Grade $R3$ Studless	Grade $R3S$ Studless	Grade $R4$ Studless	Grade $R4S$ Studless	Grade $R5$ Studless
Proof test load (kN)	$0.0148d^2(44\text{-}0.08d)$	$0.0174d^2(44\text{-}0.08d)$	$0.0192d^2(44\text{-}0.08d)$	$0.0213d^2(44\text{-}0.08d)$	$0.0223d^2(44\text{-}0.08d)$
Breaking test load (kN)	$0.0223d^2(44\text{-}0.08d)$	$0.0249d^2(44\text{-}0.08d)$	$0.0274d^2(44\text{-}0.08d)$	$0.0304d^2(44\text{-}0.08d)$	$0.0320d^2(44\text{-}0.08d)$
Chain Weight (kg/m)	Stud Link = $0.0219d^2$				
	Studless chain Weight calculations for each design are to be submitted.				
Length over 5 links (mm)	over 22d up to $22.55d$				

(11) Breaking test

(A) The breaking test for offshore chain is to be carried out by the following procedures after final heat treatment.

(a) A breaking test specimen consisting of at least 3 links is to be either taken from the offshore chain or produced at the same time and in the same manner as the offshore chain.

(b) The breaking test frequency is to be based on tests at sampling intervals according to **Table 4.8.5** corresponding to its nominal diameter provided that every cast is represented.

Table 4.8.5 Number of breaking test

Nominal diameter of offshore chain d(mm)	Maximum sampling interval(m)
$d \leq 48$	91
$48 < d \leq 60$	110
$60 < d \leq 73$	131
$73 < d \leq 85$	152
$85 < d \leq 98$	175
$98 < d \leq 111$	198
$111 < d \leq 124$	222
$124 < d \leq 137$	250
$137 < d \leq 149$	274
$149 < d \leq 162$	297
$162 < d \leq 175$	322
$175 < d \leq 186$	346
$186 < d \leq 199$	370
$199 < d \leq 210$	395

(c) Each specimen shall be capable of withstanding the break load specified in **Table 4.8.4** without fracture and shall not crack in the flash weld. It shall be considered acceptable if the specimen is loaded to the specified value and maintained at that load for 30 seconds.

(d) Where the alternative test is carried out in lieu of the testing test due to the shortage of capacity of testing machine does not reach the breaking test loads specified in **Table 4.8.4,** the following (a) and (b) are to be complied with.

(i) Procedure of the alternative test is to be submitted to the Society for approval, and the results of breaking test which were carried out at the approval of manufacturing methods are also to be submitted to the Society

(ii) Where the breaking test is carried out, tests are to include the test for approval of manufacturing method of this chain except breaking test.

(e) If a breaking test fails, a thorough examination is to be carried out to identify the cause of failure.

(f) If a breaking test fails, two additional breaking test specimens representing the same sampling length of offshore chain are to be subjected to the breaking test. If two additional breaking test result satisfactorily, it will be decided what lengths of offshore chain can be accepted based upon the results of the failure investigation specified in (e).

(g) If either or both results of the additional test and failure investigation specified in (e) and (f) fail, the sampling length of offshore chain represented will be rejected. If a single link is found to be defective or not to meet the requirement of breaking test, defective links may be cut out and connecting common link or joining shackle inserted in its place and retest of breaking test may be carried out. If the result of the retest is found satisfactory, the sampling length of offshore chain represented may be passed

(B) The breaking test for accessories of offshore chain and connecting common link is to be carried out by the following procedures after final heat treatment.

(a) For accessories of offshore chain, the breaking test is to be carried out for the following frequency which is the least. However, for connecting common link and individually produced accessories or accessories produced in small batches, the frequency of the breaking test is at the discretion of the Society

(i) one accessory from each manufacturing lot, which have the same grade, size, and heat treatment, of 25 units or less of accessories.

(ii) one accessory out of every batch.

(b) Each specimen of accessories of offshore chain and connecting common link is to be capable of withstanding the break load specified for the grade and size of offshore chain for which they are intended without fracture maintained at that load for 30 seconds.

(c) Where the breaking test is not satisfactory, the accessories may be retested by taking out two units from the same lot specified in (a). If one such test fails to meet the requirements, the entire unit of the same lot is rejected.

(C) Accessories and connecting common links used for the breaking test are not to be put into further use. However, where the accessories are of increased dimension or alternatively a material with higher strength characteristics is used and where the accessories are manufactured with following (a) and (b), they may be used in service.

(a) The accessories or connecting common links are successfully tested at the breaking load appropriate to the offshore chain for which they are intended.

(b) It is verified by breaking test carried out by the manufacturer that such accessories are so designed that breaking strength is not less than 1.4 times the breaking load of the offshore chain for which they are intended.

(D) Where the accessories for offshore chains complied with requirement in (C) have not passed the breaking test specified in (11)(B)(a) and (11)(B)(b), the requirement of (11)(B)(c) is not to be applied thereto.

(12) Proof tests

(A) The proof test is to be carried out for the entire length of offshore chain by the following procedures after final heat treatment.

(a) Offshore chains are to withstand the proof test loads specified in **Table 4.8.4** without crack, breakage or any other defects.

(b) Notwithstanding the requirements of (a) above, where plastic straining is used to set studs, the applied proof load is not to be greater than that in approval tests for manufacturing.

(c) If a link fails during proof load testing, a thorough examination is to be carried out to identify the probable cause of failure of the proof test from the manufacturing records. Where the cause of failure is identified and the presence in other lengths of factors or conditions thought to be causal to failure is not found from the above failure investigation, this length of chain except a failure link may be accepted

(d) In the event that two or more links in the proof loaded length fail, that length of offshore chain is to be rejected. An investigation and retest are to be carried out in accordance with the following (i) to (iii) and where these results are found to be satisfactory, this length of offshore chain may be accepted.

(i) A thorough examination is to be carried out to identify the probable cause of failure of the proof test from the manufacturing records. The tests in order to identify the cause of failure may be required where deemed necessary by the Society.

(ii) A breaking test specimen is to be taken from each side of the one failed link according to (11)(A)(a) and subjected to the breaking test.

(iii) Defective links may be cut out and connecting common link or joining shackle inserted in its place and retest of proof load test is to be carried out.

(B) All kinds of accessories and connecting common links are to be tested to the proof test loads specified in **Table 4.8.4,** in accordance with the kinds and diameters of the offshore chains to be connected therewith, and they are to withstand the tests without crack, breakage or any other defect. This test may be carried out simultaneously with the proof test for the offshore chains or together with any offshore chains of the same diameter with which accessories are connected.

(13) Mechanical tests

(A) Mechanical tests for offshore chains are to be carried out in accordance with the following manner after final heat treatment.

(a) One tensile test specimen and 3 sets (9 pieces) impact test specimens are to be taken from the maximum sampling interval corresponding to the nominal diameter of offshore chain specified in **Table 4.8.5** provided that every cast is represented. Test specimens are to be taken from the location given in **Fig 4.8.12** of the part specified in the followings.

(i) The tensile test specimen is to be taken in the side opposite the flash weld.

(ii) One set (3 pieces) impact test specimens are to be taken across the flash butt weld with the notch centered in the middle, one set are to be taken across the unwelded side and one set are to be taken from the bent region.

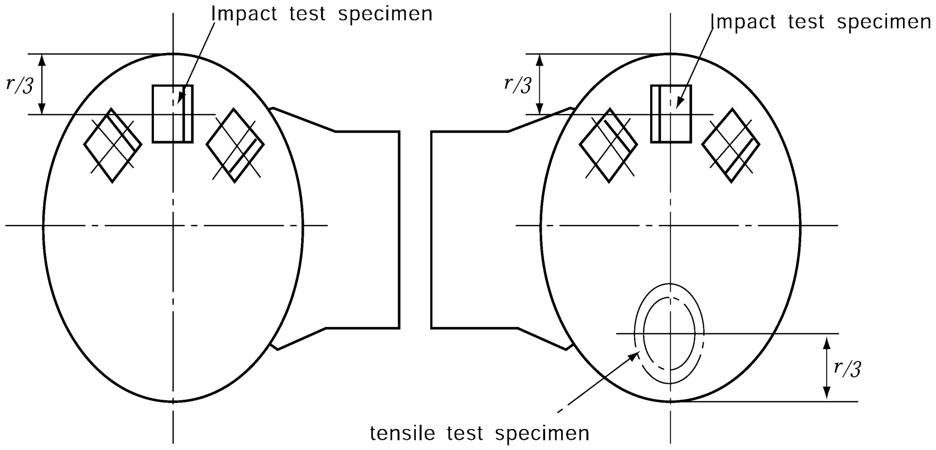


Fig 4.8.12 Location for sampling test specimens for links of offshore chains

(b) Test procedures and form of test specimen are to comply with the requirements in **Pt 2, Ch 1, Sec 2.**

(c) Mechanical properties are to comply with the requirements specified in **Table 4.8.6.**

(d) If the tensile test result does not conform to the requirements, a retest of two further specimens selected from the same sample may be carried out. Where both additional tensile tests show satisfactory results, the sampling length of offshore chain is considered acceptable.

(e) If the impact test results does not conform to the requirements, a retest of three further 1 set (3 pieces) specimens selected from the same sample may be carried out. The results of a retest are to be added to those previously obtained to form a new average. If the results of a retest comply with the requirements specified in **Table 4.8.6** and the new average comply with the requirements specified in **Table 4.8.6,** the sampling length of offshore chain is considered acceptable.

(B) Mechanical tests for accessories of offshore chains and connecting common links are to be carried out in accordance with the following manner after final heat treatment.

(a) One tensile test specimen and one set (3 pieces) impact test specimen are to be taken at the frequency specified in (11)(B)(a) of accessories of offshore chains and connecting common links and mechanical tests are to be carried out. Mechanical properties are to comply with the requirements specified in **Table 4.8.6.**

(b) Where the test results specified in (a) above do not conform to the requirements, additional tests may be carried out by the two tensile test specimens and 2 sets impact test specimens taken from the same lot specified in (a) above. The results of the retest of impact test specimens are to be added to those previously obtained to form a new average. Where one tensile test does not conform to the requirement specified in **Table 4.8.6,** the sampling rot represented is to be subjected to rejection and where the new average value does not comply with the requirements specified in **Table 4.8.6,** the sampling rot represented is to be subjected to rejection.

Table 4.8.6 Mechanical properties

Kinds of offshore chains	Tensile test				Impact test[1]		
	Yeild strength[2] (N/mm^2)	Tensile strength[2] (N/mm^2)	Elongation ($L=5d$)(%)	Reduction of area (%)	Testing temperature (°C)	Minimum mean absorbed energy (J)	
						except welded part	welded part
Grade *R* 3	410 min.	690 min.	17 min.	50 min.	-20(3)	40 min.[3]	30 min.[3]
Grade *R* 3S	490 min.	770 min.	15 min.	50 min.	-20(3)	45 min.[3]	33 min.[3]
Grade *R* 4	580 min.	860 min.	12 min.	50 min.	-20	50 min.	36 min.
Grade *R* 4S	700 min.	960 min.	12 min.	50 min.	-20	56 min.	40 min.
Grade *R* 5	760 min.	1000 min.	12 min.	50 min.	-20	58 min.	42 min.

(Notes)
[1] When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified minimum mean absorbed energy or when the absorbed energy of a single test specimen is less in value 70 % of the specified minimum mean absorbed energy, the test is considered to have failed.
[2] Aim value of yield to tensile ration is maximum 0.92
[3] Impact test of Grade *R* 3 and *R* 3S offshore chains may be carried out at the temperature of 0°C where approved by the Society. In this case, minimum mean absorbed energy is not to be less than following values.

	except welded part	welded part
(a) Grade *R* 3	60 J	50 J
(b) Grade *R* 3S	65 J	53 J

(14) Non-destructive Test
(A) Offshore chains and accessories of offshore chains are to be free from harmful defects in use such as pipe, cracks, notches, cuts, flakes and lack of fusion.
(B) All offshore chains are to be subjected to the non-destructive test specified in the following (A) and (B) after proof tests.
(a) After proof testing, all surfaces of every link shall be visually examined. Burrs, irregularities and rough edges shall be contour ground. Links shall be free from mill defects, surface cracks, dents and cuts, especially in the vicinity where gripped by clamping dies during flash welding.
(b) Magnetic Particles test or Dye Penetrant Test
(i) Magnetic particles shall be employed to examine the flash welded area including the area gripped by the clamping dies. Procedures and equipment in accordance with those approved shall be used. Frequency of examination shall be every link. Link surface at the flash weld shall be free from cracks, lack of fusion and gross porosity.
(ii) All stud welds shall be visually examined. At least 10 % of all studs welds within each length of offshore chains are to be examined by magnetic particles test or dye penetrant test after proof testing. If cracks or lack of fusion are found, all welded parts are to be examined. The welds are to be of good quality and free from defects such as cracks, lack of fusion, gross porosity and undercuts exceeding 1 mm.
(c) Ultrasonic Test
(i) Ultrasonics shall be employed to examine the flash weld fusion. Frequency of examination shall be every link. Procedures and equipment in accordance with those approved shall be used. On-site calibration standards for chain configurations shall be approved.
(ii) The flash weld shall be free from defects causing ultrasonic back reflections equal

to or greater than the calibration standard.

(C) Magnetic particles test or dye penetrant test for all ac))ssories of offshore chain and connecting common link, is to be employed to examine after proof test.

(15) Repair of Defects

(A) Where insignificant defects are found from non-destructive test specified in (14) above, they are to be repaired by grinding down no more than 5 % of the link diameter in depth and streamlined to provide no sharp contours, and where their final dimensions are to be within the dimensional tolerances required by (9), those offshore chains and their accessories are considered acceptable.

(B) Where harmful defects are found from non-destructive test specified if (14)(B), a defective link may be cut out and connecting common link or joining shackle inserted in its place. Retests specified in (11) to (13) are to be carried out, and where the results comply with the requirements, these offshore chains and their accessories are considered acceptable.

(16) Markings

(A) Where offshore chains and accessories of offshore chains have satisfactorily passed the tests and inspections required in **Par 2**, they are to be marked as follows.

(a) Places of markings
- At stud of each end of offshore chains
- At stud of each end at intervals not exceeding 100 m
- On connecting common link
- On stud of common links next to connecting common links or joining shackles
- All kinds of accessories of offshore chains

(b) Kinds of markings
- Society's stamp
- The grade of offshore chains and accessories of offshore chains (e.g. KR-*R* 3, KR-*R* 3S, KR-*R* 4, KR-*R* 4S and KR-*R* 5)
- The nominal diameter of offshore chains and accessories of offshore chains
- Manufacturer's number

(B) The marking shall make it possible to recognize leading and tail end of the chain. The marking shall be permanent and legible throughout the expected lifetime of the chain.

(C) All marked links shall be stated on the certificate, and the chain certificate shall contain information on number and location of connecting common links.

(17) Painting

Offshore chains and accessories of offshore chains are not to be painted until the tests and inspections are finished.

(18) Record

Manufacturers producing offshore chains and accessories of offshore chains are to make records with regard to the manufacturing processes tests and inspections required to offshore chains and accessories of offshore chains, and the results of them, and such records are to readily available to the Surrey or when requested.

(A) Records of manufacturing processes such as heating of bar materials, flush butt welding, heat treatment are to include the followings.

(a) Checking records of bar materials by electric resistance heating and furnace heating specified in **2** (5) (C)

(b) Checking records of the welding parameters of flash butt welding process specified in **2** (5) (D)

(c) Process of heat treatment
Temperature and time of temperature and offshore chains speed are to be controlled and continuously recorded.

(B) Records of testings and inspections are to indicates the following (a) to (d).

(a) The results of dimension measurement required by **401. 2** (9) and (10).

(b) The results of testing required by **401. 2** (11) to (13)

(c) The results of non-destructive test required by **401. 2** (14)

(d) If the testings and inspections do not meet the requirements specified in (a) to (c), photographs of the failure of offshore chains and accessories of offshore chains as well as nonconformity, corrective actions and repair works are included in records.

3. "Chafing Chain for Single Point Mooring arrangements" specified in **Pt 4, Ch 8, 401. 2** of the Rules are as follows.

(1) Scope

These requirements apply to short lengths (approximately 8 m) of 76 mm diameter chain to be connected to hawsers for the tethering of oil carriers to single point moorings, FPSO's and similar uses.

(2) Approval of Manufacturing
The chafing chain is to be manufactured by works approved by the Society .

(3) Materials
The materials used for the manufacture of the chafing chain are to satisfy the requirements specified in **403.** of the Rules

(4) Design, manufacturing, testing and certification
(A) The chafing chain is to be designed, manufactured, tested and certified in accordance with the requirements specified in **401. 2.**
(B) The arrangement of the end connections is to be of an approved type.
(C) The common link is to be of the stud link type - Grade R3 or R4.
(D) The chafing chain is to be capable of withstanding the breaking test loads of 4884 kN (Grade R3) and 6001 kN (Grade R4). However documented evidence of satisfactory testing of similar diameter mooring chain in the prior six month period may be used in lieu of break testing subject to agreement with classification society.
(E) The chain lengths shall be proof load tested in accordance with **401. 2** (12). The test load for Grade R3 is 3242 kN and for Grade R4 is 4731 kN.

409. Dimensions and forms

1. In **Pt 4, Ch 8, 409. 1** of the Rules, when manufacturer would make chains different from standard dimensions, the dimension tables are to be approved by the Society except the case where the dimensions comply with KS or ISO.

2. For anchor chain cables for large anchor specified in **Pt 4, Ch 8, 203. 1** of the Rules, the length of the shackle and accessories may be included in one length of chain.

412. Breaking test of chains

1. The omissions of breaking test of chains due to the shortage of capacity of testing machine specified in **Pt 4, Ch 8, 412. 2** of the Rules, is to be in accordance with the following requirements in (1) to (3).

(1) Chains are to be comply with the requirements as follows.
(A) Chains are to be Grade 2 or Grade 3 chain.
(B) Breaking loads specified in **Table 4.8.7** of the Rules are to be above 6000 kN.
(C) Chains are to be heat treated.
(D) Breaking test had been demonstrated at approval test for manufacturing process for the nominal diameter or more.
(E) For welded chains specified in **Pt 4, Ch 8, 413** of the Rules is to pass the mechanical test of chain link.

(2) Following tests are to be carried out as an alternative test. Manufacturers are to obtain approval of the concrete testing plan by the Society in advance. The test is able to confirm the strength of welded part for welded chain.
(A) Non-destructive inspection
(B) Marco-structure inspection
(C) Bend test
(D) Tensile test
(E) For Grade 3 chain impact test may be required for reference.

(3) Where the test had been performed as specified in (2) without breaking test, "Alternative breaking test has been applied" is indicated in the certificate.

Section 5 Steel Wire Ropes

506. Rope test

1. The values not included in breaking loads of steel wire ropes in **Table 4.8.13** specified in **Pt 4,**

Ch 8, 506. are to be as follows.

Breaking loads of rope = area coefficient × strand efficiency coefficient × tensile strength(KN/mm^2) × (diameter of rope)^2

Area coefficient and strand efficiency coefficient according to composition mark of steel wire ropes are to be as follows.

Composition mark of steel wire ropes	Area coefficient	Strand efficiency coefficient
6 x 7	0.399	0.90
6 x 12	0.252	0.88
6 x 19	0.397	0.86
6 x 24	0.358	0.87
6 x 30	0.317	0.88
6 x 37	0.395	0.85
6 x WS(36)	0.429	0.80

Section 7 Hatch Tarpaulins

701. Application

Test and inspection of hatch tarpaulins made of synthetic materials is in accordance with **"Regulations for Type Approval Test and Inspection of Ship and Ship's Articles"** ⚓

CHAPTER 9 STRENGTH AND SECURING OF SMALL HATCHES, FITTINGS AND EQUIPMENT ON THE FORE DECK

Section 2
Strength and Securing of Small Hatches on the Exposed Fore Deck

201. General

In application of **201. 3.** of the Rules, securing devices of hatches designed for emergency escape are to be of a quick-acting type(e.g., one action wheel handles are provided as central locking devices for latching/unlatching of hatch cover)operable from both sides of the hatch cover. ⚓

CHAPTER 10 SHIPBOARD EQUIPMENT, FITTINGS AND SUPPORTING HULL STRUCTURES ASSOCIATED WITH TOWING AND MOORING

Section 1 Definitions and Scope of Application

101. Application

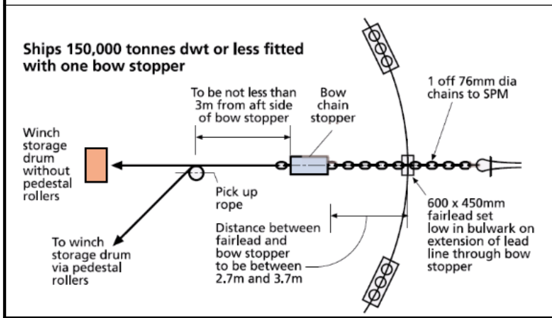
In application of **Pt 4, Ch 10, 101. 3.** of the Rules, the details are as follows.

1. General

(1) Application
This instruction, in case of survey requested by an applicants(shipowner's, shipyard's or manufacturer's, hereafter referred to as "applicants"), is to be applied to mooring equipment of SPM using standard equipment complying with the recommendations of the Oil Companies International Marine Forum(hereafter referred to as "OCIMF") fitted onboard ships such as oil tankers(hereafter referred to as "ships"), the delivery of which is after 1 January 2009.

(2) General arrangement of mooring equipment of SPM

(A) The components of the ship's equipment required for mooring equipment of SPM are the chain stopper, fairlead, pedestal roller, winch or capstan.(See **Fig 4.10.1**)
However, pedestal roller may not be installed according to arrangement of winch/capstan.

DWT ≤ 150,000	150,000 < DWT
	


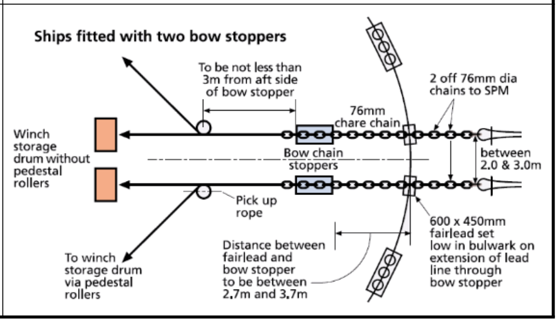


Fig 4.10.1 General arrangement of mooring equipment of SPM

(B) For mooring at SPM terminals, ships are to be provided forward with equipment to haul a standardized chafing chain of 76 mm in diameter connection to structure of single point mooring or end of the hawser wire of single buoy mooring terminals.

(C) When the chafing chain is carried on board the ship as a component for mooring equipment of SPM, chafing chain is comply with the requirements in **Pt 4, Ch 8, 401. 3** of the Guidance.

2. Design and specification of material

(1) Forward chain stoppers

(A) Chain stopper is to secured the chafing chain as a strong point. The number of chain stoppers and their safe working loads(SWL) are defined in **Table 4.10.1**

Table 4.10.1 Number and SWL of chain stoppers

Deadweight (ton)	Chain stoppers	
	Number	Safe working load(SWL) (ton)
DWT ≤ 100,000	1	200
100,000 < DWT ≤ 150,000	1	250
150,000 < DWT	2	350

(B) Chain stoppers are to be capable of securing the 76 mm common stud links of the chafing chain when the stopping device is in the closed position, and capable of passing freely the chafing chain and its associated fittings when the stopping device is in the open position.
(C) Chain stoppers may be of the hinged bar or pawl type or of other equivalent design.
(D) The stopping device of the chain stopper is to be arranged, when in the closed position, to prevent it from gradually working to the open position, which would release the chafing chain and allow it to pay out. Stopping devices are to be easy and safe to operate and, in the open position, are to be properly secured.
(E) Chain stoppers are to be located between 2.7 m and 3.7 m inward of the hull from the bow fairlead. Fairlead and pedestal roller are to be located in line with each other.
(F) Stopper supporting structures are to be trimmed to compensate for any camber and/or sheer of the deck. The leading edge of the stopper base plate is to be faired to allow for the unimpeded entry of the chafing chain into the stopper.
(G) Where the chain stopper is bolted to a seating welded to the deck, the bolts are to be satisfied with the following strength criteria. However, in such condition, efficient thrust chocks capable of withstanding a horizontal force equal to 2.0 times the required working strength are to be installed.

$$\sigma_{VM} \le \sigma_y$$

Where,

σ_{VM} : The equivalent stress in the equipment components(bolts, etc.) induced by the loads.

σ_y : Permissible stress, to be taken, in $\mathrm{N/mm^2}$, as the lower of 0.67 R_{eH} and 0.4 R_m

R_{eH} : Minimum yield stress, in $\mathrm{N/mm^2}$, of the material

R_m : Tensile strength, in $\mathrm{N/mm^2}$, of the material

(H) The steel grade of bolts is to be not less than grade 8.8 as defined by **KS B ISO898-1** (Grade 10.9 is recommended). Bolts are to be pre-stressed in compliance with appropriate standards and tightening is to be suitably checked.
(I) The chain stopper is to be made of rolled steel, steel forging or steel casting complying with the requirements of **Pt 2, Ch 1** of the Rules.
However, use of spheroidal graphite iron casting may be accepted for the main component of the chain stopper provided that:
(a) the component concerned is not to be a welded part
(b) the spheroidal graphite iron casting is of ferritic structure with an elongation not less than 12%
(c) the yield stress at 0.2% proof load is measured and surveyed
(d) the internal structure of the component is inspected by means of non-destructive examinations
(J) The material used for the stopping device (pawl or hinged bar) of chain stoppers is to have mechanical properties similar to Grade R3 chain cable.

(2) Fairleads
(A) One fairlead is to be fitted for each chain stopper.
(B) For ships of over 150,000 ton DWT, two fairleads are required and the fairleads are to be spaced 2.0 m or more center to center apart, if practicable, and in no case more than 3.0 m apart. For ships of 150,000 ton DWT or less, only one fairlead is to be fitted on the centerline.
(C) Fairleads are normally of a closed type such as Panama chocks and are to have an opening large enough to pass the largest portion of the chafing chain, pick-up rope and associated fittings. For this purpose, the inner dimensions of the bow fairlead opening are to be at least 600 mm in width and 450 mm in height.
(D) Fairleads are to be oval or round in shape. The lips of the fairleads are to be suitably faired in order to prevent the chafing chain from fouling on the lower lip when heaving inboard. The bending ratio(bearing surface diameter of the fairlead to chafing chain diameter) is to be not less than 7 to 1.
(E) Fairleads are to be located as close as possible to the deck and, in any case, to be in such

a position that the chafing chain is approximately parallel to the deck when it is pulled between the chain stopper and the fairlead.

(F) Fairleads are to be made of rolled steel, steel forging or steel casting complying with the requirements of **Pt 2, Ch 1** of the Rules.

(3) Pedestal roller

(A) Pedestal rollers are to be positioned to enable a direct pull to be achieved on the continuation of the direct lead line between the fairlead and chain stopper. They are to be fitted not less than 3.0 m behind the chain stopper.

(B) Pedestal rollers are to be capable of withstanding a horizontal force equal to the greater of the following values. Stresses generated by this horizontal force are to comply with the strength criteria indicated in **101. 2** (1) (G).

(a) 22.5 ton

(b) the resultant force due to an assumed pull of 22.5 ton in the pick-up rope

(C) It is recommended that the pedestal roller should have a diameter not less than 7 times the diameter of the pick-up rope. Where the diameter of the pick-up rope is unknown, the roller diameter should be at least 400 mm.

(4) Winches or capstans

(A) Winches or capstans used to handle the mooring gear are to be capable of heaving inboard a load of at least 15 ton. For this purpose winches or capstans are to be capable of exerting a continuous duty pull of not less than 15 ton and withstanding a braking pull of not less than 22.5 ton.

(B) If a winch storage drum is used to stow the pick-up rope, it is to be of sufficient size to accommodate 150 m of rope of 80 mm diameter.

3. Type approval

The prototype testing of mooring equipment of SPM is to be in accordance with **Ch 3, Sec 7-2.** in "**Guidance for Approval of Manufacturing Process and Type Approval, etc**".

4. Certificate Etc.

(1) Issuing, valid term and renewal for the approval certificate are to be complied with **Ch 3, Sec 1** in "**Guidance for Approval of Manufacturing Process and Type Approval, Etc**".

(2) Some components of mooring equipment of SPM may be also used for the bow emergency towing arrangements provided that the requirements of instruction are to be complied with and type approval of bow emergency towing arrangement complied with **Ch 3, Sec 7-1.** in "**Guidance for Approval of Manufacturing Process and Type Approval, Etc**".

5. Component's inspection of mooring equipment of SPM

Where components of mooring equipment of SPM have undergone the type approval of this Society and satisfactorily passed the tests and inspections required as followings, the certificate will be issued when applicants request the inspection of components.

(1) Chain stoppers used to mooring equipment of SPM are according to the followings.

(A) The materials are to comply with the requirements in **Pt 2, Ch 1** of the Rules and dimensions are to comply with an approved drawings.

(B) Performance of chain stopper is to comply with the requirements in **101. 2** (1).

(C) Chain stoppers are to be wholly examined by ultrasonic test in principle, but, if impracticable, may be examined by effective non-destructive test such as magnetic particle test.

(D) Where chain stoppers have satisfactorily passed the tests and inspections required in this Society, safe working load and identification numbers are to be marked permanently.

(2) Fairleads used to mooring equipment of SPM are to be in accordance with the following requirements.

(A) The materials are to comply with the requirements in **Pt 2, Ch 1** of the Rules and dimensions are to comply with an approved drawings.

(B) Performance of fairleads is to comply with the requirements in **101. 2** (2).

(C) Fairleads are to be wholly examined by ultrasonic test in principle, but, if impracticable, may be examined by effective non-destructive test such as magnetic particle test.

(3) Pedestal roller and winches or capstans used to mooring equipment of SPM are to comply with the requirements in **101. 2** (3), (4) and to be verified by means of certificate/report of inspection issued by manufacturer.

6. Installation inspection of mooring equipment of SPM on board

Where mooring equipment of SPM type approved by this Society is requested for the installation inspection onboard by ship owner or by shipyard, the equipment is to be satisfactorily passed drawing approval and the tests as followings, the fitness certificate including supporting hull structure is to be issued.

(1) Documentation
Prior to installation of the mooring equipment of SPM on a ship, the applicants are to submit the three copies of the following drawings and data for approval and information.
(A) Documentation for approval
(a) General layout of the forecastle arrangements and mooring at single point moorings
(b) Construction drawing of the bow chain stoppers, fairleads and pedestal roller, together with material specifications and relevant calculations
(c) Drawings and relevant calculations of the local ship structures supporting the loads applied to chain stoppers, fairleads, pedestals roller and winches or capstans
(B) Informations
(a) Specifications of winches or capstans giving the continuous duty pull and brake holding force
(b) Deadweight(ton) of the ship at summer load line
(c) Certificate and Type test record

(2) Design and material requirements
Design and material requirements are to comply with the requirements in **101. 2.**

(3) Supporting hull structures
(A) General arrangement of chain stopper and fairlead is comply with **Fig 4.10.1** and **Fig 4.10.2**
(B) The bulwark plating and stays are to be suitably reinforced in the region of the fairleads.
(C) Deck structures in way of bow chain stoppers, including deck seatings and deck connections, are to be suitably reinforced to resist a horizontal load equal to 2 times the required safe working load and, in such condition, to meet the strength criteria specified in **101. 2** (1) (G).
(D) Minimum thickness of the deck structures in way of the strongpoint and in way of fairlead as well as the deck connections is defined local structure strength calculation and to be at least 15 mm.
(E) For deck bolted chain stoppers, reinforcements are to comply with the requirements in **101. 2** (1) (G) and (H).
(F) The deck structures in way of the pedestal roller and in way of winches or capstans as well as the deck connections are to be reinforced to withstand, respectively, the horizontal force defined in **101. 2** (3) (B) or the braking pull defined in **101. 2** (4) (A) and to meet the strength criteria specified in **101. 2** (1) (G).

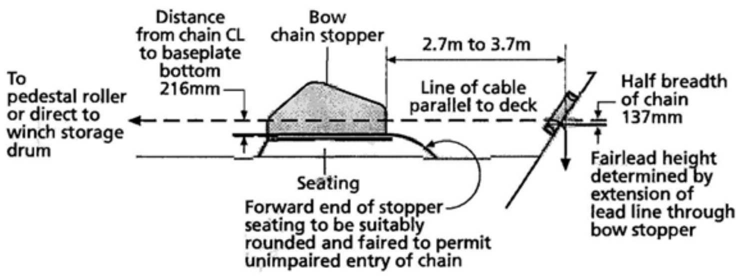

Fig 4.10.2 General arrangement of chain stopper and fairlead

(4) Installation inspection on a ship
(A) Components to be installed and inspected including support structure in accordance with an approved arrangement by this Society and components are to have no permanent deformation provided that proof test loads are equivalent to the required safe working load at least 1 minute as given **Table 4.10.1**. However, load test may be exempted in the following cases:
(a) where mooring equipment of SPM with type approved by this Society, inspection has

been approved in accordance with the requirements in **101. 5.**

(b) where mooring equipment of SPM without type approved by this Society, strength calculation sheets provided that 2 times the required safety factor should be submitted and approved by this Society and inspection has been approved in accordance with the requirements in **101. 5**., provided that proof test loads equivalent to safe working load.

(B) Supporting hull structures are to comply with the requirements in **101. 6** (3).

(C) Main welds of the chain stoppers with the hull structure are to be 100 % inspected by means of non-destructive examinations.

(D) Onboard status of an instruction manual and approved drawings are to be confirmed.

Section 2 Towing and Mooring

204. Survey after construction

The condition of deck fittings, their pedestals, if any, and the hull structures in the vicinity of the fittings are to comply with regulations specified in **Pt 1, Ch 2, 202.** of the Rules. ⚓

CHAPTER 11 ACCESS TO AND WITHIN SPACES IN, AND FORWARD OF, THE CARGO AREA OF OIL TANKERS AND BULK CARRIERS

Section 1 General

101. Application

1. In application of **101. 1.** of the Rules, the details are as follows.

(1) The contents of Res. MSC.151/8(78) can be applied for ships which were keeling on and after 1 Jan. 2005 instead of Res. MSC.133/4(76).

(2) Oil tankers:
The regulation is only applicable to oil tankers having integral tanks for carriage of oil in bulk, which is contained in the definition of oil in Annex 1 of MARPOL 73/78. Independent oil tanks can be excluded. Regulation II-1/3-6 is not normally applied to FPSO or FSO unless the Administration decides otherwise.

102. Means of access to cargo and other spaces

1. In application of **102. 2.** of the Rules, the details are as follows.

(1) Some possible alternative means of access are listed under paragraph 3.9 of TP. Always subject to acceptance as equivalent by the Administration, alternative means such as an unmanned robot arm, ROV's and dirigibles with necessary equipment of the permanent means of access for overall and close-up inspections and thickness measurements of the deck head structure such as deck transverses and deck longitudinals of cargo oil tanks and ballast tanks, are to be capable of:
- safe operation in ullage space in gas-free environment;
- introduction into the place directly from a deck access.

2. In application of **102. 3.** of the Rules, the details are as follows.

(1) Inspection
The MA arrangements, including portable equipment and attachments, are to be periodically inspected by the crew or competent inspectors as and when it is going to be used to confirm that the MAs remain in serviceable condition.

(2) Procedures

(A) Any company authorised person using the MA shall assume the role of inspector and check for obvious damage prior to using the access arrangements. Whilst using the MA the inspector is to verify the condition of the sections used by close up examination of those sections and note any deterioration in the provisions. Should any damage or deterioration be found, the effect of such deterioration is to be assessed as to whether the damage or deterioration affects the safety for continued use of the access. Deterioration found that is considered to affect safe use is to be determined as “substantial damage” and measures are to be put in place to ensure that the affected section(s) are not to be further used prior effective repair.

(B) Statutory survey of any space that contains MA shall include verification of the continued effectiveness of the MA in that space. Survey of the MA shall not be expected to exceed the scope and extent of the survey being undertaken. If the MA is found deficient the scope of survey should be extended if this is considered appropriate.

(C) Records of all inspections are to be established based on the requirements detailed in the ships Safety Management System. The records are to be readily available to persons using the MAs and a copy attached to the MA Manual. The latest record for the portion of the MA inspected should include as a minimum the date of the inspection, the name and title of the inspector, a confirmation signature, the sections of MA inspected, verification of continued serviceable condition or details of any deterioration or substantial damage found. A file of permits issued should be maintained for verification.

103. Safe access to cargo holds, cargo tanks, ballast tanks and other spaces

1. In application of **103. 1.** of the Rules, the details are as follows.

Access to a double side skin space of bulk carriers may be either from a topside tank or double bottom tank or from both.

2. In application of **103. 2.** of the Rules, the details are as follows.

A cargo oil tank of less than 35 m length without a swash bulkhead requires only one access hatch.

Where rafting is indicated in the ship structures access manual as the means to gain ready access to the under deck structure, the term "similar obstructions" referred to in the regulation includes internal structures (e.g., webs >1.5 m deep) which restrict the ability to raft (at the maximum water level needed for rafting of under deck structure) directly to the nearest access ladder and hatchway to deck. When rafts or boats alone, as an alternative means of access, are allowed under the conditions specified in resolution A.744(18), permanent means of access are to be provided to allow safe entry and exit. This means:

(1) access direct from the deck via a vertical ladder and small platform fitted approximately 2 m below the deck in each bay; or
(2) access to deck from a longitudinal permanent platform having ladders to deck in each end of the tank. The platform shall, for the full length of the tank, be arranged in level with, or above, the maximum water level needed for rafting of under deck structure. For this purpose, the ullage corresponding to the maximum water level is to be assumed not more than 3 m from the deck plate measured at the midspan of deck transverses and in the middle length of the tank. (See Figure below). A permanent means of access from the longitudinal permanent platform to the water level indicated above is to be fitted in each bay (e.g., permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).

104. Ship structure access manual

1. In application of **104. 1.** of the Rules, the details are as follows.

Access manual should address spaces listed in paragraph 3 of SOLAS II-1/3-6.

As a minimum the English version should be provided

The ship structure access manual is to contain at least the following two parts:

Part 1: Plans, instructions and inventory required by paragraphs 4.1.1 to 4.1.7 of SOLAS II-1/3-6. This part is to be approved by the Administration or the organization recognised by the Administration

Part 2 : Form of record of inspections and maintenance, and change of inventory of portable equipment due to additions or replacement after construction. This part is be approved for its form only at new building.

The following matters are to be addressed in the ship structure access manual:

(1) The access manual should clearly cover scope as specified in the regulations for use by crews, surveyors and port state control officers.
(2) Approval / re-approval procedure for the manual, i.e. any changes of the permanent, portable, movable or alternative means of access within the scope of the regulation and the Technical provisions are subject to review and approval by the Administration or by the organization recognised by the Administration.
(3) Verification of MA is to be part of safety construction survey for continued effectiveness of the MA in that space which is subject to the statutory survey.
(4) Inspection of MA by the crew and/or a competent inspector of the company as a part of regular inspection and maintenance.
(5) Actions to be taken if MA is found unsafe to use.
(6) In case of use of portable equipment plans showing the means of access within each space indicating from where and how each area in the space can be inspected;

2. In application of **104. 2.** of the Rules, the details are as follows.

(1) Critical structural areas are to be identified by advanced calculation techniques for structural

strength and fatigue performance, if available, and feed back from the service history and design development of similar or sister ships.

(2) Reference is to be made to the following publications for critical structural areas, where applicable:
- Oil tankers: Guidance Manual for Tanker Structures by TSCF;
- Bulk carriers: Bulk Carriers Guidelines for Surveys, Assessment and Repair of Hull Structure by IACS;
- Oil tankers and bulk carriers: resolution A.744 (18), as amended.

105. General technical specifications

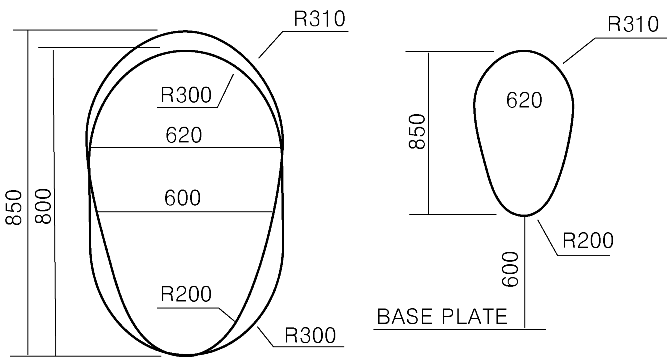
1. In application of **105. 1.** of the Rules, the details are as follows.

The minimum clear opening of 600 mm × 600 mm may have corner radii up to 100 mm maximum. The clear opening is specified in MSC/Circ.686 to keep the opening fit for passage of personnel wearing a breathing apparatus. In such a case where as a consequence of structural analysis of a given design the stress is to be reduced around the opening, it is considered appropriate to take measures to reduce the stress such as making the opening larger with increased radii, e.g. 600 mm × 800 mm with 300 mm radii, in which a clear opening of 600 mm × 600 mm with corner radii up to 100 mm maximum fits.

2. In application of **105. 2.** of the Rules, the details are as follows.

(1) The minimum clear opening of not less than 600 mm × 800 mm may also include an opening with corner radii of 300 mm. An opening of 600 mm in height × 800 mm in width may be accepted as access openings in vertical structures where it is not desirable to make large opening in the structural strength aspects, i.e. girders and floors in double bottom tanks.

(2) Subject to verification of easy evacuation of injured person on a stretcher the vertical opening 850 mm × 620 mm with wider upper half than 600 mm, while the lower half may be less than 600 mm with the overall height not less than 850 mm is considered acceptable alternative to the traditional opening of 600 mm × 800 mm with corner radii of 300 mm.



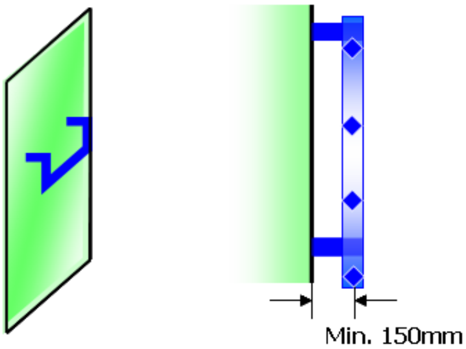
(3) If a vertical opening is at a height of more than 600 mm steps and handgrips are to be provided. In such arrangements it should be demonstrated that an injured person can be easily evacuated.

Section 2 Technical Provisions for Means of Access for Inspections

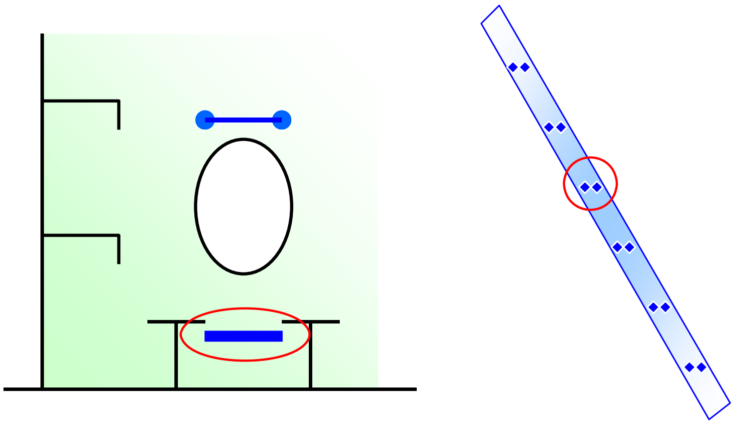
201. Definitions

1. In application of **201. 1.** of the Rules, the details are as follows.

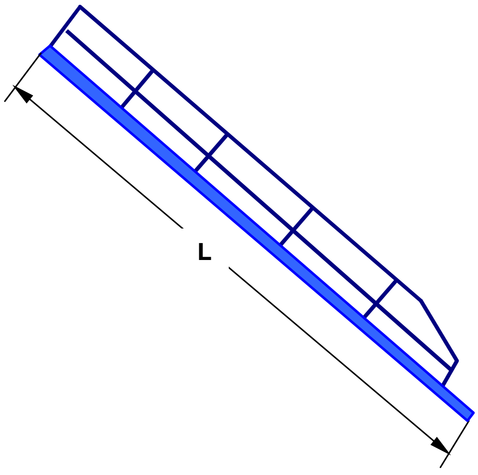
(1) rung



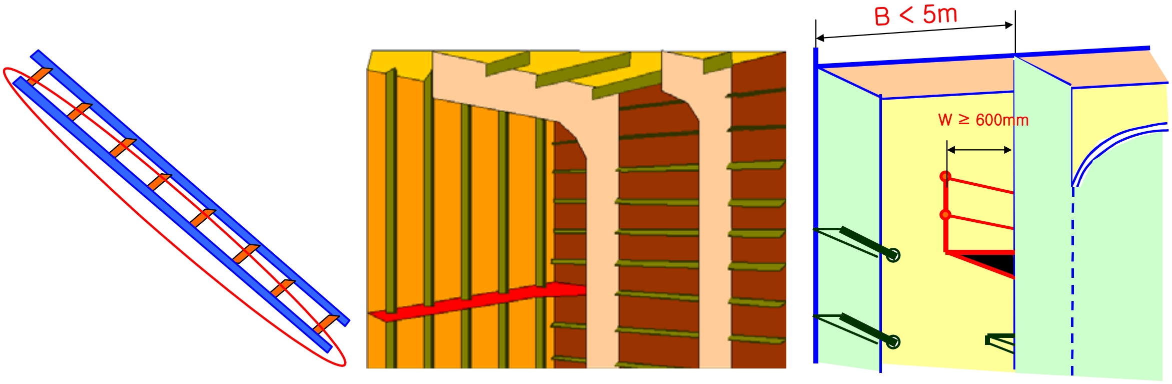
(2) tread



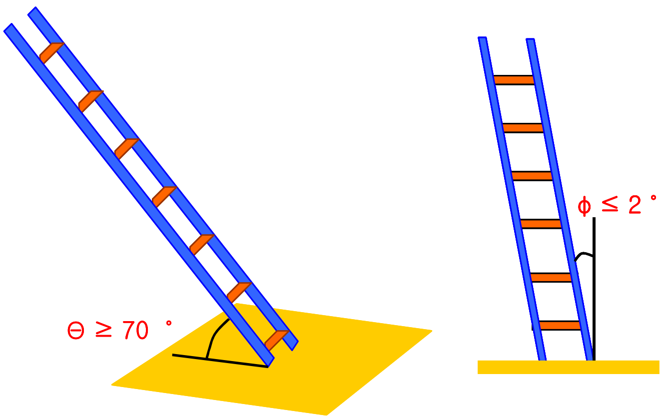
(3) flight of an inclined ladder



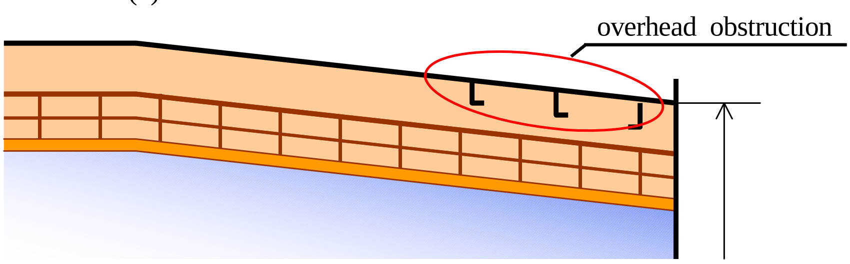
(4) stringer



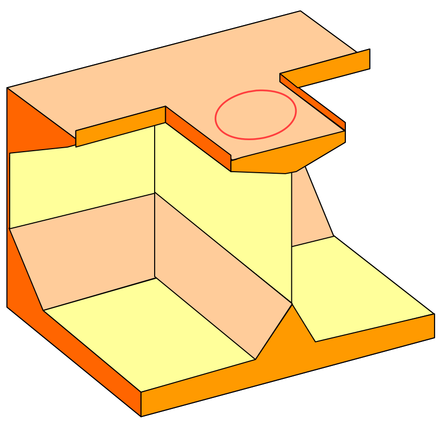
(5) vertical ladder



(6) overhead obstruction & (7) distance below deck head



(8) cross deck



202. Technical provisions

1. In application of **202. 1.** of the Rules, the details are as follows.

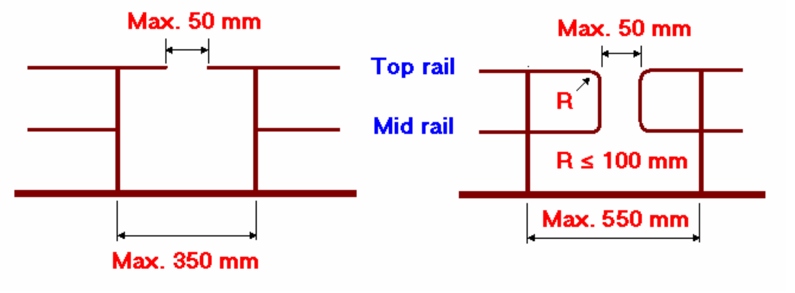
The permanent means of access to a space can be credited for the permanent means of access for inspection.

2. In application of **202. 3.** of the Rules, the details are as follows.

(1) Slopping structures are structures that are sloped by 5 or more degrees from horizontal plane when a ship is in upright position at even-keel.

(2) Guard rails are to be fitted on the open side. For stand alone passageways guard rails are to be fitted on both sides of these structures.

(3) Discontinuous top handrails are allowed, provided the gap does not exceed 50 mm.
The same maximum gap is to be considered between the top handrail and other structural members (i.e. bulkhead, web frame, etc.).
The maximum distance between the adjacent stanchions across the handrail gaps is to be 350 mm where the top and mid handrails are not connected together and 550 mm when they are connected together.
The maximum distance between the stanchion and other structural members is not to exceed 200 mm where the top and mid handrails are not connected together and 300 mm when they are connected together.
When the top and mid handrails are connected by a bent rail, the outside radius of the bent part is not to exceed 100 mm (see Figure below).

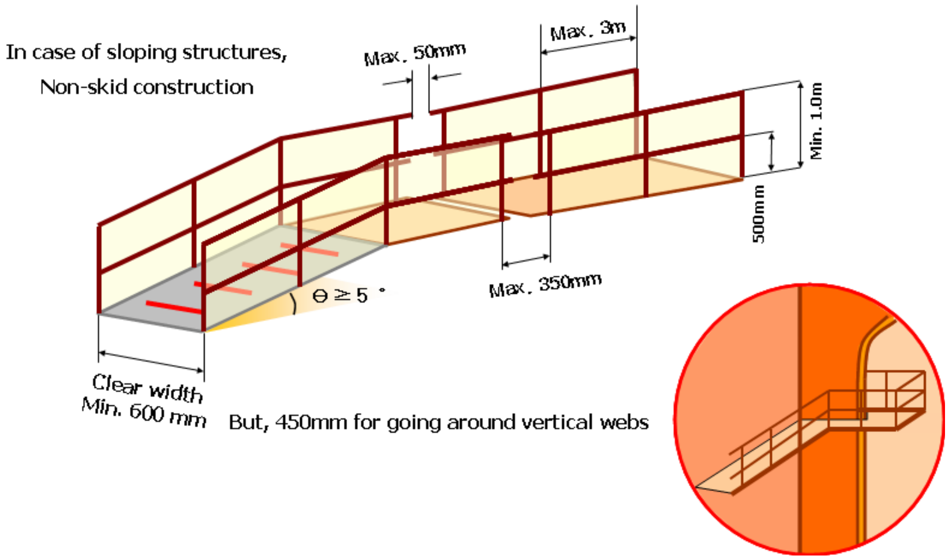


(4) Non-skid construction is such that the surface on which personnel walks provides sufficient friction to the sole of boots even the surface is wet and covered with thin sediment.

(5) "Substantial construction" is taken to refer to the as designed strength as well as the residual strength during the service life of the vessel. Durability of passageways together with guard rails should be ensured by the initial corrosion protection and inspection and maintenance during services.

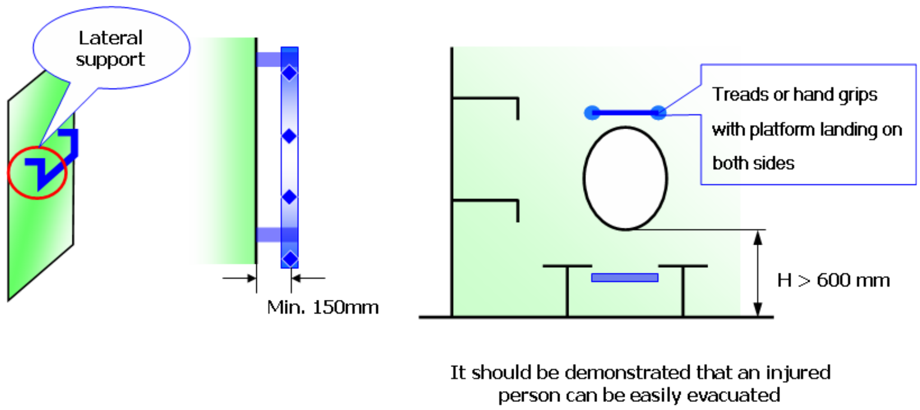
(6) For guard rails, use of alternative materials such as GRP should be subject to compatibility with the liquid carried in the tank. Non-fire resistant materials should not be used for means of access to a space with a view to securing an escape route at a high temperature.

(7) Requirements for resting platforms placed between ladders are equivalent to those applicable to elevated passageways.



3. In application of **202. 4.** of the Rules, the details are as follows.

Where the vertical manhole is at a height of more than 600 mm above the walking level, it should be demonstrated that an injured person can be easily evacuated.



4. In application of **202. 5.** of the Rules, the details are as follows.

(1) MA for access to ballast tanks, cargo tanks and spaces other than FPT:
For oil tankers:
(A) Tanks and subdivisions of tanks having a length of 35 m or more with two access hatchways:
(a) First access hatchway: Inclined ladder or ladders are to be used.
(b) Second access hatchway:
(i) A vertical ladder may be used. In such a case where the vertical distance is more than 6 m, vertical ladders should comprise one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. The uppermost section of the vertical ladder, measured clear of the overhead obstructions in way of the tank entrance, should not be less than 2.5 m but not exceed 3.0 m and should comprise a ladder linking platform which should be displaced to one side of a vertical ladder. However, the vertical distance of the upper most section of the vertical ladder may be reduced to 1.6 m, measured clear of the overhead obstructions in way of the tank entrance, if the ladder lands on a longitudinal or athwartship permanent means of access fitted within that range or
(ii) Where an inclined ladder or combination of ladders is used for access to the space, the uppermost section of the ladder, measured clear of the overhead obstructions in way of the tank entrance, should be vertical for not less than 2.5 m but not exceed

3.0 m and should comprise a landing platform continuing with an inclined ladder. However, the vertical distance of the upper most section of the vertical ladder may be reduced to 1.6 m, measured clear of the overhead obstructions in way of the tank entrance, if the ladder lands on a longitudinal or athwartship permanent means of access fitted within that range. The flights of the inclined ladders are normally to be not more than 6 m in vertical height. The lowermost section of the ladders may be vertical for the vertical distance not exceeding 2.5 m.

(B) Tanks less than 35 m in length and served by one access hatchway an inclined ladder or combination of ladders are to be used to the space as specified in (1) (ii) above.

(C) In double hull spaces of less than 2.5 m width the access to the space may be by means of vertical ladders that comprises one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. The uppermost section of the vertical ladder, measured clear of the overhead obstructions in way of the tank entrance, should not be less than 2.5 m but not exceed 3.0 m and should comprise a ladder linking platform which should be displaced to one side of a vertical ladder. However, the vertical distance of the upper most section of the vertical ladder may be reduced to 1.6 m, measured clear of the overhead obstructions in way of the tank entrance, if the ladder lands on a longitudinal or athwartship permanent means of access fitted within that range. Adjacent sections of the ladder should be laterally offset from each other by at least the width of the ladder. (Paragraph 20 of MSC/Circ.686)

(D) Access from deck to a double bottom space may be by means of vertical ladders through a trunk. The vertical distance from deck to a resting platform, between resting platforms or a resting platform and the tank bottom is not be more than 6 m unless otherwise approved by the Administration.

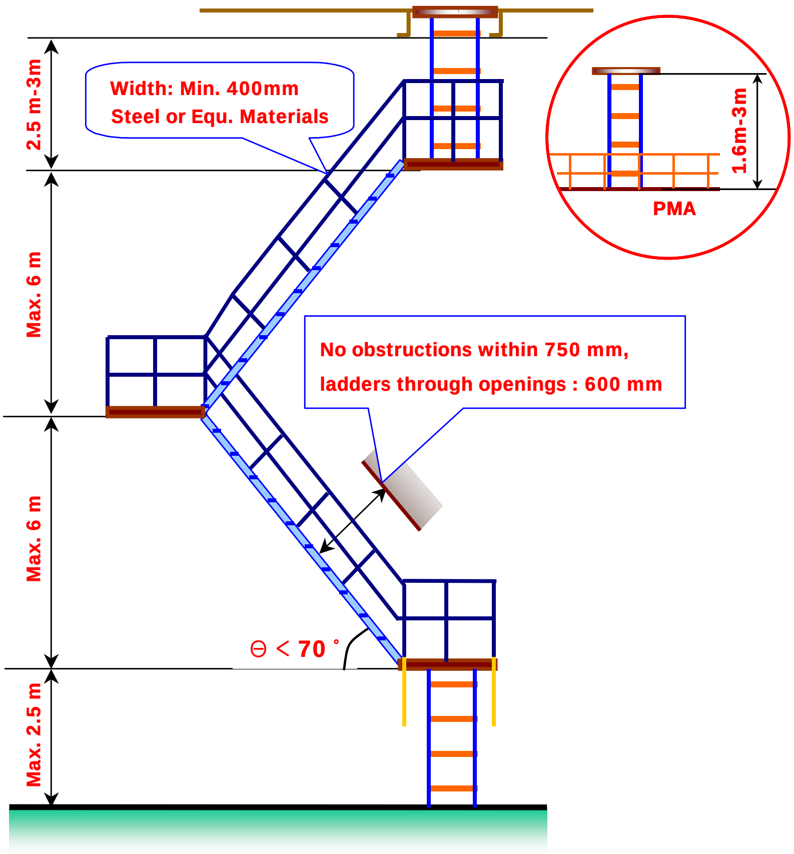
(2) MA for inspection of the vertical structure of oil tankers:

Vertical ladders provided for means of access to the space may be used for access for inspection of the vertical structure.

Unless stated otherwise in Table 1 of TP, vertical ladders that are fitted on vertical structures for inspection should comprise one or more ladder linking platforms spaced not more than 6 m apart vertically and displace to one side of the ladder. Adjacent sections of ladder should be laterally offset from each other by at least the width of the ladder. (Paragraph 20 of MSC/Circ.686)

(3) Obstruction distances

The minimum distance between the inclined ladder face and obstructions, i.e. 750 mm and, in way of openings, 600 mm specified in **202. 5.** of the Rules is to be measured perpendicular to the face of the ladder.



5. In application of **202. 6.** of the Rules, the details are as follows.

(1) Vertical height of handrails is not to be less than 890 mm from the center of the step and two course handrails are to be provided.

(2) The requirement of two square bars for treads specified in TP 3.6 is based upon the specification of construction of ladders in paragraph 3(e) of Annex 1 to resolution A.272(VIII), which addresses inclined ladders. TP.3.4 allows for single rungs fitted to vertical surfaces, which is considered for a safe grip. For vertical ladders, when steel is used, the rungs should be formed of single square bars of not less than 22 mm by 22 mm for the sake of safe grip.

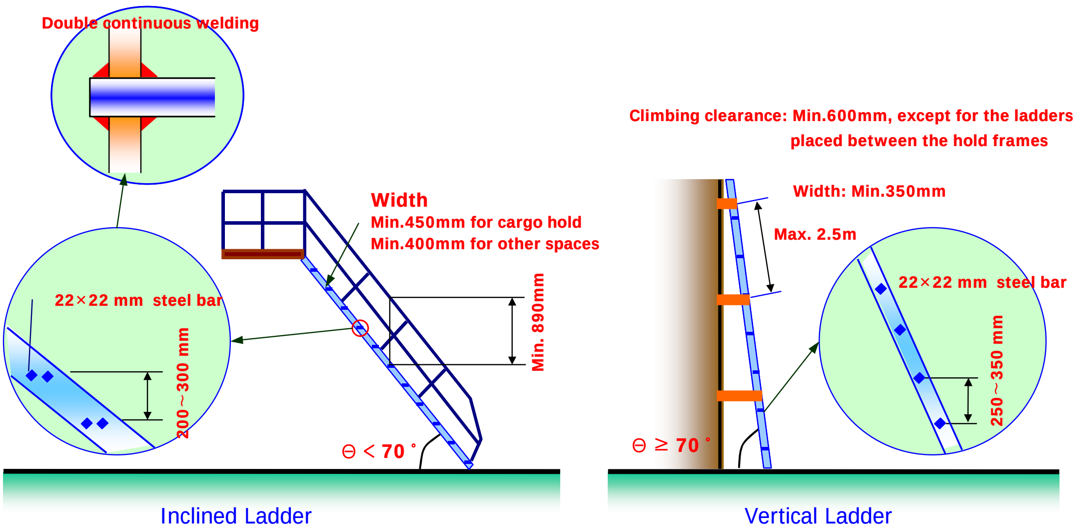
(3) The width of inclined ladders for access to a cargo hold is to be at least 450 mm to comply Australian AMSA Marine Orders Part 32, Appendix 17.

(4) The width of inclined ladders other than an access to a cargo hold is to be not less than 400 mm.

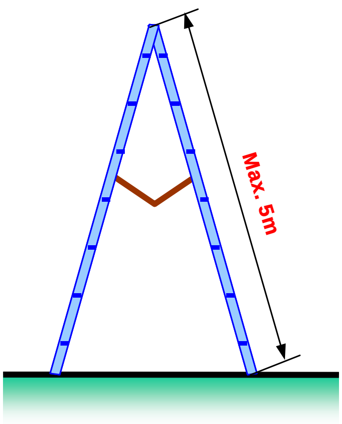
(5) The minimum width of vertical ladders is to be 350 mm and the vertical distance between the rungs is to be equal and is to be between 250 mm and 350 mm.

(6) A minimum climbing clearance in width is to be 600 mm other than the ladders placed between the hold frames.

(7) The vertical ladders should be secured at intervals not exceeding 2.5 m apart to prevent vibration.



6. In application of **202. 8.** of the Rules, the details are as follows.

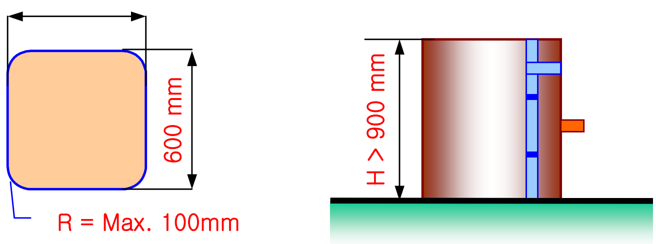


7. In application of **202. 9.** of the Rules, the details are as follows.

A mechanical device such as hooks for securing at the upper end of a ladder is considered an appropriate securing device if a movement fore/aft and sideways can be prevented at the upper end of the ladder.

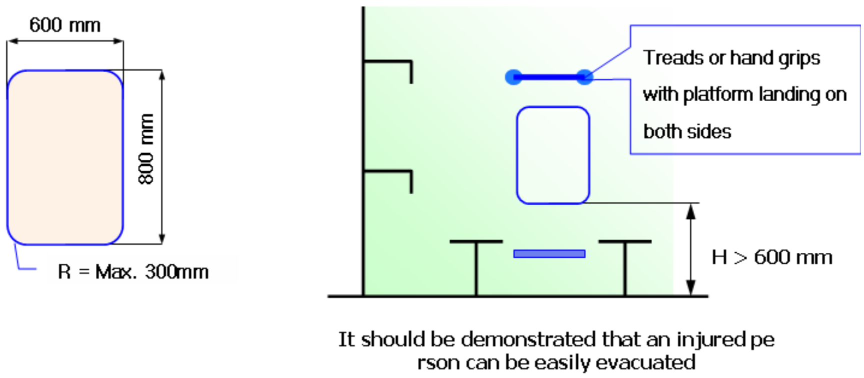
8. In application of **202. 10.** of the Rules, the details are as follows.

See interpretation for paragraphs 5.1 of the regulation



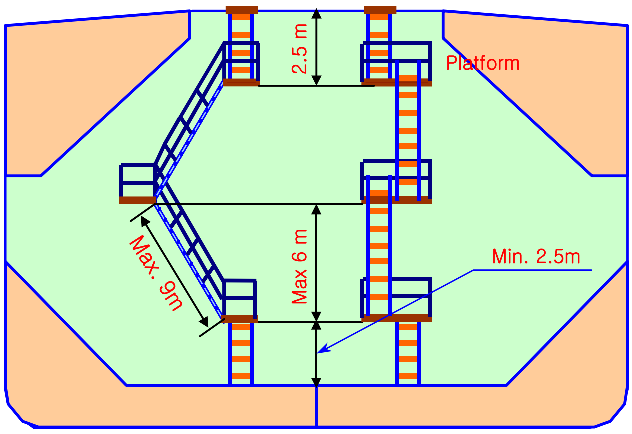
9. In application of **202. 11.** of the Rules, the details are as follows.

See interpretation for paragraphs 5.2 of the regulation

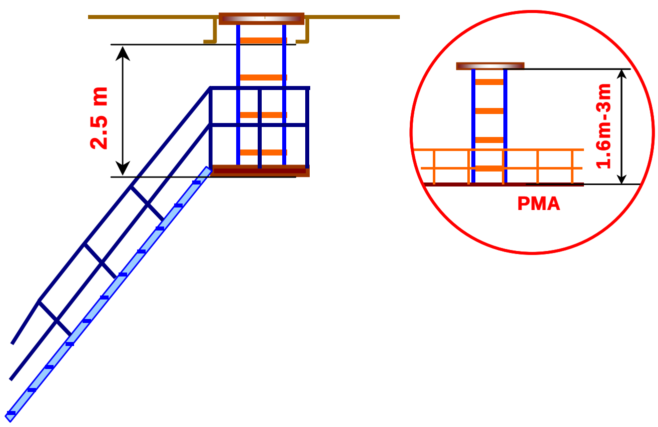


10. In application of **202. 13.** of the Rules, the details are as follows.

Either a vertical or an inclined ladder or a combination of them may be used for access to a cargo hold where the vertical distance is 6 m or less from the deck to the bottom of the cargo hold.



11. In application of **202. 14.** of the Rules, the details are as follows.



203. Corrosion protection

In application of **203.** of the Rules, the details are as follows.

1. Permanent means of access in dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers

(1) Permanent means of access arrangements that are integral to the ship structure shall be coated in accordance with the Performance standard for protective coatings for dedicated seawater ballast tanks of all types of ships and double-side skin spaces of bulk carriers (PSPC) (resolution MSC.215(82)).

(2) Guidelines for PMAs that are not part of the structural strength elements

(A) Hot dip galvanizing should be employed as the primary means for corrosion protection for the ladders, rails, walkways, gratings, stanchions, etc. Hot dip galvanizing and repairs of damages should be performed in accordance with KS D ISO 1461

(B) The galvanized items should be subsequently coated in accordance with KS M ISO 12944-5 or the coating manufacturer's recommendation.

(C) Where protective coating is applied as the sole means of corrosion protection for these PMAs, the standard in resolution MSC.215(82) should be applied to the extent possible. In such cases, the protective coating should at least comply with the requirements of the PSPC for the job specification, coating system (epoxy-based system) and total NDFT (320 µm).

2. Permanent means of access in void spaces

(1) Permanent means of access arrangements in void spaces that are integral to the ship structure should be coated in accordance with the Performance standard for protective coatings for void spaces (resolution MSC.244(83)).

(2) Guidelines for PMAs that are not part of the structural strength elements

(A) Hot dip galvanizing should be employed as the primary means for corrosion protection for these PMAs. The galvanized items should be subsequently coated according to the coating manufacturer's recommendation.

(B) Where protective coating is applied as the sole means of corrosion protection for these items, the Performance standard for protective coatings for void spaces (resolution MSC.244(83)), should be applied to the extent possible. In such case, the protective coating should at least comply with the requirements for the coating system (epoxy-based system) and total NDFT (200 µm) of that standard. ⚓

Annex 4-1
Cone Couplings of Rudder Stocks and Rudder Main Pieces

1. When rudder stocks and rudder main pieces consist with cone couplings without key (cone couplings having hydraulic devices which is consist with hydraulic nuts and oil infusion for assemble and disassemble of coupling), required push-up force and push-up length is to be standard base as obtained from the following formula.

Push-up force (F) : $F = \frac{2T_R f_{s1}}{\mu_2 d_m}\left(\mu_1 + \frac{1}{2k}\right)$ (kN)

Push-up length (l) : $l = 4k\left(\frac{T_R f_{s1} \times 10^3}{\pi E \mu_2 d_m l (1-c^2)} + R_t\right)$ (mm)

Permissible maximum push-up length (l_a) : $l_a = 2k\left(\frac{d_m \sigma_y}{E\sqrt{(3+c^4)} f_{s2}} + 2R_f\right)$ (mm)

d_m = mean diameter in corn part of rudder stock(mm)

d_c = outside diameter of gudgeon in the mid-part of taper in cone part(mm)

c = $\frac{d_m}{d_c}$

μ_1 = 0.02, the fabrication factor for the push-up

μ_2 = 0.15, the factor for slip

R_t = 0.01 mm, mean toughness of contact surface to outside of rudder stock and inside of gudgeons in the cone part.

k = a reciprocal number of taper(12～20) for the diameter of the cone part in rudder stock.

E = young's modulus of material used in gudgeons and rudder stocks. For steel, 2.06×10^5 (N/mm^2)

σ_y = yield stress of the material used in gudgeons(N/mm^2)

f_{s1} = not less than 3.0, The safety factor for slip

f_{s2} = not less than 1.25, The safety factor for the strength of gudgeons. However, special consideration is to be given to the coupling which has a large bending moment like as Type C rudder.

l = length of taper at the cone part(mm)

T_R = torque in the cone part of rudder stock(N・m)

2. When rudder stocks and rudder main pieces consist with cone couplings having sludging nuts and key (cone couplings without hydraulic devices), push-up force and push-up length may be applied to the formula described in above **1.** However in this case μ_1 and f_{s1} is 0.14 and 1.5 ⚓

Annex 4-2
Means of Access for Ballast and Cargo Tanks of Oil Tankers

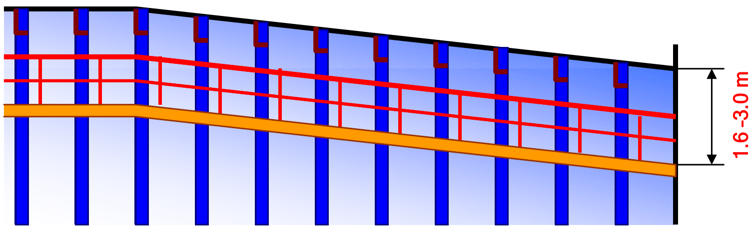
In application of **Ch11, Table 4.11.1** of the Rules, the details are as follows.

1. Water ballast tanks, except those specified in **2.**, and cargo oil tanks

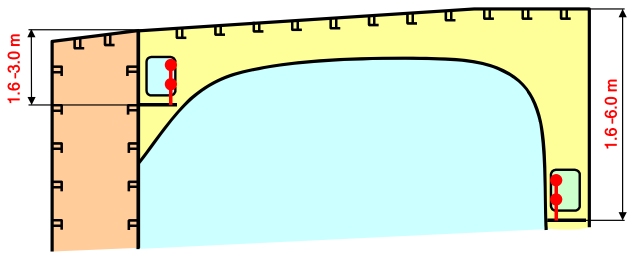
1.1

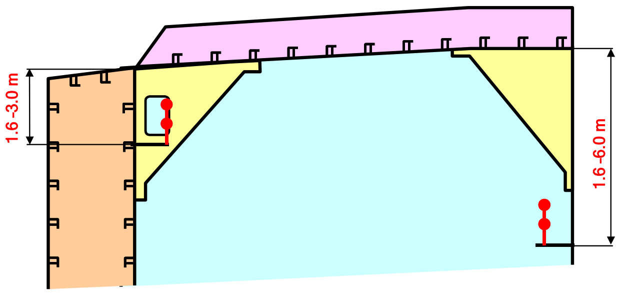
(1) Sub-paragraphs .1, .2 and .3 define access to underdeck structure, access to the uppermost sections of transverse webs and connection between these structures.
(2) Sub-paragraphs .4, .5 and .6 define access to vertical structures only and are linked to the presence of transverse webs on longitudinal bulkheads.
(3) If there are no underdeck structures (deck longitudinals and deck transverses) but there are vertical structures in the cargo tank supporting tranverse and longitudinal bulkheads, access in accordance with sub-paragraphs from .1 through to .6 is to be provided for inspection of the upper parts of vertical structure on transverse and longitudinal bulkheads.
(4) If there is no structure in the cargo tank, section 1.1 of Table 1 is not applicable.
(5) Section 1 of Table 1 is also to be applied to void spaces in cargo area, comparable in volume to spaces covered by the regulation II-1/3-6, except those spaces covered by Section 2.
(6) The vertical distance below the overhead structure is to be measured from the underside of the main deck plating to the top of the platform of the means of access at a given location.
(7) The height of the tank is to be measured at each tank. For a tank the height of which varies at different bays item 1.1 is to be applied to such bays of a tank that have height 6 m and over.

1.1.1



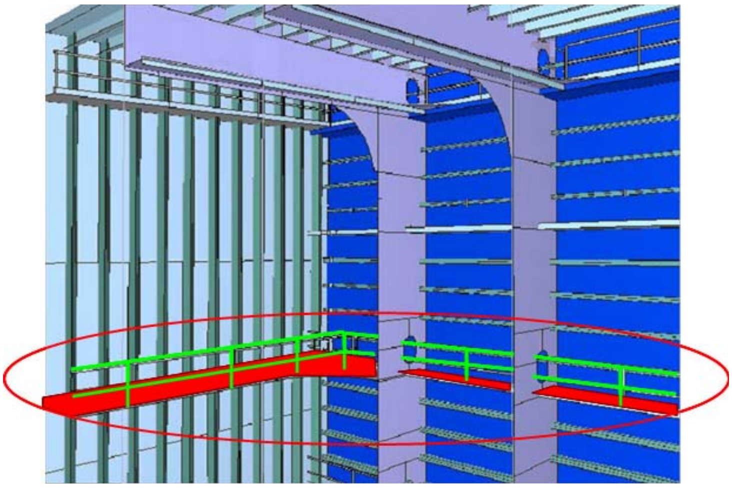
1.1.2 There is need to provide continuous longitudinal permanent means of access when the deck longitudinals and deck transverses are fitted on deck but supporting brackets are fitted under the deck.



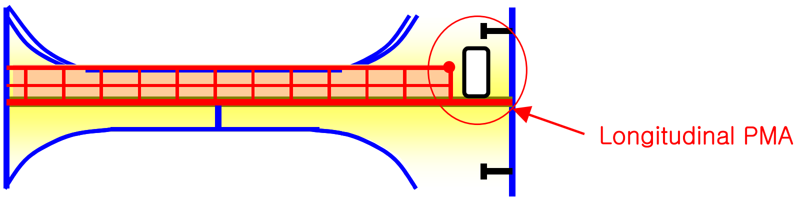


1.1.3 Means of access to tanks may be used for access to the permanent means of access for inspection.

1.1.4 The permanent fittings required to serve alternative means of access such as wire lift platform, that are to be used by crew and surveyors for inspection should provide at least an equal level of safety as the permanent means of access stated by the same paragraph. These means of access shall be carried on board the ship and be readily available for use without filling of water in the tank. Therefore, rafting is not acceptable under this provision. Alternative means of access are to be part of Access Manual which is to be approved on behalf of the flag State



1.1.5



2. Water ballast wing tanks of less than 5 m width forming double side spaces and their bilge hopper sections

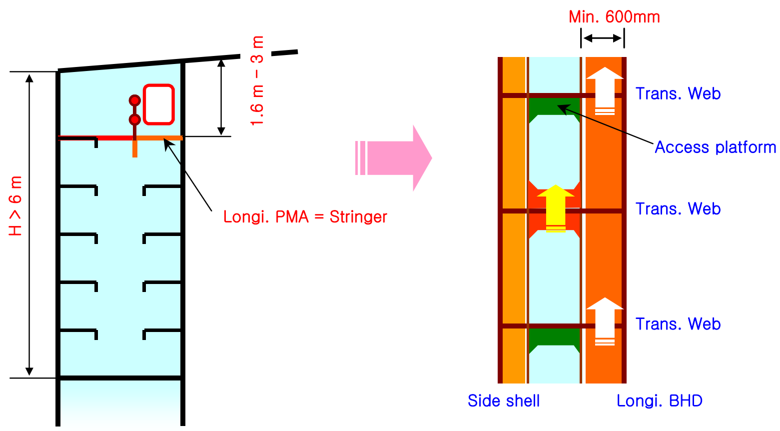
2.1 Section 2 of Table 1 is also to be applied to wing tanks designed as void spaces. Paragraph 2.1.1 represents requirements for access to underdeck structures, while paragraph 2.1.2 is a requirement for access for survey and inspection of vertical structures on longitudinal bulkheads (transverse webs).

2.1.1

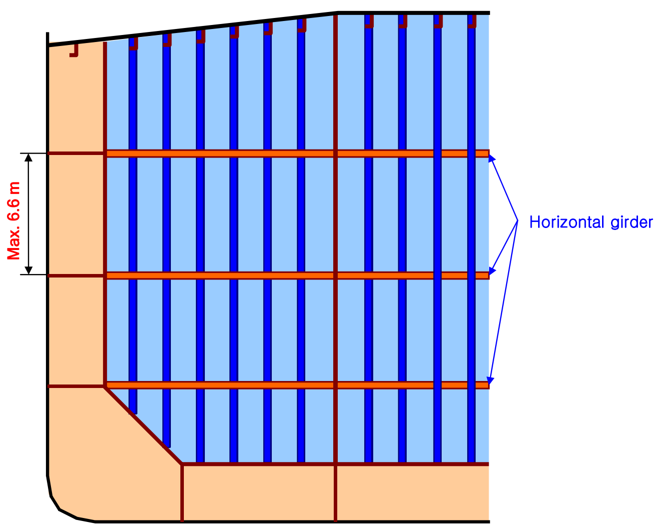
(1) For a tank the vertical distance between horizontal upper stringer and deck head of which varies at different sections item 2.1.1 is to be applied to such sections that falls under the criteria.

(2) The continuous permanent means of access may be a wide longitudinal, which provides access to critical details on the opposite side by means of platforms as necessary on web frames. In case the vertical opening of the web frame is located in way of the open part between the wide longitudinal and the longitudinal on the opposite side, platforms shall be provided on both sides of the web frames to allow safe passage through the web frame.

(3) Where two access hatches are required by SOLAS regulation II-1/3-6.3.2, access ladders at each end of the tank are to lead to the deck.



2.1.2 The continuous permanent means of access may be a wide longitudinal, which provides access to critical details on the opposite side by means of platforms as necessary on web frames. In case the vertical opening of the web is located in way of the open part between the wide longitudinal and the longitudinal on the opposite side, platforms shall be provided on both sides of the web to allow safe passage through the web. A "reasonable deviation" as noted in TP/1.4, of not more than 10% may be applied where the permanent means of access is integral with the structure itself.

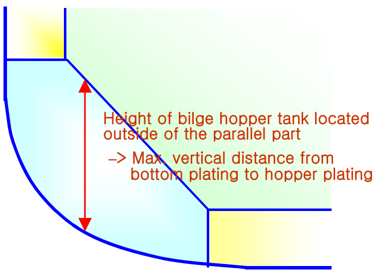


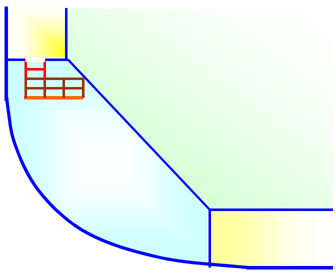
2.2

(1) Permanent means of access between the longitudinal continuous permanent means of access and the bottom of the space is to be provided.

(2) The height of a bilge hopper tank located outside of the parallel part of vessel is to be taken as the maximum of the clear vertical distance measured from the bottom plating to the hopper plating of the tank.

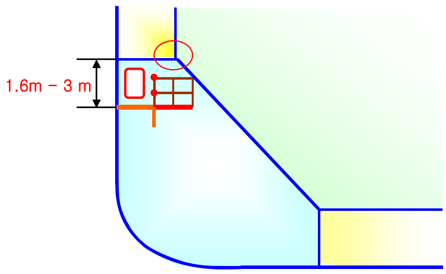
(3) The foremost and aftmost bilge hopper ballast tanks with raised bottom, of which the height is 6 m and over, a combination of transverse and vertical MA for access to the upper knuckle point for each transverse web is to be accepted in place of the longitudinal permanent means of access.

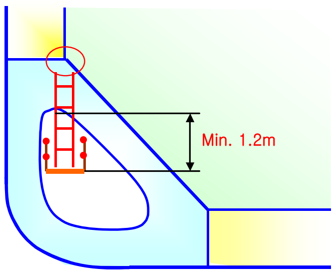




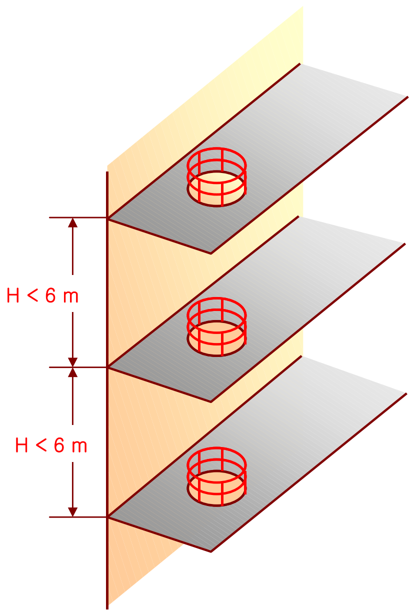
2.2.1

2.2.2





2.3



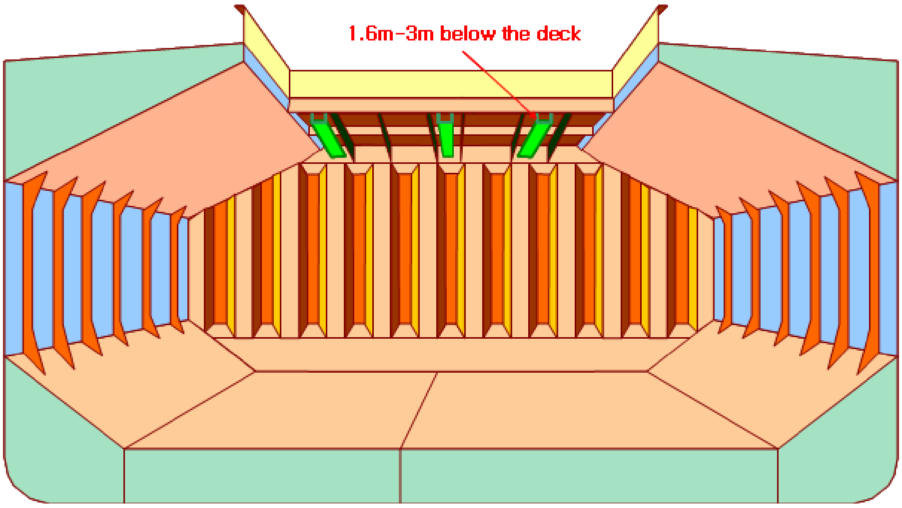
Annex 4-3 Means of Access for Bulk Carriers

In application of **Ch11, Table 4.11.2** of the Rules, the details are as follows.

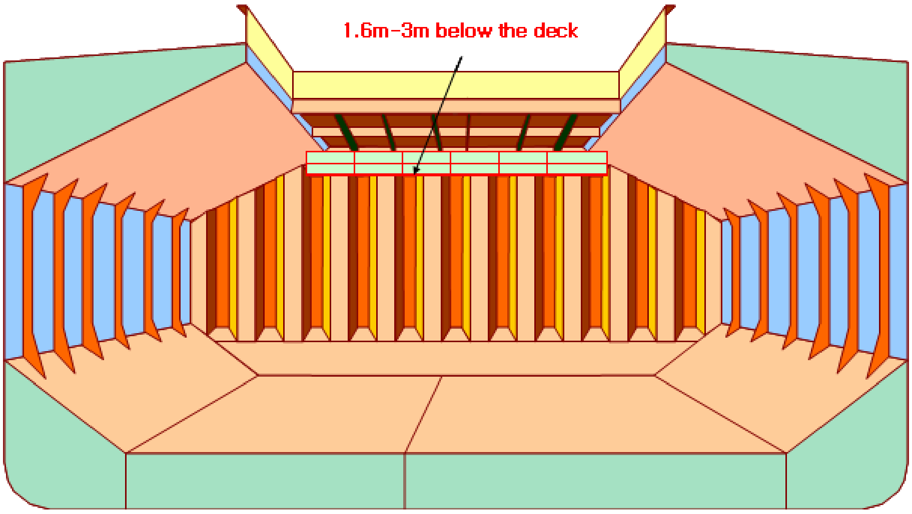
1. Cargo holds

1.1

(1) Means of access shall be provided to the crossdeck structures of the foremost and aftermost part of the each cargo hold.
(2) Interconnected means of access under the cross deck for access to three locations at both sides and in the vicinity of the centerline is acceptable as the three means of access.
(3) Permanent means of access fitted at three separate locations accessible independently, one at each side and one in the vicinity of the centerline is acceptable.
(4) Special attention is to be paid to the structural strength where any access opening is provided in the main deck or cross deck.
(5) The requirements for bulk carrier cross deck structure is also considered applicable to ore carriers.

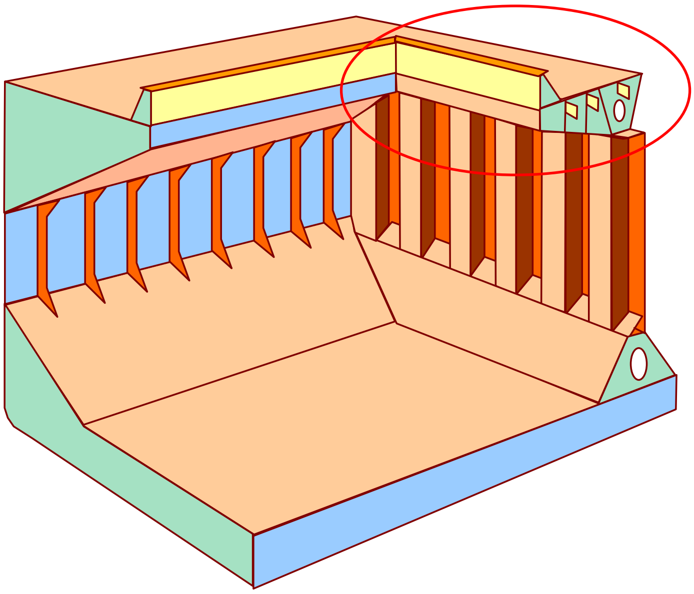


1.2



1.3 Particular attention is to be paid to preserve the structural strength in way of access opening provided in the main deck or cross deck.

1.4 "Full upper stools" are understood to be stools with a full extension between top side tanks and between hatch end beams.

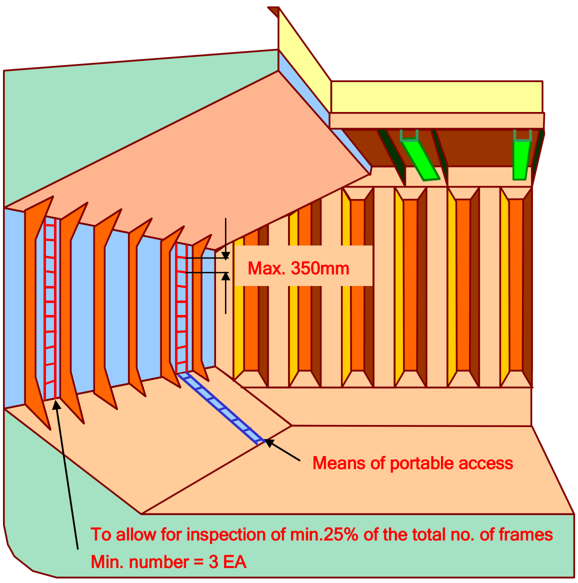


1.5

(1) The movable means of access to the underdeck structure of cross deck need not necessarily be carried on board the vessel. It is sufficient if it is made available when needed.
(2) The requirements for bulk carrier cross deck structure is also considered applicable to ore carriers.

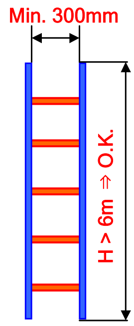
1.6

(1) The maximum vertical distance of the rungs of vertical ladders for access to hold frames is to be 350 mm.
(2) If safety harness is to be used, means should be provided for connecting the safety harness in suitable places in a practical way.



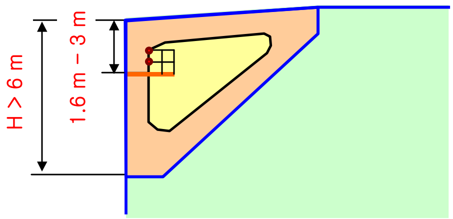
1.7 Portable, movable or alternative means of access also is to be applied to corrugated bulkheads.

1.10

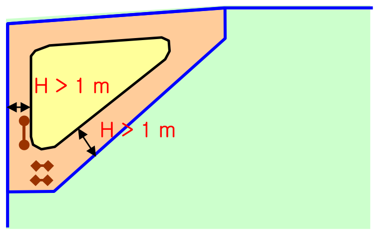


2. Ballast tanks

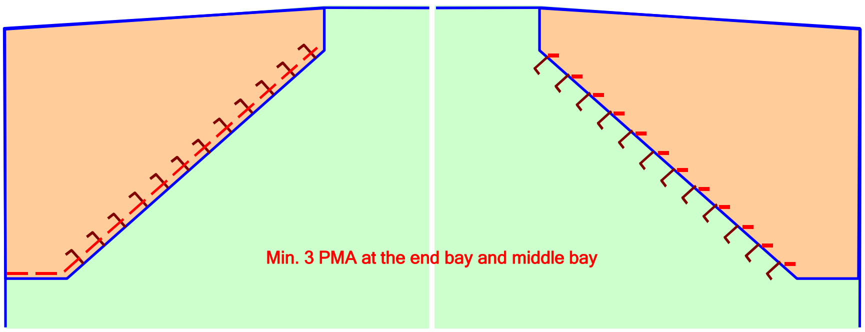
2.1



2.2



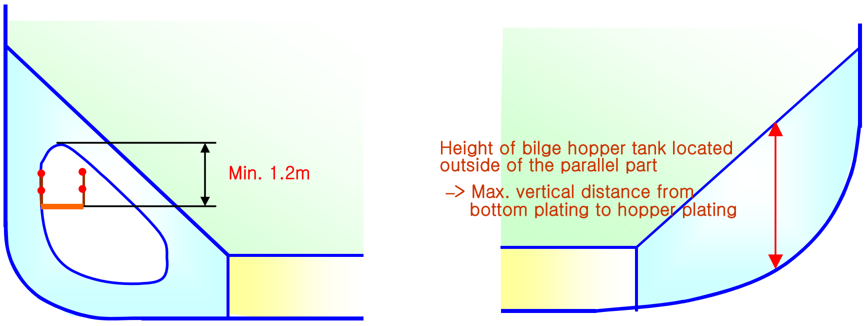
2.3 If the longitudinal structures on the sloping plate are fitted outside of the tank a means of access is to be provided.



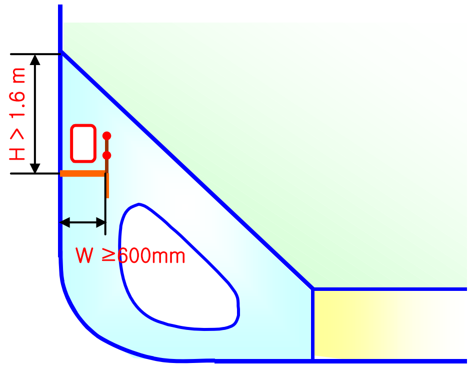
2.5

(1) The height of a bilge hopper tank located outside of the parallel part of vessel is to be taken as the maximum of the clear vertical height measured from the bottom plating to the hopper plating of the tank.

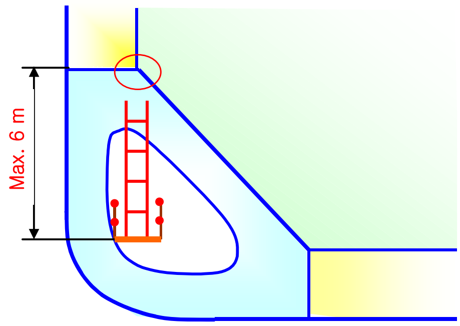
(2) It should be demonstrated that portable means for inspection can deployed and made readily available in the areas where needed.



2.5.2 A wide longitudinal frame of at least 600 mm clear width may be used for the purpose of the longitudinal continuous permanent means of access.



2.5.3



2.6 The height of web frame rings should be measured in way of side shell and tank base. ⚓

Part 5

Machinery Installations

RA-05-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF PART 5 "MACHINERY INSTALLATIONS"

1. Unless expressly specified otherwise, the requirements in the rules apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date 1 July 2011 (based on the contract date for construction)

CHAPTER 1 GENERAL

Section 2 Plans and Documents
- 202. 1 has been amended.

Section 3 Tests and Inspections
- 305. has been amended.

CHAPTER 2 MAIN AND AUXILIARY ENGINES

Section 2 Internal Combustion Engines
- 203. 9 has been amended.

CHAPTER 3 PROPULSION SHAFTING AND POWER TRANSMISSIONS

Section 4 Power Transmission Systems
- 401. 5 has been amended.

CHAPTER 5 BOILERS AND PRESSURE VESSELS

Section 3 Pressure vessels
- 301. 3 has been amended.

CHAPTER 6 AUXILIARIES AND PIPING ARRANGEMENT

Section 2 Air Pipes, Overflow Pipes and Sounding Devices
- 203. 4 (3) has been amended.

Section 4 Bilge and Ballast System
- 401. 2 (3) has been amended.

Section 9 Fuel Oil System
- 901. 7. (3) (B) has been amended.

CHAPTER 7 STEERING GEARS

Section 1 General

- 102. 1 (1), (2) and (4) have been amended.
- 103. 1 (1) (B) has been amended.

Section 4 Materials, Constructions and Strength

- 401. has been amended.
- 407. 1 has been amended.
- 408. Steering chains, rods, blocks, etc. has been deleted.
- Article No. 409 has been modified to 408 and pars.1 and 3 have been amended.
- Article No. 410 has been modified to 409.

Section 6 Additional Requirements Concerning Tankers of 10,000 Gross Tonnage and Upwards and Other Ships of 70,000 Gross Tonnage and Upwards

- 601. 2 (1) has been amended.

CHAPTER 8 WINDLASSES AND MOORING WINCHES

Section 2 Windlasses

- 204. 1 and 2 have been amended.

CONTENTS

CHAPTER 1 GENERAL

Section 1 General

101. Application

1. The requirements of this Part apply to the machinery installations intended for the ships which have no special limitations for their service area and purpose. For machinery installations intended for the ships having any limitations for their service area or intended for the small ships, the requirements in this Part may be modified. Special consideration is to be given to the ships with any limitations for their purpose.

2. The machinery installations which do not comply with the requirements of this Part may be accepted, provided that they are considered acceptable by the Society.

3. For the strength and construction of the parts of machinery on which the requirements of the Rules cannot be applied, the manufacturer is to submit for approval the detailed methods of strength calculation and data to the Society and the reliability for the strength of the parts may be decided from the results of measuring strain or deformation of them by means of a proper loading method approved by the Society. For machinery of new design, the Society may request plans and design data of more detailed parts to be submitted in addition to those specified in the Rules.

4. Since the formulae for the strength of the parts of machinery in the Rules are based upon the consideration that there is no dangerous vibration in the installation within the range of operating speeds, the manufacturers of the machinery are required to pay special attention to this point and take responsibility in the application of these formulae.

5. For the purpose of determining the power of main and auxiliary internal combustion engines, the ambient reference conditions are to be such as given in **Table 5.1.1.** However, the engine manufacturers shall not be expected to provide simulated ambient reference conditions at a test bed.

6. The ship intended to be registered and classed as the ship strengthened for navigation in ice is to be in accordance with the relevant requirements of **Pt 3**, **Ch 20**, in addition to the requirements in this Part.

7. The ships for navigation in polar waters and the vessels for polar and ice breaking service are to comply with the relevant requirements in **Pt 3, Ch 21** and **Pt 3, Ch 22** respectively, in addition to the requirements in this part.

Table 5.1.1 Ambient Reference Conditions

Description	Ambient reference conditions
Total barometric pressure	0.1 MPa
Air temperature	45 °C
Relative humidity	60 %
Sea water temperature (charge air coolant-inlet)	32 °C

102. Definitions

1. The maximum continuous output of engine is the maximum output at which the engine can run safely and continuously in the running condition at full load draught, in the engine for propulsion (hereinafter referred to as "**main engine**"). In the engine excluding main engine (hereinafter referred to as "**auxiliary engine**"), the maximum continuous output of engine is the maximum output at which the engine can run safely and continuously in the intended condition.

2. Number of maximum continuous revolutions is the number of revolutions at the maximum continuous output.

3. Propeller shaft Kind 1 or Stern tube shaft Kind 1 is the shaft which is provided with effective measures against corrosion by sea water, or the shaft which is made of approved corrosion resistance material. The propeller shaft or stern tube shaft other than specified above is Kind 2.

4. Design pressure is a pressure used in the calculations made to determine the scantlings of each component and is the maximum permissible working pressure to the component. However, the design pressure is to be not less than the highest set pressure of any relief valve.

5. Essential auxiliaries are the auxiliary machinery for important use, and are those for propulsion of ships and for safety of lives and ships or those for facilities in relation to the purpose of ships.

6. Boiler is the plant which generates steam or hot water by means of flame, combustion gas or other hot gases, including the equipment subject to a boiler.

7. Main boiler means the boiler used in moving the propulsion steam engines.

8. Essential auxiliary boiler means the auxiliary boiler other than the main boiler, which is used in supplying steam need for operating generators, auxiliary machinery in relation to the propulsion of ships, safety of lives and ships or the purpose of ships.

9. Exhaust gas boiler is a boiler which generates steam or hot water solely by exhaust gas from internal combustion engine and has a steam space or a hot well and has an outlet of steam or hot water.

10. Exhaust gas economizer is the equipment without any steam space or hot well which generates steam or hot water solely by exhaust gas from internal combustion engine and supplies to other boiler.

11. Thermal oil installation is the arrangement in which thermal oil is heated and circulated for the purpose of heating cargo or fuel oil or for production of steam and hot water for auxiliary purpose.

12. Pressure vessel is a vessel which contains gas or liquid, intended for the pressure exceeding the atmospheric pressure at its top. It includes heat exchangers and does not contact with flame, combustion gas or hot gas.

13. Equipment subject to a boiler means the superheaters, reheaters and economizers (where a stop valve is fitted between them and the main body of the boiler) and the equivalent.

14. Attachment of boiler and pressure vessel means the following;

(1) Flanges, stand pipes and distance pieces attached directly to boilers, equipment subject to a boiler, and pressure vessels
(2) Valves attached directly to boilers, equipment subject to a boiler, and pressure vessels

15. Valve attached directly to boilers and pressure vessels is the valve attached to body of boilers or pressure vessels by stud bolts, flange, stand pipe or distance piece, and includes the screw down check valve specified in **Ch 5, 127. 1**.

16. Stand pipe means the following attached directly to body of boilers and pressure vessels;

(1) Pipe and nozzle
(2) Penetration piece consisting of flange and pipe attached directly to boilers and pressure vessels for the purpose of fitting the valve attached directly to body of boilers and pressure vessels.
(3) Rings for installation of manhole, mud holes and peep holes

17. Distance piece in boilers and pressure vessels is a piece used for keeping the distance between flange or stand pipe attached directly to boilers and pressure vessels, and valve attached directly to boilers and pressure vessels, or gauges.

18. Essential pressure vessel is a pressure vessel having relevance to main engines, essential auxiliary boilers, auxiliary machinery having relevance to propulsion, auxiliary machinery having relevance to safety of lives and ships, and auxiliary machinery having relevance to service of ships.

19. Nominal pressure of the boiler with superheater is the maximum steam pressure of superheater outlet designed by the manufacturer or the owner, and is used the standard for setting the safety valve of superheater.

20. Heating surface area of a boiler is the area calculated on the combustion gas side surface where one side is exposed to combustion gas and the other side to water, but the heating surface of superheater, reheater, economizer or exhaust gas economizer is excluded, unless specially specified.

21. Dead ship condition means a condition under which :

(1) the main propulsion plant, boilers and auxiliaries are not in operation due to the loss of the main source of electrical power, and
(2) in restoring the propulsion, no stored energy for starting the propulsion plant, the main source of electrical power and other essential auxiliary machinery is assumed to be available. It is assumed that means are available to start the emergency generator at all times.

22. Piping system is a general term of pipes, valves and pipe fittings.

23. Flexible hose assembly is the short length of metallic or non-metallic hose normally with pre fabricated end fittings ready for installation.

24. Ship-side valve means the valve attached to bottom or side of ship in accordance with **Ch 6, 301. 1.**

103. Construction, materials and installation

1. The construction, installation, lubricating system and cooling system of machinery are to be such that they cause no hindrance to their proper operations under the condition as given in **Table 5.1.2.**

2. All components and systems of machinery are to be designed to ensure proper operation under the temperature conditions given in **Table 5.1.3.**

3. Means are to be provided to ensure that machinery installations can be brought into operation from the dead ship condition without external aid.

4. Materials intended for the main parts of machinery are to be of fine quality in accordance with the requirements of **Pt 2, Ch 1.** The process of manufacturing each part is to be in accordance with the best method based on the past experiences and results. The materials other than those prescribed in the Rules may, however, be used where sufficient data are submitted in connection with the design and are specially approved.

Table 5.1.2 Angle of inclination

Type of machinery installations	Angle of inclination (deg)(2)			
	Athwart-ships		Fore-and-aft	
	Static	Dynamic	Static	Dynamic
Main and auxiliary machinery	15	22.5	5(4)	7.5
Safety equipment (emergency power installations, emergency fire pumps and their devices) Switch gear(1) (electrical and electronic appliances and remote control systems)	22.5(3)	22.5(3)	10	10

NOTES:
(1) Up to an angle of inclination of 45° no undesired switching operation or operational changes may occur.
(2) Athwartships and fore-and-aft inclinations may occur simultaneously.
(3) In ships for the carriage of liquefied gases and of chemicals the emergency power supply must also remain operable with the ship flooded to a final athwartships inclination up to a maximum of 30 degrees.
(4) Where the length of the ship exceeds 100 m, the fore-and-aft static angle of inclination may be taken as $500/L$ degrees. (L : Length of the ship as defined in **Part 3, Ch 1, 102.** of the Rules, m)

Table 5.1.3 Temperature conditions

Installed location		Temperature range(°C)
Air	In enclosed spaces	0~45(1)
	On machinery components, boilers in spaces subject to higher or lower temperature	According to specific local conditions
	On the open deck	-25~45(1)
Sea water	-	32(1)

NOTE:
(1) The Society may approve other temperatures in the case of ships intended for restricted service.

5. Astern power for main propulsion

(1) In order to maintain sufficient maneuverability and secure control of the ship in all normal circumstances, the main propulsion machinery is to be capable of reversing the direction of thrust so as to bring the ship to rest from the maximum service speed. The main propulsion machinery is to be capable of maintaining in free route astern at least 70 % of the ahead revolutions corresponding to the maximum continuous ahead power.
(2) For the main propulsion systems with reversing gears, controllable pitch propellers or electric propeller drive, running astern should not lead to the overload of propulsion machinery.
(3) The reversing characteristics of the propulsion plants are to be demonstrated and recorded during trials.
(4) Where steam turbines are used for main propulsion, they are to be capable of maintaining in free route astern at least 70 % of the ahead revolutions corresponding to the maximum continuous ahead power for a period of at least 15 minutes. The astern trial is to be limited to 30 minutes or in accordance with manufacturer's recommendation to avoid overheating of the turbine due to the effects of "windage" and friction.

6. The rotating, reciprocating and high temperature parts and electrically charged parts are to be arranged with suitable protections for the safety of watchmen, operators or men neighbouring to these parts. Nuts of important parts and moving parts are to be well secured by effective means to prevent from loosening.

7. All surfaces of machinery installations with high temperature above 220 °C e.g. steam, thermal oil and exhaust gas lines, silencers, exhaust gas boilers, turbo blowers, etc and which may be impinged as a result of leakage of flammable fluid, are to be effectively insulated with non-combustible material to prevent the ignition of combustible materials coming into contact with them. Where the insulation is oil absorbent or may permit the penetration of oil, the insulation are to be encased in steel sheathing or equivalent material.

104. Automatic control device

Automatic or remote control devices for propelling machinery, essential auxiliaries or cargo handling gears, and specifically, the facilities of unmanned operation of engines are to be in accordance with the requirements of **Pt 6, Ch 2.**

105. Anti-freezing devices

The machinery fitted in ships which may serve in cold districts are to be provided with equipment for prompt starting and adequate devices to prevent the fuel oil or lubricating oil from coagulation. Suction and discharge openings to sea are to be suitably protected from becoming blocked up with ice.

106. Communication between navigating bridge and machinery spaces

At least two independent means are to be provided for communicating orders from the navigating bridge to the position in the machinery space or in the control room from which the speed and direction of thrust of the propellers are normally controlled. One of these are to be an engine-room telegraph which provides visual indication of the orders and responses both in the machinery spaces and on the navigating bridge. Appropriate means of communication are to be provided from the navigating bridge and the engine-room to any other position from which the speed or direction of thrust of the propellers may be controlled.

107. Engineers′ alarm

An engineers' alarm is to be provided to be operated from the engine control room or at the manoeuvring platform as appropriate and is to be clearly audible in the engineers accommodation.

108. Ventilating systems in machinery spaces

Machinery spaces of *Category A* are to be adequately ventilated so as to ensure that when machinery or boilers therein are operating at full power in all weather conditions including heavy weather, an adequate supply of air is maintained to the spaces for the safety and comfort of personnel and the operation of the machinery. And other machinery space is to be adequately ventilated appropriate for the purpose of that machinery space.

109. Protection against noise

Measures are to be taken to reduce machinery noise in machinery spaces to acceptable levels as determined by the Administration. If this noise can not be sufficiently reduced, the source of excessive noise is to be suitably insulated or isolated or a refuge from noise is to be provided if the space is required to be manned. Ear protectors are to be provided for personnel required to enter such spaces, if necessary.

Section 2 Plans and Documents

201. Plans and documents

1. Before the work is commenced, the shipyards or the manufacturers of machinery are to submit plans in triplicate and a copy of documents, specified in this Section, to the Society for approval. Where, however, the machinery is considered acceptable by the Society or is of the similar model already approved by the Society, the submission of plans and documents may be partially or wholly omitted according to the discretion of the Society. The plans intended for approval are to be contained such descriptions to be clearly stated the materials used, scantlings, arrangements, method of fixing and other matters in compliance with the requirements of the Rules. The Society, where considered necessary, may require further plans and documents other than those specified in this Section.

2. Where a licensee manufactures engines with the drawings and data of the engine licensor's which have been already approved by the Society, the licensee is to submit documents to the Society for each engine type, as follows;

(1) For drawings and data as per **Table 5.1.4**, the list including relevant drawing numbers and revision status from both licensor and licensee is to be submitted.
(2) Where licensee proposes design modification to components, relevant drawings and data are to be submitted. In case of significant modifications such as strength, safety and performance, a statement confirming the licensor's acceptance of the changes is also to be submitted.
(3) A complete set of drawings and data are to be provided for attending Surveyor's review at his request for test and inspection.

202. Plans and documents to be submitted by the shipyard

1. Plans for approval

(1) Machinery room arrangement.
(2) Installation of main engine, reduction gear, reversing gear and boiler.
(3) Shaft arrangement(including the structural details of strut)
(4) Various piping diagrams on board and in engine room of the ship.
(5) Details of fuel oil tanks not built in as the part of hull
(6) Calculation sheets for torsional vibration.(See **Ch 4, Sec 1**)

2. Documents

(1) Machinery part specification, and specification and instructions in connection with automation.
(2) List of particulars on main engine, boiler, shaft arrangement, main auxiliaries, etc. in engine room.
(3) Material specifications for main component parts.
(4) strength calculations for main component parts.
(5) Shafting alignment calculations.(where considered necessary by the Society)

203. Plans and documents to be submitted by the manufacturers of internal combustion engines

Table 5.1.4 Plans and documents of internal combustion engines

No.	A/R[(1)]	Plans and documents
1	R	Engine particulars (kind, type, maximum continuous output, maximum continuous revolution, firing order, maximum pressure in cylinders, mean effective indicated pressure, brake mean effective pressure, weight of reciprocating parts of each cylinder, weight and diameter of flywheel, weight and radius of balance weight as well as its position, and specifications of exhaust gas turbocharger, etc. are to be stated. They are to be submitted in accordance with the separated sheet of the Society as possible)
2	R	Engine transverse cross-section
3	R	Engine longitudinal section
4	R/A*	Bedplate and crankcase (Approval refers to welded design only. For cast design, plans are to be submitted for reference)[(2)]
5	R	Thrust bearing assembly[(3)]
6	R/A*	Thrust bearing bedplate (Approval refers to welded design only. For cast design, plans are to be submitted for reference)[(2)]
7	R/A*	Frame and column (Approval refers to welded design only. For cast design, plans are to be submitted for reference)[(2)]
8	R	Tie rod
9	R	Cylinder cover, assembly
10	R	Cylinder liner
11	A	Crankshaft, details (each cylinder No.)
12	A	Crankshaft, assembly (each cylinder No.)
13	A	Thrust shaft or intermediate shaft (if integral with engine)
14	A	Coupling bolts
15	R	Counter weights (if not integral with crankshaft)
16	R	Connecting rod
17	R	Connecting rod, assembly[(4)]
18	R	Crosshead, assembly[(4)]
19	R	Piston rod, assembly[(4)]
20	R	Piston, assembly
21	R	Camshaft drive, assembly
22	A	Material specifications of main parts with information on non-destructive material tests and pressure tests
23	A	Sectional assembly of exhaust gas turbocharger
24	R	Arrangement of foundation bolts (for main engine only)
25	A	Schematic layout or other equivalent documents of starting air system on the engine[(5)]
26	A	Schematic layout or other equivalent documents of fuel oil system on the engine[(5)]
27	A	Schematic layout or other equivalent documents of lubricating oil system on the engine[(5)]
28	A	Schematic layout or other equivalent documents of cooling water system on the engine[(5)]
29	A	Schematic diagram of engine control and safety system on the engine[(5)] (including plans for details and arrangements of oil mist detection and alarm arrangements of crankcase)
30	R	Shielding and insulation of exhaust pipes, assembly

Table 5.1.4 Plans and documents of internal combustion engines (continued)

No.	A/R(1)	Plans and documents
31	A	Shielding of high pressure fuel pipes, assembly(6)
32	A	Arrangement of crankcase explosion relief valve(7)
33	R	Operation and service manuals(8)
34	A	Schematic layout or other equivalent documents of hydraulic system (for valve lift) on the engine
35	A	Type test program and type test report
36	A	High pressure parts for fuel oil injection system(9)

(Notes)
1. Where a licensee manufactures engines with the drawings and data of the engine licensor's which have been already approved by the Society, plans and documents to be submitted are to be in accordance with **201. 2**.
2. (1) through (9) in this Table are subject to the following;
   (1) A : for approval, A* : for approval of materials and weld procedure specifications, R : for reference.
   (2) The weld procedure specification is to include details of pre and post weld heat treatment, weld consumables and fit-up conditions.
   (3) If integral with engine and not integrated in the bedplate.
   (4) Only necessary if sufficient details are not shown on the transverse cross section and longitudinal section.
   (5) The system so far as supplied by the engine manufacturer. where engines incorporate electronic control systems a failure mode and effects analysis(FMEA) is to be submitted to demonstrate that failure of electronic control system will not result in the loss of essential services for the operation of the engine and that operation of the engine will not be lost or degraded beyond an acceptable performance criteria of the engine.
   (6) all engines.
   (7) only for engines of a cylinder diameter of 200 mm or more or a crankcase volume of 0.6 m^3 or more.
   (8) Operation and service manuals are to contain maintenance requirements(servicing and repair) including details of any special tools and gauges that are to be used with their fitting/settings together with any test requirements on completion of maintenance.
   (9) The documentations to contain specification of pressure, pipe dimensions and materials.

204. Plans and documents to be submitted by the manufacturers of steam turbines

1. Plans for approval

(1) Sectional assembly.
(2) Turbine casings, rotors and turbine blades.
(3) Details of turbine installation.
(4) Sectional assembly of main condenser.
(5) Welding details for main component parts.

2. Documents

(1) Main particulars of turbines at maximum continuous output (output, number of revolutions per minute of turbine rotor, steam pressure and temperature in steam chests, vacuum of condenser or status of exhaust chamber).
(2) Critical speed of turbine rotors, number of blades in each stage, the number of nozzles in each stage and its arrangement, various piping diagrams, diagrams of control and safety device system, the other data where this Society considers necessary.
(3) Material specifications of main component parts.
(4) Data regarding calculations for torsional vibration of shaftings.(See **Ch 4, Sec 1**)
(5) Strength calculation for turbine rotors and blades.

205. Plans and documents to be submitted by the manufacturers of gas turbine

1. Plans for approval

(1) Sectional assembly
(2) Discs (and/or rotors) of turbine and compressor

(3) Combustion chambers
(4) Details of fixing of moving and stationary blades
(5) Shaft couplings and bolts
(6) Piping arrangements fitted to turbine (including fuel oil, lubricating oil, cooling water, pneumatic and hydraulic system, and indicating pipe materials, pipe sizes and service pressures)
(7) Pressure vessels and heat exchangers (classified in Class I and Class II defined in **Ch 5**) attached to turbine
(8) Details of turbine installation
(9) Turbine Particulars (type and product number of turbine, power and number of revolutions per minute of turbine and compressors at maximum continuous rating, gas pressure and temperatures at turbine inlet and outlet, pressure losses in inlet and exhaust ducts, ambient condition intended for operation, service fuel oil and lubricating oil)
(10) Welding details of principal components
(11) Critical speeds of turbine rotors and compressors
(12) Number of moving blades in each stage
(13) Number and arrangements of stationary blades

2. Documents

(1) Material specifications of principal components
(2) General arrangement
(3) Starting arrangement (attached to turbine)
(4) Inlet air and exhaust gas arrangements
(5) Diagram of turbine control systems
(6) Calculation sheets for strength of principal components
(7) Calculation sheets for vibration of turbine blades
(8) Operation instructions for fuel oil control systems
(9) Illustrative drawing of cooling method for each part of turbine
(10) Maintenance instructions

206. Plans and documents to be submitted by the manufacturers of shafting system

1. Plans for approval

(1) Thrust shaft.
(2) Intermediate shaft.
(3) Propeller shaft.
(4) Stern tube, stern tube bearing and strut bearing.
(5) Coupling and coupling bolts.
(6) Propeller.

2. Documents

(1) Specified data for the calculation of shaft system.
(2) Data regarding calculations for torsional vibration of shaftings.(See **Ch 4, Sec 1**)
(3) Strength calculations for main component parts.

207. Plans and documents to be submitted by the manufacturers of power transmission system

1. Plans for approval

(1) Sectional assembly.
(2) Construction plan for the main component parts for gears, gear shafts, flexible coupling and flexible shafts.
(3) Welding details for main component parts.
(4) Piping arrangements fitted to the power transmission system.

2. Documents

(1) Main particulars (transmitted power and revolutions per minute for each pinion at maximum continuous output, number of teeth in each gear, module, pitch circle diameters, pressure angle of teeth, helix angles, face widths, centre distances, tool tip radius, shape of teeth backlash, amount of profile shift, amount of profile and tooth trace, finishing method of tooth flank, and

its modification are to be stated).
(2) Material specifications for power transmitting parts (chemical properties, heat treatment, quality of material, mechanical properties and its test method are to be stated).
(3) Strength calculations for main component parts.
(4) Data regarding calculations for torsional vibration of shaftings.(See **Ch 4, Sec 1**)

208. Plans and documents to be submitted by the manufacturers of boilers, Class 1 and 2 pressure vessels

1. Plans for approval

(1) General arrangement of boiler and pressure vessel.
(2) Details of boiler shells and headers.
(3) Details of washers for mountings and nozzles.
(4) Arrangement and details for boiler tubes, superheater, reheater, economizer and/or exhaust gas heater.
(5) Arrangement or its diagrams for air preheater and boiler mountings.
(6) Assembly of safety valve and assembly of relief valve.
(7) Welding details of main component parts.
(8) Detail of bursting disk (if installed in accordance with **Ch 5, 124. 5**)

2. Documents

(1) Main particulars (kind, type, design pressure and temperature, steam pressure and temperature at superheater outlet, maximum designed evaporation per hour, radiant heating surface, contact heating surface, temperature of feed water, furnace volume, fuel consumption at maximum evaporation, burning capacity and number of oil burners, setting pressure of safety valve are to be stated).
(2) Strength calculations for main component parts.
(3) Operation instructions (shell type exhaust gas economizer only)

209. Plans and documents to be submitted by the manufacturers of refrigerating machinery

1. Plans for approval

(1) Piping diagrams of refrigerating systems for provision chambers and air conditioning installations
(2) Drawings of pressure vessels exposed to a pressure of the primary refrigerant

2. Documents

(1) The particulars of refrigerating machinery

210. Plans and documents to be submitted by the manufacturers of essential auxiliaries

1. Plans for approval

(1) Sectional assembly (materials of main component parts are to be stated).
(2) Construction plan for shafts

2. Documents

(1) Main particulars (kind of prime mover, output, number of revolutions, capacity, and principal dimensions are to be stated).

3. For steering gears and windlasses, plans and documents in accordance with **Ch 7, 103.** and **Ch 8, 202.**, respectively.

Section 3 Tests and Inspections

301. Shop Tests

Before installation on board, machinery installations are to be tested and inspected at the plant provided with sufficient facilities necessary for the tests in accordance with the relevant requirements of each Chapter and shop trials deemed appropriate by the Society are to be carried out.

302. On board tests

After installation on board, machinery installations are to be tested and inspected in accordance with the relevant requirements of each chapter, and those are to be verified at the sea trials that they have normal functions and are free from excessive vibrations.

303. Omission of tests

Where machinery installations or materials have certificates which are considered appropriate by the Society, a part or all of the tests may be omitted.

304. Additional tests

The Society may require, when deemed necessary, other tests and inspections than those prescribed in this Part or the records of the tests carried out by the manufacturer.

305. Inspections based on Quality Assurance Scheme for Machinery

Where the machinery installations are manufactured by an approval of quality assurance scheme specified in **Guidance for Approval of Manufacturing Process and Type Approval, etc.,** a part or all of tests and inspections in the presence of the Society's Surveyor may be entrusted to the manufacturer.

Section 4 Spare Parts and Tools

401. Application

1. In general the spare parts and tools mentioned in the following Article are to be furnished in the engine room or other convenient places on board. The ships restricted in service area or fishing vessels are to comply with the special requirements given by the Society.

2. Where two or more machinery of same dimension, type and for same service are installed and their parts are exchangeable, the spare parts for one machinery may be acceptable. Where machinery installations whose number exceeds the required number and each capacity is adequate under the normal service condition of the ship, no spare parts are required for the machinery.

402. Internal combustion engines

Description and number of spare parts for main and essential auxiliary engines are to be as given in **Table 5.1.5.**

403. Steam turbine

Description and number of spare parts for main and essential auxiliary steam turbines are to be as given in **Table 5.1.6.**

404. Shafting and power transmission system

Description and number of spare parts for shafting and power transmission system are to be as given in **Table 5.1.7.**

405. Boiler

Description and number of spare parts for boilers are to be as given in **Table 5.1.8.**

406. Essential Auxiliary

Description and number of spare parts for essential auxiliaries are to be as given in **Table 5.1.9.**

407. Tools and Instruments

All ships are to be provided with various tools and instruments as shown in **Table 5.1.10.** ⚓

Table 5.1.5 Spare Parts for Internal Combustion Engines

Item	Remarks	Number required	
		Main engine	Aux. engine
Cylinder cover	Cylinder cover, complete with all valves, joint rings and gaskets.	1	-
	Cylinder cover bolts and nuts, for one cylinder	1/2 set	-
Cylinder liner	Cylinder liner, complete with joint rings and gaskets	1	-
Pistons	Crosshead type : Piston of each type fitted, complete with piston rod, stuffing box, skirt, rings, studs and nuts	1	-
	Trunk piston type : Piston of each type fitted, complete with skirt, rings, studs, nuts, gudgeon pin and connecting rod.	1	-
Piston rings	Piston rings for one cylinder	1 set	1 set
Piston cooling	Telescopic cooling pipes and fittings or their equivalent, for one cylinder unit	1 set	1 set
Cylinder valves	Exhaust valves, complete with casings, seats, springs and other fittings for one cylinder	2 sets	2 sets
	Air inlet valves, complete with casings, seats, springs and other fittings for one cylinder.	1 set	1 set
	Starting air valve, complete with casing, seat, springs and other fittings	1	1
	Relief valve, complete with casing, springs and other fittings	1	1
	Fuel valves, complete with casings, springs and other fittings for one engine (For engine with 3 or more fuel valves per cylinder, 2 fuel valves complete per cylinder and other fuel valves need no casing)	1 set	1/2 set
Fuel injection pumps	Fuel injection pump, complete. When replacement at sea is practicable, a complete set of working parts for one pump (plunger, sleeve, valves, springs, etc.), or equivalent high pressure fuel pump	1	1
Fuel injection piping	High pressure double wall fuel pipe of each size and shape fitted, complete with couplings	1	1
Main bearings	Main bearings or shells for one bearing of each size and type fitted, complete with shims, bolts and nuts	1 set	1 set
Connecting rod bearings	Bottom-end bearings or shells of each size and type fitted, complete with shims, bolts and nuts for one cylinder	1 set	1 set
	Top-end bearings or shells of each size and type fitted, complete with shims, bolts and nuts for one cylinder	1 set	-
	Trunk piston type : Gudgeon pin with bush for one cylinder	-	1 set
Cylinder lubricators	Lubricator, complete, of the largest size, with its driving chain or gear wheels, or equivalent spare part kit	1	-
Scavenging system	Suction and delivery valves for one pump of each type fitted, complete	1 set	-
Gaskets and packings	Special gaskets and packings of each size and type fitted, for cylinder covers and cylinder liners for one cylinder	-	1 set

Table 5.1.6 Spare Parts for Steam Turbines

Item	Remark	Number required
Turbine shaft	Carbon sealing rings, where fitted, with springs for each size sealing rings and type of gland, for one engine	1 set
Oil filters	Strainer baskets or inserts, for filters of special design, of each type and size	1 set

Table 5.1.7 Spare Parts for Shafting and Power Transmission System

Item	Remarks	Number required
Main thrust bearing	Pads for one face of tilting pad type thrust with liners, or rings for turbine adjusting block with assorted liners, for one engine. When the pad of one face differ from those of the other, a complete set of pads are to be provided.	1 set
	Complete thrust shoe for one face of solid ring type	1
	Inner and outer race with roller, where roller thrust bearings are fitted	1
Reduction and/or reversing gear	Complete bearing bush, of each size fitted in the gear case assembly	1 set
	Roller or ball race, of each size fitted in the gear case assembly	1 set

Table 5.1.8 Spare Parts for Boilers

Item	Remarks	Number required
Safety valve spring of each size	Including superheater safety valve springs	1
Oil burner nozzles, complete, for one boiler		1 set
Round type water gauge glasses	Including packings	12
Flat type water gauge glasses		2
Flat type water gauge frame		1
Smoke tubes and stay tubes	For each size	5 % of total number of tubes for one boiler
Water tubes and superheater tubes	For each size	5 % of total number of tubes for one boiler

NOTES:
The number of water gauge glasses of round type and flat type are required to be the number in this Table for each boiler. The number of flat type water gauge frames is required to be one for two boilers.

Table 5.1.9 Spare Parts for Essential Auxiliaries

Item	Remarks	Number required
Piston pumps	Valves with seats and springs of each size fitted	1 set
	Piston rings of each type and size for one piston	1 set
Central and gear type pumps	Bearing of each type and size	1
	Rotor sealings of each type and size	1
Compressors for essential service	Piston rings of each type and size for one piston	1 set
	Suction and delivery valves complete of each size	1/2 set

NOTES:
1. When sufficiently rated stand-by pump is available, the spare parts for other pumps except for bilge pump may be dispensed.
2. Where the stand-by cooling pumps, stand-by lubricating pumps or stand-by fuel oil supply pumps are not provided in accordance with the requirements of **Ch 6. 702. 7, 802. 3** and **903. 1,** one complete spare of each pump is to be carried on board.

Table 5.1.10 Tools and Instruments

Item	Remarks		Number required
Tube stoppers or plug	For main boiler and essential auxiliary boilers (including those for superheater and economizer tube)	Water tube boilers	12 for each size
		Other type boilers	12 for each size
Tube expanders	For main boiler and essential auxiliary boilers		1 for each size
Standard pressure gauge	For all boilers, gauge tester will be aceptable		1
Water tester	For all boilers, two salinometer will be acceptable		1
Special tools and instruments for maintenance or repair work of the machinery			1 set

CHAPTER 2 MAIN AND AUXILIARY ENGINES

Section 1 General

101. Application

1. The requirements of this Chapter apply to main engines and auxiliary engines driving generators and essential auxiliaries. For the small auxiliary engines and emergency generator driving engines, some requirements of this Part may be modified appropriately provided that the Society considers it acceptable.

2. Engines driving generators for electric propulsion are to comply with the requirements in **Pt 6, Ch 1, Sec 17,** in addition to the relevant requirements of this Chapter.

3. Internal combustion engines driving emergency generators are to comply with the requirements in **Pt 6, Ch 1, Sec 14.**

4. Piping arrangements

Piping arrangements are also to comply with the requirements of **Ch 6** in addition to the requirements of this Chapter.

5. Welding

Where main component parts of engines are to be welded, the Society, when considered necessary, may request preliminary tests or appropriate form of tests in connection with the work before the work is commenced. Welding methods, etc., are also to be approved. These requirements are also applicable in case of welding repairs to these parts.

6. Instruments

Tachometers, pressure gauges and thermometers which are necessary for safe operation are to be provided on main propulsion and auxiliary engines.

7. Electronic controlled diesel engines

Electronically controlled diesel engines for the main propulsion engines are to be in accordance with the separated requirements of the Society, in addition to the requirements prescribed in this Chapter.

Section 2 Internal Combustion Engines

201. Materials

1. Tests

Materials intended for the parts marked in **Table 5.2.1** are to be tested and inspected in the presence of Surveyors and to comply with the requirements of **Pt 2, Ch 1.**

2. Cylinders, cylinder liners, cylinder covers, pistons and other parts subject to high temperature or pressure are to be of materials suitable for the stress and temperature to which they are exposed.

202. Construction and installation

1. Frames and bed plates Frames and bed plates are to be of rigid and oiltight construction. The bedplate is to be provided with a sufficient number of holding down bolts to thoroughly secure it to the engine bed. Resin chocks or resilient mounting subjected to the type approval by the Society may be used.

2. Fire precaution Where the structures above engines and their surroundings are constructed with inflammable materials such as wood and the like, adequate measures are to be for the protection against fire.

3. Exhaust gas turbocharger

(1) Engines for propulsion purpose fitted with exhaust gas turbocharger are to be so arranged that the ship can proceed with safe voyage in case of failure in the part of the turbochargers.
(2) Where main engine can not be operable only with the exhaust gas turbochargers in case of starting or low speed range, the auxiliary scavenging blower is to be provided. Means are to be provided so that the engine can be started and operated in case of failure of the scavenging blowers.

Table 5.2.1 Tests

No.	Component parts	Material test	Magnetic particle test or liquid penetrant test	Ultrasonic test
1	Crankshafts (Solid forged shaft or arm, pin and journal of built up shaft)	○	○	○
2	Crankshaft coupling flanges (non-integral) for main power transmission and coupling bolts	□	-	-
3	Steel piston crowns	□	□	○
4	Piston rods	□	□	□
5	Connecting rods (together with upper and lower connecting rod bearing caps)	○	○	□
6	Crossheads	□	-	-
7	Cylinder liners (steel parts)	△	-	-
8	Steel cylinder covers	△	□	○
9	Bed plates and thrust blocks of welded construction, plates and transverse bearing girders made of forged or cast steel	○	○	○
10	Frames and crankcases of welded construction	○	○	○
11	Tie rods	○	□	-
12	Supercharger shaft and rotor, including blades	△	-	-
13	Bolts and studs for cylinder covers, crossheads, connecting rod bearing, and main bearings	△	□	-
14	Steel gear wheels for camshaft drive	□	□	-

NOTES:
1. Where, mark ○ for the parts of all engines, △ for the parts of engines with cylinders over 300 mm in diameter, □ for the parts of engines with cylinders over 400 mm in diameter, — for the parts of engines need not to be tested.
2. Supercharger described 12 is understood as turbochargers and engine driven compressors (including "root blowers"), but not auxiliary blowers.
3. This table does not apply to the internal combustion engines and superchargers which are manufactured in the way of mass produced methods.

4. Fuel oil valve

Fuel oil injection valves to cylinders are to be arranged operable by hand or other means without interrupting the oil supply, while the engine stops.

5. Starting arrangement

(1) Where compressed air is used for engine starting, the starting arrangements are to comply with the requirements of **Ch 6, Sec 11.**

(2) Where the main engine is arranged for electric starting, two separate batteries are to be fitted and cannot be connected in parallel. Each battery is to be capable of starting the main engine when in cold and ready to start conditions and the combined capacity of the batteries is to be sufficient without recharging to provide within 30 minutes the number of starts of main engines as required in **Ch 6, 1101. 1.**

(3) Where the auxiliary engine is arranged for electric starting, two separate batteries are to be fitted. The capacity of the batteries for starting the auxiliary engine is to be sufficient for at least three starts for each engine when in cold and ready to start conditions. In the case of a single auxiliary engine only one battery may be required.

(4) Electric starting arrangements for auxiliary engines may be supplied by separate circuits from starting batteries of the main engine when such are provided. In this case, the capacity of the batteries for starting the main engine is to be more than sum of the capacity required in (2) and (3) above, and the amount consumed for engine monitoring purposes.

(5) The starting batteries are to be used for starting and the engine's own monitoring purposes only. Provision is to be made to maintain continuously the stored energy at all times.

(6) Starting arrangement and capacity of prime movers driving emergency generating sets are to be in accordance with the requirements in **Pt 6, Ch 1, Sec 14.**

6. Lubricating oil arrangements

(1) Where the crankcases are of closed type, they are to be arranged so that the contained oil may be drained at any time. Lubricating oil drain pipes from the engine sump to the drain tank are to be submerged at their outlet ends.

(2) Lubricating oil pipe lines are to be provided with a pressure gauge or other appropriate means at a suitable position to indicate that the proper circulation is maintained.

(3) Lubricating devices for rotor shafts of exhaust gas turbochargers are to be designed so that the lubricating oil may not be drawn into the charging air.

7. Cooling arrangements

(1) Provision is to be made for an uniform supply of cooling water or oil to each cylinder and piston. Drain cocks are to be fitted to water jackets and water pipe lines at their lowest positions.

(2) Cooling water or oil from each cylinder is to be arranged to discharge from the highest position and thermometer is to be fitted at the outlet.

203. Safety devices

1. Governors

(1) Each main engine is to be provided with a speed governor so adjusted that the engine speed can not exceed the maximum continuous revolutions by more than 15%. In addition to the normal governor, each main engine having a maximum continuous output of 220 kW and above, and which can be declutched or which drives a controllable pitch propeller, is to be provided with a separate over-speed protective device so adjusted that the speed can not exceed the maximum continuous revolutions by more than 20 %.

(2) Engines driving generators are to be provided with governors complying with the requirements of **Pt 6, Ch1, 202. 2** and **3.** In addition to the normal governor, each auxiliary engine driving electric generator and having a maximum continuous output of 220 kW and above is to be provided with a separate overspeed protective device so adjusted that the speed can not exceed the maximum continuous revolutions by more than 15 %.

2. Protection from overpressure of cylinder Each cylinder of engines having a bore exceeding 230 mm is to be provided with an effective sentinel valve, a relief valve adjusted to operate at not more than 40 % above the combustion pressure at the maximum continuous output, effective warning devices of an approved type for overpressure or other acceptable means.

3. Crankcase door

(1) Crankcase construction and crankcase doors are to be of sufficient strength to withstand anticipated crankcase pressures that may arise during a crankcase explosion taking into account the installation of explosion relief valves. Crankcase doors are to be fastened sufficiently securely for them not be readily displaced by a crankcase explosion.

(2) A warning notice is to be fitted either on the control stand or, preferably, on a crankcase door

on each side of the engine. This warning notice is to specify that, "**whenever overheating is suspected within the crankcase, the crankcase doors or sight holes are not to be opened before a reasonable time, sufficient to permit adequate cooling after stopping the engine**".

4. Relief valve of crankcase

(1) Internal combustion engines having a cylinder bore of 200 mm and above or a crankcase volume of 0.6 m^3 and above shall be provided with relief valves of an approved type, for the purpose of relieving the excess pressure in the event of an internal explosion.

(2) The number and location of the relief valves are as follows.

(A) Engines having cylinder bore not exceeding 250 mm are to have at least one valve near each end, but, over eight crankthrows, an additional valve is to be fitted near the middle of the engine.

(B) Engines having a cylinder bore exceeding 250 mm but not exceeding 300mm are to have at least one valve in way of each alternate crankthrow, with a minimum of two valves.

(C) Engines having a cylinder bore exceeding 300mm are to have at least one valve in way of each main crankthrow.

(3) The free area of each relief valve is to be not less than 45 cm^2. The combined free area of the valves fitted on an engine must not be less than 115 cm^2 per cubic metre of the crankcase gross volume. The total volume of the stationary parts within the crankcase may be discounted in estimating the crankcase gross volume (rotating and reciprocating components are to be included in the gross volume).

(4) Crankcase explosion relief valves are to be provided with lightweight spring-loaded valve discs or other quick-acting and self closing devices to relieve a crankcase of pressure in the event of an internal explosion and to prevent the in rush of air thereafter.

(5) The valve discs in crankcase explosion relief valves are to be made of ductile material capable of withstanding the shock of contact with stoppers at the full open position.

(6) Crankcase explosion relief valves are to be designed and constructed to open quickly and be fully open at a pressure not greater than 0.02 MPa.

(7) Crankcase explosion relief valves are to be provided with a flame arrester that permits flow for crankcase pressure relief and prevents passage of flame following a crankcase explosion.

(8) Additional relief valves are to be fitted in separate spaces of crankcase such as gear or chain case of camshaft or similar drives, when the gross volume of such spaces exceeds 0.6 m^3.

5. Ventilation of crankcase

(1) Ventilation of crankcase, and any arrangement which could produce a flow of external air within the crankcase, is in principle not permitted except for dual fuel engines where crankcase ventilation is to be provided to prevent the accumulation of leaked gas.

(2) Crankcase ventilation pipes, where provided, are to be as small as practicable to minimize the in rush of air after a crankcase explosion.

(3) If a forced extraction of the oil mist atmosphere from the crankcase is provided (for mist detection purposes for instance), the vacuum in the crankcase is not to exceed 25 mm of water head.

(4) To avoid interconnection between crankcases and the possible spread of fire following an explosion, crankcase ventilation pipes and oil drain pipes for each engine are to be independent of any other engine.

6. Protective devices for scavenge manifolds

(1) For crosshead type engines, scavenge spaces in open connection to the cylinders are to be connected to an approved fire extinguishing system, which is to be entirely separate from the fire extinguishing system of the engine room.

(2) Scavenge spaces in open connection to the cylinders are to be provided with explosion relief valves for preventing an overpressure in the event of explosion and minimizing the possibility of injury to personnel.

7. Protection of starting air pipes The starting air mains are to be protected against the explosion arising from improper functioning of starting valves by the following arrangements:

(1) An isolating non-return valve or equivalent thereto is to be provided at the starting air supply connection to each engine.

(2) In direct reversing engines having a main starting manifold, a bursting disc or flame arrester is to be fitted at the starting valve on each cylinder; in non-reversing engines having a main start-

ing manifold, at least one such device is to be fitted at the supply inlet to the starting air manifold on each engine. However, the above mentioned device may be omitted for engines having bore not exceeding 230 mm.

8. Alarms of lubricating oil system

Lubricating system to be used for main and auxiliary engines above 37 kW is to be provided with alarm devices which give visual and audible alarm in the event of failure of lubricating oil pressure supply or appreciable reduction in pressure of the lubricating oil supply.

9. Protection of high pressure fuel pipe All external high pressure fuel delivery lines between the high pressure fuel pumps and fuel injectors are to comply with the requirements specified in **Pt 8, Ch 2, 101. 2** (5) (B).

10. Oil mist detection arrangements of crankcase

(1) Following engines are to be provided with oil mist detection arrangements(or engine bearing temperature monitors or equivalent devices) obtained type approval.
  (A) Low speed diesel engines(crosshead type) of 2,250 kW and above or having cylinders of more than 300 mm bore : alarm and slow down purposes.
  (B) Medium and high speed diesel engines(trunk piston type) of 2,250 kW and above or having cylinders of more than 300 mm bore : alarm and automatic shutoff purposes.
(2) The oil mist detection arrangements are to be installed in accordance with the engine designer's and oil mist manufacturer's instructions and recommendations.
(3) Oil mist detection and alarm information is to be capable of being read from a safe location away from the engine.
(4) Each engine is to be provided with its own independent oil mist detection arrangements and a dedicated alarm.
(5) Oil mist detection, and alarm systems are to be capable of being tested on the test bed of shop and onboard under engine at standstill and engine running at normal operating conditions.
(6) Alarms and shutdowns for the oil mist detection system and the system arrangements are to be in accordance with the requirements in **Pt 9, Ch 3, Sec 3**.
(7) The equipment together with detectors is to be tested when installed on the test bed of shop and on board ship to demonstrate that the detection and alarm system functionally operates.
(8) Where alternative methods are provided for the prevention of the build-up of oil mist that may lead to a potentially explosive condition within the crankcase, the details are to be submitted for consideration.

204. Crankshafts

1. Application

The following requirements are to be applied to the crankshafts of diesel engines. For the crank shafts of internal combustion engines other than diesel engines, special consideration will be given.

2. Required diameter

The required diameter of crankpins or journals is not to be less than that given by the following formula:

$$d_c = \left\{ D^2 \left(M + \sqrt{M^2 + T^2} \right) \right\}^{\frac{1}{3}} \quad \text{(mm)}, \qquad M = 10^{-2} APL, \qquad T = 10^{-2} BP_i S$$

where:

D = Diameter of cylinder (mm)

S = Length of stroke (mm)

L = Span of bearings adjacent to crank measured from centre to centre (mm)

P = Maximum pressure in cylinder (MPa)

P_i = Indicated mean effective pressure (MPa)

A and B = Coefficients given in **Table 5.2.2** for engines having equal firing intervals (in case of vee engines, equal firing intervals on each bank). Special consideration will be given to the values of A and B for engines having unequal firing intervals or not covered by the **Table.**

Table 5.2.2 Coefficients A and B

(1) Single Acting In-line Engine

Number of cylinders		1	2	3	4	5	6	7	8	9	10	11	12
2-stroke cycle	A	1.00											
	B	8.8	8.8	10.0	11.1	11.4	11.7	12.0	12.3	12.6	13.4	14.2	15.0
4-stroke cycle	A	1.25											
	B	4.7	4.7	4.7	4.7	5.4	5.4	6.1	6.1	6.8	6.8	7.4	7.4

(2) Single Acting Vee Engine with Parallel Connecting Rods

Number of cylinders		Minimum firing interval between two cylinders on one crankthrow											
		45°		60°		90°		270°		300°		315°	
		A	B	A	B	A	B	A	B	A	B	A	B
2 stroke cycle	6	1.05	17.0	1.00	12.6	1.00	17.0						
	8		17.0		15.7		20.5						
	10		19.0		18.7		20.5						
	12		20.5		21.6		20.5						
	14		22.0		21.6		20.5						
	16		23.5		21.6		23.0						
	18		24.0		21.6		23.0						
	20		24.5		24.2		23.0						
4 stroke cycle	6	1.60	4.1	1.47	4.0	1.40	4.0	1.40	4.0	1.30	4.4	1.20	4.3

	10		6.7		7.0		6.5		6.5		6.1		5.9
	12		7.5		8.2		7.5		7.5		6.9		6.6
	14		8.4		9.2		8.5		8.5		7.5		7.3
	16		9.3		10.1		9.5		9.5		8.2		7.9
	18		10.1		11.1		10.5		10.5		8.8		8.5
	20		11.5		14.0		11.5		11.5		9.5		9.2

205. Dimensions of crank arms

1. Solid shaft

For solid shafts, the thickness and breadth of crank arms are to comply with the following formula or the conditions shown in **Fig 5.2.1** in connection with the diameters of crankpin and journal. However, the thickness of crank arms is not to be less than 0.36 times the diameter of crankshaft. When the actual diameter of crankshaft is larger than the minimum required diameter of crankshaft, the left side of the following formula may be multiplied by $(d_c/d)^3$.

$$\{0.122(2.20 - b/d)^2 + 0.337\}(d/t)^{1.4} \le 1$$

where:

b = Breadth of crank arm (mm)

t = Thickness of crank arm (mm)

d = Actual diameter of crankpin or journal (mm)

d_c = Minimum required diameter of crankshaft (mm)

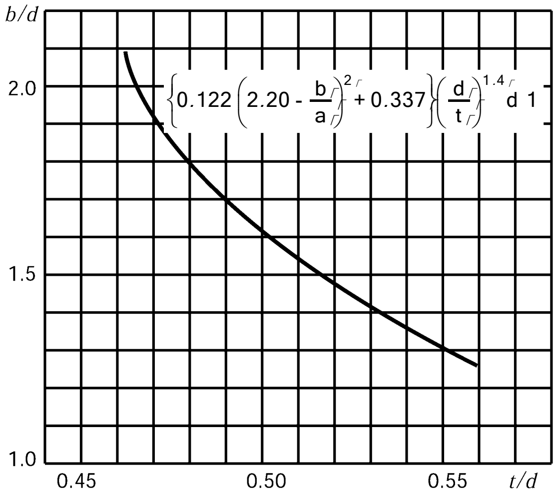

Fig. 5.2.1 Relationship between b/d and t/d

2. The fillet radius at the root of crank arms with crankpins or journals in solid crank shaft is not to be less than 0.05 times the actual diameter of the crankpins or journals respectively.

3. Semi-built-up crankshaft

In semi-built-up crankshafts, the dimensions of crank arms in way of the shrinkage fit are to comply with the following formulae. However, the dimensions of crank arms in way of the fillet parts with crankpin are to be in accordance with the requirements of **Pars 1** and **2.**

$$t_1 \geq \frac{C_1 T D^2}{C_2 {d_h}^2} \times \frac{1}{\left(1 - \frac{1}{A_s^2}\right)}$$

$$t_2 \geq 0.525 d_c$$

where:

t_1, t_2 = Thickness of crank arm measured parallel to the axis (mm)

C_1 = 10 for 2 cycle in-line engines

= 16 for 4 cycle in-line engines

T = $10^{-2} B P_i S$ (see **204. 2**)

$C_2 = 12.8\alpha - 2.4\alpha^2$, but in case of the hollow shaft, C_2 is to be multiplied by $(1 - R^2)$

$$\alpha = \frac{Shrinkage\ interference}{d_h} \times 10^3$$

$$R = \frac{Inside\ Diameter}{Outside\ Diameter}$$ for hollow shafts

d_h = Diameter of the hole at shrinkage fit (mm)

$$A_s = \frac{External\ diameter\ of\ arm}{d_h}$$

d_c = Minimum required diameter of crankshaft specified in **204. 2** (mm)

4. Built-up crankshaft

In built-up crankshafts, the dimensions of crank arms in way of the shrinkage fit are to be in accordance with the requirements of **Par 3.**

5. Shrinkage interference

In case of built-up or semi-built-up crankshafts, crank arms are to be securely shrunk on the crankpins or journals. The shrinkage interference "α_s" is to be as given below.

$$\frac{\sigma_y \cdot d_h}{E_m} \le \alpha_s \le \left(\frac{\sigma_y \cdot d_h}{E_m} + \frac{0.8 d_h}{1{,}000}\right)\frac{1}{1-R^2}$$

where:

σ_y = Specified minimum yield stress of material for crank web ($\mathrm{N/mm^2}$)

E_m = Young's modulus ($\mathrm{N/mm^2}$)

d_h, R = As specified in **Par 3.**

206. Material consideration

Where it is proposed to make the crankshafts or arms by carbon steel or low alloy steel having a specified tensile strength greater than 440 $\mathrm{N/mm^2}$, the diameter of crankshafts may be reduced by multiplying the following coefficient, K_m. This provision, however, is not to be applied to d_c in **205. 3** and K_m for other materials will be determined in each case by the Society.

$$K_m = \sqrt[3]{\frac{440}{440 + \frac{2}{3}(S-440)}}$$

where:

S = Specified minimum tensile strength of proposed material. For the high tensile strength exceeding 1,000 $\mathrm{N/mm^2}$, S is to be taken as 1,000 $\mathrm{N/mm^2}$.

207. Hollow shaft

Where crankpins or journals are hollow, the required outside diameter of the hollow shaft is not to be less than that obtained from the formula in **204. 2** multiplying by the following coefficient except where the inside diameter is less than one-third of the outside diameter.

$$K_h = \sqrt[3]{\frac{1}{1-R^4}}$$

where:

$R = \frac{Inside\ Diameter}{Outside\ Diameter}$ for hollow shafts.

208. Special consideration

Special consideration may be given to the diameter of crankshafts or the dimensions of the arms not complying with the requirements of the Rules, if the detailed data and calculations on the strength of these shafts or arms are submitted. In special cases where different manufacturing methods are made, the detailed information connected there-with and test results concerned are to be submitted to the Society for consideration. Where they are considered superior to the material strength available by the ordinary manufacturing methods, the diameter of crankshafts and dimensions of crank arms may be reduced.

209. Flywheel shafts and other shafts

Where flywheels or eccentric sheaves for pumps are fitted on crankshafts or additional shafts between the aftermost journal bearing and the thrust shaft, the shaft diameter in way of the part is not to be less than the required diameter of the crankshaft determined by the formula in **204. 2.**

210. Shaft couplings and coupling bolts

1. The required diameter of coupling bolts between crankshafts and thrust shaft, and others mentioned in **209.** at the joining faces of the coupling is to be determined by the following formula:

$$d_b = 0.7\sqrt{\frac{d_c^{\,3}}{nD} \cdot \frac{440}{T_b}} \quad (\mathrm{mm})$$

where:

d_b = Diameter of coupling bolts (mm)

n = Number of bolts

D = Diameter of pitch circle (mm)

d_c = Required diameter of crankshaft determined by the formula in **204. 2** (mm)

T_b = Specified minimum tensile strength of proposed material ($\mathrm{N/mm^2}$). For the tensile strength exceeding 1,000 $\mathrm{N/mm^2}$, T_b is to be taken as 1,000 $\mathrm{N/mm^2}$.

2. The thickness of shaft coupling flanges at the pitch circle of bolt holes is not to be less than the required diameter of coupling bolts given in **Par 1.** The fillet radius at the root of shaft coupling is not to be less than 0.08 times the actual diameter of applicable shaft. Where, however, the curvature at fillet is recessed in way of nuts and bolt heads, the radius of curvature is to be 0.125 times and above the diameter of the shaft at flanged coupling.

3. Where the shaft couplings are separate from the shaft, the couplings are to be of forged or cast steel and are to have strength enough to resist the transmitting torque of shaft and the astern pull. In this case, the shaft is to be of construction to avoid excessive stress concentration.

211. Tests and Inspections

1. Hydraulic test

Items and associated components for engines are to be tested by hydraulic pressure as indicated in **Table 5.2.3.**

2. Balancing test

The rotating assemblies of exhaust gas turbochargers are to be subjected to dynamic balancing tests after their assembly.

3. Type approval of engine

For diesel engines with novel design features or those with no service records, in case where deemed necessary by the Society, they are to be type approved in accordance with the procedure as deemed appropriate by the Society.

Table 5.2.3 Test pressure

Item	Test Pressure
Cylinder cover, cooling space Cylinder liner, over the whole length of cooling space Piston crown, cooling space	0.7 MPa
Cylinder jacket, cooling space Exhaust valve and exhaust pipe, cooling space Turbocharger cooling jacket, cooling space	0.4 MPa or 1.5P, whichever is the greater
Fuel injection pump body, pressure side Fuel injection valve Fuel injection pipe	1.5P or P + 30 MPa, whichever is the less
Scavenge pump cylinder	0.4 MPa
Heat exchanger	Apply the requirements of **Ch 5, 319. 1**
Auxiliary machinery and engine piping system	Apply the requirements of **Ch 6, Sec 13.**
Hydraulic piping for exhaust valve drive	1.5P

NOTES:
1. P : Design pressure (MPa)
2. In case of steel forging, the tests other than hydraulic test may be accepted.
3. Where the Society accepts, connected with the hydraulic test pressure indicated in the Table may be lowered or the test may be omitted.

Section 3 Steam Turbines

301. Emergency propulsion

Ships equipped with steam turbines are to be provided with means to maintain emergency propulsion in the event of failure of one main boiler.

302. Materials

1. Materials intended for turbine rotors, blades and turbine casings are to comply with the requirements of **Pt 2, Ch 1.**

2. Turbine casings and associated components that are subjected to high temperature and pressure are to be made of the material suitable for the stresses and heat to which they are exposed, and are to be properly heat-treated to remove residual stresses. Cast iron is not to be used where the maximum working temperature exceeds 230 °C.

303. General construction

1. Steam turbine cylinders are to be provided with suit-able drain devices.

2. Built-up turbine rotors of shrinkage fit type are to be properly secured by keys, dowel pins, or other approved means.

3. Thermal expansion

The structure of the parts of a turbine is to have proper fits and clearances, and to be free from distortions and other harmful deformations against thermal expansion. Turbines are to be installed on the seatings without excessive restriction against thermal expansion.

4. Devices for emergency operation of propulsion steam turbines

(1) In single screw ships fitted with cross compound steam turbines, the arrangements are to be

such as to enable safe navigation when the steam supply to any one of the turbines is required to be isolated. For this emergency operation purpose, the steam may be led directly to the L.P. turbine and either the H.P. or M.P. turbine can exhaust direct to the condenser. Adequate arrangements and controls are to be provided for these operating conditions so that the pressure and temperature of the steam will not exceed those which the turbines and condenser can safely withstand.

(2) The necessary pipes and valves for these arrangements are to be readily available and properly marked.

(3) The permissible power and speeds when operating without one of the turbines(all combinations) is to be specified and information provided on board.

(4) The operation of the turbines under emergency conditions is to be assessed for the potential influence on shaft alignment and gear teeth loading conditions.

5. Efficient steam strainers are to be provided close to the inlets to ahead and astern high pressure turbines or alternatively at the inlets to manoeuvring valves.

6. The turning gear of propulsion steam turbines is to be driven by independent power and where driven by electric motors, they shall be of the continuous rated.

304. Safety devices

1. All main and auxiliary turbines are to be provided with overspeed protective devices to prevent the design speed from being exceeded by more than 15 %. Where two or more turbines are coupled to the same main gear wheel set, the Society may agree that only one overspeed protective device be provided for all the turbines. Where main turbine installation incorporates a coupling which can be declutched or which drives a controllable pitch propeller, a separate speed governor in addition to the overspeed protective device is to be fitted and is to be capable of controlling the speed of unloaded turbine without bringing the overspeed protective device into action. Turbines driving electric generator are to be provided with governors complying with the requirements of **Pt 6, Ch 1, 202. 2** and **3,** in addition to the above.

2. Steam turbines are to be provided with a quick acting device which will automatically shut off the steam supply in the case of dangerous lowering of oil pressure in bearing lubricating system, and the device is also to be manually operated.

3. Propulsion steam turbines and main turbogenerators are to be provided with a satisfactory emergency supply of lubricating oil which will come into use automatically when the pressure drops below predetermined value. The emergency supply may be obtained from a gravity tank containing sufficient amount of oil to maintain adequate lubrication until the turbine is brought to rest or by equivalent means. For other safety devices of lubricating systems, the requirements of **Ch 6, Sec 8,** are to be applied.

4. Main turbines are to be provided with devices which automatically shut off the steam supply for ahead turbines in the case of low main condenser vacuum and the device is also to be manually operated.

5. Where the exhaust steam is extracted from turbine cylinders, approved means are to be provided to prevent the steam flowing backward to cylinders. A sentinel relief valve is to be fitted at the exhaust end of all turbines.

305. Turbine rotors

1. Turbine rotors (or discs) are to be so designed that excessive vibration may not occur within the operating range of speeds, and since the strength calculation of following **Par 2** does not include the factors of creep and others of the materials, special considerations are to be given by each manufacture to these points, as considered necessary.

2. Mean tangential stress

Mean tangential stress of turbine rotors (or discs) is to satisfy the following conditions.

$$T_m = \frac{1.10N^2}{A}\left(\rho I + \frac{rW}{2\pi}\right) \quad (\mathrm{mm})$$

$$T_m \le \frac{Y}{3}, \qquad T_m \le \frac{T_s}{4}$$

where:

T_m = Mean tangential stress ($\mathrm{N/mm^2}$)

N = Number of maximum continuous revolutions per minute divided 1,000 (rpm/1,000)

A = Sectional area of wheel profile on one side of axis of rotation ($\mathrm{cm^2}$)

I = Moment of inertia of area A on one side of axis of rotation ($\mathrm{cm^4}$)

ρ = Specific weight of turbine rotor (or disc) material. ($\mathrm{kg/cm^3}$)

W = Total weight of blade including roots (kg)

r = Distance between the center of gravity of blade (including root) and the center line of shaft (cm)

Y = Specified minimum yield stress or proof stress of the material ($\mathrm{N/mm^2}$)

T_s = Specific minimum tensile strength of the material ($\mathrm{N/mm^2}$)

306. Strength and sectional area of turbine blades

Turbine blades are to be so designed as to avoid abrupt changes in section and to provide an ample amount of stiffness to minimize deflection and vibration. The minimum sectional area at the root of the blade is to be determined by the following formula:

$$A = \frac{4.395\,WN^2 r}{S} \quad (\mathrm{cm^2})$$

where:

W = Weight of one blade (kg)

N = Number of maximum continuous revolutions per minute divided by 1,000 (rpm/1,000)

r = Distance between the centre of gravity of blade and centre line of shaft (cm)

S = Specified minimum tensile strength of blade material ($\mathrm{N/mm^2}$)

307. Tests and inspections

1. Hydraulic test

Turbines and accessory parts are to be tested by hydraulic pressures given in **Table 5.2.4.**

2. Balancing test

Turbine rotors are to be dynamically balanced after attaching the blades.

3. Tests after installation on board

A fit up test, to ensure the availability of the operation in compliance with **303. 4.** (1) and (2), is to be carried out prior to the sea trials. This test may be carried out at the shop tests.

Table 5.2.4 Test Pressure

Item		Test pressure	Remark
Turbine cylinders, high pressure turbine steam chests, steam receivers		$1.5P$ or 0.2 MPa, whichever is the greater	P = Design pressure (MPa)
Steam strainers, manoeuvring valve chests, other accessories		$2P$	
Main condenser	Steam space	0.1 MPa	-
	Water space	$P_1 + P_2 + 0.1$ MPa or 0.2 MPa, whichever is the greater	Where the scoop system is adopted, $P_1 + P_2 + 0.1$ MPa or 0.35 MPa, whichever is the greater.

NOTES:
P_1 = Maximum discharge pressure which the circulating pumps can develop with the discharge valve closed. (MPa)
P_2 = Maximum suction pressure which is developed under the full draught condition. (MPa)

Section 4 Gas Turbines

401. Materials, Construction and Strength

1. Materials

(1) Materials of the components of gas turbine specified below (hereinafter referred to as the principal components of gas turbine) are to comply with the requirements in **Pt 2, Ch 1**.
(A) Discs (or rotor), stationary blades and moving blades of turbine
(B) Discs, stationary blades and moving blades of compressor
(C) Turbine and compressor casings
(D) Combustion chambers
(E) Turbine output shaft
(F) Connecting bolts for main components of turbine
(G) Shaft coupling and bolts
(H) Pipes, valves and fittings attached to gas turbine classified in Class I or Class II in Pt **5, Ch 6.**

(2) The principal components of gas turbine (excluding bolts, pipes, valves and fittings) are to be subjected to the non-destructive tests specified in **Pt 2, Ch 1, 501. 10** and **601. 10**.

(3) The materials used in high temperature parts are to have properties suitable for the design performance and service life against corrosions, thermal stresses, creeps and relaxations. In case where the base material coated with corrosion-resistant surfacing, the coating material is to have such properties that it is hardly detached from the base material as well as not to impair the strength of the base material.

2. Construction and installations

(1) Gas turbines are to be so designed that no excessive vibration and surging are induced within the speed range of normal operation.

(2) Each part of a gas turbine is to have such constructions as no detrimental deformations caused by their thermal expansion.

(3) Where the main components of gas turbines are of welded construction, they are to comply with the requirements in **Ch 5, Sec 4**.

(4) In the event of failure of the main source of electrical power, the gas turbines for main propulsion are to be so designed as not to cause gas generator to stop, or to enable to restart immediately after the gas generator stopping.

(5) Gas turbines are to be installed on the seatings so that no excessive structural constraints are caused by thermal expansion.

402. Safety devices

1. Governors and overspeed protective devices

(1) Main gas turbines are to be provided with over speed protective devices to prevent the turbine speed from exceeding more than 15 % of the maximum continuous speed. Where a main gas turbine incorporates a reverse gear, electric transmission, controllable pitch propeller or other free-coupling arrangement, a speed governor independent of the over speed protective device is to be fitted and is to be capable of controlling the speed of the unloaded gas turbine without bringing the over speed protective device into operation.

(2) The governors of gas turbines to drive generators are to conform to the requirements in **Pt 6, Ch 1, 202. 2**. However, when gas turbines used for main propulsion machinery in electric propulsion ships are used to drive generators to supply electric power exclusively to propulsion motors, the requirements in **Pt 6, Ch 1, 1702. 2.** are to be applied.

2. Emergency stopping devices

(1) Hand trip gear for shutting off the fuel in an emergency is to be provided at the maneuvering station.

(2) Gas turbines are to be provided with automatic fuel oil shut-off devices that operate in the following cases. In addition, means are to be provided so that alarms will be issued at the control station when the automatic fuel oil shut-off devices come into action.

(A) Overspeed
(B) Unaccepted lubricating oil pressure drop
(C) Unacceptable lubricating oil pressure drop of reduction gear
(D) Loss of flame during operation
(E) Excessive vibration
(F) Excessive axial displacement of each rotor (Except for gas turbines with rolling bearings)
(G) Excessive high temperature of exhaust gas
(H) Excessive high vacuum pressure at the compressor inlet

3. Alarms

Audible and visible alarming devices listed in **Table 5.2.5** are to be provided.

Table 5.2.5 Alarming Device

Monitored parameter	Alarm	Shutdown(2)
Overspeed	○	○
Unaccepted lubricating oil pressure drop	○(1)	○
Unaccepted lubricating oil pressure drop of reducing gear	○(1)	○
High differential pressure across lubricating oil filter	○	
High lubricating oil temperature	○	
Low oil fuel supply pressure	○	
High oil fuel temperature	○	
High cooling medium temperature	○	
High bearing temperature	○	
Loss of flame during operation	○	○
Automatic starting failure	○	
Excessive vibration	○(1)	○
Excessive axial displacement of each rotor (Except for gas turbines with rolling bearings)	○	○
Excessive high temperature of exhaust gas	○(1)	○
Excessive high vacuum pressure at the compressor inlet	○(1)	○
Loss of control system	○	

NOTES :
(1) Alarms are to be activated at the suitable setting points prior to arriving the critical condition for the activation of shutdown devices.
(2) Suitable alarms are to be operated by the activation of shutdown devices.

4. Automatic temperature controls

The following turbine services are to be fitted maintain steady state conditions throughout the normal operating range of the main gas turbine :

(1) Lubricating oil supply
(2) Oil fuel supply (or automatic control of oil fuel viscosity as alternative)
(3) Exhaust gas

5. Fire detection and extinction in acoustic enclosures

Where an acoustic enclosure is fitted which completely surrounds the gas generator and the high pressure oil pipes, a fire detection and extinguishing system is to be provided for the enclosure.

403. Associated Installations

1. Air inlet systems

The air inlet system is to have such construction and arrangement that intrusion of harmful particles and water into the compressor can be minimized. Additionally, means are to be provided so that the detrimental effects caused by salt deposits in suction air can be minimized.

2. Exhaust gas arrangement

(1) The open ends of exhaust gas pipes are to be located so as to prevent exhaust gas from entering into the air inlet system.
(2) Boilers and heat exchangers utilizing the exhaust heat of gas turbines are additionally to comply with the requirements specified in **Ch 5**.
(3) Exhaust gas arrangement is correspondingly to comply with the requirements specified in **Ch 6, 602.**.

3. Starting arrangements

(1) Automatic purging
Prior to commencing the ignition process, automatic purging is to be required for all starts and restarts. The purge phase is to be of sufficient duration to clear all parts of turbine of accumulation of liquid or gaseous fuel.
(2) Preset time
Starting control system is to be fitted with ignition detection devices. If light off does not occur within a preset time, the control system is to automatically abort the ignition, shutoff the main fuel valve, and commence a purge phase.
(3) Where compressed air or batteries are used for starting, the starting arrangement is correspondingly to comply with the requirements in **Ch 2, 202. 5**.

4. Ignition arrangements

(1) Each device in ignition arrangements is to be composed of two or more systems independent with each other.
(2) The cable of electric ignition device is to have good electrical insulation and to be laid in such a way that it is hardly damaged.
(3) Ignition distributors are to be of explosion-proof construction or to be provided with proper shielding. No coils for ignition device are to be situated in areas where explosive gases may be accumulated.

5. Fuel oil arrangements

(1) Sufficient consideration is to be given to the prevention of clogging of the fuel manifolds and fuel nozzles due to solid particles contained in the fuel, and also to the prevention of corrosions of turbine blades and other parts due to salts and similar corrosive substances.
(2) The fuel oil arrangements are additionally to comply with the requirements in **Ch 6, Sec 9**.

6. Lubricating oil arrangements

(1) Gas turbines for main propulsion are to be provided with an effective emergency supply of lubricating oil which comes into service automatically and has sufficient amount of oil to ensure adequate lubrication until the turbine is brought to rest, in case of failure of the lubricating oil supplying system. The emergency supply may be obtained from a gravity tank or from an aux-

iliary lubricating oil pump driven by the turbine.

(2) Lubricating oil arrangements are additionally to comply with the requirements in **Ch 6, Sec 8**.

404. Tests

1. Shop tests

(1) For gas turbines and their accessories hydrostatic tests are to be carried out at pressures specified below.
  (A) Casing : 1.5 times the design pressure
  (B) Piping system : Pressures specified in **Ch 6, 1304.**

(2) For rotating assemblies of turbines and compressors, dynamic balancing tests are to be carried out after their assembly.

(3) For turbine rotors, excess speed tests are to be carried out at 115 % of the maximum continuous rotational speed or over at least for 2 minutes after completion of manufacture.

(4) For gas turbines, shop tests are to be carried out including the test of safety devices specified in **402.** above by the test procedure deemed appropriate by the Society. In this case the Society may request tests regarding starting characteristics and critical speeds of rotor shafts. ⚓

CHAPTER 3 PROPULSION SHAFTING AND POWER TRANSMISSION SYSTEMS

Section 1 General

101. Welded construction components

Where the main components are to be welded, the Society may require the preliminary test and other tests for the fabrication of welding before the work is commenced when considered specifically necessary. The welding procedure is to be approved. This requirement also applies to repair of main component parts by welding.

102. Other propulsion and maneuvering machinery

The propulsion and maneuvering machinery not specified in this chapter are to comply with the special requirements given by the Society.

103. Installation of propulsion shafting system

1. Where resin chocks are used for the power transmission systems, stern tube, shaft bearing, etc., their arrangements and installation procedures, materials specification, etc. are to be approved by the Society.

2. Where propeller shaft or stern tube shaft is to be supported by the strut, this strut is to have sufficient strength.

3. Propulsion shafting systems are to be installed so that the excessive bending stress and shear stress are not occurred on the shaft and the appropriate reactive force is acted on each bearing.

Section 2 Shaftings

201. Application

1. The requirements of this Section apply to the shaftings of ships having diesel engines, steam turbines and gas turbines as their main engines and of ships of electric propulsion.

2. Where alternative calculation methods other than this section are used for calculating dimensions of shafts, they are considered appropriate by the Society.

202. Materials

1. The materials for intermediate shaft, thrust shaft, stern tube shaft, propeller shaft, shaft coupling and coupling bolts are to comply with the requirements for steel forging of **Pt 2, Ch 1.** Built-up type shaft couplings may be of steel castings conforming to the requirements in **Pt 2, Ch 1.**

2. The elongation of the material(L-direction) in **Par 1** is not to be less than 16 % except when an approval is specially obtained by the Society.

3. Where shafts may experience vibratory stresses close to the permissible stresses for transient operation, the materials are to have a specified minimum ultimate tensile strength(σ_B) of 500 $\mathrm{N/mm^2}$.

203. Intermediate shaft and thrust shaft

The diameters of intermediate shaft and thrust shaft are not to be less than those obtained by the following formula:

$$d_0 = F \cdot K_1 \sqrt[3]{\frac{P}{n} \times \frac{560}{(T+160)}} \quad (\mathrm{mm})$$

where:

P = Shaft output of engine at maximum continuous output (kW)

n = Number of shaft revolution at maximum continuous output (rpm)

F = Factor for the type of propulsion installations

- 95 for intermediate shafts in turbine installation, diesel installations with hydraulic(slip type) couplings, electric propulsion installations
- 100 for all other diesel installations and all propeller shafts

T = Specified minimum tensile strength (N/mm^2) of proposed material.

- For the minimum specified tensile strength of carbon steels exceeding 760 N/mm^2, T is to be taken 760 N/mm^2
- For the minimum specified tensile strength of alloy steels exceeding 800 N/mm^2, T is to be taken 800 N/mm^2

K_1 = Factor for different shaft design features, the values given by **Table 5.3.1.**

Table 5.3.1 Values of K_1

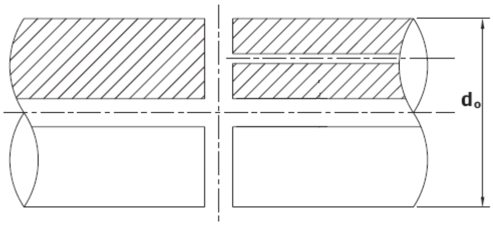
For intermediate shafts with					For thrust shafts with	
Integral coupling flange	Shrink fit coupling flange	Keyways	Radial holes	Longitudinal slots	On both side of thrust collar	In way of bearing when a roller bearing is used
1.00	1.00(1)	1.10(2)	1.10(3)	1.20(4)	1.10	1.10

NOTES:

(1) K_1 refer to the plain shaft section only. Where shafts may experience vibratory stresses close to the permissible stresses for continuous operation, an increase of 1 to 2 % in diameter to the shrink fit diameter and a blending radius nearly equal to the change in diameter are to be provided,

(2) After a length of not less than $0.2d_0$ from the end of the keyway the shaft diameter may be reduced to the diameter calculated with K_1=1.0. The fillet radius in the transverse section of keyway bottom is to be $0.0125d_0$ or more. However, keyways are in general not to used in installations with a barred speed range.

(3) Diameter of radial hole not to exceed $0.3d_0$ When a transverse hole intersects an eccentric axial hole(see below), the values is to be determined by the Society based on the submitted data in each case.



(4) Subject to limitations as slot length(l)/outside diameter(d_o) < 0.8 and inner diameter(d_i)/outside diameter (d_o) < 0.8 and slot width(e)/outside diameter(d_o) > 0.10. The end rounding of the slot is not to be less than e/2. An edge rounding should preferably be avoided as this increases the stress concentration slightly. The number of slots is to be 1, 2 or 3 and they are to be arranged 360, 180 or 120 degrees apart from each other respectively.

204. Propeller shaft and stern tube shaft

1. The diameter of propeller shaft and stern tube shaft is not to be less than that obtained by the following formula:

$$d_p = 100 \times K_2 \sqrt[3]{\frac{P}{n} \times \frac{560}{(T+160)}} \quad (\mathrm{mm})$$

where:

P, n = As specified in **203.**

K_2 = Factor concerning different shaft design features, the values given by **Table 5.3.2**

T = Specified minimum tensile strength ($\mathrm{N/mm^2}$), where the tensile strength of the steel used shall be between 400~800 $\mathrm{N/mm^2}$. For the tensile strength exceeding 600 $\mathrm{N/mm^2}$, T is to be taken as 600 $\mathrm{N/mm^2}$.

Table 5.3.2 Value of K_2

Kind of shaft	Propeller fitting method(1)	K_2(3)
Propeller shaft	Keyed	1.26
	Keyless fitting by shrink fit	1.22
	Flange(2)	1.22
Stern tube shaft		1.15

NOTES:
(1) Other propeller fitting methods are subject to special consideration.
(2) The fillet radius in the base of the flange is to be at least the order of $0.125d_p$.
(3) K_2 is applied to the shafts to which effective measures against corrosion by sea water are taken. The diameters of Kind 1 shaft made of approved corrosion-resistant materials and Kind 2 shaft are taken are to be dealt with as considered appropriate by the Society.

2. Reducing diameter

The diameter of the propeller shaft of the length of the forward edge of the bearing immediately forward of the propeller or the length of $2.5d_p$ ($4.0d_p$ in water-lubricated) from the forward face of the propeller boss or, if applicable, the forward face of the propeller flange, whichever is greater, may be reduced to the diameter in accordance with the formula in **Par 1** with the K_2 values as 1.15. The diameter of inboard end of the propeller shafts or stern tube shafts may be gradually reduced at the coupling to the value determined in **Par 1** with the values of K_2 replaced by K_1 the same as intermediate shafts in **Table 5.3.1.**

3. Sleeves

(1) Propeller shafts or stern tube shafts which are not made of corrosion resistant materials and run in seawater are to be protected against contact with sea water by sea water resistant metal sleeves.

(2) Manufacturing of sleeves
Sleeves are to be of bronze of high grade, stainless steel or above its equivalent thereto and free from porosity and other defects.

(3) thickness of sleeves

(A) The thickness of bronze sleeves fitted with propeller shafts and stern tube shafts is not to be less than that given by the following formula.

$$t_1 = 0.03d_p + 7.5 \quad (\mathrm{mm})$$

$$t_2 = 0.75t_1 \quad (\mathrm{mm})$$

Where :

t_1 : Thickness of sleeves in contact with stern tube bearing of strut bearing (mm)

t_2 : Thickness of sleeves of other parts than the above (mm)

d_p : Minimum required diameter of propeller shaft (mm)

(B) The thickness of stainless steel sleeves fitted with propeller shafts and stern tube shafts is not to be less than one-half that required for bronze sleeves or 6.5 mm, whichever is greater.

(4) Security of sleeves

(A) Sleeves are to be shrunk or forced on the shaft by pressure and they are not to be secured by pins or bolts.

(B) Sleeves are to be made in a single piece. if made of two or more lengths, the jointing of the separate pieces is to be done by an approved method of the Society.

4. Taper of propeller shaft cone

The propeller shaft cone is to be provided with the 1/10 (the 1/15 in keyless propeller) or less taper at the stern end of the propeller shaft.

5. Key of propeller shaft

(1) Key and keyway

Where a key is provided to the taper part of the propeller shaft, the key is to be tightly fitted in the keyway and to be secured by use of a set bolt. Sufficient radius is to be provided at the bottom fillet, in general, the fore end of the keyway is to be made a spoon shaped ending. For fitting part of small ship's propeller, it may be complied with *KS V* 4811.

(2) Set bolt for key

Two screw pins are to be provided for securing the key in the keyway, and the forward set bolt is to be placed at least one-third of the length of the key from the end. The depth of the tapped holes for the set bolt is not to exceed the bolt diameters, and the edges of the holes are to be bevelled slightly.

205. Hollow shaft

In accordance with the kind of shafts, the outside diameter of hollow shaft is not to be less than that given by the corresponding formula specified in **203.** and **204.** multiplying by the following coefficient K_h. For the R not exceeding $0.04d_0$, K_h is to be taken as 1.

$$K_h = \sqrt[3]{\frac{1}{1-R^4}}$$

where:

$$R = \frac{Inside\ Diameter}{Outside\ Diameter}$$ for hollow shafts

206. Stern tube bearing and sealing device

1. The length of stern bearing in the stern tube or of strut bearing supporting the weight of propeller is to comply with the following requirements.

(1) The bearings are to be type approved by the Society in their materials, construction and lubricating arrangements when rubber or synthetic materials are used.

(2) For sea water lubricated bearings of lignum vitae, rubber or synthetic materials, the length of the bearing is to be not less than 4 times the required diameter of the shaft in way of the bearing.

(3) For oil lubricated bearings of white metal or synthetic materials, the length of the bearing is to be not less than 2 times the required diameter of the shaft in way of the bearing. The length of the bearing may be less provided the nominal bearing pressure is not more than 0.8 MPa as determined by static bearing reaction calculation taking into account shaft and propeller weight which is deemed to be exerted solely on the aft bearing divided by the projected area of the shaft. For oil lubricated bearings of synthetic materials, the length of the bearing may be less provided the nominal bearing pressure is not more than 0.6 MPa as determined by static bearing reaction calculation taking into account shaft and propeller weight which is deemed to be ex-

erted solely on the aft bearing divided by the projected area of the shaft. However, the minimum length is to be not less than 1.5 times the actual diameter.

(4) The oil lubricated stern tube is always to be filled with oil and the lubricating oil is to be cooled by submerging the stern tube in the water of the after peak tank or by other suitable means. Means for ascertaining the temperature of the oil in the stern tube are also to be provided. Where a gravity tank supplying lubricating oil to the stern tube bearing is fitted, it is to be located above the load water line and provided with a low level alarm device. Adequate means are to be provided to supply ample amount of sea water for lubrication and cooling in the sea water lubricated stern tube.

(5) Where the material has been proven satisfactory through testing and operating experience, consideration may be given to an increased bearing pressure or a lessened bearing length.

2. The sealing devices other than gland packing type sea water sealing device are to be type approved by the Society in their materials, construction and arrangement.

207. Shaft coupling and coupling bolts

1. Coupling bolt

The diameter of the coupling bolts at joining face of the couplings is not to be less than that given the following formula:

$$d_b = 0.65\sqrt{\frac{d_0^3(T+160)}{n \times D \times T_b}} \quad (\mathrm{mm})$$

where:

d_0 = Minimum required diameter of intermediate shaft calculated with K_1=1.0 (mm)

n = Number of bolts

D = Diameter of pitch circle (mm)

T = Specified minimum tensile strength of the intermediate shaft material ($\mathrm{N/mm^2}$)

T_b = Specified minimum tensile strength of bolt material, while in general $T \le T_b \le 1.7T$, but not higher than 1,000 $\mathrm{N/mm^2}$.

2. Shaft coupling

(1) The thickness of coupling flange at the pitch circle is not to be less than that obtained by the following formulae, whichever is the greater.

$$t_1 = d_b \quad (\mathrm{mm})$$
$$t_2 = 0.2d \quad (\mathrm{mm})$$

where:

d_b = Minimum required diameter of bolts calculated for the material having the same tensile strength as the corresponding shaft

d = Minimum required diameter of corresponding shaft

(2) The fillet radius at the base of the flange is not to be less than 0.08 times the diameter of the shaft. Where the fillet is recessed in way of nuts and bolt heads, the fillet radius at the base of the flange is not to be less than 0.125 times the diameter of the shaft.

3. Built-up type couplings

Where the shaft couplings are separate from the shaft, the couplings are to have strength enough to resist the transmitting torque of shaft and the astern pull. In this case, the shaft is to be of construction to avoid excessive stress concentration.

208. Tests and inspections

1. Hydraulic test of stern tube

Stern tubes are to be tested by hydraulic pressure of 0.2 MPa after manufacturing.

2. Leakage test

The oil sealing devices in stern tubes are to be tested for leakage under working oil pressure after being installed in ships.

3. Hydraulic test of sleeve

Propeller shaft sleeves and stern tube shaft sleeves are to be tested by hydraulic pressure of 0.1 MPa before they are to be shrunk or forced on the shaft.

Section 3 Propellers

301. Application

The requirements of this Section apply to screw propellers. The structure and strength of propellers of special design are to be in accordance with the requirements which the Society considers appropriate.

302. Materials

The materials of propellers and blade fixing bolts of built-up propeller are to be in accordance with the requirements of **Pt 2, Ch 1.**

303. Thickness of blade

1. The thicknesses of the propeller blades for solid propellers and controllable pitch propellers (fillet at the root of the blades is not to be considered in the determination of blade thickness) are not to be less than obtained from the formula in **Table 5.3.3.** In case of high speed ship, the higher requirement may be requested.

2. For the controllable pitch propellers of tugs, trawlers or other special duty ships with similar operating profiles, the diameter/pitch ratio for the maximal bollard pull has to be used in formula. For the controllable pitch propellers of other ships, the diameter/pitch ratio applicable to open-water navigation at maximum engine power(MCR) can be used in formula.

3. Consideration

For the blades of different materials from those specified in **Table 5.3.3,** the value of K_m will be determined by the Society in each case. For propellers having a diameter of 2.5 m and less, the value of K may be taken as the value in **Table 5.3.3** multiplied by the following factors.

for $D \leq 2.0$ m : 1.2
for $D > 2.0$ m : $2.0 - 0.4D$

D : Diameter of propeller

Table 5.3.3 Thickness of Blade

Thickness of blade (mm)	$t_x = \sqrt{\dfrac{0.1K_1 \cdot P}{C_x K_2 \cdot Z \cdot N \cdot l_x}}$

P : Maximum continuous output of main propulsion machinery (kW)
Z : Number of blades
N : Number of maximum continuous revolution per minute devided by 100
C_x : Section modulus values at the blade position x (Actual section modulus÷$l_x t_{ax}{}^2$), where C_x exceeds 0.1, C_x is to be taken as 0.1
l_x : Width of blade at the radius xR (m) (x : 0.25, 0.35, 0.6)
R : Radius of propeller (m)
x : Radius position having no dimension
t_{ax} : Actual thickness of Blades (m)
K_1, K_2 : Coefficient given by the following table

Coefficient / x	Solid propeller	Controllable pitch propeller
0.25	$K_1 = \dfrac{61}{\sqrt{1+1.62\left(\dfrac{P_{0.25}}{D}\right)^2}}\left[0.092+0.329\left(\dfrac{D}{P_{0.7}}\right)+0.238\left(\dfrac{P_{0.25}}{D}\right)\right]$ $K_2 = K_m - \dfrac{D^3 \cdot N^2 \cdot \xi}{1{,}000\, l_{0.25} \cdot Z}\left[2.02+\dfrac{1.17\left(\dfrac{100E}{D}\right)+2.39}{\sqrt{1+1.62\left(\dfrac{P_{0.25}}{D}\right)^2}}\right]$	
0.35		$K_1 = \dfrac{61}{\sqrt{1+0.827\left(\dfrac{P_{0.35}}{D}\right)^2}}\left[0.074+0.264\left(\dfrac{D}{P_{0.7}}\right)+0.131\left(\dfrac{P_{0.35}}{D}\right)\right]$ $K_2 = K_m - \dfrac{D^3 \cdot N^2 \cdot \xi}{1{,}000\, l_{0.35} \cdot Z}\left[2.29+\dfrac{1.23\left(\dfrac{100E}{D}\right)+2.51}{\sqrt{1+0.827\left(\dfrac{P_{0.35}}{D}\right)^2}}\right]$
0.6	$K_1 = \dfrac{61}{\sqrt{1+0.281\left(\dfrac{P_{0.6}}{D}\right)^2}}\left[0.028+0.096\left(\dfrac{D}{P_{0.7}}\right)+0.026\left(\dfrac{P_{0.6}}{D}\right)\right]$ $K_2 = K_m - \dfrac{D^3 \cdot N^2 \cdot \xi}{1{,}000\, l_{0.6} \cdot Z}\left[1.48+\dfrac{0.68\left(\dfrac{100E}{D}\right)+1.38}{\sqrt{1+0.281\left(\dfrac{P_{0.6}}{D}\right)^2}}\right]$	$K_1 = \dfrac{61}{\sqrt{1+0.281\left(\dfrac{P_{0.6}}{D}\right)^2}}\left[0.028+0.100\left(\dfrac{D}{P_{0.7}}\right)+0.026\left(\dfrac{P_{0.6}}{D}\right)\right]$ $K_2 = K_m - \dfrac{D^3 \cdot N^2 \cdot \xi}{1{,}000\, l_{0.6} \cdot Z}\left[1.70+\dfrac{0.78\left(\dfrac{100E}{D}\right)+1.59}{\sqrt{1+0.281\left(\dfrac{P_{0.6}}{D}\right)^2}}\right]$

D : Diameter of propeller (m)
E : Rake of blade at propeller shaft center line (Distance between a cross of perpendicular line of blade tip and a cross of extension line of backface at shaft center line in the projection of maximum thickness section of the blade) (m)
P_x : Pitch at the radius xR (m) (x : 0.25, 0.35, 0.6, 0.7)
$\xi = \dfrac{A_E}{\dfrac{\pi}{4}D^2}$: Expanded area ratio
A_E : Expanded area of propeller

K_m : Values given by the following table

Materials		K_m
Grey cast iron		0.6
Cast steel	*RSC* 42	0.9
	RSC 46	
	RSC 49	1.0
Copper alloy casting	*CU* 1	1.15
	CU 2	
	CU 3	1.3
	CU 4	1.15

304. Fixing of blade

1. Fixing

Blade fixing bolts are to have sufficient strength as considered appropriate by the Society,and corrosion resistant materials are to be used or effective means precluding their direct contact with sea water are to be provided. Bolts are to be fitted tightly into the boss by flanging or other effective means, and nuts are to be secured by appropriate means to prevent loosening.

2. Recess

The recess for the blade fixing bolts are to be so provided that it has no significant influence to the strength at the root of blades.

3. Flange

The face of the flange of the blade is to be fitted tightly to the face of the boss, and the circumferential clearance of the edge of flange is to be kept to a minimum.

305. Fitting of propeller

1. The propeller is to be force-fitted on the taper of the propeller shaft or to be firmly fixed to the shaft by other appropriate means. Propeller, on force fitting or drawing out, is not to be heated partially to a high temperature.

2. Where the propeller is force-fitted to the propeller shaft without the use of a key, the calculation sheets of the pull-up length are to be submitted for approval. Where the propeller is bolted to the shaft, the blade fixing bolts are to have sufficient strength.

3. Anti-corrosion

Effective constructions are to be provided to prevent sea water from having access to the part between propeller cap or propeller boss and propeller shaft.

306. Hydraulic oil pump

Where, in controllable pitch propeller, pitch controlling devices are operated by hydraulic oil pump, a stand-by oil pump or other suitable means are to bo provided so that the ship can keep the normal voyage condition in the event of failure of the oil pump.

307. Tests and inspections

1. Balancing tests

Propellers are to be subjected to static balancing tests.

2. Contact tests

Where the propeller is force-fitted to the taper of the propeller shaft cone, the contact marking between the mating surfaces is to be verified by contact facing-up test or other suitable means.

3. Confirmation of the pull-up length

Where a propeller is force-fitted to the propeller shaft without the use of a key, the pull-up length is to be confirmed and recorded.

Section 4 Power Transmission Systems

401. General

1. Application

The requirements of this Section apply to power transmission systems which transmit power from main propulsion machinery and prime movers driving generators (excluding emergency generator) and essential auxiliaries for propulsion and safety of ships.

2. Special requirement

The construction of other power transmission systems not specified in this Section is to be such that the Society considers appropriate, functioning safely and reliably and having sufficient strength against transmitted power.

3. Hydraulic pump or air compressor, etc.

Where the clutching device of power transmission systems for propulsion is operated with hydraulic oil or air pressure, the stand-by hydraulic oil pumps or air compressor which can be used at any time or any other appropriate unit is to be provided, thereby to ensure that a ship can keep the normal service condition. However, in the case of small ships the requirement for this stand-by unit can be dispensed with at the discretion of the Society.

4. Electro-magnetic slip coupling

The electro-magnetic slip couplings are also to comply with the requirements of **Pt 6, Ch 1, 1603. 4.**

5. Materials

The materials used for main components of the power transmission system are to comply with the requirements in **Pt 2, Ch 1**. However, for small transmitted power, an attendance of Surveyor for material tests may be omitted.

402. General construction of gearing

1. Gear of built-up type

Where a gear is of built-up type, the rim is to be of a thickness to ensure sufficient strength and is to have an enough shrinkage fit against transmitted power. Where shrinkage fit is made after cutting of the teeth, the construction is to be such as to fully guarantee the accuracy of gearing, or the final tooth finishing is to be carried out after the shrinkage fit. Where gears are of welded construction, they are to have sufficient rigidity and are to be stress relieved before cutting of the teeth.

2. Casing

Gear casings are to have sufficient rigidity, and their construction is to be such that all possible facility is provided for inspection and maintenance. Where the casing is of welded structure, its construction and materials are to be approved by the Society.

3. Machining

Gear teeth are to be machined by hobbing machines of high accuracy, and it is recommended that the finishing, if available, is to be carried out as far as possible in a temperature controllable room. After the final machining, both edges of the teeth or any other sharp parts are to be properly hand finished. The surface hardening processes are to be carried out considering the influence of the thermal deformation to ensure that the necessary flank hardness and depth of hardened zone are obtained.

4. Other components of gears

Other components of the gears are also to be of reliable quality and their attachment are to be so arranged that they have no influence to the centers of gear shafts.

5. Noise

Gears are to be adjusted to give minimum noise in the normal range of revolution.

6. Lubricating oil arrangement

(1) Lubricating oil arrangement is also to comply with the requirements of **Ch 6, Sec 8**. Oil strainers used for gearing are to be those with a magnet if available.
(2) The gearing of the forced lubrication system with the driving units above 37 kW are to be pro-

vided with alarm devices which give visual and audible alarm in the event of failure of lubricating oil pressure supply or appreciable reduction in pressure of lubricating oil supply. For the lubricating oil arrangements other than forced lubrication system, suitable means are to be provided to ascertain oil level in sump.

403. Allowable tangential load for gears

1. Application

These provisions are applied to the external tooth cylindrical gears having an involute tooth profile. The external tooth cylindrical gears having tooth profiles other than the involute tooth profile are to comply with the requirements which the Society deems appropriate.

2. Allowable tangential load by bending strength

Allowable tangential loads decided for the bending strength of the teeth are to conform to the following condition:

$$P_{MCR} \le P_b$$

P_{MCR} = Tangential loads of gears at maximum continuous output, being the value to be obtained from the following formula:

$$P_{MCR} = \frac{1.91P}{nd_1 b} \times 10^6 \quad (\mathrm{N/cm})$$

where:

P = Output which the pinion shares at maximum continuous output (kW)

n = Revolutions of the pinion at maximum continuous output (rpm)

d_1 = Pitch circle diameter of the pinion (cm)

b = Effective face width of the gears on the pitch circle of the shaft parallel section (cm)

P_b = Allowable tangential loads decided for the bending strength, being obtained from the following formula:

$$P_b = 9.81(K_1 \cdot S_b - K_2) \times K_3 \left(4.85 - \frac{30.6}{Z}\right) M \quad (\mathrm{N/cm})$$

K_1 = External load magnification coefficient, being the value to be decided for the size of fluctuating loads working on the gears and to be given by the following formula. Where the value of K_1 can not be calculated, the values in **Table 5.3.4** may be used.

$$K_1 = \frac{1.10 P_{MCR}}{P_{MAX}}$$

P_{MAX} = Instantaneous maximum tangential loads occurring within the continuous revolution range (N/cm)

Table 5.3.4 Values of K_1

Driving engine	Construction or method of connection	$K_1^{(3)}$	
		Gear for propulsion	Gear for auxiliaries
Steam turbine or electric motor	Single stage reduction gear	1.00	1.15
	Multiple stage reduction gear	1.00[(1)], 1.10[(2)]	1.15
Internal combustion engine	Hydro-dynamic or electro-magnetic coupling	1.00	1.15
	High elastic coupling	0.90	1.05
	Elastic coupling	0.80	0.95
	Rigid coupling	0.50	0.60

NOTES:
(1) marked is applicable only to the gearing connected directly with the propulsion shaft system.
(2) marked is applicable only to the gearing connected directly with the propulsion shaft system through effective flexible couplings.
(3) Where one pinion meshes with more than two wheels, 0.9 times these values may be applied as the value of K_1.

K_2 = Internal load magnification value, being the value to be derived from the following formula or **Fig 5.3.1** which is dependent on the accuracy of gears and their overlap ratio.

$$K_2 = k_2 (d \times n)^{0.8}$$

where:

d = Pitch circle diameter of gears (cm)

n = Number of revolution per minute of gears divided by 1,000 (rpm/1,000)

k_2 = Value given in **Table 5.3.5.**

K_3 = Load magnification coefficient, being the value to be derived from the following formula or **Fig 5.3.2** which is dependent on the face width and pitch circle diameter.

Table 5.3.5 Values of k_2

Expected accuracy of finishing gears	k_2	
	$\varepsilon \geq 1.25$	$\varepsilon < 1.25$
Those corresponding to finishing by shaving or grinding	0.044	0.088
those corresponding to finishing by hobbing	0.11	0.22

$$\varepsilon = \frac{10 b_e \sin\beta_0}{\pi M}$$

b_e = Face width (in case of double helical gears, the face width is for one side) (cm)

β_0 = Helix angle

M = Normal module

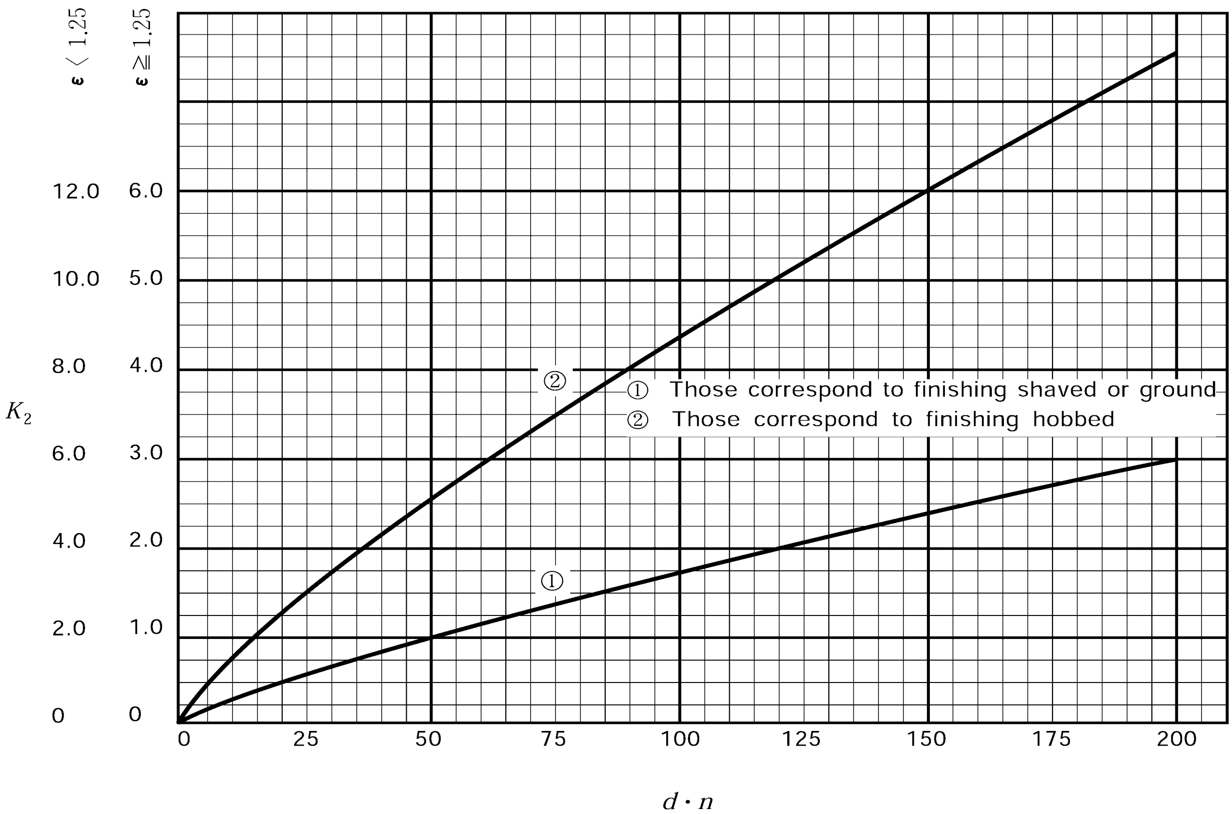


Fig 5.3.1 Values of K_2

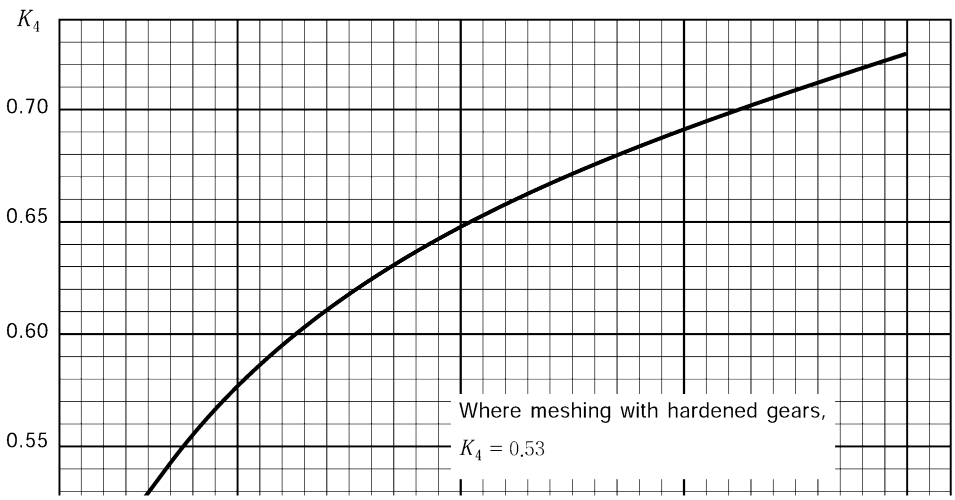

Fig 5.3.2 Values of K_3

$$K_3 = 1 - k_3 \left(\frac{b_t}{d_1} \right)^3$$

where:

b_t = Total face width of pinions (in case of double helical gears, central gap is included) (cm)

d_1 = Pitch circle diameter of pinion (cm)

k_3 = Value given by **Table 5.3.6.**

Table 5.3.6 Values of k_3

	k_3
When one pinion meshes with one wheel	0.01
When two wheels mesh with one pinion in the direction of the diameter	0.003

Z = Number of teeth

S_b = The value related mainly to the material of gears, given by the following formula. In case of ahead idle gears and astern gears, however, 0.7 times and 1.2 times respectively such value are regarded as S_b values. In any case, S_b value is not to exceed 25.

Gears to which surface hardening process was applied including bottom land:
$S_b = 0.83\sqrt{S}$

Other gears : $S_b = \frac{S+Y}{49} \times \frac{1}{F}$

$$F = 1 + (0.0096S - 2.4)\left(\frac{0.04}{\gamma_0} + 0.02\right) \times (0.023M + 0.75)$$

where:

S = Specified minimum tensile strength of gear material (N/mm^2)

Y = Specified minimum yield stress of gear material (N/mm^2)

γ_0 = Ratio between the tooth tip radius and module

M = Normal module

3. Tangential load by surface durability

The tangential loads of gears decided for surface durability of the teeth flank are to conform to the following condition, but these are not applicable to astern gears.

$$P_{MCR} \le P_S$$

P_{MCR} = As specified in **Par 2.**

P_S = Allowable tangential loads decided for the surface durability of the teeth flank and obtained by the following formula:

$$P_S = 9.81(K_1 S_S - K_2) K_3 K_4 \frac{i}{1+i} d_1 \quad (N/cm)$$

where:

K_1, K_2, K_3 = As specified in **Par 2.**

S_S = Decided by the material of gears and as given by the following formula:

Combination of gears both of which have been subjected to surface hardening process:

$$S_S = 2.236\sqrt{S_W}$$

Combination of other gears:

$$S_S = \left(0.005\frac{H_{BP}}{H_{BW}} + 0.007\right) S_W + 7.5$$

where:

S_W = Specified minimum tensile strength of wheel material ($\mathrm{N/mm^2}$)

H_{BP} = Hardness of tooth face of pinion (Brinell hardness $\mathrm{H_B}$)

H_{BW} = Hardness of tooth face of wheel (Brinell hardness $\mathrm{H_B}$)

K_4 = Lubricating coefficient, being the value decided for the following formula or **Fig 5.3.3,** which is dependent on pitch circle diameter and number of revolution. In case of meshing with hardened gears, however, K_4 = 0.53.

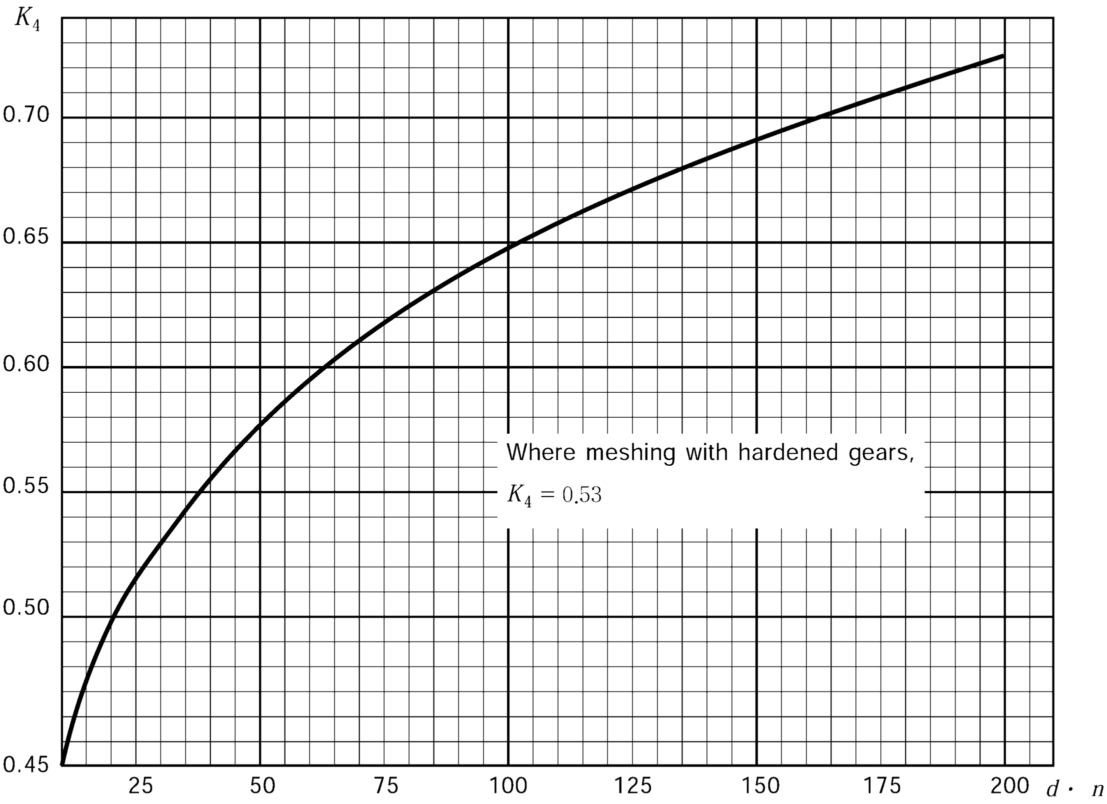

Fig 5.3.3 Values of K_4

$$K_4 = 0.3(d \cdot n)^{\frac{1}{6}}$$

where :

d = Pitch circle diameter of gears (cm)

n = Number of revolution per minute of gears divided by 1,000 (rpm/1,000)

i = Gear ratio (number of teeth of wheel/number of teeth of pinion)

d_1 = Pitch circle diameter of pinion (cm)

4. Consideration

The Society may approve special gearing devices, notwithstanding the requirements of **Pars 2** and **3,** provided that the detailed data for design, machining, using and calculations on the strength are submitted.

404. Gear shaft

1. Gear shaft

The diameter of gear shafts by which power is transmitted is not to be less than the value given by the formula in **203.** In this case, P and n in this formula represent respectively the output and the number of revolutions of the shaft at the maximum continuous output. For the tensile strength exceeding 1,000 N/mm^2 in the pinion shafts, T is to be taken as 1,000 N/mm^2. However, the diameter between the wheel shaft bearings is not to be less than the above values that multiplied by coefficient given in **Table 5.3.7.**

Table 5.3.7 Values of C

Arrangement of pinions	C
When one pinion is gearing, or when two pinions which are arranged at an angle less than 120° each other are gearing	1.16
When two pinions which are arranged at an angle more than 120° each other are gearing	1.10

2. Pinion shaft

The diameter of pinion shaft is to have sufficient rigidity against the bending force generated by meshing of gears.

405. Flexible shaft

The diameter of flexible shaft is not to be less than that given by the following formula:

$$d_f = 100\sqrt[3]{\frac{P}{n} \times \frac{440}{S}} \quad (\mathrm{mm})$$

where:

P = Output shared by flexible shaft at the maximum continuous output (kW)

n = Number of revolution per minute of flexible shaft at the maximum continuous output (rpm)

S = Specified minimum tensile strength of shaft material (N/mm^2)

406. Shaft couplings

1. Shaft couplings and coupling bolts

The dimensions of couplings and coupling bolts are applied to the related requirements in **207.** In case where they support heavy materials in cantilever style, they are to be designed so as to have sufficient strength to resist the weight.

2. Flexible couplings

The flexible couplings are to have sufficient strength against the torque to be transmitted to the shaft, and the constructions and materials are to be type approved by the Society.

407. Tests and inspections

1. Finishing accuracy

For the parts subjected to surface hardening process, the hardened depth are to be measured on sample materials, and hardness test and suitable non-destructive tests are to be carried out. The finishing accuracy of final machining of gears is to be measured minutely.

2. Dynamical balancing test

In the case of gears where the value given by the following formula exceeds 50, dynamic balancing tests are to be carried out, except for the case where specially approved by the Society to omit such test.

$$\frac{Dn}{1{,}000}$$

where:

D = Pitch circle diameter of the gear (cm)

n = Number of revolution of the gear (rpm)

3. Contact marking of teeth

The contact marking of the teeth of all gearing is to be verified under appropriate loads by coating suitable paint thinly and uniformly. And, in the case of propulsion gears where the total face width (in the case of double helical gears, the central gap is included) exceeds 300 mm or where the ratio between the total face width and pitch circle diameter of the pinion exceeds 2, the contact marking of the teeth is to be verified at sea trial by coating with copper sulphate or suitable paint on teeth flank thinly and uniformly.⚓

CHAPTER 4 TORSIONAL VIBRATION OF SHAFTINGS

Section 1 General

101. Application

1. The requirements of this Chapter apply to power transmission systems for propulsion and propulsion shafting systems, shafting systems to transmit power from main engines to generators, crankshafts of diesel engines used as main engines and shafting systems of generators driven by diesel engines.

2. Where alternative calculation methods other than this section are used for calculating dimensions of allowable torsional vibration stresses, they are to be complied with the requirements in **Ch 3, 201.3.**

102. Data to be submitted

1. For the shafting of ships, the calculation sheets for the torsional vibration are to be submitted in accordance with **Ch 1, 202.** and are to include the following particulars:

(1) Natural frequencies and modes for one node and two nodes vibration, also more nodes vibration if necessary.
(2) Estimated vibratory stresses for shafting system at each resonant critical within a speed range up to 120 % of the maximum continuous revolutions, and estimated torsional vibration stresses for the frank appearing at each non-resonant critical in the service speed range caused by a resonance having its critical speed above 120 % of the maximum continuous revolutions.
(3) Estimated vibratory torques for shafting system, gearings and flexible couplings.
(4) For propulsion shafts, estimated vibratory stresses for operation with any one cylinder misfiring(i.e. no injection but with compression)

2. Notwithstanding the requirements specified in **Par 1,** submission of the torsional vibration calculation sheets may be omitted in the following cases provided that approval of the Society is obtained:

(1) In case where the shafting system is of the same types as previously approved one.
(2) In case where there is a slight alternation in specifications of the vibration system, and the frequency and torsional vibration stress can be deduced with satisfactory accuracy on the basis of the previous result of calculations or measurements.
(3) In case where the maximum continuous output of engine is 100 kW and below.

103. Measurements

1. The alternating torsional stress amplitude can be measured on a shaft in a relevant condition over a repetitive cycle.

2. For the shafting systems where the submission of the torsional vibration calculation sheets is required, measurements to confirm correctness of the estimated value are to be carried out. However, where the submission of the calculation sheets is omitted according to the requirement in **102. 2,** and the Society considers that there is no critical vibration within the service speed range, the measurement of torsional vibration may be omitted.

Section 2 Allowable Limit of Vibration Stresses

201. Crankshafts

The torsional vibration stresses on the crankshafts of main propulsion diesel engines are to be in accordance with the following requirements. However, where the strength calculation for crankshafts is carried out according to the special requirements given by the Society, these stresses are to comply with this special requirements.

1. For continuous operation within the range below the maximum continuous revolution, the torsional vibration stresses are not to exceed τ_1 given in following.

(1) For 4 cycle in-line diesel engines and 4 cycle vee type diesel engines with firing intervals of 45° or 60°, the value of τ_1 is given by the following formula:

$$\tau_1 = 45 - 24\lambda^2 \quad (0 \le \lambda \le 1)$$

(2) For 2 cycle diesel engines and 4 cycle vee type diesel engines other than shown in (1) above, the value of τ_1 is given by the following formula:

$$\tau_1 = 45 - 29\lambda^2 \quad (0 \le \lambda \le 1)$$

where:

τ_1 = Allowable limit of torsional vibration stresses for continuous operation (N/mm^2)

λ = Ratio of the number of revolutions to the number of maximum continuous revolutions.

2. Within the range below and at 80 % of the maximum continuous revolutions, the torsional vibration stresses not exceeding τ_2 given in the following formula may be accepted, only for transient operation by passing through rapidly the range where the stresses exceed τ_1:

$$\tau_2 = 2\tau_1 \quad (0 \le \lambda \le 0.8)$$

where:

τ_2 = Allowable limit of torsional vibration stresses for transient operation (N/mm^2)

3. The torsional vibration stresses are not to exceed τ_3 given in the following, within the range from the maximum continuous revolutions to 115 %.

(1) For 4 cycle in-line diesel engines and 4 cycle vee type diesel engines with firing intervals of 45° or 60°, the value of τ_3 is given by the following formula:

$$\tau_3 = 21 + 237(\lambda - 0.8)\sqrt{\lambda - 1} \quad (1.0 \le \lambda \le 1.15)$$

(2) For 2 cycle diesel engines and 4 cycle vee type diesel engines other than shown in (1) above, the value of τ_3 is given by the following formula:

$$\tau_3 = 16 + 237(\lambda - 0.8)\sqrt{\lambda - 1} \quad (1.0 \le \lambda \le 1.15)$$

where:

τ_3 = Allowable limit of torsional vibration stresses in the range over the maximum continuous revolutions (N/mm^2)

§ = As specified in **Par 1.**

4. In case where the specified minimum tensile strength of the shaft material exceeds 440 N/mm^2, or its yield strength exceeds 225 N/mm^2, the values of τ_1, τ_2 and τ_3 given in **Pars 1** to **3** may be increased by multiplying the factor f_m given in the following formula:

(1) For τ_1 and τ_3

$$f_m = 1 + \frac{2}{3}\left(\frac{T_s}{440} - 1\right)$$

(2) For τ_2

$$f_m = \frac{Y}{225}$$

where:

f_m = Correction factor for allowable limit of torsional vibration stresses concerning the shaft material

T_s = Specified minimum tensile strength of shaft material ($\mathrm{N/mm^2}$). However, in case where the specified minimum tensile strength exceeds 590 $\mathrm{N/mm^2}$ for carbon steel forgings, or 835 $\mathrm{N/mm^2}$ for low alloy steel forgings, the value of T_s for calculating f_m is to be as deemed appropriate by the Society.

Y = Specified minimum yield stress of the shaft material ($\mathrm{N/mm^2}$).

202. Intermediate shafts, thrust shafts, propeller shafts and stern tube shafts

1. For ships equipped with main propulsion diesel engine, the torsional vibration stresses on the intermediate shafts, thrust shafts, propeller shafts and stern tube shafts are to be in accordance with the following requirements (1) and (2).

(1) For continuous operation, the torsional vibration stresses are not to exceed τ_1 given in the following formulae:

$$\tau_1 = \frac{T_s + 160}{18} C_k C_d (3 - 2\lambda^2) \qquad (0 \le \lambda \le 0.9)$$

$$\tau_1 = 1.38 \frac{T_s + 160}{18} C_k C_d \qquad (0.9 \le \lambda \le 1.05)$$

where:

τ_1 = Allowable limit of torsional vibration stresses for continuous operation $\mathrm{N/mm^2}$.

λ = As specified in **201. 1.**

T_s = Specified minimum tensile strength of shaft material ($\mathrm{N/mm^2}$). However, the values of T_s for using in the formulae is not to exceed 600 $\mathrm{N/mm^2}$ for carbon steel forgings and 800 $\mathrm{N/mm^2}$ for low alloy steel forgings in intermediate shafts and thrust shafts, and 600 $\mathrm{N/mm^2}$ in propeller shafts and stern tube shafts. Where propeller shafts and stern tube shafts are made of the approved corrosion resistant materials or other materials having effective means against corrosion by seawater, the value of T_s for using in the formulae is to be as deemed appropriate by the Society.

C_k = Coefficient concerning to the type and shape of the shaft, given in **Table 5.4.1.**

C_d = Coefficient concerning to the shaft size and determined by the following formula:

$$C_d = 0.35 + 0.93 d^{-0.2}$$

d = Diameter of the shaft (mm)

Table 5.4.1 Values of C_k

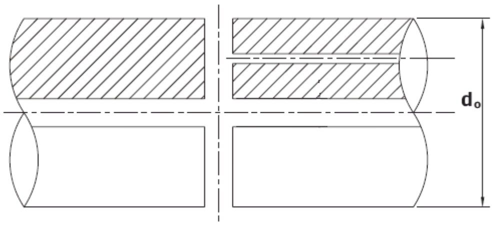
Intermediate shaft						Thrust shafts		Propeller shaft	Stern tube shaft
Integral coupling flanges	Shrink fit coupling flanges	Keyways (tapered connection)	Keyways (cylinderical connection)	Radial hole	Longitudinal slot	On both sides of thrust collar	In way of bearing when a roller bearing is used	-	
1.0	1.0 (1)	0.6 (2)	0.45 (2)	0.50 (3)	0.30 (4)(5)	0.85	0.85	0.55 (6)	0.8

NOTE:

(1) C_k refer to the plain shaft section only. Where shafts may experience vibratory stresses close to the permissible stresses for continuous operation, an increase of 1 to 2 % in diameter to the shrink fit diameter and a blending radius nearly equal to the change in diameter are to be provided,

(2) Keyways are in general not to used in installations with a barred speed range.

(3) Diameter of radial bore not to exceed $0.3d_0$ When a transverse hole intersects an eccentric axial hole(see below), the values is to be determined by the Society based on the submitted data in each case.



(4) Subject to limitations as slot length(l)/outside diameter(d_o) < 0.8 and inner diameter(d_i)/outside diameter(d_o) < 0.8 and slot width(e)/outside diameter(d_o) > 0.10. The end rounding of the slot is not to be less than e /2. An edge rounding should preferably be avoided as this increases the stress concentration slightly. The number of slots is to be 1, 2 or 3 and they are to be arranged 360, 180 or 120 degrees apart from each other respectively.

(5) C_k= 0.3 is a safe approximation within the limitations in (4) above. If the slot dimensions are outside of the above limitations, or if the use of another C_k is desired, the actual stress concentration factor is to be as deemed appropriate by the Society.

(6) Application to the portion of the propeller shaft between the forward edge of the aftermost shaft bearing and the forward face of the propeller boss(or propeller flange), but not less than $2.5d_s$. Where ; d_s : required diameter of propeller shaft or stern tube shaft.

(2) Within the range below 80 % of the maximum continuous revolutions, the torsional vibration stresses not exceeding τ_2 given in the following formula may be accepted, only for transient operation by passing through rapidly the range where the stresses exceed τ_1.

$$\tau_2 = \frac{1.7\tau_1}{\sqrt{C_k}}$$

where:

τ_2 = Allowable limit of torsional vibration stresses for transient operation (N/mm^2)

τ_1, C_k = As specified in (1)

2. For main propulsion system formed by steam turbines, gas turbines, diesel engines having slide couplings such as electro-magnetic coupling or fluid couplings, or electric propulsion systems having reduction gear, allowable limits of the torsional vibration stress on the intermediate shafts, thrust shafts, propeller shaft and stern tube shafts are to be as deemed appropriate by the Society.

203. Shafting system of generators

1. Torsional vibration stresses on the crankshafts of diesel engines to drive generators are to be in accordance with the following requirements (1) and (2). However, where the strength calculation for crankshafts is carried out according to the special requirements given by the Society, these stresses are to comply with the special requirements.

(1) The torsional vibration stresses are not to exceed τ_1 given in the following, within the range from 90 % to 110 % of the maximum continuous revolutions.

(A) For 4 cycle in-line diesel engines and 4 cycle vee type diesel engines with firing intervals of 45° or 60°, the value of τ_1 is given by the following formula:

$$\tau_1 = 21 \text{ N/mm}^2$$

(B) For 2 cycle diesel engines and 4 cycle vee type diesel engines other than shown in (A), the value of τ_1 is given by the following formula:

$$\tau_1 = 16 \text{ N/mm}^2$$

(2) Within the range below and at 90 % of the maximum continuous revolutions, the torsional vibration stresses not exceeding τ_2 given in the following formula may be accepted, only for transient operation by passing through rapidly the range where the stresses exceed τ_1.

$$\tau_1 = 90 \text{ N/mm}^2$$

2. The torsional vibration stresses on the generator shafts driven by diesel engines are to be in accordance with the following requirements (1) and (2).

(1) The torsional vibration stresses are not to exceed τ_1 given in the following, within the range from 90 % to 110 % of the maximum continuous revolutions.

$$\tau_1 = 31 \text{ N/mm}^2$$

(2) Within the range below and at 90 % of the maximum continuous revolutions, the torsional vibration stresses not exceeding τ_2 given in the following formula may be accepted, only for transient operation by passing through rapidly the range where the stresses exceed τ_1.

$$\tau_2 = 118 \text{ N/mm}^2$$

3. In case where the specified minimum tensile strength of the shaft material exceeds 440 N/mm^2, or its yield strength exceeds 225 N/mm^2, the values of τ_1 and τ_2 given in **Pars 1** and **2** may be increased by multiplying the factor f_m given in **201. 4.**

204. Avoidance of major criticals

The major criticals of one node vibration in in-line diesel engine, e.g. the n th and n/2th order for 4 cycle and the nth order for 2 cycle (n denotes the number of cylinders), are not to exist within the following speed range except when an approval is specifically obtained by the Society:

For main propulsion shafting system	$0.8 \le \lambda \le 1.1$
For generator shafting system	$0.9 \le \lambda \le 1.1$

where

λ = Ratio of the number of revolutions at the major critical to the maximum continuous revolutions

205. Detailed evaluation for strength

Special consideration will be given to the allowable limit of torsional vibration stresses not complying with the requirements in **201.** to **203.** provided that detailed data and calculations are submitted to the Society and considered appropriate.

206. Barred speed range

1. In case where the torsional vibration stresses exceed the allowable limit τ_1 specified in 201. to 203., the barred speed ranges are to be imposed in accordance with the following. The barred speed ranges are to be marked with red zones on the engine tachometers for passing through the ranges as rapidly as possible.

(1) the barred speed ranges are to be imposed between the following speed limits.

$$\frac{16N_c}{18-\lambda} \le N \le \frac{(18-\lambda)N_c}{16}$$

where:

N = The number of revolutions to be barred (rpm)

N_c = The number of revolutions at the resonant critical (rpm)

λ = Ratio of the number of revolutions at the resonant critical to the maximum continuous revolutions

(2) For controllable pitch propellers, both full and zero pitch conditions are to be considered.

(3) Restricted speed ranges in one cylinder misfiring conditions are to enable safe navigation even where the ship is provided with one propulsion engine.

2. In case where there are problems such as chattering or generation of heat caused by excessive alternating torque arising from the torsional vibration in the gears and flexible couplings, the requirement for those speed ranges is to comply with preceding **Par 1.** However, excessive alternating torque is not to be occurred in the speed range specified in **204.**

3. In case where the range in which the stresses exceed the allowable limit τ_1 specified in **201.** to **203.** is verified by measurements, such range may be taken as the barred speed range for avoiding continuous operation, notwithstanding the required range specified in the preceding **Par 1,** having regard to the tachometer accuracy.⚓

CHAPTER 5 BOILERS AND PRESSURE VESSELS

Section 1 Boilers

101. Application

1. The requirements in this Section apply to welded type boilers and their accessories, provided that the following are excluded from the scope.

(1) Steam boilers with design pressure not exceeding 0.1 MPa and heating surface not exceeding 1 m^2.

(2) Hot water boilers with design pressure not exceeding 0.1 MPa and heating surface not exceeding 8 m^2.

2. In cases where boilers are of unconventional construction and the requirements of this Section are unsuitable to be applied, the manufacturer is to submit the detailed plans, data and strength calculations for the construction to the Society for its approval.

102. Materials

1. The materials used in the construction of the pressure parts of boilers are to comply with the following requirements.

(1) All materials used for boilers are to comply with the requirements in **Pt 2, Ch 1.**

(2) The materials of fittings for boilers and piping systems are to comply with the requirements in **Pt 2. Ch 1.** However, where deemed as appropriate by the Society, the Society may accept to use the materials which meet Korean Industrial standards or equivalent.

(3) In case where heat treatment, such as hot working or stress relieving, is carried out on steel plates during the manufacturing process of boilers, the manufacturer is to inform of such intention with an order for the materials. What are expected of the manufacturer of steel plates in this case, are prescribed in **Pt 2, Ch 1, 302.3.**

(4) Appropriate heat treatments are to be carried out on the cold-formed steel plates, where it is considered that the cold-forming affects the safety of boiler.

2. Cast steel may be used in the shell plates or the end plates of the boilers where the thickness does not exceed 50 mm and the maximum working temperature does not exceed 350 °C.

3. Steel tubes

(1) Tubes used for boilers, which are subjected to the internal pressure and come in contact with fire or combustion gas, are to be either seamless steel tubes or electric resistance welded steel tubes.

(2) *RSTH* 33 as electric resistance welded steel tubes may be used for a boiler which has the design pressure of 2 MPa or below, at the places where wall temperatures are estimated to be 350 °C or below.

(3) *RSTH* 35 and *RSTH* 42 as electric resistance welded steel tubes may be used for a boiler which has the design pressure of 3 MPa or below, at the place where wall temperatures are estimated to be 400 °C or below.

4. Pipe fittings for boiler

(1) Stand pipes, flanges or distance pieces attached directly to boiler drums are to be made of steel.

(2) Valve chests or other pipe fittings which are connected to a boiler and are subjected to its pressure, are to be made of steel except for the following cases :

(A) The copper alloy castings may be used in cases where the maximum working temperature does not exceed 200 °C.

(B) The grey iron castings may be used for pipe fittings except for blow-off valve in cases where the maximum working temperature and the design pressure do not exceed 220 °C and 1 MPa respectively.

(C) Special cast iron may be used in cases where the castings are made by the specifically approved manufacturers, and the maximum working temperature and the design pressure do not exceed 230 °C and 2.5 MPa respectively.

103. Type of joint

Longitudinal and circumferential joints of boilers are to be of the approved double welded butt joints. However, for cylindrical shells of small diameter, where the inside welding is considered difficult, the joints may be of the single welded butt joint subject to the approval by the Society.

104. Welding method for each part

The welding methods to be adopted for each part are to be as those shown in **Fig 5.5.1** or the equivalent. The definitions of representative symbols are stated at the end of the figures.(Unit : mm)

105. Efficiencies of joints

The values of efficiencies of joints for the shells of boilers are to be as follows in relation to their application and type of joints.

(1) For seamless shells : J = 1.00

(2) For welded shells :

(A) Double welded butt joints : J = 1.00

(B) Other cases : J = 0.90

106. Ligament efficiency

1. The efficiency of longitudinal ligament (hereinafter referred to as "**longitudinal efficiency**") along the row of tube holes of shell plate having a row parallel or nearly parallel to the shell axis, or of shell or tube plate having several parallel rows with sufficient distance to each other, is to be determined by the following formula.

(1) In case where the pitch of tube holes is uniform (See **Fig 5.5.2**(a))

$$J = \frac{P-d}{P}$$

where :

J = Efficiency of ligament

P = Pitch of tube holes (mm)

d = Diameter of tube holes (mm)

(2) In case where the pitch of tube holes is irregular (see **Fig 5.5.2**(b))

$$J = \frac{L-nd}{L}$$

where :

J, d = As specified in (1)

L = Total length between centres corresponding to n consecutive ligaments (mm)

n = Number of tube holes in length L

2. The efficiency of circumferential ligament (hereinafter referred to as "circumferential efficiency") at the part of tube holes drilled in the circumferential direction of the shell is to be calculated in a similar manner to that prescribed in **Par 1** and is to be at least 0.50 times the efficiency of longitudinal ligaments. In this case, the pitches of tube holes in the circumferential direction are to be measured either on the flat plate before rolling or along the median line of plate thickness after rolling.

3. The efficiency of ligament at the part of tube holes drilled in the diagonal direction of the shell is to be determined by the following formula.

(1) Where tube holes drilled in the diagonal direction of the shell as shown in **Figs 5.5.2** (c) and

(d) : The value calculated by the following formula or longitudinal efficiency, whichever is lower, is to be used as the lowest efficiency of ligaments. (see **Fig 5.5.3**)

$$J=\frac{2}{A+B+\sqrt{(A-B)^2+4C^2}}$$

$$A=\frac{\cos^2\alpha+1}{2\left(1-\frac{d\cos\alpha}{a}\right)}$$

$$B=\frac{1}{2}\left(1-\frac{d\cos\alpha}{a}\right)(\sin^2\alpha+1)$$

$$C=\frac{\sin\alpha\cdot\cos\alpha}{2\left(1-\frac{d\cos\alpha}{a}\right)}$$

$$\cos\alpha=\frac{a}{\sqrt{a^2+b^2}},\qquad \sin\alpha=\frac{b}{\sqrt{a^2+b^2}}$$

where :

J = Efficiency of ligament

α = As given in **Figs 5.5.2** (c), (d) and (e)

a, b = As given in **Figs 5.5.2** (c), (d) and (e) (mm)

d = Diameter of tube holes (mm)

(2) For the above requirements in (1), where the tube holes are arranged in a regular staggered spacing as shown in **Fig 5.5.2** (e) :
The value calculated by above formula, twice the circumferential efficiency or longitudinal efficiency, whichever is the lowest, is to be used as the lowest efficiency of ligament. (see **Fig 5.5.4**)

4. Where the efficiency of tube plate cannot be obtained by the above requirements due to the special pattern of tube holes, the manufacturer may submit to the Society for its approval an alternative method of calculating the efficiency.

Fig 5.5.1 Examples of Welded Joints

Welding part	Symbol	Welding mode	Remark
(1) Welding joint between formed end plate and shell plate	1 A		$L \geq 3T_h$ (but, need not be more than 38 mm.). Where $T_h \leq 1.25T_s$, the above mentioned value may be reduced.
	1 B		
(2) Welding joint between flat end plate or cover plate and shell plate	2 A		(1) L = see **Table 5.5.4** (2) $R \geq 3T_E$
	2 B		(1) $T_f \geq 2T_s$ (2) $R \geq 3T_f$
	2 C		(1) $r \geq 0.02T_E$ (but, not less than 5 mm) (2) $t_n \geq 1.25T_{ro}$ (3) In welding the part ⓐ, such welding process as should have a good penetration to the root is to be employed. (4) End plates or cover plates are to be made of forged steel.
	2 D		Same as above

Fig 5.5.1 Examples of Welded Joints (continued)

Welding part	Symbol	Welding mode	Remark
(2) Welding joint between flat end plate or cover plate and shell plate	2 E		(1) $r \geq 0.3T_E$ (2) $L \geq T_E$ (3) For the part ⓐ, the same is required as above. (4) End plates or cover plates are to be made of forged steel.
	2 F		(1) $T_s \geq 1.25T_{ro}$ (2) $t_h \geq T_s$ (3) Where the welding of part ⓐ is considered difficult, the backing strip is to be used or the welding process which should have a good penetration to the root is to be employed.
	2 G		$T_s \geq 1.25T_{ro}$
	2 H		
	2 I		(1) $T_s \geq 1.25T_{ro}$ (2) $t_o \geq T_s$ (but, need not be over 6.5 mm) (3) $t_e \geq 1.25T_s$
	2 J		(1) Tube headers only. (2) $T_s \geq 1.25T_{ro}$ (circular only) (3) t_e is not to be less than $2T_{ro}$ or 1.25 T_s, whichever is the larger. (4) $t_a \geq T_s$ (but, need not be over 6.5 mm)

Fig 5.5.1 Examples of Welded Joints (continued)

Welding part	Symbol	Welding mode	Remark
(3) Welding joint between flue or furnace and shell or end plate	3 A		(1) To be applied for welding of boiler front. (2) Light fillet welding is to be employed for part ⓐ, (throat depth 4~6 mm) (3) θ is to be 10°~20° (4) $5 \leqq r \leqq 10$
	3 B		(1) To be applied for welding of boiler front. (2) $t \geq T_f$ (3) $L \geq 2T_s$
	3 C		(1) To be applied for welding of boiler front. (2) $t \geq T_s - 3$ (3) θ is to be 10°~20° (4) $5 \leqq r \leqq 10$
	3 D		To be applied for welding of boiler rear.
(4) welding joint between furnace ogee ring and shell plate	4 A 4 B		(1) $t \geq T_s$ (2) The welded surface is not be lower than the plate surface.
	4 C 4 D		

Fig 5.5.1 Examples of Welded Joints (continued)

Welding part	Symbol	Welding mode	Remark
	4 E		(1) $T \geq 1.265\sqrt{DP}$ Where : D = Inside diameter of shell (mm) P = Design pressure (MPa) T = Thickness of foundation ring (mm) (2) Where $D \leqq 750$: $l \geqq 50$ Where $D > 750$: $l \geqq 60$ (3) In welding the part ⓐ, such welding process as should have a good penetration to the root is to be employed.
(5) Welding joint between washer or reinforcement ring and shell or end plate	5 A		(1) In case of $d < 60$, to be applied. (2) $t_2 \geq 0.7t_m$ (3) The seal welding is to be employed for part ⓐ.
	5 B		(1) $t_1 + t_2 \geq 1.25t_m$ (2) t_1 , $t_2 \geq \frac{1}{3}t_m$ (but, the minimum is 6.5 mm)
	5 C		
(6) Welding joint between nozzle and shell or end plate	6 A		(1) $t_c \geqq 6.5$ or $0.7t_m$, whichever is the smaller. (2) $t_1 + t_2 \geq 1.25t_m$ (3) t_1 , $t_2 \geq \frac{1}{3}t_m$ (but, the minimum is 6.5 mm) (4) $t_w \geq 0.7t_m$
	6 B

	7 E		(1) $t \geq T_k$ (2) To be welded after expanding the tube, and after the welding the tube is to be further expanded slightly.
	7 F		(1) $t \geq T_k$ (2) To be welded after expanding the tube, and after the welding the tube is to be further expanded slightly. (3) On the side exposed to flame, $h \leqq 10$
	7 G		(1) $S \geq T_k + 3$ (2) On the side exposed to flame, $e \leq 1.5$ (3) To be welded after expanding the tube

NOTES :

T_s : Actual thickness of shell plate
T_h : Actual thickness of formed end plate
T_E: Actual thickness of flat end plate or cover plate
T_{ro} : Required thickness of seamless shell
T_p : Actual thickness of tube plate or flat end plate (formed end plate)
T_f : Actual thickness of flue or furnace plate, actual thickness of the flange on a forged head at the large end.
T_n : Actual thickness of nozzle
t_m : Smaller value of thickness of plates to be welded, however, the maximum value being 20 mm
T_k : Actual thickness of stay tube or tube.

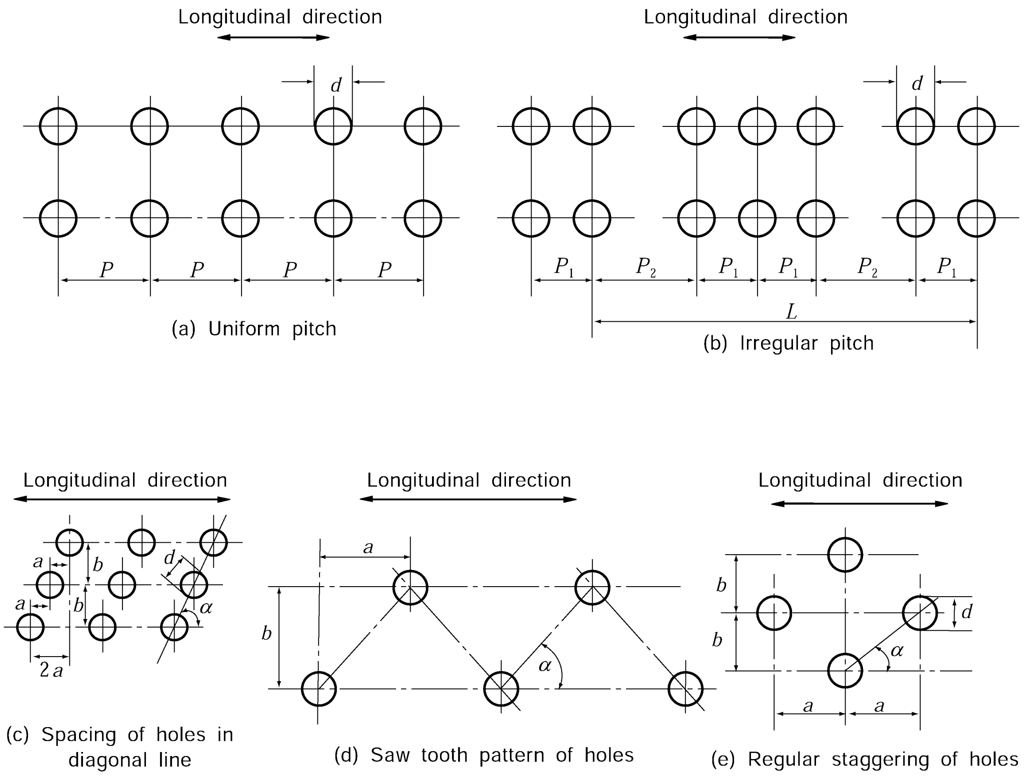

Fig. 5.5.2 Tube Holes

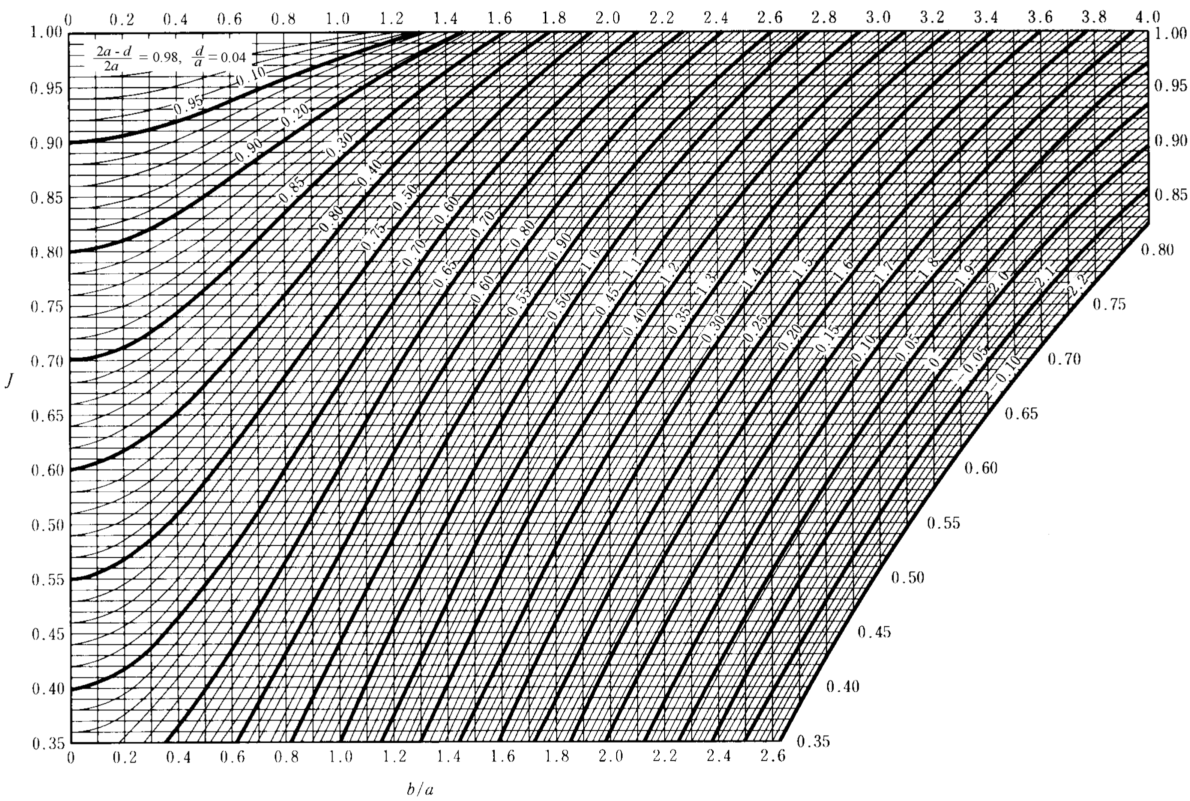

Fig. 5.5.3 The Efficiency of Ligament at the Part of Tube Holes Drilled in the Circumferential Direction

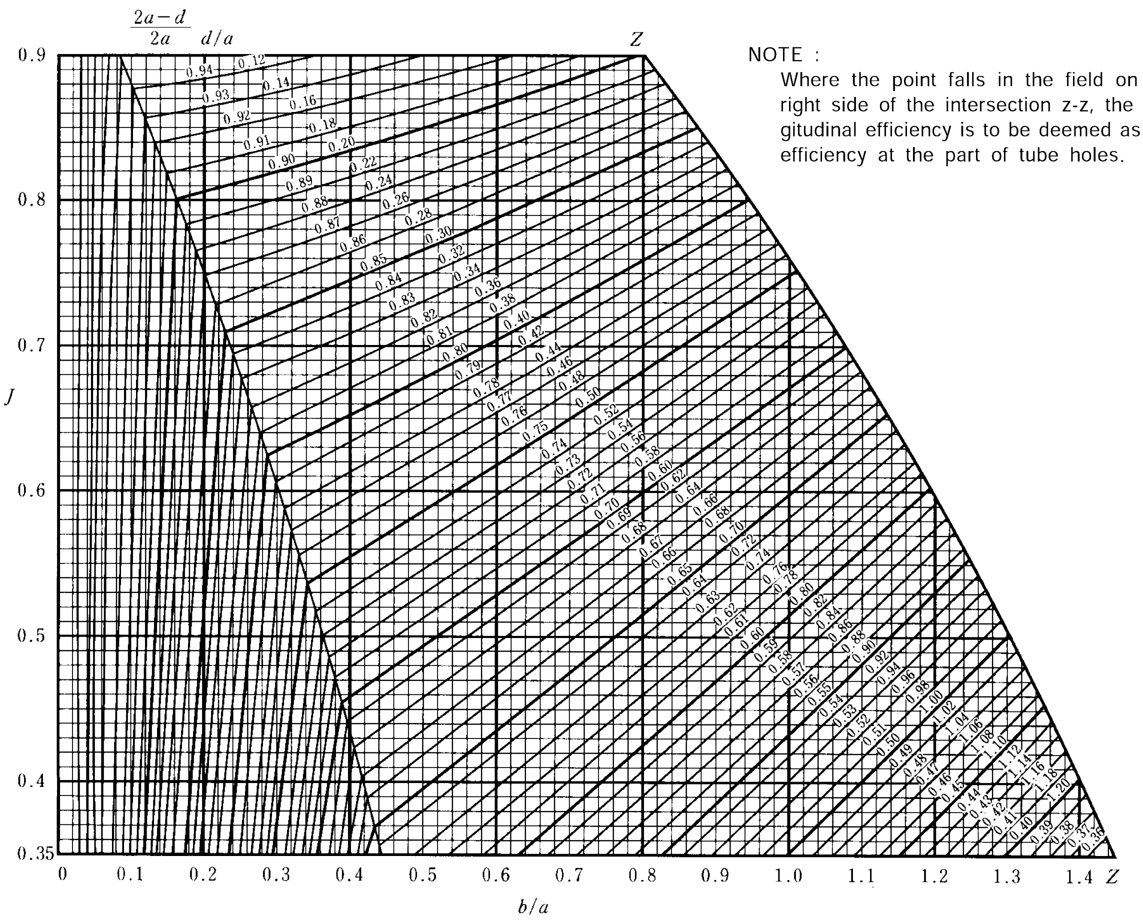

NOTE :
Where the point falls in the field on the right side of the intersection z-z, the longitudinal efficiency is to be deemed as the efficiency at the part of tube holes.

Fig. 5.5.4 The Efficiency of Ligament at the Part of Tube Holes Drilled in the Diagonal Direction

107. Allowable stress

1. The metal temperature at the heating surface, used to evaluate the allowable stress is to be taken as not less than the planned maximum temperature of the internal fluid increased by the temperature indicated in **Table 5.5.1.**

Table 5.5.1 Increase of Material Temperature

Heating surface in general	Heated by contact	25 °C
	Heated by radiation	50 °C
Heating surface of superheater	Heated by contact	35 °C
	Heated by radiation	50 °C
Heating surface of economizer	-	25 °C

2. The allowable stresses which are used for the calculation of strength in this Section are to be as follows.

(1) The allowable stress of carbon steel (including carbon manganese steel, hereinafter the same being referred in this Section) and low alloy steels excluding cast steels is not to be greater than obtained from the following formulae, whichever is the smallest. The allowable stress at each metal temperature may also be in accordance with the values given in **Table 5.5.2** instead of

the following formulae.

$$f = \frac{R_{20}}{2.7}, \quad f = \frac{f_R}{1.6}, \quad f = \frac{E_T}{1.6}, \quad f = \frac{S_C}{1.0}$$

where :

R_{20} = Specified minimum tensile strength at room temperature (N/mm^2)

f_R = Average stress to produce rupture in 100,000 hours at the design temperature (N/mm^2)

E_T = Specified minimum yield stress or 0.2 percent proof stress (N/mm^2)

S_C = Average stress to produce an elongation (creep) of 1 % in 100,000 hours at metal temperature (N/mm^2)

(2) The allowable stress of cast steels is to be 80 % of the value obtained by the formula in (1) or the value given in **Table 5.5.2.**

(3) The allowable stress of materials other than those specified in (1) and (2) will be considered in each case by the Society taking account of the mechanical properties of the materials.

Forged Steel (3)		1/4 of specified minimum tensile strength of material (where 350 °C and below)											
Cast steel (3)		1/5 of specified minimum tensile strength of material (where 350 °C and below)											

NOTES :

(1) In case where the temperature of a material is between those indicated in the Table, the value of allowable stress is to be determined by interpolation.

(2) For the electric-resistance welded steel tubes, the values of f are to be 85 % of these values.

(3) Materials specified in **Pt 2, Ch 1.**

108. General construction and strength

1. Because the formulae of this Section do not take into account such additional stresses as load from boiler fittings, localized stress, repeated load, thermal stress and so on, some measures such as increasing the size, etc. are to be taken, in case those effects are considered to exist.

2. Economizer, exhaust-gas economizer and their accessories, and fittings on feed water pipes are to be designed to stand a pressure 1.25 times the design pressure of the boiler. Where, however, it is difficult to comply with the above, they may be designed basing upon the maximum working pressure of the feed water pump or the boiler water circulating pump concerned.

3. Where part of the boiler drum and tube header is of the construction exposed to flames or high temperature gas, the part is to be suitably insulated with non-combustible material and sheathed with steel or other non-combustive material. In case where a part of the flue gas duct is composed of the end plate at the vapour space of the cylindrical boiler, the exposure of that part of flame is to be avoided by preparing an intercepting plate.

4. The construction of shell type economizer is to be such that the inspection of welding part of the tube plate to shell plate can be easily carried out. And shell type economizer is to be provided with removable lagging at the welding part of the tube plate to shell plate to enable ultrasonic examination of the part even during subsequent surveys.

5. The fixed parts of the flue tube of the vertical boilers are to be so designed that deformation of the flue tube induced by the thermal expansion of the hemispherical furnace may not be extremely restricted.

6. Sufficient consideration is to be given to (1) and (2) to prevent overheat of the water tubes for the boilers having a high carolific capacity of combustion chamber :

(1) Boiler water is to sufficiently circulate to the water tubes
(2) Proper means such as water softner, etc. are to be provided, if necessary, to prevent attachment of scales.

7. Consideration is to be given to prevent exhaust gas boilers and exhaust gas economizers, from being damaged by a soot fire.

109. Shell plates and end plates

1. The thickness of shell plates or end plates is not to be less than the required thickness prescribed in **Table 5.5.3** and further is not to be less than 6 mm. The thickness of the formed end plate except for the full hemispherical end plate is not to be less than the thickness (calculated by using the efficiency equal to 1.00) of the shell to which the end plate is attached.

2. The required thickness of the end plate having openings for which reinforcement is required is to comply with the following :

(1) In case where the openings are reinforced in accordance with the requirements in **115. 2** the required thickness is to be calculated by the previous paragraph.
(2) Where an end plate has a flanged-in manhole or access opening with a maximum diameter exceeding 150 mm, and the flanged-in reinforcement complies with the requirements in **115. 6,** the thickness is to be calculated as follows :
(A) Dished or hemispherical end plates : The thickness is to be increased by not less than 15 % (if the calculated value is less than 3 mm, the value is to be taken to 3 mm) of the required thickness calculated by the formula in **Table 5.5.3.** In this case, where the inside crown radius of the end plate is smaller than 0.80 times the inside diameter of the shell, the value of the inside crown radius in the formula is to be 0.80 times the inside diameter of the shell. In calculating the thickness of the end plate having two manholes in accordance with this (A), the distance between the two manholes is not to be less than 1/4 of the outside diameter of the end plate.
(B) Semi-ellipsoidal end plates : The same requirements in **Table 5.5.3** are to be applied. However, in this case R_1 is to be 0.80 times the inside diameter of shell and E to be 1.77.

3. The required thickness of end plates subject to pressure on the convex sides is not to be less than that obtained from the formula for end plates subject to pressure on the concave sides provided that the value of design pressure P, in the formula is taken as 1.67 times P.

Table 5.5.3 Thickness of Shell Plates and End Plates

Shell plates and end plates		Thickness (mm)
Shell plates	Cylindrical	$T=\frac{PD_1}{2fJ-1.2P}+1.0$
	Spherical	$T=\frac{PR_1}{2fJ-0.2P}+1.0$
End plates	Dished(1)	$T=\frac{PR_2E}{2fJ-0.2P}+1.0$
	Semi-spherical	$T=\frac{PR_2}{2fJ-0.2P}+1.0$
	Semi-ellipsoidal(2)	$T=\frac{PD_2}{2fJ-0.2P}+1.0$

P = Design pressure (MPa)
J = Minimum value of the efficiencies prescribed in **105.** and **106.**
f = Allowable stress prescribed in **107. 2.** (N/mm^2)
D_1 = Inside diameter of shell (mm)
D_2 = Inside length of the major axis (mm)
R_1 = Inside radius of shell (mm)
R_2 = Inside crown radius (mm)

$$E=\frac{1}{4}\left(3+\sqrt{\frac{R_2}{r}}\right)$$

r = Inside knuckle radius (mm).

NOTES :
(1) The inside crown radius of dished end plate is not to be greater than the outside diameter of the flanged part of the end plate. The inside knuckle radius of end plate is not to be less than 6 % of the outside diameter of the flanged part of the end plate or 3 times the thickness of the end plate, whichever is greater.
(2) Half the minor axis inside the semi-ellipsoidal end plate is not to be less than 1/2 of half the inside major axis of the end plate.

110. Flat end plates or cover plates without stay or other supports

The required thickness of flat end plates and cover plates without stay or other supports is not to be less than that obtained by the following formula :

$$T=C_1C_2d\sqrt{\frac{P}{f}}+1.0 \quad (mm)$$

where :

P, f = As specified in **Table 5.5.3.**

d = Inside diameter of end plate at flange part in case of circular type (mm)
= Inside length of the shortest of the spans in case of non-circular type (mm)

C_2 = 1.00 for circular type

$C_2=\sqrt{3.4-\frac{2.4d}{b}}$ for non-circular type (but, need not exceed 1.6)

b = Inside length of the greatest of the spans perpendicular to d in case of noncircular end plates(mm)

C_1 = Constant determined by the fixing method and given in **Table 5.5.4.**

Table 5.5.4 Constant C_1

Fixing method	C_{11}
In case 2A in **Fig 5.5.1**	1) In case L is not restricted (circular or non-circular), C_1 = 0.50
	2) Where $L \geq (1.1 - 0.8 \times T_S^2/T_E^2)\sqrt{dT_E}$ (circular only), C_1 = 0.39
In case 2B in **Fig 5.5.1**	Circular or non-circular, C_1 = 0.50
In case 2C, 2D, 2E, 2G, 2H in **Fig 5.5.1**	Circular, C_1 = 0.55. Non-circular, C_1 = 0.70
In case 2F, 2J in **Fig 5.5.1**	Circular or non-circular, C_1 = 0.70
In case 2I in **Fig 5.5.1**	Circular only, C_1 = 0.55

111. Flat plates or tube plates with stay or other supports

1. The required thickness of tube plates and flat plates is not to be less than 10 mm for tube plates and 6 mm for flat plates, regardless of the following paragraphs.

2. The required thickness of flat plates supported by stays or stay tubes, arranged regularly is not to be less than that obtained by the following formula :

$$T = Cd\sqrt{\frac{P}{f}} + 1.0 \quad (\mathrm{mm})$$

where :

P = Design pressure (MPa)

f = Allowable stress prescribed in **107. 2.** ($\mathrm{N/mm^2}$)

d = $\sqrt{a^2 + b^2}$

a = Horizontal pitch of stays or stay tubes (mm)

b = Vertical pitch of stays or stay tubes (mm)

C = Constant determined by the fixing methods of stays or stay tubes and given in **Table 5.5.5.** In case where various fixing methods are used, the value C is to be the mean of the constants for the respective methods.

Table 5.5.5 Constant C

Fixing method of stay or stay tube	C	
	In case the plates are exposed to flame	In case the plates are not exposed to flame
In case the stays are inserted into the plate as 7A in **Fig 5.5.1**	0.38	0.35
In case the stays are inserted into the plate as 7B in **Fig 5.5.1**	0.40	0.37
In case the stays are inserted into the plate as 7C in **Fig 5.5.1**	0.44	0.41
In case the stays are inserted into the plate as 7D in **Fig 5.5.1**	0.53	0.50
In case the stay tubes are inserted into the plate as 7E in **Fig 5.5.1**	0.45	0.42
In case the stay tubes are inserted into the plate as 7F in **Fig 5.5.1**	0.52	0.49
In case the stay tubes are inserted into the plate as 7G in **Fig 5.5.1**	0.52	0.49

3. At tube nests of tube plates supported by stay tubes arranged regularly, the required thickness of tube plates is not to be less than that obtained by the following formula :

$$T = Cd\sqrt{\frac{P}{f}} + 1.0 \quad (\mathrm{mm})$$

where :

P, f = As specified in **Par 2.**

d = Average length of four sides of the quadrilateral composed by four centre points of stay tubes at the corresponding parts (mm)

C = Constants determined by **Table 5.5.6.**

Table 5.5.6 Constant C

Fixing methods of stay tubes	C	
	In case the plates are exposed to flame	In case the plates are not exposed to flame
In case the stay tubes are inserted into the plate as 7 E in **Fig 5.5.1**	0.54	0.51
In case the stay tubes are inserted into the plate as 7 F in **Fig 5.5.1**	0.61	0.57
In case the stay tubes are inserted into the plate as 7 G in **Fig 5.5.1**	0.61	0.57

4. For the calculation of the required thickness of the flat plate in case where points of supports of stays or stay tubes are irregularly pitched, draw a maximum circle that passes through at least three points of supports with no point inside and the diameter d_1 of the circle is to be used as d in the formula in **Par 2,** or $\sqrt{a^2+b^2}$ is to be used as d in the formula in **Par 3.**

5. In case where the above formulae are applied, the commencement of curvature of the flange or the inside plain ends welded on shell or furnaces are to be regarded as points of supports, and the value of constant C in **Par 2** is determined by **Table 5.5.7.**

Table 5.5.7 Constant C

Item	C	
	In case exposed to flame	In case not exposed to flame
The commencement of curvature. However, when the inner radius of the curvature is greater than 2.5 times the thickness of the plate, the points located at a distance of 3.5 times the thickness of plate from outer surface of the flange may be considered as a commencement of the curvature.	0.39	0.36
The inside plain ends welded on shell or furnaces	0.47	0.43

112. Tube plates of vertical boiler

For vertical boilers where the smoke tubes are arranged horizontally, the required thickness of tube plate at the tube nests is not to be less than that obtained from the following formula or than that given by **111.3,** whichever is greater.

$$T = \frac{PD}{1.97fJ} + 1.0 \quad (\text{mm})$$

where :

P, f = As specified in **111. 2.**

D = Twice the distance between the axis of shell and the centre of the outer row of tube holes (mm)

$$J = \frac{P_i - d}{P_i}$$

P_i = Vertical pitch of smoke tubes (mm).

d = Diameter of tube holes (mm).

113. Tube plates of boilers with wet combustion chamber

The required thickness of rear tube plate in boiler with wet combustion chamber subjected to compression due to the pressure on the top plate is not to be less than that obtained by the following formula or than that obtained from **111. 3,** whichever is the greater.

$$T = \frac{PW}{183J} \quad (\text{mm})$$

where :

P = Design pressure (MPa)

W = Breadth at the top of combustion chamber (Inside distance between rear tube plate and back chamber plate) (mm)

$$J = \frac{P_i - d}{P_i}$$

P_i = Horizontal pitch of smoke tube (mm)

d = Inside diameter of ordinary smoke tube (mm)

114. Manholes, mud holes and peep holes

1. Manholes or mud holes are to be provided for boilers in a location where they do not come in the way on inspecting and cleaning of each portion of the boiler. The clear opening of manholes is to be not less than 300 mm by 400 mm. A mudhole opening in a boiler shell is not to be less than 60 mm by 90mm . Where, due to size or interior arrangement of a boiler, it is impractical to provide a manhole or other suitable opening for direct access, there are to be two or more suitable openings through which the interior can be inspected.

2. The manhole cover of internal type is to be provided with a spigot which has a clearance of not more than 1.5mm all round.

3. The minor axis of the oval opening to be provided on the shell plate is to be parallel to the longitudinal direction of the drum, except for the case where specially approved by the Society.

4. For the vertical boilers having cross tubes, a mud hole or some other proper attachment is to be provided for the purpose of cleaning the tube interior. Where, however, the diameter of the cross tubes is large, there are to be peep holes in the shell opposite to one end of each tube sufficiently large to permit the tube to be examined and cleaned in the easiest accessible position.

5. The caps of the peep holes of headers are to be rigid in construction, and the repetition of covering and uncovering is not to impair safety. In case where the cap is bolted, it is to be of such construction that the breakage of the bolts does not cause danger.

115. Reinforcement of openings

1. Openings in the shell are to be reinforced in accordance with the following Paragraph except single openings having a maximum diameter of not larger than 1/4 of the inside diameter of the shell and of not larger than 60 mm and the shell plate having margin in thickness for which no reinforcement is needed.

2. For openings in shell plates and formed end plates, reinforcement is to be provided in such a manner that the area of its cross section through the centre of the opening and normal to the surface of the opening is not less than that calculated by the following formula:

$$A = dT_r \quad (\mathrm{mm}^2)$$

where :

d = Maximum diameter of the finished opening in the longitudinal cross section for the shell plate or in the cross section for the end plate (mm)

T_r = Required thickness for a seamless shell or for a blank end plate (mm), except that, where the opening and its reinforcement are entirely within the spherical portion of a dished end plate, T_r is the thickness required for a seamless hemispherical end having the equal radius to the spherical portion of the head plate, and where the opening and its reinforcement are in semi-ellipsoidal end plate and are located entirely within a circle the centre of which coincides with the centre of the end plate and the diameter of which is equal to 80 % of the shell inside diameter, T_r is the thickness required for a seamless hemispherical head plate of a radius equal to 90 % of the shell inside diameter.

3. Where the flat head plates or cover plates prescribed in **110.** have openings with a diameter not exceeding one-half of the end plate diameter or the shortest span, the end plates are to have a total cross-sectional area of reinforcement not less than that given by the following formula :

$$A = 0.5dT_r \quad (\mathrm{mm}^2)$$

where :

d = Maximum diameter of holes (mm)

T_r = Required thickness calculated from the formula prescribed in **110.** (mm)

4. Effective limits of reinforcement

Reinforcement is to be provided within its effective limits. The limits of reinforcement are designated as the boundaries which are surrounded by two lines parallel to the centre line of the opening expressed by L and two lines vertical to inner and outer surfaces of the plate containing the centre of the opening expressed by H. The values of L and H may be taken as follows : (Also see **Fig 5.5.5**)

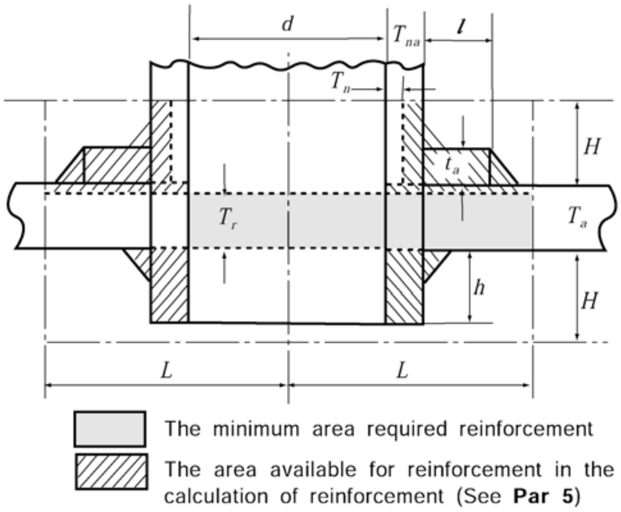

Fig. 5.5.5 Reinforcement of Holes

where :

L = d or $(d/2+T_a+T_{na})$, whichever is greater (mm)

H = $2.5T_a$ or $(2.5T_{na}+t_a)$, whichever is smaller (mm)

d = Diameter of opening in the cross section where reinforcement is intended (mm)

T_a = Actual thickness of the shell or end plate (mm)

T_{na} = Actual thickness of stand pipe (mm)

t_a = Actual thickness of reinforcement plate (mm)

5. The area available for reinforcement

The area available for reinforcement in the shell or end plate may be obtained as follows :

The total of these areas in each case is not to be less than the required sectional area A of reinforcement given in **Par 2** or **Par 3.** Where the opening requiring reinforcement passes through a joint in the shell or end plate, the actual area of the reinforcement is to be such that the efficiency of the joint is fully taken into account

$A_1 = (T_a - T_r)(2L-d)$ (mm²)

$A_2 = 2KH(T_{na} - T_n)$ (mm²)

$A_3 = 2KhT_{na}$ (mm²)

$A_4 = 2Kt_a l$ (mm²)

A_5 = Total section area of weld metal in one side (mm²)

$$A \le A_1 + A_2 + A_3 + A_4 + A_5$$

where :

T_a, T_{na}, t_a, d, L, H = As specified in **Par 4.**

T_r = As specified in **Par 2** or **3.**

T_n = Thickness of stand pipe provided as calculated from the formula in **Ch 6, 102. 6** minus corrosion allowance (mm)

h = Length of stand pipe within the effective limit where provided inside of the shell or end plate (mm)

l = Length of reinforcement in one side appearing in the cross section (mm)

$$K=\frac{Allowable\ stress\ of\ reinforcing\ material\ \text{or}\ stand\ pipe}{Allowable\ stress\ of\ shell\ \text{or}\ end\ plate}$$ (Provided that $K \leq 1.0$)

6. Where the end plate is bent around the manhole to form a flange, the depth of flange is not to be less than that obtained by the following formula :

Where the thickness of end plate is not more than 38 mm :

$$h = 3T_r \quad \text{(mm)}$$

Where the thickness of end plate exceeds 38 mm :

$$h = T_r + 76 \quad \text{(mm)}$$

where :

h = Depth of flange measured along the major axis of opening from the outer surface of end plate (mm)

T_r = The required thickness of end plate (mm)

116. Flues, furnaces, ogee rings and cross tubes

1. The thickness of flues is not to be less than that given by the following Paragraph and in no case is to be less than 5 mm and more than 22 mm.

2. The thickness of corrugated furnace plates is not to be less than that obtained by the following formula :

$$T = \frac{PD}{C} + 1.0 \quad \text{(mm)}$$

where :

P = Design pressure (MPa)

D = Minimum outside diameter measured at corrugated part of furnace (mm)

C = Constant determined by **Table 5.5.8.**

Table 5.5.8 Constant C

Furnaces	C
Morison, Deighton, Fox and similar furnaces	107
Leeds forge bulb furnaces	104

3. The required thickness of plain cylindrical furnace or cylindrical bottom of combustion chambers which are not reinforced by stays or other means is not to be less than that obtained by the following formulae, whichever is greater.

$$T_1 = \sqrt{\frac{PD(L+610)}{10,500}} + 1.0 \quad \text{(mm)}, \qquad T_2 = \frac{1}{325}\left(\frac{PD}{0.35} + L\right) + 1.0 \quad \text{(mm)}$$

where :

P = Design pressure (MPa)

D = External diameter of furnace or combustion chamber bottom (mm)

L = Length of furnace or depth of combustion chamber bottom (mm)

The length of furnace, however, is measured from commencement of curvature where the furnace plates are flanged and jointed to other plates, reinforcing rings, etc.

4. The required thickness of a hemispherical furnace without stays or other means is not to be less than that obtained by the following formula :

$$T = \frac{PR}{62} + 1.0 \quad (\mathrm{mm})$$

where :

P = Design pressure (MPa)

R = Outside radius of hemispherical furnace (mm)

5. The required thickness of furnace supported by stays or other means or cylindrical steel plates exposed to flame is to be determined in accordance with the following requirements, choosing the value whichever is greater.

(1) The sum of the thickness calculated by the formula in **Par 3** and that given by the formula in **111. 2** using 0.50 times the design pressure specified.

(2) The sum of the thickness calculated by the formula in **111.2** and that given by the formula in **Par 3** using 0.50 times the design pressure specified, whichever is the greater.

6. Ogee rings

Where ogee rings are used to connect the furnace bottom of vertical boiler to shell and to sustain the whole load of the furnace, the required thickness of ogee rings is not to be less than that obtained by the following formula :

$$T = \frac{\sqrt{PD(D - D_0)}}{1010} + 1.0 \quad (\mathrm{mm})$$

where :

P = Design pressure (MPa)

D = Inside diameter of boiler shell (mm)

D_0 = Outside diameter of the lower part of the furnace at the joint with ogee ring (mm)

7. Cross tubes

In cross tube boilers, the required thickness of cross tubes is not to be less than that obtained by the following formula. In no case, however, the thickness of cross tubes is to be less than 9.5 mm.

$$T = \frac{PD}{45} + 6.5 \quad (\mathrm{mm})$$

where :

P = Design pressure (MPa)

D = Inside diameter of cross tubes (mm)

117. Stays, stay tubes and girders

1. The required diameter of stays or stay tubes is not to be less than that obtained by the following formula. However, the thickness of stay tube is not to be less than 6.0 mm for those in bounding rows of tube nests, nor 4.5 mm for others.

$$d = C_1 k \sqrt{PA} + C_2 \quad (\mathrm{mm})$$

where :

P = Design pressure (MPa)

A = Area of plate supported by one stay or stay tube (mm^2)

$$k = \frac{1}{\sqrt{1-z^2}}$$

$z = \dfrac{Inside\ diameter}{Outside\ diameter}$, for stay tube

= 0, for stays

C_1, C_2 = Constants determined by **Table 5.5.9.**

Table 5.5.9 Constant C_1 and C_2

Description	C_1	C_2
Longitudinal stays without screws	0.127	3
Screwed stays	0.139	3
Stay tubes	0.158	0

2. Where stays are fitted diagonally, the required diameter of the stay is not to be less than that obtained from the formula in **Par 1** with the value of C_1 substituted by C_3 given in the following formula :

$$C_3 = C_1 \sqrt{\frac{L}{H}}$$

where :

L = Length of diagonal stay (mm)

H = Length of line, drawn perpendicular to boiler head or surface supported, to center of palm of diagonal stay (mm)

3. The required thickness of girders, or sum of the thickness in case of double plate construction supporting top plates of combustion chambers is not to be less than that obtained by the following formula :

$$T = \frac{PWP_i(W-a)}{CH^2S} \quad (\mathrm{mm})$$

where :

P = Design pressure (MPa)

W = Width of combustion chamber at upper part (the inside distance between rear tube plate and back plate of combustion chamber) (mm)

P_i = Pitch of girders (mm)

a = Spacing of stay bolts supporting girder (mm). For the welding type, a is to be 0.

S = Specified minimum tensile strength of the girder material (N/mm^2)

H = Depth of girder at centre (mm)

C = Constants determined by **Table 5.5.10.**

Table 5.5.10 Constant C

Description		C
Bolt type	The number (n) of stay bolts in each girder is odd	$25\times\frac{n}{n+1}$
	The number (n) of stay bolts in each girder is even	$25\times\frac{n+1}{n+2}$
Welding type		31

4. For top and side plates of combustion chambers in boiler with wet combustion chamber, the distance between outer row of the nearest stay to tube plate or back plate and the commencement of curvature of tube plate or back plate is to be not more than the value of "a" calculated by substituting design pressure in the formula of **111. 2.**

5. Where the outer radius of curvature at the flange part joining the top and side plates of combustion chambers is less than one-half the allowable pitch, P_i, of the girder calculated by substituting design pressure in the formula in **Par 3,** the distance measured from the inside surface of side plate to the centre of girder adjacent to the side plate is not to be greater than the allowable pitch, P_i, of the girder. Where this radius is greater than one-half the value of P_i, the distance from the beginning point of the curvature at the flange part to the centre of the girder is not to be greater than one-half the value of P_i.

118. Headers

1. The required thickness of cylindrical headers is not to be less than that obtained by the formula in **Table 5.5.3.**

2. The required thickness of square headers is not to be less than that obtained by the following formula :

$$T=\frac{Pl_2}{4f}\left(1+\sqrt{1+\frac{8fl_1^2}{CPl_2^2}}\right)+1.0 \quad (\mathrm{mm})$$

where :

P = Design pressure (MPa)

f = Allowable stress prescribed in **107. 2** (N/mm^2)

l_1 = Inside breadth measured between supports of flat surface for the strength calculation (mm)

l_2 = Inside breadth of another side adjacent to l_1 (mm)

C = 2.0, where holes are not arranged in succession

= 1.0 + J, where holes are arranged in succession.

J = Longitudinal efficiency of openings arranged in succession choosing the least value obtained in accordance with **106.**

3. Where the shape and dimension of the openings provided on headers are irregular, the minimum shell thickness of headers is to be specially considered by the Society.

4. Thickness of part of peep holes of tube header

The peep holes of tube headers are to be well machined so that they may be effectively covered. In this case, the thickness of the tube headers may be 1.0 mm less than that calculated by the formula in **Par 2,** but is not to be less than 9 mm.

119. Stand pipes

The thickness of stand pipes welded to shell is not to be less than either the value of 1/25 of the outside diameter of the stand pipes plus 2.5 mm or the value calculated by the formula in **Ch 6, 102. 6.** However, it need not exceed the required thickness of the shell at the part where the stand pipe is attached.

120. Boiler tubes

1. The thickness of the boiler tubes is not to be less than that given by the formula in **Par 2,** and not to be less than 2mm for the tubes less than 30 mm in outside diameter and not to be less than 2.5 mm for the tubes more than 30 mm in outside diameter. For tubes to be expanded or bent, their thickness is to be increased to compensate for thickness reduction due to expansion or bending.

2. The required thickness of smoke tubes for boilers is to be calculated by the following formula (1). And, the required thickness of water tubes, evaporating tubes, and superheater tubes subjected to the internal pressure of boilers is to be calculated by the following formula (2).

(1) $T = \frac{Pd}{70} + 2.0 \quad (\text{mm})$

(2) $T = \frac{Pd}{2f + P} + 1.5 \quad (\text{mm})$

where :

P = Design pressure (MPa)

d = Outside diameter of tube (mm)

f = Allowable stress prescribed in **107. 2** (N/mm^2)

3. Tube holes

Tube holes in the tube plates of drums are to be formed in such a way that the tubes can be effectively tightened in them. Where the tubes are practically normal to the tube plates, the parallel seating of the holes is not to be less than 10 mm in depth. Where the tube ends are not normal to the tube plate, the depth of the holes perpendicular to the tube plate is not to be less than 10 mm for tubes not exceeding 60 mm in outside diameter, and not to be less than 13 mm for tubes exceeding 60 mm in outside diameter.

4. Fixing

All tubes are to be tightly attached to the tube plate by expanding or other suitable methods and the ends are to project through the tube plate not less than 6 mm, except where being attached by welding. Both ends of tubes are to be fixed to tube plates in such a manner that they will never fall off. When fixing them simply with the tube end expanded in a flare shape, the taper is to be 30° or more.

121. Bolting methods of cover plates

1. Bolting methods of attaching unstayed cover plates are to follow the examples in **Fig 5.5.6** or other methods with the equivalent effectiveness, and the required thickness of unstayed cover plates is not to be less than that obtained by the following formulae.

(1) In case where a full-face gasket is used : (**Fig 5.5.6 A**)

$$T = d\sqrt{\frac{C_1 P}{f}} + 1.0 \quad (\mathrm{mm})$$

(2) In case where it is necessary to consider a moment due to gasket reaction : (**Fig 5.5.6 B**)

For circular plate : $T = d\sqrt{\frac{C_1 P}{f} + \frac{1.78\,Wl}{fd^3}} + 1.0 \quad (\mathrm{mm})$

For non-circular plate : $T = d\sqrt{\frac{C_1 C_2 P}{f} + \frac{6\,Wl}{fLd^2}} + 1.0 \quad (\mathrm{mm})$

where :

P = Design pressure (MPa)

f = Allowable stress given in **107. 2** ($\mathrm{N/mm^2}$)

d = Diameter of circular plate or the shortest span of non-circular plate measured as indicated in **Fig 5.5.6** (mm)

b = Longest span of non-circular plate measured perpendicular to the shortest span d (mm)

C_1 = Constant depending on attaching methods given in **Fig 5.5.6.**

$C_2 = 3.4 - 2.4d/b$ (but, need not exceed 2.5)

W = Total bolt load (N)

L = Length of non-circular curve through the centres of bolts (mm)

l = Arm length due to gasket reaction, equal to radial distance from the centre line of bolts to the line of gasket reaction (mm)

Symbol	Attaching method	Type and dimension	C_1	Remark
A	Bolted with full-face gasket		0.25 for circular and non-circular plates	—
B	Bolted	 	0.3 for circular and non-circular plates	W is mean value of the bolt load required for watertightness and the allowable bolt load in actual use.

Fig. 5.5.6 Examples of Bolting Methods of Cover Plates, etc.

122. Boiler mountings

1. The requirements in this Section apply to the fittings attached to boilers, such as valves, except where otherwise specified, and the requirements in **Ch 6** and **Pt 6, Ch 2** also apply respectively to the portions of boiler fittings that have close relation with piping systems and to the boilers that employ automatic and/or remote control.

2. Valves having nominal diameter not less than 50 A are to be of the outside-screw and yoke-rising-spindle type closing to the right hand with the bolted bonnet. Valves are to be fitted with an indicator to show whether the valve is opened or closed, except for the rising stem type.

3. All valves and cocks attached directly to a boiler are to be attached to the boiler with flange or by welding. Where stand pipes or distance pieces are used between the shell and mountings, they are to be as short as practicable. Where the thickness of boiler plate is 12 mm or above, or where a special stand for screwing is welded to the plate, the valves or cocks may be effectively attached to the boiler by pipe thread having a nominal diameter of 32 A and under. Where valves or cocks are attached to the boiler by stud bolts, the depth of threaded part inside the bolt holes is not to be less than diameter of bolt. The holes, however, are not to penetrate the whole thickness of the boiler plate.

123. The quantity and capacity of safety valves and relief valves

1. Boilers are to be fitted with not less than 2 spring loaded safety valves. However, only 1 safety valve may be accepted for the following boilers :

(1) Boilers with heating surface of less than 10 m^2

(2) Boilers with the design pressure of not more than 1 MPa, provided that they are equipped with a pressure controlling device and a device which cuts off fuel supply automatically at a pressure not exceeding the design pressure.

2. Safety valve with spring pilot valve may be used in lieu of spring loaded safety valve. The safety valve with spring pilot valve is to operate satisfactorily with the steam pressure.

3. In case where the boiler is provided with a superheater, at least one safety valve is to be fitted up at the outlet of the superheater.

4. Total area of safety valve seats

The total area of safety valve seats(for full bore valve, the required nozzle throat area) is not to be less than the required area given by the following formula. And, the seat diameter of safety valves is to be 25 mm or over, unless it is specially approved. For any boiler with an exhaust gas economizer which is so designed that it may be additionally heated while in use, the required area of the safety valves is to be calculated with the aggregated value of maximum evaporating capacity of boiler and evaporating capacity of exhaust gas economizer. But, the safety valves of the boiler having a superheater are to comply with **Par 6.**

(1) For saturated steam

$$A = \frac{KW}{10.5P + 1.0} \quad (\mathrm{mm}^2)$$

where :

A = Required area of safety valve seats (mm^2)

W = Designed maximum evaporating capacity (kg/hr)

P = Set pressure of safety valve (MPa)

K = Values given by **Table 5.5.11.**

Table 5.5.11 Values of K

Type of safety valves	K	Remarks
Ordinary type ($15 < D/L \leq 24$)	20.8	d_n : Diameter of throat (mm) L : Lift (mm) D : Inside diameter of valve seat (mm)
High lift type ($7 < D/L \leq 15$)	10.0	
Improved high lift type ($D/L \leq 7$)	5.0	
Full bore type ($D \geq 1.15\, d_n$)	3.34	

NOTES :
1. Where K is less than the above values, K is to be approved by the Society.

(2) For superheated steam
The area is to be the value calculated by the formula in (1), multiplied by

$$1 + \frac{Degree\ of\ superheat}{556}$$

5. Area of steam passages

(1) The required areas of steam passages of the ordinary type safety valve at the chest inlet and outlet are not to be less than 0.5 times and 1.1 times the required valve seat area respectively.
(2) The required areas of steam passages of the high lift type safety valve at the chest inlet and outlet are not to be less than the same and 2 times the required valve seat area respectively.
(3) The required areas of steam passages of the improved high lift type safety valve at the chest inlet and outlet are not to be less than 1.1 times and 2 times the steam passage area when the valve lift is 1/7 of the valve seat diameter respectively.
(4) The area of steam passage at the valve seat for the full bore safety valve is not to be less than 1.05 times the area at the throat, when the valve is open. Further, the areas of steam passages at the valve inlet and the nozzle are not to be less than 1.7 times the area at the throat, and the minimum steam passage area at the outlet is not to be less than 2 times the area at the valve seat when the valve is open.

6. Safety valve of superheater and reheater

(1) Where a superheater is considered as an integral part of a boiler with no intervening valve be-

tween the superheater and the boiler, the area of superheater safety valve seats may be included in determining the required total area of safety valve seats for the boiler as a whole, but is not to be credited of more than 25 % of the total capacity required in **Par 4.**

(2) The discharge capacity of the superheater safety valve is to be such that when main steam supply at normal load is shut down in an emergency, the superheater does not receive damages. In cases where this purpose cannot be achieved, the installation is to be provided so that a part of the fuel supply to the boiler is automatically shut down in emergency.

(3) One or more safety valves are to be fitted at the inlet and the outlet respectively of the independent reheater or the independent superheater, and the total discharge capacity is not to be less than the maximum passing steam quantity. The total discharge capacity of the safety valve provided at its outlet is not to be less than the quantity necessary to keep the steam temperature of the independent reheater or independent superheater not more than the designed point. However, for the independent superheater connected directly to the boiler which is designed with the same design pressure as that of the boiler, one or more safety valves are to be fitted at its outlet, and the total discharge capacity is not to be less than the quantity necessary to keep the steam temperature of the independent superheater not more than the designed point.

7. For the economizer and exhaust gas economizer equipped with a cutoff device from the boiler, one or more relief valves that are capable of discharging the quantity not lower than that calculated from the maximum absorbable energy are to be fitted. But, for shell type exhaust gas economizer having a total heating surface of 50 m^2 or more, two or more relief valves that are capable of discharging the quantity not lower than that calculated from the maximum absorbable energy are to be fitted.

124. Construction and tests of safety valves and relief valves

1. The safety valves and relief valves are to be so constructed that the springs and valves cannot be overloaded from outside and in case of fracture of the springs cannot spring out of their cages.

2. The valve springs are to be so set that the amount of contraction in length is not less than one-tenth the diameter of the valve seat, and the spring is to be such that the amount of permanent set will not exceed 1 % of the free length after it is fully compressed at cold state for 10 minutes.

3. The safety valves and relief valves are to be provided with easing gears which will surely open the valves in case of emergency and their handles are to be placed in a safe and easily accessible location.

4. The safety valves and relief valves are to be attached directly to boiler shells, headers, outlet connections of the superheater, or shells of shell type exhaust gas economizer by flanges or welded joints and the chests are to be of such type that they are not used in common with those of other valves. However, superheater safety valves may be fitted to the stand pipes or distance pieces attached at the outlet.

5. Relief valves for shell type exhaust gas economizers are to incorporate features that will ensure pressure relief even with solid matter deposits on the valve and guide, or features that will prevent the accumulation of solid matter in way of the valve and the in the clearance between the valve spindle and guide. Where no relief valves incorporating such features are fitted, a bursting disk discharging to suitable waste steam pipe is to be fitted in addition to the valve. The bursting disk is to function at a pressure not exceeding 1.25 times the economizer approved design pressure and is to have sufficient capacity to prevent damage to the economizer when operating at its design heat input level.

6. Waste steam pipe

(1) The waste steam pipe of the safety valve and relief valve is to be of such construction that back pressure does not interfere with operation of the valve. The inside diameter of the waste steam pipe is not to be less than the diameter of the valve outlet, and is to be designed at the pressure 1/4 or more of the setting pressure of the safety valve or relief valve.

(2) Where a common waste steam pipe is provided for two or more safety valves, the cross sectional area of the common pipe is not to be less than the aggregate area of required outlet area of each safety valve and where a common waste steam pipe is provided for two or more relief valves, the cross sectional area of the common pipe is not to be less than the aggregate area of

required outlet area of each relief valve. The waste steam pipes of boiler safety valves are to be separated from pipe lines containing drains such as waste steam pipes of relief valves for exhaust gas economizer or steam blow-out pipes to the atmosphere.

7. Drain

Draining hole having sufficient size is to be provided to the safety valve chest and the relief valve chest and the bursting disk specified in **Par 5** at the lowest part of the discharge side. Pipes for draining are to be led to a safety place clear of the boiler and exhaust gas economizer. No valves or cocks are to be fitted to these pipes.

8. Setting

The safety valve or relief valve is to be set in accordance with the following requirements at the completion of manufacturing at the factory and after the installation in the ship. And the valve is to operate satisfactorily while relieving at its setting pressure.

(1) The safety valve of the boiler drum is to be set to relieve steam automatically at a pressure not exceeding the design pressure. The range of pressure settings of all the drum safety valves is not to exceed 10 % of the highest pressure to which any safety valve is set. In no case is the relief pressure to be greater than the design pressure of the steam piping or that of the machinery connected to the boiler plus the pressure drop in the steam piping.

(2) Where a superheater is fitted, the superheater safety valve is to be set to relieve at a pressure no greater than the design pressure of the steam piping or the design pressure of the machinery connected to the superheater plus pressure drop in the steam piping. In no case is the superheater safety valve to be set at a pressure greater than the design pressure of the superheater. The superheater safety valve is to be set to relieve steam automatically at a pressure not greater than the value which is obtained by subtracting the setting pressure of the safety valve or valves at the boiler drum by the value of 0.035 MPa plus the steam pressure drop in the superheater at the rated load.

(3) The relieving pressure of the safety valve at the outlet of the superheater is to be set lower than that at the inlet.

(4) The relieving pressure of the relief valve provided to the economizer or exhaust gas economizer is to be set at a pressure not exceeding the design pressure.

9. Accumulation test

The accumulation test of the boiler is to be conducted in the methods specified below. However, in case the data on the evaporation of the boiler submitted to the Society has been approved, the accumulation test prescribed in (1) may be omitted.

(1) When the safety valve blows under the maximum firing condition of the boiler with the stop valves closed except for the valves for steam supply to the machinery necessary to the operation of the boiler, the accumulation of pressure in the boiler drum is not to exceed 110 % of the design pressure. In this case, however, the feed water necessary to maintain a safe water level may be supplied.

(2) For the oil burning boiler with superheater, where the accumulation test might endanger the superheater with possible overheating, the operation test of the installation by merely shutting down quickly the main steam supply under the maximum output of the boiler, as specified in **123. 6** (2).

10. In case the calculated discharge capacity of the safety valve does not comply with the requirement of **123. 4** on account of the reduction of the design pressure for the boiler, it may be accepted provided the accumulation test required by (1) of the preceding Paragraph has been carried out with satisfactory results.

125. Low water level safety device

Boiler is to be fitted with a low water level safety device which is capable of shutting off automatically the oil supply to the burners when the water level falls to a predetermined level higher than the critical level. The water level detector for this device is to be independent of water level detector for the feed water control system. For forced circulation boilers or once-through boilers, the safety device may be omitted, provided that the boiler is fitted with safety device specified in **129. 2.**

126. Steam stop valves

1. Main and auxiliary steam stop valves are to be fitted to the boiler shells at all steam outlets of boilers. Where a superheater is fitted as an integral part of a boiler, superheater steam stop valve is to be fitted at the superheater outlet side in order to prevent damage to the superheater.

2. Where the steam discharge pipes of two or more boilers are connected to each other, two stop valves are to be fitted between the boiler and the connecting part and the stop valve adjoining to the boiler is to be of the screw down check valve.

3. Where the diameter of steam stop valves exceeds 150 mm nominal diameter, by-pass valve is to be arranged as far as practicable for plant warm-up purpose.

127. Feed water connection and valves

1. A feed stop valve attached directly to the boiler is to be fitted to feed openings and a screw down check valve is to be provided as close to the stop valve as practicable. An approved feed water regulator may, however, be fitted between the check and stop valves.

2. Notwithstanding the requirement in **Par 1**, where the boiler has an economizer which is recognized as integral part of the boiler, the stop valves may be provided directly at the economizer inlet. In this case a screw-down check valve is to be provided as close to the stop valve as practicable.

3. Boilers fitted with economizers are to be provided with a check valve located in the feed water line between the economizer and the boiler drum. This check valve is to be located as close to the boiler drum feed water inlet openings as possible. When a by-pass is provided for the economizer, the check valve is to be of the stop-check type.

4. The part of the drum shell where feed water is discharged into the boiler is to be so arranged that a remarkable thermal stress may not occur due to direct contact of the feed water to the shell plate. This requirement is also to be applied to the parts of the boiler drum having desuperheater where the superheated steam pipes are penetrated through the drum.

5. Feed water discharge in the drum is to be distributed as far apart as practicable so that it may not impinge directly on the heating surfaces of the boiler at high temperature.

128. Blowoff valves and blowoff piping

1. Design

The design pressure of blowoff piping is not to be less than 1.25 times the design pressure of the boiler.

2. Blowoff valves

The boiler is to be provided with a blowoff valve mounted directly on its drum so that the boiler water may be discharged from the bottom of its water space ; its nominal diameter is not to be less than 25A but not more than 65A, except that for boilers with heating surface of 10 m^2 or less, the blowoff valve may be 20A in nominal diameter. Blowoff valves are to be of such construction that they are free from accumulation of scale and other sediments.

3. Blowoff pipe

(1) Where two or more boilers are installed and the blow off pipe of each boiler is connected to each other, screw-down check valves are to be fitted in each pipe line.
(2) Where the blowoff pipes are exposed to flame or high temperature gases, they are to be protected by thermal insulation materials.

129. Water level indicator

1. Each boiler is to be provided with at least two water level indicators independently, one of which is to be a glass water level gauge and the other is to comply with either of the following requirements. And, water level indicators other than glass water level gauge are to be type approved by the Society.

(1) Glass water level gauge located where the water level is easily read by the operator in his working area.
(2) Remote water level indicator, but, for the boiler whose design pressure is 1 MPa or under, this may be replaced with a level alarm device. In this case, remote water level indicator or detector for high and low water level alarm device is to be independent of the detector for the low water level safety device required in **125.**

2. For forced circulation or once-through boilers, where **Par 1** is not applicable for the indication of water level, a suitable level detector and the low water level safety device which are comprised of two detectors so designed to prevent the overheating of any part of the boiler by lack of water supply is to be provided.

3. In cases the water space in the boiler is long in the transverse direction of the ship, or an excessive difference in water level is feared to occur, the level indicators prescribed in **Par 1** are to be provided on both ends of the water space.

4. Construction of glass water level gauge is to be of the built-up rectangular-section box type(double-plate type) specified in the *Korean Industrial Standards or equivalent standards* or the equivalent approved by the Society.

5. The lowest visible part of the glass water gauge is to be at least 50 mm above the lowest permissible water level. The visible range of the remote level indicator is to be such that it covers all the possible water levels as related to the water level control in the boiler.

6. Each water gauge is to be fitted with shut-off valve or cock on the top and bottom, and drain valve at the bottom. Where top and bottom shut-offs of the watergauge are cocks, and where the water gauge or the water column is connected by the pipe to the boiler drum, the stop valves are to be fitted to the boiler drum.

7. The water column to which the water gauge is attached is to be strongly supported so that it may maintain its correct position. The inside diameter of the water column is to be 45 mm or over and the draining device with nominal diameter 20A or over is to be attached to the bottom of column. The connection pipes to the boiler drum are to be 15A or over for water gauge, and 25A or over for the water column in nominal diameter.

8. The connection pipes from the water column to the boiler are not to penetrate the flue, unless they are enclosed all through the flue and further the air passage of not less than 50 mm is provided around the pipes.

130. Pressure gauges and thermometers

1. The boiler drum, the superheater outlet and shell type exhaust gas economizer are to be provided with pressure gauges. These gauges are to be such that they have a scale 1.5 times and above the pressure at which the safety valves or relief valves are set and are to be placed where they can easily be observed. And they are also to be located such that the pressure can be easily read even from a position where the pressure can be controlled. In the scale of the pressure gauges, the approved working pressure and the working pressure at the superheater outlet are to be marked. A thermometer is to be provided at the outlet of superheater or reheater.

2. The pressure gauge is to be provided with a device to which a test pressure gauge for the indicator can be attached while the boiler is in operation, unless it is already equipped with a pressure gauge tester.

131. Monitoring of boiler water quality

1. Each boiler is to be provided with a boiler water takeout valve or cock in a convenient position of the body and the valve or cock is to be independent from a water gauge.

2. Boilers are to be provided with means such as water analyzer or other suitable device to supervise and control the quality of the feed water and boiler water.

132. Draught fans

The boilers are to be provided with draught fans with a capacity sufficient for the designed maximum steam evaporation of the boiler and for the stable combustion in the boiler within its service range. An alternative means which is available to ensure the normal navigation and cargo heating that is required continuously is to be provided, in the case of failure of the draught fan.

133. Safety devices and alarm devices

1. Fuel oil shut-off device

Each boiler is to be fitted with a safety device which is capable of shutting off automatically the fuel supply to all burners in the cases of the following :

(1) When automatic ignition fails.
(2) When the flame vanishes (in this case, the fuel oil supply is to be shut-off within 4 seconds after the extinguishing of flame).
(3) When the water level falls.
(4) When the combustion air supply stops.
(5) When the fuel oil supply pressure to the oil burners falls in the case of pressure atomizing, or when the steam pressure to the burners falls in steam atomizing.
(6) When considered necessary by the Society.

2. Alarm device

(1) Each boiler is to be provided with an alarm device which operates when the water level in the drum falls.
(2) In addition to the above, the main boilers are to be provided with alarm devices which operate in the following cases :
  (A) When combustion air supply reduces, or when the draught fan stops.
  (B) When the fuel oil supply pressure to the burner falls, in the case of pressure atomizing, or when the steam pressure to burner falls, in steam atomizing.
  (C) When the water level in boiler drum reaches to a high level.
  (D) When the steam temperature at the superheater outlet rises, if the superheater is provided.
  (E) When the exhaust gas temperature at the outlet of the gas type air preheater or economizer rises.
  Ff) When the flame vanishes
(3) For auxiliary boiler supplying steam to the turbines driving main generators, alarm devices which operate when the water level in the boiler drum reaches to a high level are to be provided in addition to those alarm devices given in (1).

134. Boiler installation

1. Boilers are to be efficiently insulated as far as possible and so arranged that all exterior parts, after lagging is removed, may be readily inspected or repaired. Boilers are to be so installed as to minimize the effect of the following loads or external forces.

(1) Ship motion or vibrations caused by machinery installations.
(2) External forces caused by the piping and supporting members fitted on the boiler.
(3) Thermal expansions due to temperature fluctuation.

2. Distance between boilers and fuel oil tanks

The distance between boilers and fuel oil tanks is to be 610 mm or more at the rear ends of the boilers and 457 mm or more at the other parts in order to prevent the oil temperature in the tanks from reaching the flash point of the oil. However, at the cylindrical part of a cylindrical boiler or the casing corners of a water tube boiler, the distance may be reduced down to 230 mm.

3. Water tube boilers

Water tube boilers are to be so arranged as to prevent the fuel oil from leaking into the bilge wells out of boiler bottom.

4. Dampers

In case dampers are installed in the funnels or uptakes of boilers, their openings are not to be reduced to more than 2/3 of the flue area when closed. They are to be capable of locking in any open position and the degree of the opening is to be clearly indicated.

5. Boiler casings

The boiler casings, the joints of funnels, and the covers of openings are to be so arranged as to prevent flue gas from leaking into the engines or boiler rooms.

6. Valves and cocks

All valve and cocks attached to boilers are to be so arranged as to have proper space around each of them in order to give facilities for their handling and repairing.

135. Drainage of superheaters and reheaters

Drain valves or cocks are to be arranged in the positions proper for draining water completely from the superheaters or reheaters.

136. Tests and Inspections

1. Hydraulic tests

Boilers, valves and cocks attached directly to a boiler, and water level indicators are to be tested by the hydraulic pressure specified in **Table 5.5.12** after construction in the presence of the Surveyor.

2. Tests and inspections of boiler

For the tests and inspections of the safety valves and accumulation tests of boilers, the requirements in **124. 8** and **9** are to be applied. Where boilers are automatically operated or remote-controlled, the requirements in **Pt 6, Ch 2, Sec 1** are to be applied.

Table 5.5.12 Test Pressure

Item	Test pressure
Boiler, superheater, reheater and the equivalent	1.5 times the design pressure
Economizer, exhaust gas economizer	1.5 times the design pressure in accordance with **108. 2.**
Valves and cocks attached directly to a boiler, superheater, reheater and the equivalent	2 times the design pressure of the boiler
Valves and cocks attached directly to a economizer and exhaust gas economizer	2 times the design pressure in accordance with **108. 2.**
Blow-off valves	2.5 times the design pressure of the boiler
Water level indicators	2 times the design pressure of the boiler

Section 2 Thermal Oil Heaters

201. Application

The thermal oil heaters heated by flame or combustion gas are to comply with the relevant requirements specified in **Sec 1** (in this case the term "boiler" is to be read as "thermal oil heater") as well as the requirements in this Section.

202. Safety devices for thermal oil heaters heated by flame

1. Temperature regulators are to be provided to control the temperature of the thermal oil within the predetermined range.

2. The master valve of the expansion tank is to be kept always open, and the burning system is to be interlocked in such a way that it does not start when the master valve is closed.

3. Safety valve or pressure relief pipe of sufficient capacity is to be provided.

4. The discharge pipes from the safety valve or the pressure relief pipe specified in **Par 3** are to have their open ends in the thermal oil tank with sufficient capacity.

5. The following safety devices are to be provided :

(1) Prepurging system for preventing explosion of the furnace gas.
(2) Fuel oil shut-off systems which operate in the following cases :
  (A) When the temperature of the thermal oil rises abnormally.
  (B) When the flow rate of the thermal oil falls or when the pressure difference of the thermal oil between the inlet and outlet of the heater falls.
  (C) When the level of the thermal oil in the expansion tank falls abnormally.

203. Safety devices for thermal oil heaters directly heated by the exhaust gas of engines

1. Safety devices etc., are to comply with the requirements in **202. 1, 3** and **4.**

2. The master valve of an expansion tank is to be kept normally open and, such a interlocking device that exhaust gas does not enter into the heater where the master valve is closed, is to be provided.

3. A by-pass damper is to be provided at the exhaust gas inlet of the thermal oil heater so that the engine can be operable even when the supply of the exhaust gas to the heater is shut-off.

4. Means are to be provided to prevent the leakage oil form thermal oil heaters or water used for fire fighting from flowing into the exhaust gas duct of the engine.

5. Stop valves are to be provided at the inlet and outlet of thermal oil of the thermal oil heater.

6. Audible-visible alarm is to be provided to warn on the following occasions and relayed to the monitoring station.

(1) When a fire breaks out in the thermal oil heater
(2) When abnormal high temperature of the thermal oil arises
(3) When the thermal oil leaks within the thermal oil heater
(4) When the flow rate of thermal oil falls, or when the pressure difference of the thermal oil between the inlet and outlet of the heater decreases
(5) When the liquid level in the expansion tank drops abnormally

7. A fixed fire extinguishing and cooling system as deemed appropriate by the Society is to be provided.

204. Thermal oil piping systems

Piping systems for thermal oil heaters are to comply with **Ch 6, Sec 10.**

Section 3 Pressure Vessels

301. Application

1. The requirements in this Section apply to pressure vessels and their fittings intended for marine service, provided that pressure vessels belong to Class 3 (PV-3) which are not used for important purposes are excluded.

2. In cases where pressure vessels are of unconventional construction and the requirements of this

Section are unsuitable to be applied, the manufacturer is to submit the detailed drawings, data and strength calculations for the construction to the Society for its approval.

3. The pressure vessels concerned in (1) to (3) are also to comply with the requirements in this Chapter except specially specified.

(1) Pressure vessels used for liquefied gas (**Pt 7, Ch 5**).
(2) Pressure vessels used for the refrigerating machinery (Requirements in **Ch 6, Sec 12** and **Pt 9, Ch 1**).
(3) Other pressure vessels used for inflammable gas or liquid are to comply with the separate requirements to the Society about the property and working condition of gas and liquid.

302. Classification

1. Class 1 pressure vessels (Symbol *PV*-1)

(1) Steam generators whose design pressure exceed 0.35 MPa.
(2) Pressure vessels in which inflammable high pressure gas having the vapour pressure not less than 0.2 MPa at 38 °C (hereinafter referred to as "inflammable high pressure gas") is contained. However, the requirements for "*PV*-2" may be applied to the pressure vessels with the capacity of 0.5 m^3 or under with respect to their materials, construction and welding.
(3) Pressure vessels whose shell plates exceed 38 mm in thickness, and/or whose design pressures exceed 4 MPa, and /or whose maximum working temperatures exceed 350 °C. However, the pressure vessels in which the shell plates exceed 38 mm in thickness and/or the design pressure exceed 4 MPa are classified as "*PV*-2", provided that they are subject to hydraulic pressure or water pressure at the atmospheric temperature.
(4) Pressure vessels contained ammonia or toxic gases.

2. Class 2 pressure vessels (Symbol *PV*-2**)**

(1) Steam generators whose design pressure do not exceed 0.35 MPa.
(2) Pressure vessels whose shell plate exceed 16 mm in thickness, and/or whose design pressure exceed 1 MPa, and/or whose maximum working temperature exceed 150 °C.

3. Class 3 pressure vessels (Symbol *PV*-3)

Pressure vessels not included in Class 1 and 2.

303. Materials

1. The materials used in the construction of the pressure parts of pressure vessels are to comply with following requirements.

(1) All materials used for Class 1 and Class 2 pressure vessels are to comply with the requirements in **Pt 2, Ch 1.** However, for the following Class 2 pressure vessels, the materials may be in accordance with the requirements in (2) below :
  (A) Vessels of which design pressure is less than 0.7 MPa.
  (B) Vessels whose design pressure and maximum working temperature are not more than 2 MPa and 150 °C respectively, and whose internal capacity is not more than 0.5 m^3.
(2) The materials used for Class 3 pressure vessels are to be materials specified in the *Korean Industrial Standards* in accordance with the usage, or equivalent thereto.
(3) The materials of fittings for a pressure vessel are to comply with the requirements in **Pt 2, Ch 1.** However, where deemed as appropriate by the Society, the Society may accept to use the materials which meet *Korean Industrial Standards* or equivalent.
(4) In case where the heat treatment, such as hot working or stress relieving, is carried out on steel plates during the manufacturing process of pressure vessels, the manufacturer is to inform of such intention with an order for the materials. What are expected of the manufacturer of steel plates in this case, are prescribed in **Pt 2, Ch 1, 303. 3.**
(5) Appropriate heat treatments are to be carried out on the cold-formed steel plates, where it is considered that the cold-forming affects the safety of pressure vessel.

2. Materials of cast steel and grey iron casting are to be used for the construction of pressure vessels, according to the following items.

(1) Cast steel may be used in pressure vessels.

(2) Grey iron castings may be used in the pressure vessels where the working temperature does not exceed 220 °C and the design pressure does not exceed 1 MPa. However, grey iron castings are not to be used for the pressure vessels which contain inflammable or toxic liquid or gas.
(3) Special cast iron such as nodular graphite cast iron etc. may be used for the pressure vessels with the maximum working temperature not exceeding 350 °C and the design pressure not exceeding 1.8 MPa where approved by the Society.

3. Electric resistance welded steel pipes for pressure piping may be used for shell of pressure vessels whose design pressure is 2 MPa or below and working temperature 150 °C or below, and which do not contain inflammable or toxic liquid or gas.

304. Type of joint

1. Class 1 pressure vessels

Longitudinal and circumferential joints of Class 1 pressure vessels are to be of the approved double welded butt joints. However, for cylindrical shells of small diameter, where the inside welding is considered difficult, the joints may be of the single welded butt joint subject to the approval by the Society.

2. Class 2 pressure vessels

(1) Longitudinal joints : They are to be the same as the case of Class 1 pressure vessels.
(2) Circumferential joints : They are to be of double welded butt joints or single welded butt joints with backing strip. However, for shell plates of 16mm or under in thickness, they may be of single welded butt joints.

3. Class 3 pressure vessels

(1) Longitudinal joints : Double welded butt joints or single welded butt joints with backing strip are to be applied. However, for plates of 9 mm or below in thickness, both sides welded full fillet lap joints may be accepted, and for plates of 6 mm or below in thickness, single welded butt joints may be accepted.
(2) Circumferential joints : Single welded butt joints or one side welded full fillet lap joints may be accepted.

305. Welding method for each part

The welding methods are to be in accordance with **104.**

306. Efficiencies of joints

The values of efficiencies of joints for pressure vessels are to be as follows in relation to their application and type of joints.
(1) For seamless shells : J = 1.00
(2) For welded shells : J is to be as given in **Table 5.5.13.**

Table 5.5.13 Efficiencies of Joints, J

Kind of radiographic testing / Type of joint	Full radiographic testing carried out	Spot radiographic testing carried out	No radiographic testing carried out
Double-welded butt joint or the butt welded joint considered equivalent by the Society	1.00	0.85	0.75
Single-welded butt joint where the backing strip is left unremoved or the single-welded butt joint considered equivalent by the Society	0.90	0.80	0.70
Single welded butt joint without backing strip	—	—	0.60
Double-welded full fillet lap joint	—	—	0.55
Single fillet welded lap joint	—	—	0.45

307. Allowable stress

1. The allowable stress of the materials used at room temperature is to be determined by the following items.

(1) The allowable stress of carbon steel (including carbon manganese steel) and low alloy steels excluding cast steels is not to be taken to be greater than obtained from the following formulae, whichever is the smaller. For pressure vessels used for liquefied gas, the values of denominator for f_1 and f_2 are to be 3.0 and 2.0, respectively.

$$f_1 = \frac{R_{20}}{2.7}, \quad f_2 = \frac{E_{20}}{1.6}$$

where :

R_{20} = Specified minimum tensile strength at room temperature $(\mathrm{N/mm^2})$

E_{20} = Specified minimum yield stress or 0.2% proof stress $(\mathrm{N/mm^2})$

(2) The allowable stress of the electric resistance welded steel tubes except where they are used for the shell of pressure vessels is to be taken to the value specified in (1) when subjected to the ultrasonic testing or any other compatible flaw detection approved by the Society for the entire length of the weld, and other cases 85 % of the value specified in (1).

(3) The allowable stress of cast steel is to be taken to the value obtained by (1) multiplied by the coefficients given in **Table 5.5.14.**

Table 5.5.14 Coefficients to be multiplied to Allowable Stress of Cast Steels

Type of test	Coefficient
When no radiographic test or any other alternative testing is carried out	0.7
When spot radiographic test or alternative testing is carried out	0.8
When the above tests are carried out on all parts	0.9

(4) The allowable stress of cast iron is to be taken to 1/8 of the specified minimum tensile strength. However, the allowable stress of special cast iron approved by the Society may be taken to 1/6 of the specified minimum tensile strength.

(5) The allowable stress of austenitic stainless steel is to be taken to the following f_1 or f_2, whichever is the smaller.

$$f_1 = \frac{R_{20}}{3.5}, \quad f_2 = \frac{E_{20}}{1.6}$$

where :

R_{20}, E_{20} = As specified in (1)

(6) The allowable stress of aluminium alloy is to be taken to the following f_1 or f_2 , whichever is the smaller.

$$f_1 = \frac{R_{20}}{4.0}, \quad f_2 = \frac{E_{20}}{1.5}$$

where :

R_{20}, E_{20} = As specified in (1)

2. For the allowable stress of materials used for pressure vessels for high temperature service, the requirements in **107.** or the value deemed appropriate by the Society apply.

3. The allowable tensile stress is to conform to the requirements in **Pars 1** and **2.** However, the allowable tensile stress of bolts is to comply with the following requirements :

(1) In case where bolts are used at room temperature, the value is to be taken to the following (A) or (B), whichever is the smaller. However, for bolts complying with the requirements in the recognized standards the value may be 1/3 of the proof load stress specified therein.

(A) $\frac{R_{20}}{5.0}$

(B) $\frac{E_{20}}{4.0}$

where :

R_{20}, E_{20} = As specified in (1)

(2) In case where bolts are used at high temperature, the value will be considered by the Society in each case.

4. The allowable bending stress is to comply with the following requirements :

(1) In case where the materials are used at room temperature, the requirements in **Par 1** are to be complied with. However, for cast iron or cast steel, the value is to be taken to 1.2 times thereof.

(2) In case where the materials are used at high temperature, the value will be considered by the Society in each case.

5. The allowable shearing stress for the mean primary shearing stress in the section subjected to shearing load is to be taken to 80 % of the allowable tensile stress.

6. The allowable compression stress in the cylindrical shell of pressure vessels used at room temperature subject to a load causing compression stress in longitudinal direction is to be taken to the following (1) or (2), whichever is the smaller :

(1) The value specified in **Par 1.**

(2) The allowable buckling stress by the following formula :

$$\sigma_z = \frac{0.3 E T_0}{D_m\left(1 + 0.004\frac{E}{E_{20}}\right)}$$

where :

σ_z = Allowable buckling stress (N/mm^2)

E = Modulus of longitudinal elastisity at room temperature (N/mm^2)

T_0 = Net thickness of shell plate excluding corrosion allowance from the actual shell plate (mm)

D_m = Average shell diameter (mm)

7. The allowable stress for various stresses of carbon steel or carbon manganese steel used for the shell of pressure vessels formed by rotating unit when detailed calculations are carried out, may be as follows :

$$P_m \le f$$

$$P_L \le 1.5f$$

$$P_b \le 1.5f$$

$$P_L + P_b \le 1.5f$$

$$P_m + P_b \le 1.5f$$

$P_L + P_b + Q \leq 3f$

where :

P_m = Equivalent primary general membrane stress (N/mm^2)

P_L = Equivalent primary local membrane stress (N/mm^2)

P_b = Equivalent primary bending stress (N/mm^2)

Q = Equivalent secondary stress (N/mm^2)

308. General construction and strength

1. Because the formulae of this Section do not take into account such additional stresses as load from fittings, localized stress, repeated load, thermal stress and so on, some measures such as increasing the size, etc. are to be taken, in case those effects are considered to exist.

2. In the provisions in this Section, the design pressure of the pressure vessels used for refrigerating machinery, inflammable high pressure gases or of those subjected to delivery pressure of the boiler feed pump is not to be less than the values given below ;

(1) For pressure vessels used for refrigerating machinery, **Pt 9, Ch 1, 102. 5** is to be applied depending on kinds of the refrigerants.

(2) Design pressure of pressure vessels used for liquefied gases, storaged under pressurized condition at atmospheric temperature or near it, is not to be less than the following, whichever is the greatest :

(A) Vapour pressure of the gas at 45 °C.

(B) Maximum working pressure to be expected.

(C) 0.7 MPa.

(3) For pressure vessels subjected to delivery pressure of boiler feed water pump, the allowable pressure is to be 1.25 times the design pressure of the boiler. Where, however, this is not applicable, the maximum working pressure of the feed water pump may be taken.

309. Shell plates and end plates

1. The thickness of shell plates or end plates is not to be less than the required thickness prescribed in **Table 5.5.15** and further is not to be less than 5 mm except where specially approved by the Society in consideration of the diameter, pressure, temperature, materials, etc.

2. The required thickness of the end plate having openings for which reinforcement is required is to comply with the following :

(1) In case where the openings are reinforced in accordance with the requirements in **115. 2** the required thickness is to be calculated by **Table 5.5.15.**

(2) Where an end plate has a flanged-in manhole or access opening with a maximum diameter of which exceeds 150mm and flanged-in reinforcement of which complies with the requirements in **115. 6,** the thickness is to be calculated as follows :

(A) Dished or hemi-spherical end plates : The thickness is to be increased by not less than 15 % of the required thickness by **Table 5.5.15** using the design pressure or 3 mm, whichever is greater. In this case, where the inside crown radius of the end plate is smaller than 0.80 times the inside diameter of the shell, the value of the inside crown radius in the formula is to be 0.80 times the inside diameter of the shell. In calculating the thickness of the end plate having two manholes in accordance with above paragraph, the distance between the two manholes is not to be less than 1/4 of the outside diameter of the head plate.

(B) Semi-ellipsoidal end plates : The requirements in **Table 5.5.15** are to be applied. However, in this case R_2 is to be 0.80 times the inside diameter of shell and E to be 1.77.

3. The required thickness of end plates subject to pressure on the convex sides is not to be less than that obtained from the formula for end plates subject to pressure on the concave sides provided that the value of design pressure P in the formula is taken as 1.67 times P.

Table 5.5.15 The Thickness of Shell Plates and End Plates

Shell plates and end plates		The required thickness (mm)
Shell plates	Cylindrical	$T=\frac{PD_1}{2fJ-1.2P}+1.0$
	Spherical	$T=\frac{PR_1}{2fJ-0.2P}+1.0$
End plates	Dished(1)	$T=\frac{PR_2E}{2fJ-0.2P}+1.0$
	Semi-spherical	$T=\frac{PR_2}{2fJ-0.2P}+1.0$
	Semi-ellipsoidal(2)	$T=\frac{PD_2}{2fJ-0.2P}+1.0$

P = Design pressure (MPa)
J = Minimum value of the efficiencies prescribed in **306.**
f = Allowable stress prescribed in **307.** (N/mm^2)
D_1 = Inside diameter of shell (mm)
D_2 = Inside length of the major axis (mm)
R_1 = Radius of shell (mm)
R_2 = Inside crown radius (mm).

$$E=\frac{1}{4}\left(3+\sqrt{\frac{R_2}{r}}\right)$$

r = Inside knuckle radius (mm).

NOTES :
(1) The inside crown radius of dished end plate is not to be greater than the outside diameter of the flanged part of the end plate. The inside knuckle radius of the plate is not to be less than 6 % of the outside diameter of the flanged part of the end plate or 3 times the thickness of the end plate, whichever is greater.
(2) Half the minor axis inside the semi-ellipsoidal end plate is not to be less than 1/2 of half the inside major axis of the end plate.

310. Flat end plates or cover plates without stay or other supports

The required thickness of flat end plates or cover plates without stay or other supports is to be in accordance with **110.**

311. Flat plates or tube plates with stay or other supports

The required thickness of flat plates or tube plates with stay or other supports is to be in accordance with **111.**

312. Bolting methods of cover plates

The required thickness of cover plates is to be in accordance with **121.**

313. Manholes, mud holes and peep holes

1. Pressure vessels are to be provided with manholes or mud holes on shell plates or end plates for inspection and cleaning as follows :

(1) Pressure vessels over 900 mm inside diameter of shell are to be provided with a manhole or at least two mud holes.
(2) The size of the manholes is not to be less than 300 mm by 400 mm.
(3) The size of the mud holes is not to be less than 75 mm by 100 mm, and 100mm by 150

mm where the internal diameter of shell exceeds 750 mm.

2. The construction of holes and covers is to be in accordance with **114. 2** and **3.**

314. Reinforcement of openings

Openings in the shell and end plate are to be reinforced in accordance with **115.**

315. Stand pipes

The thickness of stand pipes welded to shell is to be in accordance with **119.**

316. Required thickness of tubes for heat exchangers

The materials of the tubes for heat exchangers are to be suitable for their purposes, and the required thickness is to be calculated by the following formula.

$$t = \frac{PD_0}{2fJ} + a \quad (\mathrm{mm})$$

where ;

P = Design pressure (MPa)

f = Allowable stress. As given in **307. 1, Ch.6 Table 5.6.7.** or **Ch.6 Table 5.6.8.**

D_0 = Outside diameter of tube (mm)

a = Corrosion allowance mentioned below :

1.0 mm for steel tube

0.3 mm for copper or copper alloy tube

0 mm for austenite stainless steel and approved corrosion resistance materials

T : Actual thickness of tube (mm)

J = Efficiencies of joints mentioned below :

1.0 for seamless tubes

0.85 for electric resistance welded tubes.

317. Relief valves on pressure vessels

1. For pressure vessels in which pressure may exceed the design pressure under working condition and a pressure vessel where an additional hazard may be created by exposure of the pressure vessel to a fire or other unexpected source of external heat, a pressure relieving device is to be provided to prevent the pressure from exceeding the design pressure. However, if an air reservoir is provided with a fusible plug with melting point of approximately 100 °C to release the pressure automatically in the case of a fire, the pressure relieving device may be omitted.

2. A heat exchanger or other similar pressure vessels, where internal pressure may exceed the design pressure due to internal failure or other, is to be provided with a suitable relief valve.

3. A steam generator which comes under *PV*-1 is to be provided with a safety valve prescribed in **123.** and **124.**

4. There is to be no stop valve between a pressure vessel and a relief valve or other relieving devices, except where approved by the Society.

5. A rupture disc may be installed between a pressure vessel and a relief valve or at a discharge line of the relief valve. In this case, the bursting pressure of the rupture disc is not to exceed the setting pressure of the relief valve. In addition, the discharge capacity of the rupture disc is to be the same as the relief valve or larger.

318. Arrangement of pressure vessels

Pressure vessels and their fittings are to be arranged at places convenient for operation, repair and inspection.

319. Tests and inspections

1. Hydraulic tests

Pressure vessels and their fittings attached directly to a pressure vessel are to be subjected to hydraulic test according to **Table 5.5.16** after construction in the presence of the Surveyor.

Table 5.5.16 Hydraulic Test Pressure

Item	Test pressure
Class 1 and Class 2 pressure vessels(1)	1.5 times the design pressure
Heat exchangers and other special vessels not applicable to the above	To be determined in each case
Fittings attached directly to Class 1 and Class 2 pressure vessels	2 times the design pressure of the pressure vessel
NOTE : (1) Class 3 pressure vessels considered necessary by the Society are to be subjected to hydraulic test.	

Section 4 Welding for Boilers and Pressure Vessels

401. General

1. The manufacturers of welded boiler, Class 1 and Class 2 pressure vessels are to obtain the approval of manufacturing process and to submit to the Society for approval the detailed construction drawings and welding procedures as specified in **Ch 1, 208. 1** (7) (quality of materials, welding method, specification of welding materials, type of edge preparation, heat treatment, test methods are to be shown) before the commencement of the work. Unless specially specified otherwise, the following requirements are also to be applied to welded construction.

2. Welding procedure qualification test

The manufacturers are to submit the detailed data in connection with the welding work for examination of the Society and also conduct the welding procedure qualification tests specified by the Society if they plan to construct boilers or pressure vessels with welded structure for the first time, or if they adopt a new welding method, and if they change types of base metals, types of welding materials, or types of joints. But, for minor changes in the welding process, the test may be omitted if approved by the Surveyor.

3. General requisites for welded construction

General requisites for welded construction are as follows :

(1) Welding method and welding materials : Welding is to be carried out in accordance with the previously approved welding plans using approved electrodes, approved automatic welding materials or other equivalent materials.
(2) Welders : All important weldings are to be carried out by welders holding Society's qualification.
(3) Base materials: Unless specially approved otherwise, the base materials used are conform to the requirements of **Pt 2, Ch 1** and the carbon content is not to exceed 0.35 %.

402. Welding workmanship

1. V-out

The dimension and shape of the edges to be joined is to be such that the welding can be carried out without failure. The welded joint portion is to be designed so as not to be subjected to direct bending stress.

2. Plates of unequal thickness

Where plates of unequal thickness are to be jointed in a longitudinal butt weld of a shell, the thicker plate is as a rule to be reduced by machining both surfaces to the thickness of thinner plate with an inclination of not more than 1/4 so as to coincide the centre lines of both plates. Where the reduction in thickness is made on one surface, the distance between the centre line of weld and the commencement of the inclination is to be at least equal to the thickness of the thinner plate.

3. Joints

Details of welded joints of essential members are to be as required in **104.** or other equivalent methods with equal effectiveness.

4. Application

The details of welding workmanship are to conform to the requirements of **Pt 2, Ch 2, Sec 3** as far as practicable in addition to the requirements specified in the following Articles.

5. Misalignment

The butting edges of the plates are to be in line within a limit of the following misalignment:

(1) Longitudinal joints
 1 mm for plates of 20 mm and under in thickness.
 5 % of plate thickness for plates of over 20 mm but less than 60 mm in thickness.
 3 mm for plates of 60 mm and over in thickness.

(2) Circumferential joints
 1.5 mm for plates of 15 mm and under in thickness.
 10 % of the plate thickness for plates of over 15 mm but less than 60 mm in thickness.
 6 mm for plates of 60 mm and over in thickness.

6. Deformation

Deformation of all boilers and pressure vessels of cylindrical type is to be measured on completion of the welding or after heat treating if heat treatment is required. The difference between the maximum and minimum in inside diameter of any section of the shell is to be within a limit of 1 % of the designed diameter and there is to be no flat part on welded line.

403. Heat treatment

1. Boilers and Class 1 pressure vessels

Boilers and Class 1 pressure vessels are to be heat-treated after the joints of shells, end plates and all fitting such as stand pipes or reinforcements, are welded in place. But, for fusion-welded corrugated furnace, heat treatment may be dispensed with because the heating necessary for forming the corrugation after welding is considered to be sufficient stress relieving.

2. Class 2 pressure vessels

Class 2 pressure vessels corresponding to the following are to be subjected to stress relieving heat treatment.

(1) The thickness of shell plates exceeds 30 mm.

(2) The thickness of shell plates is not less than 16 mm and is greater than the value of T_n determined by the following formula :

$$T_n = \frac{D}{120} + 10$$

where:

D = The inside diameter of the shell (mm)

3. Omission of stress relief

In case corresponding to the following stress relieving may be omitted.

(1) In case where the material having a superior notch toughness is specially used and approved by the Society.

(2) Subsequent stress relieving is not necessary to the pressure vessels which have been carried out stress relieving, even if fillet weld is applied as described below:

(A) Seal welding not feared to induce a remarkable strain.

(B) Intermittent welding for attaching fittings provided that the welds do not exceed 6 mm in throat thickness and 50 mm in length, and have an interval of 50 mm or larger.

(3) The stress relieving for following parts may be omitted in case where the thickness of the welded part is not more than 19 mm for carbon steel or carbon manganese steel, or not more than 13mm for alloy steel.

(A) welded joint between tubes, tubes and tube flanges, and tubes and headers

(B) Circumferential joints of headers

(C) Welded parts specially approved by the Society

4. Furnace

Heat treatment is to be carried in a furnace capable of readily adjusting the temperature and of maintaining the adjusted temperature. At least 2 thermometers are to be provided to measure or record the temperature in the furnace.

5. Procedure of post weld heat treatment

The welds of boilers and Class 1 pressure vessels using carbon steel, carbon manganese steel and low alloy steel as the base metal are to be heated to a stress relieving temperature, maintained at that temperature for a period of at least one hour per 25mm of thickness and allowed to cool down slowly to a temperature of 400 °C or below in the furnace and thereafter in a still atmosphere. The stress relieving temperature is in general to be taken as 625 °C ± 25 °C but to be suitably adjusted to the material used.

6. Area of heat treatment

Where the heat treatment of a boiler and a pressure vessel cannot be accomplished at one time due to an insufficient size of the furnace, it may be carried out twice or more times, but in this case, care is to be taken to assure that sufficient area between each heat treated section is overlapped in the process of heat treatment. This provision may also be applied when a structure in sections heat-treated is welded together, in which case the joints between the sections are to be heat treated to an entire bend with width of at least six times the plate thickness on each side of the seams.

7. Local heat treatment

Stress-relieving heat treatment for reinforcements or other welded connections on heat treated boilers and pressure vessels may be carried out locally by heating a circular area around such connections provided that any part of the welded edge thereof is not less than 12 times the thickness of the plate from the nearest adjacent welded joint or other element that would tend to resist the free expansion of the heated area. The width of heat treatment area measured from the welded seam is to be at least 6 times the thickness of the plates. However, this width is not to be less than 125 mm.

8. Special heat treatment

Where the heat treatment is carried out on special materials and by special procedures, the requirements are to be specially considered by the Society according to the type of base metal and welding materials, and welding procedures. In case of need, another effectiveness test of heat treatment could be required by the Society.

404. Radiographic examination

1. Fully radiographed

For boilers and pressure vessels whose joint efficiency has been determined subject to a fully radiographic examination specified in **306.,** the entire length of both longitudinal and circumferential welded joints is to be subjected to radiographic examination (hereinafter referred to as "**fully radiographed**").

2. Spot radiographed

For pressure vessels whose joint efficiency has been determined subject to spot radiographic examination specified in **306.,** the radiographic examination is to be carried out in accordance with the following requirements (hereinafter referred to as "**spot radiographed**"):

(1) The length which is not less than 20 % of the longitudinal joints (minimum 300mm) and the intersecting part of the circumferential joints with the longitudinal joints which were welded by the same method and by the same welder, are to be spot radiographed.
(2) The locations to be spot radiographed are to be chosen by the Surveyor.

3. Reinforcement of welding

The reinforcement of the welding at the joints on which the radiographic examination is to be carried out is to be machined down to a plane surface to enable the examination. In this case, the height of reinforcement is not to exceed the following values:

(1) Double welded butt joints:

Thickness of base plate t (mm)	Height of reinforcement (mm)
$t \leq 12$	1.5
$12 < t \leq 25$	2.5
$t > 25$	3.0

(2) Single welded butt joints: 1.5 mm and under, regardless of the plate thickness.

4. Radiograph film

The radiographic technique employed is to be such as to detect as small as 2 % of the welding depth, and the thickness of the penetrameter corresponding to 2 % of the thickness of the base metal is to be clearly shown on the radiograph film. Each radiograph film is to be marked clearly as to the relative position of the weld seams to the radiograph position, and the following items are to be included in the report of radiographic examination:

(1) Thickness of material (flush or reinforced).
(2) Distance from radiation source to weld surface.
(3) Distance from film to weld surface.
(4) Type of penetrameter used.

5. Re-radiographed

The radiograph films are to be submitted to the Surveyor. There are to be no defects, such as crack, long cavity, slag inclusion, etc. If there are defects, the area is to be chipped off and to be rewelded and radiographed again. When spot radiographed is used, additional radiographic examination is to be carried out on both sides of the original spot in accordance with the indication of the Surveyor.

405. Welding workmanship approval tests for boilers and Class 1 pressure vessels

1. Test plates

Where the boilers and Class 1 pressure vessels are to be welded the approval test is to be in accordance with the following requirements, and test plates of sufficient size are to be prepared in order to make test specimens specified by the requirements in **Par 2.**

(1) The test plate is to be attached to the shell in such a manner that the centre of weld coincide with that of the longitudinal joint of the shell and that the welding is carried out continuously from the welding of the longitudinal joint of the shell. The test plates are to be adequately supported during welding in order to minimize any deformation.
(2) The test plate for the circumferential joints of shells are to be made separately under the same welding conditions as the circumferential joint. However, test plates for the circumferential joints are not required except where the shell has no longitudinal joints or welding procedure for the circumferential joints is very much different from that for the longitudinal joints.
(3) The material for the test plates is in general to be taken from a part of the structure.

2. Mechanical tests

Mechanical tests for test plate are to be in accordance with the following.

(1) The kind, number and dimension of test specimens are to be as shown in **Table 5.5.17.** However, the impact tests are to be carried out, where stress relieving was omitted in accordance with **403. 3** (1) or alloy steel was used.

(2) Face bend and root bend test are to be conducted for the test plate not more than 19 mm in thickness and side bend test is to be conducted for the test plate exceeds 19 mm.

Table 5.5.17 Test Specimen

Kind of test specimen	Number of test specimen	Dimension of test specimen
Tensile test for joint	1	As specified in **Table 2.2.1** of **Pt 2, Ch 2** (*R* 2*A* Type)
Guide bend test	1	As specified in **Table 2.2.2** of **Pt 2, Ch 2**
Charpy impact test	3	As specified in **Table 2.1.3** of **Pt 2, Ch 1**
Macro-etching test	1	—

3. Tensile test for welded joints

The tensile strength is not to be less than the minimum tensile strength specified for the base metal. However, if the test specimen breaks at the base metal but the specimen shows no sign of defect in the welded joint, and tensile strength is not less than 95 % of the specified minimum tensile strength for the base metal, the test may be considered to be satisfactory.

4. Guide bend test

The test specimen is to be put on the guide bend jig shown in **Fig 2.2.1** of **Pt 2, Ch 2,** so as to coincide with the centre line of the weld at the centre of the jig. For the side bend test, the test specimen is to be bent with one of both sides in tension, and for the root bend test, with the narrow side of the weld in tension. In all cases, the test specimens are to be bent in the jig through an angle of 180 *degrees* with internal radius of 20 mm. Cracks exceeding 3 mm in length or any other defect are not to be observed on the outer surface of the weld; however, any crack at corners of the test piece may not be considered as a failure.

5. Impact test

The impact test specimen is to be sampled from the welded joint portions such that its longitudinal axis is at right angle to the weld line and its surface is 5 mm inside from the surface of the plate. The notch on the test specimen is to coincide with the centre of the weld line and to be on the surface at right angle to the plate surface. The mean value of absorbed energy of three test specimens is not to be smaller than the standard value approved by the Society.

6. Macro-etching test

Cracks, lack of fusion, incomplete penetration or any other defect are not to be observed.

406. Welding workmanship approval tests for Class 2 pressure vessels

In case the important parts of Class 2 pressure vessels are welded, the workmanship tests prescribed for Class 1 pressure vessels are to be carried out. The guide bend test of the requirements in **405. 2,** however, are not necessary.

407. Retests and modification

1. Retest

If the result of any test does not conform to the requirements, two additional test specimens may be taken from the same test plate for each failure. In the case of retests, both of the test specimens are to conform to the requirements. Retest is allowed in the following cases :

(1) In case the results of tensile and impact tests are not less than 90 % of the value specified in the requirements.
(2) In case guide bend test fails to meet the requirements from the cause due to defects found in the part excepting the welded parts.

2. Modification of test

The workmanship tests for pressure vessels may be modified at the discretion of the Surveyor taking account of their past performances.⚓

CHAPTER 6 AUXILIARIES AND PIPING ARRANGEMENT

Section 1 General

101. General

1. Application

(1) The requirements in this Chapter apply to the materials, design, fabrication, tests and piping arrangement of auxiliaries and piping systems.
(2) The requirements in this Chapter may be modified for ships having special limitation for their service and usage and for small ships.

2. Related requirements

In addition to the requirements in this Chapter, the following relevant requirements are to be complied with.

(1) For piping systems of ships to be registered as those strengthened for navigation in ice, **Pt 3, Ch 20;** For piping systems of the ships for navigation in polar waters, **Pt 3, Ch 21;** For piping systems of the vessels for polar and ice breaking service, **Pt 3, Ch 22.**
(2) For steering gears, **Pt 5, Ch 7;** For windlasses and mooring winches, **Pt 5, Ch 8.**
(3) For automatic and remote control systems, **Pt 6, Ch 2.**
(4) For pumping arrangements of oil tankers, **Pt 7, Ch 1, Sec. 10;** For drainage of ore holds of ore carriers, **Pt 7, Ch 2 Sec. 2;** For water level detection & alarms and drainage & pumping systems for bulk carriers and single hold cargo ships, **Pt 7, Ch 3 Sec. 14;** For cargo handling facilities and piping systems of liquefied gas carriers and chemical carriers, **Pt 7, Ch 5** and **Ch 6.**

3. Definition

(1) Design pressure is the maximum working pressure of a medium inside pipes and is not to be less than the following pressures given in (A) to (H).
(A) For pipings fitted with a relief valve or other overpressure protective device, the pressure based on the set pressure of the relief valve or overpressure protective device. However, for steam pipings connected to the boiler or pipings fitted to pressure vessel, the design pressure of the boiler or the pressure vessel.
(B) For piping on the discharge side of the pumps, the pressure based on the delivery pressure of the pump with the valve on the discharge side closed running the pump at rated speed. However, for pumps having a relief valve or overpressure protective device, the pressure based on its set pressure.
(C) For feed water pipings on the discharge from the feed water pumps to feed water check valves, the pressure of the 1.25 times the design pressure of the boiler or the pump pressure against a shut valve, whichever is the greater.
(D) For pipings without relief valves on the low pressure side of pressure reducing valves, the pressure as the design pressure on the high-pressure side of the pressure reducing valve.
(E) For boiler blow-off pipings, the pressure of 1.25 times the design pressure of the boiler.
(F) For refrigerating machinery pipings, the pressure prescribed in **Pt 9, Ch 1, 102. 5.**
(G) For pipes containing fuel oil, the design pressure is to comply with the following requirements.
(a) Where the working pressure is not more than 0.7 MPa and the working temperature is not more than 60 °C : 0.3 MPa or max. working pressure, whichever is greater
(b) Where the working pressure is not more than 0.7 MPa and the working temperature exceeds 60 °C : 0.3 MPa or max. working pressure, whichever is greater
(c) Where the working pressure exceeds 0.7 MPa and the working temperature is not more than 60 °C : max. working pressure
(d) Where the working pressure exceeds 0.7 MPa and the working temperature exceeds 60 °C : 1.4 MPa or max. working pressure, whichever is greater
(H) Where it is impracticable to adopt the above values, the design pressure is to be specially considered by the Society in each case.
(2) The design temperature in this Chapter is the highest working temperature of the medium.

However, for piping systems intended for lower temperature services than the room temperature, the design temperature is the lowest working temperature of the medium.

4. Classes of piping systems

(1) For the purpose of testing, type of joint to be adopted, heat treatment and welding procedure, piping systems are subdivided into three classes as indicated in **Table 5.6.1** depending upon the service, design pressure and design temperature of the medium.

(2) Piping systems for other media than specified in **Table 5.6.1** are to be specially considered by the Society depending upon the nature of the mediums and their service conditions.

Table 5.6.1 Classes of Piping Systems

Service \ Class of piping	Class I	Class II	Class III
Steam	$P > 1.6$ or $T > 300$	Any pressure-temperature combination not belong to Class I or III	$P \le 0.7$ and $T \le 170$
Thermal oil			$P \le 0.7$ and $T \le 150$
Fuel oil Lubricating oil Flammable hydraulic oil	$P > 1.6$ or $T > 150$	Any pressure-temperature combination not belong to Class I or III	$P \le 0.7$ and $T \le 60$
Other media(3)	$P > 4.0$ or $T > 300$	Any pressure-temperature combination not belong to Class I or III	$P \le 1.6$ and $T \le 200$

NOTES;
1. Cargo oil pipes belong to Class Ⅲ.
2. P = Design Pressure (MPa), T = Design temperature (℃)
3. Including water, air, gases, non-flammable hydraulic oil.
4. Open ended pipes(drains, overflows, vents, exhaust gas lines, boiler escape pipes) belong to Class Ⅲ.
5. Piping systems for $R\,717\,(NH_3)$ used as a primary refrigerant belonging to Class Ⅰ, and for $R22$, $R\,134a$, $R\,404A$, $R\,407C$, $R\,410A$ and $R\,507A$ used as a primary refrigerant belonging to Class Ⅲ.

5. Structure, materials and strength for auxiliaries

(1) Materials for auxiliaries
(A) The shaft materials of essential auxiliaries driven by prime movers having output of 100 kW or more are to comply with the requirements in **Pt 2, Ch 1** of the Rules.
(B) The materials used for essential parts of auxiliary machinery are to be manufactured by the manufacturer approved by the Society and complied with *Korean Industrial Standards or equivalent*, unless the Society specially considers necessary.

(2) Strength of shafts for auxiliaries
Except crankshaft, the diameters of shafts for essential auxiliaries are not to be less than those obtained by the formula specified in **Ch 3, 203.** And for electric motor or hydraulic driving, P and F in this formula are to be as follows;

P : Output of prime mover driving essential auxiliaries (kW)
F : Factor, 95

(3) Power transmission systems which transmit power from prime movers driving essential auxiliaries for propulsion and safety of ships are to be complied with requirements specified in **Ch 3, Sec.4.**

6. Incinerators of waste oil and waste substance, gas bottles and piping systems of gas welding equipment are to be specially considered by the Society in each case.

102. Pipes

1. Materials

Materials for pipes are to be suitable for the medium and service for which the pipes are intended and are to be of the materials complying with the following requirements.

(1) The materials for pipes belonging to Class I or Class II are, as a rule, to be manufactured and tested in accordance with the appropriate requirements of **Pt 2, Ch 1.**

(2) The materials for pipes belonging to Class III piping systems are to be manufactured and tested in accordance with *Korean Industrial Standards or equivalent*.

2. Service limitations for steel pipes

(1) Grade 1 and Grade 2 specified in **Pt 2, Ch 1, 402.** are not to be used for pipes whose design temperature exceeds 350 °C. However, they may be used up to 400 °C if the value of the allowable stress is guaranteed.

(2) Grade 3, *RST* 338 and *RST* 342 are not to be used for the pipes whose design temperature exceeds 450 °C and Grade 3, *RST* 349 is not to be used for pipes whose design temperature exceeds 425 °C.

(3) Grade 4, *RST* 412 is not to be used for pipes whose design temperature exceeds 500 °C and Grade 4, *RST* 422, *RST* 423 and *RST* 424 are not to be used for pipes whose design temperature exceeds 550 °C.

(4) Carbon steel pipes for ordinary piping (*KS D* 3507, *SPP*) may be used for Class II and Class III piping systems having a design pressure up to 1 MPa with a design temperature up to 230 °C.

3. Service limitations for copper and copper alloy pipes

(1) Copper and copper alloy pipes are to be seamless drawn pipes or pipes fabricated by the procedure approved by the Society.

(2) Copper pipes for Class I and II are to be seamless.

(3) The design temperature of the pipes is not to exceed 200 °C for phosphorous-deoxidized copper and brass, and 300 °C for copper-nickel in **Table 5.6.7.**

(4) Copper and copper alloy pipes which are considered inappropriate by the Society are not to be used for piping system.

4. Service limitations for cast iron pipes

Spheroidal or nodular graphite iron castings according to **Pt 2, Ch 1** may be accepted for bilge, ballast and cargo oil piping.

5. Special material pipes, expansion pipes and flexible pipes

(1) Such special materials as rubber hoses, plastic pipes, vinyl pipes, aluminium alloys, etc, notwithstanding the provision in **Pars 2, 3** and **4** above, may be used where approved by the Society taking into account safety against fire and flooding as well as their service conditions.

(2) Expansion pipes and flexible pipes of metallic or non-metallic material may be installed between two points to provide flexibility for proper operation of the machinery, and they are to be as deemed appropriate by the Society.

6. Required wall thickness of pipes

(1) The minimum wall thickness of steel pipes is not to be less than the greater of the minimum wall thickness calculated by **Par 7** or the minimum wall thickness shown in **Table 5.6.2.** and **5.6.3.**

(2) The minimum wall thickness of copper and copper alloy pipes is not to be less than the greater of the minimum wall thickness calculated by **Par 7** or the minimum wall thickness shown in **Table 5.6.4.**

(3) The minimum wall thickness of austenitic stainless steel pipes is not to be less than the greater of the minimum wall thickness calculated by **Par 7** or the minimum wall thickness shown in **Table 5.6.5.**

7. Minimum calculated wall thickness of pipes

(1) The minimum calculated wall thickness of straight pipes subject to internal pressure is to be determined by the following formula:

$$t = (t_0 + c)\frac{100}{100 - a} \quad (\mathrm{mm})$$

where:

t_0 = Strength thickness specified in (3) (mm)

c = Corrosion allowance specified in **Tables 5.6.6** and **5.6.7** (mm)

a = Negative manufacturing tolerance (%)

Table 5.6.2 Minimum Wall Thickness for Steel Pipes (mm)

Nominal diameter (A)	Pipes in general	1. Air, overflow and sounding pipes for structural tanks 2. Over board scupper pipes	Bilge, ballast and sea water pipes	1. Bilge pipes, overflow pipes, air pipes, sounding pipes and fresh water pipes passing through ballast or fuel oil tanks 2. Ballast pipes passing through fuel oil tanks 3. Fuel oil pipes passing through ballast tank 4. Air pipes on exposed deck(position I or II)	Overboard scupper pipes to be omitted the nonreturn valve	1. 300	5.6	6.3	6.3	8.8	12.5	12.5
350	5.6	6.3	6.3	8.8		12.5
400	6.3	6.3	6.3	8.8		12.5
450	6.3	6.3	6.3	8.8		12.5

NOTES:

1. Diameter and thickness according to other national or international standards recognized by the Society may be accepted.
2. Where pipes and any integral pipe joints are protected against corrosion by means of coating, lining etc., the thickness may be reduced by an amount up to not more than 1 mm.
3. For sounding pipes, except those for flammable cargoes, the minimum wall thickness in air, overflow and sounding pipes for structural tanks is intended to apply only to the part outside the tank.
4. The minimum thicknesses listed in this table are the nominal wall thickness. No allowance needs to be made for negative tolerance or for reduction in thickness due to bending.
5. For threaded pipes, where allowed, the minimum wall thickness is to be measured at the bottom of the thread.
6. (1) and (2) in this Table apply to the pipes passing through dangerous zone and the minimum wall thickness of following pipes is not to be less than 16 mm :
   (A) Overboard discharge pipes(bilge and ballast pipes) passing through cargo oil tanks.
   (B) In case where ballast pipes passing through cargo oil tanks are led to ballast tank located forward of the collision bulkhead.
7. The minimum wall thickness for pipes larger than 450 A nominal size is to be in accordance with a national or international standard recognized by the Society and in any case not less than the minimum wall thickness of the appropriate column indicated for 450 A pipe size.
8. The air pipes located within the forward 0.25 L are to be complied with the requirements of **Pt 4, Ch 9, 303. 1.**

Table 5.6.3 Minimum Wall Thickness for Steel Pipes for CO_2 fire extinguishing (mm)

Nominal diameter (A)	Fire extinguishing CO_2 pipes	
	From bottles to distribution station	From distribution station to nozzle
15	3.2	2.6
20	3.2	2.6
25	4.0	3.2

90	6.3	4.0
100	7.1	4.5
125	8.0	5.0
150	8.8	5.6

NOTES:
1. Pipes are to be galvanized at least inside, except those fitted in the engine room where galvanizing may not be required at the discretion of the Society.
2. For threaded pipes, where allowed, the minimum wall thickness is to be measured at the bottom of the thread.
3. The external diameters and thicknesses have been selected from ISO Recommendations *R* 336 for smooth welded and seamless steel pipes. Diameter and thickness according to other national or international standards may be accepted.
4. For larger diameters specified in this table, the minimum wall thickness will be subject to special consideration by the Society.
5. The minimum thicknesses listed in this table are the nominal wall thickness. No allowance needs to be made for negative tolerance or for reduction in thickness due to bending.

Table 5.6.4 Minimum Wall Thickness for Copper and Copper Alloy Pipes (mm)

External diameter (mm)	Copper pipes	Copper alloy pipes
8 ~ 10	1.0	0.8
12 ~ 22	1.2	1.0
25 ~ 44.5	1.5	1.2
50 ~ 76.1	2.0	1.5
88.9 ~ 108	2.5	2.0
133 ~ 159	3.0	2.5
193.7 ~ 267	3.5	3.0
273 ~ 457	4.0	3.5
(470)	4.0	3.5
508	4.5	4.0

NOTES:
Diameter and thickness according to national or international standards recognized by the Society may be accepted.

Table 5.6.5 Minimum wall thickness for austenitic stainless steel pipes (mm)

External diameter	Minimum wall thickness
10.2 ~ 17.2	1.0
21.3 ~ 48.3	1.6
60.3 ~ 88.9	2.0
114.3 ~ 168.3	2.3
219.1	2.6
273.0	2.9
323.9 ~ 406.4	3.6
over 406.4	4.0

NOTES:
Diameters and thicknesses according to national or international standards recognized by the Society may be accepted.

Table 5.6.6 Corrosion Allowance for Steel Pipes (mm)

Piping service	c
Superheated steam systems	0.3
Saturated steam systems	0.8
Steam coil systems in cargo tanks	2.0
Steam coil systems in fuel oil tanks	1.0
Feed water for boilers in open circuit systems	1.5
Feed water for boilers in closed circuit systems	0.5
Blow-off (for boilers) systems	1.5
Compressed air systems	1.0
Lubricating and hydraulic oil systems	0.3
Fuel oil systems	1.0
Cargo oil systems	2.0
Refrigerating plants	0.3
Fresh water systems	0.8
Sea water systems	3.0

NOTES:
1. For pipes passing through tanks, an additional corrosion allowance is to be considered according to the figures given in the Table, and depending on the external medium, in order to account for the external corrosion.
2. Where pipes and any integral pipe joints are protected against corrosion by means of coating, lining, etc., the corrosion allowance may be reduced by not more than 50 %.
3. In the case of use of special alloy steel with sufficient corrosion resistance, the corrosion allowance may be reduced to zero.
4. For other systems than specified in this Table, the corrosion allowance is to be specially considered by the Society in each case.
5. For sea water systems, steel pipes whose nominal diameter is 25 A or below, the corrosion allowance may be reduced to 1.5 mm.

Table 5.6.7 Corrosion Allowance for Copper and Copper Alloy Pipes (mm)

Pipe material	c
Phosphorus-deoxidized copper seamless pipes and brass seamless pipes specified in **Table 5.6.9**	0.8
Copper nickel seamless pipes specified in **Table 5.6.9**	0.5

NOTE:
For media without corrosive action in respect of the material employed, the corrosion allowance may be reduced to zero.

(2) Where pipes are bent, the minimum calculated wall thickness, t_b, before bending is to be determined by the following formula.

$$t_b = (t_0 + c + b)\frac{100}{100 - a} \quad \text{(mm)}$$

where:

b = Bending allowance specified in (4) (mm)

t_0, c, a = As defined in (1)

(3) The strength thickness is to be determined by the following formula:

$$t_0 = \frac{PD}{2fJ+P} \quad (\mathrm{mm})$$

where:

P = Design pressure (MPa)

D = Outer diameter of pipe (mm)

f = Allowable stress specified in (5) ($\mathrm{N/mm^2}$)

J = Efficiency factor

- Seamless pipes -------------------------- 1.00
- Electric resistance welded pipes ---- 0.85 (1.0 may be adopted for those which are considered as equivalent to seamless pipes.)
- For other welded pipes and forge butt welded pipes, the Society will consider an efficiency factor value depending upon the welding procedure.

(4) The bending allowance, b, is not be less than calculated by the following formula, except where it can be demonstrated that the minimum wall thickness at any point after bending is not to be less than the minimum calculated wall thickness of straight pipe:

$$b = \frac{1}{2.5} \times \frac{D}{R} t_0 \quad (\mathrm{mm})$$

where:

D = Outer diameter of pipe (mm)

R = Radius of curvature of a pipe bend at the centre line of the pipe (mm)
However, $R \geq 2D$

t_0 = Strength thickness specified in (3) (mm)

(5) Allowable stress

(A) The allowable stress for carbon steel and alloy steel pipes is in general to be chosen as the lowest of the following values:

$$f = \frac{E_T}{1.6}, \quad f = \frac{R_{20}}{2.7}, \quad f = \frac{f_R}{1.6}$$

where:

E_T = Specified minimum yield stress or 0.2 percent proof stress ($\mathrm{N/mm^2}$)

R_{20} = Specified minimum tensile strength at room temperature ($\mathrm{N/mm^2}$)

f_R = Average stress to produce rupture in 100,000 hours at the design temperature ($\mathrm{N/mm^2}$)

(B) For steel pipes for pressure piping prescribed in **Pt 2, Ch 1** the allowable stresses may be obtained from **Table 5.6.8.**

(C) The allowable stresses for copper and copper alloy pipes are to be obtained from **Table 5.6.9.**

Table 5.6.8 Allowable Stress of Steel Pipes for Pressure Piping (N/mm^2)

Kinds	Symbols \ Design Temperature °C	100 or less	150	200	250	300	350	375	400	425	450	475	500	525	550

	C 7150	81	79	77	75	73	71	69	67	65.5	64	62

NOTES:
1. Intermediate values are to be determined by interpolation.
2. Kind of materials are to be in compliance with *KS D* 5301.
3. Allowable stress for materials not specified in the Table will be specially considered by the Society in each case.

103. Valves and fitting

1. Materials

Materials for valves and pipe fittings are to be suitable for the medium and service for which the pipes are intended and are to be of the materials complying with the following requirements.

(1) The materials of valves and fittings belonging to Class I and Class II piping systems, ship-side valves and fittings, and valves on the collision bulkhead are, as a rule, to comply with the relevant requirement of **Pt 2, Ch 1.** However, the Society may accept to use valves and fittings made of materials which meet *Korean Industrial Standards* or equivalent.

(2) The materials for valves and pipe fittings belonging to Class III piping systems are to be manufactured and tested in accordance with the requirements of acceptable *Korean Industrial Standards or equivalent*.

2. Service limitations for carbon and low alloy steel

Carbon steel castings and steel forgings are not to be used for valves and pipe fittings in the piping system whose design temperature exceeds 425 °C. Low alloy steel castings and low alloy steel forgings are not to be used for valves and pipe fittings in the piping system whose design temperature exceeds 550 °C.

3. Service limitations for copper alloy

Valves and pipe fittings made of copper alloy are not to be used for valves and pipe fittings with a design temperature over 200 °C. However, special bronze, when approved by the Society, can be used for valves and pipe fittings with a design temperature of 260 °C or less

4. Service limitations for cast iron for valves and pipe fittings

(1) Valves and pipe fittings made of cast iron with an elongation of 12 % or above can be used for valves and pipe fittings in the piping system with a design temperature of 350 °C or less, and they may be used only where deemed appropriate by the Society.

(2) Valves and pipe fittings made of cast iron with an elongation of less than 12 % are not to be used for the following piping system.
  (A) Ship-side valves and fittings.
  (B) Valves fitted on the collision bulkhead.
  (C) Valves fitted on the external wall of fuel tanks and subjected to the static head of internal fluid unless the valves are mechanically protected to the Society's satisfaction.
  (D) Valves and pipe fittings for boiler blow-off piping.
  (E) Valves fitted on shore connection for cargo pipings of inflammable liquid.
  (F) Valves and pipe fittings for piping liable to be subjected to water hammer, excessive strain or vibration.
  (G) Valves and pipe fittings whose design temperature exceeds 220 °C.
  (H) Valves and pipe fittings used for pipes of Class II (except steam pipes).
  (I) Valves and pipe fittings for clean ballast piping systems which penetrate cargo oil tanks and reach the forepeak tank.
  (J) Valves and pipe fittings used for cargo oil pipelines exceeding design pressure of 1.6 MPa.

(3) Cast iron products are not to be used for valves and pipe fittings in the piping system belonging to Class I, unless specially approved by the Society.

5. Construction of valves and pipe fittings

Valves, pipe fittings, gaskets and packings are to be suitable for the condition of use and to have a construction specified in *Korean Industrial Standards* or equivalent construction thereto. The dimensions of flanges and relative bolts are to be chosen in accordance with *Korean Industrial Standards* or equivalent. For special applications, when the temperature, the pressure and the size of the flange have values above certain limits, to be fixed, the complete calculation of bolts and flanges is to be carried out.

104. Type of connections

1. Direct connection of pipe lengths

Direct connection of pipe lengths is to be made by direct welding, flanges, threaded joints or mechanical joints, and is to be of a recognized standard or of a design proven to be suitable for the intended purpose and acceptable to the Society.

2. Welded connections

(1) Butt welded joints

(A) Butt welded joints are to be of full penetration type generally with or without special provision for a high quality of root side. The expression "special provision for a high quality of root side" means that butt welds were accomplished as double welded or by use of a backing ring or inert gas back-up on first pass, or other similar methods accepted by the Society.

(B) Butt welded joints with special provision for a high quality of root side may be used for piping of any Class, any outside diameter.

(C) Butt welded joints without special provision for a high quality of root side may be used for piping systems of Class II and III irrespective of outside diameter.

(2) Slip-on sleeve and socket welded joints

(A) Slip-on sleeve and socket welded joints are to have sleeves, sockets and weldments of adequate dimensions conforming to the Society Rules or recognized Standard.

(B) Slip-on sleeve and socket welded joints may be used in Class III systems, any outside diameter.

(C) In particular cases, slip-on sleeve and socket welded joints may be allowed by the Society for piping systems of Class I and II having nominal diameter 80 A and below (outside diameter ≤ 88.9 mm) except for piping systems conveying toxic media or services where fatigue, severe erosion or crevice corrosion is expected to occur.

3. Flange connections

(1) The dimensions and configuration of flanges and bolts are to be chosen in accordance with recognized standards.

(2) Gaskets are to be suitable for the media being conveyed under design pressure and temperature conditions and their dimensions and configuration are to be in accordance with recognised standards.

(3) For non-standard flanges, the dimensions of flanges and bolts are to be subject to special consideration.

(4) Typical examples of flange attachments are shown in **Fig 5.6.1.** However, other types of flange attachments may be considered by the Society in each particular case.

(5) Flange attachments are to be in accordance with *Korean Industrial Standards or equivalent* that are applicable to the piping system and are to recognize the boundary fluids, design pressure and temperature conditions, external or cyclic loading and location.

4. Slip-on threaded joints

(1) Slip-on threaded joints having pipe threads where pressure-tight joints are made on the threads with parallel or tapered threads, are to comply with requirements of a recognized national or international standard.

(2) Slip-on threaded joints may be used for outside diameters as stated below except for piping systems conveying toxic or flammable media or services where fatigue, severe erosion or crevice corrosion is expected to occur.

(A) Threaded joints in CO_2 systems are to be allowed only inside protected spaces and in CO_2 cylinder rooms.

(B) Threaded joints for direct connectors of pipe lengths with tapered thread are to be allowed for:

(a) Class I, outside diameter not more than 33.7 mm.

(b) Class II and Class III, outside diameter not more than 60.3 mm.

(C) Threaded joints with parallel thread are to be allowed for Class III, outside diameter not more than 60.3 mm.

(D) In particular cases, sizes in excess of those mentioned above may be accepted by the Society if in compliance with *Korean Industrial Standards or equivalent.*

5. Mechanical joints

These requirements are applicable to pipe unions, compression couplings, slip-on joints as shown in **Fig 5.6.2.** Similar joints complying with these requirements may be acceptable.

Type of flange	Example of attachments
Type A	A1  Welding neck flange A2  Loose flange with welding neck
Type B	B1  B2  B3  Slip-on welding flange-fully welded
Type C	C1  C2  C3  Slip-on welding flange
Type D	 Slip-on threaded flange-conical thread
Type E	 Lap joint flange-on flanged pipe
NOTE : For type D, the pipe and flange are to be screwed with a tapered thread and the diameter of the screw portion of the pipe over the thread is not to be appreciably less than the outside diameter of the unthreaded pipe. For certain types of thread, after the flange has been screwed hard home, the pipe is to be expanded into the flange.	

Fig 5.6.1 Examples of Flange Attachments

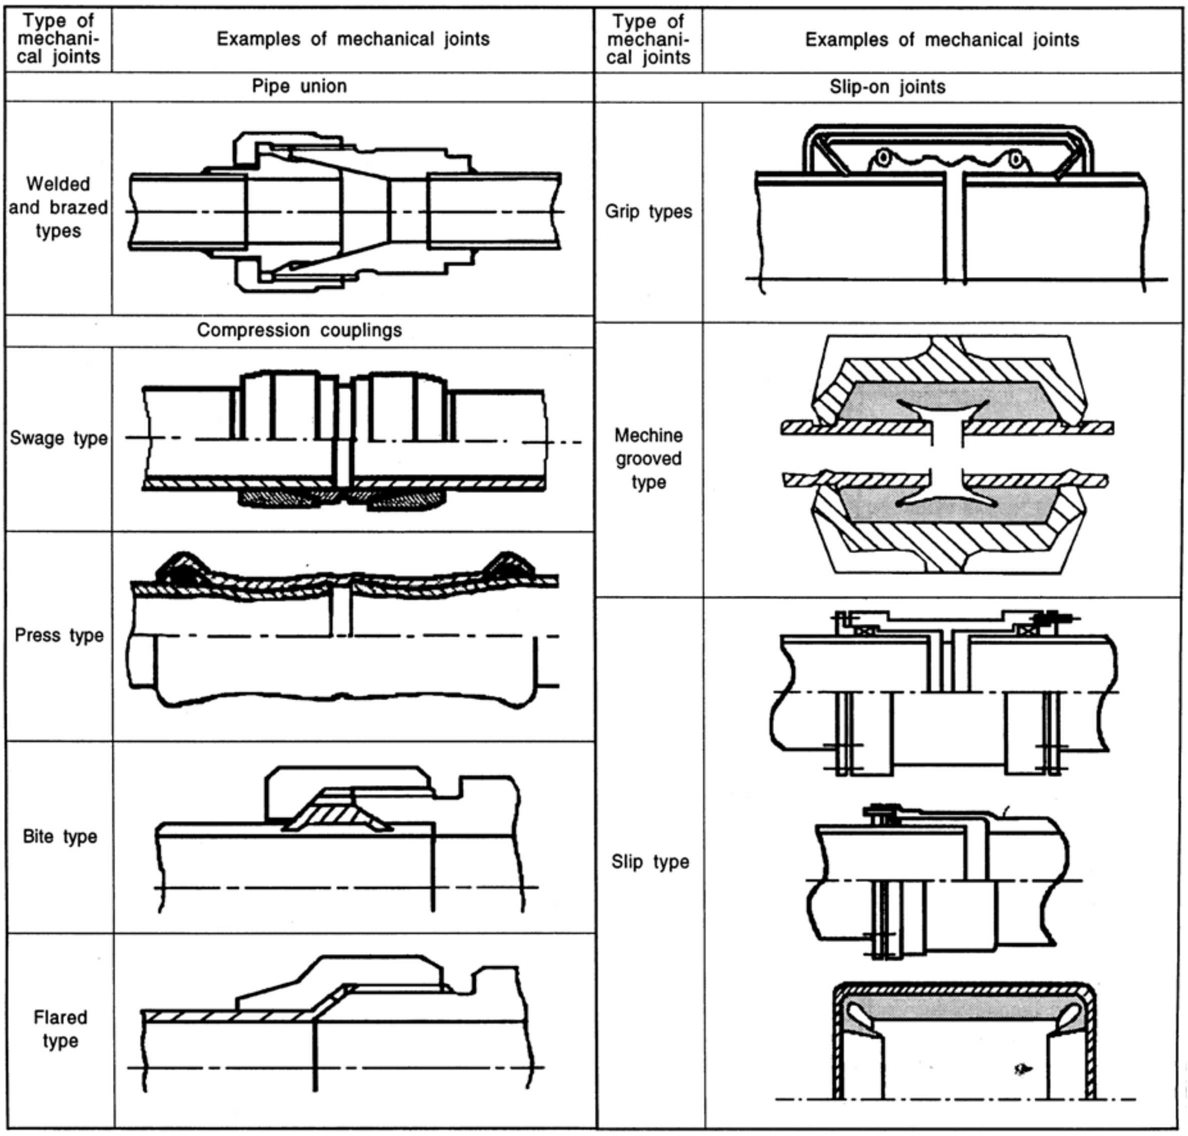

Fig 5.6.2 Examples of Mechanical Joints

(1) Mechanical joints including pipe unions, compression coupling, slip-on joints and similar joints are to be of approved type for service conditions and the intended application.
(2) Where the application of mechanical joints results in reduction in pipe wall thickness, this is to be taken into account in determining the minimum wall thickness of the pipe to withstand the design pressure.
(3) Construction of mechanical joints is to prevent the possibility of tightness failure affected by pressure pulsation, piping vibration, temperature variation and other similar adverse effects occurring during operation on board.
(4) Material of mechanical joints is to be compatible with the piping material and internal and external media.
(5) Mechanical joints are to be tested where applicable, to a burst pressure of 4 times the design pressure. For design pressures above 20 MPa, the required burst pressure will be specially considered by the Society.
(6) Mechanical joints are to be of fire resistant type as required by **Table 5.6.10.**
(7) Mechanical joints, which in the event of damage could cause fire or flooding, are not to be used in piping sections directly connected to the sea openings or tanks containing flammable fluids.
(8) The mechanical joints are to be designed to withstand internal and external pressure as applicable and where used in suction lines are to be capable of operating under vacuum.

(9) The number of mechanical joints in oil systems is to be kept to a minimum.

(10) Piping in which a mechanical joint is fitted is to be adequately adjusted, aligned and supported. Supports or hangers are not to be used to force alignment of piping at the point of connection.

(11) Slip-on joints are not to be used in pipelines in cargo holds, tanks, and other spaces which are not easily accessible. Application of these joints inside tanks may be permitted only for the same media that is in the tanks. Unrestrained slip-on joints are to be used only in cases where compensation of lateral pipe deformation is necessary. Usage of these joints as the main means of pipe connection is not permitted.

(12) Typical Application of mechanical joints and their acceptable use for each service is indicated in **Table 5.6.10;** dependence upon the Class of piping, pipe dimensions, working pressure and temperature is indicated in **Table 5.6.11.** In particular cases, sizes in excess of those mentioned above may be accepted by the Society if in compliance with a recognized national and/or international standard.

Table 5.6.10 Application of Mechanical Joints

The following table indicates systems where the various kinds of joints may be accepted. However, in all cases, acceptance of the joint type is to be subject to approval for the intended application, and subject to conditions of the approval and applicable Rules.

Systems		Kind of connections		
		Pipe Unions	Compression Couplings[6)]	Slip-on joints

Abbreviations ○ : Application is allowed, - : Application is not allowed

NOTES:
1) Inside machinery spaces of category A - only approved fire resistant types
2) Excluding inside machinery spaces of category A or accommodation spaces. May be accepted in other machinery spaces provided the joints are located in easily visible and accessible positions.
3) Approved fire resistant types
4) Above free board deck only
5) In pump rooms and open decks - only approved fire resistant types
6) If compression couplings include any components which readily deteriorate in case of fire, they are to be of approved fire resistant type as required for slip-on joints.
7) Slip type joints as shown in **Fig 5.6.2**, provided that they are restrained on the pipes, may be used for pipes on deck with a design pressure of 1 MPa or less.

105. Welding of pipes and pipe fittings

1. Scope and documentation

(1) The following requirements apply to the fabrication of Class I and II piping systems operating at ambient or high temperature and made of steel of the types given below. At the discretion of the Society, these requirements may be applied also to the Class III piping systems and to repair welding pipelines.
   (A) carbon and carbon-manganese steels having minimum tensile strength 320, 360, 410, 460 and 490 N/mm^2.
   (B) low alloy carbon-molybdenum, chromium-molybdenum, chromium-molybdenum-vanadium steels having chemical composition 0.3 Mo; 1 Cr - 0.5 Mo; 2.25 Cr - 1 Mo; 0.5 Cr - 0.5 Mo - 0.25 V.

(2) The manufacturers are to submit to the Society for its approval the detailed construction drawings and welding procedures (quality of materials, welding method, specification of welding materials, type of edge preparation, heat treatment, test methods are to be shown) before the commencement of the work.

2. Welding workmanship

(1) Welding is to be carried out in accordance with the previously approved welding procedures using approved electrodes, approved automatic welding materials or other equivalent materials. Tack welds are to be made with an electrode suitable for the base metal; tack welds which form part of the finished weld are to be made using approved welding procedures. When welding materials requiring preheating, the same preheating is to be applied during tack welding.

(2) Welding is to be carried out at welding shops, in principle, and by the welders holding the Society's qualification specified in **Pt 2, Ch 2, Sec 5.**

(3) Base materials used in the welding work, unless otherwise specifically approved, are to conform to the requirements in **Pt 2, Ch 1,** and further the carbon content is not to exceed 0.35 %.

(4) Edge preparation is to be in accordance with recognized standards and/or approved drawings. The preparation of the edges is to be preferably carried out by mechanical means. When flame cutting is used, care is to be taken to remove the oxide scales and any notch due to irregular cutting by matching grinding or chipping back to sound metal.

3. Welded connections

(1) Welded butt joints are to be of the full penetration type. For Class I pipes, special provisions are to be taken to ensure a high quality of the root side.

(2) If the parts to be joined differ in wall thickness, the thicker wall is to be gradually tapered to that of the thinner of the butt joint with a slope not steeper than 1/4.

(3) Branches may be attached to pressure pipes by means of welding provided that the pipe is reinforced at the branch by a compensating plate or collar or other approved means, or alternatively that the thicknesses of pipe and branch are increased to maintain the strength of the pipe.

(4) Mis-alignment of joints
   The tolerances on the alignment of the pipes to be welded are to be as follows.
   (A) Where the pipes welded with backing ring: 0.5 mm
   (B) Where the pipes welded without backing ring:
      (a) In the case of the inside diameter less than 150 mm and up to 6 mm in thickness, 1 mm or 25 % of the thickness, whichever is less.
      (b) In the case of the inside diameter less than 300 mm and up to 9.5 mm in thickness, 1.5 mm or 25 % of the thickness, whichever is less.
      (c) In the case of the inside diameter 300 mm and over, or over 9.5 mm in thickness, 2 mm or 25 % of the thickness, whichever is less.

4. Preheating of welds

When pipes are welded, pipes are to be preheated adequately depending on the kinds and thickness of materials as specified in **Table 5.6.12.**

Table 5.6.12 Preheating of Welds

Kind of material		Thickness of welds t (mm)	Minimum preheating temperature(°C)
Grade 1 Grade 2 Grade 3	$C+\frac{Mn}{6} \leq 0.4$	$t \geq 20^{(1)}$	50
	$C+\frac{Mn}{6} > 0.4$	$t \geq 20^{(1)}$	100
Grade 4	*RST* 412	$t > 13^{(1)}$	100
	RST 422 *RST* 423	$t < 13$	100
		$t \geq 13$	150
	RST 424(2)	$t < 13$	150
		$t \geq 13$	200

NOTES:
1. Kind of materials are to be in accordance with the requirements in **Pt 2, Ch 1, 402.**
2. (1) and (2) marked in this Table are as follows :
(1) For welding in ambient temperature below 0 °C, the minimum preheating temperature is required independent of the thickness unless specifically approved by the Society.
(2) For these materials, preheating may be omitted for thicknesses up to 6 mm if the results of hardness test carried out on welding procedure qualification are considered acceptable by the Society.

5. Post weld heat treatment

(1) The heat treatments are not to impair the specified properties of the materials; verifications may be required to this effect as necessary. The heat treatments are preferably to be carried out in suitable furnaces provided with temperature recording equipment. However, localized heat treatments on a sufficient portion of the length way of the welded joint, carried out with approved procedures, also can be accepted.
(2) After the welding(excluding the oxy-acetylene welding process), the pipes specified in **Table 5.6.13** are to be subject to post weld heat treatment according to the kinds of materials for relieving the residual stress. The post weld heat treatment is to consist in heating the piping slowly and uniformly to a temperature within the range indicated in the **Table 5.6.13,** and soaking at this temperature for a suitable period(in general, one hour per 25 mm of thickness with minimum of half an hour), cooling slowly and uniformly in the furnace to a temperature not exceeding 400 °C and subsequently cooling in a still atmospheric temperature. In any case, the heat treatment temperature is not to be higher than $t_T - 20$ °C, where t_T is the temperature of the final tempering treatment of the material.
(3) After the oxy-acetylene welding, the pipes specified in **Table 5.6.14** are to be subject to post weld heat treatment according to the kinds of materials.
(4) Post weld heat treatment of pipes and pipe fittings made of materials other than those specified in (1), (2) and (3) above is to be made as deemed appropriate by the Society according to the kinds of base metals, welding materials, welding procedure and so on.

Table 5.6.13 Pipes Requiring Post Weld Heat Treatment

Kind of material		Thickness of welds t (mm)	Minimum preheating temperature (°C)
Grade 1 Grade 2 Grade 3		$t \geq 15^{(2),(3)}$	550 ~ 620
Grade 4	*RST* 412	$t \geq 15^{(2)}$	550 ~ 620
	RST 422 *RST* 423	$t > 8$	620 ~ 680
	RST 424	any (1)	650 ~ 720

NOTES:
1. Kind of materials is to be in accordance with the requirements in **Pt 2, Ch 1, 402.**
2. (1) ~ (3) in this Table are as following.
   (1) Post weld heat treatment may be omitted for pipes having thickness ≤ 8 mm, diameter ≤ 100 mm and design temperature ≤ 450 °C.
   (2) When steels with specified Charpy V notch impact properties at low temperature are used, the above thickness which post welded heat treatment is to be applied may be increased by special consideration of the Society.
   (3) For C and C-Mn steels, stress relieving heat treatment may be omitted up to 30 mm thickness by special consideration of the Society.

Table 5.6.14 Heat Treatment after Forming and Welding of Pipes

Kind of Material		Heat treatment and temperature (°C)
Grade 1, Grade 2, Grade 3		Normalizing 880 to 940
Grade 4	*RST* 412	Normalizing 900 to 940
	RST 422, *RST* 423	Normalizing 900 to 960, Tempering 640 to 720
	RST 424 (2.25 Cr - 1 Mo)	Normalizing 900 to 960, Tempering 650 to 780
	R*RST* 424 (0.5 Cr - 0.5 Mo - 0.25 V)	Normalizing 930 to 980, Tempering 670 to 720

106. Forming of pipes and heat treatment after forming

1. Hot forming of pipes of Class I and Class II is to be generally carried out in the temperature range of 1,000 °C ~ 850 °C. However, the temperature may decrease to 750 °C during the forming process. For steel pipes of Grade 4, the stress relieving heat treatment is to be carried out according to the requirements specified in **Table 5.6.13.**

(1) When the hot forming is carried out within this temperature range, a subsequent new heat treatment in accordance with is required for *RST* 422, *RST* 423 and *RST* 424. No subsequent heat treatment is required for Grade 1 through 3 and *RST* 412.

(2) When the hot forming is carried outside the above temperature range, a subsequent new heat treatment in accordance with **Table 5.6.14** is generally required for all grades.

2. When pipes of Class I and Class II are subjected to cold-forming, a stress relieving heat treatment in accordance with **Table 5.6.13** is required for all grades other than carbon and carbon-manganese steels with minimum tensile strength 320, 360 and 410 N/mm^2. After cold forming, when $r \leq 4D$ (where r is the mean bending radius and D is the outside diameter of pipe), consideration is to be given to a complete heat treatment in accordance with **Table 5.6.14.**

107. General requirements for piping arrangement

1. Installation

(1) Pipes are to be arranged in good and systematic order to facilitate the removal of pipes and fittings as well as the maintenance of machinery.

(2) Ample provision is to be made to take care of expansion or contraction stresses in pipes due to temperature changes or deflection of the hull.
(3) Piping arrangements are to be so made as not to give effects on the performance of machinery due to the stay of drain and air or the pressure loss in pipes.
(4) The support of the pipe system is to be such that detrimental vibrations do not arise in the system.
(5) Heavy pipes, valves and fittings are to be supported in such a way that their weight does not cause large additional stresses in adjacent piping and connected machinery.
(6) So far as practicable, pipes are not to be led in the vicinity of electrical equipment such as generators, motors, switchboards, control gears, etc. Where it is not practicable, all detachable pipe joints are to be at a safe distance from the electrical equipment, unless provision is made to prevent any leakage from pouring on the equipment.
(7) Oil pipes (fuel oil, lubricating oil, cargo oil and other oil) are not to be led upright the boiler, steam pipes, exhaust gas pipes, silencer and the other areas which are in a high temperature, and so far as practicable, to be isolated from the above systems.
(8) Hydraulic unit having working pressure above 1.5 MPa and having potential of oil leakage coming contact with hot surfaces, electrical installations or other sources of ignition, is to preferably be placed in separate spaces. If it is impracticable to locate such units in a separate space, adequate shielding is to be provided.

2. Protection of pipes and fittings

(1) All pipes, valves, cocks, pipe fittings, valve operating rods and handles are to be effectively secured and adequately protected for those liable to be damaged, and for those installed in cargo holds and chain lockers. Where a casing is provided for protection, it is to be so constructed as to be easily removed for inspection.
(2) All pipes including bilge, air and sounding pipes in refrigerating spaces are to be well insulated so that water in pipes may not freeze.
(3) For pipes arranged in the positions inaccessible for maintenance and inspection, due consideration such as corrosion protection is to be given to prevent corrosion.

3. Relief valves

All pipe lines which may be exposed to pressures greater than the design pressure are to be safeguarded by suitable relief valves or equivalent safety devices.

4. Pressure gauges and thermometers

(1) Pressure gauges and thermometers are to be provided on piping systems where deemed necessary.
(2) Cocks or valves are to be provided at the root of pressure measuring devices for isolating them from the pipes under a pressurized condition.
(3) Where thermometers are fitted in fuel oil, lubricating oil and other flammable oil piping or apparatuses, the thermometer is to be put in a safe protective pocket to prevent oil from spraying in case of fracture or removal of the thermometer.

5. Gaskets and packings for piping

Gaskets and packings used for flanges, pipe joints, valve covers, valves spindles, etc. in piping systems are to be selected carefully by taking account of the kinds of fluids, operating conditions and the type of flange contact surfaces.

6. Slip joints

Slip joints are not to be used in pipe lines in cargo holds, deep tanks and other spaces which are not easily accessible, unless otherwise specified.

7. Penetrations through bulkheads, decks, etc.

Where pipes are led through watertight bulkheads, decks, boundary plates of deep tanks and inner bottom plating, arrangements are to be made to ensure the integrity of the watertightness of the structure.

8. Watertight bulkheads

(1) Valves or cocks such as drain valves, which do not constitute a part of any pipe line are not

to be fitted on the collision bulkhead.

(2) Except as provided in para. (3), the collision bulkhead may be pierced below the bulkhead deck by not more than one(1) pipe for dealing with fluid in the forepeak tank in principle and the pipe is to be fitted with a screw-down valve capable of being operated from above the bulkhead deck, the valve chest being secured inside the forepeak to the collision bulkhead. The valve, however, may be fitted on the after side of the collision bulkhead provide that the valves are readily accessible under all service conditions and the space in which they are located is not a cargo space.

(3) If the fore peak is divided to hold two different kinds of liquids, the Society may allow the collision bulkhead to be pierced below the bulkhead deck by two pipes complying with para. (2), provided that the Society is satisfied that there is no practical alternative to the fitting of such a second pipe and that, having regard to the additional subdivision provided in the forepeak, the safety of the ship is maintained.

(4) Valves and cocks, such as drain valves, which do not constitute a part of any pipe lines may be fitted to watertight bulkheads other than the collision bulkhead, provided that they are readily accessible at any time for the inspection. Such valves and cocks are to be operable from above the bulkhead deck and to be provide with an indicator to show whether they are open or closed, except where the valves or cocks are secured at the fore or after bulkhead inside the engine room. In addition, the operation rod is to be so constructed that the weight of it is not supported by the valve or cock.

9. Prohibition of carriage of oil in forepeak tanks

In ships of 400 gross tonnage and above, compartments forward of the collision bulkhead are not to be arranged for the carriage of oil or other liquid substances which are flammable.

10. Marking

(1) The pipes located in the space where deemed necessary for safety are to be marked with distinctive colour.

(2) The valves for piping systems which are available for fire extinguishing aboard ship are to be marked with red paint.

11. Pipe cleaning

Piping systems are to be cleaned after fabrication or installation in ships where considered necessary.

12. Sea water and fresh water pipings

Sea water pipes are to be led separately as far as possible from fresh water pipes. Where such leading is not practicable, care is to be taken to prevent the accidental contamination of fresh water with sea water.

Section 2 Air Pipes, Overflow Pipes and Sounding Devices

201. Air pipes

1. General

(1) Air pipes are to be fitted to all tanks, cofferdams and tunnels.

(2) The air pipes are to be fitted at the fore and after portions of the tanks. Where the tanks are less than 7 m both in length and in width or having inclined top plates, one air pipe may be fitted at the highest part of the tanks.

(3) Where the tank top is of unusual or irregular profile, special consideration is to be given to the number and position of the air pipes.

(4) Air pipes are to be arranged to be self-draining under normal conditions of trim and to be clearly marked at the upper end.

(5) Air pipes for fuel oil service, settling and lubrication oil tanks are to be such that in the event of a broken air pipe this is not directly to lead to the risk of ingress of seawater splashes or rain water.

2. Termination of air pipe outlets

Air pipe to double bottom tank, deep tanks, cofferdams or tanks which can be run up from the sea are to be led to above the bulkhead deck. The position of open ends of air pipes are to be in accordance with the following requirements depending on the kinds of tanks.

(1) Air pipes to fuel oil and cargo oil tanks, cofferdams adjacent to their tanks and all tanks which can be pumped up are to be led to the open area.
(2) The open ends of air pipes to fuel oil and cargo oil tanks are to be situated where no danger will be incurred from issuing oil or vapour when the tank is being filled.
(3) Air pipes from lubricating oil tanks may terminate in the machinery space, provided that the open ends are so situated that issuing oil or gas cannot come into contact with electrical equipment or heated surfaces. However, air pipes from the heated lubricating oil tanks are to be led to the open area.
(4) Air pipes from fresh water tanks may terminate in the machinery space.

3. Protection of air pipe outlets

(1) All openings of air pipes extending above weather decks are to be provided with an automatic type closing devices. All automatic type closing devices are to be type approved by the Society.
(2) The open ends of air pipes to fuel oil and cargo oil tanks are to be furnished with the flame-screens which can be readily removed for cleaning or renewal and deemed appropriate by the Society. The clear area through the mesh of the flame-screens is not to be less than the required sectional area of the air pipe.

4. Size of air pipes

(1) The aggregated sectional area of air pipes to tanks which can be pumped up is not to be less than 1.25 times the aggregated sectional area of filling pipes. Where the tank is provided with an overflow pipe, the aggregated sectional area of air pipes is to be accordance with the requirements which the Society considers appropriate.
(2) The internal diameters of air pipes to cofferdams or tanks which form part of ship's structure are not to be less than 50 mm.

5. Height of air pipes

Where air pipes extend above the freeboard and superstructure decks, the exposed parts of the pipes are to be of substantial construction; the height from the upper surface of the deck to the point where water may have access below is to be at least as given in the following table: Where these height may interfere with the working of the ship, a lower height may be accepted, provided that the Society is satisfied that the closing arrangement and other circumstances justify the lower height.

Location	Height of coaming
On the freeboard deck	760 mm
On the superstructure deck	450 mm

202. Overflow pipes

1. General

(1) Where tanks which can be pumped up come under either one of the following categories, overflow pipes of steel are to be fitted:
 (A) Where the cross-sectional area of the air pipes does not comply with the requirements in **201. 4** (1).
 (B) Where there is any opening below the open ends of air pipes fitted to tanks.
 (C) Fuel oil settling tank and fuel oil service tank.
(2) Overflow pipes are to be arranged to be readily visible and self-draining under normal conditions of trim and to be clearly marked at the upper end.

2. Termination of overflow pipes

(1) In case of fuel oil and lubricating oil tanks, the overflow pipe is to be led to an overflow tank of adequate capacity or to a storage tank having a space reserved for overflow purposes.

(2) A sight glass is to be provided in the overflow pipe at a readily visible position or, alternatively, an alarm device is to be provided to give warning either when the tanks are overflowing or when the oil reaches a predetermined level in the tanks.
(3) Overflow pipes from tanks, other than fuel oil, cargo oil and lubricating oil tanks, are to be led to the open air or to suitable tanks where the overflows can be disposed of.

3. Size of overflow pipes

The total cross-sectional area of the overflow pipes is not to be less than 1.25 times the effective area of the filling pipes. In any case, the minimum internal diameter for overflow pipes is not to be less than 50 mm.

4. Prevention of counter-flow of overflow lines

(1) The overflow system is to be so arranged that water from the sea cannot enter through the overflow main line into tanks located in other watertight compartments in the event of any tank being damaged.
(2) Where overflows from tanks which are used for the alternative carriage of oil, ballast water, general cargo, etc., are connected to an overflow system, arrangements are to be made to prevent the entering of liquid or vapour from other tanks into the tank carrying general cargo, or to prevent the entering of oil different quality or ballast water from other tanks into the tank carrying oil.
(3) Overflow pipes discharging through the ship's sides are to extend above the load line and are to be provided with non-return valves fitted on the ship's sides.
Where the overflow pipes do not extend above the freeboard deck, the opening at the shell is to be protected against sea water ingress in accordance with the same provisions as that for overboard gravity drain from watertight spaces described in **302. 4.** In this connection, the vertical distance of the 'inboard end' from the summer load water line may be taken as the height from the summer load water line to the level that the sea water has to rise to find its way inboard through the overboard pipe.
Where, in accordance with **302. 4**, a non-return valve with positive means of closing is required, means is to be provided to prevent unauthorized operation of this valve. This may be a notice posted at the valve operator warning that it may be shut by authorized personnel only.

203. Sounding devices

1. General

(1) All tanks, cofferdams and other compartments which are not at all times readily accessible are to be provided with sounding pipes.
(2) In cargo holds, sounding pipes are to be fitted to the bilges on each side and as near the suction pipe rose boxes as practicable.
(3) All sounding pipes are to be clearly marked at the upper end.
(4) In addition to this requirements, the relevant requirements in **Pt 8, Ch 2, 101.** are to be complied with.

2. Termination of sounding pipes

(1) Sounding pipes are to be led to positions above the bulkhead deck which are at all times readily accessible and are to be provided with effective closing means at the upper end.
(2) In machinery spaces and shaft tunnels where it is not always practicable to extend the sounding pipes above the bulkhead deck, short sounding pipes extending to readily accessible positions above the platform may be fitted. In this case, the following closing means are to be fitted to the upper end of the pipes according to the kinds of tanks:
(A) Sounding pipes to fuel oil tank, lubricating oil tank and other flammable oil storage tank are to comply with relevant requirements in **Pt 8, Ch 2, 101.**
(B) Sounding pipes to other tanks mentioned in (A) and cofferdams are to be fitted with sluice valves, cocks or screw caps attached to the pipes by chains.

3. Construction of sounding pipes

(1) Sounding pipes are to be arranged as straight as practicable, and if curved, the curvature must be sufficiently easy to permit the ready passage of the sounding rod or chain.
(2) Striking plates of adequate thickness and size are to be fitted under open ended sounding pipes.

Where sounding pipes having closed ends are employed, the closing plugs are to be of substantial construction.

(3) The inside diameter of sounding pipes is not to be less than 32 mm. But the inside diameter of sounding pipes passing through a refrigerated chamber cooled down 0 °C or below is not to be less than 65 mm.

4. Sounding devices other than sounding pipes

(1) Sounding devices of approved type may be used in lieu of sounding pipes for sounding tanks.
(2) These devices are to be tested at the working condition on completion of the installation.
(3) Glass gauges used for tanks carrying fuel oils, lubricating oils and other flammable oils are to comply with the requirements specified in **Pt 8, Ch 2, 101. 2** (3) (E) (b) and (c).

Section 3 Ship-side Valves and Overboard Discharge

301. Ship-side valves and fittings

1. Installation

(1) All sea inlet and overboard discharge pipes are to be fitted with valves or cocks secured direct to the shell plating or to the plating of fabricated steel water boxes attached to the shell plating.
(2) These valves or cocks are to be fitted up to the doublings which are welded to shell plating or sea chest by using stud bolts not piercing the shell plating, or to the distance pieces attached to shell plating by using bolts.

2. Construction of distance pieces

Distance pieces attached to the shell plating are to be of rigid construction and as short as practicable.

3. Construction of sea chests

(1) Sea chests forming part of the ship's structure are to be as compact as possible and of rigid construction with no air to stay inside.
(2) Gratings are to be fitted at all openings in the ship's side for sea inlet valves or sea chest. The net area through the gratings is to be not less than twice that of the valves connected to the sea inlets, and provision is to be made for clearing the gratings by use of low pressure steam or compressed air.

4. Sea inlet and overboard discharge valves

(1) Sea inlet and overboard discharge valves or cocks are in all cases to be fitted in easily accessible position. Indicators are to be provided local to the valves or cocks showing whether they are open or shut.
(2) Sea inlet valves are to be so located as to minimize the possibility of blanking off the suction and the valve spindles are to be extended above the lower platform. Power operated sea inlet valves are to be arranged for manual operation in the event of failure of the power supply.
(3) Discharge valves or cocks are to have spigots extending through the shell plating unless they are provided with distance pieces or doublings having spigots.

5. Blow-off valves of boilers and evaporators

(1) Blow-off valves or cocks of boiler and evaporators are to be fitted on the accessible ship's side and are to be provided with indicators showing whether they are open or shut, Cock handles are not to be capable of being removed unless the cocks are shut and if valves are fitted, the hand wheels are to be suitably retained on the spindle.
(2) These blow-off valves or cocks are to have spigots extending through the shell plating and protecting rings.

6. Location of overboard discharges

The location of overboard discharges is not to be such that water can be discharged into life boats when launched. Where such location is unavoidable, special consideration is to be given to prevent the discharge water from entering into the life boats.

302. Scuppers and sanitary discharge

1. General

Scuppers, sanitary discharges or similar openings led through the ship's side are to have, as far as possible, one common discharge; if this is impracticable, it is recommended to minimize the number of discharge openings by other means. In general, however, different systems of overboard discharges are not to be connected to each other unless specially approved by the Society.

2. Scupper

(1) Scuppers sufficient in number and size to provide effective drainage are to be fitted in all decks.
(2) Where scuppers penetrate shell plating or superstructure side plating, suitable reinforcement is to be made at the penetrating parts.

3. Scuppers of exposed decks

Scuppers draining weather decks and spaces within superstructures or deck houses not fitted with efficient weathertight doors are to be led overboard.

4. Non-return valves of scuppers and sanitary pipes

Scuppers and sanitary pipes from spaces below the freeboard deck or from spaces within enclosed superstructures or enclosed deckhouses on the freeboard deck are to be led to the bilges or to suitable sanitary tanks. Alternatively, they may be led to overboard where they are provided with valves in accordance with the following requirements.
(1) Each separate discharge is to have one automatic non-return valve with a positive means of closing it from a position above the freeboard deck or, alternatively, one automatic non-return valve having no positive closing means and one stop valve controlled from above the freeboard deck. However, where the scuppers lead overboard through the shell plating in way of manned engine room, the fitting to the shell plating of a locally operated positive closing valve, together with a non-return valve inboard, will also be accepted. The means for operating the positive action valve from above the freeboard deck are to be readily accessible and provided with an indicator showing whether the valve is open or closed.
(2) Where, however, the vertical distance from the load line to the inboard end of the scupper pipe exceeds $0.01L_f$ (L_f : length for freeboard specified in **Pt 3, Ch 1** of the Rules), the scupper pipe may have two automatic non-return valves without positive means of closing in lieu of valves prescribed in (1). In this case, the inboard valve is to be located above the level of the tropical load line and always accessible for inspection under service condition. If this is not practicable, the inboard valve need not be located above the tropical load line, provided that a locally controlled stop valve is fitted between the two automatic non-return valves.
(3) Where the vertical distance from the summer load water line to the inboard end of the discharge pipe exceeds $0.02\ L_f$, a single automatic non-return valve without positive means of closing may be fitted.

5. Scupper pipes from the enclosed cargo spaces on the freeboard deck

Notwithstanding the requirements in above **Par 4.**, scupper pipes from the enclosed cargo spaces on the freeboard deck are to be in accordance with the following requirements.
(1) Where the freeboard to the freeboard deck is such that the deck edge is immersed when the ship heels more than 5°, scupper pipes are to be led directly overboard, fitted in accordance with the requirement specified in above **Par 4**.
(2) Where the freeboard to the freeboard deck is such that the deck edge is immersed when the ship heels 5° or less, scupper pipes are to be in accordance with the following requirements.
  (A) Scupper pipes are to be led directly to inboard bilge wells.
  (B) High water level alarm is to be provided in the bilge wells to where scupper pipes are led.
  (C) Where the enclosed cargo space is protected by a carbon dioxide fire-extinguishing system, the deck scuppers are to be fitted with means to prevent the escape of the smothering gas.

6. Overboard scuppers

Scuppers and discharge pipes originating at any level and penetrating the shell plating either more than 450 mm below the freeboard deck or less than 600 mm above the summer load waterline, are to be provided with an automatic non-return valve at the shell plating. This valve, unless required by **Par 4,** may be omitted provided that the pipe thickness is in accordance with the **Table 5.6.2.**

7. Deck wash and sanitary pipes

Sea water pipes for deck wash and sanitary pipes are not to be led through cargo holds except where specially approved for unavoidable cases.

8. Garbage chute

(1) For garbage chute, two gate valves instead of the non-return valve with a positive means of closing from a position above the freeboard deck which comply with the following requirements are acceptable.
  (A) Two gate valves are to be controlled from the working deck of the chute.
  (B) The lower gate valve is to be controlled from a position above the freeboard deck. An interlock system between the two valves is to be arranged.
  (C) The inboard end is to be located above the waterline formed by an 8.5° heel to port or starboard at a draft corresponding to the assigned summer freeboard, but not less than 1,000 mm above the summer waterline. Where the inboard end exceeds 0.01 L_f above the summer waterline, valve control from the freeboard deck is not required, provided the inboard gate valve is always accessible under service conditions.

(2) A hinged weathertight cover at the inboard end of the chute together with a discharge flap may be acceptable in lieu of the upper and lower gate valves complying with the requirements in (1). In this case, the cover and flap are to be arranged with an interlock so that the discharge flap cannot be operated until the hopper cover is closed.

(3) The entire chute, including the cover, is to be constructed of material of substantial thickness.

(4) The controls for the gate valves and/or hinged covers are to be clearly marked: **"Keep closed when not in use"**.

(5) For ships applied to damage stability requirements, following requirements are to be satisfied where the inboard end of the chute is below the freeboard deck.
  (A) The inboard end hinged cover/valve is to be watertight.
  (B) The screw-down non-return valve is to be fitted in an easily accessible position above the deepest load line and is to be controlled from a position above the bulkhead deck and provided with open/closed indicators. The valve control is to be clearly marked: **"Keep closed when not in use"**.

Section 4 Bilge and Ballast System

401. General

1. Application

(1) The requirements of this Section apply to the bilge and ballast system on the ship not less than 50 m in length.

(2) Bilge and ballast system of passenger ship, special ship and the ship less than 50 m in length are to be in accordance with the discretion of the Society.

2. Piping arrangement

(1) An efficient bilge pumping system is to be provided, capable of pumping from and draining any watertight compartment other than a space permanently appropriate for the carriage of liquid and for which other efficient means of pumping are provided, under all practical conditions and these suctions are, except where otherwise stated, to be branch bilge suctions connected to a main bilge line.

(2) An efficient ballast piping system is to be provided, capable of pumping ballast water into and from any tanks for carriage of ballast water under all practical conditions.

(3) In addition to the requirements in this chapter, following requirements for the drainage system

are to comply with:
(A) Where means of cooling the under deck cargo space for dangerous goods by an arrangement of fixed spraying nozzles etc. are installed, **Pt 8, Ch 5, 202. 1** (3);
(B) Where a fixed pressure water-spraying system is installed in the ro-ro space for dangerous goods, **Pt 8, Ch 5, 202. 9**;
(C) Where a fixed pressure water-spraying system is installed in the vehicle, special category and ro-ro spaces, **Pt 8, Ch 5, 305. 1** (4) and (5).

402. Drainage of compartment other than machinery spaces

1. Cargo holds

(1) In ships having only one hold, and this over 33 m in length, bilge suctions are to be fitted in suitable positions in the fore and after suctions of the hold.
(2) Where the inner bottom plating extends to the ship's side, the bilge suctions are to be led to wells placed at the wings and also at the center line if the top plating has inverse camber. But in the case of fishing vessels, a single well may be accepted.
(3) Where close ceiling or continuous gusset plates are fitted over the bilges, arrangements are to be made whereby water in a hold compartment may find its way to the suction pipes.
(4) Bilge pipe arrangement in refrigerating chambers of ships except those to be registered according to **Pt 1, Ch 1, Sec 13,** is to be in accordance with the requirements in **Pt 9, Ch 1, Sec 5.**

2. Tanks

(1) All tanks including double bottom tanks are to be provided with suction pipes, led to suitable power pumps, from the after end of each tank. Where fore and after peak tanks are used as fresh water tanks and small capacity, a hand pump may be substituted.
(2) All ballast tanks are to be connected to at least two(2) power driven ballast pumps. One of which may be driven by the propulsion unit. Bilge, sanitary and general service pumps driven by independent power may be accepted as independent power ballast pumps, provided that they are connected properly to the line. However, gravity discharge from top side tanks are to be complied with **302. 2** (1) (B) of **the Guidance**. And, where cargo pump is arranged for de-ballasting in emergency as **Pt 7, Ch 1, 1003. 2** (2), the cargo pump may be accepted as one(1) independent power ballast pumps,

3. Dry compartment other than cargo holds

(1) Bilge of chain lockers, fore and after peaks not used as tanks or deck forming the top of these tanks may be drained by eductors or hand pumps. These eductors or hand pumps are to be capable of being operated at any time from accessible position above the summer load water line.
(2) If steering gear compartments or other small enclosed spaces situated in the after peak compartment are adequately isolated from the adjacent decks and are capable of draining by gravity, they may be drained to the shaft tunnel or the machinery space by scuppers. In this cases, these pipes are not to be more than 65 A in nominal diameter and are to be provided with a quick-acting self-closing valve located in an accessible position.

4. Maintenance of integrity of bulkheads

(1) The intactness of the machinery space bulkhead, and of tunnel plating required to be of watertight construction, is not to be impaired by the fitting of scuppers discharging to machinery space or tunnels from adjacent compartments which are situated below the bulkhead deck. These scuppers may, however, be led into a strongly constructed scupper drain tank situated in the machinery space or tunnel, but closed to these spaces and drained by means of a suction of appropriate size led from the main bilge line through a screw-down non-return valve.
(2) The air pipe of scupper drain tank is to be led above the bulkhead deck, and provision is to be made for ascertaining the level of water in the tank.
(3) Where one tank is used for the drainage of several watertight compartments, the scupper pipes are to be provided with screw-down non-return valves.

403. Drainage of machinery spaces

1. Machinery space with double bottom

(1) Where the double bottom extends to the full length of the machinery space and the bilge ways

are to be formed at both wings, one branch bilge suction and one direct bilge suction are to be provided at each side.

(2) Where the double bottom plating extends the full length and breadth of the compartment, one branch bilge suction and one direct bilge suction are to be led to each of two bilge wells, situated one at each side.

2. Machinery space without double bottom

(1) Where there is no double bottom and the rise of floor is not less than 5°, one branch and one direct bilge suction are to be led to accessible positions as near the centerline as practicable.

(2) In ships where the rise of floor is less than 5°, additional bilge suctions are to be provided at the wings.

3. Additional bilge suctions

Additional bilge suctions are to be provided where considered necessary in connection with the arrangement of machinery room, ship's bottom structure or machinery layout.

4. Separate machinery spaces

Where the machinery space if divided by a watertight bulkhead to separate the boiler room or the auxiliary engine room from the main engine room, the bilge pipe arrangements in the boiler room and the auxiliary engine room are to be in accordance with the requirements of **Par 1** or **2.** However, only one direct bilge suction is enough though there is a double bottom.

5. Direct bilge suction

(1) The direct bilge suctions provided in machinery rooms are to be connected directly to the pumps driven by independent power specified in **405. 1** and their arrangements are to be such that they can be used independently of all other piping lines.

(2) The inside diameter of direct bilge suction pipes is not to be less than the inside diameter of main bilge pipes required. Where direct bilge suction is provided on each side of the machinery room with double bottom and also the emergency bilge suction is provided, the inside diameter of the direct bilge suction pipe at the side where the emergency bilge suction is provided, may be reduced to the required inside diameter of bilge suction branch pipe.

(3) Where the separate machinery spaces are of small dimensions, the sizes of the direct bilge suctions to these spaces will be specially considered.

6. Emergency bilge suction

(1) In addition to the bilge branch suctions and direct bilge suctions, an emergency bilge suction is to be provided in each main machinery space.

(2) This suction with a screw-down non-return valve having a hand wheel which is easily operable from above the platform in the machinery space is to be led to the main cooling water pump or main circulating pump and the suction is to be led to a suitable level in the machinery space.

(3) Where two or more cooling water pumps are provided, each capable of supplying cooling water for normal power, only one pump need be fitted with an emergency bilge suction.

(4) In ships with steam propelling machinery, the internal diameter of suction pipe is not to be less than two-thirds of the diameter of that of the main circulating pump suction. In other ships, the suction is to be the same size as the diameter of the main cooling pump suction.

(5) Where main cooling water pumps are not suitable for bilge pumping duties, the emergency bilge suction is to be led to the largest available power pump, which is not a bilge pump as specified in **405. 1.** This pump is to have a capacity not less than that required for a bilge pump specified in **405. 2,** and the bilge suction is to be the same size as that of the pump suction branch.

(6) Where the pump to which the emergency bilge suction is connected is of self-priming type, the direct bilge suction arranged on the same side of the ship as the emergency bilge suction may be omitted.

404. Size of bilge suction pipes.

1. Main bilge line

The internal diameter d_m of the main bilge line is to be not less than that required by the following formula, to the nearest standard pipes, but in no case is the diameter to be less than that required for any branch bilge suction:

$$d_m = 1.68\sqrt{L(B+D)} + 25 \quad (\mathrm{mm})$$

where:

L, B, D = Length, breadth and depth of ship, respectively (m), defined in **Pt 3, Ch 1.**

2. Branch bilge suction

The internal diameter d_b of the branch bilge suction pipes is not to be less than that required by the following formula, to the nearest standard pipes, but in no case is the diameter to be less than 50 mm except that for drainage of a small compartment, it may be reduced to 40 mm, where considered acceptable by the Society.

$$d_b = 2.15\sqrt{l(B+D)} + 25 \quad (\mathrm{mm})$$

where:

l = Length of the compartment which shall be drained by branch pipe (m)

B, D = Breadth and depth of ship, respectively (m), defined in **Pt 3, Ch 1.**

3. Main bilge line of tanker and similar ships

In oil tankers, where bilge pumps in the machinery space are exclusively used for the bilge drainage of the machinery space, the internal diameter of main bilge suction pipes may be reduced to the value obtained from the following formula.

$$d_{m0} = \sqrt{2}\,(2.15\sqrt{l_m(B+D)} + 25) \quad (\mathrm{mm})$$

where:

l_m = Length of engine room (m)

B, D = Breadth and Depth of ship, respectively (m), defined in **Pt 3, Ch 1**.

4. Common bilge suction pipes

(1) The internal sectional area of common bilge suction pipes connecting two or more branch bilge suction pipes to the main bilge line is not to be less than the sum of internal sectional areas of the largest two branch bilge suction pipes, but need not be greater than the internal sectional area of the main bilge line.

(2) Where permitted, common-main type bilge system is to have the fore-and-after piping installed inboard of 20 % of the molded beam of the vessel. The control valves required in the branches from the bilge main are to be accessible at all times and are to be of the stopcheck type with an approved type of remote operator. Remote operators may be located in a manned machinery space, or from an accessible position above the freeboard deck, or from underdeck walkways. Remote operators may be of the hydraulic, pneumatic or reach-rod type.

5. Peak tanks and shaft tunnels

The internal diameter of bilge pipes in peak tanks and shaft tunnels is not to be less than 65 mm. However, in ships of 60 m or less in length, the internal diameter may be reduced to 50 mm.

6. Where bilge suctions are provided at the fore and after part of cargo hold in accordance with the requirements in **402. 1** (1), the internal diameter of the branch bilge suction pipe at the fore part may be reduced to 0.7 times that obtained from the formula in **Par 2.**

405. Bilge pumps

1. Number of pumps

(1) All ships are to be provided in their machinery rooms with at least two sets or two groups of independent power bilge pumps connected to the bilge main. In ships of 90 m in length and under, one of these pumps may be driven by the main engines.
(2) Ballast, sanitary and general service pumps driven by independent power may be accepted as independent power bilge pumps, provided that they are connected properly to the main bilge line.
(3) One of the independent power bilge pumps prescribed in (1) may be substituted by an eductor in connection with a sea water pump other than bilge pump where considered acceptable by the Society. In this case, the capacity of the eductor is to comply with the requirement in **Par 2.**

2. Capacity of pumps

(1) The capacity, Q, of each bilge pumping unit or bilge pump is not to be less than that required by the following formula.

$$Q = 5.66 d_m^2 10^{-3} \quad (\mathrm{m^3/hr})$$

where:

d_m = Required internal diameter of main bilge line (mm)

(2) Where one bilge pump or pumping unit is of slightly less than the required capacity, the deficiency may be made good by an excess capacity of the other unit. But in any cases the capacity of this pump is to be more than 70 % of the required capacity.

3. Self-priming type

All power pumps required in **Par 1** are to be of the self-priming or the equivalent type and are to be so arranged that they are immediately operable when in use.

4. Connection of bilge pumps and suction pipes

All of the power pumps prescribed in **Par 1** are to be arranged for discharging bilge from all holds, engine room and shaft tunnel. Where, however, an eductor is used exclusively for bilge drainage in a hold, the bilge suction pipe of this hold need not be connected to the bilge pumps prescribed in **Par 1**. In this case, the eductor is to be so arranged as to be driven by two or more pumps. Capacity of the sea water pump for sending driving water to the eductor, capacity of the eductor, internal diameter of the suction pipe are to be considered appropriate by the Society.

5. Pump connections

(1) The bilge pumps may be used for ballast, fire or general service duties of an intermittent nature.
(2) The connections at the bilge pumps are to be such that one unit may continue in operation when the other pump is being opened up for overhaul.
(3) Pumps required for essential services are not to be connected to a common suction or discharge chest or pipe unless the arrangements are such that the working of any of the pumps so connected is unaffected by the other pumps being in operation at the same time.

406. Pipe systems and their fittings

1. Isolation of bilge system

Bilge suction pipes used for draining cargo holds, machinery room and shaft tunnels are to be entirely separate from pipes other than the bilge suction pipes.

2. Prevention of communication between compartments

The arrangement of bilge system is to be such as to prevent the ingress of water or oil inadvertently from the sea or the tanks to machinery spaces, dry cargo spaces or other similar compartments, or of bilge passing from one watertight compartment to another. For this purpose, screw-down non-return valves or cocks are to be provided as follow.

(1) Screw-down non-return valves or cocks which bilge and water or oil are not to be communicated at same time, are to be provided at the bilge pipes connected to the pump drawing water or oil.
(2) Screw-down non-return valves are to be provided between each branch bilge suction and distribution chests.

3. Bilge pipes in way of double bottom tanks

Bilge pipes passing through double bottom tanks are to be led through oiltight or watertight pipe tunnel or alternatively, are to be of sufficient thickness complying with the requirements in **Table 5.6.2.**

4. Bilge pipes or ballast pipes in way of deep tanks

Bilge pipes passing through deep tanks and ballast pipes passing through deep tanks except for ballast tanks are to be led through an oiltight or watertight pipe tunnel or alternately, are to be of sufficient thickness complying with the requirements in **Table 5.6.2** and all joint of them are to be welded, and they are to be properly installed taking sufficient care of leakage, expansion and contraction.

5. Valves and valve boxes

(1) All valves, valve boxes or cocks which are fitted to the bilge piping are to be provided at easily accessible locations in any condition of the ship.
(2) Bilge pipes passing through double bottoms, side tanks, bilge hopper tanks or void spaces, where there is a possibility of damage of these pipes due to grounding or collision, are to be provided with non-return valves near the bilge suctions or stop valves capable of being closed from readily accessible positions.

6. Pipes in various purpose deep tanks

(1) Where a hold is intended for carrying ballast water and cargo alternately, adequate provisions such as blank flange or spool piece are to be made in the ballast piping system to prevent inadvertent ingress of sea water through ballast pipes when carrying cargo and in the bilge piping system to prevent inadvertent discharge of ballast water through bilge pipes when carrying ballast water.
(2) Where a tank is intended to be used both for fuel oil and ballast water, adequate provisions such as blank flange or spool piece are to be made to prevent mixing of fuel oil and ballast water in the ballast pipe when carrying fuel oil and in the fuel oil pipe when carrying ballast water.

7. Ballast piping system

(1) Ballast piping system is to be provided with a suitable provision such as a non-return valve or a stop valve which can be kept closed at all times excluding the time of ballasting and de-ballasting and which is provided with an indicator to show whether it is open or closed, in order to prevent the possibility of water inadvertently passing from the sea to the ballast tanks or of ballast passing from one ballast tank to another.
Where butterfly valves(except remote control valves) are used, they are to be of type with positive holding arrangements, or equivalents, that will prevent movement of the valve position due to vibration or flow of fluids.
(2) Remote control valves, where fitted, are to be arranged so that they will close and remain closed in the event of loss of control power. Alternatively, the remote control valves may remain in the last ordered position upon loss of power, provided that there is a readily accessible manual means to the valves upon loss of power.
Remote control valves are to be clearly identified as to the tanks they serve and are to be provided with position indicators at the ballast control station.

8. Mud boxes

All bilge suction pipes in the machinery room are to be provided with mud boxes, having straight tail pipes to bilges and fitted with covers which can be readily opened or closed and placed at easily accessible positions above the floor level of the machinery room. For emergency bilge suction pipes these requirements may not be complied with.

9. Rose boxes

All bilge suction branch pipes of such cargo holds and spaces other than machinery compartment are to be fitted at their open ends with rose boxes which can be cleaned without disconnecting the flanges of the suction pipes. The diameter of suction holes on the rose boxes is not to be greater than 10mm and the total open area of perforation is not to be less than three times that of the suction pipe.

10. Bilge wells

(1) Bilge wells are to be constructed of steel and not less in capacity than 0.17 m^3. However, where the spaces to be drained are of small dimensions, steel bilge hats of reasonable capacity may be fitted.
(2) The depth of bilge wells constructed in double bottom and the vertical distance between the bottom shell plating and the bottom plate of bilge wells are to comply with the requirements in **Pt 3, Ch 7, 103.**

11. Manhole

Where accessible manholes to the bilge well of cargo holds are necessary, they are to be fitted as near bilge suctions as practicable. It is to be avoided to provide the above manholes in the fore and after bulkheads and tank top plating of the machinery space. Where, however, this arrangement is necessary, a manhole cover of the hinged type is to be fitted and notice plate indicating "**To be kept shut except when access is required**", is to be posted up in well observable position near the manholes.

Section 5 Feed Water and Condensate System for Boiler

501. Feed water pumps

1. Ships equipped with main boiler for steam propulsion and essential auxiliary boiler for driving of essential auxiliaries are to be provided with at least two independent power driven feed water pumps. One feed pump may, however, be accepted in case of auxiliary boiler other than the essential auxiliary boiler.

2. Each pump is to be of the capacity sufficient to supply water to the boilers under designed full load conditions.

3. The feed pumps are to be driven by independent prime movers.

4. The feed pumps are to be used exclusively for feed purposes.

502. Feed water piping

1. For all main and auxiliary boilers which are required for essential services, at least two separate means of feed are to be provided between the pumps and each boiler. However, a single penetration in the steam drum is acceptable. In this case, the screw down check valve in **Ch 5, 127.** is to be installed in each of the two feed lines.

2. One feed water system may be accepted in case of auxiliary boilers other than the essential auxiliary boilers. In this case, feed water regulator, feed water heater and de-oiler installed on discharge piping of feed water pumps are to be provided with a by-pass valve.

3. A feed water regulator capable of automatically controlling the feed rate is to be provided on the feed water system of main boiler or essential auxiliary boiler.

4. Where auxiliary boiler other than essential auxiliary boiler is controlled automatically, a feed water regulator capable of automatically controlling the feed rate is to be provided on the feed water piping.

503. Condensate pumps

1. At least two independent condensate pumps are to be provided for dealing with condensate from the main condenser.

2. Each of these condensate pumps is to have a capacity to deal with the maximum designed rate of condensate from the condenser.

504. Piping

1. Where two feed pumps or two condensate pumps are required, these pumps are to be installed such that one pump may continue in operation when the other pump is being opened up for overhaul.

2. The pipe lines connected to boiler feed water or drinking fresh water tanks are to be entirely separate from oil pipe lines or pipe lines for oily water.

3. Boiler feed water pipes are not to be led through tanks which contain oil, nor are oil pipes to be led through boiler feed water tanks.

505. Distilling plant and feed water tank

1. In ships with main boilers, at least one distilling plant with a sufficient capacity is to be provided.

2. All ships with boilers are to be provided with feed water tanks of sufficient capacity.

Section 6 Steam and Exhaust Gas Piping

601. Steam piping

1. Piping

(1) In all steam piping systems, provision is to be made for expansion and contraction to take place without unduly straining the pipes.
(2) Water pockets in the steam flow lines are to be avoided as far as practicable in order to prevent water hammer in the system. If this cannot be avoided, drain cocks or valves are to be fitted in such places that the pipes may be efficiently drained while in operation.
(3) Steam pipes are not to be led through cargo spaces without special approval.
(4) If a steam pipe or fitting may receive steam from any source at a higher pressure than that for which it is designed a suitable reducting valve, relief valve and pressure gauge are to be fitted.

2. Steam supply to auxiliary machinery

In ships with two or more boilers, the arrangement of steam piping for auxiliaries is to be such that it is possible to supply steam from at least two boilers to the essential auxiliaries, prime movers thereof and steam whistle.

3. Oil heating pipes

Where steam is used for heating of fuel oil or lubricating oil, the steam drain pipes are to be led to observation tanks in a well-lighted and accessible position in machinery spaces.

602. Exhaust gas piping

1. Exhaust gas pipes for internal combustion engines

(1) Exhaust gas pipes and silencers are to be water cooled or effectively insulated against heat. Silencers are to be so arranged that they may be easily cleaned.
(2) In principle, exhaust gas pipes of two or more engines are not to be connected together. But if the pipes have to be led to a common silencer, effective means are to be arranged to prevent the return of exhaust gases to the cylinders of non-operating engines.
(3) Boiler uptakes and engine exhaust lines are not to be connected, except when specially approved as in the case where the boilers are arranged to utilize the waste heat from the engines.
(4) Exhaust gas lines led overboard near the water line are to be provided with suitable device to prevent water from being siphoned back to the cylinders.

2. Exhaust gas pipes for boilers

Exhaust gas pipes for boilers are to be complied with **Ch 5, 134. 4.**

Section 7 Cooling System

701. Main cooling pumps

1. Cooling system for the main engines, essential auxiliary engines and various attached coolers are to be provided with main cooling water pump to have sufficient capacity for supplying the cooling water under working condition at the maximum continuous output.

2. In steam turbine ships, adequately installed scoop arrangement may be accepted in place of main cooling water pumps.

3. Main cooling pumps may be driven either directly by main or auxiliary engines or by independent prime movers.

702. Stand-by cooling water pumps

1. Cooling system for the main engines, essential auxiliary engines and various attached coolers are to be provided with stand-by cooling water pump in addition to the main cooling pump to have sufficient capacity for supplying the cooling water under normal service condition.

2. Stand-by cooling pumps are to be driven by independent prime movers.

3. In ships having steam turbines as their main engines and provided with the scoop arrangement in place of main cooling pumps, their main condensers are to be so arranged as to be sufficiently cooled with other cooling systems while ships run at low speed, in addition to the cooling system by stand-by cooling pumps.

4. Where duplicate essential auxiliary engines are provided with exclusive cooling pump respectively, stand-by cooling pump need not be provided.

5. Where any suitable independent power driven pump for other purposes is available as a stand-by cooling pump, this pump may be regarded as a stand-by cooling pump.

6. Where fresh water is employed for the cooling, the stand-by fresh water cooling pump need not be fitted if there is suitable connections with sea water cooling system.

7. Where two or more main engines are provided, each of them having a built-in main cooling pump, and where it is possible to give a navigable speed even if one of the pumps is out of use, the stand-by cooling pumps may be dispensed with on condition that one complete spare pump is carried on board.

8. Where engines with a built-in main cooling pump in a small ship, a stand-by cooling pump may be omitted.

703. Sea inlets

Sea water cooling systems for the main engine and prime mover driving the essential auxiliaries needed to propel the ship, are to be connected to at least two sea inlets, on opposite sides and close to the ships bottom.

704. Strainer

Where sea water is used for the direct cooling of the main engine and essential auxiliary engine, strainers which are arranged to be capable of being cleaned without stopping the supply of filtered cooling water to the respective engines are to be provided between the sea suction valve and the cooling sea water pump. In small ships. however, these strainers may be omitted with approval of the Society.

705. Using lubricating oil or fuel oil

Where lubricating oil or fuel oil is used for cooling the machinery, the lubricating oil system or fuel oil systems are to be complied with **Sec 8** or **9** respectively.

Section 8 Lubricating Oil System

801. General

In addition to the requirements in this section, the relevant requirements in **Pt 8, Ch 2, 101.** are to be complied with.

802. Lubricating oil pumps

1. Main engines, propulsion shaftings and their power transmission systems, and auxiliary machinery essential for the propulsion and their prime movers are to be provided with main lubricating oil pumps of sufficient capacity to maintain the supply of oil at the maximum continuous output and stand-by lubricating oil pumps of sufficient capacity to supply oil under normal service condition.

2. The main lubricating oil pumps may be driven either directly by main engines or by independent prime movers. Stand-by lubricating oil pump, however, are to be driven by independent prime movers.

3. Where two or more main engines, propulsion shaftings and their power transmission systems are provided, and where each of them has a built-in main lubricating oil pump and when it is possible to give a navigable speed even if one of them is out of use, the stand-by lubricating oil pumps may be dispensed with on condition that one complete spare pump is carried on board.

4. Where duplicate essential auxiliary engines are provided with exclusive lubricating oil pump respectively stand-by pump may be omitted.

5. Where any suitable independent power driven pump for other purposes is available as a stand-by lubricating oil pump, this pump may be regarded as a stand-by lubricating oil pump.

6. For engines having maximum continuous output not exceeding 257 kW with a built-in main lubricating oil pump, a stand-by lubricating oil pump may be omitted with the approval of the Society.

7. Main lubricating oil pumps and their corresponding stand-by lubricating oil pumps are to be easily changed over each other.

803. Piping

1. Lubricating oil pipings are to be entirely separate from other piping system except where specially approved by the Society.

2. For ships of 100 m and above in length where a double bottom is used as a lubricating oil sump tank, a stop valve is to be provided between the engine and the lubricating oil sump tank and is to be so arranged as to facilitate its operation from the engine room floor.

804. Lubricating oil filters and purifiers

1. Where forced lubrication system (including gravity supply from head tank) is adopted for lubrication of engines, lubrication oil filters are to be provided.

2. The filters used for the lubricating oil systems of main engine, power transmission of propeller shafting and controllable pitch propeller system are to be capable of being cleaned without stopping the supply of filtered lubricating oil.

3. Lubricating oil purifiers or equally effective filters are to be provided in ships which have internal combustion engines or steam turbines as their main engines.

805. Lubricating oil drain

Metallic drip trays with sufficiently deep coaming are to be provided under lubricating oil pumps, lubricating oil filters, lubricating oil tanks and other lubricating oil appliances which are often opened up for cleaning or adjustment, and leaked oil and/or discharged drain are to be led to lubricating oil drain tanks. If it is impossible to lead them from each drip tray to a lubricating oil drain tank, coaming of each drip tray is to be made deep and every possible means is to be taken to ensure that no drain is left behind at any time.

Section 9 Fuel Oil System

901. General

1. In addition to the requirements in this section, the relevant requirements in **Pt 8, Ch 2, 101.** are to be complied with.

2. Arrangement of fuel oil systems

(1) The compartments in which fuel oil burning systems, fuel oil settling and service tanks, fuel oil purifiers, etc. are located, are to be readily accessible and well ventilated.
(2) Fuel oil tanks, fuel oil pumps, fuel oil filters, etc. are not to be located right above or near units of high temperature including boilers, steam pipe lines, exhaust pipe lines, silencers, etc.
(3) The distance of separation between fuel oil tanks and boilers is to be complied with the requirements **Ch 5, 134. 2.**
(4) As far as practicable, fuel oil pipes are to be located far from hot surfaces and electrical equipments, but where this is impracticable, the pipe joints are not to be located above nor near such ignition sources. The pipes are to be led in well lighted and readily visible positions.
(5) Valves, cocks and other fittings fitted on fuel oil tanks are to be located in safe positions so as to protect them from the external damage.
(6) All valves or cocks connected to fuel oil system in machinery spaces or boiler spaces are to be capable of being operated from the floor.

3. Fuel oil pipes and their fittings

(1) Fuel oil pipes are to be of steel. Fuel oil pipes intended for the design temperature above 60 °C and the design pressure above 1 MPa are to be seamless steel pipes or pipes fabricated with the approved procedure.
(2) The valves and fittings used for the fuel oil system with a design temperature above 60 °C and a design pressure above 1 MPa are to be of not to be less than 1.6 MPa in nominal pressure of Korean Industry Standard or national industry standard. The valves and fittings used for fuel oil transfer piping lines, fuel oil suction piping lines and other low pressure fuel oil piping lines are not to be less than 0.5 MPa in nominal pressure.
(3) Packings for pipe joints are to be both heat and oil resisting and to be as thin as practicable.
(4) Where union joints are used for short pipes connecting fuel oil injection pipes for internal combustion engines or boiler burners, they are to be of specially robust construction and to have

metal contact of conical or spherical shape.

(5) Oil fuel lines are to be screened or otherwise suitably protected to avoid as far as practicable oil spray or oil leakages onto hot surfaces, into machinery air intakes, or other sources of ignition. The number of joints in such piping systems are to be kept to a minimum.

4. Drainage system

(1) Metallic drip trays with sufficiently deep coaming are to be provided under burners, fuel oil pumps, fuel oil filters, fuel oil tanks such as fuel oil settling and service tanks, and other fuel oil appliances which are opened up for cleaning or maintenance.
(2) Fuel oil settling tanks and service tanks are to be provided with drain valves or cocks on their bottoms.
(3) Where drain valves or cocks are fitted to fuel oil tanks, the valves or cocks are to be of self-closing type.
(4) Oil in the drip trays and from drain valves is to be led to suitable oil drain tanks not forming part of an overflow system.
(5) Suitable appliances are to be provided for disposing fuel oil drains stored in the drain tanks.

5. Construction of fuel tanks

Fuel oil tanks which do not form part of ship's structure are to be so constructed that they can be readily inspected and cleaned, and the thickness of plating of the tank is not to be less than 5 mm, but in case of small tanks may be reduced to 3 mm.

6. Tank filling pipes

(1) Filling pipes of fuel oil tanks from outboard are to be of exclusive use and to be led above decks as far as possible, and to be provided with strong covers at their open ends.
(2) Where fuel oil filling pipes are fitted not on nor near the top of fuel oil tanks, non-return valves are to be directly fitted to the tanks, or alternatively, valves or cocks having remote closing means specified in **Pt 8, Ch 2, 101. 2** (3) (D) are to be provided.
(3) Notwithstanding the requirements in (1), where fuel oil filling pipes are connected to suction pipes, stop valves are to be provided on the filling pipes. And additional non-return valves are to be provided where the tanks are situated on a higher position than the double bottom and fuel oil may flow to other fuel oil tanks through the filling pipes thereto and overflow from the openings of sounding pipes, etc.

7. Valves for tank suction pipe

(1) All suction pipes from double bottom fuel oil tanks are to be provided with stop valves or cocks which are capable of controlling in engine room.
(2) The relevant requirements in **Pt 8, Ch 2, 101. 2** (3) (D) are to be complied with.
(3) Pneumatic remote shut-down devices (of the type that requires compressed air only at the time of closing) of main suction valves of fuel oil tanks are to comply with the following requirements:
  (A) an exclusive air bottle for remote shut-down is to be provided in an easily accessible position outside the compartment in which fuel oil tanks are situated.
  (B) The capacity of air bottle is to be sufficient for closing all the main suction valves of fuel oil tanks at least 2 times.
  (C) The air bottle is to be provided with a pressure measuring device at a position which can be easily seen from the position where the remote shut-down device is operated.
  (D) Air pipes from the air bottle to the main suction valve's actuators are not to be provided with valves except for valves for remote control and blow-off valves for these pipes.
  (E) Air pipes from the air bottle to the main suction valve's actuators are to be steel or copper pipes.
  (F) Air charging pipes to the air bottle are to be provided with non-return valves.

8. Fuel oil pumps

(1) Stop valves or cocks are to be fitted on both the suction and delivery sides of fuel oil pumps to overhaul these pumps.
(2) All pumps which are capable of developing a pressure exceeding the design pressure of the system are to be provided with relief valves arranged discharge back to the suction side of the pump. However, pressure relief valves may not be fitted when the system is served only by centrifugal pumps, so designed that the pressure delivered can not exceed that for which the

piping is designed.

(3) The power supply to the fuel oil transfer pump, fuel oil burning pump, fuel valve cooling oil pump, other similar fuel oil pumps and fuel oil purifiers is to be capable of being stopped from a remote position which will always be accessible in the event of fire taking place in the compartment in which they are situated or its neighbourhood, as well as from the compartment itself.

9. Fuel oil transfer pumps

(1) In ships where a power pump is used for pumping up to the settling and service tanks, at least, two independent power fuel oil pumps are to be provided, and these pumps are to be connected ready for use. In case of small ships, however, a manual pump of proper capacity may be used in lieu of power pump.

(2) Where any suitable fuel oil pump being driven by an independent prime mover for other purposes is available as one of the transfer pumps, this pump may be regarded as a fuel oil transfer pump.

10. Fuel oil piping

(1) Fuel oil piping systems are to be entirely separated from other piping systems as far as practicable. Should it be unavoidable to interconnect to other systems, effective means are to be provided to prevent the accidental contamination with other liquids.

(2) Where it is intended to carry fuel oil and ballast water in the same compartment alternately, the pipes are to be so arranged that the fuel oil can be pumped from any one compartment at the same time as the ballast water is being discharged from any other compartment. Where settling or service tanks are provided, each having a capacity sufficient to permit 12 hours normal service without replenishment, the above requirement may be modified.

(3) Pipelines intended for serving the oil fuel tanks are not to pass through the cargo and slop tanks and are to have no connection with pipelines serving the cargo and sloptanks.

11. Fuel oil heating systems

(1) Heating arrangements in tanks

(A) Flash point

Fuel oil in storage tanks is not to be heated within 10 °C below its flash point. Where fuel oil in service tanks, settling tanks and any other tanks in the supply system is heated, the arrangements are to comply with the following :

(a) The temperature at the open ends of the air pipes from the tanks is to be below flash point of fuel oil, or the outlet of the air pipes is to located at least 3 m away from a source of ignition.

(b) Air pipes are to be fitted with the flame-screens.

(c) There are no openings from the vapor space of the fuel tanks leading into machinery spaces, except for bolted manholes.

(e) Enclosed spaces, such as workshops, accommodation spaces, etc., are not to be located directly over the fuel tanks, except for vented cofferdams.

(B) Fuel oil temperature control

All heated fuel oil tanks located within machinery spaces are to be fitted with a temperature indicator. Means of temperature control are to be provided to prevent overheating of fuel oil, in accordance with (A) above. However, electric heaters are to be provided with automatic temperature controlling devices.

(C) Temperature of heating media

Where heating is by means of fluid heating medium(steam, thermal oil, etc.), a high temperature alarm is to be fitted to warn of any high medium temperature. This alarm may be omitted if the maximum temperature of the heating medium can, in no case, exceed 220 °C.

(D) Steam heating

To guard against possible contamination of boiler feed water, where fuel oil tanks are heated by steam heating coils, steam condensate returns are to be led to an observation tank, or other approved means, to enable detection of oil leaking into the steam system.

(E) Electric heating

(a) Where electric heating is installed, the heating elements are to be arranged to be submerged at all times during operation, and are to be fitted with an safety temperature switch of preventing the surface temperature of the heating element from exceeding 220 °C. This safety temperature switch is to be independent of the fuel oil temperature control specified in (B) above. Additionally, this safety temperature switch is to cut off the electrical power supply in the event of excessive temperature and is to be provided with manual reset.

(b) Double bottom tanks and deep tanks are not to be provided with electric heaters, unless approved by the Society.

(F) UMA and CMA ships

Fuel oil tanks provided with heating arrangements are to be fitted with the following alarms at the centralized control station.

(a) High temperature alarm and temperature display for the heated fuel oil in the settling and service tanks.

(b) High temperature alarm for the fluid heating medium (steam, thermal oil, etc.) for fuel oil tanks, where the maximum temperature of the heating medium would exceed 220 °C .

(2) Heaters

(A) Fuel oil temperature control

All heaters are to be fitted with a fuel oil temperature indicator and a means of temperature control.

(B) Heating media and electric heating

The requirements specified in (1) (C), (D) and (E) (a)are also applicable to fuel oil heaters.

(C) Relief valve

Relief valves are to be fitted on the fuel oil side of the heaters. The discharge from the relief valve is to be led to a safe location.

(D) UMA and CMA ships

Fuel oil heaters are to be fitted with the following alarms at the centralized control station.

(a) Fuel oil high temperature (or low viscosity) alarm

(b) High temperature alarm for the fluid heating medium (steam, thermal oil, etc.) for fuel oil heater, where the maximum temperature of the heating medium would exceed 220℃.

12. Oil tanks for galleys

Oil tanks provided for galleys are not to be installed in the galley space and are to be fitted with filling and air pipes of approved construction. Stop valve is to be fitted on the fuel oil supply line at an easily accessible location so that the valve can be readily shut in case of fire in the galley.

13. Fuel oil service tanks

Two fuel oil service tanks for each type of fuel used on board necessary for propulsion and vital systems or equivalent arrangements are to be provided with a capacity of at least 8 hours at maximum continuous rating of the propulsion plant and normal operating load at sea of the generating plant.

902. Burning systems for boiler

1. Burning system

(1) Where the main boiler is provided with the combustion system of pressurized fuel injection type, at least two oil burning units, each unit comprising a burning pump, a suction filter, a discharge filter and a heater, are to be provided, and each unit is to be capable of supplying oil for generating steam of required quality even in the case of failure of one unit.

(2) As for essential auxiliary boiler and other boilers to supply steam for fuel oil heating necessary for the operation of the main engine or cargo heating that is required continuously, the burning systems are to be provided in accordance with the requirements in (1) above. However, where the alternative means, such as exhaust gas economizer, heating equipments, etc., are available to ensure the normal navigation and cargo heating with the burning system being out of operation only one unit of burning system will be accepted.

2. Oil feeding by gravity

Where in main boiler or essential auxiliary boiler oil is fed to the burners by gravity, the fuel oil filters are to be capable of being cleaned without stopping the supply of fuel oil.

3. Cold starting

In main or essential auxiliary boiler, a suitable cold starting device which does not require power from the shore is to be provided.

4. Burners

(1) Boiler burners are to be so arranged that they cannot be removed unless the fuel supply is cut off and also that the fuel oil cannot be supplied unless the burners are set correctly.
(2) Boilers designed to use both exhaust gas and fuel oil, are to be provided with devices which will not allow the supply of fuel oil unless the gas in the exhaust gas pipe is cut off.

5. Piping arrangement for fuel oil burning pumps

Fuel oil pipings of burning pumps are not to be connected with other piping lines than those for fuel oil.

6. Automatic combustion systems

Where the automatic control and/or remote control are used with boilers, the burning systems are to be in accordance with the requirements in **Pt 6, Ch 2** in addition to the requirements in this Chapter.

903. Fuel oil supply system of internal combustion engines

1. Fuel oil supply pumps

(1) For main engines and essential auxiliary engines, one stand-by fuel oil supply pump driven by independent power having a sufficient capacity to maintain the supply of fuel under normal service condition is to be provided in addition to the main fuel oil supply pump which has a sufficient capacity for suppling the fuel oil under working condition at the maximum continuous output.
(2) Where any fuel oil pump driven by independent power source intended for other purposes is available as a stand-by fuel oil supply pump, this pump may be regarded as a stand-by fuel oil supply pump.
(3) As for the internal combustion engines driving the auxiliary machinery for important use requiring main and stand-by and where each engine is provided with a fuel oil supply pump, the stand-by fuel oil supply pump may be omitted.
(4) For engines having maximum continuous output not exceeding 370 kW with a built-in main fuel oil supply pump, a stand-by fuel oil supply pump may be omitted subject to the approval by the Society.
(5) Main fuel oil supply pumps may be driven by engines or independent power, but stand-by fuel oil supply pumps are to be driven by independent power sources.
(6) Where two or more main propulsion machinery is provided, and where each of them has a built-in main fuel oil supply pump and when it is possible to give a navigable speed even if one of them is out of use, stand-by fuel oil supply pump may be dispensed with on condition that one complete spare pump is carried on board.

2. Fuel oil filters

(1) Fuel oil filters are to be provided on fuel oil supply piping lines for internal combustion engines. These fuel oil filters under pressure for diesel engines are to be located such that, in the event of oil leakage, they can not be sprayed onto the exhaust manifold.
(2) The filters for internal combustion engines for propulsion are to be capable of being cleaned without stopping the supply of filtered fuel oil.

3. Fuel oil heating devices and fuel oil purifying devices

Where low grade oil is used as fuel oil, suitable fuel oil heating devices and fuel oil purifying devices are to be provided.

Section 10 Thermal Oil System

1001. Application

1. Thermal oil piping systems are to be complied with the requirements specified in **201., 901. 2, 4, 6** (2), **7** and **8** (1).

2. In addition to the requirements of this Section, these systems are to comply with the requirements in **Pt 8, Ch 2, 101. 4** of the Rules.

1002. Thermal oil piping system

1. Expansion tanks are to be provided with liquid level indicator.

2. Circulating pumps are to be provided with a pressure measuring device at a suitable position on the delivery and suction sides.

3. The inlet and outlet valves on thermal oil heaters are to be controllable from outside the compartment where they are installed. As an alternative, an arrangement for quick gravity drainage of the thermal oil contained in the system into a collecting tank is acceptable.

1003. Pumps for thermal oil system

1. The thermal oil system for important use is to be provided with two thermal oil circulating pumps and two fuel oil burning pumps. However, only one fuel oil burning pump will be accepted, where alternative means are available to ensure the normal navigation and cargo heating in case of failure of the pump.

2. Circulating pumps are to be capable of being stopped from a suitable position other than a space in which thermal oil heaters are situated.

1004. Heating of liquid cargoes with flash points below 60 ℃

1. Heating of liquid cargoes with flash points below 60 °C is to be arranged by means of a separate secondary system, located completely within the cargo area. However, a single circuit system may be accepted, where the thermal oil systems are satisfied with the following whole conditions:

(1) The system is to be arranged so that a positive pressure in the coil is at least 3 m water column above the static head of the cargo when circulating pump is not in operation.
(2) The thermal oil system expansion tank is to be fitted with high and low level alarms.
(3) Means is to be provided in the thermal oil system expansion tank for detection of flammable cargo vapours. Portable equipment may be accepted.
(4) Valves for the individual heating coils are to be provided with locking arrangement to ensure that the coils are under static pressure from thermal oils at all times.

Section 11 Compressed Air System

1101. Compressed air starting devices

1. Number and capacity of main air reservoirs

(1) Where the main engines are arranged for starting by compressed air, at least two starting air reservoirs of about equal capacity are to be fitted. These reservoirs are to be connected ready for use.
(2) The total capacity of air reservoirs is to be sufficient to provide, without their being replenished, not less than 12 consecutive starts altering between Ahead and Astern of each main engine of the reversible type, and not less than 6 consecutive starts of each main non-reversible type engine. The number of starts refers to engine in cold and ready to start conditions.

(3) Where the auxiliary engines are designed for starting by compressed air, two separate auxiliary air reservoirs which are to be sufficient for at least three starts for each auxiliary engine when in cold and ready to start conditions are to be fitted, or starting air for auxiliary engines is to be supplied by separate piping from main air reservoirs. In case where only one auxiliary reservoir is fitted, starting air pipes are to be connected with main air reservoir.

(4) Where the auxiliary engines are designed for starting by the main air reservoirs, the capacity of the main air reservoirs is to be more than sum of the capacity required in (2) and (3) above, and the amount consumed for engine control systems, whistle, etc.

(5) For multi-engine installations, the number of starts required for each engine is to be determined as deemed appropriate by the Society.

2. Number and total capacity of air compressors

(1) Where the main engines are designed for starting by compressed air, at least two starting air compressors are to be provided and arranged so as to be able to charge each reservoir.

(2) At least one of them is to be driven by a prime mover other than main engines. Where cylinders are provided with air charging valves by the small engine, the charging valves may be considered as equivalent to an air compressor driven by the main engine.

(3) The total capacity of air compressors is to be sufficient to supply air in the reservoirs from atmospheric pressure to the pressure required for the consecutive starts prescribed in **Par 1** within one hour.

3. Emergency air compressors

(1) Where prime movers driving air compressors specified in **Par 2** are arranged for air starting, an independent power driven emergency air compressor is to be provided.

(2) The prime movers driving the emergency air compressor are to be capable of starting without compressed air.

(3) The capacity of the emergency air compressor is to be sufficient to start the prime movers of the air compressor prescribed in **Par 2.** For this purpose, a small air reservoir for emergency air compressor may be provided.

(4) In case of a small installation, a manual air compressor of adequate capacity may be accepted as an emergency air compressor.

4. Arrangement of starting air piping

(1) All discharge pipes from starting air compressors are to be led directly to starting air reservoirs.

(2) All starting pipes from the air reservoirs to main or auxiliary engines are to be entirely separate from the said compressor discharge system.

1102. Construction and safety devices

1. Construction, materials, strength and safety device of air compressors

(1) Provision is to be made to the arrangement of air compressor to reduce the entry of oil into compressed air to a minimum.

(2) Air coolers of air compressors are to be so constructed and arranged that they can be easily overhauled for inspection.

(3) Materials used for shafts and essential parts of air compressor are to be in accordance with **101. 5** (1).

(4) The strength of crankshafts of air compressors is to be in accordance with **1102. of the Guidance** and the strength of shafts other than crankshafts is to be in accordance with **101. 5** (2).

(5) Each air compressor is to be provided with a relief valve to prevent that the pressure of cylinder exceeds the design pressure.

2. Construction and safety device of air reservoirs.

(1) Relief devices and other fittings for air reservoirs are to comply with the requirements in **Ch 5, 317.**

(2) Air reservoirs are to be so constructed and arranged that they can be readily opened up for cleaning and inspection, and to be provided with drainage arrangement at a suitable position permitting drain to be effectively blown out under extreme condition of trim.

(3) All air reservoirs are to be provided with pressure gauges at the position where it can be easily seen.

Section 12 Refrigerating Machinery

1201. General

1. Application

(1) The requirements in this Section apply to the refrigerating machinery of refrigerating chamber using the primary refrigerants listed below and forming the refrigerating cycle used for refrigeration, etc.. However, the refrigerating machinery with compressors of 7.5 kW or less and the refrigerating machinery using primary refrigerants other than those listed below are to be as deemed appropriate by the Society.

$R\ 22$: $CHClF2$
$R\ 134a$: $CH2FCF3$
$R\ 404A$: $R\ 125/R\ 143a/R\ 134a$ (44/52/4 $wt\%$)
$CHF2CF3/CH3CF3/CH2FCF3$
$R\ 407C$: $R\ 32/R\ 125/R\ 134a$(23/25/52 $wt\%$)
$CH2F2/CHF2CF3/CH2FCF3$
$R\ 410A$: $R\ 32/R\ 125$ (50/50 $wt\%$) $CH2F2/CHF2CF3$
$R\ 507A$: $R\ 125/R\ 143a$(50/50 $wt\%$)
$CHF2CF3/CH3CF3$

(2) For items especially provided in this Section, the requirements in this Section are applied in lieu of the requirements in **Ch 5** and **6**.

1202. Design of refrigerating machinery

1. General

The design pressure of pressure vessels and piping systems and the class of pipes used for refrigerating machinery are as follows :

(1) The design pressure of the pressure vessels and piping systems used for the refrigerating machinery and exposed to a pressure of the refrigerant is not to be less than the pressure in **Table 5.6.15** depending on the kind of the refrigerants.
(2) Pipes for the refrigerants specified in **Table 5.6.15** are to be classified into Class III.

2. Locations

Refrigerating machinery compartments are to be provided with efficient arrangements of drainage and ventilation, and separated by gastight bulkheads from the adjacent refrigerated chambers.

Table 5.6.15 Design pressure of pressure vessels and piping systems for refrigerating machinery

Refrigerants	High Pressure side (MPa)(1)	Low Pressure side (MPa)(2)
$R\ 22$	1.9	1.5
$R\ 134a$	1.4	1.1
$R\ 404A$	2.5	2.0
$R\ 407C$	2.4	1.9
$R\ 410A$	3.3	2.6
$R\ 507A$	2.5	2.0

NOTES:
(1) High Pressure side : The pressure part from the compressor delivery side to the expansion valve.
(2) Low Pressure side : The pressure part from the expansion valve to the compressor suction valve. In case where a multistage compression system is adopted, the pressure part from the lower-stage delivery side to the higher-stage suction side is to be included.

3. Materials

(1) Materials used for the refrigerating machinery are to be suitable for the refrigerant used, the design pressure, the minimum working temperature, etc.
(2) Materials used for the primary refrigerant pipes, valves and their fittings are to comply with the requirements in **102. 1.** to **5.** and **103. 1.** to **5.** according to the classes of pipes specified in **1202. 1** (2).
(3) Materials used for the pressure vessels exposed to the refrigerant pressure(condensers, receivers and other pressure vessels) are to comply with the requirements in **Ch 5, 303.** to **307.** according to the classes of pressure vessels specified in **Ch 5, 302.**
(4) Materials used for essential parts of refrigerating compressor are to be in accordance with **101. 5** (1).
(5) The following materials are not to be used for the parts of refrigerating machinery.
  (A) Aluminium alloy containing magnesium over 2 % for parts to be contacted with primary refrigerants.
  (B) Pure aluminium less than 99.7 % for parts to be usually contacted with water without corrosion protection.
(6) The service limitations of valves made of iron castings are shown in **Table 5.6.16.** Although utilizing of iron castings is permitted by the Table, they are not to be used for valves in pipings having a design temperature below 0 °C or exceeding 220 °C. However, where the normal working pressure of the piping is not exceeding 1/2.5 times the design pressure, the temperature limitations may be lowered to -50 °C.

Table 5.6.16 Service limitation of Valves made of Iron Casting

Kind of valves	Materials	Application
Stop valves	Gray iron castings with specified tensile strength not exceeding 200 N/mm^2 or equivalent thereto	Not to be used
	Gray iron castings other than those specified in above, Spheroidal graphite iron castings, Malleable iron castings or equivalent thereto	1) May be used for design pressure not exceeding 1.6 MPa 2) May be used for design pressure exceeding 1.6 MPa but not exceeding 2.6 MPa, provided nominal diameter does not exceed 100 mm and design temperature is 150 ℃ or below.
Relief Valve	Any iron casting	Not to be used
Automatic control valve	Gray iron castings with specified tensile strength not exceeding 200 N/mm^2 or equivalent thereto	Not to be used
	Gray iron castings other than those specified in above or equivalent thereto	1) May be used for design pressure not exceeding 1.6 MPa 2) May be used for design pressure exceeding 1.6 MPa but not exceeding 2.6 MPa, provided nominal diameter does not exceed 100 mm and design temperature is 150 ℃ or below.
	Spheroidal graphite iron castings, Malleable iron castings or equivalent thereto	Not to be used for design pressure exceeding 3.2 MPa

4. Pressure relief devices

(1) A relief valve is to be provided between compressor cylinder and gas delivery stop valve, and then the discharge is to be led to suction side of the compressor. However, compressors of 11 kW or less for the refrigerating installation may be provided with a pressure control switch in lieu of the above safety device.

(2) Relief valves are to be fitted to the pressure vessels which may be isolated and store the primary refrigerants in a liquid condition. The discharged gases from the relief valves are to be led to the atmosphere in a safe place above the weather deck or to the low pressure parts of the equipment.
(3) Where the discharged gases from relief valves on high pressure parts of primary refrigerants are led to low pressure parts before being relieved to the atmosphere, the operation of the relief valves are not to be interrupted by back pressure accumulation.
(4) Relief valves are to be provided to the cooling liquid side of condenser and brine side of evaporator except where the pump connected is so constructed that the pressure does not exceed the design pressure.

1203. Test

1. Shop test

Refrigerating machinery is, to be tested according to the following :
(1) Pressure vessels exposed to a pressure of the primary refrigerant are to be subjected to a hydraulic test at the pressure of 1.5 times the design pressure and a tightness test at a pressure equal to the design pressure.
(2) Cylinders and crankcases of the compressors of the refrigerator are to be subjected to a hydraulic test at the pressure of 1.5 times the design pressure and a tightness test at a pressure equal to the design pressure.

2. Test after installation on board

The piping systems which are exposed to a pressure of the primary refrigerant are, after installed on board, to be subjected to a leak test at the pressure of 90 % of the design pressure.

Section 13 Tests and Inspections

1301. Hydrostatic Tests of auxiliary machinery

1. The pressure receiving portions of the essential auxiliary are to be tested to a hydrostatic pressure of 1.5 times the design pressure after having been machine-finished, except where otherwise specified. The test pressure, however, is not to be less than 0.2 MPa.

2. The compressor cylinders and crankcases of the refrigerating machinery subject to the requirements in **Sec 12** are to be tested to hydrostatic pressure of 1.5 times the pressure specified in **Pt 9, Ch 1, 102. 5,** respectively and additionally be subjected to tightness tests for the pressure respectively stipulated in the same Article.

1302. Hydrostatic tests of valves and pipe fittings

1. Valves and pipe fittings belonging to Class I and Class II piping are to be subjected to a hydrostatic test at the pressure of 1.5 times the design pressure. However, the hydrostatic test may be omitted according to the discretion of the Society.

2. Ship-side valves and cocks fitted at the ship side below the load waterline are to be subjected to a hydrostatic test at the pressure of 0.5 MPa.

1303. Hydrostatic tests of fuel tanks

Fuel oil tanks with their fittings which do not form part of ship's structure are, after having been constructed, to be tested to a hydrostatic pressure corresponding to a head of water not less than 2.5 m above the top plates. Hydrostatic tests may be replaced by gastight tests at the discretion of the Society.

1304. Tests on workmanship of pipes

1. Welding procedure qualification tests

The manufacturers are to submit the detailed data in connection with the welding work for examination by the Society and also to conduct the welding procedure qualification test specified by the Society where they plan to joint pipes to pipes, pipes to valves or pipes to fittings belonging to Class I and Class II piping system by welding for the first time, or where they adopt a new welding method, and where they change quality of base metals, grade of welding materials or type of joint. But, for minor changes in the welding process, the test may be omitted where approved by the Society.

2. Non-destructive tests

(1) For butt welded joints of Class I pipes with a nominal diameter exceeding 65A, fully radiographic examination is to be carried out.
(2) For butt welded joints of Class I pipes with a nominal diameter not exceeding 65A and of Class II pipes with a nominal diameter exceeding 90A, at least 10 % spot radiography examination is to be carried out.
(3) More stringent requirements may be applied at the Society's discretion depending on the kinds of materials, welding procedure and controls during the fabrication. An approved ultrasonic testing procedure may be accepted, at the Society's discretion, in lieu of radiography testing when the conditions are such that a comparable level of weld quality is assured.
(4) Fillet welds of flange pipe connections are to be examined by the magnetic particle method or by other appropriate non-destructive methods, in case of Class I pipes. In other cases, magnetic particle examination or equivalent non-destructive testing may be required at the discretion of the Surveyor.
(5) The Society may require other particular testing considering welding procedures or properties of welding consumables.
(6) Radiographic examination methods are to comply with the requirements in **Ch 5, 404. 3** to **5.**
(7) Radiographic and ultrasonic examination are to be performed with an appropriate technique by trained operators. At the request of the Society, complete details of the radiographic and ultrasonic technique are to be submitted for approval.
(8) Magnetic particle examination is to be performed with suitable equipment and procedures, and with a magnetic flux output sufficient for defect detection. The equipment is to be required to be checked using standard samples.

3. Hydrostatic tests

(1) All Class I and II pipes and all steam pipes, feed water pipes, compressed air pipes and fuel oil pipes having a design pressure greater than 0.35 MPa are to be subjected to hydrostatic tests together with the welded fittings, after completion of manufacture but before insulation or coating, at a pressure of 1.5 times the design pressure. However, where joints between pipes and valves are welded on board, the hydrostatic test may be omitted provided non-destructive tests deemed appropriate by the Society are carried out.
(2) For steel pipes and intergral fittings having a design temperatures above 300 °C, the test pressure(P_h) is to be determined by the following formula but need not exceed 2 times the design pressure.

$$P_h = 1.5\frac{\sigma_{100}}{\sigma}P \quad (\mathrm{MPa})$$

where:

σ_{100} = Allowable stress at 100 °C (N/mm^2)

σ = Allowable stress at the design temperature (N/mm^2)

P = Design pressure (MPa)

The test pressure may be reduced to 1.5 times the design pressure, in order to avoid excessive stress in way of bends, T-pieces, etc.
(3) In any case the membrane stress is not to exceed 90 % of the specified yield stress at the test-

ing temperature.

(4) When, for technical reasons, it is not possible to carry out complete hydro-testing before assembly on board, for all sections of piping, proposals are to be submitted for approval to the Society for testing the closing lengths of piping, particularly in respect to the closing seams.

(5) The hydrostatic test of piping referred in (1) may be carried out after installation on board. In this case, the test is to be carried out together with the welded fittings at a pressure described in (1) or (2) after completion of manufacture but before insulation or coating and this test may be carried out in conjunction with the test required under **1305.**

(6) Pressure testing of small bore pipes (outside diameter less than 15 mm) may be waived at the discretion of the Society depending on the application.

1305. Tests of piping systems on board

1. Piping systems are, after installation on board, to be tested in accordance with the following requirements.

(1) All piping systems specified in this Chapter are to be tested for effectiveness together with machinery under the working conditions and checked for leakage.

(2) Fuel oil piping systems and heating coil in tanks are to be tested by hydrostatic pressure not less than 1.5 times the design pressure but in no case less than 0.4 MPa. ⚓

CHAPTER 7 STEERING GEARS

Section 1 General

101. Application

1. The requirements in this Chapter apply to powerdriven steering gears. For small ships, however, the requirements in **102., 103., 105., 301. 3** and **410.** may be modified.

2. Manual steering gears are to be of the construction approved by the Society, and to be tested and examined to the satisfaction of the Society.

102. Terminology

1. The terms used in this Chapter are defined as follows:

(1) **Main steering gear** is the machinery such as rudder actuators, steering gear power units, if any, and ancillary equipment and the means of applying torque to the rudder stock (e.g. tiller) necessary for effecting movement of the rudder for the purpose of steering the ship under normal service conditions.

(2) **Auxiliary steering gear** is the equipment other than any part of the main steering gear necessary to steer the ship in the event of failure of the main steering gear but not including the tiller or components serving the same purpose (hereinafter referred to as "tiller, etc.").

(3) **Steering gear power unit** (hereinafter referred to as "power unit") is:
   (A) in the case of electric gear, an electric motor and its associated electrical equipment;
   (B) in the case of electro-hydraulic steering gear, a hydraulic pump, electric motor and its associated electrical equipment; and
   (C) in the case of hydraulic steering gear other than those in (B), a hydraulic pump and its driving engine.

(4) **Power actuating system** is the hydraulic equipment provided for supplying power to turn the rudder stock, comprising a power unit or units, together with the associated hydraulic pipes and fittings, and a rudder actuator. The power actuating system may share common mechanical components, i.e., tiller, etc.

(5) **Rudder actuator** is the component which converts directly hydraulic pressure into mechanical action to move the rudder.

(6) **Control system** is the equipment by which orders are transmitted from the navigating bridge to the power units. Steering gear control systems comprise transmitters, receivers, hydraulic control pumps and their associated motors, motor controllers, piping and cables.

103. Plans and documents

1. Plans and documents to be submitted are as follows:

(1) Plans
   (A) General arrangements of steering gear
   (B) Details of tiller, etc.
   (C) Assembly and details of power units
   (D) Assembly and details of rudder actuators
   (E) Piping diagram of hydraulic pipes; Arrangements of control systems
   (F) Diagram of hydraulic and electrical systems (including alarm devices and automatic steering gear)
   (G) Arrangements and diagram of an alternative source of power
   (H) Diagram of a rudder angle indicator

(2) Documents
   (A) Particulars
   (B) Calculation sheet of the strength of essential parts
   (C) Operating instructions (including plans showing the change-over procedure for power units and control systems, plans showing the sequence of automatic supply of power from an alternative source of power; and the type, particulars and an assembly of the power source in

the case that the alternative source of power is an independent source of power)
(D) Manuals for countermeasures to be taken at the time of a single failure of the power actuating system.

104. Display of operating instructions

1. Simple operating instructions with a block diagram showing the change-over procedures for power units and control systems are to be displayed on the navigating bridge and in the steering gear compartment of a ship equipped with power-operated steering gears.

2. Where the system failure alarms according to **301. 4** are provided, instructions for emergency procedures when the alarm is activated, are to be displayed on the navigating bridge.

105. Related requirements

1. The strength of the pressure vessels such as accumulators, etc. used in power actuating systems is to comply with the relevant requirements in **Ch 5** in addition to this Chapter.

2. Hydraulic piping systems used in the power actuating systems are to comply with the relevant requirements in **Ch 6** in addition to this Chapter.

3. Electrical equipment for steering gear are to comply with the relevant requirements in **Pt 6, Ch 1** in addition to this Chapter.

Section 2 Performance and Arrangement

201. Number of steering gears

1. Unless expressly provided otherwise, every ship is to be provided with a main steering gear and an auxiliary steering gear. The main steering gear and the auxiliary steering gear are to be so arranged that the failure of one of them will not render the other one inoperative.

2. Where the main steering gear comprises two or more identical power units, the auxiliary steering gear need not be fitted provided that:

(1) The main steering gear is capable of operating the rudder as required **202.** (1) while operating with all power units. In a passenger ship, the main steering gear is capable of operating the rudder as required by **202.** (1) while any one of the power units is out of operation;

(2) The main steering gear is so arranged that after a single failure in its piping system or in one of the power units the defect can be isolated so that steering capability can be maintained or speedily regained. Steering gears other than of the hydraulic type will be considered by the Society in each case.

202. Performance of main steering gear

1. The main steering gear is to be capable of putting the rudder over from 35 degrees on one side to 35 degrees on the other side with the ship at its load draught and running ahead at the speed specified in **Pt 3, Ch 1, 120**. and, under the same conditions, from 35 degrees on either side to 30 degrees on the other side in not more than 28 seconds.

2. The main steering gear is to be operated by power where necessary to meet the requirements in **1.** and in any case when the diameter of upper rudder stock is required in **Pt 4, Ch 1** to be over 120 mm (excluding the additional for strengthening for navigation in ice, the same being referred hereinafter).

3. The main steering gear is to be so designed that they will not be damaged at maximum astern speed. However, this design requirement need not be provided by trials at maximum astern speed and maximum rudder angle.

203. Performance of auxiliary steering gear

1. The auxiliary steering gear is to be capable of putting the rudder over from 15 degrees on one side to 15 degrees on the other side in not more than 60 seconds with the ship at its load draught and running ahead at one half of the speed specified in **Pt 3, Ch 1, 120.** or 7 knots, whichever is the greater, and capable of being brought speedily into action in an emergency.

2. The auxiliary steering gear is to be operated by power where necessary to meet the requirement in **1.** and in any case when the diameter of upper rudder stock is required in **Pt 4, Ch 1** to be over 230 mm.

204. Piping

1. The hydraulic piping system is to be arranged so that transfer between power units can be readily effected.

2. Suitable arrangements to maintain the cleanliness of the hydraulic fluid are to be provided taking into consideration the type and design of the power actuating system.

3. Arrangements for bleeding air from the power actuating system are to be provided where necessary.

4. Relief valves are to be fitted to any part of the hydraulic system which can be isolated and in which pressure can be generated from the power source or from external forces. The setting pressure of the relief valves is not to be less than 1.25 times the maximum working pressure. The minimum discharge capacity of the relief valves are not to be less than total capacity of pumps which provide power for the actuator, increased by 10 %. Under such conditions the rise in pressure is not to exceed 10 % of the setting pressure. In this regard, due consideration is to be given to the extreme foreseen ambient conditions in respect of oil viscosity.

5. A low level alarm is to be provided for each hydraulic fluid reservoir to give the earliest practicable indication of hydraulic fluid leakage. This alarm is to be audible and visual and to be given on the navigating bridge and at a position from which the main engine is manually controlled.

6. A fixed storage tank having sufficient capacity to recharge at least one power actuating system including the reservoir is to be provided, where the main steering gear is operated by hydraulic power. The storage tank is to be permanently connected by piping in such a manner that the hydraulic system, can be readily recharged from a position within the steering gear compartment and is to be provided with a contents gauge.

7. Where the steering gear is so arranged that more than one system (either power or control) can be simultaneously operated, the risk of hydraulic locking caused by single failure is to be considered.

205. Re-start and power-failure alarm of power units

1. Main and auxiliary steering gear power units are to be :

(1) arranged to re-start automatically when power is restored after a power failure and
(2) capable of being brought into operation on the navigation bridge. In the event of a power failure to any one of the power units, an audible and visual alarm is to be given on the navigating bridge.

206. Alternative source of power

1. Where the diameter of upper rudder stock is required in **Pt 4, Ch. 1** to be over 230 mm, an alternative source of power supply to steering gears is to be provided in accordance with the following:

(1) The alternative source of power is to be either:
  (A) emergency source of electric power; or
  (B) independent source of power located in the steering gear compartment and used only for this purpose.
(2) The alternative source of power is to be capable of automatically supplying, within 45 seconds, alternative power to the power unit and its associated control system and the rudder angle indicator. In every ship of 10,000 gross tonnage and upwards, the alternative source of power is

to have a capacity for at least 30 minutes of continuous operation of the steering gear and in any other ship for at least 10 minutes.

(3) Steering gears operated by the alternative power supply are to be capable of operating the rudder as required by **203.**

(4) The automatic starting arrangement for the generator or the prime mover of the pump used as the independent source of power specified in (1) (B) is to comply with the requirements for starting device and performance in **Pt 6, Ch 1, 1406.**

207. Electrical installations for electric and electro-hydraulic steering gear

1. Cables used in power circuits required to be installed in duplicate by this Chapter are to be separated as far as practicable throughout the length.

2. Means for indicating that the power units are running are to be installed on the navigating bridge and at the position from which the main engine is normally controlled.

3. Each electric or electro-hydraulic steering gear comprising one or more power units is to be served by at least two exclusive circuit fed directly from the main switchboard. However, one of the circuits may be supplied through the emergency switchboard.

4. An auxiliary electric or electro-hydraulic steering gear associated with a main electric or electro-hydraulic steering gear may be connected to one of the circuits supplying this main steering gear. The circuits are to have adequate rating for supplying all motors which can be simultaneously connected to them and may be required to operate simultaneously.

5. Short circuit protection and overload alarm are to be provided for such circuits and motors. The overload alarm is to be both audible and visual and to be situated in a conspicuous position in the place from which the main engine is normally controlled.

6. Protection against excess current including starting current, if provided, is to be for not less than twice the load current of the motor or circuit so protected, and to be arranged to permit the passage of the appropriate starting currents.

7. Where a three-phase supply is used an alarm is to be provided that will indicate failure of any one of the supply phases. The alarm is to be both audible and visual and to be situated in a conspicuous position in the place from which the main engine is normally controlled.

8. When in a ship of less than 1,600 gross tonnage an auxiliary steering gear which is required by **203.** to be operated by power is not electrically powered or is powered by an electric motor primarily intended for other services, the main steering gear may be fed by one circuit from the main switchboard. Where such an electric motor primarily intended for other services is arranged to power such an auxiliary steering gear, the requirements in **Pars 5** to **7** may be waived by the Society if satisfied with the protection arrangement together with the requirements in **205.** and **301. 1** (3) applicable to auxiliary steering gear.

208. Position of steering gears

1. The steering gear is to be installed in an enclosed compartment readily accessible and, as far as possible, separated from machinery spaces.

2. The steering gear compartment is to be provided with suitable arrangements to ensure working access to steering gear machinery and controls. These arrangements are to include handrails and gratings or other non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage.

209. Means of communication

A means of communication is to be provided between the navigating bridge and the steering gear compartment.

210. Rudder angle indicator

1. The angular position of rudder is to be indicated in the navigating bridge. The rudder angle indicator is to be independent of the control system.

2. The angular position of rudder is to be recognizable in the steering gear compartment.

Section 3 Controls

301. General

1. Steering gear control is to be provided:

(1) for the main steering gear, both on the navigating bridge and in the steering gear compartment;
(2) where the main steering gear is arranged in accordance with the requirements in **201. 2.** by two independent control systems, both operable from the navigating bridge. This does not require duplication of the steering wheel or steering lever. Where the control system consists of a hydraulic telemotor, a second independent system need not be fitted.
(3) for the auxiliary steering gear, in the steering gear compartment and, if power operated, it is also to be operable from the navigating bridge and to be independent of the control system for main steering gear.

2. Any main and auxiliary steering gear control system operable from the navigating bridge is to comply with the following:

(1) If electric, it is to be served by its own separate circuit supplied from a steering gear power circuit from a point within the steering gear compartment, or directly from switchboard busbars supplying that steering gear power circuit at a point on the switchboard adjacent to the supply to the steering gear power circuit.
(2) Means are to be provided in the steering gear compartment for disconnecting any control system operable from the navigating bridge from the steering gear it serves.
(3) The system is to be capable of being brought into operation from a position on the navigating bridge.
(4) In the event of a failure of electrical power supply to the control system, an audible and visual alarm is to be given on the navigating bridge.
(5) Short circuit protection only is to be provided for steering gear control supply circuits.

3. Cables and pipes of control systems required to be in duplicate by this Chapter are to be separated as far as practicable throughout their length.

4. For the steering gears which are so arranged that more than one system (either power or control) can be simultaneously operated, where hydraulic locking, caused by a single failure, may lead to loss of steering, an audible and visual alarm, which identifies the failed system, is to be provided on navigation bridge.

302. Change-over from automatic to manual steering

The steering gears of a ship provided with an automatic pilot are to be capable of immediate change-over from automatic to manual steering.

Section 4 Materials, Constructions and Strength

401. Materials

1. Materials used in the steering gears are to be sound, flawless and adequate for their service conditions.

2. Materials used for cylinders and housings of rudder actuators, pipings subjected to a hydraulic pressure and all components transmitting mechanical forces to the rudder stock are to be of steel or other approved ductile material, comply with the requirements in **Pt 2, Ch 1.** In general such materials are not to have a minimum elongation of less than 12 % nor a specified minimum tensile strength in excess of 650 N/mm^2. This does not apply to the materials for valves and bolts where approved by the Society.

3. Materials used for bolts for assembling split type tillers and bolts for securing the vanes to the bosses of rotary vane type rudder actuators are to be forged steels or rolled steels comply with the requirements in **Pt 2, Ch 1.**

4. Materials used for major parts other than those mentioned in **Pars 2** to **3** are to comply with the requirements in recognized standards.

5. Materials other than those mentioned in **Pars 2** to **4** may be used where approved by the Society.

402. Welds

1. All welded joints of the parts of power actuating systems are to be such that there are no incomplete penetration and other injurious defects.

2. Welded joints in parts subjected to the internal pressure of the power actuating system are to have sufficient strength.

403. General construction of steering gear

1. The steering gears are to be of sufficient strength and reliability.

2. Configurations of major parts of the steering gear are to be determined to avoid local concentration of stress.

3. The design pressure for calculations to determine the scantlings of piping and other steering gear components subjected to internal hydraulic pressure is to be at least 1.25 times the maximum working pressure to be expected under the operational conditions specified in **202. 1** taking into account any pressure which may exist in the low pressure side of the system. The design pressure is not to be less than the relief valve setting pressure.

4. Special consideration is to be given to the suitability of any essential component which is not duplicated. Any such essential component is, where appropriate, to utilize anti-friction bearings such as ball bearings, roller bearings or sleeve bearings which are to be permanently lubricated or provided with lubrication fittings.

5. Where considered necessary, fatigue analysis is to be carried out to the piping and components, taking into account pulsating pressure due to dynamic loads. Both the cases of high cycle and cumulative fatigue are to be considered.

404. Strength of rudder actuators

1. Strength of all components of rudder actuators subjected to an internal pressure, except for the allowable stress specified in this Chapter, is to comply with relevant requirements in **Ch 5.**

2. In the strength calculations specified in **Par 1,** the allowable stress for the equivalent primary general membrane stress is not to be greater than the following values (1) or (2), whichever is the smaller:

(1) $\frac{\sigma_B}{A}$

(2) $\frac{\sigma_Y}{B}$

where:

σ_B = Specified minimum tensile strength of the material (N/mm^2)

σ_Y = Specified minimum yield stress or 0.2 proof stress of the material (N/mm^2)

A, B = As given in the following **Table 5.7.1.**

Table 5.7.1 Constants of A and B

	Steel	Cast steel	Nodular cast iron
A	3.5	4	5
B	1.7	2	3

405. Oil seals in rudder actuators

1. Oil seals between non-moving parts, forming part of the external pressure boundary, are to be of the metal upon metal type or of an equivalent type.

2. Oil seals between moving parts, forming part of the external pressure boundary, are to be duplicated, so that the failure of one seal does not render the actuator inoperative. Alternative arrangements providing equivalent protection against leakage will be accepted where approved by the Society.

406. Flexible pipes

Flexible hose assemblies specified in **Ch 6, 102. 5** are to be used in piping systems where flexibility is required.

407. Tillers etc.

1. The scantlings of tillers of forged steels are to comply with the requirements in the following. The scantlings of those of cast steels and ductile material will be considered by the Society in each case.

(1) The scantlings of tillers are to comply with the requirements in the following:

(A) The sectional area of each side of the tiller boss about the vertical section at centre of rudder stock is not to be less than that obtained from the following formula:

$$A = 0.4 d_u^2 \quad (\mathrm{cm}^2)$$

where:

d_u = The diameter of upper stock required in **Pt 4, Ch 1** taken as having been calculated for upper rudder stock of mild steel with a yield strength of 235 $\mathrm{N/mm^2}$(i.e. with a material factor K_S = 1)

(B) The section modulus, Z, of arm about the vertical axis is not to be less than that obtained from the following formula:

$$Z = 0.163\left(1 - \frac{r_0}{R}\right) d_u^3 \quad (\mathrm{cm}^3)$$

where:

r_0 = Distance from the centre of rudder stock to the section (cm)

R = Length of tiller arm measured from the centre of rudder stock to the point of application of the driving force (cm). In case where the length varies in accordance with rudder angle, R is the maximum length within 35 degrees of rudder angle.

(C) The standard sectional area of arm at its outer end is obtained from the following formula:

$$A = 0.22 d_u^2 \quad (\mathrm{cm}^2)$$

(D) In case of tiller having two arms, where power units are connected to each arm and these two power units are driven simultaneously, the scantlings of arms may be suitably modified.

(2) Tillers are to be of shrinkage fit or bolted to the stock in addition to being secured by a key in any case.

(3) Where tillers are bolted on both sides of rudder stock, there are to be at least two bolts on each side of the head. Diameter of the bolts at the bottom of threads is not to be less than that obtained from the following formula. In such a case, the thickness of coupling flange is not to be less than three-fourths of the diameter of the bolts.

$$d = 0.5\sqrt{\frac{d_u^3}{nb}} \quad (\mathrm{cm})$$

where:

n = Number of bolts on each side of the head

b = Distance from the centre of rudder stock to the centre of bolts (cm)

(4) The scantlings of tillers of exclusive auxiliary steering gear system are to have the strength 0.5 times those specified in (1).

408. Stoppers

1. Tillers are to be provided with the suitable stopping arrangement to restrict the rudder movement. This arrangement may be an integral part of the rudder actuator.

2. Steering gears are to be provided with positive arrangements, such as limit switches, for stopping the gear before the rudder stops are reached. These arrangements are to be synchronized with the gear itself and not with the steering gear control. These arrangements, however, may be operated through a mechanical links such as a floating levers.

3. Suitable brake arrangements are to be provided to tillers to keep the rudder steady in the event of an emergency. In the case of hydraulic steering gear, where the rudder can be stopped safely by closing the oil pressure valves, this brake arrangement will not be required.

409. Buffers

Steering gears other than of hydraulic type are to be provided with spring buffers or other suitable buffer arrangements to relieve the gear from shocks given by the rudder.

Section 5 Testing

501. Shop tests

1. Pressure vessels and piping systems are to be subjected to tests in accordance with the requirements in **Chs 5** and **6,** in addition to the tests specified in this Section.

2. All pressure parts are to be subjected to pressure tests with a pressure equal to 1.5 times the design pressure.

3. Each type of pumps used as a power unit is to be subjected to a running test for a duration of not less than 100 hours. The test arrangements are to be such that the pump may run in idle condition, and at maximum delivery capacity at maximum working pressure. The passage from one condition to another is to occur at least as quickly as on board. During the test, idling periods are to be alternated with periods at maximum delivery capacity at maximum working pressure. During the whole test no abnormal heating, excessive vibration or other irregularities are permitted. After the test, the pump is to be disassembled to ascertain that there is no abnormality. The test may be waived for a power unit which has been proved to be reliable in marine service.

502. Testing after installation

1. Hydraulic piping systems are after installed on board to be subjected to a leak test at a pressure at least equal to the maximum working pressure.

2. The steering gear is after installed on board to be subjected to the running test.

503. Sea trials

1. The steering gears are to be subjected to the following tests during sea trials. However, the tests required in (4), (7) and (8) may be carried out at the time when a vessel is being anchored or at dockside.

(1) Tests on the steering capabilities specified in **202.** and **203.** For controllable pitch propellers, the propeller pitch is to be at the maximum design pitch approved for number of maximum continuous ahead revolution at the main steering gear trial. If the ship cannot be tested at the load draught, alternative trial draught conditions will be specially considered. In this case for the main steering gear trial, the speed of ship corresponding to the number of maximum continuous revolution of main engine is to apply.
(2) Running tests of the power units, including transfer between power units.
(3) Tests on the isolation of one power actuating system, checking the time for regaining steering capability.
(4) Tests on the hydraulic fluid recharging system.
(5) Tests on the emergency power supply required by **206.**
(6) the steering gear controls, including transfer of control and local control
(7) Tests on the means of communication between the navigating bridge and the steering gear compartment.
(8) Tests on the functioning of indicators for the alarms, rudder angle indicator and power units.
(9) Where the steering gear is designed to avoid hydraulic locking, this feature is to be demonstrated.

Section 6 Additional Requirements Concerning Tankers of 10,000 Gross Tonnage and Upwards and Other Ships of 70,000 Gross Tonnage and Upwards

601. Main steering gears

1. In every oil tanker, ships carrying liquefied gases or dangerous chemicals in bulk (hereinafter referred to as "**tankers**" in this Section) of 10,000 gross tonnage and upwards and in every other ship of 70,000 gross tonnage and upwards, the main steering gear is to comprise two or more equivalent power units complying with the requirements in **201. 2.**

2. The steering gear in every tanker of 10,000 gross tonnage and upwards is to comply with the following:

(1) The main steering gear is to be so arranged that in the event of loss of steering capability due to a single failure in any part of one of the power actuating system of the main steering gear, excluding failure in the tiller, etc. and seizure in the rudder actuator, steering capability is to be regained in not more than 45 seconds after the loss of one power actuating system.
(2) The main steering gear is to comprise either:
(A) Two independent and separate power actuating systems, each capable of meeting the requirements in **202. 1;** or
(B) at least two equivalent power actuating systems which, acting simultaneously in normal operation, are to be capable of meeting the requirements in **202. 1.** In this case, the following requirements of (a) and (b) are also to be met:
(a) Loss of hydraulic fluid from one system is to be capable of being detected and the defective system automatically isolated so that the other actuating system or systems are to remain fully operational.
(b) Where necessary to obtain steering capability, interconnection of hydraulic power actuating systems is to be provided.

(3) Steering gears other than of the hydraulic type will be considered by the Society in each case.

602. Controls

In the case of tankers of 10,000 gross tonnage or upwards, the modification for the hydraulic telemotor permitted in **301. 1** (2) is not to be applied.

603. Number and strength of rudder actuators

1. For tankers of 10,000 gross tonnage and upwards, but of less than 100,000 tons deadweight, a single rudder actuator may be permitted provided that:

(1) Following loss of steering capability due to a single failure of any part of the piping system or in one of the power units, steering capability is to be regained within 45 seconds;

(2) Special consideration is to be given to stress analysis for the design including fatigue analysis and fracture mechanics analysis, as appropriate, to the material used, to the installation of sealing arrangements and to testing and inspection and to the provision of effective maintenance. In this case, the high cycle fatigue and cumulative fatigue are to be considered.

(3) Isolating valves are to be directly mounted on the rudder actuator so as to isolate the rudder actuator from the hydraulic oil in the piping systems; and

(4) Relief valves for protecting the rudder actuator against overpressure as required in **204. 4** are to be provided.

2. For tankers of 10,000 gross tonnage and upwards, but less than 100,000 tons deadweight and equipped with a single rudder actuator, the strength of the rudder actuator is to comply with the following requirements in addition to those of **404.**

(1) A detailed calculation of the major parts of the rudder actuator is to be carried out to confirm their strength.

(2) A detailed stress analysis of the parts of rudder actuators subject to hydraulic pressure is to be carried out to confirm the strength sufficient to withstand the design pressure.

(3) Where considered necessary because of the design complexity or manufacturing procedures, a fatigue analysis and fracture mechanics analysis are to be carried out. In this case, the high cycle fatigue and cumulative fatigue are to be considered. In connection with these analyses, all foreseen dynamic loads are to be taken into account. Where considered necessary by the Society, experimental stress analysis may be required in addition to, or in lieu of, theoretical calculations.

(4) For the purpose of determining the general scantlings of parts of rudder actuators subject to internal hydraulic pressure, the allowable stresses are to comply with:

$$\sigma_m \leq f$$
$$\sigma_l \leq 1.5f$$
$$\sigma_b \leq 1.5f$$
$$\sigma_l + \sigma_b \leq 1.5f$$
$$\sigma_m + \sigma_b \leq 1.5f$$

where:

σ_m = Equivalent primary general membrane stress ($\mathrm{N/mm^2}$)

σ_l = Equivalent primary local membrane stress ($\mathrm{N/mm^2}$)

σ_b = Equivalent primary bending stress ($\mathrm{N/mm^2}$)

f = Lesser of σ_B/A or σ_Y/B

σ_B = Specified minimum tensile strength of material ($\mathrm{N/mm^2}$)

σ_Y = Specified minimum yield stress of 0.2 % proof stress of material ($\mathrm{N/mm^2}$)

A, B = As given in the following Table

	Rolled or forged steel	Cast steel	Nodular cast iron
A	4	4.6	5.8
B	2	2.3	3.5

(5) Where the parts of rudder actuators subject to hydraulic pressure are subjected to a burst test at the minimum bursting pressure specified below and they are confirmed to withstand this test, the detailed stress analysis required by (2) may be omitted. Where, however, considered necessary because of the design complexity or manufacturing procedures, the detailed stress analysis required by (2) is to be carried out notwithstanding the above.

$$P_b = P \times A \frac{\sigma_{Ba}}{\sigma_B} \quad (\text{MPa})$$

where:

P_b = Minimum bursting pressure (MPa)

P = Design pressure (MPa)

A = As given in (4)

σ_{Ba} = Actual tensile strength of the material (N/mm^2)

σ_B = Specified minimum tensile strength of the material (N/mm^2)

604. Non-destructive tests

For tankers of 10,000 gross tonnage and upwards, but less than 100,000 tons deadweight and equipped with a single rudder actuator, the rudder actuator is to be subjected to suitable and complete non-destructive testing to detect both surface flaw and volumetric flaws. The procedure and acceptance criteria for the non-destructive testing will be considered by the Society in each case. Where considered necessary, fracture mechanics analysis is to be used for determining maximum allowable flaw size.⚓

CHAPTER 8 WINDLASSES AND MOORING WINCHES

Section 1 General

101. Application

1. The requirements in this Chapter apply to electric driven, steam reciprocating engine driven or hydraulic driven windlasses and mooring winches. The requirements of windlasses and mooring winches manually operated as the main driving power are to be to the satisfaction of the Society.

2. In addition to complying with the requirements in this Chapter, those are to be applied with appropriate modifications respectively such as follows: For power transmission gears, **Ch 3;** For pressure vessels and hydraulic pumps, **Ch 5;** For piping arrangements, **Ch 6.**

102. Materials

Materials used in the major parts are to be of steel forgings, steel castings or equivalent thereto.

Section 2 Windlasses

201. Definitions

1. The working load, derived from the nominal diameter and the grade of anchor chain cables, is the tensile force exerted upon the cable lifter in the tangential direction when the anchor and anchor chain cable are being hoisted.

2. The overload pull is the necessary temporary overload capacity of the windlass, and to be not less than 1.5 times the working load.

3. The holding load is the maximum static load on the anchor chain cables which the cable lifter brake should withstand.

4. Nominal speed is the average speed of recovery of 55 m (two lengths) of anchor chain cables when 82.5 m (three lengths) of the cables are submerged and freely suspended at commencement of lifting.

5. The breaking test load of the anchor chain cables is the minimum breaking test load specified in **Pt 4, Table 4.8.8.**

202. Plans and documents

1. Plans and documents to be submitted are as follows:

(1) Plans
- (A) General arrangement
- (B) Sectional drawings
- (C) Diagram of steam and hydraulic systems
- (D) Diagram of electric systems and arrangement of control systems
- (E) Detail drawings of gears and driving shafts of power transmission gears

(2) Documents
- (A) Particulars for major parts
- (B) Particulars for material of power transmission parts
- (C) Calculation sheet for the strength of major parts

203. Design, construction and equipment

1. Type of drive

The drive of windlasses with two cable lifters is to be of the type capable of hauling up both anchors simultaneously.

2. Strength

(1) The parts for the windlass proper such as the bedplate, cable lifter, cable lifter shaft, bearing frame, brake gear, holding down bolt, etc. are to have such strength that the stress on these parts is below the yield points of the materials when sustaining the holding load on the cable lifter specified in **Table 5.8.1.**

(2) The driving section of windlass is to have such strength that the stress on each part is below 40 % of the yield points of the materials used when the working load specified **204. 1**. is applied.

Table 5.8.1

Division of chain cable stopper	Holding load
with chain cable stopper	B.T.L×0.45
without chain cable stopper	B.T.L×0.8
NOTES: B.T.L. : Breaking test load of anchor chain cable	

3. Construction and equipment

(1) Construction

(A) The windlasses are to be so designed as to ensure smooth operation of the components in consideration of impact such as waves. The closed portions of the windlass installed on exposed decks are to have suitable watertight construction.

(B) The cable lifters are to be provided with 5 teeth at minimum, and the revolution speed of the anchor chain cable lifter is to be controllable.

(2) Equipment

(A) Protective devices and safety devices

Prime movers and gearing are to be provided with protective devices and safety devices against excessive torque and shock as follows;

(a) Overpressure preventive devices for hydraulic equipment
(b) Slipping clutches between electric motor and reduction gear
(c) Protective devices for the electric motor against overload
(d) Covers for open gear

(B) Clutches

Windlasses are to be fitted with clutches between the cable lifter and the driving shaft. Power operated clutches are to be declutchable by hand.

(C) Brake systems

(a) Electric windlasses are to be provided with an automatic control brake system which operates when the control handle is in the "Off" position or when the power supply is cut off. The automatic breaking system is to be capable of sustaining 130 % of the working load.

(b) Each cable lifter is to be fitted with a hand-brake system, which may be remotely controlled, capable of applying a brake torque sufficient to maintain a load equal to the holding load specified in **201. 3.**

(D) Emergency stop mechanism

Each remotely controlled windlass is to be fitted with a quick acting local emergency stop mechanism.

204. Performance

1. Windlasses are to be capable of lifting anchor and anchor chain at a nominal speed of at least 0.15 m/s.

2. The windlasses are to be capable of continuous operation for a period of 30 minutes under the working load specified in **Table 5.8.2** and be capable of operating under the overload for a period of 2 minutes at a correspondingly reduced lifting speed.

Table 5.8.2 Working Load

Kind of chain cable	Working load (N)
Grade 1 chain	$37.5d^2$
Grade 2 chain	$42.5d^2$
Grade 3 chain	$47.5d^2$

NOTES :
1. d is the diameter of chain cable (mm).
2. Studless chain cables are to be to the satisfaction of the Society.

205. Tests and Inspections

1. Windlasses are to be carried out following tests after construction, which are in accordance with the procedures as deemed appropriate by the Society.

(1) No load test
(2) Load test
(3) Brake test

Section 3 Mooring Winches

301. Relevant requirements

1. The relevant requirements such as the design, etc. for mooring winch are to comply with ISO 3730(KS V ISO 3730) or other recognized standards which deemed appropriate by the Society.

302. Test and inspections

1. Mooring winches are to be subjected to the following tests after their installation on board :

(1) Running test
The winch is to be run for 10 minutes at no load speed, 5 minutes continuously in each direction.

(2) Bearings
Bearing temperature rises shall be checked. ⚓

2011

Guidance Relating to the Rules for the Classification of Steel Ships

Part 5

Machinery Installations

GA-05-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance relating to the Rules for the Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF PART 5 "MACHINERY INSTALLATIONS"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date : 1 Jan. 2011 (regardless of the contract date for construction)

CHAPTER 1 GENERAL

Section 1 General
- 103. 1 has been deleted.

Effective Date : 1 July 2011 (based on the contract date for construction)

CHAPTER 2 MAIN AND AUXILIARY ENGINES

Section 1 Generals
- 101. 1 has been amended.

Section 2 Internal Combustion Engines
- 203. 4 has been deleted.

CHAPTER 6 AUXILIARIES AND PIPING ARRANGEMENT

Section 2 Air Pipes, Overflow Pipes and Sounding Devices
- 203. 2 and 3 have been deleted.

Section 3 Ship−side Valves and Overboard Discharge
- 302. 3 has been amended. .

Section 12 Refrigerating Machinery
- 1201. 1 has been amended.

CHAPTER 7 STEERING GEARS

Section 2 Performance and Arrangement
- 201 has been amended.

Section 3 Controls
- 301. 2 has been amended.
- 301. 3 has been newly added.

Section 4 Materials, Constructions and Strength
- 401 has been amended.

- 407 has been amended.
- Article No. 410 has been modified to 409 and pars.2 has been deleted.

Section 5 Testing

- 503. 1 has been newly added.

CHAPTER 8 WINLASSES AND MOORING WINCHES

Section 1 General

- 101. 1 (2) and (4) have been amended.

CONTENTS

<ANNEX>

CHAPTER 1 GENERAL

Section 1 General

101. Application

In application to **101. 3** of the Rules, the thrusters may be in accordance with the following;

1. Thrusters

(1) Application
These requirements apply to the thrusters and their control units (hereinafter called "**thrusters**").
(2) Plans and documents
Before the work is commenced, the manufacturers are to submit the following plans and documents in triplicate to the Society for approval.
(A) General arrangement of thruster
(B) Sectional assembly (including materials of principal component)
(C) Controlling diagrams
(D) Shaft arrangement and sealing devices
(E) Propeller
(F) Power transmission gear arrangement
(G) Piping arrangement
(H) Main particulars (kind of prime mover, output, number of revolution, capacity, etc. are to be stated)
(I) Plans and documents considered necessary by the Society
(3) Materials
The materials used in the principal component, in principle, are to be complied with the requirements of **Pt 2, Ch 1** of the Rules. However, the Society may accept to be used of the materials which comply with *Korean Industrial Standard* or standard considered as equivalent thereto.
(4) Shop tests
(A) The test requirements of shafting, propellers and power transmission gears are to be applied appropriate modifications respectively such as follows;
For shafting, **Ch 3, Sec 2** of the Rules; For propellers, **Ch 3, Sec 3** of the Rules;
For power transmission gears **Ch 3, Sec 4** of the Rules.
(B) The hydraulic tests for hydraulically pressurised parts of equipment and piping systems are to be in accordance with the requirements of **Ch 6** of the Rules. However, theses shop tests may be substituted for the tests carried out by the manufacturer.
(C) The test requirements of piping system are to be applied appropriate modifications of **Ch 6** of the Rules.
(D) The requirements of electrical installations are to be applied appropriate modifications of **Pt 6, Ch 1** of the Rules.
(5) On board tests
The performance test and the safety device test for thruster are to be carried out.

102. Definitions

1. The essential auxiliaries given in **102. 5** of the Rules are as follows;

(1) Auxiliary machinery essential for main propulsion
(A) For ships equipped with an internal combustion engine as main engine
(a) For cooling water system
Jacket cooling water pumps, piston cooling water (oil) pumps, fuel valve cooling water (oil) pumps, turbo-charger cooling water pumps, cooler cooling water pumps, generator engine cooling water (oil) pumps, air compressor cooling water pumps
(b) For fuel oil system
Fuel oil supply (booster) pumps, fuel oil transfer pumps
(c) For lubricating oil system
Lubricating oil pumps, cam shaft lubricating oil pumps, turbo-charger lubricating oil pumps, reduction gear lubricating oil pumps
(d) Hydraulic oil pumps (a pump to supply hydraulic oil to the hydraulic circuit for driving

or controlling the equipment having relevance to main propulsion)
ex) a controllable pitch propeller hydraulic oil pump
(e) Air compressors (excluding air compressor for emergency use)
(f) For auxiliary boilers
Feed water pumps, boiler water circulating pumps, exhaust gas economizer feed water pumps, draught fans for boiler, burner units
(g) Other
Auxiliary blowers for main engine
(h) Other auxiliary machinery as deemed essential by the Society
(B) For ships equipped with a steam turbine as main engine
(a) For feed water, condensed water and drain system
Feed water pumps, condensate water pumps and drain pumps
(b) For cooling water system
Circulating water pumps
(c) For fuel oil system
Burning pumps, fuel oil transfer pumps, fuel oil service pumps
(d) For lubricating oil system
Lubricating oil pumps
(e) Hydraulic oil pumps (a pump to supply hydraulic oil to the hydraulic circuit for driving or controlling the equipment having relevance to main propulsion)
ex) a controllable pitch propeller oil pump
(f) Others
Vacuum pumps for condenser, gland steam exhaust fans, boiler draught fans, fresh water generators, control air compressors
(g) Other auxiliary machinery as deemed essential by the Society
(2) Auxiliary machinery for the safety of life and ship
(A) Pumps
Bilge pumps, ballast pumps, fire pumps (including fire pump for emergency use), eductors provided instead of bilge pump
(B) For the maneuvering of ship
Steering gears, thrusters, stabilizers
(C) Deck machinery
Windlasses
(D) Ventilating fans (installed in hazardous area due to flammable gases or gases harmful to the health such as cargo oil pump room of oil tanker, etc.), ventilating fans for cargo oil tank of oil tankers, machinery for gas free and machinery for inert gas system
(E) Other auxiliary machineries as deemed essential by the Society
(3) Auxiliary machinery having relevance to specific service of ships
(A) Cargo handling machinery subject to **Pt 9, Ch 2** of the Rules
Hydraulic pump for cargo handling machinery
(B) Auxiliary machineries for oil tankers, ships carrying liquefied gases in bulk, ships carrying dangerous chemicals in bulk
Cargo pumps, stripping pumps, tank cleaning pumps, gas compressors, pumps for gas cooling system, gas refrigerating compressors
(C) Refrigerating machinery
Compressors, liquid pump and condenser cooling pumps used for cargo refrigerating machinery (including items subject to **Pt 9, Ch 1** of the Rules)
(D) Other auxiliary machineries as deemed essential by the Society

2. Pipe fittings given in **102. 22** of the Rules mean the following;
(1) Pipe connection units
(A) Pipe flanges and pipe pieces(elbow, reducer, tee, bend, socket, etc.), etc.
(B) Mechanical joints, expansion joints and flexible joints
(2) Fittings installed on a piping arrangement (strainers, separators, flow meters, viscosity meters, etc.)

103. Construction, materials and installation

In application to **103. 7** of the Rules, where insulation for surfaces of machinery installations e.g. turbo blowers, etc, is difficult, consideration will be given to the discretion of the Society.

106. Communication between Navigating Bridge and Machinery Space

The telegraph is required in any case, even if the remote control of the engine is foreseen, irrespective of the fact that the engine room is attended or not.

109. Protection against noise

In application to **109.** of the Rules, the allowable noise levels are as follow;
(1) Where there are noise level criteria specified by the Administration, the levels are to comply with the requirements of the Administration.
(2) Where there are no noise level criteria specified by the Administration, IMO Res. A.468(XII). may be referred.

Section 2 Plans and Documents

202. Plans and documents to be submitted by the shipyard

1. Plans for approval

(1) The following are to be stated in the various piping diagrams for the purpose of reviewing to be satisfied with the requirements of **Pt 5, Ch 6** of the Rules.
(A) Material, nominal diameter or outside diameter, thickness and design pressure of pipes
(B) Kind, material and nominal diameter or outside diameter of valves, cocks and pipe fittings
(C) Kind, particular, capacity, etc. of auxiliaries and their prime mover
(D) Total capacity of tanks
(E) Design temperature of superheaters, if provided
(2) Type, capacity, kind, and output of essential auxiliaries and their prime mover and related equipment are to be stated in the machinery particulars.
(3) The following are to be stated on drawings of scupper piping arrangement;
(A) Designed load line
(B) Line of 0.01 L_f and 0.02 L_f above the designed load line
(C) Line of 600 mm above the designed load line
(D) Line of 450 mm below the free-board deck
(4) In application to **202. 1** (5) of the Rules, following may be applied.
(A) In case of fuel oil tanks not more than 1 m^3 (0.5 m^3 in case of ships subject to SOLAS), submission of the plans for the tanks may be omitted.
(B) Where the shipyards are submitted the manufacturing practice for tanks and the manufacturing practice are approved by the Society, the manufacturing practice may be considered as the details of the tanks.

2. In application to **202. 2** (5) of the Rules, where considered necessary by the Society is the following (1), and shaft alignment calculations are to comply with the following (2) and (3).
(1) Shaft alignment calculations for the following alignment-sensitive types of installations are to be submitted for reference :
(A) Propulsion shafting of the actual propeller shaft diameter greater than 400 mm.
(B) Propulsion shafting with reduction gears where the gear wheel is driven by two or more ahead pinions.
(C) Propulsion shafting for which the propeller shaft bearings are to be slope-boring.
(D) Propulsion shafting for which the bearings in shafting are to be slope-alignment
(2) The alignment calculations are to include bearing reactions, shear forces and bending moments along the shafting, slope boring details (if applicable) and detailed description of alignment procedure.
(3) The alignment calculations are to take account of thermal effects, and to be performed for cold and hot conditions of the shafting.

203. Plans and documents to be submitted by the manufacturers of internal combustion engines

1. In application to **203. Table 5.1.4**, the plans and documents to be submitted for reference of all type of engines intended to be installed for the first time on the ship which is going to be registered by the Society, are as follows ;

(1) Plans
. General arrangement (the length, width, height and weight are to be entered)
. Cylinder cover, cylinder liner, cylinder block, piston crown, piston skirt, guide ring
. Piston pin
. Frame and intermediate frame
. Scavenging air chamber installed below cylinder block
. Camshaft drive
. Cam and cam shaft assembly
. Fuel oil pump
. Valve driving mechanism
. Diagram of engine control
. Tie rod (including coupling and set-screw)
. Main bearing bolt and cylinder cover fixing bolt (including valve box fixing bolt)
. Construction and arrangement of relief valve for cylinder
. Construction and arrangement of bracing of the engine
. Construction and arrangement of damper and detuner
. Construction and arrangement of balancer or compensator
. Flywheel (in case of a power transmission component)
. Other construction and arrangement as deemed necessary by the Society

(2) Documents
. Operation and service manual of engine (including inspection and maintenance instruction)
. Review sheets on bracing, balancing and prevention of vibration of the engine (including calculation sheets)
. Data for vibration of engine (construction and arrangement of dampers, detuners, balancers or compensators, and data regarding calculations for torsional(see **Ch 4, Sec 1** of the Rules) and axial vibration of shafting)

(A) Whenever the manufacturers propose modification of construction, particulars or materials, the reasons of modification, and the associated plans and documents are to be submitted by the manufacturer.

(B) Where the particulars, list and application for omission of plans and document for approval are submitted, the submission of plans and documents same as the approved engine type may be omitted. The list is to include the subject of approved plans and documents relation to the components and units specified in **203. Table 5.1.4** of the Rules, and **203.** of the Guidance, engine serial number, name of shipyard and hull number.

2. In application to **203. Table 5.1.4 of the Rules**, the special sheet of the Society is as the following **Table 5.1.1**.

204. Plans and documents to be submitted by the manufacturers of steam turbines

1. The various piping diagrams given in **204. 2** of the Rules are to include the piping diagrams of steam, lubricating oil, drain, and are to be stated materials, dimension and working pressure for pipes belonging to Class I or II according to requirements of **Pt 5, Ch 6** of the Rules.

2. Whenever the manufacturers propose modification of construction, particulars or materials, the reasons of modification and the associated plans and documents are to be submitted by the manufacturer.

3. The plans and documents to be submitted for reference of all type of steam turbine intended to be installed for the first time on the ship which is going to be registered by the Society, are as follows;

(1) Plans given in **204. 1** of the Rules

(2) Documents given in **204. 2** of the Rules, steam condition at every stage at the continuous maximum output, natural frequencies of blade and nozzle (whichever calculated values or measured values), and operation and service manual of stem turbine

4. Where the application for omission of plans and document for approval are submitted according to the requirements of **203. 1** (2) (B) of the Guidance, the submission of those same as the plans and documents for approved type of steam turbine may be omitted.

208. Plans and documents to be submitted by the manufacturers of boilers, Class 1 and 2 pressure vessels

1. The submission of plans and documents for approval of air inter-cooler of internal combustion engines may be waived.

2. Operation instructions specified in **208. 2.** (3) of the Rules is to be include following items.

(1) Feed water treatment and sampling arrangements
(2) Operating temperatures(exhaust gas and feed water temperatures)
(3) Operating pressure
(4) Inspection and cleaning procedures
(5) Records of maintenance and inspection
(6) The need to maintain adequate water flow through the economizer under all operating conditions
(7) Periodical operational checks of the safety devices to be carried out by the operating personnel and to be documented accordingly
(8) Procedures for using the exhaust gas economizer in the dry condition
(9) Procedures for maintenance and overhaul of safety valves

210. Plans and documents to be submitted by the manufacturers of essential auxiliaries

1. In application to **210.** of the Rules, the essential auxiliaries required approval of the Society are following;

(1) Air compressors (except air compressor for emergency use)
(2) Fresh water generators (in case of ships equipped with main boiler)
(3) Pumps (in case where the output of prime mover is not less than 100 kW)
(4) Draught fans for boiler and auxiliary blowers for main engine (in case where the output of prime mover is not less than 100 kW)
(5) Draught fans installed in cargo oil pump room and cargo space of tankers intended to carry oils having a flash point not exceeding 60 °C.
(6) Auxiliaries for maneuvering (steering gears, side thrusters, stabilizers, etc.)
(7) Deck auxiliaries (windlasses)
(8) Cargo handling machinery subject to **Pt 9, Ch 2** of the Rules
(9) Auxiliary machinery for oil tankers, ships carrying liquefied gases in bulk, and ships carrying dangerous chemicals in bulk (Cargo pumps, stripping pumps, tank cleaning pumps, gas compressors, pumps for gas cooling system, gas refrigerating compressors)
(10) Refrigerating machinery (excluding refrigerating machinery having both *R* 22, *R* 134*a*, *R* 404*A*, *R* 407*C*, *R* 410*A* and *R* 507*A* as primary refrigerant and prime mover with output of 7.5 kW or less)

Section 3 Tests and Inspections

301. Shop trials

1. The programme for shop trials of diesel engine is to be in accordance with the following;

(1) During all stages being tested, the engine manufacturers are to measure and record data pertaining to operation. The crankshaft deflection is to be checked when this check is required by the manufacturer during the operating life of the engine.

(2) All data measured at the various load points are to be measured at steady operating conditions.

(3) When no-load operating is carried out for adjusting the engine maneuvering conditions, the fuel delivery system, maneuvering system and safety devices are to be properly adjusted before operating.

(4) The programme shown in **Table 5.1.2** of the Guidance is to be used as a standard for shop trial of diesel engines. In this case, the details for the programme are to be referred to specified below. Additional test items may be requested according to the discretion of the Society.

(A) For main engines of diesel ships and electric propulsion ships;
KS V 4314 (Shop Test Code for Marine Internal Combustion Engine for Propelling Use) or standards considered as equivalent thereto

(B) For diesel engines driving main generators or essential auxiliaries;
KS V 4316 (Water-Cooled Four Cycle Marine Diesel Engines for Electrical Generator) or standards considered as equivalent thereto

(5) For electronically controlled diesel engines, integration tests are to be carried out to verify that the response of the complete mechanical, hydraulic and electronic system is as predicted for all intended operational modes. The scope of these tests is to be selected based on the FMEA required in **Table 5.1.4** Note 2. (5) of the Rules and confirmed by the Society.

2. *KS V* 4211 (Shop Test Code of Marine Steam Engine for Propelling Use) or standards considered as equivalent thereto are to be used as a standard for the programme of shop trial for steam turbines, and the performance test for safety devices is to be included in the details of programme.

3. The manufacturers of gas turbine are to submit the details of the programme to the Society, and the shop tests are to be carried out according to the details of the programme approved by the Society.

4. In application to **301.** of the Rules, auxiliary to be inspected means only the essential auxiliaries. For the items of tests and inspections not specified in the Rules or Guidance, consideration will be given to the discretion of the Society.

<tr><td colspan="2">Overhaul inspection(7)</td><td>0</td><td>0</td><td>0</td></tr>
</table>

NOTES :

1. For electronically controlled diesel engines, integration tests are to be carried out in accordance with **301. 1** (5) of the Guidance.
2. (1) through (7) in this Table are subject to the following;
   (1) After the trials, the fuel delivery system is to be blocked so as to limit the engines to run at not more than 100 % power.
   (2) After the trials, the fuel delivery system is to be adjusted such that overload (110 % power) can be given in service after installation on board, so that the governing characteristics including the activation of generator protective devices can be fulfilled at all times.
   (3) The testing time may be shorten to 20 minutes for engines having a cylinder bore 400 mm or less when deemed appropriate by the Society in consideration of the conditions of quality assurance, production records, etc. of the manufacturer.
   (4) The readings are to be taken twice at an interval of at least 30 minutes.
   (5) The test item may be dispensed with when deemed appropriate by the Society.
   (6) The test item applies only to direct reversible engines.
   (7) The overhaul inspection for one cylinder assembly is to be carried out, but the scope of overhaul inspection may be extended according to the discretion of the attending Surveyor.

302. On-board tests

In application to **302.** of the Rules, the programme for on-board tests or sea trials is to be in accordance with the following, and only the essential auxiliary machinery is to be inspected;

1. The **Table 5.1.3** of the Guidance is to be used as a standard for the details of on-board test programme or sea trial programme for diesel engines. Additional tests may be carried out according to *KS V* 0811 (Sea Trials Code for Machinery Department) where considered necessary by the Society. The details of the programme are referred to *KS V* 0811 or standards considered as equivalent thereto, and the overhaul inspection for cylinder assembly may be carried out where considered necessary by the Society.

Table 5.1.3 Programme for Sea Trials (on-board tests)

<tr><td colspan="2">Minimum engine speed test</td><td>0</td><td>-</td><td>-</td></tr>
<tr><td colspan="2">Starting maneuvering test(7)</td><td>0</td><td>0</td><td>0</td></tr>
<tr><td colspan="2">Reverse maneuvering test</td><td>10 minutes at the minimum engine speed of 70 % of the rated engine speed</td><td>10 minutes at the minimum engine speed of 70 % of the nominal propeller speed</td><td></td></tr>
<tr><td colspan="2">UMA test(8)</td><td>0</td><td>0</td><td>0</td></tr>
<tr><td colspan="2">Alarms and safety devices test</td><td>0</td><td>0</td><td>0</td></tr>
<tr><td colspan="2">Test for fitness of fuel oil(9)</td><td>0</td><td>0</td><td>0</td></tr>
</table>

NOTES: (1) through (9) in this Table are subject to the following;
(1) For controllable pitch propellers, the tests are to be carried out at the various pitches.
(2) The governor is to be adjusted constantly, the rated electrical powers of electric propulsion motors is to be used as the standard.
(3) The governor is to be adjusted constantly, the rated output of driving generator is to be used as the standard.
(4) The test may be dispensed with when deemed appropriate by the Society in consideration of the result of the shop trials.
(5) The testing time may be shorten appropriately when deemed appropriate by the Society in consideration of the result of the shop trials (for main engines of diesel ships or electric propulsion ships, 1 hour or more).
(6) In case that it is difficult to give the demanded load, the load may be reduced appropriately.
(7) The direct reversible engines are to be carried out ahead and astern starting repeatedly without replenishment, and the other engines are to be carried out starting and stop repeatedly without replenishment.
(8) The test is to be carried out for ships which are going to be registered as ships provided with unattended machinery automatic systems.
(9) The test is to be carried out for the engines used residue oil or equivalent thereto. However, the test may be dispense with when deemed appropriate by the Society or in the case of that the fitness was certified at the shop trial.

2. *KS V* 0811 (Sea Trials Code for Machinery Department) or standards considered as equivalent thereto are to be used as a standard for the details of on-board test programme or sea trial programme for steam turbines. The steam turbines are to be sufficiently able to ensure their function and reliable under all service conditions, and are not to be set up any abnormal vibration at the engine working speed. However, for the steam turbines certified and carried out the shop tests in accordance with **301.** of the Guidance, the on-board tests may be considered appropriately at the discretion of the Society.

3. The details of sea trial programme for gas turbines are to be approved by the Society. The gas turbines are to be sufficiently able to ensure their function and reliable under all service condition, and are not to be set up any abnormal vibration at the engine working speed. However, for the gas turbines certified and carried out the shop tests in accordance with **301.** of the Guidance, the on-board tests may be considered appropriately at the discretion of the Society.

Section 4 Spare Parts and Tools

401. Application

1. For the kind and number of spare parts, each table in **Ch 1, Sec 4** of the Rules is to be applied in general and the Regulations and Instructions regarding Machinery Installations of Ship's of the Korean Government is to be applied for ships with smooth water service or coastal service or fishing vessel. However, the requirements of this section are for general guidance purpose and in general are not mandatory for retention of class. Kind and number of spare parts specified in this section may be added or reduced when deemed appropriate by the Society in consideration of the design, recommendations of the manufacturer, the discussion with owner, production records of the same type machinery and maintenance method.

2. The prime movers for auxiliaries to be furnished spare parts in accordance with **Ch 1, Sec 4** of the Rules are those essential for main propulsion specified in **102.** of the Guidance.

402. Internal combustion engines

In application to **402.** of the Rules, at the request of the Owners, the spare parts of camshaft driving gears, chains and bearings may be omitted according to the discretion of the Society.

405. Boiler

Description and number of spare parts for steam heating type steam generator are to be applied appropriate modifications of **Ch 1, Table 5.1.8** of the Rules except oil burner complete.

406. Essential auxiliary

1. In the case that a scoop is provided instead of a circulating pump at the ships equipped with a main steam turbine, the spare parts for reserve circulating pump are to be furnished.

2. The spare parts for exhaust gas economizer circulating water pump and independent ballast pump may not be furnished.

407. Tools and instruments

Indicators and bridge gauges or equivalent thereto are included in the special tools and instruments for maintenance or repair work of the machinery. ⚓

CHAPTER 2 MAIN AND AUXILIARY ENGINES

Section 1 General

101. Application

1. In application to **101. 1** of the Rules, "the small auxiliary engines and auxiliary engines driving emergency generators" may apply to the following;

(1) For auxiliary engines having output of 100 kW or less driving generators or essential auxiliaries, or for auxiliary engines driving emergency generators

(A) Where a auxiliary engine is not for driving generators and where an auxiliary engine is for driving emergency generators, the submission of plans and documents may be omitted. However, plans or documents to confirm that the engines are comply with requirements in **Ch 1, 103. 1** and **Ch 2, 203. 9** of the Rules, are to be submitted to attending Surveyor.

(B) Materials used in the main components may comply with *Korean Industrial Standards or equivalent.*

(C) The attending Surveyor may admit of the hydraulic test results carried out by manufacturer.

(2) For auxiliary engines for cargo handling machinery having output of 100 kW or over, but less than 375 kW, the plans and documents are to be submitted, however, (1) (B) and (C) may apply to materials and tests.

2. Welding In application to **101. 5** of the Rules, the general requirements for principal component with welded construction are to be comply with **Ch 5, Sec 4** of the Rules.

3. Electronically controlled diesel engines In application to **101. 7** of the Rules, the additional requirements specified otherwise by the Society are to be in accordance with **Annex 5-8** of the Guidance.

Section 2 Internal Combustion Engines

201. Materials

In application to **Table 5.2.1** of the Rules, necessary actions for prohibition of arc strike are to be taken at magnetic particle test by prod method.

203. Safety devices

1. Control and safety systems for dual fuel diesel engines are to comply with the requirements given in **Annex 5-7.**

2. In application to **203. 2** of the Rules, other acceptable means may includes methods to prevent over pressure by tension of cylinder head bolts.

3. In application to **203. 4** of the Rules, manual and name plate for relief valves of crankcase are to be in accordance with the following.

(1) A copy manufacturer's installation and maintenance manual that is pertinent to the size and type of relief valve being supplied for installation on a particular engine is to be provided on board ship. The manual is to contain the following information.

(A) Description of valve with details of function and design limits
(B) Installation instructions
(C) Maintenance in service instructions to include testing and renewal of any sealing arrangements
(D) Actions required after a crankcase explosion

(2) Relief valves are to be provided with suitable markings that include the following information.

(A) Name and address of manufacturer
(B) Designation and size
(C) Month/Year of manufacture
(D) Approved installation orientation

4. In application to **203. 10** (1) of the Rules, bearing temperature monitors or equivalent devices are to be in accordance with the following.

(1) Bearing temperature monitors of low speed diesel engines(crosshead type) are to be capable of monitoring temperature(or oil outlet temp.) of main bearing, crank bearing and crosshead bearing.
(2) Bearing temperature monitors of medium and high speed diesel engines(trunk piston type) are to be capable of monitoring temperature(or oil outlet temp.) of main bearing and crank bearing.
(3) An equivalent device could be interpreted as measures applied to high speed engines where specific design features to preclude the risk of crankcase explosions are incorporated.

5. In application to **203. 10** (1) of the Rules, where an overriding for automatic shutoff arrangements is installed, the documents on the consequences are to be submitted to this Society for approval.

6. In application to **203. 10** (2) of the Rules, the engine designer's and oil mist manufacturer's instructions are to be included the following particulars.

(1) Schematic layout of engine oil mist detection and alarm system showing location of engine crankcase sample points and piping or cable arrangements together with pipe dimensions to detector.
(2) Evidence of study to justify the selected location of sample points and sample extraction rate (if applicable) in consideration of the crankcase arrangements and geometry and the predicted crankcase atmosphere where oil mist can accumulate.
(3) The manufacturer's maintenance and test manual.(A copy of the manual is to be provided on board ship.)
(4) Information relating to type or in-service testing of the engine with engine protection system test arrangements having approved types of oil mist detection equipment.

7. In application to **203. 10** (8) of the Rules, the details are to be submitted for consideration are to be in accordance with the following.

(1) Engine particulars (type, power, speed, stroke, bore and crankcase volume, etc.)
(2) Details of arrangements prevent the build up of potentially explosive conditions within the crankcase, e.g., bearing temperature monitoring, oil splash temperature, crankcase pressure monitoring, recirculation arrangements.
(3) Evidence to demonstrate that the arrangements are effective in preventing the build up of potentially explosive conditions together with details of in-service experience.
(4) Operating instructions and the maintenance and test instructions.

204. Crank shafts

1. Minimum diameter In application to **Table 5.2.2,** coefficients A and B for engines having unequal firing intervals are to be in accordance with the following;

(1) 4-stroke cycle in-line engines

Number of cylinders	Arrangement of crank	*A*	*B*
4		1.25	4.7

(2) 2-stroke cycle vee engines

Number of cylinders	Minimum firing interval between two clyinders on one crankpin	Arrangement of crank	A	B
12	60°		1.00	21.6
				15.0
16				26.3

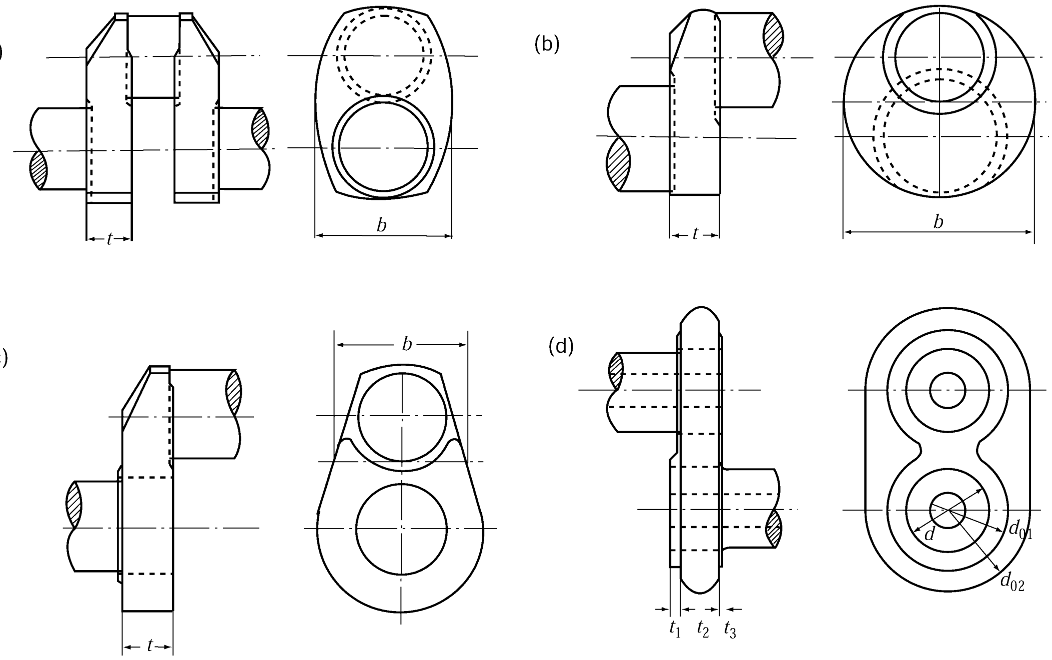
205. Dimensions of crank arms

The dimensions of the crank arms breadth b, crank arms thickness t and radius in fillet r are to be in accordance with the following;

1. Solid crankshaft

(1) In application to **205. 1** of the Rules, as for b, the breadth on the perpendicular bisector of the line between the crankpin center and journal center is to be used. As for t, the thickness at the same section as b is to be used, and the recess need not be accounted in the thickness even when it is provided. As for r, the radius connecting to the crankpin or journal is to be used when a composite radius is provided.

(2) When the diameters of crankpin and journal are different each other, their t/d and b/d are to be in accordance with **205. 1** or **Fig 5.2.1** of the Rules.



(Note)
$A_{s1}=d_{01}/d$, $A_{s2}=d_{02}/d, \cdots$ (values divided out-diameters of crankarm in way of crankarm splited up t_1, $t_2 \cdots$ into hole diameter in way of the shrinkage fit) are to apply to the formula given in **205. 3** of the Guidances.

Fig. 5.2.1 Measuring Method of b and t

2. Semi-built-up crankshaft

In application to **205. 3** of the Rules as for b, the breath on the line perpendicularly interested to the line between the crankpin center and journal center and tangent to the crankpin is to be used. As for t, the thickness at the same section as b is to be used, and the recess need not be accounted in the thickness even when it is provided, and the ring around the shringkage hole is not to be included in the thickness. As for r, the radius connecting to the crankpin or journal is to be used when a composite radius is provided. b and t are given in **Fig 5.2.1** of the Guidance.

3. In application to **205. 3** and **4** of the Rules the thickness of crankarm in way of the shrinkage fit as **Fig 5.2.1** (d) of the Guidance is to comply with the following formula instead of **205. 3** of the Rules;

$$t_1\left(1-\frac{1}{A_{s_1}^2}\right)+t_2\left(1-\frac{1}{A_{s_2}^2}\right)+\cdots\cdots \geq \frac{C_1 TD^2}{C_2 d_h^2}$$

$$t_2 \geq 0.525 d_c$$

206. Material consideration

In the application **206.** of the Rules, in case where the semi-built-up crankshaft made of the materials having a specified tensile strength less than 440 $\mathrm{N/mm^2}$, the coefficient K_m may be 1.

208. Special consideration

1. The requirements of **208.** of the Rules are in accordance with the following;

(1) The definition and approval test for “manufacturing process of the different manufacturing methods of forged crankshaft” are to be in accordance with **Ch 2, Sec 5** of the "**Guidance for Approval of Manufacturing Process and Type Approval, Etc.**"

(2) The diameter of crankshaft manufactured by the different manufacturing methods mentioned previous (1) may be reduced by multiplying d_c by the less coefficient between k_r and k_p.

(A) In case where the crankshaft are manufacturers by such a special method approved by the Society that the forging grain-flow is continuous, and the product quality is stable, and the fatigue strength is considered to be improved by 20 % or more compared with that in free forging process;

$$k_r = \sqrt[3]{\frac{1}{1.15}}$$

(B) In case where the crankshaft are manufactured by such a special method approved by the Society that a surface hardening is provided and the product quality is stable, and a superiority is considered in the fatigue strength;

$$k_\rho = \sqrt[3]{\frac{1}{1+\rho/100}}$$

ρ : Degree of improvement in strength approved by the Society relative to the surface hardening (%)

(3) In case **205. 3** and **210. 1** of the Rules, the previous (2) is not to be applied.

2. In case where the diameter of crankshaft, dimension of crankarm and radius in fillet are less than the valves required in **204.** and **205.** of the Rules, the requirements of **208.** of the Rules are in accordance with the following (refer to **Fig 5.2.2** of the Guidance).

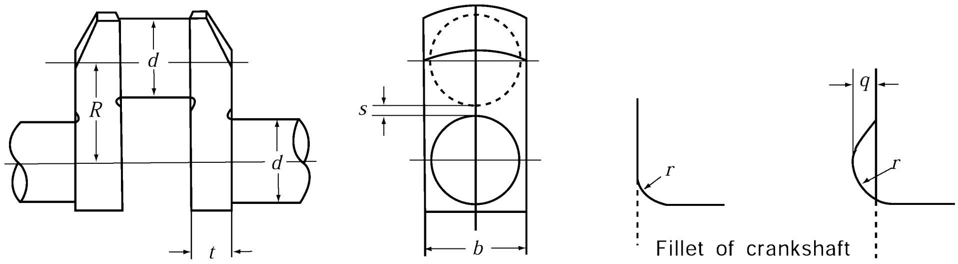


Fig. 5.2.2 Dimensions for Crankshaft

(1) When it is not satisfied with **204. 2** of the Rules;
In case where the diameter of crankpins or journals is less than the required diameter d_c given in **204. 2** of the Rules and considered according to **206., 207.** of the Rules and **208. 1** (2) of the Guidance, consideration will be given in each case on basis of the stress levels in fillets, the torsional stress levels in parallel parts, friction force of shrinkage fitted parts, material, etc. In this connection, the stress levels in fillets are to be in accordance with the following (A) or (B).

(A) In case where the torsional stress in crankpins and journals are evaluated without carrying out a forced vibration calculation including the stern shaftings;
The diameter of pin may be acceptable where the value of equivalent stress amplitude de calculated by the **Annex 5-2** (Guidance for calculation of crankshaft stress(1)) is not more than the allowable stress s obtained from the formula below with the coefficient shown in **Table 5.2.1** of the Guidance.

$$\sigma = \sigma_a \cdot f_m \cdot f_s + a (\mathrm{N/mm^2})$$

Table 5.2.1 Coefficient of Allowable Stress at Fillet

σ_a N/㎟	Cycle		2 cycle		4 cycle
	Type of crankshaft		Semi-built-up	Solid	Solid
	Solid Shaft Diameter(d)	$d \geq 200$	53.9	53.9(※)	83.3
		$200 > d \geq 100$	—	132.3 - d/4	
		$100 > d$	—	107.8	
	NOTES : d is the actual diameter of crankpin or journal whichever is larger. (※) In case engine bed other than welded type, σ_a may be applied 83.3.				
f_m	$1 + \frac{2}{3}\left(\frac{T_s}{440} - 1\right)$				
	NOTES : T_s is the minimum specified tensile strength ($\mathrm{N/mm^2}$) of crankshaft materials.				
f_s	Manufacturing method				
	Ordinary method	Method meeting (A) for K_r specified in **208. 1.** (2) of the Guidance		Method meeting (B) for K_ρ specified in **208. 1.** (2) of the Guidance	
	1	1.15		1 + ρ/100	
	NOTES : ρ signifies the degree of strength improvement(%) approved by the Society relative to surface hardening.				
α N/mm^2	Main bearing material				
	White metal		Tri-metal or kelmet		
	0		9.8		

(B) In case where the torsional stress in crankpins and journals are evaluated by carrying out a forced vibration calculation in including the stern shafting:
The diameter may be acceptable where the value of the acceptability factor Q calculated by the **Annex 5-3** (Guidance for calculation of crankshaft stress(2)) is comply with the following formula.

$$Q \geq 1.15$$

(2) In case where the dimensions of crankarms fail to meet the requirements **205.** of the Rules;
(A) The dimension of crankarms may be acceptable where the actual diameters d of crankpins and journals are not less than the required diameter d_c calculated by **204.** of the Guidance by replacing M and T with those specified below. In this case, the dimensions are to be within the following ranges. And, b, t and r are specified in **205.** of the Guidance.

$$M = 10^{-2} APL \times \frac{\alpha_{KB}}{5}$$

$$T = 10^{-2} BP_i S \times \frac{\alpha_{KT}}{1.8}$$

Where :

$$0 \leq \frac{q}{r} \leq 1,\ -0.3 \leq \frac{s}{d} \leq 0.4,\ 8 \leq \frac{d}{r} \leq 27$$

$$1.1 \leq \frac{b}{d} \leq 2.1,\ 0.2 \leq \frac{t}{d} \leq 0.56$$

$_{KB\,r}$= 4.84f1Å f2Å f3Å f4Å f5 (Stress concentration factor for bending)

$$f_1 = 0.42 + 0.16\sqrt{\frac{d}{r} - 6.864}$$

$$f_2 = 1 + 81\left\{0.769 - \left(0.407 - \frac{s}{d}\right)^2\right\}\left(\frac{q}{r}\right)\left(\frac{r}{d}\right)^2$$

$$f_3 = 0.285\left(2.2 - \frac{b}{d}\right)^2 + 0.785$$

$$f_4 = 0.444\left(\frac{d}{t}\right)^{1.4}$$

$$f_5 = 1 - \left\{\left(\frac{s}{d} + 0.1\right)^2 / \left(4\frac{t}{d} - 0.7\right)\right\} \cdot \cdot \cdot \cdot \cdot \left(\frac{t}{d} \geq 0.36\right)$$

$$= 1 - 1.35\left(\frac{s}{d} + 0.1\right)^2 \cdot \cdot \cdot \cdot \cdot \left(\frac{t}{d} < 0.36 \text{ and } \frac{s}{d} > -0.1\right)$$

$$= 1 \cdot \cdot \cdot \cdot \cdot \left(\frac{t}{d} < 0.36 \text{ and } \frac{s}{d} \leq -0.1\right)$$

$_{KT\,r}$= 1.75g1Å g2Å g3 (Stress concentration factor for torsion)

$$g_1 = 31.6\left(0.152 - \frac{r}{d}\right)^2 + 0.67$$

$$g_2 = 1.04 + 0.317\frac{s}{d}$$

$$g_3 = 1.31 - 0.233\frac{b}{d}$$

d : actual diameter of crankpin or journal (mm)

r : radius in fillet (mm)

q : recess (mm)

s : Offset between crankpin and journal (mm)

$$s = \frac{Diameter\,of\,pin + Diameter\,of\,journal - Length\,of\,stroke}{2}$$

(B) In case where the dimensions of the crankarms fail to meet the requirements even after applying (A) above, **208. 2** (1) (A) and (B) of the Guidance may be applied.

(C) In case where the thickness or outside diameter of crankarms of built-up crankshaft fail to meet the requirements, they may be acceptable provided that the following is satisfied.

$$d^2 \times t \times p_m \geq CTD^2$$

where :

C : 103 for 2-stroke cycle in-line engines
165 for 4-stroke cycle in-line engines

d : Diameter of the hole at shrinkage fit (mm)

t : Thickness of crankarm measured parallel to the axis (mm)

T : Same as **204.** of the Rules

D : Cylinder bore (mm)

P_m : Surface pressure at shrinkage fit (N/mm^2), as given by the following formula;

$$p_m = Y\left[\log_e K + \frac{1}{2}\left\{1 - \frac{K^2}{A_s^2}\right\}\right] \times (1 - R^2)$$

Y : Yield strength of crank web material (N/mm^2)

$$A_s = \frac{External\,diameter\,of\,web\,(mm)}{d}$$

$$K = 0.9\sqrt{\frac{206\,\alpha}{Y} + 0.25}$$

$$\alpha = \frac{Shringkage\,all\,lowance\,(mm)}{d} \times 10^3$$

R : Quotient obtained by dividing the inside diameter of hollow shaft by its outside diameter

211. Tests and inspections

1. In the application **211. 3** of the Rules, "the procedure as deemed appropriate by the Society" means the procedure specified in **Ch 3, Sec 8-1** or 8-**2** of the "**Guidance for Approval of Manufacturing Process and Type Approval, Etc.**"

2. In the application **Table 5.2.3** NOTES 2 of the Rules, for piston crowns and cylinder covers, test methods other than hydraulic testing may be accepted. e.g. suitable non-destructive examination and dimension measurement and surface inspection.

3. In the application **Table 5.2.3** of the Rules, where the cooling space of piston crowns is sealed by piston rod or by piston rod and skirt, hydraulic test is to be carried out after assembly.

Section 3 Steam Turbines

304. Safety devices

It is recommended that the main turbines are provided with a quick acting device which automatically shut off the steam supply in case of unacceptable axial displacement of the turbine rotor in addition to the devices mentioned in **304. 2** and **3** of the Rules.

306. Strength and sectional area of turbine blades

When the calculations for vibration stress for the blade or the specified 0.01 % proof-stress of the blade material are submitted to the Society and are deemed appropriate by the Society, the values of 2 times the specified 0.01 % proof-stress for the blade material may be applied instead of S in the formula given in **306.** of the Rules. ⚓

CHAPTER 3 PROPULSION SHAFTING AND POWER TRANSMISSION SYSTEMS

Section 1 General

101. Welded structure component

In application to **101.** of the Rules, the general requirements for major parts with welded construction are to apply appropriate modifications of **Ch 5, Sec 4** of the Rules.

102. Other propulsion and maneuvering machinery

In application to **102.** of the Rules, water-jet propulsion systems and azimuth or rotatable thrusters may be complied with the following ;

1. Water-jet propulsion systems and azimuth or rotatable thrusters water-jet propulsion systems or azimuth or rotatable thrusters are to comply with the requirements given in **Annex 5-1.**

Section 2 Shafting

201. Application

1. In application to **201. 2.** of the Rules, the alternative calculation methods are considered appropriate by the Society are to be in accordance with the following.

(1) Any alternative calculation method is to include all relevant loads on the complete dynamic shafting system under all permissible operating conditions.
(2) Consideration is to be given to the dimensions and arrangements of all shaft connections.
(3) An alternative calculation method is to take into account design criteria for continuous and transient operating loads (dimensioning for fatigue strength) and for peak operating loads (dimensioning for yield strength).
(4) The fatigue strength analysis may be carried out separately for different load assumptions as follows.
(A) Low cycle fatigue criterion (typically $< 10^4$)
(B) High cycle fatigue criterion (typically $>> 10^7$)
(C) The accumulated fatigue due to torsional vibration when passing through a barred speed range or any other transient condition

203. Intermediate shaft and thrust shaft

1. In case the ships engaged in smooth water service area, the values of F in formula given in **203.** of the Rules may be taken as 95.

2. The diameter of shafts may be reduced on the basis of the application to **204. 2** of the Rules.

204. Propeller shaft and stern tube shaft

1. In application to **Table 5.3.2** NOTE (3) of the Rules, the required diameters of Kind 1 shaft made of approved corrosion-resistant materials and kind 2 shaft are to be determined by the following formula;

$$d_p = K_4 \times \sqrt[3]{\frac{P}{n}} \quad (\mathrm{mm})$$

P : Maximum continuous output of main propulsion machinery (kW)

n : Number of shaft revolution at maximum continuous output (rpm)

K_4 : Factor concerning shaft design, given in **Table 5.3.1** of the Guidance

Table 5.3.1 Values of $K4$

Application \ Shaft Material		Propeller shaft kind 1		Propeller shaft kind 2
		Precipitation hardened stainless(KS STS 630 series or equivalent)approved by the Society	Austenitic stainless steels with the diameter not exceeding 200 mm (KS STS 316 series or equivalent)	Austenitic stainless steels (KS STS 304 or equivalent series)
1	The portion from the big end of the tapered part of propeller shaft(in case of flange connected propeller, the fwd end of flange) to the fwd end of the after most stern tube bearing or to 2.5 d_p(4.0 d_p in sea-water-lubricated) whichever is larger	105	128	128
2	The portion in the direction toward the bow side up to the fwd end of fwd stern tube sealing assembly and excluding the portion shown in 1 above	$94^{(1)}$	$116^{(1)}$	$116^{(1)}$
3	The portion between the fwd end of the fwd stern tube sealing assembly and the intermediate shaft coupling	$94^{(2)}$	$116^{(2)}$	$116^{(2)}$
4	Stern tube shaft	94	116	116

NOTES : (1) and (2) in the Table are as follows;
(1) The diameter of boundary portion is to be tapered down smoothly.
(2) The diameter may be tapered down to the diameter calculated by the formula given in **203.** of the Rules assumed as T = 410 N/mm^2

2. Reducing diameter

In case where the diameter of shafts fails to meet the requirements specified in **203.** and **204.** of the Rules, the criteria specified in below may be used.

(1) In case of ships engaged in smooth water service area, the diameters of propeller shaft and stern shaft may be taken as the values not less than 92 % of the value calculated in accordance with **204. 1** of the Rules or prescribed **1.**

(2) The diameter of shafts may be reduced to those having the torsional stress satisfying following formula.

$$\gamma_m \cdot \tau_m + \gamma_t \cdot \tau_D \le \frac{\tau_y}{S_y}$$

$$\gamma_t \cdot \tau_D \le \frac{\tau_f}{S_f}$$

τ_m : Average torsional stress on the shaft. However, in case where the average bending stress acts on the shaft, it is to be accordance with the following formula.

$$\tau_{me} = \sqrt{\tau_m^2 + \frac{1}{3}\sigma_m^2}$$

τ_{me} : Equivalent average torsional stress (N/mm^2)
σ_m : Average bending stress (N/mm^2)

β_m : Notch parameter for static stress

τ_D : Variable torsional stress on shaft. However, where the variable bending stress acts on the shaft, it is to be accordance with the following formula.

$$\tau_{De} = \sqrt{\tau_D^2 + \frac{1}{3}\left(\frac{\beta_b}{\beta_t}\sigma_D\right)^2}$$

τ_{De} : Equivalent variable torsional stress (N/mm^2)

σ_D : Variable bending stress (N/mm^2)

β_b : Notch parameter for bending stress

β_t : Notch parameter for torsional stress

τ_y : Torsional yield strength of shaft material (N/mm^2)

S_y : Safety factor for yield strength

τ_f : Torsional fatigue strength of shaft material when average stress τ_m (or τ_{me}) is loaded on (N/mm^2)

S_f : Safety factor for fatigue strength

(3) In above (2), the torsional fatigue strength and torsional yield strength of shaft are determinated by the Society through considering the materials, heat-treatment and surface treatment and reviewing the submitted documents. The safety factors for fatigue and yield are determinated by the Society through considering the using purpose and conditions of shaft.

206. Stern tube bearing and sealing devices

In application to **206. 1.** (3) of the Rules, where the length of oil lubricated bearings is less than 2 times the required calculation diameter of the propeller shaft in way of the bearing, the following are to be satisfied with.

(1) Improvement in condition of bearing loads
The relative contact condition between propeller shaft and its bearing in the longitudinal direction is to be improved by employing the slope alignment (including the slope boring) and uniform distribution of bearing loads are to be ensured. For approval of the above, an slop alignment calculation sheet (bending moment, bending stress bearing pressure, bearing load, amount of deflection, angle of inclination, etc.) satisfying the following, and installation instruction is to be submitted.
(A) Alignment calculation only dealing with the static external force may be accepted (the review for shaft alignment variation due to dynamic force such as variation of bending moment, bending stress and etc. is not accepted).
(B) At any position on the propeller shaft static bending moment (absolute value) is not to exceed the value at the aft end of the stern tube bearing.

(2) Improvement in lubricating oil and condition of lubricating
For improving the lubricating condition of stern tube bearing, the following measures are to be taken;
(A) The lubricating oil inlet is to be provided at the aft end of the bearing for ensuring the forced circulation of the lubricating oil.
(B) To be use lubricating oil with superior resistance against burning out bearing and characteristic being easy to emulsify (being difficult to separate). However, additaments for lubricating oil are to be considered the fitness with sealing materials for stern tube sealing device such as rubber.
(C) Damage found of bearings at early stage
For finding of bearings burned out at early stage and preventing of extension of the damage, at least one(1) temperature sensor in bearing shell and high temperature alarm (Set point 60 °c or below) are to be provided.
(D) Low level alarm is to be provided in the lubricating oil tank.

Section 3 Propellers

301. Application

1. For the propellers such as following, the Society may request the submission of calculation sheets for stress of blades.

(1) Propellers having special type blade such as nozzle propeller, jacket propeller, etc.
(2) Propellers for special purpose ships such as tug boat, stern trawler, pusher, etc.
(3) Propellers having pitch ratio of more than 0.8 at the radius 0.25 R.
(4) Specially designed propellers for improving propelling efficiency.

302. Materials

1. The major parts of propeller (an oblique line part in **Fig 5.3.1** of the Guidance) are to be carried out liquid penetrant test or other effective non-destructive test.

303. Thickness of blades

1. The thickness of skewed propeller blades more than 25° of skew angle is to comply with the following requirements depending on skew angle (the angle, on the expanded blade drawing, between the line connecting the center of the propeller shaft with the point at the blade tip on the center line of blade width and the tangential line drawn from the center of the propeller shaft to center line of blade width(See **Fig 5.3.2**)

(1) In case where the skew angle exceeds 25° but is 60° or less

(A) The blade thicknesses at a radius of 0.25 R (0.35 R for controllable pitch propellers) and 0.6 R are not to be less than the values obtained by multiplying the values (t_x) calculated by the formula in **303.** of the Rules, by the coefficient A given in the formula below;

$$A = \left(1 + B\frac{\theta - 25^\circ}{60^\circ}\right)$$

θ : Skew angle (°)

B : 0.2 at 0.25 R (0.35 R for controllable pitch propeller)

0.6 at 0.6 R

(B) Blade thickness t_x at any radius between 0.6 R and 0.9 R is not to be less than the value determined by the following formula.

$$t_x = 0.003D + \frac{(1-x)(t_{0.6} - 0.003D)}{0.4} \quad (\mathrm{mm})$$

D : Diameter of propeller (mm)

x : Radius position having no dimension

$t_{0.6}$: blade thickness at 0.6 R as required in (A) above

(2) In case where the skew angle exceeds 60°
On the basis of the precise calculation sheet on propeller strength submitted by the manufacturer or designer, the blade thickness is to be determined under the satisfaction of the Society.

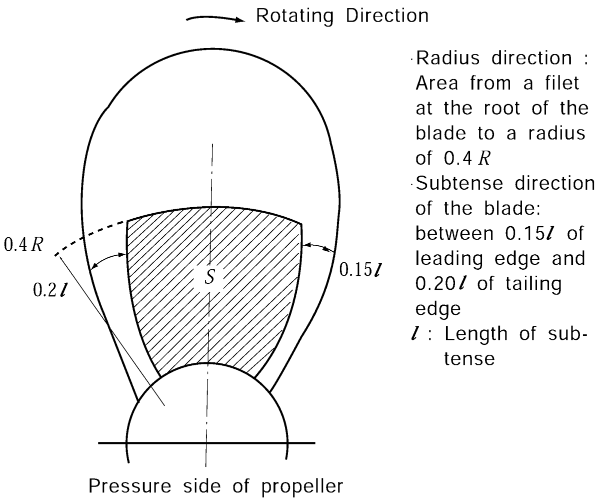

Fig 5.3.1 Non-destructive Testing Area

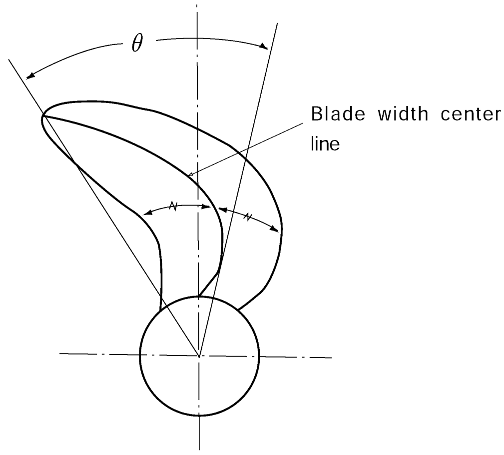

Fig 5.3.2 Skew Angle

304. Fixing of blades

In **304. 1** of the Rules, the blade fixing bolts are in accordance with the following.

(1) The diameter of blade fixing bolts of controllable pitch propellers is not to be less than the value calculated by the following formula. In this case, the value of K_3 may be taken as the values specified in **Fig 5.3.3** of the Guidance.

$$d = 0.55\sqrt{\frac{1}{\sigma_a} \cdot \frac{1}{n}\left(\frac{A \cdot K_3}{L} + F_c\right)}$$

where;

d : Required diameter of blade fixing bolt (mm)

A : Value given by the following formula.

$$A = 3.0 \times 10^4 \frac{H}{NZ}$$

H : Maximum continuous output of main propulsion machinery (kW)

Z : Number of blades

N : Number of maximum continuos revolution per minute divided by 100 (rpm/100)

K_3 : Values given by the following formula

$$K_3 = \sqrt{(D/P)^2(0.622 - 0.9x_0)^2 + (0.318 - 0.499x_0)^2}$$

x_0 : Ratio of the radius at the boundary between blade flange and pitch control gear to propeller radius (see **Fig 5.3.3** of the Guidance). Where $x_0 >$ 0.3, the ratio is to be taken as 0.3.

D : Diameter of propeller (m)

P : Pitch at radius of 0.7 R (m), (R = Radius of propeller)

L : Mean value of L_1 and L_2 (cm)

L_1 and L_2 show the length of the perpendicular lines constructed to the line which passes through the rotating center of blade flange and has an inclination compatible with the pitch angle β at 0.7 R, from the center of bolts located on each edge side in face side when the pitch angle is β. (see **Fig 5.3.4** of the Guidance)

F_C : Centrifugal force (N) of propeller blade given by the following formula:

$$F_C = 1.10 \times mR'N^2$$

m : Mass of one blade (kg)

R' : Distance between center of gravity of blade and propeller shaft center line (cm)

n : Number of bolts on the face side of blade

σ_a : Allowable stress of bolt material given by the following formula (N/mm²)

$$\sigma_a = 34.7 \times \left(\frac{\sigma_B + 160}{600}\right)$$

σ_B : Specified tensile strength of bolt material (N/mm²). Where σ_B > 800 N/mm², it is to be taken as 800 N/mm².

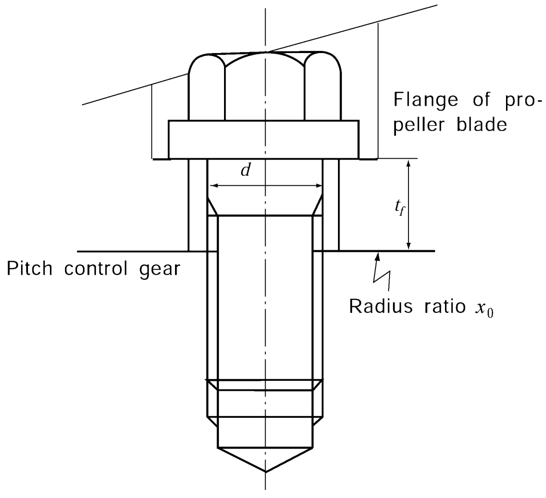

Fig 5.3.3 Measuring Method of Blade Fixing Bolt Dimension

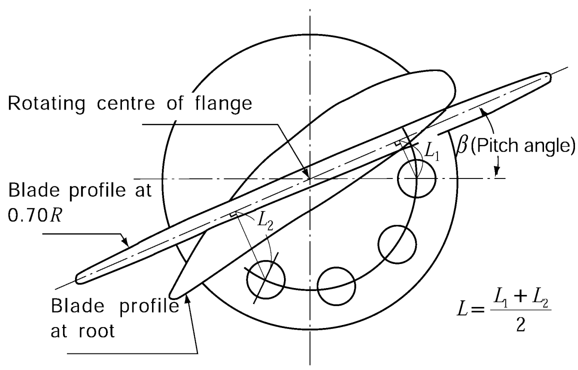

Fig 5.3.4 Determination of *L*

(2) The thickness of flange for fixing the blade to the pitch control gear (the thickness as measured from the seat of fixing bolt or nut to the boundary face between the flange and the pitch control gear) is to be not less than the value calculated by the following formula:

$$t_f = 0.9d$$

Where;

t_f : Thickness of flange (mm) (see **Fig 5.3.3** of the Guidance)

d : Required diameter of bolt calculated by the formula specified in (1) (mm)

(3) The blades are to be fixed securely to the pitch control gears by giving the fixing bolts the ad-

equate initial fixing force. It is to be regarded as the standard practice that the initial fixing force complies with the following condition;

$$\frac{1.3}{n}\left(\frac{A \cdot K_3}{L}+F_C\right)< T_0 < 0.55\,\sigma_0 \cdot d^2$$

where

T_0 : Initial fixing force (N)

σ_0 : Yield strength or 0.2 % proof strength of bolt material (N/mm^2)

Other symbols are the same as in the formula shown in (1).

305. Fitting of propeller

1. In **305. 1** of the Rules, the heating temperature of propeller boss at drawing out is to be not more than 100 °C.

2. In application **305. 2** of the Rules, keyless forced fitting propellers are to satisfy the following.

(A) General

(a) The formula, etc., given herein are not applicable for propellers where a sleeve is introduced between propeller shaft (hereinafter referred to as "**shaft**") and propeller boss (hereinafter referred to as "**boss**").

(b) The taper of the shaft cone is not to exceed 1/15.

(c) Prior to final pull-up, the contact area between the mating surface is to be checked and is not to be less than 70 % of the theoretical contact area. Non-contact bands extending circumferentially around the boss or over the full length of the boss are not acceptable.

(d) After final pull-up, the propeller is to be secured by a nut on the propeller shaft. The nut is to be secured to the shaft.

(e) The factor of safety against friction slip at 35 °C is not to be less than 2.8 under the action of rated torque at corresponding power and speed plus pulsating torque due to torsional.

(f) For the oil injection method the coefficient of friction is to be 0.13 for bosses made of bronze and steel.

(g) The maximum equivalent uniaxial stress (N/mm^2) in the boss at 0 °C based on the Mises-Hencky criterion should not exceed 70 % of the yield point or 0.2 % proof-stress (0.2 % offset yield strength) for the propeller. For cast iron the value should not exceed 30 % of the nominal tensile strength.

(B) Materials

Modulus of elasticity, Poisson's ratio and coefficient of linear expansion of materials are in accordance with the **Table 5.3.2** of the Guidance.

Table 5.3.2 Modulus of Elasticity, Poisson's Ratio and Coefficient of Linear Expansion

Kind of material	Modulus of elasticity (N/mm^2)	Poisson's ratio	Coefficient of linear expansion (mm/mm °C)
Steel castings and steel forgings	20.6×10^{4}	0.29	12.0×10^{-6}
Cast iron	9.8×10^{4}	0.26	12.0×10^{-6}
High strength brass casting, CU1, CU2	10.8×10^{4}	0.33	17.5×10^{-6}
Aluminium bronze casting, CU3, CU4	11.8×10^{4}	0.33	17.5×10^{-6}

(C) Calculations for pull-up length and pull-up load

(a) The formulae are applicable for solid shafts only.

(b) Pull-up length

(i) Corresponding minimum pull-up length at 35 °C (mm) :

$${}_{35} = P_{35}\frac{D_s}{2\text{¤}}\left[\frac{1}{E_b}\left(\frac{K^2+1}{K^2-1}+v_b\right)+\frac{1}{E_s}(1-v_s)\right]$$

(ii) Minimum pull-up length at temperature t (t < 35 °C) (mm)

$$_{t} = {}_{35} + \frac{D_{s}}{2¤}({}_{b} - {}_{s})(35 - t)$$

(iii) Corresponding maximum permissible pull-up length at 0 °C (mm)

$$_{max} = \frac{P_{max}}{P_{35}}{}_{35}$$

Where

P_{35} : Minimum required surface pressure at 35 °C (N/mm²)

$$P_{35} = \frac{ST}{AB}\left[-S\theta + \sqrt{\mu^2 + B\left(\frac{F_V}{T}\right)^2}\right]$$

S : Factor of safety against friction slip at 35 °C

T : Thrust(N) (if not given, calculate P35 with the value calculated by the following formulas and take the value which make P35 grater)

$$T = 1{,}762\frac{H}{V_s} \text{ or } T = 57.4 \times 10^6\frac{H}{PN}$$

H : Maximum continuous output (kW)

V_s : Ship speed at maximum continuous output (Knots)

P : Mean propeller pitch (mm)

N : Number of revolution at maximum continuous output (rpm)

A : 100 % theoretical contact area between boss and shaft, as read from drawings and disregarding oil grooves (mm²)

B : Values according to the following formula

$$B = \mu^2 - S^2\theta^2$$

μ : Coefficient of friction between mating surfaces

θ : Half taper of tail-shaft (e.g. taper = 1/15, θ = 1/30)

F_V : Shear force at interface (N)

$$F_V = \frac{2cQ}{D_s}$$

c : Constant,

1 : for turbines, geared diesel drives, electric drives and for direct diesel drives with a hydraulic or an electromagnetic or high elasticity coupling

1.2 : for a direct diesel drive

Q : Troque transmitted according to maximum continuous output (N/mm)

D_s : Diameter of tail-shaft at the midpoint of the taper in the axial direction (mm)

K : Values according to the following formula

$$K = \frac{D_b}{D_s}$$

D_b : Mean outer diameter of propeller boss at the axial position corresponding to D_s (mm)

E_b : Modulus of elasticity of boss material (N/mm^2)

V_b : Poisson s ratio for boss material

E_s : Modulus of elasticity of shaft material (N/mm^2)

V_s : Poisson s ratio for shaft material

a_b : Coefficient of linear expansion of boss material (mm/mm °C)

a_s : Coefficient of linear expansion of shaft material (mm/mm °C)

P_{max} : Maximum permissible surface pressure at 0 °C (N/mm^2)

$$P_{max} = 0.7\frac{\sigma_y(K^2-1)}{\sqrt{3K^4+1}}$$

σ_y : Yield point or 0.2 % proof stress (0.2 % offset yield strength) boss material (N/mm^2)

(c) Minimum pull-up load at temperature t °C (N)

$$W_t = AP_t(\mu+\theta)$$

where

P_t : Corresponding minimum surface pressure at temperature t °C (N/mm^2)

$$P_t = P_{35}\frac{\delta_t}{\delta_{35}}$$

3. When the propeller is forced fitted to the propeller shaft by hydraulic force, the confirmation of the pull-up length specified in **307. 3** of the Rules is to be made assuming that the true relative start point is the point where the pull-up load equal zero on the approximate line drawn in the measured points plotted on the chart of the relation between pull-up length and load. And when the propeller is forced fitted to the propeller shaft after second times, the pull-up length is to be confirmed by the calculations and the records drawn up at the previous time.

307. Tests and inspections

1. Static balancing test for propellers The unbalanced mass at a static balancing test of propeller is not to exceed the value determined by the following formula;

$$P = C\frac{m}{R \cdot n^2} \text{ or } P = K \cdot m$$

where

P : Unbalanced mass referred to the circumference of the propeller (kg)

m : Mass of propeller (kg)

R : Radius of propeller (m)

n : Number of propeller revolution at the maximum continuos output (rpm)

C and K : Given in the following table

Class*	S	I	II	III
C K	15 0.0005	25 0.001	40 0.001	75 0.001
NOTE: * Refer to ISO 484/1-1981				

2. Where it is not possible to confirm the unbalanced mass and torque by the static balancing tests, dynamic balancing tests may be carried out where deemed appropriate by the Surveyor.

Section 4 Power Transmission Systems

401. General

1. "Small ships" given in **401. 3** of the Rules means ships having length not more than 50 m.

2. The for small transmitted power specified in **401. 5** of the Rules means the transmitted power less than 257 kW .

402. General construction of gearing

The general requirements for the major parts with welded construction are to apply **Pt 2, Ch 2** of the Rules.

403. Allowable tangential load for gears

1. In gearing for main propulsion internal combustion engines having maximum continuos output not more than 257 kW and maximum continuos revolution not less than 1,300 rpm, where the coupling complied with the following (1) or (2) is provided between engines and gearing, and the gearing and coupling are of type having actual examples used on ships, the value of K_1 given in **403. 2** of the Rules may be taken as 1.0.

(1) High elasticity couplings

(2) Elasticity coupling not existed resonance rpm occurring critical fluctuation at revolution ratio 0.4 through 1.15

2. In application **403. 4** of the Rules, the strength calculation for gears of power transmission systems may be in accordance with **Annex 5-4** of the Guidance. ⚓

CHAPTER 4 TORSIONAL VIBRATION OF SHAFTING

Section 2 Allowable Limit of Vibration Stresses

201. Crankshafts

1. In application to **201.** of the Rules, the strength calculation for crankshafts is carried out according to the special requirements given by the Society means **Annex 5-3**. For the allowable limit of vibration stresses, the nominal alternating torsional stresses(τ_N) specified in **Annex 5-3**, **2**. (2) (A) are to be applied in the operational speed range of the engine. Where barred speed ranges are imposed, the allowable torsional vibration stresses in the ranges may be specially considered.

2. In application to **201. 4** of the Rules, in case where the specified minimum tensile strength of the crankshaft exceeds 590 $\mathrm{N/mm^2}$ for carbon steel forging, or 835 $\mathrm{N/mm^2}$ for low alloy steel forging, the value of T_s given in formula for f_m is to be in accordance with the following.

(1) The value of T_s is to be taken as 590 $\mathrm{N/mm^2}$ for carbon steel forging, and 835 $\mathrm{N/mm^2}$ for low alloy steel forging. However (2) below is to be excepted.

(2) Where the crankshaft approved by **Ch 2, Sec 5, 503. 2** of the "**Guidance for Approval of Manufacturing Process and Type Approval, etc.**" for torsional fatigue strength of crankshaft, the value of T_s is to be taken as the value added the fatigue strength improved.

202. Intermediate shafts, thrust shafts, propeller shafts and stern tube shafts

1. The allowable limit of torsional vibration stress for propeller shafts made of the approved corrosion resistance materials is to be calculated by the following formula in place of the formula for τ_1 shown in **202. 1** of the Rules.

$$\tau_1 = A - B\lambda^2 \quad (\lambda \le 0.9)$$
$$\tau_1 = C \quad (0.9 < \lambda)$$

τ_1 : Allowable limit of torsional vibration stress at the continuos operation ($\mathrm{N/mm^2}$)
λ : Ratio of the number of revolution to the number of maximum continuos revolution
A, B, C : Constant dependent on shaft materials given in **Table 5.4.1** of the Guidance

Table 5.4.1 Values of A, B and C

	Precipitation hardened stainless steel	Austenitic stainless steel(*KS STS* 304 or equivalent)
A	61.1	40.7
B	47.3	30.5
C	22.8	16.0
NOTES : For material other than above, the values are to be determined on each case.		

2. For ships powered by steam turbines, gas turbines, diesel engines having slip couplings such as electro-magnetic couplings or fluid couplings or electric propulsion systems with reduction gear, the allowable limits of torsional vibration stress on the intermediate shafts, thrust shafts, propeller shafts and stern tube shafts are to be calculated by applying the values of C_K given in the **Table 5.4.2** of the Guidance to the formula specified in **202. 1** of the Rules.

Table 5.4.2 Values of C_K

Intermediate shaft	Integral flange couplings	0.75
	Shrink fit couplings	0.75
	Keyways	0.45
Thrust shaft	On both sides of the thrust collar	0.65
	In way of axial bearings where a roller bearing is used as a thrust bearing	0.65
Propeller shaft and stern tube shaft	-	0.35
NOTE : The value of C_K other than above is to be determined by the Society in each case.		

3. In application to **Table 5.4.1** NOTE (5) of the Rules, if the slot dimensions are outside of the limitations, or if the use of another C_K is desired, C_K is to be in accordance with the following.

$$C_K = 1.45/scf$$

scf : stress concentration factor at the end of slots defined as the ratio between the maximum local principal stress and $\sqrt{3}$ times the nominal torsional stress determined for the hollow shaft without slots.

$$scf = \alpha_{t(hole)} + 0.57 \cdot \frac{(l-e)/d_o}{\sqrt{1-\left(\frac{d_i}{d_o}\right) \cdot \frac{e}{d_o}}}$$

l : slot length (mm)
e : slot width (mm)
d_i : inside diameter of the hollow shaft at the slot (mm)
d_o : outside diameter of the hollow shaft (mm)
$\alpha_{t(hole)}$: stress concentration factor of radial holes(in this context e = hole diameter) determined by the following formula

$$\alpha_{t(hole)} = 2.3 - 3 \cdot \frac{e}{d_o} + 15 \cdot \left(\frac{e}{d_o}\right)^2 + 10 \cdot \left(\frac{e}{d_o}\right)^2 \cdot \left(\frac{d_i}{d_o}\right)^2$$

or simplied to $\alpha_{t(hole)} = 2.3$

However, this formula for above stress concentrate factor applies to the following slots.
(A) Slots at 120 or 180 or 360 degrees apart
(B) Slots with semicircular ends (A multi-radii slot end is not included in this empirical formula)
(C) Slots with no edge rounding(except chamfering)

203. Shafting system of generators

1. In application to **203.** of the Rules, the strength calculation for crankshafts is carried out according to the special requirements given by the Society means **Annex 5-3**. For the allowable limit of vibration stresses, the nominal alternating torsional stresses(τ_N) specified in **Annex 5-3**, **2**. (2) (A) are to be applied in the operational speed range of the engine. Where barred speed ranges are imposed, the allowable torsional vibration stresses in the ranges may be specially considered.

205. Detailed evaluation for strength

Where the torsional vibration stress acted on shaft is satisfied with requirements of **Ch 3, 204. 3** of the Guidance, τ_D according to the requirements of **Ch 3, 204. 3** of the Guidance may be taken instead of τ_1 given in **Pt 5, Ch 4** of the Rules at the calculation for allowable limit of torsional vibration stress. ⚓

CHAPTER 5 BOILERS AND PRESSURE VESSELS

Section 1 Boilers

101. Applications

1. In application to **101. 2** of the Rules, small boilers having design pressure less than 0.35 MPa (hereinafter referred to as "**small boiler**") may be in accordance with the following regardless of requirements in **Ch 5, Sec 1** of the Rules.

(1) Materials, construction, strength and accessories of small boilers
  (A) Materials, construction, strength and accessories of small boilers are to be complied with *Korean Industrial Standards or equivalent.*
  (B) Safety valve or pressure relief pipe having sufficient capacity is to be fitted.
  (C) Safety devices for the following are to be fitted.
    (a) Draught fan for pre-purging to prevent the gas explosion in furnace
    (b) Fuel oil shut-off device in the case of flame vanishes, automatic ignition fails or combustion air supply stops
    (c) Fuel oil shut-off device when the fuel oil supply pressure to the oil burners falls in case of pressure atomizing
    (d) Fuel oil shut-off device for preventing from overheating of boilers when the water level falls

(2) Tests
  (A) The pressure receiving portions are to be tested to a hydrostatic pressure of 2 times the design pressure. However, the test pressure is not to be less than 0.2 MPa
  (B) Performance test for the safety devices mentioned above (1) (C) are to be carried out.

102. Materials

1. In application to **102. 1** (2) of the Rules, "where deemed appropriate by the Society" means the fittings having design pressure less than 3 MPa and nominal diameter less than 100 A.

2. In application to **102. 2** of the Rules, the cast steels used for body of the boilers are to be ensured that the materials have not any harmful defect through radiographic examination and magnetic particle test. Test methods and judgement standards are to be in accordance with the following.

(1) The radiographic examination is to be carried out according to "*KS D* 0227 (method of radiographic examination for cast steels and classification of grade for radiograph film)", and if there is crack, the cast steel is to be rejected. The defects specified in *KS D* 0227 such as blow holes, sand spots, inclusions and concavity are to be accepted only defects of Grade 1.
(2) The magnetic particle test is to be carried out according to "*KS D* 0213 (method of magnetic particle test for steels and classification of grade for defect shape of magnetic particle)", the defects specified in *KS D* 0213 are to be accepted only defects of Grade 1 or Grade 2.
(3) The cast steels rejected by above (1) and (2) may be repaired. Repairing method by welding is to comply with **Pt 2, Ch 1, 501. 11** of the Rules.

111. Flat plates or tube plates with stay or other supports

1. Where the required thickness at the portion including water tube holes of the tube plates of a dry combustion cylindrical boiler is calculated by the formula specified in **111. 3** of the Rules, the value of C in the formula for the supports adjacent to water tube holes is to be divided by the square of the rate of strength reduction obtained by the following formula.

$$\eta = \frac{p - 0.5d}{p}$$

where

η : Rate of strength reduction

p : Pitch of water tube holes (mm)

d : Diameter of water tube holes (mm)

114. Manholes, mud holes and peep holes

1. The required thickness of manhole covers is to be determined by the formula below. However, the thickness at the center is not to be made 14 mm or less. In case where a groove is provided at the periphery of a manhole cover, the thickness of such a part may be reduced to 2/3 of that of the central area.

$$T = \frac{b}{2c}\sqrt{\frac{100P}{f}}$$

where

T : Required thickness of manhole cover (mm)

P : Design pressure (MPa)

f : Allowable stress specified in the Rules (N/mm^2)

b : Length of minor axis of manhole (mm)

c : Value given in **Fig 5.5.1** of the Guidance. In **Fig 5.5.1** of the Guidance, a stands for the length of major axis of manhole (mm), and when b/a is 1, c is to be 9. In the case of the corrugated manhole cover, a and b are to be taken as shown in **Fig 5.5.2** of the Guidance.

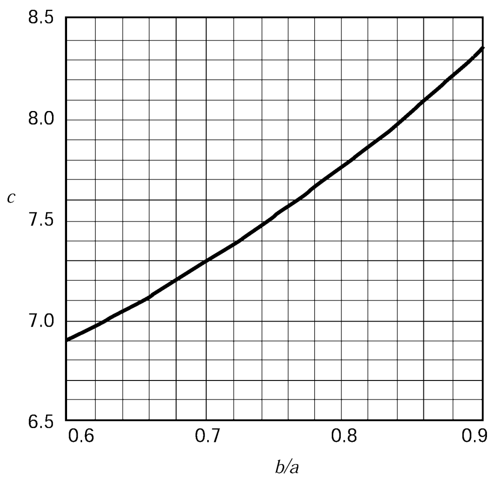

Fig 5.5.1 Values of *c*

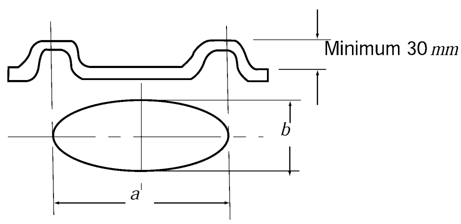

Fig 5.5.2 a and b of Corrugated Manhole Cover

116. Flues, furnaces, ogee rings and cross tubes

1. The required thickness of plain cylindrical furnaces supported with stays or other members is to be calculated by the formula in **116. 3** of the Rules by regarding the effective length between the stays as L in the formula.

117. Stays, stay tubes and girders

1. The required diameter (d) of stays or stay tubes specified in **117. 1** of the Rules is to be determined as follows.

(1) When the adjacent support is a stay or stay tube, the boundary is considered as the perpendicu-

lar bisector of the line connecting the both support points.
(2) When the adjacent support is curved flange or welded joint, the boundary is considered as the locus of the center of inscribed circle to the support point in question and the commencement line of curvature or the inside plain ends welded on shell or furnaces specified in **111. 5** of the Rules.
(3) At the corner part of smoke tube nests, the calculation may be carried out by regarding the half of the sum of two area supported by stays or stay tubes adjacent each other.
(4) The areas of stay, stay tube and smoke tube included in the concerned area are to exclude from the area specified in above (1) through (3).

124. Construction and tests of safety valves

1. In application to **124. 8** of the Rules, the duration of accumulation test is to be in accordance with the following.
(1) For water tube boilers : 7 minutes
(2) For smoke tube boilers : 15 minutes

129. Water level indicator

1. In application to **129. 2** of the Rules, exhaust gas boilers are to be provided with a glass water level gauge, and a remote water level indicator or a high/low water level alarm device.

136. Tests and inspections

1. Hydraulic test
(1) The hydraulic test of desuperheaters installed within water drum or steam drum of boiler is to be carried out at 1.5 times or more the design pressure of the boiler when a steam stop valve is provided at the inlet of desuperheater, and 1.5 times or more the assumed pressure difference when a stop valve is provided only at the outlet of the desuperheater. However, test pressure is not to be less than 2 MPa.
(2) In the hydraulic tests for boilers the test pressure for the hydraulic test of boiler tubes and connecting pipes after completion of welding and assembly may be modified to 1.25 times the design pressure, in case where parts or members such as drums, headers, and others are subjected to hydraulic test individually at a test pressure of 1.5 times the design pressure.

Section 2 Thermal Oil Heaters

203. Safety devices for thermal oil heaters directly heated by the exhaust gas of engines

In application to **203. 7** of the Rules, “Fixed fire extinguishing and cooling system as deemed appropriate by the Society” means the combination of fixed gas fire-extinguishing systems and the systems for cooling the heating coil, header, casing, etc., and the heater itself such as water-spray. The fixed fire extinguishing cooling system can be a water-drenching system able to discharge copious amounts of water. In this case, the suitable means for collection and drainage, to prevent the water from flowing into the diesel engines, are to be provided on exhaust ducting below the heater, and the drainage is to be led to suitable places.

Section 3 Pressure Vessels

302. Classification

1. The low pressure steam generators belong to Class 1 are to be provided with the following accessories.
(1) Water level indicators : 1 set of glass water level gauge
(2) Safety valves : To be applied with appropriate modifications of the requirements of the boilers.

(3) Peep holes : To be applied with appropriate modifications of the requirements of the boilers.
(4) Boiler water blow-off valves : To be applied with appropriate modifications of the requirements of the boilers.
(5) Relief valve : To be applied with appropriate modifications of the requirements of the boilers.
(6) Pressure gauges : To be applied with appropriate modifications of the requirements of the boilers.
(7) Thermometers : To be applied with appropriate modifications of the requirements of the boilers.

303. Materials

1. In application to **303. 2** of the Rules, body of pressure vessels used for noxious substances is not to be used special iron castings.

2. When the steel castings are used for the body of Class 1 or Class 2 pressure vessels, non-destructive test methods and judgement standards are to be in accordance with the following.

(1) The radiographic examination is to be carried out according to "*KS D* 0227 (method of radiographic examination for steel castings and classification of grade for radiograph film)" and if there is crack, to be rejected. The defects specified in *KS D* 0227 such as blowholes, sand spots, inclusions and concavity are to be accepted only defects of Grade 1. However, in the case of Class 2 pressure vessels, the defects specified in *KS D* 0227 such as blowholes, sand spots and inclusions found on test portions of thickness more than 25 mm may be accepted defects of Grade 1 and Grade 2.
(2) The magnetic particle test is to be carried out according to "*KS D* 0213 (method of magnetic particle test for steels and classification of grade for defect shape of magnetic particle)", the defects specified in *KS D* 0213 are to be accepted only defects of Grade 1 or Grade 2.
(3) The penetration inspection is to be carried out according to "*KS D* 0816 (method of penetration inspection and classification of grade for defect shape)", the judgement standards of defects are to be applied with appropriate modifications the above (2).
(4) The steel castings rejected by above (1) through (3) may be repaired. Repairing method by welding is to comply with **Pt 2, Ch 1, 501. 11** of the Rules.

3. The materials used for fitting are restricted to the following;

(1) The gray iron castings are not for fitting of pressure vessels intended for containing inflammable or toxic substances.
(2) The special iron castings are not used for fittings for pressure vessels intended for containing toxic substances.

4. In application to **303. 1** (3) of the Rules, "where deemed as appropriate by the Society" means the fittings having design pressure less than 3 MPa and nominal diameter less than 100 A.

308. General construction and strength

1. Construction of fitting is to comply with the following.

(1) Fittings such as valves, flanges, and bolts, nuts, gaskets, etc. are to have the construction and dimension conforming to the recognized standards and they are to conform to the service conditions specified in such standards.
(2) Fittings are to be attached to shells of Class 1 and Class 2 pressure vessels by flanged joint or by welding. However, in case where the thickness of the shell is over 12 mm or in case where a seat for screwing is fitted to the shell, the fittings of not more than 32 *A* in nominal diameter may be attached to the shell by screwing.

310. Flat end plates or tube plates without stay or other supports

1. The thickness of tube plates for heat exchangers without tube stays is to comply with the following requirements:

(1) Except for floating head, the required thickness of flat tube plates without tube stays for the heat exchangers and the like is to be either of the values calculated by the following formula, whichever is the greater;

$$T_1 = \frac{CD}{2}\sqrt{\frac{P}{f}} + a$$
$$T_2 = \frac{PA}{\tau L} + a$$

where

P : Design pressure (MPa)

f : Allowable bending stress of material (N/mm^2)

τ : Allowable shearing stress of material (N/mm^2)

C : Factor determined by the supporting method of tube end plate. Where the tube plates are not integral with the shell, this value is to be taken to 1.0 when straight tubes are used and 1.25 when U-tubes are used. Where the tube plates are integral with the shell, the values are shown in **Fig 5.5.3** of the Guidance.

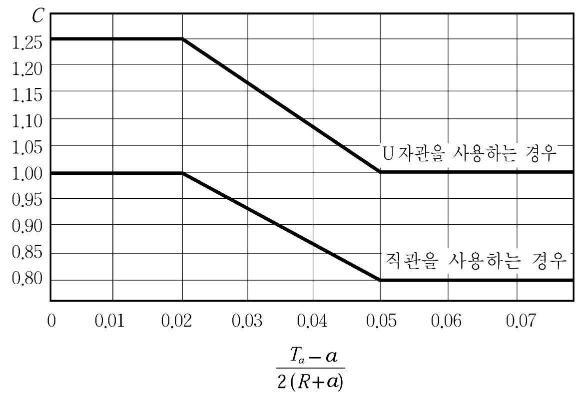
D : Diameter of outer circle of tube end plate (mm), i.e., in case where the tube end plate is bolted to flange, D is the diameter of a circle passing through the position to which gasket reaction is acted; where tube end plate is fixed to the shell, D is the inside diameter of the shell (corrosion allowance is to be deducted)

A : Area of a polygon obtained by connecting the center of outermost tube holes (mm^2) (see **Fig 5.5.4** of the Guidance)

L : Length obtained by deducting the sum of tube hole diameters of the outermost tubes from the length of the outer periphery of the forementioned polygon (mm)

a : 1.0 mm as corrosion allowance. In case where corrosion resistance materials are used, where effective corrosion control measures are taken or when there is no possibility of corrosion, a may be taken as 0.

(2) In obtaining the thickness in (1), calculations are to be carried out on both sides by using respective P, C and D. However, in case where differential pressure calculation is carried out, consideration will be given by the Society in each case.



(비고) T_a : 동판의 실제 두께 R : 동체의 안쪽반지름

Fig 5.5.3 Value of C

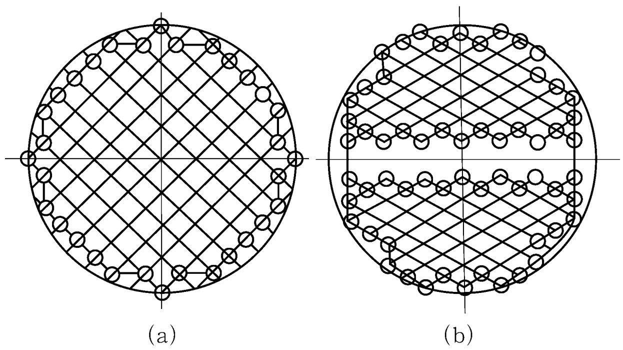


Fig 5.5.4 Polygon Used for Tube Plate Calculation

313. Manholes, mud holes and peep holes

In application to **313.** of the Rules, manholes, mud holes or peep holes of pressure vessels with inside-diameter 900 mm or less may be applied with *Korean Industrial Standards* or standards considered as equivalent thereto according to the discretion of the Society.

319. Tests and inspections

In application to **319. 1. Table 5.5.16** of the Rules, the Class 3 pressure vessels which deemed necessary by the Society mean vessels satisfied with the following (1) or (2).

(1) Design pressure (MPa) × Capacity (m^3) ≥ 1

(2) Heat exchangers (fresh water coolers, lubricating oil coolers, hydraulic oil coolers, lubricating oil heater, fuel oil heaters, condensors, feed water heaters, air coolers, etc.) and air tanks (control air tank, etc.) for operating the following; and other essential pressure vessels :

(A) Main propulsion engines, essential auxiliary engines and propulsion shafting systems

(B) Boilers and thermal oil installations (main boilers, essential auxiliary boilers, boilers and thermal oil heaters for main propulsion engine fuel oil heating and for heating of cargo to be usually heated)

Section 4 Welding for Boilers and Pressure Vessels

401. General

1. Welding procedure qualification tests In application to **401. 2** of the Rules, the welding procedure qualification tests are to comply with **Pt 2, Ch 2, Sec 4** of the Guidance.

2. In application to **401. 3** (3) of the Rules, the requirements of base metals for welding are to be in accordance with the following.

(1) Base metals used in the welding work are to be those suitable for welding. And the carbon content is not to exceed 0.23 % for carbon steel and low alloy steel castings and forging, or 0.35 % for other materials. When approved by the Society in consideration of the welding conditions, the carbon content may be increased to the value approved.

(2) The upper limit of the carbon equivalent for high tensile steels as base material is to be as deemed appropriate by the Society.

403. Heat treatment

1. Omission of stress relief In application to **403. 3** (1) of the Rules, the required conditions for omitting stress relieving in case where the material having superior notch toughness is used, are to be as specified below:

(1) The base metal is to be of steel plate with the specified impact value of 47.1 J or more by the use of test specimens R 4 at a temperature of 0 °C.

(2) The plate thickness of the material is to be 40 mm or less.

(3) Regardless above (1) and (2), in case of the pressure vessels specially designed or used for special condition, the necessity of stress relieving is to be determined at every time of test.

404. Radiographic examination

1. In application to **404.** of the Rules, ultrasonic examination may be substituted for radiographic examination subject to the approval by the Society.

405. Welding workmanship approval tests for boilers and Class 1 pressure vessels

1. In application to **405. 3** of the Rules, when the capacity of tensile test equipment is insufficient, the thickness of tensile test specimens may be reduced to thickness which can be carried out the test. However, when the distribution of strength is identified by the welding procedure qualification test and etc., the tensile test for representative specimens may be substituted for the tensile tests.

2. In application to **405. 5** of the Rules, "the standard value approved by the Society" means the impact test values specified in **Pt 2, Ch 2, Table 2.2.7** and **2.2.8** of the Rules, and in case when materials are not specified in the Tables, that means the impact values of base metal. However, in case where the impact values for base metals are not specified, impact test may be omitted subject to the approval by the Society. ⚓

CHAPTER 6 AUXILIARIES AND PIPING ARRANGEMENT

Section 1 General

101. General

1. Application In application to **101. 1** of the Rules, the construction of auxiliaries is accordance with the following.

(1) The auxiliaries are to have the sufficient strength and adapt to purpose of service, and they are to be maintained and checked easily and made of materials adequate for service.
(2) Bearing bolt of auxiliaries, bolts and nuts of moving parts are to be well secured by effective means to prevent from slaking such as split pin or equivalent.
(3) The auxiliaries and piping systems, as practicable as, are not to leak gases harmful to operators or inflammable gases.
(4) The auxiliaries are installed in the space where the gases mentioned in (3) can be discharged rapidly.
(5) The rotating parts, reciprocating parts and high temperature parts are to be arranged with suitable protection means for the safety of watchmen, operators or men neighbouring to these parts.

2. Definitions The definitions are in accordance with the following and **101. 3** of the Rules;

(1) The planned discharge pressure of 1.1 times is to be used as the standard for design pressure of piping systems on the discharge side for positive displacement pumps.
(2) The range for applying to design pressure specified in **101. 3** (1) (A) and (B) of the Rules is in accordance with the following;
  (A) For piping systems on the discharge side of ballast pumps or cargo oil pumps, from piping systems on the discharge side of pumps to inlet valves of ballast tanks or cargo oil tanks and joints of shore connection. However, where the ships discharge ballast water through sea chests, piping systems to sea chests are to be included.
  (B) For piping systems for operating oil, from hydraulic winches and hydraulic operating valves to the nearest stop valves.
(3) The design pressure of piping systems on the discharge side of circulating water pumps for exhaust gas economizer is applied appropriate modifications of the definitions for design pressure of feed water pump specified in **101. 3** (1) (C) of the Rules.

3. Structure, materials and strength for auxiliaries

In application to **101. 5** (1) of the Rules, "the Society specially considers necessary" is to be in accordance with the following;

(1) For the special auxiliaries specially considered necessary by the Society, the materials are to be determined case by case by the Society.

102. Pipes

1. Materials

(1) The carbon steel pipes for ordinary piping marked *KS* as pipes produced at the manufacturing process approval factory of the Society may be used for Class II on the assumption that the requirement specified in **102. 2.** (4) of the Rules.

2. Service limitations for copper and copper alloy pipes In application to **102. 3** of the Rules, service limitations for copper and copper alloy pipes are to be in accordance with the following;

(1) Copper pipes are not to be used for the following;
  (A) Pipes of which design temperature exceeds 200 °C (excluding pipes for gauging)
  (B) Fuel oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes, air purge pipes, and short pipes from fuel oil burning pumps to combustion units)
  (C) Lubricating oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes, air purge pipes, and pipes arranged in spaces except machinery spaces)
  (D) Hydraulic oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes and air purge pipes)
  (E) Thermal oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes and air purge pipes)

(F) Cargo oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes and air purge pipes)
(G) Bilge pipes (excluding pipes for gauging, drain pipes and air purge pipes)
(H) Ballast water pipes (excluding pipes for gauging and air purge pipes)
(I) Pipes for fire extinguishing (excluding pipes for gauging)
(J) Pipes which directly affect water ingress by damage when fire(application range is cooling sea water pipes installed below the load water line in machinery space category A excluding pipes for gauging, drain pipes and air purge pipes).
(K) Air pipes (including starting air pipes)
(L) Overflow pipes
(M) Sounding pipes (excluding pipes in the sounded compartments)
(N) Pipes considered necessary by the Society

(2) Copper alloy pipes are not to be used for the following;
(A) Pipes of which design temperature exceeds 200 °C (excluding pipes for gauging), white copper pipes of which design temperature exceeds 300 °C (excluding pipes for gauging)
(B) Fuel oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes and air purge pipes)
(C) Lubricating oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes, air purge pipes, and pipes arranged in spaces except machinery spaces)
(D) Hydraulic oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes, air purge pipes and pipes arranged in spaces exept machinery spaces)
(E) Control oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes and air purge pipes)
(F) Thermal oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes, and air purge pipes and pipes arranged in spaces except machinery spaces)
(G) Cargo oil pipes (excluding pipes arranged in tanks, pipes for gauging, drain pipes and air purge pipes)
(H) Pipes for fire extinguishing (excluding pipes for gauging)
(I) Pipes which directly affect water ingress by damage when fire(application range is cooling sea water pipes installed below the load water line in machinery space category A excluding pipes for gauging, drain pipes and air purge pipes)
(J) Control air pipes of auxiliaries and valves being used for fire extinguishing (excluding drain pipes)
(K) Any pipe penetrating either A class division or B class division
(L) Pipes specified in above (1) (G), (H), (K) through (N)

(3) Copper and copper alloy pipes for gauging are to be of short only.

3. Use of special materials and flexible pipes In application to **102. 5** of the Rules, the following are to apply.

(1) In case where plastic pipes are used, plastic pipes are to comply with the requirements given in the **Annex 5-6.**

(2) When aluminium alloy pipes are used, the following requirements are to be complied with;
(A) Aluminium alloy pipes are, as a rule, to be in accordance with the requirements of the standards deemed appropriate by the Society, and are to be of seamless drawn pipes or seamless extruded pipes.
(B) The pipes for the following are not to be of aluminium alloy;
(a) As a rule, pipes with a design temperature exceeding 150 °C
(b) Pipes specified in above **2.** (2) (B) through (L)
(C) The required wall thickness of aluminium alloy pipes subject to internal pressure are to be in accordance with the following;
The wall thickness of pipes is to be determined by the formula in **102. 6** of the Rules. In this case, the allowable stress f is to be of the minimum value of the following values. However, when the design temperature is not in the creep region of the material, no consideration may be required for the value of f_3.

$$f_1 = \frac{R_{20}}{4.0}, \quad f_2 = \frac{E_T}{1.5}, \quad f_3 = \frac{S_R}{1.6}$$

Where

R_{20} : Specified minimum tensile strength (N/mm^2) of the material at room temperature (less than 50 °C)

E_T : 0.2 % proof strength (N/mm^2) of the material at the design temperature

S_R : Mean value of creep breaking stress (N/mm^2) of the material after 100,000 hours at the design temperature

(3) Expansion pipes(including end connection parts) and flexible pipes(including end connection parts) of metallic or non-metallic material, used for the pipes of Class 1 or class 2 or used for pipes likely to cause fire or flooding in case of their fracture, are to be of approved type. And flexible pipes(including end connection parts) are to be in accordance with the requirements given in the **Annex 5-9.**

4. Required wall thickness of pipes

(1) The column "Overboard scupper pipes" in **Table 5.6.2** of the Rules is applied to ships having length of 24 m or over, and international service area.
(2) The requirement of "threaded pipes" in **Table 5.6.3** NOTES 2. of the Rules is not applied to pipes from distribution stations to nozzles on CO_2 piping for fire fighting.
(3) The minimum wall thickness of exposed parts of air pipes opened on free-board deck or superstructure of ships having length of 24 m or over, and international service area is to be in accordance with the following;
(A) For the air pipes installed on position I or position II of exposed deck openings defined in **Pt 4, Ch 2, 102.** of the Rules, and induced to compartments under freeboard deck, enclosed super-structure or enclosed deck house, the relevant column of "Air pipes on exposed deck" in **Table 5.6.2** of the Rules is applied.
(B) For the pipes other than above (A), the relevant column of "Air, overflow and sounding pipes for hull structural tanks" in **Table 5.6.2** of the Rules is applied.
(4) The corrosion allowance for CO_2 pipes used for fire fighting may be reduced to zero.

103. Valves and fittings

1. In application to **103. 1.** (1) and **4.** (1) of the Rules, "the Society may accept to use valves and fittings made of materials which meet Korean Industrial Standards or Equivalent." means the following valves and fittings.

Materials	Design Temperature (°C)	Nominal diameter (D) : A Design pressure (P) : MPa
Carbon and low alloy steel, cast iron with an elongation of 12 % or above	< 300 and	$D \leq 50$ or $P \times D \leq 250$
Copper alloy	< 200 and	$D \leq 50$ or $P \times D \leq 150$

2. The materials for pipes, valves, cocks and fittings of piping systems used for ships having length less than 30 m may be manufactured and tested in accordance with *Korean Industrial Standards* or standards considered as equivalent thereto.

3. Service limitations for cast iron for valves and pipe fittings In application to **103. 4** (3) of the Rules, the gray cast iron may be used for the following piping system.

(1) The valves and pipe fittings used in cargo oil lines within cargo tanks of tankers.
(2) The valves and pipe fittings used in piping systems on open deck for flammable liquid cargo which has not any other risks.

4. Rubber seat butterfly valves are to be dealt with under the following requirements ;

(1) Application
Rubber seat butterfly valves (hereinafter referred to as the butterfly valve) may not to be used for the applications below. However, they may be used according to the discretion of the Society.

(A) Outlet valves fitted to the tank carrying flammable or combustible liquid (e.g., fuel oil, crude oil, etc.) and subjected to the liquid head, installed in the engine room or area susceptible to fire. However, they may be as those installed within the cargo oil tanks or outlet valves leading to the pump room of oil tankers.
(B) Valves in piping system with a design pressure exceeding 1.6 MPa
(C) Valves in piping system with a design temperature exceeding 70 °C
(D) Valves in piping system handling special liquids other than water and oil
(E) Valves in the fuel oil piping system within the engine room in case they have such a construction that the internal lining rubber is extended to the abutting face of flange for using as a gasket.

(2) Construction and marking of product
The construction of butterfly valves is to conform to the following requirements ;
(A) Stopper can be engaged at the designed "Open" and "Shut" positions.
(B) Valves serving at intermediate valve disc position can be kept the position with the locking system not to be loosened between "Open" and "Shut" by vibration, mechanical impact or liquid flow, etc..
(C) The valve can be one-man-operated.
(D) Means are to be provided to indicate the valve disc position.
(E) The valve stem is to have a sufficient strength and the valve disc is to be fitted to the valve stem in such a way of hardly loosening.
(F) The materials of the main parts of the valve are to have sufficient corrosion resistance and wear resistance in consideration of its intended use.
(G) Butterfly valves used as seawater suction valves or overboard discharge valves are, in principle, to be of the flange type.
(H) Marking of product
The butterfly valve is to be marked with the following items at a conspicuous place of the product:
(a) Kind of liquid
(b) Design pressure
(c) Material of valve box
(d) Nominal diameter
(e) Name of manufacturer

(3) Tests and Inspections
The butterfly valve is to be tested and inspected in accordance with the following. However, where the attendance of the surveyor is required by the Rules, tests and inspections are to be in accordance with the relevant requirements.
(A) Material test
Material test is to comply with the requirement given in **103. 1.**
(B) Hydrostatic test for valves
Valves are to be subjected to a hydrostatic test at the pressure not less than 1.5 times the design pressure. However, the ship-side valves are to be subjected to a hydrostatic test at the pressure of 0.5 MPa. (in way of valves with rubber lining, to be tested after lining)
(C) Leak test for valves
Valves are to be subjected to a leak test by 1.1 times the design pressure at each sides. Valves with special seat construction are to be subjected to tests according to the construction. However, leak test of pressure side only may be accepted where deemed necessary by the Society.
(D) Operating test
Operating tests are to be carried out appropriate times.
(E) Visual inspection
Visual inspections for valve seat and valve disc are to be carried out after tests specified in (B) and (C).
(F) The attending surveyor may request documents relating to inspections for rubber materials used for seat and lining.

5. Construction and standard of pipe fittings

(1) Standards for pipe flanges
Standards for pipe flanges are to be in accordance with the following;
(A) In **103. 5** of the Rules, "construction specified in *Korean Industrial Standards*" means those

complying with the requirements of "*KS B* 1501-1503, 1506, 1507, 1509-1511, 1519, 1521 and *KS B* 1540"

(B) Where pipe flanges complying with "*B* 16-150~2500 *Lb*" specified in *ANSI* are used, the material, size and type of weld joints may be taken as equivalent to those complying with the Rules.

(2) Nominal diameter (The following applies same-wise to "nominal diameter of pipes" used in **Pt 5, Ch 6** of the Rules)
Nominal diameters of pipes are to be in accordance with the following;

(A) For the pipes having their nominal diameter specified in *KS*, the pipes having the nominal diameter specified in the Rules or the Guidance are to be taken for those having same nominal diameter in *KS*.

(B) For the pipes having their nominal diameter not specified in *KS*, the pipes having "nominal diameter 00 mm" specified in the Rules or the Guidance are to be taken for those having corresponding "out-diameter xx mm" in *KS*, being replaced by the relation between the nominal diameters and the outside diameters of pipes in *KS*.

(3) Pipe flanges
Flanges specified in "*KS B* 1503, 1511 and *KS B* 1521" may be used at the pressure specified in "*KS B* 1501".

104. Type of connection

1. Flange connections

(1) The type of pipe joint with a bell-mouthed pipe end as shown in **Fig 5.6.1** of the Guidance may be used for pipes in pipes in Class Ⅲ and pipes in Class I or II with a design pressure of 1 MPa or less and with a nominal diameter of 50 A or less.

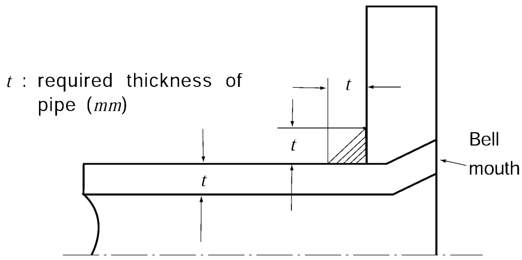

Fig 5.6.1

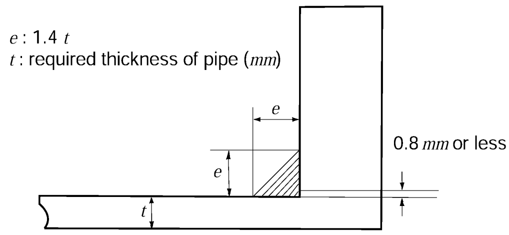

Fig 5.6.2

(2) The one side welded flange joint shown in **Fig 5.6.2** of the Guidance may be used for drinking water piping, scupper piping and sanitary piping located above the load line, drain piping, overflow piping, air vent piping, exhaust gas piping, gas vent piping of crank chambers, exhaust steam piping and foam fire extinguishing agent discharge piping having an open end. For pipes in Class Ⅲ used for pipes other than above, they may be used for pipes with a nominal diameter of 40 A or less other than for flammable oils.

(3) In application to **104. 3.** (5) of the Rules, application of flange connections is to comply with Guidance **Table 5.6.1**.

2. Slip-on threaded joints

In application to **104. 1** of the Rules, threaded pipe joints may be used in pipes having small diameter for gauging devices.

3. Solder

In application to **104.** 1 of the Rules, non-ferrous metal valves and fittings may be soldered to non-ferrous metal pipes. Where design pressure 0.7 MPa or below and the design temperature does not exceed 93 °C, ordinary solder may be used. When pipe flanges are soldered to copper pipes, the procedure for soldering is to comply with the following.

(1) The portion to be soldered is to be provided with a suitable molten pool and the pipe end is to be bell mouthed.

(2) Fillet welding is not recommendable for connecting a copper pipe with pipe flange. However, this recommendation may be waived when special soldering method such as silver soldering or TIG welding is applied.
(3) Copper pipes connected by soldering may be used for applications when the design temperature is 200 °C or below.

Table 5.6.1 Typical Application of Flange Connections

Class of piping \ Service	Steam[(1)] and thermal oil	Fuel and lubricating oil	Air[(1)], Water[(1)], Hydraulic oil[(1)] and gas[(1)]
I	A, B[(2)]	A, B	A, B
II	A, B, C, D[(3)]	A, B, C	A, B, C, D[(3)]
III	A, B, C, D	A, B, C	A, B, C, D, E[(4)]

NOTES:
1. (1) to (5) marked in this Table are as follows.
   (1) Type A joints are to be used for pipes whose design temperature exceeds 400°C.
   (2) Type B joints may be used for pipes having a nominal diameter not exceeding 150A only.
   (3) Types D and E joints are not to be used for pipes whose design temperature exceeds 250°C.
   (4) Type E joints may be used for water pipes or pipes with an open end.
2. Type A, B or C joints may be used for refrigerant piping of ammonia.

106. Post weld heat treatment

1. Nevertheless the requirements of **106. 1** of the Rules, for pipes for pressure gauge equipped with pipe systems belonging to Class I or Class II, the post weld heat treatment may be omitted after considering temperature of fluid.

107. General requirements for piping arrangement

1. Installation In application to **107. 1** (6) of the Rules, where pipes are inevitably led in the vicinity of electrical equipment, it is to be also complied with requirements of **Part 6, 301. 1** of the Guidance.

2. Protection of pipes and fittings In application to **107. 2** (2) of the Rules, drain traps are to be provided on the scuppers from refrigerating spaces.

3. Pressure gauges and temperature gauges In application to **107. 4** of the Rules, pressure gauges and temperature gauges, as a general rule, are to be installed in accordance with "*KS V* 7013 and *KS V* 7014".

4. Gaskets and packings In application to **107. 5** of the Rules, packings for flanges, pipe fittings, valve covers and valve stems, as a general rule, are to be installed in accordance with "*KS V* 7112".

5. Slip joints In application to **107. 6** of the Rules, the slip joints are to be complied with the following.

(1) The joints of bilge suction piping and ballast piping led to cargo hold are to be flanged connections or welding type joints. However, slip joints may be used where deemed appropriate by the Society.
(2) For the pipes within the tanks containing the same liquid as that drawn through the piping, slip joints may be used.
(3) Slip joints may be used for the cargo oil pipes, but are not to be used within the ballast tanks through which the pipes are passing.

6. Penetration of pipes In application to **107. 7** of the Rules, valve stems of various valves are, in principle, not to penetrate through the part subjected to liquid head such as the bottom plate of wing tanks and top plate of double bottom used for tanks. In case where such penetrations are unavoidable, considerations are to be taken by providing such means as protection pipe to prevent liquid head from imposing on the stuffing box.

7. Watertight Bulkhead In application to **107. 8** of the Rules, suction pipes of the stern tank are to be fitted with stop valves at the fore side of the bulkhead.

8. Sea water and fresh water piping In application to **107. 12** of the Rules, Where the piping are unavoidably used both as sea water service and fresh water service, the stop valve is to be provided on each suctions, with a notice plate suitably put so as to prevent from mishandling.

9. When equipment for gas welding are provided on-board, it is to comply with **Annex 5-5** of the Guidance.

10. Marking In application to **107. 10** (1) of the Rules, markings for identification of pipes, as a general rule, are to be in accordance with "*KS V* 7015 (Identification of Pipes for Vessels)".

Section 2 Air Pipes, Overflow Pipes and Sounding Devices

201. Air pipes

1. General

In application to **201. 1** (5) of the Rules, the examples of the construction preventing direct ingress of seawater splashes or rain water are as shown in **Fig 5.6.3** of the Guidance. This requirement applies only to ships subject to the requirements of the SOLAS. However, where air pipes are located in higher position than the upper deck and are considered not to be damaged by wave or other external force such as fuel oil tank and lubricating oil tank for emergency generator, this may be omitted.

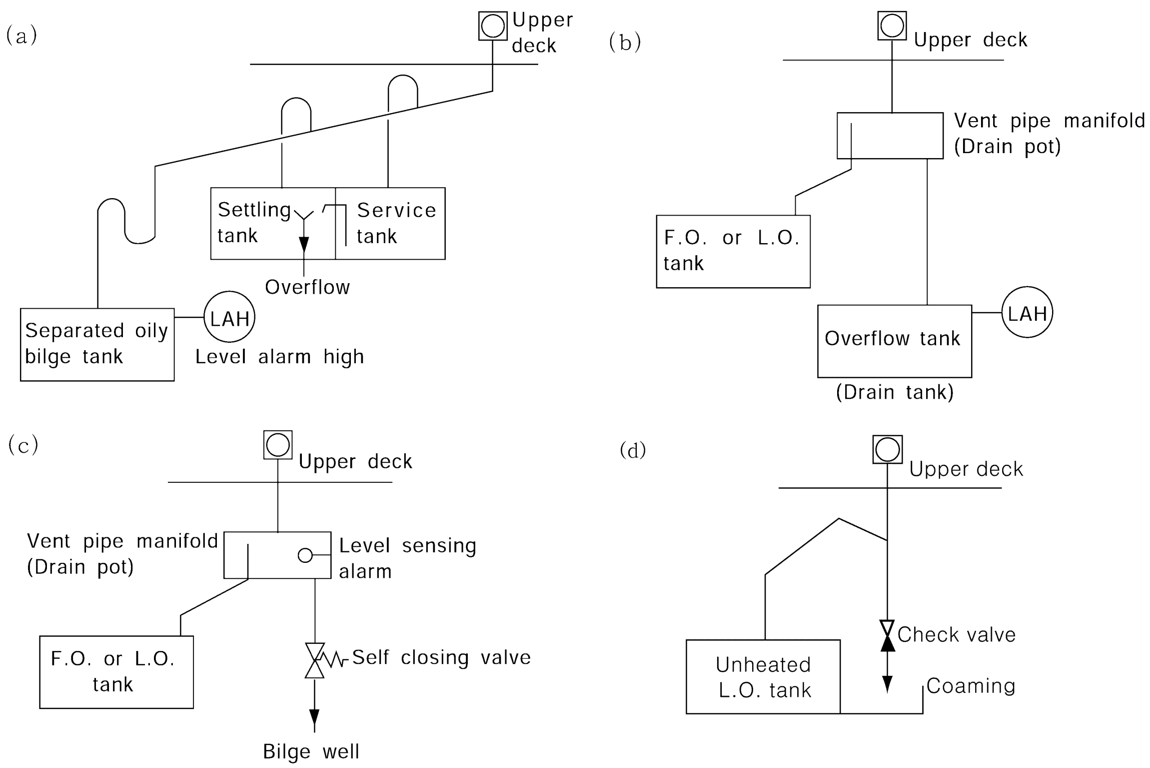

Fig 5.6.3 The Example of Construction Preventing Direct Ingress of Seawater Splashes or Rain Water

2. Protection of air pipe outlets

(1) In application to **201. 3** (2) of the Rules, the wording "the flame-screens which deemed appropriate by the Society" is to comply with the following.

(A) to be made of corrosion resisting material
(B) to comprise two fitted screens of at least 20 × 20 mesh spaced 25.4 ± 12.7 mm apart or single fitted screen of at least 30 × 30 mesh, or to have a performance equivalent thereto.

3. Size of air pipes

In application to **201. 4.** (1) of the Rules, the air pipes for the tank is provided with an overflow pipe are to comply with the following.

(1) Where the aggregated sectional area of overflow pipes in the tank is greater than 1.25 times the effective area of the filling pipes, the air pipes may be omitted. In this time, the sectional area of air pipes in the overflow tank is not less than the aggregated sectional area of overflow pipes.

(2) For the tanks which are provided with common overflow pipes, the air pipes in each tank may be omitted where the sectional area of overflow pipes from each tank is greater than 1.25 times the effective area of filling pipes from each tank, and the sectional area of common overflow pipes and the sectional area of air pipes of the overflow tank are greater than 1.25 times the aggregated sectional area of the filling pipe of each tank which filled simultaneously. However, the sectional area of common overflow pipes and the sectional area of air pipes of the overflow tank are need not to exceed 1.25 times the sectional area of common filling pipes.

(3) In application to (1) and (2) above, where overflows from the tanks such as fuel oil settling tank, fuel oil service tank, etc. are led to other tank with air pipes, suitable means are to be provided so that the air in the highest portion of these tanks is vented to other tank with air pipes. (refer to **Fig 5.6.4** of the Guidance).

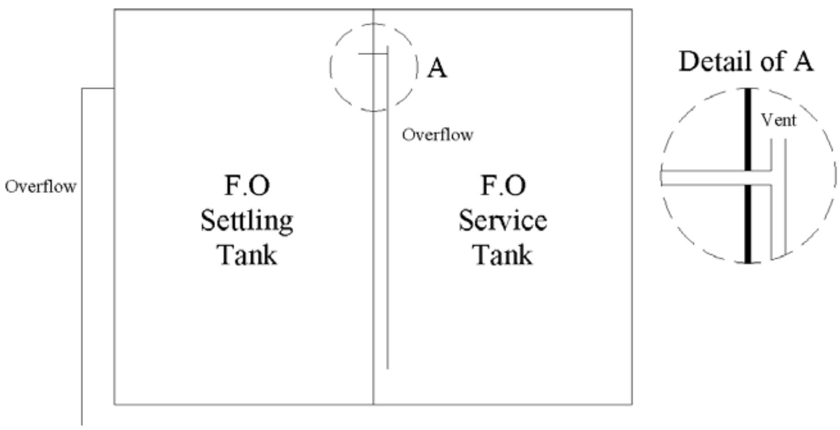

Fig 5.6.4 Example of Details of Overflow Pipe

4. Height of air pipes

(1) In application to **201. 5** of the Rules, the height of air pipes above deck is to be measured as shown in **Fig 5.6.5** of the Guidance.

(2) In application of **201. 5** of the Rules, where these height interfere with the working of the ships, such as ships not engaging on international voyages, tug boat, barge, etc., a lower height may be accepted, provided that the automatic closing device approved by the Society is fitted. In such cases, the minimum height may be reduced to 450 mm on the freeboard deck and 300 mm on the superstructure deck.

203. Sounding devices

1. Construction of sounding pipes In application to **203. 3** of the Rules, construction of sounding pipes is to be complied with the following.

(1) In case where elbow type sounding pipe is unavoidable to use, sufficient support is to be provided for the arm of the pipe. The standard thickness value of striking plate is approximately 10 mm for ships having length less than 30 m and 12 mm for ships having length 30 m or over. (refer to **Fig 5.6.6** of the Guidance)

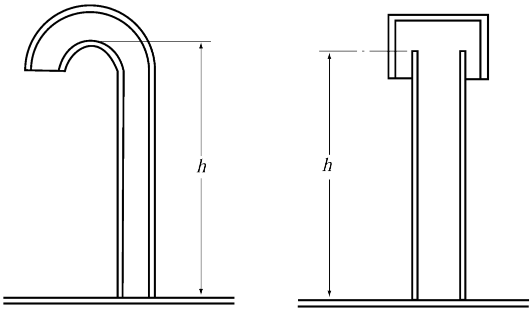

Fig 5.6.5 The Height of Air Pipe

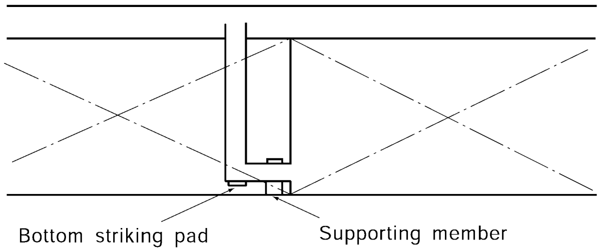

Fig 5.6.6 Example of Elbow Type Sounding Pipe Arrangement

Section 3 Ship-side Valves and Overboard Discharge

301. Ship-side valves and fittings

1. Construction of distance pieces In application to **301. 2** of the Rules, distance pieces are to be complied with "*KS V* 7141 (ship-side distance pieces)" or equivalent.

2. Location of overboard discharges In application to **301. 6** of the Rules, location of overboard discharges is to be complied with the following.

(1) The wording "overboard discharges" specified in **301. 6** of the Rules, means the discharge opening subjected to pressure by the pump and not including those for natural gravitational discharge.

(2) The wording "such location" specified in **301. 6** of the Rules, means the area other than that hatched in **Fig 5.6.7** of the Guidance.

(3) Where the location of overboard discharges is to be such that water can be discharged into life boats when launched, either of the following means is to be provided.

(A) Means to guide the water flow to the shell plating.

(B) Means to stop water discharge which is able to be operated from the weather deck and in the vicinity of the installed place of the lifeboat.

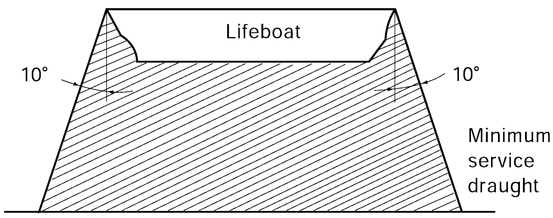

Fig 5.6.7

302. Scuppers and sanitary discharge

1. Scuppers of exposed decks In application to **302. 3** of the Rules, scuppers piping within superstructures are not to be connected to the scupper piping of exposed decks.

2. Non-return valves of scuppers and sanitary pipes In application to **302. 4** of the Rules, discharge from spaces under the freeboard deck is to comply with the following.

(1) Discharge from under the freeboard deck

(A) Inboard open end of scuppers

(a) Where discharge of bilge from the small compartments at fore and stern (steering gear room, boatswain's store, chain locker, etc.) is carried out by hand pumps or ejectors, "the vertical distance to the inboard opening end of scupper" means the vertical distance to the position located highest in the system of such discharge pipes.

(b) Inboard open end of scupper pipes in case where timber load lines are marked, the vertical distance to the inboard open end is to be measured from the timber summer load line.

(B) Overboard discharge pipes which are always closed during navigation.
Requirements of **302. 4** of the Rules are to be applied to normally opened discharge pipes during a voyage, but, in case normally closed discharge pipes, except when discharging, during a voyage such as gravity discharge of top side tank, a screw down stop valve with opened/close indicator being operable from a position easily accessible on the freeboard deck may be used.

(C) Overboard discharge pipes
Discharge pipes passing through cargo hold are to be of steel pipe with SCH.160 or 16 mm of wall thickness and above, or are to be protected appropriately.

3. Scupper pipes from the enclosed cargo spaces on the freeboard deck

In application to **302. 5** (1) of the rules, where the freeboard to the freeboard deck is such that the deck edge is immersed when the ship heels more than 5°, the drainage of the enclosed cargo spaces on the freeboard deck to suitable spaces below deck is also permitted, provided such drainage is arranged in accordance with the requirements in **302. 5** (2) of the Rules.

Section 4 Bilge and Ballast System

401. General

1. Application Bilge piping of ships having length less than 50 m is to comply with the following. However, requirements not specified in the following are to be in accordance with the Rules.

(1) Number of bilge pumps
Number of bilge pumps are to be in accordance with **Table 5.6.2** of the Guidance.

(2) Capacity of bilge pump
The independent power bilge pump specified **Table 5.6.2** of the Guidance, is to have capacity not less than that obtained from the formula in **405. 2** of the Rules. However, it may be added to the capacity of a independent power bilge pump given in (1) above.

(3) Internal-diameter of bilge suction pipes
Main bilge suction pipes, direct bilge suction pipes and bilge suction branch pipes are to be of internal diameters not less than the diameter obtained from the following formula (A) through (C).

(A) Main bilge suction pipes or direct bilge suction pipes

(a) For ships having length less than 25 m

$$d = 1.22 \times (L - 10) + 10 \quad (\mathrm{mm})$$

(b) For ships having length 25 m or over, but less than 35 m

$$d = 2.67 \times (L - 20) + 15 \quad (\mathrm{mm})$$

(c) For ships having length 35 m or over

$$d = 1.68\sqrt{L(B+D)} + 25 \quad (\mathrm{mm})$$

(However, d is not to be less than 50 mm.)

(B) Bilge suction branch pipes

(a) For ships having length 35 m or over

$$d' = 2.15\sqrt{l(B+D)} + 25 \quad (\mathrm{mm})$$

(b) In ships having international service area, internal diameter of bilge suction branch pipes is not to be less than 50 mm, but, internal diameter of bilge suction pipe for small compartments may be 40 mm according to the discretion of the Society.
(c) Internal diameter of bilge suction branch pipes for bow and stern tanks and shaft tunnel may be reduced to 50 mm in ships having length 35 m or over, and to internal diameter approved by the Society in ships having length less than 35 m.

(C) In ships having length 35 m or over, internal diameter of main bilge suction pipes is not to be less than the largest value for bilge suction branch pipe obtained from the formula specified in (B).

(4) Direct bilge suction pipe
Nevertheless above (A), the internal diameter of direct bilge suction pipes may be reduced appropriately according to the discretion of the Society.

(5) Emergency bilge suction pipe
Emergency bilge suction pipes are to comply with the following.
(A) Ships provided with steam turbine as main engine are to be provided with emergency bilge suction pipes complied with the Rules.
(B) Ships provided with diesel engine as main engine may be omitted according to the discretion of the Society.

(6) Bilge pipe in engine room
Bilge pipes made of copper may be used.

Table 5.6.2 Number of Bilge Pumps

Length of ship(L)	Power bilge pump		Manual pump	Remarks
	Main engine driven pump	Independent power pump		
$L < 25$ m	1 set	—	1 set	The main engine driven pump may be omitted according to the discretion of the Society. In case ships less than 10 m, a bucket may be provided instead of a pump.(※)
25 m ≤ L < 30 m	1 set	1 set	—	2 sets of manual pumps may be provided instead of the main engine driven pump. Where ships is difficult to be provided with the independent power pump, the independent power pump may be omitted by considering piping system and capacity of other pumps.(※)
30 m ≤ L < 50 m	1 set	1 set	—	2 sets of manual pumps may be provided instead of the main engine driven pump.

(Note)
1. The requirement with mark (※) is to be applied to ships other than passenger ship.
2. In this Table, power pump may be provided instead of manual pump, and independent power pump may be provided instead of main engine driven pump.
3. In ships having length 25 m or over, but less than 30 m, the requirement for omission of independent power pump is to be applied to ships difficult to be provided with the independent power pump, provided with main engine driven pump having capacity more than suction capacity required by independent power pump, and arranged bilge piping in all compartment required bilge discharge. Where the hand pump is substituted for main engine driven pump, the independent power pump may be omitted.
4. In ships having coastal service area, the bilge pump for oil filtering equipment may be recognized as a manual bilge pump.
5. All power pumps and manual pumps are to discharge bilge from cargo hold, engine room and shaft tunnel.

2. In application to **401. 2** (1) of the Rules, where void spaces and cofferdams do not affect to ship's stability and are located above the load water line, the spaces may be drained by installation of a separate bilge pump(a portable pump may be accepted) or by gravity, instead of fixed bilge piping system connected to main bilge line. However, where draining by gravity, this pipe is to be provide with a quick-acting self-closing valve located in a readily accessible position.

402. Drainage of compartment other than machinery spaces

1. Omission of bilge suction pipes For small compartment such as echo sounder recess, the provision of bilge suction pipes may be omitted under the approval of the Society.

2. Bilge scuppers in special case In case where hold bilges are drained to the engine room or shaft tunnel adjacent thereto through the watertight construction as specified in **Fig 5.6.8** of the guidance, the bilge drainage piping is to be led to spaces readily accessible and self-closing valve or cock is to be provided. Where such bilge is led to the watertight bilge tanks, the above mentioned valve or cock may be omitted, but where the hold is located under the load line, non-return valve is to be provided. In case where hold bilges are led to the shaft tunnel, no sounding pipe may be provided, but the diameter of the drainage pipe is not to be less than the value specified for bilge suction pipe.

3. Bilge well high water level alarms For ships being within the application limits of regulation XII/4.2 of SOLAS, which have been constructed with an insufficient number of transverse watertight bulkheads to satisfy the regulation, it is provided with bilge well high water level alarms in all cargo holds, or in cargo conveyor tunnels, as appropriate, giving an audible and visual alarm on the navigation bridge.

404. Size of bilge suction pipes

1. Main bilge pipes

(1) Internal diameter of main bilge pipes is not to be less than 60 mm in ship engaged in international service area, and not to be less than 50 mm in ships having length 35m or over.
(2) The standard pipes of internal diameter nearest to the calculated diameter may be used. However, in case where the diameter of such standard pipes is small of the calculated value by 13mm or over, standard pipes of one grade higher diameter are to be used.

2. Bilge suction branch pipes In application to **404. 2** of the Rules, the bilge suction branch pipes are to be complied with the following.

(1) For bilge suction piping of hold bilges, the main bilge suction system (Christmas tree system) is, in principle, not to be adopted. In case where such an arrangement is unavoidable, the ship is to be ensured satisfying the one-sub-division flooding condition. The internal diameter of bilge suction pipe in such a system is to be calculated according to the **Fig 5.6.9** of the Guidance.

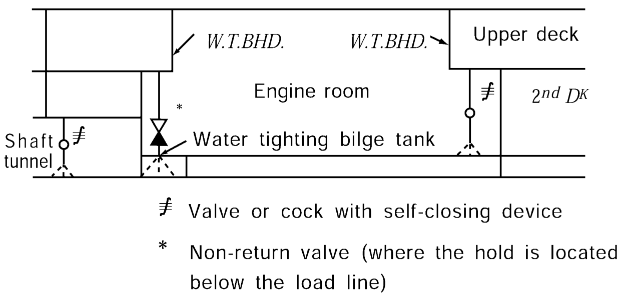

Fig 5.6.8 Example of Hold Bilge Drainage Line through the Watertight Construction

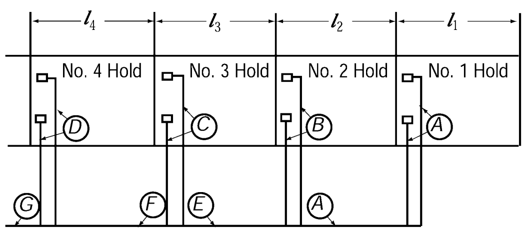

Fig 5.6.9 Example of Main Bilge Suction System for Hold Bilge Suction Line

(A) Pipes A, B, C and D are to be calculated as bilge suction branch pipe respectively by substituting l_1, l_2, l_3 and l_4 to l.
(B) Pipe E is to be calculated as main bilge line by regarding the sum of l_1+l_2 as L, and the sectional area of pipe E is to be sum of sectional areas of pipe A and B or more.
(C) Pipe F is to be calculated as main bilge line by regarding the sum of $l_1+l_2+l_3$ as L, and the sectional area of pipe F is to be sum of sectional areas of the largest two bilge suction

branch pipes among A, B and C.

(D) Pipe G is to be calculated as main bilge line by regarding the sum of $l_1+l_2+l_3+l_4$ as L, and the sectional area of pipe G is to be sum of sectional areas of the largest two bilge suction branch pipes among A, B, C and D. In this case, a screw-down type non-return valve is to be provided at the suction of each branch piping. In case where the installed position of such valve is not readily accessible, a remote control device is to be provided.

(2) Internal diameter of bilge suction pipe of a ship with double hull construction.
In ships with double hull construction, the inside diameter of bilge suction pipe may be determined by using the distance between the inner hull in place of the breadth of a ship.

(3) Internal diameter of the bilge branch suction pipes for ships is not required more than 100 mm, but internal diameter of the bilge suction branch pipes for ships engaged in international service area is not to be less than 50mm . In case of **401. 2** (3) of the Rules, internal diameter of the bilge branch suction pipes is to have a capacity of not less than 125 % of the capacity required in water spraying system, etc.

405. Bilge pumps

1. Number of bilge pumps

(1) Ships other than passenger ship may be provided with a bilge eductor instead of 1 set of bilge pump required **405. 1** of the Rules. In this case, pump supplying sea water to bilge eductor is to be pump other than main cooling water pump.

(2) Minimum number of combined using pumps for essential services (fire pump, ballast pump, bilge pump and auxiliary gas scrubber pump) of non-continuous nature in ships of 500 GT and over are in accordance with the following.

(A) On tankers provided with inert gas system, a minimum of 4 pumps, including an emergency fire pump, are to be required.

(B) On other cargo ships and tankers not provided with inert gas system, a minimum of 3 pumps, including an emergency fire pump, are to be required.

2. The wording "to be considered appropriate by the Society" specified in **405. 4** of the Rules means as below.

(1) Internal diameter of bilge suction pipes
The internal diameter of bilge suction pipes is not to be less than the value obtained by the following formula.

$$d = 1.68\sqrt{l(B+D)} + 25 \quad (\mathrm{mm})$$

Where

d : Internal diameter of bilge suction pipe (mm)

l : Length of cargo hold (m)

B : Breadth of cargo hold (m)

D : depth of ship (m)

(2) Suction capacity of eductor
The suction capacity of eductors is to be not less than that obtained from the formula.

$$Q = 5.66d^2 \times 10^{-3} \quad (\mathrm{m^3/h})$$

where

Q : Bilge suction capacity of eductor ($\mathrm{m^3/h}$)

d : Same as in (1) above

(3) Amount of driving water for eductor
The eductor is to be so arranged as to be driven by two or more units of pumps. In case where bilges in two or more cargo holds are discharged by the eductors driven by these pumps, the amount of driving water of each pump is to be sufficient to draw bilges in at least two

cargo holds simultaneously with the suction capacity as specified in (2) above.

(4) Eductor driving water stop valve and bilge discharge valve are to be provided. These valves are to be operable from a position on the bulkhead deck or upward, except where these valves are provided in the engine room.

(5) Bilge high level alarm device

(A) To prevent the back-flow of the eductor driving water to the bilge wells, a bilge high level alarm device is to be provided in each bilge well which activates the alarm when the back-flow occurs. The bilge high level alarm device is to activate audible and visible alarm in a normally manned position at which the cargo hold whose bilge level in the bilge well becomes high can be identified.

(B) The circuit of bilge high level alarm device is to have a self-monitoring function or at least two independent circuits are to be arranged in each cargo hold.

(C) The bilge high level alarm device in cargo holds loaded with coal is to comply with the requirements in **Pt 7, Ch 3, 1602.** of the Rules.

(6) Eductor driving water pipes passing through a side tank

In ships omitted bulkhead subject to double bottoms, where eductor driving water pipes pass through a side tank, open end of bilge suction pipes is provided with a non-return valve. And eductor driving water pipes, bilge discharge pipes and eductors in side tanks, as far as practicable, are to be located in the vicinity of longitudinal bulkhead of cargo hold side.

(7) Rose boxes at bilge suction ends

The rose boxes provided at bilge suction ends are to be of adequate ones matching the bilge suction capacity of eductor and comply with the requirements specified in **406. 9** of the Rules.

(8) Protection of bilge piping system in cargo holds

The eductor driving water piping, bilge discharge piping and eductor are to be so arranged as not to be damaged by cargo.

(9) Common use of eductor driving water with fire water

In case where eductor driving water is taken from the fire piping, consideration is to be so given that no adverse effect is cause on the fire-fighting function.

406. Pipe systems and their fittings

1. Bilge suction pipes and ballast suction pipes passing through deep tanks In application to **406. 4** of the Rules, the bilge suction pipes and ballast suction pipes passing through deep tanks are to be dealt with under the following requirements.

(1) For the bilge suction pipes passing through deep tank serving as the exclusive ballast tank, welded pipe joints may not be required if flange joints corresponding to a nominal pressure one rank higher than that according to the design pressure are used.

(2) In case where gravitational ballasting/deballasting is intended by using sea chests provided in the exclusive ballast tanks, double stop valves being operable from a position on the freeboard deck are to be provided.

(3) Suction pipes such as the bilge suction pipes and ballast suction pipes are not to pass through deep tanks carrying cargo oil, except that in case where th pipes are installed in pipe tunnel provided within the deep tanks.

(4) In the application of the requirements specified in (1) to (3) above, bilge hoppers are to be regarded as deep tanks.

2. Mud box In application to **406. 8** of the Rules, where ships having length less than 50 m, a rose box is provided instead of a mud box fitted in open end of bilge suction pipes and reserve bilge suction pipes according to the discretion of the Society.

Section 5 Feed Water and Condensate System for Boiler

501. Feed water pumps

1. Where feed water system of main boilers is group system, a stand-by feed water pump having capacity same as one set among feed water pumps in the group is to be provided. And, when one set among feed water pumps in the group is out of order during operating, the stand-by feed water pump is to be easily operated instead of it.

2. In essential auxiliary boilers having heat surface area 50 m^2 or less, a injector may be provided instead of one set among two sets of feed water pump.

502. Feed water piping

1. In application to **502. 1** of the Rules, the examples of a single penetration in the steam drum from two separate means of feed are as shown in **Fig 5.6.10** of the Guidance.

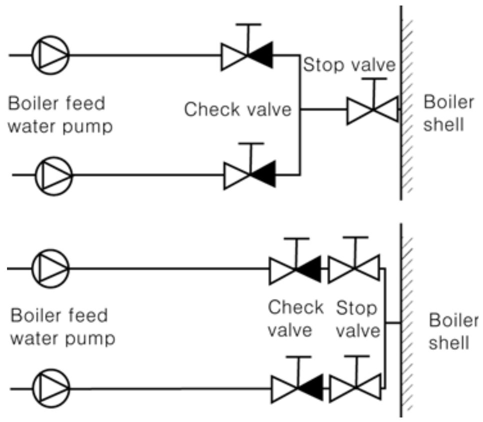

Fig 5.6.10

2. In application to **502. 1** of the Rules, where two or more adequately sized boilers are installed and the feed water for each of these boilers is supplied by a single feed water pipe, the level of redundancy for the piping of the feedwater system is considered to comply with **502. 1** of the Rules.

3. One feed water system may be accepted to provide for small package type auxiliary boilers which are required for essential services according to the discretion of the Society. In this case, one set of spare feed water pump is to be provided and when feed water pump is out of order, the spare feed water pump is to be easily exchanged for it.

4. Essential auxiliary boilers or other boilers intended to supply steam for fuel oil heating necessary for the operation of the main propulsion or cargo heating that is required continuously are to be provided with feed water systems in accordance with **501.** and **502.** of the Rules. The requirements in **501. 1, 2** and **502. 1** of the Rules need not to be applied provided that an alternative means is available to ensure the normal navigation and cargo heating with the feed water system being out of operation. For an auxiliary boiler used exclusively for the fuel oil heating necessary for the operation of main propulsion machinery and the cargo heating requiring continuously, only one feed water system may be accepted when one complete spare unit of feed water pump and one set of feed water check valve capable of being replaced in a short period of time.

Section 6 Steam and Exhaust Gas Piping

601. Steam piping

1. Piping In application to **601. 1** of the Rules, steam piping is to comply with the following.

(1) Steam heating pipes are to be so supported as not to be in direct contact with the hull members such as floor plates, etc.
(2) In principle, steam pipes are not to be led through cargo holds, but where it is impracticable to avoid this arrangement, pipes are to be insulated and protected by steel plate and, all joints are to be welded.
(3) Steam piping for steam turbine is to be in accordance with **Ch 2** of the Rules.
(4) Steam piping for boiler safety valves is in accordance with **Ch 5** of the Rules.

2. Where main steam lines of two or more boilers connected to common steam line, main steam valve of each boiler is to be screw down check valve and a stop valve is to be fitted between the screw down check valve and the common steam line.

3. Oil heating pipes In application to **601. 3** of the Rules, where oil heating pipe is jointed between heating main line and heating branch line for cargo oil tanks, duplicate stop valves or spectacle flanges are to be fitted in the heating branch line.

Section 7 Cooling System

702. Stand-by cooling water pumps

1. In application to **702. 3** of the Rules, the capacity of stand-by circulating pump in ships with main turbine propulsion machinery is to be of assuring sufficient engine output to develop speed of the ship to 7 knots or over, and speed effectively capable of steering.

2. In application to **702.** of the Rules, ships complied with the following as ships having a gross tonnage less than 500 tons may be omitted to provide the stand-by cooling pump.

(1) Ships engaged in smooth water service.
(2) Ships engaged in coastal service area, and equipped with two sets of main engine and independent cooling water pump for each main engine.

3. In application to **702. 7** of the Rules, high speed rotating engine of specific construction which can not be changed to spare pump without complete engine overhaul may be omitted to provide with spare pump.

4. In application to **702. 8** of the Rules, engines in small ship means a main engine or a auxiliary engine which are installed in ships having length less than 30 m. In case of a main engine, one set of spare pump is to be provided.

703. Sea inlets

Two sea inlets are located at bottom plate and, as far as practicable, are to be departed from each other to ship sides.

704. Strainers

1. In application to **704**. of the Rules, "the strainers which can be cleaned without interruption to the cooling water supply" is to comply with the following.

(1) For multi propeller ships and where single strainer is fitted between the sea water suction valves and the cooling water pump of internal combustion engine which coupled with each shafting system
(2) Where two or more the independent driven engines are coupled with one shafting system and single strainer is fitted in the individual engine
(3) Where two or more internal combustion engines driving essential auxiliary machinery are installed and single strainer is fitted in the individual engine

2. In application to **704.** of the Rules, "in small ship, the strainers may be omitted with approval of Society" is to comply with the following.

(1) In ships having length lass than 30 m, internal combustion engine driving main engine and essential auxiliary machinery may be omitted to provide the strainers.
(2) In ships having length lass than 30 m or over, and less than 50 m, internal combustion engine driving essential auxiliary machinery may be omitted to provide the strainers.

Section 8 Lubricating Oil System

802. Lubricating oil pumps

1. In **802.** of the Rules, ships complied with the following as ships having gross tonnage less than 500 tons may be omitted to provide the stand-by lubricating oil pump.

(1) Ships engaged in smooth water service.

(2) Ships engaged in coastal service area, and equipped with two sets of main engine and independent lubricating oil pump for each main engine.

2. In application to **802. 3** of the Rules, high speed rotating engine of specific construction which can not be changed to spare pump without complete engine overhaul may be omitted to provide with spare pump.

3. In application to **802. 6** of the Rules, the engine means a main engine or an auxiliary engine. In case of a main engine, one set of spare pump is to be provided.

803. Piping

Where steam heaters or heaters using other heating media are provided in lubricating oil systems, the heaters are to comply with **901. 11** (1) and (2) of the Rules.

804. Lubricating oil filters and purifiers

1. In application to **804. 2** of the Rules, the following may be accepted as "filters capable of being cleaned without stopping the supply of filtered lubricating oil".

(1) Auto cleaner or self cleaning filter

(2) Where single filter capable of being readily replaced or cleaned is fitted and by-pass line is provided in the ships engaged in smooth water service or coastal service.

(3) In case where a high-rotating-speed internal combustion engine of specific construction has single filter and differential pressure alarm device for the filter, and is provided with automatic lubricating oil feed line, and the Society considers appropriate.

(4) For multi propeller ships and where single filter is fitted in each engine which coupled with each shafting system.

(5) Where two or more the independent driven engines are coupled with one shafting system and single filter fitted in the individual engine.

2. In application to **804. 3** of the Rules, where any one of following is fulfilled, lubricating oil purifiers or equal effective filters may be omitted.

(1) In case where ships having a gross tonnage less than 500 tons and engaged in coastal service area have lubricating oil storage tank with sufficient capacity to exchange the system lubricating oil one time.

(2) In case where fishing vessels have lubricating oil storage tank with sufficient capacity to exchange the system lubricating oil one time regardless of tonnage and navigation area.

Section 9 Fuel Oil System

901. General

1. Arrangement of fuel oil system In application to the **901. 2** of the Rules, it is recommendable for fuel oil tanks not to be installed above main engine, auxiliary boiler and such others as far as practicable in consideration of oil leakage from tanks and accumulation of inflammable gas. In case where installation of oil tanks above the high temperature units is unavoidable, the following requirements are to apply, in addition to the relevant requirements provided in **Pt 5, Ch 6, Sec 1** and **Sec 9** of the Rules. The existing ships, if they are of such consideration as mentioned above, are to be reconstructed accordingly as far as practicable.

(1) Provision of means such as to install, if necessary, mechanical ventilation ducts and others, is to be considered, for the purpose of improving ventilation at the compartment installed the tanks.

(2) Drip trays are to have an adequate area as well as a sufficient depth. The trays are recommended to have their surface made less by increasing its depth than its area when the trays are intended to increase their volume.
(3) Oil drains from drip trays to oil drain tanks through drain pipes having suitable diameter. In this case, care is to be taken to arrange the pipes shortest possible with ample declivity and to permit no oil to stay in pipes. Drain tanks are to be equipped with the sounding gauge or to be of the construction being capable of sounding its depth.
(4) The overflow pipes fitted to fuel oil tanks are to comply with the requirements provided in the following.
 (A) The fuel oil tanks having its opening within machinery space like the case of fitting internal mount type float gauge into fuel oil tank, are to be provided with the overflow pipes having their aggregate sectional area 1.25 times or above as much the aggregate sectional area of filling pipes to such tanks.
 (B) The highest point of overflow pipes is to be located lower than the opened portion of fuel oil tank.
 (C) Overflow pipes are to be short and declined as far as possible.
 (D) Overflow pipes are to be fitted with non-return valve at a suitable position in order to prevent oil or water from counter-flowing into fuel oil tank when the tanks to receive overflow oil are being filled with oil or water. The non-return valve intended for this purpose is not to be of screw-down type. In case, however, the use of such type is necessary, suitable notice plate is to be affixed to the valve.
 (E) Excepting the non-return valves specified in the preceding (d), no stop valve is to be fitted to overflow pipes.
 (F) Overflow pipes and drain pipes are not to be connected mutually.
(5) Exhaust gas manifolds in the vicinity of which are installed fuel oil tanks, are to be adequately insulated for heat and further be covered, including their flanges, with the oil tight metal casing or with the cloth specially coated by oil resistant compound.

2. Fuel oil pipes and their fittings In application to **901. 3** (5) of the Rules, "hot surfaces" means all surfaces with temperatures above 220 °C.

3. Drainage system In **901. 4** of the Rules, the drainage systems are to be complied with the following.
(1) Drain valves of settling tanks for fuel oil pipe systems are to be of self-closing valves or cocks
(2) Fuel oil heaters having possibility to get pressure exceeding its maximum working pressure are to be provided with an relief valve, and the relieved drain is to be led to drain tanks or alternatively be disposed of by other means so as not to get scattered.
(3) In case where fuel oil tanks are unavoidably installed intermediately above the high temperature units, fuel oil drain is to be comply with the requirements in above **2** (1) (B) and (C).

4. Construction of fuel oil tanks In application to **901. 5** of the Rules, "small tanks" means fuel oil tanks having 1 m^3 or less in its full capacity.

5. Valves for tank suction pipe **901. 7** of the Rules is to be in accordance with the following.

The air piping for the remote shut-down valves of fuel oil tank main suction valve is to be arranged separately from piping for other purposes, and the air outlet valve from the air reservoir is to be fitted with name tag for clear identification of the intended service.

6. Fuel oil transfer pumps In application to **901. 9** of the Rules, the following may be accepted.
(1) The fuel oil transfer pumps may be in accordance with the following.
 (A) For main engine with output 368 kW or above but less than 1,471 kW or ships having length less than 50 m, the main fuel oil transfer pump is to be a power pump. Stand-by pump may be acceptable by hand pump.
 (B) Where main engine output is 368 kW or less, hand pump may be acceptable.
 (C) In case of ships equipped with two or more engines, the main engine output means total output of the engines.
(2) In case of ships engaged in smooth water service, 1 set of fuel oil transfer pump may be acceptable.

7. Fuel oil piping In application to **901. 10** of the Rules, for tanks used in common service with fuel oil tanks and ballast tanks, piping arrangement is to be made in such a way that either fuel oil or ballast water can be drawn individually under any circumstances. (refer to **Fig 5.6.11** of the

Guidance)

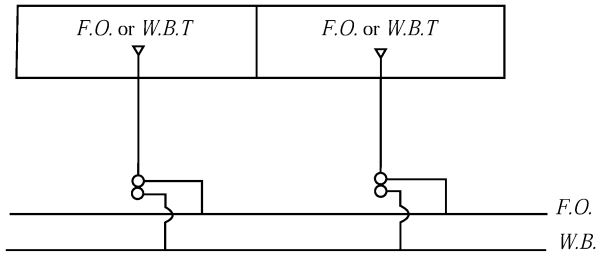

Fig 5.6.11 Example of Piping Arrangement for Fuel Oil Tank and Ballast Tank in Common Service

8. No fuel oil pipes are to be led through drinking water tanks, and no drinking water pipes are to be led through fuel oil tanks.

9. In application to **901. 13** of the Rules, the example of two fuel oil service tanks for each type of fuel oil used on board are as shown in **Fig 5.6.12** of the Guidance. This requirement applies only to ships subject to the requirements of the SOLAS.

(1) Example 1

(A) Requirement according to SOLAS : main, auxiliary engines and boilers operating with Heavy Fuel Oil(HFO) (one fuel ship)

HFO service tank capacity for at least 8 h Main engine + Aux. engine + Aux. boiler	HFO service tank capacity for at least 8 h Main engine + Aux. engine + Aux. boiler	MDO tank For initial cold starting or repair work of engines/boiler

(B) Equivalent arrangement

HFO service tank capacity for at least 8 h Main engine + Aux. engine + Aux. boiler	MDO service tank capacity for at least 8 h Main engine + Aux. engine + Aux. boiler

(Note)

1. this arrangement only appies where main and auxiliary engines can operate with heavy fuel oil under all load conditions and, in the case of main engines, during maneuvering.
2. For pilot burners of auxiliary boilers of provided, an additional MDO tank for 8 hours may be necessary.

(2) Example 2

(A) Requirement according to SOLAS : main engines and auxiliary boilers operating with Heavy Fuel Oil(HFO), auxiliary engines operating with Marine Diesel Oil(MDO)

HFO service tank capacity for at least 8 h Main engine+Aux. boiler	HFO service tank capacity for at least 8 h Main engine+Aux. boiler	MDO service tank capacity for at least 8 h Aux. engine	MDO service tank capacity for at least 8 h Aux. engine

(B) Equivalent arrangement

HFO service tank capacity for at least 8 h Main engine+Aux. boiler	MDO service tank Capacity for at least the highest of : · 4 h Main engine+Aux. engine+Aux. boiler or · 8 h Aux. engine+Aux. boiler	MDO service tank Capacity for at least the highest of : · 4 h Main engine+Aux. engine+Aux. boiler or · 8 h Aux. engine+Aux. boiler

(Note)

1. The arrangements in above apply, provided the propulsion and vital systems which use two type of fuel support rapid change over and are capable of operating in all normal operating conditions at sea with both types of fuel(MDO and HFO).
2. Service tank is a fuel oil tank which contains only fuel of a quality ready for use. use of a setting tank with or without purifiers, or purifiers alone, and one service tank is not acceptable as an equivalent arrangement to two service tank.

Fig 5.6.12 Example of Application for Fuel Oil Service Tank

902. Burning systems for boiler

1. Burning system For an auxiliary boiler used exclusively for the fuel oil heating necessary for the operation of main propulsion machinery or the cargo heating requiring continuously, only one burning system may be accepted, when one complete spare unit of burning pump capable of being replaced in a short period of time is equipped, notwithstanding the requirements in **902. 1** (2) of the Rules.

2. For small package type auxiliary boilers, where it is difficult to arrange two burning systems, one burning system may be accepted. In this case, one set of spare burning pump is to be provided and when burning pump is out of order, the spare burning system is to be easily exchanged for it.

903. Fuel oil supply system of internal combustion engines

1. Fuel oil supply pumps In application to **903. 1** of the Rules, the following are to apply.

(1) In case of ships complied with the following as ships having gross tonnage less than 500 tons may be omitted to provide the stand-by fuel oil supply pump.
   (A) Ships engaged in smooth water service
   (B) Ships engaged in coastal service area, and equipped with two sets of main engine and independent fuel oil supply pump for each main engine.
(2) In application to **903. 1** (4) of the Rules, the engine means a main engine or an auxiliary engine. In case of a main engine, one set of spare pump is to be provided.
(3) In ships engaged in smooth water service area and coastal service area, where internal combustion engines use lighting fuel oil supplied by gravity, the fuel oil supply pump may be omitted.
(4) In application to **903. 1** (6) of the Rules, engine of specific construction which can not be changed to spare pump without complete engine overhaul may be omitted to provide with spare pump.

2. Fuel oil filters

In Application to **903. 2** (2) of the Rules, "the filters are to be capable of being cleaned without stopping the supply of filtered fuel oil" is to comply with the following.
(1) Auto cleaner or self cleaning filter
(2) For multi propeller ships and where single filter is fitted in each engine which coupled with each shafting system.
(3) Where two or more the independent engines are coupled with one shafting system and single filter fitted in the individual engine.

3. Fuel oil heaters and purifiers In application to **903. 3** of the Rules, in principle, "low grade oil" means heavy oil which have a kinematic viscosity(50 ℃, cSt) more than 150.

Section 10 Thermal Oil System

1003. Pumps for thermal oil system

1. The wording “the thermal oil system for important use" specified in **1003. 1** of the Rules means the one in which thermal oil is used for either of the following :
(1) The fuel oil heating necessary for the operation of main propulsion machinery
(2) The cargo oil heating requiring continuously

2. Notwithstanding the requirements in **1003.** of the Rules, the thermal oil system for important use may be provided with only one fuel oil burning pump where one complete spare unit of the pump capable of being replaced in a short period of time is placed onboard.

Section 11 Compressed Air System

1101. Compressed air starting devices

1. Number and total capacity of main air reservoirs In **1101. 1** of the Rules, the total capacity of the starting air reservoirs is to be sufficient to provide, without replenishment, not less than the number of consecutive starts as specified in the following.
(1) For direct reversible engines

$$N = 12C$$

where;
N : Total number of starts of each engine
C : Constant determined by the arrangement of main propulsion engines and shafting sys-

tem, where the following values are to be referred to as the standard.

C = 1.0
For single screw ships, where one engine is coupled with the shaft either directly or through reduction gears

C = 1.5
For twin screw ships, where two engines are coupled with the shafts either directly or through reduction gear, or for single screw ships, where two engines are coupled with the shaft through deductable coupling provided between engine and reduction gear

C = 2.0
For single screw ships, where two engines are coupled with the shaft without any declutchable coupling between engine and reduction gear

C = 2.3
For triple screw ships, where three engines are coupled with the shaft either directly or through reduction gear, or for single screw ships, where four engines are coupled with the shaft through declutchable coupling provided between engine and reduction gear, or for twin screw ships, where four engines are coupled with the shaft through declutchable coupling provided between engine and reduction gear

C = 3.0
For twin screw ships, where four engine are coupled with the reduction gear directly

(2) For non-reversible type engines, 1/2 of the total number of starts specified in above may be accepted.
(3) For electric propulsion ships

$$N = 6+3(k-1)$$

N : Total number of starts of engine
k : Number of engines and it is not necessary for the value of k to exceed 3.

2. Number and total capacity of air compressors In application to **1101. 2** and **3** of the Rules, the following are to apply.
(1) "Small engines" mean engines having output 368 kW or less.
(2) In case where the capacity of compressors are different, the compressor having a little capacity is to supply within one hours air sufficient to provide not less than 4 consecutive starts for direct reversible engines, and 2 consecutive starts for in-direct reversible engines.
(3) The compressor driven by engine capable to manual start may be accepted to use for emergency.
(4) In case of ships equipped with diesel engine having output 88 kW or less, a manual operating compressor may be considered as equivalent to one unit among the compressors. Ships engaged in smooth water service area may be accepted to be provided with only a compressor.

3. Emergency air compressor

In application to **1101. 3** of the Rules, where the motor driving air compressor is powered by the emergency generator, emergency air compressor may be omitted.

1102. Construction and safety devices

In application to **1102. 1** (4) of the Rules, the following is to be applied for the strength of crankshaft of air compressor.
(1) The required diameters d_k of journals and crank pins are not to be less than that given by the following formula.

$$d_k = 0.126 \cdot \sqrt[3]{D^2 \cdot p_c \cdot C_l \cdot C_W \cdot (2 \cdot H + f \cdot L)} \quad (\mathrm{mm})$$

D = Cylinder bore for single-stage compressors (mm)

= D_{Hd} : Cylinder bore of the second stage in two-stage compressors with separate pistons

= $1.4 \cdot D_{Hd}$: for two stage compressors with a stepped piston as in **Fig 5.6.13** of the Guidance

= $\sqrt{(D_{Nd})^2 - (D_{Hd})^2}$: for two stage compressors with a differential piston as in **Fig 5.6.14** of the Guidance

p_c : Design pressure, applicable up to 40 (bar)

H : Piston stroke (mm)

L : a value of distance between main bearing centers (mm) X following factor.

① Where one crank is located between two bearings : 1.0

② Where two cranks at different angles are located between two main bearings : 0.85

③ Where 2 or 3 connecting rods are mounted on one crank : 0.95

f : ① Where the cylinders are in line : 1.0

② V or W type

- where the cylinders are at 90° : 1.2
- where the cylinders are at 60° : 1.5
- where the cylinders are at 45° : 1.8

C_l : Coefficient according to **Table 5.6.3** of the Guidance

z : Number of cylinders

C_w : Material factor according to **Table 5.6.4** or **Table 5.6.5** of the Guidance

R_m : Specified minimum tensile strength ($\mathrm{N/mm^2}$)

(2) Special consideration may be given to the diameter of crank shafts not complying with the requirements of above (1), if the detailed data and calculations on the strength of crank shafts are submitted.

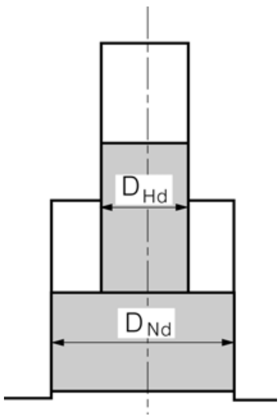

Fig 5.6.13

Section 12 Refrigerating Machinery

1201. General

1. Application

(1) In application to **1201. 1** (1) of the Rules, "the refrigerating machinery forming refrigerating cycle“ contains compressor, condenser, receiver, evaporator, pipings and associated equipments, etc.
(2) The refrigerating machinery with compressors of 7.5 kW or less using $R22$, $R\ 134a$, $R\ 404A$, $R\ 407C$, $R\ 410A$ or $R\ 507A$ as the primary refrigerant is to be suitable for use, service condition and environment on board.
(3) Refrigerating machinery using $R\ 717$ as the primary refrigerant is to comply with the requirements specified in (4) to (14) given below, in addition to those specified in the Rules.
(4) Plans and documents to be submitted, in addition to those specified in **Pt 5, Ch 1, 209.** of the Rules are generally as the following :
  (A) $R\ 717$ Refrigerant Piping Diagram
  (B) Gas Detector Arrangement
  (C) General Arrangement of Refrigerating Machinery Compartment
(5) General requirements of ammonia refrigerating machinery
  (A) Pressure vessels used in refrigerating machinery is to be classed into Class 1 pressure vessels specified in **Pt 5, Ch 5, Sec 3** of the Rules, and the primary refrigerant pipes (hereinafter referred to as refrigerant pipes) are to be classified into Class I pipes specified in **Pt 5, Ch 6, Sec 1** of the Rules.

(B) The design pressure of pressure vessels and pipes which form the refrigerating machinery is not to be less than 2.3 MPa at the high pressure side and not to be less than 1.8 MPa at the low pressure side.

(6) Materials of ammonia refrigerating machinery

(A) Material capable of highly corrosion (copper, zinc, cadmium, or their alloys) and materials containing mercury are not to be used at locations where ammonia comes into contact.

(B) Nickel steel is not to be used in pressure vessels and piping systems.

(C) Cast iron valves are not to be used in the refrigerant piping system.

(D) Material for sea water-cooled condenser is to be selected considering the corrosion due to sea water.

(E) Where flat tanks of quick freezers(contact freezers) are manufactured by extrusion molding of aluminium alloy, the material is to be approved in accordance with **Ch 2, Sec 6** of "**Guidance for approval of Manufacturing Process and Type Approval, Etc**".

(7) Piping arrangement of ammonia refrigerating machinery

(A) Refrigerant piping is not to pass through accommodation spaces.

(B) Pipe joints of the refrigerant piping system are to be butt welded as far as practicable.

(C) The refrigerant gas discharged from a pressure relief valve is to be absorbed in water, except when leading the gas to the low pressure side.

(D) If liquid level gauges made of glass are used at locations where pressure exists permanently, they are to comply with the following requirements ;

(a) Flat type glass is to be used in the liquid level gauge, and the construction is to be such that the gauge is adequately protected against external impacts.

(b) The construction of the stop valve for the liquid level gauge is to be such that the flow of liquid is automatically cut off if the glass breaks.

(E) The gas discharged from the purging valve is not to be discharged directly to the atmosphere, but absorbed in water.

(F) The discharge pipes of cooling sea water for the condenser is to be used the independent pipes. The piping is to be led directly overboard without passing through accommodation spaces.

(8) Control and alarm system of ammonia refrigerating machinery

Refrigerant compressors are to be provided with means for automatically stopping the compressor when the pressure on the high pressure side of the refrigerant piping system becomes excessively high. Also, an alarm system which generates visible and audible alarms when this means are in operation is to be installed in the refrigerating machinery compartment and monitoring position.

(9) Ammonia refrigerating machinery compartment

(A) The compartment where the compressor, receiver and condenser are installed (hereinafter referred to as **refrigerating machinery compartment**) is to be special compartment isolated by gastight bulkheads and decks from all other compartments so that leaked ammonia does not enter other compartments. Also, the refrigerating machinery compartment is to be provided with doors which comply with the following requirements :

(a) Except for small compartments, at least two access doors are to be provided in the refrigerating machinery compartment as far apart as possible from each other.

(b) Access doors not leading to weather deck are to be of high tightly and self-closing type.

(c) Access doors are to be capable of being operated easily and are to open outward.

(B) Penetrations on gastight bulkheads and decks where cables and piping from the refrigerating machinery compartment pass through, are to be of gastight construction.

(C) Passages leading to the refrigerating machinery compartment are to be isolated from accommodation spaces, hospital room or control room by gastight bulkheads and decks.

(D) An independent drainage system is to be provided in the refrigerating machinery compartment so that the drainage is not discharged into open bilge wells or bilge ways of other compartments.

(10) Ammonia gas expulsion system

A gas expulsion system consisting of ventilation system and water screening system is to be installed in the refrigerating machinery compartment, in accordance with (A) to (B) below so that gas leaked out accidentally can be expelled quickly from the refrigerating machinery compartment.

(A) A exhaust type mechanical ventilation system which complies with the following requirements as a rule, is to be installed in the refrigerating machinery compartment so that this space can be ventilated all the time.

(a) The ventilation system is to have adequate capacity to ensure at least 30 air changes per hour in the refrigerating machinery compartment.

(b) The ventilation system is to be independent of other ventilation systems on board the ship, and is to be capable of being operated from outside the refrigerating machinery compartment.

(c) Exhaust outlets are to be installed properly so as to prevent exhaust air from flowing in through air intake openings, openings of accommodation spaces, service spaces and control stations.

(d) Exhaust fans and the exhaust ducts in which the fans are installed, are to be of a construction such that sparks are not generated according to any of the following.

(i) Either the impeller or the casing, or both, are made of non-electrostatic, nonmetallic materials.

(ii) Non-ferrous metallic material is used in the impeller and the casing.

(iii) In case where ferrous material is used in the impeller and the casing, the tip clearance is greater than 13 mm. However, use of a combination of aluminium or magnesium alloy with ferrous material has possibilities of generating sparks regardless of the tip clearance, therefore, such materials are not to be used in the refrigerating machinery compartment. As a rule, motors for driving the fans are to be of the exterior mounted type.

(B) All doors of the refrigerating machinery compartment are to be provided with water screening system which can be operated from outside the compartment.

(11) Ammonia gas detection and alarm systems

Fixed type ammonia gas detection and alarm systems are to be provided to activate alarms inside and outside of the refrigerating machinery compartment.

(12) Electrical equipment for ammonia refrigerating machinery

(A) Electrical equipment in the refrigerating machinery compartment required to be operated in the event of leakage accidents, gas detection and alarm system and emergency lights are to be of certified safe types for use in the flammable atmosphere concerned.

(B) Electrical equipment in the refrigerating machinery compartment other than mentioned in (A) above, are required to switch off automatically by means of circuit breakers outside the refrigerating machinery compartment when the flammable gas detector specified in (11) activates.

(13) Safety and protective equipment for ammonia refrigerating machinery

Safety and protective equipment for ammonia refrigerating machinery as given below, as a rule, are to be provided, and are to be stored at locations outside the refrigerating machinery compartment so that they can be easily retrieved in the event of leakage of the refrigerant. Storage locations are to be marked with signs so that they can be identified easily.

(A) Protective clothing (helmet, safety boots, gloves, etc.) × 2
(B) Self-contained breathing apparatus (capable of functioning for at least 30 minutes) × 2
(C) Protective goggles × 2
(D) Eye washer × 1
(E) Boric acid
(F) Emergency electric torch × 2
(G) Electric insulation resistance meter × 1

(14) Requirements for fishing vessels, etc.

Refrigerating installations provided in fishing vessels of length under 55 m or refrigeration machinery retaining ammonia not more than 25 kg are to be according to (A) to (E) given below, notwithstanding (9) to (12).

(A) Refrigerating machinery may be installed in the engine room. In this case, drain trays are to be provided at a position lower than the refrigerating machinery.

(B) Ammonia gas exclusion system is to comply with the following.

(a) Ventilation system with special hoods above the refrigerating machinery is to be provided for exhaust capable of ventilation without accumulation of ammonia gas. The fans of the ventilation systems are to be independent of those of engine room ventilation systems.

(b) A water sprinkler system capable of absorbing enough leaked ammonia gas is to be provided in the vicinity of the space where the refrigerating machinery is installed.

Sprinkler hoses and water spraying nozzles are to be positioned so that water can be dispersed quickly when a leak occurs.

(C) Ammonia gas detection and alarm systems are to be provided to activate visible and audible alarms in the monitoring room (or control room) and engine room entrance. In this case, the detectors are to be installed in the vicinity of the upper parts of the refrigerating machinery, exhaust outlets and other locations deemed necessary by the Society.

(D) As far as possible, electrical equipment are not to be installed in the vicinity of the refrigerating machinery.

(E) Two(2) sets of protective clothing (helmet, safety boots, gloves, etc.) and two(2) sets of self-contained breathing apparatus (capable of functioning for at least 30 minutes) are to be provided. And, if the escape route from the monitoring room (or control room) passes through the engine room, one of the self-contained breathing apparatus sets is to be provided in the monitoring room (or control room).

Section 13 Tests and Inspections

1301. Tests of auxiliary machinery

In application to **1301. 1** of the Rules, "where otherwise specified" means those specified in other Chapters and **Table 5.6.6** of the Guidance.

Table 5.6.6

Item	Hydrostatic test pressure
Hydrulic motor	1.5 times the design pressure of hydraulic pump

1302. Hydrostatic tests of valves and pipe fittings

1. In application to **1302. 1** of the Rules, the hydrostatic test of following valves and pipe fittings may be omitted.

(1) Pipe flanges and pipe pieces(elbow, reducer, tee, bend, socket, etc.), etc.

(2) Valves and pipe fittings not exceeding 25 A

2. In application to **1302. 2** of the Rules, the valve means valve body.

3. Considering the characteristics and purpose of valves, scoop valves may be subjected to a leak test at pressure side only.

4. Dimension and visual inspection may be omitted for the valves and pipe fittings not exceeding 25 A.

1303. Hydrostatic tests of fuel tanks

1. When hydrostatic test is replaced by gastight tests, the pressure of gastight test is to be 0.02 MPa.

1304. Tests on workmanship of pipes

1. Welding procedure qualification tests Welding procedure qualification tests specified in **1304. 1** of the Rules are to comply with **Pt 2, Ch 2, Sec 4** of the Guidance.

2. Welding joints of hydraulic pipes belong to Class I and passed through the spaces other than engine room, cargo pump room, steering gear room and accommodation space may be applied with the requirements for pipes belong to Class II specified in **1304. 2** of the Rules.

3. RST 422, 423 or 424 used for design temperature 550 °C and over, and belong to Grade 4 of steel pipes for pressure piping, specified in **Pt 2, Ch 1** of the Rules and over are to be carried out hydrostatic test by 2 times the design pressure. However, the test pressure P_h is not required to be more than the value calculated by the following formula. And in case where a bent of pipes, tee, etc. have a risk of excessive stress at the test, the test pressure may be reduced to 1.5 times the design pressure.

$$P_h = \frac{378t}{D-t} \quad (\text{MPa})$$

where

D : Outside diameter of pipe (mm)

t : Thickness of pipe (mm)

4. When water residue by the hydraulic test completion of shipboard installation of piping systems may not be desirable, the hydraulic test may be omitted in case where adequate non-destructive tests are carried out on welded joints with results free from defects.

1305. Tests of piping system on board

1. In application to **1305. 1.** (2) of the Rules, "tests by hydrostatic pressure" are to be in accordance with the following.

(1) In principle, tests by hydrostatic pressure are to be carried out hydrostatic tests using liquid such as water, etc.

(2) In general, airtight tests instead of hydrostatic test are not permitted. Where it is impracticable to carry out the required hydrostatic test, airtight tests may be considered.

(3) In such case, the procedure for carrying out the airtight test, having regard to safety of personnel, is to be submitted to the Surveyr. ⚓

CHAPTER 7 STEERING GEARS

Section 1 General

101. Application

1. Manual steering gears are to be in accordance with the requirements of **Pt 5, Ch 7, Sec 1, 201.** through **203. 208.** through **210., 301., Sec 4** (excluding **409. 2**) and **Sec 5** of the Rules and the relevant requirements of the Guidance.

103. Drawings and documents

1. Operating instructions for hydraulic type steering gear are to include informations about importance of hydraulic fluid quality and its influence to probability of hydraulic locking possibility of two simultaneously operated power units. The operating instructions of same contents as above-mentioned ones, are to be kept on the bridge.

104. Display of operating instructions

In application to **104. 2** of the Rules, the "appropriate instructions for emergency procedures" are to simply indicate emergency procedures corresponding to the design of steering gear (for example, to shut down the failed system indicated by the alarming system), and are to be fitted at a suitable place on steering control post on the navigation bridge where applicable.

Section 2 Performance and Arrangement

201. Number of steering gears

1. In case where ships whose required upper stock diameter is not more than 120 mm according to **Pt 4, Ch 1** of the Rules and engaged in the service in smooth water area, or ships with a gross tonnage less than 50 tons, provide that spare parts liable to wear down such as packings, bearings are provided where the main steering gear is operated by power, the auxiliary steering gear required by **201.** of the Rules may be omitted.

2. In case where the auxiliary steering gear as specified in **201. 1** of the Rules is of hydraulic type, the rudder actuator can serve in common with that for the main steering gear. Further, part of the hydraulic piping of the rudder actuator of the main steering gear may be used in common with that for the auxiliary steering gear. In this case, but the pipe length of the part of common use is to be as short as practicable.

202. Performances of main steering gear

In application to **202. 2** of the Rules, the diameter specified in **Pt 4, Ch 1** of the Rules is to be taken as having been calculated for upper rudder stock of mild steel with a yield strength of 235 N/mm^2 (i.e. with a material factor K_s = 1).

203. Performances of auxiliary steering gear

In application to **203. 2** of the Rules, the diameter specified in **Pt 4, Ch 1** of the Rules is to be taken as having been calculated for upper rudder stock of mild steel with a yield strength of 235 N/mm^2 (i.e. with a material factor K_s = 1).

204. Piping

1. In case of steering gears complied with the following, the requirements of **204. 5** and **6** of the Rules may not be applied.

(1) Steering gears equipped in ships with a gross tonnage less than 500 tons
(2) Steering gears equipped in ships engaged in domestic coastal or smooth water service area

(excluding where auxiliary steering gear is omitted by **201. 2** of the Rules)

206. Alternative source of power

1. In case of steering gears complied with the following, the requirements of **206.** of the Rules may not be applied.

(1) Steering gears equipped in ships with a gross tonnage less than 500 tons, or
(2) Steering gears equipped in ships engaged in domestic coastal or smooth water service area

207. Electric installations for electric and electro-hydraulic steering gear

1. In case of manual auxiliary steering gears for a ship which SOLAS is not applicable to, the power supply circuit from the main switchboard to the steering gear may be one circuit.

2. In case of steering gears complied with the following, the requirements of **207. 1, 5** (excluding short circuit protection) and **7** of the Rules may not be applied.

(1) Ships with a gross tonnage less than 500 tons, or
(2) Ships engaged in domestic coastal or smooth water service area

3. In application to **207. 5** and **6** of the Rules, steering gear motor circuits which are limited to full load current via an electronic converter are exempt from the requirement to provide protection against excess current, including starting current, of not less than twice the full load current of the motor. In this case, the required overload alarm is to be set to a value not greater than the normal load of the electronic converter.

209. Means of communication

1. Means of communication between the navigating bridge and the steering gear compartment are not to depend solely on the shipboard telephone system for general purpose.

2. In case of ships complied with the following, the means of communication specified in **209.** of the Rules and above **1** may be alternated with appropriate means of communication.

(1) Ships with a gross tonnage less than 500 tons, or
(2) Ships engaged in domestic coastal or smooth water service area

Section 3 Controls

301. General

1. It may be acceptable that only one set of floating lever or other mechanical follow-up control system is provided.

2. The control system specified in the requirements of **301. 1** (2) of the Rules is to comply with following requirements.

(1) The control system is in principle to be of the follow-up type.
(2) Control systems and components are to be so designed and arranged that the failure of one of them will not render the other one inoperative.
(A) Wires, terminals and the components for duplicated steering gear control systems installed in units, control boxes, switchboards or bridge consoles are to be separated as far as practicable. Where physical separation is not practicable, separation may be achieved by means of a fire retardant plate.
(B) All electric components of the steering gear control systems are to be duplicated. This dose not require duplication of the steering wheel or steering lever.
(C) If a joint steering mode selector switch (uniaxial switch) is employed for both steering gear control systems, the connections for the circuits of the control systems are to be divided accordingly and separated from each other by an isolating plate or by air gap.
(D) In the case of double follow-up control, the amplifiers are to be designed and fed so as to be electrically and mechanically separated.
(E) Control circuits for additional control systems, e.g. steering lever or autopilot are to be de-

signed for all-pole disconnection.

(F) The feed-back units and limit switches, if any, for the steering gear control systems are to be separated electrically and mechanically connected to the rudder stock or actuator separately.

(G) Hydraulic system components in the power actuating or hydraulic servo systems controlling the power systems of the steering gear (e.g. solenoid valves, magnetic valves) are to be considered as part of the steering gear control system and are to be duplicated and separated. Hydraulic system components in the steering gear control system that are part of a power unit may be regarded as being duplicated and separated when there are two or more separate power units provided and the piping to each power unit can be isolated.

3. Failure detection and system response upon failure of the control system specified in the requirements of **301. 1** (2) of the Rules is to comply with following requirements

(1) The most probable failures that may cause reduced or erroneous system performance are to be detected, and are to consider at least the following:

(A) Power supply failure

(B) Loop failures in closed loop systems, both command and feedback loops (normally short circuit, broken connections and earth faults)

(C) If programmable electronic system are used, data communication errors, computer hardware and software failures (Also the system is to be complied with the requirements of system category Ⅲ in **Pt 6, Ch 2, 201. 7.**)

(D) Hydraulic locking.

(2) Alternatively to (1) (B) and (C), depending on the rudder characteristic, critical deviations between rudder order and response are to be indicated visually and audibly as steering failure alarm on the navigating bridge. The following parameters are to be monitored:

(A) Direction (Actual rudder position follows the set value)

(B) Delay (Rudder's actual position reaches set position within acceptable time limits)

(C) Accuracy (The end actual position is to correspond to the set value within the design offset tolerances)

(3) Hydraulic locking is always to be warned individually unless system design makes manual action unnecessary.

(4) The most probable failures (i.e : power supply failure, loop failures, etc.) are to result in the least critical of any new possible conditions.

4. Amplifiers, relays, etc., included in the control system may be used also for the automatic pilot systems.

5. In electro-hydraulic steering gears equipped with power units comprising variable-displacement pumps, two sets each of hydraulic servo cylinders and associated hydraulic system (including pump driving electric motors and control equipment) or electric servo motors for controlling displacement of the pump plungers are to be provided.

6. In case of ships complied with the following, the means of communication specified in **301. 3** of the Rules may not be applied.

(1) Ships with a gross tonnage less than 500 tons, or

(2) Ships engaged in domestic coastal or smooth water service area

7. In application to **301. 4** of the Rules, in general, following cases are not considered as the case of “where hydraulic locking, caused by a single failure, may lead to loss of steering”.

(1) Steering systems with performance at least equal to that required for an auxiliary steering gear are fitted as stand-by systems and are operable from navigating bridge. In this case, the stand-by systems are so designed not to run parallel using an interlocking devices, etc.

(2) Not less than 3 systems are operated parallel and, in the case of a single failure, steering capability at least equal to that required for an auxiliary steering gears are maintained.

(3) Steering gears designed to avoid leading to loss of steering by by-passing the failed system automatically using duplicated control valve system. This arrangement is subject to special consideration with respect to reduced reliability due to increased complexity.

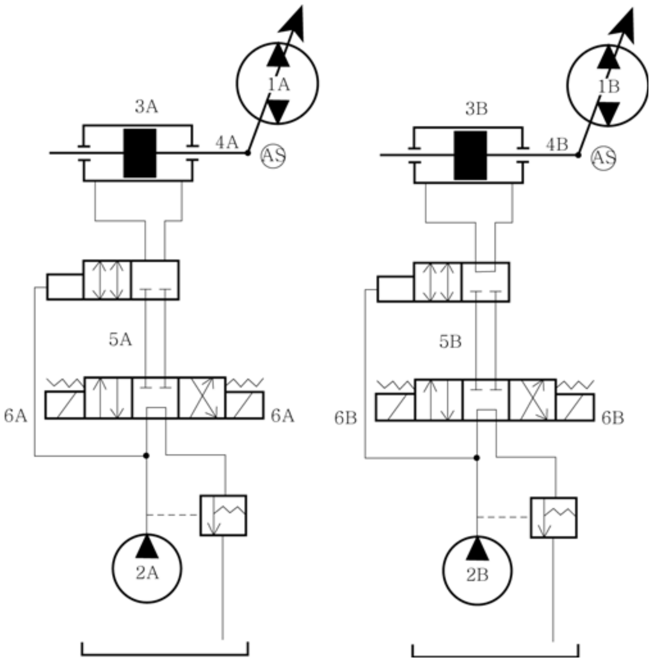
8. In application to **301. 4** of the Rules, the "audible and visual alarm, which identifies the failed system" is to be activated in following conditions in general.

(1) Position of the variable displacement pump control system does not correspond with given order.

(2) Incorrect position of 3-way full flow valve or similar in constant delivery pump system is

detected.

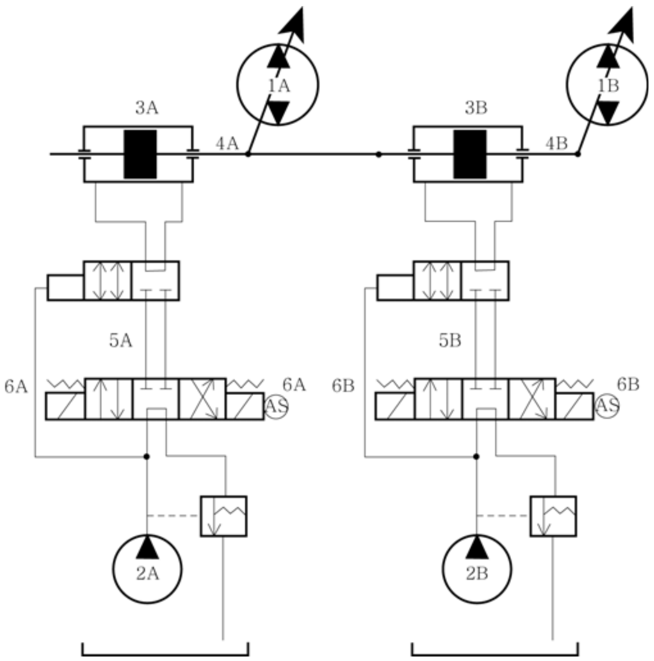
9. The location of sensors of alarm specified in aforementioned **8**, are to be as near actuator as possible. For the part of steering gears, where two or more pumps are mechanically interconnected by floating bar or similar, their breakage may not be considered. The example of acceptable location of alarm sensors are indicated in **Fig 5.7.1**.



(a) Separated system

(AS) : denoted location of alarm sensors

1. Main pump of variable displacement type.
2. Pilot pump
3. Control actuator
4. Control linkage
5. Solenoid controlled 3-way valve.
6. Solenoid.



(b) Mechanically interconnected system

(Note)

Where systems are so designed not to run 1A & 1B IN (a) nor 2A & 2B in (b), the alarm devices are not required.

Fig 5.7.1 Example location of hydraulic locking alarm sensors

302. Change over from automatic to manual steering

1. At any rudder angle, the change over from automatic to manual steering is to be available within 3 seconds by two attempts of control operation at the most.

2. The change over from automatic to manual steering is to be available under any circumstances including the case of failure of the automatic pilot.

3. The device to change over from automatic to manual steering is to be installed close to the normal steering position.

Section 4 Materials, Constructions and Strength

401. Materials

Scantling of tillers made of casting or ductile materials are to be 1.05 times the values specified in the requirements of **407.** of the Rules.

407. Tillers, etc.

1. Scantling of tiller having two arms In the case of tiller having two arms, where power units are connected to each arm and these two power units are driven simultaneously, the scantling of each tiler may be reduced to 0.6 times those required in **407. 1** (1) (B) and (C) of the Rules.

2. The scantling of tillers for the exclusive use of auxiliary steering gear are to have the strength assures 1/2 or more of that specified in the requirements of **407.** 1 (1) of the Rules.

409. Buffers

In case of ships having smooth water service area and ships with a gross tonnage less than 500 tons, the buffers required by **409.** of the Rules may be omitted.

Section 5 Testing

503. Sea trials

1. In Application to **503. 1** (1) of the Rules, where trials are conducted in conditions other than full load because it is impractical to conduct trials at full load, trials are to be conducted as close to full load draught and zero trim as possible and special attention are also to be given to ensuring that sufficient propeller immersion exists in the trial condition. And the trial results to the full load condition are to be predicted using a reliable method. (i.e. model tests or reliable computer simulation)

2. In application to **503. 1** (9) of the Rules, the wordings “steering gear is designed to avoid hydraulic locking” means steering gears designed not to run parallel using an interlocking devices, etc. or steering gears designed to maintain their steering capability or to recover them by by-passing the failed system automatically. For the steering systems which are dispensed with the consideration of hydraulic locking because of that considerations of the breakages at mechanical linkage of floating bar or similar are waived, these demonstrations may not be carried out. ⚓

CHAPTER 8 WINDLASSES AND MOORING WINCHES

Section 1 General

101. Application

1. In application to **101. 1** of the Rules, manual operating windlasses are to be complied with the following.

(1) In the case of windlasses complied with the following, the manual operating windlasses may be accepted.

(A) In the case of windlasses for anchor with weight 250 kgf or less

(B) In the case of windlasses for anchors with weight 500 kgf or less equipped on barges engaged in domestic service area and ships engaged in smooth water service area

(2) Manual operating windlasses are to be capable of lifting anchor and chain at the nominal speed of at least 0.033 m/s. In this case, the human power driving them is to be 147 N or less when their crank radius of 350 mm is rotated about 30 rpm.

(3) Materials used in the major parts are complied with *Korean Industrial Standards* or other recognized standards.

(4) For manual operating windlasses, brake test and load test are to be carried out. The test procedures are to be applied with appropriate modifications of the requirements of **205. 2** of the Guidance. However, the nominal speed and the human power driving them are to be applied with (2) above.

102. Materials

1. In application to **102.** of the Rules, "major parts" means the following.

(1) Driving shafts and gears of power transmission system
(2) Chain lifters and shafts of chain lifter (Windlass)
(3) Rope drums and shafts of rope drum (Mooring winch)
(4) Brake bands and spindles
(5) Chain stoppers (Windlass)

Section 2 Windlasses

205. Tests and Inspections

1. No load test

Windlasses are to be run without load in normal and reverse direction, for a sum of each 15 minutes, under the rated voltage at the rotating speed equivalent to the rated speed at the shop. During the test, tightness against oil leakage, temperature of bearings and presence of abnormal noise are to be checked. However, when it is difficult to be carried out the test at the shop, the test may be carried out on board.

2. Brake test and load test

Windlasses are, after installation on board, to be tested and checked about the following at the location ensured depth of water deeper than the total length of 3 lengths of anchor chain and anchor.

(A) Brake test
The anchor chain cable is to be hoisted to the position that the anchors are submerged in water, and the anchor is to be fallen freely until getting to sea-bed. At this time, brake systems are to be checked every 1/2 length. In this case, it is considered as a standard that braking distance of brake systems is to be 7 m or less.

(B) Load test

(a) At the condition that 3 lengths of chain cable is submerged in water but anchor is not got to sea-bed, 2 lengths of one side anchor chain are to be hoisted and 2 lengths of the other side anchor chain are to be hoisted, and 1 length remained in each side is to be hoisted simultaneously.

(b) The average speeds are to be measured when 2 lengths of each side anchor chain are hoisted according to above (a), and are to be 0.15 m/s or over.

(c) Particulars required identification of capability, utility, and conditions for constructions and components of the windlass are to be checked during load test.

(C) In the case where the depth of water deeper than the total length of 3 lengths of anchor chain and anchor is difficult to be ensured geographically at sea trial, load test may be carried out according to the following. However, in this case, the tests are to be carried out at the deepest area among the sea trial area.

(a) Symmetrical double cable-lifter windlasses

(i) The anchor chain cable of each side is to be lifted until the position that the anchor gets to the surface of water. And the anchor of each side is to be fallen in the water until 1 length of chain cable is submerged in water but anchor is not got to sea-bed.

(ii) The average speeds are to be measured when each 1 length of both sides anchor chain is lifted simultaneously, and are to be 0.15 m/s or over at the conditions mentioned above (i).

(b) Single cable lifter windlasses

Average speed is to be measured by anyone among the following after identifying the above (a) (i).

(i) Where windlass is capable to lift simultaneously anchor chain cable of both sides by use of independent hydraulic pump unit of one side, the average speed is to be 0.15 m/s or over at the test mentioned in above (a) (i) making use of a hydraulic pump unit of one side.

(ii) Where windlass is incapable to lift simultaneously anchor chain cable of both sides by use of independent hydraulic pump unit of one side, the average speed of recovery of chain cables, when the maximum length of anchor chain cables are submerged but freely suspended at commencement of lifting is to be 0.15 m/s or over by comparing with the measurements for capability particulars and the estimated performance curve. In case of where the result is doubted by comparing with performance curve, it may be carried out retesting.

(iii) Single cable lifter windlasses driven by electric motor or steam are to be applied with appropriate modifications of the requirements of (ii) above.

(c) Couple windlasses

Couple windlasses are to be applied with appropriate modifications of the requirements of above (a). In this case, 2 sets of prime mover may be used for lifting anchors of one side or both sides simultaneously. ⚓

ANNEX

Annex 5-1 Requirements for the Water-jet Propulsion Systems and Azimuth or Rotatable Thrusters

1. Water-jet propulsion systems

(1) General

(A) The requirements in this Guidance apply to the surveys, construction, strength and materials for the installation of ships equipped with two or more water-jet propulsion systems driven by high speed engines (hereinafter referred to as the propulsion systems).

(B) For items not specified in this Guidance, the relevant requirements specified in **Pt 5** of the Rules apply.

(C) Propulsion systems of special type or other which have unavoidable but justifiable reasons precluding the due compliance with the requirements of this Guidance are to be examined in consideration of each design.

(D) Equivalency

Propulsion systems which do not comply with the requirements of this Guidance may be accepted provided that they are deemed by the Society to be equivalent to those specified in this Guidance.

(E) Terminology

The terms used in this Guidance are defined as follows:

(a) **Propulsion system** is a system, including next (ii) to (vii) that receives water through an inlet duct and discharges it through a nozzle at increased velocity to produce propulsive thrust.

(b) **Impeller** is a rotating assembly provided with blades to give energy to the water.

(c) **Main shaft** is a shaft that transmits power to the impeller blades.

(d) **Water intake duct** is the portion that leads the water drawn from the water intake to the impeller inlet.

(e) **Nozzle** is the portion that injects the rectified water from the impeller.

(f) **Deflecter** is the device serving as a rudder by leading the water injected from the nozzle either to port or to starboard.

(g) **Reverser** is the device to thrust the ship to go astern by reversing the flow direction of the water injected from the nozzle.

(h) **High speed engine** is the high-rotating-speed internal combustion engine specified in **Pt 1, Ch 2, 303. 3** of the Guidance or gas turbine.

(2) Drawings and Data to be Submitted

Before the work is commenced, the manufacturers of propulsion systems are to submit drawing in triplicate and a copy of data specified below, to the Society for approval.

(A) General arrangement and sectional assembly (showing the materials and dimensions of various parts including the water intake duct, etc.)

(B) Shafting arrangement (showing the arrangements, shapes and construction of the main engine, gear, clutch, coupling, main shaft, main shaft bearing, thrust bearing, sealing device, impeller, etc.)

(C) Details of water intake duct

(D) Construction of impeller (showing the detailed blade sections, the maximum diameter of blade from the centre of the main shaft, number of blades, and material specifications)

(E) Details of main shaft bearings, thrust bearing, and forward sealing device of the main shaft

(F) Details of deflecter

(G) Hydraulic piping system diagram

(H) Details of reverser

(I) Torsional vibration calculation sheets and calculation sheets of the bending natural frequency when bending vibration due to self-weight is expected

(J) Strength calculation sheets for deflector and reverser

(K) Others considered to be necessary by the Society

(3) Materials, Construction and Strength

(A) Materials

The materials of parts of the propulsion system are to be suitable for respective uses in-

tended, and the following important components are to comply with the requirements in **Pt 2, Ch 1** of the Rules. However, the Society may accept to use those made of materials which comply with Korean Industrial Standards or standards as considered equivalent therto.
(a) Main shaft
(b) Shaft coupling and coupling bolts
(c) Impeller
(d) Water intake duct, nozzle and impeller casings which are composing a part of shell plating

(B) Construction and strength
(a) Main shaft
The minimum diameter of the main shaft is to be not less than the value determined by the following formula:

$$d_s = k \cdot \sqrt[3]{\frac{H}{Z}}$$

where
d_s : Required diameter of main shaft (mm)
H : Maximum continuous output of main engine (kW)
Z : Number of revolutions of main shaft at the maximum continuous output (rpm)
k : Values shown in **Table 5.1**

Table 5.1 Values of k according to Fitting Method

<table>
<tr><td colspan="2" rowspan="2">Position

<tr><td colspan="7">NOTES : For $200 \leq \sigma_y \leq 400$
$k = a_1 - 0.1(\sigma_y - 200)$
For $\sigma_y > 400$
$k = a_2$
σ_y : Specified yield point or 0.2 % of proof strength of shaft material (N/mm^2)</td></tr>
</table>

(b) Shaft couplings and coupling bolts
(i) The minimum diameter of the shaft coupling bolts at the joining face of the couplings is to be not less than the value determined by the following formula:

$$d_b = 15{,}300\sqrt{\frac{H}{Z} \cdot \frac{1}{nDT_b}}$$

where
d_b : Required diameter of shaft coupling bolt (mm)
n : Number of bolts

D : Pitch circle diameter (mm)

T_b : Specified tensile strength of bolt material (N/mm²)

(ii) The thickness of the shaft coupling flange at the pitch circle is not to be less than the required diameter of shaft coupling bolts determined by the formula in (i) above. However, it is not to be less than 0.2 times the required diameter of the corresponding shaft.

(iii) The fillet radius at the base of the flange is not to be less than 0.08 times the diameter of the shaft. The fillets are to have a smooth finish. Where the fillet is recessed in way of nuts and bolt heads, the fillet radius at the base of the flange is not to be less than 0.125 times the diameter of the shaft.

(c) Water intake duct, etc.
The water intake duct, impeller casing and nozzle are to have strength according to the design pressure, and consideration is to be given for corrosion.

(d) Impeller blade
The strength of the impeller blade at root is to be determined so that the following formula is satisfied. In this case, the allowable stress value of the material is, in principle, to be 1/1.8 of the specified yield point (or 0.2 % of proof strength).

$$S \geq \frac{5.8 \times 10^5 H}{L t^2 Z N} + 2.2 \times 10^{-7} D^2 N^2$$

where

S : Allowable stress of impeller material (N/mm²)

H : Maximum continuous output of main engine (kW)

N : Value obtained by dividing the number of revolutions of impeller by 100 (rpm /100)

Z : Number of impeller blades

L : Width of impeller blade at root (mm)

t : Maximum thickness of impeller blade at root (mm)

D : Diameter of impeller (mm)

(C) Torsional vibration and bending vibration of main shaft

(a) General

(i) Notwithstanding the requirements specified in above (2) (I) concerning to submission of the torsional vibration calculation sheets for the main shafting systems, submission of those may be omitted in cases where the shafting system is of the same type as previously approved one or it can be readily assumed that the shafting system has no excessive vibration stress.

(ii) Measurements of torsional vibration to confirm accuracy of the estimated value are to be carried out. In cases, however, submission of the torsional vibration calculation sheets is omitted according to the requirements in above (1), or the Society considers that there is no critical vibration within the service speed range, the measurement of torsional vibration may be omitted.

(b) Allowable limit of torsional vibration stress
The torsional vibration stress of the shafting system is to be in accordance with the following requirements within the service speed range of the shafting system.

(i) The torsional vibration stresses produced when the revolutions of the engine are within the range from 80 % to 105 % of maximum continuous revolutions are not to exceed τ_1 given in following :

$$\tau_1 = A - B\lambda^2 \quad (\lambda \leq 0.9) \text{ and}$$
$$\tau_1 = C \quad (\lambda > 0.9)$$

where

τ_1 : Allowable limit of torsional vibration stresses for the range of $0.8 < \lambda \leq 1.05$ (N/mm^2)

λ : Ratio of the number of maximum continuous revolutions to the number of service revolution of the engine

A, B and C : Values shown in **Table 5.2**

Table 5.2 Values of A, B and C

	Carbon steel or low alloy steel		Austenitic stainless steel	Martensite precipitation hardened type stainless steel
	Shaft of Kind 1	Shaft of Kind 2		
A	24.3	9.0	26.4	39.6
B	24.1	6.2	26.4	37.1
C	4.8	4.0	5.0	9.6

In case where the specified tensile strength of materials of carbon steel shafts or low alloy steel shafts of Kind 1 exceeds 400 N/mm^2 the value of τ_1 may be increased by multiplying the factor k_m given in the following formula:

$$k_m = (T_s + 160)/56$$

where

k_m : Correction factor

T_s : Specified tensile strength of main shaft material (N/mm^2)

(ii) The torsional vibration stresses of the main shaft within the range below and at 80 % of the maximum continuous revolutions of the engine are not to exceed τ_2 given in following. In case where torsional vibration stresses exceed the value calculated by the formula of τ_1 shown in (i), the barred speed ranges are to be imposed. In this case, the formula for τ_1 is the one for the range of $\lambda \leq 0.9$.

$$\tau_2 = 2.3\tau_1$$

where

τ_2 : Allowable limit of torsional vibration stresses for the range of $\lambda \leq 0.8$ (N/mm^2)

(c) Bending vibration
For the main shafting system of the propulsion system, consideration is to be given to natural vibrations due to bending of the shafting system.

(D) Steering systems
Deflector is to be capable of steering from 30 degrees on one side to 30 degrees on the other side with ship at its load draught while running ahead at the speed specified in **Pt 3, Ch 1, 120.** of the Rules and, under the same conditions, from maximum steering angle on either side to maximum steering angle on the other side in not more than 28 seconds. However, where the detailed documents for construction, steering capability, etc. of deflector are submitted by manufacturer and it is deemed appropriate by the Society, the maximum steering angle and steering capability of deflector may be reduced.

(E) Reversing gear and astern power
(a) The reverser is to be such that it provide sufficient power for going astern to secure proper control of the ship in all normal circumstances, and when transferred from ahead to astern runs, it is to have an astern power to provide effective breaking for the ship.

(b) The reverser is to have sufficient strength against the thrust at the maximum astern power output.

(F) Hydraulic system
The hydraulic system driving the deflecter and the reverser is to be duplicated or to be provided with an emergency hydraulic power source, in case where it is not equipped for each shafting independently.

(4) Tests and Inspections

(A) Hydrostatic test

(a) Hydrostatic tests are to be carried out at a pressure 1.5 times the design pressure for impeller casing.

(b) Hydrostatic tests are to be carried out at a pressure of at least 0.2 MPa or 1.5 times the design pressure whichever is higher for the forward bearing tube of the main shaft and the sealing device.

(B) Dynamic balancing test
Dynamic balancing test of the impeller are to be carried out.

(C) Test after installation on board
The propulsion systems are to be subjected to running trials after being installed on board and the following items are to be verified:

(a) Verification of steering performance specified in (3) (D)

(b) Operating test of reverser specified in (3) (E)

(c) Measurement of torsional vibration is to be in accordance with **Ch 4, 103.** of the Rules.

2. Azimuth or rotatable thrusters

(1) General

(A) Ships equipped with azimuth or rotatable thrusters as main propulsion system are to have at least two azimuth or rotatable thrusters.

(B) For items not specified in this Guidance, the relevant requirements specified in **Pt 5** of the Rules apply.

(C) Propulsion systems of special type or others which have unavoidable but justifiable reasons precluding the due compliance with the requirements of this Guidance are to be examined in consideration of each design.

(2) Drawings and data to be submitted
Before the work is commenced, the manufacturers of propulsion systems are to submit drawing in triplicate and a copy of data specified below, to the Society for approval.

(A) Drawings

(a) General arrangement and sectional assembly (showing the materials and dimensions of various parts including nozzle ring)

(b) Details of shafting arrangement, gears, shaft couplings and coupling bolts

(c) Details of steering systems

(d) Specification of bearings

(e) Piping systems

(B) Data

(a) Data for strength calculation according to kind of main propulsion engine

(b) Torsional vibration calculation sheets of shafting

(c) Strength calculations for main component parts

(d) Operating manual

(3) Materials, constructions and strength

(A) Materials, constructions and strength of shafting arrangement, propellers, gears and steering systems are to be applied with appropriate modifications of the relevant requirements of **Ch 3, Ch 4** and **Ch 7** of the Rules.

(B) Materials, constructions and strength of piping systems and auxiliaries are to be applied with appropriate modifications of the relevant requirements of **Ch 6** of the Rules.

(4) Tests and inspections

(A) Tests and inspections of shafting arrangement, propellers, gears and steering systems are to be applied with appropriate modifications of the relevant requirements of **Ch 3** and **Ch 7** of the Rules.

(B) Tests and inspections of piping systems and auxiliaries are to be applied with appropriate modifications of the relevant requirements of **Ch 6** of the Rules.

(C) On-board tests and inspections

(a) Torsional vibration of shafting are to be applied with the requirements of **Ch 4, 103.** of the Rules.

(b) Operating tests of various parts are to be carried out according to operating manual.

Annex 5-2 Guidance for Calculation of Crankshaft Stress (1)

The direct calculation method of the local stress at crankpin fillet or crankjournal fillet of the crankshaft is as follows:

(1) Stress af fillet due to bending moment is to be obtained by the following formula:

$$\sigma_x = 1.08\alpha_{KB}\frac{M_W}{Z} \text{ --------------- } (1)$$

$$\sigma_y = 0.285\alpha_{KB}\frac{M_W}{Z} \text{ -------------- } (2)$$

where

σ_x : Axial stress due to bending moment at fillet

σ_y : Circumferential stress due to bending moment at fillet

α_{KB}: Stress concentration factor for bending, as shown in **Ch 2, 208. 2** (2) of the Guidance

Z : Section modules of crankpin or journal

M_W: Bending moment at the centre of the arm thickness, normal to the crankplane

(A) As external forces acting on the crankshaft, combustion pressure, and inertial forces of reciprocating and unbalanced rotating mass may only be considered. It is assumed that external force acts on the centre of crankpin bearing as a concentrated load, and the shaft is supported at the centre of each main bearing.

(B) Bending moment (M_i) at the support is to be determined by solving a set of simultaneous continuous beam equations taking account of the deflection of support due to reaction force. (See **Fig 5.1**)

Calculation is to be developed in such a way that at least one each span directly afore and abaft the crank throw under consideration are included.

$$\begin{aligned}
&\frac{3}{32}\frac{L_{i-1}^2}{L_i}M_{i-2}+\left\{L_i-\frac{2}{32}\frac{L_{i-1}^2}{L_i}\left(1+\frac{L_{i-1}}{L_i}\right)-\frac{3L_i}{32}\left(1+\frac{L_i}{L_{i+1}}\right)\right\}M_{i-1}\\
&+\left[2(L_i+L_{i+1})+\frac{3}{32}\left\{\frac{L_{i-1}^3}{L_i^2}+L_i\left(1+\frac{L_i}{L_{i+1}}\right)^2+L_{i+1}\right\}\right]M_i\\
&+\left[L_{i+1}-\frac{3}{32}\left\{\frac{L_i^2}{L_{i+1}}\left(1+\frac{L_i}{L_{i+1}}\right)+L_{i+1}\left(1+\frac{L_{i+1}}{L_{i+2}}\right)\right\}\right]M_{i+1}+\frac{3}{32}\frac{L_{i+1}^2}{L_{i+2}}M_{i+2}\\
&+\frac{3}{32}\left\{\frac{L_{i-1}^2}{L_i}\sum_j W_{i-1\times j}\,a_{i-1\times j}-L_i\left(1+\frac{L_i}{L_{i+1}}\right)\sum_j W_{ij}a_{ij}\right.\\
&+\frac{L_{i-1}^3}{L_i^2}\sum_j W_{ij}(L_i-a_{ij})+L_{i+1}\sum_j W_{i+1\times j}\,a_{i+1\times j}-\frac{L_i^2}{L_{i+1}}\\
&\left(1+\frac{L_i}{L_{i+1}}\right)\sum_j W_{i+1\times j}(L_{i+1}-a_{i+1\times j})+\frac{L_{i+1}^2}{L_{i+2}}\sum_j W_{ij}a_{ij}(L_i^2-a_{ij}^2)\\
&+\frac{1}{L_{i+1}}\sum_j W_{i+1\times j}a_{i+1\times j}(L_{i+1}-a_{i+1\times j})(2L_{i+1}-a_{i+1\times j})=0 \quad \text{------ } (3)
\end{aligned}$$

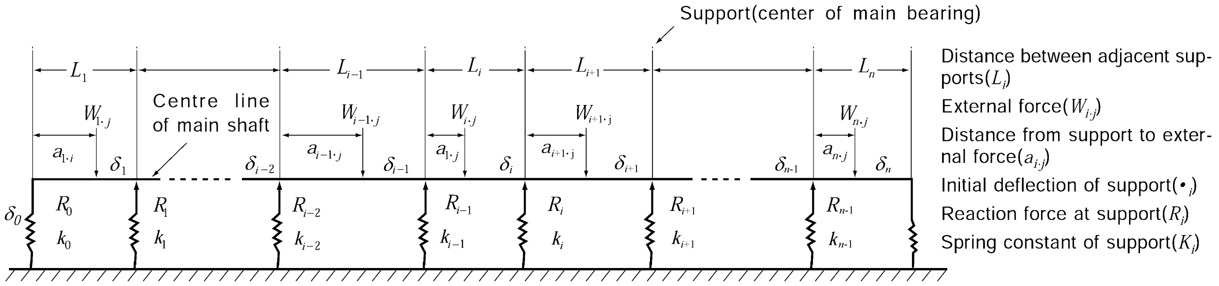

Fig 5.1 Continuous Beam

(C) Bending moment on the centre of crank web (M_W) is to be obtained by the following formulae: (see **Fig 5.2**)

$$M_{WFi} = \frac{L_i - l_{WFi}}{L_i} M_{i-1} + \frac{l_{WFi}}{L_i} M_i + l_W \sum_j \left(1 - \frac{a_{i\cdot j}}{L_i}\right) W_i$$

$$M_{WAi} = \frac{L_i - l_{WFi}}{L_i} M_{i-1} + \frac{l_{WFi}}{L_i} M_i + \left(L_i - l_{Wi} \sum_j \frac{a_{i\cdot j}}{L_i} W_i\right) \quad \text{--------------------} \quad (4)$$

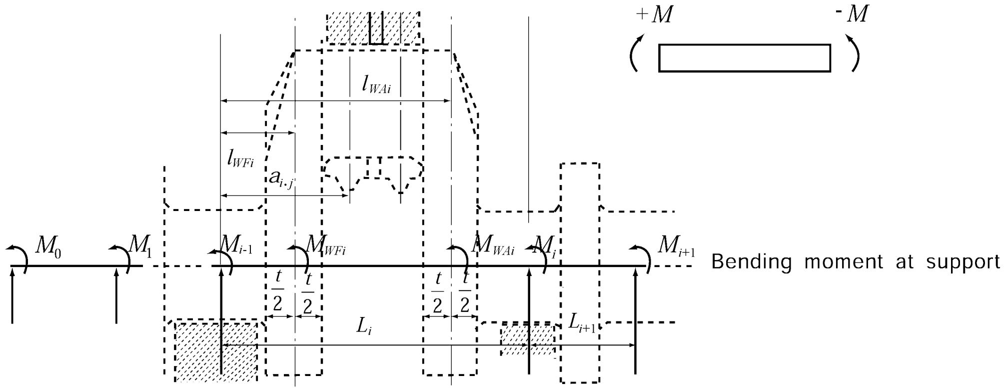

Fig 5.2 Bending Moment at Arbitrary Point

(2) The torsional stress at fillet due to twisting moment is to be obtained by the following formula:

$$\tau_f = \alpha_{KT} \frac{T}{Z_p} \quad \text{--------------------------} \quad (5)$$

where

τ_f : Torsional stress in fillet at the root of arms

α_{KT} : Stress concentration factor for torsion, as specified in **Ch 2, 208. 2** (2) of the Guidance

Z_P : Polar section modulus of crankpin or journal

T : Twisting moment acting on crankpin or journal, which is to be determined by summing up sequentially from the side on the free end. External forces to be considered are the same as in the case of bending moment.

(3) Principal stress is to be obtained by the following formula :

$$\left.\begin{matrix}\sigma_1\\ \sigma_2\end{matrix}\right\} = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_f^2} \text{------ (6)}$$

$$\delta = \frac{1}{2} tan^{-1} \frac{2\tau_f}{\sigma_x - \sigma_u} \text{ ------------------------ (7)}$$

where

σ_1 : Maximum principal stress at fillet

σ_2 : Minimum principal stress at fillet

δ : Inclination of σ_1 against axial direction

(4) Single amplitude of equivalent stress σ_e is to be determined as follows.
The calculations specified in (1) through (3) are to be carried out for every 10° of crank angle; $\sigma_{resultont}$ is to be calculated by the following formula (8) through combining these values and the maximum value thus obtained is to be taken as the single amplitude of equivalent stress se of the crankthrow.

$$\sigma_{resultont} = \frac{1}{2}[\sigma_{1\theta I}\cos^2\theta - \sigma_{2\theta II}\sin^2(\theta + \delta_{\theta II} - \delta_{\theta I})] \text{------------------- (8)}$$

where

$$\theta = \frac{1}{2} tan^{-1} \frac{-2\sigma_{2\theta II}}{\sigma_{1\theta I} - \sigma_{2\theta II}} cot(\delta_{\theta II} - \delta_{\theta I})$$

$\sigma_{1\theta}$, σ_{θ} : σ_1 and δ obtained when shaft revolution angle is θ_I

$\sigma_{2\theta 1}$, $\sigma_{\theta 1}$: σ_2 and δ obtained when shaft revolution angle is θ_{II}

Annex 5-3 Guidance for Calculation of Crankshaft Stress (2)

1. General

(1) Scope
This Guidance is to apply to solid-forged and semi-built-up crankshafts of forged or cast steel, with one crankthrow between main bearings.

(2) Principles of calculation

(A) The design of crankshafts is based on an evaluation of safety against fatigue in the highly stressed areas.

(B) The calculation is based on the assumption that the areas exposed to highest stresses are as follows.

(a) Fillet transitions between the crankpin and web as well as between the journal and web

(b) Outlets of crankpin oil bores

(C) When journal diameter is equal or larger than the crankpin one, the outlets of main journal oil bores are to be formed in a similar way to the crankpin oil bores, otherwise separate documentation of fatigue safety may be required.

(D) Calculation of crankshaft strength consists initially in determining the nominal alternating bending and nominal alternating torsional stresses which, multiplied by the appropriate stress concentration factors, result in an equivalent alternating stress(uni-axial stress). This equivalent alternating stress is then compared with the fatigue strength of the selected crankshaft material. This comparison will show whether or not the crankshaft concerned is dimensioned adequately.

2. Calculation of Stresses

(1) Calculation of alternating stresses due to bending moments and radial forces

(A) Assumption

(a) The calculation of alternating stresses is based on a statically determined system, composed of a single crankthrow supported in the centre of adjacent main journals and subject to gas and inertia forces. The bending length is taken as the length between the two main bearing midpoints(distance L_3, see **Fig 5.3** and **5.4**).

(b) The bending moments(M_{BR}, M_{BT}) are calculated in the relevant section based on triangular bending moment diagrams due to the radial component(F_R) and tangential component(F_T) of the connecting-rod force, respectively(see **Fig 5.3**).

(c) For crankthrows with two connecting-rods acting upon one crankpin, the relevant bending moments are obtained by superposition of the two triangular bending moment diagrams according to phase(see **Fig 5.4**).

(d) Bending moments and radial forces acting in web

(i) The bending moment(M_{BRF}) and the radial force(Q_{RF}) are taken as acting in the centre of the solid web(distance L_1) and are derived from the radial component of the connecting-rod force.

(ii) The alternating bending and compressive stresses due to bending moments and radial forces are to be related to the cross-section of the crank web. This reference section results from the web thickness(W) and the web width(B)(see **Fig 5.5**).

(iii) Mean stresses are neglected.

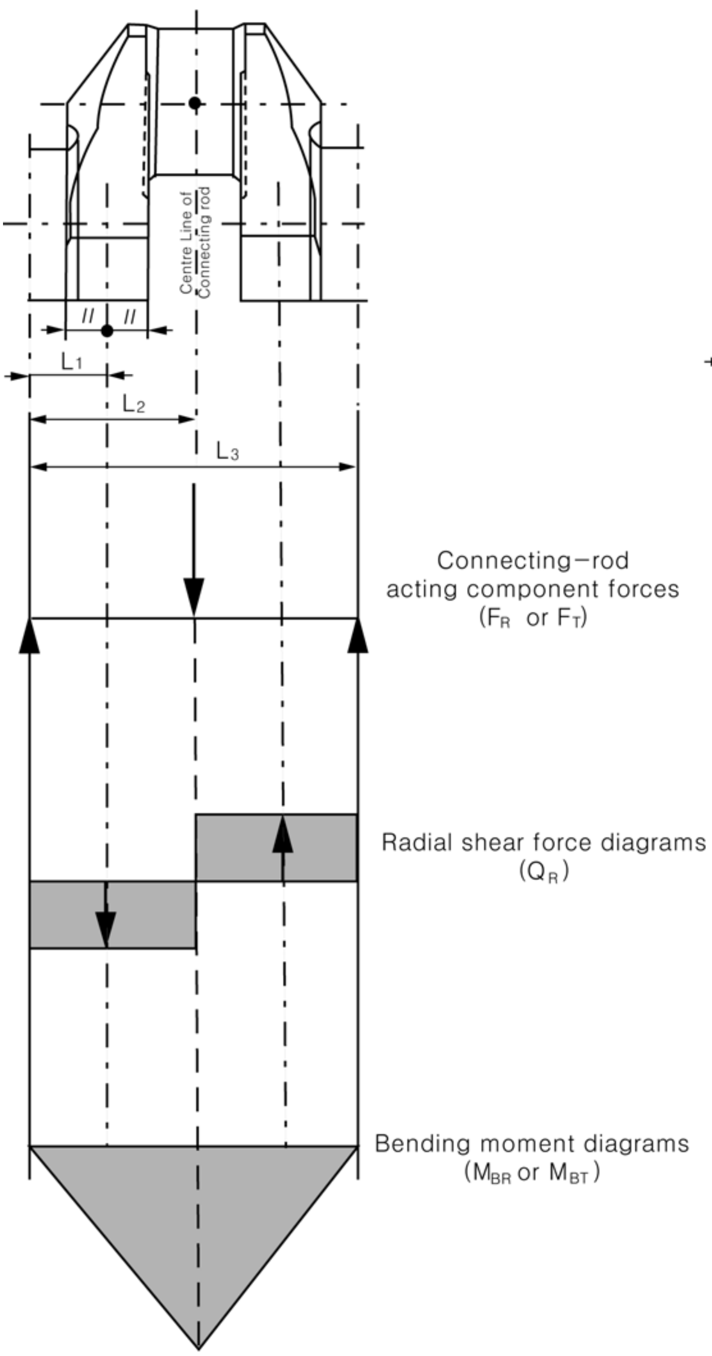

Fig 5.3 Crankthrow for in line engine

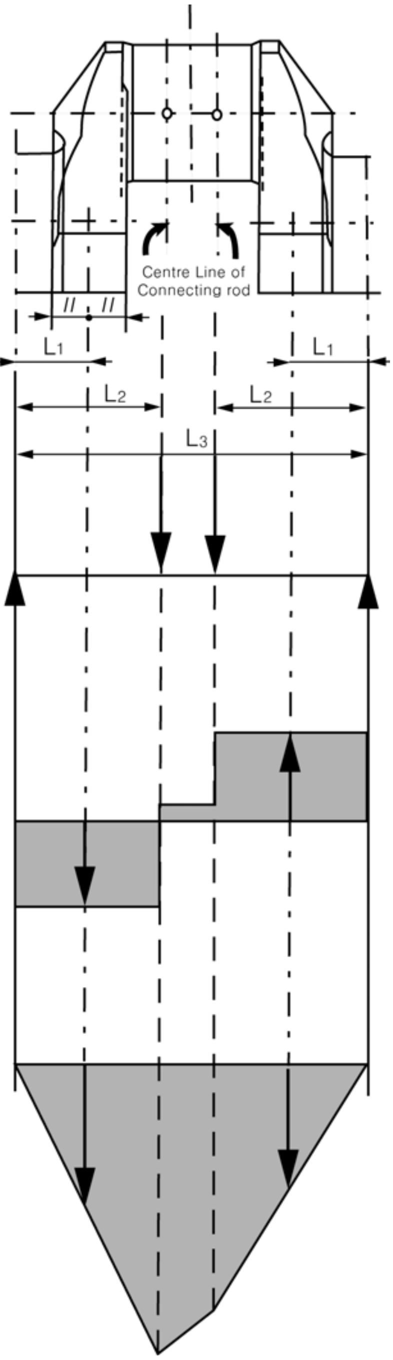

Fig 5.4 Crankthrow for Vee engine with 2 adjacent connecting-rods

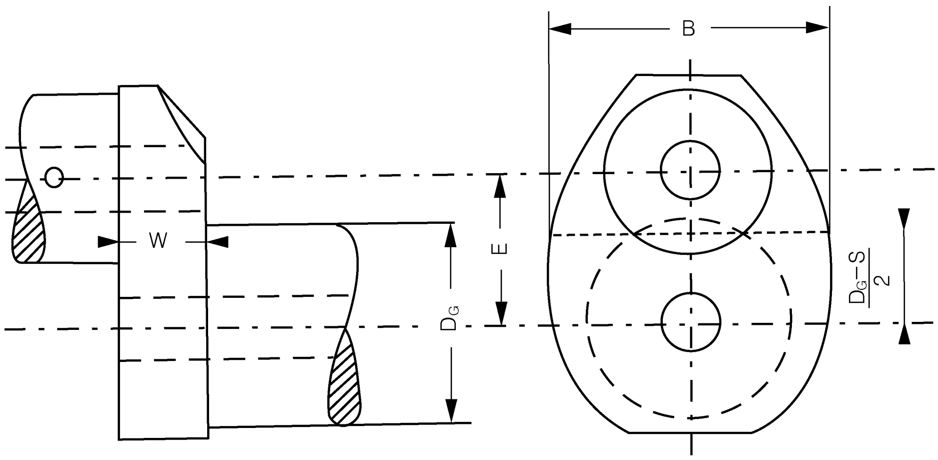
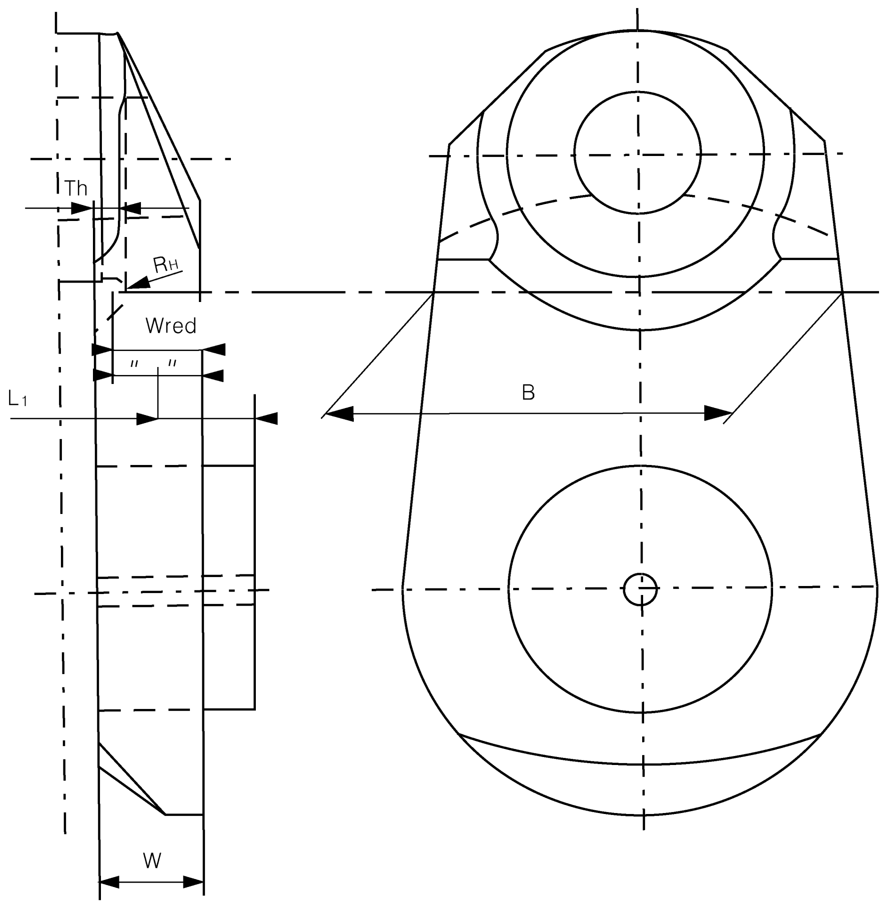
L_1 = Distance between main journal centre line and crankweb center(see also **Fig 5.5** for crankshaft without overlap)

L_2 = Distance between main journal centre line and connecting-rod centre

L_3 = Distance between two adjacent main journal centre lines



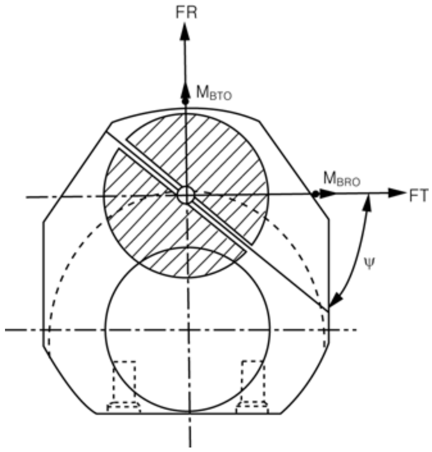
Overlapped crankshaft



Crankshaft without overlap

Fig 5.5 Reference area of crankweb cross section

(e) Bending acting in outlet of crankpin oil bore
(i) The two relevant bending moments are taken in the crankpin cross-section through the oil bore.
(ii) The alternating stresses due to these bending moments are to be related to the cross-sectional area of the axially bored crankpin.
(iii) Mean bending stresses are neglected.



M_{BRO} : is the bending moment of the radial component of the connecting-rod force

M_{BTO} : is the bending moment of the tangential component of the connecting-rod force

Fig 5.6 Crankpin section through the oil bore

(B) Nominal alternating bending and compressive stresses in web
(a) The methods of calculation are as follows.
(i) The radial and tangential forces due to gas and inertia loads acting upon the crankpin at each connecting-rod position will be calculated over one working cycle.
(ii) Using the forces calculated over one working cycle and taking into account of the distance from the main bearing midpoint, the time curve of the bending moments (M_{BRF}, M_{BRO}, M_{BTO}) and radial forces(Q_{RF}) - as defined in (1) (A) (d) and (e) - will then be calculated.
(iii) In case of V-type engines, the bending moments - progressively calculated from the gas and inertia forces - of the two cylinders acting on one crankthrow are superposed according to phase. Different designs (forked connecting-rod, articulated-type connecting-rod or adjacent connecting-rods) shall be taken into account.
(iv) Where there are cranks of different geometrical configurations in one crankshaft, the calculation is to cover all crank variants.
(v) The decisive alternating values are to be calculated according to the following formula:

$$X_N = \pm \frac{1}{2}[X_{\max} - X_{\min}]$$

where

X_N : Alternative values considered as alternating force, moment or stress

$X_{\max}$: Maximum value within one working cycle

$X_{\min}$: Minimum value within one working cycle

(b) The calculation of the nominal alternating bending and compressive stresses is as follows.

$$\sigma_{BFN} = \pm \frac{M_{BRFN}}{W_{eqw}} \cdot 10^3 \cdot K_e$$

$$\sigma_{QFN} = \pm \frac{Q_{RFN}}{F} \cdot K_e$$

where,

σ_{BFN} : Nominal alternating bending stress related to the web (N/mm^2)

M_{BRFN} : Alternating bending moment related to the center of the web (N • m) (see **Fig 5.3** and **5.4**)

$$M_{BRFN} = \pm \frac{1}{2}\left[M_{BRF_{\max}} - M_{BRF_{\min}}\right]$$

W_{eqw} : Section modulus related to cross-section of web (mm^3)

$$W_{eqw} = \frac{B \cdot W^2}{6}$$

K_e : Empirical factor considering to some extent the influence of adjacent crank and bearing restraint with : K_e = 0.8 for 2-stroke engines
K_e = 1.0 for 4-stroke engines

σ_{QFN} : Nominal alternating compressive stress due to radial force related to the web (N/mm^2)

Q_{RFN} : Alternating radial force related to the web (N) (see **Fig 5.3** and **5.4**)

$$Q_{RFN} = \pm \frac{1}{2}\left[Q_{RF_{\max}} - Q_{RF_{\min}}\right]$$

F : Area related to cross-section of web (mm^2)

$$F = B \cdot W$$

(c) The calculation of nominal alternating bending stress in outlet of crankpin oil bore is as follows.

$$\sigma_{BON} = \pm \frac{M_{BON}}{W_e} \cdot 10^3$$

where,

σ_{BON} : Nominal alternating bending stress related to the crank pin diameter (N/mm^2)

M_{BON} : Alternating bending moment calculated at the outlet of crankpin oil bore ($N \cdot m$)

$$M_{BON} = \pm \frac{1}{2}\left[M_{BO_{\max}} - M_{BO_{\min}}\right]$$

$M_{BO} = (M_{BTO} \cdot \cos\psi + M_{BRO} \cdot \sin\psi)$ and ψ (°) angular position (see **Fig 5.6**)

W_e : Section modulus related to cross-section of axially bored crankpin (mm^3)

$$W_e = \frac{\pi}{32}\left[\frac{D^4 - D_{BH}^4}{D}\right]$$

(C) Alternating bending stresses in fillets

(a) The calculation of stresses for the crankpin fillet is to be carried out as the following formula:

$$\sigma_{BH} = \pm(\alpha_B \cdot \sigma_{BFN})$$

where,

σ_{BH} : Alternating bending stress in crankpin fillet (N/mm^2)

α_B : Stress concentration factor for bending in crankpin fillet (see **3.** (2))

(b) The calculation of stresses for the journal fillet is to be carried out as the following formula(not applicable to semi-built crankshaft):

$$\sigma_{BG} = \pm((\beta_B \cdot \sigma_{BFN} + \beta_Q \cdot \sigma_{QFN})$$

where,

σ_{BG} : Alternating bending stress in journal fillet (N/mm^2)

β_B : Stress concentration factor for bending in journal fillet (see **3.** (2))

β_Q : Stress concentration factor for compression due to radial force in journal fillet (see **3**. (2))

(D) The calculation of alternating bending stresses in outlet of crankpin oil bore is to be carried out as the following formula:

$$\sigma_{BO} = \pm(\gamma_B \cdot \sigma_{BON})$$

where,

σ_{BO} : alternating bending stress in outlet of crankpin oil bore (N/mm^2)

γ_B : stress concentration factor for bending in crankpin oil bore (see **3.** (2))

(2) Alternating torsional stresses

(A) Nominal alternating torsional stresses

(a) The maximum and minimum torques are to be ascertained for every mass point of the complete dynamic system and for the entire speed range by means of a harmonic synthesis of the forced vibrations from the 1st order up to and including the 15th order for 2-stroke cycle engines and from the 0.5th order up to and including the 12th order for 4-stroke cycle engines.

(b) The allowance must be made for the damping that exists in the system and for unfavourable conditions such as misfiring in one of the cylinders.

(c) The speed step calculation shall be selected in such a way that any resonance found in the operational speed range of the engine shall be detected.

(d) Where barred speed ranges are necessary, they shall be arranged so that satisfactory operation is possible despite their existence. There are to be no barred speed ranges above a speed ratio of $\lambda \geq 0.8$ for normal firing conditions.

(e) The nominal alternating torsional stress in every mass point, which is essential to the assessment, results from the following equation.

$$\tau_N = \pm \frac{M_{TN}}{W_P} \cdot 10^3$$

where,

τ_N : Nominal alternating torsional stress referred to crankpin or journal (N/mm^2)

M_{TN} : Maximum alternating torque (N · m)

$$M_{TN} = \pm \frac{1}{2}\left[M_{T_{\max}} - M_{T_{\min}}\right]$$

$M_{T_{\max}}$: Maximum value of the torque (N • m)

$M_{T_{\min}}$: Minimum value of the torque (N • m)

W_P : Polar section modulus related to cross-section of axially bored crankpin or bored journal (mm^3)

$$W_P = \frac{\pi}{16}\left(\frac{D^4 - D_{BH}^4}{D}\right) \text{ 또는 } W_P = \frac{\pi}{16}\left(\frac{D_G^4 - D_{BG}^4}{D_G}\right)$$

(f) For the purpose of the crankshaft assessment, the nominal alternating torsional stress considered in further calculations is the highest calculated value, according to above method, occurring at the most torsionally loaded mass point of the crankshaft system. Where barred speed ranges exist, the torsional stresses within these ranges are not to be considered for assessment calculations.

(g) The approval of crankshaft will be based on the installation having the largest nominal alternating torsional stress (but not exceeding the maximum figure specified by engine manufacturer).

(B) Alternating torsional stresses in fillets and outlet of crankpin oil bore

(a) The calculation of stresses for the crankpin fillet is to be carried out as the following equation.

$$\tau_H = \pm(\alpha_T \cdot \tau_N)$$

where,

τ_H : Alternating torsional stress in crankpin fillet (N/mm^2)

α_T : Atress concentration factor for torsion in crankpin fillet (see **3.** (2))

τ_N : Nominal alternating torsional stress related to crankpin diameter (N/mm^2)

(b) The calculation of stresses for the journal fillet is to be carried out as the following equation(not applicable to semi-built crankshafts).

$$\tau_G = \pm(\beta_T \cdot \tau_N)$$

where,

τ_G : Alternating torsional stress in journal fillet N/mm^2(N/mm^2)

β_T : Stress concentration factor for torsion in journal fillet (see **3.** (2))

τ_N : Nominal alternating torsional stress related to journal diameter (N/mm^2)

(c) The calculation of stresses for the outlet of the crankpin oil bore is to be carried out as the following equation.

$$\sigma_{T0} = \pm(\gamma_T \cdot \tau_N)$$

where,

σ_{T0} : Alternating stress in outlet of crankpin oil bore due to torsion (N/mm^2)

γ_T : Stress concentration factor for torsion in outlet of crankpin oil bore (see **3.** (2))

τ_N : Nominal alternating torsional stress related to crankpin diameter (N/mm^2)

3. Stress Concentration Factors

(1) General

(A) The stress concentration factors are evaluated by means of the formulae according to **3.** (2), (3) and (4) applicable to the fillets and crankpin oil bore of solid forged web-type crankshafts and to the crankpin fillets of semi-built crankshafts only. It must be noticed that stress concentration factor formulae concerning the oil bore are only applicable to a radially drilled oil hole. All formulae are based on investigations of FVV (Forschungsvereinigung Verbrennungskraftmaschinen) for fillets and on investigations of ESDU(Engineering Science Data Unit) for oil holes(All crank dimensions necessary for the calculation of stress concentration factors are shown in **Fig 5.7**).

(B) The stress concentration factor for bending (α_B, β_B) is defined as the ratio of the maximum equivalent stress (VON MISES) - occurring in the fillets under bending load - to the nominal bending stress related to the web cross-section (see **Fig 5.9**).

(C) The stress concentration factor for compression (β_Q) in the journal fillet is defined as the ratio of the maximum equivalent stress (VON MISES) - occurring in the fillet due to the radial force - to the nominal compressive stress related to the web cross-section.

(D) The stress concentration factor for torsion (α_T, β_T) is defined as the ratio of the maximum equivalent shear stress - occurring in the fillets under torsional load - to the nominal torsional stress related to the axially bored crankpin or journal cross-section(see **Fig 5.9**).

(E) The stress concentration factors for bending(γ_B) and torsion(γ_T) are defined as the ratio of the maximum principal stress - occurring at the outlet of the crankpin oil-hole under bending and torsional loads - to the corresponding nominal stress related to the axially bored crankpin cross section(see **Fig 5.10**).

(F) When reliable measurements and/or calculations are available, which can allow direct assessment of stress concentration factors, the relevant documents and their analysis method have to be submitted to the Society in order to demonstrate their equivalence to present rules evaluation.

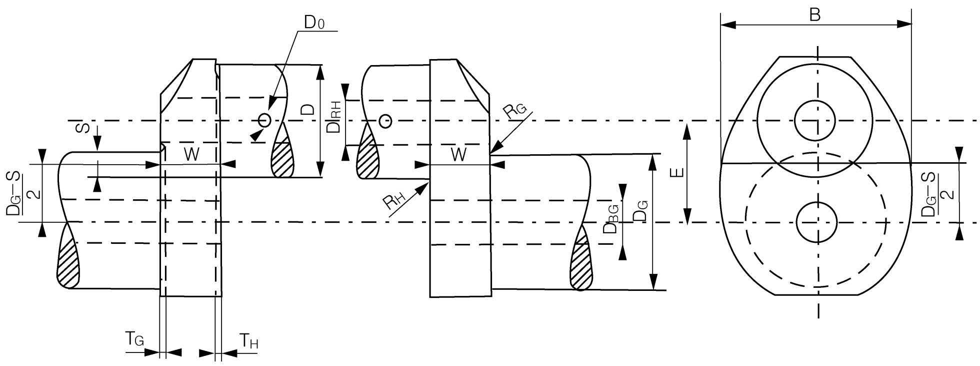


Fig 5.7 Crank dimension

(G) The symbols mean as follows.

D : Crankpin diameter (mm)
D_{RH} : Diameter of axial bore in crankpin (mm)
D_O : Diameter of oil bore in crankpin (mm)
R_H : Fillet radius of crankpin (mm)
T_H : Recess of crankpin fillet (mm)
D_G : Journal diameter (mm)
D_{BG} : Diameter of axial bore in journal (mm)
R_G : Fillet radius of journal (mm)
T_G : Recess of journal fillet (mm)
E : Pin eccentricity (mm)
S : Pin overlap (mm)

$$S = \frac{D+D_G}{2} - E$$

W : web thickness (mm)

B : web width (mm)

In the case of 2 stroke semi-built crankshafts :

- When $T_H > R_H$, the web thickness(W) must be considered as equal to :

$$W_{red} = W-(T_H-R_H)$$ [refer to **Fig 5.5**]

- Web width(B) must be taken in way of crankpin fillet radius centre according to **Fig 5.5.**

The following related dimensions will be applied for the calculation of stress concentration factors in :

Crankpin fillet	Journal fillet
$r = R_H/D$ (0.03 $\leq r \leq$ 0.13)	$r = R_G/D$ (0.03 $\leq r \leq$ 0.13)
$s = S/D$ ($s \leq$ 0.5) $w = W/D$ (0.2 $\leq w \leq$ 0.8) (crankshafts with overlap) W_{red}/D (0.2 $\leq w \leq$ 0.8) (crankshafts without overlap) $b = B/D$ (1.1 $\leq b \leq$ 2.2) $d_o = D_O/D$ (0 $\leq d_O \leq$ 0.2) $d_G = D_{BG}/D$ (0 $\leq d_G \leq$ 0.8) $d_H = D_{BH}/D$ (0 $\leq d_H \leq$ 0.8) $t_H = T_H/D$ $t_G = T_G/D$	

(H) Low range of s can be extended down to large negative values provided that :
- If calculated f(recess) < 1 then the factor f(recess) is not to be considered (f(recess) = 1)
- If s < -0.5 then $f(s, w)$ and $f(r, s)$ are to be evaluated replacing actual value of s by -0.5.

(2) Stress concentration factors for crankpin fillet

(A) The stress concentration factor for bending(α_B) is given as follows.

$$\alpha_B = 2.6914 \cdot f(s,w) \cdot f(w) \cdot f(b) \cdot f(r) \cdot f(d_G) \cdot f(d_H) \cdot f(recess)$$

where,

$$f(s,w) = -4.1883 + 29.2004 \cdot w - 77.5925 \cdot w^2 + 91.9454 \cdot w^3 - 40.0416 \cdot w^4$$
$$+ (1-s) \cdot (9.5440 - 58.3480 \cdot w + 159.3415 \cdot w^2 - 192.5846 \cdot w^3 + 85.2916 \cdot w^4)$$
$$+ (1-s)^2 \cdot (-3.8399 + 25.0444 \cdot w - 70.5571 \cdot w^2 + 87.0328 \cdot w^3 - 39.1832 \cdot w^4)$$

$$f(w) = 2.1790 \cdot w^{0.7171}$$

$$f(b) = 0.6840 - 0.0077 \cdot b + 0.1473 \cdot b^2$$

$$f(r) = 0.2081 \cdot r^{-0.5231}$$

$$f(d_G) = 0.9993 + 0.27 \cdot d_G - 1.0211 \cdot d_G^2 + 0.5306 \cdot d_G^3$$

$f(d_H) = 0.9978 + 0.3145 \cdot d_H - 1.5241 \cdot d_H^2 + 2.4147 \cdot d_H^3$

$f(recess) = 1 + (t_H + t_G) \cdot (1.8 + 3.2 \cdot s)$

(B) The stress concentration factor for torsion(α_T) is given as follows.

$$\alpha_T = 0.8 \cdot f(r,s) \cdot f(b) \cdot f(w)$$

where,

$f(r,s) = r^{-0.322 + 0.1015(1-s)}$

$f(b) = 7.8955 - 10.654 \cdot b + 5.3482 \cdot b^2 - 0.85 \cdot b^3$

$f(w) = w^{-0.145}$

(3) Stress concentration factors for journal fillet (not applicable to semi-built crankshaft)

(A) The stress concentration factor for bending (β_B) is given as follows.

$$\beta_B = 2.7146 \cdot f_B(s,w) \cdot f_B(w) \cdot f_B(b) \cdot f_B(r) \cdot f_B(d_G) \cdot f_B(d_H) \cdot f(recess)$$

where,

$f_B(s,w) = -1.7625 + 2.9821 \cdot w - 1.527 \cdot w^2 + (1-s) \cdot (5.1169 - 5.8089 \cdot w + 3.1391 \cdot w^2)$
$+ (1-s)^2 \cdot (-2.1567 + 2.3297 \cdot w - 1.2952 \cdot w^2)$

$f_B(w) = 2.2422 \cdot w^{0.7548}$

$f_B(b) = 0.5616 + 0.1197 \cdot b + 0.1176 \cdot b^2$

$f_B(r) = 0.1908 \cdot r^{-0.5568}$

$f_B(d_G) = 1.0012 - 0.6441 \cdot d_G + 1.2265 \cdot d_G^2$

$f_B(d_H) = 1.0022 - 0.1903 \cdot d_H + 0.0073 \cdot d_H^2$

$f(recess) = 1 + (t_H + t_G) \cdot (1.8 + 3.2 \cdot s)$

(B) The stress concentration factor for compression (β_Q) due to the radial force is given as follows.

$$\beta_Q = 3.0128 \cdot f_Q(s) \cdot f_Q(w) \cdot f_Q(b) \cdot f_Q(r) \cdot f_Q(d_H) \cdot f(recess)$$

where,

$f_Q(s) = 0.4368 + 2.1630 \cdot (1-s) - 1.5212 \cdot (1-s)^2$

$f_Q(w) = \dfrac{w}{0.0637 + 0.9369 \cdot w}$

$f_Q(b) = -0.5 + b$

$f_Q(r) = 0.5331 \cdot r^{-0.2038}$

$f_Q(d_H) = 0.9937 - 1.1949 \cdot d_H + 1.7373 \cdot d_H^2$

$f(recess) = 1 + (t_H + t_G) \cdot (1.8 + 3.2 \cdot s)$

(C) The stress concentration factor for torsion (β_T) is given as follows.

(a) If the diameters and fillet radii of crankpin and journal are the same.

$$\beta_T = \alpha_T$$

(b) If crankpin and journal diameters and/or radii are of different sizes.

$$\beta_T = 0.8 \cdot f(r,s) \cdot f(b) \cdot f(w)$$

where,

$f(r,s)$, $f(b)$ and $f(w)$ are to be determined in accordance with item 3. (2), however, the radius of the journal fillet is to be related to the journal diameter :

$$r = \frac{R_G}{D_G}$$

(D) The stress concentration factor for outlet of crankpin oil bore

(a) The stress concentration factor for bending(γ_B) is given as follows.

$$\gamma_B = 3 - 5.88 \cdot d_O + 34.6 \cdot d_O^2$$

(b) The stress concentration factor for torsion(γ_T) is given as follows.

$$\gamma_T = 4 - 6 \cdot d_O + 30 \cdot d_O^2$$

4. Additional Bending Stresses σ_{add}

(1) In addition to the alternating bending stresses in fillets further bending stresses due to misalignment and bedplate deformation as well as due to axial and bending vibrations are to be considered by applying additional bending stresses(σ_{add}) as given by table.

Type of engine	σ_{add} (N/mm^2)
Crosshead engines	± 30 (1)
Trunk piston engines	± 10

NOTES : The additional stress of ± 30 N/mm^2 is composed of two components.
1) An additional stress of ± 20 N/mm^2 resulting from axial vibration
2) An additional stress of ± 10 N/mm^2 resulting from misalignment/bedplate deformation

(2) It is recommended that a value of ± 20 N/mm^2 be used for the axial vibration component for assessment purposes where axial vibration calculation results of the complete dynamic system (engine/shafting/gearing/propeller) are not available.

(3) Where axial vibration calculation results of the complete dynamic system are available, the calculated figures may be used instead.

5. Calculation of Equivalent Alternating Stress

(1) General

(A) In the fillets, bending and torsion lead to two different biaxial stress fields which can be represented by a Von Mises equivalent stress with the additional assumptions that bending and torsion stresses are time phased and the corresponding peak values occur at the same location(see **Fig 5.9**). As a result the equivalent alternating stress is to be calculated for the crankpin fillet as well as for the journal fillet by using the Von Mises criterion.

(B) At the oil hole outlet, bending and torsion lead to two different stress fields which can be represented by an equivalent principal stress equal to the maximum of principal stress resulting from combination of these two stress fields with the assumption that bending and torsion are time phased(see **Fig 5.10**).

(C) The above two different ways of equivalent stress evaluation both lead to stresses which may be compared to the same fatigue strength value of crankshaft assessed according to Von Mises criterion.

(2) The equivalent alternating stress for the crankpin fillet is calculated in accordance with the formulae given.

$$\sigma_v = \pm \sqrt{(\sigma_{BH}+\sigma_{add})^2 + 3 \cdot \tau_H^2}$$

(3) The equivalent alternating stress for the journal fillet is calculated in accordance with the formulae given.

$$\sigma_v = \pm \sqrt{(\sigma_{BG}+\sigma_{add})^2 + 3 \cdot \tau_G^2}$$

(4) The equivalent alternating stress for the outlet of crankpin oil bore is calculated in accordance with the formulae given.

$$\sigma_V = \pm \frac{1}{3}\sigma_{BO} \cdot \left[1 + 2\sqrt{1 + \frac{9}{4}\left(\frac{\sigma_{T0}}{\sigma_{BO}}\right)^2}\right]$$

where,

σ_V : equivalent alternating stress (N/mm^2)

for other parameters **see 2**, (1) (C), **2.** (2) (B) and **4**.

6. Fatigue Strength

(1) Fatigue strength related to the crankpin diameter

The fatigue strength related to the crankpin diameter may be evaluated by means of the following formula.

$$\sigma_{DW} = \pm K \cdot (0.42 \cdot \sigma_B + 39.3) \cdot \left[0.264 + 1.073 \cdot D^{-0.2} + \frac{785 - \sigma_B}{4900} + \frac{196}{\sigma_B} \cdot \sqrt{\frac{1}{R_X}}\right]$$

where,

$R_X = R_H$ (in the fillet area)

$R_X = D_O/2$ (in the oil bore area)

(2) Fatigue strength related to the journal diameter

(A) The fatigue strength related to the journal diameter may be evaluated by means of the following formula.

$$\sigma_{DW} = \pm K \cdot (0.42 \cdot \sigma_B + 39.3) \cdot \left[0.264 + 1.073 \cdot D_G^{-0.2} + \frac{785 - \sigma_B}{4900} + \frac{196}{\sigma_B} \cdot \sqrt{\frac{1}{R_G}}\right]$$

where,

σ_{DW} : Allowable fatigue strength of crankshaft (N/mm^2)

K : Factor for different types of crankshafts without surface treatment. Values greater than 1 are only applicable to fatigue strength in fillet area.

= 1.05 for continuous grain flow forged or drop-forged crankshafts

= 1.0 for free form forged crankshafts (without continuous grain flow)

Factor for cast steel crankshafts with cold rolling treatment in fillet area

= 0.93 for cast steel crankshafts manufactured by companies using approved cold rolling process of the Society

σ_B : minimum tensile strength of crankshaft material (N/mm^2)

For other parameters **see 3.** (1). However, for calculation purposes R_H, R_G or R_X are to be taken as not less than 2 mm.

(B) When a surface treatment process is applied, it must be approved by the Society.

(C) Surfaces of the fillet, the outlet of the oil bore and inside the oil bore(down to a minimum depth equal to 1.5 times the oil bore diameter) shall be smoothly finished.

(3) Alternative method

(A) The fatigue strength of the crankshaft can be determined by experiment based either on full size crankthrow (or crankshaft) or on specimens taken from a full size crankthrow.

(B) The experimental procedure for fatigue evaluation of specimens and fatigue strength of crankshaft assessment have to be submitted for approval to the Society(method, type of specimens, number of specimens(or crankthrows), number of tests, survival probability, confidence number,.⋯).

7. Acceptability Criteria

The sufficient dimensioning of a crankshaft is confirmed by a comparison of the equivalent alternating stress and the fatigue strength. This comparison has to be carried out for the crankpin fillet, the journal fillet, the outlet of crankpin oil bore and is based on the formula.

$$Q=\frac{\sigma_{DW}}{\sigma_V} \geq 1.15$$

where,

Q : Acceptability factor

8. Calculation of Shrink-fits of Semi-built crankshaft

(1) General

(A) All crank dimensions necessary for the calculation of the shrink-fit are shown in **Fig 5.8.**

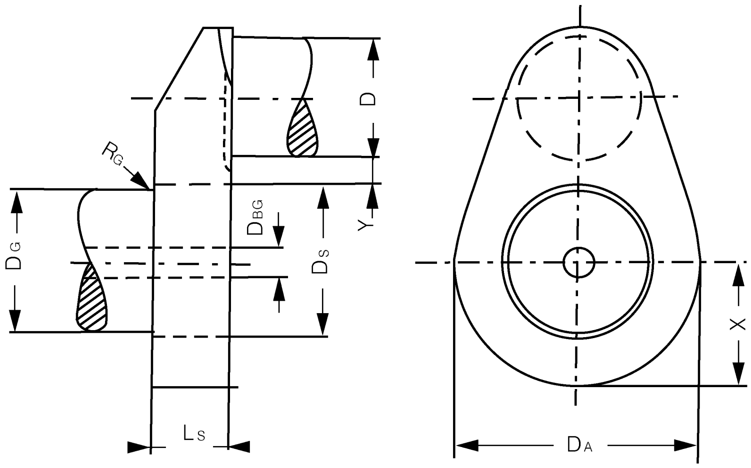

Fig 5.8 Crankthrow of semi-built crankshaft

(B) the symbols means as follows.

D_A : Outside diameter of web or twice the minimum distance(X) between centre-line of journals and outer contour of web, whichever is less (mm)

D_S : Shrink diameter (mm)

D_G : Journal diameter (mm)

D_{BG} : Diameter of axial bore in journal (mm)

L_S : Length of shrink-fit (mm)

R_G : Fillet radius of journal (mm)

Y : Distance between the adjacent generating lines of journal and pin (mm)

- $Y \geq 0.05 \cdot D_S$
- Where Y is less than $0.1 \cdot D_S$ special consideration is to be given to the effect of the stress due to the shrink-fit on the fatigue strength at the crankpin fillet.

(C) Respecting the radius of the transition from the journal to the shrink diameter, the following should be complied with :

$$R_G \geq 0.015 \cdot D_G$$

and

$$R_G \geq 0.5 \cdot (D_S - D_G)$$

where the greater value is to be considered.

(D) The actual oversize(Z) of the shrink-fit must be within the limits $Z_{\min}$ and $Z_{\max}$ calculated in accordance with **8.** (3) and (4).

(E) In the case where **8.** (2) condition cannot be fulfilled then **8.** (3) and **8.** (4) calculation methods of $Z_{\min}$ and $Z_{\max}$ are not applicable due to multizone-plasticity problems. In such case $Z_{\min}$ and $Z_{\max}$ have to be established based on FEM calculations.

(2) Maximum permissible hole in the journal pin

(A) The maximum permissible hole diameter in the journal pin is calculated in accordance with the following formula:

$$D_{BG} = D_S \cdot \sqrt{1 - \frac{4000 \cdot S_R \cdot M_{\max}}{\mu \cdot \pi \cdot D_S^2 \cdot L_S \cdot \sigma_{sp}}}$$

S_R : Safety factor against slipping, however a value not less than 2 is to be taken unless documented by experiments.

$M_{\max}$: A bsolute maximum value of the torque($M_{T_{\max}}$) in accordance with **2.** (2) (A) (N • m)

μ : Coefficient for static friction, however a value not greater than 0.2 is to be taken unless documented by experiments.

σ_{SP} : Minimum yield strength of material for journal pin (N/mm^2)

(B) This condition serves to avoid plasticity in the hole of the journal pin.

(3) Necessary minimum oversize of shrink-fit

The necessary minimum oversize is determined by the greater value calculated according to the following formula:

$$Z_{\min} \geq \frac{\sigma_{SW} \cdot D_S}{E_m}$$

$$Z_{\min} \geq \frac{4000}{\mu \cdot \pi} \cdot \frac{S_R \cdot M_{\max}}{E_m \cdot D_S \cdot L_S} \cdot \frac{1 - Q_A^2 \cdot Q_S^2}{(1 - Q_A^2) \cdot (1 - Q_S^2)}$$

where,

$Z_{\min}$: Minimum oversize (mm)

E_m : Young's modulus (N/mm^2)

σ_{SW} : Minimum yield strength of material for crank web (N/mm^2)

Q_A : Web ratio, $Q_A = \frac{D_S}{D_A}$

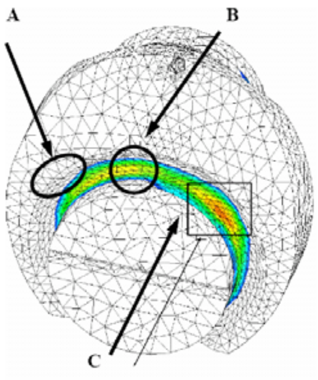
Q_S : Shaft ratio, $Q_S = \frac{D_{BG}}{D_S}$

(4) Maximum permissible oversize of shrink-fit

(A) The maximum permissible oversize is calculated according to the following formula:

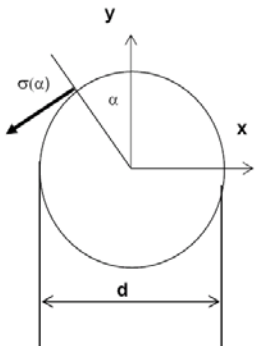
$$Z_{\max} \leq D_S \bullet \left(\frac{\sigma_{SW}}{E_m} + \frac{0.8}{1000} \right)$$

(B) This condition serves to restrict the shrinkage induced mean stress in the fillet.



Loading	Stress	Max $\|\|\sigma_3\|\|$	Max σ_1	
Torsional loading	Location of maximal stresses	A	C	B
	Typical principal stress system Mohr's circle diagram with $\sigma_2 = 0$	 $\|\|\sigma_3\|\| > \sigma_1$	 $\sigma_1 > \|\|\sigma_3\|\|$	 $\sigma_1 \approx \|\|\sigma_3\|\|$
	Equivalent stress and S.C.F.	$\tau_{equiv} = \frac{\sigma_1 - \sigma_3}{2}$ $S.C.F. = \frac{\tau_{equiv}}{\tau_n}$ for α_T, β_T		
Bending loading	Location of maximal stresses	B	B	B
	Typical principal stress system Mohr's circle diagram with $\sigma_3 = 0$			$\sigma 2 \neq 0$
	Equivalent stress and S.C.F.	$\sigma_{equiv} = \sqrt{\sigma_1^2 + \sigma_2^2 - \sigma_1 . \sigma_2}$ $S.C.F. = \frac{\sigma_{equiv}}{\sigma_n}$ for $\alpha_B, \beta_B, \beta_Q$		

Fig 5.9 Definition of Stress Concentration Factors in crankshaft fillets



Stress type	Nominal stress tensor	Uniaxial stress distribution around the edge	Mohr's circle diagram
Tension	$\begin{bmatrix} \sigma_n & 0 \\ 0 & 0 \end{bmatrix}$	$\sigma_\alpha = \sigma_n \gamma_B / 3 \, [1+2\cos(2\alpha)]$ 	 $\gamma_B = \sigma_{max} / \sigma_n$ for $\alpha = k\pi$
Shear	$\begin{bmatrix} 0 & \tau_n \\ \tau_n & 0 \end{bmatrix}$	$\sigma_\alpha = \gamma_T \tau_n \sin(2\alpha)$ 	 $\gamma_T = \sigma_{max} / \tau_n$ for $\alpha = \frac{\pi}{4} + k\frac{\pi}{2}$
Tension + shear	$\begin{bmatrix} \sigma_n & \tau_n \\ \tau_n & 0 \end{bmatrix}$	$\sigma_\alpha = \frac{\gamma_B}{3}\sigma_n \left\{1 + 2\left[\cos(2\alpha) + \frac{3}{2}\frac{\gamma_T}{\gamma_B}\frac{\tau_n}{\sigma_n}\sin(2\alpha)\right]\right\}$ 	 $\sigma_{max} = \frac{\gamma_B}{3}\sigma_n \left[1 + 2\sqrt{1 + \frac{9}{4}\left(\frac{\gamma_T}{\gamma_B}\frac{\tau_n}{\sigma_n}\right)^2}\right]$ for $\alpha = \frac{1}{2}\mathrm{tg}^{-1}\left(\frac{3\gamma_T\tau_n}{2\gamma_B\sigma_n}\right)$

Fig 5.10 Stress Concentration factors and distribution at the edge of oil drillings

Annex 5-4 Strength Calculation for Gears of Power Transmission Systems

1. General

(1) Application

This Guidance is to apply to enclosed gear used for transmission system which transmit power from main propulsion machinery and prime movers driving generators and essential auxiliaries(excluding auxiliary machinery for specific use etc,).

(2) Basic principles

(A) The methods for calculation of strength of gears specified in this Guidance deal with surface durability(pitting) and tooth root bending strength.

(B) All influence factors related to strength are defined regarding their physical interpretation. Some of the influence factors are determined by the gear geometry or have been established by conventions. Other factors, which are approximations, can be calculated according to methods acceptable to the Society.

2. Symbols and units

a : Center distance (mm)

b : Common facewidth (mm)

$b_{1,2}$: Facewidth of pinion, wheel (mm)

C_r : Tooth mesh stiffness (mean total mesh stiffness per unit face width) (N/mm • μm)

d : Reference diameter (mm)

$d_{1,2}$: Reference diameter of pinion, wheel (mm)

$d_{a1,2}$: Tip diameter of pinion, wheel (mm)

$d_{b1,2}$: Base diameter of pinion, wheel (mm)

$df_{1,2}$: Root diameter of pinion, wheel (mm)

$d_{W1,2}$: Working diameter of pinion, wheel (mm)

F_t : Nominal tangential load (N)

F_{bt} : Nominal tangential load on base cylinder in the transverse section (N)

F_β : Total tooth alignment deviation (mm)

$F_{\beta x}$: Actual longitudinal tooth flank deviation before running (mm)

$F_{\beta y}$: Actual longitudinal tooth flank deviation after running (mm)

F_m : Nominal tangential tooth load (N)

f_{pb} : Maximum base pitch deviation of wheel (μm)

f_{pt} : Face pitch deviation (μm)

f_{ma} : Tooth flank misalignment due to manufacturing errors (mm)

f_{sh} : Tooth flank misalignment due to wheel and pinion deflections (mm)

h : Total depth of tooth (mm)

hF : Bending moment arm for tooth root bending stress for application of load at the outer point of single tooth pair contact (mm)

m_n : Nominal module (mm)

m_t : Transverse module (mm)

$n_{1,2}$: Rotational speed of pinion, wheel (rpm)

P : Maximum continuous power transmitted by the gear set (kW)

R_a : Surface roughness (mm)

R_z : Mean peak to-valley roughness of tooth root fillets (μm)

$R_{z1,2}$: Mean peak to-valley roughness of tooth root fillets for pinion, wheel after running (μm)

R_{z100} : Mean peak to-valley roughness of tooth root fillets with relative radius of curvature 10 mm at the pitch of center distance ρ=100 mm
q_s : Notch parameter
sF_n : Root fillet radius in the critical section (mm)
$T_{1,2}$: Torque in way of pinion, wheel (N • m)
u : Gear ratio
V : Linear speed at pitch diameter (m/s)
$x_{1,2}$: Addendum modification coefficient of pinion, wheel
y_α : Running in base pitch allowance (μm)
$y_{\alpha 1,2}$: Running in base pitch allowance of pinion, wheel (mm)
y_β : Running in allowance (μm)
z : Number of teeth
$z_{1,2}$: Number of teeth of pinion, wheel
z_n : Virtual number of teeth
$z_{n1,2}$: Virtual number of teeth of pinion, wheel
α_n : Nominal pressure angle at reference cylinder (degree)
α_t : Transverse pressure angle at ref. cylinder (degree)
α_{tw} : Transverse pressure angle at working pitch cylinder (degree)
αFen : Pressure angle at the outer point of single tooth pair contact in the normal section (degree)
β : Helix angle at reference diameter (degree)
β_b : Helix angle at base diameter (degree)
ε_α : Transverse contact ratio
ε_β : Overlap ratio
ε_γ : Total contact ratio
ρF : Root fillet radius in the critical section (mm)
σ_b : Tensile strength (N/mm^2)
φ_p : Allowance value

3. Geometrical definitions

$z_2, a, d_2, d_{a2}, d_{b2}$ and d_{w2} are positive for external gearing, and are negative for internal gearing. u is positive for external gears, and is negative for internal gears. The absolute value of the gear ratio, defined as follows, is always greater or equal to the unity.

$$u = z_2/z_1 = d_{w2}/d_{w1} = d_2/d_1$$

The pinion is defined as the gear with the smaller number of teeth.In the equation of surface durability b is the common facewidth on the pitch diameter. In the equation of tooth root bending stress b_1 and b_2 are the facewidth at the respective tooth roots.

$\tan \alpha_t = \tan a_n / \cos \beta$

$\tan \beta_b = \tan \beta \cos \alpha_t$

$d = z m_n / \cos \beta$

$d_b = d \cos \alpha_t = d_w \cos \alpha_{tw}$

$a = 0.5(d_{w1} + d_{w2})$

$z_n = z / (\cos^2 \beta_b \cos \beta)$

$m_t = m_n / \cos \beta$

$inv\, \alpha = \tan \alpha - \pi \alpha / 180 (\alpha = \text{degree})$

$inv\, \alpha_{tw} = inv\, \alpha_t + 2 \tan \alpha_n (x_1 + x_2) / (z_1 + z_2)$

$$\varepsilon_a = \frac{0.5\sqrt{d_{a1}^2 - d_{b1}^2} \pm 0.5\sqrt{d_{a2}^2 - d_{b2}^2} - a sin a_{tw}}{\pi m_n \cos\alpha_t / \cos\beta}$$

(the positive sign is used for external gears, the negative sign for internal gears)

$\varepsilon_\beta = b sin \beta / p m_n$

(for double helix, b is to be taken as the width of one helix)

$\varepsilon_\gamma = \varepsilon_\alpha + \varepsilon_\beta$

$v = d_{1,2} n_{1,2} /$ 19,099

4. Nominal tangential load, F_t

The nominal tangential load is calculated directly from the maximum continuous power transmitted by the gear set by means of following equations.

$F_t = 2{,}000\, T_{1,2} / d_{1,2}$ (N)

$T_{1,2} = 9{,}549 P / n_{1,2}$

5. General influence factors

(1) Application factor, K_A
The application factor accounts for dynamic overloads from sources external to the gearing, and is defined as the ratio between the maximum repetitive cyclic torque applied to the gear set and the nominal rated torque, and is in accordance with the **Table 5.3.** However, where the calculation sheets or data are submitted or the factor is measured actually, the value may be applied according to the discretion of the Society.

(2) Load sharing factor, K_γ
The load sharing factor which accounts for the maldistribution of load in multiple path transmissions (dual tandem, epicycle, double helix, etc.), is defined as the ratio between the maximum load through an actual path and the evenly shared load, and is in accordance with the **Table 5.4.** However, where the calculation sheets or data are submitted or the factor is measured actually, the value may be applied according to the discretion of the Society.

Table 5.3 Application Factor, K_A

Driving engine	Construction or method of connection	K_A
Main propulsion	Diesel engine with hydraulic or electromagnetic slip coupling	1.00
	Diesel engine with high elasticity coupling	1.30
	Diesel engine with other couplings	1.50
Auxiliary	Electric motor, diesel engine with hydraulic or electromagnetic slip coupling	1.00
	Diesel engine with high elasticity coupling	1.20
	Diesel engine with other couplings	1.40

Table 5.4 Load sharing factor

Planetary gears	K_γ
up to 3	1.0
4	1.2
5	1.3
6	1.4

(3) Dynamic factor, K_V
The dynamic factor which accounts for internally generated dynamic loads due to vibrations of pinion and wheel against each other, is defined as the ratio between the maximum load which dynamically acts on the tooth flanks and the maximum externally applied load ($F_t K_A K_\gamma$), and can be calculated as follows.
(A) Application
(a) Steel gears of heavy rims sections
(b) $F_t/b > 150$ N/mm
(c) $Z_1 < 50$
(d) Running speed in the subcritical range
(i) for helical gears: $(vz_1)/100 < 14$
(ii) for spur gears: $(vz_1)/100 < 10$
(iii) others: $(vz_1)/100 < 3$
(B) Calculation formula
(a) Helical gears
(i) For overlap ratio $(\varepsilon_\beta) > 1$
The dynamic factor is obtained from **Fig 5.11**
(ii) For overlap ratio $(\varepsilon_\beta) < 1$
The dynamic factor is obtained from the formula

$$K_V = K_{V2} - \varepsilon_\beta (K_{V2} - K_{V1})$$

K_{V1} : K_V value for helical gears, given by **Fig 5.11**
K_{V2} : K_V value for spurl gears, given by **Fig 5.12**
(b) Spur gears
The dynamic factor is obtained from **Fig 5.12**
(c) The dynamic factor can also be determined as follows.

$$K_V = 1 + K_1 (vz_1)/100$$

K_1 : Values specified in the **Table 5.5**

(C) Where the gears other than those applied with (A), The dynamic factor is the value according to the calculation sheets or data submitted to the Society and recognized appropriateness by the Society.

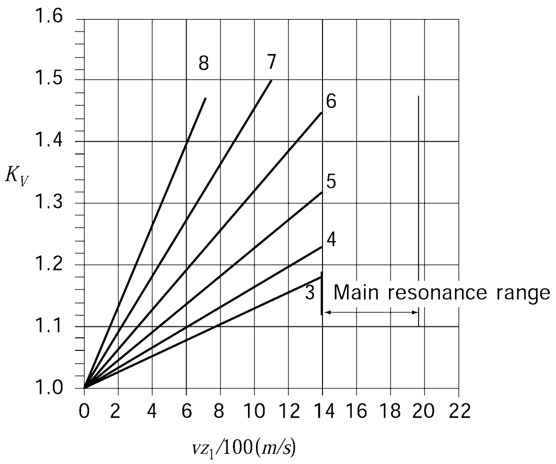


Fig 5.11 Dynamic Factor for Helical Gear. ISO Grades of Accuracy 3-8

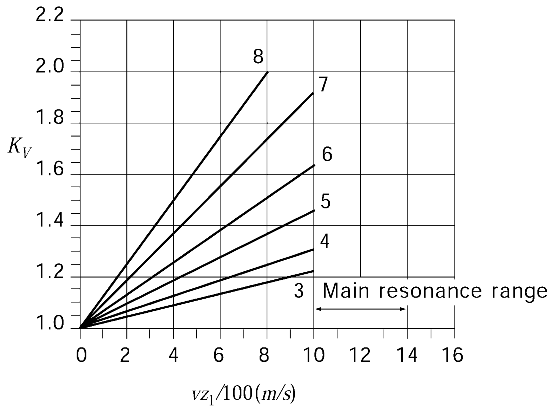

Fig 5.12 Dynamic Factor for Spur Gear. ISO Grades of Accuracy 3-8

Table 5.5 Values of K_1

Kind of gear	K_1 (*ISO* 1328 grades of accuracy)					
	3*	4*	5*	6*	7*	8*
Spur gear	0.022	0.030	0.043	0.062	0.092	0.125
Helical gear	0.0125	0.0165	0.0230	0.0330	0.0480	0.070

NOTE
* ISO grades of accuracy according to *ISO* 1328. In case of mating gears with different grades of accuracy the grade corresponding to the lower accuracy is to be used.

(4) Face load distribution factors $K_{H\beta}, K_{F\beta}$

(A) The face load distribution factors, $K_{H\beta}$, for contact stress, $K_{F\beta}$, for tooth root bending stress, account for the effect of non-uniform distribution of load across the facewidth. $K_{H\beta}$ and $K_{F\beta}$ are defined as follows:

$$K_{H\beta} = \frac{Maximum\ load\ per\ unit\ facewidth}{Mean\ load\ per\ unit\ facewidth}$$

$$K_{F\beta} = \frac{Maximum\ bending\ stress\ at\ tooth\ root\ per\ unit\ facewidth}{Mean\ bending\ stress\ at\ tooth\ root\ per\ unit\ facewidth}$$

(B) The face load distribution factors, $K_{H\beta}$, for contact stress, and $K_{F\beta}$ for tooth root bending stress, can be determined according to the method $C2$ outlined in the *ISO* 6336/1 standard. However, where the calculation sheets or data are submitted or the factors are measured actually, the values may be applied according to the discretion of the Society.

(a) The face load distribution factors for contact stress, $K_{H\beta}$

At the stage of design, $K_{H\beta}$, is the value calculated by the following formula under allowable manufacturing deviation.

(i) For $\frac{bF_{\beta y}C_{\gamma}}{2F_m} \geq 1$:

$$K_{H\beta} = \sqrt{\frac{2bF_{\beta y}C_\gamma}{F_m}}$$

(ii) For $\frac{bF_{\beta y}C_\gamma}{2F_m} < 1$:

$$K_{H\beta} = 1 + \frac{bF_{\beta y}C_\gamma}{2F_m}$$

where

$F_m = F_t F_A F_V F_g$

$F_{\beta y} = F_{\beta x} - y_b$

$F_{\beta x} = f_{sh} + f_{ma}$

$f_{sh} = (F_m/b) f_{sho}$

f_{sho} : The values specified in the following.

- For gears without helix correction and without end relief

f_{sho} = $23\,\gamma\,10^{-3}$ (μm mm/N)

- For gears without helix correction but with end relief

fsho = $16\,\gamma\,10^{-3}$ (μm mm/N)

$\gamma: = \left(\frac{b}{d_1}\right)^2$: For single helical and spur gears

$= 3\left(\frac{b}{2d_1}\right)^2$: For double helical gears

- The following minimum values are applicable, these also being the values where helix correction has been applied.
  - · For helical gears : 10 x 10^{-3} μm mm/N
  - · For spur gears : 5 x 10^{-3} μm mm/N

$$C_\gamma = \frac{0.8}{q} cos\beta(0.75\varepsilon_a + 0.25)$$

$$q = 0.4723 + \frac{0.15551}{z_{n1}} + \frac{0.25791}{z_{n2}} - 0.00635x_1 - 0.11654\frac{x_1}{z_{n1}} - 0.00193x_2 - 0.24188\frac{x_2}{z_{n2}} + 0.00529x_1^2 + 0.00182x_2^2$$

$$z_{n1,2} = \frac{z_{1,2}}{\cos\beta_b^2 \cos\beta}$$

(For internal gears, z_{n2} = ∞)

f_{ma} : The values specified in the following

- For gears without helix correction : F_β
- For gears with helix correction and with crown : 0.5 F_β
- For gears with helix correction and with end relief : 0.7 F_β

F_β: Where the face width is more than 160 mm, F_β is the values calculated accordance with the **Table 5.6.** However, in case where the face width is 160 mm or less, F_β is the value according to the calculation sheets or data submitted to the Society and recognized appropriateness by the Society.

y_β: The values specified in **Table 5.7.**

Table 5.6 Total Tooth Alignment Deviation

Grades according to *ISO* 1328	Total tooth alignment deviation F_β (μm)	Grades according to *ISO* 1328	Total tooth alignment deviation F_β (μm)
1	$0.315\sqrt{b}+1.6$	7	$1.25\sqrt{b}+6.3$
2	$0.40\sqrt{b}+2$	8	$2\sqrt{b}+10$
3	$0.50\sqrt{b}+2.5$	9	$3.15\sqrt{b}+16$
4	$0.63\sqrt{b}+3.15$	10	$5\sqrt{b}+25$
5	$0.80\sqrt{b}+4$	11	$8\sqrt{b}+40$
6	$1\sqrt{b}+5$	12	$12.5\sqrt{b}+63$

Table 5.7 Running in Allowance

Materials of gear and heat-treatment	y_b(mm)	Maximum limit of y_b (μm)		
		Range of circumferential speed v (m/s)		
		$v > 10$	$10 \geq v > 5$	$v \leq 5$
Quenched steels	$\frac{320}{\sigma_{Hlim}} F_{\beta x}$	$\leq \frac{12,800}{\sigma_{Hlim}}$	$\leq \frac{25,600}{\sigma_{Hlim}}$	-
cast irons	0.55 F_{bx}	$\leq$22	$\leq$45	-
Surface hardened steels	0.15 F_{bx}	-	$\leq$6	-

(b) The face load distribution factor, $K_{F\beta}$ for bending stress, is the value calculated by the following formula.

$$K_{F\beta} = K_{H\beta}{}^{N}$$

$$N = \frac{(b/h)^2}{1+(b/h)+(b/h)^2}$$

b/h : b_1/h_1 or b_2/h_2, whichever is the minimum value

(For gears with little load or without load acted on the end of face width, or for gears with end relief or crowning, $K_{F\beta}$ may be $K_{H\beta}$.)

(5) Transverse load distribution factors for surface durability and bending strength, $K_{H\alpha}$, $K_{F\alpha}$

The transverse load distribution factors, $K_{H\alpha}$, $K_{F\alpha}$ account for the effects of pitch and profile errors on the transversal load distribution between two or more pairs of teeth in mesh, and can be determined according to method *B* outlined in *ISO* 6336. However, where the calculation sheets or data are submitted or the factors are measured actually, the values may be applied according to the discretion of the Society.

(A) For $\varepsilon_r < 2$, the transverse load distribution factors, $K_{H\alpha}$, $K_{F\alpha}$, are the values calculated by the following formula.

$$K_{F\alpha} = K_{H\alpha} = \frac{\varepsilon_r}{2}\left[0.9+0.4\frac{C_\gamma(f_{pb}-y_a)b}{F_{tH}}\right]$$

(B) For $\varepsilon_r \geq 2$, the transverse load distribution factors, $K_{H\alpha}$, $K_{F\alpha}$, are the values calculated by the following formula.

$$K_{F\alpha} = K_{H\alpha} = 0.9 + 0.4\sqrt{\frac{2(\varepsilon_\gamma - 1)}{\varepsilon_\gamma}}\left[\frac{C_\gamma(f_{pd} - y_\alpha)b}{F_{tH}}\right]$$

Where, in above formulas, $KH\alpha$ is determined by the values of $\frac{\varepsilon_\gamma}{\varepsilon_\alpha Z_\varepsilon^2}$

For $K_{H\alpha} < 1$, $K_{H\alpha} = 1$
For $K_{F\alpha} > \varepsilon_r$, $K_{F\alpha} = \varepsilon_r$
For $K_{F\alpha} < 1$, $K_{F\alpha} = 1$

$F_{tH} = F_t K_A K_r K_v K_{HB}$ or $F_{tH} = F_t K_A K_r K_v K_{F\beta}$

C_γ : Same as (4) (B) (a) (ii)

f_{pb} : Maximum base pitch deviation of wheel and pinion (μm). Generally, when tip relief for the surface load of gear is applied using the base pitch deviation of wheel, f_{pb} is to be half of the allowance. However, where it is difficult to determine the value, the value calculated by the following formula may be applied.

$$f_{pb} = f_{pt}\cos\alpha$$

f_{pt} : The values calculated by **Table 5.8.**

y_α : The values calculated by **Table 5.9.** However, for pinion and wheel used different materials, the value calculated by the following formula is to be applied.

$$y_\alpha = 0.5(y_{\alpha 1} + y_{\alpha 2})$$

Table 5.8 Face Pitch Deviation

Grades according to ISO 1328	Face pitch deviation f_{pt} (μm)
1	0.063 φ_P + 0.8
2	0.10 φ_P + 1.25
3	0.16 φ_P + 2
4	0.25 φ_P + 3.15
5	0.40 φ_P+ 5
6	0.63 φ_P+ 8
7	0.90 φ_P + 11.2
8	1.25 φ_P + 16
9	1.8 φ_P + 22.4
10	2.5 φ_P + 31.5
11	3.55 φ_P + 45
12	5 φ_P + 63
NOTE: $\varphi_P = m_n + 0.25\sqrt{a}$	

Table 5.9 Running in Base Pitch Allowance

Materials of gear and hea-treatment	y_α(mm)	Maximum limit of y_α (mm)		
		Range of circumferential speed v (m/s)		
		v> 10	10 ≥ v> 5	v ≤ 5
Quenched steels Spheroidal graphite cast irons	$\frac{160}{\sigma_{Hlirn}} f_{pt}$	$\le \frac{6,400}{\sigma_{Hlirn}}$	$\le \frac{12,800}{\sigma_{Hlirn}}$	-
Surface hardened steels	0.75 f_{pb}	≤3		

6. Surface durability

The criterion for surface durability is based on the Hertz pressure on the operating pitch point or at the inner point of single pair contact. The contact stress σ_H is to be equal to or less than the permissible contact stress σ_{HP}.

(1) Basic equations

(A) Contact stress, σH

$$\sigma_H = \sigma_{Ho}\sqrt{K_A K_\gamma K_v K_{H\alpha} K_{H\beta}} \le \sigma_{HP}$$

$$\sigma_{Ho} = Z_B Z_N Z_E Z_\epsilon Z_\beta \sqrt{\frac{F_t}{d_1 b}\frac{u+1}{u}} \text{ : Pinion}$$

$$\sigma_{Ho} = Z_D Z_H Z_E Z_\epsilon Z_\beta \sqrt{\frac{F_t}{d_1 b}\frac{u+1}{u}} \text{ : Wheel}$$

where

σ_{Ho} : Basic value of contact stress for pinion and wheel

Z_B : Single pair mesh factor for pinion

Z_D : Single pair mesh factor for wheel

Z_H : Zone factor

Z_E : Elasticity factor

Z_ε : Contact ratio factor

Z_β : Contact ratio factor

F_t : Nominal tangential load

(B) Allowable contact stress, σ_{HP}

$$\sigma_{HP} : (\sigma_{Hlim}\, Z_n / S_H) Z_L Z_V Z_R Z_W Z_X$$

where

σ_{Hlim}: Endurance limit for contact stress

Z_n : Life factor for contact stress

Z_L : Lubrication factor

Z_V : Speed factor

Z_R : Roughness factor

Z_W : Hardness ratio factor

Z_X : Size factor for contact stress

S_H : Safety factor for contact stress

(2) Single pair mesh factor, Z_B, Z_D

Single pair mesh factors, Z_B for pinion and Z_D for wheel account for the influence on contact stresses of tooth flank curvature at the inner point of single pair contact in relation to zone factor, and can be determined as follows :

(A) For spur gears

Z_B = M_1 or 1, whichever is the larger value

Z_D = M_2 or 1, whichever is the larger value

$$M_1 = \frac{\tan\alpha_{tw}}{\sqrt{\left[\sqrt{\left(\frac{d_{a1}}{d_{b1}}\right)^2 - 1} - \left(\frac{2\pi}{z_1}\right)\right]\left[\sqrt{\left(\frac{d_{a2}}{d_{b2}}\right)^2 - 1} - (\epsilon_\alpha - 1)\left(\frac{2\pi}{z_2}\right)\right]}}$$

$$M_2 = \frac{\tan\alpha_{tw}}{\sqrt{\left[\sqrt{\left(\frac{d_{a2}}{d_{b2}}\right)^2 - 1} - \left(\frac{2\pi}{z_2}\right)\right]\left[\sqrt{\left(\frac{d_{a1}}{d_{b1}}\right)^2 - 1} - (\epsilon_\alpha - 1)\left(\frac{2\pi}{z_1}\right)\right]}}$$

(B) For helical gears

(a) When $\varepsilon_\beta \geq 1$

$$Z_B = Z_D = 1$$

(b) When $\varepsilon_\beta < 1$, Z_B and Z_D can be determined as follows;

$$Z_B = M_1 - \varepsilon_\beta(M_1 - 1),\ Z_B \geq 1$$
$$Z_D = M_2 - \varepsilon_\beta(M_2 - 1),\ Z_D \geq 1$$

M_1 and M_2 : same as (A)

(3) Zone factor, Z_H

The zone factor, Z_H accounts for the influence on the Hertzian pressure of tooth flank curvature at pitch point and relates the tangential force at the reference cylinder to the normal force at the pitch cylinder, and can be determined as follows :

$$Z_H = \sqrt{\frac{2\cos\beta_b \cdot \cos\alpha_{tw}}{\cos^2\alpha_t \cdot \sin\alpha_{tw}}}$$

(4) Elasticity factor, Z_E

The elasticity factor is the value haven relevance with the material properties affeted contact stress, and can be determined as follows :

(A) For steel pinions and wheels (E = 206,000 N/mm^2, ν = 0.3)

$$Z_E = 189.8(\sqrt{N/mm^2})$$

E : Modulus of elasticity (N/mm^2)

ν : Poisson's ratio

(B) Where material used in pinions and wheels are other than steel, where the calculation sheets are submitted or the factor is measured actually, the value may be applied according to the discretion of the Society.

(5) Contact ratio factor, Z_ε

The contact ratio factor, Z_ε, account for the influence of transverse contact ratio and the overlap ratio on the specified surface load of gears, and can be determined as follows :

(A) For spur gear

$$Z_\varepsilon = \sqrt{\frac{4 - \varepsilon_\alpha}{3}}$$

(B) For helical gears

For $\varepsilon_\beta < 1$, $Z_\varepsilon = \sqrt{\frac{4 - \varepsilon_\alpha}{3}(1 - \varepsilon_\beta) + \frac{\varepsilon_\beta}{\varepsilon_\alpha}}$

For $\varepsilon_\beta \geq 1$, $Z_\varepsilon = \sqrt{\frac{1}{\varepsilon_\alpha}}$

(6) Helix angle factor, Z_β
The helix angle factor, Z_β, account for the influence of helix angle on surface durability, allowing for such variable as the distribution of load along the lines of contact, and can be determined as follows :

$$Z_\beta = \sqrt{\cos\beta}$$

(7) Endurance limit for contact stress, σ_{Hlim}
The value of σ_{Hlim} can be regarded as the level of contact stress, and is the values calculated in accordance with the **Table 5.10.**

(8) Life factor, Z_n
The life factor, Z_n, account for the higher permissible contact stress in case a limited life (number of cycles)is required, and is 1. However, for reversing gears, intermediate gears or special purpose gears, the life factor, Z_n, may be of the value more than 1 according to the discretion of the Society.

Table 5.10 Endurance Limit for Contact Stress

Heat treatment		σ_{Hlim} (N/mm^2)
Pinion	Wheel	
Quenched	Quenched	0.46 σ_b + 255
Surface hardened	Through hardened	0.42 σ_b + 415
Carburized, nitrided or induction hardened	Induction hardened	0.88HV + 675
Carburized, nitrded or induction hardened	Soft bath nitrided (Tufftrided)	1,000
Carburized, nitrided	Nitrided	1,300
Carburized	Carburized	1,500
NOTE : HV; Vickers hardness		

(9) Influence factor on lubrication film, Z_L, Z_V, Z_R

(A) Lubricant factor, Z_L
The lubricant factor, Z_L, account for the influence of the type of lubricant and its viscosity, and can be determined as follows :

$$Z_L = C_{ZL} + \frac{4(1.0 - C_{ZL})}{(1.2 + 134/v_{40})^2}$$

C_{ZL} :The values specified in the following.

- For 850 < σ_{Hlim} < 1,200 N/mm^2

$$C_{ZL} = \frac{0.08(\sigma_{Hlim} - 850)}{350} + 0.83$$

- For $\sigma_{Hlim} \leq 850\ N/mm^2$, C_{ZL} = 0.83
- For $\sigma_{Hlim} \geq 1200\ N/mm^2$, C_{ZL} = 0.91

v_{40} : nominal kinematic viscosity of the oil at 40 ℃ (mm^2/s)

(B) Speed factor, Z_V
The speed factor, Z_V, can be calculated from the following equations :

$$Z_V = C_{ZV} + \frac{1(1.0 - C_{Zv})}{\sqrt{0.8 + 32/v}}$$

C_{ZV} : The values specified in the following.

- For 850 < σ_{Hlim} < 1,200 N/mm^2,

$$C_{ZV} = \frac{0.08(\sigma_{Hlim} - 850)}{350} + 0.85$$

- For $\sigma_{Hlim} \leq$ 850 N/mm^2, C_{ZV} = 0.85
- For $\sigma_{Hlim} \geq$ 1,200 N/mm^2, C_{ZV} = 0.93

(C) Roughness factor, Z_R

The roughness facto, Z_R, can be calculated from the following equations;

$$Z_R = \left(\frac{3}{R_{z100}}\right)^{C_{ZR}}$$

R_{z100} : The values calculated by the following formula

$$R_{z100} = R_z \cdot \sqrt[3]{\frac{10}{\rho_{red}}}$$

R_z : The values calculated by the following formula

$$R_z = \frac{R_{z1} + R_{z2}}{2}$$

$R_{z1,2}$: If the roughness stated is an R_a value the following approximate relationship can be applied.

$$R_{z1,2} = 6 R_{a1,2}$$

$$\rho_{red} = \frac{\rho_1 \cdot \rho_2}{\rho_1 + \rho_2}$$

$$\rho 1,2 = 0.5 d_{b1,2} \tan \alpha_{tw}$$

C_{ZR} : The values specified in the following

- For 850 < σ_{Hlim} < 1,200 N/mm^2, C_{ZR} = 0.32 - 0.0002 σ_{Hlim}
- For $\sigma_{Hlim} \leq$ 850 N/mm^2, C_{ZR} = 0.150
- For $\sigma_{Hlim} \geq$ 1,200 N/mm^2, C_{ZR} = 0.080

(10) Hardness ratio factor, Z_W

The hardness ratio factor, Z_W, accounts for the increase of surface durability of a soft steel gear meshing with a significantly harder gear with a smooth surface, and can be determined as follows. However, for HB < 130, Z_W = 1.2 will be used, and for HB > 470, Z_W = 1.0 will be used.

$$Z_W = 1.2 - \frac{HB - 130}{1,700}$$

HB : Brinell hardness of the softer material

(11) Size factor, Z_X

The size factor, Z_X, accounts for the influence of tooth dimensions on permissible contact stress, and is the values specified in the **Table 5.11.**

(12) Safety factor for contact stress, S_H
The safety factor for contact stress, S_H, is the values specified in the follows. However, where the calculation sheets or data are submitted or the factor is measured actually, the value may be applied according to the discretion of the Society.
(A) Main propulsion gears : 1.20
(B) Auxiliary gears : 1.15

Table 5.11 Size Factor, Z_X

Pinion heat treatment	Range	Z_X
Carburized and induction	$m_n \leq 10$	1.0
	$10 < m_n < 30$	1.05 - 0.005 m_n
	$m_n \geq 30$	0.9
Nitrided	$m_n \leq 7.5$	1.0
	$7.5 < m_n < 30$	1.08 - 0.01 m_n
	$m_n \geq 30$	0.75
Quenched	-	1.0

7. Bending strength

The criterion for tooth root bending strength is the permissible limit of local tensile strength in the root fillet. The root stress, σ_F and the permissible root stress, σ_{FP} is to be calculated separately for the pinion and the wheel. σ_F is not to be exeed σ_{FP}.

(1) Basic equations

(A) Tooth root bending stress for pinion and wheel, σ_F (N/mm^2)

$$\sigma_F = (F_t/bm_n)\, Y_F Y_S Y_\beta K_A K_\gamma K_v K_{F\alpha} K_{F\beta} \leq \sigma_{FP}$$

Y_F : Tooth form factor
Y_S : Stress correction factor
Y_β : Helix angle factor
$K_A, K_\gamma, K_v, K_{F\alpha}, K_{F\beta}$: refer to **4.**

(B) Permissible tooth root bending stress for pinion and wheel, σ_{FP} (N/mm^2)

$$\sigma_{FP} = (\sigma_{FE} Y_d / S_F)\, Y_N Y_{\sigma relT} Y_{RelR} Y_X$$

σ_{FE}: Bending endurance limit
Y_d : Design factor
Y_N : Life factor
$Y_{\sigma relT}$: Relative notch sensitivity factor
Y_{RelT} : Relative surface factor
Y_X : Size factor
S_F : Safety factor for tooth root bending stress

(C) Tooth form factor, Y_F
The tooth form factor, Y_F, is the values calculated by the following formula. (refer to **Fig 5.13**)

$$Y_F = \frac{6\frac{hF}{m_n}cos\alpha Fen}{\left(\frac{sFn}{m_n}\right)^2 \cos\alpha_n}$$

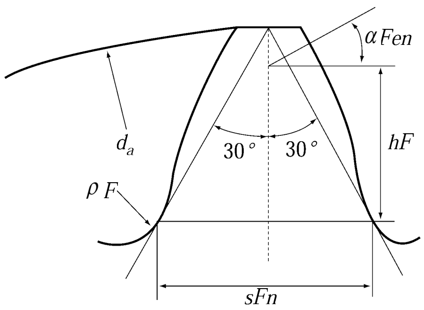

Fig 5.13 For the Calculation of hF, sFn and αFen

(D) Stress correction factor, Y_S

The stress correction factor, Y_S, is used to convert the nominal bending, and is the values calculated by the following formula. (having range of validity: $1 \leq q_s < 8$)

$$Y_S = (1.2 + 0.13L) q_s^{\frac{1}{\left(1.21 + \frac{2.3}{L}\right)}}$$

$$q_s = \frac{sFn}{2\rho F}$$

$$L = \frac{sFn}{hF}$$

(E) Helix angle factor, Y_B

The helix angle factor, Y_B, account for the influence of helix angle on bending stress, and is the values calculated by the following formula. However, 1.0 is substituted for ε_β when $\varepsilon_\beta > 1$, 30° is substituted for β when $\varepsilon_\beta > 30°$.

$$Y_\beta = 1 - \varepsilon_\beta \frac{\beta}{120}$$

(F) Bending endurance limit, σ_{FE}

Bending endurance limit is to be in accordance with following formula;

$$\sigma_{FE} = 2 \bullet \sigma_{Flim}$$

σ_{Flim} is a factor for regarding the endurance limit of bending stress and to be determined in accordance with the **Table 5.12.**

(G) Design factor, Y_d

The design factor, Y_d, takes into account the influence of load reversing and shrinkfit prestressing on the tooth root strength. The design factor, Y_d, for load reversing, can be determined as follows. However, for shrinkfit, The design factor is the value according to the calculation sheets or data submitted to the Society and recognized appropriateness by the Society.

$Y_d = 1$: In general (For gears with uniformed load direction and not shrinkfit)

$Y_d = 0.9$: For gears with occasional part load in reverse direction, such as main wheel in reversing

Y_d = 0.7 : For idler gears

Table 5.12 Bending Endurance Limit, σ_{Flim}

Remarks	σ_{Flim} (N/mm^2)
Quenched carbon steels	$0.09\ \sigma_b + 150$
Quenched alloy steels	$0.1\ \sigma_b + 185$
Induction hardened steels	$0.35\ HV + 125$
Soft bath nitrided (tufftrided) steels	330
Gas nitrided steels	390
Carburized steels other than Cr Ni Mo steels	410
Carburized Cr-Ni-Mo steels	450
NOTE : HV ; Vicker's hardness	

(H) Life factor, Y_N

The life factor, Y_N, accounts for the higher tooth root bending stress permissible in case a limited life (number of cycles) is required, and is 1. However, for reversing gears, intermediate gears or special purpose gears, the life factor, Y_N, may be required the value more than 1 according to the discretion of the Society.

(I) Relative notch sensitivity factor, $Y_{\sigma relT}$

The relative notch sensitivity factor, $Y_{\sigma relT}$, indicates the extent to which the theoretically concentrated stress and can be determined as follows;

(a) For $1.5 < q_s < 4$

$$Y_{\sigma relT} = 1$$

(b) For $q_s \leq 1.5$ or $q_s \geq 4$

The relative notch sensitivity factor is the value accoring to the calculation sheets or data submitted to the Society and recognized appropriateness by the Society.

(J) Relative surface factor, Y_{RelT}

The relative surface factor, Y_{RelT}, takes into account the dependence of the root strength on the surface condition in the tooth root fillet, and is the values specified in the **Table 5.13.**

Table 5.13 Relative Surface Factor, Y_{RelT}

Y_{RelT}		Remarks
$R_z < 1$	$1 \leq R_z \leq 40$	
1.120	$1.675 - 0.53\,(R_z + 1)^{0.1}$	Carburized steels, Quenched steels ($\sigma_b \geq 800$N/mm^2)
1.070	$5.3 - 4.2\,(R_z + 1)^{0.01}$	Non-hardened steels ($\sigma_b < 800$N/mm^2)
1.025	$4.3 - 3.26\,(R_z + 1)^{0.001}$	Nitrided steels
NOTE : R_z : same as 6. (9) (C)		

(K) Size factor, Y_X

The size factor, Y_X, takes into account the decrease of strength with increasing size. and is the values caculated in accordance with the **Table 5.14.**

Table 5.14 Size Factor, Y_X

Remarks	Range	Y_X
-	$m_n \leq 5$	1
Non-hardened steels and Quenched steels	$5 < m_n < 30$	$1.03 - 0.06\, m_n$
	$m_n \geq 30$	0.85
Surface hardened steels	$5 < m_n < 25$	$1.05 - 0.010\, m_n$
	$m_n \geq 25$	0.8

(L) Safety factor for tooth root bending stress, S_F
The safety factor for tooth root bending stress, S_F, is the values specified in the following. However, the safety factor for tooth root bending stress is the value according to the calculation sheets or data submitted to the Society and recognized appropriateness by the Society.
(a) Main propulsion gears : 1.55
(b) Auxiliary gears : 1.40

Annex 5-5 Requirements of Equipment for Gas welding

1. Gas bottles and piping systems are to be satisfied with the following :

(1) Materials for piping systems are to comply with the standards recognized by the Society
(2) The Society may accept to use bottles manufactured according to the *Korean Government Rules for Safety Management of Gas* in spite of **Pt 5, Ch 5** of the Rules.
(3) For pipes, valves and pipe fittings, hydraulic tests may be omitted carrying.

2. Location of gas bottles is to be as specified below :

(1) Gas bottles are not to be located in machinery spaces of category A and accommodation spaces.
(2) Acetylene gas bottles are to be located in the area where the temperature can be maintained at 38 ℃ or less.
(3) Gas bottles are to be stored in areas not exposed to direct sun beam and also safe against waves, flame and high temperature.
(4) Except when located in a store room, gas bottles are to be placed in areas sufficiently distant from accommodation spaces and openings from which hydrocarbon gases, etc. are likely to flow out.
(5) Gas bottles are to be stored at areas of good ventilation free from stagnation of leaked gases.
(6) The store room of gas bottles is to have such a construction as to allow access only from the weather deck.

3. Gas bottles are to be so stored that the safety against ship motions and vibrations is ensured, and they are to stand upright as far as practicable. Acetylene bottles and oxygen bottles are to be store apart to the extent practicable. Further, means are to be provided so that gas bottles can be transferred quickly in case of fire.

4. In case where permanent piping is arranged between the gas bottles and working area, the following requirements are to be complied with :

(1) Steel pipes are to be used for acetylene gas piping, and steel or copper pipes are to be used for oxygen gas piping. Use of flexible joints made of non-metal material ensleeved in metal sheath in part of the piping may be accepted.
(2) No cast iron is to be used as the material of valves and pipe fittings. Further, no copper or copper alloy with a copper content exceeding 62 % is to be used as the material of valves and pipe fittings in the acetylene gas piping.
(3) The procedures of piping arrangement are to be as specified below :
  (A) Acetylene gas piping and oxygen gas piping are not to be led through the accommodation spaces and enclosed spaces which are susceptible to fire.
  (B) On acetylene gas piping and oxygen gas piping, stop valves are to be fitted at adequate locations of the penetrations through the casing of the store room and working area.
  (C) Joints between pipes and pipe fittings are to be of welded joint or flange joint as far as practicable.
  (D) For clear distinction of the acetylene gas piping system and oxygen gas piping system, the piping systems are to be provided with adequate means of identification.

5. In case where rubber hoses are used, the following apply:

(1) Hoses are to comply with *KS M* 6543 for acetylene gas and *KS M* 6557 for oxygen gas, or equivalent.
(2) The joint methods between rubber hose and permanently installed pipes are to comply with *KS B* 4604, or equivalent.

6. After completion of shipboard installation, piping systems are to be subjected to air-tightness test at a pressure of 1.25 times or more of the maximum working pressure of the pressure regulator (refer to *KS B* 4603).

Annex 5-6 Plastic Pipes

1. Application

(1) The requirements in this Annex apply to plastic pipes/piping systems on ships.
(2) Plastic pipes may be used for Class III piping system. Proposals for the use of plastic pipes in Class I and Class II piping system will be specially considered.
(3) The requirements in this Annex are not applicable to flexible pipes and hoses and mechanical couplings used in metallic piping systems.

2. Definitions

(1) Plastic(s) is both thermoplastic and thermosetting plastic materials with or without reinforcement, such as PVC and fibre reinforced plastics - FRP.
(2) Fire endurance is the capability of piping to maintain its strength and integrity (i.e. capable of performing its intended function) for some predetermined period of time while exposed to fire.

3. Materials

(1) PVC pipes and GRP pipes are to be those approved by the Society in accordance with "**Guidance for Approval of Manufacturing Process and Type Approval, etc.**" and adequate for their service conditions.
(2) Notwithstanding the requirement in (1), pipes complying with the recognized standards e.g. *Korean Industrial Standards* and equivalent standard having self-extinguishing property and adequate for their service condition may be used for drinking water pipes, domestic water pipes (including hot water pipes) and sanitary pipes within accommodation spaces and engine room and deck scuppers within the identical spaces.

4. General requirements

The specification of piping is to be in accordance with a recognised national or international standard approved by the Society. In addition, the following requirements apply:

(1) Strength
(A) The strength of the pipes is to be determined by a hydrostatic test failure pressure and collapse pressure of a pipe specimen under the following standard conditions. The hydrostatic test failure pressure and collapse pressure may be determined by testing or may be determined by a combination of testing and calculation., where deemed appropriate by the Society.

atmospheric pressure : 0.1 MPa
relative humidity : 30 %
fluid temperature : 25 ℃

(B) The strength of fittings and joints is to be not less than that of the pipes.
(C) The design pressure is to be specified with due regard for design temperatures in accordance with Manufacturer's recommendations.
(D) Internal pressure
The internal pressure of pipes is to be not lesser of the following, and is to be more than the design pressure of system intended to use the pipes.

$$P_{int} \le \frac{P_{sth}}{4} \text{ or } P_{int} \le \frac{P_{lth}}{2.5}$$

P_{int} : Internal Pressure
P_{sth} : Short-term hydrostatic test failure pressure
P_{lth} : Short-term hydrostatic test failure pressure (> 100,000 h)

(E) External pressure
External pressure is to be determined by the following.

$$P_{ext} \le \frac{P_{col}}{3}$$

P_{ext} : External pressure

P_{col} : Pipe collapse pressure. In no case is the collapse pressure to be less than 0.3 MPa.

The design external pressure is a sum of the vacuum inside the pipe and a head of liquid acting on the outside of the pipe.

(2) Axial strength

(A) The sum of the longitudinal stresses due to pressure, weight and other loads is not to exceed the allowable stress in the longitudinal direction.

(B) In the case of fibre reinforced plastic pipes, the sum of the longitudinal stresses is not to exceed half of the nominal circumferential stress derived from the nominal internal pressure condition prescribed in (1) (D) above.

(3) Impact Resistance

(A) Plastic pipes and joints are to have a minimum resistance to impact in accordance with recognised national or international standards.

(B) After the test, the specimen is to be subjected to hydrostatic pressure equal to 2.5 times the design pressure for at least 1 hour.

(4) Temperature

(A) The design temperature depending on the working pressure is to be in accordance with Manufacturer's recommendations, but in each case it is to be at least 20 ℃ lower than the minimum heat distortion temperature of the pipe material, determined according to *ISO 75* method A, or equivalent.

(B) The minimum heat distortion temperature is to be not less than 80 ℃.

5. Requirements for pipes/piping systems depending on service and/or locations

(1) Fire endurance

(A) Pipes and their associated fittings whose integrity is essential to the safety of ships are required to meet the minimum fire endurance requirements of Appendix 1 or 2, as applicable, of IMO Res A.753 (18).

(B) Depending on the capability of a piping system to maintain its strength and integrity, there exist three different levels of fire endurance for piping systems.

(a) Level 1(L1) : Piping having passed the fire endurance test specified in Appendix 1 of IMO Res. A. 753 (18) for a duration of a minimum of one hour without loss of integrity in the dry condition is considered to meet level 1 fire endurance standard.

(b) Level 2(L2) : Piping having passed the fire endurance test specified in Appendix 1 of IMO Res. A 753 (18) for a duration of a minimum of 30 minutes in the dry condition is considered to meet level 2 fire endurance standard.

(c) Level 3(L3) : Piping having passed the fire endurance test specified in Appendix 2 of IMO Res. A .753 (18) for a duration of a minimum of 30 minutes in the wet condition is considered to meet level 3 fire endurance standard.

(C) Permitted use of piping depending on fire endurance, location and piping system is given in **Table 5.15.**

(2) Flame spread

(A) All pipes, except those fitted on open decks and within tanks, cofferdams, pipe tunnels and ducts are to have low surface flame spread characteristics not exceeding average values specified in **Ch 3, 2604. 3** of the **"Guidance for Approval of Manufacturing Process and Type Approval, etc."**.

(B) Surface flame spread characteristics are to be determined using the procedure specified in **Ch 3, 2604. 3** of the **"Guidance for Approval of Manufacturing Process and Type Approval, etc."** with regard to the modifications due to the curvilinear pipe surfaces as listed in Appendix 3 of IMO Resolution A.753 (18).

(C) Surface flame spread characteristics may also be determined using the text procedures given in national or international standards.

(3) Fire protection coatings

(A) Where a fire protective coating of pipes and fittings is necessary for achieving the fire endurance level required, it is to meet the following requirements:

(a) The pipes are generally to be delivered from the manufacturer with the protective coating on.

(b) The fire protection properties of the coating are not to be diminished when exposed to salt water, oil or bilge slops. It is to be demonstrated that the coating is resistant to products likely to come into contact with the piping.

(c) In considering fire protection coatings, such characteristics as thermal expansion, resistance against vibrations, and elasticity are to be taken into account.

(d) The fire protection coatings are to have sufficient resistance to impact to retain their integrity.

(4) Electrical conductivity

Where electrical conductivity is to be ensured, the resistance of the pipes and fittings is not to exceed $1 \times 10^5\ \Omega/\mathrm{m}$.

(5) Durability against chemicals

The pipes are to be resistant to any chemical substances expected during service.

6. Installation

(1) Supports

(A) Selection and spacing of pipe supports in shipboard systems are to be determined as a function of allowable stresses and maximum deflection criteria. Support spacing is not to be greater than the pipe Manufacturer's recommended spacing. The selection and spacing of pipe supports are to take into account pipe dimensions, mechanical and physical properties of the pipe material, mass of pipe and contained fluid, external pressure, operating temperature, thermal expansion effects, loads due to external forces, thrust forces, water hammer, vibrations, maximum accelerations to which the system may be subjected. Combination of loads is to be considered.

(B) Each support is to evenly distribute the load of the pipe and its contents over the full width of the support. Measures are to be taken to minimize wear of the pipes where they contact the supports.

(C) Heavy components in the piping system such as valves and expansion joints are to be independently supported.

(2) Expansion

(A) Suitable provision is to be made in each pipeline to allow for relative movement between pipes made of plastic and the steel structure, having due regard to:

(a) The difference in the coefficients of thermal expansion;

(b) deformations of the ship's hull and its structure.

(B) When calculating the thermal expansions, account is to be taken of the system working temperature and the temperature at which assembly is performed.

(3) External loads

(A) When installing the piping, allowance is to be made for temporary point loads, where applicable. Such allowances are to include at least the force exerted by a load (person) of 100 *kg* at mid-span on any pipe of more than 100 mm nominal outside diameter.

(B) Besides for providing adequate robustness for all piping including open-ended piping a minimum wall thickness, complying with **4** (1) above, may be increased upon the demand of the Society taking into account the conditions encountered during service on board ships.

(C) Pipes are to be protected from mechanical damage where necessary.

(4) Strength of connections

(A) The strength of connections is to be not less than that of the piping system in which they are installed.

(B) Pipes may be assembled using adhesive-bonded, welded, flanged or other joints.

(C) Adhesives, when used for joint assembly, are to be suitable for providing a permanent seal between the pipes and fittings throughout the temperature and pressure range of the intended application.

(D) Tightening of joints is to be performed in accordance with Manufacturer's instructions.

Table 5.15 Fire Endurance Requirements Matrix

Abbreviations :

- L1 Fire endurance test (IMO Resolution A.753(18), Appendix 1) in dry conditions, 60 min.
- L2 Fire endurance test (IMO Resolution A.753(18), Appendix 1) in dry conditions, 30 min.
- L3 Fire endurance test (IMO Resolution A.753(18), Appendix 2) in wet conditions, 30 min.
- 0 No fire endurance test required
- NA Not applicable
- X Metallic materials having a melting point greater than 925 °C

Footnotes :

1. Where non-metallic piping is used, remotely controlled valves to be provided at ship's side (valve is to be controlled from outside space).
2. Remote closing valves to be provided at the cargo tanks.
3. When cargo tanks contain flammable liquids with f.p. > 60 °C, "O may replace "NA or "X".
4. For drains serving only the space concerned, "O may replace "L1"
5. When controlling functions are not required by statutory requirements or guidelines, "O may replace "L1"
6. For pipe between machinery space and deck water seal, "O may replace "L1"
7. For passenger vessels, "X is to replace "L1".
8. Scuppers serving open decks in positions 1 and 2, as defined in regulation 13 of the International Convention on Load Lines, 1966, are to be "X throughout unless fitted at the upper end with the means of closing capable of being operated from a position above the freeboard deck in order to prevent downflooding.
9. For essential services, such as fuel oil tank heating and ship's whistle, "X is to replace "O".
10. For tankers where compliance with paragraph 3 (f) of regulation 13F of Annex I of MARPOL 73/78 is required, "NA is to replace "O".

Table 5.15 Fire Endurance Requirements Matrix (continued)

Location definitions - A (Machinery spaces of category A) : Machinery spaces of category A as defined in SOLAS* regulation II-2/3.19. - B (Other machinery spaces and pump rooms) : Spaces, other than category A machinery spaces and cargo pump rooms, containing propulsion machinery, boilers, steam and internal combustion engines, generators and major electrical machinery, pumps, oil filling stations, refrigerating, stabilizing, ventilation and air-conditioning machinery, and similar spaces, and trunks to such spaces. - C (Cargo pump rooms) : Spaces containing cargo pumps and entrances and trunks to such spaces. - D (Ro-ro cargo holds) : Ro-Ro cargo holds are Ro-Ro cargo spaces and special category spaces as defined in SOLAS* regulation II-2/3.14 and 3.18. - E (Other dry cargo holds) : All spaces other than Ro-Ro cargo holds used for non-liquid cargo and trunks to such spaces. - F (Cargo tanks) : All spaces used for liquid cargo and trunks to such spaces. - G (Fuel oil tanks) : All spaces used for fuel oil (excluding cargo tanks) and trunks to such spaces. - H (Ballast water tanks) : All spaces used for ballast water and trunks to such spaces. - I (Cofferdams, voids, etc.) : Cofferdams and voids are those empty spaces between two bulkheads separating two adjacent compartments. - J (Accommodation, service) : Accommodation spaces, service spaces and control stations as defined in SOLAS * regulation II-2/3.10, 3.12, 3.22. - K (Open decks) : Open deck spaces as defined in SOLAS* regulation II-2/26.2.2. (5). * SOLAS 74 as amended by the 1978 SOLAS Protocol and the 1981 and 1983 amendments (consolidated text).

(5) Installation of Conductive Pipes
(A) Piping system for fluids with conductivity less than 1,000 pico siemens per metre (pS/m) such as refined products and distillates use is to be made of conductive pipes.
(B) Regardless of the fluid being conveyed, plastic piping is to be electrically conductive if the piping passes through a hazardous area. The resistance to earth from any point in the piping system is not to exceed $1 \times 10^6\ \Omega$. It is preferred that pipes and fittings be homogeneously conductive. Pipes and fittings having conductive layers are to be protected against a possibility of spark damage to the pipe wall. Satisfactory earthing is to be provided.
(C) After completion of the installation, the resistance to earth is to be verified. Earthing wires are to be accessible for inspection.
(6) Application of Fire Protection Coatings
(A) Fire protection coatings are to be applied on the joints, where necessary for meeting the required fire endurance prescribed **5.** (3) above, after performing hydrostatic pressure tests of the piping system.
(B) The fire protection coatings are to be applied in accordance with Manufacturer's recommendations, using a procedure approved in each particular case.
(7) Penetration of divisions
(A) Where plastic pipes pass through "A" or "B" class divisions, arrangements are to be made to ensure that the fire endurance is not impaired. These arrangements are to be tested in accordance with fire test procedures for "A" and "B" bulkheads specified in **Ch 3, 2604. 2** of the "**Guidance for Approval of Manufacturing Process and Type Approval, etc.**".
(B) When plastic pipes pass through watertight bulkheads or decks, the watertight integrity of the bulkhead or deck is to be maintained.
(C) If the bulkhead or deck is also a fire division and destruction by fire of plastic pipes may cause the inflow of liquid from tanks, a metallic shut-off valve operable from above the freeboard deck is to be fitted at the bulkhead or deck.
(8) Control during installation
(A) Installation is to be in accordance with the Manufacturer's guidelines.
(B) Prior to commencing the work, joining techniques are to be approved by the Society.
(C) The tests and examinations specified in this Annex are to be completed before shipboard piping installation commences.

(D) The personnel performing this work are to be properly qualified and certified to the satisfaction of the Society.
(E) The procedure of making bonds is to include:
(a) Materials used,
(b) Tools and fixtures,
(c) Joint preparation requirements,
(d) Cure temperature,
(e) Dimensional requirements and tolerances, and
(f) Tests acceptance criteria upon completion of the assembly.
(F) Any change in the bonding procedure which will affect the physical and mechanical properties of the joint is to require the procedure to be requalified.

(9) Bonding procedure quality testing
(A) A test assembly is to be fabricated in accordance with the procedure to be qualified and it is to consist of at least one pipe-to-pipe joint and one pipe-to-fitting joint.
(B) When the test assembly has been cured, it is to be subjected to a hydrostatic test pressure at a safety factor 2.5 times the design pressure of the test assembly, for not less than one hour. No leakage or separation of joints is allowed. The test is to be conducted so that the joint is loaded in both longitudinal and circumferential directions.
(C) Selection of the pipes used for test assembly, is to be in accordance with the following:
(a) When the largest size to be joined is 200 A nominal outside diameter, or smaller, the test assembly is to be the largest piping size to be joined.
(b) When the largest size to be joined is greater than 200 A nominal outside diameter, the size of the test assembly is to be either 200 A or 25 % of the largest piping size to be joined, whichever is greater.
(D) Bonding operator performance qualification tests
When conducting performance qualifications, each bonder and each bonding operator are to make up test assemblies prescribed in (A) through (C), the size and number of which are to be as required above.

(10) Shop tests
(A) Plastic pipes except for piping systems specified in **3** (2) above are to be subjected to the following tests and measurements of dimension after the manufacturer. The number of test specimens, testing procedures, results, procedures of measurement of dimension and tolerance are to be complied with the manufacturer's approved by the Society.
(a) Tensile test
(b) Hydrostatic test of each pipe/fitting(A hydrostatic pressure is to be not less than 1.5 times the nominal pressure). Alternatively, where pipe/fittings are not employing hand lay up techniques and are manufactured in accordance with *Korean Industrial Standards or equivalent* by manufacturer who has an effective quality system accepted by this Society, the hydrostatic pressure test may be carried out in accordance with the standards.
(c) Outside diameter and wall thickness measurements
(d) Ascertainment of uniform quality and no harmful defect
(f) Electric conductivity test(only for pipes required for electric conductivity by specified in **5** (4) above)
(g) Depending upon the intended application, the Society may require the pressure testing of each pipe/fitting.
(B) For tests and measurements specified in (A), in case where the manufacture has been assessed in accordance with **Pt 1, Annex 1-11** of the Guidance, testing items under the Surveyor's attendance may be omitted. In this case, the Society's surveyor may require submission of the test results.

(11) Testing after installation on board
(A) Piping systems for essential services are to be subjected to a test pressure not less than 1.5 times the design pressure or 0.4 MPa whichever is greater.
(B) Piping systems for non-essential services are to be checked for leakage under operational conditions.
(C) For piping required to be electrically conductive, earthing is to be checked and random resistance testing is to be conducted.

Annex 5-7 Control and Safety System for Dual Fuel Diesel Engines

1. Application

In addition to the requirements of **Pt 5, Ch 2, Sec 2** of the Rules and **Pt 7, Ch 5, Sec 5** and **Sec 16** of the Rules, as far as found applicable, the following requirements are to be applied to dual-fuel diesel engines utilizing high pressure Methane gas fuel injection (hereinafter referred to as **DFD engines**).

2. Operation mode

(1) DFD engines are to be of the dual-fuel type employing pilot fuel ignition and to be capable of immediate change-over to oil fuel only.
(2) Only oil fuel is to be used when starting the engine.
(3) Only oil fuel is, in principle, to be used when the operation of an engine is unstable, and/or during maneuvering and port operations.
(4) In case of shut-off of the gas fuel supply, the engines are to be capable of continuous operation by oil fuel only.

3. Protection of crankcase

(1) Crankcase relief valves are to be fitted in way of each crank throw. The construction and operating pressure of the relief valves are to be determined considering explosions due to gas leaks.
(2) If a trunk piston type engine is used as DFD engine, the crankcase is to be protected by the following measures.
  (A) Ventilation is to be provided to prevent the accumulation of leaked gas, the outlet for which is to be led to a safe location in the open through flame arrester.
  (B) Gas detecting or equivalent equipment(It is recommended that means for automatic injection of inert gas are to be provided.)
  (C) Oil mist detector
(3) If a cross-head type engine is used as DFD, the crankcase is to be protected by oil mist detector or bearing temperature detector.

4. Protection for piston underside space of cross-head type engine

(1) Gas detecting or equivalent equipment is to be provided for piston underside space of cross-head type engine.

5. Engine Exhaust System

(1) Explosion relief valves or other appropriate protection system against explosion are to be provided in the exhaust, scavenge and air inlet manifolds.
(2) The exhaust gas pipes from DFD engines are not to be connected to the exhaust pipes of other engines or systems.

6. Starting air line

(1) Starting air branch pipes to each cylinder are to be provided with effective flame arresters.

7. Combustion Monitoring

(1) A failure mode and effect analysis (FMEA) examining all possible faults affecting the combustion process is to be submitted.
(2) Details of required monitoring will be determined based on the outcome of the analysis.

8. Gas fuel supply to engine

(1) Flame arresters are to be provided at the inlet to the gas supply manifold for the engine.
(2) Arrangements are to be made so that the gas supply to the engine can be shut-off manually from starting platform or any other control position.

(3) The arrangement and installation of the gas piping are to provide the necessary flexibility for the gas supply piping to accommodate the oscillating movements of DFD engine, without risk of fatigue failure.

9. Gas fuel supply piping systems

(1) Gas fuel piping may pass through or extend into machinery spaces or gas-safe spaces other than accommodation spaces, service spaces and control stations provided that they fulfil one of the following :

(A) The system complying with **Pt 7, Ch 5, 1603. 1.** (1) of the Rules, and in addition, with (a), (b and (c) given

(a) The pressure in the space between concentric pipes is monitored continuously. Alarm is to be issued and automatic valves specified in **Pt 7, Ch 5, 1603. 6** of the Rules(hereinafter referred to as "**interlocked gas valves**") and the master gas fuel valves specified in **Pt 7, Ch 5, 1603. 7** of the Rules(hereinafter referred to as "**master gas valve**") are to be closed before the pressure drops to below the inner pipe pressure (however, an interlocked gas valve connected to vent outlet is to be opened).

(b) Construction and strength of the outer pipes are to comply with the requirements of **Pt 7, Ch 5, 502.** of the Rules.

(c) It is to be so arranged that the inside of the gas fuel supply piping system between the master gas valve and the DFD engine is to be automatically purged with inert gas, when the master gas valve is closed; or

(B) The system complying with **Pt 7, Ch 5, 1603. 1.** (2) of the Rules, and in addition, with (a) through (c) given below.

(a) Materials, construction and strength of protection pipes or ducts and mechanical ventilation systems are to be sufficiently durable against bursting and rapid expansion of high pressure gas in the event of gas pipe burst.

(b) The air intakes of mechanical ventilating systems are to be provided with non-return devices effective for gas fuel leaks. However, if a gas detector is fitted at the air intakes, these requirements may be dispensed with.

(c) The number of flange joints of protective pipes or ducts is to be minimized; or

(C) Alternative arrangements to those given in paragraph (A) and (B) will be specially considered based upon an equivalent level of safety.

(2) High pressure gas piping system are to be ensured to have sufficient constructive strength by carrying out stress analysis taking into account the stresses due to the weight of the piping system including acceleration load when significant, internal pressure and loads induced by hog and sag of the ships.

(3) All valves and expansion joints used in high pressure gas fuel supply lines are to be of an approved type.

(4) Joints on entire length of the gas fuel supply lines are to be butt-welded joints with full penetration and to be fully radiographed, except where specially approved by the Society.

(5) Pipe joints other than welded joints at the locations specially approved by the society are to comply with the appropriate standards recognised by the society, or those whose structural strength has been verified through tests and analysis as deemed appropriate by the Society.

(6) For all butt-welded joints of high pressure gas fuel supply lines, post-weld heat treatment are to be performed depending on the kind of material.

10. Shut-off of gas fuel supply

(1) In addition to the causes specified in **Pt 7, Ch 5, 1603. 6.** of the Rules, supply of gas fuel to DFD engines is to be shut off by the interlocked gas valves in case following abnormality occurs;

(A) Abnormality specified in **7.** (1) above.

(B) DFD engine stops from any cause

(C) Abnormality specified in **9.** (1) (A) (a) above.

(2) In addition to the causes specified in **Pt 7, Ch 5, 1603. 7.** of the Rules, the master gas valve is to be closed in case of any of the following:

(A) Oil mist detector or bearing temperature detector specified in **3.** (2) (B) and **3.** (3) above detects abnormality.

(B) Any kind of gas fuel leakage is detected.

(C) Abnormality specified in **9.** (1) (A) (a) above
(D) Abnormality specified in **11.** (1) below

(3) The master gas valve is recommended to close automatically upon activation of the interlocked gas valves.

11. Emergency stop of the DFD engines

(1) DFD engine is to stopped before the gas concentration detected by the gas detectors specified in **Pt 7, Ch 5, 1602. 2.** of the Rules reached 60 % of lower flammable limit.

12. Gas fuel make-up plant and related storage tanks

(1) Construction, control and safety system of high pressure gas compressors, pressure vessels and heat exchangers constituting a gas fuel make-up plant are so arranged as to the satisfaction of the Society.

(2) The possibility for fatigue failure of the high pressure gas piping due to vibration is to be considered.

(3) The possibility for pulsation of gas fuel supply pressure caused by the high pressure gas compressor is to be considered.

Annex 5-8 The Additional Requirements on Electronically-Controlled Diesel Engines

1. Application

The requirements in this Guidance apply to electronically-controlled diesel engines in addition to the requirements prescribed in **Pt 5, Ch 2** of the Rules.

2. Definitions

(1) Accumulator is a small pressure vessel provided for each cylinder which provides hydraulic oil to the actuator attached to the fuel injection device or the exhaust valve driving gear.
(2) Common accumulator is a pressure vessel common to all cylinders for providing hydraulic oil or pressurized fuel oil.
(3) Control valve is a component to control the delivery of hydraulic oil to drive the actuator, as a generic name of on-off-controlled solenoid valve, proportional-controlled valve or variable-controlled valve, etc.
(4) Fuel oil pressure pump is a pump to provide pressurized fuel oil for the common accumulator.
(5) Hydraulic oil pressure pump is a pump to provide hydraulic oil for the equipment, e.g. fuel injection devices, exhaust valve driving gears or control valves, through the common accumulator.
(6) Functional block is a block to classify all items structuring the whole system into the groups of systems, sub-systems, components, assemblies and parts, functionally
(7) Reliability block diagram is a logical figure showing the relations between the functional blocks and the analytic level.
(8) Normal operation of the main propulsion machinery is an operation at normal out-put condition, under using the governor and all safety devices.
(9) High-pressure piping is a piping in the downstream of the fuel oil pressure pump or hydraulic oil pressure pump.

3. Plans and Documents

The following plans and documents are to be submitted. However, for systems and equipment having particular construction, the Society may require to submit other plans and documents.

(1) Plans and documents for approval
 (A) Construction of accumulators
 (B) Construction of common accumulators
(2) Plans and documents for reference
 (A) Construction of control valve
 (B) Construction of fuel oil high-pressure pumps
 (C) Construction of hydraulic oil pressure pumps
 (D) Construction of step-up gear (if application)
 (E) Results of Failure Mode Effective Analysis (including reliability block diagrams)

4. Construction and Associated Installations

(1) General
Essential components are to be so arranged that the normal operation of the main propulsion machinery is capable of being sustained or restored even though one of them becomes inoperable, except where special consideration is given by the Society to the reliability of a single arrangement. A single component provided for each cylinder, of which spare is not required, may be acceptable in case where the failed part can be isolated.
(2) Control valves
 (A) Control valves are to be capable of retaining the expected functions for a period prescribed by the manufacturer. In principle, this period is to be set up at least 3 years.
 (B) Control valves are to be independently provided for each function(e.g. fuel injection, exhaust valve driving).
(3) Accumulators and common accumulators
 (A) Accumulators and Common Accumulators are to comply with the requirements in **Pt 5, Ch 5, Sec 3** of the Rules.

(B) Accumulators are to be capable of retaining the expected functions for a period prescribed by the manufacturer. In principle, this period is to be set up at least 3 years.
(C) Common Accumulators are to be independently provided at least two in different uses, in principle. In case where the result of fatigue analysis upon the fluctuating stress is submitted and approved by the Society, a single arrangement may be acceptable.

(4) Fuel Oil Piping System and Hydraulic Oil Piping System
(A) Piping systems are to comply with the requirements in **Pt 5, Ch 6, Sec 1** of the Rules.
(B) Fuel oil pressure pumps and hydraulic oil pressure pumps are to be independently provided at least two in different uses respectively. In this case, even though one of the pumps becomes inoperable, the remained pumps are capable of supplying a sufficient amount of oil at the maximum continuous output of the main propulsion machinery. These pumps are to be connected ready for use anytime.
(C) The piping arrangement from the fuel oil pressure pump to the fuel injection device and from the hydraulic oil pressure pump to the exhaust valve driving gear is to be protected with a jacketed piping system or an oil tight enclosure, to prevent the spread oil from igniting.
(D) The common piping arrangement from a fuel oil pressure pump or a hydraulic oil pressure pump to a common accumulator, from a common accumulator to an other common accumulator and from a common accumulator to the position where distributed to each cylinder is to be independently provided at least two in different uses, respectively. In case where the result of fatigue analysis upon the fluctuating stress is submitted and approved by the Society, a single arrangement may be acceptable.
(E) Valves or cocks provided on a piping connected to an equipment, e.g. an accumulator or a pump, are to be located as close to the equipment as practicable.
(F) In the high-pressure piping, a high-pressure alarm is to be provided. A relief valve is also to be provided at the proper position, so as to lead the released oil to the lower-pressure side.
(G) In case where a pressure gauge using a bourdon-tube is provided in a high-pressure piping, it is to be of one to comply with a recognized industrial standard, e.g. ISO, and of vibration-proof and heat-resistant type.

5. System Design

(1) Electronic control system
(A) In case of a single failure in any part of equipment or circuit, the system is to be so arranged that the function of the whole system is capable of being sustained or restored.
(B) Controllers for the system are to comply with the following.
(a) At least two main controllers which are integrated to control every function, e.g. fuel injection, exhaust valve drive, cylinder lubrication and supercharge, are to be provided.
(b) Notwithstanding the requirement in (a) above, a single main controller may be acceptable, in case where the normal operation of the main propulsion machinery is available by using a control system independent from the main controller.
(C) Sensors essential for the operation of the main propulsion machinery, e.g. for the following uses, are to be independently provided at least two. In case where the normal operation for the main propulsion machinery is available without any feedback from these sensors, a single arrangement may be acceptable.
(a) Number of revolutions
(b) Crank angle
(c) Pressure of fuel in common accumulators
(D) The power for the control system is to be supplied from two independent sources, one of which is to be a battery supply, and through two independent circuits.
(E) The power for driving solenoid valves is to be supplied from two independent sources, and through two independent circuits.
(F) An electronic-control system of the main propulsion machinery to comply with the requirements prescribed in **5.** (1) (A) through (E) is regarded as the one to comply with the following requirements.
(a) **Pt 6, Ch 2, 201. 4.** (5) (A) of the Rules
(b) **Pt 6, Ch 2, 202. 2.** (3) (C) of the Rules

(2) Failure Mode Effective Analysis(FMEA)
Failure Mode Effective Analysis(FMEA) is to be carried out for the electronic control system in accordance with the following, in order to confirm that any one equipment or circuit in the system which becomes out of function may not cause any malfunction or deterioration in the other equipment or circuits.
(A) The system is to be divided into each functional block and drawn out in the reliability block diagram in which the function blocks are systematically organized.
(B) The analytic level may be sufficient up to the extent of the functional block regarding sub-systems and components.
(C) FMEA is to be resulted in a table shown in **Table 5.16** or equivalent thereto.
(D) For the failure mode, every possible failure from minor to catastrophic is to be considered.

Table 5.16 Failure Mode Effective Analysis Table

System				Element								
ID Number	Component	Sub-system	Operating mode	Failure mode	Failure cause	Failure detection means	Effect of failure			Failure severity	Corrective action	Remarks
							On component	On sub-system	On system			

NOTES :
1. Example of Operating Mode : back-up operation, fuel cost priority operation, NOx reduce operation, etc.
2. Example of Failure Mode : piston pin stuck, connecting rod broken, lubricating oil leaked out, etc.(Failure parts are to be shown.)
3. Failure Severity
(a) catastrophic : loss of complete function, explosion, loss of life(Design change is to be compulsory.)
(b) major : loss or deterioration of a part of function(Possible design change is to be investigated.
(c) minor : negligible affect on function(Design change may not be required.

6. Others

(1) Safety measures
(A) Means are to be provided to stop the main propulsion machinery at a local position in addition to the emergency stopping device in **Pt 6, Ch 2, 202. 2.** (3) (E) of the Rules.
(B) Means are to be provided to prevent fuel oil from continuously flowing into a cylinder due to a failure of a control valve.
(2) Spare parts
The spare parts for the electronically-controlled diesel engine are to be in accordance with **Table 5.17.**

Table 5.17 Spare Parts

Items	Number required	Remarks
Control valves	Each 1 in different types	
Accumulators diaphragms	Each 2 in different types	
Sensors provided for each cylinder	Each 1 in different types	spare parts may be omitted where the normal operation of the main propulsion machinery is available without these sensors.

Annex 5-9 Flexible Pipes

1. Scope

(1) The requirements apply to flexible pipes of metallic or non-metallic material intended for a permanent connection between a fixed piping system and items of machinery. The requirements may also be applied to temporary connected flexible pipes or hoses of portable equipment.
(2) Flexible pipe assemblies may be accepted for use in oil fuel, lubricating, hydraulic and thermal oil systems, fresh water and sea water cooling systems, compressed air systems, bilge and ballast systems, and Class III steam systems where they comply with the requirements. flexible pipes in high pressure fuel oil injection systems are not to be accepted.
(3) These requirements for flexible pipe assemblies are not applicable to hoses intended to be used in fixed fire extinguishing systems.

2. Design and construction

(1) Flexible pipes are to be designed and constructed in accordance with *Korean Industrial Standards or equivalent.*
(2) Flexible pipes constructed of rubber materials and intended for use in bilge, ballast, compressed air, oil fuel, lubricating, hydraulic and thermal oil systems are to incorporate a single, double or more closely woven integral wire braid or other suitable material reinforcement. Flexible hoses of plastics materials for the same purposes, such as Teflon or Nylon, which are unable to be reinforced by incorporating closely woven integral wire braid are to have suitable material reinforcement as far as practicable. Where rubber or plastics materials hoses are to be used in oil supply lines to burners, the hoses are to have external wire braid protection in addition to the reinforcement mentioned above. Flexible pipes for use in steam systems are to be of metallic construction.
(3) Flexible pipes are to be completed with approved end fittings in accordance with manufacturer's specification. The end connections that do not have a flange are to comply with **104. 5** of the Rules and each type of hose/fitting combination is to be subject to prototype testing to the same standard as that required by the hose with particular reference to pressure and impulse tests.
(4) The use of hose clamps and similar types of end attachments is not acceptable for flexible pipes in piping systems for steam, flammable media, starting air systems or for sea water systems where failure may result in flooding. In other piping systems, the use of hose clamps may be accepted where the working pressure is less than 0.5 MPa and provided there are double clamps at each end connection.
(5) Flexible pipe assemblies intended for installation in piping systems where pressure pulses and/or high levels of vibration are expected to occur in service, are to be designed for the maximum expected impulse peak pressure and forces due to vibration. The tests required by **4.** are to take into consideration the maximum anticipated in-service pressures, vibration frequencies and forces due to installation.
(6) Flexible pipe assemblies constructed of non-metallic materials intended for installation in piping systems for flammable media and sea water systems where failure may result in flooding, are to be of fire-resistant type. Fire resistance is to be demonstrated by testing to **ISO 15540**(or **KS V 0820**) and **ISO 15541**(or **KS V 0821**).
(7) Flexible pipe assemblies are to be selected for the intended location and application taking into consideration ambient conditions, compatibility with fluids under working pressure and temperature conditions consistent with the manufacturer's instructions and any requirements of the Society.

3. Installation

(1) In general, flexible pipes are to be limited to a length necessary to provide for relative movement between fixed and flexibly mounted items of machinery/equipment or systems.
(2) Flexible pipe assemblies are not to be installed where they may be subjected to torsion deformation(twisting) under normal operating conditions.
(3) The number of flexible pipes, in piping systems mentioned in **1.** (2) of the Guidance is to be kept to minimum and to be limited for the purpose stated in **1.** (1) of the Guidance.

(4) Where flexible pipes are intended to be used in piping systems conveying flammable fluids that are in close proximity of heated surfaces the risk of ignition due to failure of the pipe assembly and subsequent release of fluids is to be mitigated as far as practicable by the use of screens or other similar protection to the satisfaction of the Society.
(5) Flexible pipes are to be installed in clearly visible and readily accessible locations.
(6) The installation of flexible pipe assemblies is to be in accordance with the manufacturer's instructions and use limitations with particular attention to the following.
(A) Orientation
(B) End connection support (where necessary)
(C) Avoidance of hose contact that could cause rubbing and abrasion
(D) Minimum bend radii

4. Marking

(1) Flexible pipes are to be permanently marked by the manufacturer with the following details.
(A) Hose manufacturer's name or trademark
(B) Date of manufacture (month/year)
(C) Designation type reference
(D) Nominal diameter
(E) Pressure rating
(F) Temperature rating
(2) Where a flexible pipe assembly is made up of items from different manufacturers, the components are to be clearly identified and traceable to evidence of prototype testing. ⚓

APPLICATION OF
PART 6 "ELECTRICAL EQUIPMENT AND CONTROL SYSTEMS"

1. Unless expressly specified otherwise, the requirements in the Rules apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date : 20 August 2010 (based on the application date for classification survey)

CHAPTER 2 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 2 System and Control
- 202. 3 (3) has been amended.

Effective Date : 1 July 2011

CHAPTER 1 ELECTRICAL EQUIPMENT

Section 1 General
- 109. 1 (1) and 2 have been amended.

Section 2 Rotating Machinery
- 209. 1 has been amended.
- 209. 15 and 16 have been newly added.

Section 5 Distribution
- 507. 4 has been amended.

Section 10 Lighting Fittings, Heating Appliances and Wiring Accessories
- 1002. 2 (4) and 3 have been newly added.

Section 11 Internal Communications
- 1106. has been newly added.

CONTENTS

CHAPTER 1 ELECTRICAL EQUIPMENT

Section 1 General

101. General

1. Application

(1) The requirements of this Chapter apply to the electrical equipment and electric propulsion machinery intended for ships without special limitations for their service or purpose. For electrical equipment and electric propulsion machinery intended for ships with special limitations for their service or purpose and intended for small ships of less than 500 ton gross tonnage, the requirements in this Chapter may be modified within an extent considered appropriate by this Society.
(2) Except where a specific statement is made to the contrary, all requirements specified in this chapter are equally applicable to *a.c.* and *d.c.* installations.
(3) When the Society considers necessary, requirements specified in international electrical standards may apply.

2. Special electrical equipment

Electrical equipment and electric propulsion machinery not specified in this Chapter are to be as deemed appropriate by the Society.

3. Passenger ships

The electrical equipment of passenger ships engaged on international voyages is to comply with the requirements in this Part and in addition, attention is to be paid to compliance with the requirements of passenger ships specified in the International Convention for the Safety of Life at Sea (hereinafter referred to as the "SOLAS Convention").

4. Terminology

Terms used in this Chapter are as follows:

(1) **Dangerous spaces** are the following areas or spaces where flammable or explosive substances are placed and where it is likely to arise flammable or explosive gases or vapours from these substances and they are classified according to generation frequency and period of life for explosive gas atmosphere.
  (A) Zone 0 : area in which an explosive gas atmosphere is present continuously or is present for long periods.
  (B) Zone 1 : area in which an explosive gas atmosphere is sometimes likely to occur in normal operation..
  (C) Zone 2 : area in which an explosive gas atmosphere is not likely to occur in normal operation and, if it does occur, is likely to do so only infrequently and will exist for a short period only.
(2) **Selective tripping** is such an arrangement that only the protective device nearest to a fault point is opened automatically in order to maintain the power supply to the rests of sound circuits, in the event of a fault in the circuit having protective devices connected in series.
(3) **Preference tripping** is such an arrangement that the protective devices for unimportant circuits are opened automatically in order to ensure the power supply for vital services, when any one generator becomes overloaded or likely.
(4) **Normal operational and habitable condition** is a condition under which the ship as a whole, the machinery, services, means and aids ensuring propulsion, ability to steer, safe navigation, fire and flooding safety, internal and external communication and signals, means of escape, and emergency boat winches, as well as the designed comfortable conditions of habitability are in working order and functioning normally. All electrical services necessary for maintaining the ship in normal operational and habitable conditions are essential services and services for habitability.
(5) **Emergency condition** is a condition under which any services needed for normal operational and habitable conditions are not in working order due to failure of the main source of electrical power.
(6) **Main source of electrical power** is a source intended to supply electrical power to the main

switchboard for distribution to all services necessary for maintaining the ship in normal operational and habitable conditions.

(7) **Main generating station** is the space in which the main source of electrical power is situated.

(8) **Main switchboard** is a switchboard which is directly supplied by the main source of electrical power and is intended to distribute electrical energy to the ship's services.

(9) **Emergency source of electrical power** is a source of electrical power, intended to supply the emergency switchboard in the event of failure of the supply from the main source of electrical power.

(10) **Emergency switchboard** is a switchboard which in the event of failure of the main electrical power supply system is directly supplied by the emergency source of electrical power or the transitional source of emergency power and is intended to distribute electrical energy to the emergency services.

(11) Electrical services are classified into essential services and services for habitability.

(12) Essential services are those services essential for propulsion and steering, and safety of the ship, which are made up of "primary essential services" and "secondary essential services". Definitions and examples of such services are given in (A) and (B) below.

(A) Primary essential services are those services which need to be in continuous operation to maintain propulsion and steering. Examples of equipment for primary essential services are as follows:

(a) Steering gears
(b) Pumps for controllable pitch propellers
(c) Scavenging air blower, fuel oil supply pumps, fuel valve cooling pumps, lubricating oil pumps and cooling water pumps for main and auxiliary engines and turbines necessary for propulsion
(d) Forced draught fans, feed water pumps, water circulating pumps, vacuum pumps and condensate pumps for steam plants on steam turbine ships, and also for auxiliary boilers on ships where steam is used for equipment supplying primary essential services
(e) Oil burning installations for steam plants on steam turbine ships and for auxiliary boilers where steam is used for equipment supplying primary essential services
(f) Azimuth thrusters which are the sole means for propulsion/steering with lubricating oil pumps, cooling water pumps
(g) Electrical equipment for electric propulsion plant with lubricating oil pumps and cooling water pumps
(h) Electric generators and associated power sources supplying the primary essential service equipment
(i) Hydraulic pumps supplying the primary essential service equipment
(j) Viscosity control equipment for heavy fuel oil
(k) Control, monitoring and safety devices/systems for equipment to primary essential services

(B) Secondary essential services are those services which need not necessarily be in continuous operation to maintain propulsion and steering but which are necessary for maintaining the vessel's safety. Examples of equipment for secondary essential services are as follows:

(a) Windlass
(b) Fuel oil transfer pumps and fuel oil treatment equipment
(c) Lubrication oil transfer pumps and lubrication oil treatment equipment
(d) Pre-heaters for heavy fuel oil
(e) Starting air and control air compressors
(f) Bilge, ballast and heeling pumps
(g) Fire pumps and other fire extinguishing medium pumps
(h) Ventilating fans for engine and boiler rooms
(i) Services considered necessary to maintain dangerous spaces in a safe condition
(j) Navigation lights, aids and signals
(k) Internal safety communication equipment
(l) Fire detection and alarm system
(m) Lighting system
(n) Electrical Equipment for watertight closing appliances
(o) Electric generators and associated power sources supplying the secondary essential service equipment
(p) Hydraulic pumps supplying the secondary essential service equipment

(q) Control, monitoring and safety systems for cargo containment systems
(r) Control, monitoring and safety devices/systems for equipment to secondary essential services

(13) Services for habitability are those services which need to be in operation for maintaining the vessel's minimum comfort conditions for the crew and passengers. Examples of equipment for maintaining conditions of habitability are as follows:
(A) Cooking
(B) Heating
(C) Domestic refrigeration
(D) Mechanical ventilation
(E) Sanitary and fresh water
(F) Electric generators and associated power sources supplying the above equipment

(14) Dead ship condition means a condition under which:
(A) the main propulsion plant, boilers and auxiliary machinery are not in operation due to the loss of the main source of electrical power, and
(B) in restoring propulsion, the stored energy for starting the propulsion plant, the main source of electrical power and other essential auxiliary machinery is assumed to be not available. It is assumed that means are available to start the emergency generator at all times.

102. Drawings and data

The drawings and data to be submitted for approval before the commencement of work are generally as follows:

1. Drawings and data to be submitted by the shipyard

(1) Investigation table of electrical load analysis (main and emergency sources including batteries)
(2) Wiring diagram for power systems (including emergency source)
(3) Wiring diagram for lighting systems (including emergency lightings)
(4) Wiring diagram for control systems
(5) Wiring diagram for navigation and communication systems
(6) Wiring diagram for radio systems
(7) Wiring diagram for fire detection and alarm systems
(8) General arrangement for electrical systems (bridge, radio room, accommodation space, engine room, all decks, etc.)
(9) Arrangement for navigation and signal lights
(10) Drawings indicating dangerous spaces (if necessary)
(11) Drawings of measuring equipment for cargo tanks (if necessary)
(12) List of particulars of high voltage electrical equipment(if necessary)
(13) Calculation sheets of short-circuit current in the circuits(if the sum of rated power is 500 kVA (kW) and over)
(14) Drawings and data as deemed necessary by the Society (in case of special construction ships)

2. Drawings and data to be submitted by the manufacturers of electrical equipment

(1) Manufacturing drawings for generators of 100 kVA and above and motors of 100 kW and above
(2) Drawings of main and emergency switchboard (including battery charging and discharging board)
(3) Drawings of control panel in bridge
(4) Drawings of control panel in engine room
(5) Drawings of remote control system (for main engine, generator and boiler)
(6) Manufacturing drawings for alarm and control system (including list of alarm points)
(7) Drawings of explosion-proof electrical equipment
(8) Drawing of control panel for electric propulsion unit (including electronic coupling and frequency changer)
(9) Drawings and data as deemed necessary by the Society (in case of special equipment)

103. Construction and installation

1. Construction

Electrical equipment is to be so constructed as to provide easy accessibility to all parts requiring inspection, overhaul and repair.

2. Protection against corrosion

(1) Bolts, nuts, pins, screws, terminals, studs, springs and such other small parts are to be made of corrosion resistant materials or those suitably protected against corrosion.
(2) If electrical fittings, not of aluminium, are attached to aluminium, suitable means are to be taken to prevent corrosion.

3. Protection against electrical shock

(1) Where the operators are liable to inadvertently touch the live part of electrical apparatus due to ship's inclination and vibration, such parts are to be protected with suitable means to prevent electrical shock.
(2) The moving parts, reciprocating parts, high temperature parts or charged parts of electrical equipment are to be provided with suitable protections for one who watches, operates or approaches the equipment to avoid injury.
(3) To minimize shock from high-frequency voltage induced by the radio transmitter, handles, handrails, etc. of metal on the bridge or upper decks are to be in good electrical connection with the hull or superstructure.

4. Installation of propulsion machines

Means are to be provided to prevent the accumulation of bilge under propulsion machines (generators, motor-generators, motors, electro-magnetic slip couplings).

5. Installation and protective enclosure

Electrical equipment is to be accessibly placed in well ventilated and adequately lighted spaces in which inflammable gases cannot accumulate and where it is not exposed to the risk of mechanical injuries or damage from water, steam or oil, and is to be so installed that space is available for maintenance. Where, however, electrical equipment are unavoidably installed in spaces not fulfilled the above conditions, they are to be of the following construction.

(1) Drip-proof construction where water drip and oil are liable to drop.
(2) Water-proof construction where installed on exposed decks liable to get wet by sea water, rain or bilge water.
(3) Submersible construction where employed in water.
(4) Explosion-proof construction where explosive or inflammable materials are stored or liable to accumulate.

6. Insulating materials and insulated windings

Insulating materials and insulated windings are to be of resisting quality against moisture, sea air and oil vapour.

7. Power source control switches

Electrical equipment is not to remain alive through the control circuits or pilot lamps when switched off by the control switch.

8. Mechanical lock

All nuts and screws used in connection with current carrying parts and working parts are to be effectively locked.

9. Consideration of magnetic compass

Electrical equipment and cables are to be placed at such a distance from the magnetic compasses that the interfering external magnetic field is negligible, even when circuits are switched on and off.

10. Electromagnetic compatibility

Electrical and electronic equipment on the bridge are to be so installed that electromagnetic interference does not affect the proper function of navigational systems and equipment.

104. Earthing of electrical equipment

1. Fixed electrical equipment

All accessible non-current-carrying metal parts of fixed electrical equipment are to be effectively earthed. Where earthing connections are necessary, the sectional area of the earthing conductor is to be as deemed appropriate by the Society. (refer to the Guidance)

2. Exposed metal parts of electrical machines or equipment which are not intended to be live but which are liable under fault conditions to become live are to be earthed unless the machines or equipment are:

(1) supplied at a voltage not exceeding 50 V *d.c.* or 50 V *a.c.*, root mean square between conductors; auto-transformers are not to be used for the purpose of achieving this voltage; or
(2) supplied at a voltage not exceeding 250 V by safety isolating transformers supplying only one consuming device; or
(3) constructed in accordance with the principle of double insulation.

3. Additional safety means are to be provided for portable electrical apparatus for use in confined or exceptionally damp spaces where particular risks due to conductivity exist.

105. System of supply

The following systems of supply are considered as standard:
(1) Two-wire for direct current.
(2) Three-wire for direct current (three-wire insulated system or three-wire mid-wire earthed system).
(3) Single phase two-wire for alternating current.
(4) Three phase three-wire for alternating current.
(5) Three phase four-wire for alternating current.

106. Voltage and frequency

1. Supply voltage

Supply voltage is not to exceed:

(1) 500V for cooking and heating equipment permanently connected to fixed wiring.
(2) 15,000 V *a.c.* or 3,000 V *d.c.* for electric propulsion equipment.
(3) 15,000 V *a.c.* or 500 V *d.c.* for generators and power equipment.
(4) 250 V for lighting, heaters in cabins and public rooms and other applications not mentioned (1), (2) and (3) above.

2. Standard frequency

Frequency of 50 Hz or 60 Hz is recognized as a standard.

3. Voltage and frequency variations

(1) All electrical appliances supplied from the main or emergency systems are to be so designed and manufactured that they are capable of operating satisfactorily under the normally occurring variations in voltage and frequency.
(2) Unless otherwise stated in the national or international standards, all equipment are to operate satisfactorily with the variations from its rated value shown in the **Tables 6.1.1** on the following conditions.
  (A) For alternative current components, voltage and frequency variations shown in the **Table 6.1.1** (a) are to be assumed.
  (B) For direct current components supplied by *d.c.* generators or converted by rectifiers, voltage variations shown in the **Table 6.1.1** (b) are to be assumed.
  (C) For direct current components supplied by electrical batteries, voltage variations shown in the **Table 6.1.1** (c) are to be assumed.
(3) Any special systems, e.g. electronic circuits, whose function cannot operate satisfactorily within the limits shown in **Table 6.1.1** is not to be supplied directly from the system but by alternative means, e.g. through stabilized supply.

4. Harmonic distortion

The total harmonic distortion(THD) in the voltage waveform in the distribution systems is not to exceed 8% and any single order harmonics not to exceed 3%. Other higher values may be accepted provided the distribution equipment and consumers are designed to operate at the higher limits.

107. Ambient conditions

1. The ambient conditions given in **Table 5.1.2** and **Table 5.1.3** in **Pt 5, Ch 1** are to be applied unless otherwise specified, to the design, selection and arrangement of electrical installations as to ensure proper operation. However, ambient temperatures for electrical equipment installed in environmentally controlled spaces are to be in accordance with the requirements which the Society considers appropriate.

2. The operation of all electrical equipment is to be sufficient under such conditions of vibration as to arise in normal practice.

Table 6.1.1 Voltage and frequency variations

(a) Voltage and frequency variations for *a.c.* distribution systems

Type of variations	Variations	
	Permanent	Transient
Frequency	± 5 %	± 10 % (5 sec)
Voltage	+ 6 %, -10 %	± 20 % (1.5 sec)

(b) Voltage variations for d.c distribution systems

Parameters	Variations
Voltage tolerance (continuous)	± 10 %
Voltage cyclic variation deviation	5 %
Voltage ripple(*a.c.* r.m.s. over steady *d.c.* voltage)	10 %

(c) Voltage variations for battery systems

Systems	Variations
Components connected to the battery during charging (see Note)	+30 %, -25 %
Components not connected to the battery during charging	+20 %, -25 %

(Note)
Different voltage variations as determined by the charging/discharging characteristics, including ripple voltage from the charging device, may be considered.

108. Clearance and creepage

1. The clearances and creepages between live parts and between live part and earthed metal (hereinafter to be called the “clearance and creepage”) are to be adequate for the working voltage having regard to the nature and service condition of the insulating material.

2. The clearance and creepage for the inside terminal box of rotating machinery, the switchboard busbar and the controlling equipment, etc. are to conform to the values as required in each relevant Section in this Chapter.

109. Testing and inspection

1. General

(1) The following electrical equipment is to be tested, in principle, in accordance with relevant requirements of this Chapter at the manufacturer's works or at other works having the adequate apparatus for testing and inspections.

(A) Rotating machines for propulsion and their control gears
(B) Ship service generators (main, auxiliary and emergency)
(C) Control gears for the motors, and motors which drive essential auxiliaries specified in **Pt 5, Ch 1, 102.** of the Guidance and exceed the output 7.5 kW (For the output of not more than 50 kW, if there are manufacturer's own test reports, a part or all of tests and inspections in the presence of the Society's Surveyor may be omitted subject to the Society's permission)
(D) Main switchboards, emergency switchboards, battery charging and discharging boards, and control consoles
(E) Transformers for power and lighting of single phase 1 kVA or more and 3 phase 5 kVA or more (For the transformer with running capacity of less than 100 kVA, if there are manufacturer's own test reports, a part or all of tests and inspections in the presence of the Society's Surveyor may be omitted subject to the Society's permission)
(F) Power semi-conductor rectifiers of 5 kW or more, uninterrupted power supplies for control monitoring/alarm of 5 kVA or more, uninterrupted power supplies for emergency source of electrical power of 50 kVA or more.

(2) The following electrical appliances and cables are to be type approved in accordance with the 「Guidance for Approval of Manufacturing Process and Type Approval, etc.」 before being taken into use.
(A) Fuses
(B) Circuit-breakers
(C) Electro-magnetic contactors
(D) Explosion-proof electrical equipment
(E) Cables
(F) Cable trays/protective casings made of plastic materials
(G) Protection relay

2. Inspections based on Quality Assurance Scheme

Where the electrical equipment is manufactured by Quality Assurance Scheme specified in 「Guidance for Approval of Manufacturing Process and Type Approval, etc.」, a part or all of the tests and inspections in the presence of the Society's Surveyor may be omitted.

3. Tests after installation on board

Electrical equipment and cables, after installation on board the ship, are to be tested and inspected in accordance with the requirements in **Sec 18.**

4. Additional tests and inspections

The Society may require, when it deems necessary, other tests and inspections than those specified in this Chapter.

5. Exemption from tests and inspections

Electrical equipment having the certificate considered acceptable by the Society may be exempted partially or wholly from the tests and inspections.

6. Tests and inspections on type approved products

Tests and inspections on type approved products are to be in accordance with the requirements which the Society considers appropriate.

Section 2 Rotating Machinery

201. General

1. Requirements of electrical installation

(1) All electrical auxiliary services necessary for maintaining the ship in normal operational and habitable conditions will be ensured without recourse to the emergency source of electrical power.
(2) Electrical services essential for safety will be ensured under various emergency conditions.

(3) The safety of crew and ship from electrical hazards will be ensured.

2. Main source of electrical power

(1) A main source of electrical power of sufficient capacity to supply essential services and services for habitability is to be provided. This main source of electrical power is to consist of at least two generating sets.
(2) The capacity of these generating sets is to be such that in the event of any one generating set being stopped it will still be possible to supply essential services and services for habitability.
(3) The arrangements of the ship's main source of electrical power is to be such that the essential services and services for habitability can be maintained regardless of the speed and direction of rotation of the propulsion machinery or shafting.
(4) The generating sets are to be such as to ensure that with any one generator or its primary source of power out of operation, the remaining generating sets are to be capable of providing the electrical services necessary to start the main propulsion plant from a dead ship condition. The emergency source of electrical power may be used for the purpose of starting from a dead ship condition if its capability either alone or combined with that of any other source of electrical power is sufficient to provide at the same time those services required to be supplied by **1402. 2** (1) to (5).
(5) Where the main source of electrical power is necessary for propulsion and steering of the ship, the system is to be so arranged that the electrical supply to equipment necessary for propulsion and steering and to ensure safety of the ship will be maintained or immediately restored in the case of loss of any one of the generators in service. Preference tripping or other equivalent arrangements are to be provided to protect the generators against sustained overload.

3. Fault current

Ship's service generators are to be capable of withstanding the mechanical and thermal effects of fault current for the duration of any time delay which may be fitted in a tripping device for discrimination purposes.

4. Clearance and creepage inside terminal box

The clearance and creepage for the inside terminal box of rotating machine are not to be less than as required **Table 6.1.2.** However, the requirements in the above are not applied to small motors such as controlling motors, self synchronous motors, etc. and also not applied when an insulating barrier is used.

Table 6.1.2 Minimum Clearance and Creepage inside the Terminal Box of Rotating Machine

Rated voltage (V)	Clearance (mm)	Creepage (mm)
61 ~ 250	5	8
251 ~ 380	6	10
381 ~ 500	8	12

5. Air coolers and means of prevention of moisture condensation

(1) Where air coolers are provided for rotating machines they are so arranged as to prevent the possibility of water into the machines by leakage or condensation in the air coolers.
(2) Where there is fear of deterioration of insulations by moisture condensation within rotating machines, it is to be provided with means, such as space heater, etc., to prevent it.

202. Prime movers for generators

1. Application

Prime movers are to be constructed in accordance with the following requirements in addition to the requirements of the applicable Chapters of the Rules.

2. Governors

Governors on prime movers driving main or emergency electric generators are to be capable of automatically maintaining the speed within the following limits:

(1) Prime movers for driving generators of the main and emergency sources of electrical power are to be fitted with a speed governor which will prevent transient frequency variations in the electrical network in excess of ±10% of the rated frequency with a recovery time to steady state conditions not exceeding 5 seconds, when the maximum electrical step load is switched on or off. In the case when a step load equivalent to the rated output of a generator is switched off, a transient speed variation in excess of 10% of the rated speed may be acceptable, provided this does not cause the intervention of the overspeed device specified in **Pt 5, Ch 2, 203. 1** (1).

(2) Application of electrical load is to be possible with 2 load steps and must be such that prime movers - running at no load - can suddenly be loaded to 50% of the rated power of the generator followed by the remaining 50% after an interval sufficient to restore the speed to steady state. Steady state conditions are to be achieved in not more than 5 seconds. Steady state conditions are those at which the envelope of speed variation does not exceed +1% of the declared speed at the new power.

(3) At all loads between no load and rated power the permanent speed variation should not be more than ±5% of the rated speed.

(4) Emergency generator sets must satisfy the governor conditions as per items (1) and (3) even when:

(A) their total consumer load is applied suddenly, or

(B) their total consumer load is applied in steps, subject to:

- the total load is supplied within 45 seconds since power failure on the main switchboard.
- the maximum step load is declared and demonstrated.
- the power distribution system is designed such that the declared maximum step loading is not exceeded.
- the compliance of time delays and loading sequence with the above is to be demonstrated at ship's trials.

3. Governors on prime movers operating in parallel

For *a.c.* generating sets operating in parallel, the governors or prime movers are to have such characteristics that load sharing stipulated in **206. 4** is ensured, and are to be of those easily conducting the load adjustment, at normal frequency, within 5 % of the rated load.

4. Turbine-driven *d.c.* generators operating in parallel

Turbine-driven *d.c.* generators arranged to run in parallel are to be fitted with switching device to open the generator circuit-breakers when the emergency governor comes into function.

203. Rotating machinery shaft

1. Rotating machinery shaft

The diameter of rotating machinery shaft in the length from the section where rotor is fixed to the shaft end of prime mover side or load side is not to be less than value obtained from the formula specified in **Pt 5, Ch 3, 203.** of the Rules. P, n and F in the formula mean as follows:

P = Output of rotating machinery (kW).

n = Number of revolutions of rotating machinery (rpm).

F = Values given in **Table 6.1.3.**

In case where the stress concentration remains on the part of minimum shaft diameter or where it is apprehended that the transient torque is remarkably greater than the normal torque in operation, F is to be increased by the value recognized by the Society.

2. Shaft coupling

Where bearings are fitted at both ends of rotating machinery shaft, the diameter of the shaft near the coupling part of the driving side and the shaft of bearing contacting parts may be taken as 93% of the values obtained from the formula in **Par 1** provided that there is no sudden change in the shape of the shaft.

3. Torsional vibration

Generator shafting is to be so designed to prevent any excessive vibration within the operating range. The torsional vibration of generator shafting driven by diesel engine is to conform to the requirements equivalent to those given in **Pt 5, Ch 4, 203.**

Table 6.1.3 Values of Constant F

Bearing arrangement of a rotating machinery shaft	In case of generator driven by steam or gas turbine, generator driven by diesel engine through slip type coupling[(1)], or electrical motor	In case of generator driven by diesel engine other than those mentioned in the left-hand column
Where bearings are arranged at both sides of a rotating machinery shaft	110	115
Where no bearing is arranged at prime mover side or load side of a rotating machinery shaft	120	125
(NOTE) (1) Slip type coupling signifies hydraulic coupling, electro-magnetic coupling or the equivalent		

204. Temperature rise

1. The temperature rise of rotating machines is not to exceed the values in **Table 6.1.4** when continuously operated at the rated load or intermittently operated according to their duties.

2. The temperature rise of static exciters is to comply with the requirements in **307. 2.**

3. The temperature rise of rotating machines equipped with air cooler may be increased by 13℃ from the values in the Table, provided that the temperature of cooling water at the inlet of air cooler does not exceed 32℃.

4. Where the ambient temperature exceeds 45℃, limits of temperature rise are to be decreased by the difference from the values given in **Table 6.1.4.**

5. Where the ambient temperature does not exceed 45℃, the limits of temperature rise may be increased by the difference from the values in the **Table 6.1.4.** In this case, the ambient temperature is not to be set below 40℃.

205. Ship's service *d.c.* generator

1. *D.C.* **generators**

D.C. generators other than those referred to in **Par 2** are to be either of the following types:

(1) Compound-wound generator
(2) Shunt-wound generator with an automatic voltage regulator

2. *D.C.* **generators used for charging batteries**

D.C. generators used for charging batteries without series of regulating resistor are to be either of the following types:

(1) Shunt-wound generator
(2) Compound-wound generator with switches arranged so that the series winding can be made inoperative at the time of charging

Table 6.1.4 Temperature Rise of Rotating Machines (°C) (Based on 45℃ ambient temperature)

Item		Part of machine	Class A insulation			Class E insulation			Class B insulation			Class F insulation			Class H insulation		
			T	R	E.T.D.	T	R	E.T.D.	T	R	E.T.D.	T	R	E.T.D.	T	R	E.T.D.
1	a)	A.C. windings of machines having outputs of 5,000 kW (or kVA) or more	-	55	60	-	-	-	-	75	80	-	95	100	-	120	125
	b)	A.C. windings of machines having outputs above 200 kW (or kVA) but less than 5,000 kW (or kVA)	-	55	60	-	70	-	-	75	85	-	100	105	-	120	125
	c)	A.C. windings of machines having outputs of 200 kW (or kVA) or less, other than those in items 1d) or 1e) *1	-	55	-	-	70	-	-	75	-	-	100	-	-	120	-
	d)	A.C. windings of machines having rated outputs of less than 600 W (or VA) *1	-	60	-	-	70	-	-	80	-	-	105	-	-	125	-
	e)	A.C. windings of machines which are self-cooled without fan and/or with encapsulated windings *1	-	60	-	-	70	-	-	80	-	-	105	-	-	125	-
2		Windings of armatures having commutators	45	55	-	60	70	-	65	75	-	80	100	-	100	120	-
3		Field winding of a.c. and d.c. machines having d.c. excitation other than those in item 4	45	55	-	60	70	-	65	75	-	80	100	-	100	120	-
4	a)	Field windings of synchronous machines with cylindrical rotors having d.c. excitation winding embedded in slots except synchronous induction motors	-	-	-	-	-	-	-	85	-	-	105	-	-	130	-
	b)	Stationary field windings, of d.c. machines, having more than one layer	45	55	-	60	70	-	65	75	85	80	100	105	100	120	130
	c)	Low resistance field winding of a.c. and d.c. machines and compensating windings of d.c. machines having more than one layer	55	55	-	70	70	-	75	75	-	95	95	-	120	120	-
	d)	Single-layer windings of a.c. and d.c. machines with exposed bare or varnished metal surfaces and single-layer compensating windings of d.c. machines *2	60	60	-	75	75	-	85	85	-	105	105	-	130	130	-
5		Permanently short-circuited windings	The temperature rise is in no case to reach such a value that there is a risk of injury to any insulating material on adjacent parts.														
6		Magnetic cores and all structural components, whether or not in direct contact with insulation (excluding bearings)															
7		Commutators and slip-rings and their brushes and brush gear	The temperature rise is in no case to reach such a value that there is a risk of injury to any insulating material on adjacent parts. Additionally, the temperature is not to exceed that at which the combination of brush grade and commutator/slip-ring materials can handle the current over the complete operating range.														

T = Thermometer method, R = Resistance method, E.T.D. = Embedded temperature detector

(NOTES)

1. With application of the super position method to windings of machines rated 200 kW (or kVA) or less with insulation classes A, E, B and F, marked with *1, the limits of temperature rise given for the resistance method may be exceeded by 5℃
2. Also includes multiple layer windings provided that the under layers are each in contact with the circulating primary coolant.

3. Field regulator for *d.c.* generators

Field regulator for *d.c.* generator is to be capable of adjusting the voltage of the generator to within 0.5 % of the rated voltage for machines above 100 kW and 1 % of the rated voltage for smaller machines respectively at all loads between no load and full load at the operating temperature.

4. Overall voltage regulation of *d.c.* generators

The overall voltage regulation of *d.c.* generators is to conform to the following requirements. The rotating speed is to be adjusted with the rated speed at full load.

(1) Shunt-wound generator : After the temperature test, when the voltage sets at full load, the steady voltage at no load is not to exceed 115 % of the full load value, and the voltage obtained at any value of load is not to exceed the no load value.

(2) Compound-wound generator : After the temperature test, when the voltage at 20 % load is adjusted within ±1 % of rated voltage, the voltage at full load is to be within ±1.5 % of the rated voltage and the average of the ascending and descending load / voltage curves between 20 % load and full load is not to vary by more than 3 % from the rated voltage. However, for the compound-wound generators operating in parallel, the drop in voltage may be acceptable up to 4 % of the rated voltage when the load is gradually increased from 20 % load to 100 % load.

(3) Three-wire generator : In addition to conforming to (1) and (2) above, when the generator is operating at the rated current on either positive or negative leads and a current of 25 % of the rated current in the neutral wire, the resulting difference in voltage between the positive and neutral leads or the negative and neutral leads is not to exceed 2 % of the rated voltage between the positive and negative leads.

5. Load sharing of *d.c.* generators

When *d.c.* generators are run in parallel, the load on any generator is not to differ by more than ±10 % of the rated output of the largest generator from its proportionate share, based on the generator ratings, of the combined load, for any steady-state condition in the combined load between 20 % and 100 % of the sum of the rated outputs of all the generators. The starting point for the test is to be at 75 % load with each generator carrying its proportionate share.

6. Series winding of compound-wound generator

The series winding of each two-wire compound-wound generator is to be connected to the negative terminal.

7. Equalizer connection

Equalizer connections of *d.c.* generator are to have a cross-sectional area not less than 50 % of that of the negative connection from the generator to the switchboard.

206. Ship's service *a.c.* generator

1. Automatic voltage regulators

Each *a.c.* generator, unless of the self-excited type, is to be provided with an automatic voltage regulator.

2. Overall voltage regulation of *a.c.* generators

The overall voltage regulation of *a.c.* generators is to be such that at all loads from zero to full load at the rated power factor, the rated voltage is to be maintained under steady conditions within ±2.5 %, except that for emergency generators the limits may be increased to ± 3.5 %.

3. Exciters of *a.c.* generators

Exciters of *a.c.* generators are to be capable of maintaining the current of at least three times its rated current for a duration up to 2 seconds, unless protection selectivity requirements which allow different characteristics exist.

4. Load sharing of *a.c.* generators

When *a.c.* generators are run in parallel, each generator is to be stable in running and the load on any generator is not to differ by more than 15 % of the rated output of the largest generator from its proportionate share, based on the generator ratings, of the combined load for any steady-state condition in the combined load between 20 % and 100 % of the sum of the rated loads of all the generators. The starting point for the test is to be at 75 % load with each generator carrying its proportionate share.

207. Shaft currents

Suitable measures are to be taken to prevent the ill effects of flow of currents circulating between the shaft and bearings.

208. Welding

When welding is applied to the shaft and other torque members of rotating machines, this is subject to the approval of the Society.

209. Testing and inspection

1. General

Rotating machines of essential use are to meet the requirements of this Section in their construction and are to be tested in accordance with the requirements of the following articles. However, the tests in the presence of the Surveyor may be omitted subject to the Society's permission for rotating machines of small capacity.

2. Material test of shaft

(1) The shaft materials for rotating machines (except emergency generator) of 100 kW(kVA) and above are to be tested in accordance with the requirements in **Pt 2, Ch 1.**
(2) The shaft materials for rotating machines of less than 100 kW(kVA) or emergency generator are to comply with the relevant Korean Industrial Standards (KS) or the equivalents.

3. Temperature test

After the rotating machine has run continuously under full rated load until a final steady temperature, the temperature rises in the machine are not to exceed the values in **204.**

4. Overcurrent or excess torque test

After the temperature test, rotating machines, except special type, are to withstand the following overcurrent or excess torque test while maintaining the voltage, revolving speed and frequency as near their rated values as possible. In the above, special types involve deck machinery motors (winch, windlass, capstan, etc.) and single phase *a.c.* motors.

Kinds	Overcurrent or excess torque	Seconds
D.C. generators	50 % overcurrent	15
A.C. generators	50 % overcurrent	120
D.C. motors	50 % excess torque	15
Synchronous motors	50 % excess torque	15
Induction motors	60 % excess torque	15

5. Overspeed test

Rotating machines are to withstand the overspeed test specified in the following for 2 minutes.

Kinds		Testing speed
Generators	Turbine driven	115 % of rated speed
	Internal combustion engine driven	120 % of rated speed
	All others	125 % of rated speed
Motors	Shunt-wound motors	125 % of rated speed
	Series-wound motors	200 % of rated speed
	Compound-wound motors	125 % of no load speed
	Synchronous motors	125 % of synchronous speed
	Induction motors	125 % of synchronous speed

6. Insulation resistance test

(1) Immediately after the temperature test and the high voltage test, the insulation resistance of the rotating machine are to be measure using a direct current insulation tester between:

(A) All current carrying parts connected together and earth.

(B) All current carrying parts of different polarity or phase, where both ends of each polarity or phase are individually accessible.

(2) The minimum values of test voltages and insulation resistances are given in the following.

Rated voltage Un(V)	Minimum test voltage(V)	Minimum insulation resistance(MΩ)
$Un \leq$ 250	$2 \times Un$	1
250 < $Un \leq$ 1,000	500	
1,000 < $Un \leq$ 7,200	1,000	$1+\frac{U_n}{1,000}$
7,200 < $Un \leq$ 15,000	5,000	

7. High voltage test

Rotating machines are to withstand for 1 minute the high voltage test between live parts and between live parts and earth with a.c. voltage in commercial frequency as given in **Table 6.1.5.**

8. Voltage regulation test

Generators are to be subjected to voltage regulation test specified in the following and are to pass the requirements.

(1) Test for the requirements specified in **205. 4** or **206. 2** of the Rules

(2) When the generator is driven at rated speed, giving its rated voltage, and is subjected to a sudden change of symmetrical load within the limits of specified current and power factor, the voltage is not to fall below 85 % nor exceed 120 % of the rated voltage. The voltage of the generator is then to be restored to within plus or minus 3 % of the rated voltage for the main generator sets in not more than 1.5 seconds. For emergency sets, these values may be increased to plus or minus 4 % in not more than 5 seconds, respectively.

9. Winding resistance measurement

The resistances of the machine windings are to be measured using an appropriate bridge method, or voltage and current method.

10. Commutation test

Rotating machines with commutators are to work with fixed brushes setting from no load to 50 % overload without injurious sparking.

11. Verification of steady short-circuit condition

It is to be verified that under steady-state short-circuit conditions, the generator with its voltage regulating system is capable of maintaining, without sustaining any damage, a current of at least three times the rated current for a duration of 2 seconds or, where precise data is available, for a duration of any time delay which may be fitted in a tripping device for discrimination purposes.

12. No load test

Machines are to be operated at no load and rated speed whilst being supplied at rated voltage and frequency as a motor or if a generator it is to be driven by a suitable means and excited to give rated terminal voltage. During the running test, the vibration of the machine and operation of the bearing lubrication system, if appropriate, are to be checked.

13. Parallel operation test

Generators to run in parallel operation are to be subjected to parallel operation test and are to pass the requirements in **205. 5** or **206. 4.**

Table 6.1.5 Testing Voltage

Item	Machine or part		Testing voltage (r.m.s.) (V)
1	Insulated windings of rotating machines of size less than 1 kW (or kVA), and of rated voltage less than 100V with exception of those in items 3 to 6		$2E + 500$
2	Insulated windings of rotating machines with exception of those in item 1 and items 3 to 6		$2E + 1{,}000$ (Minimum 1,500V)
3	Separately-excited field windings of d.c. machines		$2E_f + 1{,}000$ (Minimum 1,500V)
4	Field windings of synchronous generators, synchronous motors and synchronous condensers	$E_x \leqq 500$ V $E_x > 500$ V	$10E_x$ (Minimum 1,500V) $2E_x + 4{,}000$
		When intended to be started with the field winding short-circuited or connected across a resistance of value less than ten times the resistance of the winding	$10E_x$ (Minimum 1,500V, Maximum 3,500V)
		When intended to be started with the field winding on open circuit or connected across a resistance of value equal to, or more than, ten times the resistance ofthe winding	$2E_y + 1{,}000$ (Minimum 1,500V)
5	Secondary (usually rotor) windings of induction motors or synchronous induction motors if not permanently short-circuited (e.g. if intended for the rheostatic starting)	For non-reversing motors or motors reversible from standstill only	$2E_s + 1{,}000$
		For motors to be reversed or braked by reversing the primary supply while the motor is running	$4E_s + 1{,}000$
6	Exciters with the exception of : Exciters of synchronous motors (including synchronous induction motors) if connected to earth or disconnected from the field windings during starting; and Separately excited field windings of exciters		$2E_i + 1{,}000$ (Minimum 1,500V)

(NOTES)

1. E = Rated voltage
   E_f = Maximum rated voltage in field circuit
   E_x = Rated field voltage
   E_y = Induced terminal voltage between the terminals of field windings and starting rotor windings when applied the starting voltage to armature winding during the rotor's standstill and terminal voltage in such condition that the field windings or starting windings are started by connecting with the resistance
   E_s = Induced voltage between the terminals of secondary windings when the machine is at a standstill
   E_i = Rated exciter voltage
2. For two-phase windings having one terminal in common, the voltage in the formula is to be the highest r.m.s. voltage arising between any two terminals during operation.
3. High voltage tests on machines having graded insulation may be as deemed appropriate by the Society.
4. For the semi-conductor rectifier of exciters, the requirements for semi-conductor rectifiers for power in **Sec 12** are to be applied.

14. Verification of bearings

Upon completion of the above tests, machines which have plane bearings are to be opened upon request for examination by the Surveyor, to establish that the shaft is correctly seated in the bearing shells.

15. Verification of degree of protection

Degree of protection is to be verified in accordance with **Table 6.1.1** to **Table 6.1.6** or (KS C) IEC 60034-5.

16. Tests

The tests of rotating machinery are as following table according to its kinds

No.	Tests	A.C. Generator		A.C. Motors		D.C. Machines	
		Type test*	Routine test(1)	Type test*	Routine test(1)	Type test*	Routine test(1)
1	Examination of the technical documentation, visual inspection	X	X	X	X	X	X
2	Material test of shaft	X(2)	X(2)	X(2)	X(2)	X(2)	X(2)
3	Temperature test	X	X(8)	X	X(8)	X	X(8)
4	Overcurrent or excess torque test	X	X(3)	X	X(3)	X	X(3)
5	Overspeed test	X	X	X(4)	X(4)	X(4)	X(4)
6	Inspection resistance test	X	X	X	X	X	X
7	High voltage test	X	X	X	X	X	X
8	Voltage regulation test	X	X(5)				
9	Winding resistance measurement	X	X	X	X	X	X
10	Commutation test					X(6)	
11	Verification of steady short-circuit condition (7)	X	X(8)				
12	No load test	X	X	X	X	X	X
13	Verification of bearings	X	X	X	X	X	X
14	Verification of degree of protection	X	X(8)	X	X(8)	X	X(8)

(Notes)
* Type tests on prototype machine or tests on at least the first batch of machines.
(1) Test report of machines routine tested is to contain the manufacturer's serial number of the machine which has been type tested and the test result.
(2) Only applicable for rotating machines of 100kW and more (except emergency generators).
(3) Only applicable for rotating machines of essential services rated 100kW and more.
(4) Not applicable for squirrel cage motors.
(5) Only functional test of voltage regular system.
(6) Only applicable for rotating machines with commutators.
(7) Only applicable for synchronous generators.
(8) Test and verification may be omitted subject to the Society's permission (type approval, etc).

Section 3 Switchboards, Section Boards, Distribution Boards and Protective Equipment

301. General

1. Installation

(1) Switchboards are to be installed in dry places away from the vicinity of steam, water and oil pipes.
(2) The main switchboard is to be so placed relative to one main generating station that, as far as is practicable, the integrity of the normal electrical supply may be affected only by a fire or other casualty in one space. An environmental enclosure for the main switchboard, such as may be provided by a machinery control room situated within the main boundaries of the space, is not to be considered as separating the switchboards from the generators.

2. Space for operation and maintenance

Sufficient space for operation is to be provided in front of switchboards. Where necessary, space at the rear of switchboards is to be ample to permit operation and maintenance of disconnecting switches, switches, fuses and other parts. The space is not to be less than 0.5 m in width.

3. Safety precautions to operators

Where the live parts of switchboards face a passageway, the following means are to be provided.
(1) Insulated handrails are to be provided.
(2) Insulated mats are to be provided on the floor of passageway.

302. Construction

1. Construction

(1) Busbars, circuit-breakers and other electrical appliances of the main switchboards are to be so arranged that the electrical equipment of essential services installed in duplicate will not become out of action simultaneously by a single fault.
(2) The generator switchboard is to be provided for each generator, and the switchboards adjoining each other are to be partitioned by the walls of steel or flame-retardant material. The main busbars are to be subdivided into at least two parts which are to be normally connected by the circuit breaker or other approved means. So far as is practicable, the connection of generating sets and other duplicated equipment of essential services are to be equally divided between the parts.
(3) Cable entries of switchboard are to be so constructed that no ingress of water be permitted into the switchboard along the cables.

2. Dead-front type switchboards

For voltage between poles, or to earth, exceeding 55V *d.c.* or 55V *a.c.* switchboards are to be of dead-front type.

3. Materials of insulation and wiring for switchboards

(1) Insulating materials used in the construction of switchboards are to be mechanically strong, flame-retardant and moisture-resistant.
(2) Insulated wires for switchboard are to be those of flame-retardant and moisture-resistant, having the maximum permissible conductor temperature not less than 75℃.
(3) Ducts and straps for wiring are to be of flame-retardant materials.
(4) Insulated wires for control and instrument circuits are not to be bunched together with wires for main circuits, unless the rated voltage and maximum permissible conductor temperature of both wires are the same.

303. Busbars and equalizer connections

1. Busbars

(1) Busbars are to be of copper having the conductivity of 97 % or more.
(2) Busbar connections are to be so made as to inhibit corrosion and oxidization.
(3) Busbars and their connections are to be so supported as to withstand the electromagnetic force

resulted from short-circuiting.

(4) Temperature rises of busbars, connecting conductors and their connections are not to exceed 45℃ at the limit ambient temperature of 45% when carrying full load current.

(5) The clearances and creepages of busbars are not to be less than the values in **Table 6.1.6.**

Table 6.1.6 Clearances and Creepages of Busbars

Rated voltage(V)	Clearance (mm)	Creepage (mm)
250 or less	15	20
251 ~ 660	20	30
Exceeding 660	25	35

2. Equalizer for *d.c.* generator

(1) The current rating of equalizer connections and equalizer switches is not to be less than 50 % the rated full-load current of the generator.

(2) The current rating of equalizer busbars is not to be less than 50% the rated full-load current of the largest generator in the group of parallel operation.

304. Measuring instruments for switchboards

1. *D.C.* ship's service generator panels

D.C. ship's service generator panels are at least to be provided with the instruments given in **Table 6.1.7.**

Table 6.1.7 Instruments for *D.C.* Generator Panel

<table>
<tr><th rowspan="2">Operation</th><th rowspan="2">Type of instrument</th><th colspan="2">Quantity</th></tr>
<tr><th>2-wire system</th><th>3-wire system</th></tr>
<tr><td rowspan="2">Not parallel</td><td>Ammeter</td><td>1 for each generator (positive pole)</td><td>* 2 for each generator (positive and negative poles)</td></tr>
<tr><td>Voltmeter</td><td>1 for each generator</td><td>1 for each generator (voltage measurement between positive and negative poles or between positive or negative pole and neutral pole)</td></tr>
<tr><td rowspan="2">Parallel</td><td>Ammeter</td><td>1 for each generator (positive pole)</td><td>* 2 for each generator (in case of compound winding, between equalizer and armature, and in case of shunt winding, for positive and negative poles)</td></tr>
<tr><td>Voltmeter</td><td>2 (busbar and each generator)</td><td>2 (voltage measurement between busbar and positive and negative poles of each generator, or between positive or negative pole and neutral pole)</td></tr>
<tr><td colspan="4">(NOTES)
1. For * in the Table, a zero center ammeter is to be added to earth line when employed neutral line earthed system.
2. One voltmeter is to be capable of measuring shore supply voltage.
3. Where a control panel is provided for automatic control of generators, the instruments in the above table may be installed on the control panel, except that, if the control panel is installed outside engine rooms, the minimum number of instruments required to carry out single or parallel operation of generators are to be mounted on switchboards.</td></tr>
</table>

2. *A.C.* ship's service generator panels

A.C. ship's service generator panels are at least to be provided with the instruments given in **Table 6.1.8.**

Table 6.1.8 Instruments for *A.C.* Generator Panel

Operation	Type of instrument	Quantity
Not parallel	Ammeter Voltmeter Wattmeter Frequency meter * Ammeter	1 for each generator (current measurement of each phase) 1 for each generator (voltage measurement between each phase) 1 for each generator (It may be omitted for 50 kVA or less) 1 (frequency measurement of each generator) 1 for exciting circuit of each generator
Parallel	Ammeter Voltmeter Wattmeter Frequency meter Synchroscope * Ammeter	1 for each generator (current measurement of each phase) 2 (voltage measurement between each phase of generators and busbar) 1 for each generator 2 (frequency measurement of each generator and busbar) 1 set 1 for exciting citcuit of each generator

(NOTES)
1. For * in the Table, the ammeters are to be provided only if necessary.
2. One of the voltmeters is to be capable of measuring shore supply voltage.
3. Where a control panel is provided for automatic control of generators, the instruments in the above table may be installed on the control panel, except that, if the control panel is installed outside engine rooms, the minimum number of instruments required to carry out single or parallel operation of generators are to be mounted on switchboards.

3. Instrument scales

(1) The upper limit of the scale of every ammeter is to be approximately 130 % of the normal rating of the circuit.
(2) The upper limit of the scale of every voltmeter is to be approximately 120 % of the normal voltage of the circuit.
(3) Ammeters for *d.c.* generators or wattmeters for *a.c.* generators which may operate in parallel are to be capable of indicating reverse current or reverse power up to 15 % respectively.

305. Protective devices

1. General

Electrical installations of ships are to be protected against accidental over-currents including short-circuit. The protective devices are to be capable of breaking the fault circuit and continuously serve other circuits as far as possible and at the same time eliminate the danger of damage to the system and fire hazard.

2. Protection of circuits

(1) Short-circuit protection is to be provided in each pole and phase of all insulated circuits except neutral and equalizer circuits.
(2) Overload protections are to be provided for all circuits liable to be overloaded as follows, except as permitted where the Society may exceptionally permit, and the rating or appropriate setting of the overload protective device for each circuit is to be permanently indicated at the location of the protective device.
 (a) Two-wire *d.c.* or single-phase *a.c.* system: at least one line or phase.
 (b) Three-wire *d.c.* system: both outer lines.
 (c) Three-phase, three-wire *a.c.* system: at least two phases.
 (d) Three-phase, four-wire *a.c.* system: at each phase.
(3) Fuse, non-linked circuit breaker or non-linked switch is not to be inserted in an earthed conductor and a neutral line.

3. Circuit breakers and fuses

(1) Circuit breakers and fuses are to comply with the requirements in **Sec 8.**
(2) Circuit breakers are to be such that repairs and replacement can be done without disconnecting from the busbar connections and switching off the power source. Where isolation switch is provided additionally, the requirement may be exempted.
(3) Overcurrent relays of circuit breakers for generators and overload protection except moulded-case

circuit breakers are to be capable of adjusting their current setting or time-delay characteristics.

4. Protection against overload

(1) The overcurrent tripping characteristics of circuit breakers and the fusing characteristics of fuses are to be chosen suitably taking into consideration of the thermal capacity of electrical equipment and cables to be protected thereby.
(2) Fuses of the rated current exceeding 200A are not to be used for overload protection.

5. Protection against short-circuit

(1) The rated breaking capacity of every protective device is not to be less than the maximum value of the short-circuit current which can flow at the point of installation at the instant of contact separation.
(2) Where the rated breaking capacity of the shortcircuit protection is not in compliance with the requirement in (1) above, fuses or circuit breakers having the rated breaking capacity not less than the prospective short-circuit current are to be provided at the power source side of the foregoing short-circuit protection. The generator breaker is not to be used for this purpose. The circuit breakers connected to the load side, are to be capable of being continuously in service without excessive damage in the following cases:
(a) When the short-circuit current is broken by the back-up circuit breaker or fuse.
(b) When the circuit breaker at the load side is closed on the short-circuit current, while the backup circuit breaker or fuse is broken.
(3) The making capacity of every circuit-breaker or switch intended to be capable of being closed, if necessary, on short-circuit, is not to be less than the maximum value of the short-circuit current at the point of installation.
(4) In the absence of precise data of rotating machines, the following tripping short-circuit currents are to be assumed. Where the motor is considered as load, the short-circuit current of the motor is to be added to that of generator.
(a) *D.C.* system
10 times the rated current for generators normally connected (including spare).
6 times the rated current for motors simultaneously in service.
(b) *A.C.* system
10 times the rated current for generators normally connected (including spare).
3 times the rated current for motors simultaneously in service.

6. Protection of generators

(1) Generators are to be protected against short-circuit and overcurrent by a multipole circuit-breaker arranged to open simultaneously all insulated poles. For generators with capacity of less than 65 kVA, however, a multipole-linked switch with a fuse or circuit-breaker in each insulated pole may be used for protection. The overload protection is to be adequate to the thermal capacity of generators.
(2) For *d.c.* generators arranged to operate in parallel, in addition to the requirement of (1), an instantaneous reverse-current protection, operating at a fixed value of reverse-current within the limits of 2 % to 15 % of the rated current of generators, is to be provided. This requirement, however, does not apply to the reverse-current generated from load side, e.g. cargo winch motors, etc.
(3) For *a.c.* generators arranged to operate in parallel, in addition to the requirement in (1), a reverse-power protection, with time delay, selected and set within the limits of 2 % to 15 % of full load to a value fixed in accordance with the characteristics of the prime mover, is to be provided.

7. Protection of power and lighting transformers

(1) The primary circuits of power and lighting transformers are to be protected against short-circuit and overload by circuit-breakers or fuses.
(2) When transformers are arranged to operate in parallel, means of isolation are to be provided on the secondary circuits. Switches and circuit-breakers are to be capable of withstanding surge currents.

8. Protection of motors

(1) Motors of rating exceeding 0.5 kW and all motors for essential services are to be protected individually against overload, except steering gear motors complying with the requirements in **Pt 5, Ch 7, 207.**

(2) The protective device is to have a delay characteristics to enable the motor to start.
(3) For motors of intermittent service, the protective device is to be chosen in relation to the service condition.

9. Protection of feeder circuits

(1) Feeder circuits to section boards, distribution boards, group starters and the similar are to be protected against overload and short-circuit by multi-pole circuit breakers or fuses. Where fuses are used for this purpose, the switches complying with the requirements in **1004. 3** are to be provided at the power source side of the fuses as a rule.
(2) Circuits which supply motors fitted with overload protection may be provided with short-circuit protection only.
(3) When fuses are used to protect three-phase *a.c.* motor circuits, consideration is to be given for protection against single phasing.

10. Protection of essential service

Where essential machinery is driven electrically, arrangements are to be made to disconnect automatically the excess non-primary essential service loads when the generators are overloaded. If required, this preference tripping may be carried out in two or more stages.

11. Protection of batteries

Storage batteries other than engine starting batteries, are to be protected against overload and short-circuit with devices placed as near as practicable to the batteries. Emergency batteries supplying essential services may have short-circuit protection only.

12. Protection of meters, pilot lamps and control circuits

(1) Protection is to be provided for voltmeters, voltage coils of measuring instruments, earth indicating devices and pilot lamps with their connecting leads by means of fuses fitted to each insulating pole. A pilot lamp installed as an integral part of another item of equipment need not be individually protected, provided that any damage of pilot lamp circuit does not cause failures on the supply to essential equipment. Consideration is to be given to the omission of fuses in circuits such as those of automatic voltage regulators where loss of voltage might have serious consequences.
(2) Insulated wires for control and instrument circuits directly led from busbars and generator mains are to be protected by fuses at the nearest location to the connecting points. Insulated wires from the connecting points to the fuses are not to be bunched together with the wires for other circuits.

306. Section boards and distribution boards

1. General

Insulations, busbars, wiring materials and electrical protective devices for section boards and distribution boards are to be those of being in compliance with the requirements of this Section.

2. Protective enclosures

Section boards and distribution boards are to be protected by suitable enclosures depending on their locations. The enclosures are to be made of incombustible and moisture resistant materials.

3. Arrangement of appliances

Where the same section board or distribution boards is used for the supply circuits having different voltages, all appliances are to be so arranged that the wires of different rated voltages can be laid without contacting each other within the boards. The section boards and distribution boards for emergency distribution circuits are in principle to be provided independently.

307. Testing and inspection

1. General

Switchboards are to meet the requirements of this Section in their construction and are to be tested in accordance with the requirements of the following articles. However, the test required by **Par 2** may be omitted subject to the Society‘s permission for each switchboard which is produced in series having identical type with its first unit tested in the presence of the Surveyor.

2. Temperature test

The temperature rises of switchboards are not to exceed the values given in **Table 6.1.9** under the specified current and/or rated voltage, except these provided in the relevant Sections of this Chapter.

Table 6.1.9 Limits of Temperature Rise of Electrical Appliances for Switchboard

(Based on ambient temperature 45℃)

Item and part			Limit of temperature rise (℃): Thermometer method	Limit of temperature rise (℃): Resistance method
Coil	Class A insulation		45	65
	Class E insulation		60	80
	Class B insulation		75	95
	Bare windings of single layer		75	-
Contact pieces	Mass form	Copper or copper alloy	40	-
		Silver or silver alloy	70	-
	Multilayer form	Copper or copper alloy	25	-
	Knife form	Copper or copper alloy	25	-
Terminals for external cables			45	-
Metallic resistors	Moulded-case type		245	-
	Those other than moulded-case type	For continuous service	295	-
		For intermittint service	345	-
	Exhaust (approx. 25 mm above the exhaust port)		170	-

(NOTE)
The temperature rise for the exciters incorporated in generators to which 50℃ is applied as a limit ambient temperature, is to take the value reduced by 5℃ as limit from the above Table.

3. Operation test

Operations of instruments, circuit-breakers, switching gears, etc. on switchboards are to be confirmed.

4. High voltage test

Switchboards with all components are to withstand the high voltage by applying the following voltage at commercial frequency for 1 minute between all current-carrying parts connected together and earth and between current-carrying parts of opposite polarity of phase. Instruments and auxiliary apparatus may be disconnected during the highvoltage test:

Rated voltage up to 60 V : 500 V

Rated voltage exceeding 60 V : 1,000 V + twice the rated voltage (min. 1,500 V)

5. Insulation resistance test

Immediately after high voltage test, the insulation resistance between all current-carrying parts connected and earth and between current-carrying parts of opposite polarity or phase is not to be less than 1 MΩ when tested with a direct current voltage of at least 500 volts.

Section 4 Cables

401. General

The application of cables used for electrical equipment in ships are to comply with the requirements of this Section. Where it is desired to use other cables than those stipulated in this Section, they are subject to the consideration of the Society.

402. Application of cables

1. Insulating materials

Insulating materials are to be as given in **Table 6.1.10.**

2. Sheath and armour

Cables are to be protected by sheath or armour in accordance with the following requirements.

(1) Cables fitted on weather decks, and in bath rooms, cargo holds, in any other location where water, oil or explosive gases may be present, are to have an impervious sheath.

(2) Cables fitted where they are likely to suffer from mechanical damages are to be metal armoured except where effective metallic casings or non-metallic casings are provided or except where approved by this Society.

3. Fire safety

Except special types of cables such as radio frequency cables, cables are to be satisfied with the required characteristic of flame retardant or fire resisting type.

Table 6.1.10. Permissible Temperature of Insulating Materials

Insulating material	Abbreviated designation	Maximum rated conductor temp.(℃)	
		Normal operation	Short-circuit
Polyvinyl chloride	PVC	70	150
Ethylene propylene rubber	EPR	90	250
High modulus or hard grade ethylene propylene rubber	HEPR	90	250
Cross-linked polyethylene	XLPE	90	250
Halogen free ethylene propylene rubber	HF EPR	90	250
High modulus or hard grade Halogen-free ethylene propylene rubber	HF HEPR	90	250
Halogen-free cross-linked polyethylene	HF XLPE	90	250
Cross-linked polyolefin for halogen-free cables	HF 90	90	250
Silicon rubber	S 95	95	350*
Halogen-free silicone rubber	HF S 95	95	350*
* : This temperature is applicable only to power cables and not appropriate for tinned copper conductors.			

403. Current rating of cable

1. Maximum continuous load

The highest continuous load carried by a cable is not to exceed its current rating specified in **Par 5.** The diversity factor of the individual load may be allowed for in estimating the maximum continuous load.

2. Voltage drop

The voltage drop from the main or emergency switch board busbars to any electrical installation, except for navigation lights, is not to exceed 6 % of the rated voltage of the installation, when the cables are carrying maximum load current under normal condition of service. For supplies from batteries of voltage not exceeding 24 volts, the voltage drop may be increased to 10 %.

3. Estimation of lighting load

In assessing the current rating of lighting circuits every lamp holder is to be assessed at the maximum load likely to be connected to it, with a minimum of 60 watts, unless the fitting is so constructed as to take only a lamp rated at less than 60 watts.

4. Short-time load

Where the motors used for cargo winches, windlasses and capstans are short time duty the current rating of the cables may be allowed to be increased according to their duty.

5. Current rating of cables

The current rating of cables is to comply with the following (1) to (5).

(1) Current rating of cables for continuous services
The current rating of cables for continuous services is not to exceed the values given in **Table 6.1.11.**

(2) Correction factor of ambient temperature
Where the ambient temperature is different from that specified in (1) above, the current rating of cables is to be calculated by multiplying the correction factor given in **Table 6.1.12.**

(3) Current rating of cables for short-time services
The current rating of cables for short-time services (30 minutes or 60 minutes) is to be calculated by multiplying the value given in **Table 6.1.11** by the following correction factor.

$$\text{correction factor : } \sqrt{\frac{1.12}{1-\exp\left(\frac{-t_s}{0.245\cdot d^{1.35}}\right)}}$$

where,

t_s : 30 or 60 (minute)

d : overall diameter of the finished cable (mm)

(4) Current rating of cables for intermittent services
The current rating of cables for intermittent services (for periods of 10 minutes, of which 4 minutes are with a constant load and 6 minutes without load) is to be calculated by multiplying the value given in **Table 6.1.11** by the following correction factor.

$$\text{correction factor : } \sqrt{\frac{1-\exp\left(-\frac{10}{0.245\cdot d^{1.35}}\right)}{1-\exp\left(-\frac{4}{0.245\cdot d^{1.35}}\right)}}$$

where,

d : overall diameter of the finished cable (mm)

(5) Where more than 6 cables belonging to the same circuit are bunched together, a correction factor of 0.85 is to be applied.

Table 6.1.11 Current Rating of Cables (for continuous services)

(Based on ambient temperature 45℃)

Nominal sectional area of conductor (mm^2)	Current rating (*A*)								
	PVC insulation (70℃)			Ethylene propylene rubber, High modulus or hard grade ethylene propylene rubber, Cross-linked polyethylene, Halogen free ethylene propylene rubber, High modulus or hard grade Halogen-free ethylene propylene rubber, Halogen-free cross-linked polyethylene, Cross-linked polyolefin for halogen-free cables insulation (90℃)			Silicon rubber, Halogen-free silicone rubber insulation (95℃)		
	1 core	2 core	3 core	1 core	2 core	3 core	1 core	2 core	3 core
1	11	9	8	18	15	13	20	17	14
1.5	15	13	11	23	20	16	24	20	17
2.5	22	19	15	30	26	21	32	27	22
4	29	25	20	40	34	28	42	36	29
6	37	31	26	52	44	36	55	47	39
10	51	43	36	72	61	50	75	64	53
16	69	59	48	96	82	67	100	85	70
25	91	77	64	127	108	89	135	115	95
35	112	95	78	157	133	110	165	140	116
50	140	119	98	196	167	137	200	170	140

240	374	318	262	-	-	-	-	-	-
300	430	366	301	-	-	-	-	-	-

Table 6.1.12 Correction Factor for Various Ambient Temperature

Maximum rated conductor temperature of insulation	Ambient temperature										
	35℃	40℃	45℃	50℃	55℃	60℃	65℃	70℃	75℃	80℃	85℃
60℃	1.29	1.15	1.00	0.82	-	-	-	-	-	-	-
65℃	1.22	1.12	1.00	0.87	0.71	-	-	-	-	-	-
70℃	1.18	1.10	1.00	0.89	0.77	0.63	-	-	-	-	-
75℃	1.15	1.08	1.00	0.91	0.82	0.71	0.58	-	-	-	-
80℃	1.13	1.07	1.00	0.93	0.85	0.76	0.65	0.53	-	-	-
85℃	1.12	1.06	1.00	0.94	0.87	0.79	0.71	0.61	0.50	-	-
90℃	1.10	1.05	1.00	0.94	0.88	0.82	0.74	0.67	0.58	0.47	-
95℃	1.10	1.05	1.00	0.95	0.89	0.84	0.77	0.71	0.63	0.55	0.45

404. Installation of cables

1. General

Cable runs are to be, as far as possible, straight and accessible.

2. Expansion joints

The installation of cables across expanding parts in the ship's structure is, as far as possible to be avoided. Where this is not practicable a loop of cable of length proportional to the expansion of the part is to be provided. The internal radius of the loop is to be at least 12 times the external diameter of the cable.

3. Precaution against fire protection

(1) Where cables are installed in bunches and the risk of fire propagation is considered high, special precautions are to be taken in cable installation to prevent fire propagation.
(2) Cables and wiring serving essential or emergency power, lighting, internal communications or signals are to be so far as practicable routed clear of galleys, laundries, machinery spaces of category A and their casings and other high fire risk areas. Cables connecting fire pumps to the emergency switchboard are to be of a fire resistant type where they pass through high fire risk areas. Where practicable all such cables are to be run in such a manner as to preclude their being rendered unserviceable by heating of the bulkheads that may be caused by a fire in an adjacent space.
(3) Where cables for services required to be operable under fire conditions including their power supplies pass through high fire risk areas, and in addition for passenger ships, main vertical fire zones, other than those which they serve, they are to be so arranged that a fire in any of these areas or zones does not affect the operation of the service in any other area or zone. This may be achieved by either of the following measures:

4. Bunching

Cables having insulating materials with different maximum rated conductor temperature are not to be bunched together, or, where this is not practicable, the cables are to be operated so that no cable reaches a temperature higher than that permitted for the lowest temperature-rated cable in the group.

5. Protection covering

Cables having a protective covering which may damage the covering of other cables are not to be bunched with those other cables.

6. Maximum internal radius of bend

When cables are to be installed bent, the minimum internal radius of bend is to be not less than the following values:

(1) 6 d for rubber and PVC insulated cables with metal covering.
(2) 4 d for rubber and PVC insulated cables without metal covering.
(3) 4 d for mineral insulated cables.
(d = overall diameter of cable)

7. Cables in refrigerated spaces

Cables are not to be installed in refrigerated spaces, as far as possible. Where cables are unavoidably installed in the spaces, however, the following requirements are to be observed.

(1) PVC insulated cables are not to be used.
(2) Cables are to have a lead sheath or cold-resisting impervious sheath.
(3) Cables are not to be, as a rule, embedded in structural heat insulation.
(4) Where cables must pass through structural heat insulation, they are to be installed at a right angle to such insulation and are to be protected by a pipe, preferably fitted with a watertight stuffing tube at each end.
(5) Cables are to be installed with ample space from ceilings, side walls or the face of air duct casings and are to be supported by plating, hangers or cleats.
(6) Supporting strips, plating or hangers used for securing the cable are to be galvanized or otherwise protected against corrosion.

405. Mechanical protection of cables

1. Cables in cargo holds

Cables in cargo holds and other space where there is exceptional risk of mechanical damage are to be suitably protected even if they are armoured, except where approved by this Society.

2. Mechanical protection of cables

Metal casings for mechanical protection of cables are to be efficiently protected against corrosion.

3. Non-metallic ducts or conduits

Non-metallic duct or conduit is to be of flame-retardant material. PVC conduit is not to be used in refrigerated spaces or on open decks.

406. Earthing

1. Earthing of metallic coverings of cables

Metal coverings of cables are to be effectively earthed at both ends, provided that in final sub-circuits earthing may be at the supply end only.

2. Electrical continuity of metallic coverings of cables

Effective means are to be taken to ensure that all metallic coverings of cables are made electrically continuous throughout their length.

3. Lead sheath

The lead sheath of lead-sheated cables is not to be used as the sole means of earthing the non-current carrying metal parts of items of equipment.

407. Securing of cables

1. General

Cables are to be effectively secured, except cables for portable appliances and those installed in pipes, conduits or special casings.

2. Supporting and fixing distance for cables

Supporting and fixing distance for cables are not to be more than the values given in **Table 6.1.13.**

Table 6.1.13 Supporting and Fixing Distance for Cables

Cable run	Cable run space	Supporting distance (cm)	Fixing distance (cm)
Vertical run	All space	30	30
Horizontal run	Cable run in exposed space	30	30
	Cable run in space except exposed space	30	*90

(NOTE)
* In case where the cables are not laid on a hanger, etc., the Fixing distance is not to be more than 30 cm

3. Clips, supports and accessories

(1) Clips are to be robust and are to be those by which cables are effectively secured without any damage on coverings of the cables.
(2) Clips, supports and accessories are to be of corrosion-resistant material or to be suitably treated to prevent corrosion.
(3) Clips and supports of non-metallic materials are to be flame-retardant.

(4) When cables secured by clips of non-metallic materials are not laid on top of horizontal cable trays or supports, special considerations are to be given to prevent the release of cables during a fire.

4. Cable trays/protective casings made of plastic materials

(1) Installation requirements
Cable trays/protective casings made of plastic materials are to be supplemented by metallic fixing and straps such that in the event of a fire they, and the cables affixed, are prevented from falling and causing an injury to personnel and/or an obstruction to any escape route. When plastic cable trays/protective casings are used on open deck, they are additionally to be protected against UV light. "Plastic" means both thermoplastic and thermosetting plastic materials with or without reinforcement, such as PVC and fibre reinforced plastics - FRP. "Protective casing" means a closed cover in the form of a pipe or other closed ducts of non-circular shape.

(2) Safety working load
The load on the cable trays/protective casings is to be within the safe working load (SWL). The support spacing is not to exceed the spacing at the SWL test. In general the spacing is not to exceed 2 meters. The selection and spacing of cable tray/protective casing supports are to take into account:
(A) Cable trays/protective casings' dimensions
(B) Mechanical and physical properties of their material
(C) Mass of cable trays/protective casings
(D) Loads due weight of cables, external forces, thrust forces and vibrations
(E) Maximum accelerations to which the system may be subjected
(F) Combination of loads

(3) Cable occupation ratio in protective casing
The sum of the cables' total cross-sectional area, based on the cables' external diameter, is not to exceed 40% of the protective casing's internal cross-sectional area. This does not apply to a single cable in a protective casing.

408. Penetration of bulkheads and decks

1. Penetration through bulkheads and decks

Where cables pass through bulkheads and decks which are required to have some degree of tightness, they are to be so constructed as to ensure that the strength and tightness are not impaired.

2. Penetration through fireproof bulkheads and decks

Where cables pass through bulkheads and decks which are required to have some degree of fire integrity, they are to be so constructed as to ensure that the fire integrity is not impaired.

3. Bushing

Where cables pass through non-watertight bulkheads or steel structures, the holes are to be bushed with lead or other suitable materials in order to avoid damage to cables. If the thickness of the steel is sufficient, adequately round edges may be accepted as the equivalent of bushing.

409. Metallic pipes and conduits

1. General

Metallic pipe or conduits are to be effectively earthed and are to be mechanically and electrically continuous across joints.

2. Internal radius of bend

The internal radius of bend of pipes and conduits is to be in accordance with the requirement in **404. 6.** Where, however, pipes exceed 64mm in outside diameter, the internal radius of bend is not to be less than twice the outside diameter of the pipe.

3. Internal cross-sectional area of pipes

The internal cross-sectional area of the pipe is not to be less than 250 % of the sum of the cross-sectional areas of the cables to be installed in the pipe.

4. Drainage

Horizontal pipes or conduits are to have suitable drainage.

5. Expansion joints

Where pipe arrangement is long, expansion joints are to be provided where necessary.

410. Cables for alternating current

Where it is necessary to use single-core cables for alternating current circuits rated in excess of 20A, the following requirements are to be complied with:

(1) Cables are to be either non-armoured or armoured with non-magnetic material.
(2) Where installed in pipe or conduit, cables belong to the same circuit are to be installed in the same pipe or conduit.
(3) Cable clips are to include cables of all phases of a circuit unless the clips are of non-magnetic material.
(4) Where two or three single-core cables forming respectively single-phase circuits or three-phase circuits are installed, the cables are to be in contact with one another as far as possible. In any event, the distance between adjacent cables is not to be greater than the diameter of the cable.
(5) If single-core cables of current rating greater than 250A are to run along steel bulkheads, wherever practicable, the cables should be spaced as far away from the steel bulkheads as possible.
(6) Where single-core cables of large cross section and exceeding 30 m in length are used, the phase are to be transposed at regular intervals of approximately 15 m in order to balance the impedances of circuits.
(7) In case of circuits involving two or more single-core cables in parallel per phase, all cables are to have the same length and the same cross-section.
(8) Magnetic material is not to be placed between single-core cables of a group. Where cables pass through steel plates, all cables of the same circuit are to pass through a plate or gland of non-magnetic material and the space between the cables and the magnetic material is not to be less than 75 mm wherever practicable.

411. Joints and branch circuits

1. Cable splices

Cable splice is to be made of fire resistant replacement insulation equivalent in electrical and thermal properties to the original insulation. The replacement jacket is to be at least equivalent to the original impervious sheath and is to assure a watertight splice. Splices are to be made using the splice kit, which is to contain the following:

(1) Connector of correct size and number
(2) Replacement insulation
(3) Replacement jacket
(4) Instructions for use

All cable splices are to be type approved before use.

2. Installation of cable splices

No splice is permitted in hazardous areas, except for cables of intrinsically safe circuits. Neither is splice permitted in propulsion cables. Where permitted, the following installation details are to be complied with:

(1) All splices are to be made after the cables are in place and are to be in locations accessible for inspection.
(2) The conductor splice is to be made using a pressure type butt connector.
(3) Armored cables having splices are not required to have the armor replaced, provided that the armor is made electrically continuous.
(4) Splices are to be so arranged that mechanical stresses are not carried by the splice.

3. Cable junction boxes

Live parts within the junction box are to be provided with suitable clearances and creepage distances, or with shielding by flame retarding insulation material. Junction boxes having compartments for different voltage levels are to have each compartment appropriately identified as to its rated voltage. Cables within the junction boxes are to be well supported so as not to put stress on the cable contacts.

4. Installation of cable junction boxes

Junction boxes are not to be used in propulsion cables, however. Where permitted, the following installation details are to be complied with:

(1) Junction boxes are to be in locations accessible for inspection.
(2) For low voltage systems(up to 1 kV AC), each voltage level is to be provided with its own junction box or separated by physical barriers within the same junction box. For high voltage systems (> 1 kV), a separate junction box is to be used for each of the voltage levels.
(3) Emergency circuits and normal circuits are not to share the same junction box.
(4) Armored cables are to have their armoring made electrically continuous.
(5) Cables arranged for connection at a junction box are to be well-supported and fastened so that conductor contacts are not subjected to undue stress.

5. Cable termination

Cables stripped of moisture-resistant insulation are to be sealed against the admission of moisture by methods such as taping in combination with insulating compound or sealing devices. Cable conductors for connection to terminals are to be fitted with crimp lugs of corresponding current rating, or equivalent. Soldered lugs are permitted for conductors up to 2.5 mm^2 only. Cables are to be secured to the terminal box or other sturdy structure in such a manner that stresses are not transmitted to the terminal. Where applicable, other properties of the cable, e.g., flame retarding, fire resistant, etc. are to be retained through to the terminal box.

412. Testing and inspection

Cables are to be in compliance with the requirements **109. 1** to **6.**

Section 5 Distribution

501. Methods of distribution

1. General

Every current-consuming appliance is to be supplied by either a switchboard or a section board or a distribution board.

2. Power and lighting circuits

Lighting circuits and power circuits are to be supplied from a switchboard independently.

3. Insulation monitoring system

(1) When a distribution system, whether primary or secondary, for power, heating or lighting, with no connection to earth is used, a device capable of continuously monitoring the insulation level to earth and of giving an audible or visual indication of abnormally low insulation values is to be provided.
(2) Earthing current flowing through the insulation monitoring system specified in (1) is not to exceed 30 mA under any circumstances.

4. Hull return distribution

(1) The hull return system of distribution is not to be used for power, heating, or lighting in a tanker or in a ship of 1,600 tons gross tonnage and upwards.
   (A) Impressed current cathodic protection system for outer hull protection only.
   (B) Earth indication devices or other alternative means, however, in no case the circulation current to exceed 30 mA.
   (C) Limited and locally earthed systems, such as starting and ignition systems of internal combustion engines.

(D) Electrical circuits having no fear of causing hull current in the dangerous spaces, subjected to the approval of the Society.

(2) Where the hull return system is used, all final subcircuits, i.e. all circuits fitted after the last protective device, are to be two-wire and special precautions are to be taken to the satisfaction of the Society.

502. Unbalance of circuits

1. Three-wire *d.c.* systems

Unbalance of loads between an outer conductor and the middle wire at the switchboards, section boards and distribution boards is not to exceed 15 % of the full load current as far as possible.

2. Three-wire *a.c.* systems

Unbalance of loads on each phase at the switchboards, section boards and distribution boards is not to exceed 15 % of the full load current as far as possible.

503. Shore connections

1. Installation of connection boxes

Where arrangements are made for the supply of electricity from a source on shore, a connection box is to be installed in a suitable position. And also high voltage shore connections(above 1 kV), are to comply with requirements in **Sec 16**.

2. Connection boxes

The connection box is to contain terminals to facilitate a satisfactory connection and a circuit-breaker or an isolating switch with fuses. Means are to be provided for checking the phase sequence (for three-phase alternating current) or the polarity (for direct current).

3. Cables between connection box and main switchboard

Cables between the connection box and the main switchboard are to be permanently fixed and a pilot lamp for source and a switch or a circuit-breaker are to be provided on the main switchboard.

504. Power feeders

1. Essential power circuits

The circuits supplying electrical equipment which is disconnected at sea are, as a rule, not to be connected to the power circuits supplying electrical equipment required for essential services.

2. Independently supplied circuits

The feeders of the auxiliaries in main engine room and boiler room, cargo gear motors, radio equipment, searchlights, ventilating sets, etc. are to be independently supplied from switchboards or distribution boards.

3. Circuits for ventilation fans

Fans for cargo hold ventilation and for accommodation ventilation are not to be supplied from the same feeder.

505. Steering gear circuits

Steering gear power unit circuits are to comply with the relevant requirements in **Pt 5, Ch 7.**

506. Navigation light circuits

1. Final sub-circuits of navigation lights

Navigation lights are to be connected separately to the navigation light indicator.

2. Control and protection

Each navigation light is to be controlled and protected in each insulated pole by a switch with fuses and a circuit-breaker fitted on the navigation light indicator.

3. Feeder circuits of navigation lights

The navigation light indicator is to be supplied by two alternative circuits, one from the main source of power and one from the emergency source of power.

4. Prohibition of switches and fuses

Switch and fuse are not to be provided on the feeder circuits of navigation lights, except the switchboard and indicator.

5. Installation of navigation light indicator

The navigation light indicator is to be placed in an accessible position on the navigation bridge.

507. Lighting circuits

1. Lighting in engine room, accommodation spaces, etc.

In main engine room, boiler room, large machinery spaces, large galleys, corridors, stairways leading to boat-decks and public spaces, lighting is to be supplied from at least two circuits and to be so arranged that failure of any one circuit will not leave these spaces in darkness. One of the circuits may be emergency lighting circuit.

2. The arrangement of the main electric lighting system is to be such that a fire or other casualty in spaces containing the main source of electrical power, associated transforming equipment, if any, the main switchboard and the main lighting switchboard, will not render the emergency electric lighting system required by **1402. 2** (1) to (3) inoperative.

3. The arrangement of the emergency electric lighting system is to be such that a fire or other casualty in spaces containing the emergency source of electrical power, associated transforming equipment, if any, the emergency switchboard and the emergency lighting switchboard will not render the main electric lighting system required by **Par 1** inoperative.

4. Fixed lighting fittings of cargo holds and coal stores

Fixed lighting fittings of cargo holds and coal stores are to be controlled by multipole linked switches situated outside these areas. Provision is to be made to lock in the switches or switch boxes except where installed in cargo holds carrying cargoes with no danger of ignition.

508. Feeder circuits for communication and signalling system, other lights

1. Radio installation

Feeder circuits for radio installation are to be in compliance with the requirements of the relevant regulations.

2. Internal communications

Feeder circuits for internal communications are to comply with the requirements in **Sec 11.**

3. Daylight signalling lamp

The daylight signalling lamp is not to be solely dependent upon the ship's energy source of electrical power. When emergency source of electrical power is used for the lamp, it is to be in accordance with the requirements in **1402. 2.**

4. General emergency alarm systems

General emergency alarm systems specified in **7.2.1** of International Life-Saving Appliance Code (LSA Code) and public address system or other suitable means of communication specified in Regulation III / 6.4.2 of SOLAS Convention are to be supplied from both main source of electrical power and emergency source of electrical power.

5. Not under command lights and anchor lights

Not under command lights and anchor lights are to be supplied from both main source of electrical power and emergency source of electrical power.

509. Final sub-circuits

1. Motor circuits

In general, a separate final sub-circuit is to be provided for every motor of essential service and every motor of 1 kW or more in rating.

2. Lighting circuits

(1) Lighting fittings are not to be supplied from final sub-circuits for heaters and motors.
(2) The number of lighting points supplied from a final sub-circuit of 15 A or less in rating is not to exceed the followings, except the case where the number of lighting points and total load current are invariable, the number of lighting points may be increased, provided the aggregate load current does not exceed 80 % of the rating of protective device in the circuit.
For circuits of 50 V and below 10 ea.
For circuits of 51 V - 130 V 14 ea.
For circuits of 131 V - 250 V 24 ea.
(3) In a final sub-circuits for panel lighting and electric signs, where lamp holders are closely grouped, the number of points supplied is unrestricted, provided the maximum operating current in the sub-circuit does not exceed 10 A.

3. Heating circuits

A separate final sub-circuit is to be provided for each heater, except the small heaters up to 10 of aggregate current rating not exceeding 15 A may be supplied from a single final sub-circuit.

4. Final sub-circuits of rating exceeding 15 A

A final sub-circuit of rating exceeding 15 A is not to supply more than one point as a rule.

5. Protection of final sub-circuits

Each insulated pole of final sub-circuits is to be protected by a fuse or a circuit breaker.

510. Indication of circuits

The current-carrying capacity of each circuit is to be permanently indicated together with the rating or appropriate setting of the overload protective device.

Section 6 Transformers for Power and Lighting

601. General

1. Application

Transformers rated at 1 kVA or more for single phase and at 5 kVA or more for three-phase are to comply with the requirements of this Section.

2. Number and ratings of transformer

Where essential services are supplied, the number and ratings of transformers are to be sufficient to ensure the operation of essential services even when one transformer is out of service.

602. Construction

1. Transformers in accommodation spaces

Transformers in accommodation spaces are to be of dry, naturally cooled type. In machinery spaces they may be of oil-immersed, naturally cooled type.

2. Windings of transformers

Complete insulation is to be made between primary windings and secondary windings of transformers except those for motor starting.

3. Oil-immersed transformers rated at 10 kVA or more

Oil-immersed transformers rated at 10 kVA or more are to be provided with oil gauges and means for drainage, and when rated at 75 kVA or more with thermometers in addition.

4. Precautions against short-circuit current

All transformers are to be capable of withstanding the thermal and mechanical effects without damage, when carrying with short-circuit current for 2 seconds while in use.

603. Temperature rise

The temperature rise of transformers is not to exceed the values given in **Table 6.1.14** during continuous operation at rated output. Where, however, the ambient temperature is not more than 40℃, the table values may be increased by the amount of difference.

Table 6.1.14 Limit of Temperature Rise of Transformers

(Based on ambient temperature 45℃)

Part		Limit of temperature rise (℃)					
		Measuring method	Class A insulation	Class E insulation	Class B insulation	Class F insulation	Class H insulation
Windings	Dry type transformer	Resistance method	55	70	75	95	120
	Oil-immersed transformer	Resistance method	60	-	-	-	-
Oil		Thermometer method	45				
Core		Thermometer method	Temperature not injurious to insulation				

604. Voltage regulation

The voltage regulation of transformers is not to exceed the following values at full load and 100 % power factor.

Single phase 5 kVA or more and three-phase 15 kVA or more : 2.5 %

Single phase less than 5kVA and three-phase less than 15 kVA : 5 %

605. Testing and inspection

1. General

Transformers are to meet the requirements of this Section in their construction and are to be tested in accordance with the requirements of the following Paragraph. However, the test required by **Par 2** may be omitted subject to the Society's permission for each transformer which is produced in series having identical type with its first unit tested in the presence of the Surveyor.

2. Temperature test

The temperature rises of transformers under the rated full load are not to exceed the values given in **603.**

3. Voltage regulation test

Transformers are to be subjected to the voltage regulation test and comply with the requirements of

604. except that it may also be obtained by calculation.

4. High voltage test

After the temperature test, transformers are to withstand the test voltage by applying *a.c.* 1000V plus twice the maximum line voltage of commercial frequency between windings and between windings and earth for 1 minute. The test voltage in this test is to be at least 1500V.

5. Induced high voltage test

Transformers are to withstand for the duration of the test expressed by the following formula, when twice the normal voltage is induced on the winding at any frequency between 100 and 500Hz, but the duration of the test is to be at least for 15 seconds and not over 60 seconds.

$$\text{Testing time (second)} = 60 \times \frac{2 \times \text{Rated frequency}}{\text{Test frequency}}$$

6. Insulation resistance test

Before and after the high voltage test, the insulation resistance test for all current-carrying parts are to be carried out and minimum values are to be given in the following.

Rated voltage Un (V)	Minimum test voltage (V)	Minimum insulation resistance (MΩ)
$Un \leq 250$	$2 \times Un$	1
$250 < Un \leq 1,000$	500	
$1,000 < Un \leq 7,200$	1,000	$1 + \frac{U_n}{1,000}$
$7,200 < Un \leq 15,000$	5,000	

Section 7 Controlgears for Motors and Magnetic Brakes

701. Construction

1. General

(1) Controlgears for motors are to be of durable construction and provided with efficient means of starting, stopping, reversing and speed controlling of motors together with essential safety devices.
(2) Controlgears for motors are to have suitable protective enclosures depending on their locations and to be so constructed that operators can safely handle them.
(3) Where intrinsically safe electrical appliances are built in controlgears for motors, they are to be arranged in compliance with the requirements in **902. 3** (3) and the wires for intrinsically safe circuits are to be speparated from those for other circuits, and to be shielded electrically if necessary. Suitable measures are to be taken to identify the wires for intrinsically safe circuits easily.

2. Grouped starters

(1) In case where controlgears for motors of essential services which are to be provided in duplicate are built in a grouped starter panel, the busbars, appliances and others are to be so arranged that one fault on the appliances or the circuits do not render the motors for the same use unusable simultaneously.
(2) Transformers for power supply to control circuits are to be provided for each motor or each group of motors incorporated in an apparatus.

3. Wearing parts of controlgears for motors

All wearing parts of controlgears for motors are to be readily accessible for inspection and maintenance.

4. Control-gears for motors above 0.5 kW

Motors above 0.5 kW are to be provided with the following control apparatus :

(1) Means to prevent undesired restarting after a stoppage due to low voltage or complete loss of voltage. This does not apply to motors, the continuous availability of which is essential to the safety of the ship and the automatically operated motors.
(2) Efficient means of isolation are to be provided so that all voltage may be cut off from the motor, except that where means of isolation (that provided at the switchboard, section board, distribution board, etc.) are adjacent to the motor.
(3) Means for automatic disconnection of the supply are to be provided in the event of excess current due to mechanical overloading of the motor. This does not apply to steering motors.

5. Magnetic contactors and overcurrent relays for motors

(1) Magnetic contactors are to be in compliance with the requirements in **Sec 8.**
(2) Overcurrent relays for motors are to have suitable characteristics in relation to the thermal capacities of motors.

702. Temperature rise

The temperature rises of controlgears for motors are not to exceed the values given in **Table 6.1.15** under the specified currents and rated voltage, except where required in the relevant Sections of this Chapter.

703. Emergency stopping apparatus

Means are to be provided for stopping the motors of forced and induced draft fans, oil fuel transfer pumps, oil fuel unit pumps, lubricating oil service pumps, thermal oil circulating pumps, oil separators(purifiers) and cargo pumps from accessible position outside the space where the motors are installed in case of fire in the space or in the vicinity thereof. But, each separate emergency stop control circuits of ventilators are to be provided for machinery space and other spaces.

704. Starters for steering motors

1. Starters for steering motors are to be of low-voltage release type and arranged in such a way that the steering motors are re-started automatically and safely when electric power is restored after a power failure.

2. Running indicators and overload alarms for steering motors are to be provided in accordance with the relevant requirements in **Pt 5, Ch 7.**

705. Magnetic brakes

1. Magnetic brakes of waterproof type motors

Electrical parts of magnetic brakes applied for waterproof type motors are to be waterproof construction.

2. *D.C.* shunt-wound brakes and *d.c.* compound- wound brakes

D.C. shunt-wound brakes are to operate satisfactorily at 85 % of rated voltage at working temperature, and *d.c* compound-wound brakes at the same conditions as above are to be operated satisfactorily at 85 % of starting current.

3. *D.C.* series-wound brakes

D.C. series-wound brakes are to release down at a current not less than 40 % of full-load current and in every case at the starting current, and are to set at a current 10 % or less of full-load current.

4. *A.C.* magnetic brakes

A.C. magnetic brakes are to be in accordance with the following requirements :

(1) *A.C.* magnetic brakes are to be operated satisfactorily at 80 % of rated voltage at working temperature.
(2) *A.C.* magnetic brakes are not to be noisy due to magnetic action in the working condition.

706. Clearance and creepage distances of control appliances

The clearance and creepage distances of control appliances (e.g., contactors, rheostats, control switches, limit switches, protection and control relays for motors, terminal boards, incorporating semi-conductors and their combinations) are to comply with the following requirements in (1) and (2) depending on the degree of protection of enclosures of the appliances or the atmosphere in which the appliances are installed.

(1) The minimum clearance and creepage distances of control appliances (e.g., electromagnetic contactors, control switches, terminal boards) are not to be less than the values given in **Table 6.1.16** if the appliances are designed and constructed in consideration of the moisture, dust, etc. or are operated in the ambient condition not accompanying the extremely high humidity and heavy deposit of dusts.
(2) The clearance and creepage distances of small control appliances of 15A or less in rating current may be shortened to the values as deemed appropriate by the Society, depending on the degree of protection of enclosures of the appliances or the ambient condition in which the appliances are installed, notwithstanding the requirements in (1) above.
(3) The requirements of above (1) and (2) are not applied to the following items :
  (a) Spark gaps.
  (b) Appliances used in secondary windings of induction motors.
  (c) Oil-immersed appliances.
  (d) Pilot lamp fittings and sockets.
  (e) Small switches in living quarters.
  (f) The sealed portion of the appliances which are of sealed construction.

707. Testing and inspection

1. General

Controlgears for motors are to meet the requirements of this Section in their construction and are to be tested in accordance with the requirements of th following **Pars 2** to **5.** However, the test required by **Par 2** may be omitted subject to the Society´s permission for each controlgear which is produced in series having identical type with its first unit tested in the presence of Surveyor.

2. Temperature test

Controlgears for motors are to be subjected to the temperature test under normal working condition, and than the temperature rise is not to exceed the values given in **702.**

3. Operation test

Operation of instruments, switching gears, protective devices, etc. for controlgears for motors are to be confirmed.

4. High voltage test

Controlgears with components are to withstand the high voltage by applying the following voltage at commercial frequency for 1 minute between all current-carrying parts of switching gears including control devices and earth and between poles or phases. Instruments and auxiliary apparatus may be disconnected during the high voltage test.

Rated voltage of 60V or less : 500V

Rated voltage exceeding 60V : 1,000V + twice the rated voltage (minimum 1,500V)

5. Insulation resistance test

Immediately after the high voltage test, the insulation resistance between all current-carrying parts and earth and between the current-carrying parts of poles or phases are not to be less than 1 megohm when tested with direct current voltage of at least 500V.

Table 6.1.15 Limit of Temperature Rise of Controlgears for Motors

(Based on ambient temperature rise 45℃)

Item and part				Limit of temperature rise (℃) Thermometer method	Limit of temperature rise (℃) Resistance method
Coils (air)	Class A insulation			60	80
	Class E insulation			75	95
	Class B insulation			85	105
	Class F insulation			110	130
	Class H insulation			135	155
	Class C insulation			no limit	no limit
	Single layer enamel windings	Class A insulation		80	-
		Class E insulation		95	-
		Class B insulation		105	-
		Class F insulation		130	-
		Class H insulation		155	-
		Class C insulation		no limit	-
Contact piece	Mass form	Continuous use over 8 hours	Copper or copper alloy	40	-
			Silver or silver alloy	70	-
		Switch on & off one time or more in about 8 hours	Copper or copper alloy	60	-
			Silver or silver alloy	70	-
	Multilayer form or knife form		Copper or copper alloy	35	-
Busbar and connecting conductor (Bare or Class A insulation and higher)				60	-
Terminals for external cables				45	-
Metallic resistors	Moulded-case type			245	-
	Those other than moulded-case type	For continuous use		295	-
		For intermittent use		345	-
		For starter use		345	-
	Exhaust (approx. 25 mm above exhaust port)			170	-

(NOTES)
1. Measurement of temperature of voltage coil is in principle to be made by resistance method only.
2. Where the insulation of single layer enamel windings is higher in class than that of the adjacent parts, the temperature rise associated with the class of insulation for the adjacent parts is to be applied.
3. For single layer bare windings, the temperature rise associated with the class of insulating material on the adjacent part is to be applied.
4. Moulded-case type metallic resistor means such a type as to be buried in the insulating material so as no surface of metallic resistor being exposed.

Table 6.1.16 Minimum Clearance and Creepage Distances for Control Appliances

Rated insulating voltage (V) (D.C. & A.C.)	Clearance (mm)						Creepage (3)(4) (mm)					
	Less than 15A (5)		15A or over and 63A or under (5)		Exceeding 63A (5)		Less than 15A (5)		15A or over and 63A or under (5)		Exceeding 63A (5)	
	$L-L$ (1)	$L-A$ (2)	$L-L$ (1)	$L-A$ (2)	$L-L$ (1)	$L-A$ (2)	a	b	a	b	a	b
Not exceeding 60	2	3	2	3	3	5	2	3	2	3	3	4
Exceeding 60 and 250 or under	3	5	4	5	5	6	3	4	6	6	6	8
Exceeding 250 and 380 or under	4	6	4	6	6	8	4	6	6	6	6	10
Exceeding 380 and 500 or under	6	8	6	8	8	10	6	10	6	10	8	12
Exceeding 500 and 660 or under	6	8	6	8	8	10	8	12	8	12	10	14
Exceeding 660	10	14	10	14	10	14	10	14	10	14	14	20

(NOTES) (1) to (5) marked in this Table are as follows

(1) "$L-L$" applies to clearances between bare live parts and between live part and earthed metal part.

(2) "$L-A$" applies to clearance between live part and metal part which accidentally becomes dangerous.

(3) Creepage distance is to be determined by type and shape of insulation. "a" applies to ceramic insulator(steatite and porcelain), and comparable other insulator which is particularly safe against leaked electricity provided with ribbed construction or vertical partitions proved to be equally effective as ceramic insulator through experiments having a tracking index greater than 140V e.g., phenol resins formed items. "b" applies to other insulation materials.

(4) In case where "$L-A$" is greater than the corresponding creepage "a" or "b" the creepage distances between live parts and insulated metals which operator may readilly touch and which becomes live parts by the deterioration of insulation are to be "$L-A$" or more.

(5) Current value is to ve expressed by the rated current-carrying value.

Section 8 Fuses, Circuit-breakers and Electromagnetic Contactors

801. General

Fuses, circuit-breakers and electromagnetic contactors are to comply with Korean Industrial Standards or equivalent thereto, and in addition, they are also to comply with the requirements of this Section.

802. Fuse

1. Construction

(1) Fuses are to be of enclosed type and the construction is to be such that its enclosure is not broken nor burnt and the adjacent insulation is not deteriorated by flowing of fused metal or emitting of gases, when the fuse element has blown out.

(2) Fuses are to be easily exchangeable for their spare parts without the risk of getting electric shock or burn on setting fuses in and out.

(3) Each fuse is to be clearly indicated of its rated voltage and rated current, and in addition rated breaking capacity, fusing characteristics and current-limiting characteristics according to its kind. Such indication may be made in terms of value or symbol.

2. Performance

(1) The temperature rise on the connecting terminals of cables is not to exceed 45℃, when the fuses and fuse-holders has been fitted up to the normal working condition and 100 % of the rated current is carried thereon.

(2) Fuses are to have the fusing characteristics corresponding to their kind, and under the circuit conditions specified in the standards referred to in **801.**, they are to be capable of breaking securely all currents whichever is below the rated breaking capacity and above the fusing current.

803. Circuit-breakers

1. Construction

(1) Circuit-breakers are to be of trip-free type and depending upon the field of their application, the trip attachments are to have a time-delay or an instantaneous overcurrent trip feature or both of them.
(2) The main contacts of the circuit-breakers are to be such as to have no undue burning and pitting. Arcing contacts except those of the moulded-case circuit-breakers are easily renewable.
(3) Instantaneous overcurrent trip devices are to be provided in each pole of the circuit-breakers and are to be so constructed as to be capable of tripping them directly by short-circuit current.
(4) Circuit-breakers are to be such that no accidental opening and closing occur due to the vibration of a ship, and furthermore, no malfunction is caused by the list of an angle of 30° in any direction.
(5) The fused circuit-breakers of moulded-case type are to be so constructed that single phasing does not occur in the event of blowing of fuses and that the fuses can be replaced easily without the risk of accidental touch to their live-parts.
(6) Each circuit-breaker is to be clearly indicated of its rated voltage and rated current, and in addition rated breaking capacity, rated making current and rated short-time current according to its kind. Each time-delay overcurrent trip device is to be indicated of its operating characteristics, except the moulded-case circuit-breakers.

2. Performance

(1) The temperature rise on the connecting terminals of cables is not to exceed 45°C when 100 % of the rated current is carried thereon.
(2) All circuit-breakers are, according to their kind, to be such as to be able to securely break the overcurrent not more than the rated breaking capacity and safely make the circuit to carry the current not more than the rated making current under the circuit conditions specified in the standards referred to in **801.**
(3) The time-delay overcurrent trip devices of circuit-breakers for generator circuits are to be such that the readjustment of the current setting does not cause remarkable change to the time-delay feature.
(4) The characteristics of the time-delay overcurrent trip devices are not to be affected excessively by ambient temperature.

804. Electromagnetic contactors

1. Construction

(1) Electromagnetic contactors are to be such that no accidental opening and closing occur due to the vibration of a ship, and furthermore, no malfunction is caused by the list of an angle of 30° in any direction.
(2) The contact pieces and magnetic coils are to be readily replaceable.
(3) Each electromagnetic contactor is to be clearly indicated of its rated voltage, rated current, rated voltage of magnetic coil, interruption current capacity and closed circuit current capacity. Such indication may be made in terms of value or symbol.

2. Performance

(1) The temperature rise on each part of electromagnetic contactor is not to exceed the values specified in **702.** when current-carrying is made continuously with the full load current corresponding to the rated capacity supplied to the main contacts and with the rated voltage applied to the magnetic coil.
(2) Electromagnetic contactors are to have a suitable interruption current capacity and closed-circuit current capacity depending on their application.

805. Testing and inspection

Fuses, circuit-breakers and electromagnetic contactors are to be in compliance with the requirements in **109. 1** to **6.**

Section 9 Explosion-protected Electrical Equipment

901. General

1. Applicable standards

Explosion-protected electrical equipments is to comply with (KS C) IEC 60079 or equivalent standards and they are to comply with the requirements in this Section.

2. The kind of explosion-protected construction

The explosion-protected construction used for electrical equipment on board ships is to be selected from the followings.

(1) Flameproof type (Ex-d)
(2) Intrinsically safe type
  (A) Category 'ia' intrinsically safe type (Ex-ia)
  (B) Category 'ib' intrinsically safe type (Ex-ib)
(3) Increased safety type (Ex-e)
(4) Pressurized protected type (Ex-p)
(5) Powder filling type (Ex-q)
(6) Oil immersion type (Ex-o)
(7) Encapsulation type (Ex-m)
(8) Non-sparking type (Ex-n)

3. Materials

(1) Materials for explosion-protected construction are to have an adequate electrical, mechanical, thermal and chemical resistance against the environmental condition and flammable gases or vapours (hereinafter referred to as "gases" at the location of the electrical equipment concerned.
(2) Enclosures and outer fittings of portable appliances are to be of material which minimizes the risk of spark by friction, or to have a non-metallic strong cover with hanging strap.
(3) Insulating compounds and sealing compounds used for integral parts of explosion-protected construction are to be such that no harmful expansion, contraction, softening or crack is found during in service. And the insulating compounds applied to bare live-parts are to be flame-retardant.

4. Construction

(1) The glazed ports of lighting fittings and the inspection windows of other electrical apparatus of flameproof type, increased safety type and pressurized protected type are, as a rule, to be provided with robust metallic guards.
(2) In case where a gasket is used with a view to give watertightness to the explosion protected electrical equipment installed on weather decks and other similar spaces, the gasket is to be so fitted as not to impair the explosion-proof characteristics due to its deterioration or breakage.
(3) The leading-in part of cables is to be of a construction suitable for ship cables. Consideration is to be given so that the cables can be surely fixed at the leading-in part, except where the cables are installed in steel conduits.
(4) Electrical equipment associated with intrinsically safe circuits and located in dangerous spaces are in principle to be of totally enclosed construction.
(5) Explosion-protected electrical equipment is to be clearly indicated of its type and the kind of gases for which the equipment is designed. And the lighting fittings are also to be indicated of the kind of lighting bulb applicable thereto and its wattage.

5. Ambient temperature

Reference ambient temperature for explosion-protected electrical equipment is to be 50℃.

902. Special requirements

Explosion-protected electrical equipment for each explosion-protected construction specified in **901. 2** is to be as deemed appropriate by the Society.

903. Testing and inspection

Explosion-protected electrical equipment is to be in compliance with the requirements in **109. 1** to **7.**

Section 10 Lighting Fittings, Heating Appliances and Wiring Accessories

1001. General

Lighting fittings, heating appliances and wiring accessories are to comply with Korean Industrial Standards or equivalent thereto, and in addition they are also to comply with the requirements in this Section.

1002. Lighting fittings

1. Construction and location

(1) Enclosures are to be composed of metal, glass or synthetic resin having a sufficient mechanical, thermal and chemical resistivity and to have a suitable degree of protection depending on their location. Synthetic resin enclosures which support current-carrying parts are to be flame retardant.
(2) Terminal box and leading-in part of cables are to be of construction suitable for ship cables. Consideration is to be given so that the insulation of cables may not be deteriorated at an early stage due to the temperature rise on terminals and other parts.
(3) Lighting fittings installed in engine room or similar spaces which are exposed to the risk of mechanical damage are to be provided with suitable grilled metallic guards to protect their lamps and glass globes against such damage.

2. Fluorescent lighting fittings

(1) Reactors, capacitors and other auxiliaries are not to be mounted on surfaces which are liable to be subjected to high temperatures.
(2) Every capacitor of 0.5 microfarad or more is to be provided with a protective leak or other protective means which reduces the voltage of the capacitor to not more than 50V within 1 minute after disconnection from the supply sources.
(3) Transformers are to be installed as close as practicable to the associated discharge lamp.
(4) In principle, fluorescent lighting of electronic ballast stabilizer type installed in navigation bridge is to be approved by the Society.

3. LED lighting

In principle, LED lighting installed in navigation bridge is to be approved by the Society.

1003. Heating appliances

1. Construction and location

(1) In principle, no bare heating element is to be used.
(2) Where the heating element is employed in liquid, it is to be protected by anticorrosive metal sheath.
(3) The high temperature parts of electric heating appliances are to be so protected as to be kept from the risk of a combustible material to come in touch under normal working condition.
(4) Space heaters are to be installed in such a manner as to have no risk of dangerous heating of decks or bulkheads or other surroundings.

2. Control switches

Heating appliances are to be controlled by a fixed switch. Where a plug is used for the appliance, the fixed switch is to be placed in the immediate vicinity of the socket-outlet.

1004. Wiring accessories

1. Material

(1) Enclosures are to be of metal or of flame-retardant material.
(2) The insulating material of live parts is to be of flame-retardant and non-hygroscopic material.

2. Temperature rise

The temperature rise on live parts is not to exceed 30℃.

3. Switches

Switches are to be capable of breaking and making safely a load current equal to 150 % of their rated current at the rated voltage.

4. Plugs and receptacles

(1) Receptacles of rated current exceeding 15 amperes are to be provided with a switch so interlocked that the plug cannot be inserted or withdrawn when the switch is in the "on" position.
(2) Where distribution systems of different voltages are in use, receptacles and plugs are to be of such design that an incorrect connection cannot be made.
(3) Each receptacles and plug having the rated voltage of 55V and over for *d.c.* and 55V and over for *a.c.* are to be provided with an additional contactor for earthing the casing or frame of appliance, except those for double insulated appliances having no non-current carrying metal parts for which earthing is required. The earthing contactors are to make contact in advance of the live contact pins when inserting the plug.

Section 11 Internal Communications

1101. Applicable standards

Each internal communication apparatus is to comply with Korean Industrial Standard or equivalent and above.

1102. Essential internal communication systems

Electric internal communication and signal systems forming part of the essential operating systems of the ship are to be as independent and self-sustaining as possible.

1103. Induced interference suppression

All communication cables are to be so arranged that unwanted interference and cross-talk is avoided.

1104. Protective devices

Where numerous internal communication circuits are branched from common feeder, each circuit and feeder is to be protected by the fuses and other means, and the rating of feeder is to be based on the connected load.

1105. General emergency alarm system

No switch is to be provided for feeder circuits of general emergency alarm system, except for operation switch. Where circuit breaker is used for overcurrent protection, suitable means are to be taken to prevent the circuit breaker from being kept "off" position.

1106. Public address system

1. It is to be loudspeaker installation enabling the broadcast of messages into all spaces where crew members or passengers, or both, are normally present, and to muster stations.

2. Source of electrical power is to be supplied from the main source of electrical power and the emergency source of electrical power where used in order to supplement a general emergency alarm system.

3. It is to allow for the broadcast of messages from the navigation bridge and such at least one other places (cargo control station, fire control station, engine control station, etc) on board the ship as the Society deems necessary.

4. It is to be protected against unauthorized use.

5. It is to be installed with regard to acoustically marginal conditions and not require any action form the addressee.

6. With the ship underway in normal conditions, the minimum sound pressure levels for broadcasting emergency announcements shall be as follows.

(1) In interior spaces 75 dB(A) and at least 20 dB(A) above the speech interference level; and
(2) In exterior spaces 80 dB(A) and at least 15 dB(A) above the speech interference level.

7. It is to be arranged to minimize the effect of a single failure where used in order to supplement a general emergency alarm system.

Section 12 Semi-Conductor Rectifiers for Power

1201. General

1. The requirements in this Section are to be applied to the semi-conductor rectifiers for power (hereinafter referred to as "rectifiers") not less than 5 kW. Further, the rectifiers specified in this Section are to be taken as a rectifier including thyristor.

2. Accessories of the rectifier are to be in accordance with all applicable requirements in this Chapter.

1202. Construction and location

1. Construction

(1) Rectifier valve units, rectifier stacks or cells are to be so arranged that they can be removed from equipment without dismantling the complete unit.
(2) Air-cooled rectifiers are to be suitably installed or protected against the effects of salty air and humidity.
(3) Where mercury vapour are liable to be generated, self-cooling and air-cooled semi-conductor rectifiers are not to be used.
(4) Where rectifier elements are connected in series or parallel, they are so arranged that the voltage or current on each element will become equal as far as practicable.

2. Location

(1) Rectifiers are to be installed in such a manner that the circulation of cooling air is not impeded and that the temperature of the inlet air to the air-cooled rectifier stacks does not exceed the allowable value.
(2) Rectifiers are to be separated from resistors, steam pipes or other sources of radiant heat as far as practicable.

1203. Protective devices, etc.

1. Protective devices

(1) Where forced cooling is provided, the rectifier is to be so arranged that the rectifier can not remain loaded unless effective cooling is maintained.
(2) Where necessary, means are to be provided to guard against transient over-voltage caused by switching and breaking of the circuits and *d.c.* voltage rise due to regenerative power.

2. Temperature of rectifier cells

The maximum permissible temperature rise of junction of rectifier cells is to be such a value as will be specified by the manufacturer. Where the information is not available, the maximum permissible temperature rise of junction of rectifier cells is not to exceed the following values :

Selenium : 70℃

Silicon : 150℃ (thyristor : 125℃)

3. Transformers for rectifiers

Transformers for rectifier are to be of two separate windings.

1204. Thyristor control

1. Gate control circuits

Gate control circuits are to comply with the following requirements.

(1) Gate control circuits of thyristors are to be so arranged that they can generate the gate pulse not exceeding the gate rating and having the pulse width enough to fire all thyristors connected. The gate control circuits are also to be protected from misfire caused by electrostatic induction and electromagnetic induction.

(2) Where thyristors are connected in series or parallel, gate control circuits are to be so arranged that firing timings of each thyristor are not irregular.

2. Thyristor control for *d.c.* motor

Where *d.c.* motors are controlled by thyristor, the following requirements are to be applied.

(1) Where commutation of *d.c.* motor may be affected by the harmonics of thyristor output waveform, appropriate measures are to be taken to reduce such harmonics.

(2) Where electric sources may be affected by lower power factor resulted from the phase control of thyristor, means are to be provided to compensate it.

(3) In case where motors are operated in either direction of rotation by means of changing-over the field polarity, interlock is to be made so as to reverse the polarity of field after armature-current reaching zero, and in addition, suitable means are to be provided to limit electrical non-locked conditions of armature.

1205. Testing and inspection

1. General

Rectifiers and their accessories are to be tested in accordance with the following requirements. The test required by **Par 2,** however, may be omitted subject to the Society's permission for each product which is produced in series having identical type with its first unit tested in the presence of the Surveyor.

2. Temperature test

Temperature test of rectifiers and their accessories is to be carried out under normal working conditions, and the test results are to comply with the requirements in **1203. 2** not exceeding the values specified in the requirements in **702.** as well.

3. Operation test

Instruments, switching devices and protective devices are to be checked under operating conditions.

4. High voltage test

(1) Rectifiers are to withstand the high voltage by applying the following *a.c.* voltage for 1 minute between rectifier cells or live parts of accessories charged with main circuit potential and earth.

Testing voltage (V) = $1.5E_{pi} + 1{,}000$ (Minimum 2,000V)

Where : E_{pi} = Peak reverse voltage

Where *d.c.* voltage is less than 100V, minimum testing voltage may be 1,500V. Rectifier cell is to be short-circuited before the test.

(2) High voltage test between live parts and earth for accessories charged with auxiliary circuit potential is to be in accordance with the applicable requirements in **707. 4.**

5. Insulation resistance test

After the high-voltage test, insulation resistance between live parts of rectifiers and their accessories and earth is not to be less than 1 MΩ when tested with *d.c.* voltage of at least 500V.

Section 13 Accumulator Batteries

1301. Applicable standards

1. Lead-acid accumulator batteries are to comply with Korean Industrial Standard or equivalent and above.

2. Construction, arrangement, etc. of the secondary accumulator batteries other than vent type secondary accumulator batteries (capable of exchanging electrolyte, and vent gas when they charge and discharge) are to apply appropriate measures recognized by the Society.

1302. Construction

The cells of all batteries are to be so constructed and secured as to prevent spilling of the electrolyte due to the vibration, inclination, etc., of the ship and to prevent emission of acid or alkaline spray.

1303. Location

1. Batteries are to be located where they are not exposed to excessive heat, extreme cold, spray, steam or other conditions which would impair performance or accelerate deterioration.

2. Alkaline batteries and lead acid batteries are not to be in the same compartment.

3. Batteries are not to be placed in living quarters.

4. Large batteries are to be installed in a space assigned to the batteries only or alternatively in a deck box if such a space is not available, the batteries may be installed in appropriate space.

5. Engine starting batteries are to be located as close as practicable to the engines served. If such batteries cannot be accommodated in the battery room, they are to be installed so that adequate ventilation is ensured.

1304. Electrical installation in battery compartment

1. Lighting fittings in battery rooms are to be of explosion-proof type.

2. Switches, fuses and other electrical equipment liable to cause an arc are not to be fitted in battery compartments.

3. Cables, with the exception of those appertaining to the battery or the local lighting, are not to be installed in battery compartments as a rule.

1305. Protection against corrosion

The interior of all battery compartments is to be protected with lead-sheet lining of 1.6 mm thick or more or corrosion-resistant paint in accordance with the following Paragraphs :

(1) The entire floor and all walls up to 150 mm high of battery rooms are to be lined with lead-sheet and the linings are to be watertight. Where approved by the Society, lead-sheet lining may be substituted by acid-resisting paint.
(2) Ceilings, walls other than those specified in (1), battery shelves and wooden crates are to be painted with acid-resisting paint.
(3) Battery tray and sulfuric acid bottle base are to be lined with lead-sheet.
(4) Ventilating ducts and fans are to be made of corrosion-resisting material or their interior surfaces are to be coated with corrosion-resisting paint.

1306. Ventilation

1. All rooms, lockers and boxes for accumulator batteries are to be arranged to avoid accumulation of inflammable gas. Where batteries are arranged in two or more tiers, all shelves are to have not less than 50 mm space, front and back, for circulation of air.

2. The ventilation of battery room may be conducted with either natural ventilation or ventilating fan.

3. The battery room is to be provided with effective air inlet near floor surface.

4. Ventilating fans are to be so constructed and be of a material such as not to arise sparking in the event of the impeller touching the fan casing.

5. Fan motor associated with a duct used to exhaust the air from a battery space is, in principle, to be placed outside of the duct.

6. Ventilating ducts terminating at least 1.25 m above in a gooseneck shape or equivalent are to be provided above the top of battery boxes. Holes for air inlets are to be provided on at least two opposite sides of the box.

1307. Charging facilities

1. For floating service or for any other conditions where the load is connected to the battery while it is on charge, the maximum battery voltage is not to exceed the safe value of any connected apparatus. A voltage regulator or other means of voltage control may be provided for this purpose.

2. Battery charging facilities by means of *d.c.* generator and series resistor are to be provided with protection against reversal of current when the charging voltage is 20 % of the line voltage or higher.

1308. Maintenance record of battery

The record of the type, location and maintenance cycle of batteries is to be kept on board ship.

(1) Where batteries are fitted for use for essential and emergency services a schedule of such batteries is to be compiled and maintained. The schedule, which is to be reviewed by the Society, is to include at least the following information regarding the batteries:
   (A) Type and manufacturer's type designation
   (B) Voltage and ampere-hour rating
   (C) Location
   (D) Equipment and/or systems served
   (E) Maintenance/replacement cycle dates
   (F) Dates of last maintenance and/or replacement
   (G) For replacement batteries in storage, the date of manufacture and shelf life

(2) Procedures are to be put in place to ensure that where batteries are replaced that they are of an equivalent performance type.

(3) Where vented type batteries replace valve- regulated sealed types, it is to be ensured that there is adequate ventilation and that the Society's requirements relevant to the location and installation of vented types batteries are complied with.

(4) Details of the schedule and of the procedures are to be included in the ship's safety management system and be integrated into the ship's operational maintenance routine as appropriate to be verified by the Society's Surveyor.

Section 14 Emergency Electrical Equipment

1401. Application

1. A self-contained emergency source of electrical power is to provided.

2. The emergency source of electrical power, associated transforming equipment, if any, transitional source of emergency power, emergency switchboard and emergency lighting switchboard are to be located above the uppermost continuous deck and are to be readily accessible from the open deck. They are not to be located forward of the collision bulkhead, except where permitted by the Society in exceptional circumstances.

3. The location of the emergency source of electrical power, associated transforming equipment, if any, the transitional source of emergency power, the emergency switchboard and the emergency lighting switchboard in relation to the main source of electrical power, associated transforming equipment, if any, and the main switchboard are to be such as to ensure to the satisfaction of the Society that a fire or other casualty in spaces containing the main source of electrical power, associated transforming equipment, if any, and the main switchboard, or in any machinery space of category A will not interfere with the supply, control and distribution of emergency electrical power. As far as practicable, the space containing the emergency source of electrical power, associated transforming equipment, if any, the transitional source of emergency electrical power and the emergency switchboard are not to be contiguous to the boundaries of machinery spaces of category A or those spaces containing the main source of electrical power, associated transforming equipment, if any, or the main switchboard.

4. Provided that suitable measures are taken for safeguarding independent emergency operation under all circumstances, the emergency generator may be used exceptionally, and for short periods, to supply non-emergency circuits.

1402. Capacity of emergency source of power

1. The electrical power available is to be sufficient to supply all those services that are essential for safety in an emergency, due regard being paid to such services as may have to be operated simultaneously.

2. The emergency source of electrical power is to be capable, having regard to starting currents and the transitory nature of certain loads, of supplying simultaneously at least the following services for the periods specified hereinafter, if they depend upon an electrical source for their operation:

(1) For a period of 3 hours, emergency lighting at every muster and embarkation station and over the sides as required by regulations III/11.4 and III/16.7, Amendments to SOLAS 1974.

(2) For a period of 18 hours, following emergency lighting.

(A) In all service and accommodation alleyways, stairways and exits, personnel lift cars and personnel lift trunks ;

(B) In the machinery spaces and main generating stations including their control positions ;

(C) In all control stations, machinery control rooms, and at each main and emergency switchboard ;

(D) At all stowage positions for firemen's outfits ;

(E) At the steering gear ; and.

(F) At the fire pump referred to in (6) at the sprinkler pump, if any, and at the emergency bilge pump, if any, and at the starting positions of their motors.

(G) In all cargo pump rooms of tankers

(3) For a period of 18 hours, the navigation lights and other lights required by the International Regulations for Preventing Collisions at Sea in force.

(4) For a period of 18 hours ;
VHF radio installation required by regulations IV/7.1.1 and IV/7.1.2, MF radio installation required by regulations IV/9.1.1, IV/9.1.2, IV/10.1.2 and IV/10.1.3, INMARSAT Ship Earth Stations required by regulation IV/10.1.1 and MF/HF radio installation as required by regulations IV/10.2.1, IV/10.2.2 and IV/11.1 of SOLAS Convention.

(5) For a period of 18 hours, except those services have an independent supply for the period of 18 hours from an accumulator battery suitably located for use in an emergency.

(A) All internal communication equipment as required in an emergency.

(B) The navigational equipment as required by regulation V/19 of SOLAS Convention where such provision is unreasonable or impracticable the Society may waive this requirement for ships of less than 5,000 gross tonnage.

(C) The fire detection and fire alarm system.

(D) Intermittent operation of the daylight signalling lamp, the ship's whistle, the manual fire alarms and all internal signals that are required in an emergency.

(6) For a period of 18 hours, one of the fire pumps required by regulation II-2 / 10 of SOLAS Convention if dependent upon the emergency generator for its source of power.

(7) For the period of time required by **Pt 5, Ch 7** the steering gear where it is required to be so supplied by that requirement.

(8) In a ship engaged regularly in voyages of short duration, the Society if satisfied that an adequate standard of safety would be attained may accept a lesser period than the 18 hours period specified in (2) to (6) but not less than 12 hours.

1403. Kind and performance of emergency source of electrical power

The emergency source of electrical power is to be a generator, an accumulator battery or an uninterruptible power system(UPS), which is to comply with the following ;

(1) Where the emergency source of electrical power is a generator, it is to comply with the following :

(A) The emergency generator is to be driven by a suitable prime mover with an independent supply of fuel, having a flashpoint (closed cup test) of not less than 43°C ;

(B) The emergency generator is to be started automatically upon failure of the main source of electrical power supply unless a transitional source of emergency electrical power in accordance with (C) is provided; where the emergency generator is automatically started, it is to be automatically connected to the emergency switchboard; those services referred to the requirements in **1404.** are then to be connected automatically to the emergency generator ;

(C) A transitional source of emergency electrical power as specified in **1404.** is to be provided unless an emergency generator is provided capable both of supplying the services mentioned in that paragraph and of being automatically started and supplying the required load as quickly as is safe and practicable subject to a maximum of 45 seconds.

(2) Where the emergency source of electrical power is an accumulator battery, it is to be capable of :

(A) carrying the emergency electrical load without recharging while maintaining the voltage of the battery throughout the discharge period within 12 % above or below its nominal voltage ;

(B) automatically connecting to the emergency switchboard in the event of failure of the main source of electrical power ; and

(C) immediately supplying at least those services specified in **1404.**

(3) Where the emergency source of electrical power is an uninterruptible power system(UPS), it is to comply with the requirements which the Society considers appropriate.

(4) Where electrical power is necessary to restore propulsion, the capacity is to be sufficient to restore propulsion to the ship in conjunction with other machinery, as appropriate, from a dead ship condition within 30 minutes.

1404. Transitional source of emergency electrical power

The transitional source of emergency electrical power where required by **1403.** is to consist of an accumulator battery suitably located for use in an emergency which is to :

(1) operate without recharging while maintaining the voltage of the battery throughout the discharge period within 12 % above or below its nominal voltage ; and

(2) be of sufficient capacity and be so arranged as to supply automatically in the event of failure of either the main or the emergency source of electrical power for half an hour at least the following services if they depend upon an electrical source for their operation :

(A) The lighting required by **1402. 2** (1) to (3). For this transitional phase, the required emergency electric lighting, in respect of the machinery space and accommodation and service spaces may be provided by permanently fixed, individual, automatically charged, relay operated accumulator lamps ; and

(B) All services required by **1402. 2** (5) (a), (c) and (d) unless such services have an independent supply for the period specified from an accumulator battery suitably located for use in an emergency.

1405. Location, etc. of emergency source of electrical power

1. The emergency switchboard is to be installed as near as is practicable to the emergency source of electrical power.

2. Where the emergency source of electrical power is a generator, the emergency switchboard is to be located in the same space unless the operation of the emergency switchboard would thereby be impaired. No accumulator battery fitted in accordance with this regulation is to be installed in the same space as the emergency switchboard.

3. An indicator is to be mounted in a suitable place on the main switchboard or in the machinery control room to indicate when the batteries constituting either the emergency source of electrical power or the transitional source of electrical power are being discharged.

4. The emergency switchboard is to be supplied during normal operation from the main switchboard by an interconnector feeder which is to be adequately protected at the main switchboard against overload and short circuit and which is to be disconnected automatically at the emergency switchboard upon failure of the main source of electrical power. Where the system is arranged for feedback operation the interconnector feeder is also to be protected at the emergency switch board at least against short circuit.

5. In order to ensure ready availability of the emergency source of electrical power, arrangements are to be made where necessary to disconnect automatically non-emergency circuits from the emergency switchboard to ensure that electrical power is to be available automatically to the emergency circuits.

6. Emergency electrical system is to be provided with measures for periodic testing. The periodic testing is to include the testing of automatic starting arrangements.

1406. Starting arrangements for emergency generating sets

1. Emergency generating sets are to be capable of being readily started in their cold condition at a temperature of 0℃. If this is impracticable, or if lower temperatures are likely to be encountered, provision acceptable to the Society is to be made for maintenance of heating arrangements, to ensure ready starting of the generating sets.

2. Each emergency generating set arranged to be automatically started is to be equipped with approved starting devices approved by the Society with a storage energy capability of at least three consecutive starts. The source of stored energy is to be protected to preclude critical depletion by the automatic starting system, unless a second independent means of starting is provided. In addition, a second source of energy is to be provided for an additional three starts within 30 minutes unless manual starting can be demonstrated to be effective.

3. The stored energy is to be maintained at all times, as follows :

(1) Electrical and hydraulic starting systems are to be maintained from the emergency switchboard.
(2) Compressed air starting systems may be maintained by the main or auxiliary compressed air receivers through a suitable non-return valve or by an emergency air compressor which, if electrically driven, is supplied from the emergency switchboard.
(3) All of these starting, charging and energy storing devices are to be located in the emergency generator space.

4. Where automatic starting is not required, manual starting is permissible, such as manual cranking inertia starters, manually charged hydraulic accumulators, or power charge cartridges, where they can be demonstrated as being effective.

5. When manual starting is not practicable, the requirements of **Pars 2** and **3** are to be complied with except that starting may be manually initiated.

Section 15 Lightning Conductors

1501. General

Lightning conductors are to be fitted on each mast of ships having wooden masts.

1502. Size of lightning conductors

1. Lightning conductors are to be composed of continuous copper tape or rope having a section not less than 75 mm^2. Lightning conductors are to run as straight as possible and sharp bends are to be avoided.

2. The resistance of lightning conductor between the mast top and the point on the earth plate or hull is not to exceed 0.02 ohms.

Section 16 High Voltage Electrical Installations

1601. General

1. Application

(1) The requirements in this Section apply to *a.c.* three-phase supply systems with voltages in the range above 1 kV up to and including 15 kV. Nominal voltage is the voltage between phases.
(2) The high voltage electrical installations are to comply with (KS C) IEC 60092-503 and the applicable requirements in this Chapter in addition to those in this Section.

2. High-voltage, low-voltage segregation Equipment with voltage above about 1 kV is not to be installed in the same enclosure as low voltage equipment, unless segregation or other suitable measures are taken to ensure that access to low voltage equipment is obtained without danger.

1602. System Design

1. Distribution

(1) Network configuration for continuity of ship services
It is to be possible to split the main switchboard into at least two independent sections, by means of at least one circuit breaker or other suitable disconnecting devices, each supplied by at least one generator. If two separate switchboards are provided and interconnected with cables, a circuit breaker is to be provided at each end of the cable. Services which are duplicated are to be divided between the sections.
(2) Earthed neutral systems
In case of earth fault, the current is not to be greater than full load current of the largest generator on the switchboard or relevant switchboard section and not less than three times the minimum current required to operate any device against earth fault. It is to be assured that at least one source neutral to ground connection is available whenever the system is in the energized mode. Electrical equipment in directly earthed neutral or other neutral earthed systems is to withstand the current due to a single phase fault against earth for the time necessary to trip the protection device.
(3) Neutral disconnection
Means of disconnection are to be fitted in the neutral earthing connection of each generator so that the generator may be disconnected for maintenance and for insulation resistance measurement.
(4) Hull connection of earthing impedance
All earthing impedances are to be connected to the hull. The connection to the hull is to be so arranged that any circulating currents in the earth connections do not interfere with radio, radar, communication and control equipment circuits.
(5) Divided systems
In the systems with neutral earthed, connection of the neutral to the hull is to be provided for each section.

2. Degrees of protection

(1) General
Each part of the electrical installation is to be provided with a degree of protection appropriate to the location, as a minimum the requirements of (KS C) IEC Publication 60092-201.
(2) Rotating machines
The degree of protection of enclosures of rotating electrical machines is to be at least IP 23. The degree of protection of terminals is to be at least IP44. For motors installed in spaces accessible to unqualified personnel, a degree of protection against approaching or contact with live or moving parts of at least IP4X is required.
(3) Transformers
The degree of protection of enclosures of transformers is to be at least IP23 For transformers installed in spaces accessible to unqualified personnel a degree of protection of at least IP4X is required. For transformers not contained in enclosures, see **1607. 1.**
(4) Switchgear, controlgear assemblies and converters
The degree of protection of metal enclosed switchgear, controlgear assemblies and static convertors is to be at least IP32. For switchgear, control gear assemblies and static converters in-

stalled in spaces accessible to unqualified personnel, a degree of protection of at least IP4X is required.

3. Insulation

(1) Air clearance
In general, phase-to-phase air clearances and phase-to-earth air clearances between non-insulated parts of equipment are to be not less than those specified in Table as below;

Nominal Voltage(kV)	Minimum air clearance(mm)
3 (3.3)	55
6 (6.6)	90
10 (11)	120
15	160

(2) Creepage distances
Creepage distances between live parts and between live parts and earthed metal parts for standard components are to be in accordance with relevant IEC Publications for the nominal voltage of the system, the nature of the insulation material and the transient overvoltage developed by switch and fault conditions. For non-standardized parts within the busbar section of a switchgear assembly, the minimum creepage distance is to be at least 25 mm/kV and behind current limiting devices, 16 mm/kV.

4. Protection

(1) Faults on the generator side of circuit breaker
Protective devices are to be provided against phase-to-phase faults in the cables connecting the generators to the main switchboard and against interwinding faults within the generators. The protective devices are to trip the generator circuit breaker and to automatically de-excite the generator. In distribution systems with a neutral earthed, phase to earth faults are also to be treated as above.

(2) Faults to earth
Any earth fault in the system is to be indicated by means of a visual and audible alarm. Any earth fault in the system is to be indicated by means of a visual and audible alarm. In low impedance or direct earthed systems provision is to be made to automatic disconnect the faulty circuits. In high impedance earthed systems, where outgoing feeders will not be isolated in case of an earth fault, the insulation of the equipment is to be designed for the phase to phase voltage.

(3) Power transformers
Power transformers are to be provided with overload and short circuit protection. When transformers are connected in parallel, tripping of the protective devices at the primary side has to automatically trip the switch connected at the secondary side.

(4) Voltage transformers for control and instrumentation
Voltage transformers are to be provided with overload and short circuit protection on the secondary side.

(5) Fuses
Fuses are not to be used for overload protection.

(6) Low voltage systems
Lower voltage systems supplied through transformers from high voltage systems are to be protected against overvoltages. This may be achieved by:
- direct earthing of the lower voltage system
- appropriate neutral voltage limiters
- earthed screen between the primary and secondary windings of transformers.

1603. Rotating machinery

1. Stator windings of generators

Generator stator windings are to have all phase ends brought out for the installation of the differential protection.

2. Temperature detectors

Rotating machinery is to be provided with temperature detectors in their stator windings to actuate a visual and audible alarm in a normally attended position whenever the temperature exceeds the permissible limit. If embedded temperature detectors are used, means are to be provided to protect the circuit against overvoltage.

3 Tests

In addition to the tests normally required for rotating machinery, a high frequency high voltage test in accordance with (KS C) IEC Publication 60034-15 is to be carried out on the individual coils in order to demonstrate a satisfactory withstand level of the inter-turn insulation to steep fronted switching surges.

1604. Power Transformers

1. General

Dry type transformers have to comply with (KS C) IEC Publication 60076-11. Liquid cooled transformers have to comply with (KS C) IEC Publication 60076. Oil immersed transformers are to be provided with the following alarms and protections:

- liquid level (Low)-alarm / trip or load reduction
- liquid temperature (High)-alarm / trip or load reduction
- gas pressure relay (High)-trip

2. Test voltage of High voltage test

System nominal voltage(kV)	*a.c.* Test voltage of High voltage(kV), 1min. commercial frequency(50Hz or 60Hz)
≤ 1.1	3
3.6	10
7.2	20
12	28
15	38

1605. Cables

1. General

Cables are to be constructed in accordance with the (KS C) IEC Publication 60092-353 and 60092-354 or other equivalent Standard.

2. Test voltage of High voltage test

System nominal voltage(kV)	*a.c.* Test voltage of High voltage(kV), 5min. commercial frequency(50Hz or 60Hz)
1 ～ 1.1	3.5
3 ～ 3.3	6.5
6 ～ 6.6	11
10 ～ 11	15
15	22

1606. Switchgear and controlgear assemblies

1. General

Switchgear and controlgear assemblies are to be constructed according to IEC 62271-200 and the following additional requirements.

2. Construction

(1) Mechanical construction
Switchgear is to be of metal enclosed type in accordance with IEC 62271-200 or of the insulation enclosed type in accordance with IEC 60466.
(2) Locking facilities
Withdrawable circuit breakers and switches are to be provided with mechanical locking facilities in both service and disconnected positions. For maintenance purposes, key locking of withdrawable circuit breakers and switches and fixed disconnectors is to be possible. Withdrawable circuit breakers are to be located in the service position so that there is no relative motion between fixed and moving portions.
(3) Shutters
The fixed contacts of withdrawable circuit breakers and switches are to be so arranged that in the withdrawable position the live contacts are automatically covered.
(4) Earthing and short-circuiting
For maintenance purposes an adequate number of earthing and short-circuiting devices is to be provided to enable circuits to be worked upon with safety.

3. Auxiliary systems

(1) Source and capacity of supply
If electrical energy and/or physical energy is required for the operation of circuit breakers and switches, a store supply of such energy is to be provided for at least two operations of all the components. However, the tripping due to overload or short-circuit, and under-voltage is to be independent of any stored electrical energy sources.
(2) Number of external supply sources
When external source of supply is necessary for auxiliary circuits, at least two external sources of supply are to be provided and so arranged that a failure or loss of one source will not cause the loss of more than one generator set and/or set of essential services. Where necessary one source of supply is to be from the emergency source of electrical power for the start up from dead ship condition.

4. High voltage test

A power-frequency voltage test is to be carried out on any switchgear and controlgear assemblies. The test voltages are to be in accordance with the following **Table 6.1.17** and the test procedure is to be in accordance with the IEC Publication 62271-200.

Table 6.1.17 Test voltage of High voltage test

System nominal voltage(kV)	*a.c.* Test voltage of High voltage(kV), 1min. commercial frequency(50Hz or 60Hz)
1 ～ 1.1	2.8
3 ～ 3.3	10
6 ～ 6.6	20
10 ～ 11	28
15	38

1607. Installation

1. Electrical equipment

(1) Where equipment is not contained in an enclosure but a room forms the enclosure of the equip-

ment, the access doors are to be so interlocked that they cannot be opened until the supply is isolated and the equipment earthed down.

(2) At the entrance of the spaces where high-voltage electrical equipment is installed, a suitable marking is to be placed which indicates danger of high-voltage. As regard the high-voltage electrical equipment installed out-side a.m. spaces, the similar marking is to be provided.

(3) The switchboard is to be provided with safe and effective measures to vent the accidental arc gases within the switchboard.

2. Cables

(1) Runs of cables
In accommodation spaces, high voltage cables are to be run in enclosed cable transit systems.

(2) Segregation
High voltage cables are to be segregated from cables operating at different voltage ratings each other; in particular, they are not to be run in the same cable bunch, nor in the same ducts or pipes, or, in the same box. Where high voltage cables of different voltage ratings are installed on the same cable tray, the air clearance between cables is not to be less than the minimum air clearance for the higher voltage side in **1602. 3** (1). However, high voltage cables are not to be installed on the same cable tray for the cables operating at the nominal system voltage of 1kV and less.

(3) Installation arrangements
High voltage cables, in general, are to be installed on carrier plating when they are provided with a continuous metallic sheath or armour which is effectively bonded to earth; otherwise they are to be installed for their entire length in metallic castings effectively bonded to earth.

(4) Terminations
Terminations in all conductors of high voltage cables are to be, as far as practicable, effectively covered with suitable insulating material. In terminal boxes, if conductors are not insulated, phases are to be separated from earth and from each other by substantial barriers of suitable insulating materials.

(5) Marking
High voltage cables are to be readily identifiable by suitable marking.

(6) Test after installation
Before a new high voltage cable installation, or an addition to an existing installation, is put into service a voltage withstand test is to be satisfactorily carried out on each completed cable and its accessories. The test is to be carried out after an insulation resistance test. When a *d.c.* voltage withstand test is carried out, the voltage is to be not less than:

- 1.6 (2.5 U_o +2 kV) for cables of rated voltage (U_o) up to and including 3.6 kV, or
- 4.2 U_o for higher rated voltages

where U_o is the rated power frequency voltage between conductor and earth or metallic screen, for which the cable is designed.

The test voltage is to be maintained for a minimum of 15 minutes. After completion of the test the conductors are to be connected to earth for a sufficient period in order to remove any trapped electric charge. An insulation resistance test is then repeated. Alternatively, an *a.c.* voltage withstand test may be carried out upon advice from high voltage cable manufacturer at a voltage not less than normal operating voltage of the cable and it is to be maintained for a minimum of 24 hours.

Section 17 Electric Propulsion Unit

1701. General

1. Application

The electric propulsion unit is to meet the requirements in this Section in addition to (KS C) IEC 60092-501 and those in this Chapter.

2. Motor torque

(1) Torque available for maneuvering a ship is to be capable of stopping or reversing of the ship in a reasonable time when the ship is running at the maximum service speed.
(2) Adequate torque margin is to be provided in *a.c.* propulsion systems to guard against the motor to be pulled out of synchronism during rough weather and at the time of turning in a multiple-screw ship.

3. Protection against torsional vibration, etc.

Prime movers, generators, motors, shafting and propellers are to be such that harmful torsional vibrations or excessive electrical oscillations in alternating-current systems are not observed at any normal operating speed.

4. Protection against overload

Where arrangements permit a propulsion motor to be connected to the generating plant having a continuous rating greater than the motor rating, means are to be provided to prevent continuous operation at the overload or overtorque conditions not permitted to the motor and shafting.

5. Lubrication

(1) Lubrication of the bearings of propulsion motors and shafting is to be effective at all operational speeds including creep speeds.
(2) When a forced lubrication system is used for the bearings of rotating machines and prime movers, low oil pressure alarm is to be provided.

1702. Prime movers

1. General

Prime movers are to comply with the requirements of **Pt 5, Ch 2, Secs 2** and **3,** and their rated power in conjunction with their overloading facilities and load built-up facilities is to be adequate to supply the needed power during transitional changes in operating conditions of electrical equipment.

2. Speed governor

(1) Prime movers of any type are to be provided with a governor capable of maintaining the pre-set steady speed within a range not exceeding 5 % of the rated full-load speed for load changes from full-load to no load.
(2) The governors are to be such that they will automatically maintain the momentary speed within 10 % of the rated speed when the full load is suddenly thrown off.
(3) In the case of parallel operation of generators, the governing system used are to permit stable operation to be maintained over the entire operational speed range of the prime movers.
(4) Where the speed control of the propeller requires speed variation of the prime mover, the governor is to permit a very gradual variation of speed within the necessary speed range and means are to be provided to enable local manual control as well as remote control of the governor.
(5) The overspeed governor is to be set to a speed in excess of the highest possible speed during periods of regenerated power, and the generator set including prime mover is to be so designed that no damage will be caused by an overspeed equal to that at which the governor is set.

1703. Rotating machines

1. General

(1) When variable speed rotating machines are fitted with an integral fan and have to be operated at speeds below the rated speed with full-load torque, full-load current, full-load excitation or the like, temperature limits according to **Table 6.1.4** are not to be exceeded.
(2) The rotors are to be so constructed that they will withstand for 2 minutes at an overspeed in accordance with the requirements in **209. 5.** However, the overspeed of turbo-generators and electromagnetic slip-couplings is to be 120 % of the rated speed.
(3) The collector rings and commutators are to be suitably arranged to be maintained easily. For purposes of inspection and repair, provision is to be made for easy access to each kind of coils and bearings, and for withdrawal and replacement of the field coils as well.

(4) Effective means are to be provided in rotating machines to prevent accumulation of moisture and condensation even when they are idle for appreciable periods.

2. Generators and motors

(1) For *a.c.* generators and motors of 500 kW and above, embedded temperature detectors are to be provided in the stator windings, and the temperature indicator is to be mounted in a convenient position to read a temperature on the control board.
(2) For *d.c.* motors liable to overspeed excessively, overspeed protection devices are to be provided, and the rotors are to be suitably constructed to prevent damage due to temporary overspeed.

3. Means of excitation

(1) Separately excited rotating machines are to be provided with at least 2 independent sources of excitation.
(2) The strength of shafts and couplings of exciter is to be suitable for the increased output necessary during maneuvering and sudden short-circuit conditions.

4. Electromagnetic slip-couplings

(1) Means are to be provided to facilitate periodical checking of the air gaps of the magnetic circuit, and appropriate calibrated gauges are to be supplied for this purpose.
(2) Electromagnetic slip-couplings are to be at least of drip-proof type. Where they are of non-enclosed type, suitable means are to be taken to prevent accidental touch with rotating parts and ingress of foreign material.

1704. Control gear

1. General

(1) Control gears for propulsion equipment are to be designed for the appropriate voltages and are to include the apparatus necessary for starting, stopping, reversing and controlling the speed of motors together with essential instruments and safety devices.
(2) Where, on stopping or reversing the propeller, the regenerated energy transmitted by the propulsion motor is such as to cause a dangerous increase of speed in the prime mover, means are to be provided for suitably absorbing or limiting such energy.
(3) All levers, handles and their accessories for switches and contactors are to be of such proportions as to permit a satisfactory manual operation.
(4) All levers for operating contactors, line switches, field switches and the like are to be interlocked to prevent their wrong operation. These interlocks are to be of mechanical type as far as practicable.
(5) Where steam and oil gauges are mounted on the main control assembly, provisions are to be made so that in case of leakage, steam and oil may not come into contact with the energized parts.
(6) When power-aided control is used, other suitable means are to be provided to restore control in a short time in the event of power failure.
(7) The controlgears are to be so arranged that in case of damage to the equipment outside the engine room, control can always be executed from the engine room maneuvering control stations.

2. Location of maneuvering control

(1) Control of the propulsion machines may be carried out from the bridge or deck. Alternative control in the engine room is to be provided, Transfer of control to the engine room in an emergency is to be possible without excessive loss of time.
(2) When two or more control stations are provided, indicating lights are to be located at each control station to indicate which station is in control. Means are to be provided to make incapable of being operated simultaneously from different stations.

3. Main circuit and control circuit

(1) Propulsion system having two or more generator or motors respectively on one propeller shaft, is to be so arranged that any unit of them can be taken out of service and isolated electrically.
(2) Field circuits are to be provided with means of suppressing voltage rise when a field switch is opened.

4. Protection

(1) Over-current protective devices, if any, in the main circuits are to be set sufficiently high so

that there is no possibility of their operating due to over-currents caused by maneuvering or normal operation in heavy seas.

(2) Where separately driven *d.c.* generators are connected electrically in series, means are to be provided to prevent reversal of the rotation of a generator at the failure of the driving power of its prime mover.

(3) In excitation circuits, there is to be no overload protection causing the opening of the circuit.

(4) Means are to be provided to detect sudden short circuit currents and to protect against phase unbalance. When damage likely to cause to the electrical equipment is more serious than the possible consequences of losing propulsion power, consideration is to be given to providing means for rapid reduction of the magnetic fluxes of the generators or motors.

(5) Means for earth leakage detection are to be provided for the main propulsion circuit, and these are to be arranged to operate an alarm upon the occurrence of an earth fault.

(6) Insulated excitation circuits are to be provided with earth leakage detection which may consist of voltmeters or lamps.

5. Control gears for electromagnetic slip-couplings

Control gears for electromagnetic slip-couplings are to include a two-pole disconnecting switch, short-circuit protection and an ammeter for the coupling excitation circuit. Interlocking gear is to be provided to prevent the coupling from being energized when the driving machine control levers are in an inappropriate position. Such controlgear may be combined with the prime mover speed control and reversing gears.

6. Instruments

(1) The following instruments, where required, are to be mounted in the main control assembly or any other location :

(a) For *a.c.* systems
Ammeter, voltmeter, indicating wattmeter and field ammeter for each propulsion generator,
Field ammeter for each synchronous motor,
Speed indicator for each propeller shaft,
Temperature indicator for reading directly the temperature of each propulsion generator stator and motor stator.

(b) For *d.c.* systems
Ammeter for the main circuit,
Ammeter for each generator and motor field circuit,
Voltmeter for reading voltage in each generator, motor and exciter,
Speed indicator for each propeller shaft.

(2) Where control outside the engine room is used, instruments necessary for operation and monitoring of the main propulsion system are to be installed at a convenient location near such a station.

1705. Cables

Conductors of cables and wiring are to consist of not less than 7 strands and conductors of a cross sectional area smaller than 1.5 mm^2 are not to be installed except cables or wiring for automatic equipment not directly connected to main circuits.

1706. Testing and inspection

After electric propulsion plants are installed on board ship, sea trial is to be carried out.

Section 18 Tests after Installation on Board

1801. Insulation resistance test

1. Electric propulsion, auxiliary power and lighting circuits

Each circuit of electric propulsion, auxiliary power and lighting is to have insulation resistances not less than the values in **Table 6.1.18** between conductors and between each conductor and earth.

Table 6.1.18 Insulation Resistance

Load	Insulation resistance
Up to 5 A	2 MΩ
Up to 10 A	1 MΩ
Up to 25 A	400,000 Ω
Up to 50 A	250,000 Ω
Up to 100 A	100,000 Ω
Up to 200 A	50,000 Ω
Over 200 A	25,000 Ω
(NOTE) During the above test, any or all electric heaters, small appliance and the like connected thereto may be disconnected from the circuit.	

2. Internal communication circuits

Insulation resistances of internal communication circuits are to comply with the following requirements:

(1) Each circuit of 100 V and above is to have an insulation resistance not less than 1 MΩ between conductors and between each conductor and earth.
(2) For circuits below 100 V, the insulation resistance is to be at least 1/3 MΩ.
(3) During the test for (1) and (2) any or all appliances connected thereto may be disconnected from the circuit.

3. Generators and motors

The insulation resistance of each generator and motor under working temperature is to be in accordance with the requirements in **209. 6.**

4. Switchboards

The insulation resistance of each switchboard under working temperature is to be in accordance with the requirements in **307. 5.**

1802. Performance test

1. Generators

Generators are to be tested as follows:

(1) The operation of overspeed trip and other safety devices is to be demonstrated.
(2) If generators are intended to operate in parallel, they are to be tested over a range of loading sufficient to demonstrate that load sharing and parallel operation are satisfactory. Voltage regulation is to be satisfactory.
(3) All generators are to be run at full rated load for a duration sufficient to demonstrate that temperature rises, commutation, absence of vibration and others are satisfactory.

2. Switchboards

All switches, circuit-breakers and associated equipment on the switchboard are to be operated on load to demonstrate suitability, and also section boxes and distribution boxes are to be tested as above.

3. Motors

Motors are to be tested as follows :

(1) Motors and their controlgears are to be examined under working condition that wiring, capacity, speed and operation are satisfactory.
(2) Motors driving various auxiliary machinery pumps, etc. are to be operated to demonstrate that operating characteristics are satisfactory.
(3) Motors driving cargo winches and windlasses are to hoist and lower their specified loads.

4. Lighting system

Lighting system is to be tested as follows :

(1) Circuits are to be tested to demonstrate that all lighting fittings, branch boxes, switches, plugs, receptacles and other connected fittings are in suitable operating condition.

(2) Emergency lighting circuits are is to be tested in the same manner as specified in (1) above.

5. Electric heaters and electric cooking ranges

Electric heaters, electric cooking ranges and the like are to be tested to demonstrate that the heating elements function satisfactorily.

6. Internal communication systems

Each internal communication system is to be throughly tested to demonstrate its specified functioning. Particular attention is to be paid to the tests of operation of the ship's essential electric communication systems which include engine order telegraphs, helm indicators, fire alarms, emergency signals, morse signal lamp, navigation light indicator panel and telephones.

7. Voltage drop

During above tests, it is to be ascertained that the voltage drop of feeder circuits does not exceed the values specified in **403. 2.**

Section 19 Spare Parts, Tools and Instruments

1901. Spare parts

1. General

(1) For the rotating machines and controlgears intended for electric propulsion plants, the spare parts mentioned in **Tables 6.1.19, 6.1.21** and **6.1.23** are to be supplied.

(2) For ship´s service generators, essential service motors and their controlgears and switchboards, the spare parts mentioned in **Tables 6.1.19** to **6.1.23,** so far as applicable, are recommended to be supplied as a standard.

(3) Quantity mentioned in (1) and (2) is the quantity of spare parts for identical installation per ship.

(4) For steering gear motors and motor-generators, if no stand-by machine is installed, spare parts in **Table 6.1.20** are required in addition to the spare parts for motors enumerated in **Table 6.1.19.**

Table 6.1.19 Spare Parts for Generators, Exciters and Motors

Spare parts	Quantity (ea)	Remarks
Bearing or bearing linings	1 for each 4 or less	Including oil rings
Brush holders	1 for each 10 or less	
Springs	1 for each 4 or less	For brush holder
Brushes	1 for each 1	
Field coils	1 for each 10 or less	For *d.c.* machines only. Excluding uninsulated interpoles coils
Resistors for field rheostat and discharge resistors	See **Table 6.1.21**	For generators and exciters
Amatures of cargo winch	1 for 6 or more	Stator in case of *a.c.* cage-rotor motor. Rotor in case of *a.c.* wound-rotor motor.
Slip-rings	1 for each kind and size	Required for rotating machines for electric propulsion only.

Table 6.1.20 Additional Spare parts for Steering Gear Motors without Stand-by Motor-Generator

Spare parts		Quantity (ea)
D.C.	Amatures of motors and motor-generators	1 for each size (incl. shaft and coupling)
A.C.	Stators of cage-rotor motors	1
	Rotors of wound-rotor motors	1 (incl. shaft and coupling)

Table 6.1.21 Spare parts for Controlgear

Spare parts	Quantity (ea)	Remarks
Contact pieces	1 for each 2 sets or less	For arcing and wear parts only
Springs	1 for each 4 or less	
Operating and shunt coils	1 for each 10 or less	
Resistors	1 for each 10 or less	For each kind and size
Fuses and their elements	See **Table 6.1.23**	
Lenses and lamps for pilot lamps	See **Table 6.1.23**	

Table 6.1.22 Spare Parts for Brakes

Spare parts	Quantity (ea)	Remark
Shoe linings and rivets	1 for each 4 or less	
Springs	1 for each 4 or less	
Coils	1 for each 10 or less	

Table 6.1.23 Spare Parts for Switchboards, Section Boards and Distribution Boards

Spare parts	Quantity (ea)	Remarks
Fuses (not renewable)	1 for each 1	Need not exceed 20
Fuse (renewable)	1 for each 10	Need not exceed 10
Fuse elements	1 for each 1	
Arcing contacts	1 for each 1	Need not exceed 10
Springs	1 for each 1	Need not exceed 10
Complete trip element assembly for moulded case thermal type circuit-breakers	1 for each 10 identical trip elements or less	Applicable where interchangeable elements are used
Complete moulded case thermal type circuit-breakers	1 for each group of 10 identical breakers or less	Applicable where non-interchangeable trip elements are used
Potential coils	1 for each kind	
Resistors	1 for each kind	
Lenses of pilot and signal lamps	1 for each 10 identical lenses or less	
Lamps for pilot and singnal lamps	1 for each 1	

2. Emergency lighting fittings

Where the voltage of emergency lighting circuits are different from that of general service, 1 for each 2 lamps are to be supplied as the spare.

1902. Testing instruments

Ships having electrical equipment of 50 kW and above are to be provided with a 500 volt insulation resistance measuring instrument in order that the insulation may be tested at regular intervals. In addition, the following portable instruments are recommended :

(1) One portable voltmeter, *a.c.* or *d.c.* or both as required.

(2) One portable ammeter, *a.c.* or *d.c.* or both as required, with shunts or current transformers as required.

1903. Disassembling tools

Where special tools are required to adjust or to disassemble electrical equipment, one set of each tool is to be provided.

1904. Storing method

All spare parts, instruments and tools are to be packed in suitable wooden boxes or corrosion protected steel boxes and are to be marked to indicate the contents on the surface of boxes and are to be stored in suitable locations. Where lockers are provided to store these spare parts, individual boxes may be omitted. ⚓

CHAPTER 2 CONTROL SYSTEMS

Section 1 General

101. General

1. Application

(1) The requirements in this Chapter apply to the systems of control, alarm and safety which are used to control all machinery and equipment which are subject to Rule requirements.
(2) Where considered necessary by the Society, the requirements in this Chapter are correspondingly applied to the systems of control, alarm and safety which are used for controlling machinery and equipment.

2. Terminology

Terms used in this Chapter are defined as follows:

(1) **Monitoring station** (excluding control station) is a position where measuring instruments, indicators, alarms, etc. for the machinery and equipment are centralized and necessary information to grasp the operating condition of them can be obtained. Where, however, a monitoring station is provided with the ship in addition to a control station mentioned in (2) below, the requirements of the Rules relating to a monitoring station do not apply to the monitoring station concerned.
(2) **Control station** is a position which has a function as a monitoring station and from which the machinery and equipment can be controlled.
(3) **Main control station** is a control station provided with equipment necessary and sufficient to control the main propulsion machinery (this equipment will be referred to as "main control equipment" in this (3) and (4) and from which the main propulsion machinery is normally controlled, of the ship which provides the main control equipment at the outside of the navigation bridge.
(4) **Main control station on bridge** is a navigation bridge of the ship which provides main control equipment at the navigation bridge and that the main propulsion machinery is normally controlled there.
(5) **Sub-control station** is such a control station at which the main propulsion machinery is capable of being controlled, except for local control station for the main propulsion machinery, that is provided in the machinery room of the ship provided with a main control station on bridge.
(6) **Bridge control devices** are remote control devices for the main propulsion machinery or controllable pitch propellers provided on a navigation bridge or a main control station on bridge.
(7) **Sequential control** is a pattern of control that can be carried out automatically in the redetermined sequence.
(8) **Program control** is a pattern of control that desired values can be changed in the predetermined schedule.
(9) **Local control** is direct manual control of the machinery and equipment performed at or near their locations, receiving the necessary information from the measuring instruments, indicators and so on.
(10) **Safety system** is a system which operates automatically, in order to prevent damages to the machinery and equipment in case where serious impediments to functioning should occur on them during operation so that one of the following actions will take place.
(A) Starting of standby machinery or equipment.
(B) Reduction of outputs of the machinery or equipment.
(C) Shutting off the fuel or power supplies thereby stopping the machinery or equipment.
(11) **Computer-based system** is a system of one or more computers(including programmable electronic device), associated software, peripherals and interfaces, and the computer network with its protocol.
(12) **Integrated system** is a system consisting of two or more subsystem having independent functions connected by a data transmission network and operated from one or more workstations.
(13) **Expert system** is an intelligent knowledge-based system that is designed to solve a problem with information that has been compiled using some form of human expertise.

(14) **Software** is the program, procedures and associated documentation pertaining to the operation of the computer system.
(15) **Basic software** is the minimum software, which includes firmware and middleware, required to support the application software.
(16) **Application software** is a software performing tasks specific to the actual configuration of the computer-based system and supported by the basic software.
(17) **Interface** is a transfer point at which information is exchanged. (examples : interfaces including input/output interface; communications interface)
(18) **Peripheral** is a device performing an auxiliary function in the system(examples : printer, data storage device)
(19) **Failure mode and effect analysis(FMEA)** is a failure analysis methodology used during design to postulate every failure mode and the corresponding effect or consequences.

3. Drawings and data

(1) Drawings and data concerning automation
(A) List of measuring points
(B) List of alarm points
(C) Control devices and safety devices
(a) List of controlled objects and controlled variables
(b) Kinds of sources of control energy (self-actuated, pneumatic, electric, etc.)
(c) List of conditions for emergency stopping, speed reduction (automatic or demand for reduction), etc.
(2) Following drawings and data for the automatic control devices and remote control devices for main engines or controllable pitch propellers:
(A) Operating instructions of main engines such as starting and stopping, changeover of direction of revolution, increase and decrease of output, etc.
(B) Arrangements of safety devices (including those attached to the engines) and pilot lamps
(C) Controlling diagrams
(3) Following drawings and data for the automatic control devices and remote control devices for boilers:
(A) Operating instructions of sequential control, feed water control, pressure control, combustion control and safety devices
(B) Diagrams for automatic combustion control devices and automatic feed water control devices
(4) Diagrams and operating instructions for automatic control devices for electric generating sets (automatic load sharing devices, preference tripping devices, automatic starting devices, automatic synchronous making devices, sequential starting devices, etc.)
(5) Panel arrangements of monitoring panels, alarming panels and control stands at respective control stations
(6) Schedules of on-board tests and sea trials
(7) Drawings and data for computer-based systems
(A) Computer hardware
The documentation to be submitted is to include followings:
(a) Hardware information of importance for the application and a list of documents that apply to the system
(b) The supply circuit diagram
(c) A description of hardware and software tools for equipment configuration
(d) The information to activate the system
(e) General information for trouble shooting and repair when the system is in operation
(B) Computer software
The documentation to be submitted is to include
(a) A list of all main software modules installed per hardware unit with names and version numbers
(b) A description of all main software which is to include at least:
(i) A description of basic software installed per hardware unit, including communication software, when applicable
(ii) A description of application software
(C) System reliability analysis
The documentation to be submitted is to demonstrate the reliability of the system by means of appropriate analysis such as:

(a) A failure mode analysis describing the effects due to failures leading to the destruction of the automation system, In addition, this documentation is to show the consequences on other systems, if any.
(b) Mean time between failures (MTBF) calculation
(c) Any other documentation demonstrating the reliability of the system

(D) User interface description
The documentation is to contain:
(a) A description of the functions allocated to each operator interface(keyboard/screen or equivalent)
(b) A description of individual screen views (schematics, colour photos, etc.)
(c) A description of how menus are operated (tree presentation)
(d) An operator manual providing necessary information for installation and use.

(E) Test programs
The following test program are to be submitted:
(a) Software module/unit test
(b) Software integration test
(c) System validation test
(d) On-board test
Each test program is to include:
(i) A description of each test item
(ii) A description of the acceptance criteria for each tests.

Section 2 System and Control

201. System design

1. System design requirements

(1) Control systems, alarm systems and safety systems are to be so designed that one fault does not result in other faults as far as practicable and the extent of the damage could be kept to a minimum.
(2) Control systems, alarm systems and safety systems are to be designed on the fail-to-safe principle. The characteristics of fail-to-safe is to be evaluated on the basis not only of the respective systems themselves and associated machinery and equipment, but also the total safety of the ship.
(3) Systems of automatic or remote control are to be sufficiently reliable under service conditions.
(4) Cables for signals are to be installed in such a manner that harmful induced interference can be avoided.

2. Supply of power

(1) Supply of electric power
The supply of electric power is to be in accordance with the following:
(A) Electric supply circuits to control systems, alarm systems and safety systems are not to branch off from the power circuits and lighting circuits, except that the electric power to the control systems, alarm systems and safety systems may be supplied from the power circuits to the machinery and equipment they serve.
(B) The electric power to alarm systems and safety systems for electric generating sets is also to be supplied from an accumulator battery.

(2) Supply of oil pressure
The supply of control oil pressure is to be in accordance with the following:
(A) Sources of oil pressure are to be capable of supplying stably necessary pressure and quantity of purified oil.
(B) Overpressure preventive devices are to be provided on the delivery side of oil pressure pumps.
(C) Two or more sets of oil pressure pumps for the control of main engines and main shaftings are to be provided and they are to be so arranged that in case where one of the pumps in operation becomes out of action standby pump(s) may start automatically or may be readily remotely started. In this case, the oil pressure pumps are not to be used for the control of other machinery and equipment than main engines and main shaftings.

(3) Supply of pneumatic pressure
The supply of control air is to be in accordance with the following:
(A) Control systems are to be provided with an air reservoir having a capacity capable of supplying air to control devices at least for 5 minutes in the event of failure of the control air compressor.
(B) Where starting air reservoirs for main propulsion diesel engines are used as control air reservoirs, pressure reducing valves are to be duplicated.
(C) There are to be two or more sets of air compressors which may be used as a source of control air. Each air compressor is to have redundant capacity even in the event of failure of either one of them.
(D) Control air is to pass through a filter and, if necessary, a drier so that solid, oil and water may be removed to a minimum.
(E) Control air pipes are to be independent of general service air pipes and starting air pipes.

3. Environmental conditions

Systems of automatic or remote control are to be capable of withstanding the environmental conditions of the places where they are installed.

4. Control systems

(1) Independency of control systems
Control systems for main engines or controllable pitch propellers, boilers, electric generating sets and auxiliaries for main propulsion of the ship (hereinafter referred to as "essential auxiliary machinery") are to be independent each other or designed such that failure of one system does not degrade the performance of another system.
(2) Interconnection devices
In case of plural main engines, electric generating sets or important auxiliaries which are designed to be operated simultaneously in multiple under the same condition, interconnection devices may be provided between the control devices of these installations.
(3) Control characteristics
Remote control devices and automatic control devices are to have control characteristics in conformity with the dynamic properties of the machinery and equipment they serve and to be considered not to invite malfunction and hunting due to disturbance.
(4) Interlock
Control devices are to be provided with suitable interlocking arrangements in order to prevent damages to the machinery and equipment due to anticipated malfunction and maloperation of the machinery and equipment.
(5) Change-over to manual operating
Change-over to manual operating is to comply with the following requirements:
(A) Main engines, boilers, electric generating sets and auxiliaries for main propulsion of the ship are to be so arranged as to be manually started, operated and controlled even in the event where automatic control devices become out of action.
(B) Automatic control devices are generally to be provided with provisions to stop manually the automatic function of these devices.
(C) The provisions specified in (B) are to be capable of stopping the automatic function of the automatic control devices, even where any part of the automatic control devices become out of action.
(6) Cancellation of remote control function
For remote control devices, the function of remote control is to be capable of being manually cancelled.
(7) Indication of control locations
In case where the machinery and equipment are capable of being operated from more than one station, the following requirements in (A) and (B) are to be complied with. However, this requirement need not be complied with in case the safety of the machinery and equipment and the safety at the time of maintenance work can be obtained by means of other measures considered appropriate by the Society.
(A) At each control station there is to be an indicator showing which station is in control of the machinery and equipment.
(B) Control of the machinery and equipment is to be possible only from one station at a time.

5. Alarm systems

(1) Function of alarm systems is to comply with the following requirements:
(A) In case where an abnormal condition is detected devices to issue visual and audible alarms (hereinafter referred to as "alarm devices" in this Chapter) are to operate.
(B) In case where arrangements are made to silence audible alarms they are not to extinguish visual alarms.
(C) Two or more faults are to be indicated at the same time.
(D) Audible alarms for machinery and equipment are to be clearly distinguishable from other audible alarms such as general alarm, fire alarm, CO_2 flooding alarm, etc.
(2) Function of the alarm systems provided in the monitoring station for main engines or controllable pitch propellers is to comply with the following requirements, in addition to the requirements in (1).
(A) The visual indications of visual alarms are to remain until the fault has been corrected.
(B) The acceptance of any alarm is not to inhibit another alarm.
(C) If an alarm has been acknowledged and a second fault occurs prior to the first being rectified, alarm devices are again to operate.
(D) Manual stopping of each alarm system is to be clearly indicated.
(3) Visual alarms are to be such that each abnormal condition of the machinery and equipment is readily distinguishable and so arranged that acknowledgement is clearly noticeable.

6. Safety systems

(1) Constitution of systems
Constitution of safety systems is to comply with the following requirements:
(A) The safety systems are to be, as far as practicable, provided independently of the control systems and alarm systems.
(B) The safety systems for the main engines, boilers, electric generating sets and auxiliaries for main propulsion of the ship are to be independent each other.
(2) Function of safety systems
Function of the safety systems is to comply with the following requirements:
(A) The alarm systems which have functions prescribed in **Par 5** are to operate when the safety system is put into action.
(B) In case where the safety system is put into action and the operation of the machinery or equipment is stopped, they are not to automatically restart before manual reset is made.
(3) Override arrangements
Where arrangements for stopping temporarily the functions of safety system in part or in whole(hereinafter referred to as "override arrangements") are provided, the following requirements in (A) and (B) are to be complied with:
(A) Visual indication is to be given at the relevant control stations of the machinery and equipment when an override is operated.
(B) The override arrangements are to be such that inadvertent operation is prevented.

7. Computer-based systems

(1) Application
(A) Computer-based systems where used for control, monitoring and safety systems are to comply with the provisons of this **Paragraph.**
(B) Computerized control systems, alarm systems and safety systems are divided into three categories as shown in **Table 6.2.1** based on the impact a single failure has on human and vessel safety, and the environment.
(2) Systems requirements
(A) System security
Computer-based systems are to be protected against unintentional or unauthorized modification of software.
(a) The systems categorized in Categories Ⅱ and Ⅲ in **Table 6.2.1** are to be protected against program modification by end users.
(b) For the systems categorized in Categories Ⅲ in **Table 6.2.1**, modifications of parameters by manufacturers are to be approved by the Society.
(c) Any modifications made after shipment are to be documented and traceable.

Table 6.2.1 Computer-based system categories

Category	Effects in case of failure	System functionality
Ⅰ	Those systems, failure of which will not lead to dangerous situations for human safety, safety of the vessel and/or threat to the environment.	- Monitoring function for informational /administrative tasks
Ⅱ	Those systems, failure of which could eventually lead to dangerous situations for human safety, safety of the vessel and/or threat to the environment.	- Alarm and monitoring functions - Control functions which are necessary to maintain the ship in its normal operational and habitable conditions
Ⅲ	Those systems, failure of which could immediately lead to dangerous situations for human safety, safety of the vessel and/or threat to the environment.	- Control functions for maintaining the vessel's propulsion and steering - Safety functions

(B) Program and memory data
To preclude the possible loss or corruption of data as a result of power disruption, programs and associated memory data considered to be essential for the operation of the specific system are to be stored in non-volatile memory.

(C) Start-up after power failure
The system's software and hardware is to be designed so that upon restoration of power supply after power failure, automatic or remote control and monitoring capabilities can immediately be available after the pre-established computer control access (sign-in) procedure has been completed.

(D) Self monitoring
Computer-based systems are to be self-monitoring and any incorrect operation or abnormal condition is to be alarmed at the computer workstation.

(E) Power supply
The power supply is to be monitored for voltage failure and protected for short circuit. Where redundant computer systems are provided to satisfy (F), they are to be separately fed.

(F) System independence
Control, monitoring and safety systems are to be arranged such that a single failure or malfunction of the computer equipment will not affect more than one of these system functions.

(G) Response time
Computer system's memory is to be of sufficient capacity to handle the operation of all computer programs as configured in the computer system. The time response for processing and transmitting data is to be such that an undesirable chain of events may not arise as a result of unacceptable data delay or response time during the computer system's worst data overload operating condition. For propulsion related system applications, the time limit on response delays for safety and alarm displays is not to exceed two(2) seconds. The response delay is to be taken as the time between detection of an alarm or safety critical condition and the display of the alarm or actuation of the safety system.

(H) Fail-safe
Computer-based system is to be designed such that failure of any of the system's components will not cause unsafe operation of the process or the equipment it controls. FMEA is to be used to determine that any component failure will not result in the complete loss of control, the shutdown of the process or equipment, or other undesirable consequences.

(3) Additional requirements for integrated systems

(A) General
Common hardware in an integrated system serving many subsystems, e.g., monitor, keyboard, microprocessor, etc., is to be duplicated or otherwise provided with a means of backup.

(B) Component independence
Failure of one part (individual module, equipment or subsystem) of the integrated system is not to affect the functionality of other parts, except for those functions directly dependent upon information from the defective part.

(C) Data communication

(a) Data link

(i) Any detected abnormal condition is to be alarmed at the centralized control station and on the navigation bridge.

(ii) Safeguards are to be provided to prevent unacceptable data transmission delays (overloading of network).

(iii) Alarm is to be activated prior to a critical data overload condition.

(b) Duplicated data link

(i) When the same data link is used for two or more essential functions (e.g., propulsion control and generator control), this link is to be duplicated, and each is to be routed as far apart from the other as practical.

(ii) The duplicate link is for standby purpose only and not to be used to reduce traffic in the online link.

(iii) Duplicated data link is to be arranged so that upon the failure of the on-line link, the standby link is automatically connected to the system. Switching between duplicated links is not to disturb data communication or continuous functioning of the system.

(iv) The failure of one link is to be alarmed at the centralized control station and on the navigation bridge.

(c) Connection failure

A complete failure in connectivity between component systems and the data highway is not to affect individual functionality of the component systems.

(d) Transmission software

(i) The transmission software is to be so designed that alarm or control data have priority over any other data.

(ii) The transmission protocol is to be chosen among international standards.

(iii) A means of transmission control is to be provided and designed so as to verify the completion of the data transmitted (Cyclic Redundancy Check(CRC) or equivalent acceptable method).

(iv) When corrupted data is detected, th number of retries is to be limited so as to keep an acceptable global response time.

(4) Expert system

The expert system software is not to be implemented on a computer linked with essential functions and is not to be used for direct control or operation.

(5) Hardware

(A) Design for ease of maintenance

(a) The design and layout of the hardware is to ensure ease of access to interchangeable parts for repairs and maintenance.

(b) Each replaceable part is to be simple to replace and is to be constructed for easy and safe handling.

(c) All replaceable parts are to be so designed that it is not possible to connect them incorrectly or to use incorrect replacements. Where this is not practicable, the replaceable parts and their mounting location, including their means of electrical connection, are to be clearly marked.

(B) User interface and input devices

(a) General

Input devices are to have clearly marked functions and, as far as practicable, are to be arranged to avoid conceivable inadvertent errors in their operations.

(b) Security

Input devices, such as keyboard, which can be used to effect changes to equipment or processes under control, are to be provided with security arrangement, such as password, so as to limit access to authorized personnel only.

Where a single action of, for example, pressing of a key is able to cause dangerous operating conditions or malfunctions, measures such as use of two or more keys are to be taken to prevent execution by a single action.

(c) Control Status

Where control action can be effected from more than one station, conflicting control station actions are to be prevented by means of interlock or warning. Control status is to be indicated at all stations.

(C) Visual display unit

(a) General

The size, color and density of text and graphic information displayed on a visual display unit are to be such that it may be easily read from the normal operator position under all operational lighting conditions. The brightness and contrast are to be capable of being adjusted.

(b) Alarm display

Where alarms are displayed by means of visual display unit, they are to appear in the sequence as the incoming signals are received. Alarming of the incoming fault signals is to appear on the screen, regardless of the mode the computer or the visual display unit is in.

(c) Propulsion monitoring

Where visual display unit is used to display monitored parameters, unless other display means are provided capable of displaying the same information, the centralized control station is to be provided with at least two computer monitors.

(d) Color monitor

The failure of a primary color is not to prevent an alarm from being distinctly indicated.

(D) Graphical display

(a) General

Information is to be presented clearly and intelligibly, according to its functional relations. Display presentations are to be restricted to the data which is directly relevant for the user.

(b) Alarms

Alarms are to be clearly distinguishable from other information and are to be visually and audibly presented with priority over other information, regardless of the mode the computer or the visual display unit is in.

(6) Software

(A) General

(a) The basic software is to be developed in consistent and independent modules and a self checking function is to be provided to identify failure of software module. When hardware (e.g. input/output devices, communication links, memory, etc.) is arranged to limit the consequences of failures, the corresponding software is also to be separated in different software modules ensuring the same degree of independence.

(b) Loading of software, when necessary, is to be performed in the aided conversational mode.

(c) A clear warning is to be displayed when using functions such as alteration of control condition, or change of data or programs in the memory of the system.

(B) Software development quality

(a) Software development si to be carried out according to a quality plan defined by the builder and records are to be kept.

(b) The standard ISO/IEC 90003:2004 Software Engineering - Guidelines for the application of ISO 9001:2000 to computer software or equivalent international standards, is to be taken as Guidance for the quality procedure.

(c) The quality plan is to include the test procedure for software and the results of the tests are to be documented.

202. Automatic and remote control of main engines or controllable pitch propellers

1. General

Remote control devices for main propulsion machinery or controllable pitch propellers are to be complied with the requirements of this **202**.

2. Remote control devices for main engines or controllable pitch propellers

(1) General

(A) The remote control devices for main engines or controllable pitch propellers are to be capable of controlling the propeller speed and the direction of thrust (the blade angle of propellers in the case of controllable pitch propellers) by means of a simple operation.

(B) The remote control devices for main engines or controllable pitch propellers are to be provided for each propeller.

(C) In case where the speed of the main diesel engines is controlled by governors, the governors are to be adjusted so that main engine may not exceed 103 % of the maximum continuous revolutions. The governors are to be capable of maintaining the safe minimum speed.

(D) In case where the program control is adopted, the program for increase and decrease of output is to be so designed that undue mechanical stresses and thermal stresses do not occur in any parts of machinery.

(E) In the remote control stations and monitoring stations for the main engines, the following instruments are to be provided:

(a) Indicators for propeller speed and direction of rotation in the case of solid propellers.

(b) Indicators for propeller speed and pitch position in the case of controllable pitch propeller.

(F) In the remote control stations for main engines or controllable pitch propellers, alarm devices necessary for the control of main engines are to be provided.

(2) Transfer of control

The remote control devices for main engines or controllable pitch propellers are to comply with the following requirements with respect to transfer of control:

(A) Each control station for main engines or controllable pitch propellers is to be provided with means to indicate which of them is in control.

(B) Remote control of the main engines is to be possible only from one location at a time.

(C) Transfer of control is to be possible only with order by the serving station and acknowledgement by the receiving station except for the following cases.

(a) Transfer of control between local control station for main propulsion machinery and main control station or sub-control station.

(b) Transfer of control during the stopping condition of the main propulsion machinery.

(D) The transfer of control between the navigating bridge and the local or main control station is to be possible only in the local or main control station.

(E) Means are to be provided to prevent the propelling thrust from altering significantly when transferring control from one location to another except for the transfer of control described in (C) (a) and (D).

(3) Failure of remote control systems of main engines or controllable pitch propellers

The following requirements are to be complied with in case of failure of remote control devices for main engines or controllable pitch propellers:

(A) In the remote control stations for main engines or controllable pitch propellers alarm devices which operate in the event of failure of the remote control devices for main engines or controllable pitch propellers are to be provided.

(B) In the event of failure of the remote control devices for main engines or controllable pitch propellers, the main engines are to be possible to control locally.

(C) In the event of failure of the remote control devices for main engines or controllable pitch propellers, the preset speed and direction of the propeller thrust are to be maintained until the control is in operation at the main control station or the local control station, unless this is considered impracticable by the Society.

(D) In the event of failure of the remote control devices for main engines or controllable pitch propellers, the transfer of control to the main control station or the local control station is to be possible by a simple operation.

(E) Remote control stations for main engines or controllable pitch propellers are to be provided with independent emergency stopping devices for the main engines, which are effective in the event of failure of the remote control devices for main engines or controllable pitch propellers.

(4) Remote starting of main diesel engines

Starting by means of remote control devices for main engines or controllable pitch propellers is to comply with the following:

(A) The number of starting of main engines is to satisfy the number specified in **Pt 5, Ch 6, 1101.**

(B) The remote control devices for main engines or controllable pitch propellers arranged to automatically start are to be so designed that the number of automatic consecutive attempts which fail to produce a start is limited to three times. In the event of failure of starting, a visual and audible alarm is to be issued at the relevant control station and the main control station or monitoring station for the main engines.

(C) Where compressed air is used for starting of the main engines, alarm devices to indicate the low starting air pressure are to be provided at the remote control station and the monitoring station for the main engines.
(D) The low starting air pressure mentioned in (C) for the operation of alarm devices is to be set at a level to permit further main engines starting operations.

3. Bridge control devices

Bridge control devices are to comply with the following requirements as well as those in **202. 2.**
(1) Even when the main engines are controlled from the navigating bridge, the telegraph orders at the navigating bridge are to be indicated in the main control station.
(2) The bridge control devices are to be provided with either one of the following devices in order to prevent prolonged running of main engines in critical speed range:
(A) Devices to make to pass automatically and rapidly through the critical speed range; or
(B) Alarm devices which operate in case where the main engines operate exceeding a pre-determined period in the critical speed range.
(3) Automation system is to be designed in a manner which ensures that threshold warning of impending or imminent slowdown or shutdown of the propulsion system is given to the officer in charge of the navigational watch in time to assess navigational circumstances in an emergency. In particular, the systems shall control, monitor, report, alert and take safety action to slow down or stop propulsion which providing the officer in charge of the navigational watch an opportunity to manually intervene, except for those cases where manual intervention will result in total failure of the engine and/or propulsion equipment within a short time, for example in the case of overspeed.

4. Safety measures

(1) Safety measures for main engines or controllable pitch propellers
Safety measures for main engines or controllable pitch propellers are to comply with the following requirements:
(A) The following safety measures are to be taken to the remote control devices for the main engines:
(a) Necessary interlocking devices are to be provided to prevent serious damage due to mis-operation.
(b) Where the auxiliaries for propulsion of the ship are driven by electric motors, the main engines are to be so designed as to stop automatically in the event of failure of the main source of electric power or to be capable of being stopped.
(c) The main engines are to be so arranged as not to re-start automatically when electric power is restored after the failure of the main source of electric power whereas the main engines were stopped.
(d) The remote control devices for main engines or controllable pitch propellers are to be so designed that the engines may not be abnormally overloaded in the event of failure of them.
(B) Stopping devices for main engines or controllable pitch propellers are to be provided at the monitoring station for main engines or controllable pitch propellers.
(2) Safety systems of main engines
Safety systems of main engines are to comply with the following requirements:
(A) A device to shut off the fuel or steam supply to the main engines (this device hereinafter being referred to as "safety device") is not to be automatically activated except in cases which could lead to complete breakdown, serious damage or explosion.
(B) The safety systems for main engines or controllable pitch propellers are to be so designed as not to lose their function or as to fail-to-safe, even in the event of failure of main electric source or air source.
(3) Self-reversing diesel engines
As least the following safety measures are to be taken to the remote control devices for self-reversing diesel engines:
(A) Starting operation is to be possible only when the camshaft is surely at the position of "Ahead" or "Astern".
(B) During reversing operation, fuel is not to be injected.
(C) Reversing operation is to be conducted after "Ahead" revolution is reduced to a pre-determined value.
(4) Multi-engines to single shaft

At least the following safety measures are to be taken to the remote control devices for multi-engines coupled to a single shaft:
(A) Each engine is to be provided with an overload preventive device.
(B) Each engine is not to be subjected to an abnormally unbalanced load.
(5) Main propulsion machinery with clutch
At least the following safety measures are to be taken to the remote control devices for engines with clutch:
(A) The clutch equipped to a main propulsion machinery in a multi-engines coupled to a single shaft is to be disengaged when the main propulsion machinery is stopped in an emergency. While multi-engines are operating in different directions of rotation their clutches are not to be engaged simultaneously.
(B) Engaging and disengaging of clutches are to be carried out below a predetermined value of the number of revolutions of the main engines.
(C) A overspeed protective device specified in **Pt 5, Ch 2, 203. 1.** or **304. 1.**
(D) In case where there is fear that the speed of the propulsion motor would exceed 125 % of the rated revolutions when the clutch is disengaged, an overspeed protective device as deemed appropriate by the Society is to be approved.
(6) Main propulsion machinery driving controllable pitch propellers
At least the following safety measures are to be taken to the remote control devices for engines driving controllable pitch propellers:
(A) Overload preventive devices are to be provided.
(B) Starting of engines or engaging of clutches is to be performed while the propeller blades are in a neutral position.
(C) An overspeed protective device as specified in **Pt 5, Ch 2, 203. 1.** or **304. 1.**
(D) In case where there is fear that the speed of the propulsion motor would exceed 125 % of the rated revolutions when the propeller pitch is altered, an overspeed protective device as deemed appropriate by the Society is to be provided.

203. Automatic and remote control of boilers

1. General

(1) The systems of automatic control for both combustion and feed water of oil-fired boilers are to comply with the requirements in **Pars 2** to **4** respectively.
(2) The systems of automatic control for either combustion or feed water of oil-fired boilers are to comply with the relevant requirements in **Par 2** or **3** as well as the requirements in **Par 4.**
(3) Automatic control of boilers other than oil-fired boilers or having a special feature will be considered in each case.
(4) Remote water level indicators are to comply with the requirements in **Pt 5, Ch 5, 129.**

2. Automatic combustion control systems

(1) General
Automatic combustion control systems are to comply with the following requirements:
(A) The automatic combustion control systems are to be able to control so as to obtain planned steam amount, steam pressure and steam temperature and to secure stable combustion.
(B) The devices to control the fuel supply to meet the load imposed are to be capable of ensuring stable combustion in the controllable range of fuel supply.
(C) Where combustion control is carried out according to the pressure of the boiler, the upper limit of this pressure is to be lower than the set pressure of the safety valves.
(2) Combustion control devices for intermittent operation
The combustion control devices for intermittent operation are to comply with the following requirements and they are to operate according to the planned sequence:
(A) Before ignition on the pilot burner or before ignition on the main burner if the pilot burner is not fitted, the combustion chamber and flue are to be prepurged by air of not less than four times the volume of combustion chamber and flue up to the boiler uptake. For small boilers with only one burner, prepurge for not less than 30 seconds will be accepted.
(B) In case of direct ignition which is the method of ignition that the main burner is fired by ignition spark, opening of the fuel valve is not to precede the ignition spark.
(C) In case of indirect ignition which is a method of ignition that the main burner is fired by pilot burner, opening of the fuel valve for pilot burner (hereinafter referred to as "ignition

fuel valve") is not to precede the ignition spark, and opening of the fuel valve for main burner (hereinafter referred to as "main fuel valve") is not to precede the opening of ignition fuel valve.

(D) Firing is to be surely carried out within the planned period. Main fuel valve is to be so designed as to close after opening of the valve not exceeding 10 seconds in the case of direct ignition and 15 seconds in the case of indirect ignition if the firing on the main burner has failed.

(E) Firing on main burners is to be carried out at their low firing position.

(F) After closure of the main fuel valve, postpurge is to be carried out for not less than 20 seconds to ensure adequate combustion air to completely burn all fuel oil remaining between the fuel oil valve and the burner nozzle. This requirement need not be complied with in the case of auxiliary boilers where approved by the Society.

(3) Combustion control devices for the control of the number of firing burners
The combustion control devices for the control of the number of firing burners are to comply with the following requirements:

(A) Each burner is to be fired and extinguished according to the planned sequence. However, the base burner may be fired by manual operation and other burners may be fired by flame of a burner(s) already fired.

(B) The remaining fuel in the extinguished burner is to be automatically burnt up in order not to interfere the restarting. However, while the pilot burner is not fired, the remaining fuel in the base burner is not to be removed by steam or air when it is in place.

(C) The burners for main boilers are to be capable of being fired and extinguished from the main control station, except for the firing of base burner.

(4) Other combustion control devices
Other combustion control devices will be considered in each case by the Society, as well as they are to comply with the relevant requirements in (2) and (3).

3. Automatic feed water control devices

(1) The automatic feed water control devices are to be capable of controlling automatically the feed water in order to maintain the water level in the boilers in a predetermined range.

(2) Main boilers are to be provided with not less than three water level detectors used for feed water control device, remote water level indicator, low water level safety device and low-water level alarm device.

4. Safety measures

(1) Safety devices
Safety devices are to comply with the requirements in **Pt 5, Ch 5, 133. 1.**

(2) Heating of fuel oil
In case where heated fuel oil is used, an automatic temperature control device is to be provided to the heater and the boiler is to be provided with a device to shut off automatically the fuel supply to the burners or an alarm device which operates when the temperature of fuel oil falls below a predetermined value.

5. Alarms

Alarm devices are to comply with the requirements in **Pt 5, Ch 5, 133. 2.**

204. Control system of electric generating sets

1. General

(1) Electric generating set arranged to be automatically or remotely started is to be provided with interlocking devices necessary for safe operation.

(2) Electric generating set arranged to be automatically started is to be so designed that the number of automatic consecutive attempts which fail to produce a start is limited to two times and to be provided with an alarm device which operate at the time of the failure of starting.

(3) In case where a diesel engine to drive a propulsion generator is remote started the number of starting is to conform to the required number specified in **Pt 5, Ch 2, 202. 5.**

(4) Where automatic start of the standby generating set with automatic connection to the switchboard busbars is provided, automatic closure on to the busbars is to be limited to one attempt, in the event of the original power failure being caused by short circuit.

(5) Automatic control and remote control systems for the electric generating set, whose generator is driven by the main propulsion machinery and supplies electrical power to the electrical installations necessary for normal operating and living conditions and is operated while the main propulsion machinery is controlled by the bridge control devices, are to comply with the requirements in **Pt 6, Ch 1, 201. 2** in addition to those in this Article.

2. Emergency Source of Electric Power

Automatic or remote control devices for diesel engines to drive emergency generators for non-emergency purposes are to be complied with the following requirements:

(1) Alarm devices to be activated in the event of the abnormal conditions given in **Table 6.2.2** are to be provided.
(2) Devices referred to in (1) are to provide alarms at both local and control positions. The visual alarms at control positions may be of group indication.
(3) Each diesel engine with a maximum continuous output of 220 kW or over is to be provided with an overspeed protective device specified in **Pt 5, Ch 2, 203. 1** (2) of the Rules.
(4) When devices to shutdown the diesel engines are provided other than those referred to in **Table 6.2.2**, means are to be provided to override those devices automatically during navigation.
(5) The silencing of the audible alarms from the control positions is not to cause the silencing of the audible alarm at local position.

Table 6.2.2 Alarms for diesel engines to drive emergency generators

Monitored parameters [H=High L=Low O=Abnormal status]			AA	Auto Shut down with alarm	Notes [AA=Alarm Activation ●=apply]
Temp.	Lub. oil inlet	H	●		For engines having a power of 220 kW or over
	Cooling water(or cooling air) outlet	H	●		
Press.	Lub. oil inlet	L	●		
	Pressure or flow of cooling water inlet	L	●		For engines having a power of 220 kW or over
Others	Oil mist concentration in crankcase(H) or main & connecting rod bearing temp. (or oil outlet temp.)(H) or an equivalent device	H	●		For engines having a power of more than 2250 kW, or a cylinder bore of more than 300 mm An equivalent device could be interpreted as measures applied to high speed engines where specific design features to preclude the risk of crankcase explosions are incorporated.(1)
	Fuel oil leakage from pressure pipes	O	●		
	Overspeed	O	●	●	For engines having a power of 220 kW or over

(NOTE)
(1) Oil mist detection system is to be of the approved type by the Society, tested by **Ch 3, Sec. 10** of **the Guidance for Approval of Manufacturing Process and Type Approval, Etc.** and applied to **Pt.5 Ch 2, 203.**

205. Automatic and remote control of auxiliary machinery

1. Automatic operation of air compressors

In case where air compressors for starting and air compressors for controlling are automatically operated, alarm devices are to be provided to indicate pressure drop in air reservoirs.

2. Automatic starting and stopping of bilge pumping arrangements

In case where the bilge pumps are capable of being started and stopped automatically, alarm devices are to be provided to indicate high level of bilge in the relevant bilge wells and running of pumps for a long time.

3. Thermal oil installations

Thermal oil installations arranged to be automatically controlled are to comply with the following:

(1) Standby pumps
Pumps listed in the following of the thermal oil installations for important use are to be provided in two sets or more. The standby pumps are to be so arranged that they can start automatically or are capable of being started without delay from the relevant monitoring station when the discharge pressure or flow rate from the working pump falls below a predetermined value or when the pump stops.
(A) Thermal oil circulating pumps
(B) Fuel oil supply pumps

(2) Control devices
Control devices are to comply with **203. 2** (1) and (2), and also with **Pt 5, Ch 5, 202. 1** and **2.**

(3) Safety devices
Safety devices are to comply with **Pt 5, Ch 5, 201.** and **202. 5.**

(4) Alarm devices
Thermal oil installations are to be provided with alarm devices which operate in the following cases:
(A) When the safety devices required in (3) have operated.
(B) When the temperature of fuel at the inlet of burner has fallen.

4. High temperature alarm for oil heaters

In case where temperature for fuel oil and lubricating oil is automatically controlled, high temperature alarm devices are to be provided, except where oils are not heated above the flashpoint.

5. Opening and closing devices for sea valves

In case where sea valves to be fitted on the shell plating below the load water line are remotely or automatically controlled, other opening and closing devices which can be easily operated even in the event of failure of the automatic or remote control devices are to be provided.

6. Liquid level alarm systems for fuel oil tanks

In case where fuel transfer to fuel oil tanks is automatically controlled, the receiving tanks are to be provided with high and low level alarm systems.

7. Mooring arrangements

In case where mooring arrangements are provided with remote control devices, the mooring arrangements are to be capable of being locally operated.

8. Fuel oil filling arrangements

In case where arrangements for filling fuel oil into respective fuel oil tanks from the outside of the ships (hereinafter referred to as "fuel oil filling arrangements" in this Chapter) are provided with remote control devices, the fuel oil filling arrangements are to be such as not to interfere with filling of fuel even in the event of failure of the remote control devices.

9. Emergency Diesel Engines

The requirements in **204. 2** apply correspondingly to the automatic or remote control devices for emergency diesel engines used for non-emergency purposes other than those mentioned in **204. 2**.

206. Control system of electric propulsion unit

It is to comply with the requirements in **Ch 1, Sec 17** in addition to the relevant requirements of this Chapter.

Section 3 Tests

301. Shop test

1. Type approval

Devices, units and sensors (hereinafter referred to as "automatic devices" in the Rules) and automatic equipment composed of automatic devices and basic software (if applicable) are to be type approved, in principle, according to the test methods approved by the Society before being taken into use.

2. Shop tests of automation system

The automatic devices which have passed through the type approval tests specified in **Par 1.** are to be subjected to the following tests after completion of assembly as automation system.

(1) Hardware
- (A) External examination
- (B) Operation tests and performance tests
- (C) Insulation resistance tests and high voltage tests (to be applied to electric devices, electronic devices and so on)
- (D) Pressure tests (to be applied to hydraulic devices, pneumatic devices and so on)
- (E) Other tests considered necessary by the Society

(2) Software
Software acceptance tests of computer-based systems are to be carried out to verify their adaptation to their use on board, and concern mainly the application software
- (A) The software modules of the application software are to be tested individually and subsequently subjected to an integration test. The test results are to be documented and to be part of the final file. The followings are to be checked.
  - (a) The development work has been carried out in accordance with the plan
  - (b) The documentation includes the proposed test, the acceptance criteria and the result.

Repetition tests may be required to verify the consistency of test results.
- (B) Software acceptance will be granted subject followings
  - (a) Examination of the avaliable documentation
  - (b) A function test of the whole system

302. On-board tests

After installed on board the systems of automatic or remote control of the machinery and equipment are to be confirmed that they operate effectively, under as far practical condition as possible. However, part of these tests may be carried out during sea trials. The proper documents, in which test procedures, set value for alarms and for operation of safety systems and so on are recorded, are to be kept on board.

303. Sea trials

1. Main propulsion machinery and controllable pitch propellers

The control systems for main engines or controllable pitch propellers are to be subjected to the following tests. After completion of the test on transfer of control specified in (3), it is to be shown that the main engines can be smoothly operated from the respective control stations.

(1) The main engines are to be subjected to starting tests, ahead-astern tests and running tests in the whole range of output, by means of the remote control devices from the main control station.

(2) In addition to output increase and decrease tests, the operation tests of the main engines using the bridge control devices are to be carried out at the discretion of the Society.

(3) In case where there are other control stations for main engines or controllable pitch propellers such as navigating bridge, the test on transfer of control for main engines or controllable pitch propellers is to be carried out during ahead and astern operations of the main engines. In case where, however, considered appropriate by the Society, the test on transfer of control to the local control stations may be carried out during stoppage of the main engines.

2. Boilers

The control systems for boilers are to be subjected to the following tests.

(1) With respect to the main boilers, it is to be confirmed that the feed water control devices, combustion control devices and so on can operate stably in response to load variation of the main boilers, and the main boilers can supply steam stably to the main engines, electric generating sets and auxiliaries for propulsion of the ship, without local manual operation.
(2) With respect to auxiliary boilers used for important use, it is to be confirmed that they can supply steam stably to the auxiliaries for propulsion of the ship without manual operation.
(3) In case where an exhaust gas economizer is used as a source of steam supply to a turbine for driving a generator and steam supply from a boiler is carried out automatically in the case of low power condition of the main engines, operation tests of automatic control devices for this system are to be carried out.

3. Electric generating sets

In case where generators which supply electric power to the loads necessary for propulsion of ships and whose motive power is relying upon the propulsion systems, the systems of automatic or remote control of electric generating sets are to be subjected to operation tests.

4. Electric propulsion plants

After electric propulsion plants are installed on board ship, sea trial is to be carried out in accordance with the test procedure. ⚓

KOREAN REGISTER

2011

Guidance Relating to the Rules for the Classification of Steel Ships

Part 6

Electrical Equipment and Control Systems

GA-06-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance relating to the Rules for Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF
PART 6 "ELECTRICAL EQUIPMENT AND CONTROL SYSTEMS"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date : 20 August 2010 (based on the application date for classification survey)

CHAPTER 2 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 2 System and Control

- 202. 3 (2) has been newly added.

Effective Date : 1 July 2011

CHAPTER 1 ELECTRICAL EQUIPMENT

Section 1 General

- 101. 1 (4) and (5) have been amended.
- 101. 1 (7) has been newly added.
- 103. 2 (1) Table 6.1.6 has been amended.

Section 2 Rotating Machinery

- 209. 1 has been deleted.

Section 3 Switchboards, Section Boards, Distribution Boards and Protective Equipment

- 301. 4 has been amended.

Section 4 Cables

- 402. 1 has been deleted.
- 404. 1 (1) has been amended.

Section 5 Distribution

- 506. 1 has been amended.

Section 9 Explosion−protected Electrical Equipment

- 902. 8 has been newly added.

Section 10 Lighting Fittings, Heating Appliances and Wiring Accessories

- 1002. 2 has been newly added.

Section 11 Internal Communications

- 1106. has been newly added.

Section 14 Emergency Electrical Equipment

- 1402. 2 (5) has been amended.

CHAPTER 2 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 3 Tests

- 301. 1 (1) has been amended.
- 301. 2 has been newly added.

CONTENTS

CHAPTER 1 ELECTRICAL EQUIPMENT

Section 1 General

101. General

1. Application

(1) The requirements in **Pt 6, Ch 1** of the Rules do not apply to the following electrical equipment except the case where the explosion-protected construction is necessary:
   (A) Radiotelegraph or radiotelephone equipment installed in accordance with the international laws or law of the flag state.
   (B) Navigation aids installed in accordance with the international laws or law of the flag state (those prescribed in regulation V/19 of Amendment 2009 to SOLAS Convention 1974)

(2) Electrical equipment for working and cargo handling, and home electrical appliances to be brought to ships such as television sets, radio sets, etc., are not applied to the requirements specified in **Pt 6, Ch 1** of the Rules excluding protection against electrical shock, firing and other casualties(including explosion). Electrical appliances not applied to the requirements of the Rules, as far as possible, are to comply with Korean Industrial Standards.

(3) Cables and protection devices (circuit breakers and fuses) connected to the electrical equipment or appliances stipulated in the requirements of (1) and (2) above, are to comply with the relevant requirements in **Pt 6, Ch 1** of the Rules.

(4) In application to **101. 1** (1) of the Rules, ships with special limitations for their service or small ships (less than 500 tons) mean the ships specified in the following:
   (A) Ships having service restriction notations of equipment of C, S or equivalent thereto as ships with gross tonnage less than 500 tons.
   (B) Ships not having service restriction notations of equipment specified in (A) above as ships with gross tonnage less than 500 tons.
   (C) Ships having service restriction notations of equipment specified in (A) above as ships with 500 tons gross tonnage or more, and ships complying with the requirements in **Pt 8 Annex 8-3, 12, 13, 14**.
   (D) Ships having class notations "$n \cdot f$" and service restriction notations of equipment specified in (A) above as ships with 500 tons gross tonnage or more and ships not complying with the requirements in **Pt 8 Annex 8-3, 12, 13, 14**.

(5) Electrical equipment on board the ships specified in (4) above are to be in accordance with (1) through (3) above, and the following:

Mitigated requirements for ships described in (A) to (D)

	Relevant requirements[1]	(mitigated requirements)	(A)	(B)	(C)	(D)
(a)	Rule 107.	Ambient conditions	O		O	
(b)	Rule 302. 1 (1)	Main switchboards' construction	O	O	O	
	Rule 302. 1 (2)	Generator switchboard's construction	O	O	O	
(c)	Rule 304. 1	D.C. ship's service generator panels	O		O	
(d)	Rule 304. 2	A.C. ship's service generator panels	O		O	
(e)	Rule 701. 2	Grouped starters	O	O		
(f)	Rule 404. 3 (2)	Precaution against fire protection of cables	O	O	O	
(g)	Rule 1203.	Protective devices, etc.	O	O	O	
(h)	Rule 201. 2	Main source of electrical power	O	O[2]	O	
(i)	Rule 601.	Transformers	O		O	
(j)	Rule 14	Emergency electrical equipment	O	O	O	
(k)	Rule 506. 3	Feeder circuits of navigation lights indicator	O	O	O[3]	
(l)	Rule 1901.	Spare parts	O		O	O
(m)	Rule 501. 3	Insulation monitoring system	O			
(n)	Rule 305. [3 (2)]	Protective devices [circuit breakers and fuses]	O		O[4]	
(o)	Rule 201. 2 (5)	Where the main source of electrical power is necessary for propulsion and steering of the ship	O	O	O	O
(p)	Rule 1106.	Public address systems	O	O	O	O

NOTES)
1) : The detailed contents are to comply with the below (A)
2) : The detailed contents are to comply with the below (B) (b)
3) : The detailed contents are to comply with the below (C) (c)
4) : The detailed contents are to comply with the below (C) (b)

(A) Ships specified in (4) (A) above

(a) In **107.** of the Rules, air temperature may apply 40℃ instead of 45℃, and sea water temperature may apply 27℃ instead of 32℃. However, ships engaged in tropical regions service are to be applied to the requirements in the Table. (refer to **Pt 5, Table 5.1.3** of the Rules)

(b) The requirements in **302. 1** (1) and (2) of the Rules do not apply.

(c) In **304. 1** of the Rules, where ships are provided with two or more d.c. generators engaged in single running only, ammeter and voltmeter are provided with each 1 set and are used in common for the generators. But, where the number of meters are made reduce, portable ammeter and voltmeter complied with the requirements in **1902.** of the Rules are to be equipped.

(d) In **304. 2** of the Rules, where the ships are provided with two or more a.c. generators engaged in single running only, ammeter, voltmeter and wattmeter are provided with each 1 set and are used in common for the generators. But, where the number of meters are made reduce, portable ammeter and voltmeter complied with the requirements in **1902.** of the Rules are to be equipped.

(e) The requirements in **701. 2** of the Rules do not apply.

(f) The requirements in **404. 3** (2) of the Rules do not apply.
(g) The requirements in **1203.** of the Rules do not apply.
(h) In application to **201. 2** (1) of the Rules, a generator driven by independent auxiliary engine may be provided with 1 set, except ships having class notation UMA and ships with coastal service.
(i) In **601.** of the Rules, where a accumulator battery with sufficient capacity necessary for electrical services of lightings, signal devices, radio equipment, etc. is provided, a reserved transformer may be omitted.
(j) The requirements in **1401.** of the Rules do not apply. However emergency source of electrical power capable of supplying simultaneously the following services at least for 3 hours (for a period of 30 minutes with continuous operation for the below (iv) & (v) system), is to be provided.
(i) All internal communication equipment required in an emergency
(ii) Navigation lights and signal lights (not under command lights, anchor lights)
(iii) Emergency lights installed in the following station
① Embarkation station of life raft, etc. and over the sides
② Accommodation alleyways, stairways and exits
③ Machinery spaces and spaces installed emergency source of electrical power
④ Control stations for main engine
(iv) Intermittent operation of the daylight signalling lamp, the ship's whistle, and all internal signals that are required in an emergency.
(v) The fire detection system and manually operated call point.
(k) In **506. 3** of the Rules, navigation light indicators may be served by one circuit fed from the emergency source. The following may be considered the emergency source.
① Either of the two generators which come into immediately operation in the event of loss of the normal power
② Charging devices for electric batteries
(l) In case of ships provided with efficient manual auxiliary steering gear, the requirements in **1901.** of the Rules do not apply.
(m) In **501. 3** of the Rules, a earth indicator may be installed instead of the device capable of continuously monitoring the insulation level to earth. in case of lamp type earth indicator, the indicator is to be of 2 lamp type or 3 lamp type having metal filament of capacity of 30W or less, and distance between lamps less than 150 mm.
(n) The requirements in **305. 3** (2) of the Rules do not apply. But, for the passenger ships, tankers and ships carrying dangerous chemicals in bulk, the plug-in type is to be applied only for the main switchboard and group start panels.
(o) The requirements in **201. 2** (5) of the Rules do not apply.
(p) The requirements in **1106.** of the Rules do not apply.
(B) Ships specified in (4) (B) above
(a) The requirements in (A) (b), (e), (f), (g), (j), (k), (o) and (p) above apply.
(b) In **201. 2** (2) of the Rules, the capacity of generator is to be possible to supply services necessary to provide normal operational conditions of propulsion and safety in spite of the event of any one generating set being stopped.
(C) Ships specified in (4) (C) above
(a) The requirements in (A) (a), (b), (c), (d), (f), (g), (h), (i), (j), (l), (o) and (p) above apply.
(b) The requirements in **305.** of the Rules do not apply. Group stater panels separated No.1 group and No.2 group are to be provided.
(c) In **506. 3** of the Rules, The navigation light indicator may be fed from the main switchboard and emergency switchboard or a lighting distribution board installed in the wheel house.
(D) Ships specified in (4) (D) above
(a) The requirements in (A) (l), (o) and (p) above apply.
(6) Where a ship applied to the requirements of (4) and (5) above makes an alteration of service area, purpose, etc., electrical equipment are to be installed in accordance with the Rules.
(7) The requirements for the emergency power on board passenger ships employed to domestic voyage are to apply as follows;
(A) The passenger ships employed to domestic voyage shall be equipped with the independent emergency power which satisfies following requirement of (a). However, for the passenger

ships, of which navigation area is below the level of smooth water area, provided with the batteries for main power, if these batteries satisfy the item (7) with the following requirements of (a), the independent emergency power requirement is exempted.

(a) The batteries (equipped with electric discharge indicator) shall be charged with needed power always and be able to be charged imminently without radical drop of voltage

(b) For the case of the generator driven by the independent oil suppliers and the effective motors with the starter recognized to be proper by the Society.(limited to the ones of which fuel oil's flash point of not less than 43 ℃). Emergency switchboard is to be installed as near as possible to emergency power.

(B) Emergency power according to the above (A) shall be charged imminently and automatically in the event of failure of the main source of electrical power due to malfunction, etc.

(C) Emergency source of electric power installed according to the above requirement (A) is to be supplied at least for 12 hours for the following services. However, in case of the ships expected voyage period with less than 6 hour, electric power may be supplied for 6 hours.

(a) Navigation lights
(b) Signal lights supplied from main source of electric power
(c) Emergency lights installed in the following stations.
(i) Corridors, stairways, ladders and exits
(ii) Main engine room, main generating room and engine control room
(iii) Navigation bridge, chart rooms and radio rooms
(iv) Places installed life boats, life rafts or life buoys and embarkation places.
(v) Other places where considered necessary by the Society
(d) Electric alarm system and indicators
(e) Fire detection system and manually operated call point.
(f) Other communication system, etc.

(D) Emergency source of electric power installed according to the above (A) is to be installed in accordance with the requirements of the followings.

(a) It is to be located above the uppermost continuous deck
(b) It is not to be contiguous to the boundaries of the engine room.
(c) It is to be located afterward of the collision bulkhead
(d) Supply of emergency electrical power is not to be interfered due to a fire or other casualty in spaces of engine rooms
(e) It is to be separated and ventilated from a fire or electrical sparks.

2. In application to **101. 2** of the Rules, International Electrotechnical Commission Publication and etc. may be referred.

3. In application to **101. 4** (1) of the Rules, a gas explosive atmosphere is the condition in which the gas that combustion can be continuous because it is not ignited and consumed in atmospheric condition and combustible materials in vapour condition are compounded. Where concentration of mixture exceeds the upper explosive limit, because it is easy to be explosible spaces, although it is not a gas explosive atmosphere, this condition is considered as a gas explosive atmosphere.

103. Construction and installation

1. Protection devices In application to **103. 3** of the Rules, power source switch of electrical equipment is to be so arranged that the equipment is not charged through control circuit or pilot lamp when the switch is in "off" position.

2. Installation and protective enclosure

(1) In a case where the characteristic letter IP showing the protection type of enclosures in accordance with the International Electrotechnical Commission 60529 is used for the protective enclosures of electrical equipment, the following requirements are to be complied with.

(A) Degree and expression of protection of enclosures
The degree of protection of enclosures is to be as given in **Table 6.1.1** of the Guidance. Protection type is to be expressed by the combination of symbol IP, first characteristic numeral which shows the degree of protection against access to hazardous parts and ingress of solid foreign objects, second characteristic numeral which shows degree of protection against ingress of water with harmful effects and additional letter which shows the protection against access to hazardous parts.

(B) Construction and test method of degree of protection

Construction and test methods of degree of protection are in accordance with **Table 6.1.2, Table 6.1.3, Table 6.1.4** and **Table 6.1.5** of the Guidance. The manufacturer is to carry out the relevant test for initial product at least, and is to identify effectiveness of protection type marked on the product. An individual test for the products may be carried out according to the discretion of the Surveyor.

(C) Application of degree of protection
As a guide for the selection of degree of protection for the electrical equipment on the basis of the circumstances of the place of installation, the requirements given in **Table 6.1.6** of the Guidance are to be taken into consideration.

Table 6.1.1 Degree of Protection and Expression

Code letters	First characteristic numeral	Second characteristic numeral	Additional letter(optional)	Supplementary letter(optional)
	Against access to hazardous parts and ingress of solid foreign objects	Against ingress of water with harmful effects	Against access to hazardous parts	Supplementary information
IP	0 1 2 3 4 5 6	0 1 2 3 4 5 6 7 8	A B C D	H M S W

(NOTES)
Out of expression, when either one of the first characteristic numeral or the second characteristic numeral is to be expressed, the degree of protection unnecessary is to be represented by X
Examples : IPX8 - Degree of protection only against ingress of water with harmful effects
IP5X - Degree of protection only against access to hazardous parts and ingress of solid foreign objects

Table 6.1.2 Degree of protection against access to hazardous parts and ingress of solid foreign objects shown by the first characteristic numeral

First characteristic numeral	Construction of protection	Testing methods and criteria
0	Non protected	-
1	Protected against access to hazardous parts with the back of a hand and protected against solid foreign objectsof 50mmϕ and greater	The sphere of 50(+0.05, -0) mm is not to fully penetrate with 50 N ±10 % of test force and adequate clearance form hazardous parts is to be kept.
2	Protected against access to hazardous parts with a finger and protected against solid foreign objects of 12.5 mmϕ and greater	The jointed test finger of 12 mmϕ, 80 mm length, may penetrate up to its 80 mm length with test force of 10 N±10 %, but adequate clearance form hazardous parts is to be kept. In addition, the sphere of 12.5(+0.05, -0) mm is not to fully penetrate with 30 N± 10 % of test force.
3	Protected against access to hazardous parts with a tool and protected against solid foreign objects of 2.5 mmϕ and greater	The test rod of 2.5(+0.05, -0) mm is not to penetrate with 3N± 10 % of test force and adequate clearance form hazardous parts is to be kept.

Table 6.1.2 Degree of protection against access to hazardous parts and ingress of solid foreign objects shown by the first characteristic numeral

First characteristic numeral	Construction of protection	Testing methods and criteria
4	Protected against access to hazardous parts with a wire and protected against solid foreign objects of 1.0 mmϕ and greater	The test rod of 1.0(+0.05, -0) mm is not to penetrate with 1N± 10 % of test force and adequate clearance form hazardous parts is to be kept.
5	Protected against access to hazardous parts with a wire and dust-protected	(1) Testing methods and criteria against the first characteristic numeral 4 are to be complied with. (2) The enclosure where the normal working cycle of the equipment causes reductions in air pressure within the enclosure below that of the surrounding air, e.g., due to thermal cycling effects (hereinafter referred to as Category 1 enclosure) is to comply with the following (a) and (b). At the end of the test, talcum powder is not to be accumulated in a quantity or location such that it could interfere with the correct operation of the equipment or impair safety. (a) The test is to be made using a dust chamber. The powder circulation pump circulates and floats the talcum powder-continuously in the test chamber. The talcum powder used is to be capable of passing through a square meshed sieve the nominal wire diameter of which is 50 μm and the nominal width between wires 75 μm. The amount of talcum powder is to be 2 kg/m^2 of the testchamber. It is not to be used for more than 20 tests. The enclosure under test is to be supported inside the chamber by fixing or hanging. The pressure inside the enclosure is to be maintained below the surrounding atmospheric by a vacuum pump. The depression of the pressure is not to exceed 2 kPa. (b) If an extraction rate of 40 to 60 vol/hour is obtained the duration of the test is to be 2 hours. If, with a maximum depression of 2 kPa, the extraction rate is less than 40 vol/hour, the test is to be continued until 80 vol. have been drawn through, or a period of 8 *hours* has elapsed (3) Enclosures where no pressure difference relative to the surrounding air is present (hereinafter referred to as Category 2 enclosures) are to comply with the above (2) tests in condition that the enclosure under the test is supported in its normal operating position, but is not connected to a vacuum pump. The test is to be continued for a period of 8 hours. At the end of the test, talcum powder is not to be accumulated in a quantity or location such that it could interfere with the correct operation of the equipment or impair safety.
6	Protected against access to hazardous parts with a wire and dust-tight	(1) Testing methods and criteria against the first characteristic numeral 4 are to be complied with. (2) The above (2) tests against the first characteristic numeral 5 are to be carried out and deposit of dust is not to be observed inside the enclosure at the end of the test.
(NOTES) The detailed test methods and criteria are referred to (KS C) IEC 60529.		

Table 6.1.3 Degree of protection against ingress of water with harmful effects shown by the second characteristic numeral

Second characteristic numeral	Construction of protection	Testing methods and criteria
0	Non protected	-
1	Protected against vertically falling water drops	The enclosure under test is to be placed in its normal operating position and 200 mm below the drip box. A flow of water drops, of which flow rate is 1(+0.5, -0) mm/min are to be produced for 10 min. At the end of the test, water is not to have accumulated in a quantity or location such that it could interfere with the correct operation of the equipment or impair safety
2	Protected against vertically falling water drops when enclosure tilted up to 15 degrees	The enclosure under test is to be placed in its normal operating position and 200 mm below the drip box. A flow of water drops, of which flow rate is 3(+0.5, -0) mm/min, are to be produced for 2.5 min in each of four fixed positions. These positions are to be 15 degrees on either side of the vertical. At the end of the test, water is not to have accumulated in a quantity or location such that it could interfere with the correct operation of the equipment or impair safety
3	Protected against spraying water	The enclosure under test is to be placed in its normal operating position. A uniform flow of water drops are to be produced over the whole area between vertical and 60 degrees on either side of the vertical at the distance of 300 mm to 500 mm from the enclosure. The delivery rate of water flow is to be 10(+0.5, -0.5) mm/min. The pressure to achieve this delivery rate is to be the range of 50 kPa to 150 kPa. The test duration is to be 1 min/m^2 of the calculated surface area of the enclosure(excluding any mounting surface), with a minimum of 5 min. At the end of the test, water is not to have accumulated in a quantity or location such that it could interfere with the correct operation of the equipment or impair safety
4	Protected against splashing water	The enclosure under test is to be placed in its normal operating position. A uniform flow of water drops are to be produced over the whole area between vertical and 180 degrees on either side of the vertical at the distance of 300 mm to 500 mm from the enclosure. The delivery rate of water flow is 10(+0.5, -0.5) l/min. The pressure to achieve this delivery rate is to be the range of 50 kPa to 150 kPa. The test duration is to be 1 min/m^2 of the calculated surface area of the enclosure(excluding any mounting surface), with a minimum of 5 min. At the end of the test, water is not to have accumulated in a quantity or location such that it could interfere with the correct operation of the equipment or impair safety
5	Protected against water jet	The enclosure under test is to be placed in its normal operating position. A stream of water from a standard nozzle of which internal diameter is 6.3 mm is to be sprayed to the enclosure from all directions. The distance between the nozzle and the enclosure is to be 2.5 m. The delivery rate is (12.5 l ± 0.5 %)/min. Core of the substantial stream is to be a circle of approximately 40mm diameter at 2.5 m distance from nozzle. Test duration per square metre of enclosure surface area likely to be sprayed is to be 1 min. Minimum test duration is to be 3 min. At the end of the test, water is not to have accumulated in a quantity or location such that it could interfere with the correct operation of the equipment or impair safety
6	Protected against powerful jet	The enclosure under test is to be placed in its normal operating position. A stream of water from a standard nozzle, of which internal diameter is 12.5 mm, is to be sprayed on the enclosure from all directions. The distance between the nozzle and the enclosure is to be 2.5 m to 3 m. The delivery rate is (100 l ± 0.5 %)/min. Core of the substantial stream is to be a circle of approximately 120 mm diameter at 2.5 m distance from nozzle. Test duration per square metre of enclosure surface area likely to be sprayed is to be 1 min. Minimum test duration is to be 3 min. At the end of the test, no water is to have entered into the enclosure.

Table 6.1.3 Degree of protection against ingress of water with harmful effects shown by the second characteristic numeral

Second characteristic numeral	Construction of protection	Testing methods and criteria
7	Protected against the effects of temporary immersion in water	The highest point of enclosures is to be located deeper than 150 mm below the surface of water, and also the lowest point of the enclosures is to be located deeper than 1000 mm below the surface of water. The duration of the test is to be 30 min. The water temperature is not to differ from that of the equipment by more than 5K. However, it may be waived where the equipment is energized and/or its parts in motion. At the end of the test, no water is to have entered into the enclosure.
8	Protected against the effects of continuous immersion in water	The test conditions are to be subject to agreement between manufacturer and user, but they are to be more severe than the conditions for the second characteristic numeral 7 and they are to take account of the condition that the enclosure will be continuously immersed in actual use. At the end of the test, no water is to have entered into the enclosure.
(NOTES) The detailed test methods and criteria are referred to (KS C) IEC 60529.		

Table 6.1.4 Degree of protection against access to hazardous parts shown by the additional letters

Additional letter	Construction of enclosure	Test methods and criteria
A	Protected against access with the back of the hand	The access probe, sphere of 50 mmϕ, is to have adequate clearance form hazardous parts with 50 N ± 10 % of test force.
B	Protected against access with a finger	The jointed test finger of 12 mmϕ, 80 mm length, is to have adequate clearance form hazardous parts with 10 N ± 10 % of test force.
C	Protected against access with a tool	The access probe of 2.5 mmϕ, 100 mm length, is to have adequate clearance form hazardous parts with 3 N ± 10 % of test force.
D	Protected against access with a wire	The access probe of 1.0 mmϕ, 100 mm length, is to have adequate clearance form hazardous parts with 1 N ± 10 % of test force.
(NOTES) The detailed test methods and criteria are referred to (KS C) IEC 60529.		

Table 6.1.5 Supplementary information shown by the supplementary letters

Supplementary letter	Significance
H	High voltage apparatus
M	Tested for harmful effects due to the ingress of water when the movable parts of the equipment, e.g., the rotor of the rotating machine, are in motion
S	Tested for harmful effects due to the ingress of water when the movable parts of the equipment, e.g., the rotor of the rotating machine, are stationary
W	Suitable for use under specified weather conditions and provided with additional protective features or process

Table 6.1.6 Application of Degree of Protection

Example of location	Condition of location	Switchboard, etc[1]	Generators	Motors	Transformers, Converters	Lighting fixtures	Heating appliances	Accessories[2]

(NOTES)

(1) It contains distribution boards, motor control centers and controllers.

(2) Accessories include switches, detectors, junction boxes, etc.

(3) Socket outlets are not to be installed in engine rooms, boiler rooms below floor plates, enclosed fuel and lubricating oil separator rooms or spaces requiring certified safe equipment.

(4) Navigation bridge may be categorized as a "dry control room" and consequently, the installation of IP 20 equipment would suffice therein provided that : (a) the equipment is located at to preclude being exposed to stream, or dripping/spraying water emanating from pipe flanges, valves, ventilation ducts and outlets, etc., installed in its vicinity, and (b) the equipment is placed to preclude the possibility of being exposed to sea or rain.

(5) Where the equipment is located within areas protected by local fixed pressure water spraying or water-mist fire extinguishing system and its adjacent areas.

(6) Electric motors and starting transformers for thrusters shall be equipped with heating elements (space heater, etc) for standstill heating. Provided the space will not be used as pump room for ballast, fuel oil, etc., the thrusters motor may be accepted with IP 22 enclosure type.

* "-" marks indicate installation of electrical equipment is not recommended., selection for explosion-protected construction is to be in accordance with the relevant requirements of **Pt 6, Ch 1** of the Rules.

(2) Electrical equipment installed in paint stores and enclosed spaces giving access to the paint store is to be in accordance with the followings.

(A) Electrical equipment installed in paint stores and ventilating ducts for the paint store are to be of explosion-protected type and cables of armoured type or installed in metallic conduits are to be used.

(B) In the areas on open deck within 1 m of inlet and exhaust ventilation openings or within 3 m of exhaust mechanical ventilation outlets, the following electrical equipment is to be installed:

(a) Electrical equipment with the type of protection as permitted in paint stores or

(b) Equipment of protection class Exn, or

(c) Appliances which do not generate arcs in service and whose surface does not reach unacceptably high temperature, or

(d) Appliances with simplified pressurized enclosures or vapour-proof enclosures (minimum class of protection IP55) whose surface does not reach unacceptably high temperature

(C) The enclosed spaces giving access to the paint store may be considered as non-hazardous spaces, provided that :

(a) The door to the paint store is a gastight door with self-closing devices without holding back arrangements.

(b) The paint store is provided with an acceptable, independent, natural ventilation system ventilated from a safe area.

(c) Warning notices are fitted adjacent to the paint store entrance stating that the store contains flammable liquids.

(D) Switches, protective devices, and motor control gear of electrical equipment installed in a paint store are to interrupt all poles or phases and preferably are to be located in non-hazardous space.

(3) Electrical equipment and relevant ventilation ducts installed in paint stores, battery rooms, acetylene stores are classified as "zone 1". Explosion protecting classes are to be higher than at least the followings in accordance with (KS C) IEC 60079.

(A) Paint store : Gas vapour group IIB, temperature class T3

(B) Battery room : Gas vapour group IIC, temperature class T1

(C) Acetylene store : Gas vapour group IIC, temperature class T2

(4) Electrical equipment installed in spaces on open deck within 1 m from ventilation openings of paint stores, battery rooms, acetylene stores or 3 m from outlets of mechanical ventilation equipments is classified as "zone 2".

3. In application to **103. 9** of the Rules, when current not more than rated values of electrical equipment and cables flows, deviation of magnetic compass needle not more than ±0.5° is not considered as a bad effect. And the excessive effect happened at the time of circuit on and off may not be considered, but the circuits switched on and off frequently are to be considered.

104. Earthing of electrical equipment

1. In application to **104. 2** of the Rules, the following exposed metal parts may not be earthen:

(1) Non-current-carrying metal parts of electrical equipment which are unlikely to be touched by persons during their service

(2) Lamp caps

(3) Shades, reflectors and guards, supported on lampholders or lighting fittings constructed of, or shrouded in non-conducting material

(4) Metal parts or screw separated by insulators from the current-carrying parts or from earthen non-current-carrying parts which are not charged or earthen under normal service condition

(5) Bearing housing insulated to prevent circulation of current in the bearing

(6) Clips of fluorescent lighting tube

(7) Equipment supplied at safety voltage

(8) Cable clips

2. Earthing may be made under the requirements as specified below:

(1) All earthing connections are to be made through copper or other corrosion resistance material and to be securely installed to hull structure. All earthing conductors are to be protected, where necessary, against mechanical damage and electrolytic corrosion.

(2) Where the metal frame or enclosure of electrical equipment is directly fitted to hull structure,

and the surface in contact are clean and free from rust, scales and paints, and bolted firmly, no earthing conductors may be provided.

(3) Under any circumstances, a lead cable sheath is not to be used as a sole earthing means.

(4) Nominal cross-sectional areas of all copper earthing conductors are to be as given in **Table 6.1.7** of the Guidance, In a case where earthing conductors other than copper are used, their conductances are to be of more than that of copper conductors given in **Table 6.1.7** of the Guidance.

(5) Connections between earthing conductors and hull structure are to be made in an accessible position, and to be secured by a screw of brass or other corrosion resistance material of diameter not less than 4 mm which is to be used for this purpose only. In any case, the contact faces are to have glossy metal surface when screws are tightened.

3. In a power distribution system where one line of the system is earthen and normally of non-current carrying line, the earthing connection is to be as specified in **2** above. However, the upper limit value 64 mm^2 of the cross-sectional area of the earthing conductor given in **Table 6.1.7** of the Guidance does not apply.

Table 6.1.7 Sizes of Earthing Conductor

<table>
<tr><th colspan="2">Kind of earthing conductor</th><th>Conductor's sectional area of current-carrying parts</th><th>Minimum sectional area of copper earthing conductor</th></tr>
<tr><td colspan="2" rowspan="2">1. Earthing conductor in flexible cables and flexible cords</td><td>16 mm^2 or less</td><td>100 % of conductor's sectional area of current-carrying parts</td></tr>
<tr><td>Over 16 mm^2</td><td>50 % of conductor's sectional area of current-carrying parts, but minimum 16 mm^2</td></tr>
<tr><td rowspan="4">2. Earthing conductor in cable runs secured</td><td rowspan="2">Insulated earthing conductor</td><td>16 mm^2 or less</td><td>100 % of conductor's sectional area of current-carrying parts, but minimum 1.5 mm^2</td></tr>
<tr><td>Over 16 mm^2</td><td>50 % of conductor's sectional area of current-carrying parts, but minimum 16 mm^2</td></tr>
<tr><td rowspan="2">Bared earthing conductor connected directly with lead sheath</td><td>2.5 mm^2 or less</td><td>1 mm^2</td></tr>
<tr><td>Over 2.5 mm^2 ~ 6 mm^2</td><td>1.5 mm^2</td></tr>
<tr><td colspan="2" rowspan="3">3. Single earthing conductor</td><td>(a) 3 mm^2 or less</td><td>100 % of conductor's sectional area of current-carrying parts, but minimum 1.5 mm^2 in case of lead wire, and minimum 3 mm^2 in case of the others</td></tr>
<tr><td>(b) Over 3 mm^2 ~ 125 mm^2</td><td>50 % of conductor's sectional area of current-carrying parts, but minimum 3 mm^2</td></tr>
<tr><td>(c) over 125 mm^2</td><td>64 mm^2</td></tr>
</table>

4. In application to **104. 3** of the Rules, portable electrical appliances are to be in accordance with the followings.

(1) The non-current-carrying metal parts of portable electrical appliances are to be earthed through plugs and receptacles by mean of earthing conductors provided in flexible cables or cords.

(2) Portable electrical appliances insulated doubly may not be earthed.

5. Aluminium superstructures Methods of securing aluminium superstructures to the steel hull of a ship often include insulation to prevent electrolytic corrosion between these materials. In such case, a separate bonding connection is to be provided between superstructure and the hull which should be made in such a manner that electrolytic corrosion is avoided and the points of connection may readily be inspected.

107. Ambient conditions

1. In application to **107. 1** of the Rules, "Ambient temperatures for electrical equipment installed in environmentally controlled spaces" are in accordance with the followings.

(1) Where electrical equipment is installed within environmentally controlled spaces the ambient temperature for which the equipment is to be suitable may be reduced from 45 °C and maintained at a value not less than 35 °C provided:

(A) The equipment is not for use for emergency services.

(B) Temperature control is achieved by at least two cooling units so arranged that in the event of loss of one cooling unit, for any reason, the remaining unit(s) is capable of satisfactorily maintaining the design temperature.

(C) The equipment is able to be initially set to work safely within a 45 °C ambient temperature until such a time that the lesser ambient temperature may be achieved; the cooling equipment is to be rated for a 45 °C ambient temperature.

(D) Audible and visual alarms are provided, at a continually manned control station, to indicate any malfunction of the cooling units.

(2) In accepting a lesser ambient temperature than 45 °C , it is to be ensured that electrical cables for their entire length are adequately rated for the maximum ambient temperature to which they are exposed along their length.

(3) The equipment used for cooling and maintaining the lesser ambient temperature is to be classified as a secondary essential service.

108. Clearance and creepage

1. Clearance and creepage are in accordance with **706. 2** of the Guidance.

109. Testing and inspection

1. The generators, switchboards and transformers used for cargo refrigerating installations and cargo handling arrangements specified in **Pt 9** of the Rules, are to be tested and inspected in accordance with the requirements in **109.** of the Rules.

2. The cables to be type approved by the requirements in **109. 1** (2) are in accordance with the followings.

(1) Cables used for supply and distribution circuits for power, lighting and internal communications

(2) Sheathed portable cords used for supplying and distribution circuits for power

(3) Polyvinylchloride insulated multi-core cables for 150 V electronic equipment

(4) Cables used for control circuit(insulation cables used for distribution boards and control gears)

(5) Cables used for communication such as optical fiber cables, coaxial cables and etc.

3. Type approval test for sheathed portable cords and Polyvinylchloride sheath cords other than cables specified in 4 above, may be carried out according to manufacturer's request.

4. Tests and inspections on type approved products

In application to **109. 6** of the Rules, it is to be in accordance with the followings.

(1) The inspections and tests in the presence of the Surveyor for individual product of followings among type-approved electrical equipment may be wholly omitted.

(A) Fuse

(B) Circuit breaker

(C) Magnetic contactor

(D) Cable trays/protective casings made of plastic materials

(E) Protection relay

(2) The individual products of followings among type-approved electrical equipment are to be tested in the presence of the Surveyor as follows:

(A) Explosion-proof type electrical equipment (rotating machinery only)

(a) Construction inspection (including dimension check for gab size, depth, etc.

(b) Temperature test

(c) Insulation resistance test

(d) High voltage test

(e) Water-proof test(sealing type only)

(B) Cables

(a) Construction inspection and dimension check
(b) Insulation resistance test
(c) High voltage test

5. "Where deemed appropriate by the Society " required in **109. 1** (1) (C), (D) of the Rules means "the cases approved by QA or others."

Section 2 Rotating Machinery

201. General

1. Main source of electrical power

(1) In application to **201. 2** (3) of the Rules, the shaft driven generator systems are to comply with following requirements.
(A) Forming part of the ship's main source of electrical power
(a) They are to be capable of operating under all weather conditions during sailing and during maneuvering, also when the vessel is stopped, within the specified limits for the voltage variation in **205. 4** and **206. 2** of the Rules and the frequency variation in **106. 3 Table 6.1.1** of the Rules.
(b) Their rated capacity is safeguarded during all operations given (a) above and is such that in the event of any other one of the generators failing, the essential services and services for habitability can be maintained.
(c) The short circuit current of the generator/generator system is sufficient to trip the generator/generator system circuit-breaker taking into account the selectivity of the protective devices for the distribution system. Protection is to be arranged in order to safeguard the generator/generator system in case of a short circuit in the main bus bar. The generator/generator system is to be suitable for further use after fault clearance.
(d) Standby generators are automatically started.
(B) Not forming part of the ship's main source of electrical power
Generators and generator systems, having the ship's propulsion machinery as their prime mover but not forming part of the ship's main source of electrical power may be used whilst the ship is at sea to supply electrical services required for normal operational and habitable conditions provided that:
(a) There are sufficient and adequately rated additional generators fitted, which constitute the main source of electrical power required by **201. 2.** (1), (2) and (3).
(b) Arrangements are fitted to automatically start one or more of the generators, constituting the main source of electrical power required by **201. 2.** (1), (2) and (3) and also upon the frequency variations exceeding ±10% of the limits specified in (c) below.
(c) The specified limits for the voltage variations in **205. 4** and **206. 2** of the Rules and the frequency variation in **106. 3 Table 6.1.1** of the Rules can be met within the declared operating range of the generators and/or generator systems.
(d) The short circuit current of the generator and/or generator system is sufficient to trip the generator/generator system circuit-breaker taking into account the selectivity of the protective devices for the distribution system.
(e) Where considered appropriate, load shedding arrangements are fitted.
(f) On ships having remote control of the ship's propulsion machinery from the navigating bridge means are provided, or procedures be in place, so as to ensure that supplies to essential services are maintained during maneuvering conditions in order to avoid a blackout situation.

(2) Provisions for maintaining or immediately restoring the electrical supply to equipment propulsion and steering specified in **201. 2** (5) of the Rules are to comply with followings:
(A) Where the electrical power is normally supplied by more than one generator set simultaneously in parallel operation, provision of protection, including automatic disconnection of sufficient non-essential services and if necessary secondary essential services and those provided for habitability, is to be made to ensure that, in case of loss of any of these generating sets, the remaining ones are kept in operation to permit propulsion and steering and to ensure safety.
(B) Where the electrical power is normally be supplied by one generator, the following require-

ments are to be complied with.

(a) provision is to be made, upon loss of power, for automatic starting and connecting to the main switchboard of stand-by generator(s) of sufficient capacity with automatic re-starting of the essential auxiliaries, in sequential operation if required.

(b) The time for automatic starting and connecting to the main switchboard of a standby generator specified in (a) above is to be preferably within 30 seconds, but in any case not more than 45 seconds, after loss of power.

202. Prime movers for generators

For prime movers with a brake mean effective pressure of 1.35 MPa or more to which the application of the method of throwing on the rated load of a generator specified in **202. 2** (2) of the Rules is impossible, the throwing-on method in three or four steps in accordance with the formulae below is to be used notwithstanding the requirements of the Rules:

Total throw-on load at the 1st step(%) = 80/BMEP

Total throw-on load at the 2nd step(%) = 135/BMEP

Total throw-on load at the 3rd step(%) = 180/BMEP

Total throw-on load at the 4th step(%) = 100

Where, BMEP : Brake mean effective pressure(MPa)

However, in case where the above throwing-on method applies, the manufacturers or shipyards are requested to submit a throw-on power calculation sheet demonstrating that the thrown load and base load at each step of operation do not exceed the value determined by the formulae above under any circumstances, to the Society for approval.

(1) At the time of power restoration after blackout

(2) At the time of sequential starting

(3) At the time of starting with a large start-up load

(4) At the time of instantaneous load transfer when one set of the generators fails (during parallel running)

203. Rotating machinery shaft

1. Rotating machinery shaft

(1) In application to **203. 1** of the Rules, The fillet radius on edge part is to be 0.08 times the shaft's actual diameter to prevent the stress concentration. In a case where the filet radius is less than 0.08 times the shaft's actual diameter, the shaft diameter is to be increased proportionally according to the coefficient of stress concentration.

(2) “Where it is apprehended that the torque is remarkably greater than normal torque” means where the auto synchronizing device is not installed. In this case the value of F is to be 120 % of the value given in accordance with **Table 6.1.3** of the Rules.

204. Temperature rise

1. In application to **204. 1** of the Rules, temperature rising of bearing is to be in accordance with the followings.

(1) Temperature rising limit of bearing (self-cooling type) is 35℃ when it measures at the surface, and is 40℃ when it measures by keeping temperature sensor under the metal. However, where heat-proof lubricating oil is used, it is 50℃ when it measures at the surface.

(2) Where rotating machinery used heat-proof insulation material of up-grade than F-Grade is difficult to apply to (1) above, data for heat-proof temperature rising limit is to be submitted to the Society, and is to be approved by the Society.

2. Temperature measuring method for winding of rotating of machinery forced cooling type by air cooler is to be the method of keeping temperature sensor under the winding or bridge method.

3. When cooling water temperature of rotating machinery of forced cooling type by air cooler is over 32℃, the temperature limit is to be in accordance with the discretion of the Society.

205. Ship's service d.c. generator

1. Undervoltage protection (For a.c and d.c generators)

For generators arranged for parallel operation with one another or with shore power feeder, measures are to be taken to prevent the generator breaker from closing if the generator is not generating and to prevent the generator remaining connected to the busbars if voltage collapses.

In the case of an undervoltage release provided for this purpose, the operation is to be instantaneous when preventing closure of the braker, but is to be delayed for discrimination purposes when tripping a breaker.

208. Welding

1. The manufacturers are to submit the detailed data in connection with the welding work for examination of the Society if they plan to make coupling of generator shaft welded with flange for the first time. And fatigue test is to be included in the welding process qualification test.

2. The manufacturers are to submit the following data in connection with the welding work for examination of the Society if they plan to make generator shaft welded with rib, etc.

(1) Standard design stress and strength calculation data for rib, etc. attached to the shaft by welding
(2) Standard for welding workmanship and details for control standard
(3) Welding process qualification test record. The test results carried out by means of the test specimen manufactured according to the standard for welding workmanship specified in above (2), are to be included to the record, and macro test, micro test and hardness distribution measurement for welding parts are to be carried out.

3. The torque transmission parts such as spider(center of rotor), etc. with welded construction are to be in accordance with 2 above.

4. Welding for electric motor shaft is to be in accordance with the followings.

(1) The essential auxiliary driving motors having output of 100 kW or over are to be in accordance with **1** and **2** above.
(2) The motors having output less than 100 kW are to be in accordance with the followings.
 (A) Shaft coupling flanges with welded construction are to be applied with appropriate modification of (1) above.
 (B) For rib, etc. with welded construction, standard for welding workmanship only instead of (A) above may be submitted.

209. Testing and inspection

1. Temperature test

In application to **209. 3** of the Rules, temperature test of rotating machinery, as a general rule, is carried out at actual load. But, in an unavoidable case, the zero power factor method or the temperature deduction method may apply to synchronous machines, and the equivalent load method may apply to induction machinery, such as the followings.

(1) Synchronous machines
 (A) Zero power factor method
 The rotating machinery is to be over-excited at unload condition by generator or motor, and is to be tested by flowing current close to rated current of zero power factor at rated voltage and frequency. The zero power factor method is capable of applying to synchronous machines for compensating of power factor, but where the method applies to synchronous generator or motor, sufficient field current to get value close to rated output providing for the case a hard to get the rated output by short of field current, is to flow at the test, and the test result is to be corrected according to the followings.
 (a) Temperature test is to be carried out for each rated voltage and no-load (armature open circuit), and rising temperature t_0 of armature winding and rising temperature t_{c0} of iron core of armature are to be get from the test.
 (b) In zero power factor method
 t' = rising temperature of windings at voltage V', current I'

t'_c = rising temperature of iron cores at voltage V', current I'

t'_f = rising temperature of field windings at field current I'_f

(c) when rated voltage is V, Rising temperature can be calculated by the following formula.

Armature windings : $T = t_0 + (t' - t_0) \times \left(\frac{I}{T}\right)^2$

Iron core of armature : $T = t_{c0} + (t' - t_{c0}) \times \left(\frac{I}{T}\right)^2$

Field windings : $I_f = t'_f \times \left(\frac{I_f}{T_f}\right)^2$

The test voltage V', as far as possible, is to be rated voltage, but voltage over than 90 % of rated voltage.

(B) Temperature deduction

Whichever is available among the followings.

(a) The rising temperature of iron core at rated output is the rising temperature of iron core when rotating machinery is operated at unload condition of terminal voltage equivalent to 110 % of rated voltage, and the rising temperature of armature windings at rated output is the rising temperature of armature windings when rotating machinery is operated at short condition of all terminals carrying armature current equivalent to 125 % of rated output.

(b) Total rising temperature of iron cores and armature windings, in each case, measured final temperature of iron core and armature windings when rotating machinery is operated at unload condition of rated voltage or at short condition of all terminals carrying rated current, is each rising temperature for rated output.

(c) The circulation current equivalent to rated current armature at $d.c.$ or single phase source is to be transmitted at the condition of that windings are connected by ring shape(triangle) line connection type, and opened one side, the terminal voltage equivalent to rated voltage, rising temperature of armature iron cores and windings are almost same as rated output when rotating machinery operates at rated speed through exciting to generate voltage of terminals equivalent to rated voltage. The current of field is to be corrected by zero power factor method.

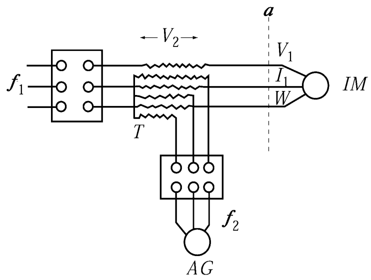
(2) Inductors

(A) First stage synthesizing equivalency load method

This method is test method carried out by increasing and decreasing the voltage and frequency after synthesizing the voltage of main source and low voltage having frequency different from the voltage of main source when the inductor for testing connected such as **Fig 6.1.1** of the Guidance operates at no-load condition, and in general, the method synthesizing first stage current and total load current (current standard method), is used. The method (loss standard method) that input is equalized with loss at rated load calculated from the circle diagram method for inductors of special squirrel cage, 2 pole machinery and large output.

(B) Second stage synthesizing load method

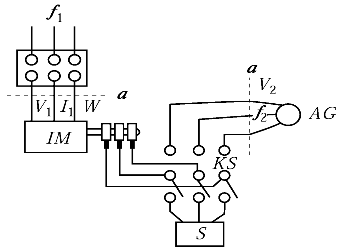
This method is test method transmitted full load current to first stage by increasing and decreasing the voltage and frequency after synthesizing the second stage voltage and low voltage having low frequency when the inductor for testing connected as **Fig 6.1.2** operates at no-load condition.



IM : Inductor for testing
a : Connection point of Volt-meter, Am-meter, Watt-meter
AG : Generator for auxiliary source
I_1 : First stage current of inductor
f_1 : Frequency of source (rated frequency)
T: Series transformer
f_2 : Synthesizing frequency
V_1 : Terminal voltage (rated voltage)
W : Input
V_2 : Synthesizing voltage

(NOTES)
1. The direction of phase circulation of auxiliary source is to be selected same as that of main source.
2. V_2 is to be exceedingly less than V_1.(about impedance voltage of inductor for testing)

Fig 6.1.1 First stage synthesizing equivalency load method



IM : Inductor for testing
I_1 : First stage current of inductor
a : Connection point of Volt-meter, Am-meter, Watt-meter
V_2 : Synthesizing voltage
f_2 : Synthesizing frequency
AG : Generator for auxiliary source
W : Input
V_1 : Terminal voltage (rated voltage)
S : Starting resistor
f_1 : Frequency of source (rated frequency)
KS : Change-over switch

(NOTES)
1. When inductor operates by auxiliary source after having a short-circuit of field, the direction of auxiliary source is to be selected direction same as that of rotator the case operated by main source.
2. It is recommended that, as far as possible, synthesizing frequency f_2 is not more than 1/2 f_1.

Fig 6.1.2 Second stage synthesizing load method

2. Over-current or excess torque test

In application to **209. 4** of the Rules, excess torque test of special type motor may be carried out as the following unless otherwise designated.

Single phase motor : excess torque of 33 % during 15 seconds

Motor used for deck machinery : excess torque of 50 % during 15 seconds

Synchronous induction motor : excess torque of 35 % during 15 seconds

3. Over speed test

In application to **209. 5** of the Rules, over speed test for 2 pole induction motor having 500 kW or over, is to be carried out at 120 % of synchronizing speed.

4. Voltage regulation test

(1) In application to **209. 8** of the Rules, voltage regulation test for generator, as a general rule, is to be carried out at the condition that the generator is connected directly with prime mover. Where the test is carried out by generator only, it is supposed that speed between no load and full load is changed in a straight line, and the voltage regulation rate is 3.5 % in the case of that there is no data about speed variation of prime mover.

(2) In application to **209. 8** (2) of the Rules, In the absence of precise information concerning the maximum values of the sudden loads, the following conditions may be assumed: 60 % of the rated current with a power factor of between 0.4 lagging and zero to be suddenly switched on with the generator running at no load, and then switched off after steady-state conditions have been reached.

5. Commutation test

(1) In application to **209. 10** of the Rules, grade of spark between commutator and brush of *d.c.* machinery is divided into 8 kinds specified in **Fig 6.1.3** of the Guidance, the sparks of No.5 through No.8 are considered as harmful spark.

(2) Nevertheless (1) above, when surface of commutator after the temperature test and over-load test becomes black or gets damaged depending on spark, or the brush wears down or gets damaged, the spark is considered harmful spark.

(3) The spark of No.2 or No.1 are recommended as spark at load of rated output or less.

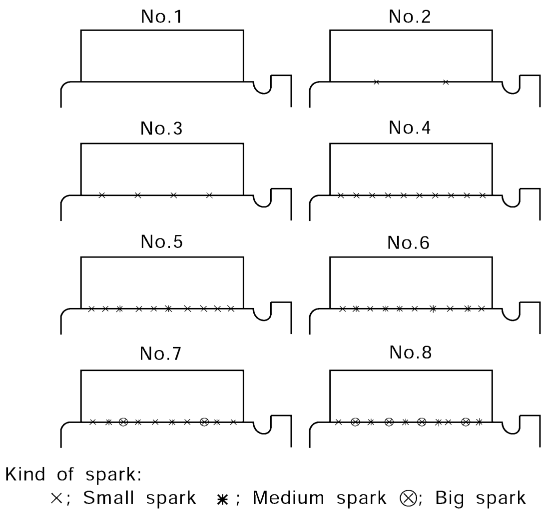


Fig 6.1.3 spark on surface of commutator

Section 3 Switchboards, Section Boards, Distribution Boards and Protective Equipment

301. General

1. Locations

In application to **301. 1** (1) of the Rules, in a case where steam pipes, water pipes, oil pipes, etc. are inevitably laid in the proximity of switchboards, flanges of these pipes are to be of welded joints or means are to be so provided that no detrimental effects would be exerted on switchboards if a leakage occurs.

2. In application **301. 1** (2) of the Rules, the followings are to be complied with.

(1) The main generating station is to be situated within the machinery space, i.e. within the extreme main transverse watertight bulkheads.

(2) Any bulkhead between the extreme main transverse watertight bulkheads is not regarded as separating the equipment in the main generating station provided that there is access between the spaces.

(3) The main switchboard is to be located as close as practicable to the main generating station, within the same machinery space and the same vertical and horizontal A-60 fire boundaries.

(4) Where essential services for steering and propulsion are supplied from section boards, these and any transformers, converters and similar appliances constituting an essential part of electrical supply system are also to satisfy the foregoing.

3. Safety spaces of operators

In application to **301. 2** of the Rules, the width of broken space to be provided in front of switchboards is to be 0.9 m or more as the standard. Furthermore, in case of emergency switchboard supplied from batteries or switchboards of small ships so constructed that necessary operation and maintenance can be done from their front, the passageway at the rear side of switchboards may be omitted.

4. Safety precautions to operators

In application to **301. 3** of the Rules, insulation mats have to get the type approval or product inspection by the Society and relevant requirements are to be in accordance with (KS C) IEC 61111.

302. Construction

1. Flame retardant test of insulation material is to be carried out at the normal temperature and the condition of that there is no wind, and round bar or thin steel plate having minimum length 120 mm, breadth 10 mm and thickness 3 mm is to be used as a standard for test specimen. The specimen is to be so tied up with a fine wire that breadth becomes an angle of about 45° vertically and length becomes horizontally. The test is to be used liquefied natural gas, and the flame is to be so adjusted vertically in air that the height of flame becomes about 125 mm and blue area of the flame becomes about 35 mm. The centerline of the flame is to become vertically, and the front of blue area of the flame is to be attached 5 times every 15 seconds intervals during 15 seconds at bottom of the specimen. It may be recognized that the specimen burns out after testing. Where the damaged length of the specimen is 60 mm or less, it is recognized as flame retardant material.

2. Flame retardant test of sealing compound for penetration of cables through fire-proof bulkheads and decks is to be applied with appropriate modifications of the requirements of **1** above. Where the damaged length of the specimen is 60 mm or less, the material is recognized as flame retardant compound (material equivalent to compound of non-combustible material).

3. The following may be regarded as the "other approved means" specified in **302. 1** (2) of the Rules.

(1) Circuit breaker without tripping mechanism
(2) Disconnecting link or switch by which busbars can be split easily and safely.

303. Busbars and equalizer connections

1. Busbars and the contact faces of busbars and linking conductors are to be protected against corrosion or oxidization by means of silver plating, tin plating or dipping in solder bath, etc.

2. Current rating of busbars may generally be determined by **Table 6.1.8** of the Guidance.

Table 6.1.8 Current Rating of Busbars

Type		Current rating
For Generator	In case where only one generator is feeding power to the busbars	100 % or more of the rated current of the generator
	In case where two or more generators are feeding power at their full capacities to the busbars	{(100 % of the rated current of one generator of the largest capacity) + (80 % of sum of the rated currents of the rest of generators)} or more
For Power Feeding	In case of general power feeding circuit	75 % of sum of the rated currents of the feeding circuits (including spare circuits) or more, but need be not more than the capacity of generator busbar
	In case where the feeding circuit has only one load circuit, or where power is fed to a group of motors under continuous service	The total rated current or more

304. Measuring instruments for switchboards

1. Instrument scales

In application to **304. 3** of the Rules, instrument scales mean effective measuring range. And where the scale of current meter for electrical motor needs to be extended for starting current, the extended scales do not apply with this requirement.

305. Protective devices

1. Protection against short-circuit

(1) In application to **305. 5** of the Rules, the circuit-breakers approved by the Society are recog-

nized as the circuit-breaker having the following making capacity, but the case specified in **305. 5** (3) of the Rules is excluded.

(A) d.c. circuit-breaker: value same as the rated short-circuit current

(B) a.c. circuit breaker: value specified in **Table 6.1.9** of the Guidance

(2) In a.c. circuit breaker, short-circuit test is to be carried out by test circuit having power factor different from the value specified in **Table 6.1.9** of the Guidance, the value calculated by the formula is to be used as a standard value for the making capacity of circuit-breaker passed the test.

$$I_{making} = I_{sy} \times n(A), \qquad n = \sqrt{2}\left\{1 + \sin\phi \times e^{-\frac{\frac{\pi}{2}+\phi}{\tan\phi}}\right\}$$

I_{making} : Making current

I_{sy} : Rated short-circuit current (effective value of short-circuit current in contrast to 1/2 cycle after shorting the circuit)

Table 6.1.9 Making Current of A.C. Circuit Breaker

Kind	Rated short-circuit current I_{sy} (A)	Making current I_{making} (A)	n I_{making}/I_{sy}	Power factor of circuit for short-circuit test $cos\phi$
Moduled-case circuit- breaker	2,500 5,000 7,500 10,000 14,000 18,000	4,250 8,500 12,750 17,000 23,800 30,600	1.7	0.5
	22,000 25,000 30,000 35,000 42,000 50,000 65,000 85,000 100,000	48,400 55,000 66,000 77,000 92,400 110,000 143,000 187,000 220,000	2.2	0.2
Air circuit- breaker	10,000 20,000 40,000 70,000 90,000	20,000 44,000 92,000 161,000 207,000	2.0 2.2 2.3 2.3 2.3	0.3 0.2 0.15 0.15 0.15

(3) In case where determination of cascade breaking capacity of breakers necessary for employing for short-circuit protection is intended in accordance with **305. 5** (2) of the Rules, the test method and criteria are to be as specified the followings.

(A) Test method

Back-up circuit breakers and fuses are to be connected in series with the circuit breakers on load side, and short-circuit tests under an operating duty of O - 2 minutes* - CO 1 time for one circuit breaker on load side are to be carried out.

Note: In case where the thermal trip reset time and fuse replacement time exceed 2 minutes, the time asterisked is the one deemed appropriate by the Society.

(B) Criteria after tests

The circuit breakers on load side are to satisfy the following requirements.

(a) No short-circuit is to be caused if the back-up circuit breaker is reclosed with the pow-

er supply being connected, and no voltage is to be applied on the terminals of the circuit breaker on load side.
(b) Circuit breaker can be safely and easily replaced with a spare.
(c) No damage is to be caused on the case body and cover.
(d) Maker and break of circuit is to be possible.
(e) High voltage test is to be carried out at a voltage 2 times the rated voltage, and to prove that it resists the voltage.
(f) Insulation resistance is to be 0.5 MΩ or over.

2. Protection of generator

In application to **305. 6** of the Rules, protection of generator is to be in accordance with the followings.

(1) The trip current scale adjusting value of over-current trip device, with time delay, for generator is to be selected as value protected at safety over-current according to heat capacity of generator and characteristics of over-current trip device, with time delay. And where kind and adjusting value of over-current trip device, with time delay (long delay and short delay), for short-circuit protection device are selected, cooperation between protection devices is to be considered.
(2) When parallel running of two sets or more of generators is capable, and selection trip device is provided, the adjusting value and characteristics of over-current trip device, with time delay, are so selected that over-current trip device of generator is not to operate with preference trip device at the same time. And when essential service motors are in danger of operating selection trip device at starting, the device may be interlocked during operating the motors.
(3) The following adjusting values for reverse power protection device are standard value.
(A) Generator driven by turbine : 2 ~ 6 %
(B) Generator driven by diesel engine : 6 ~ 15 %

3. Protection of feeder circuits

In application to **305. 9** of the Rules, rated current or trip current value of protection device used in single motor circuit excluding circuit for steering gear motors and small motors of rated current value 6A or less is, as possible as, to be not more than value specified in **Table 6.1.10** of the Guidance.

Table 6.1.10 Protection of feeder circuits

Kind of motor (starting method)		Rated current of fuse or moduled-case circuit-breaker
d.c. motor		150
Winding type induction motor		
Single phase, squirrel cage type, and synchronous motor (full voltage, reactor and resistor starting)		300
Squirrel cage type and synchronous motor (single winding transformer starting), special squirrel cage type motor	less than 30 A	250
	30 A or over	200

4. Protection of circuits

(1) In application to **305. 2** (2) of the Rules, “where the Society may exceptionally permit” means the followings.
(A) When it is impracticable, for example engine starting battery circuit
(B) For essential motors which are duplicated and thruster motor, the overload protection may be replaced by an overload alarm
(C) For exceptional permission according to **Pt 5, Ch 7, 207. 5** and **301. 2** (5) of the Rules

307. Testing and inspection

1. Switchboards of same type are those manufactured by same method at the same factory, and are to comply with the following.

(1) External dimension, internal capacity and ventilating method of generator panel having synchronizer panel are to be about the same.
(2) Type and rated values of generator circuit-breaker are to be same, and dimension, and arrangement of busbar and construction of terminal for connection are to be about the same.
(3) Load currents of busbar are to be about the same or less than the current.
(4) The arrangements of attached components in panels adjoined with heat source such as relay, fuse, resistor, etc. are to be about the same, and their total consumption power is to be about the same or less than the power.
(5) Construction and arrangement of terminals excluding maneuvering circuit, circuit for instrument, etc. are to be about the same.

2. Temperature test

In application to **307. 2** of the Rules, where coil is used with Class F insulation or Class H insulation, temperature rising limit of the coil is in accordance with the **Table 6.1.11** of the Guidance.

Table 6.1.11 Temperature Rising Limit of the Coil (°C) (Based on ambient temperature of 45°C)

Kind of insulation \ Test method	Thermometer method	Resistance method
Class F insulation	95	115
Class H insulation	120	140

3. High voltage test

(1) In **307. 4** of the Rules, auxiliary apparatus means connected indicating lamp, small transformer, relay, etc. between different poles or each phase
(2) When high voltage test for distribution boards is carried out according to **307. 4** of the Rules, instrument and auxiliary apparatus are to be removed. But the high voltage test for a unit of each apparatus is to be carried out for a unit of each apparatus and to comply with **307. 4** of the Rules.
(3) Electronic equipment or installations which is assembled within distribution boards, but are not connected directly with essential circuits of distribution boards or main circuits of supply and distribution on board, excluding special cases, do not apply to the Rules.

Section 4 Cables

401. General

1. In application to **401.** of the Rules, the term “consideration” means (KS C) IEC 60092 series, (KS C) IEC 60794, (KS C) IEC 60092-373 or standards considered as equivalent thereto.

2. Specifications including composition, dimension, property of composition material, test items, and for cables other than cables specified in **Par 1** above or **401.** of the Rules are to be submitted are to be approved by the Society.

402. Application of cables

1. In application to **402. 2** (3) of the Rules, "except where specially approved by the Society regarding mechanical damages" means that it is able to use un-armoured cables as long as the following tests are satisfied.

(1) **Tensile testing** is to be either of the followings.
(A) Tensile strength of inner sheath is to be 20 N/mm^2 and above, tensile strength of outer

sheath is to be 13 $\mathrm{N/mm^2}$ and above. Fracture elongation of inner or outer sheath is to be 250 % and above.

(B) Tensile strength of inner & outer sheath is to be 17 $\mathrm{N/mm^2}$ and above. Fracture elongation of inner or outer sheath is to be 400 % and above.

(2) **Impact testing and wear resistant testing**
Testing method and contents are to be approved by the Society.

(3) **Compression testing**
Insulation is not to be destructed by force of 1ton.

2. In application to **402. 3** of the Rules, flame retardant and fire resisting cables are to satisfy the followings;

(1) Flame retardant cable : (KS C) IEC 60332 series
(2) Fire resistant cable : (KS C) IEC 60331 series

403. Current rating of cable

1. Voltage drop In application to **403. 2** of the Rules, calculation of voltage drop is to complying with the following formulae as the standard :

(1) In the case of *d.c.* circuit

$$\text{Voltage drop}(\%) = \frac{R_{20} \times K \times 2L \times I \times 100}{V}$$

(2) In the case of *a.c.* circuit
Single phase *a.c.* circuit

$$\text{Voltage drop}(\%) = \left(\frac{R_{20} \times K \times 2L \times I \times 100}{V}\right) \times \delta(\%)$$

Three phase *a.c.* circuit

$$\text{Voltage drop}(\%) = \left(\frac{R_{20} \times K \times 2L \times I \times 100}{V}\right) \times \frac{1.73}{2} \times \delta(\%)$$

L : Length of cable for single passage (m)
I : Maximum load current (A)
V : Circuit voltage (V)
R_{20}: *d.c.* resistance at 20℃ (Ω/m)
K : Temperature factor at the maximum allowable temperature of conductor
(60℃ : 1.16, 75℃ : 1.22, 80℃ : 1.24, 85℃ : 1.26)
δ : Factor of voltage drop (Refer to **Table 6.1.12** and **Table 6.1.13** of the Guidance)

2. In circuits of electric motors, voltage drop is to be calculated by taking into account the starting current of an electric motor with the largest capacity. Further, in circuits of generators, approximately 115 % of the rated current is to be regarded as the maximum load thereby it is recommended that voltage drop is to be controlled to 1 % or less as far as practicable. Also, voltage drop in circuits of accumulator batteries, shore connection, etc. is to be controlled to 2 % or less as far as practicable.

Table 6.1.12 Factor of A.C. Voltage Drop in Rubber Insulated Cables (δ)

Nominal sectional area of conductor (mm^2)	Power factor (%)							Inductance (mH/km)	
	100	95	90	85	80	75	70	660 V	250 V
325	1.15	1.51	1.61	1.68	1.72	1.74	1.75	0.244	
250	1.10	1.37	1.45	1.49	1.51	1.52	1.52	0.246	
200	1.06	1.26	1.31	1.34	1.34	1.34	1.33	0.248

404. Installation of cables

1. Precaution against fire protection

(1) In application to **404. 3** (1) of the Rules, "special precautions" means the installation work of cables in the enclosed space or semi-enclosed space in ships meets either of the following requirements. However, the works (B) (iii) below are to be approved by the Society in accordance with the requirements in **Pt 3, Sec 22** of the「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」

(A) One cable is installed independently. Where the distance between those cables is to be of 5 times or more the diameter of the larger cable, the distance between one cable and bunched cables is to be of 5 times or more the diameter of the largest (the minimum value: the width of bunched cables or more), or an adequate fire stop is to be provided between one independently installed cable and others, they may be installed independently.

(B) In a case where bunched cables are installed, the following requirements are to be complied with:

(a) Flame retardant cables in a bunched condition which have passed the test of Category A, (KS C) IEC 60332-3-22(Test on electric cables under fire conditions - Part 3-22 : Test for vertical flame spread of vertically-mounted bunched wires or cable - Category A) in accordance with the requirements in **Pt 3, Sec 21 2108** of the「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」are to be used.

(b) In case where cables other than those specified in (i) above are used, the following means are to be taken (Refer to **Fig 6.1.4** of the Guidance).

(i) Fire stops having at least B-0 penetrations fitted as follows:
- cable entries at the main and emergency switchboard,
- where cables enter engine control rooms,
- cable entries at centralized control panels for propulsion machinery and essential auxiliaries,
- at each end of totally enclosed cable trunks (additional fire stops do not need to be installed inside totally enclosed cable trunks); and

(ii) Cable runs in non-totally-enclosed trunks and open cable runs are to comply with the following:
- to have fire protection coating applied to at least 1m in every 14m and to entire length of vertical runs, or
- to be fitted with fire stops having at least B-0 penetrations every second deck or approximately 6 m for vertical runs and at every 14 m for horizontal runs.

(iii)The cable penetrations are to be installed in steel plates of at least 3 mm thickness(see **Fig 6.1.4** (3)), but need not extend through ceilings, decks, bulkheads or solid sides of trunk. In cargo area, fire stops need only be fitted at the boundaries of the spaces.

(c) In case where the effect of the proposed means for preventing flame propagation are considered to be compatible with or better than that available with those specified in (b) above, such method may be used.

(2) In (1) above, in case where cables are taken additional measures, the additional measures are not to have a bad effect on the cables, and be of heat-resistance materials considered as equivalent to the cables.

(3) In application to **404. 3** (3) of the Rules, the followings are to be complied with.

(A) Electrical services required to be operable under fire conditions are as follows:

(a) Control and power systems to power-operated fire doors and status indication for all fire doors
(b) Control and power systems to power-operated watertight doors and their status indication
(c) Emergency fire pump
(d) Emergency lighting
(e) Fire and general alarms
(f) Fire detection systems
(g) Fire-extinguishing systems and fire-extinguishing media release alarms
(h) Low location lighting
(i) Public address systems
(j) Remote emergency stop/shutdown arrangements for systems which may support the propagation of fire and/or explosion

(B) In application to **404. 3** (3) of the Rules, the followings are to be complied with.

(a) Cables being of a fire resistant type complying with IEC 60331-31 for cables of greater than 20 mm overall diameter, otherwise 60331-21, are installed and run continuous to keep the fire integrity within the high fire risk area. (see **Fig 6.1.5**)

(b) At least two-loops/radial distributions run as widely apart as is practicable and so arranged that in the event of damage by fire at least one of the loops/radial distributions remains operational.

Systems that are self monitoring, fail safe or duplicated with cable runs as widely separated as is practicable may be exempted.

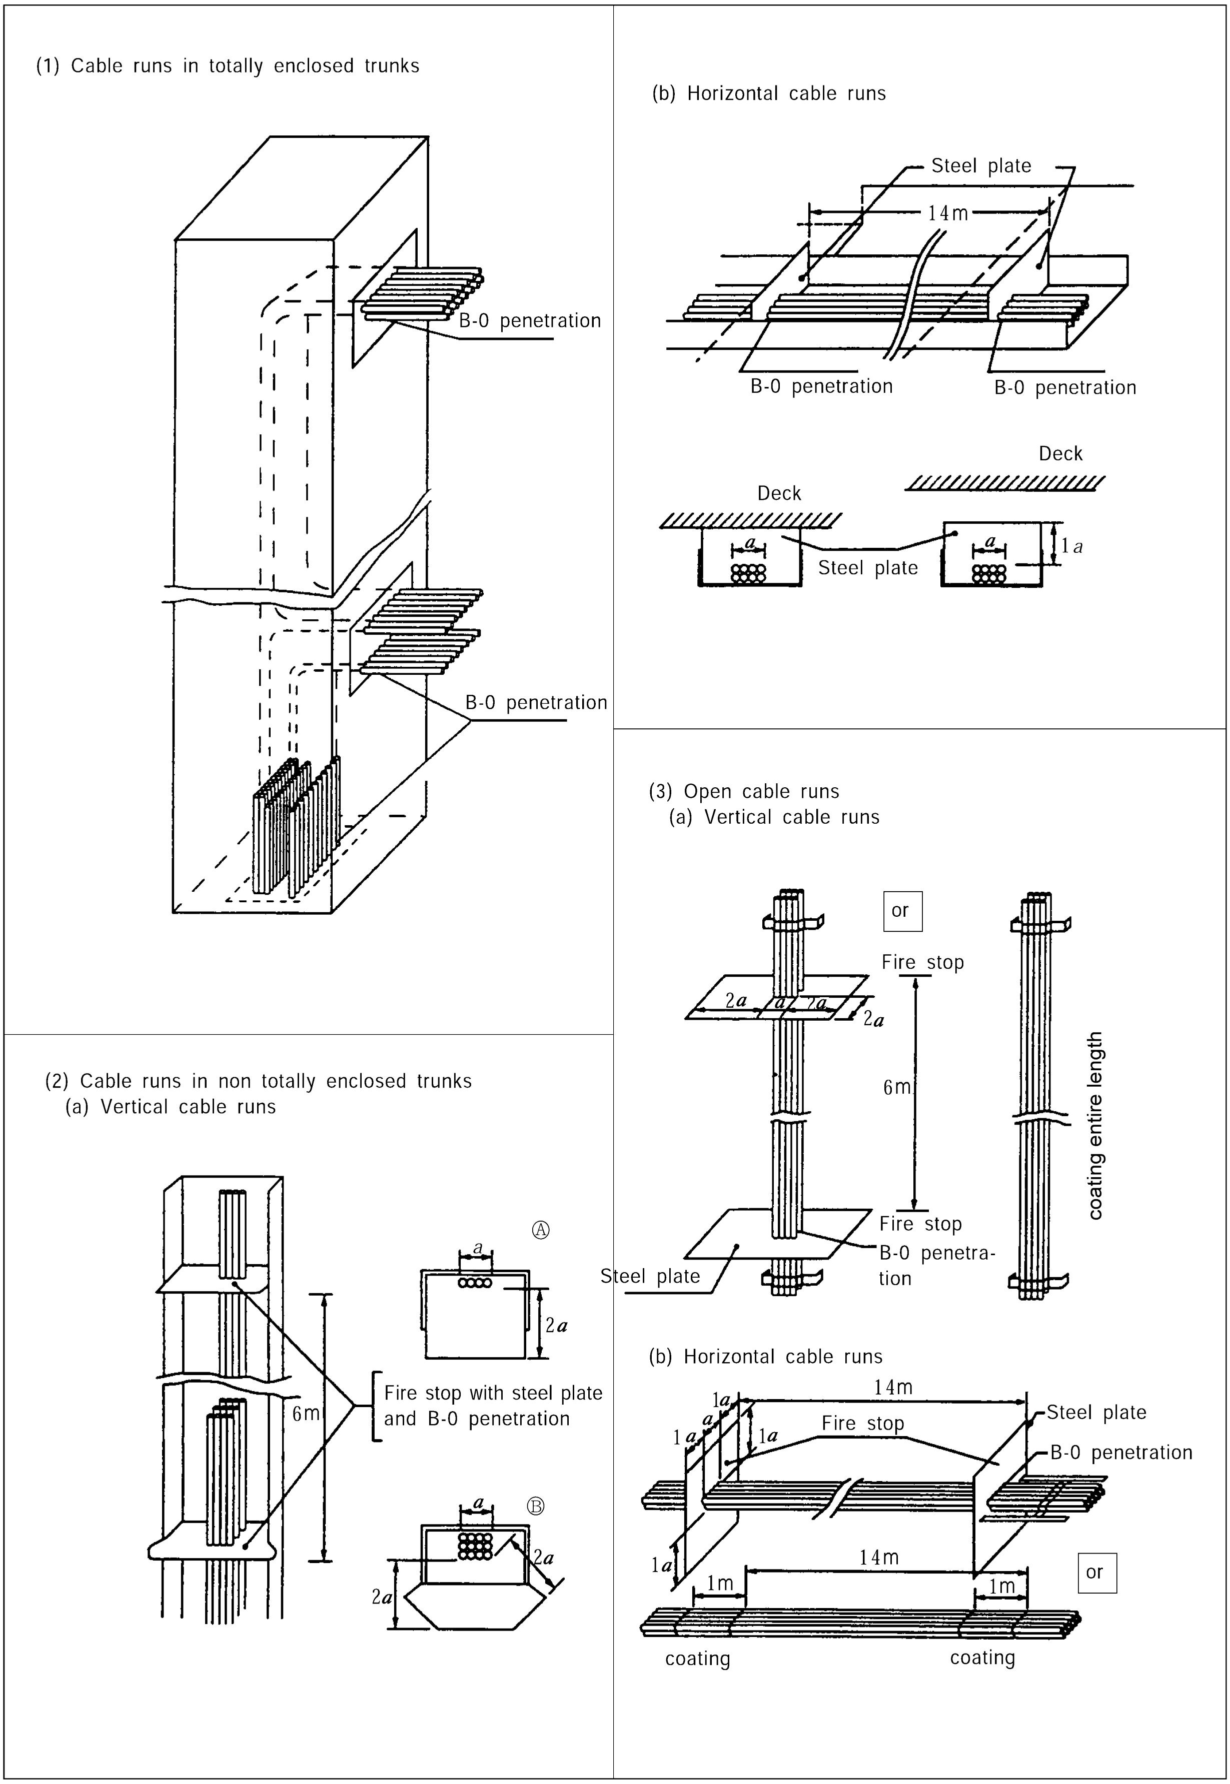

Fig 6.1.4 Flame propagation prevention measures

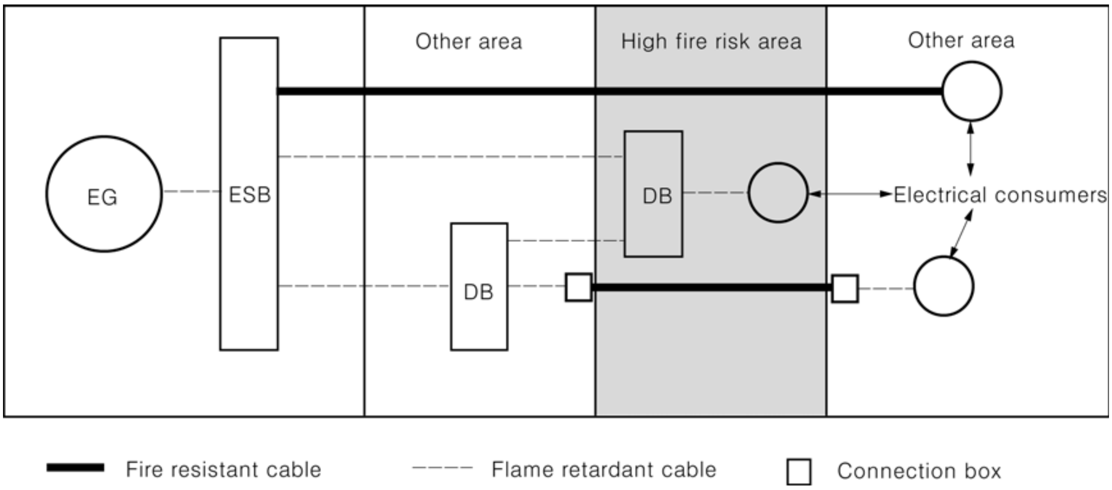

Fig 6.1.5 Example for Application of Fire Resistant Cables

(C) The definition for “high fire risk areas” is the following:
  (a) Machinery spaces as defined by Chap. II-2 / Reg. 3.30 of SOLAS
  (b) Spaces containing fuel treatment equipment and other highly flammable substances
  (c) Galley and Pantries containing cooking appliances
  (d) Laundry containing drying equipment
  (e) Spaces as defined by paragraphs (8), (12), and (14) of Chap. II-2 / Reg. 9.2.2.3.2.2 of SOLAS for ships carrying more than 36 passengers
(D) Fire resistant type cables are to be easily distinguishable.
(E) For special cables, requirements in the following standards may be used:
  (a) Electric data cables : (KS C) IEC 60331-23
  (b) Optical fibre cables : (KS C) IEC 60331-25

(4) The interconnecting cable between a generator and the main switchboard is to be routed clear fuel oil purifier spaces, above the other generator engines and fuel oil purifiers except the cables are;
(A) subdivided into at least two groups separated throughout their length as widely as practicable,
(B) fire resisting cables which have passed the test specified in (KS C) IEC 60331, or
(C) protected by means deemed appropriate by the Society.

2. The wording "a fire in an adjacent space" in **404. 3** (2) of the Rules generally means the fire from which standard time-temperature curves are obtainable in the standard fire test defined in regulation II-2/3.47 of Annex to SOLAS Convention.

3. The wording "high fire risk areas" in **403. 3** (2) of the Rules generally means spaces specified in **Pt 8, Ch 3, 301. 3** (3) ⑨ and **4** (2) ⑨ of the Rules excluding lockers.

4. Cables in refrigerated spaces In application to **404. 7** of the Rules, in case where non-metallic sheaths such as PVC or polychloroprene are used for cables installed in refrigerated spaces, materials which are not affected at the lowest temperature of refrigerated spaces are to be selected and the cables are to be installed in such a manner that they are not subjected to mechanical damage.

5. In case where installation of cables specified in **401. 1** of the Guidance in the space specified in **404. 3** of the Rules is unavoidable, these cables are to be installed in insulated steel pipes or steel ducts equivalent to A-60 or more, or fire resisting cables which have passed the test specified in (KS C) IEC 60331 are to be used.

6. Cables in dangerous spaces

Where cables are installed in dangerous spaces worried over fire or explosion due to electrical accident, the cable are to be protected properly.

(1) Dangerous spaces generally mean the following areas:
(A) Dangerous spaces specified in **Pt 7, Ch 1, Sec 11** of the Rules, Rules for Ships Carrying Liquefied Gases in Bulk (**Pt 7, Ch 5** of the Rules), and Rules for Ships Carrying

Dangerous Chemical in Bulk (**Pt 7, Ch 6** of the Rules).
(B) Cargo holds specified in **Pt 7, Ch 3, Sec 9** of the Rules
(C) Battery rooms, paint store and flammable gas bottle room such as acetylene gas bottle storage room

(2) Protections for cables to be installed in the dangerous spaces specified in (1) above are to comply with the following requirements:
(A) Cables to be installed in dangerous spaces specified in (1) (A) above may be regarded to have the protection by this requirement if the relevant requirements in **Pt 7, Ch 1, Sec 11** of the Rules, Rules for Ships Carrying Liquefied Gases in Bulk (**Pt 7, Ch 5** of the Rules), and Rules for Ships Carrying Dangerous Chemical in Bulk (**Pt 7, Ch 6** of the Rules) are complied with.
(B) Cables to be installed in cargo holds specified in (1) (B) above may be respectively regarded to have the protection by this requirement if the relevant requirements in **Pt 7, Ch 3, Sec 9** of the Rules are complied with.
(C) The protections for cables to be installed in each compartment specified in (1) (C) above are to comply with the following requirements:
(i) Cables are, in principle, to be of the metal armoured ones.
(ii) Protections for preventing mechanical damage to cables are to be provided as necessary.

406. Earthing

1. Earthing of Metallic Coverings

In application to **406. 1** of the Rules, earthing of metallic coverings of cables may comply with the requirements as specified below:

(1) Cable sheaths and armours may be earthen with earthing glands so designed as to allow effective earthing. Glands are to be installed in such a manner that they are securely fixed to the earthen metal structure with good electrical contact.
(2) Conduits may be earthen by being screwed into a metal enclosure, or by nuts on both sides of the wall of a metallic enclosure, provided the surfaces in contact are clean and free from rust, scale or paint and that the enclosure is securely earthen. The connection is to be painted immediately after assembly in order to inhibit corrosion.
(3) Cable sheaths and armour, and conduits may be earthen by means of clamps or clips of corrosion resistant materials making effective contact with sheath or armour and earth metal in lieu of the procedures specified in (1) and (2) above.
(4) All contacts of metal conduits, ducts and metal sheaths of cables used for earth continuity are to be soundly made and, where necessary, to be protected against corrosion.

407. Securing of cables

1. Clips, support and accessories

(1) In application to **407. 3** of the Rules, in case where non-metal cable bands and supports are used, their specification of material, dimension, property and manner is to be submitted to the society for obtaining approval. However, that those used for the interior of switchboards, etc. may be excluded from this requirement.
(2) In application to **407. 3** (4) of the Rules, the wording 'special considerations are to be given in order to prevent the release of the cable means the reinforcement by metal cable bands. Metal cable bands are to be arranged at intervals of 1 to 2 m considering the outside diameter of the cable.

408. Penetration of bulkheads and decks

1. Maintenance of the water-tightness and gas-tightness

In application to **408. 1** of the Rules, in maintenance of the water-tightness and gas-tightness at the cable penetrations, the construction and characteristics of materials of the cables are to be considered.

2. Penetration through fireproof bulkheads and decks

In application to **408. 2** of the Rules, penetration of bulkheads and decks is to be in accordance with the followings:

(1) The cable penetrations through A class bulkheads or decks are to be approved by the Society in accordance with the requirements of **Ch 3** of the「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」

(2) In case where cable glands are used those in the cable penetration through A class bulkheads or decks are to be filled with the non-combustible compound approved by the Society at least to a thickness of 25 mm or more may be accepted notwithstanding the requirements specified above. In this case, except A-0 class divisions, thermal insulation material is to be fitted additionally according to the class of fire protection as in other cases.

(3) The compound used in the cable penetrations through B class bulkheads or decks is to be of the non-combustible compound approved by the Society. In case where the compound is used to fill the sealing box or coaming, the length of the filled part is to be at least 50 mm or more.

(4) The compound approved to be used at the cable penetrations through A class bulkheads or decks under the requirements specified in (1) above may be regarded as the non-combustible compound meeting the requirements in (2) and (3) above.

409. Metallic pipes and conduits

1. In application to **409. 5** of the Rules, "where pipe arrangement is long" means not less than 30 m.

410. Cables for alternating current

1. In application to **410.** (5) of the Rules, distance between cable and steel bulkhead, as far as possible, is to be 50 mm or over.

2. "Large cross section" in **410.** (6) of the Rules means conductor having section area 185 mm^2 or over.

411. Joints and branch circuits

1. In application to **411. 2** of the Rules, "propulsion cable" means the cable of entire length between generators and electric motors for propulsion in electric propulsion ships.

412. Testing and inspection

1. For each product of cables passed type approval test according to **109. 1** (2) of the Rules, and each product of cables approved by **109. 6** of the Rules, material test for cable component may be omitted.

2. PVC sheathed cables to be installed in refrigerated spaces below -10℃ are to pass the cold bending test of cooling temperature which is -5℃ below the lowest temperature of a refrigerated space. A figure in an unit not exceed 5 is considered as 5 and that exceeding 5 is considered as 10 of the test temperature.

3. In case where the cables specified in 2 above are used with polychloroprene rubber sheath, the cables are to pass the cold bending test for PVC sheathed cables. But the test may be omitted in case where the lowest temperature of a refrigerated space is -30°C or over.

4. Cables are to be tested by **Ch 3, Sec 21** of the「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」, and are to be passed.

Section 5 Distribution

501. Methods of distribution

1. Insulation monitoring system

(1) Distribution system is the circuit such as the followings.

(A) First stage distribution circuit connected with circuit of electric generator

(B) Second stage distribution circuit connected by way of insulation transformer from the first stage distribution circuit in (A) above. But, as far as not specifying specially, second stage distribution circuit of specific equipment (for example, Suez canal search light, heater and lighting circuit for specific crane, etc.) is to be excluded.

(C) Lighting circuit using accumulator batteries as electrical source or main busbar of distribution boards connected to the circuit

(2) Alarm setting value of insulation monitoring device is used are 1/10 of insulation value at normal condition of electrical circuit as a standard.

(3) Where insulation monitoring device is used with earth lighting, interlocking device between them is to be provided.

2. Hull return distribution

The wording "special precautions taken to the satisfaction of the Society in **501. 4** (2) of the Rules" is the followings.

(1) All final sub-circuit is to consist of two insulated wires, and the hull return circuit is to be achieved by connecting directly to the hull one of the busbars of the distribution board from which they originate.

(2) Earth wires are to be installed in readily accessible locations to permit their examination and disconnection for testing of insulation.

503. Shore connections

1. Protector of connection box

In application to **503. 2** of the Rules, in case where portable means checking the phase sequence or polarity is provided on-board, means checking the phase sequence or polarity for shore connection may be omitted.

506. Navigation light circuits

1. Installation of navigation light indicator

In application to **506. 5** of the Rules, navigation light indicator is to be placed in both an accessible position on the navigation bridge and an easily accessible position for operating, and alarm is to be provided for power failure of navigation lights and in case that navigation lights are turned out due to short circuit, etc.

508. Feeder circuits for communication and signalling system, other lights

1. Daylight signalling lamp

In application to **508. 3** of the Rules, the power supply of the daylight signalling lamps is to comply with following requirements.

(1) Daylight signalling lamps are not to be solely dependent upon the ship's main or emergency sources of electrical energy.

(2) Daylight signalling lamps are to be provided with a portable battery with a complete weight of not more than 7.5 kg.

(3) The portable battery is to have sufficient capacity to operate the daylight signalling lamp for a period of not less than 2 hours.

(4) The portable battery is to be charged from the ship's main or emergency sources of electrical energy.

Section 6 Transformers for Power and Lighting

601. General

1. Capacity and number of transformer

(1) In application to **601. 2** of the Rules, where 3 sets of single phase transformer are arranged with Δ circuit connection at each first and second stage, and sufficient capacity necessary for

essential services can be supplied in spite of arranging *V* circuit connection due to failure of 1 set among them, a reserved transformer does not need to be installed specially. But, where 3 phase transformer of *Y*-*Δ* circuit connection is used, a reserved 3 phase transformer is to be installed.

(2) Arrangement of transformers are to be as follows. (see **Fig 6.1.6**)

(A) Each transformer is to be located as a separate unit with separate enclosure or equivalent thereto.

(B) Each transformer is to be served by separate circuits on the primary and secondary side.

(C) Each primary circuit is to be provided with switch-gear and protection devices in each phase.

(D) Each of the secondary circuits is to be provided with a multipole isolating switch.

(E) Transformers supplying bow thruster are excluded.

602. Construction

1. Transformer for accommodation

In application to **602. 1** of the Rules, the box and cover of dry type transformer are to be of metal and be of drip-proof type excluding where transformers are installed in switchboard or control panel having enclosure of appropriate construction. And the opening is to be of gab not more than 12 mm or to have grating not entered rounding bar of diameter 12 mm or over, and is to be of construction which a mouth, etc. cannot enter into the opening.

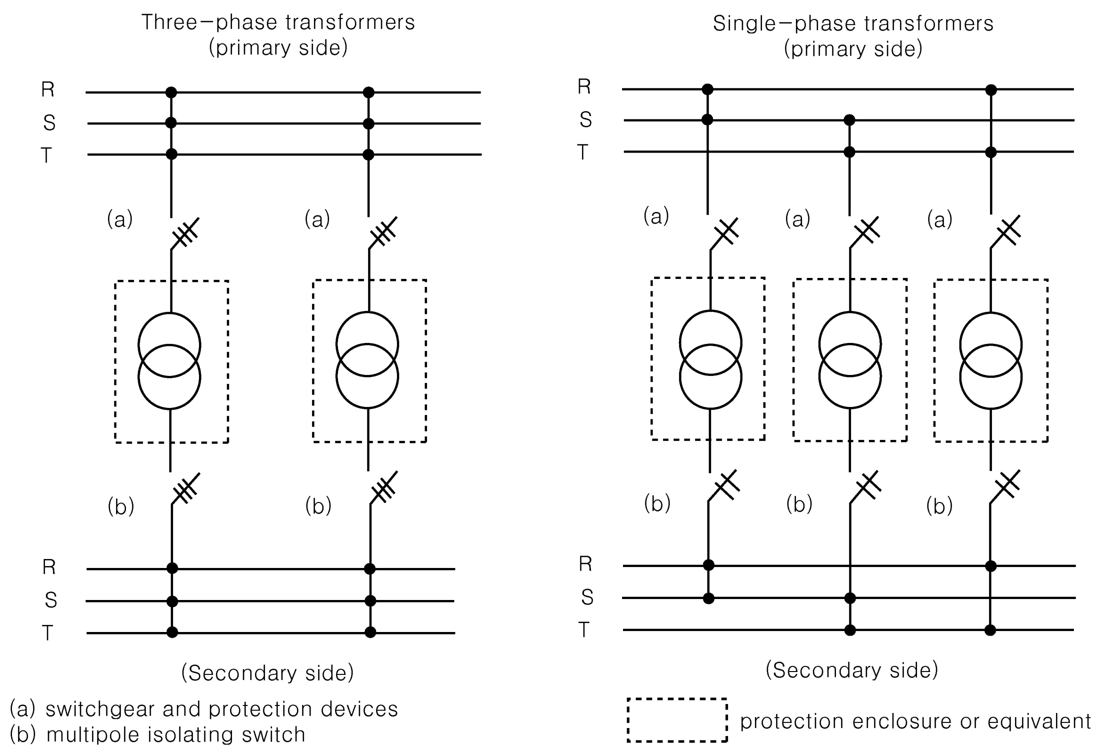

Fig 6.1.6 Arrangement of Transformers

605. Testing and inspection

1. General

In application to **605. 1** of the Rules, "transformer which is produced in series having identical type" is a transformer of identical capacity, voltage, current, major dimensions, cooling method and insulation grade, and manufactured by same manufacturing method at same factory.

2. Voltage variation test

In application to **605. 3** of the Rules, rate of voltage variation by calculation formula in is accordance with the following.

Rate of voltage variation = $q_r + \frac{q_z^2}{200}(\%)$

q_r : Voltage drop by resistance (%)

· In case of single phase : $q_r = \frac{P_{75}}{EI} \times 100$ or $q_r = \frac{P_{115}}{EI} \times 100$

· In case of 3 phase : $q_r = \frac{P_{75}}{\sqrt{3}\,EI} \times 100$ or $q_r = \frac{P_{115}}{\sqrt{3}\,EI} \times 100$

q_x : Voltage drop by reactance $= \frac{E_x}{E} \times 100(\%)$

P_t : Loss against rated capacity at t°C (W)

P_{75} : Loss against rated capacity calculated in terms of 75°C (W)

P_{115} : Loss against rated capacity calculated in terms of 115°C (W)

E_z : impedance voltage (V), i.e. voltage between first stage terminals when P_t is measured.

E_x : Reactance voltage (V)

· In case of single phase : $E_x = \sqrt{E_z^2 - \left(\frac{P_t}{I}\right)^2}$

· In case of 3 phase : $E_x = \sqrt{E_z^2 - \left(\frac{P_t}{\sqrt{3}\,I}\right)^2}$

E : Rated first stage voltage (V)

I : Rated first stage current (A)

And $P75$ in calculation formula above apply to A, E and B grade insulation, P_{115} apply to F and H grade insulation.

Section 7 Control-gears for Motors and Magnetic Brakes

701. Construction

1. Magnetic contactor and over-current relay for electric motor

In application to **701. 5** of the Rules, thermal relays or magnetic over-current relays for electric motor are to comply with the following at environmental temperature of 45℃.

(1) To be operated within 2~30 seconds under the condition of flowing the current of 600 % of the full load.

(2) To be operated within 4 minutes under the condition of flowing the current of 200 % of the current value after passing the current corresponding to the full load of electric motor until saturated temperature.

(3) To be not operated under the condition of flowing the current of 100 % of the full load, and to be operated within 2 hours under the condition of flowing the current of 125 % of the current value after saturated temperature.

703. Emergency stopping apparatus

In application to **703.** of the Rules, emergency stopping apparatus of equipments installed in machinery spaces are to be installed at the outside of machinery spaces.

706. Clearance and creepage distance of control appliances

1. The rated insulating voltage means the voltage having no difficulty in use as standard insulating voltage for design of control-gear, and the rated insulating voltage is the rated voltage or over.

2. Minimum creepage distances in **706.** (2) of the Rules are to be in accordance with **Table 6.1.15** and **Table 6.1.16** of the Guidance according to the grades specified in **Table 6.1.14** of the Guidance.

3. Clearance and creepage distance of control-gear is to be in accordance with the following (refer to **Table 6.1.17** of the Guidance). Grade C in the following means degree of protection and ambient condition specified in **706.** (1) of the Rules.

(1) Clearance is to be decided on the minimum distance between bare live parts, minimum value of Grade C is the value specified in **Table 6.1.16** of the Rules, and minimum value of Grade A and B is the value specified in **Table 6.1.15** and **6.1.16** of the Guidance.

(2) Creepage is to be decided on the minimum distance adjoining the surface of insulating material inserted between bare live parts, minimum value of Grade C is the value specified in **Table 6.1.16** of the Rules, and minimum value of Grade A and B is the value specified in **Table 6.1.15** and **6.1.16** of the Guidance. But the space such as the following existing in the surface of insulating material is to be decided to be no space.

(A) Breadth or depth of space less than 1 mm in Grade B rated insulating voltage 125 V over and Grade C rated insulating voltage 250 V or less

(B) Breadth or depth of space less than 2 mm in Grade C rated insulating voltage 250 V over

(3) In (1) and (2) above, where insulating material is divided by metal between bare live parts, creepage distance of control-gear is to comprise one of the followings.

(A) The maximum value among the divided insulation material is to be decided on, in case of Grade C, the value specified in **Table 6.1.16** of the Rules or more, and in case of Grade A and B, the each value specified in **Table 6.1.15** and **6.1.16** of the Guidance or more.

(B) The sum of two higher values among the divided insulation material is to be, in case of Grade C, the value specified in **Table 6.1.16** of the Rules or more, and in case of Grade A and B, the each value specified in **Table 6.1.15** and **6.1.16** of the Guidance or more. But the divided insulation materials less than 1mm in Grade B rated insulating voltage 125 V over and Grade C rated insulating voltage 250 V or less, and those less than 2 mm in Grade C rated insulating voltage 250 V or less are excluded.

Table 6.1.14 Class for Protection Condition and Environmental Condition

Class	Minimum value	Protection condition	Environmental condition
A	**Table 6.1.15**	Inside of control-gear protected enough to be not affected with environmental condition such as moisture, dust, etc. Example: Inside of dust-protection type relay, plated printing distribution board.	Control gear using at excellent environmental condition which has nothing to worry about pollution Example: Air-conditioning clean room
B	**Table 6.1.16**	Control-gear protected enough to be not affected with environmental condition such as moisture, dust, etc. Example: Small relay for control device, exclusive use socket, not plated printing distribution board.	Control gear using at good environmental condition Example: Clean electrical equipment room

Table 6.1.15 Minimum Clearance and Creepage Distance for Class A Control Appliances

Rated insulating voltage V	Class A			
	Clearance mm		Creepage [(3)(4)] mm	
(*d.c., a.c.*)	$L-L^{(1)}$	$L-A^{(2)}$	*a*	*b*
Not exceeding 12	0.2	0.2	0.2	0.2
Exceeding 12 to 30	0.4	0.4	0.4	0.4
Exceeding 30 to 60	0.5	0.5	0.5	0.5
Exceeding 60 to 125	0.5	0.5	0.5	1
Exceeding 125 to 250	1	1	1	1.5
Exceeding 250 to 380	1.5	1.5	1.5	2
Exceeding 380 to 500	2	2	2	3

Table 6.1.16 Minimum Clearance and Creepage Distance for Class B Control Appliances

Rated insulating voltage V	Class B			
	Clearance mm		Creepage [(3)(4)] mm	
(*d.c.*, *a.c.*)	$L-L$ [(1)]	$L-A$ [(2)]	a	b
Not exceeding 12	0.4	0.4	0.4	0.4
Exceeding 12 to 30	1	1	1	1.5
Exceeding 30 to 60	1	1	1	2
Exceeding 60 to 125	1.5	1.5	1.5	2.5
Exceeding 125 to 250	2	3	2	3
Exceeding 250 to 380	3	3	3	4
Exceeding 380 to 500	4	4	4	6

(NOTES)
(1) "$L-L$" applies to clearance between bare live parts, and between live part and earthen metal part.
(2) "$L-A$" applies to clearance between live part and metal part which accidently becomes dangerous.
(3) Creepage distance is to be determined by type and shape of insulation. a applies to ceramic insulator (steatite and porcelain), and comparable other insulator which is particularly safe against leaked electricity provided with ribbed construction or vertical partitions proved to be equally effective as ceramic insulator through experiments having a tracking index greater than 140 e.g., phenol resins formed items. "b" applies to other insulation materials.
(4) In case where "$L-A$" is greater than the corresponding creepage "a" or "b", the creepage distance between bare live parts and insulated metals which operator may readily touch and which becomes live parts by the deterioration of insulation are to be "$L-A$" or more.
(5) Current value is to be expressed by the rated current-carrying value.

Table 6.1.17 Selection of Clearance and Creepage Distance

No.	Figure	Condition	Clearance (G)	Creepage (L)
1		For W or d<1mm Class B: Exeeding 125V Class C: 250V or under For W or d<2mm Class C: Exeeding 250V	G	L
2		For W or $d \geq$ 1mm Class B: Exeeding 125V Class C: 250V or under For W or $d \geq$ 2mm Class C: Exeeding 250V	G	$L = l_1+l_2+W+2d$
3		For W=1mm or $d \geq$ 1mm Class B: Exeeding 125V Class C: 250 V or under For W=2mm or $d \geq$ 2mm Class C: Exeeding 250V	G	$L = l_1+l_2+W$
4		For h<1mm Class B: Exeeding 125V Class C: 250V or under For h<2mm Class C: Exeeding 250V	G	$L = l_1+l_2+W$
5		For $h \geq$ 1mm Class B: Exeeding 125V Class C: 250V or under For $h \geq$ 2mm Class C: Exeeding 250V	$G=g_1+g_2+W$	$L=l_1+l_2+W+2h$
6		In case where metal exists between live parts Example: $g_1>g_2>g_3>g_4$ $l_1>l_2>l_3>l_4$ For g_2 and $l_2 \geq$ 1mm Class B: Exeeding 125V Class C: 250V or under For g_2 and l_2 $\geq$ 2mm Class C: Exeeding 250V	$g_1 \geq$ requirement value or $g_1 + g_2 \geq$ requirement value × 1.25	$l_1 \geq$ requirement value or $l_1 + l_2 \geq$ requirement value × 1.25

Table 6.1.17 Selection of Clearance and Creepage Distance (Continued)

No.	Figure	Condition	Clearance (G)	Creepage (L)
7		Where the depth of space of insulation material is deeper than inserting part.	$G = g_1+g_2+W_1$	$L = l_1+l_2+W_2+2d$
8		Where the insulation material and rib are so inserted as to be seen one body.	$G=g_1+g_2+W$	$L=l_1+l_2+W+2h$
9		For W=1mm or l_2<1mm Class B: Exeeding 125V Class C: 250V or under For W=2mm or $l_2 \geq$ 2mm Class C: Exeeding 250V	$G = g+l_1$	$L = l_1+d$
10		For $l_2 \geq$ 1mm Class B: Exeeding 125V Class C: 250V or under For $l_2 \geq$ 2mm Class C: Exeeding 250V	$G = g+l_1$	$L = l_1+l_2+d$
11		For $l_2 \geq$ 1mm Class B: Exeeding 125V Class C: 250V or under For $l_2 \geq$ 2mm Class C: Exeeding 250V	$G = d_2+d_3$	$L = l_1+l_2+d_1+d_2$
12		In case where there is in receptacle of metal	$G_1 = l_1+l_2+W$ (between bare live parts) $G_2 = g_1(g_1 < g_2 < d_1)$ (between ground)	$L_1 = l_1+l_2+W+2h$ (between bare live parts) $L_2 = d_2$ (between ground)

(4) In (1) and (2) above, where rib exists in the surface of insulating material inserted between bare live parts, the creepage and clearance are to be decided on the values excluded the height such as the followings.
  (A) Height of rib less than 1 mm in Grade B rated insulating voltage 125 V over and Grade C rated insulating voltage 250 V or less
  (B) Hight of rib less than 2 mm in Grade C rated insulating voltage 250 V over
(5) In (1) and (2) above, where the other rib inserted in insulating material between bare live parts, and the inserted distance is less than the depth of space of insulation material, creepage is to be decided on minimum distance along the line of the inserted rib.
(6) In (5) above, where the rib of material able to see as same insulating material is inserted, creepage and clearance are to be decided on minimum distance along the line of surface of the rib.
(7) Creepage to earth and clearance to earth are to be decided on minimum distance according to (1) and (2) above.
(8) The insulation distance of those having insulating metal which becomes bare live part by deterioration is to be decided according to (3) above.

707. Testing and inspection

1. General

In application to **707. 1** of the Rules, “control-gear which is produced in series having identical type” is a control-gear manufactured by same manufacturing method at same factory and complying with the followings.

(1) External dimension of panel, box, etc., internal capacity and ventilating method are to be about the same.
(2) Type and rated values of circuit-breaker, magnetic contactor of main circuit are same, and dimension and arrangement of main circuit conductor and construction of terminal for connection are to be about the same.
(3) Load currents of main circuit are to be about the same or less than the current.
(4) The arrangement of attached components in panel adjoined with heat source such as relay, fuse, resistor, etc. are to be about the same, and their total consumption power is to be about the same or less than the power.

2. High voltage test

In **707. 4** of the Rules, the high voltage test is to be in accordance with **307. 4** of the Rules.

Section 8 Fuses, Circuit-breakers and Electromagnetic Contactors

801. General

1. Korean Industrial Standards or equivalent are the followings. And where products made by manufacturer other than Korean flag, the standard established by the nation may apply according to the discretion of the Society. However, the standards are to be updated. And where these standards are not standard for ship's store, the products are to be considered with ship's environmental condition (to comply with **Pt 6, Ch 1, Sec 1** of the Rules).

(1) Fuse
  (KS C) IEC 60269 Low-voltage fuses
(2) Circuit breaker
  (KS C) IEC 60947-2 Low-voltage switchgear and controlgear - Part 2: Circuit-breakers
(3) Electromagnetic contactor
  (KS C) IEC 60947-4-1 Low-voltage switchgear & controlgear - Part 4-1: Contactors and motor-starters - Electromechanical contactors and motor-starters

Section 9 Explosion-protected Electrical Equipment

901. General

1. Material

"Material which minimizes the risk of spark by friction" in **901. 3** (2) of the Rules means material which does not occur explosion owing to spark caused by friction or impact between metals. That means material identified anti-ignition tested by using the drop tester specified in KS E 3903 (Non-ignition Testing Methods for Non-sparking Beryllium Copper Alloy Tools).

2. Construction

Pressurized protected and intrinsically safe electrical equipment are to be indicated the followings in addition to requirements specified in **901. 4** (5) of the Rules.

(1) Pressurized protected electrical equipment
Ventilating type and sealing type are to be indicated the followings.
(A) Internal capacity of equipment
(B) Required wind pressure and wind capacity at the protection gas inlet of equipment
(C) Required wind pressure at the protection gas outlet of equipment (ventilating type only)
(D) Permissible maximum wind pressure of container

(2) Intrinsically safe electrical equipment
(A) The followings are to be indicated. But for detector, etc. the requirements (a) through (c) may be omitted.
(a) Rated value of intrinsically safe circuit
(b) Rated value of non-intrinsically safe circuit
(c) Useful condition
(B) Where a non-intrinsically safe circuit in incorporated equipment is not explosion- protected type, the followings are to be indicated in addition to (A) above.
(a) Caution for prohibition from installing in dangerous spaces
(b) Caution for prohibition from alteration, modification for component of equipment, wiring, etc.
(C) A intrinsically safe circuit in incorporated equipment is to be indicated clearly with the purport at terminals. Wiring diagram of equipment is to be attached and seen inside cover of equipment.

902. Special requirements

The wording “as deemed appropriate by the Society” in 902. of the Rules means the followings.

1. Flameproof type electrical equipment

(1) Where flameproof lighting fittings are fitted with bulkheads penetrated through, they are to be so installed as not to impair the integrity of the bulkheads.
(2) In case where a drain discharging devices is provided to the enclosure of flameproof construction, it is to be so constructed as not to impair the flameproof characteristics even with the device in the open position.
(3) In case where a waterproof packing is provided to the flameproof construction, it is to be so constructed as not to impair the flameproof joints, such as length of flame path and gaps etc., caused by the water intrusion.
(4) In case where a cable is connected to a terminal box by the cable pipe connecting method, sealing fittings are to be provided near the terminal box.

2. Intrinsically safe type electrical equipment

(1) Intrinsically safe electrical equipment is to be installed independently against general electrical equipment. Where the combined installation with general equipment is necessary, earthed metallic partitions are to be provided between these equipment.
(2) The wires for intrinsically safe circuits are to be measured to discriminate easily against those for other circuits. And the wires are also to be separated 50mm or more from those for other circuits and to be shielded electrically, if necessary.
(3) Connection terminal for intrinsically safe circuit and non-intrinsically safe circuit under the combined installation are to comply with either of the followings.

(A) Connection terminals for the both circuits are to be installed in individually circuit boards separated from 50mm each other.
(B) Earthed metallic partitions having efficient mechanical strength and insulation are to be provided between the connection terminals for the both circuits.

(4) Even if an electrical fault for general circuit other than intrinsically safe circuits is happened, the function of a safety barrier is to be kept operating.
(5) Safety barriers are to be located in non-hazardous areas.
(6) Safety barriers are to be structured by at least two same components unless one component specified below is used. In case where one of the components is broken, an explosion protecting performance is to be maintained.

(A) Power Transformers
The insulation between first and second field windings is to be ensured by earthed partitions made by copper. And each field winding is to have an efficient insulation performance.
(B) Current Limitation Resistors
The surface of the resistors is to be covered by a synthetic resin or the resistors are to be embedded in a formed resin.
(C) Blocking Condensers
The condenser is to be structured by two solid dielectric type capacitors connected with each other in series which have high reliability. Electrolytic capacitors including tantalum type are not to be used.

3. Increased safety type electrical equipment

(1) Enclosures of increased safety lighting fittings are to be of a robust construction made of non-hygroscopic flame-retardant or incombustible material, and also they are to be of watertight construction or equivalent thereto.
(2) In case where an increased safety type motor or transformer is used, the efficient protection for overload and overheat is to be provided. Especially for a squirrel cage induction motor, the additional protection is to be provided not so as to use it over an allowable restraint time and abnormal temperature rise is not to be occurred under the restraint condition of the rotor.
(3) In case where there is a limitation for use in order to maintain an explosion protecting performance, the approval for use by the Society is to be necessary.

4. Pressurized protected type electrical equipment

(1) When air is used as the pressurized medium, the air inlet is to be located in a safe space.
(2) Where air or inert gas is used as the pressurized medium, an interlock device is to be provided to ensure a displacement of air within the apparatus of at least 10 times the free volume of its enclosure and thus to obtain the required pressure before it can be energized.
(3) Pressurized protected electrical equipment is to be automatically disconnected from the source of electrical power in the event of the loss of pressure within its enclosure. However, if this arrangement increases the hazard to the ship, it may be permitted for loss of pressure to operate an alarm device only.

5. Powder filling type electrical equipment

(1) The enclosure is to be at least IP54 or higher. If it is IP55 or higher grade, a breathing device is to be provided.
(2) A powder material filled in the enclosure is to be quartz or solid glass particles and have an efficient insulation performance.
