Rules for the Classification of Steel Ships

Part 1

Classification and Surveys

RA-01-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF PART 1 "CLASSIFICATION AND SURVEYS"

1. Unless expressly specified otherwise, the requirements in the Rules apply to ships for which the application for Classification Survey is submitted to the Society on or after 1 July 2011.
2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date 1 July 2010

CHAPTER 1 CLASSIFICATION

Section 4 Classification Survey after Construction
- 403. has been amended.

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 1 General
- 109. 1 and 4 have been amended.

CHAPTER 3 HULL SURVEYS OF SHIPS SUBJECT TO THE ENHANCED SURVEY PROGRAMME

Section 1 General
- 101. 2 (2) has been amended.

Effective Date 13 August 2010

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 4 Special Survey(Hull, Equipment and Fire–extinguishing Appliances)
- 403. has been deleted.

Effective Date 1 January 2011 (Regardless of the application date for Classification Survey)

CHAPTER 1 CLASSIFICATION

Section 15 Miscellaneous
- 1501. has been newly added.

Effective Date 1 January 2011

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 1 General

- 107. 5 (1) and (2) have been amended.

Effective Date 1 May 2011

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 2 Annual Survey

- 202. 1 (8), (9), (18), (19) and (23) to (26) have been newly added.
- 202. 1 (17) and (20) have been amended.
- 203. 9 and 16 have been amended.
- 204. 1, 2 and 3 have been amended.

Section 3 Intermediate Survey

- Table 1.2.1 has been amended.

Effective Date 1 July 2011

CHAPTER 1 CLASSIFICATION

Section 3 Classification Survey during Construction

- 303. has been amended.
- 309. has been moved from Chapter 2, 101. and amended.

Section 7 Cooperation Duties of Owners

- 702. 5 has been newly added.

Section 8 Competence and Duties of Surveyors

- 803. has been amended.
- 805. has been amended.

Section 9 Suspension/Withdrawal of Class and Reclassification

- 901. 2 (6) has been newly added.

Section 14 External Audit

- 1401. 1 and 2 have been amended.

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 1 General

- 110. 1 (6) and (7) have been newly added.

Section 4 Special Survey(Hull, Equipment and Fire-extinguishing Appliances)

- 401. 8 has been newly added.
- 403. 1 (1) has been amended.

Section 5-1 Special Survey(Machinery, Electrical Installations and Additional Installations)

- 502. 6 has been newly added.

Section 5-2 Special Survey(Additional Requirements to Ship Types)

- 3 (1) (C) has been amended.

Section 6 Docking Survey

- 603. 10 and 11 have been newly added.
- 604. 2 has been newly added and 3 has been amended.
- 605. has been newly added.

Section 14 Hull Surveys for General Dry Cargo Ships

- 1404. 1 (7) has been amended.

CONTENTS

CHAPTER 1 CLASSIFICATION

Section 1 General

101. Classification

1. Steel ships built and surveyed in accordance with the Rules of the Society(hereafter referred to as "the Rules") or with the alternatives equivalent to the Rules will be assigned a class designation by the Society and registered in the Registration Master.

2. All ships classed with the Society are, for continuation of the classification, to be subjected to the periodical and other surveys, and are to be maintained in good condition in accordance with the requirements of the Rules.

3. When a ship classed with the Society makes an alteration or modification of such an extent as to influence to the ship's original performances, the plans have to be submitted for the Society's approval before the work is commenced and the alteration work has to be supervised by the Surveyor.

102. Standard application of the Rules

1. The Rules are framed on the understanding that ships will be properly loaded and handled. But those do not provide special distributions and concentrations of loading unless stated in the class notation.

2. The plans of ships designed for specific condition of loading or particular features in respect of the hull, machinery or equipment are also to be submitted for approval.

103. Exclusion from the Rules

The Society cannot assume responsibility for trim, hull vibration or other technical characteristics not covered by the Rules. However, the Society may advise on such matters upon application by an Owner.

104. Equivalence

The Society may consider the acceptance of alternatives to the Rules, provided that they are deemed to be equivalent to the Rules to the satisfaction to the Society.

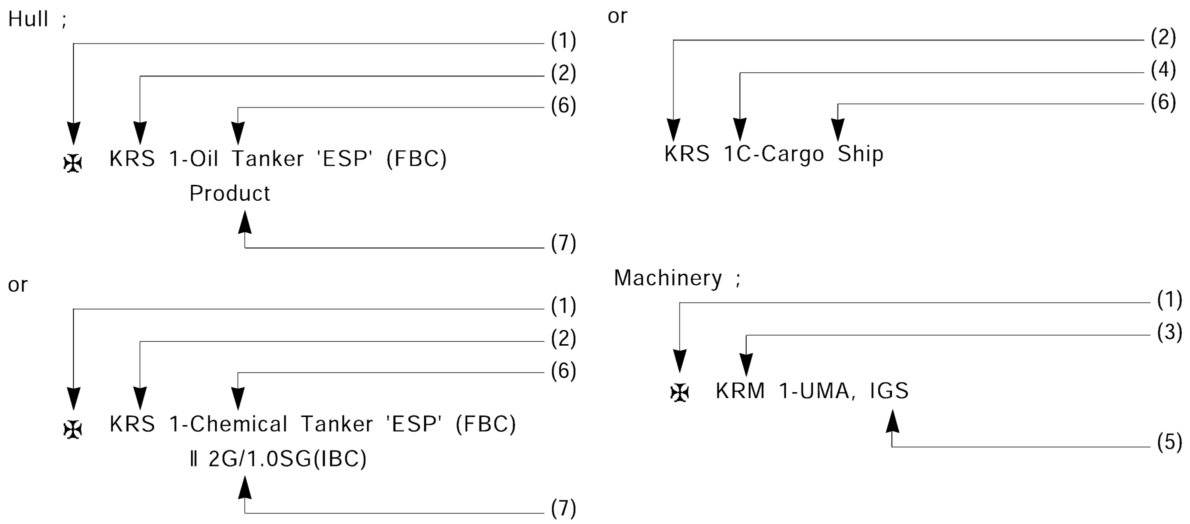
105. Novel features

The Society may consider the classification of ships based on or applying novel design principles or features, to which the Rules are not directly applicable, on the basis of experiments, calculations or other supporting information provided to the Society.

Section 2 Character of Classification

201. Class notations

The class notations assigned to the ships classed with the Society are to be in accordance with the followings:



(1) **Construction symbols**

The construction symbols assigned to the ships according to the distinction of Classification Survey are to be in accordance with the followings:

✠ ; For ships built under the supervision of the Society.
No symbol ; For ships considered to be fit as the result of surveys by the Surveyor after construction with the exception of the above mentioned construction symbols.

(2) **Service restriction notations of hull**

The following service restriction notations will be given for ships with hull construction and strength found to be in compliance with the Rules:

KRS1 ; For ships unrestricted in service area.
KRS0 ; For ships restricted in service area.

(3) **Service restriction notations of machinery**

The following service restriction notations will be given for ships with machinery and electrical installations found to be in compliance with the Rules:

KRM1 ; For ships unrestricted in service area.
KRM0 ; For ships restricted in service area.

(4) **Service restriction notations of equipment**

The following service restriction notations will be given for ships with equipment found to be in compliance with the Rules:

No symbol ; For ships unrestricted in service area.
C ; For ships approved with the condition of coastal service.
S ; For ships approved with the condition of smooth water service.

(5) **Additional installations notations**
Ships designed for the application of additional installations on hull items will be distinguished after the character of hull by the class notation such as "LI", "CHA", "HMS" or "HMS1", etc. and on machinery items will be distinguished after the character of machinery by the class notation such as "CMA", "UMA", "DPS", "NBS", "IGS", "COW", "STCM" or "RMC", etc.

(6) **Ship type notations**
Ships designed in compliance with particular Rules intended to apply to that type of ship will be indicated by the appropriate designations such as Oil Tanker 'ESP'(FBC), Bulk Carrier 'ESP', Cargo Ship, Passenger Ship, Tug Boat, Barge, etc. affixed to the character of hull.

(7) **Special feature notations**
When considered necessary by the Society, the special feature notations may be appended to the character of the ship type notations. These special feature notations could consist of the hull structure and the cargo tank type fitted for the kind and nature of cargoes, ice strengthening, in-water survey, cargo loading condition, design temperature, design pressure, the apparent specific gravity of cargoes, corrosion control, direct strength assessment, direct fatigue assessment, hull construction monitoring, and/or longitudinal strength of hull girder in flooded condition for bulk carriers, etc. Also, the restriction of navigation area and condition may be remarked additionally.

202. Class notations of yachts

The class notations of yachts classed with the Society are to be in accordance with the requirements specified in **Pt 8, Ch 1, 102.** of the **Guidance Relating to the Rules for the Classification of High Speed and Light Crafts** irrespective of the requirements in **201.**

Section 3 Classification Survey during Construction

301. Classification Survey during Construction

For a ship requiring Classification Survey during Construction, the construction, materials, scantlings and workmanship of the hull, equipment and machinery are to be examined in detail in order to ascertain that they meet the appropriate requirements of the Rules.

302. Approval of plans

For a ship requiring Classification Survey during Construction, the plans and documents showing the details of the construction, materials, scantlings and particulars of the hull, equipment and machinery are to be submitted in triplicate and approved before the work is commenced. The same applies also to the cases of any subsequent modifications to the approved drawings or documents.

303. Materials and equipments

All materials used for a ship requiring Classification Survey during Construction are to be manufactured under approved method or under alternative process considered equivalent to the approved method and are to be adequate to the relevant requirements of the Rules. The Society may request the relevant documents such as certificate of materials or equipment, etc. for the confirmation of the materials or equipment which are used.

304. Machinery installation

Main engines, shafting arrangement, boilers, pressure vessels, electrical equipment, essential auxiliary machinery, and piping arrangements to be installed on a ship intended for classification are to be surveyed during construction. Shop trials are to be carried out on completion under a same condition as installed on-board ship or a similar condition as far as practicable. Various tests on any special part amongst the automatic or remote control systems and measuring devices considered necessary by the Society may be requested at the manufacturing sites.

305. Workmanship

For Classification Survey of a ship, the materials, workmanship and arrangements are to be surveyed under the supervision of the Surveyor from the commencement of the work until the completion of the ship. When the machinery is constructed under Classification Survey, this survey is to be related to the period from the commencement of the work until the final test under working conditions. Any item found not to be in accordance with the Rules or the approved plans, or any material, workmanship or arrangement found to be unsatisfactory are to be rectified.

306. Tests

In the Classification Survey during Construction, hydrostatic, watertight and performance tests are to be carried out in accordance with the relevant part of the Rules. Also the control systems and measuring device after installation are to receive the necessary tests, as deemed necessary by the Society.

307. Stability experiments

1. In the Classification Survey during Construction for passenger ships and ships of 24 m and above in length other than passenger ships, stability experiments are to be carried out upon completion of the ship. A final stability information booklet adequate for the service intended and prepared on the basis of the stability particulars determined by the results of stability experiments, is to be approved by the Society and supplied to the master. However, a preliminary stability information booklet approved by the Society in lieu of a final stability information booklet may be provided on-board for a specific period.

2. Where an loading instrument having a stability computation capability as supplemental use of stability information booklet specified in **Par 1** is provided, the test report of representative operational conditions is to be submitted to the Society, and the loading instrument shall cover all stability requirements applicable to the ship such as intact, damage and grain stability, etc. When the stability information include sufficient loading conditions of the ship, some part of the function may be omitted. The instrument is to be confirmed by the Surveyor upon installation in accordance with the test report approved by the Society.

308. Trials

Trials are to be carried out for all equipment, machinery and electrical equipment under working conditions after completion of the ship in order to ascertain their performances. In the sea trials, speed test, astern test, steering test, emergency steering test and turning test are to be carried out. In addition, the operating conditions of machinery and other behaviors of the ship during the trial are to be examined.

309. Date of contract for construction

1. The date of contract for construction of a vessel is the date on which the contract to build the vessel is signed between the prospective Owner and the shipbuilder. This date and the construction numbers(i.e. hull numbers) of all the vessels included in the contract are to be declared to the Society by the party applying for the assignment of class to a newbuilding.

2. The date of contract for construction of a series of vessels, including specified optional vessels for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective Owner and the shipbuilder.

3. In application to **Par 2**, vessels built under a single contract for construction are considered a series of vessels if they are built to the same approved plans for classification purposes. However, vessels within a series may have design alterations from the original design provided;

(1) Such alterations do not affect matters related to classification, or

(2) If the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective owner and the shipbuilder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to the Society for approval.

The optional vessels will be considered part of the same series of vessels if the option is exercised not later than 1 year after the contract to build the series was signed.

4. If a contract for construction is later amended to include additional vessels or additional options, the date of contract for construction for such vessels is the date on which the amendment to the contract, is signed between the prospective Owner and the shipbuilder. The amendment to the contract is to be considered as a new contract to which **Par 1** to **Par 3** above apply.

5. If a contract for construction is amended to change the ship type, the date of contract for construction of this modified vessel, or vessels, is the date on which revised contract or new contract is signed between the Owner, or Owners, and the shipbuilder.

Section 4 Classification Survey after Construction

401. Classification Survey after Construction

In the Classification Survey after Construction, the actual scantlings of main parts of the ship are to be measured in addition to such examinations of the construction, materials, workmanship and actual conditions of hull, machinery, outfittings, and equipment as required for the Special Survey corresponding to the ship's age in order to ascertain that they meet the relevant requirements in the Rules.

402. Submission of plans

In the Classification Survey after Construction, plans and documents as may be required for Classification Survey during Construction are to be submitted. If plans cannot be obtained, facilities are to be given for the Surveyor to take the necessary informations from the ship.

403. Classification Survey of ships classed by other Societies

When a ship holding class with any Society which is subject to verification of compliance with QSCS(Quality System Certification Scheme) of IACS is intended for classification, plans and documents to be submitted and survey items, etc. are to be in accordance with the Guidance relating to the Rules.

404. Tests

In the Classification Survey after Construction, the hydraulic pressure tests, watertight tests, performance tests and sea trials are to be carried out in accordance with the requirements of the Rules. However, sea trials may be dispensed with provided that sufficient data on the previous tests are available and neither alteration nor repair affecting the previous data has been made since the previous trials.

405. Stability experiments

In the Classification Survey after Construction for passenger ships and ships of 24 m and above in length other than passenger ships, stability experiments are to be carried out. A final stability information booklet adequate for the service intended and prepared on the basis of the stability particulars determined by the results of stability experiments, is to be approved by the Society and supplied to the master. However, a preliminary stability information booklet approved by the Society in lieu of a final stability information booklet may be provided on-board for a specific period. Stability experiments may be dispensed with provided that sufficient information based on previous stability experiments is available and neither alteration nor repair affecting the stability has been made since the previous experiments.

Section 5 Certificates and Reports

501. Certificate of Classification

1. Where ships have undergone the Classification Survey during or after Construction to the satisfaction of the Surveyor and approved by the Classification Committee, the ships will be classed and entered in the Registration Master with the issue of the Certificate of Classification.

2. Where ships have undergone the Special Survey to the satisfaction of the Surveyor, the Certificate of Classification is issued newly.

502. Interim Certificate of Classification

Where ships have undergone a Classification Survey during or after Construction to the satisfaction of the Surveyor, the Interim Certificate of Classification will be issued.

503. Certificate for construction survey

Where ships not intending to be classed have undergone the survey during construction, or marine engines, boilers, auxiliary machinery and outfittings have undergone the surveys during construction to the satisfaction of the Surveyor, the Certificate for Construction Survey will be issued.

504. Survey reports

On completion of the Classification Survey and the surveys assigned to maintain the classification, the Survey Reports will be issued. Ship's particulars, survey results, the date and description of the next surveys, etc. are to be stated in the Survey Reports. The Survey Reports will be used as notice to the Owners.

505. Keeping of the certificates and survey reports

The Certificate of Classification, the Interim Certificate of Classification, Particular Sheets and Survey Reports, etc. are always to be kept on board by the master of the ship and are to be produced when requested by the Surveyor.

506. Mention on certificate

1. Where ships classed with the Society have satisfactorily undergone the periodical survey, or where the period of validity of the Certificate of Classification is extended, or where the anniversary date is amended, the periodical survey or the case will be endorsed on the Appendix of Certificate of Classification or Interim Certificate of Classification.

2. Assigning of date of build

(1) The year, month and date at which the Classification Survey during Construction is completed shall be specified as the "Date of Build". Where there is substantial delay between completion of the Classification Survey during Construction and the ship commencing active service, the date of commissioning may be also specified.

(2) Where the ship is altered, the Date of Build shall be remain assigned to the ship and the altered parts are to be complied with **Ch 2, Sec 11.**

507. Re-issue and return of certificate

1. When the Certificate of Classification, the Interim Certificate of Classification, Particular Sheets, or Survey Reports are lost or impaired, or when the items stated in them require alteration, the application for re-issue must be made without delay.

2. When a ship holding the Interim Certificate of Classification is furnished with the Certificate of Classification, when the certificate is re-issued except in the case of its loss, or when the classification is cancelled, the old certificate is to be returned to the Society without delay.

508. Certificates of related equipment

The Society may, upon application, survey such equipment relating to ships as prime movers, shaftings, boilers, pressure vessels, auxiliary machinery, electrical equipment and other machinery installations and issue certificates where they are to the satisfaction of the Surveyor.

509. Class Maintenance Certificate

The Society will issue, upon request, a Class Maintenance Certificate to the Owner of a ship or the person having obtained his consent.

Section 6 Application for Survey

601. Classification Survey

The application for Classification Survey is to be made by the Builder for a ship during construction and by the Owner for a ship after construction.

602. Periodical and other surveys

The application for surveys of ship for the continuation of her classification is to be made by the Owner(including Charterer, Representatives of Owner, Representatives of Charterer and Master of the ship, hereafter referred to as "the Owner").

603. Re-issue of certificate

The application for re-issue and return of the Classification Certificate, the Interim Classification Certificate, Particular Sheets and Survey Reports are to be made by the Owner.

Section 7 Cooperation Duties of Owners

701. Report items

When any of the following cases occurs, the Owner is to report to the Society without delay:
(1) When the ship is sustained with a sea casualty by which her present class is deemed affected.
(2) When the ship is placed in drydock or on a slipway.
(3) When the ship is laid up or dismantled.
(4) When the Owner is changed.
(5) When the ship is withdrawn.
(6) When any items which may affect her class are changed.

702. Cooperation of survey

1. All such preparations as required for Classification Survey and periodical surveys necessary for the maintenance of class are to be made by the applicant of the survey in accordance with the requirements of the Rules. To permit safe and effective survey, such preparations are to include the provision of the work environment and safety measures in the way of suitable lighting, ventilation and access condition.

2. The Owner, master, chief engineer or their representatives are to attend the survey according to the items to be examined and are to give necessary assistances.

3. When a ship is to be surveyed, it is the duty of the Owner to inform the Surveyor of the correct place and items of survey.

4. Where it is intended to use service suppliers for the survey of ship, the service suppliers approved by the Society are used as a general rule, and the approval procedure and items are to be in accordance with the Guidance relating to the Rules.

5. The applicant of the survey is to ensure that there is no falsehood in the description on the application form, the notice and the presented data, etc. to the Society.

703. Cooperation Duties

Notwithstanding the general duty of confidentiality owed by the Society to its clients as specified in **805.**, the Society's clients hereby accept that the Society will participate in Early Warning Scheme which requires each Society to provide the involved Societies(the Classification Societies classing a sister or a similar ship to the one involved in the incident) with relevant technical information(but not including any drawings relating to the ship which may be the specific property of another party) on serious hull structural and engineering systems failures, as defined in the Early Warning Scheme(Refer to IACS PR No.2 Procedure for Failure Incident Reporting and Early Warning of Serious Failure Incidents - Early Warning Scheme - EWS) to enable such useful information to be shared and utilised to facilitate the proper working of Early Warning Scheme. The Society will provide its client with written details of such information upon sending the same to the involved Societies.

Section 8 Competence and Duties of Surveyors

801. Competence of Surveyors

1. The Surveyor can attend the classed ships at all reasonable times.

2. The Surveyor may suspend surveys when the necessary preparations required in the Rules have not been made or any appropriate attendant is not present.

3. The Surveyor may, if deemed necessary by the condition of a classed ship, request additional surveys of a part though such part may not fall under the survey items.

4. The Surveyor will notify the survey applicant of his recommendations for repairs or renewals when the hull, machinery or other equipments are in conflict with the requirements of the Rules, damaged, or worn out. Upon this notification the applicant is to carry out the repairs to the satisfaction of the Surveyor.

802. Duties of Surveyors

1. The Surveyor is to undertake all the surveys on a classed ship for which the application is made and is to report to the Head Office without delay.

2. For the convenience of the Owner, the Surveyor is to avoid any unnecessary duplication of surveys or repair works in carrying out his surveys.

803. Liability of Classification Society

1. (Liability) The Society shall be responsible for damage or loss incurred by the shipowner arising from a negligence of the Society. The liability will be limited to the greater of an amount equal to 10 times the sum actually paid for services alleged to be deficient, or USD 1,000,000.

2. The limitation on liability specified in **Par 1** does not apply in case of a willful act or imprudent feasance despite being cognizant of the fact that there is a concern for damage, or nonfeasance.

3. (Time bar) Rights of claims against the survey and other contracted services provided by the Society shall become nullified after 6 months from the date when the Owner had notice of the damage.

4. (Jurisdiction and Governing laws) All disputes which may arise from the services by the Society shall be subject to the exclusive jurisdiction of Korean court and be governed by the Laws of Korea.

804. Independence of Classification Society

The Society and its staff shall not be affected by designer, manufacturer, supplier, installer, purchaser, owner, user, maintainer and any other individuals of the item subject to the service and shall perform its works for the customers fairly from independent position.

805. Confidentiality

The Society and its staff shall not be perused, transferred or disclosed the confidential information obtained through the handling of records to the third party without the consent of the relevant customer, unless otherwise requested by the national Administration, investigative agency or a law court.

Section 9 Suspension/Withdrawal of Class and Reclassification

901. Suspension/Reinstatement of class

1. The classification is automatically suspended.

(1) when the Special Survey has not been completed by the due date unless the vessel is under attendance for completion of the Special Survey prior to resuming trading by the due date.
(2) when the Annual Survey or Intermediate Survey has not been completed by the end of the corresponding survey time window unless the vessel is under attendance for completion of the Annual Survey or Intermediate Survey by the end of the corresponding survey time window.

Classification will be reinstated upon satisfactory completion of the surveys due. Such surveys are to be credited from the date originally due. However, the vessel is disclassed from the date of suspension until the date class is reinstated.

2. The classification may be suspended in accordance with the Society's suspension procedure.

(1) when a vessel is not operated in compliance with the rule requirements, such as in cases of services or conditions not covered by the class notation, or trade outside the navigation restrictions for which the class was assigned.
(2) When the Society considers that a ship has not complied with the Rules.
(3) When any damage to the ship is to such an extent as affecting her class and is not repaired in accordance with the Rules of the Society, or when alterations or conversions affecting her class are carried out without the approval of the Society.
(4) When a ship proceeds to sea with less freeboard than that assigned, or when the freeboard marks are placed higher on the sides of the ship than the position assigned.
(5) when the assigned surveys to maintain the classification, except Annual Survey, Intermediate Survey and Special Survey, is not dealt with, or postponed by agreement, by the due date.
(6) When the Continuous Survey item(s) due or overdue at the time of Annual Survey is not surveyed, or postponed by agreement.
(7) in the event of non-payment of fees

Classification will be reinstated if the cause of such suspension are removed, or upon verification that the overdue survey has been satisfactorily dealt with. Suspension of class decided by the Society takes effect from the date when the condition for suspension of class are met and will remain in effect until such time as the class is reinstated once the due items and/or surveys have been dealt with.

3. Vessels laid-up in accordance with the Society's Rules prior to surveys becoming overdue need not be suspended when surveys addressed above become overdue. However, vessels which are laid-up after being suspended as a result of surveys going overdue, remain suspended until the overdue surveys are completed.

4. When a vessel is dual classed and in the event that the other Society involved takes action to suspend the class of the vessel for technical reasons, the Society will, upon receipt of this advice, also suspend the class of the vessel in accordance with the Society's suspension procedure, unless it can otherwise document that such suspension is incorrect.

5. When a vessel is intended for a demolition voyage with any periodical survey overdue, the vessel's class suspension may be held in abeyance and consideration may be given to allow the vessel to proceed on a single direct ballast voyage from the lay up or final discharge port to the demolition yard. In such cases a Interim Certificate of Classification with conditions for the voyage noted may be issued provided the attending Surveyor finds the vessel in satisfactory condition to proceed for the intended voyage.

6. If, due to circumstances reasonably beyond the owner's or the Society's control, the vessel is not in a port where the overdue surveys can be completed at the expiry of the periods allowed, the Society may allow the vessel to sail, in class, directly to an agreed discharge port, and if necessary, hence, in ballast, to an agreed port at which the survey will be completed, provided the Society:

(1) exams the ship's records;
(2) carries out the due and/or overdue surveys and examination of Recommendations/Conditions of Class at the first port of call when there is an unforeseen inability of the Society to attend the vessel in the present port, and
(3) has satisfied itself that the vessel is in condition to sail for one trip to a discharge port and subsequent ballast voyage to a repair facility if necessary.(Where there is unforeseen inability of the Society to attend the vessel in the present port, the master is to confirm that his ship is in condition to sail to the nearest port of call.)

If class has already been automatically suspended in such cases, it may be reinstated subject to the conditions prescribed in this paragraph.
Where 'force majeure' means damage to the ship; unforeseen inability of the Society to attend the vessel due to the governmental restrictions on right of access or movement of personnel; unforeseeable delays in port or inability to discharge cargo due to unusually lengthy periods of severe weather, strikes or civil strife; acts of war; or other force majeure.

902. Withdrawal of class

1. The classification may be withdrawn under the approval of the Classification Committee.

(1) when class of a vessel has been suspended for a period of six(6) months. A longer suspension period may be granted when the vessel is not trading as in cases of lay-up, awaiting disposition in case of a casualty or attendance for reinstatement.
(2) when the vessel is reported as a constructive total loss.
(3) when the vessel is lost.
(4) when the vessel is reported scrapped.
(5) when the Surveyor reports that the vessel has not complied with the Rules of the Society as regards surveys to maintain the classification specified in **Ch 2, 102.**

2. Notwithstanding **Par 1**, the class may be withdrawn from the Society in consequence of a request from the Owner.

903. Reclassification

When reclassification is desired for a ship for which the class previously assigned has been withdrawn, the Society will carry out a survey for reclassification, appropriate to the age of the ship and condition of the ship and the circumstances of the case. If, at such survey, the ship be found in good and efficient condition in accordance with the requirements of the Rules, the Society will be prepared to reinstate her classification.

Section 10 Fees

1001. Survey fees

1. When the surveys or testing of materials are carried out by the Surveyor, fees will be charged for the surveys, testing of materials, and the certificates issued in accordance with separately established Tariff of Fees.

2. When travelling is required on account of a survey, the travelling expenses, communication expenses, and other expenses incurred by such travel will be charged.

3. When the attendance of a survey is required to suit the convenience of the Owners, outside of normal working hours or on holidays, an extra fee will be charged.

1002. Fees for plan approval

In the case of plans and other documents approval by the Society, fees will be charged in accordance with separately established Tariff of Fees.

Section 11 Appeal on Disagreement

1101. Appeal on disagreement

In case of disagreement between the Owners or Builders and the Surveyor regarding the application of the Rules, materials, workmanship and extent of repairs, etc. relating to any survey carried out by the Society, an appeal may be made to the Society.

1102. Re-survey

The Society will carry out re-survey when an appeal on disagreement is made.

1103. Fees for re-survey

The fees and expenses of re-survey are to be paid by the party appealing.

Section 12 Related Regulations and Surveys

1201. Governmental regulations

The Society may require to apply governmental regulations for items not specified in the Rules.

1202. International conventions

1. Following ships classed or intended to be classed with the Society are to meet the *International Convention for Load Lines, Safety of Life at Sea* and other related conventions,

(1) Ships flying Korean flag to which the conventions apply.

(2) Ships flying foreign flags, to which the conventions apply, where the Society is authorized by the concerned Governments to issue certificates and requested by the Owner.

2. Unless explicitly stipulated otherwise in the text of the regulations in the *International Convention for the Safety of Life at Sea, Load Lines* and *the Prevention of Pollution from Ships* and any of their mandatory Codes, distances are to be measured by using moulded dimensions.

1203. IACS Unified Interpretations

1. Ships classed with the Society are to be complied with the International Association of Classification Societies(IACS) Unified Interpretations applicable to a ship, its machinery and equipment, in accordance with the implementation dates and provisions stated in the UI, when the Society is acting as a recognized organization, authorized by a flag State Administration to act on its behalf, unless the flag Administration provides its own interpretation.

2. The requirements specified in **Par 1** above does not require the application of IACS UIs to ships retroactively, except for those UIs which explicitly require retroactive application.

Section 13 Classification of Other Installations or Equipment

1301. Classification

The Society may, upon application, survey such installations or equipment other than those relating to ship as offshore drilling unit, mobile/fixed offshore structures, dredgers, floating docks, cargo handling appliances, prime movers, boilers, pressure vessels, and other machinery installations for land service, and they will be registered to the Society with the issue of certificates where they are in satisfaction of the Surveyor. In this case, class notation shall be given to them at the discretion of the Society.

1302. Certificate

Where the installations or equipments have undergone the Classification Survey during or after Construction to the satisfaction of the Surveyor in accordance with the requirement in **1301.** the Certificate will be issued according to the requirements of **Sec 5.**

1303. Construction and survey

Constructions and surveys of installations or equipment intending to be registered are to be in accordance with the Guidance relating to the Rules.

1304. Maintenance of classification

Installations or equipment classed to the Society are to be upon the examination at the surveys assigned to maintain the classification in accordance with the requirements specified by the Society. The application for survey is to be made by the Owners or managers in substitute for the Owners.

1305. Related requirements

The requirements specified in **Sec 6** to **Sec 11** are applicable to the installations or equipment stated in this Section.

Section 14 External Audit

1401. External Audit

1. The auditors of external body such as flag state administration, etc. may conducts audits of processes followed by the Society to assess the degree of compliance with the relevant audit requirements.

2. Auditors of **Par 1** may accompany KR personnel at any stage of work which may necessitate the auditors having access to a vessel or access to the premises of a manufacturer or shipbuilder. In such instances, prior authorization for the auditor's access and any necessary assistances will be sought by the Society.

Section 15 Miscellaneous

1501. New installation of materials containing asbestos

1. This requirement is to apply to materials used for the structure, machinery, electrical installations and equipment.

2. For all ships, new installation of materials which contain asbestos is to be prohibited. ⚓

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 1 General

101. Definitions

The definitions of terms used in **Ch 2** and **Ch 3** are to be as specified in the followings, unless otherwise specified elsewhere.

1. **Anniversary date** means the day and the month of each year which will correspond to the due date of the next Special Survey from the completion date of the initial Classification Survey or of the Special Survey.

2. A **bulk carrier** means a ship which is constructed generally with single deck, topside tanks and hopper side tanks in cargo spaces, and is intended primarily to carry dry cargo in bulk. Combination carriers are included. For single skin combination carriers additional requirements are specified in **Ch 3, Sec 3.**

3. An **oil tanker** means a ship which is constructed primarily to carry oil in bulk and includes ship types such as combination carrier(Ore/Oil ship, etc.).

4. A **chemical tanker** means a ship constructed or adapted and used for the carriage in bulk of any liquid product listed in **Pt 7, Ch 6, Sec 17.**

5. A **tanker** means a ship constructed or adapted for the carriage in bulk of liquid cargoes of an inflammable nature.

6. A **liquefied gas carrier** means a ship constructed or adapted and used for the carriage in bulk of any liquid product listed in **Pt 7, Ch 5, Sec 19.**

7. A **ballast tank** is a tank that is being used primarily for salt water ballast.

8. A **space** is a separate compartment including holds and tanks.

9. A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and longitudinal bulkhead. For transversely framed vessels, a transverse section includes adjacent frames and their end construction in way of transverse sections.

10. A **representative space/tank** is a space/tank which is expected to reflect the conditions of other spaces/tanks of similar type and service and with similar corrosion prevention systems. When selecting representative spaces/tanks, account is to be taken of the service and repair history on board and identifiable critical structural areas and/or suspect areas.

11. A **suspect area** is a location showing substantial corrosion and/or is considered by the Surveyor to be prone to rapid wastage.

12. **Substantial corrosion** is an extent of corrosion such that assessment of corrosion pattern indicates a wastage in excess of 75 % of allowable margins, but within acceptable limits. For vessels built under the IACS Common Structural Rules, substantial corrosion is an extent of corrosion such that the assessment of the corrosion pattern indicates a gauged(or measured) thickness between t_{net} + 0.5 mm and t_{net}.

13. An **Overall Survey** means a survey intended to report on the overall condition of the hull structure and determine the extent of additional Close-up Surveys.

14. A **Close-up Survey** means a survey where the details of structural components are within the close visual inspection range of the Surveyor, i.e. normally within reach of hand.

15. Corrosion prevention system

A corrosion prevention system is normally considered a full hard protective coating. Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems, which are neither soft nor semi-hard coatings, may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specifications.

Where soft coating means a coating that remains soft so that is wears off at low mechanical impact or when touched; often based on oil(vegetable or petroleum) or lanolin(sheep wool grease) and semi-hard coating means a coating that dries or converts in such a way that it stays flexible although hard enough to touch and walk upon.

16. Coating condition is defined as follows:

(1) **GOOD** condition with only minor spot rusting
(2) **FAIR** condition with local breakdown at edges of stiffeners and weld connections and/or light rusting over 20 % or more of areas under consideration, but less than as defined for POOR condition
(3) **POOR** condition with general breakdown of coating over 20 % or more, or hard scale at 10 % or more, of areas under consideration

17. A **prompt and thorough repair** is a permanent repair completed at the time of survey to the satisfaction of the Surveyor, therein removing the need for the imposition of any associated condition of classification, or recommendation.

18. Enhanced survey programme means, in addition to **Ch 2**, an enhanced survey method applied for hull structure and piping systems in way of cargo holds/tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks in accordance with **Ch 3.**

19. Critical structural area is location which has been identified from calculations to require monitoring or from the service history of the subject ship or from similar ships or sister ships, if available, to be sensitive to cracking, buckling or corrosion which would impair the structural integrity of the ship.

20. Special consideration or specially considered (in connection with Close-up Surveys and thickness measurements) means sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.

21. Air pipe head

Air pipe heads installed on the exposed decks are those extending above the freeboard deck or superstructure decks.

22. Cargo length area is that part of the ship which contains all cargo holds and adjacent areas including fuel tanks, cofferdams, ballast tanks and void spaces.

102. Kinds of surveys

Periodical and other surveys to maintain the classification are divided as follows;
(1) Special Survey
(2) Intermediate Survey
(3) Annual Survey
(4) Docking Survey
(5) Propeller Shaft Survey
(6) Boiler Survey
(7) Continuous Survey
(8) Occasional Survey
(9) Alteration Survey

103. Duplication of surveys

When heavier kind of survey is carried out at the due range or in advance of a periodical survey, the periodical survey may be dispensed with.

104. Execution of heavier survey

At the periodical survey, any items as specially considered necessary by the Surveyor or specially requested by the Owner may be inspected to the standard of heavier periodical surveys.

105. Laid-up ships

No periodical surveys are to be carried out for classed ships when they are laid-up. In order to put the laid-up ship into service, the ship has to receive the heaviest kind of survey amongst all the due surveys during laid-up period.

106. Tests

At the periodical survey, when the repair to the ship is likely to affect the ship's speed or safety, the speed trials and inclining experiment may be required.

107. Repairs

1. When the Surveyor recommends the necessity of repairs in consequence of the surveys, he is to notify the applicant the reasons of his recommendations and the applicant after such notification must receive the supervision of the Surveyor during the repairs.

2. Any damage in association with wastage over the allowable limits(including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the vessel's structural, watertight or weathertight integrity, is to be promptly and thoroughly repaired. Areas to be considered include;

(1) side shell frames, their end attachments and adjacent shell plating
(2) deck structure and deck plating
(3) bottom structure and bottom plating
(4) watertight or oiltight bulkheads
(5) hatch cover and hatch coamings
(6) items in **202. 1** (1) (f), (g) and (6)
(7) for bulk carriers and double skin bulk carriers;
- bottom structure and bottom plating
- side structure and side plating
- deck structure and deck plating
- inner bottom structure and inner bottom plating
- inner side structure and inner side plating
- watertight or oil tight bulkheads
- hatch covers and hatch coamings
- bunker and vent piping system, including ventilators

(8) for oil tankers, chemical tankers and double hull oil tankers;
- bottom structure and bottom plating
- side structure and side plating
- deck structure and deck plating
- watertight or oiltight bulkheads
- hatch covers or hatch coamings, where fitted

3. For location where adequate repair facilities are not available, consideration may be given to allow the vessel to proceed directly to a repair facility. This may require discharging the cargo and/or temporary repairs for the intended voyage.

4. Additionally, when a survey results in the identification of structural defects or corrosion, either of which, in the opinion of the Surveyor, will impair the vessel's fitness for continued service, remedial measures are to be implemented before the ship continues in service.

5. Voyage repairs and maintenance

(1) Where repairs to hull, machinery or equipment, which affect or may affect classification, are to be carried out by a riding crew during a voyage, they are to be planned in advance. A complete repair procedure including the extent of proposed repair and the need for Surveyor's attendance during the voyage is to be submitted to the Society in advance and the repair procedure is to be in accordance with the separate requirement specified by the Society. Where in any emergency circumstance, emergency repairs are to be effected immediately, the repairs should be documented in the ship's log and submitted thereafter to the Society for use in determining further survey requirements.

(2) The above is not intended to include maintenance and overhaul to hull, machinery and equipment in accordance with manufacturer's recommended procedures and established marine practice and which does not require the approval of the Society. However, any repairs as a result of such maintenance and overhauls which affects or may affect classification is to be noted in the ship's log and submitted to the attending Surveyor for use in determining further survey requirements.

108. Wear limit on structural members

When the thickness of hull structural members or the scantlings of equipment, etc. exceed the wear limit, they have to be renewed with those having the original scantlings or the scantlings considered suitable by the Society. As regards the scantlings of structural members which have been reduced by virtue of an approved system of corrosion control, the present scantlings are to be examined regarding them as having been corroded by the reduced amount since the time of construction. However, when the original scantlings were larger than the required ones, or when deemed appropriate by the Society, these requirements may be modified taking into account of the location, extent, kind of the wear.

109. Procedures for thickness measurements

1. Prior to commencement of the Intermediate or Special Survey, as required by **Sec 3, Sec 4, Sec 14, Sec 15** or **Ch 3**, a meeting is to be held between the attending Surveyor(s), the master of the ship or an appropriately qualified representative appointed by the master or company, the Owner's representative(s) in attendance and the thickness measurement firm's representative(s) so as to ensure the safe and efficient execution of the surveys and thickness measurements to be carried out onboard.

2. Thickness measurements are to be made by an appropriate ultrasonic equipment or other equivalent means and the results of the gaugings are to be reported.

3. Thickness measurements required in the context of hull structural classification surveys, if not carried out by the Society itself, shall be witnessed by a Surveyor. This requires the Surveyor to be on board, while the gaugings are taken, to the extent necessary to control the process.

4. Where the Surveyor is to attend to the thickness measurements in accordance with preceding **Par 3**, the control of the thickness measurement process, review, verification and record of attendance are to be in accordance with the separate requirement specified by the Society.

5. Thickness measurements and Close-up Surveys

In any kind of survey, i.e. Special, Intermediate, Annual or other Surveys having the scope of the foregoing ones, thickness measurements of structures in areas where Close-up Surveys are required shall be carried out simultaneously with Close-up Surveys.

110. Preparations for survey

1. Conditions for survey

(1) The Owner is to provide the necessary facilities for a safe execution of the survey.
(2) Tanks and spaces are to be safe for access, i.e. safe measured such as gas freed, ventilated, and illuminated.
(3) In preparation for survey and thickness measurements and to allow for a thorough examination, all spaces are to be cleaned including removal from surfaces of all loose accumulated corrosion scale. Spaces are to be sufficiently clean and free from water, scale, dirt, oil residues etc. to reveal corrosion, deformation, fractures, damages, or other structural deterioration. However, those areas of structure whose renewal has already been decided by the Owner need only be cleaned and descaled to the extent necessary to determine the limits of the areas to be renewed.
(4) Sufficient illumination is to be provided to reveal corrosion, deformation, fractures, damages or other structural deterioration.
(5) Where soft or semi-hard coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft or semi-hard coating is to be removed.
(6) Casings, ceilings or linings, and loose insulation, where fitted, are to be removed, as required by the Surveyor, for examination of plating and framing. Compositions on plating are to be examined and sounded, but need not be disturbed if found adhering satisfactorily to the plating.
(7) In refrigerated cargo spaces the condition of the coating behind the insulation is to be examined at representative locations. The examination may be limited to verification that the protective coating remains effective and that there are no visible structural defects. Where POOR coating condition is found, the examination is to be extended as deemed necessary by the Surveyor. The condition of the coating is to be reported. If indents, scratches, etc., are detected during surveys of shell plating from the outside, insulations in way are to be removed as required by the Surveyor, for further examination of the plating and adjacent frames.

2. Access to structures

(1) For survey, means are to be provided to enable the Surveyor to examine the hull structure in a safe and practical way.
(2) For survey in cargo holds and ballast tank, one or more of the following means for access, acceptable to the Surveyor, is to be provided:
(A) permanent staging and passages through structures
(B) temporary staging and passages through structures
(C) lifts and movable platforms
(D) boats or rafts
(E) other equivalent means

3. Equipment for survey

(1) Thickness measurement is normally to be carried out by means of ultrasonic test equipment. The accuracy of the equipment is to be proven to the Surveyor as required. Thickness measurements are to be carried out by a firm approved by the Society in accordance with **Annex 1-11** of the Guidance, except that in respect of measurements on non-ESP ships less than 500 gross tonnage and all fishing vessels, the firm need not be so approved.
(2) One or more of the following fracture detection procedures may be required if deemed necessary by the Surveyor:
(A) radiographic equipment
(B) ultrasonic equipment
(C) magnetic particle equipment
(D) dye penetrant

4. Survey at sea or at anchorage

(1) Survey at sea or at anchorage may be accepted provided the Surveyor is given the necessary assistance from the personnel onboard. Necessary precautions and procedures for carrying out the survey are to be in accordance with **Par 1, Par 2** and **Par 3** above.
(2) A communication system is to be arranged between the survey party in the tank or space and the responsible officer on deck. This system is to also include the personnel in charge of ballast pump handling if boats or rafts are used.
(3) When boats or rafts are used, appropriate life jackets are to be available for all participants. Boats or rafts are to have satisfactory residual buoyancy and stability even if one chamber is ruptured. A safety check-list is to be provided.
(4) Surveys of tanks by means of boats or rafts may only be undertaken at the sole discretion of the Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response under foreseeable conditions.

111. Special consideration for military vessels

Special consideration may be given in application of relevant sections of this chapter to commercial vessels owned or chartered by Governments, which are utilized in support of military operations or service.

112. Internal examination for ballast tanks with semi-hard coating

As for the requirements regarding semi-hard coatings, these coatings, if already applied, will not be accepted form the next Special or Intermediate Survey commenced on or after 1 July 2010, which-ever comes first, with respect to waving the annual internal examination of the ballast tanks.

Section 2 Annual Survey

201. Due range

1. Annual Survey is to be carried out within 3 months before or after each anniversary date.

2. Annual Survey may be carried out in advance even if it is not due, upon application by the Owner. However, if Annual Survey is carried out more than 3 months earlier than the anniversary date, the anniversary date will be newly assigned to the date of 3 months later than the date on which the survey was completed. The subsequent Annual Survey shall be completed at the interval which will correspond to the new anniversary date.

202. Hull, equipment and fire-extinguishing appliances

1. The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, hatch covers, hatch coamings, closing appliances, and equipment are maintained in a satisfactory condition.

(1) Examination of weather decks, ship side plating above waterline, hatch covers and coamings.
(a) Confirmation is to be obtained that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.
(b) Where mechanically operated steel covers are fitted, checking the satisfactory condition, as applicable, of:
(i) hatch covers
(ii) tightness devices of longitudinal, transverse and intermediate cross junctions(gaskets, gaskets lips, compression bars, drainage channels)
(iii) clamping devices, retaining bars, cleating, chain or rope pulleys
(iv) guides, guide rails and track wheels, stoppers, etc.
(v) wires, chains, gypsies, tensioning devices
(vi) hydraulic system essential to closing and securing
(vii) safety locks and retaining devices
(c) Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition where applicable, of:
(i) wooden covers and portable beams, carriers or sockets for the portable beams, and their securing devices
(ii) steel pontoons, tarpaulins
(iii) cleats, battens and wedges
(iv) hatch securing bars and their securing devices
(v) loading pads/bars and the side plate edge
(vi) guide plates and chocks
(vii) compression bars, drainage channels and drain pipes(if any)
(d) Checking the satisfactory condition of hatch coamings plating and their stiffeners, where applicable.
(e) Random checking of the satisfactory operation of mechanically operated hatch covers is to be made including:
(i) stowage and securing in open condition
(ii) proper fit and efficiency of sealing in closed condition
(iii) operational testing of hydraulic and power components, wires, chains and link drives
(f) Examination of the weld connection between air pipes and deck plating.
(g) External examination of all air pipe heads installed on the exposed decks.
(h) Examination of flame screens on the open ends of air pipes to all bunker tanks.

(2) Checking that no alterations have been made to the hull or superstructures that would affect the calculations determining the position of the load lines.
(3) Checking of the positions of the deck line and load line which, if necessary, are to be re-marked and re-painted.
(4) Examining the means of securing the weathertightness of cargo hatchways, other hatchways and other openings on the freeboard and superstructure decks.
(5) Examining the watertight integrity of the closures to any openings in the ship's side below the freeboard deck.
(6) Examining the ventilators and air pipes, including their coamings and closing appliances.

(7) Examining the scuppers, inlets and discharges.
(8) Examining the garbage chutes
(9) Examining the means provided to minimize water ingress through the spurling pipes and chain lockers
(10) Examining the side scuttles and deadlights.
(11) Examining the bulwarks including the provision of freeing ports, special attention being given to any freeing ports fitted with shutters.
(12) Examining the guardrails, gangways, walkways and other means provided for the protection of the crew and for gaining access to and from crew's quarters and working spaces.
(13) Checking, when applicable, the fittings and appliances for timber cargoes on deck.
(14) Confirming that the drainage from enclosed cargo spaces situated on the freeboard deck is satisfactory.
(15) Examining engine room and boiler room including exposed engine casings and their openings, engine room skylights, ventilator openings and their closing appliances.
(16) Examining flush scuttles and manhole covers.
(17) General condition of outside of the hull above the water line including weather deck and the arrangement for drainage, mooring and anchoring(including the hull structures in the vicinity of the fittings) are to be examined so far as could be seen. For ships built after 1 January 2007 subject to the *International Convention for the Safety of Life at Sea(SOLAS)*, confirming that the towing and mooring equipment is clearly and properly marked with any restriction associated with its safe operation
(18) Examining the superstructure end bulkheads, and examining the collision and the other watertight bulkheads as far as can be seen
(19) Examining and testing(locally and remotely) all the watertight doors in watertight bulkheads
(20) Examining penetrations and stop valves on watertight bulkheads and closing appliances of openings on superstructure end bulkheads. If considered necessary by the Surveyor, performance test for closing appliances of openings on superstructure end bulkheads is to be carried out.
(21) Examining, when applicable, the special requirements for ships permitted to sail with reduced freeboard.
(22) Examining each bilge pump and confirming that the bilge pumping system for each watertight compartment is satisfactory.
(23) Confirming, when appropriate and as far as is practicable when examining internal spaces on oil tankers and bulk carriers, that the means of access to cargo and other spaces remain in good condition (SOLAS 74/00/02, Reg.II-1/3-6)
(24) Examining the functionality of bilge well alarms to all cargo holds and conveyor tunnels (SOLAS 74/97, Reg.XII/9)
(25) For bulk carriers, examining the hold, ballast and dry space water level detectors and their audible and visual alarms (SOLAS 74/02, Reg.XII/12)
(26) For bulk carriers, checking the arrangements for availability of draining and pumping systems forward of the collision bulkhead (SOLAS 74/02, Reg.XII/13)
(27) For container ships equipped with container securing arrangements in accordance with **Pt 7, Ch 4, 702.** of the Rules, the container securing arrangements are to be examined as follows:
(a) general examination for arrangements
(b) confirmation of on-board record book
(28) For ships provided with a loading instrument in accordance with the requirements of **Pt 3, Ch 3, 104.,** it is to be confirmed that a loading instrument having the performance and functions as deemed appropriate by the Society is installed on board. Where a stability instrument specified in **Ch 1, 307.** is provided on-board, then the system is to be tested.
(29) Documentations on board including the stability data, etc. approved by the Society are to be confirmed to be kept on board.
(30) Suspect areas
Suspect areas identified at previous surveys are to be examined. Thickness measurements are to be taken of the areas of substantial corrosion and the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the Annual Survey is credited as completed.
Note : These requirements are not applicable to cargo tanks of oil tankers, chemical tankers and double hull oil tankers, surveyed in accordance with **Ch 3, Sec 3, Sec 4** and **Sec 5.**

(31) Examination of ballast tanks
Examination of ballast tank when required as a consequence of the results of the Special Survey and Intermediate Survey is to be carried out. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increase to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the Annual Survey is credited as completed.

(32) For ships provided with the equipment employed in the mooring of ships at single point mooring specified in **Pt 4, Ch 10, 101. 3** and assigned the additional class notation "EQ-SPM", the general function and deformation condition of this equipment employed in the mooring of ships at single point mooring and hull supporting structures are to be checked.

2. For fire-extinguishing appliances, the survey is to be in accordance with the Guidance relating to the Rules.

3. For ships subject to the enhanced survey programme such as **bulk carriers, oil tankers** and **chemical tankers**, etc., in addition to items of **Par 1** through **Par 2**, the additional requirements in accordance with **Ch 3** are to be taken. However, if the duplicated survey items are exist, these are not to be applied twice.

4. For additional requirements applicable to water level detectors fitted on single hold cargo ships, refer **Sec 14**.

5. In addition to **Par 1** through **Par 2, Ch 14** is also to be taken for general dry cargo ships and **Ch 15** is also to be taken for liquefied gas carriers. However, if the duplicated survey items are exist, these are not to be applied twice.

6. In addition to **Par 1** through **Par 2**, relevant requirements of **Ch 16** and/or **Ch 17** are also to be taken if applicable.

203. Machinery, electrical installations and additional installations

1. Confirming that the machinery, boilers and other pressure vessels, associated piping systems and fittings are installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

2. Confirming that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

3. Confirming that means are provided so that the machinery can be brought into operation from the dead ship condition without external aid.

4. Carrying out a general examination of the machinery, the boilers, all steam, hydraulic, pneumatic and other systems and their associated fittings to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

5. Examining and testing the operation of main and auxiliary steering arrangements, including their associated equipment and control system.

6. Confirming that the means of communication between the navigating bridge and the steering gear compartment and the means of indicating the angular position of the rudder are operating satisfactorily.

7. Confirming that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supply visual compass reading to the emergency steering position.

8. Confirming that various alarms required for hydraulic power-operated, electric and electro-hydraulic steering gears are operating satisfactorily and that the re-charging arrangements for hydraulic power-operated steering gears are being maintained.

9. Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including, when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge(including the control, monitoring, reporting, alert and safety actions) and the arrangements to operate the main and other machinery from a machinery control room.

10. Confirming the operation of the ventilation for the machinery spaces.

11. Confirming that the engine room telegraph, the second means of communication between the navigating bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

12. Confirming that the engineer's alarm is clearly audible in the engineer's accommodation.

13. Examining, as far as practicable, visually and in operation, the electrical installations, including the main source of power and the lighting systems.

14. Confirming, as far as practicable, the operation of the emergency sources of electrical power including their staring arrangements, the systems supplied and, when appropriate, their automatic operation.

15. Examining, in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

16. Confirming, as far as practicable, that no changes have been made in the structural fire protection, examining any manual and automatic fir doors and proving their operation, testing the means of closing the main inlets and outlets of all ventilation systems and testing the means of stopping power ventilation systems from outside the space served.

17. Confirming that the means of escape from accommodation, machinery and other spaces are satisfactory.

18. Examining the arrangements for gaseous fuel for domestic purpose.

19. Examining visually the condition of any expansion joints in sea water systems.

20. External survey of boilers and thermal oil heaters including test of safety and protective devices, and test of safety valve using its relieving gear, is to be carried out. For exhaust gas economizers, the safety valves are to be tested by the Chief Engineer at sea within the Annual Survey. This test is to be recorded in the log book for review by the attending Surveyor prior to crediting the Annual Survey.

21. Examination for the pressure relief devices of the refrigerating machinery given in **Pt 5, Ch 6, Sec 12** is to be carried out. Where the test results done by ship's crew are considered satisfactory by the Surveyor, the test may be dispensed with.

22. The surveys for water jet propulsion systems and azimuth or rotatable thruster are to be carried out in accordance with the Guidance relating to the Rules.

23. The surveys for additional installations(cargo refrigerating installations, cargo handling appliances, centralized monitoring and control system for main propulsion and essential auxiliary machinery, operating systems for periodically unattended machinery spaces, automation equipment, dynamic positioning system, navigation bridge systems and hull monitoring systems, etc.) are to be carried out in accordance with the requirements specified in **Pt 9**, etc.

24. In case where ships with STCM(stern tube condition monitoring) notation, confirming that parameters in the stern tube condition monitoring records are within the permissible limit.

25. Where considered necessary by the Surveyor, opening up examination of the above items may be requested.

204. Additional requirements to ship types

1. Oil tankers(including tankers) :

The additional requirements are to be surveyed as follows, as far as practicable. Where considered necessary by the Surveyor, the performance test and overhauling may be required.

(1) Checking the deck foam system, including the supplies of foam concentrate and testing that the minimum required number of jets of water at the required pressure in the fire main is obtained when the system is in operation.
(2) Examining the inert gas system, and in particular:
  (A) Examining externally for any sign of gas or effluent leakage.
  (B) Confirming the proper operation of both inert gas blowers.
  (C) Observing the operation of the scrubber room ventilation system.
  (D) Checking the deck water seal for automatic filling and draining.
  (E) Examining the operation of all remotely operated or automatically controlled valves and, in-particular, the flue gas isolating valves.
  (F) Observing a test of the interlocking feature of soot blowers.
  (G) Observing that the gas pressure regulating valve automatically closes when the inert gas blowers are secured.
  (H) Checking, as far as practicable, the following alarms and safety devices of the inert gas system using simulated condition where necessary.
    (a) high oxygen content of gas in the inert gas main.
    (b) low gas pressure in the inert gas main.
    (c) low pressure in the supply to the deck water seal.
    (d) high temperature of gas in the inert gas main.
    (e) low water pressure or low water-flow rate.
    (f) accuracy of portable and fixed oxygen-measuring equipment by means of calibration gas.
    (g) high water level in the scrubber.
    (h) failure of the inert gas blower.
    (i) failure of the power supply to the automatic control system for the gas regulating valve and to the instrumentation for continuous indication and permanent recording of pressure and oxygen content in the inert gas main.
    (j) high pressure of gas in the inert gas main.
(3) Checking, when practicable, the proper operation of the inert gas system on completion of the checks listed above. And then the inert gas systems using stored carbon dioxide, oil fuel combustion type systems, etc. except those using flue gases, are to be tested to ascertain that they are in good working order.
(4) Examining the fixed fire-fighting system for cargo pump rooms, and confirming, as far as practicable, the operation of the remote means for closing the various openings.
(5) Checking protection of cargo pump room and in particular:
  (A) Checking temperature sensing devices for bulkhead gland and alarms.
  (B) Checking interlock between lighting and ventilation.
  (C) Checking gas detection system.
  (D) Checking bilge level monitoring devices and alarms.
(6) Confirming, when appropriate, that the requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.
(7) Examining the cargo tank openings, including gaskets, covers, coamings and screens.
(8) Examining the cargo tank pressure/vacuum valves and devices to prevent the passage of flame.
(9) Examining flame screens on the open ends of air pipes to all bunker tanks, ballast tanks adjacent to cargo oil tanks, slop tanks and void spaces adjacent to cargo oil tanks.
(10) Examining the cargo tank venting, cargo tank purging and gas-freeing and other ventilation systems.
(11) Examining the cargo, crude oil washing, ballast and stripping systems both on deck and in the cargo pump-rooms and the bunker system on deck.
(12) Confirming that all electrical equipment in dangerous zones is suitable for such locations, is in good condition and is being properly maintained.
(13) Confirming that potential sources of ignition in or near the cargo pump-room are eliminated, such as loose gear, combustible materials, etc., that there are no signs of undue leakage and that access ladders are in good condition.

(14) Examining all pump-room bulkheads for signs of oil leakage or fractures and, in particular, the sealing arrangements of all penetrations of cargo pump-room bulkheads.
(15) Examining, as far as practicable, the cargo, bilge, ballast and stripping pumps for undue gland seal leakage. Verifying the proper operation of electrical and mechanical remote operating and shutdown devices and operation of cargo pump-room bilge system, and checking that pump foundations are intact.
(16) Confirming that the pump-room ventilation system is operational, ducting is intact, dampers are operational and screens are clean.
(17) Verifying that installed pressure gauges on cargo discharge lines and level indicator systems are operational.
(18) Examining access to bow arrangement.
(19) Examining the towing arrangement for tankers of not less than 20,000 tonnes deadweight.
(20) Examining the emergency lighting in all cargo pump rooms of tanker constructed after 1 July 2002.

2. Chemical tankers :

The additional requirements are to be surveyed as follows, as far as practicable. Where considered necessary by the Surveyor, the performance test and overhauling may be required.

(1) Confirming, when appropriate, that the requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.
(2) Examining the cargo tank openings, including gaskets, covers, coamings and screens.
(3) Examining the cargo tank pressure/vacuum valves and devices to prevent the passage of flame.
(4) Examining flame screens on the open ends of air pipes to all bunker tanks, ballast tanks adjacent to cargo tanks, slop tanks and void spaces adjacent to cargo tanks.
(5) Examining the cargo tank venting, cargo tank purging and gas-freeing and other ventilation systems.
(6) Examining the cargo, tank cleaning, ballast and stripping systems both on deck and in the cargo pump-rooms and the bunker system on deck.
(7) Examining, as far as practicable, the cargo, bilge, ballast and stripping pumps for undue gland seal leakage. Verification of the proper operation of electrical and mechanical remote operating and shutdown devices and operation of cargo pump-room bilge system, and checking that pump foundations are intact.
(8) Confirming that the pump-room ventilation system is operational, ducting is intact, dampers are operational and screens are clean.
(9) Verifying that installed pressure gauges on cargo discharge lines and level indicator systems are operational.
(10) Confirming that wheelhouse doors and windows, sidescuttles and windows in superstructure and deckhouse ends facing the cargo area are in a satisfactory condition.
(11) Confirming that potential sources of ignition in or near the cargo pump-room are eliminated, such as loose gear, combustible materials, etc., that there are no signs of undue leakage and that access ladders are in good condition.
(12) Confirming that removable pipe lengths or other approved equipment necessary for cargo separation are available in the pump room and are in a satisfactory condition.
(13) Examining all pump room bulkhead for signs of cargo leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room bulkheads.
(14) Confirming that the remote operation of cargo pump bilge system is satisfactory.
(15) Examining the bilge and ballast arrangements and confirming that pumps and pipelines are identified.
(16) Confirming, when applicable, that the bow or stern loading and unloading arrangements are in order and testing the means of communication and the remote shut down for the cargo pumps.
(17) Examining the cargo transfer arrangements and confirming that any hoses are suitable for their intended purpose and, where appropriate, type-approved or marked with date of testing.
(18) Examining, as far as practicable, the cargo heating or cooling systems, including any sampling arrangements, and confirming that the means for measuring the temperature and associated alarms are operating satisfactorily.
(19) Examining, as far as practicable, the cargo tank vent systems, including the pressure/vacuum valves and secondary means to prevent over or under pressure and flame screens.
(20) Examining the gauging devices, high-level alarms and valves associated with overflow control.

(21) Confirming that arrangements for sufficient gas to be carried or generated to compensate for normal losses and that the means provided for monitoring ullage spaces are satisfactory.
(22) Confirming that arrangements are made for sufficient medium to be carried where drying agents are used on air inlets to cargo tanks.
(23) Confirming that all electrical equipments in dangerous zones is suitable for such locations, is in satisfactory condition and has been properly maintained.
(24) Examining the fixed fire-fighting system for the cargo pump room and the deck foam system for the cargo area and confirming that their means of operation are clearly marked.
(25) Confirming that the condition of the portable fire extinguishing equipment for the cargoes to be carried in the cargo area is satisfactory.
(26) Examining, as far as practicable, and confirming the satisfactory operation of, the arrangements for the ventilation of spaces normally entered during cargo handling operations and other spaces in the cargo area.
(27) Examining, as far as practicable, that the intrinsically safe systems and circuits used for measurement, monitoring, control and communication purposes in all hazardous locations are being properly maintained.
(28) Examining the equipment for personal protection and in particular that:
(A) the protective clothing for crew engaged in loading and discharging operation and its stowage is in a satisfactory condition;
(B) the required safety equipment and associated breathing apparatus and associated air supplies and, when appropriate, emergency-escape respiratory and eye protection are in a satisfactory condition and are properly stowed;
(C) medical first-aid equipment, including stretchers and oxygen resuscitation equipment are in a satisfactory condition;
(D) arrangements have been made for the antidotes for the cargoes actually carried to be on board;
(E) decontamination arrangements and eyewashes are operational;
(F) the required gas detection instruction are on board and that arrangements have been made for the supply of the appropriate vapour detection tubes;
(G) the arrangements for the stowage of cargo samples are satisfactory;
(29) Confirming that the system for continuous monitoring of the concentration of flammable vapours which is installed in cargo pump room is satisfactory. And, confirming that sampling points or detector heads are located in suitable positions in order that potentially dangerous leakages are readily detected.
(30) Examining externally and confirming that the pumping and piping systems, including a stripping system if fitted, and associated equipment remain as approved.
(31) Examining externally the tank washing piping and confirming that the type, capacity, number, and arrangement of the tank washing machine are as approved.
(32) Examining externally the wash water heating system.
(33) Examining externally, as far as practicable, the underwater discharge arrangements.
(34) Confirming that the means of controlling the rate of discharge of the residue is as approved.
(35) Confirming that the flow rate indicating device is operable.
(36) Confirming that the ventilation equipment for residue removal is as approved.
(37) Examining externally, as far as it is accessible, the heating system required for solidifying and high viscosity substances.
(38) Confirming that any cargo tank high-level alarms are operable.
(39) Examining any additional requirements for the carriage of cargoes listed on the relevant Certificate.
(40) Examining access to bow arrangement.
(41) Examining the towing arrangement for tankers of not less than 20,000 tonnes deadweight.
(42) Examining the emergency lighting in all cargo pump rooms of tanker constructed after 1 July 2002.

3. Liquefied gas carriers :

The additional requirements are to be surveyed as follows, as far as practicable, during a loading or discharging operation. Access for cargo tanks or inerted hold spaces, however, need not be surveyed unless otherwise specially required by the Surveyor. Where considered necessary by the Surveyor, the performance test and overhauling may be required.

(1) Confirming, when appropriate, that the requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.
(2) Examining the cargo tank openings, including gaskets, covers, coamings and screens.
(3) Examining flame screens on the open ends of air pipes to all bunker tanks, ballast tanks adjacent to cargo tanks and spaces adjacent to cargo tanks.
(4) Examining the cargo tank venting, cargo tank purging and gas-freeing and other ventilation systems.
(5) Examining the cargo piping systems both on deck and in the cargo compressor-rooms and the bunker system on deck.
(6) Confirming that all electrical equipment in dangerous zones is suitable for such locations, is in good condition and has been properly maintained.
(7) Confirming that potential sources of ignition in or near the cargo compressor-room are eliminated, such as loose gear, combustible materials, etc., that there are no signs of undue leakage and that access ladders are in good condition.
(8) Examining all cargo compressor-room bulkheads for signs of oil leakage or fractures and, in particular, the sealing arrangements of all penetrations of cargo compressor-room bulkheads.
(9) Confirming that the compressor-room ventilation system is operational, ducting is intact, dampers are operational and screens are clean.
(10) Verifying that installed pressure gauges on cargo discharge lines and level indicator systems are operational.
(11) Confirming that special arrangements to survive conditions of damage are in order.
(12) Confirming that wheelhouse doors and windows, sidescuttles and windows in superstructure and deckhouse ends in the cargo area are in a satisfactory condition.
(13) Examining the cargo pump rooms and cargo compressor rooms
(14) Confirming the manually operated emergency shutdown system together with the automatic shutdown of the cargo pumps and compressors are satisfactory.
(15) Examining the cargo control room.
(16) Examining the gas detection arrangements for cargo control rooms and measures taken to exclude ignition sources where such spaces are not gas-safe.
(17) Confirming the arrangements for the air locks are being properly maintained.
(18) Examining, as far as practicable, the bilge, ballast and oil fuel arrangements.
(19) Examining, when applicable, the bow or stern loading and unloading arrangements with particular reference to the electrical equipment, fire-fighting arrangements and means of communication between cargo control room and the shore location.
(20) Confirming that the sealing arrangements at gas domes are satisfactory
(21) Confirming that portable or fixed drip tray of deck insulation for cargo leakage is in order.
(22) Examining the cargo and process piping, including the expansion arrangements, insulation from the hull structure, pressure relief and drainage arrangements.
(23) Confirming that the cargo tank and interbarrier space pressure and relief valves, including safety systems and alarms, are satisfactory.
(24) Confirming that the any liquid and vapour hoses are suitable for their intended purpose and, where appropriate, type-approved or marked with date of testing.
(25) Examining the arrangements for the cargo pressure/temperature control including, when fitted, any refrigeration system and confirming that any associated alarms are satisfactory.
(26) Examining the cargo, bunker, ballast and vent piping systems, including vent masters and flame screens, as far as practicable.
(27) Confirming that arrangements are made for sufficient inert gas to be carried to compensate for normal losses and that means are provided for monitoring the spaces.
(28) Confirming that the use of inert gas has not increased beyond that needed to compensate for normal losses by examining records of inert gas usage.
(29) Confirming that any air-drying system and any interbarrier and hold space purging inert gas system are satisfactory.

(30) Confirming that electrical equipments in gas-dangerous spaces and zones is in a satisfactory condition and is being properly maintained.
(31) Examining the arrangements for the fire protection and fire extinction and testing the remote means of starting one main fire pump.
(32) Examining the fixed fire-fighting system for the cargo pump room and confirming that its means of operation is clearly marked.
(33) Examining the water spray system for cooling, fire protection and crew protection and confirming that its means of operation is clearly marked.
(34) Examining the dry chemical powder fire-extinguishing system for the cargo area and confirming that its means of operation is clearly marked.
(35) Examining the fixed installation for the gas-dangerous spaces and confirming its means of operation is clearly marked.
(36) Examining, as far as practicable, and confirming the satisfactory operation of , the arrangements for the mechanical ventilation of spaces in the cargo area normally entered during cargo handling operations.
(37) Examining, and confirming the satisfactory operation of, the arrangements for the mechanical ventilation of spaces normally entered other than those covered by (36) above.
(38) Examining, and testing as appropriate and as far as practicable, the liquid level indicators, overflow control, pressure gauges, high pressure and, when applicable, low pressure alarms, and temperature indicating devices for the cargo tanks.
(39) Examining, and testing as appropriate, the gas detection equipment.
(40) Confirming that two sets of portable gas detection equipment suitable for the cargoes to be carried and a suitable instrument for measuring oxygen levels have been provided.
(41) checking the provision of equipment for personal protection and in particular that:
(A) two complete sets of safety equipment each permitting personnel to enter and work in a gas-filled space are provided and are properly stowed;
(B) the requisite supply of compressed air is provided and examining, when applicable, the arrangements for any special air compressor and low-pressure air line system.
(C) medical first-aid equipment, including stretchers and oxygen resusciation equipment and antidotes, when available, for the products to be carried are provided.
(D) respiratory and eye protection suitable for emergency escape purposes are provided.
(E) examining when applicable, the arrangements to protect personnel against the effects of major cargo release by a special suitably designed and equipped space within the accommodation area;
(F) examining, when applicable, the arrangements for the use of cargo as fuel and testing, as far as practicable, that the gas supply to the machinery space is cut off should the exhaust ventilation not be functioning correctly and that master gas fuel valve may be remotely closed from within the machinery space.
(42) The log books are to examined with regard to correct functioning of the cargo containment and cargo handling systems. The hours per day of the reliquefaction plants or the boil-off rate is to be considered.
(43) All accessible gas-tight bulkhead penetrations including gas-tight shaft sealings are to be visually examined.
(44) The means for accomplishing gas tightness of the wheelhouse doors and windows is to be examined. All windows and side scuttles within the area required to be of the fixed type (non-opening) are to be examined for gas tightness. the closing devices for all air intakes and openings into accommodation spaces, service spaces, machinery spaces, control stations and approved openings in superstructures and deckhouses facing the cargo area or bow and stern loading/unloading arrangements, are to be examined.
(45) Cargo handing systems
The cargo handling piping and machinery, e.g. cargo and process piping, cargo heat exchangers, vaporizers, pumps, compressors and cargo hoses are in general to be visually examined, as far as possible, during operation.
(46) Cargo containment venting systems
Venting systems, including protection screens if provided, for the cargo tanks, interbarrier spaces and hold spaces are to be visually examined externally. It is to be verified that the cargo tank relief valves are sealed and that the certificate for the relief valves opening/closing pressure is onboard.

(47) Instrumentation and safety systems
(A) The instrumentation of the cargo installations with regard to pressure, temperature and liquid level is to be verified in good working order by one or more of the following methods:
- Visual external examination
- Comparing of read outs from different indicators
- Consideration of read outs with regard to the actual cargo and/or actual condition
- Examination of maintenance records with reference to cargo plant instrumentation maintenance manual
- Verification of calibration status of the measuring instruments

(B) The logbooks are to be examined for confirmation that the emergency shutdown system has been tested.

(48) Environmental control for cargo containment systems
(A) Inert gas/ dry air installations including the means for prevention of backflow of cargo vapour to gas-safe spaces are to be verified as being in satisfactory operating condition.
(B) For membrane containment systems normal operation of the nitrogen control system for insulation and interbarrier spaces shall be confirmed to the Surveyor by the Master.

(49) Miscellaneous
(A) It is to be verified that all accessible cargo piping systems are electrically bonded to the hull.
(B) Arrangements for burning methane boil-off are to be visually examined as far as practicable. The instrumentation and safety systems are to be verified as being in good working order in accordance with (37) (A) above.
(C) The relevant instruction and information material such as cargo handling plans, filling limit information, cooling down procedures etc. are to be verified as being onboard.
(D) Mechanical ventilation fans in gas dangerous spaces are to be visually examined.

(50) Examining access to bow arrangement.
(51) Examining the towing arrangement for tankers of not less than 20,000 tonnes deadweight.
(52) Examining the emergency lighting in all cargo pump rooms of tanker constructed after 1 July 2002.

4. Pushers and integrated pusher barges :

The additional requirements for the connection system between pusher and integrated pusher barge are to be surveyed as follows.

(1) Confirmation of operating condition of connection system according to the operation procedure.
(2) Examination of connection condition including the supporting structures.
(3) Examination of hydraulic system for leak and operating condition, if fitted.
(4) Examination of hinge arm and joint pins, if fitted.
(5) Examination of mechanical locking/unlocking device including operating condition, if fitted.

Section 3 Intermediate Survey

301. Due range

1. Intermediate Survey is to be carried out within 3 months before or after the second or third anniversary date from the completion date of the initial Classification Survey or of the previous Special Survey. However, for passenger ships, submersibles, nuclear ships, hydrofoils, air cushion vehicles, high speed crafts, Intermediate Survey is to be carried out within 3 months before or after each anniversary date.

2. Intermediate Survey may be carried out in advance even if it is not due, upon application by an Owner. However, if Intermediate Survey is carried out more than 3 months earlier than the anniversary date, the anniversary date will be newly assigned to the date of 3 months later than the date on which the survey was completed. The subsequent Intermediate Survey shall be completed at the interval which will correspond to the new anniversary date.

3. A part of Intermediate Survey items which are additional to the requirements of the Annual Survey may be surveyed either at or between the 2nd and 3rd Annual Survey, except those ships mentioned in **Par 1** of which Intermediate Survey is to be carried out every year.

4. A survey planning meeting is to be held prior to the commencement of the survey.

5. Concurrent crediting to both Intermediate Survey and Special Survey for surveys and thickness measurements of spaces are not acceptable.

302. Hull, equipment and fire-extinguishing appliances

At the Intermediate Survey, in addition to all the requirements for Annual Survey, the following items are to be surveyed:

1. Internal examination of ballast tanks and cargo spaces are given in **Table 1.2.1.**

Table 1.2.1 Internal examination of ballast tanks and cargo spaces

	5 years 〈 age ≤ 10 years	10 years 〈 age ≤ 15 years	15 years 〈 age
Ballast tanks	Representative ballast tanks[1), 2), 3), 4)]	All ballast tanks[2), 3), 4)]	All ballast tanks[2), 3), 4)]
Cargo holds	-	1. Ships carrying logs: each one of cargo hold at the forward and aft ends	1. Ships carrying logs: each one of cargo hold at the forward and aft ends 2. Ships carrying dry cargoes[5)]: selected cargo holds
Cargo tanks[6)]	-	Selected cargo tanks	Selected cargo tanks

(NOTES)
1) If there is no hard protective coating, soft or semi-hard coating, or POOR coating condition, the examination is to be extended to other ballast tanks of the same type.
2) If such examinations reveal no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains effective.
3) For ballast tanks, excluding double bottom ballast tanks, if there is no hard protective coating, soft or semi-hard coating, or POOR coating condition and it is not renewed, the spaces in question is are to be internally examined at annual intervals.
4) When such condition as above 3) are found in double bottom ballast tanks, the spaces in question may be internally examined at annual intervals.
5) General dry cargo ships subject to **Sec 14** or, bulk carriers or double skin bulk carriers subject to **Ch 3, Sec 2** or **Sec 6** are exempted and each relevant requirements are applied.
6) Liquefied gas carriers subject to **Sec 15** or, oil tankers, chemical tankers or double hull oil tankers subject to **Ch 3, Sec 3, Sec 4** or **Sec 5** are exempted and each relevant requirements are applied.

2. For fire-extinguishing appliances, the survey is to be in accordance with the Guidance relating to the Rules.

3. For ships subject to the enhanced survey programme such as **bulk carriers, oil tankers** and **chemical tankers**, etc., in addition to items of **Par 1** through **Par 2**, the additional requirements in accordance with **Ch 3** are to be taken. However, if the duplicated survey items are exist, these are not to be applied twice.

4. In addition to **Par 1** through **Par 2, Ch 14** is also to be taken for general dry cargo ships and **Ch 15** is also to be taken for liquefied gas carriers. However, if the duplicated survey items are exist, these are not to be applied twice.

5. In addition to **Par 1** through **Par 2**, relevant requirements of **Ch 16** and/or **Ch 17** are also to be taken if applicable.

303. Machinery, electrical installations and additional installations

At each Intermediate Survey, in addition to all the requirements of Annual Survey, the following requirements are to be complied with.

1. Steam turbines for main engines

(1) Examinations are to be carried out while rotating the rotor after removing the upper part of the turbine and rotor shaft bearings. The examinations on rotors may be dispensed with when deemed unnecessary by the Surveyor.
(2) The clutch coupling is to be examined.

2. Internal combustion engines for main engines

(1) Partial open-up survey for one cylinder is, in principle, to be carried out as follows, however, the extent may be extended when deemed necessary by the Surveyor.
  (A) Internal examinations of the cylinders and combustion side of the cylinder covers are to be carried out. Pistons may not have to be removed except when deemed necessary by the Surveyor.
  (B) Examinations are to be carried out while rotating the crank shaft after removing the upper parts of main bearings and crank-pin bearings. The deflection of crank webs are to be measured and where deemed necessary the alignment of the bearing are to be adjusted.
(2) Examination for high-rotating-speed internal combustion engines is to be done by the requirement specified in the above (1), but the measurement for crank web deflections may be dispensed with. However, where total running hours for an internal combustion engine is confirmed and found in satisfactory by the Surveyor, the survey may be extended until next overhauling hours recommended by the manufacturer since the previous overhauling survey.
(3) The survey for a passenger ship is to be in accordance with the Guidance relating to the Rules.

3. Auxiliary engines

Examinations on auxiliary engines driving generators(except emergency use) and other auxiliary machinery related with ship propulsion are to be carried out in accordance with the requirements for main engine.

4. Other essential auxiliaries

General examinations are to be carried out on other essential auxiliary machinery. Detailed examinations may, however, be required when deemed necessary by the Surveyor.

5. Electrical installations

Where deemed necessary by the Surveyor, insulation resistance test is to be made.

6. The surveys for water jet propulsion systems and azimuth or rotatable thruster are to be carried out in accordance with the Guidance relating to the Rules.

7. In addition to **Par 1** through **Par 6**, relevant requirements of **Ch 17** are also to be taken if applicable.

304. Additional requirements to ship types

At each Intermediate Survey, in addition to all the requirements of Annual Survey, the following requirements are to be complied with.

1. Oil tankers(including tankers) :

The additional requirements are to be surveyed as follows, as far as practicable.

(1) Should there by any doubt as to its condition when examining the various piping systems, the piping may be required to be pressure tested, gauged or both. Particular attention is to be paid to repairs such as welded doublers.
(2) For ships over ten years of age an internal examination of selected cargo spaces;
(3) Testing the insulation resistance of electrical circuits in dangerous zones such as cargo pump rooms and area adjacent to cargo tanks but in case where a proper record of testing is maintained consideration should be given to accepting recent readings.
(4) Checks are to be made on the resistance to earth for bonding straps described in **Pt 7, Ch 1, 1104.**, when deemed necessary by the Surveyor.

2. Chemical tankers :

The additional requirements are to be surveyed as follows, as far as practicable.

(1) Verifying from the cargo record book that the pumping and stripping arrangements have been emptying the tanks efficiently and are all in working order;
(2) Confirming, if possible, that the discharge outlets are in good condition;
(3) Confirming the satisfactory operation of the recording device, as fitted, and verifying by an actual flow test that it has an accuracy of ± 15 % or better;
(4) Confirming that the ventilation equipment for residue removal is satisfactory and that the pressure in the driving medium for portable fans for ventilation equipment for residue removal can be achieved to give the required fan capacity.
(5) Examination of vent line drainage arrangements.
(6) Confirmation, where applicable, that pipelines and independent cargo tanks are electrically bonded to the hull.
(7) Generally examining the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks to check for defective equipment, fixtures and wiring. The insulation resistance of the circuits should be tested and in cases where a proper record of testing is maintained, consideration should be given to accepting recent readings.
(8) Confirmation that spares are provided for cargo area mechanical ventilation fans.

3. Liquefied gas carriers :

The additional requirements are to be surveyed as follows, as far as practicable. This survey is preferably to be carried out with the ship in a gas-free conditions. The extent of the testing required for this survey will normally be such that the survey cannot be carried out during a loading or discharging operation, and then testing cargo handling installations with related automatic control, alarm and safety systems for correct functioning.

(1) Confirmation, where applicable, that pipelines and independent cargo tanks are electrically bonded to the hull.
(2) Generally examining the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks to check for defective equipment, fixtures and wiring. The insulation resistance of the circuits should be tested and in cases where a proper record of testing is maintained, consideration should be given to accepting recent readings.
(3) Confirmation that spares are provided for cargo area mechanical ventilation fans.
(4) Confirming that the heating arrangements, if any, for steel structures are satisfactory.
(5) The instrumentation of the cargo installation with regard to pressure, temperature and liquid level is to be visually examined and to be tested by changing the pressure, temperature and level as applicable and comparing with test instruments. Simulated testing may be accepted for sensors which are not accessible or for sensors located within cargo tanks or inerted hold spaces. The testing is to be include testing of alarm and safety function.
(6) The piping of the gas detection system is to be visually inspected for corrosion and damage as far as practicable. The integrity of the suction lines between suction points and analyzing units is to be verified as far as possible. Gas Detectors are to be calibrated or verified with sample gases.

(7) The emergency shutdown system is to be tested, without flow in the pipe lines, to verify that the system will cause the cargo pumps and compressors to stop.
(8) Electrical equipment in gas-dangerous spaces and zones is to be examined as far as practicable with particular respect to the following:
(A) Protective earthing(Spot check)
(B) Integrity of enclosures
(C) Damage of outer sheath of cable
(D) Function testing of pressurized equipment and of associated alarms
(E) Testing of systems for de-energizing non-certified safe electrical equipment located in spaces protected by air-locks, such as electrical motor-rooms, cargo control room, etc.
(F) Testing of insulation resistance of circuits. Such measurements are only to be made when the ship is in a gas-free or inerted condition. Where proper records of testing are maintained consideration may be given to accepting recent readings by the ship's crew.
(9) The instrumentation and safety systems for burning cargo as fuel are to be examined in accordance with (5). Inspection and maintenance of electrical equipment installed in hazardous area shall be complied with the requirements given in IEC60079-17, Part 17.
(10) Examination for non-metallic membranes of pressure relief valves for cargo tanks in accordance with the Guidance relating to the Rules.

Section 4 Special Survey (Hull, Equipment and Fire-extinguishing Appliances)

401. Due range

1. The first Special Survey is to be completed within 5 years from the date of the initial Classification Survey and thereafter within 5 years from the credited date of the previous Special Survey. Under 'exceptional circumstances', the Society may grant an extension not exceeding three(3) months to allow for completion of the Special Survey provided that the vessel is attended and the attending Surveyor(s) so recommend(s) after the following has been carried out: Where ‘exceptional circumstance' means unavailability of dry-docking facilities; unavailability of repair facilities; unavailability of essential materials, equipment or spare parts; or delays incurred by action taken to avoid severe weather conditions.

(1) Annual Survey;
(2) re-examination of Recommendations/Conditions of Class;
(3) progression of the Special Survey as far as practicable;
(4) in the case where dry docking is due prior to the end of the class extension, an underwater examination is to be carried out by an approved diving company. An underwater examination by an approved company may be dispensed with in the case of extension of dry-docking survey not exceeding 36 months interval provided the ship is without outstanding Recommendation/Condition of Class regarding underwater parts.

In this case, the next period of class will start from the expiry date of the Special Survey before the extension was granted.

2. In the case that the Certificate of Classification will expire when the vessel in expected to be at sea, an extension to allow for completion of the Special Survey may be granted provided there is documented agreement to such an extension prior to the expiry date of the certificate, and provided that positive arrangements have been made for attendance of the Surveyor at the first port of call, and provided that the Society is satisfied that there is technical justification for such an extension. Such an extension is to be granted only until arrival at the first port of call after the expiry date of the certificate. However, if owing to 'exceptional circumstances' the Special Survey cannot be completed at the first port of call, above **Par 1** may be followed, but the total period of extension shall in no case be longer than three(3) months after the original due date of the Special Survey.

3. For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start form the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the next Special Survey shall be assigned at the date of 5 years after the completion date of the concerned Special Survey.

4. The Special Survey including docking survey, compartment survey and thickness measurement may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date.

5. When the Special Survey is commenced prior to the 4th Annual Survey, the entire survey is to be completed within 15 months if such work is to be credited to the Special Survey.

6. A survey planning meeting is to be held prior to the commencement of the survey.

7. Concurrent crediting to both Intermediate Survey and Special Survey for surveys and thickness measurements of spaces are not acceptable.

8. Continuous Survey of Hull

For ships other than those subject to **Ch 3 Hull Surveys of Ships subject to the Enhanced Survey Programme** and **Sec 14 Hull Surveys for General Dry Cargo Ships,**

(1) A part of hull items of the Special Survey can be carried out on the Continuous Survey System basis, at the request of an Owner if has been approved by the Society. A part of hull items of the Special Survey(i.e. hull continuous survey items) means the internal examination, thickness measurements, survey in dry-dock, survey for anchor/chain cables, tank pressure test and survey for hatch covers/coamings. Ships on the Continuous Survey System are not exempt from other periodical surveys.

(2) When such a system is adopted all the hull continuous survey items of the particular Special Survey must be completed at the end of the five-year Special Survey period.

(3) During each survey cycle, all the hull continuous survey items are to be surveyed (and tested, where required) in regular rotation, as far as practicable, with uniform annual share within the five-year Special Survey period. In general, approximately 20 % of the total number of the hull continuous survey items of the Special Survey is to be completed each year.

(4) At the end of the five-year Special Survey period, for the purpose of completion of Special Survey, a survey at least in the scope of an Annual Survey is be carried out during which the Surveyor will satisfy himself/herself as to whether all items required to be surveyed have been surveyed throughout, and with satisfactory results. The Surveyor may inspect individual parts again if deemed necessary by the Surveyor.

(5) The Owner is entitled to fix the sequence in which the individual hull continuous survey items are intended to be surveyed. However, the sequence in each survey cycle shall be linked with that of the previous one in such a way that the interval between consecutive (in two cycles) examinations of each hull continuous survey items should not generally exceed five years. The survey in dry-dock may be held at any time within the five-year Special Survey period, provided all the requirements of **Sec 6** are also complied with. For ships more than 10 years of age, the ballast tanks are to be internally examined twice in each five-year Special Survey period, i.e. once within the scope of the Intermediate Survey and once within the scope of the Continuous Survey of Hull for the Special Survey.

(6) The Surveyor may extend the inspection at his/her discretion, to other items if the inspections carried out revealed any defects.

(7) The approval for surveys to be carried out on a Continuous Survey System basis may be withdrawn at discretion of the Society.

402. Kinds of Special Surveys

The first Special Survey on a ship after the Classification Survey during Construction is designated as Special Survey No. 1 and subsequent Special Surveys are designated as Special Survey No. 2, No. 3, etc. The kinds of Special Surveys on a ship for the Classification Survey after Construction are to be determined based upon the Special Surveys applied to the Classification Survey according to the ship's age.

403. Requirements of survey

1. The Special Survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping, as required in (9), are in satisfactory condition and is fit for the intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and the periodical surveys being carried out at the due dates. The examinations of the hull are to be supplemented by thickness measurements and testing as required in (9) and (13), to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages, or other structural deterioration, that may be present.

(1) The vessel is to be placed in a drydock or upon a slipway and all items of **603.** are to be examined. However ships subject to the "Extended Dry-docking Interval System" specified in **605.**, this examination can be carried out in accordance with **605.**

(2) Hatch covers and coamings
The hatch covers and coamings are to be surveyed as follows:
  (a) A thorough inspection of the items listed in **202. 1** (1) and (6), including Close-up Survey of hatch cover plating and hatch coaming plating, is to be carried out.
  (b) Checking of the satisfactory operation of all mechanically operated hatch covers is to made, including:
    (i) stowage and securing in open condition
    (ii) proper fit and efficiency of sealing in closed condition
    (iii) operational testing of hydraulic and power components, wires, chains and link drives
  (c) Checking of the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent as necessary.

(3) The anchors and chain cables are to be ranged, examined and the required complement and condition verified. The chain locker, holdfasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested. At Special Survey No. 2 and subsequent Special Surveys, chain cables are to be gauged and renewed in cases where their mean diameter is 12 % or more below the original required nominal size.

(4) Inside of the hull is to be examined after articles not permanently attached to the hull are removed as far as possible and after all limber boards, mud boxes, strainers of bilge suction pipes, etc. are opened and interior of the hull is cleaned.

(5) All decks are to be examined, attention being paid to the welded parts of the strength deck, structures in way of discontinuities and corners of hatchway openings, etc. It is also to be ascertained whether the deck composition satisfactorily adheres to the plating.

(6) The protected structures are to be examined in accordance with **Table 1.2.2.**

Table 1.2.2 Examination of the protected structures at each Special Survey

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3 and Subsequent
	In addition to the requirements of Special Survey No. 1,	In addition to the requirements of Special Survey No. 2,
1) Single bottom construction is to be examined after removing at least one strake of bottom ceilings on each side of the centerline and the bilges and flooring plates in machinery space where deemed necessary. Special attention is to be paid to ascertain that the cement of other composition laid on the inner surface of bottom plating is in satisfactory condition.	1) Throughout the ship, in way of single bottoms one strake of ceilings on each side near to the keelson and in way of double bottoms and deep water or oil tanks ceilings at bilge (including limber hole) and centre line part, lower parts of pillars and bulkheads, shaft tunnels and any other parts deemed necessary by the Surveyor are to be removed and the internal structures are to be examined.	1) All ceilings, sparrings, wood linings, casings in the holds, and floor plates in the machinery spaces are to be removed in sufficient quantities to enable the Surveyor to examine the conditions of structure under them. The ship is to be made free from rust inside and outside in order to expose for examination the framing and plating together with discharges, scuppers, air and sounding pipes, and the steel-work is to be examined.
2) Where a double bottom is fitted, a sufficient amount of ceiling as deemed necessary by the Surveyor is to be removed and the condition of the top plating examined.	2) Shell plating in way of the side scuttles is to be examined with special attention, and where deemed necessary by the Surveyor, the thickness of the said parts and any other parts of the structure being excessively corroded is to be gauged.	2) Wood planks and other covering on steel decks are to be removed as required by the Surveyor and examined. Cement chocks on the ship's sides at bilges and decks are to be examined, portions of them are to be removed as deemed necessary by the Surveyor so that the condition of the shell plating and adjacent steel-work can be ascertained.
	3) The condition of steel deck plating under wooden deck is to be examined by drilling the worn parts of wooden deck.	3) Where deemed necessary by the Surveyor, the lining in way of the side scuttles is to be removed as required by the Surveyor, and the shell plating examined.
		4) Where the holds are insulated for carriage of refrigerated cargoes, the limbers and hatches are to be removed, and where considered necessary by the Surveyor, a sufficient amount of insulation is to be removed in each of the chambers to enable the Surveyor to ascertain the condition of the plating and framing.

(7) Internal examination of tanks and spaces
(a) All spaces including tanks and spaces in accordance with **Table 1.2.3** are to be internally examined.
(b) When tanks are examined internally, the plating and framing, bilges and drain wells, sounding, venting, pumping and drainage arrangements within the tanks and spaces are to be examined.
(c) Where provided, the condition of corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom ballast tanks, where a hard protective coating is found in POOR condition and it is not renewed, where soft or semi-hard coating has been applied, of where a hard protective coating was not applied from time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor.
(d) When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary be the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

Table 1.2.3 Minimum requirements for Internal examination of tanks and spaces at each Special Survey

Tanks or Spaces \ No. of Special Survey		Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
Cargo holds(and their 'tween decks where fitted), cargo tanks		○	○	○	○
Double bottom tanks, deep tanks, ballast tanks, peak tanks		○	○	○	○
Pump room, pipe tunnel, duct keel, machinery spaces, dry spaces, cofferdams, void spaces		○	○	○	○
Fuel oil tanks△	Engine room	-	-	1	1
	Cargo length area	-	1	2	Half, minimum 2
Lubrication oil tanks△		-	-	-	1
Fresh water tanks△		-	1	○	○

(NOTES)
Purpose of tank has a priority in application.
○ : All tanks and spaces are to be internally examined.
△ : As follows:
1) These requirements apply to tanks of integral (structural) type.
2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each Special Survey, on a rotational basis.
3) Peak tanks (all uses) are subject to internal examination at each Special Survey.
4) At Special Survey No. 3 and subsequent surveys, one deep tank for fuel oil adjacent to side shell plate in the cargo length area is to be included, if fitted.

(8) The arrangements for mooring and anchoring are to be examined and their performances are to be tested. However, the performance tests may be dispensed with at the discretion of the Surveyor.
(9) The performance of hand bilge pumps is to be tested. All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.
(10) Fire protection, fire equipments and its operation tests.
(11) In tanks to which an approved measure of corrosion control in accordance with **Pt 3, Ch 1, Sec 8** is applied, the condition of coating or corrosion protection is to be examined.
(12) For **container ships,** equipped with container securing arrangements in accordance with **Pt 7, Ch 4, 702.** of the Rules, the container securing arrangements are to be examined as follows:
(a) Visual inspection for cell guides and securing devices(cracks, fractures, etc. of welds).
(b) Confirmation of comparison between on-board record book and securing devices.
(13) Thickness measurement
(a) Thickness measurements are to be carried out in accordance with **Table 1.2.4.** The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the survey is credited as completed.
(b) For the ships specified by the Society, the longitudinal strength is to be evaluated after carrying out the thickness measurements in accordance with the requirement specified in (a) above. However, the only thickness measurement records which have been measured within one(1) year period from the date of the longitudinal strength evaluation shall be considered valid.

Table 1.2.4 Minimum requirements for Thickness Measurements at Special Survey

1. General Ships

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect areas throughout the vessel	1. Suspect areas throughout the vessel 2. One transverse section of deck plating in way of a cargo space within the amidships 0.5 L	1. Suspect areas throughout the vessel 2. Two transverse sections within the amidships 0.5 L in way of two different cargo spaces4), 5), 6), 7) 3. All cargo hold hatch covers and coamings(plating and stiffeners) 4. Internals in forepeak and afterpeak tanks 5. All transverse bulkheads in all cargo tanks8) 6. All transverse bulkheads in all ballast tanks8)	1. Suspect areas throughout the vessel 2. A minimum of three transverse sections in way of cargo spaces within the amidships 0.5 L5), 6), 7) 3. All cargo hold hatch covers and coamings (plating and stiffeners) 4. Internals in forepeak and aftpeak tanks 5. All exposed main deck plating full length 6. Representative exposed deck plating (poop, bridge and forecastle deck) 7. Lowest strake and strakes in way of 'tween decks of all transverse bulkheads in cargo spaces together with internals in way 8. All wind and water strakes, port and starboard, full length 9. All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space and aft end of tanks 10. Plating of seachests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor 11. All transverse bulkheads and one web frame ring in all cargo tanks8) 12. All transverse bulkheads and all web frame ring in all ballast tanks8)

(NOTES)

1) In application to this table, General Ships means ships except Other Ships in **Table 1.2.4, 2.**
2) Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.
3) Thickness measurements of internals may be specially considered by the Surveyor if the hard protective coating is in GOOD condition.
4) For ships more than 100 meters in length, at Special Survey No. 3, thickness measurements of exposed deck plating within amidship 0.5 L may be required.
5) For ships less than 100 meters in length, the number of transverse sections required at Special Survey No. 3 may be reduced to one (1), and the number of transverse sections required at Special Survey No. 4 and subsequent may be reduced to two (2).
6) For the pure car carrier, the extent of thickness measurement for transverse sections may be considered as follows:
   - Exposed deck plate, side shell plate, bottom shell plate, inner bottom plate and longitudinal members in double bottom spaces.
7) Where the evaluation of longitudinal strength is required, all longitudinal structural members at the corresponding sections are to be gauged.
8) This requirement is to be applied only for tankers(including barges) carrying liquid cargo.

Table 1.2.4 Minimum requirements for Thickness Measurements at Special Survey (Continued)

2. Other Ships

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect areas throughout the vessel	1. Suspect areas throughout the vessel 2. One transverse section of deck plating[5], side shell plating and bottom plating within the amidships 0.5 L	1. Suspect areas throughout the vessel 2. Two transverse sections of deck plating[5], side shell plating and bottom plating within the amidships 0.5 L 3. Internals in forepeak and afterpeak tanks	1. Suspect areas throughout the vessel 2. Two transverse sections of side shell plating within the amidships 0.5L 3. Full length, 1) All exposed main deck plating[5] 2) Representative exposed superstructure deck plating(poop, bridge and forecastle deck) 3) Selected wind and water strakes 4) Bottom plating 5) Flat keel plating 4. Internals in forepeak and aftpeak tanks

(NOTES)
1) In application to this table, Other Ships means the ship specified as follows except Special Purpose Ship - Waste in **Annex 1-1, 1.1** of the Guidance relating to the Rules.
   - the ship type **12, 13**
   - the ship less than 500 GT and not engaged on international voyages among ship type **15, 16, 17** and **19** to **29**
2) Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion.
3) Thickness measurements of internals may be specially considered by the Surveyor if the hard protective coating is in GOOD condition.
4) When the evaluation of longitudinal strength is required, all longitudinal members at the corresponding sections are to be gauged.
5) For fishing vessel, thickness measurement requirements in way of deck(gutter water way part and hatch coaming part) may be modified at the discretion of the Surveyor if the structure remains effectively protected against corrosion by a permanent type special coating.

Table 1.2.5 Requirements for extent of thickness measurement at those areas of substantial corrosion

Structural Member	Extent of Measurement	Pattern of Measurement
Plating	Suspect area and adjacent plates	5 point pattern over 1 m^2
Stiffeners	Suspect area	3 measurements each in line across web and flange

(14) Tank testing
  (a) Tank testings are to be carried out in accordance with **Table 1.2.6.**
  (b) Tanks may be tested afloat at the discretion of the Surveyor, provided that the internal examination of the bottom is also carried out afloat.

Table 1.2.6 Minimum requirements for tank testing

Tanks \ No. of Special Survey	Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
Double bottom tank, deep tank, ballast tank, peak tank and other tank (including holds adopted for the carriage of salt water ballast)	○	○	○	○
Fuel oil tank, lubrication oil tank, fresh water tank	△	△	△	△

(NOTES)
1. Purpose of tank has a priority in application.
2. Boundaries of tanks are to be tested with a head of liquid to the top of air pipes or to near the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lube oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions.
3. ○ : All tanks are to be tested.
   △ : Tank testing of fuel oil, lube oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.
4. For the cargo tanks(except cargo tanks for the liquefied natural gas), tests may be dispensed with, provided after an external and internal examination of the tanks, the Surveyor is satisfied with the condition of the tanks.
5. The Surveyor may extend the testing as deemed necessary.

(15) Where considered necessary by the Surveyor, the effectiveness of shell plating, watertight bulkheads, shaft tunnels, watertight doors and the closing appliances of openings on superstructure end bulkheads is to be confirmed.
(16) Engine room structure is to be examined. Particular attention is to be given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops, and engine room bulkheads in way of tank top and bilge wells. Particular attention is to be given to the sea suctions, sea water cooling pipes and overboard discharge valves and their connections to the shell plating. Where wastage is evident or suspect, thickness measurements are to be carried out, and renewals or repairs made when wastage exceeds allowable limits.

(17) For all ships except for passenger ships, automatic air pipe heads are to be completely examined(both externally and internally) as indicated in **Table 1.2.7.** For designs where the inner parts cannot be properly inspected from outside, this is to include removal of the head from air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanized steel.

Table 1.2.7 Survey requirements for automatic air pipe heads at Special Survey

Special Survey No. 1 1), 2)	Special Survey No. 2 1), 2)	Special Survey No. 3 and Subsequent
· Two air pipe heads, one port and one starboard, located on the exposed decks in the forward 0.25 L, preferably air pipes serving ballast tanks	· All air pipe heads located on the exposed decks in the forward 0.25 L	· All air pipe heads located on the exposed decks
· Two air pipe heads, one port and one starboard, on the exposed decks, serving spaces aft of 0.25 L, preferably air pipes serving ballast tanks	· At least 20% of air pipe heads on the exposed decks serving spaces aft of 0.25 L, preferably air pipes serving ballast tanks	

(NOTES)
1) The selection of air pipe heads to be examined is left to the attending Surveyor.
2) According to the results of this examination, the Surveyor may require the examination of other heads located on the exposed deck.

(18) Where a stability instrument is provided on-board, all approved test loading conditions are to be examined.

(19) For ships provided with the equipment employed in the mooring of ships at single point mooring specified in **Pt 4, Ch 10, 101. 3** and assigned the additional class notation "EQ-SPM", the function and deformation condition of this equipment employed in the mooring of ships at single point mooring and hull supporting structures are to be closely checked and confirmed its satisfactory conditions. Where deemed necessary, non-destructive examinations may be required.

2. For ships subject to the enhanced survey programme such as **bulk carriers, oil tankers** and **chemical tankers**, etc., in addition to items of **Par 1** the additional requirements in accordance with **Ch 3** are to be taken. However, if the duplicated survey items are exist, these are not need to be applied twice.

3. For additional requirements applicable to water level detectors fitted on single hold cargo ships, refer **Sec 14.**

4. In addition to **Par 1, Ch 14** is also to be taken for general dry cargo ships and **Ch 15** is also to be taken for liquefied gas carriers. However, if the duplicated survey items are exist, these are not need to be applied twice.

5. In addition to **Par 1**, relevant requirements of **Ch 16** and/or **Ch 17** are also to be taken if applicable.

404. Fire-extinguishing appliances

For fire-extinguishing appliances, the survey is to be in accordance with the Guidance relating to the Rules.

Section 5-1 Special Survey (Machinery, Electrical Installations and Additional Installations)

501. Due range

The due range of Special Survey(Machinery, electrical installations and additional installations) is to be complied with the requirements specified in **401.**

502. Requirements of survey

At the Special Survey(Machinery, electrical installations and additional installations), in addition to the requirements for Intermediate Survey, the following requirements specified in **Par 1** to **Par 6** are to be complied with.

1. Requirements of main engines and auxiliary engines

(1) At the Special Survey for main engines, the following requirements are to be conformed to with respect to the type of engine, where deemed necessary by the Surveyor, control devices, governing devices and safety devices are to be tested.

(a) For internal combustion engines, cylinders, cylinder covers, pistons, piston rods and connecting rods, crosshead(including pins, bearings and guides), crank shafts and all bearings, elasticity couplings, cam shafts and their driving gears, essential valves and valve arrangements, fuel oil pumps and fittings, scavenging pumps, scavenging blowers, superchargers, intercoolers, filter or oil separators and safety devices, clutches, reverse gears, attached pumps and coolers, crank cases and explosion relief devices are to be opened up and examined, and the deflections of crank arms are to be measured. And, effectiveness of vibration damper is to be confirmed and balancers are to be examined.
However, those total running hours not more than the overhauling time recommended by the manufacturer since the previous overhauling survey, the survey is to be in accordance with the Guidance relating to the Rules.

(b) Examinations for high-rotating-speed internal combustion engines of specific construction such that complete engine overhaul is required for surveys may be in accordance with the Guidance relating to the Rules.

(c) Where the propulsion steam turbines are of a well known type, and fitted with rotor position indicators and vibration indicators of an approved type, as well as measuring equipment of steam pressure at proper locations along the steam flow, and the arrangements for change over in case of emergency operation of the plant are readily operable, the first Special Survey may be limited to be examination of rotor bearings, thrust bearings and flexible couplings, provided the Surveyor has been satisfied from operation service records and power trials subsequent to the survey, that the turbine plant is in good working condition. Turbine casings should be opened at the next second Special Survey and subsequent Special Surveys.

(2) For auxiliary engines, the requirements corresponding to those of the main engine are to be conformed to.

2. Requirements of machinery except for main engines and auxiliary engines

(1) All shafts(except the propeller and stern tube shafts), thrust blocks and line shaft bearings are to be examined. The lower halves of bearings need not be exposed, if alignment and wear are found satisfactory.

(2) Reduction gears are to be examined. Where deemed necessary by the Surveyor, reduction gears are to be opened up and the gear wheels, pinions, gear shafts and bearings are to be examined.

(3) Air compressors with their intercoolers, filters and/or oil separators and safety devices, and all pumps and components used for essential services are to be opened up as considered necessary by the Surveyor and examined.

(4) Operational conditions of steering gear are to be examined. Where deemed necessary by the Surveyor, main parts are to be opened up and examined.

(5) Operational conditions of windlass, mooring winches and cargo winches are to be examined. Where deemed necessary by the Surveyor, main parts of them are to be opened up and examined.

(6) Evaporators are to be opened up and examined. Their safety valves are also to be checked under working condition.

(7) The foundation bolts and chocks of main and auxiliary engines, gear casings, thrust blocks and line shaft bearings are to be examined.

(8) All air receivers and other pressure vessels for essential services together with their mountings and safety devices are to be opened up and examined internally and externally. If internal examination of them is not practicable, they are to be tested hydraulically to 1.5 times the working pressure, and if considered necessary by the Surveyor, performance test of safety valves for the above mentioned devices is to be carried out.

(9) Pumping and piping arrangements

(a) Valves, cocks and strainers of the bilge system including the emergency bilge suction valves are to be examined. And where deemed necessary by the Surveyor, opening up examination of above items or effectiveness test of the bilge system is to be carried out.

(b) The fuel oil, feed and lubricating oil systems, the ballast pipe connections and blanking arrangement to the ballast holds and all filters, heaters, coolers and condensers for essential services are to be opened up and examined. The pressure tests may be carried out, including safety devices, where deemed necessary by the Surveyor.

(c) Fuel oil tanks which do not form part of the ship's structure are to be examined internally and externally and, if considered necessary by the Surveyor, they are to be tested to the pressure specified for new tanks. At the Special Survey No. 1, internal examination of the tanks may be dispensed with, provided they are found satisfactory in external examination. All mountings, fittings and remote controls are to be examined as far as practicable.

(10) Where deemed necessary by the Surveyor, the performance tests of pressure gauges, revolutions and thermometers are to be made.

(11) Where automatic and remote controls are fitted up for essential machinery, they are to be tested to demonstrate that they are in good working order.

(12) Main steam pipes, where considered necessary by the Surveyor are to be examined after removing the lagging indicated by the Surveyor. The thickness of pipes is also to be checked as necessary.

(13) The following safety inspections are to be carried out for the cargo refrigerating machinery given in **Pt 5, Ch 6, 1201. 1.**

(a) Leaks of the refrigerants are to be tested while the machinery is examined in running condition.

(b) Coils of coil type condensers and evaporators, shell tube type condensers and shells of receivers are to be tested at a pressure of at least 90 percent of the design pressure. Where, however, relief valves attached to them are adjusted to a pressure less than the design pressure, the test pressure may be reduced to a pressure of 90 percent of the pressure to which the relief valves are adjusted. The above pressure test may be dispensed with except for those using NH_3 or CH_3Cl as refrigerants.

(14) Essential parts of incinerators are to be opened up and internally examined.

3. Electrical equipment

In the Special Survey for electrical equipment, the following requirements are to be conformed to.

(1) Main and emergency switchboards, section panels, and sub-distribution fuse panels are to be examined and overcurrent protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.

(2) The generators are to be running under the loaded condition, either separately or in parallel and the performances of speed governors, switches and circuit breakers are to be tested.

(3) The insulation resistances of generators, switchboards, motors, cables and other electrical equipment are to be tested and adjusted if it is found not to comply with the requirements given in **Pt 6, Ch 1, 1801. 1.** However, this test may be dispensed with, where it is found that the measured records remain efficient and they comply with the requirements specified in **Pt 6, Ch 1, 1801. 1.**

(4) Where deemed necessary by the Surveyor, the lighting arrangements, internal communication and signalling systems, mechanical ventilation systems, and other electrical equipment are to be tested for effectiveness.

4. The surveys for water jet propulsion systems and azimuth or rotatable thruster are to be carried out in accordance with the Guidance relating to the Rules.

5. Where CMS specified in **Sec 9** is applied, the performance test for safety devices including the items other than CMS. are to be surveyed.

6. In addition to **Par 1** through **Par 5**, relevant requirements of **Ch 17** are also to be taken if applicable.

Section 5-2 Special Survey (Additional Requirements to Ship Types)

The Special Survey(Additional requirements to ship types), in addition to the requirements for Intermediate Survey, shall be carried out as follows.

1. Oil tankers(including tankers) :

The additional requirements are to be surveyed as follows,

(1) For pump room, in particular, the foundations and gland seals of pumps, stuffing box, sealing arrangements of all penetrations of bulkheads and ventilating arrangements are to be examined.
(2) Condition of the inner surface of the bottom plating in cargo tanks is to be examined in order to ascertain that there is no excessive pitting of the plating.
(3) Bell mouths of the cargo suction pipes in cargo tanks are to be removed to enable examination of the shell plating and bulkheads in that vicinity.
(4) All piping systems in the tanks and spaces, cargo oil pipes on weather deck, breather valves, flame screens on vents, purge systems, gas free systems, inert gas systems and other piping systems are to be examined. When considered necessary by the Surveyor, pressure tests and/or gaugings for pipings are to be carried out.
(5) For inert gas system, the following items are to be examined, when appropriate, opened-up.
    (A) Major parts of inert gas scrubbers.
    (B) Major parts of inert gas blowers.
    (C) Major parts of non-return devices(e.g., deck water seal).
    (D) Major parts of flue gas isolating valves.
    (E) Major parts of P/V breakers.

2. Chemical tankers :

The additional requirements are to be surveyed as follows,

(1) Foundation of cargo containments, including supports, keys and anti-rolling/anti-pitching devices are to be examined.
(2) Closing and sealing devices of the domes of cargo containments, where they penetrate decks are to be examined.
(3) The pumps are to be opened and examined.

3. Lliquefied gas carriers :

The additional requirements are to be surveyed as follows,

(1) Cargo containment survey
    (A) All cargo tanks are to be examined internally.
    (B) Special attention is to be paid to the cargo tank and insulation in way of chocks, supports, keys and other parts which consist of the foundation of tanks. Removal of insulation may be required in order to verify the condition of the tank or the insulation itself if found necessary by the Surveyor. Where the arrangement is such that the insulation cannot be examined, the surrounding structure of the wing tanks, double bottom tanks and cofferdams are to be examined for cold spots when the cargo tanks are in the cold condition unless voyage record together with the instrumentation give sufficient evidence of the integrity of the insulation system.

(C) Non-destructive test
Non-destructive testing is to supplement cargo tank inspection with special attention to be given to the integrity of the main structural members, tank shell and highly stressed parts, including welded connection as deemed necessary by the surveyor. However, this does not mean that non-destructive testing can be dispensed with totally. The following items are, inter alia, considered as highly stressed parts:
- cargo tank supports and anti-rolling/anti-pitching devices
- web frames or stiffening rings
- swash bulkhead boundaries
- dome and stump connections to tank shell
- foundations for pumps, towers, ladders, etc.
- pipe connections

For the independent tank type B, the extent of non-destructive testing shall be given in a programme specially prepared for the cargo tank design.

(D) The tightness of all cargo tanks is to be verified by an appropriate procedure. Provided that the effectiveness of the ships's gas detection equipment has been confirmed, it will be acceptable to utilize this equipment for the tightness test of independent tanks below deck.

(E) Where findings of (A) to (D) or an examination of the voyage records raises doubts as to the structure integrity of a cargo tank, a hydraulic or hydro-pneumatic test is to be carried out. For integral tanks and for independent tank type A and B, the test pressure is to be carried out in accordance with proper pressure based on design of each tank. For independent tank type C, the test pressure is not to be less than 1.25 times the MARVS.

(F) At every other special survey(i.e., 2nd, 4th, 6th, etc) all independent cargo tank type C are to be either:
(a) Hydraulically or hydro-pneumatically tested to 1.25 times MARVS, followed by non-destructive testing in accordance with (C), or
(b) Subjected to a thorough, planned non-destructive testing. This testing is to be carried out in accordance with a programme specially prepared for the tank design. If a special program does not exist, the following applies:
- cargo tank supports and anti-rolling/anti-pitching devices
- stiffening rings
- Y-connections between tank shell and a longitudinal bulkhead of tanks
- swash bulkhead boundaries
- dome and stump connections to the tank shell
- foundations for pumps, towers, ladders etc.
- pipe connections

At least 10 % of the length of the welded connections in each of the above mentioned areas is to be tested. This testing is to be carried out internally and externally as applicable. Insulation is to be removed as necessary for the required non-destructive test.

(2) As far as practicable all hold spaces and hull insulation(if provided), secondary barriers and tank supporting structures are to be visually examined. The secondary barriers is to be checked for their effectiveness by means of a pressure/ vacuum test, a visual inspection or another acceptable method.

(3) Membrane and semi-membrane tank
(A) For membrane and semi-membrane tank system, inspection and testing are to be carried out in accordance with programmes specially prepared in accordance with an approved method for the actual tank system.
(B) For membrane containment systems a tightness test of the secondary barrier shall be carried out in accordance with the system designers’ procedures as approved by the Society.
(C) For membrane containment systems with glued secondary barriers the values obtained shall be compared with previous results or results obtained at newbuilding stage. If significant differences are observed for each tank or between tanks, the Surveyor is to require an evaluation and additional testing as necessary.

(4) The pressure/vacuum relief valve, rupture disc and other pressure relief devices for interbarrier spaces and hold spaces are to be opened, tested and readjusted as necessary, depending on their design.

(5) The pressure relief valves for the cargo tanks are to be opened for examination, adjusted, function tested, and sealed. If the cargo tanks are equipped with relief valves with non-metallic membranes in the main or pilot valves, such non-metallic membranes are be replaced. Where a proper record of continuous overhaul and retesting of individually identifiable relief valves is maintained, consideration will be given to acceptance on the basis of opening, internal examination, and testing of a representative sampling of valves, including each size and type of liquefied gas or vapor relief valve in use, provided there is logbook evidence that the remaining valves have been overhauled and tested since crediting of the previous Special Survey.

(6) Piping systems

(A) The cargo, liquid nitrogen and process piping systems, including valves, actuators, compensators etc. are to be opened for examination as deemed necessary. Insulation is to be removed as deemed necessary to ascertain the condition of the pipes. If the visual examination raises doubt as to the integrity of the pipelines, a pressure test at 1.25 times the MARVS for the pipeline is to be carried out. After reassembly the complete piping systems are to be tested for leaks.

(B) The pressure relief valves are to be function-tested. A random selection of valve is to be opened for examination and adjusted.

(7) Components

Cargo pumps, compressors, process pressure vessels, liquid nitrogen tanks, heat exchangers and other components, including prime movers, used in connection with cargo handling and methane boil-off burning are to be examined.

(8) Miscellaneous

(A) Systems for removal of water or cargo from interbarrier spaces and holds are to be examined and tested as deemed necessary.

(B) All gas-tight bulkhead are to be inspected. The effectiveness of gas-tight shaft sealing is to be verified.

(C) Hose and spool pieces used for segregation of piping systems for cargo, inert gas and bilging are to be examined.

(D) It is to be verified that all cargo piping system are electrically bonded to the hull.

Section 6 Docking Survey

601. Due range

1. There is to be a minimum of two examinations of the outside of the ship's bottom and related items during each five-year Special Survey period. One such examination is to be carried out in conjunction with the Special Survey. In all cases the interval between any two such examinations is not to exceed 36 months.

2. Notwithstanding the requirements specified in **Par 1** above, for passenger ships, submersibles, nuclear ships, hydrofoils, air cushion vehicles, high speed crafts, the docking survey is to be a part of the Special, Intermediate or Annual Survey. But the Docking Survey may be subject to the requirements as provided separately by the Society.

3. In addition to **Par 1** through **Par 2**, relevant requirements of **Ch 17** are also to be taken if applicable.

602. Extension of survey

The Docking Survey may be extended upon the request of the Owner as follows:

1. Where the Special Survey is extended in accordance with **401. 1** and **2**, an extension of Docking Survey can be granted in accordance with the requirements specified in **401. 1** (4).

2. An extension of Docking Survey of 3 months beyond the due date can be granted upon the approval of the Society in exceptional circumstances defined in **401. 1.**

603. Requirements of survey

1. The ship is to be placed in a drydock or on a slipway, and it is to be placed on blocks of sufficient height and with the necessary staging to permit the examination of elements such as shell plating including bottom and bow plating, stern frame and rudder, sea chests and valves, propeller, etc.

2. The shell plating is to be examined for excessive corrosion, or deterioration due to chafing or contact with the ground and for any undue unfairness or buckling. Special attention is to be paid to bilge keels.

3. Rudder, rudder pintles, rudder shafts and couplings and stern frame are to be examined. If considered necessary by the Surveyor, the rudder is to be lifted or the inspection plates removed for the examination of pintles. The clearance in the rudder bearings is to be ascertained and recorded. If it exceeds the values given below, the bush is to be adjusted. Where applicable, pressure test of the rudder may be required as deemed necessary by the Surveyor.

Pintle (Diameter of Pintle : d_p)	Allowable clearance
$d_p \leq$ 50 mm	3.0 mm
50 mm < $d_p \leq$ 100 mm	5.0 mm
100 mm < d_p	0.01 d_p + 4.0 mm
Neck bearing (Diameter of rudder stock : d_s)	0.01 d_s + 2.0 mm

4. Sea chests and their gratings, sea connections and overboard discharge valves and cocks and their fastenings to the hull or sea chests are to be examined. Valves and cocks could be opened up at Docking Survey as a part of Special Survey unless considered necessary by the Surveyor.

5. The propeller is to be examined. The efficiency of the oil gland, if fitted, is to be ascertained and clearance or weardown in the stern bush are to be measured. For controllable pitch propellers and special type propellers, the sealing and tightness conditions are to be ascertained and recorded. In the case where the pitch control device is fitted, it is to be ascertained that the device is in good working order. However, if considered necessary by the Surveyor, the device is to be opened up for further examination.

6. Visible parts of side thrusters and anti-rolling devices are to be examined.

7. The clearance between the propeller shaft and the after bearing of stern tube or the shaft bracket bearing is to be measured for water-lubricated stern tube bearings, and if it exceeds the values given below, the lignumvitae bush is to be adjusted. Stern tube shafts are also to be comply with these requirements.

Diameter of propeller shaft D_p	Allowable clearance
$D_p \leq$ 230 mm	6.0 mm
230 mm $< D_p \leq$ 305 mm	8.0 mm
305 mm $< D_p$	9.5 mm

8. The surveys for water jet propulsion systems and azimuth or rotatable thruster are to be carried out in accordance with the Guidance relating to the Rules.

9. A mooring trial is to be carried out to attending Surveyor's satisfaction to confirm satisfactory operation of main and auxiliary machinery. If significant repairs are carried out to main or auxiliary machinery or steering gear, consideration is to be given to a sea trial to attending Surveyor's satisfaction.

10. For ships with IWS notation, the requirements to assign the IWS notation specified in **604. 3.** (8) are to be confirmed for continuing compliance.

11. For ships with EDD notation, the requirements to assign the EDD notation specified in **605. 2.** are to be confirmed for continuing compliance.

604. In-water survey

1. The Society may accept an In-water Survey in lieu of the intermediate docking between Special Surveys required in a five year period on ships less than 15 years of age. Special consideration of the Society is to be given to ships of 15 years of age or over before being permitted to have such In-water Survey. For ships with ESP notation exceeding 15 years of age, such In-water Surveys are not to be allowed.

2. In-water Survey in lieu of the Docking Survey may be restricted at the discretion of the Society if there are record or indication of abnormal deterioration, existing outstanding recommendation for repairs, or damage to underwater part of the shell plating, the rudder, the propeller, the propeller shaft, sea connections or overboard discharge valves.

3. Where an In-water Survey in lieu of the intermediate docking between Special Surveys is desired, the survey procedures are as follows:

(1) Plans and documents
The following plans and documents are to be submitted to the Surveyor and the divers.
(a) Plans of shell plating below waterline showing the location and sizes of shell openings, location of bottom plugs, location of appendages, location of measuring position of navigation instruments, location of bilge keels, location of water-tight and oil-tight bulkheads, and location of welded seams and butts including any doublers and straps.
(b) Detailed information or drawing of constructions and arrangements indicated in (2) below.

(2) Constructions, arrangements, etc.
Where an In-water Survey in lieu of the docking survey is desired, the following construction and arrangements are to be made.
(a) Rudder arrangements are to be such that rudder pintle clearances can be checked.
(b) Rope-guard ring plates are to be of such construction as to facilitate the inspection of shaftings between propeller hubs and stern frame boss.
(c) In case of water lubricated stern tube bearings, the construction is to be suitable for confirmation and measurement of the clearance between the propeller shafts and these bearings.
(d) In case of oil lubricated stern tube bearings, suitable means of ascertaining the performances of stern tube bearings including oil sealing devices are to be provided.

(3) Condition of survey
(a) In the lightest draught condition as possible.
(b) The condition of hull below waterline and hull bottom is can be ascertained.
(c) The sea state conditions such as current, visibility, swell, etc., at the location of the survey are to be calm and peaceful.
(d) The distance between hull bottom and sea bottom is to be enough.
(e) In-water Survey are to be carried out by a company approved by the Society.

(4) Survey extent
(a) The In-water Survey is to provide the information normally obtained from a Docking Survey. Special consideration shall be given to ascertaining rudder bearing clearances and stern bush clearances of oil stern bearings based on a review of the operating history, on board testing and stern oil sample reports. These considerations are to be included in the proposals for In-water Survey which are to be submitted in advance of the survey so that satisfactory arrangements can be agreed with the Society.
(b) General inspection for sea connections and overboard discharge valves, at inside of the ship

(5) Practice of In-water Survey
(a) In-water Survey is to be carried out in the presences of the Surveyor and the Owner.
(b) All preparations required for an In-water Survey are to be made by the Owner.
(c) The Surveyor shall confirm the preparation for survey and the operational condition of In-water Survey equipment.
(d) The Surveyor shall know the status of the ship in advance, and inform the diver before diving of survey items and measurement.
(e) The means are to be provided to maintain good communication between the Surveyor and the underwater diver at all times.
(f) The Surveyor may confirm the status of survey by in-water photographs, cameras, television monitors and other means.
(g) In a job site, the results of In-water Survey shall be immediately reported to the Owner, and the Owner and diver sign their names on the Diving Report, confirming the result.

(6) Diving report
The following items are to be stated in the diving report.
(a) Name of diving company
(b) Name of diver and licence No.
(c) Date and place of survey
(d) Name of equipment used in In-water Survey
(e) Name of ship, classification character and notations, gross tonnage, port of registry, owner of ship
(f) Drafts(forward and aft)
(g) Contents and results of survey(damage configuration and status, etc.)
(7) Further surveys
(a) The Surveyor may require the further examination such as internal examinations, thickness measurement, etc. where deemed necessary by the Surveyor as a result of the In-water Survey
(b) If the result of In-water Survey reveals damage or deterioration that requires early attention, the Surveyor may require that the ship be dry-docked in order that a detailed survey can be undertaken and the necessary repairs carried out.
(8) For a ship with IWS of additional special feature notation, the following requirements are to be complied with, in addition to the requirements specified in preceding (1) to (7).
(a) The plans and documents specified in (1) and (b) to (d) below are to be submitted to the Society for approval, and are to be kept on board.
(b) Anodes are to be attached in such a manner as to be easily replaced when necessary.
(c) To the shell plating below load waterline, provision is to be made for ready identification of the position of bulkhead.
(d) Ships contracted for construction or intended to have IWS notation newly, on or after 1 July 2011, are to be complied with the following requirements additionally.
(i) A suitable means of ascertaining the position and identity of each blade of the propellers are to be provided.
(ii) Hinged gratings are to be installed on all sea chests and constructed so as to facilitate opening and closing by the diver.
(iii) Markings indicating the position of longitudinal and transverse bulkheads and the names of interior spaces, sea suction and overboard discharge openings on the shell plating below the load water line are to be provided so that the diver is able to orient his/her position relative to the ship. Such markings may be consist of a weld bead or center punch, and a contrasting color coating. Other suitable arrangements or means may be considered as equivalent where deemed appropriate by the Society.

605. Extended Dry-docking Interval System

1. General

(1) The "Extended Dry-docking Interval System" is in any case subject to approval by the relevant flag state. The approval or acceptance of this rule by the relevant flag state doesn't means the approval for the application of Extended Dry-docking Interval System on the relevant ship, and the separate approval by the each relevant flag state is required for the application of Extended Dry-docking Interval System.
(2) The "Extended Dry-docking Interval System" applies to ships with Container Ship notation or Cargo Ship notation and General Dry Cargo Ships specified in **Sec 14.**
(3) In application to **601. 1**, at the request of the Owners, where deemed appropriate by the Society considering survey history, damage history and coating conditions, etc. it is possible until the ship reaches 15 years of age to perform the first and second Docking Survey due from the completion date of the Classification Survey during Construction or the completion date of the previous Docking Survey as an In-water Survey, and the third Docking Survey has to be performed in dry-dock or on a slipway within 7.5 years from the completion date of the Classification Survey during Construction or the completion date of the previous Docking Survey.
(4) The Owner can apply to join the "Extended Dry-docking Interval System" before the date on which the ship reaches 10 years of age. When the Owner applied to join the "Extended Dry-docking Interval System" after the No.1 Special Survey and the Docking Survey assigned between 10 years to 15 years of age has carried out in dry-dock or on a slipway, the next Docking Surveys can be carried out as Docking Survey and In-water Survey alternately start with In-water Survey.
(5) In the case of a change in Owner or flag, the application of the "Extended Dry-docking Interval System" is to be reconsidered and a Docking Survey may be assigned or required immediately.
(6) The Society reserves the right to suspend the "Extended Dry-docking Interval System" at any time if it is determined that a dry-docking is necessary.
(7) The EDD notation shall be assigned as an additional special feature notation to ships carrying out the "Extended Dry-docking Interval System".

2. Necessary requirements

The necessary requirements for implementation of the "Extended Dry-docking Interval System" are as followings.

(1) To be applied the Owner's Hull Inspection and Maintenance Program according to **Annex 1-13** of the Guidance
(2) Ships contracted for construction on or after 1 July 2010 and classed through the Classification Survey during Construction are to have IWS notation according to **604. 3** (8), and the other ships can be carried out the In-water Survey according to **604. 2** and **3.**
(3) To have STCM(stern tube condition monitoring) notation according to **704.** Ships not assigned STCM notation are to be fitted with a shaft bearing and sealing system of approved design with implementation of regular monitoring procedures
(4) To be applied the Planned Maintenance System of machinery according to **903.**
(5) For ships contracted for construction on or after 1 July 2011, the dry film thickness(DFT) of the coating system for shell plating below the load water line excluding antifouling for the shell plating is to be more than 300 μm and for the other ships it is to be more than 250 μm. In addition, the anodes are to be fitted and/or the impressed cathodic current protection system are to be installed and maintained.
(6) In lieu of (5) above, the Society may accept the other coating system provided that the coating manufacturer proves with relevant documents that the coating system applied are designed to last for the 7.5 years.
(7) Ballast tanks shall have a corrosion prevention system and to be maintained in GOOD coating condition.
(8) The hull below load waterline is to be free of any recommendation.

3. Approval and survey

(1) Documents and approval

For implementation of the "Extended Dry-docking Interval System" the following documents shall be presented to the Society. The Society will issue an approval document for the "Extended Dry-docking Interval System" after review the presented documents. This approval document is to be placed on-board.

(A) Application for “Extended Dry-docking Interval System"

(B) Description of the system for the "Extended Dry-docking Interval System" with flow charts of the system organization within the company

(C) Plans and/or information showing the ship is satisfy to the necessary requirements for the "Extended Dry-docking Interval System" specified in **Par 2** above including the followings

(a) Manual for the Hull Inspection and Maintenance Program according to **Annex 1-13** of the Guidance

(b) Inspection procedures for In-water Survey

(c) Procedure for stern tube condition monitoring

(d) Certificate of planned maintenance system for machinery

(e) Coating system for shell plating below the load water line

(D) Other documents as deemed necessary by the Society

(2) Implementation survey

(A) Additional to the approval according to (1) above, the implementation survey is to be carried out within one year from the date of the approval of the "Extended Dry-docking Interval System" to verify that the "Extended Dry-docking Interval System"is implemented in accordance with the approval document.

(B) During the implementation survey, the attending Surveyor is to check the following items.

(a) An approval document for the "Extended Dry-docking Interval System"

(b) Documents specified in **Par 3** (1) (B) to (D)

(c) Whether the Master is familiar with the "Extended Dry-docking Interval System"

(d) A random check for compliance of the necessary requirements specified in **Par 2** above including the followings.

- Check whether the Owner's Hull Inspection and Maintenance Program specified in **Annex 1-13** of the Guidance is operated satisfactorily.
- Check the stern tube condition monitoring
- Check the planned maintenance system for machinery
- Check the impressed cathodic current protection system, if fitted

(3) Annual audit

(A) An annual audit is to be carried out to check the operation of the "Extended Dry-docking System" at Annual Survey

(B) At the annual audit the attending Surveyor is to check the following items.

(a) An approval document for the "Extended Dry-docking Interval System"

(b) Documents specified in **Par 3** (1) (B) to (D)

(c) Whether the Master is familiar with the "Extended Dry-docking Interval System"

(d) Check for compliance of the necessary requirements specified in **Par 2** above including the followings.

- Check whether the Owner's Hull Inspection and Maintenance Program specified in **Annex 1-13** of the Guidance is operated satisfactorily and confirmation of random compartments
- Check the stern tube condition monitoring
- Check the planned maintenance system for machinery
- Check the impressed cathodic current protection system, if fitted

Section 7 Surveys of Propeller Shaft and Stern Tube Shaft, Etc.

701. Due range

1. Propeller shafts Kind 1(including stern tube shafts, etc.) are to be surveyed with an interval of 5 years from the completion date of the previous survey.

2. Propeller shafts Kind 2(including stern tube shafts, etc.) are to be surveyed with an interval not exceeding 30 months from the completion date of the previous survey.

3. The surveys for water jet propulsion systems and azimuth or rotatable thruster are to be carried out in accordance with the Guidance relating to the Rules.

4. Upon the request of the Owner, the survey of propeller shaft(including stern tube shaft, etc.) may be postponed for a period not exceeding 6 months from the due date.

702. Ordinary survey items

1. After drawn out the propeller shaft from the stern tube bearings, parts of the propeller shaft, sleeves, fillets of coupling flange connected to the intermediate shaft and the coupling bolts are to be examined.

2. The stern tube bearings are to be examined and bearing weardown is to be measured.

3. Major parts of the stern tube sealing devices are to be opened and examined.

4. After the propeller is removed, the following examinations for the propeller shaft, in way of the propeller fitting area, is to be carried out:

(1) For shafts with keyed propeller, examination is to be carried out by an efficient crack detection method for the after end of the cylindrical part of the shaft(or from the after end of the liner, if any), and for about one-third of the length of the taper from the big end.

(2) For shafts with keyless propeller, examination is to be carried out by an efficient crack detection method for the forward part of the aft shaft taper. And when the propeller is force-fitted, the pull-up length is to be in accordance with the Guidance relating to the Rules.

(3) For shafts having coupling flanges at the after end, the flange fillet and coupling bolts are to be examined by an efficient crack detection method.

5. Propeller and propeller boss bore in way of the propeller shaft taper is to be examined. Pitch control gear and working parts for a controllable pitch propeller are to be examined and propeller blade fixing bolts are to be examined by an efficient crack detection method.

6. Where the water-lubricated stern tube bearings are adopted, the sea water piping for lubrication is to be examined.

7. Where the oil-lubricated stern tube bearings are adopted, low oil level alarms of lubricating oil tanks, oil temperature measuring devices and oil circulating pumps are to be confirmed in good operating condition, and lubricating oil records are to be examined.

703. Extension of Propeller Shaft Survey

1. Upon the request of the owner, where the propeller shaft is Kind 1 type fitted with oil-lubricated stern tube bearings and oil sealing gland and provided that new oil seals are able to be fitted without removal of the propeller(except in case of keyed propeller), instead of the survey specified in **702.**, after survey of the following items, the survey interval may be prolonged for not more than 5 years from the due date but not to be applied twice consecutively. However, where the results of the following surveys are not satisfactory, all the surveys required in **702.** with the drawn shaft are to be carried out.

(1) The shaft is to be drawn partially to expose the aft bearing contact area of the shaft for the examination. However, it may be exempted where stern tube bearing temperature and oil consumption are recorded and considered to be within permissible limits, and data of lubricating oil analysis in accordance with the Guidance relating to the Rules are satisfactory.
(2) The forward bearing is to be examined as far as possible and all accessible parts of the shaft including the propeller connection to the shaft is to be examined.
(3) Visual examination to confirm the good condition of oil sealing gland is to be carried out. And clearance or wear down of the aft bearing(or the after end of the strut bearing, if any) is to be measured.
(4) For shafts with keyed propeller, examination is to be carried out by an efficient crack detection method for about one-third of the length of the taper from the big end after removal of the propeller.

2. Upon the request of the owner, where the propeller shaft is Kind 1 type fitted with oil-lubricated stern tube bearings and oil sealing gland and provided that new oil seals are able to be fitted without removal of the propeller(except in case of keyed propeller), the following survey without drawing the propeller shaft may be carried out and after finding the good results, the survey interval may be prolonged for not more than 30 months from the due date but to be applied only once.

(1) Oil sealing devices of stern tube
(2) Measurement of clearance or wear down of the aft bearing(or the after end of the strut bearing, if any)
(3) For shafts with keyed propeller, examination is to be carried out by an efficient crack detection method for the forward part of the taper after removal of the propeller.

704. Survey for ships with STCM(Stern Tube Condition Monitoring) notation

Upon the request of the owner, an additional notation of STCM may be assigned provided that an approved oil-lubricated stern tube bearings comply with the following requirements. And if the Surveyor confirms at the periodical survey that parameters in the condition monitoring records are within permissible limits, the examination of this survey may be carried out without withdrawal of the shaft and omitted the requirements given in **702. 1** to **3** above. However, where the results of the surveys are not satisfactory, all the surveys required in **702.** with the drawn shaft are to be carried out.

(1) Regularly at intervals lubricating oil analysis specified separatedly is to be carried out.
(2) Lubricating oil consumption is to be recorded.
(3) At the aft stern tube bearing, two temperature sensors are to be provided, or if only one temperature senor is provided, a spare temperature sensor which can be replaced easily is to be provided when the using sensor is out of order.
(4) Aft stern tube bearing temperatures are to be recorded.
(5) Measurement of bearing weardown is to be provided.
(6) Oil seals devices are to be renewed without removal of propeller.

Section 8 Boiler Survey

801. Due range

1. The following boilers(including thermal oil heaters) are to be internally examined minimum twice during each 5 year Special Survey period. In all cases the interval between any two such examinations is not to exceed 36 months.

(1) Water tube boilers used for propulsion, including reheat boilers
(2) All other boilers of essential service
(3) Boilers of non-essential service having working pressure exceeding 3.5 bar and a heating surface exceeding 4.5 m^2

2. For main boilers with smoke tube type or single main boiler with water tube type which are over 7.5 years of age, the surveys are to be carried out within 3 months before or after every year.

802. Survey items

1. The surveys of boilers are to be carried out as follows, and where deemed necessary by the Surveyor, the parts of lagging are to be removed and inspected. Where deemed necessary by the Surveyor, further surveys may be required.

(1) At each survey, the boilers, superheaters and economizers are to be examined internally on water-steam side and fire side. Boiler mountings and safety valves are to be examined at each survey and opened out as considered necessary by the Surveyor.
(2) The adjustment of the safety valves is to be verified during each boiler internal survey. Boiler safety valve and relieving gear are to be examined and tested to verify satisfactory operation. However, for exhaust gas heated economizers, if steam cannot be raised at port, the safety valves may be set by the Chief Engineer at sea, and the results recorded in the log book for review by the Surveyor.
(3) Review of the following records since the last Boiler Survey is to be carried out as part of the survey:
(a) Operation
(b) Maintenance
(c) Repair history
(d) Feedwater chemistry

2. An extension of the internal examination of the boiler(including thermal oil heaters) up to 3 months beyond the due date can be granted in exceptional circumstance defined in **401. 1.** The extension may be granted by the Surveyor after the following is satisfactorily carried out:

(1) External examination of the boiler
(2) Boiler safety valve relieving gear is to be examined and operationally tested
(3) Boiler protective devices operationally tested
(4) Review of the following records since the last boiler Survey:
(a) Operation
(b) Maintenance
(c) Repair history
(d) Feedwater chemistry

3. In addition to the other requirements **Par 1** above(internal examination) in exhaust gas heated economizers of the shell type, all accessible welded joints are to be subjected to a visual examination for cracking. Non-destructive Testing may be required as deemed necessary by the Surveyor.

4. The surveys of thermal oil heaters are to be carried out as follows. Where deemed necessary by the Surveyor, further surveys may be required.

(1) The tightness of the installation to flange connections and valves and packings is to be examined.
(2) The coils in the oil fired furnace are to be externally examined.
(3) Plant instrumentation including regulation and safety systems is to be examined and tested.
(4) Liquid relief valves are to be examined, and the pressure is to adjusted.
(5) For thermal oil heater tubes heated by exhaust gas, hydraulic testing to the design pressure is to be carried out.
(6) Fuel oil equipment are to be examined.

Section 9 Continuous Survey of Machinery

901. Due range

1. At the request of the Owner, and upon approval of the proposed arrangements by the Society, continuous survey of machinery(hereafter referred to as "CMS") may be undertaken for all the items of machinery installations to be surveyed at the Special Survey in accordance with the Guidance relating to the Rules. When such a system is adopted, all the requirements of the Special Survey are to be surveyed in regular rotation, as far as practicable, with uniform annual share within 5 year period and to be completed.

2. CMS is to be carried out at the time of or during the periodical survey. However, at the request of the owner, CMS may be carried out as an Occasional Survey.

902. Survey items

1. The procedure of CMS is to be complied with the Guidance relating to the Rules.

2. Where any machinery installations were overhauled and inspected by the Chief Engineer the overhauled inspections may substitute for the CMS in accordance with the Guidance relating to the Rules. However, for each part of the main internal combustion engine and internal combustion engine to drive main generator among machinery permissible for the Chief Engineer's inspection, open-up survey by the Surveyor for at least one of two CMS cycles is to be carried.

3. If any defects of the CMS is found, further examinations of overhauling are to be carried out where deemed necessary by the Surveyor.

4. For passenger ships, the CMS is to be complied with the Guidance relating to the Rules.

5. The CMS is to be commenced after the classification of Ships to the Society in accordance with the Guidance relating to the Rules.

6. The withdrawal of CMS is to be complied with the requirements of the Guidance relating to the Rules.

903. Planned Maintenance System

1. At the request of the Owner, where deemed appropriate by the Society in accordance with the Guidance relating to the Rules, the Planned Maintenance System(hereinafter referred to as "PMS") may be applied by the maintenance procedures scheme as an alternative to the Continuous Machinery Survey(CMS). But passenger ships shall not apply to PMS and the Society may consider a special application for PMS on ships exceeding 15 years old based on their condition. However, where deemed necessary by the Surveyor, the overhaul inspection of the equipment may be required.

2. PMS certificate is to be issued and the inspection based on the PMS may be carried out by the chief engineer certified by this Society. The implementation survey and annual audit are to be in accordance with the requirements of the Guidance relating to the Rules.

3. In case the ship under PMS, the condition monitoring equipments(hereinafter referred to as "CM"). approved by the Society shall be in accordance with the Guidance relating to the Rules.

4. The damage and repairs for PMS are to be in accordance with the requirements of the Guidance relating to the Rules.

5. The withdrawal of PMS is to be in accordance with the requirements of the Guidance relating to the Rules.

6. Where there is change of ship management or shipowner, the approved PMS may be reconsidered.

Section 10 Occasional Survey

1001. Occasional Survey

All classed ships are to be subjected to Occasional Surveys when they fall under either of the following conditions at the periods other than those of Special, Intermediate, or Annual Survey:

(1) When main parts of hull or machinery, or important fittings or equipment which have been surveyed by the Society, have been damaged, or are about to be repaired or altered.
(2) When whole or a part of machinery are about to be shifted.
(3) When safety valves are opened up or when settings of safety valves is altered.
(4) When propeller shafts are drawn out and the survey of the shaft is requested by the Owner.
(5) When load lines are required to be changed or to be newly marked.
(6) Other cases where surveys are designated or whenever survey is deemed necessary by the Surveyor.
(7) When the due dates of surveys are to be postponed.

1002. Items of survey

1. In the Occasional Surveys, the necessary parts are to be examined in each case of **1001.**

2. When a ship is in drydock or on a slipway, the requirements specified in **603. 9** are applicable.

Section 11 Alteration Survey

1101. Alteration survey

All classed ships are to be subjected to survey when hull, machinery, or equipment are about to be altered.

1102. Approval of plans

When it is intended to obtain a surveys for alterations, plans and documents equivalent to the survey during construction are to be submitted to the Society for the approval before the work is commenced.

1103. Items of survey

1. In the surveys for alterations, the altered parts are to be examined in accordance with the survey items equivalent to the survey during construction.

2. Where a complete replacement or addition of a major portion of the ship(e.g. forward section, after section, main cargo section) is involved at the alteration, the Date of Build(i.e. the year, month and date at which the alteration survey is completed) associated with each altered major portion of the ship shall be indicated in the Certificate of Classification in addition to the Date of Build assigned to the ship, and survey requirements for each altered major portion of the ship shall be based on this Date of Build. Such survey due dates may be aligned with ships survey due date at the discretion of the Society.

Section 12 Survey of Ships Carrying Dangerous Goods and Other Special Cargoes

1201. Surveys

For surveys of ships carrying dangerous goods and other special cargoes, the Society may request to apply, in addition to the Rules, *Korean Ship Safety Act*, related international conventions and other regulations as deemed appropriate.

Section 13 Additional Installations Survey

1301. Surveys

The surveys for additional installations(cargo refrigerating installations, cargo handling appliances, centralized monitoring and control system for main propulsion and essential auxiliary machinery, operating systems for periodically unattended machinery spaces, automation equipment, dynamic positioning system, navigation bridge systems and hull monitoring systems, etc.) are to be carried out in accordance with the requirements specified in **Pt 9**, etc.

Section 14 Hull Surveys for General Dry Cargo Ships

1401. General

1. Application

(1) In addition to the other requirements specified in **Ch 2**, the requirements apply to all self-propelled general dry cargo ships of 500 GT and above carrying solid cargoes other than:
- Bulk Carriers and Double Skin Bulk Carriers subjects to the enhanced survey programme(ESP)
- dedicated container carriers
- dedicated forest product carriers(not timber or log carriers)
- Ro-Ro cargo ships
- refrigerated cargo ships
- dedicated wood chip carriers
- dedicated cement carriers
- livestock carriers
- deck cargo ship(A ship that is designed to carry cargo exclusively above deck without any access for cargo below deck)

However, the requirements specified in **1402. 7** and **1404. 7** also apply to those cargo ships, which, although belonging to the ship types listed above that are excluded from the application of this requirements, are fitted with a single cargo hold.

(2) The requirements apply to surveys of hull structure and piping systems in way of the following spaces;
(A) cargo holds, cofferdams, pipe tunnels, void spaces and fuel oil tanks within the cargo area
(B) all ballast tanks

(3) The requirements contain the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional Close-up Survey when necessary.

2. Definitions

A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and hopper side plating, longitudinal bulkheads and bottom plating in top wing tanks. For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections.

3. Procedures for thickness measurements

(1) The required thickness measurements, if not carried out by the Society itself, are to be witnessed by a Surveyor. The Surveyor is to be on board to the extent necessary to control the process. In this case, the control of thickness measurement process is to be in accordance with the separate requirements specified by the Society.
(2) The thickness measurement company is to be part of the survey planning meeting to be held prior to commencing the survey.
(3) Thickness measurements of structures in areas where Close-up Surveys are required shall be carried out simultaneously with Close-up Surveys.
(4) The thickness measurements are to be carried out by a company certified by the Society.
(5) A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measurement equipment, names of personnel and their qualifications and has to be signed by the operator.
(6) The Surveyor is to review the final thickness measurement report and countersign the cover page.

1402. Annual Survey

1. General

(1) The due range of Annual Survey is to be in accordance with the requirements of **201.**
(2) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, hatch covers, coamings and piping are maintained in a satisfactory condition.

2. Examination of the hull

(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.

3. Examination of weather deck, hatch covers and coamings

(1) Confirmation is to be obtained that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.
(2) Where mechanically operated steel covers are fitted, checking the satisfactory condition of:
   (a) hatch covers; including Close-up Survey of hatch cover plating
   (b) tightness devices of longitudinal, transverse and intermediate cross joints(gaskets, gasket lips, compression bars, drainage channels)
   (c) clamping devices, retaining bars, cleating, chain or rope pulleys
   (d) guides, guide rails, track wheels and stoppers, etc.
   (e) wires, chains, gypsies, tensioning devices
   (f) hydraulic system essential to closing and securing
   (g) safety locks and retaining devices
(3) Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition where applicable of:
   (a) wooden covers and portable beams, carriers or sockets for the portable beam, and their securing devices
   (b) steel pontoons
   (c) tarpaulins
   (d) cleats, battens and wedges
   (e) hatch securing bars and their securing devices
   (f) loading pads/bars and the side plate edge
   (g) guide plates and chocks
   (h) compression bars, drainage channels and drain pipes(if any)
(4) Checking the satisfactory condition of hatch coaming plating and their stiffeners including Close-up Survey.
(5) Random checking of the satisfactory operating of mechanically operated hatch covers is to be made including:
   (a) stowage and securing in open condition
   (b) proper fit and efficiency of sealing in closed condition
   (c) operational testing of hydraulic and power components, wires, chains and link drives

Note : For survey of air pipes, flame screens on the open ends of air pipes and ventilations refer to **202. 1** (1) (f) to (h) and (6).

4. Suspect areas

Suspect areas identified at previous surveys are to be examined. Thickness measurements are to be taken of the areas of substantial corrosion and the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the Annual Survey is credited as completed.

5. Examination of cargo holds

The examination of cargo holds in Annual Survey is to be in accordance with the follows.

	10 years < age ≤ 15 years[3]	15 years < age[1), 2), 3)]
Overall Survey	· One forward cargo hold (and their associated 'tween deck spaces, where fitted) · One after cargo hold (and their associated 'tween deck spaces, where fitted)	All cargo hold (and their associated 'tween deck spaces, where fitted)
Close-up Survey	-	1. Cargo holds: · one forward lower cargo hold · one other lower cargo hold 2. Extent: · Close-up examination of sufficient extent, minimum 25 % of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating
Others	-	All piping and penetrations in cargo holds, including overboard piping, are to be examined

(NOTES)
1) Where the protective coating in cargo holds, as applicable, is found to be in GOOD condition, the extent of Close-up Surveys may be specially considered.
2) Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a Close-up Survey of all of the shell frames and adjacent shell plating of those cargo holds and associated 'tween deck spaces(as applicable) as well as a Close-up Survey of sufficient extent of all remaining cargo holds and 'tween deck spaces(as applicable).
3) When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements is to be carried out before the Annual Survey is credited as completed.

6. Examination of ballast tanks

Examination of ballast tanks when required as a consequence of the results of the Special Survey and Intermediate Survey is to be carried out. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the Annual Survey is credited as completed.

7. Additional Annual Survey requirements for single hold cargo ships (See 1401. 1 (1)) after determining compliance with SOLAS II-1/23-3 and II-1/25

For ships complying with the requirements of SOLAS II-1/23-3 and II-1/25 for hold water level detectors, the Annual Survey is to include an examination and a test, at random, of the water ingress detection system and of their alarms.

1403. Intermediate Survey

1. General

(1) The due range of Intermediate Survey is to be in accordance with the requirements of **301.**
(2) At each Intermediate Survey, in addition to the requirements of the Annual Survey, the following items are to be surveyed. Those items which are additional to the requirements of the Annual Survey may be surveyed either at or between the 2nd and 3rd Annual Survey.
(3) A survey planning meeting is to be held prior to the commencement of the survey.
(4) Ships over 15 years of age, the following is to apply:
  (a) The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in **1404.**, except for item 2. c) in column for Special Survey No. 4 and Subsequent of **Table 1.2.9**. (Caution : In this case, the requirements specified in **403.** are not need to be applied) However, tank testing specified in **1404. 6**, survey of automatic air pipe heads(See Notes in **1404. 1** (6) and **1404. 4** (4)) and internal examination of fuel oil, lube oil and fresh water tanks(See **1404. 4** (1)) are not required unless deemed necessary by the attending Surveyor.
  (b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application **401. 4** and **5**.
  (c) In lieu of the requirements of **1404. 1** (7), an under water survey may be considered as equivalent.

2. Examination of ballast tanks

The examination of ballast tanks in Intermediate Survey is to be in accordance with the follows.

5 years < age ≤ 10 years[1), 2), 3)]	10 years < age ≤ 15 years[1), 3)]	15 years < age
· Overall Survey of representative ballast tanks · Survey of suspect areas found at previous surveys in accordance with the requirements specified in **1402. 4.**	· Overall Survey of all ballast tanks · Survey of suspect areas found at previous surveys in accordance with the requirements specified in **1402. 4.**	**1403. 1** (4) to be applied

(NOTES)
1) If such Overall Survey reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient.
2) Where POOR coating condition, soft or semi-hard coating, corrosion or other defects are found in ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.
3) In ballast tanks other than double bottom ballast tanks, where a hard protective coating is found in POOR condition, and it is not renewed, where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual intervals. When such breakdown of hard protective coating is found in double bottom ballast tanks, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied, the tanks in question may be examined at annual intervals. When considered necessary by the attending Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

3. Examination of cargo holds

The examination of cargo holds in Intermediate Survey is to be in accordance with the follows.

5 years < age ≤ 10 years	10 years < age ≤ 15 years[1]	15 years < age
· Overall Survey of one forward and one after cargo hold(and their associated 'tween deck spaces, where fitted) · Survey of suspect areas found at previous surveys in accordance with the requirements specified in **1402. 4.**	· Overall Survey of all cargo holds(and their associated 'tween deck spaces, where fitted) · Survey of suspect areas found at previous surveys in accordance with the requirements specified in **1402. 4.**	**1403. 1** (4) to be applied
(NOTES) 1) When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the survey is credited as completed.		

1404. Special Survey

1. General

(1) The due range of Special Survey is to be in accordance with the requirements of **401.**
(2) A survey planing meeting is to be held prior to the commencement of the survey.
(3) The Special Survey is to include, in addition to the requirements of the Annual Surveys, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in (5), are in a satisfactory condition and is fit for the intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.
(4) All cargo holds, ballast tanks, including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in **Par 5** and **Par 6**, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(5) All piping systems within the spaces specified in (4) above are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.
(6) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.
Note : For survey of automatic air pipe heads refer to **403. 1** (17).
(7) A survey in dry dock is to be a part of the Special Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks are to be carried out in accordance with the applicable requirements for Special Surveys, if not already performed.
Note : Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.
However, ships subject to the "Extended Dry-docking Interval System" specified in **605.**, this survey in dry dock can be carried out in accordance with **605.**

2. Tank protection

(1) Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom ballast tanks, where a hard protective coating is found in POOR condition and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary be the Surveyor.
(2) When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.
(3) Where the hard protective coating in spaces is found to be in a GOOD condition, the extent of Close-up Surveys and thickness measurements may be specially considered.

3. Hatch covers and coamings

In addition to the requirements in **1402. 3** of the Annual Survey, the following items are to be surveyed.

(1) Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:
(a) stowage and securing in open condition
(b) proper fit and efficiency of sealing in closed condition
(c) operational testing of hydraulic and power components, wires, chains and link drives
(2) Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent is to be carried out.
(3) Thickness measurement of the hatch cover and coaming plating and stiffeners is to be carried out as given in **Table 1.2.9.**

4. Extent of Overall and Close-up Survey

(1) An Overall Survey of all tanks and spaces, excluding fuel oil, lube-oil and fresh water tanks, is to be carried out at each Special Survey.
Note : For fuel oil, lube oil and fresh water tanks, reference is to be made to **Table 1.2.3.**
(2) The minimum requirements for Close-up Surveys at Special Surveys are given in **Table 1.2.8.**
(3) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.
(4) For areas in spaces where hard protective coatings are found in a GOOD condition, the extent of Close-up Surveys according to **Table 1.2.8** may be specially considered.
Note : For examination of automatic air pipe heads, reference is to be made to **Table 1.2.7.**

5. Extent of thickness measurement

(1) The minimum requirements for thickness measurements at Special Survey are given in **Table 1.2.9.**
(2) Representative thickness measurement to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and ballast tanks is to be carried out. Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating. The thickness measurements may be dispensed with provided the Surveyor is satisfied by the Close-up Survey, that there is no structural diminution, and the hard protective coating where applied remains efficient.
(3) The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements.
(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurement according to **Table 1.2.9** may be specially considered.
(5) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

6. Extent of tank testing

(1) All boundaries of ballast tanks and deep tanks used for water ballast within the cargo length area are to be pressure tested. For fuel oil tanks within the cargo length area, representative tanks are to be pressure tested.
(2) The Surveyor may extend the tank testing as deemed necessary.
(3) Tank testing of fuel oil tanks is to be carried out with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be spacially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.

7. Additional Special Survey requirements for single hold cargo ships (See 1401. 1 (1)) after determining compliance with SOLAS II-1/23-3 and II-1/25

For ships complying with the requirements of SOLAS II-1/23-3 and II-1/25 for hold water level detectors, the Special Survey is to include an examination and a test of the all water ingress detection system and of their alarms.

Table 1.2.8 Minimum requirements for Close-up Survey at Special Survey of General Dry Cargo Ships

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Selected shell frames in one forward and one aft cargo hold and associated 'tween deck spaces (*1)	1. Selected shell frames in all cargo holds and 'tween deck spaces (*1)	1. All shell frames in the forward lower cargo hold and 25 % frames in each of the remaining cargo holds and 'tween deck spaces including upper and lower end attachments and adjacent shell plating (*1)	1. All shell frames in all cargo holds and 'tween deck spaces including upper and lower end attachments and adjacent shell plating (*1)
2. One selected cargo hold transverse bulkhead (*2)	2. One transverse bulkhead in each cargo hold (*2)	2. All cargo hold transverse bulkheads (*2)	2. All cargo hold transverse bulkheads (*2)
	3. Forward and aft transverse bulkhead in one side ballast tank, including stiffening system (*2)	3. All transverse bulkheads in ballast tanks, including stiffening system (*2)	3. All transverse bulkheads in ballast tanks, including stiffening system (*2)
	4. One transverse web with associated plating and framing in two representative ballast tanks of each type (i.e. topside, hopper side, side tank or double bottom tank) (*3)	4. All transverse webs with associated plating and framing in each ballast tank (*3)	4. All transverse webs with associated plating and framing in each ballast tank (*3)
3. All cargo hold hatch covers and coamings (plating and stiffeners) (*4)	5. All cargo hold hatch covers and coamings (plating and stiffeners) (*4)	5. All cargo hold hatch covers and coamings (plating and stiffeners) (*4)	5. All cargo hold hatch covers and coamings (plating and stiffeners) (*4)
	6. Selected areas of all deck plating and underdeck structure inside line of hatch openings between cargo hold hatches (*5)	6. All deck plating and underdeck structure inside line of hatch openings between cargo hold hatches (*5)	6. All deck plating and underdeck structure inside line of hatch openings between cargo hold hatches (*5)
	7. Selected areas of inner bottom plating (*6)	7. All areas of inner bottom plating (*6)	7. All areas of inner bottom plating (*6)

(NOTES)
1) (*1) to (*6) means as follows and are illustrated in **Annex 1-6** of the Guidance:
(*1) Cargo hold transverse frames
(*2) Cargo hold transverse bulkhead plating, stiffeners and girders
(*3) Transverse web frame or watertight transverse bulkhead in ballast tanks
(*4) Cargo hold hatch covers and coamings
(*5) Deck plating and underdeck structure inside line of hatch openings between cargo hold hatches
(*6) Inner bottom plating
2) Close-up Survey of cargo hold transverse bulkheads is to be carried out at the following levels:
· Immediately above the inner bottom and immediately above the 'tween decks, as applicable
· Mid-height of the bulkheads for holds without 'tween decks
· Immediately below the main deck plating and 'tween deck plating

Table 1.2.9 Minimum requirements for thickness measurements at Special Survey of General Dry Cargo Ships

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect areas	1. Suspect areas	1. Suspect areas	1. Suspect areas
	2. One transverse section of deck plating in way of a cargo length area within the amidships 0.5 L	2. Two transverse sections within the amidships 0.5 L in way of two different cargo spaces	2. Within the cargo length area: 1) A minimum of three transverse sections within the amidships 0.5 L 2) Each deck plate outside line of cargo hatch openings 3) Each bottom plate, including lower turn of bilge 4) Duct keel or pipe tunnel plating and internals
	3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey according to **Table 1.2.8**	3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey according to **Table 1.2.8**	3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey according to **Table 1.2.8**
		4. Within the cargo length area, each deck plate outside line of cargo hatch openings	
		5. All wind and water strakes within the cargo length area	4. All wind and water strakes full length
		6. Selected wind and water strakes outside the cargo length area	

(NOTES)
1) Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.
2) For ships less than 100 meters in length, the number of transverse sections required at Special Survey No. 3 may be reduced to one and the number of transverse sections at Special Survey No. 4 and subsequent surveys may be reduced to two.

Section 15 Hull Surveys for Liquefied Gas Carriers

1501. General

1. Application

(1) In addition to the other requirements specified in **Ch 2**, the requirements apply to all self-propelled ships carrying liquefied gases in bulk.

(2) The requirements apply to surveys of hull structure and piping systems, except piping covered by **204. 3, 304. 3** and **Sec 5-2, 3**, in way of the following spaces;

(A) pump rooms, compressor rooms, cofferdams, pipe tunnels, void spaces and fuel oil tanks within the cargo area

(B) all ballast tanks

Refer to **204. 3, 304. 3** and **Sec 5-2, 3** for periodical surveys of cargo carriage and handling installations

(3) The requirements contain the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional Close-up Survey when necessary.

2. Definitions

(1) A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and longitudinal bulkheads.

(2) **Cargo area** is that part of the ship which contains cargo tanks, cargo/ballast pump-rooms, compressor rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.

3. Procedures for thickness measurements

(1) The required thickness measurements, if not carried out by the Society itself, are to be witnessed by a Surveyor. The Surveyor is to be on board to the extent necessary to control the process. In this case, the control of thickness measurement process is to be in accordance with the separate requirements specified by the Society.

(2) The thickness measurement company is to be part of the survey planning meeting to be held prior to commencing the survey.

(3) Thickness measurements of structures in areas where Close-up Surveys are required shall be carried out simultaneously with Close-up Surveys.

(4) The thickness measurements are to be carried out by a company certified by the Society.

(5) A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measurement equipment, names of personnel and their qualifications and has to be signed by the operator.

(6) The Surveyor is to review the final thickness measurement report and countersign the cover page.

1502. Annual Survey

1. General

(1) The due range of Annual Survey is to be in accordance with the requirements of **201.**
(2) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.

2. Examination of the hull

(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.

3. Examination of weather deck

(1) Examination of flame screens on the open ends of air pipes to all bunker tanks.
(2) Examination of bunker and vent piping systems.

4. Examination of cargo pump rooms and compressor rooms and, as far as practicable, pipe tunnels if fitted

(1) Examination of all pump room and compressor room bulkheads for signs of leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room and compressor room bulkheads.
(2) Examination of the condition of all piping systems, except those covered by **204. 3, 304. 3** and **Sec 5-2, 3.**

Note : For survey of air pipes, flame screens on the open ends of air pipes and ventilations refer to **202. 1** (1) (f) to (h) and (6).

5. Suspect areas

Suspect areas identified at previous surveys are to be examined. Thickness measurements are to be taken of the areas of substantial corrosion and the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the Annual Survey is credited as completed.

6. Examination of ballast tanks

Examination of ballast tanks when required as a consequence of the results of the Special Survey and Intermediate Survey is to be carried out. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements. These extended thickness measurements are to be carried out before the Annual Survey is credited as completed.

1503. Intermediate Survey

1. General

(1) The due range of Intermediate Survey is to be in accordance with the requirements of **301.**
(2) At each Intermediate Survey, in addition to the requirements of the Annual Survey, the following items are to be surveyed. Those items which are additional to the requirements of the Annual Survey may be surveyed either at or between the 2nd and 3rd Annual Survey.
(3) A survey planning meeting is to be held prior to the commencement of the survey.

2. Examination of ballast tanks

(1) The Overall Survey of ballast tanks in Intermediate Survey is to be in accordance with the follows.

5 years < age ≤ 10 years1), 2), 3)	10 years < age1), 3)
Overall Survey of representative ballast tanks	Overall Survey of all ballast tanks
(NOTES) 1) If such examinations reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient. 2) If there is no hard protective coating, soft or semi-hard coating or POOR coating condition, the examination is to be extended to other ballast tanks of the same type. 3) For ballast tanks, excluding double bottom ballast tanks, if there is no hard protective coating, soft or semi-hard coating, or POOR coating condition and it is not renewed, the tanks in question are to be internally examined at annual intervals. 4) When such conditions as above 3) are found in double bottom ballast tanks, the tanks in question may be internally examined at annual intervals.	

(2) The minimum requirements for Close-up Survey of ballast tanks in Intermediate Survey is to be in accordance with the follows.

10 years < age ≤ 15 years	15 years < age
Close-up Survey of: 1. all web frames and both transverse bulkheads in a representative ballast tank (*1) and (*2) 2. the upper part of one web frame in another representative ballast tank 3. one transverse bulkhead in another representative ballast tank (*2)	Close-up Survey of: 1. all web frames and both transverse bulkheads in two representative ballast tanks (*1) and (*2)
(NOTES) 1) (*1) and (*2) mean as follows; (*1) : Complete transverse web frame including adjacent structural members (*2) : Transverse bulkhead complete, including girder system and adjacent structural members, and adjacent longitudinal bulkhead structure 2) Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted. 3) For areas in tanks where protective coatings are found to be in GOOD condition, the extent of Close-up Surveys may be specially considered by the Society. 4) For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of Close-up Surveys may be specially considered by the Society. 5) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases: - in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information; - in tanks having structures approved with reduced scantlings.	

1504. Special Survey

1. General

(1) The due range of Special Survey is to be in accordance with the requirements of **401.**
(2) A survey planing meeting is to be held prior to the commencement of the survey.
(3) The Special Survey is to include, in addition to the requirements of the Annual Surveys, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in (5), are in a satisfactory condition and is fit for the intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.
(4) Ballast tanks, including double bottom tanks, pump rooms, compressor rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in **Par 4** and **Par 5**, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(5) All piping systems within the spaces specified in (4) above, except those covered by **204. 3, 304. 3** and **Sec 5-2, 3**, are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.
(6) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.
Note : For survey of automatic air pipe heads refer to **403. 1** (17).
(7) A survey in dry dock is to be a part of the Special Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the ballast tanks are to be carried out in accordance with the applicable requirements for Special Surveys, if not already performed.
Note : Lower portions of the ballast tanks are considered to be the parts below light ballast water line.

2. Tank protection

(1) Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom ballast tanks, where a hard protective coating is found in POOR condition and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary be the Surveyor.
(2) When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.
(3) Where the hard protective coating in ballast tanks is found to be in a GOOD condition, the extent of Close-up Surveys and thickness measurements may be specially considered.

3. Extent of Overall and Close-up Survey

(1) An Overall Survey of all tanks and spaces, excluding fuel oil, lube-oil and fresh water tanks, is to be carried out at each Special Survey.
Note : For fuel oil, lube oil and fresh water tanks, reference is to be made to **Table 1.2.3.**
(2) The minimum requirements for Close-up Surveys at Special Surveys are given in **Table 1.2.10.**
(3) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and where tanks have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.
(4) For areas in tanks where hard protective coatings are found in a GOOD condition, the extent of Close-up Surveys according to **Table 1.2.10** may be specially considered.
Note : For examination of automatic air pipe heads, reference is to be made to **Table 1.2.7.**

4. Extent of thickness measurement

(1) The minimum requirements for thickness measurements at Special Survey are given in **Table 1.2.11.**

(2) The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion. **Table 1.2.5** may be used as guidance for these additional thickness measurements.

(3) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurement according to **Table 1.2.11** may be specially considered.

(4) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

5. Extent of tank testing

(1) All boundaries of ballast tanks and deep tanks used for water ballast within the cargo area are to be pressure tested. For fuel oil tanks within the cargo length area, representative tanks are to be pressure tested.

(2) The Surveyor may extend the tank testing as deemed necessary.

(3) Tank testing of fuel oil tanks is to be carried out with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be spacially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.

Table 1.2.10 Minimum requirements for Close-up Survey at Special Survey of Liquefied Gas Carriers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3 and Subsequent
1. One web frame in a representative ballast tank of the topside, hopper side and double hull side type (*1)	1. All web frame in a ballast tank, which is to be a double hull side tank or a topside tank. If such tanks are not fitted, another ballast tank is to be selected. (*1) 2. One web frame in each remaining ballast tank (*1)	1. All web frames in all ballast tanks (*1)
	3. One transverse bulkhead in each ballast tank (*2)	2. All transverse bulkheads in all ballast tanks (*2)
2. One transverse bulkhead in a ballast tank (*3)		

(NOTES)

1) (*1) to (*3) mean as follows and the typical midship sections of liquefied gas carriers are illustrated in **Annex 1-6** of the Guidance.
   (*1) : Complete transverse web frame including adjacent structural members
   (*2) : Transverse bulkhead complete, including girder system and adjacent structural members, and adjacent longitudinal bulkhead structure
   (*3) : Transverse bulkhead lower part including girder system and adjacent structural members
2) Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.
3) For areas in tanks where protective coatings are found to be in GOOD condition, the extent of Close-up Surveys may be specially considered by the Society.
4) For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of Close-up Surveys may be specially considered by the Society.
5) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:
   - in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information;
   - in tanks having structures approved with reduced scantlings.

Table 1.2.11 Minimum requirements for thickness measurements at Special Survey of Liquefied Gas Carriers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect areas	1. Suspect areas	1. Suspect areas	1. Suspect areas
2. One section of deck plating for the full beam of the ship within 0.5 L amidships in way of a ballast tank, if any	2. Within the cargo area: 1) Each deck plate 2) One transverse section within 0.5 L amidships in way of a ballast tank, if any	2. Within the cargo area: 1) Each deck plate 2) Two transverse sections[1)] 3) All wind and water strakes	2. Within the cargo area: 1) Each deck plate 2) Three transverse sections[1)] 3) Each bottom plate 4) Duct keel plating and internals
	3. Selected wind and water strakes outside the cargo area	3. Selected wind and water strakes outside the cargo area	3. All wind and water strakes, full length
3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey according to **Table 1.2.10**	4. Measurement for general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey according to **Table 1.2.10**	4. Measurement for general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey according to **Table 1.2.10**	4. Measurement for general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey according to **Table 1.2.10**

(NOTES)
1) At least one section is to include a ballast tank within 0.5 L amidships, if any.
2) For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of thickness measurements may be increased to include the tank top plating at the discretion of the Surveyor.
3) For areas in spaces where protective coatings are found to be in GOOD condition, the extent of thickness measurements may be specially considered by the Society.
4) The Surveyor may extend the thickness measurements as deemed necessary. Where substantial corrosion is found, the extent of thickness measurements is to be increased to the satisfaction of the Surveyor.

Section 16 Additional Requirements

1601. Strength and securing of small hatches, fittings and equipment on the fore deck

1. Ships that are described in **Pt 4, Ch 9, 101. 1** that are contracted for construction on or after 1 January 2004 are to comply with the requirements specified in **Pt 4, Ch 9** by the time of delivery.

2. Ships described in **Pt 4, Ch 9, 101. 2** that are contracted for construction prior to 1 January 2004 are to comply with the requirements specified in **Pt 4, Ch 9.**

(1) For ships which will be 15 years of age or more on 1 January 2004 by the due date of the first Intermediate or Special Survey after that date;
(2) For ships which will be 10 years of age or more on 1 January 2004 by the due date of the first Special Survey after that date;
(3) For ships which will be less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

3. Ships described in **Pt 4, Ch 9, 101.**, contracted for construction prior to 1 July 2007, are to comply with the requirements specified in **Pt 4, Ch 9, 201.** of the Guidance relating to the Rules by the relevant compliance date specified in **Par 1** or **Par 2** above, or by the due date of the first Special Survey after 1 July 2007, whichever is later. Completion prior to 1 July 2007 of a Special Survey with a due date after 1 July 2007 cannot be used to postpone compliance.

1602. Water level detectors on single hold cargo ships other than bulk carriers

Among the ships subject to the requirements specified in **Pt 7, Ch 3, 1402. 2,** ships constructed before 1 January 2007 shall comply with the requirements specified in **Pt 7, Ch 3, 1403. 3** not later than the date of the first Intermediate or Special Survey of the ship to be carried out after 1 January 2007, whichever comes first, but not later than 31 December 2009.

Section 17 Special Requirements for Ships Subject to Korean Ship Safety Act

1701. Special requirements

1. In application to **202. 2**(Fire-extinguishing appliances at Annual Survey), **302. 2**(Fire-extinguishing appliances at Intermediate Survey) and **404.**(Fire-extinguishing appliances at Special Survey), the survey for fire-extinguishing appliances is to be in accordance with the relevant requirements of *Korean Ship Safety Act*.

2. In application to **301.**(Intermediate Survey), Intermediate Surveys for Ships of 24 m in length and above and over 30 years after launching date(except fishing vessels) are to be carried out within 3 months before or after each anniversary date.

3. At the Intermediate Survey according to **Par 2** above, the following relevant requirements are applied only at the Intermediate Survey carried out within 3 months before or after the second or third anniversary date from the completion date of the previous Special Survey in accordance with **301.**

(1) **1403.**
(2) **1503.**
(3) **Ch 3, 201. 1** (3), (4), (6) and **203.**
(4) **Ch 3, 303.**
(5) **Ch 3, 403.**
(6) **Ch 3, 503.**
(7) **Ch 3, 603.**

4. At the Intermediate Survey according to **Par 2** above, the surveys in **303.**(Machinery, electrical installations and additional installations at Intermediate Survey) **Par 1** to **Par 4** are applied only at the Intermediate Survey carried out within 3 months before or after the second or third anniversary date from the completion date of the previous Special Survey in accordance with **301.**

5. In application to **303.**(Machinery, electrical installations and additional installations at Intermediate Survey), spare parts for ships are to be examined.

6. In application to **Pt 9, Ch 2**(Cargo handling appliances), the cargo handling appliances, except cargo ramps, of safe working load not less than 1 ton are to be included.

7. When a Korean flagged Deep-Sea Fishing Vessel(except for factory ship or carrier) approved for pelagic fishing by the Korean Government, at the time of Annual or Intermediate Survey, is not at the location where the survey can be taken due to the fishing operation in foreign waters, the relevant survey may be postponed within 12 months from the anniversary date through the approval of the Society. ⚓

CHAPTER 3 HULL SURVEYS OF SHIPS SUBJECT TO THE ENHANCED SURVEY PROGRAMME

Section 1 General

101. Application

1. In addition to the requirements specified in **Ch 2,** these requirements apply to hull surveys of ships subject to the enhanced survey programme such as **bulk carriers, oil tankers** and **chemical tankers,** etc.

2. Procedural requirements for certain ESP surveys

The objective of these requirements are to improve the quality of surveys. Taking into consideration, the size of vessels and scope of surveys for vessels noted below, it is more effective to have more than one Surveyor examine the required spaces, holds or tanks and to provide mutual support and consultation during the surveys in recommending repairs and actions required for conditions of class/recommendations.

(1) On ships 20,000 DWT and above, subject to ESP, starting with Special Survey No. 3, all special and intermediate hull classification surveys are to be carried out by at least two exclusive Surveyors. On bulk carriers 100,000 DWT and above of single side skin construction the intermediate hull classification survey between 10 and 15 years of age is to be performed by two exclusive Surveyors.

(2) This requires that at least two exclusive Surveyors attend on board at the same time to perform the required survey. Where compatible with relevant laws and regulations, on dual class vessels, the requirement for two Surveyors may be fulfilled by having one Surveyor attend from each Society.

(3) Though each attending Surveyor is not required to perform all aspects of the required survey, they are required to consult with each other and to do joint Overall and Close-up Surveys to the extent necessary to determine the condition of the vessel. The extent of these surveys should be sufficient for the Surveyors to agree on actions required to complete the survey with respect to renewals, repairs, and other recommendations or conditions of class. Each Surveyor is required to co-sign the survey report or indicate their concurrence in an equivalent manner.

(4) The following surveys may be witnessed by a single Surveyor;

- Thickness measurements in accordance with **Ch 2, 109**. of the Rules
- Tank testing in accordance with the applicable **Ch 3** of the Rules
- Repairs carried out in association with intermediate and special hull classification survey, the extent of which have been agreed upon by the required two Surveyors during the course of the surveys

(5) Surveyors used to fulfill this requirements are to be qualified in the survey processes involved.

(6) The onboard attendance of the Surveyors is to be documented according to the separate requirements specified by the Society.

102. Preparations for survey

1. Survey programme

(1) The Owner in cooperation with the Society is to work out a specific survey programme prior to the commencement of any part of:
- the Special Survey
- the Intermediate Survey for ships subject to the enhanced survey programme over 10 years of age.

The survey programme is to be in a written format, based on the information in **Annex 1-3, Table 1** of the Guidance. The survey is not to commence until the survey programme has been agreed.

The survey programme at Intermediate Survey may consist of the survey programme at the previous Special Survey supplemented by the executive hull summary of that Special Survey and later relevant survey reports. The survey programme is to be worked out taking into account any amendments to the survey requirements implemented after the last Special Survey carried out.

Prior to the development of the survey programme, the survey planning questionnaire is to be completed by the Owner based on the information set out in **Annex 1-3, Table 2** of the Guidance, and forwarded to the Society.

(2) In developing the survey programme, the following documentation is to be collected and consulted with a view to selecting cargo holds/tanks, tanks, areas, and structural elements to be examined:

(A) Bulk carriers and double skin bulk carriers
(a) Survey status and basic ship information
(b) Documentation on-board, as described in **103. 2** and **3**
(c) Main structural plans(scantling drawings), including information regarding use of high tensile steels(HTS)
(d) Relevant previous survey and inspection reports from both the Society and the Owner
(e) Information regarding the use of the ship's holds and tanks, typical cargoes and other relevant data
(f) Information regarding corrosion prevention level on the new building
(g) Information regarding the relevant maintenance level during operation

(B) Oil tankers, chemical tankers and double hull oil tankers
(a) Survey status and basic ship information
(b) Documentation on-board, as described in **103. 2** and **3**
(c) Main structural plans of cargo and ballast tanks(scantling drawings), including information regarding use of high tensile steels(HTS), clad steel and stainless steel(for chemical tankers)
(d) Executive hull summary
(e) Relevant previous damage and repair history
(f) Relevant previous survey and inspection reports from both the Society and the Owner
(g) For oil tankers and double hull oil tankers cargo and ballast history for the last 3 years, including carriage of cargo under heated conditions, for chemical tankers information regarding the use of the ship's tanks, typical cargoes and other relevant data
(h) Details of the inert gas plant and tank cleaning procedures
(i) Information and other relevant data regarding conversion or modification of the ship's cargo and ballast tanks since the time of construction
(j) Description and history of the coating and corrosion prevention system, if any
(k) Inspections by the Owner’s personnel during the last 3 years with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the coating and corrosion prevention system, if any
(l) Information regarding the relevant maintenance level during operation including port state control reports of inspection containing hull related deficiencies, Safety Management System non-conformities relating to hull maintenance, including the associated corrective action(s)
(m) Any other information that will help identify suspect areas and critical structural areas

(3) The submitted survey programme is to include relevant information including at least:
  (A) Bulk carriers and double skin bulk carriers
    (a) Basic ship information and particulars
    (b) Main structural plans(scantling drawings), including information regarding use of high tensile steels(HTS)
    (c) Plan of tanks and holds
    (d) List of tanks and holds with information on use, protection and condition of coating
    (e) Conditions for survey(e.g., information regarding hold and tank cleaning, gas freeing, ventilation, lighting, etc.)
    (f) Provisions and methods for access to structures
    (g) Equipment for surveys
    (h) Nomination of hold and tanks and areas for Close-up Survey
    (i) Nominations of sections and areas for thickness measurement
    (j) Nomination of tanks for tank pressure testing
    (k) Damage experience related to the ship in question
  (B) Oil tankers, chemical tankers and double hull oil tankers
    (a) Basic ship information and particulars
    (b) Main structural plans of cargo and ballast tanks(scantling drawings), including information regarding use of high tensile steels(HTS), clad steel and stainless steel(for chemical tankers)
    (c) Arrangement of tanks
    (d) List of tanks with information on their use, extent and condition of coatings and corrosion prevention systems
    (e) Conditions for survey(e.g., information regarding tank cleaning, gas freeing, ventilation, lighting, etc.)
    (f) Provisions and methods for access to structures
    (g) Equipment for surveys
    (h) Nomination of tanks and areas for Close-up Survey
    (i) Nomination of areas and sections for thickness measurement
    (j) Nomination of tanks for tank pressure testing and the pipes that are to undergo pipe pressure testing as per **404. 6** (for chemical tankers)
    (k) Identification of the thickness measurement company
    (l) Damage experience related to the ship in question
    (m) Critical structural areas and suspect areas, where relevant

(4) The Society will advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the vessel.

(5) Use may also be made of the process contained in **Annex 1-3, Par 1** of the Guidance in conjunction with the preparation of the required survey programme. This process is a recommended tool which may be invoked at the discretion of the Society, when considered necessary and appropriate.

2. Conditions for survey

(1) The Owner is to provide the necessary facilities for a safe execution of the survey.
   (A) In order to enable the attending Surveyors to carry out the survey, provisions for proper and safe access are to be agreed between the Owner and the Society.
   (B) Details of the means of access are to be provided in the survey planning questionnaire.
   (C) In cases where the provisions of safety and required access are judged by the attending Surveyor(s) not to be adequate, the survey of the spaces involved is not to proceed.

(2) Cargo holds, tanks and spaces are to be safe for access. Cargo holds, tanks and spaces are to be gas free and properly ventilated. Prior to entering a tank, void or enclosed space, it is to be verified that the atmosphere in that space is free from hazardous gas and contains sufficient oxygen.

(3) In preparation for survey and thickness measurements and to allow for a thorough examination, all spaces are to be cleaned including removal from surfaces of all loose accumulated corrosion scale. Spaces are to be sufficiently clean and free from water, scale, dirt, oil residues etc. to reveal corrosion, deformation, fractures, damages, or other structural deterioration as well as the condition of the coating. However, those areas of structure whose renewal has already been decided by the Owner need only be cleaned and descaled to the extent necessary to determine the limits of the areas to be renewed.

(4) Sufficient illumination is to be provided to reveal corrosion, deformation, fractures, damages or other structural deterioration as well as the condition of the coating.

(5) Where soft or semi-hard coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft or semi-hard coating is to be removed.

(6) The Surveyor(s) are to always be accompanied by at least one responsible person, assigned by the Owner, experienced in tank and enclosed spaces inspection. In addition a backup team of at least two experienced persons is to be stationed at the hatch opening of the tank or space that is being surveyed. The back-up team is to continuously observe the work in the tank or space and is to keep lifesaving and evacuation equipment ready for use.

(7) A communication system is to be arranged between the survey party in the cargo hold, tank or space being examined, the responsible officer on deck and, as the case may be, the navigation bridge. The communication arrangements are to be maintained throughout the survey.

3. Access to structures

(1) For Overall Survey, means are to be provided to enable the Surveyor to examine the hull structure in a safe and practical way.

(2) For Close-up Survey(for bulk carriers(except double skin bulk carriers), Close-up Survey of the hull structure, other than cargo hold shell frames), one or more of the following means for access, acceptable to Surveyor, is to be provided:
   (A) permanent staging and passages through structures
   (B) temporary staging and passages through structures
   (C) lifts and movable platforms
   (D) boats or rafts
   (E) portable ladders
   (F) other equivalent means

(3) For Close-up Surveys of the cargo hold shell frames of bulk carriers(except double skin bulk carriers) less than 100,000 DWT, one or more of the following means for access, acceptable to the Surveyor, is to be provided:
   (A) permanent staging and passage through structures
   (B) temporary staging and passage through structures
   (C) portable ladder restricted to not more than 5 m in length may be accepted for surveys of lower section of a shell frame including bracket
   (D) hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
   (E) boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water
   (F) other equivalent means

(4) For Close-up Surveys of the cargo hold shell frames of bulk carriers(except double skin bulk carriers) 100,000 DWT and above, the use of portable ladders is not accepted, and one or more of the following means for access, acceptable to the Surveyor, is to be provided:
 (A) Annual Surveys, Intermediate Survey under 10 years of age and Special Survey No. 1
  (a) permanent staging and passage through structures
  (b) temporary staging and passage through structures
  (c) hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
  (d) boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water
  (e) other equivalent means
 (B) Subsequent Intermediate Surveys and Special Surveys
  (a) either permanent or temporary staging and passage through structures for Close-up Survey of at least the upper part of hold frames
  (b) hydraulic arm vehicles such as conventional cherry pickers for surveys of lower and middle part of shell frames as alternative to staging
  (c) lifts and movable platforms
  (d) boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water
  (e) other equivalent means
 Notwithstanding the above requirements, the use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable for the "close-up examination of sufficient extent, minimum 25 % of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating of the forward cargo hold" at Annual Survey, required in **202. 4**(10 years < age ≤ 15 years, Close-up Survey), and the "one other selected cargo hold" required in **202. 4**(15 years ≤ age, Close-up Survey).

4. Equipment for survey

(1) Thickness measurement is normally to be carried out by means of ultrasonic test equipment. The accuracy of the equipment is to be proven to the Surveyor as required.
(2) One or more of the following fracture detection procedures may be required if deemed necessary by the Surveyor:
 (A) radiographic equipment
 (B) ultrasonic equipment
 (C) magnetic particle equipment
 (D) dye penetrant
(3) Explosimeter, oxygen-meter, breathing apparatus, lifelines, riding belts with rope and hook and whistles together with instructions and guidance on their use are to be made available during the survey. A safety check-list is to be provided.
(4) Adequate and safe lighting is to be provided for the safe and efficient conduct of the survey.
(5) Adequate protective clothing is to be made available and used during the survey(e.g. safety helmet, gloves, safety shoes, etc.).

5. Survey at sea or at anchorage

(1) Survey at sea or at anchorage may be accepted provided the Surveyor is given the necessary assistance from the personnel onboard. Necessary precautions and procedures for carrying out the survey are to be in accordance with **Par 1, Par 2, Par 3** and **Par 4** above.

(2) A communication system is to be arranged between the survey party in the tank or space under examination and the responsible officer on deck. This system is to also include the personnel in charge of ballast pump handling if boats or rafts are used.

(3) Surveys of tanks or applicable holds by means of boats or rafts may only be undertaken with the agreement of the Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response under foreseeable conditions and provided the expected rise of water within the tank or hold does not exceed 0.25 m.

(4) When rafts or boats are used for Close-up Survey the following conditions are to be observed.

(A) only rough duty, inflatable rafts or boats, having satisfactory residual buoyancy and stability even if one chamber is ruptured, are to be used.

(B) the boat or raft is to be tethered to the access ladder and an additional person is to be stationed down the access ladder with a clear view of the boat or raft.

(C) appropriate lifejackets are to be available for all participants.

(D) the surface of water in the tank or hold is to be calm(under all foreseeable conditions the expected rise of water within the tank or hold is not to exceed 0.25 m) and the water level stationary. On no account is to the level of the water be rising while the boat or raft is in use.

(E) the tank, hold or space must contain clean ballast water only. Even a thin sheen of oil or cargo on the water is not acceptable.

(F) at no time is the water level to be allowed to be within 1 m of the deepest under deck web face flat so that the survey team is not isolated from a direct escape route to the tank hatch. Filling to levels above the deck transverses is only to be contemplated if a deck access manhole is fitted and open in the bay being examined, so that an escape route for the survey party is available at all times. Other effective means of escape to the deck may be considered.

(G) if the tanks(or spaces) are connected by a common venting system, or inert gas system, the tank in which the boat or raft is to be used is to be isolated to prevent a transfer of gas from other tanks(or spaces).

(5) Rafts or boats alone may be allowed for inspection of the under deck areas for tanks or spaces, if the depth of the webs is 1.5 m or less.

(6) If the depth of the webs is more than 1.5 m, rafts or boats alone may be allowed only:

(A) when the coating of the under deck structure is in GOOD condition and there is no evidence of wastage; or

(B) if a permanent means of access is provided in each bay to allow safe entry and exit. This means:

(a) access direct from the deck via a vertical ladder and a small platform fitted approximately 2 m below the deck in each bay; or

(b) access to deck from a longitudinal permanent platform having ladders to deck in each end of the tank. The platform shall, for the full length of the tank, be arranged in level with, or above, the maximum water level needed for rafting of under deck structure. For this purpose, the ullage corresponding to the maximum water level is to be assumed not more than 3 m from the deck plate measured at the midspan of deck transverses and in the middle length of the tank. (For oil tankers, chemical tankers and double hull oil tankers, see **Fig 1.3.1**)

If neither of the above conditions are met, then staging or an "other equivalent means" is to be provided for the survey of the under deck areas.

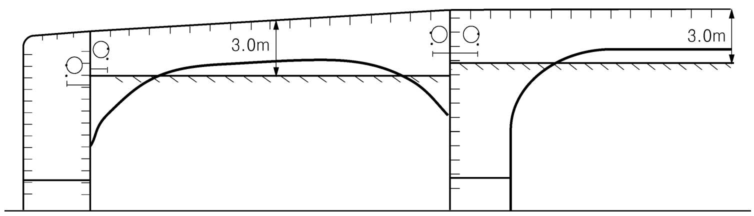


Fig 1.3.1

(7) The use of rafts or boats alone in (5) and (6) above does not preclude the use of boats or rafts to move about within a tank during a survey.

6. Survey planning meeting

(1) The establishment of proper preparation and close co-operation between the attending Surveyor(s) and the Owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

(2) Prior to the commencement of any part of the Special and Intermediate Survey, a survey planning meeting is to be held between the attending Surveyor(s), the Owner's representative in attendance, the thickness measurement company operator(as applicable) and the master of the ship or an appropriately qualified representative appointed by the master or company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

(3) The following is an indicative list of items that are to be addressed in the meeting.

(A) schedule of the vessel(i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.)

(B) provisions and arrangements for thickness measurements(i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety)

(C) extent of the thickness measurements

(D) acceptance criteria

(E) extent of Close-up Survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion

(F) execution of thickness measurements

(G) taking representative readings in general and where uneven corrosion/pitting is found

(H) mapping of areas of substantial corrosion

(I) communication between attending Surveyor(s) the thickness measurement company operator(s) and Owner representative(s) concerning findings

103. Documentation on board

1. General

(1) The Owner is to obtain, supply and maintain on board documentation as specified in **Par 2** and **Par 3** below, which is to be readily available for the Surveyor.
(2) The documentation is to be kept on board for the life time of the ship.

2. Survey report file

(1) A survey report file is to be a part of the documentation on board consisting of
   (A) Reports of structural surveys
   (B) Executive hull summary
   (C) Thickness measurement reports
(2) The survey report file is to be available also in the Owner's and the Society's management offices.

3. Supporting documents

The following additional documentation is to be available onboard.
(1) Main structural plans of cargo (holds) and ballast tanks
(2) Previous repair history
(3) Cargo and ballast history
(4) Extent of use of inert gas plant and tank cleaning procedures
(5) The Owners inspection report with reference to
   (A) structural deterioration in general
   (B) leakages in bulkheads and piping
   (C) condition of corrosion prevention system, if any
(6) Any other information that will help identify critical structural areas and/or suspect areas requiring inspection
(7) Survey programme as required in **102. 1** until such time as the Special Survey or Intermediate Survey, as applicable, has been completed

4. Review of documentation on board

Prior to survey, the Surveyor is to examine the completeness of the documentation onboard, and its contents as a basis for the survey.

104. Procedures for thickness measurements

1. General

(1) The required thickness measurements, if not carried out by the Society itself, are to be witnessed by a Surveyor. The Surveyor is to be on board to the extent necessary to control the process. In this case, the control of thickness measurement process, review, verification and record of attendance are to be in accordance with the separate requirements specified by the Society.
(2) The thickness measurement company is to be part of the survey planning meeting to be held prior to commencing the survey.
(3) Thickness measurements of structures in areas where Close-up Surveys are required shall be carried out simultaneously with Close-up Surveys.
(4) In all cases the extent of the thickness measurements is to be sufficient as to represent the actual average condition.
(5) The thickness measurements are to be carried out by a qualified company certified by the Society.

2. Reporting

(1) A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measurement equipment, names of personnel and their qualifications and has to be signed by the operator. The thickness measurement report is to follow the principles as specified in **Annex 1-5** of the Guidance.
(2) The Surveyor is to review the final thickness measurements report and countersign the cover page.

105. Reporting and evaluation of survey

1. Evaluation of survey report

(1) The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.
(2) In case of oil tankers(including double hull oil tankers) of 130 m in length and upwards(as defined in **Pt 3, Ch 1, 103.**), the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the Special Survey carried out after the ship reached 10 years of age in accordance with the criteria for longitudinal strength of the ship's hull girder for oil tankers specified in the separate requirements specified by the Society. However, the only thickness measurement records which have been measured within one(1) year period from the date of the longitudinal strength evaluation shall be considered valid.
(3) The final result of evaluation of the ship's longitudinal strength required (2) above, after renewal or reinforcement work of structural members, if carried out as a result of initial evaluation, is to be reported as a part of the executive hull summary.

2. Reporting

An executive hull summary of the survey and results is to be issued to the Owner and placed on board the vessel for reference at future surveys. The executive hull summary is to be endorsed by the Society.

3. When a survey is split between different survey stations, a report is to be made for each portion of the survey. A list of items examined and/or tested(pressure testing, thickness measurements etc.) and an indication of whether the item has been credited, are to be made available to the next attending Surveyor(s), prior to continuing or completing the survey.

Section 2 Bulk Carriers

201. General

1. Application

(1) In addition to the requirements specified in **Ch 2**, the requirements apply to surveys of hull structure and piping systems in way of the following spaces for all bulk carriers with ESP notation other than double skin bulk carriers as defined in **601. 2** (1).

(a) cargo holds, cofferdams, pipe tunnels, void spaces and fuel oil tanks within the cargo length area

(b) all ballast tanks

(2) The requirements contain the minimum extent of examination, thickness measurement and tank testing. The survey is to be extended when Substantial Corrosion and/or structural defects are found and include additional Close-Up Survey when necessary.

(3) Ships, specified in **Pt 7, Annex 7-5, 1** of the Guidance, which are required to comply with IACS UR S19(Evaluation of Scantlings of the Transverse Watertight Corrugated Bulkhead between Cargo Holds Nos. 1 and 2, with Cargo Hold No.1 Flooded, for Existing Bulk Carriers) are subject to the additional thickness measurement guidance contained in **Annex 1-5, Table 9** of the Guidance with respect to the vertically corrugated transverse watertight bulkhead between cargo hold Nos.1 and 2 for purpose of determining compliance with UR S19 prior to the relevant compliance deadline stipulated in UR S23(Implementation of IACS UR S19 and S22 for Existing Single Side Skin Bulk Carriers) as following and at subsequent Intermediate Surveys(for ships over 10 years of age) and Special Surveys for purpose of verifying continuing compliance with UR S19.

(A) For ships which were 20 years of age or more on 1 July 1998, by the due date of the first Intermediate or the due date of the first Special Survey to be held after 1 July 1998, whichever comes first, the compliance with the requirements specified in **Pt 7, Annex 7-5** of the Guidance is to be confirmed.

(B) For ships which were 15 years of age or more but less than 20 years of age on 1 July 1998, by the due date of the first Special Survey to be held after 1 July 1998, but not later than 1 July 2002, the compliance with the requirements specified in **Pt 7, Annex 7-5** of the Guidance is to be confirmed.

(C) For ships which were 10 years of age or more but less than 15 years of age on 1 July 1998, by the due date of the first Intermediate, or the due date of the first Special Survey to be held after the date on which the ship reaches 15 years of age but not later than the date on which the ship reaches 17 years of age, the compliance with the requirements specified in **Pt 7, Annex 7-5** of the Guidance is to be confirmed.

(D) For ships which were 5 years of age or more but less than 10 years of age on 1 July 1998, by the due date, after 1 July 2003, of the first Intermediate or the first Special Survey after the date on which the ship reaches 10 years of age, whichever occurs first, the compliance with the requirements specified in **Pt 7, Annex 7-5** of the Guidance is to be confirmed.

(E) For ship which were less than 5 years of age on 1 July 1998, by the date on which the ship reaches 10 years of age, the compliance with the requirements specified in **Pt 7, Annex 7-5** of the Guidance is to be confirmed.

(F) Completion prior to 1 July 2003 of an Intermediate or Special Survey with a due date after 1 July 2003 cannot be used to postpone compliance. However, completion prior to 1 July 2003 of an Intermediate Survey the window for which straddles 1 July 2003 can be accepted.

(4) Ships, specified in **Pt 7, Ch 3, Sec 17** which required to comply with IACS UR S31(Renewal Criteria for Side Shell Frames and Brackets in Single Side Skin Bulk Carriers and Single Side Skin OBO Carriers not Built in accordance with UR S12 Rev.1 or subsequent revisions) are subject to the additional thickness measurement guidance contained in **Pt 7, Ch 3, Sec 17** and the separate requirements specified by the Society with respect to the side shell frames and brackets for the purpose of determining compliance with UR S31 prior to the relevant compliance deadline stipulated in UR S31 as following and at subsequent Intermediate and Special Surveys for purpose of verifying continuing compliance with UR S31.
   (A) Bulk Carriers subject to the requirements specified in **Pt 7, Ch 3, Sec 17** are to be assessed for compliance with the requirements of this rules and steel renewal, reinforcement or coating, where required in accordance with this rules, is to be carried out in accordance with the following schedule and at subsequent Intermediate and Special Surveys.
      (a) For bulk carriers which will be 15 years of age or more on 1 January 2004 by the due date of the first Intermediate or Special Survey after that date;
      (b) For bulk carriers which will be 10 years of age or more on 1 January 2004 by the due date of the first Special Survey after that date;
      (c) For bulk carriers which will be less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.
      (d) Completion prior to 1 January 2004 of an Intermediate or Special Survey with a due date after 1 January 2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an Intermediate Survey the window for which straddles 1 January 2004 can be accepted.
   (B) OBO carriers subject to the requirements specified in **Pt 7, Ch 3, Sec 17** are to be assessed for compliance with the requirements of this rules and steel renewal, reinforcement or coating, where required in accordance with this rules, is to be carried out in accordance with the following schedule and at subsequent Intermediate and Special Surveys.
      (a) For OBO carriers which will be 15 years of age or more on 1 July 2005 by the due date of the first Intermediate or Special Survey after that date;
      (b) For OBO carriers which will be 10 years of age or more on 1 July 2005 by the due date of the first Special Survey after that date;
      (c) For OBO carriers which will be less than 10 years of age on 1 July 2005 by the date on which the ship reaches 10 years of age.
      (d) Completion prior to 1 July 2005 of an Intermediate or Special Survey with a due date after 1 July 2005 cannot be used to postpone compliance. However, completion prior to 1 July 2005 of an Intermediate Survey the window for which straddles 1 July 2005 can be accepted.

(5) For bulk carriers with hybrid cargo hold arrangements, e.g. with some cargo holds of single side skin and others of double side skin, the requirements of **Sec 6** are to apply to cargo hold of double side skin and associated wing spaces.

(6) All bulk carriers, which required to comply with IACS UR S30(Cargo Hatch Cover Securing Arrangements for Bulk Carriers not Built in accordance with UR S21(Rev.3)), not built in accordance with **Pt 7, Ch 3, Sec 9** are to comply with the requirements specified in **Pt 7, Ch 3, Sec 18** in accordance with the following schedule:
   (A) For ships which will be 15 years of age or more on 1 January 2004 by the due date of the first Intermediate or Special Survey after that date;
   (B) For ships which will be 10 years of age or more on 1 January 2004 by the due date of the first Special Survey after that date;
   (C) For ships which will be less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.
   (D) Completion prior to 1 January 2004 of an Intermediate or Special Survey with a due date after 1 January 2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an Intermediate Survey the window for which straddles 1 January 2004 can be accepted.

2. Definitions

(1) A **ballast tank** is a tank which is used solely for salt water ballast, or, where applicable, a space which is used for both cargo and slat water ballast will be treated as a ballast tank when substantial corrosion has been found in that space.

(2) A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom hopper sides, longitudinal bulkheads and bottom in top wing tanks.

(3) **Spaces** are separate compartments including holds, tanks, cofferdams and void spaces bounding cargo holds, decks and the outer hull.

202. Annual Survey

1. General

(1) The due range of Annual Survey is to be in accordance with the requirements of **Ch 2, 201.**
(2) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, weather decks, hatch covers, coamings and piping are maintained in a satisfactory condition.

2. Examination of the hull

(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.

3. Examination of weather decks, hatch covers and coamings

(1) Confirmation is to be obtained that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.
(2) A thorough survey of cargo hatch covers and coamings is only possible by examination in the open as well as closed positions and is to include verification of proper opening and closing operation. As a result, the hatch cover sets within the forward 25 % of the ship's length and at least one additional set, such that all sets on the ship are assessed at least once in every 5-year period, are to be surveyed open, closed and in operation to the full extent on each direction at each Annual Survey, including:
(A) stowage and securing in open condition
(B) proper fit and efficiency of sealing in closed condition
(C) operational testing of hydraulic and power components, wires, chains, and link drives
The closing of the covers is to include the fastening of all peripheral and cross joint cleats or other securing devices. Particular attention is to be paid to the condition of the hatch covers in the forward 25 % of the ship's length, where sea loads are normally greatest.
(3) If there are indications of difficulty in operating and securing hatch covers, additional sets above those required by (2), at the discretion of the Surveyor, are to be tested in operation.
(4) Where the cargo hatch securing system does not function properly, repairs are to be carried out under the supervision of the Society.
(5) For each cargo hatch cover set, at each Annual Survey, the following items are to be surveyed:
(A) cover panels, including side plates, and stiffener attachments that may be accessible in the open position by Close-up Survey(for corrosion, cracks, deformation)
(B) sealing arrangements of perimeter and cross joints(gaskets for condition and permanent deformation, flexible seals on combination carriers, gasket lips, compression bars, drainage channels and non return valves)
(C) clamping devices, retaining bars, cleating(for wastage, adjustment, and condition of rubber components)
(D) closed cover locating devices(for distortion and attachment)
(E) chain or rope pulleys
(F) guides
(G) guide rails and track wheels
(H) stoppers
(I) wires, chains, tensioners, and gypsies
(J) hydraulic system, electrical safety devices and interlocks
(K) end and interpanel hinges, pins and stools where fitted
(6) At each hatchway, at each Annual Survey, the coamings, with panel stiffeners and brackets are to be checked for corrosion, cracks and deformation, especially of the coaming tops, including Close-up Survey.
(7) Where considered necessary, the effectiveness of sealing arrangements may be proved by hose or chalk testing supplemented by dimensional measurements of seal compressing components.

(8) Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition, where applicable, of:
  (A) wooden covers and portable beams, carriers or sockets for the portable beam, and their securing devices
  (B) steel pontoons, including Close-up Survey of hatch cover plating
  (C) tarpaulins
  (D) cleats, battens and wedges
  (E) hatch securing bars and their securing devices
  (F) loading pads/bars and the side plate edge
  (G) guide plates and chocks
  (H) compression bars, drainage channels and drain pipes(if any)
(9) Examination of flame screens on the open ends of air pipes to all bunker tanks.
(10) Examination of bunker and vent piping systems, including ventilators.

4. Examination of cargo holds

The examination of cargo holds in Annual Survey is to be in accordance with the follows.

	10 years 〈 age ≤ 15 years[2), 3)]	15 years 〈 age[2), 3)]
Overall Survey	All cargo holds	All cargo holds
Close-up Survey	1. Cargo Holds: - forward cargo hold 2. Extent: Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating[1)]	1. Cargo Holds: - forward cargo hold - one other selected cargo hold 2. Extent: Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating[1)]
Others	All piping and penetrations in cargo holds, including overboard piping, are to be examined.	All piping and penetrations in cargo holds, including overboard piping, are to be examined.

(NOTES)
1) Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a Close-up Survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a Close-up Survey of sufficient extent of all remaining cargo holds.
2) When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the Guidance relating to the Rules. These increased thickness measurements are to be carried out before the Annual Survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurement taken.
3) Where a hard protective coating in cargo holds is found to be in GOOD condition, the extent of Close-up Surveys and thickness measurements may be specially considered.

5. Examination of ballast tanks

Examination of ballast tanks when required as a consequence of the results of the Special Survey and Intermediate Survey is to be carried out. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the Guidance relating to the Rules. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous survey are to have thickness measurements taken.

6. Additional Annual Survey requirements for the foremost cargo hold of ships subject to SOLAS XII/9.1

(1) Ships subject to SOLAS XII/9.1 are those meeting all the following conditions;
- Bulk Carriers of 150 m in length and upwards of single side skin construction,
- carrying solid bulk cargoes having a density of 1780 kg/m^3 and above,
- contracted for construction before 1 July 1999, and
- constructed with an insufficient number of transverse watertight bulkheads to enable them to withstand flooding of the foremost cargo hold in all loading conditions and remain afloat in a satisfactory condition of equilibrium as specified in SOLAS XII/4.3.

(2) In accordance with SOLAS XII/9.1, for the foremost cargo hold of such ships, the additional survey requirements listed in the Guidance relating to the Rules shall apply.

7. Additional Annual Survey requirements after determining compliance with SOLAS XII/12 and XII/13

(1) For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors, the Annual Survey is to include an examination and a test, at random, of the water ingress detection systems and of their alarms.

(2) For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems, the Annual Survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

203. Intermediate Survey

1. General

(1) The due range of Intermediate Survey is to be in accordance with the requirements of **Ch 2, 301.**
(2) At each Intermediate Survey, in addition to the requirements of the Annual Survey, the following items are to be surveyed. Those items which are additional to the requirements of the Annual Survey may be surveyed either at or between the 2nd and 3rd Annual Survey.
(3) Bulk carriers exceeding 10 years of age up to 15 years of age, the following is to apply:
(a) The requirements of the Intermediate Survey are to be to the same extent to the previous Special Survey as required in **204.** and **102. 1.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, internal examination of fuel tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.
(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**
(c) In application of (a) above, an under water survey may be considered in lieu of the requirements of **204. 1** (6).
(4) Bulk carriers over 15 years of age, the following is to apply:
(a) The requirements of the Intermediate Survey are to be to the same extent to the previous Special Survey as required in **204.** and **102. 1.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, internal examination of fuel tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.
(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**
(c) In application of (a) above, a survey in dry dock is to be part of the Intermediate Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks are to be carried out in accordance with the applicable requirements for Intermediate Surveys, if not already performed.
Note : Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

2. Examination of ballast tanks

The examination of ballast tanks in Intermediate Survey is to be in accordance with the follows.

5 years 〈 age ≤ 10 years[1), 2), 3)]	10 years 〈 age ≤ 15 years	15 years 〈 age
1. Overall Survey of representative ballast tanks 2. Overall Survey and Close-up Survey of suspect areas identified at previous surveys	**203. 1** (3) to be applied.	**203. 1** (4) to be applied.

(NOTES)
1) The selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks. If such Overall Survey reveals no visible structural defects, the examination may be limited to verification that the corrosion prevention system remains efficient.
2) Where POOR coating condition, corrosion or other defects are found in ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.
3) In ballast tanks other than double bottom ballast tanks, where a hard protective coating is found in POOR condition, and it is not renewed, or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual intervals. When such breakdown of hard protective coating is found in double bottom ballast tanks, of where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

3. Examination of cargo holds

The examination of cargo holds in Intermediate Survey is to be in accordance with the follows.

	5 years 〈 age ≤ 10 years[1)]	10 years 〈 age ≤ 15 years	15 years 〈 age
Overall Survey	All cargo holds	**203. 1** (3) to be applied.	**203. 1** (4) to be applied.
Close-up Survey	1. Cargo holds: - forward cargo hold - one other selected cargo hold. (extent : Survey of sufficient extent, minimum 25% of frames, is to be carried out to establish the condition of: shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads) 2. Suspect areas found at previous surveys	**203. 1** (3) to be applied.	**203. 1** (4) to be applied.

(NOTES)
1) Where considered necessary by the Surveyor as a result of the Overall and Close-up Survey, the survey is to be extended to include a Close-up Survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a Close-up Survey of sufficient extent of all remaining cargo holds.

4. Extent of thickness measurement

(1) Bulk carriers exceeding 5 years of age up to 10 years of age, the following is to apply:
(a) Thickness measurements are to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to Close-up Survey, as described in **Par 3.** The minimum requirement for thickness measurements at the Intermediate Survey are areas found to be suspect areas at previous surveys.
(b) The thickness measurement may be specially considered provided the Surveyor is satisfied by the Close-up Survey, that there is no structural diminution and the hard protective coatings are found to be in a GOOD condition.
(c) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the Guidance relating to the Rules. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.
(d) Where the hard protective coating in cargo holds is found to be in GOOD condition, the extent of Close-up Surveys and thickness measurements may be specially considered.
Note : For existing bulk carriers, where Owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the Close-up Surveys and thickness measurement. Prior to the coating of cargo holds of existing ships, scantlings should be ascertained in the presence of a Surveyor.
(2) Bulk carriers exceeding 10 years of age up to 15 years of age, **Par 1** (3) above is to apply.
(3) Bulk carriers exceeding 15 years of age, **Par 1** (4) above is to apply.
(4) The side shell frames and brackets of cargo holds bounded by the single side shell of bulk carriers which were not built in accordance with **Pt 7, Ch 3, Sec 7** are to have thickness measurements taken for the extent of Close-up Survey according to the ship's age.

204. Special Survey

1. General

(1) The due range of Special Survey is to be in accordance with the requirements of **Ch 2, 401.**
(2) The Special Survey is to include, in addition to the requirements of the Annual Survey, examination, tests, and checks of sufficient extent to ensure that the hull and related piping, as required in (4), is in a satisfactory condition and is fit for its intended purpose for the new period of class of 5 years to be assigned subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.
(3) All cargo holds, ballast tanks, including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in **Par 5** and **Par 6**, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(4) All piping systems within the spaces specified in (3) above are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remains satisfactory.
(5) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.
(6) A survey in dry dock is to be a part of the Special Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks are to be carried out in accordance with the applicable requirements for Special Surveys, if not already performed.
Note : Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

2. Tank protection

(1) Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom ballast tanks, where a hard protective coating is found in POOR condition and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor.
(2) When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.
(3) Where a hard protective coating is provided in cargo holds and is found in GOOD condition, the extent of Close-up Surveys and thickness measurements may be specially considered.

3. Hatch covers and coamings

In addition to the requirements in **202. 3** of the Annual Survey, the following items are to be surveyed.

(1) Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:
   (a) stowage and securing in open condition
   (b) proper fit and efficiency of sealing in closed condition
   (c) operational testing of hydraulic and power components, wires, chains, and link drives.
(2) Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.
(3) Thickness measurement of the hatch cover and coaming plating and stiffeners is to be carried out as given in **Table 1.3.2.**

4. Extent of Overall and Close-up Survey

(1) An Overall Survey of all tanks and spaces is to be carried out at each Special Survey. Fuel oil tanks in cargo length area are to be surveyed as follows:

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
-	One	Two	Half, minimum two

(NOTES)
1. These requirements apply to tanks of integral (structural) type.
2. If a selection of tanks is accepted to be examined, then different tanks are to be examined at each Special Survey, on a rotational basis.
3. Peak tanks (all uses) are subject to internal examination at each Special Survey.
4. At Special Survey No. 3 and subsequent Special Surveys, one deep tank adjacent to side shell plate for fuel oil in the cargo area is to be included, if fitted.

(2) The minimum requirements for Close-up Survey at Special Survey are given in **Table 1.3.1.**
(3) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.
(4) For areas in spaces where hard protective coatings are found to be in a GOOD condition, the extent of Close-up Surveys according to **Table 1.3.1** may be specially considered. (Refer also to **204. 2** (3))

5. Extent of thickness measurement

(1) The minimum requirements for thickness measurements at Special Survey are given in **Table 1.3.2.** For additional thickness measurement guidelines applicable to the vertically corrugated transverse watertight bulkhead between cargo hold Nos. 1 and 2 on ships subject to compliance with IACS URs S19 and S23, reference is to be made to **201. 1** (3) and **Annex 1-5**, **Table 9** of the Guidance. For additional thickness measurement guidelines applicable to the side shell frames and brackets on ships subject to compliance with IACS UR S31, reference is to be made to **201. 1** (4) and **Pt 7, Ch 3, Sec 17** of the Rules and the separate requirements specified by the Society.
(2) Provisions for extended measurements for areas with substantial corrosion are given in the Guidance relating to the Rules and as may be additionally specified in the survey programme as required in **102. 1.** These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.
(3) The Surveyor may further extend the thickness measurements as deemed necessary.
(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurement according to **Table 1.3.2** may be specially considered. (Refer also to **204. 2** (3))
(5) Transverse sections are to be chosen where largest reductions are suspected to occur or are revealed from deck plating measurements.
(6) Representative thickness measurement to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and ballast tanks is to be carried out. Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating. The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the Close-up Survey, that there is no structural diminution, and the hard protective coating where applied remains efficient.

6. Extent of tank testing

The minimum requirements for tank testing at Special Survey are given in **Table 1.3.3.**

7. Additional Special Survey requirements after determining compliance with SOLAS XII/12 and XII/13

(1) For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors, the Special Survey is to include an examination and a test of the all water ingress detection systems and of their alarms.

(2) For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems, the Special Survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

Table 1.3.1 Minimum requirements for Close-up Survey at Special Survey of Bulk Carriers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. 25% of shell frames in the forward cargo hold at representative positions, and selected frames in remaining cargo holds (*1)	1. All shell frames in the forward cargo hold and 25% of shell frames in each of the remaining cargo holds including upper and lower end attachments and adjacent shell plating. For bulk carriers 100,000 DWT and above, all shell frames in the forward cargo hold and 50% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating. (*1)	1. All shell frames in the forward and one other selected cargo hold and 50% of frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating (*1)	1. All shell frames in all cargo holds, including upper and lower end attachments and adjacent shell plating (*1)
2. One transverse web with associated plating and longitudinals in two representative ballast tanks of each type (i.e. topside, or hopper side tank) (*2)	2. One transverse web with associated plating and longitudinals in each ballast tank (*2)	2. All transverse webs with associated plating and longitudinals in each ballast tank (*2)	2. All transverse webs with associated plating and longitudinals in each ballast tank (*2)
3. Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (*3)	3. Forward and aft transverse bulkhead in one ballast tank, including stiffening system (*2)	3. All transverse bulkheads in ballast tanks, including stiffening system (*2)	3. All transverse bulkheads in ballast tanks, including stiffening system (*2)
4. All cargo hold hatch covers and coamings (plating and stiffeners) (*4)	4. All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (*3)	4. All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (*3)	4. All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (*3)
	5. All cargo hold hatch covers and coamings (plating and stiffeners) (*4)	5. All cargo hold hatch covers and coamings (plating and stiffeners) (*4)	5. All cargo hold hatch covers and coamings (plating and stiffeners) (*4)
	6. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches. (*5)	6. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches. (*5)	6. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches. (*5)

(NOTES)

1. (*1) to (*5) means as follows and are illustrated in **Annex 1-6** of the Guidance:
   (*1) : Cargo hold transverse frames
   (*2) : Transverse web frame or watertight transverse bulkhead in ballast tanks
   (*3) : Cargo hold transverse bulkheads stiffeners and girders
   (*4) : Cargo hold hatch covers and coamings
   (*5) : Deck plating and under deck structure inside line of hatch openings between cargo hold hatches
2. Close-up Survey of transverse bulkheads to be carried out at four levels:
   Level(a) : Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.
   Level(b) : Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.
   Level(c) : About mid-height of the bulkhead.
   Level(d) : Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Table 1.3.2 Minimum requirements for thickness measurements at Special Survey of Bulk Carriers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect areas	1. Suspect areas	1. Suspect areas	1. Suspect areas
	2. Within the cargo length: 1) Two transverse sections of deck plating outside line of cargo hatch openings	2. Within the cargo length: 1) Each deck plate outside line of cargo hatch openings 2) Two Transverse Sections, one in the amidship area, outside line of cargo hatch openings 3) All wind and water strakes	2. Within the cargo length: 1) Each deck plate outside line of cargo hatch openings 2) Three Transverse Sections, one in the amidship area, outside line of cargo hatch openings 3) Each bottom plate
	3. 1) Wind and water strakes in way of the transverse sections considered under **2** above 2) Selected wind and water strakes outside the cargo length area	3. Selected wind and water strakes outside the cargo length area	3. All wind and water strakes, full length
	4. Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.1**	4. Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.1**	4. Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.1**
		5. See **201. 1** (3) and **Annex 1-5, Table 9** of the Guidance for additional thickness measurement guidelines applicable to the vertically corrugated transverse watertight bulkhead between cargo hold Nos. 1 and 2 on ships subject to compliance with IACS URs S19 and S23	5. See **201. 1** (3) and **Annex 1-5, Table 9** of the Guidance for additional thickness measurement guidelines applicable to the vertically corrugated transverse watertight bulkhead between cargo hold Nos. 1 and 2 on ships subject to compliance with IACS URs S19 and S23
	5. See **201. 1** (4), **Pt 7, Ch 3, Sec 17** and the separate requirements specified by the Society for additional thickness measurement guidelines applicable to the side shell frames and brackets on ships subject to compliance with IACS UR S31	6. See **201. 1** (4), **Pt 7, Ch 3, Sec 17** and the separate requirements specified by the Society for additional thickness measurement guidelines applicable to the side shell frames and brackets on ships subject to compliance with IACS UR S31	6. See **201. 1** (4), **Pt 7, Ch 3, Sec 17** and the separate requirements specified by the Society for additional thickness measurement guidelines applicable to the side shell frames and brackets on ships subject to compliance with IACS UR S31

Table 1.3.3 Minimum requirements for tank testing at Special Survey of Bulk Carriers

Tanks or spaces \ No. of Special Survey	Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
All boundaries of ballast tanks, deep tanks and cargo holds used for water ballast within the cargo length area	○	○	○	○

(NOTES)
1. For fuel oil tanks within the cargo length area, only representative tanks are to be pressure tested.
2. The Surveyor may extend the tank testing as deemed necessary.
3. Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.
4. Boundaries of ballast holds are to be tested with a head of liquid to near to the top of hatches.
5. Boundaries of fuel oil tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.
6. The testing of double bottom and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tanktop is carried out.

Section 3 Oil Tankers

301. General

1. Application

(1) In addition to the requirements specified in **Ch 2**, the requirements apply to surveys of hull structure and piping systems in way of the following spaces for all oil tankers with ESP notation other than Double Hull Oil Tankers as defined in **501. 2** (1).
  (a) cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area
  (b) all ballast tanks

(2) The requirements contain the minimum extent of examination, thickness measurements and tank testing. The survey should be extended when substantial corrosion and/or structural defects are found and include additional Close-up Survey when necessary.

2. Definitions

(1) A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and longitudinal bulkheads.

(2) **Cargo area** is that part of the ship which contains cargo tanks, slop tanks and cargo/ballast pump-rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.

(3) A **ballast tank** is a tank which is used solely for the carriage of salt water ballast.

(4) A **combined cargo/ballast tank** is a tank which is used for the carriage of cargo or ballast water as a routine part of the vessel's operation and will be treated as a ballast tank. Cargo tanks in which water ballast might be carried only in exceptional cases per MARPOL Annex I, Ch 4, Reg. 18.3 are to be treated as cargo tanks.

302. Annual Survey

1. General

(1) The due range of Annual Survey is to be in accordance with the requirements of **Ch 2, 201.**
(2) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.

2. Examination of the hull

(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.

3. Examination of weather decks

(1) Examination of cargo tank openings including gaskets, covers, coamings and flame screens.
(2) Examination of cargo tanks pressure/vacuum valves and flame screens.
(3) Examination of flame screens on the open ends of air pipes to all bunker tanks.
(4) Examination of cargo, crude oil washing, bunker and vent piping systems, including vent masts and headers.

4. Examination of cargo pump rooms and pipe tunnels(if fitted)

(1) Examination of all pump room bulkheads for signs of oil leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room bulkheads.
(2) Examination of the condition of all piping systems.

5. Examination of ballast tanks

Examination of ballast tanks where required as a consequence of the results of the Special Survey(See **304. 2**) and Intermediate Survey(See **303. 3**) is to be carried out. When considered necessary by the Surveyor, or when extensive corrosion exists, thickness measurements are to be carried out and if the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the Guidance relating to the Rules. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

303. Intermediate Survey

1. General

(1) The due range of Intermediate Survey is to be in accordance with the requirements of **Ch 2, 301.**

(2) At each Intermediate Survey, in addition to the requirements of the Annual Survey, the following items are to be surveyed. Those items which are additional to the requirements of the Annual Survey may be surveyed either at or between the 2nd and 3rd Annual Survey.

(3) Oil tankers exceeding 10 years of age up to 15 years of age, the following is to apply:

(a) The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in **102. 1** and **304.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of hull girder as required in **105. 1** (2) are not required unless deemed necessary by the attending Surveyor.

(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**

(c) In application of (a) above, an under water survey may be considered in lieu of the requirements of **304. 1** (5).

(4) Oil tankers over 15 years of age, the following is to apply:

(a) The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in **102. 1** and **304.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of hull girder as required in **105. 1** (2) are not required unless deemed necessary by the attending Surveyor.

(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**

(c) In application of (a) above, a survey in dry dock is to be a part of the Intermediate Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for Intermediate Surveys, if not already performed.

Note : Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

2. For weather decks, an examination as far as applicable of:

(1) Cargo, crude oil washing, bunker, ballast, steam and vent piping systems as well as vent masts and headers is to be carried out.

(2) If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both.

3. Extent of examination

The examination in Intermediate Survey is to be in accordance with the follows.

5 years 〈 age ≤ 10 years[1), 2)]	10 years 〈 age ≤ 15 years	15 years 〈 age
1. All ballast tanks 2. Suspect areas identified at previous surveys	**303. 1** (3) to be applied.	**303. 1** (4) to be applied.

(NOTES)

1) When considered necessary by the Surveyor, thickness measurement and testing are to be carried out to ensure that the structural integrity remains effective.

2) A ballast tank is to be examined at subsequent annual intervals where:

- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

304. Special Survey

1. General

(1) The due range of Special Survey is to be in accordance with the requirements of **Ch 2, 401.**
(2) The Special Survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in (4), is in a satisfactory condition and is fit for its intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.
(3) All cargo tanks, ballast tanks, including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, this examination is to be supplemented by thickness measurement and testing as required in **Par 4** and **Par 5**, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(4) Cargo piping on deck, including crude oil washing (COW) piping, cargo and ballast piping within the tanks and spaces specified in (3) above are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are opened during repair periods and can be examined internally.
(5) A survey in dry dock is to be a part of the Special Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for Special Surveys, if not already performed.
Note : Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

2. Tank protection

Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined. A ballast tank is to be examined at subsequent annual intervals where:
- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurements are to be carried out as deemed necessary by the Surveyor.

3. Extent of Overall and Close-up Survey

(1) An Overall Survey of all tanks and spaces is to be carried out at each Special Survey.
(2) The minimum requirements for Close-up Survey at Special Survey are given in **Table 1.3.4.**
(3) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:
(a) In particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information.
(b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.
(4) For areas in tanks where hard protective coatings are found to be in GOOD condition, the extent of Close-up Surveys according to **Table 1.3.4** may be specially considered.

4. Extent of thickness measurement

(1) The minimum requirements for thickness measurements at Special Survey are given in **Table 1.3.5.**

(2) Provisions for extended measurements for areas with substantial corrosion are given in the Guidance relating to the Rules, and as may be additionally specified in the survey programme as required in **102. 1.** These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

(3) The Surveyor may further extend the thickness measurements as deemed necessary.

(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurements according to **Table 1.3.5** may be specially considered.

(5) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

(6) In case where two or three sections are to be measured, at least one is to include a ballast tank within 0.5 L amidships. In case of oil tankers of 130 m in length and upwards(as defined in **Pt 3, Ch 1, 103.**) and more than 10 years of age, for the evaluation of the ship's longitudinal strength as required in **105. 1** (2), the sampling method of thickness measurements is given in the Guidance relating to the Rules.

5. Extent of tank testing

The minimum requirements for tank testing at Special Survey are given in **Table 1.3.6.**

Table 1.3.4 Minimum requirements for Close-up Survey at Special Survey of Oil Tankers, Ore/Oil Ships and etc.[1)]

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. One web frame ring in a ballast wing tank, if any, or a cargo wing tank, used primarily for water ballast (*1)	1. All web frame rings in a ballast wing tank, if any, or a cargo wing tank, used primarily for water ballast (*1)	1. All web frame rings in all ballast tanks (*1) 2. All web frame rings in a cargo wing tank (*1) 3. A minimum of 30% of all web frame ring in each remaining cargo wing tank (*1)[2)]	1. All web frames rings in all ballast tanks (*1) 2. All web frame rings in a cargo wing tank (*1) 3. A minimum of 30% of all web frame ring in each remaining cargo wing tank (*1)[2)]
2. One deck transverse in a cargo oil tank (*2)	2. One deck transverse in each of the remaining ballast tanks, if any (*2) 3. One deck transverse in a cargo wing tank (*2) 4. One deck transverse in two cargo centre tanks (*2)		
	5. Both transverse bulkheads in a wing ballast tank, if any, or a cargo wing tank used primarily for water ballast (*3)	4. All transverse bulkheads in all cargo and ballast tanks (*3)	4. All transverse bulkheads in all cargo and ballast tanks (*3)
3. One transverse bulkhead in a ballast tank (*4)	6. One transverse bulkhead in each remaining ballast tank (*4)	5. A minimum of 30% of deck and bottom transverse including adjacent structural members in each cargo centre tank (*5)	5. A minimum of 30% of deck and bottom transverse including adjacent structural members in each cargo centre tank (*5)
4. One transverse bulkhead in a cargo oil wing tank (*4)	7. One transverse bulkhead in a cargo oil wing tank (*4)	6. As considered necessary by the Surveyor (*6)	6. As considered necessary by the Surveyor (*6)
5. One transverse bulkhead in a cargo oil centre tank (*4)	8. One transverse bulkhead in two cargo centre tanks (*4)		7. Additional transverses included as deemed necessary by the Society

(NOTES)

1) (*1) to (*6) mean as follows and are illustrated in **Annex 1-6** of the Guidance:
   - (*1) : Complete transverse web frame ring including adjacent structural members
   - (*2) : Deck transverse including adjacent deck structural members
   - (*3) : Transverse bulkhead complete including girder system and adjacent structural members
   - (*4) : Transverse bulkhead lower part including girder system and adjacent structural members
   - (*5) : Deck and bottom transverse including adjacent structural members
   - (*6) : Additional complete transverse web frame ring

2) The 30 % is to be rounded up to the next whole integer.

Table 1.3.5 Minimum requirements for thickness measurements at Special Survey of Oil Tankers, Ore/Oil Ships and etc.

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect areas 2. One transverse section of deck plating for the full beam of the ship within the cargo area (in way of a ballast tank, if any, or a cargo tank used primarily for water ballast) 3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.4**	1. Suspect areas 2. Within the cargo area: 1) Each deck plate 2) One transverse section 3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.4** 4. Selected wind and water strakes outside the cargo area	1. Suspect areas 2. Within the cargo area: 1) Each deck plate 2) Two transverse sections[1)] 3) All wind and water strakes 3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.4** 4. All wind and water strakes, full length

(NOTES)
1) At least one section is to include a ballast tank within 0.5 L amidships.

Table 1.3.6 Minimum requirements for tank testing at Special Survey of Oil Tankers, Ore/Oil Ships and etc.

Special Survey No. 1	Special Survey No. 2 and Subsequent
1. All ballast tank boundaries 2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump-rooms or cofferdams	1. All ballast tank boundaries 2. All cargo tank bulkheads

(NOTES)
1. The Surveyor may extend the tank testing as deemed necessary.
2. Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.
3. Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

Section 4 Chemical Tankers

401. General

1. Application

(1) In addition to the requirements specified in **Ch 2**, the requirements apply to all Chemical Tankers, with ESP notation, with integral tanks. If a chemical tanker is constructed with both integral and independent tanks, these requirements are applicable only to that portion of the cargo length containing integral tanks. Combined gas carriers/chemical tankers with independent tanks within the hull, are to be surveyed as gas carriers.

(2) The requirements apply to surveys of hull structure and piping systems in way of following spaces. The requirements are not applicable for independent tanks on deck:
(a) cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area
(b) all ballast tanks

(3) These requirements contain the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional Close-up Survey when necessary.

2. Definitions

(1) A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and longitudinal bulkheads.

(2) **Cargo area** is that part of the ship which contains cargo tanks, slop tanks and cargo/ballast pump-rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.

(3) A **ballast tank** is a tank which is used solely for the carriage of salt water ballast.

(4) A **combined cargo/ballast tank** is a tank which is used for the carriage of cargo or ballast water as a routine part of the vessel's operation and will be treated as a ballast tank. Cargo tanks in which water ballast might be carried only in exceptional cases per MARPOL Annex I, Ch 4, Reg. 18.3 are to be treated as cargo tanks.

402. Annual Survey

1. General

(1) The due range of Annual Survey is to be in accordance with the requirements of **Ch 2, 201.**
(2) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.

2. Examination of the hull

(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.

3. Examination of weather decks

(1) Examination of cargo tank openings including gaskets, covers, coamings and flame screens.
(2) Examination of cargo tanks pressure/vacuum valves and flame screens.
(3) Examination of flame screens on the open ends of air pipes to all bunker tanks.
(4) Examination of cargo, bunker and vent piping systems, including vent masts and headers.

4. Examination of cargo pump rooms and pipe tunnels(if fitted)

(1) Examination of all pump room bulkheads for signs of chemical leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room bulkheads.
(2) Examination of the condition of all piping systems.

5. Examination of ballast tanks

Examination of ballast tanks where required as a consequence of the results of the Special Survey(See **404. 2**) and Intermediate Survey(See **403. 3**) is to carried out. When considered necessary by the Surveyor, or when extensive corrosion exists, thickness measurements are to be carried out and if the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the Guidance relating to the Rules. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

403. Intermediate Survey

1. General

(1) The due range of Intermediate Survey is to be in accordance with the requirements of **Ch 2, 301.**

(2) At each Intermediate Survey, in addition to the requirements of the Annual Survey, the following items are to be surveyed. Those items which are additional to the requirements of the Annual Survey may be surveyed either at or between the 2nd and 3rd Annual Survey.

(3) Chemical tankers exceeding 10 years of age up to 15 years of age, the following is to apply:

(a) The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in **102. 1** and **404.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, pressure testing of cargo and ballast tanks is not required unless deemed necessary by the attending Surveyor.

(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**

(c) In application of (a) above, an under water survey may be considered in lieu of the requirements of **404. 1** (5).

(4) Chemical tankers over 15 years of age, the following is to apply:

(a) The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in **102. 1** and **404.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, pressure testing of cargo and ballast tanks is not required unless deemed necessary by the attending Surveyor.

(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**

(c) In application of (a) above, a survey in dry dock is to be a part of the Intermediate Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for Intermediate Surveys, if not already performed.

Note : Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

2. For weather decks, an examination as far as applicable of:

(1) Cargo, bunker, ballast, steam and vent piping systems as well as vent masts and headers is to be carried out.

(2) If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both.

3. Extent of examination

The examination in Intermediate Survey is to be in accordance with the follows.

5 years 〈 age ≤ 10 years[1), 2)]	10 years 〈 age ≤ 15 years	15 years 〈 age
1. Overall Survey of representative ballast tanks 2. Examination of suspect areas identified at previous surveys	**403. 1** (3) to be applied.	**403. 1** (4) to be applied.

(NOTES)

1) If such inspections reveal no visible structural defects, the examination may be limited to a verification that the hard protective coating remains in GOOD condition.

2) A ballast tank is to be examined at subsequent annual intervals where:
- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

404. Special Survey

1. General

(1) The due range of Special Survey is to be in accordance with the requirements of **Ch 2, 401.**
(2) The Special Survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in (4), is in a satisfactory condition and is fit for its intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.
(3) All cargo tanks, ballast tanks, including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, this examination is to be supplemented by thickness measurement and testing as required in **Par 4** and **Par 5**, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(4) Cargo piping on deck and cargo and ballast piping within the tanks and spaces specified in (3) above are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are opened during repair periods and can be examined internally.
(5) A survey in dry dock is to be a part of the Special Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for Special Surveys, if not already performed.
Note : Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

2. Tank protection

Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined. A ballast tank is to be examined at subsequent annual intervals where:

- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurements are to be carried out as deemed necessary by the Surveyor.

3. Extent of Overall and Close-up Survey

(1) An Overall Survey of all tanks and spaces is to be carried out at each Special Survey.
(2) The minimum requirements for Close-up Survey at Special Survey are given in **Table 1.3.7.** The survey of stainless steel tanks may be carried out as an Overall Survey supplemented by Close-up Survey as deemed necessary by the Surveyor.
(3) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:
(a) In particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information.
(b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.
(4) For areas in tanks where hard protective coatings are found to be in GOOD condition, the extent of Close-up Surveys according to **Table 1.3.7** may be specially considered.

4. Extent of Thickness Measurement

(1) The minimum requirements for thickness measurements at Special Survey are given in **Table 1.3.8.** The thickness measurement of stainless steel hull structure and piping may be waived, except for clad steel plating.
(2) Provisions for extended measurements for areas with substantial corrosion are given in the Guidance relating to the Rules, and as may be additionally specified in the survey programme as required in **102. 1.** These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.
(3) The Surveyor may further extend the thickness measurements as deemed necessary.
(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurements according to **Table 1.3.8** may be specially considered.
(5) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.
(6) In case where two or three sections are to be measured, at least one is to include a ballast tank within 0.5 L amidships.

5. Extent of tank testing

The minimum requirements for tank testing at Special Survey are given in **Table 1.3.9.** Pressure testing of cargo tanks may be specially considered based on a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with a satisfactory result.

6. Chemical tankers over 10 years of age

(1) Selected steel cargo pipes outside cargo tanks and ballast pipes passing through cargo tanks are to be:
  (a) thickness measured at random or selected pipe lengths to be opened for internal inspection.
  (b) pressure tested to the maximum working pressure.
(2) Special attention is to be given to cargo/slop discharge piping through ballast tanks and void spaces.

Table 1.3.7 Minimum requirements for Close-up Survey at Special Survey of Chemical Tankers[1)]

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. One web frame in a ballast wing tank(for S.H.) or ballast double hull tank(for D.H.)[2)] (*1)	1. All web frames in a ballast wing tank(for S.H.) or ballast double hull tank(for D.H.)[2)] (*1)	1. All web frames in all ballast tanks (*1)	1. All web frames in all ballast tanks (*1)
2. One deck transverse in a cargo tank or on deck (*2)	2. One deck transverse in each remaining ballast tank or on deck(for S.H.) (*2) 3. The knuckle area and the upper part(3 metres approx) of one web frame in each remaining ballast tank(for D.H.) (*2)	2. All web frames in a cargo wing tank (*1)	2. All web frames in a cargo wing tank (*1)
3. One transverse bulkhead(lower part for S.H., complete for D.H.) in a ballast tank (*3) (*4)	4. One deck transverse in a cargo wing tank or on deck(for S.H.) (*2)	3. One web frame in each remaining cargo tank (*1)	3. One web frame in each remaining cargo tank (*1)
4. One transverse bulkhead in a cargo wing tank (*4) 5. One transverse bulkhead in a cargo centre tank[3)] (*4)	5. One deck transverse in two cargo centre tanks or on deck(for S.H.) and one deck transverse in two cargo tanks(for D.H.) (*2) 6. Both transverse bulkhead in a ballast wing tank(for S.H.) (*3) 7. One transverse bulkhead in each ballast tank(for D.H.)[2)] (*3) 8. One transverse bulkhead in each remaining ballast tank(for S.H.) (*4) 9. One transverse bulkhead in a cargo wing tank (*4) 10. One transverse bulkhead in two cargo centre tanks[3)] (*4)	4. All transverse bulkhead in all cargo and ballast tanks (*3)	4. All transverse bulkhead in all cargo and ballast tanks (*3) 5. Additional transverse areas as deemed necessary by the Society

(NOTES)

1) (*1) to (*4) mean as follows and are illustrated in **Annex 1-6** of the Guidance:
   - (*1) : Complete transverse web frame ring including adjacent structural members
   - (*2) : Deck transverse including adjacent deck structural members
   - (*3) : Transverse bulkhead complete including girder system and adjacent structural members
   - (*4) : Transverse bulkhead lower part including girder system and adjacent structural members

2) Double hull tank - including double bottom and side tank even though these tanks are separate.

3) Where no centre cargo tanks are fitted(as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

Table 1.3.8 Minimum requirements for thickness measurements at Special Survey of Chemical Tankers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect areas 2. One transverse section of deck plating for the full beam of the ship within the cargo area (in way of a ballast tank, if any, or a cargo tank used primarily for water ballast) 3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.7.**	1. Suspect areas 2. Within the cargo area: 1) Each deck plate 2) One transverse section 3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.7.** 4. All wind and water strakes, full length
(NOTES) 1) At least one section is to include a ballast tank within 0.5 L amidships.			

Table 1.3.9 Minimum requirements for tank testing at Special Survey of Chemical Tankers

Special Survey No. 1	Special Survey No. 2 and Subsequent
1. All ballast tank boundaries 2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump-rooms or cofferdams	1. All ballast tank boundaries 2. All cargo tank bulkheads
(NOTES) 1. The Surveyor may extend the tank testing as deemed necessary. 2. Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes. 3. Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions. 4. The testing of double bottom and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tanktop is carried out.	

Section 5 Double Hull Oil Tankers

501. General

1. Application

(1) In addition to the requirements specified in **Ch 2**, the requirements apply to surveys of hull structure and piping systems in way of the following spaces for all double hull oil tankers with ESP notation.

(a) cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area

(b) all ballast tanks

(2) The requirements contain the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when substantial corrosion and/or structural defects are found and include additional Close-up Survey when necessary.

2. Definitions

(1) A **double hull oil tanker** is a ship which is constructed primarily for the carriage of oil in bulk, which have the cargo tanks protected by a double hull which extends for the entire length of the cargo area, consisting of double sides and double bottom spaces for the carriage of water ballast or void spaces.

(2) A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and longitudinal bulkheads.

(3) **Cargo area** is that part of the ship which contains cargo tanks, slop tanks and cargo/ballast pump rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over above mentioned spaces.

(4) A **ballast tank** is a tank which is used solely for the carriage of salt water ballast.

(5) A **combined cargo/ballast tank** is a tank which is used for the carriage of cargo or ballast water as a routine part of the vessel's operation and will be treated as a ballast tank. Cargo tanks in which water ballast might be carried only in exceptional cases per MARPOL Annex I, Ch 4, Reg. 18.3 are to be treated as cargo tanks.

502. Annual Survey

1. General

(1) The due range of Annual Survey is to be in accordance with the requirements of **Ch 2, 201.**
(2) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.

2. Examination of the hull

(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.

3. Examination of the weather deck

(1) Examination of cargo tank openings including gaskets, covers, coamings and flame screens.
(2) Examination of cargo tanks pressure/vacuum valves and flame screens.
(3) Examination of flame screens on the open ends of air pipes to all bunker tanks.
(4) Examination of cargo, crude oil washing, bunker and vent piping systems, including vent masts and headers.

4. Examination of cargo pump rooms and pipe tunnels(if fitted)

(1) Examination of all pump rooms bulkheads for signs of oil leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room bulkheads.
(2) Examination of the condition of all piping systems.

5. Examination of ballast tanks

Examination of ballast tanks where required as a consequence of the results of the Special Survey(See **504. 2**) and Intermediate Survey(See **503. 3**) is to be carried out. When considered necessary by the Surveyor, or when extensive corrosion exists, thickness measurements are to be carried out and if the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the Guidance relating to the Rules. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

503. Intermediate Survey

1. General

(1) The due range of Intermediate Survey is to be in accordance with the requirements of **Ch 2, 301.**
(2) At each Intermediate Survey, in addition to the requirements of the Annual Survey, the following items are to be surveyed. Those items which are additional to the requirements of the Annual Survey may be surveyed either at or between the 2nd and 3rd Annual Survey.
(3) Double hull oil tankers exceeding 10 years of age up to 15 years of age, the following is to apply:
(a) The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in **102. 1** and **504.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of hull girder as required in **105. 1** (2) are not required unless deemed necessary by the attending Surveyor.
(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**
(c) In application of (a) above, an under water survey may be considered in lieu of the requirements of **504. 1** (5).
(4) Double hull oil tankers over 15 years of age, the following is to apply:
(a) The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in **102. 1** and **504.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of hull girder as required in **105. 1** (2) are not required unless deemed necessary by the attending Surveyor.
(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**
(c) In application of (a) above, a survey in dry dock is to be a part of the Intermediate Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for Intermediate Surveys, if not already performed.
Note : Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

2. For weather decks, an examination as far as applicable of:

(1) Cargo, crude oil washing, bunker, ballast, steam and vent piping systems as well as vent masts and headers is to be carried out.
(2) If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressures-tested, thickness measured or both.

3. Extent of examination

The examination in Intermediate Survey is to be in accordance with the follows.

5 years < age ≤ 10 years[1), 2)]	10 years < age ≤ 15 years	15 years < age
1. Overall Survey of representative ballast tanks 2. Examination of suspect areas identified at previous surveys	**503. 1** (3) to be applied.	**503. 1** (4) to be applied.

(NOTES)
1) If such inspections reveal no visible structural defects, the examination may be limited to a verification that the hard protective coating remains in GOOD condition.
2) A ballast tank is to be examined at subsequent annual intervals where:
- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

504. Special Survey

1. General

(1) The due range of Special Survey is to be in accordance with the requirements of **Ch 2, 401.**

(2) The Special Survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in (4), is in a satisfactory condition and is fit for its intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

(3) All cargo tanks, ballast tanks, including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, this examination is to be supplemented by thickness measurement and testing as required in **Par 4** and **Par 5**, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

(4) Cargo piping on deck, including crude oil washing (COW) piping, cargo and ballast piping within the tanks and spaces specified in (3) above are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are opened during repair periods and can be examined internally.

(5) A survey in dry dock is to be a part of the Special Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for Special Surveys, if not already performed.

Note : Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

2. Tank protection

Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined. A ballast tank is to be examined at subsequent annual intervals where:

- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurements are to be carried out as deemed necessary by the Surveyor.

3. Extent of Overall and Close-up Survey

(1) An Overall Survey of all tanks and spaces is to be carried out at each Special Survey.

(2) The minimum requirements for Close-up Survey at Special Survey are given in **Table 1.3.10**.

(3) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

(a) In particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information.

(b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

(4) For areas in tanks where hard protective coatings are found to be in GOOD condition, the extent of Close-up Surveys according **Table 1.3.10** may be specially considered.

4. Extent of thickness measurement

(1) The minimum requirements for thickness measurements at Special Survey are given in **Table 1.3.11.**

(2) Provisions for extended measurements for areas with substantial corrosion are given in the Guidance relating to the Rules, and as may be additionally specified in the survey programme as required in **102. 1.** These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

(3) The Surveyor may further extend the thickness measurements as deemed necessary.

(4) For areas in tanks where hard protective coatings are found to be in GOOD condition, the extent of thickness measurements according to **Table 1.3.11** may be specially considered.

(5) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

(6) In case where two or three sections are to be measured, at least one is to include a ballast tank within 0.5 L amidships. In case of oil tankers of 130 m in length and upwards(as defined in **Pt 3, Ch 1, 103.**) and more than 10 years of age, for the evaluation of the ship's longitudinal strength as required in **105. 1** (2), the sampling method of thickness measurements is given in the Guidance relating to the Rules.

5. Extent of tank testing

The minimum requirements for tank testing at Special Survey are given in **Table 1.3.12.**

Table 1.3.10 Minimum requirements for Close-up Survey at Special Survey of Double Hull Oil Tankers[1]

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. One web frame, in a ballast tank[2] (*1)	1. All web frames, in a ballast tank[2] (*1)	1. All web frames, in all ballast tanks (*1)	1. As for Special Survey No. 3
2. One deck transverse, in a cargo oil tank (*2)	2. The knuckle area and the upper part (5 meters approximately) of one web frame in each remaining ballast tank (*6)	2. All web frames, including deck transverse and cross ties, if fitted, in a cargo oil tank (*7)	2. Additional transverse areas as deemed necessary by the Society
3. One transverse bulkhead, in a ballast tank[2] (*4)	3. One deck transverse, in two cargo oil tanks (*2)	3. One web frame, including deck transverse and cross ties, if fitted, in each remaining cargo oil tank (*7)	
4. One transverse bulkhead, in a cargo oil centre tank[3] (*5)	4. One transverse bulkhead, in each ballast tank[2] (*4)	4. All transverse bulkheads, in all cargo oil (*3) and ballast (*4) tanks	
5. One transverse bulkhead, in a cargo oil wing tank (*5)	5. One transverse bulkhead, in two cargo oil centre tanks[3] (*5)		
	6. One transverse bulkhead, in a cargo oil wing tank (*5)		

(NOTES)

1) (*1) to (*7) mean as follows and are illustrated in **Annex 1-6** of the Guidance:
   - (*1) Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank(where fitted), including adjacent structural members. In fore and aft peak tanks web frame means a complete transverse web frame ring including adjacent structural members.
   - (*2) Deck transverse, including adjacent deck structural members(or external structure on deck in way of the tank, where applicable)
   - (*3) Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members(such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.
   - (*4) Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.
   - (*5) Transverse bulkhead lower part in cargo tank, including girder system, adjacent structural members(such as longitudinal bulkheads) and internal structure of lower stool, where fitted.
   - (*6) The knuckle area and the upper part(5 metres approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, up to 2 metres from the corners both on the bulkhead and the double bottom.
   - (*7) Web frame in a cargo oil tank means deck transverse, longitudinal bulkhead vertical girder and cross ties, where fitted, including adjacent structural members.

2) Ballast tank : means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.

3) Where no centre cargo tanks are fitted(as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

Table 1.3.11 Minimum requirements for thickness measurements at Special Survey of Double Hull Oil Tankers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect areas	1. Suspect areas	1. Suspect areas	1. Suspect areas
2. One section of deck plating for the full beam of the ship within the cargo area	2. Within the cargo area : 1) Each deck plate 2) One transverse section	2. 3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.10**	3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.10**	3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.10**	3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.10**
	4. Selected wind and water strakes outside the cargo area	4. Selected wind and water strakes outside the cargo area	4. All wind and water strakes, full length

(NOTES)
1) At least one section is to include a ballast tank within $0.5L$ amidships.

Table 1.3.12 Minimum requirements for tank testing at Special Survey of Double Hull Oil Tankers

Special Survey No. 1	Special Survey No. 2 and Subsequent
1. All ballast tank boundaries	1. All ballast tank boundaries
2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump-rooms or cofferdams	2. All cargo tank bulkheads

(NOTES)
1. The Surveyor may extend the tank testing as deemed necessary.
2. Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.
3. Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.
4. The testing of double bottom and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tanktop is carried out.

Section 6 Double Skin Bulk Carriers

601. General

1. Application

(1) In addition to the requirements specified in **Ch 2**, the requirements apply to surveys of hull structure and piping systems in way of the following spaces for all double skin bulk carriers with ESP notation.

(A) cargo holds, cofferdams, pipe tunnels, void spaces, fuel oil tanks within the cargo length area

(B) all ballast tanks

(2) The requirements contain the minimum extent of examination, thickness measurements and tank testing. The survey is to be extended when Substantial Corrosion and/or structural defects are found and include additional Close-up Survey when necessary.

(3) For some cargo holds of single side skin, and where IACS UR S19 or S30 is required to be complied, the requirements of **Sec 2** are to apply as applicable.

2. Definitions

(1) A **Double Skin Bulk Carrier** is a ship which is constructed generally with single deck, topside tank and hopper side tanks in cargo spaces, and is intended primarily to carry dry cargo in bulk, including such types as ore carriers and combination carriers, in which all cargo holds are bounded by a double-side skin(regardless of the width of the wing space). For combination carriers with longitudinal bulkheads additional requirements are specified in **Sec 3** or **Sec 5,** as applicable.

(2) A **Ballast Tank** is a tank which is used solely for salt water ballast, or, where applicable, a space which is used for both cargo and salt water ballast will be treated as a ballast tank when substantial corrosion has been found in that space. A Double Side Tank is to be considered as a separate tank even if it is in connection to either the topside tank or the hopper side tank.

(3) A **transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom, hopper sides top wing inner sides and longitudinal bulkheads.

(4) **Spaces** are separate compartments including holds, tanks, cofferdams and void spaces bounding cargo holds, decks and the outer hull.

602. Annual Survey

1. General

(1) The due range of Annual Survey is to be in accordance with the requirements of **Ch 2, 201.**
(2) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, weather decks, hatch covers, coamings and piping are maintained in a satisfactory condition.

2. Examination of the hull

(1) Examination of the hull plating and its closing appliances as far as can be seen.
(2) Examination of watertight penetrations as far as practicable.

3. Examination of weather deck, hatch covers and coamings

(1) Confirmation is to be obtained that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.
(2) A thorough survey of cargo hatch covers and coamings is only possible by examination in the open as well as closed positions and is to include verification of proper opening and closing operation. As a result, the hatch cover sets within the forward 25 % of the ship's length and at least one additional set, such that all sets on the ship are assessed at least once in every 5-year period, are to be surveyed open, closed and in operation to the full extent on each direction at each Annual Survey, including:
(A) stowage and securing in open condition
(B) proper fit and efficiency of sealing in closed condition
(C) operational testing of hydraulic and power components, wires, chains, and link drives
The closing of the covers is to include the fastening of all peripheral and cross joint cleats or other securing devices. Particular attention is to be paid to the condition of the hatch covers in the forward 25% of the ship's length, where sea loads are normally greatest.
(3) If there are indications of difficulty in operating and securing hatch covers, additional sets above those required by (2), at the discretion of the Surveyor, are to be tested in operation.
(4) Where the cargo hatch securing system does not function properly, repairs are to be carried out under the supervision of the Society.
(5) For each cargo hatch cover set, at each Annual Survey, the following items are to be surveyed:
(A) cover panels, including side plates, and stiffener attachments that may be accessible in the open position by Close-up Survey(for corrosion, cracks, deformation)
(B) sealing arrangements of perimeter and cross joints(gaskets for condition and permanent deformation, flexible seals on combination carriers, gasket lips, compression bars, drainage channels and non return valves)
(C) clamping devices, retaining bars, cleating(for wastage, adjustment, and condition of rubber components)
(D) closed cover locating devices(for distortion and attachment)
(E) chain or rope pulleys
(F) guides
(G) guide rails and track wheels
(H) stoppers
(I) wires, chains, tensioners, and gypsies
(J) hydraulic system, electrical safety devices and interlocks
(K) end and interpanel hinges, pins and stools where fitted
(6) At each hatchway, at each Annual Survey, the coamings, with panel stiffeners and brackets are to be checked for corrosion, cracks and deformation, especially of the coaming tops, including Close-up Survey.
(7) Where considered necessary, the effectiveness of sealing arrangements may be proved by hose or chalk testing supplemented by dimensional measurements of seal compressing components.

(8) Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition, where applicable, of:
 (A) wooden covers and portable beams, carriers or sockets for the portable beam, and their securing devices
 (B) steel pontoons, including Close-up Survey of hatch cover plating
 (C) tarpaulins
 (D) cleats, battens and wedges
 (E) hatch securing bars and their securing devices
 (F) loading pads/bars and the side plate edge
 (G) guide plates and chocks
 (H) compression bars, drainage channels and drain pipes(if any)
(9) Examination of flame screens on the open ends of air pipes to all bunker tanks.
(10) Examination of bunker and vent piping systems, including ventilators.

4. Examination of cargo holds

The examination of cargo holds in Annual Survey is to be in accordance with the follows.

	10 years < age ≤ 15 years	15 years 〈 age
Overall Survey	Two selected cargo holds	All cargo holds
Others	All piping and penetrations in cargo holds, including overboard piping, are to be examined.	All piping and penetrations in cargo holds, including overboard piping, are to be examined.

(NOTES)
1. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the Guidance relating to the Rules. These increased thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

5. Examination of ballast tanks

Examination of ballast tanks when required as a consequence of the results of the Special Survey and Intermediate Survey is to be carried out. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that Substantial Corrosion is found, the extent of thickness measurements is to be increased in accordance with the Guidance relating to the Rules. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect Areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

6. Additional Annual Survey requirements after determining compliance with SOLAS XII/12 and XII/13

(1) For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors, the Annual Survey is to include an examination and a test, at random, of the water ingress detection systems and of their alarms.
(2) For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems, the Annual Survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

603. Intermediate Survey

1. General

(1) The due range of Intermediate Survey is to be in accordance with the requirements of **Ch 2, 301.**

(2) At each Intermediate Survey, in addition to the requirements of the Annual Survey, the following items are to be surveyed. Those items which are additional to the requirements of the Annual Survey may be surveyed either at or between the 2nd and 3rd Annual Survey.

(3) Double skin bulk carriers exceeding 10 years of age up to 15 years of age, the following is to apply:

(a) The requirements of the Intermediate Survey are to be to the same extent to the previous Special Survey as required in **604.** and **102. 1.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, internal examination of fuel oil tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.

(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**

(c) In application of (a) above, an under water survey may be considered in lieu of the requirements of **604. 1** (6).

(4) Double skin bulk carriers over 15 years of age, the following is to apply:

(a) The requirements of the Intermediate Survey are to be to the same extent to the previous Special Survey as required in **604.** and **102. 1.** (Caution : In this case, the requirements specified in **Ch 2, 403.** are not need to be applied) However, internal examination of fuel oil tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.

(b) In application of (a) above, the Intermediate Survey may be commenced at the second Annual Survey and be progressed during the succeeding year with a view to completion at the third Annual Survey in lieu of the application of **Ch 2, 401. 4** and **5.**

(c) In application of (a) above, a survey in dry dock is to be part of the Intermediate Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks are to be carried out in accordance with the applicable requirements for Intermediate Surveys, if not already performed.

Note : Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

2. Examination of ballast tanks

The examination of ballast tanks in Intermediate Survey is to be in accordance with the follows.

5 years 〈 age ≤10 years 1), 2), 3)	10 years 〈 age ≤ 15 years	15 years 〈 age
1. Overall Survey of representative ballast tanks 2. Overall Survey and Close-up Survey of suspect areas identified at previous surveys	**603. 1** (3) to be applied.	**603. 1** (4) to be applied.
(NOTES) 1) The selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks. If such Overall Survey reveals no visible structural defects, the examination may be limited to verification that the corrosion prevention system remains efficient. 2) Where POOR coating condition, corrosion or other defects are found in ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tank of the same type. 3) In ballast tanks other than double bottom ballast tanks, where a hard protective coating is found in POOR condition, and it is not renewed, or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual intervals. When such breakdown of hard protective coating is found in double bottom ballast tanks, or where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied, the tanks in question may be examined at annual interval. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.		

3. Examination of cargo holds

The examination of cargo holds in Intermediate Survey is to be in accordance with the follow.

5 years 〈 age ≤10 years[1)]	10 years 〈 age ≤ 15 years	15 years 〈 age
Overall Survey of all cargo holds	**603. 1** (3) to be applied.	**603. 1** (4) to be applied.

(NOTES)
1) Where considered necessary by the Surveyor as a result of the Overall Survey, the survey is to be extended to include a Close-up Survey of those areas of structure in the cargo holds selected by the Surveyor.

4. Extent of thickness measurements

(1) Double skin bulk carriers exceeding 5 years of age up to 10 years of age, the following is to apply:
   (a) Thickness measurements are to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to Close-up Survey, where required as per preceding **Par 2** and **Par 3**.
   (b) The extent of thickness measurement may be specially considered provided the Surveyor is satisfied by the Close-up Survey that there is no structural diminution and the hard protective coatings are found to be in a GOOD condition.
   (c) Where Substantial Corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of the Guidance relating to the Rules. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.
   (d) Where the hard protective coating in cargo holds is found to be in GOOD condition, the extent of Close-up Surveys and thickness measurements may be specially considered.
   Note : For existing bulk carriers, where Owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the Close-up Surveys and thickness measurement. Prior to the coating of cargo holds of existing ships, scantlings should be ascertained in the presence of a Surveyor.
(2) Double skin bulk carriers exceeding 10 years of age up to 15 years of age, **Par 1** (3) above is to apply.
(3) Double skin bulk carriers exceeding 15 years of age, **Par 1** (4) above is to apply.

604. Special Survey

1. General

(1) The due range of Special Survey is to be in accordance with the requirements of **Ch 2, 401.**
(2) The Special Survey is to include, in addition to the requirements of the Annual Survey, examination, tests, and checks of sufficient extent to ensure that the hull and related piping, as required in (4), is in a satisfactory condition and is fit for its intended purpose for the new period of class of 5 years to be assigned subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.
(3) All cargo holds, ballast tanks, including double bottom and double side tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in **Par 5** and **Par 6**, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.
(4) All piping systems within the spaces specified in (3) above are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.
(5) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.
(6) A survey in dry dock is to be a part of the Special Survey. The Overall and Close-up Surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks are to be carried out in accordance with the applicable requirements for Special Surveys, if not already performed.
Note : Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

2. Tank protection

(1) Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom ballast tanks, where a hard protective coating is found in POOR condition and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor.
(2) When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating is applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.
(3) Where a hard protective coating is provided in cargo holds, and is found in GOOD condition, the extent of Close-up Surveys and thickness measurements may be specially considered.

3. Hatch covers and coamings

In addition to the requirements in **602. 3** of the Annual Survey, the following items are to be surveyed.
(1) Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:
  (A) stowage and securing in open condition;
  (B) proper fit and efficiency of sealing in closed condition;
  (C) operational testing of hydraulic and power components, wires, chains, and link drives.
(2) Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.
(3) Thickness measurement of the hatch cover and coaming plating and stiffeners is to be carried out as given in **Table 1.3.14.**

4. Extent of Overall and Close-up Survey

(1) An Overall Survey of all tanks and spaces is to be carried out at each Special Survey. Fuel oil tanks in the cargo length area are to be surveyed as follows:

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
-	One	Two	Half, minimum two

(NOTES)
1. These requirements apply to tanks of integral (structural) type.
2. If a selection of tanks is accepted to be examined, then different tanks are to be examined at each Special Survey, on a rotational basis.
3. Peak tanks (all uses) are subject to internal examination at each Special Survey.
4. At Special Survey No. 3 and subsequent Special Surveys, one deep tank adjacent to side shell plate for fuel oil in the cargo area is to be included, if fitted.

(2) The minimum requirements for Close-up Survey at Special Survey are given in **Table 1.3.13.** 1) for double skin bulk carriers, excluding ore carriers and in **Table 1.3.13**, 2) for ore carriers, respectively.
(3) The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.
(4) For areas in spaces where hard protective coatings are found to be in a GOOD condition, the extent of Close-up Survey according to **Table 1.3.13** may be specially considered. (Refer also to **604. 2** (3))

5. Extent of thickness measurements

(1) The minimum requirements for thickness measurements at Special Survey are given in **Table 1.3.14.**
(2) Provisions for extended measurements for areas with substantial corrosion are given in the Guidance relating to the Rules and as may be additionally specified in the survey programme as required in **102. 1.** These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.
(3) The Surveyor may further extend the thickness measurements as deemed necessary.
(4) For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurement according to **Table 1.3.14** may be specially considered. (Refer also to **604. 2** (3))
(5) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.
(6) Representative thickness measurement to determine both general and local levels of corrosion in the transverse web frames in ballast tanks is to be carried out. Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating. The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the Close-up Survey, that there is no structural diminution, and the hard protective coating where applied remains efficient.

6. Extent of tank testing

The minimum requirements for tank testing at Special Survey are given in **Table 1.3.15.**

7. Additional Special Survey requirements after determining compliance with SOLAS XII/12 and XII/13

(1) For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors, the Special Survey is to include an examination and a test of the all water ingress detection systems and of their alarms.
(2) For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems, the Special Survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

Table 1.3.13 Minimum requirements for Close-up Survey at Special Survey for Double Skin Bulk Carriers

1) Excluding ore carriers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. One transverse web with associated plating and longitudinals in two representative ballast tanks of each type(This is to include the foremost topside and double side ballast tanks on either side) (*1)	1. One transverse web with associated plating and longitudinals as applicable in each ballast tank (*1) 2. Forward and aft transverse bulkheads including stiffening system in a transverse section including topside, hopper side and double side ballast tanks (*1) 3. 25% of ordinary transverse web frames in the foremost double side tanks (*2)	1. All transverse webs with associated plating and longitudinals as applicable in each ballast tank (*1) 2. All transverse bulkheads including stiffening system in each ballast tanks (*1) 3. 25% of ordinary transverse web frames in all double side tanks (*2)	1. All transverse webs with associated plating and longitudinals as applicable in each ballast tank (*1) 2. All transverse bulkheads including stiffening system in each ballast tanks (*1) 3. All ordinary transverse web frames in all double side tanks (*2)
2. Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (*3) 3. All cargo hold hatch covers and coamings (platings and stiffeners) (*4)	4. One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted (*3) 5. All cargo hold hatch covers and coamings (platings and stiffeners) (*4) 6. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (*5)	4. All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (*3) 5. All cargo hold hatch covers and coamings (platings and stiffeners) (*4) 6. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (*5)	4. All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (*3) 5. All cargo hold hatch covers and coamings (platings and stiffeners) (*4) 6. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (*5)

(NOTES)

1. (*1) to (*5) means as follows and are illustrated in **Annex 1-6** of the Guidance.
   - (*1) : Transverse web frame or watertight transverse bulkhead in topside, hopper side and double side ballast tanks. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members
   - (*2) : Ordinary transverse frame in double side tanks
   - (*3) : Cargo hold transverse bulkheads plating, stiffeners and girders
   - (*4) : Cargo hold hatch covers and coamings
   - (*5) : Deck plating and under deck structure inside line of hatch openings between cargo hold hatches
2. Close-up Survey of transverse bulkheads to be carried out at four levels:
   - Level(a) : Immediately above the inner bottom and immediately above the line of gussets(if fitted) and shedders for ships without lower stool
   - Level(b) : Immediately above and below the lower stool shelf plate(for those ships fitted with lower stools), and immediately above the line of the shedder plates
   - Level(c) : About mid-height of the bulkhead
   - Level(d) : Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks

2) Ore carriers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. One web frame ring complete including adjacent structural members in a ballast wing tank (*1)	1. All web frame rings complete including adjacent structural members in a ballast wing tank (*1)	1. All web frame rings complete including adjacent structural members in each ballast tank (*1)	1. All web frame rings complete including adjacent structural members in each ballast tank (*1)
	2. One deck transverse including adjacent deck structural members in each remaining ballast tank (*1)	2. All transverse bulkheads complete, including girder system and adjacent structural members, in each ballast tank (*1)	2. All transverse bulkheads complete, including girder system and adjacent structural members, in each ballast tank (*1)
	3. Forward and aft transverse bulkheads complete, including girder system and adjacent structural members, in a ballast wing tank (*1)	3. One web frame ring complete including adjacent structural members in each wing void space (*1)	3. One web frame ring complete including adjacent structural members in each wing void space (*1)
2. One transverse bulkhead lower part including girder system and adjacent structural members in a ballast tank (*1)	4. One transverse bulkhead lower part, including girder system and adjacent structural members, in each remaining ballast tank (*1)	4. Additional web frame rings in void spaces as deemed necessary by the Society (*1)	4. Additional web frame rings in void spaces as deemed necessary by the Society (*1)
3. Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted (*3)	5. One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted (*3)	5. All cargo hold transverse bulkhead, including internal structure of upper and lower stools, where fitted (*3)	5. All cargo hold transverse bulkhead, including internal structure of upper and lower stools, where fitted (*3)
4. All cargo hold hatch covers and coamings(plating and stiffeners) (*4)	6. All cargo hold hatch covers and coamings(plating and stiffeners) (*4)	6. All cargo hold hatch covers and coamings(plating and stiffeners) (*4)	6. All cargo hold hatch covers and coamings(plating and stiffeners) (*4)
	7. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (*5)	7. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (*5)	7. All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches (*5)

(NOTES)
1. (*1), (*3), (*4) and (*5) means as follows and are illustrated in **Annex 1-6** of the Guidance.
   - (*1) : Transverse web frame or watertight transverse bulkhead in ballast wing tanks and void spaces. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members
   - (*3) : Cargo hold transverse bulkheads plating, stiffeners and girders
   - (*4) : Cargo hold hatch covers and coamings
   - (*5) : Deck plating and under deck structure inside line of hatch openings between cargo hold hatches
2. Close-up Survey of transverse bulkheads to be carried out at four levels:
   - Level(a) : Immediately above the inner bottom and immediately above the line of gussets(if fitted) and shedders for ships without lower stool
   - Level(b) : Immediately above and below the lower stool shelf plate(for those ships fitted with lower stools), and immediately above the line of the shedder plates
   - Level(c) : About mid-height of the bulkhead
   - Level(d) : Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks

Table 1.3.14 Minimum requirements for thickness measurements at Special Survey of Double Skin Bulk Carriers

Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
1. Suspect area	1. Suspect area 2. Within the cargo length: 1) Two transverse sections of deck plating outside line of cargo hatch openings 3. Wind and water strakes in way of the two transverse sections considered above 4. Selected wind and water strakes outside the cargo length area 5. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.13**	1. Suspect area 2. Within the cargo length: 1) each deck plate outside line of cargo hatch openings 2) two transverse sections, one in the amidship area, outside line of cargo hatch openings 3) all wind and water strakes 3. Selected wind and water strakes outside the cargo length area 4. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.13**	1. Suspect area 2. Within the cargo length: 1) each deck plate outside line of cargo hatch openings 2) three transverse sections, one in the amidship area, outside line of cargo hatch openings 3) each bottom plate 3. All wind and water strakes, full length 4. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to **Table 1.3.13**

Tanks or spaces \ No. of Special Survey	Special Survey No. 1	Special Survey No. 2	Special Survey No. 3	Special Survey No. 4 and Subsequent
All boundaries of ballast tanks, deep tanks and cargo holds used for water ballast within the cargo length area	○	○	○	○

(NOTES)
1. For fuel oil tanks within the cargo length area, only representative tanks are to be pressure tested.
2. The Surveyor may extend the tank testing as deemed necessary.
3. Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.
4. Boundaries of ballast holds are to be tested with a head of liquid to near to the top of hatches.
5. Boundaries of fuel oil tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.
6. The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tanktop is carried out.

Guidance Relating to the Rules for the Classification of Steel Ships

Part 1

Classification and Surveys

GA-01-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance Relating to the Rules for the Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF PART 1 "CLASSIFICATION AND SURVEYS"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which the application for Classification Survey is submitted to the Society on or after 1 July 2011.
2. The amendments to the Guidance for 2010 version and their effective date are as follows;

Effective Date 1 July 2010

CHAPTER 1 CLASSIFICATION

Section 4 Classification Survey after Construction

- 403. has been amended.

Effective Date 1 January 2011

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 1 General

- 107. has been newly added.

Effective Date 1 July 2011

CHAPTER 1 CLASSIFICATION

Section 1 General

- has been newly added.

Section 3 Classification Survey during Construction

- 302. 2 has been amended.
- 307. 1 has been amended.

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 1 General

- 109. 1 has been newly added.

Section 6 Docking Survey

- 604. 2 has been moved to 604. 3 (4) (a) of the Rules.

CHAPTER 3 HULL SURVEYS OF SHIPS SUBJECT TO THE ENHANCED SURVEY PROGRAMME

Section 1 General

- 102. has been newly added.

<ANNEX>

Annex 1-1 Character of Classification

- Par 1, 1.1 2-2 and Remarks(3-2) to (3-4) have been newly added.
- Par 1, 1.1 Remarks(23) has been moved to Remarks(30).
- Par 1, 1.1 17 has been amended.
- Par 1, 1.1 Remarks(30) has been amended.
- Par 1, 1.2 has been amended.
- Par 2, 2.1.2 has been newly added.

Annex 1-13 Owner's Hull Inspection and Maintenance Program

- has been newly added.

CONTENTS

CHAPTER 1 CLASSIFICATION

Section 1 General

Tests and Inspections specified in the Rules of the Society are to be carried out under attendance of the Surveyor, unless expressly specified otherwise.

Section 2 Character of Classification

201. Class notations

1. The definitions of terms specified in **201.** (2) to (4) of the Rules are as follows. If the following definition are expressly provided by the flag administration, they are to follow the provided definition.

(A) Coastal service area : Water area within 20 Nautical miles(1 Nautical mile = 1852 m) of the shore

(B) Smooth water service area : Water area within lakes, rivers and harbours

2. Upon the request of the applicant(i.e., the Owner or the Builder), character of class including class notations shall be assigned to ships which have been built to comply with the corresponding requirements of the Rules. The requirements are given in the following paragraphs.

3. In applications to **201.** (2) to (4) of the Rules, the following service restriction notations of hull, machinery and equipment shall be applied.

(1) Service restriction notations of hull

KRS 0 : Ships which have been built to comply with the following requirements for a limited service(i.e., coastal or smooth water service)

(A) Requirements specified in **Pt 3, Ch 1, 201.** (1) of the Guidance relating to the Rules for the Classification of Steel Ships(hereinafter called the Guidance)

(B) Requirements specified in **Ch 23, 202.** or **302.** of the Rules for the Classification of Steel Barges

(C) Requirements specified in **Pt 10, Ch 1, 201. 1** (1) to (3) and **2** (1) to (3) of the Guidance

(2) Service restriction notations of machinery

KRM 0 : Ships which have been built to comply with the following requirements for a limited service

(A) Requirements specified in **Pt 5, Ch 3, 203.** and **204. 2** of the Guidance

(B) Requirements specified in **Pt 6, Ch 1, 101. 1** (4) and (5) of the Guidance

(3) Service restriction notations of equipment

For ships which have been built to comply with the following requirements for a limited service(i.e., coastal or smooth water service), the notation of "C" or "S" shall be appended to the character of hull and/or machinery.

(A) C : Notation for coastal service

(a) Hull equipment

(i) Requirements specified in **Pt 3, Ch 1, 201.** (2) and (3) of the Guidance

(ii) Requirements specified in **Pt 10, Ch 1, 201. 1** (4) and (5) of the Guidance

(iii) Requirements specified in **Ch 23, 203.** of the Rules for the Classification of Steel Barges

(b) Machinery equipment

(i) Requirements specified in **Pt 5, Ch 1, 401. 1** / **Pt 8, Annex 8-3, 16** (3) (B) / **Pt 5, Ch 6, 702. 2** (2), **802. 1** (2), **804. 1** (2) and **2** (1), **903. 1** (1) and (3) / **Pt 5, Ch 7, 204. 1** (2), **206. 1** (2), **207. 2** (2), **209. 2** (2), **301. 6** (2) and **Pt 5, Ch 8, 101. 1** (1) of the Guidance

(B) S : Notation for smooth water service

(a) Hull equipment

(i) Requirements specified in **Pt 3, Ch 1, 201.** (2), (3) and **Pt 4, Ch 8, 101. 1** of the Guidance

(ii) Requirements specified in **Pt 10, Ch 1, 201. 2** (4) to (7) of the Guidance

(iii) Requirements specified in **Ch 23, 303., 304., 305.** and **306.** of the Rules for the Classification of Steel Barges

(b) Machinery equipment

(i) Requirements specified in **Pt 5, Ch 1, 401. 1** / **Pt 5, Ch 6, 702. 2** (1), **802. 1** (1), **901. 6** (2), **903. 1** (1) / **Pt 5, Ch 7, 201. 1, 409.** and **Pt 5, Ch 8, 101. 1** (1) of the Guidance

4. The details for ship type, special feature notations and additional installations notations of class notations are given in **Annex 1-1** of the Guidance.

Section 3 Classification Survey during Construction

301. Classification Survey during Construction

The hull survey for Classification Survey during Construction for ships subject to **Annex 1-12** is to be in accordance with **Annex 1-12.**

302. Approval of plans

1. The following contents shall be described in the drawings submitted to the Society for approval:

(1) Midship section
(A) Scantling draught(d_s) or length of ship(L_s) corresponding to d_s, where $d_s - d >$ 300 mm(is to be also indicated in other Key plans).
(B) Kind of Freeboard to be assigned(is to be also indicated in other plans relating to the conditions of freeboard assignment).
(C) Position of freeboard deck in ships with multiple decks.
(D) Draught in meter corresponding to designed timber freeboard, where timber load line is intended to be marked.
(E) Deck load(KN/m^2) in ships carrying deck cargoes(including timbers).
(F) Loading condition(specific gravity, etc.) in bulk carriers.
(G) Length of ship(L) specified in **Pt 3, Ch 1, 102.** of the Rules.

(2) Construction profile and deck plans
L_f and the points of fore/after end of L_f or 0.25 L_f from the fore end of L_f

(3) Shell expansion
Comparison table between the standard sheer and actual sheer on the exposed deck(in case that exposed freeboard or superstructure deck has a well formed by bulwarks and end bulkheads of superstructure).

(4) Arrangements of scuppers
(A) Lines of 0.01 L_f and 0.02 L_f above the summer load line
(B) Line of 600 mm above the summer load line
(C) Line of 450 mm below the freeboard deck

2. Omission and addition of plans and documents to be submitted

(1) Submission of the plans and documents may be omitted in case where a sister ship is intended to be built. Where the omission is desired, the following plans in triplicate are to be submitted, together with a written request format. A sister-ship means a ship intended to be built by the same builder, based on the plans and documents approved for other ships and regarded as the same or similar by the Society.
(A) General arrangement
(B) Midship section
(C) Construction profile and deck plans
(D) Shell expansion
(E) Machinery arrangement of machinery space
(F) Shafting arrangement
(G) Machinery room piping diagram
(H) Electrical power diagram
(I) Revised plans for revision of original plans and corresponding original plans
(J) Revised plans where applicable requirements of the Rules are changed

(2) In application to (1), (I) and (J), calculation sheets are to be submitted, additionally. Where the omission of plans is accepted by the Society, the omitted plans shall be regarded as the same that approved for other ships.

(3) In case of other than (1), the submission of the plans and documents may be omitted also in accordance with (1) and (2) where it is desired to build the vessels based on the plans and documents which are already approved by the Society.

(4) Additional copies of the plans and documents may be required where the required attendance of the Surveyor is anticipated at more than one location.

3. Re-examination of plans in cases where freeboard is to be altered

Reassignment of a smaller freeboard, other than that corresponding to the designed draught(d) may be desired due to allowance of the form freeboard found as a result of freeboard calculation. In such case, application for the intended draught(d_f) is to be submitted to the Society with the following documents specifying the intended d_f accompanied by calculation sheets on strength of hull members and on longitudinal hull strength for the desired d_f as early as practicable.

(1) Where $d_f - d \leq$ 300 mm :
Application for re-examination of plans and documents for the increase of draught
Where $d_s \geq d_f$, this requirement may be ignored
(2) Where $d_f - d >$ 300 mm :
Application for re-examination of plans and documents for the increase of draught
(3) In case of above (2), the length of ship corresponding to d_f is to be specified in the application for re-examination of plans and documents. In this case, key plans specifying the revised principal dimensions are to be re-submitted.
(4) The equipment number and the equipment are to comply with the requirements specified in **Pt 4, Ch 8** of the Guidance.

4. Examination and test plans

The shipbuilder is to submit the examination and test plans including the followings to the Surveyor prior to the relevant examination and test.

(1) Inspection and Test Plan(ITP)
(2) proposals for the examination of completed steelwork - generally referred to as the block plan and are to include details of joining blocks together at the pre-erection and erection stages or at other relevant stages
(3) proposals for fit up examinations where necessary
(4) proposals for testing of the structure(leak and hydrostatic) as well as for all watertight and weathertight closing appliances
(5) proposals for non-destructive examination
(6) Procedure of stability experiment
(7) Procedure of Sea Trial
(8) The coating work specification and quality control scheme(including inspection of surface preparation and coating processes for ships with PSPC notation)
(9) Proposals for the examination of cargo handling appliances(where applicable)
(10) Onboard Test Procedure
(11) any other proposals specific to the ship type or to the statutory requirements(where applicable)

304. Machinery installation

In application to **304.** of the Rules, the term "considered necessary by the Society" means the requirements specified in **Pt 6, Ch 2, 301. 1** and **2** of the Rules. (for CMA Ships or UMA Ships as defined in **Pt 9**, the requirements specified in **Pt 9, Ch 3, 203.** of the Rules are to be applied)

306. Tests

In application to **306.** of the Rules, the term "considered necessary tests" means the tests specified in **Pt 6, Ch 2, 302.** and **303.** of the Rules. (for CMA Ships or UMA Ships as defined in **Pt 9**, the requirements specified in **Pt 9, Ch 3, 204.** and **205.** of the Rules are to be applied)

307. Stability experiments

1. In application to **307. 1** of the Rules, the requirements shall not apply to the following ships not engaged on international voyage and less than 24 meters in length.

(1) Tug boat, Salvage, Dredger or Survey ship
(2) Steel barges
(3) Ships other than passenger ships or car ferries operating in water area within lakes, rivers and harbours
(4) Floating structures used for the storage in bulk of oil or waste etc.
(5) Floating structures used for the storage in bulk of dangerous goods

2. Stability experiments stated in the Rules mean inclining experiments and rolling tests. Where the rolling period could be calculated in accordance with the formula specified in **Annex 1-2** of the Guidance, the rolling tests may be dispensed with except those specially required by the Society.

3. The requirements for intact stability shall be given in **Annex 1-2** of the Guidance.

4. Where a loading instrument is installed onboard according to requirement in **307. 2** of the Rules, the approval and survey procedures are given in **Annex 1-10** of the Guidance.

Section 4 Classification Survey after Construction

401. Classification Survey after Construction

1. For ships intended to register with the Society, where it is deemed necessary to do a preliminary survey, due to the age and status of the ships, the preliminary survey is to be carried out prior to the commencement of the Classification Survey. The Classification Survey shall be carried out based on the results of the preliminary survey. In such case, certain survey items may be specially required by the Society.

2. In application to **401.** of the Rules, parts of hull, machinery, outfittings and equipment which, if necessary, are to be measured for actual scantlings are those necessary for record of particulars on hull and machinery of ship in review of register data.

402. Submission of plans

1. For the Classification Survey after Construction, the following plans and documents are to be submitted to the Society well in advance. Where deemed necessary by the Society, the list of plans and documents other than those specified below are to be notified to the owner and there are to be submitted to the Society.

(1) Hull : 2 copies(4 copies for stability information booklet and loading manual)
- (A) General arrangement
- (B) Midship section
- (C) Construction profile and deck plans
- (D) Shell expansion
- (E) Transverse bulkheads
- (F) Rudder and rudder stock construction
- (G) Stern frame
- (H) Hatches and hatch-closing arrangements(when hatch covers are provided)
- (I) Capacity plan
- (J) Loading manual(when loading manual is required)
- (K) Loading instrument(when loading instrument is required)
- (L) Lines(where freeboard assignment is required)
- (M) Hydrostatic curves
- (N) Lumber storage plan(where assignment of timber freeboard is required)
- (O) Stability information booklet

(2) Machinery : 2 copies
- (A) Machinery arrangement of machinery space
- (B) Shafting arrangement
- (C) Electric wiring diagram
- (D) Power transmission systems, intermediate shaft, thrust shaft and propeller shaft
- (E) Propeller
- (F) Piping diagram
- (G) Main engine, propulsion gears and clutch systems(or manufacturer make, model and rating information)
- (H) Steering gear system piping and arrangements and steering gear manufacturer make and model information
- (I) For steam turbine vessels, main boilers, superheaters and economisers(or manufacturer make, model and rating information) and steam piping
- (J) For vessels less than two(2) years old, torsional vibration calculations are to be submitted
- (K) Additional plans required for UMA-ship
  - Instrument and alarm list
  - Fire alarm system
  - List of automatic safety functions(e.g. slowdowns, shutdowns, etc.)
  - Function testing plan

(3) Plans required in Flag Administration or Convention(where applicable) : 2 copies
(4) Others
(A) A copy of survey reports(including Ship's Particulars and Initial Records)
(B) Copies of Classification Certificate, Statutory Certificate and Certificate of Registry
(C) Others indicating the ship's history and other particulars if necessary

2. In case that the plans and documents considered equivalent to those specified in **Par 1** are submitted, they may be accepted at the discretion of the Society.

3. Notice of review results of plans and documents

Where examination of plans and documents specified in **Par 1** above, is made by the Society, the applicant will be notified of the results. In cases where insufficient information accompanies the submitted plans and documents, the Society may require onboard inspection.

403. Classification Survey of ships classed by other classes

When a ship holding class with any Society which is subject to verification of compliance with QSCS(Quality System Certification Scheme) of IACS is intended for classification, plans and documents to be submitted and items to be surveyed etc., are listed as below. Where deemed necessary by the Society, the list of plans and documents other than those specified below are to be notified to the Owner and there are to be submitted to the Society.

1. Plan and document

(1) Hull : 1 copy
(A) General arrangement
(B) Midship section
(C) Construction profile and deck plans
(D) Shell expansion
(E) Loading manual(when loading manual is required)
(F) Stability information booklet
(G) Transverse bulkheads
(H) Rudder and Rudder stock construction
(I) Hatches and hatch-closing arrangements(when hatch covers are provided)
(J) Capacity plan
(K) Lines(where freeboard assignment is required)
(L) Hydrostatic curves
(M) Lumber storage plan(where assignment of timber freeboard is required)

(2) Machinery : 1 copy
(A) Machinery arrangement of machinery space
(B) Shafting arrangement
(C) Electric wiring diagram
(D) Power transmission systems, intermediate shaft, thrust shaft and propeller shaft
(E) Propeller
(F) Piping diagram
(G) Main engine, propulsion gears and clutch systems(or manufacturer make, model and rating information)
(H) Steering gear system piping and arrangements and steering gear manufacturer make and model information
(I) For steam turbine vessels, main boilers, superheaters and economisers(or manufacturer make, model and rating information) and steam piping
(J) For vessels less than two(2) years old, torsional vibration calculations are to be submitted
(K) Additional plans required for UMA-ship
- Instrument and alarm list
- Fire alarm system
- List of automatic safety functions(e.g. slowdowns, shutdowns, etc.)
- Function testing plan

(3) For vessels with ice class notation, plans for flexible couplings and/or torque limiting shafting devices in the propulsion line shafting(or manufacturer make, model and rating information) are to be submitted.
(4) For oil tankers, pumping arrangement at the forward and after ends and drainage of cofferdams and pump rooms are to be submitted.
(5) Plans required in Flag Administration or Convention(where applicable) : 1 copy
(6) In accordance with the agreement of TOC, owner's authorization letter indicating that the Society may request the survey status and relevant documents from previous Society.
When ship Owner is going to change or is changed, Owner's authorization may be written by the Owner who requests at the Society the Classification Survey.
(7) Others
(A) A copy of survey reports(including Ship's Particulars and Initial Records)
(B) Copies of Classification Certificate, Statutory Certificate and Certificate of Registry
(C) Others indicating the ship's history and other particulars if necessary.
(D) Hull Executive Summary(where required)

2. In case that the plans and documents considered equivalent to those specified in **Par 1** are submitted, they may be accepted at the discretion of the Society.

3. Where any of the following cases is applicable at the moment of Classification Survey of ships classed by other classes, the submission of plan and documents is to be in accordance with **402.** (However, 3 copies of plans for alterations are to be submitted)

(1) change of service area to higher grade
(2) alterations or conversions
(3) change of ship's use
(4) application of additional requirements due to change of ship's nationality.

4. Classification Survey

Classification Surveys may be, but are not required to be, credited as periodical surveys for maintenance of classification. Recommendations and/or conditions of class due for compliance at a specified periodical survey for maintenance of classification need not be carried out/complied with at a Classification Survey unless the Classification Survey is credited as the specified periodical survey for maintenance of classification or the recommendation/condition of classification is overdue.

(1) When a ship is classed by the Society as a results of transfer of class
(A) Notwithstanding the records indicating that all surveys are up-to-date, a Classification Survey is to be held as minimum technical requirements by the Society, the extent of which is to be based on the age of the vessel and the losing Society's class status as follows: However, the Society is to request, if necessary, more strict surveys than the following requirements according to the condition of ship.
(a) Hull Classification Survey
(i) For vessels of age less than 5 years the survey is to take the form of an Annual Survey.
(ii) Additionally, for vessels between 5 and 10 years of age, the survey is to include inspection of a representative number of ballast spaces.
(iii) Additionally, for vessels of 10 years of age and above but less than 20 years of age, the survey is to include inspection of a representative number of cargo spaces.
(iv) For vessels subject to ESP notation(Bulk carrier, Oil tanker and Chemical tanker, etc.), which are 15 years of age and above but less than 20 years of age, the survey is to have the scope of a Special Survey or an Intermediate Survey whichever is due next.
(v) For all vessels, which are 20 years of age and above, the survey is to have the scope of a Special Survey.
(vi) In the context of applying (iv) and (v) above, if a dry-docking of the vessel is not due at the time of Classification Survey of ships classed by other classes, consideration can be given to carrying out an underwater examination in lieu of dry-docking.

(vii) In the context of applying (i) to (vi) above, as applicable, consideration may be given by the Society to the acceptance of thickness measurements taken by the losing society provided;

① if the Classification Survey is to be credited as a periodical survey for maintenance of class, they were carried out within the applicable survey window of the periodical survey in question.

② if the Classification Survey is not to be credited as a periodical survey for maintenance of class, they were carried out;

- within 15 months prior to completion of Classification Survey when it is in the scope of a Special Survey,
- within 18 months prior to completion of Classification Survey when it is in the scope of an Intermediate Survey.

In ① and ② both cases, the thickness measurements are to be reviewed by the Society for compliance with the applicable survey requirements, and confirmatory gaugings are to be taken to the satisfactory of the Society.

(viii) In the context of applying (iii) to (vi) above, as applicable, tank pressure testing for vessels over 15 years of age is not required to be carried out as part of the Classification Survey unless the Classification Survey is being credited as a periodical survey for maintenance of class.

(ix) In the context of applying (i) to (vi) above, as applicable, compliance with IACS Unified Requirements that require compliance at the forthcoming due periodical surveys (such as S26(Strength and Securing of Small Hatches on the Exposed Fore Deck) and S27(Strength Requirements for Fore Deck Fittings and Equipment)) are not required to be carried out/completed as part of the Classification Survey unless the Classification Survey is credited as a periodical survey for maintenance of class.

(b) Machinery Classification Survey

A general examination of all essential machinery is to be held and included:

(i) The adjustment of all boiler, economizer and steam generator safety valves are to be verified and oil fuel burning equipment examined under working conditions.

(ii) All pressure vessels are to be identified with the submitted plans and/or certificates.

(iii) Insulation resistance, generator circuit breakers, preference tripping relays and generator prime mover governors are to be tested and paralleling and load distributing to be proved.

(iv) In all cases, navigation lights and indicators are to be examined under working condition and alternative source of supply to be verified.

(v) Bilge pumping and oil fuel burning installations, together with emergency fire pump and remote controls for oil valves, oil fuel pumps, lubricating oil pumps and forced draught fans are to be examined and tested under working conditions.

(vi) Recirculating and ice clearing arrangements are to be verified as conforming to Rule requirements(When ice class is required).

(vii) The main and all auxiliary machinery necessary for operation of the ship at sea together with essential controls and steering gear are to be tested under working conditions. Alternative means of steering are to be tested. A short sea trial may be held at the Surveyor's discretion if the ship has been laid up for a long period.

(viii) Initial start arrangements are to be verified.

(ix) In the case of oil tankers, the cargo oil system and electrical installation in way of dangerous spaces are to be checked for compliance with rule requirements. Where explosion protected electrical safe equipment is installed, the Surveyors are to confirm themselves that such equipment has been approved by a recognised authority. The safety devices, alarms and essential instruments of inert gas system are to be verified and the plant generally examined to ensure that it does not constitute a hazard to the ship.

Note : For the transfer of class or adding class as a double classed vessel or a dual classed vessel at ship's delivery after completion of the new construction survey of other society, items iii) and ix) may be verified by reviewing the ship's record.

(B) For vessels less than 15 years of age, an Interim Certificate of Class, or other documents enabling the vessel to trade are not to be issued, until all relevant surveys specified in (A) above have been satisfactorily completed; until all overdue surveys and all overdue recommendations/conditions of class previously issued against the subject vessel as specified to the Owner by the losing Society, have been completed and rectified by the Society.
For vessels 15 years of age and above, an Interim Certificate of Class, or other documents enabling the vessel to trade are not to be issued, until all relevant surveys specified in (A) above have been satisfactorily completed; until all overdue surveys and all overdue recommendations/conditions of class previously issued against the subject vessel as specified to the Owner by the losing Society, have been completed and rectified by the losing Society.
When facilities are not available in the first port of survey, an Interim Certificate of Class may be issued to allow the vessel to undertake a direct voyage to a port where facilities are available to complete the surveys required in (A) above. In such cases, the surveys specified in (A) above are to be carried out to the maximum extent practicable at the first port of survey, but in no case less than the scope of annual hull survey and machinery surveys as required in (A) (b).
(C) The validity of the Interim Certificate of Class and the subsequent Certificate of Class is subject to any outstanding recommendations/conditions of class previously issued against the vessel being completed by the due and as specified by the losing Society. Any outstanding recommendations/conditions of class with their due dates are to be clearly stated on the:
(a) Interim Certificate of Class and/or class survey record available on board; and
(b) Survey status when the Certificate of Class is issued.
(D) Any additional information regarding outstanding surveys or recommendations/conditions of class received from the losing Society is to be dealt with in accordance with above (B) and (C) as applicable. If this additional information is received after the Interim Certificate of Classification has been issued, any surveys or recommendations/conditions of class which are overdue are to be dealt with at the first port of call:
(a) by the Society in vessels less than 15 years of age; or
(b) by the losing Society in vessels 15 years of age or over
(2) When a vessel is classed by the Society as a double classed vessel
(A) Double classed vessel is a vessel which is classed by two Societies and where each Society works as if it is the only Society classing the vessel, and does all surveys in accordance with its own requirements and schedule.
(B) Classification Survey is to be carried out in accordance with the requirements of (1) (A) above taking account of the recommendations/conditions of class of in the status provided by the first Society.
(3) When a vessel is classed by the Society as a dual classed vessel
(A) Dual classed vessel is a vessel which is classed by two Societies between which there is a written agreement regarding sharing of work.
(B) Classification Survey having the scope of an Annual Survey as a minimum is to be carried out.
(4) When a vessel is classed by the Society as a double classed vessel or a dual classed vessel at ship's delivery after completion of the new construction survey of other society, all relevant surveys specified in (1) (A) are to be carried out and satisfactorily completed.

5. When a vessel is withdrawing class of the other Society from a double class arrangement with the Society
(A) For vessels less than 15 years of age, all overdue recommendations/conditions of class of the withdrawing Society are to be completed at the first port of call at which surveys can be carried out and all outstanding recommendations/conditions of class of the withdrawing Society are to be completed by the due date of the withdrawing Society.
For vessels of 15 years of age and over, all overdue recommendations/conditions of class of the withdrawing Society are to be completed by the withdrawing Society and all outstanding recommendations/conditions of class of the withdrawing Society are to be completed by the due date of the withdrawing Society.

(B) The validity of the Certificate of Classification is subject to any outstanding recommendations/conditions of class previously issued against the vessel by the withdrawing Society being completed by the due date and as specified by the withdrawing Society. Any outstanding recommendations/conditions of class with their due dates are to be clearly stated on the:
   (a) class survey record if available on board; and
   (b) survey status

(C) Any additional information regarding recommendations/conditions of class received from the withdrawing Society is to be dealt with in accordance with above (A) and (B) as applicable. If this additional information is received from the withdrawing Society after the Interim Certificate of Classification has been issued or the confirmation of the validation of the Certificate of Classification has been done, any recommendations/conditions of class which are overdue are to be dealt with at the first port of call at which surveys can be carried out by the relevant Society, depending on the age of the vessel.

(D) When facilities are not available in the first port of survey, a direct voyage to a port where facilities are available may be accepted to complete surveys for overdue recommendations/conditions of class of the withdrawing Society.

405. Stability experiments

Stability criteria and a standardized form of the stability information booklet are to comply with the requirements given in **307.** of the Guidance.

Section 7 Cooperation Duties of Owners

702. Cooperation to survey

In application to **702. 4** of the Rules, the Guidance means the requirements specified in **Annex 1-11** of the Guidance.

Section 8 Competence and Duties of Surveyors

801. Competence of Surveyors

In application to **801. 3** of the Rules, open-up survey or performance test may be required for the following (1) or (2).

(1) In case where abnormality is suspected from survey for general or operating conditions.

(2) In case where considered as having abnormality to require open-up survey or performance test, taking into account the records for maneuvering, operating and measuring of the ship and equipment, and the ship officers' information for ship conditions.

Section 9 Suspension/Withdrawal of Class and Reclassification

902. Withdrawal of class

When a ship classed with the Society is detained following a Port State Control inspection with serious deficiencies found, the class of the ship may be suspended or withdrawn through the deliberation of the Classification Committee.

Section 13 Classification of Other Installations or Equipment

1301. Classification

In application to **1301.** of the Rules, **Annex 1-1** of the Guidance is to be referred for the assignment of the class notation.

1303. Construction and Survey

In application to **1303.** of the Rules, the requirements of construction and survey as deemed appropriate by the Society means the requirements specified in related Rules.

1304. Maintenance of classification

In application to **1304.** of the Rules, the requirements specified by the Society means the requirements specified in the relevant technical rules of the Society. ⚓

CHAPTER 2 PERIODICAL AND OTHER SURVEYS

Section 1 General

101. Definitions

In application to **101. 11** of the Rules, the term "location prone to rapid wastage" means one of the following cases among the location specified in **Annex 1-5, Table 2** of the Guidance:
(1) Area with standing bilges
(2) Bulkheads facing fuel oil tanks being heated

104. Execution of heavier survey

In application to **104.** of the Rules, the term "as specially considered necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Rules.

107. Repairs

In application to **107. 5** (1) of the Rules, the emergency circumstance means the circumstance which affect or may affect the ships maneuvering, survival, marine pollution or protection of the cargoes directly.

108. Wear limit on structural members

In application to **108.** of the Rules, the terms "considered suitable" or "deemed appropriate by the Society" mean to comply with the requirements specified in **Pt 2** and **Pt 3** of the Rules.

109. Procedures for thickness measurements

1. In application to **109. 1** of the Rules, an appropriately qualified representative means a ship's officer.

2. Methods of thickness measurement are to comply with the requirements specified in **Annex 1-5** of the Guidance.

Section 2 Annual Survey

202. Hull, equipment and fire-extinguishing appliances

In application to **202. 2** of the Rules, the following items are to be surveyed.

1. Examining the fire pumps, fire main, hydrants, hoses and nozzles and the international shore connection and checking that each fire pump, including the emergency fire pump, can be operated separately so that two jets of water are produced simultaneously from different hydrants at any part of the ship whilst the required pressure is maintained in the fire main.

2. Checking the provision and randomly examining the condition of the portable and non-portable fire extinguishers.

3. Confirming that the fire fighter's outfits and emergency escape breathing devices(EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self contained-breathing apparatus are suitably charged.

4. Checking the operational readiness and maintenance of fire fighting systems.

5. Examining the fixed fire fighting system for the machinery, cargo, vehicle, special category and ro-ro spaces, as appropriate, and confirming that its means of operation is clearly marked.

6. Examining the fire-extinguishing and special arrangements in the machinery spaces and confirming, as far as practicable and as appropriate, the operation of the remote means of control provided for the opening and closing of the skylights, the release of smoke, the closure of the funnel and ventilation openings, the closure of power operated and other doors, the stopping of ventilation and boiler forced and induced draft fans and the stopping of oil fuel and other pumps that discharge flammable liquids.

7. Examining, as far as possible, and testing, as feasible, any fire detection and alarm system.

8. Examining the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep-fat cooking equipment in accommodation and service spaces.

9. Examining the helicopter facilities.

10. Examining the arrangements for remote closing of valves for oil fuel, lubricating oil and other flammable oils and confirming, as far as practicable and as appropriate, the operation of the remote means of closing the valves on the tanks that contain oil fuel, lubricating oil and other flammable oils.

11. Examining and testing of the general emergency alarm system.

12. Examining the fire protection arrangements in cargo, vehicle and ro-ro spaces and confirming, as far as practicable and as appropriate, the operation of the means of control provided for closing the various openings.

13. Examining, when appropriate, the special arrangements for carrying dangerous goods, including checking the electrical equipment and wiring, the ventilation, the provision of protective clothing and portable appliances and the testing of the water supply, bilge pumping and any water spray system.

203. Machinery, electrical installations and additional installations

1. In application to **203. 21** of the Rules, the term "considered satisfactory by the Surveyor" means the other cases except for the cases as specified in **Ch 1, 801.** of the Guidance.

2. In application to **203. 22** of the Rules, the Guidance means the requirements specified in **Annex 1-9** of the Guidance.

204. Additional requirements to ship types

In application to **204. 1** to **3** of the Rules, the term "considered necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

Section 3 Intermediate Survey

301. Due range

In application to **301. 3** of the Rules, survey items of Intermediate Survey mean the following items among all survey items of Intermediate Survey.

(1) Compartments survey(except compartments which are to be surveyed at each periodical survey)
(2) Thickness measurement
(3) Docking Survey as a part of Intermediate Survey(except the ships of which Docking Survey is to be carried out at each periodical survey)
(4) Overhauling survey of machinery(except the ships subject to CMS or PMS)

302. Hull, equipment and fire-extinguishing appliances

In application to **302. 2** of the Rules, the Guidance means the requirements specified in **202.** of the Guidance. In this case, for foam fire-extinguishing systems, the foam is to be tested by the manufacturer or recognized test organization and the test records are to be submitted for approval.

303. Machinery, electrical installations and additional installations

1. In application to **303. 1** (1) of the Rules, the term "deemed unnecessary by the Surveyor" means the other cases except for the cases as specified in **Ch 1, 801.** of the Guidance.

2. In application to **303. 2** (1) and (1) (A) of the Rules, the term "deemed necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

3. In application to **303. 2** (2) of the Rules, high-rotating-speed internal combustion engines of specific construction refer to those which comply with the formulae below and which can not be included in a survey of the crankshaft and bearings without complete engine overhaul.

$$C_s = \frac{S \cdot n^2}{1.8 \times 10^6} \geq 90, \qquad V = \frac{\pi \cdot d \cdot n}{6 \times 10^4} \geq 6$$

where,

S : Stroke (mm)
n : Maximum continuous revolution (rpm)
d : Diameter of crankshaft journal (mm)

4. In application to **303. 2** (3) of the Rules, the Guidance for passenger ship means that it is to be confirmed that the requirements specified in **902. 3** apply to the ship.

5. In application to **303. 4** of the Rules, the term "deemed necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

6. In application to **303. 5** of the Rules, the term "deemed necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

7. In application to **303. 6** of the Rules, the Guidance means the requirements specified in **Annex 1-9** of the Guidance.

304. Additional requirements to Ship types

In application to **304. 1** (10) of the Rules, Non-metallic membranes of pressure relief valves for cargo tanks, in principle, should be inspected every three(3) years and then replaced with new ones when they are showing probability of hardening or malfunction. However, Non-metallic membranes are may be permitted to use exceeding three(3) years subject to comply with the following inspections.

(1) To be confirmed that the function test of the pressure relief valve is carried out and found in good order. However, where deemed necessary by the surveyor in accordance with **Ch 1, 801.** of the Guidance, the open-up survey is to be carried out.

(2) To be confirmed that, on the basis of log-book or crew's statement, no leakage from the pressure relief valves during the voyage has been occurred.

(3) As a result of the examination (1) and (2) above, it is to be verified that the surface and the function of the pressure relief valves are satisfactory.

Section 4 Special Survey (Hull, Equipment and Fire-extinguishing Appliances)

401. Due range

1. In application to **401. 5** of the Rules, survey items of Special Survey mean the following items among all survey items of Special Survey.

(1) Compartments survey(except compartments which are to be surveyed at each Periodical Survey)
(2) Thickness measurement
(3) Docking Survey(except the ships of which Docking Survey is to be carried out at each periodical survey)
(4) Overhauling survey of machinery(except the ships subject to CMS or PMS)
(5) Examination of **403. 1** (3) of the Rules
(6) Examination of **Sec 5-2, 3** of the Rules

2. For passenger ships, submersibles, nuclear ships, hydrofoils, air cushion vehicles and high speed crafts the requirements specified in **401. 4** and **5** of the Rules do not apply.

403. Requirements of survey

1. In application to **403. 1** (8) of the Rules, the term "deemed appropriate by the Surveyor" means the other cases except for the cases as specified in **Ch 1, 801.** of the Guidance.

2. In application to **403. 1** (15) of the Rules, the term "considered necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

404. Fire-extinguishing appliances

In application to **404.** of the Rules, the Guidance means the requirements specified in **302.** of the Guidance.

Section 5-1 Special Survey (Machinery, Electrical Installations and Additional Installations)

502. Requirements of survey

1. In application to **502. 1** (1) (a) of the Rules, where total running hours for an internal combustion engine is confirmed and found in satisfactory by the Surveyor, the survey may be extended until next overhauling hours recommended by the manufacturer since the previous overhauling survey. However, the interval is not to exceed 5 years from the date of the previous overhauling survey. And the survey item of essential valves and valve arrangements are to be included the isolating non-return valve for starting air mains against explosion as specified in **Pt 5, Ch 2, 203. 9** of the Rules.

2. In application to **502. 1** (1) (b) of the Rules, the Guidance means the requirements specified in **303. 3** of the Guidance, and the due date of survey is same as **Par 1** above.

3. In application to **502. 2** (2) to (5), (8), (10) and (12) of the Rules, the terms "deemed necessary by the Surveyor" and "considered necessary by the Surveyor" mean the cases as specified in **Ch 1, 801.** of the Guidance.

4. In application to **502. 2** (9) (a) and (c) of the Rules, the terms "deemed necessary by the Surveyor" and "considered necessary by the surveyor" mean the cases as specified in **Ch 1, 801.** of the Guidance. In application to **502. 2** (9) (b) of the Rules, the term "deemed necessary by the Surveyor" means the cases as specified in **Pt 5, Ch 6, 1305.** of the Rules when open-up surveys are carried out.

5. In application to **502. 2** (9) (b) of the Rules, open type coolers which are of air-cooled type and not of shell-and-tube type are to be examined externally instead of open-up survey.

6. In application to **502. 3** (4) of the Rules, the term "deemed necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

7. In application to **502. 4** of the Rules, the Guidance means the requirements specified in **Annex 1-9** of the Guidance.

Section 6 Docking Survey

601. Due range

The docking survey intervals for passenger ship engaged on international voyages are to be subject to the relevant requirements of the International Convention for Safety of Life at Sea. But in five-year Special Survey period two times of Docking Survey with an interval not exceeding 36 months from the completion date of the previous Docking Survey and three times of In-water Survey specified in **604.** of the Rules in lieu of the Docking Survey may be carried out. However, where specific requirements are provided by the Administration the relevant requirements are to be applied.

603. Requirements of survey

1. In application to **603. 2** of the Rules, the term "special attention" means a careful examination of the connection between the bilge strakes and the bilge keels.

2. In application to **603. 3** of the Rules, the term "as deemed necessary" in that "the pressure test of the rudder may be required as deemed necessary by the Surveyor" means the case which repair work relating with the air tightness of rudder is done.

3. In application to **603. 5** of the Rules, the term "considered necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

4. In application to **603. 8** of the Rules, the Guidance means the requirements specified in **Annex 1-9** of the Guidance.

604. In-water Survey

In application to **604. 1** of the Rules, survey status, latest docking survey reports and thickness measurement records, etc. are to be considered when special consideration is given.

Section 7 Surveys of Propeller Shaft and Stern Tube Shaft, Etc.

701. Due range

1. In application to **701. 1** and **2** of the Rules, "Propeller shafts Kind 1 & 2" means that specified in **Pt 5, Ch 1, 102. 3** of the Rules.

2. In application to **701. 3** of the Rules, the Guidance means the requirements specified in **Annex 1-9** of the Guidance.

3. In application to **701. 4** of the Rules, the method for postponement of propeller shaft survey is to be in accordance with the separate requirements specified by the Society.

702. Survey items

1. In application to **702. 4** and **5** of the Rules, the term "an effective crack detection method", in principle, means a magnetic particle test. Where it is not practicable for shafts of nonmagnetic material, etc. a liquid penetrant test may be used.

2. In application to **702. 4** and **5** of the Rules, where the entire withdrawal of propeller shaft is not required and the survey may be carried out on the state that propeller is moved in the possible range, the propeller need not be entirely removed. However, where considered necessary by the Surveyor, the entire removal may be required.

3. In application to **702. 4** (2) of the Rules, where keyless propeller is force-fitted to the propeller shaft, it is to be ascertained at each time when the propeller is fitted, that the pull-up length is within the upper and lower limits of pull-up length approved by the Society in accordance with the requirements specified in **Pt 5, Ch 3, 305.** of the Guidance.

703. Extension of propeller shaft survey

1. In application to **703. 1** (1) of the Rules, the oil consumption is to be recorded as an interval determined by the Owner and the term "lubricating oil analysis data" means the periodical analysis data within six months including the following items made by recognized lubricating oil laboratory or manufacturer. The sample for analysis is to be obtained during operation condition. The water and metal content values are to be considered taking into account the type of stern tube seals used and the chemical composition of the bearing material(according to manufacturer's recommendation), and the following values in parentheses are recommended.

(1) Water contents(1 %)
(2) Chloride contents(according to manufacturer's recommendation)
(3) Contents of bearing metal particles(chromium 10 ppm, copper 50 ppm, iron 30 ppm, lead 10 ppm, nickle 10 ppm, silicon 40 ppm, tin 10 ppm)
(4) Resistance to oxidation(according to manufacturer's recommendation)

2. In application to **703. 1** (2) of the Rules, the examination of forward bearing is required only when the shaft is drawn partially by **703. 1** (1) of the Rules and a visual examination of visible parts of the bearing under the condition that forward sealing arrangements is removed is to be performed.

3. In application to **703. 1** (4) and **2** (3) of the Rules, where the entire withdrawal of propeller shaft is not required and the survey may be carried out on the state that propeller is moved in the possible range, the propeller need not be entirely removed. However, where considered necessary by the Surveyor, the entire removal may be required.

704. Survey for ships with STCM (Stern Tube Condition Monitoring) notation

In application to **704.** (1) of the Rules, the Guidance means the requirements specified in **703.** of the Guidance.

Section 8 Boiler Survey

802. Survey items

In application to **802. 1** and **4** of the Rules, the term "deemed necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance and includes the following items:

(1) The measurements of the thickness of boiler plates and tubes, and diameter of stays.
(2) The hydrostatic test at a pressure above the allowable pressure after the repairs of boiler is carried out.
(3) For the unfired steam generators, exhaust gas heaters and steam reservoirs or similar pressure vessels for the purpose of processing fishes, the same examination as the requirements specified for boilers.

Section 9 Continuous Survey of Machinery

902. Survey items

1. In application to **902. 1** and **2** of the Rules, the Guidance means the requirements specified in **Annex 1-7** of the Guidance.

2. In application to **902. 3** of the Rules, the term "deemed necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

3. In application to **902. 4** of the Rules, in case of passenger ships, the CMS should be complied with the followings.

(1) In principle, the CMS system cannot be applied to passenger ships. However, CMS for auxiliaries other than main and auxiliary engines can be applied.

(2) Nevertheless the main and auxiliary engines for passenger ships may be overhauled(or opened up) in accordance with the following tables.

Open-up time of main and auxiliary engine

Nos. of Main/Aux. engines	Open-up time
1 set	at the period of the Special Survey
2 sets	1 set : at the period of the Special Survey 1 set : at the period of the third Intermediate Survey
3 sets	1 set : at the period of the Special Survey 1 set : at the period of the second Intermediate Survey 1 set : at the period of the third Intermediate Survey
4 sets	1 set : at the period of the Special Survey 1 set : at the period of the first Intermediate Survey 1 set : at the period of the third Intermediate Survey 1 set : at the period of the fourth Intermediate Survey

Example for open-up survey of main & auxiliary engines(periodical survey)

Nos. of Main/Aux. engines		S	I_1	I_2	I_3	I_4	S
E×1		○	△	△	△	△	○
E×2	E_1 E_2	△ ○	△ △	△ △	○ △	△ △	△ ○
E×3	E_1 E_2 E_3	△ ○ △	△ △ △	△ △ ○	○ △ △	△ △ △	△ ○ △
E×4	E_1 E_2 E_3 E_4	△ △ △ ○	○ △ △ △	△ △ △ △	△ ○ △ △	△ △ ○ △	△ △ △ ○

(NOTES)
○ : full open-up(See **Ch 2, 502.** of the Rules)
△ : internal examinations of the cylinder and combustion side of the cylinder cover, crankshaft bearing parts and measurement for the deflection of the crank web(See **Ch 2, 303.** of the Rules).
I_1, I_2, I_3, I_4 : first, second, third, fourth Intermediate Survey between Special Surveys

4. In application to **902. 5** of the Rules, the Guidance means that it should be complied with the following requirements.

(1) The CMS may be commenced since the Classification Survey during Construction.
(2) Upon the request of owner, where deemed appropriate by the Society, the CMS may be commenced since the Classification Survey after Construction and in case of TOC(transfer of classification) the CMS may be continued to commence the CMS status executed by another society.
(3) On ships registered in the Society, where the shipowner is newly to apply for the CMS, after the Special Survey all CMS may be carried out subject to planning a regular CMS cycle at once until the date of the next Special Survey.

5. In application to **902. 6** of the Rules, the withdrawal of CMS should be satisfied with the followings:

(1) Where withdrawal of the CMS by the shipowner's request or the CMS system not carried out in accordance with the requirements is found, the CMS may be cancelled by the Society.
(2) After cancellation of CMS, if there are any CMS items of which due date would exceed 5 years at the date of the next Special Survey, the items are recommended to be inspected within 5 years from the last survey.
(3) All items scheduled for survey at Special Survey are to be carried out from the next Special Survey.

903. Planned Maintenance System

1. In application to **903. 1** of the Rules, the Guidance means the requirements specified in **Annex 1-8** of the Guidance, and the term "deemed necessary by the Surveyor" means the cases as specified in **Ch 1, 801.** of the Guidance.

2. In application to **903. 2** of the Rules, the Implementation Survey and Annual Audit mean as follows;

(1) Implementation Survey;
  (A) The Implementation Survey shall be carried out by the Society within one year from the date of approval.
  (B) During the Implementation Survey the following shall be verified by the Surveyor to ensure;
    (a) the PMS is implemented according to the approved documents, and is adapted to the type and complexity of the components/system on board;
    (b) the PMS is producing the documentation required for the Annual Audit and the requirements of surveys and testing for retention of class are complied with;
    (c) the onboard personnel is familiar with the PMS.
    (d) where this survey is carried out and the implementation is found in order, a report describing the system shall be submitted to the Society and the system may be put into service.
  (C) An Implementation Survey shall be carried out to confirm the validity of "Certificate of Approval for Planned Maintenance Scheme".
(2) Annual Audit;
  (A) An Annual Audit of the PMS shall be carried out by a Society's Surveyor and preferably concurrently with the annual survey of machinery.
  (B) The Surveyor shall review the annual report or verify that it has been reviewed by the Society.
  (C) The purpose of this survey shall be to verify that the scheme is being correctly operated and that the machinery has been functioning satisfactorily since the previous survey. A general examination of the items concerned shall be carried out.
  (D) The performance and maintenance records shall be examined to verify that the machinery has functioned satisfactorily since the previous survey or action has been taken in response to machinery operating parameters exceeding acceptable tolerance and the overhaul intervals have been maintained.
  (E) Written details of break-down or malfunction shall be made available.
  (F) Description of repairs carried out shall be examined. Any machinery part, which has been replaced by a spare one, due to damage, is to be retained on board, where possible, until examined by the Society's Surveyor.

(G) At the discretion of the Surveyor, function tests, confirmatory surveys and random check readings, where condition monitoring equipment is in use, shall be carried out as far as practicable and reasonable.

(H) Upon satisfactory completion of the above requirements, the Society shall retain the PMS

3. In application to **903. 3** of the Rules, the Guidance means the requirements specified in **Annex 1-8** of the Guidance.

4. In application to **903. 4** of the Rules, the damage and repairs for PMS should be complied with the following requirements.

(1) The damage of components/machinery, it shall be reported to the Society. The repairs of such damaged components/machinery shall be carried out to the satisfaction of the Surveyor.

(2) Any repairs and corrective action regarding machinery under PMS shall be recorded in the PMS logbook and to be verified by the Society's Surveyor at the Annual Audit.

(3) In the case of overdue outstanding recommendations or a record of unrepaired damage which would affect the PMS, the relevant items shall be kept out the PMS until the recommendation is fulfilled or the repair is carried out.

5. In application to **903. 5** of the Rules, the withdrawal of PMS should be satisfied with the following requirements.

(1) The survey arrangement for machinery under PMS can be cancelled by the Society if PMS is not being satisfactorily carried out either from the maintenance records or the general condition of the machinery, or when the agreed intervals between overhauls are exceeded.

(2) The shipowner may, at any time, cancel the survey arrangement for machinery under PMS by informing the Society in writing and for this case the items which have been inspected under the PMS since the last Annual Survey can be accepted by the Society.

Section 10 Occasional Survey

1001. Occasional Survey

1. Alteration for tank use of cargo hold as deep tank(water or oil)

When tank use is to be altered from cargo hold as deep tank to cargo hold, application of the alteration, in written form, is to be submitted by the Owners to the Society. Suction mouths in cargo holds as deep tanks are to be removed, and the end parts of the pipings are to be closed by blind flanges. Upon completion of alteration works and thereafter, tank testings for the altered cargo holds are dispensed with.

2. Alteration for tank use of each tank

When an alteration of tank use is desired, the Owners should notify the Society that the alteration will be made. The Society will review the recalculation of longitudinal strength and whether or not reinforcements will be necessary. However, this requirement does not apply to a ship treated according to **Pt 3, Ch 3, 101.** of the Rules.

3. Alteration for loading condition

When it is planned that a specialized ship is about to be loaded in an outstandingly different manner(other than that reviewed by the Society at the time of plan approval), the plans showing the calculation of longitudinal strength, shear strength and local strength should be approved by the Society.

4. In application to **1001.** (1) of the Rules, main parts of machinery refer to those which are to be examined at the time of Classification Survey during Construction and the term "deemed necessary by the Surveyor" in (6) of the Rules means the cases as specified in **Ch 1, 801.** of the Guidance.

Section 11 Alteration Survey

1103. Items of survey

In application to **1103. 2** of the Rules, "Where a complete replacement or addition of a major portion of the ship is involved at the alteration" means the case one or more whole compartments are completely replaced or added, and it is to be applied to this compartment.

Section 14 Hull Surveys for General Dry Cargo Ships

1404. Special Survey

In application to **Table 1.2.8** NOTES 1) of the Rules, the general drawing for Close-up Survey area is shown in **Annex 1-6, 1** (1) of the Guidance.

Section 17 Special Requirements for Ships Subject to Korean Ship Safety Act

1701. Special requirements

1. In application to **301.**(Due range of Intermediate Survey) **3** and **401.**(Due range of Special Survey) **4** and **5** of the Rules, ships specified in **1701. 2** of the Rules are not to be applied.

2. In application to **303.**(Machinery, electrical installations and additional installations of Intermediate Survey) **3** and **502.**(Requirement of Special Survey(Machinery, electrical installations and additional installations)) **2**, the due date of examinations/overhauling survey for internal combustion engines, which are installed on ships engaged on domestic voyage only, is to be in accordance with the relevant requirements of *Korean Ship Safety Act*.

3. The Docking Survey for ships operating in the inland waters only is able to be substituted by In-water Survey except when the Docking Survey is to be carried out in conjunction with the Special Survey, but not 3 times continuously in case of passenger ships.

4. In application to **1701. 2** of the Rules, the surveys required in **603.** of the Rules are to be carried out in drydock or on a slipway at the Intermediate Survey. However the clearance measurements for sea water lubricated stern tube bearing and rudder bearing may be omitted but not 3 times continuously. ⚓

CHAPTER 3 HULL SURVEYS OF SHIPS SUBJECT TO THE ENHANCED SURVEY PROGRAMME

Section 1 General

102. Preparations for survey

In application to **102. 6** (2) of the Rules, an appropriately qualified representative means a ship's officer.

103. Documentation on board

The Owner's inspection reports specified in **103. 3** (5) of the Rules is shown in **Annex 1-4** of the Guidance.

104. Procedure for thickness measurement

Methods of thickness measurement are to be comply with the requirements specified in **Annex 1-5** of the Guidance.

Section 2 Bulk Carriers

202. Annual Survey

1. In application to **202. 4** and **5** of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 14** of the Guidance.

2. In application to **202. 6** (2) of the Rules, the Guidance means the requirements specified as follows.

(1) General

(A) In the case of bulk carrier over 5 year of age, the Annual Survey is to include, in addition to the requirements of the Annual Surveys specified in **202.** of the Rules, an examination of the following items:

(B) Extent of Survey

(a) For bulk carriers of 5 - 15 years of age:

(i) An Overall Survey of the foremost cargo hold, including Close-up Survey of sufficient extent, minimum 25% of frames, is to be carried out to establish the condition of:

- Shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads.
- Suspect areas identified at previous surveys.

(ii) Where considered necessary by the Surveyor as a result of the Overall and Close-up Survey as described in (i) above, the survey is to be extended to include a Close-up Survey of all of the shell frames and adjacent shell plating of the cargo hold.

(b) For bulk carriers exceeding 15 years of age:

(i) An Overall Survey of the foremost cargo hold, including Close-up Survey is to be carried out to establish the condition of:

- All shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads.
- Suspect areas identified at previous surveys.

(C) Extent of thickness measurement

(a) Thickness measurement is to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to Close-up Survey, as described in (B) (a) (i) and (b) (i) above. The minimum requirement for thickness measurement for thickness measurements are suspect areas identified at previous surveys. Where substantial corrosion is found, the extent of thickness measurements should be increased with the requirements of **Annex 1-5, Table 14** of the Guidance.

(b) The thickness measurement may be dispensed with provided the Surveyor is satisfied by the Close-up Survey, that there is no structural diminution and the hard protective coating where fitted remains effective.

(D) Special consideration

(a) Where the hard protective coating in the foremost cargo hold is found to be in GOOD condition, the extent of Close-up Surveys and thickness measurements may be specially considered.

Note : For existing bulk carriers, where Owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the Close-up Surveys and thickness measurement. Prior to the coating of cargo holds of existing ships, scantlings should be ascertained in the presence of a Surveyor.

203. Intermediate Survey

In application to **203. 4** (1) (c) of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 14** of the Guidance.

204. Special Survey

1. In application to **204. 5** (2) of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 14** of the Guidance.

2. In application to **Table 1.3.1** NOTES 1 of the Rules, the general drawing for Close-up Survey areas is shown in **Annex 1-6, 1** (2) of the Guidance.

Section 3 Oil Tankers

302. Annual Survey

In application to **302. 5** of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 15** of the Guidance.

304. Special Survey

1. In application to **304. 1** (4) of the Rules, the term "operationally tested to working pressure" means the confirmation of the leakage or excessive vibration, etc.

2. In application to **304. 4** (2) of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 15** of the Guidance.

3. In application to **304. 4** (6) of the Rules, the Guidance means the requirements specified in **Annex 1-5, Par 6** of the Guidance.

4. In application to **Table 1.3.4** NOTES 1) of the Rules, the general drawing for Close-up Survey areas is shown in **Annex 1-6, 1** (3) of the Guidance.

Section 4 Chemical Tankers

402. Annual Survey

In application to **402. 5** of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 16** of the Guidance.

404. Special Survey

1. In application to **404. 1** (4) of the Rules, the term "operationally tested to working pressure" means the confirmation of the leakage or excessive vibration, etc.

2. In application to **404. 4** (2) of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 16** of the Guidance.

3. In application to **Table 1.3.7** NOTES 1) of the Rules, the general drawing for Close-up Survey areas is shown in **Annex 1-6, 1** (4) of the Guidance.

Section 5 Double Hull Oil Tankers

502. Annual Survey

In application to **502. 5** of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 17** of the Guidance.

504. Special Survey

1. In application to **504. 1** (4) of the Rules, the term "operationally tested to working pressure" means the confirmation of the leakage or excessive vibration, etc.

2. In application to **504. 4** (2) of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 17** of the Guidance.

3. In application to **504. 4** (6) of the Rules, the Guidance means the requirements specified in **Annex 1-5, 6** of the Guidance.

4. In application to **Table 1.3.10** NOTES 1) of the Rules, the general drawing for Close-up Survey area is shown in **Annex 1-6, 1** (5) of the Guidance.

Section 6 Double Skin Bulk Carriers

602. Annual Survey

In application to **602. 4** and **5** of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 18** of the Guidance.

603. Intermediate Survey

In application to **603. 4** (1) (c) of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 18** of the Guidance.

604. Special Survey

1. In application to **604. 5** (2) of the Rules, the Guidance means the requirements specified in **Annex 1-5, Table 18** of the Guidance.

2. In application to **Table 1.3.13** NOTES 1 of the Rules, the general drawing for Close-up Survey area is shown in **Annex 1-6, 1** (6) of the Guidance. ⚓

Annex 1-1 Character of Classification

1. Class Notation

1.1 Ship Type and Special Feature Notations

Ship Types		Special Feature Notations	Remarks
1. Oil Tanker[2-0] (Double hull)[2-2] (FAC)[1] (FAO)[1] (FBC)[1] (CSR)[2-4]	'ESP'[2-1]	Crude Product Crude/Product	[1] : The notations FA, FB, FAC, FAO and FBC in rows 1, 3, 4, 8, 9 and 18 of the first column imply: FA : Flash point above 60°C FB : Flash point of 60°C and below FAC : FA with controlled tank vents FAO : FA with open tank vents FBC : FB with controlled tank vents [2-0] : See examples given in **2.0** [2-1] : The notation "ESP" shall be assigned to ships which are constructed generally with integral tanks and intended primarily to carry oil in bulk. This type notation shall be assigned to tankers of both single and double hull construction, as well as tankers with alternative structural arrangements, e.g. mid-deck designs. (Typical midship sections are given in **Fig 1**)  **Fig 1 Typical midship sections of Oil Tanker 'ESP'** [2-2] : The notation "(Double Hull)" shall be assigned to ships which are constructed primarily for the carriage of oil in bulk, which have the cargo tanks protected by a double hull which extends for the entire length of the cargo area, consisting of double sides and double bottom spaces for the carriage of water ballast or void spaces. [2-3] : The additional requirements for Oil Tanker 'ESP' and Oil Tanker(Double Hull) 'ESP' specified in **Pt 1** of the Rules are not to be applied. [2-4] : This notation shall be assigned to ships comply with the requirements specified in **Pt 12** of the Rules.
		Asphalt[2-3]

3-2. NLS Tanker	Category Z(18)(7-2)				(7-2) : This notation shall be appended to vessels carrying only cargoes in bulk, except liquid cargoes specified in **Pt 7, Ch 6, Sec 17** of the Rules, classified as pollution category Z, or category Z and OS, which are not subject to IBC code, specified in **Pt 7, Ch 6, Sec 18** of the Rules. (8) : As shown in the following: 1) The notation "IBC" shall be appended to vessels built in compliance with the requirements given in **Pt 7, Ch 6** of the Rules and constructed on or after 1 July, 1986. 2) The notation "BCH" shall be appended to vessels built in compliance with the requirements given in **Pt 7, Ch 6** of the Rules and constructed before 30 June, 1986 and on or after 12 April, 1972. 3) The notation "BCX" shall be appended to vessels built in compliance with Para. 1.7.3 of BCH code and constructed before 11 April, 1972
4. Oil/Chemical Tanker (Double Hull)(2-2) 'ESP'(2-1)(7-1) (FAC)(1) (FAO)(1) (FBC)(1) (CSR)(2-4)	Product(9)				(9) : See special feature for chemical tanker as shown in row 3 and examples given in **2.2.**

Ship Types	Special Feature Notations		Remarks
(10)	A		(10) : See examples given in **2.3.** (11-1) : This notation shall be assigned in the following cases. (Note: The relevant requirements specified in **Pt 1, Ch 3, Sec 6** Double Skin Bulk Carriers are to be applied if applicable even if the ship has no Double Skin notation) (1) the ships, constructed before 1 July 1999, have double side skin construction (2) the ships, constructed before 1 January 2000, have double side skin construction of not less than 760 mm breadth at any location within the hold length, measured perpendicular to the side shell (3) the ships, constructed on or after 1 January 2000, have double side skin construction of not less than 1000 mm breadth at any location within the hold length, measured perpendicular to the side shell (11-2) : The notation "ESP" shall be assigned to ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo length area and intended primarily to carry dry cargoes in bulk. For ships constructed on or after 1 July 2010, however, the notation 'ESP' shall be assigned even if they lack some or all of the specified constructional feature above and (EXP) notation shall be followed. (Typical midship sections are given in **Fig 3**)  **Fig 3 Typical midship sections of Bulk Carrier 'ESP'** (11-3) : This notation shall be assigned to ships comply with the requirements specified in **Pt 11** of the Rules. (12) : The additional notation, **HC,** is normally assigned to a ship with the double bottom structure specially strengthened for the carriage of heavy cargoes having mass density, γ, specified in **Pt 3, Ch 7, 101. 6** of the Rules, not less than 1.25(t/m^3). (13) : The additional notation, **HC/E,** is normally assigned to a ship intended for the alternate loading, in addition to the requirements specified in (12) above. (14) : Where ships constructed before 1 July 2010 with other structural configurations than stated in (11-2) above comply with the applicable requirements specified in **Pt 7, Ch 3** of the Rules, the notation "Bulk Carrier", upon the request of the Owners, may be assigned to the concerned ships to the satisfaction of the Society. In such cases, the additional requirements for Bulk Carrier 'ESP' and Bulk Carrier(Double Skin) 'ESP' specified in **Pt 1** of the Rules shall not be applied. * : Bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with specified holds empty at maximum draught in addition to BC-B conditions as **Pt 7, Ch 3, Sec 2** or **Pt 11, Ch 1, Sec 1** of the Rules. ** : Bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with all cargo holds loaded in addition to BC-C conditions as **Pt 7, Ch 3, Sec 2** or **Pt 11, Ch 1, Sec 1** of the Rules. *** : Bulk carriers designed to carry dry bulk cargoes of cargo density of less than 1.0 t/m^3 as **Pt 7, Ch 3, Sec 2** or **Pt 11, Ch 1, Sec 1** of the Rules. ****: The additional notation GRAB[X] is assigned to ships with holds designed for loading/unloading by grabs having a maximum specific weight up to [X] tons in compliance with the requirements of **Pt 11, Ch 12, Sec 1** of the Rules, the GRAB[X] notation is mandatory for ships having one of BC-A or BC-B, according to **Pt 11, Ch 1, Sec 1** of the Rules and these ships are to be complied with for an unladen grab weight X equal to or greater than 20 tons. For all other ships GRAB[X] is voluntary.

1.2 Additional Installations Notations

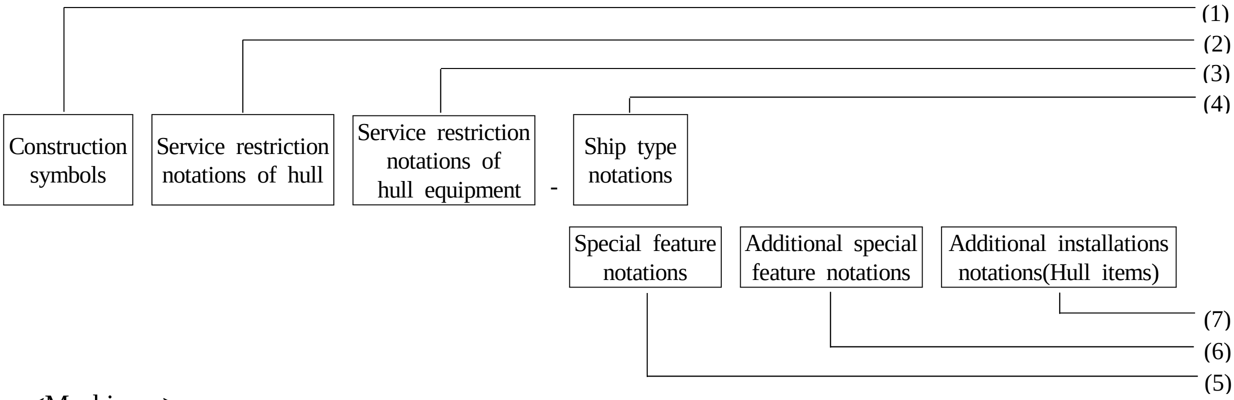
The following Additional Installations Notations may be appended to ships complying with the relevant requirements.

Additional Installations Notations		Relevant Requirements
Hull Items	LI	to ships where the Loading Instrument on Stability specified in **Pt 1, 307.** of the Rules or the Longitudinal Strength Loading Instrument specified in **Pt 3, Ch 3, 104.** of the Rules is provided onboard.
	CHA	to ships where the Cargo Handing Appliances specified in **Pt 9, Ch 2** of the Rules are provided onboard.
	HMS, HMS1	to ships where the Hull Monitoring System specified in **Pt 9, Ch 6** of the Rules is provided onboard.
	EQ-SPM	to ships where the Equipment Employed in the Mooring of Ships at Single Point Mooring specified in **Pt 4, Ch 10, 101. 3** of the Rules is provided onboard.
	PKS	to offshore units where the Position Keeping System specified in **Ch 4, Sec 6** of **the Rules for the Classification of Mobile Offshore Units** is provided onboard.
	SUR, BOU, SAT	to ships where the diving systems specified in **Pt 4, Ch 3, 102. 16** of **the Rules for the Classification of Underwater Vehicles and Diving Systems.**
Machinery Items	STCM	to ships where the Stern Tube Condition Monitoring System specified in **Ch 2, 704.** of the Rules is provided onboard.
	RMC	to ships where the Cargo Refrigerating Installations specified in **Pt 9, Ch 1** of the Rules are provided onboard.
	CMA	to ships where the Centralized Monitoring and Control System for Main Propulsion and Essential Auxiliary Machinery specified in **Pt 9, Ch 3** of the Rules is provided onboard.
	UMA	to ships where the Operating Systems for Periodically Unattended Machinery Spaces specified in **Pt 9, Ch 3** of the Rules are provided onboard.
	UMA1, UMA2, UMA3	to ships where the Automation Equipment specified in **Pt 9, Ch 3** of the Rules is provided onboard.
	DPS(0), DPS(1), DPS(2), DPS(3)	to ships where the Dynamic Positioning System specified in **Pt 9, Ch 4** of the Rules is provided onboard.
	NBS, NBS1, NBS2	to ships where Bridge Layouts and Bridge Working Environments, Navigation Equipments, Accident Prevention Systems and Bridge Work Assist Systems specified in **Pt 9, Ch 5** of the Rules are provided.
	IGS	to ships where the Inert Gas Systems specified in **Pt 8, Ch 2, 104. 5** of the Rules are provided onboard.
	COW	to ships where the Crude Oil Washing System specified in "Annex I of International Convention for the Prevention of Pollution from Ships, 1973 and Protocol of 1978 relating to the International Convention for the Prevention of Pollution from Ships, 1973(MARPOL 73/78)" are provided onboard.

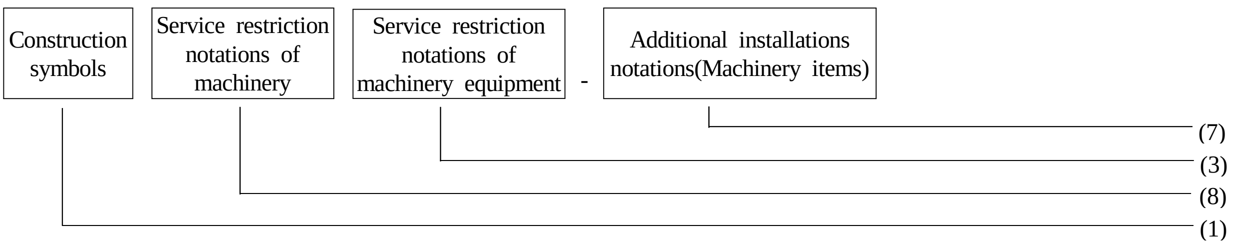
2. Written Examples of Class Notations

A typical arrangement of Class Notations will consist of the following structure.

<Hull>

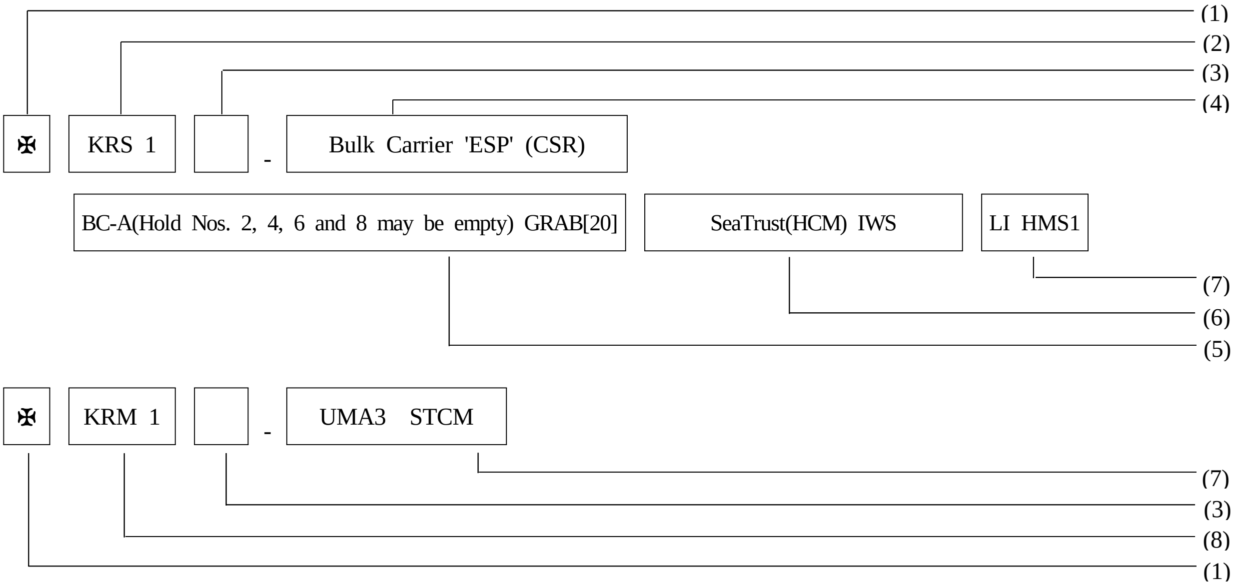


<Machinery>



(1) Construction symbols specified in **Ch 1, 201.** (1) of the Rules.
(2) Service restriction notations of hull specified in **Ch 1, 201.** (2) of the Rules.
(3) Service restriction notations of hull and machinery equipment specified in **Ch 1, 201.** (4) of the Rules.
(4) Ship type notations specified in **Ch 1, 201.** (6) of the Rules and **1.1** above.
(5) Special feature notations specified in **Ch 1, 201.** (7) of the Rules and **1.1** above.
(6) Additional special feature notations specified in **Ch 1, 201.** (7) of the Rules and **1.1** Remarks (30) above.
(7) Additional installations notations(Hull and Machinery items) specified in **Ch 1, 201.** (5) of the Rules and **1.2** above.
(8) Service restriction notations of machinery specified in **Ch 1, 201.** (3) of the Rules.

Example)



2.0 Oil Tanker

Class Character :

KRS 1 - Oil Tanker Special Feature

KRS 1 - Oil Tanker 'ESP' Special Feature

KRS 1 - Oil Tanker(Double Hull) 'ESP' Special Feature

Example :

1) For dedicated asphalt carriers

KRS 1 - Oil Tanker (FAO) Asphalt

2) For oil tankers

KRS 1 - Oil Tanker 'ESP' (FBC) Crude/Product

3) For double hull oil tankers comply with the requirements specified in **Pt 12** of the Rules

KRS 1 - Oil Tanker(Double Hull) 'ESP' (FBC) (CSR) Crude/Product

2.1.1 Liquefied Gas Carrier

Class Character :

KRS 1 - Liquefied Gas Carrier
A B (C) / D (IGC)

KRS 1C - Liquefied Gas Carrier
B (C) / P (GCX)

The symbols A, B, (C), D and P imply :

A	: Type of Ship
B	: Type of Tank
(C)	: Transportation Mode
D	: Design Pressure, Temperature and Specific Gravity (SG)
P	: Name of Product when exclusively carried

Example :

(1) For ships to comply with IGC or GC code

KRS 1 - Liquefied Gas Carrier
2G 1C (R)/0.25bar, -50°C, 1.0SG (IGC)

KRS 1C - Liquefied Gas Carrier
1C (P)/Propane (GCX)

(2) For ships not to comply with IGC or GC code

1) For ships carrying exclusively LPG, i.e., Propane or Butane

KRS 1 - Liquefied Gas Carrier
LPG

2) For ships carrying Liquefied Gases those other than LPG

KRS 1C - Liquefied Gas Carrier
VCM

A means type of ship to be determined by "damage assumption", "location of cargo tanks", "standard of damage" and "survival requirements" specified in **Pt 7, Ch 5, Sec 2** and **Sec 19** of the Rules.

Ship Type	Contents(*)
1G	Gas carrier intended to transport products which require maximum preventive measures to preclude the escape of such cargo
2G	Gas carrier intended to transport products which require significant preventive measures to preclude the escape of such cargo
2PG	Gas carrier of 150 m in length or less intended to transport products which require significant preventive measures to preclude the escape of such cargo, and where the products are carried in independent type C tanks designed for a MARVS of at least 7 bar gauge and a cargo containment system of design temperature of -55℃ or above. (Note : a ship of this description, but over 150 m in length is to be considered a type 2G ship.)
3G	Gas carrier intended to carry products which require moderate preventive measures to preclude the escape of such cargo
(NOTES) (*) : See column C of "Summary of Minimum Requirements" specified in **Pt 7, Ch 5, Sec 19** of the Rules	

B means type of tank to be determined by "cargo containment" specified in **Pt 7, Ch 5, Sec 4** of the Rules.

Tank Type	Symbol	Contents
Integral Tank	2I	(1) Tank to form a structural part of the ship's hull(primary barrier for containment of cargo) (2) Design vapour pressure Po not to normally exceed 0.25 bar(Max. 0.7 bar) (3) Boiling point of the cargo To not to be below -10 °c
Membrane Tank	3M	(1) Non-self supporting tanks which consist of a thin layer(membrane) supported through insulation by the adjacent hull structure (2) Design vapour pressure Po not to normally exceed 0.25 bar(Max. 0.7 bar) (3) Thickness of the membrane not to normally exceed 10 mm
Semi-membrane Tank	3S	(1) Non-self supporting tanks in the loaded condition, which consist of a layer, part of which is supported through insulation by the adjacent hull structure(primary barrier for containment of cargo) (2) Design vapour pressure Po not to normally exceed 0.25 bar(Max. 0.7 bar)
Independent Tank Type A	1A	(1) Gravity tanks (2) Tanks designed using the requirements of **Pt 3, Ch 15** of the Rules (3) Design vapour pressure Po less than 0.7 bar(for plane surfaces)
Independent Tank Type B	1B	(1) Gravity tanks or pressure vessels (2) Tanks designed using model tests, refined analytical tools and analysis methods (3) Design vapour pressure Po less than 0.7 bar(for plane surfaces)
Independent Tank Type C	1C	(1) Pressure vessels (2) Tanks designed using the requirements of **Pt 5, Ch 5** of the Rules (3) Design vapour pressure to be specially considered
Internal Insulation Tank Type 1	1N	(1) Tanks in which the insulation or a combination of the insulation and one or more liners functions only as the primary barrier (2) Inner hull or an independent tank structure to function as the secondary barrier when required. The inner surface of the insulation is not exposed to the cargo (3) Design criteria same as 2I, 3M and 3S
Internal Insulation Tank Type 2	2N	(1) Tanks in which the insulation or a combination of the insulation and one or more liners functions only as both the primary and the secondary barrier (2) Design criteria same as 2I, 3M and 3S
(NOTES) The number in the second column indicates: 1: independent, 2: integral, 3: membrane		

C means transportation mode.

Symbol	Contents
(R)	Fully Refrigerated
(P)	Fully Pressurized
(RP)	Refrigerated and Pressurized

2.1.2 Compressed Natural Gas Carrier

Class Character :

KRS 1 - Compressed Natural Gas Carrier
A / B

A : Type of Cargo Tank

B : Design Pressure, Minimum Temperature

Example :

KRS 1 - Compressed Natural Gas Carrier
CY/13 MPa, -30 ℃

2.2 Chemical Tanker

Class Character :

KRS 1 - Chemical Tanker 'ESP' (FBC) [A] [B] / [D] (IBC)

KRS 1C - Chemical Tanker 'ESP' (FAO) [B] / [P] (BCX)

The symbols A, B, D and P imply :

[A] : Type of Ship

[B] : Type of Tank

[D] : Specific Gravity (SG)

[P] : Name of Product when exclusively carried

Example :

(1) For chemical tanker

KRS 1 - Chemical Tanker 'ESP' (FBC) II 2G/1.0SG (IBC)

KRS 1C - Chemical Tanker (FAO) 1G/Sulphur Molten (BCX)

(2) For combination carrier of oil and chemical

KRS 1 - Oil/Chemical Tanker 'ESP' (FAC) Product/III 2G/1.2SG (IBC)

[A] means type of ship to be determined by "damage assumption", "location of cargo tanks", "standard of damage" and "survival requirements" specified in **Pt 7, Ch 6, Sec 2** of the Rules.

Ship Type	Contents(*)
I	Chemical tanker intended to transport products with very severe environmental and safety hazards which require maximum preventive measures to preclude an escape of such cargo
II	Chemical tanker intended to transport products with appreciably severe environmental and safety hazards which require significant preventive measures to preclude an escape of such cargo
III	Chemical tanker intended to transport products with sufficiently severe environmental and safety hazards which require a moderate degree of containment to increase survival capability in a damaged condition
(NOTES) (*) : See column E of "Summary of Minimum Requirements" specified in **Pt 7, Ch 6, Sec 17** of the Rules.	

B

means type of tank to be determined by "cargo containment" specified in **Pt 7, Ch 6, Sec 4** and **Sec 17** of the Rules, as shown in the following.

1G
2G
1P

Symbol	Tank Type	Contents
1	Independent Tank	(1) Gravity tanks or pressure vessels (2) Tanks designed using the requirements of **Pt 3, Ch 15** and **Pt 5, Ch 5** of the Rules.
2	Integral Tank	(1) Self-supporting hull construction tank (2) Tank having a design pressure not greater than 0.25 bar(Max. 0.7 bar) (3) Boiling point of the cargo not to be below -10°C
G	Gravity Tank	(1) Independent or integral (2) Tank having a design pressure not greater than 0.7 bar
P	Pressure Tank	(1) Independent tank (2) Tank designed using the requirements of **Pt 5, Ch 5** of the Rules (3) Tank having a design pressure greater than 0.7 bar

2.3 Bulk Carrier or Cargo Ship

Class Character :

KRS 1 - Bulk Carrier 'ESP' A	KRS 1C - Bulk Carrier(Double Skin) 'ESP' A
KRS 1 - Bulk Carrier A	KRS 1 - Cargo Ship A

Example :

(1) For ships with double bottom structures specially strengthened for the carriage of heavy cargoes

KRS 1 - Bulk Carrier 'ESP'
HC

(2) For ships with double bottom structures specially strengthened for the carriage of heavy cargoes as an alternate loading

KRS 1 - Bulk Carrier 'ESP'
HC/E(Hold Nos. 2, 4, 6 and 8 may be empty)

(3) In cases where the ship is fitted with BC-B

KRS 1 - Bulk Carrier 'ESP'
BC-B

(4) In cases where the ship is fitted with BC-B and the maximum cargo density is less than 3.0 t/m^3

KRS 1 - Bulk Carrier 'ESP'
BC-B(max cargo density --- t/m^3)

(5) In cases where the ship is fitted with BC-A

KRS 1 - Bulk Carrier 'ESP'
BC-A(Hold Nos. 2, 4, 6 and 8 may be empty)

(6) In cases where the ship is fitted with BC-A and the maximum cargo density is less than 3.0 t/m^3

KRS 1 - Bulk Carrier 'ESP'
BC-A(Hold Nos. 2, 4, 6 and 8 may be empty
with max cargo density --- t/m^3)

(7) In cases where the ship is not fitted with **Pt 7, Ch 3, 201. 5** (3) of the Rules

KRS 1 - Bulk Carrier 'ESP'
BC-A(or BC-B, BC-C) (no MP)

(8) In cases where the ship is complied with for unladen grab weight X equal to or greater than 20 tons according to **Pt 11, Ch 1, Sec 1** of the Rules

KRS 1 - Bulk Carrier 'ESP' (CSR)
BC-A(or BC-B) GRAB[X]

(9) Others

KRS 1 - Bulk Carrier

KRS 1C - Cargo Ship
HC

2.4 Fishing Vessel

Class Character :

KRS 1 - Fishing Vessel (Special Feature)

Example :

KRS 1 - Fishing Vessel Stern Trawler

KRS 1 - Fishing Vessel Long Liner and Angling

2.5 Passenger Ship

KRS 1C - Passenger Ship * [A] / [B] / [C]

*Only for submersible

Example :

KRS 1C - Passenger Ship Catamaran/Car Ferry

KRS 1C - Passenger Ship Hydrofoil

KRS 1C - Passenger Ship Submersible/Leisure/Max. 70M, 2Hrs

2.6 Special Purpose Submersible

Class Character :

KRS 1C - Special Purpose Submersible [A][B] / [C] / [D]

Example :

KRS 1C - Special Purpose Submersible Manned, Self-Propelled/Research/Max. 70M, 1.5Hrs

2.7 Drilling Unit

Class Character :

KRS 1C - Drilling Unit
A | B / C

Example :

KRS 1 - Drilling Unit Mobile, Column Stabilized

KRS 1 - Offshore Structure Fixed, Leg(Tripod)/Plant(Power)

2.8 Open Space Car Ferry

Class Notation		Remarks
Ship Type	Special Feature	
10. RoRo Ship	Car Ferry	Ships designed for the carriage of vehicles with loaded cargoes
	Car Ferry(Open Space)	-
14. Passenger Ship	Car Ferry	Passenger ships fitted with equipment capable of loading vehicles
	Car Ferry(Open Space)	-

(NOTES)

The notation "Open Space" expressed in the second column shall be assigned to the following cases.

(1) For ships without openings on the side shell plates within vehicle region and walls in the fore and after end parts of the ship, and where the sum of the area of openings on the upper deck complies with the following formula:

$$\frac{a}{A} \geq \frac{1}{2}$$

a : Sum of area of openings on the upper deck
A : Area of vehicle decks

(2) For ships with openings evenly distributed, as far as practicable, on both sides shell plates within vehicle region, and where the sum of the area of openings on the upper deck complies with the following formula:

$$\frac{a}{A} + \frac{5}{3} \cdot \frac{S_a}{S_A} \geq \frac{1}{2}$$

a and A : As specified in (1).
S_a : Sum of area of opening on one side shell plates within vehicle region
S_A : Area of one side shell plates within vehicle region

2.9 Special feature

Example :
In cases where the ship is applied to the reduced scantling as the restriction of navigation area and condition :

✠ KRS 0 - Barge Service between Korea and Sakhalin during May and June

※ Comparison of Ice Strengthening Class of the Society with Finnish-Swedish Ice Class Rules 1985 and Arctic Shipping Pollution Prevention Regulations

⚓

Annex 1-2 Intact Stability

1. Application

(1) The requirements on intact stability(hereafter referred to as "stability") in this Annex apply to ships of 24 meters in length and over. However, passenger ships, tug boats, dredger, steel barges, sailing ships, twin-hull craft and dynamically supported craft may be exempted.

(2) Stability of steel barges of 24 meters in length and over, which are steel barges(pontoon barges) complying with following (A) to (E) may be applied to the requirements of **2008 IS Code, Part B, Ch 2.2.**

(A) To be non self-propelled and unmanned during navigation.

(B) Block coefficient (C_b) is to be not less than 0.9.

(C) The ratio B/D is to be not less than 3.0.

(D) To load cargoes on deck only.

(E) No opening except small manholes fitted with watertight steel covers is to be provided on deck.

(3) Stability of offshore supply vessels are to comply with the following requirements.

(A) **2008 IS Code, Part B, Ch 2.4** Offshore supply vessels

(B) **2008 IS Code, Part A, Ch 2.3** Severe wind and rolling criterion(weather criterion)

(4) Special consideration may be given to the ships registered for a restricted service.

(5) Additional to the requirements in this Annex, attention is to be paid to the stability requirements in the local regulations of the flag states in which ships are flying.

2. Stability Requirements

(1) General

(A) All designed loading conditions are deemed appropriate by the Society and it is to be verified that they comply with the requirements in (3) and (4).

(B) For ships navigating in the area where icing is expected to occur, it is to be considered that the projected area against wind is increased and the position of center of gravity is heightened due to icing on the structures.

(2) Calculation on stability

Stability is to be calculated taking into account the following conditions.

(A) The position center of gravity is to be determined on the basis of the data obtained at inclining test.

(B) Free surface effects of liquid in tanks are to be of what the results of calculation of stability curves in each heeling angle are made most severe during navigation under relevant designed loading condition. However, in the arrival condition, those are to be applied to actual loading of all liquid tanks.

(C) Even if anti-rolling devices are fitted, effect of the devices is to be ignored.

(3) General Stability Requirements

(A) For ships without timber deck cargoes, the stability curves are to comply with the following requirements.

(a) The area under the righting lever curve(GZ curve) should not be less than 0.055 metre-radians up to $\theta = 30°$ angle of heel and not less than 0.09 metre-radians up to $\theta = 40°$ or the angle of flooding θ_f, if this angle is less than 40°. Additionally, the area under the righting lever curve between the angles of heel of 30° and 40° or between 30° and θ_f, if this angle is less than 40° should not be less than 0.03 metre-radians.

(b) The righting lever GZ should be at least 0.20 m at an angle of heel equal to or greater than 30°.

(c) The maximum righting arm should occur at an angle of heel preferably exceeding 30° but not less than 25°. However, in case of ships of 2.5 and over in B/D, the stability requirements may be complied with IMO/MSC/Cir. 1281, Ch 4.

(d) The initial metacentric height G_0M that is corrected due to free surface effects should not be less than 0.15 m. However, in case of fishing vessels, it should not be less than 0.35 m.

(e) In fishing vessels with complete superstructure or fishing vessels of 70 m in length and over, the metacentric height G_0M should be at least 0.15 m.

(f) θ_f is an angle of heel at which openings in the hull, superstructures or deckhouses which cannot be closed weathertight immerse. The closed weathertight is that the devices for maintenance and insurance of weathertight are to satisfy the Society requirements. However, small openings through which progressive flooding cannot take place need not be considered as open.

(B) For ships loaded with timber deck cargoes, the stability curves are to comply with the following requirements:

(a) The area under the righting lever should not be less than 0.08 metre-radians up to θ = 40° or the angle of flooding if this angle is less than 40°.

(b) The maximum value of the righting lever should be at least 0.25 m.

(c) At all times during a voyage the metacentric height G_0M should not be less than 0.10 m after correction for the free surface effects of liquid in tanks and, where appropriate, the absorption of water by the deck cargo and/or ice accretion on the exposed surfaces.

(C) Where above (B) is applied, the following requirements shall be considered additionally.

(a) For ships loading with timber deck cargoes, stability is to be calculated under following conditions((b) and (c)), provided that the requirements in Regulation 44, ILLC are complied with and timber cargoes are stowed in full breadth of ships. However, when the ship has a rounded gunnel, allowance not exceeding 4 percent of the breadth of ships for loading may be given.

(b) 75 % of the volume occupied by timber may be added to buoyancy.

(c) In the arrival condition it should be assumed that the weight of the deck cargo has increased by 10 % due to water absorption, and when it is anticipated that some formation of ice will take place an allowance should be made in the arrival condition for the additional weight.

(4) Stability Requirements in Wind and Waves

(A) Stability of ships except fishing vessels is to comply with the following requirements(See **Fig 1**):

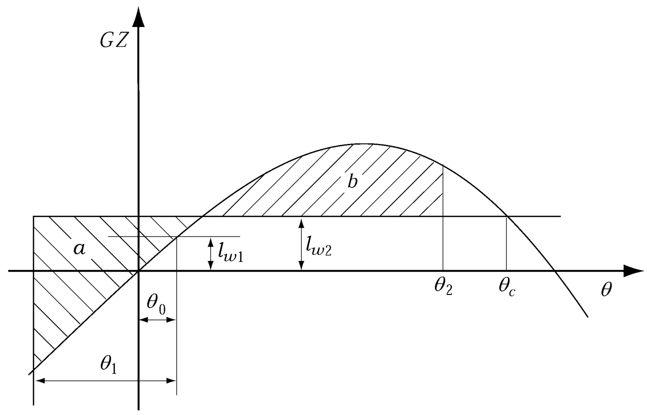

Fig 1 Stability and Wind-Heeling Moment Lever Curve (Stability Requirements in Wind and Waves)

(a) θ_0 is to be less than 16° or an angle corresponding to 80 % of immersing angle of deck edge, whichever is less.(For ships loaded with timber deck cargoes, θ_0 is to be less than 16°.)

(b) Area "b" is not to be less than area "a"

l_{w1} : Heeling moment lever caused by steady wind(m) given by the following formula.

$$l_{w1} = \frac{0.0514AZ}{W} \text{ (m)}$$

A : Projected lateral area of portion of the ship and deck cargo above the waterline (m^2).

Z : Vertical distance from the center of A to the center of the underwater lateral area or to a point at one half the draught (m).

W : Displacement (ton).
l_{w2} : Heeling moment lever caused by gust(m) given by the following formula

$$l_{w2} = 1.5\, l_{w1} \text{ (m)}$$

a : Area encircled by stability curve, l_{w2} and θ_r (m-rad).
b : Area encircled by stability curve, l_{w2} and θ_2 (m-rad).
θ_r : Angle of rolling stop motion (degree). In general, it may be given by the following formula.

$$\theta_r = \theta_0 - \theta_1 \text{ (degree)}$$

θ_c : Heeling angle at the second intersection between heeling moment lever and stability curve (degree).
θ_0 : Angle of heel under action of steady wind (degree).
θ_1 : Angle of roll to windward due to wave action (degree) given by the following formula:

$$\theta_1 = 109 X_1 X_2 k \sqrt{rs} \quad (^\circ)$$

θ_2 : Angle of flooding(θ_f), 50° or θ_c whichever is lesser
X_1 : Values obtained from **Table 1** according to the value of B/d'. In case the value of B/d' becomes intermediate, values are to be determined by interpolation.

Table 1 Values of X_1

B/d'	≤2.4	2.5	2.6	2.7	2.8	2.9	3.0	3.1	3.2	3.3	3.4	≥3.5
X_1	1.0	0.98	0.96	0.95	0.93	0.91	0.90	0.88	0.86	0.84	0.82	0.80

d' : Mean draught of the ship (m).
X_2 : Values obtained from **Table 2** according to C_b'. In case C_b' becomes intermediate, values are to be determined by interpolation.

Table 2 Values of X_2

C_b'	≤0.45	0.50	0.55	0.60	0.65	≥0.70
X_2	0.75	0.82	0.89	0.95	0.97	1.0

C_b' : Block coefficient given by the following formula:

$$C_b' = \frac{W}{1.025 L' B d'}$$

L' : Length of the ship at waterline (m).
k : Values determined as follows:
(i) For round-bilged ships having neither bilge keels nor bar keels : k = 1.0
(ii) For ships with sharp bilges : k = 0.7
(iii) For ships with bilge keel or bar keel : Values obtained from **Table 3.** However, In case 100 $A_k/L'B$ becomes intermediate, values are to be de-

termined by interpolation.

Table 3 Values of k

$100\ A_k/L'B$	0	1.0	1.5	2.0	2.5	3.0	3.5	≥4.0
k	1.0	0.98	0.95	0.88	0.79	0.74	0.72	0.70

A_k : Total area of bilge keels, projected lateral area of bar keels or sum of those area (m^2).

r : Values obtained from the following formula.

$$r = 0.73 + 0.6\frac{OG}{d'}$$

OG : Distance between the center of gravity and waterline (m), and is taken as positive when the center of gravity is above waterline.

s : Values obtained from **Table 4** according to the value of T. In case of T becomes intermediate, values are to be determined by interpolation.

Table 4 Values of s

T	≤6	7	8	12	14	16	18	≥20
s	0.100	0.098	0.093	0.065	0.053	0.044	0.038	0.035

T : Rolling period (sec). However, in case of the omission of period test or that experiment results of sister ship cannot be used, it is obtained from the following formula:

$$T = \frac{2B}{\sqrt{G_0M}}\left(0.373 + 0.023\frac{B}{d'} - 0.043\frac{L'}{100}\right)\ (\text{sec})$$

G_0M : Initial metacentric height corrected by free surface effect (m).

(B) In case of the ships for restricted service, the requirements specified above (A) do not apply.

3. Guidance for Stability Information for Master

(1) General

(A) This Guidance gives the standardized form and mentioned items for preparation of Stability Information for Master(hereafter referred to as "the information") and the Stability information is recommended to meet the requirements of this Guidance as far as possible.

(B) The information is to be written in a language understandable to Master. If a language other than English is used, English version is to be attached.

(C) By reason of special operation configuration, etc., items deemed necessary are to be added. It is considered beneficial that a computer for calculation of parameters of stability is provided on board. However, omission of the information is not permitted even in the such case.

(2) Arrangement of Stability Information

The information is to be generally arranged as follows.

(A) Table of contents

In the table of contents, the title and first page of each data are to be listed in corresponding position to ensure easy access.

(B) Notice on ship operation

(a) The particular loading conditions(ballast, etc.) that are to ensure stability during navigation and loading/unloading are to be described.
(b) If the buoyancy of superstructures of car carriers, etc. having bow doors, side doors and/or stern doors is included in stability calculation, statement is to be made that those doors must be closed in watertight or weathertight condition before departure and that the stability curve is prepared under the condition with those doors closed.
(c) If any special operation for keeping ample stability is required during cargo handling, the procedure is to be stated.
(d) Notices on loading cargoes(e.g. designed maximum weight of cargoes), if any, are to be described.
(e) Any other notices deemed necessary for stability are to be described.

(C) Principal Particulars
The following items are to be listed in general.
(a) Name of ship
(b) Builder and yard number of ship
(c) Date of build(keel-lay, launch and delivery) or conversion
(d) Purpose of ship
(e) Classification character and notations
(f) Nationality, port of registry, official number and signal letters
(g) Principal dimensions(length, breadth and depth)
(h) Tonnage descriptions
(i) Output of main engine and ship speed
(j) Load line marks, convention or the Rules applied and type of free board (Type 'A', Type 'B', etc.)
(k) IMO number

(D) Explanation of Symbols used
Designations, symbols and abbreviations for various units used in stability information are to be described. The units used are preferably unified in a single system. If plural systems(for example, when SI unit and MKS unit are used) are inevitable, a conversion table between the systems is to be attached.

(E) Data for Cargoes, Stowages, etc.
(a) A list is to be prepared for densities or stowage factors of various cargoes intended to be loaded on board.
(b) Drawings in a suitable scale, which show the arrangement of cargo spaces, tanks, lockers and stores, and other compartments together with their name, are to be attached.
(c) As to weight and location of center of gravity of following items which are used in stability calculation, assumed total weight and position of center of gravity and the basis of assumption are to be listed with, if appropriate:
(i) Passengers and their effects.
(ii) Crew and their effects.
(iii) Motorcars in case of car carriers or car ferries.
(iv) Deck cargoes(If deck cargoes are anticipated to absorb water, the weight of them is to be increased by absorbed water in arrival condition).
(v) Hanging cargoes and container cargoes(The plan of loading arrangement of containers is to be provided, in which maximum gross weight tare weight and center of gravity of each container is described and each container is numbered in consideration of easy identification).

(F) Results of Stability Experiments
(a) The results of inclining tests are to include light weight and location of centre of gravity, date of inclining and surveyor's confirmed signature. When any permanent ballast are included in light condition, the material, weight and arrangement of them are to be described by the drawing.
(b) When rolling tests were carried out, the details of rolling test procedures are to be included in the test results. And an explanation of the relation between rolling period and G_0M is to be attached.

(G) Method of Utilizing Information
Explanations for following items are to be stated. In order that the master calculates stability curves and evaluates the stability of ship, examples of calculations are to be added and the basis of all data are to be clarified. Blank forms for calculation are to be attached.

(a) Calculation for displacement and location of center of gravity
(b) Calculation for draught and trim
(c) Method of preparation for GZ-curve
(d) Method of correction due to free-surface effect on GZ-curve and GM
(e) Method of estimating the effect of wind and waves
(f) Method of evaluation for GZ-curve, etc. under the applicable stability requirements
(g) Maximum permissible vertical center of gravity
(h) Other items deemed necessary(for example, when anti-rolling devices, heeling tanks, etc. are installed, the service procedures for them and operational restrictions thereto are to be explained)

(H) Applied Stability Requirements
(a) It is to be described that the ship complies with the requirements in Annex which meet the requirements in A.167, A.206, A.562 of IMO Resolutions.
(b) If any special requirements are made by the flag state other than the above-mentioned Resolutions, excerpts or summary of relevant provisions are given.
(c) For ships intended to navigate in area where icing is liable to occur, details of assumed icing are to be given together with the location, weight and center of gravity of icing.

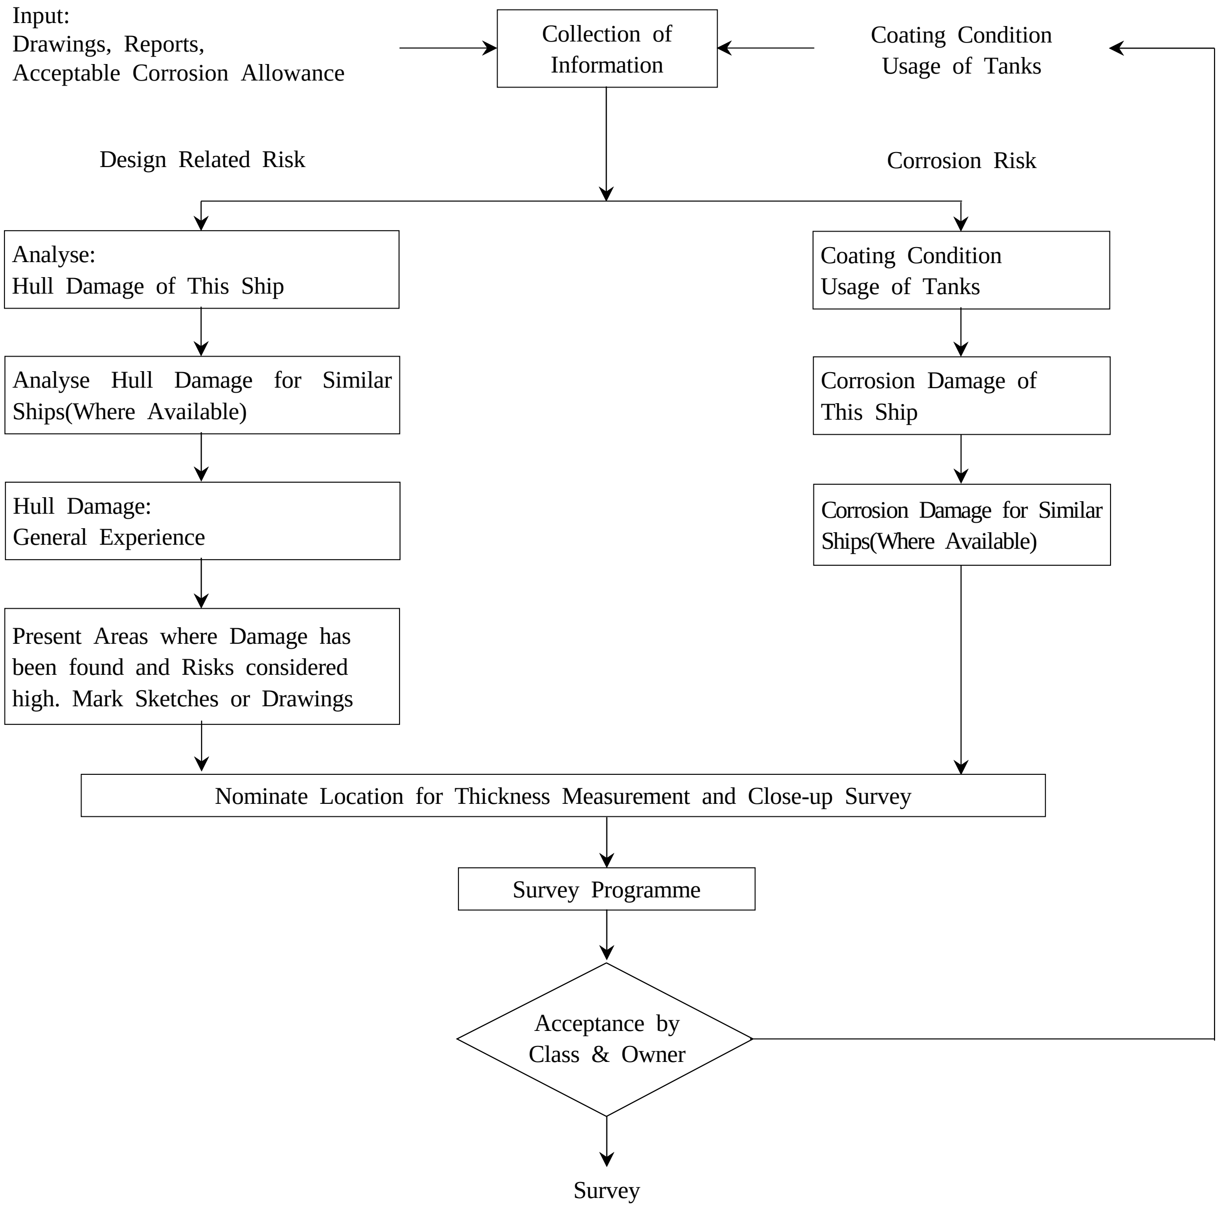
(I) Stability in Standard Loading Condition
(a) The under mentioned conditions are to be at least included in standard loading conditions unless they are cleary inappropriate.
(i) Except fishing vessels, a departure condition means a condition in which provisions and fuel are fully loaded and an arrival condition means a condition in which 90% thereof are consumed.
① Light condition
② Docking condition
③ Ballast departure condition and ballast arrival condition
④ Full load departure condition and full load arrival condition
⑤ Loading condition in which the parameters of stability are liable to be changed on a large scale(e.g., ballasting during navigation, possible icing, etc.)
(ii) For fishing vessels
① Light condition
② Departure for the fishing grounds with full fuel, stores, ice, fishing gear, etc.
③ Departure from fishing grounds with full catch and 25 % stores, fuel, etc.
④ Arrival at home port with full catch and 10 % stores, fuel, etc.
⑤ Arrival at home port with 20 % of full catch and 10 % stores, fuel, etc.
⑥ Loading condition in which the parameters of stability are liable to be changed on a large scale(e.g., ballasting during navigation, possible icing, etc.)
(b) The following items are to be stated concerning each loading condition. If there are any limitations upon loading they are to be included:
(i) Arrangement in suitable scale showing distribution of all components constituting deadweight.
(ii) Light weight, and weight, position of centre of gravity, weight moment and displacement.
(iii) Mean draught, corresponding draught, position of centre of buoyancy and centre of gravity, position of centre of flotation, MTC, trim, draughts at forward and aft perpendiculars, GG_0, KG_0 and G_0M.
(iv) GZ-curves taking effect of free surface.
(v) Evaluation of conformity with stability requirements.
(vi) Down flooding angle and other items.

(J) General data
The following items are to be included in stability data:
(a) Capacity and the location of the centre of capacity of compartments, and the moment of inertia of free surface, are to be presented in numerical tables or curves.
(b) Hydrostatic curves or numerical tables.
(c) Cross curves or numerical tables.
(d) Curve of down flooding angle or numerical tables.
(e) Projected lateral windage area or numerical tables.
(f) Maximum permissible height of center of gravity or numerical tables.
(g) Other data deemed necessary. ⚓

Annex 1-3 Example of the Survey Programme and the Survey Planning Questionnaire

1. The following process may be considered to assist in identifying critical structural areas, nomination suspect areas and in focusing attention on structural elements or areas of structural elements which may be particularly susceptible to, or evidence a history of, wastage or damage in conjunction with the preparation of the survey programme, the example is shown in **Table 1.**

(Use may be made of the IACS UR Z10's Annex I, if it necessary)



2. Prior to the development of the survey programme, the survey planning questionnaire is to be completed by the Owner based on the information set out in **Annex 1-3, Table 2** of the Guidance, and forwarded to the Society.

Table 1 Example of the Survey Programme

SURVEY PROGRAMME

For Special Survey No. _____ / Intermediate Survey at ______ years of age,
scheduled from ________________________________ to ________________________________
at ____.
(If the commencement-completion survey system is applied, outlines of each survey are to be listed in the next page)

Basic information and particulars

Name of ship :	
Class No. :	IMO No. :
Class Notation :	
Flag State :	
Port of registry :	
Gross tonnage :	
Deadweight(metric tones) :	
Length between perpendiculars(m) :	
Shipbuilder :	
Hull number :	
Date of delivery of the ship :	
Date of build / major conversion :	/
Owner :	
Thickness measurement company :	

Prepared by the Owner in co-operation with the Society;

Owner's representative :	Classification Society :
Signature ________________ Name (Place / Date)	Signature ________________ Name (Place / Date)

SURVEY PROGRAMME

Outlines of each commencement-completion survey

Date	Place	Docking (Yes/No)	Overall Survey	Close-up Survey	Thickness measurement	Tank Testing	Suspect Area

1. Preamble

1.1 Scope

1.1.1 The present survey programme covers the minimum extent of Overall Surveys, Close-up Surveys, thickness measurements and pressure testing within the cargo (length) area, cargo holds/tanks, ballast tanks, including fore and aft peak tanks, required by the Rules.

1.1.2 The arrangements and safety aspects of the survey are to be acceptable to the attending Surveyor(s).

1.2 Documentation

All documents used in the development of the survey programme are to be available onboard during the survey as required by the relevant requirements specified in the Rules.

SURVEY PROGRAMME

2. Arrangement of cargo holds, tanks and spaces

This section of the survey programme is to provide information(either in the form of plans or text) on the arrangement of cargo holds, tanks and spaces that fall within the scope of the survey.

SURVEY PROGRAMME

3. List of cargo holds, tanks and spaces with information on their use, extent of coatings and corrosion prevention system

This section of the survey programme is to indicate any changes relating to (and is to update) the information on the use of the holds and tanks of the ship, the extent of coatings and the corrosion prevention system provided in the survey planning questionnaire.

SURVEY PROGRAMME

4. Conditions for survey

This section of the survey programme is to provide information on the conditions for survey, e.g. information regarding cargo hold and tank cleaning, gas freeing, ventilation, lighting, etc.

Hold/Tank/Space	Cleaning	Gas freeing	Ventilation	Lighting	Etc.

SURVEY PROGRAMME

5. Provisions and method of access to structures

This section of the survey programme is to indicate any changes relating to (and is to update) the information on the provisions and methods of access to structures provided in the survey planning questionnaire.

SURVEY PROGRAMME

6. List of equipment for survey

This section of the survey programme is to identify and list the equipment that will be made available for carrying out the survey and the required thickness measurements.

(e.g. thickness measurement equipment, fracture detection equipment, explosimeter, oxygen-meter, breathing apparatus, lifelines, riding belts with rope and hook, whistles, safe lighting, protective clothing(safety helmet, gloves, safety shoes, etc.), etc.)

Equipment	Sets	Description	Used for

SURVEY PROGRAMME

7. Survey requirements

7.1 Overall Survey

This section of the survey programme is to identify and list the spaces that are to undergo an Overall Survey for the ship in accordance with the Rules.

Hold/Tank/Space	Remarks

SURVEY PROGRAMME

7.2 Close-up Survey

This section of the survey programme is to identify and list the hull structures that are to undergo a Close-up Survey for the ship in accordance with the Rules.

Hold/Tank/Space	Areas for Close-up Survey

SURVEY PROGRAMME

8. Identification of tanks for tank testing and pipes for pipe testing

This section of the survey programme is to identify and list the cargo holds and tanks that are to undergo tank testing for the ship and the pipes that are to undergo pipe testing(for chemical tankers) in accordance with the Rules.

Hold/Tank/Pipe	Remarks

SURVEY PROGRAMME

9. Identification of areas and sections for thickness measurements

This section of the survey programme is to identify and list the areas and sections where thickness measurements are to be taken in accordance with the Rules.

Hold/Tank	Areas and sections for thickness measurement

SURVEY PROGRAMME

10. Minimum thickness of hull structures

This section of the survey programme is to specify the minimum thickness for hull structures of the ship that are subject to survey. (indicate either (a) or preferably (b), if such information is available):

(a) ☐ Determined from the attached wastage allowance table and the original thickness to the hull structure plans of the ship;

(b) ☐ Given in the following table(s):

Area or location	Original as-built thickness(mm)	Minimum thickness(mm)	Substantial corrosion thickness(mm)

Note: The wastage allowance tables are to be attached to the survey programme.

SURVEY PROGRAMME

11. Thickness measurement company

This section of the survey programme is to identify changes, if any, relating to the information on the thickness measurement company provided in the survey planning questionnaire.

SURVEY PROGRAMME

12. Damage experience related to the ship

This section of the survey programme is to, using the tables provided below, provide details of the hull damages for at least the last three years in way of the cargo holds/tanks, ballast tanks and void spaces within the cargo (length) area. These damages are subject to survey.

Hull damages sorted by location for the ship

Cargo hold, tank or space number or area	Possible cause, if known	Description of the damages	Location	Repair	Date of repair

Hull damages for sister or similar ships (if available) in the case of design related damage

Cargo hold, tank or space number or area	Possible cause, if known	Description of the damages	Location	Repair	Date of repair

SURVEY PROGRAMME

13. Areas identified with substantial corrosion from previous surveys

This section of the survey programme is to identify and list the areas of substantial corrosion from previous surveys.

Hold/Tank/Space	Areas of substantial corrosion	Date and kind of survey

SURVEY PROGRAMME

14. Critical structural areas and suspect areas

This section of the survey programme is to identify and list the critical structural areas and the suspect areas, when such information is available.

Hold/Tank/Space	Critical structural areas	Suspect areas

SURVEY PROGRAMME

15. Other relevant comments and information

This section of the survey programme is to provide any other comments and information relevant to the survey.

SURVEY PROGRAMME

16. Appendices

Appendix 1 - List of plans

The Rules require that main structural plans of cargo holds/tanks and ballast tanks (scantling drawings), including information regarding use of high tensile steel (HTS), clad steel and stainless steel(for chemical tankers) are to be available. This appendix of the survey programme is to identify and list the main structural plans which form part of the survey programme.

Appendix 2 - Survey planning questionnaire

The survey planning questionnaire, which has been submitted by the Owner, is to be appended to the survey programme.

Appendix 3 - Other documentation

This part of the survey programme is to identify and list any other documentation that forms part of the plan.

Table 2 Example of the Survey Planning Questionnaire

SURVEY PLANNING QUESTIONNAIRE

The following information will enable the Owner in co-operation with the Society to develop a survey programme complying with the requirements of the Rules. It is essential that the Owner provides, when completing the present questionnaire, up-to-date information. The present questionnaire, when completed, is to provide all information and material required by the Rules.

Basic information and particulars

Name of ship :	
Class No. :	IMO No. :
Class Notation :	
Flag State :	
Port of registry :	
Gross tonnage :	
Deadweight(metric tones) :	
Length between perpendiculars(m) :	
Shipbuilder :	
Hull number :	
Date of delivery of the ship :	
Date of build / major conversion :	/
Owner :	
Thickness measurement company :	

Owner's representative :
Signature ________________ Name (Place / Date)

SURVEY PLANNING QUESTIONNAIRE

1. Information on access provisions for Close-up Surveys and thickness measurement

The Owner is to indicate, in the table below, the means of access to the structures subject to Close-up Survey and thickness measurement. A Close-up Survey is an examination where the details of structural components are within the close visual inspection range of the attending Surveyor, i.e. normally within reach of hand.

Hold/Tank/Space	Structure*	C(Cargo)/B (Ballast)	Access provisions				
			Temporary staging	Rafts/Boats	Ladders	Direct access	Other means (please specify)

* Each structural components which have different type of access provisions are to be specified. (e.g. Fore peak/Aft peak/Under deck/Side shell/Bottom transverse/Longitudinal/Transverse/Hatch side coamings/Topside slopping plate/Upper stool plating/Cross deck/Side shell, frames & brackets/Transverse bulkhead/Hopper slopping plating/Lower stool/Tank top/Double bottom structure/Upper stool internal structure/Lower stool internal structure, etc.)

History of bulk cargoes of a corrosive nature(e.g. high sulphur content) / History of cargo with H_2S content or heated cargo for the last 3 years together with indication as to whether cargo was heated and, where available, Marine Safety Data Sheets(MSDS)*

* Refer to resolution MSC.150(70) on Recommendation for material safety data sheets for MARPOL Annex I cargoes and marine fuel oils.

SURVEY PLANNING QUESTIONNAIRE

2. Owner's inspections

Using a format similar to that of the table below (which is given as an example), the Owner is to provide details of the results of their inspections for the last 3 years on all cargo holds/tanks, ballast tanks and void spaces within the cargo (length) area, including peak tanks.

Hold/Tank/Space	Use	Corrosion prevention system (1)	Coating extent (2)	Coating condition (3)	Structural deterioration (4)	Hold/tank/space history (5)

(1) HC=hard coating, SC=soft coating, SH=semi-hard coating, NP=no prevention
(2) U=upper part, M=middle part, L=lower part, C=complete
(3) G=good, F=fair, P=poor, RC=recoated(during the last 3 years)
(4) N=no findings recorded,
Y=findings recorded, description of findings is to be attached to the questionnaire
(5) DR=damage & repair, L=leakages,
CV=conversion(description is to be attached to the questionnaire)

Owner's representative :
Signature ________________ Name (Place / Date)

SURVEY PLANNING QUESTIONNAIRE

3. Reports of Port State Control inspections

List the reports of Port State Control inspections containing hull structural related deficiencies and relevant information on rectification of the deficiencies:

4. Safety Management System

List non-conformities related to hull maintenance, including the associated corrective actions:

5. Name and address of the approved thickness measurement company

Name	Address	Approved by

⚓

Annex 1-4 Owners Inspection Report

The Owner of ships subject to the enhanced survey programme such as bulk carriers, oil tankers and chemical tankers, etc. is to complete the Owner Inspection Report and retain it inside the ship, according to requirement **Ch 3, 103.** of the Rules. An example of the Owner Inspection Report is shown in **Table 1.**

Table 1 Example of Owner Inspection Report

Annex 1-5 Thickness Measurement Method for Hull Structural Members

1. General

(1) Purpose of thickness measurement

(A) Corrosion seems to be one of the common denominators in many cases of serious hull casualties resulting in losses of vessels, cargoes and human lives. The purpose of thickness measurement described in the Rules is to prevent vessels from hull casualties. Information provided in the report of hull thickness measurements for a vessel put in service indicates that the vessel is maintaining sufficient local and global strength, if necessary renewal/repair works can be made accordingly. Therefore, thickness measurement reports giving information for the assessment of hull strength(including watertight integrity) as well as for the maintenance of the hull is to be carefully considered.

(B) Where the ship has been constructed with FRP, aluminum alloy or other anti-corrosion materials, the thickness measurements may be dispensed with.

(2) Extent of thickness measurement

The standard extent of thickness measurements complying with the "Rules for Classification of Steel Ships" is given in **Table 4** to **Table 13.** However, the extent of thickness measurements may be specially considered by the Society, considering the coating and corrosion condition.

(3) Thickness measurement report

(A) The thickness measurement report submitted to the Society shall include the general particulars as shown in **Table 19,** measuring position, diagram with details of the position to be measured, original thickness, maximum allowable diminution and present thickness(gauged) and diminution, etc. Reporting form shown in **Table 20**(or equivalent form) is to be used for recording measuring position, original thickness, maximum allowable diminution, present thickness(gauged) and diminution, etc.

(B) The thickness measurement report is to be verified and countersigned by the attending Surveyor, and the record is to be kept in the Society and on board the ship.

2. Wear Limit

(1) General

(A) This annex provides standard of wear limit for decision of repair of main hull structural members. Wear limit or allowable wear quantity means allowable wear limit.

(B) When worn down thickness of hull structural members exceed the wear limit, inspections are to be carried out in detail and corresponding hull structural members are to be renewed by the date recommended by the Surveyor.

(C) Wear limit provided by this annex is based on the requirements and scantlings during construction. Therefore, the wear limit for the structural members which have scantlings larger than the required ones and margin in strength may be considered appropriately.

(D) Wear limit on hull structural members not provided by this annex follows what is deemed appropriate by the Surveyor.

(2) Wear limit on hull structural members

(A) Wear limits on structural members are provided in **Table 1.**

(B) Value of wear limit indicates the limit on equally distributed wearing.

(C) When partial corrosion occurs in stress concentrated part, partial replacement or reinforcement shall be carried out without reference to **Table 1.**

Table 1 Wear limit on members

<table>
<tr><td rowspan="8">Local

Wear
Limit</td><td rowspan="2">Name of member</td><td colspan="3">Wear limit</td></tr>
<tr><td>Class Ⅰ [3)]</td><td>Class Ⅱ [3)]</td><td>Class Ⅲ [3)]</td></tr>
<tr><td>Strength deck plating, sheer strake and longitudinals to these members,
shell plating, bottom shell plating,
bulkhead plating of deep tank,
topside sloping plating,
hopper side sloping plating,
inner bottom plating</td><td>20 % of
original thickness</td><td>(20 % of
original
thickness)
+ 1 mm</td><td rowspan="5">1 mm</td></tr>
<tr><td>Floor & girder of double bottom,
web and face of primary supporting member</td><td>20 % of
original thickness</td><td>25 % of
original thickness</td></tr>
<tr><td>Effective deck plating,
superstructure deck plating,
deck plating inside the line of cargo hatch openings,
watertight bulkhead plating[2)],
hatch cover(including stiffeners),
hatch coaming(including stiffeners),
web, face and brackets of secondary stiffener[1)]</td><td>25 % of
original thickness</td><td>30 % of
original thickness</td></tr>
<tr><td>Web, face and brackets of frames in cargo hold/tank</td><td>20 % of
original thickness
or 1.5 mm,
whichever greater</td><td>25 % of
original thickness
or 2.5 mm,
whichever
greater</td></tr>
<tr><td>Partial corrosion (e.g pitting)</td><td>30 % of
original thickness</td><td>35 % of
original thickness</td></tr>
<tr><td colspan="4">(NOTES)
1) Secondary stiffener refers to the member which is supported by the primary supporting member and does not support another reinforcement member.
2) Among watertight bulkhead platings, the bulkhead plating of tanks used for carriage of water, fuel oil and other liquids, forming a part of the hull structures, is to be treated as a bulkhead plating of deep tank.
3) For ships classed through the Classification Survey during Construction : the Class I, II and III are as follow.
(a) Class I : It is applied to ships having one or two of the following characteristics.
(i) Ships, with of length of 90 m and above, which are classed with Classification Survey during Construction in accordance with the Rules after 1st July 1998.
(ii) Ships carry for liquid cargo, which are classed with Classification Survey during Construction in accordance with the Rules after 1st July 1998.
(b) Class II : Ships, other than in Class I and III.
(c) Class III : Ships constructed with steel, which is applied to the Rules for the Classification of High Speed and Light Crafts and the Guidance Relating to the Rules for the Classification of High Speed and Light Crafts.
4) For ships classed through the Classification Survey after Construction, the separate requirements specified by the Society are to be applied.</td></tr>
<tr><td>Wear relating to the Shearing Strength</td><td colspan="4">The shearing strength evaluation is to be carried out in any of the following cases when the thickness measurement for the longitudinal strength evaluation is carried out in accordance with the separate requirements specified by the Society.
1) For oil tankers(including chemical tankers), the average corrosion of any stake in side shell or longitudinal bulkhead exceeds the followings,
Class I : 2.0 mm
Class II : 3.0 mm
2) For liquefied gas carriers, the average corrosion of any stake in side shell bulkhead exceeds the followings, or
Class I : 1.5 mm
Class II : 2.5 mm
3) For bulk carriers(including ore carriers) intended for alternate loading, the average corrosion of any stake in side shell or longitudinal bulkhead exceeds the followings
Class I : 1.5 mm
Class II : 2.5 mm</td></tr>
</table>

(3) Wear limit of hold hatch cover of bulk carriers which are contracted for construction after 1st July 1998 and before 1st January 2004 and designed by the Rules **Pt 7, Ch 3, Sec 9** is to be determined in accordance with the following requirements.

(A) Single skin hatch covers and the pontoon hatch covers

(a) Steel renewal is required where the gauged thickness is worn more than 1.5 mm (less than $t_{net}+0.5$ mm). The net thickness t_{net} is the thickness obtained by subtracting the corrosion addition from the required thickness.

(b) Where the gauged thickness is worn within the range 1.0 mm and 1.5 mm ($t_{net}+0.5$ mm and $t_{net}+1.0$ mm), coating applied in accordance with coating manufacturer's requirements or annual gauging may be adopted as an alterative to steel renewal.

(B) Internal structural members of pontoon hatch covers

Thickness gauging is required when plating renewal is to be carried out in accordance with previous (a) or when it is deemed necessary, at the discretion of the Society, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is worn more than 1.5 mm (less than t_{net}).

(4) Wear limit of hold hatch cover and hatch coatings of all bulk carriers, ore carriers and combination carriers which are contracted for construction on or after 1st January 2004 and designed by the Rules **Pt 7, Ch 3, Sec 9** is to be determined in accordance with the following requirements.

(A) Single skin hatch covers and double skin hatch covers

(a) Steel renewal is required where the gauged thickness is worn more than 1.5 mm (less than $t_{net}+0.5$ mm).

(b) Where the gauged thickness is worn within the range 1.0 mm and 1.5 mm ($t_{net}+0.5$ mm and $t_{net}+1.0$ mm), coating applied in accordance with coating manufacturer's requirements or annual gauging may be adopted as an alterative to steel renewal. Coating is to be maintained in GOOD condition, as defined in **Pt 1, Ch 2, 101. 16** of the Rules

(B) Internal structural members of double skin hatch covers

Thickness gauging is required when plating renewal is to be carried out in accordance with previous (a) or when it is deemed necessary, at the discretion of the Society, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is worn more than 1.5 mm (less than t_{net}).

(C) Hatch coamings

(a) Steel renewal is required where the gauged thickness is worn more than 1.0 mm (less than $t_{net}+0.5$ mm).

(b) Where the gauged thickness is worn within the range 0.5 mm and 1.0 mm ($t_{net}+0.5$ mm and $t_{net}+1.0$ mm), coating applied in accordance with coating manufacturer's requirements or annual gauging may be adopted as an alterative to steel renewal. Coating is to be maintained in GOOD condition, as defined in **Pt 1, Ch 2, 101. 16** of the Rules

(5) The renewal thickness($t_{renewal}$) of steel hatch covers and coamings in position I and II on exposed decks, subjected to **Pt 4, Ch 2**, of ships other than bulk carriers which are keel laid on or after 1st January 2005 are to be in accordance with as followings. (Refer to **Pt 4, Ch 2, 105. 2**)

$$t_{renewal} = t_{as-built} - t_c + 0.5 \qquad (\mathrm{mm})$$

Where,

$t_{as-built}$: as built thickness

t_c : corrosion addition according to **Pt 4, Ch 2, 105. Table 4.2.1** of the Rules

Where the corrosion addition t_c is 1.0 mm, the renewal thickness may be given by the following formula

$$t_{renewal} = t_{as-built} - t_c \quad (\mathrm{mm})$$

(6) Wear limit of corrugated transverse watertight bulkheads for bulk carriers, which are contracted for construction after 1st July 1998 and designed by the Rules **Pt 7, Ch 3, 1201.** is to be determined in accordance with the following requirements.
(A) Steel renewal is required where the gauged thickness is worn more than 3.0 mm (less than $t_{net}+0.5$ mm).
(B) Where the gauged thickness is worn within the range 2.5 mm and 3.0 mm ($t_{net}+0.5$ mm and $t_{net}+1.0$ mm), coating applied in accordance with coating manufacturer's requirements or annual gauging may be adopted as an alterative to steel renewal.
(7) Corrosion addition and steel renewal of vertically corrugated transverse watertight bulkheads between cargo holds No. 1 and 2 for bulk carriers, which are applied to **Pt 7, Annex 7-5, 1** (1) (A) of the Guidance, are to be determined in accordance with the requirements specified in **Pt 7, Annex 7-5, 1** (6).
(8) The wastage allowances of supporting hull structures associated with towing and mooring, subject to **Pt 4, Ch 10** of the Rules, of ships which are keel laid on or after 1st January 2007 are not to exceed the corrosion addition as specified in **Pt 4, Ch 10, 201. 6** and **202. 6** of the Rules.

3. Methods of Thickness Measurement

An essential part of most surveys is the determination of the residual thickness of the structure in critical areas. Ultrasonic thickness gauging by pulse echo method is used almost exclusively for this purpose. However, measuring by drilled holes may also be acceptable. As a method of thickness measurement, where ultrasonic thickness gauging methods are used, attention is to be paid to the following:
(1) Surface condition
Surfaces upon which the probe makes contact are to be sufficiently free from scale, loose paint, corroded surfaces or other foreign matters to the extent that their presence does not result in inaccurate readings when acoustic couplants such as glycerine or glycerine-water solutions are used during inspection. In special cases, readings through paint film by a special instrument may be accepted.
(2) Couplants
It is essential that good acoustic contact is achieved between the probe and the surface of the plate being measured. Therefore, acoustic couplants(e.g., coupling fluid; 75 % glycerine-water solutions or glycerine) between the probe and surface of material are usually used for better achievements. Where the direction of contact surfaces is vertical or overhead, a paste or liquid with suitable viscosity may be used to prevent acoustic couplants from dropping.
(3) Calibrations
An instrument is to be calibrated with a reference calibration standard each time it is used, and it is to be recalibrated whenever equipment calibration is suspected of being in error.

4. Location of Thickness Measurement

(1) Thickness measurements for suspect area
At each Special Survey, the thickness gaugings may be required as a result of Close-up Survey in suspect areas(i.e., locations showing substantial corrosion and/or considered by the Surveyor to be prone to rapid wastage). Details are given in **Table 2.**
(2) Location and number of thickness measuring points
The standard location and number of thickness measuring points and patterns are shown in **Table 3.** These figures show typical arrangements of ships such as bulk carriers and oil tankers, etc. and these may be used as guidance for different type of ships other than those illustrated. The location and number of thickness measuring points for other hull structural members which are not specified in this Annex are to be in accordance with what considered appropriate by the Surveyor taking into account of the ship's age and hull structure, etc.
(3) Thickness Measurement at Special Survey
The standard extent of thickness measurements at each Special Survey are given in **Table 4** to **Table 13.**

5. Additional Thickness Measurement

The extent of additional thickness measurement at those areas of substantial corrosion of ships subject to the enhanced survey programme such as bulk carriers, oil tankers and chemical tankers, etc. is shown in **Table 14** to **Table 18.**

6. Sampling method of thickness measurements for longitudinal strength evaluation and repair methods for oil tankers or double hull oil tankers subject to the enhanced survey programme

(1) Extent of longitudinal strength evaluation
Longitudinal strength should be evaluated within 0.4 L amidships for the extent of the hull girder length that contains tanks therein and within 0.5 L amidships for adjacent tanks which may extent beyond 0.4 L amidships, where tanks means ballast tanks and cargo tanks.

(2) Sampling method of thickness measurement

(A) Pursuant to the requirements of **Ch 3, 304. 4** or **504. 4** of the Rules as applicable, transverse sections should be chosen such that thickness measurements can be taken for as many different tanks in corrosive environments as possible, e.g. ballast tanks sharing a common plane boundary with cargo tanks fitted with heating coils, other ballast tanks, cargo tanks permitted to be filled with sea water and other cargo tanks. Ballast tanks sharing a common plane boundary with cargo tanks fitted with heating coils and cargo tanks permitted to be filled with sea water should be selected where present.

(B) The minimum number of transverse sections to be sampled should be in accordance with **Ch 3, Table 1.3.5** or **Table 1.3.11** of the Rules as applicable. The transverse sections should be located where the largest thickness reductions are suspected to occur or are revealed from deck and bottom plating measurements prescribed in (C) and should be clear of areas which have been locally renewed or reinforced.

(C) At least two points should be measured on each deck plate and/or bottom shell plate required to be measured within the cargo area in accordance with the requirements of **Ch 3, Table 1.3.5** or **Table 1.3.11** of the Rules as applicable.

(D) Within 0.1 D (where D is the ship's moulded depth) of the deck and bottom at each transverse section to be measured in accordance with the requirements of **Ch 3, Table 1.3.5** or **Table 1.3.11** of the Rules as applicable, every longitudinal and girder should be measured on the web and face plate, and every plate should be measured at one point between longitudinals.

(E) For longitudinal members other than those specified in (D) above to be measured at each transverse section in accordance with the requirements of **Ch 3, Table 1.3.5** or **Table 1.3.11** of the Rules as applicable, every longitudinal and girder should be measured on the web and face plate, and every plate should be measured at least in one point per strake.

(F) The thickness of each compartment should be determined by averaging all of the measurements taken in way of the transverse section on each compartment.

(3) Additional measurements where the longitudinal strength is deficient.

(A) Where one or more of the transverse sections are found to be deficient in respect of the longitudinal strength requirements, the number of transverse sections for thickness measurement should be increased such that each tank within the 0.5 L amidships region has been sampled. Tank spaces that are partially within, but extend beyond, 0.5 L region, should be sampled.

(B) Additional thickness measurements should also be performed on one transverse section forward and one aft of each repaired area to the extent necessary to ensure that the areas bordering the repaired section also comply with the requirements of the Rules.

(4) Effective repair methods

(A) The extent of renewal or reinforcement carried out to comply with the Rules should be in accordance with (B) below.

(B) The minimum continuous length of a renewed or reinforced structural member should be not less than twice the spacing of the primary members in way. In addition, the thickness diminution in way of the butt joint of each joining member forward and aft of the replaced member(plates, stiffeners, girder webs and flanges, etc.) should not be within the substantial corrosion range(75% of the allowable webs and flanges, etc.) should not be within the substantial corrosion range(75% of the allowable diminution associated with each particular member). Where differences in thickness at the butt joint exceed 15% of the lower thickness, a transition taper should be provided.

(C) Alternative repair methods involving the fitting of straps or structural member modification should be subject to special consideration. In considering the fitting of straps, it should be limited to the following conditions:

(a) to restore and/or increase longitudinal strength;

(b) the thickness diminution of the deck or bottom plating to be reinforced should not be within the substantial corrosion range(75% of the allowable diminution associated with the deck plating):

(c) the alignment and arrangement, including the termination of the straps, is in accordance with the separate requirements specified by the Society;

(d) the straps are continuous over the entire 0.5 L amidships length; and

(e) continuous fillet welding and full penetration welds are used at butt welding and, depending on the width of the strap, slot welds. The welding procedures applied should be acceptable to the Society.

(D) The existing structure adjacent to replacement areas and in conjunction with the fitted straps, etc. should be capable of withstanding the applied loads, taking into account the buckling resistance and the condition of welds between the longitudinal members and hull envelope plating.

7. Thickness measurements and renewal criteria for ships subject to the Common Structural Rules(CSR)

Thickness measurements and renewal criteria for ships subject to the Common Structural Rules(CSR) specified in **Pt 11** or **Pt 12** are to be in accordance with these relevant Part of the Rules.

Table 2 Suspect areas on which attention is to be paid

Location	Measuring Points	
Deck and upper structures	Special attention is to be given on fore parts (forward of 0.5 L amidships) of strength deck, areas with standing bilges and members with originally light scantlings in addition to the following:	
	F'cle, poop and deckhouse	Break bulkheads of superstructures, Lower parts of deckhouse walls, Pipe penetration areas, Areas with drain plugs, Deck platings of superstructures, Deck platings in way of bilge-ways, deck scuppers, deck machinery(winches, windlasses etc.), fair-leaders and bollards etc.
	Deck platings inside line of hatch openings and inside superstructures and deckhouses	Deck platings inside line of openings between cargo hatch-ways, and of deck platings inside superstructures and deckhouses.
	Hatch coamings and coaming stays	Lower parts attached to upper deck, Parts around steam pipes.
	Bulwark platings and bulwark stays	Lower parts attached to upper deck, End parts connected to superstructures and deckhouses, Platings around freeing ports.
	Winch foundation	Special attention is to be given to steam winch foundations
	Steel hatch covers	Steel pontoon covers (including cleats, etc.)
Shells	Wind and water strakes	Special attention is to be given to fore and after part outside of 0.5 L amidships.
	Shell platings connected to end brackets	After removal of limber boards and cement chocks, Close-up Survey is required.
	Shells attached to hold frames	Special attention is to be given to groovings on shells.
	Shells around chain lockers	-
	Hard spotted shells	Special attention is to be given to shells (parts or positions) in ballast tanks
Internal members	Special attention is to be given to areas with high humidity, standing bilges and poorly ventilated spaces in addition to the following :	
	Joint parts between hold frames and frame brackets	After removal of limber board, those parts are to be examined (problem areas in aged ships)
	Intersections between transverse W/T Bulkhead and inner bottom	After removal of bottom ceilings, those parts are to be examined.
	Tank top platings of double bottom tanks and of deep tanks used as ballast tanks	-
	Fillet weld parts between hold frames and side shells	Special attention is to be paid to hold frames in intermittent welds.
	Bilge wells	Special attention si to be given to bilge wells in E/R and bilge wells with piping arrangements.
	Inner bottom platings under pillars	-
	Internal members around sea water pumps in E/R	-
	Sea chest boundaries in E/R	-
	Joint parts between shaft tunnel and inner bottom	Close-up Survey is required for aged ships
	Intersections between tweendeck frames or tweendeck bulkheads and lower deck	-
	Lower parts of collision BHD and bottom of chain lockers	-
	Intersections between panting/side stringers and frames, and end parts, slot areas in way of panting/side stringers	-

Table 2 Suspect areas on which attention is to be paid (continued)

Location	Measuring Points	
Inside of tanks	Special attention is to be paid to the combined tanks (ballast and fuel oil), prone to rapid wastage, in addition to the following:	
	All of ballast tanks in front of E/R boundaries	Close-up Survey is required for tank top, bottom and boundary platings of the tanks not forming their boundaries by full envelope (both shells and decks). And special attention is to be paid to connections between frames and brackets, and on docking brackets, lightening holes
	Double bottom ballast tanks, side ballast tanks, and shaft tunnels	Special attention is to be paid to inner bottom platings meeting bulkheads, edge platings reaching to tank side brackets, and on lightening holes/slots in way of girders and on bottom shells around striking pads below sounding pipes.
	Bulkheads facing a heated zone	Special attention is to be paid to bulkheads facing E/R space, or fuel oil tanks being heated.
	Bottom platings below sounding pipes	Special attention is to be paid to bilge tanks in E/R
	Chain lockers in fore peak tanks	Special attention is to be paid to bottom platings and side boundaries of chain lockers.

Table 3 Location and number of thickness measuring points

Items	Location and number of thickness measuring points
Transverse Section	1. For oil tankers, chemical tankers or double hull oil tankers subject to the enhanced survey programme (See **Fig 1** and **Fig 2**) (1) At each transverse section, every plate within 0.1D(where D is the ship's moulded depth) of the deck and bottom is to be measured at one point between longitudinals, and all the other plate is to be measured at least one point per strake. (2) Where the thickness measurements for a transverse section are to include all longitudinal members, every longitudinal is to be measured at one point on the web and face plate. 2. For single skin bulk carriers, double skin bulk carriers or general dry cargo ships (See **Fig 3** and **Fig 4**) (1) At each transverse section, every plate of the deck and inner bottom is to be measured at one point between longitudinals, and all the other plate is to be measured at least one point per strake. (2) Where the thickness measurements for a transverse section are to include all longitudinal members, every longitudinal is to be measured at one point on the web and face plate. 3. For general ships other than **1** and **2** above (See **Fig 5**) (1) At each transverse section, every plate is to be measured at least two points per strake. (2) Where the thickness measurements for a transverse section are to include all longitudinal members, every longitudinal is to be measured at one point on the web and face plate.
Transverse Section of deck, side shell and bottom plating	At least two points on each plate(either at each 1/4 extremity of plate or at representative areas of average corrosion) are to be measured in the transverse section concerned.
Selected plates: Selected plates on deck(including deck inside line of hatch openings), tank top, bottom, inner bottom plates, etc. and wind-and-water strakes	At least two points are to be measured at representative areas of average corrosion. Where the length of the plate exceeds 6 m, two points per 6 m are to be gauged additionally. Where plates cross ballast/cargo tank boundaries separate measurements for the area of plating in way of each type of tank are to be taken. In case of side shell plating, one or two wind and water strakes are to be gauged according to No. of Special Survey. The gauging location of each plate may be selected by the attending Surveyor in consideration of the corrosion pattern.
All plates: All deck(including deck inside line of hatch openings), tank top, bottom, inner bottom plates, etc. and wind-and-water strakes	At least two points on each plate(either at each 1/4 extremity of plate or at representative areas of average corrosion) are to be measured. Where the length of the plate exceeds 6 m, two points per 6 m are to be gauged additionally. Where plates cross ballast/cargo tank boundaries separate measurements for the area of plating in way of each type of tank are to be taken.
Selected internal structures: Selected internal structure such as floors and longitudinals, transverse frames, web frames, deck beams, girders	The internal structural members to be measured in each space internally surveyed are to be 1. at least 10% outside the cargo (length) area, 2. at least 20% within the cargo (length) area. (For oil tankers, chemical tankers or double hull oil tankers subject to the enhanced survey programme see **Fig 1** and **Fig 2**, for single skin or double skin bulk carriers see **Fig 6**, for other ships see **Fig 7**)

Table 3 Location and number of thickness measuring points

Items	Location and number of thickness measuring points
Selected side shell frames in cargo holds for single skin bulk carriers or general dry cargo ships	1. 25% of frames: one out of four frames is to be chosen preferably throughout the cargo hold length on each side. 2. "Selected frames" means at least 3 frames on each side of cargo holds. (For single skin bulk carriers see **Fig 6**, for general dry cargo ships see **Fig 7**)
Transverse webs in ballast tanks for single skin bulk carriers, double skin bulk carriers or general dry cargo ships	One of the representative tanks of each type (i.e. topside or hopper or side tank) is to be chosen in the forward part. (For single skin or double skin bulk carriers see **Fig 6**, for general dry cargo ships see **Fig 7**)
Transverse frames in double skin tanks for double skin bulk carriers	25% of transverse frames: one out of four transverse frames is to be chosen preferably throughout the double skin tank length. (See **Fig 8**)
Transverse bulkheads	1. For oil tankers, chemical tankers or double hull oil tankers subject to the enhanced survey programme: See **Fig 1** and **Fig 2** 2. For single skin bulk carriers, double skin bulk carriers or general dry cargo ships (See **Fig 9** to **Fig 11**) (1) Transverse bulkheads in cargo holds - Includes bulkheads plating, stiffeners and girders, including internal structure of upper and lower stools, where fitted. - Two selected bulkheads : one is to be the bulkhead between the two foremost cargo holds and the second may be chosen in other positions (2) One transverse bulkhead in each cargo hold - The Close-up Survey and related thickness measurements are to be carried out on one side of the bulkhead; the side is to be chosen based on the outcome of the Overall Survey of both sides. In the event of doubt, the Surveyor may also require (possibly partial) Close-up Survey on the other side. (3) Transverse bulkheads in one ballast tank - The ballast tank is to be chosen based on the history of ballasting among those prone to have the most severe conditions.
Cargo hold hatch covers and coamings	See **Fig 12**

(NOTES)
1. (dotted oval) mark : means the location to be measured.
2. X mark : means the point to be measured.

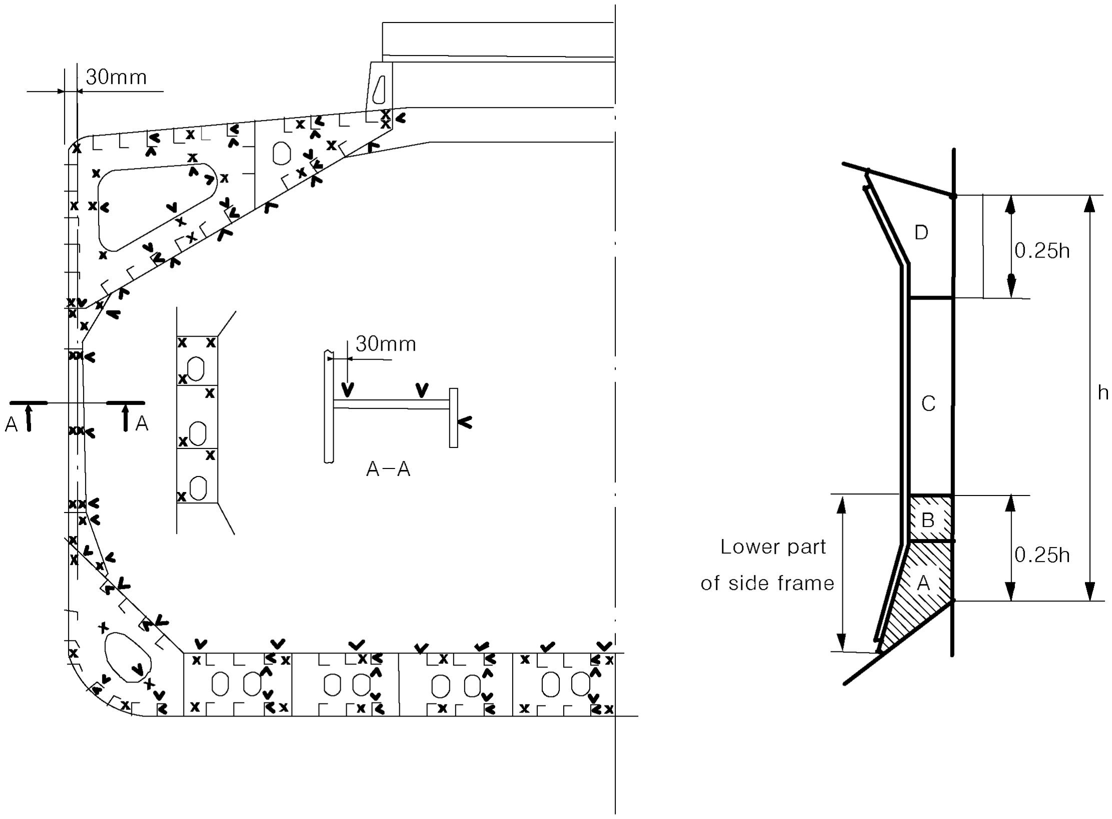
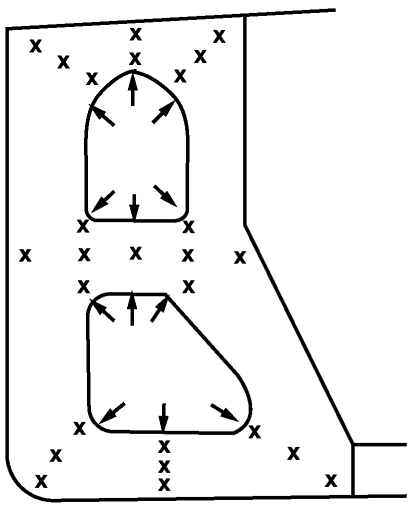
Fig 5 Locations of measurements on transverse section of general ships

Table 3 Location and number of thickness measuring points (continued)



(Bulk Carriers)



(Ore Carriers)

(Notes) The gauging pattern for web plating is to be a three point pattern for zones A, C and D, and a two point pattern for zone B. The gauging report is to reflect the average reading. The average reading is to be compared with the allowable thickness. If the web plating has general corrosion the this pattern is to be expanded to a five point pattern.

Table 3 Location and number of thickness measuring points (continued)

(Notes)
① For each hatch covers, three sections at L/4, L/2 and 3L/4 of hatch cover length, including:
- one measurement of each hatch cover plate and skirt plate
- measurements of adjacent beams or girder(including stiffeners)
- one measurement of coaming plates and coaming flange, each side

② For each hatch covers, one measurement of hatch cover skirt plate, coaming plate and coaming flange on both ends
③ One measurement of one out of three hatch coaming brackets and bars, on both sides and both ends
④ One measurement of each hatch coaming end bracket

Fig 12 Locations of measurements on hatch covers and coamings

Table 4 Extent of thickness measurements at Special Survey – General Ships

No. of Special Survey	Extent and location of measurement
Special Survey No. 1	(1) Suspect areas throughout the vessel
Special Survey No. 2	 (1) Suspect areas throughout the vessel (2) One transverse section of deck plating in way of a cargo space within the amidships 0.5 L
Special Survey No. 3	 (1) Suspect areas throughout the vessel (2) Two transverse sections within the amidships 0.5 L in way of two different cargo spaces[4), 5), 6), 7)] (3) All cargo hold hatch covers and coamings(plating and stiffeners) (4) Internals in forepeak and afterpeak tanks (5) All transverse bulkheads in all cargo tanks[8)] (6) All transverse bulkheads in all ballast tanks[8)]

Table 4 Extent of thickness measurements at Special Survey - General Ships (Continued)

No. of Special Survey	Extent and location of measurement
Special Survey No. 4 and Subsequent	 (1) Suspect areas throughout the vessel (2) A minimum of three transverse sections in way of cargo spaces within the amidships 0.5 L 5), 6), 7) (3) All cargo hold hatch covers and coamings(plating and stiffeners) (4) Internals in forepeak and afterpeak tanks (5) All exposed main deck plating full length (6) Representative exposed superstructure deck plating(poop, bridge and forecastle deck) (7) Lowest strake and strakes in way of 'tween decks of all transverse bulkheads in cargo spaces together with internals in way (8) All wind and water strakes, port and starboard, full length (9) All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space and aft end of tanks (10) Plating of seachests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor (11) All transverse bulkheads and one web frame ring in all cargo tanks 8) (12) All transverse bulkheads and all web frame ring in all ballast tanks 8)

(NOTES)

- : Thickness gaugings for deck plates
- : Thickness gaugings for side shell plates
- : Thickness gaugings for the transverse section(applied for plates only)
- : Thickness gaugings for the transverse section(including longitudinal members)

1) In application to this table, General Ships means ships except Other Ships in **Table 1.2.4, 2.** of the Rules.
2) Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.
3) Thickness measurements of internals may be specially considered by the Surveyor if the hard protective coating is in GOOD condition.
4) For ships more than 100 meters in length, at Special Survey No. 3, thickness measurements of exposed deck plating within amidship 0.5L may be required.
5) For ships less than 100 meters in length, the number of transverse sections required at Special Survey No. 3 may be reduced to one (1), and the number of transverse sections required at Special Survey No. 4 and subsequent may be reduced to two (2).
6) For the pure car carrier, the extent of thickness measurement for transverse sections may by considered as follow: Exposed deck plates, side shell plates, bottom shell plates, inner bottom plates and longitudinal members in double bottom spaces.
7) Where the evaluation of longitudinal strength is required, all longitudinal structural members at the corresponding sections are to be gauged.
8) This requirement is to be applied only for tankers(including barges) for liquid cargo.

Table 5 Extent of thickness measurements at Special Survey - Other Ships

No. of Special Survey	Extent and location of measurement
Special Survey No. 1	(1) Suspect areas throughout the vessel
Special Survey No. 2	 (1) Suspect areas throughout the vessel (2) One transverse section of deck plating[5)], side shell plating and bottom plating within the amidships 0.5 L
Special Survey No. 3	 (1) Suspect areas throughout the vessel (2) Two transverse sections of deck plating[5)], side shell plating and bottom plating within the amidships 0.5 L (3) Internals in forepeak and afterpeak tanks

Table 5 Extent of thickness measurements at Special Survey - Other Ships (Continued)

No. of Special Survey	Extent and location of measurement
Special Survey No. 4 and Subsequent	 (1) Suspect areas throughout the vessel (2) Two transverse sections of side shell plating within the amidships 0.5 L (3) Full length, all exposed main deck plating[5)] (4) Full length, representative exposed superstructure deck plating(poop, bridge and forecastle deck) (5) Full length, selected wind and water strakes (6) Full length, bottom plating and flat keel plating (7) Internals in forepeak and afterpeak tanks

(NOTES)

: Thickness gaugings for deck plates
: Thickness gaugings for side shell plates
: Thickness gaugings for the transverse section(applied for plates only)

1) In application to this table, Other Ships means the ship specified as follows except Special Purpose Ship - Waste in **Annex 1-1, 1.1** of the Guidance.
   - the ship type **12, 13**
   - the ship less than 500 GT and not engaged on international voyages among ship type **15, 16, 17** and **19** to **29**.
2) Thickness measurement locations are to be selected to provide the best representative sampling of area likely to be most exposed to corrosion.
3) Thickness measurements of internals may be specially considered by the Surveyor if the hard protective coating is in GOOD condition.
4) When the evaluation of longitudinal strength is required, all longitudinal structural members at the corresponding sections are to be gauged.
5) For fishing vessel, thickness measurement requirements in way of deck(gutter water way part and hatch coaming part) may be modified at the discretion of the Surveyor if the structure remains effectively protected against corrosion by a permanent type special coating.

1) At least one section is to include a ballast tank within 0.5 L amidships, if any.
2) For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of thickness measurements may be increased to include the tank top plating at the discretion of the Surveyor.
3) For areas in spaces where protective coatings are found to be in GOOD condition, the extent of thickness measurements may be specially considered by the Society.
4) The Surveyor may extend the thickness measurements as deemed necessary. Where substantial corrosion is found, the extent of thickness measurements is to be increased to the satisfaction of the Surveyor.

Table 9 Additional thickness measurements of the vertically corrugated transverse watertight bulkhead between holds Nos. 1 and 2

Location	Vertically corrugated transverse watertight bulkhead between holds Nos. 1 and 2
Gauging point	1. The gauging is to be carried out at the levels as described below. To adequately assess the scantlings of each individual vertical corrugation, each corrugation flange, webs, shedder plate and gusset plate within each of the levels given below are to be gauged. (1) Level (A) : Ships without lower stool (See **Fig 1**) (a) The mid-breadth of the corrugation flanges at approximately 200 mm above the line of shedder plates; (b) The middle of gusset plates between corrugation flanges, where fitted; (c) The middle of the shedder plates; (d) The mid-breadth of the corrugation webs at approximately 200 mm above the line of shedder plates. (2) Level (B) : Ships with lower stool (See **Fig 2**) (a) The mid-breadth of the corrugation flanges at approximately 200 mm above the line of shedder plates; (b) The middle of gusset plates between corrugation flanges, where fitted; (c) The middle of the shedder plates; (d) The mid-breadth of the corrugation webs at approximately 200 mm above the line of shedder plates. (3) Level (C) : Ships with or without lower stool (See **Fig 1** or **Fig 2**) (a) The mid-breadth of the corrugation flanges and webs at about the mid-height of the corrugation. 2. Where the thickness changes within the horizontal levels, the thinner plate is to be gauged.

- (diagonal hatching) : Thickness gaugings for side shell plates
- (horizontal lines) : Thickness gaugings for the transverse section(applied for plates only)
- (heavy diagonal hatching) : Thickness gaugings for the transverse section(including longitudinal members)
- (vertical lines) : Thickness gaugings in way of the ballast tank

1) At least one section is to include a ballast tank within 0.5 L amidships.

Table 11 Extent of thickness measurements at Special Survey - Chemical Tankers with ESP notation

No. of Special Survey	Extent and location of measurement
Special Survey No. 1	 (1) Suspect areas (2) One transverse section of deck plating for the full beam of the ship within the cargo area (in way of a ballast tank, if any, or a cargo tank used primarily for water ballast) (3) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey
Special Survey No. 2	 (1) Suspect areas (2) Within the cargo area, each deck plate (3) Within the cargo area, one transverse section (4) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey (5) Selected wind and water strakes outside the cargo area

Table 11 Extent of thickness measurements at Special Survey - Chemical Tankers with ESP notation (continued)

No. of Special Survey	Extent and location of measurement
Special Survey No. 3	 (1) Suspect area (2) Within the cargo area, each deck plate (3) Within the cargo area, two transverse sections[1)] (4) Within the cargo area, all wind and water strakes (5) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey (6) Selected wind and water strakes outside the cargo area
Special Survey No. 4 and Subsequent	 (1) Suspect areas (2) Within the cargo area, each deck plate (3) Within the cargo area, three transverse sections[1)] (4) Within the cargo area, each bottom plate (5) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey (6) All wind and water strakes, full length

(NOTES)

: Thickness gaugings for deck plates
: Thickness gaugings for side shell plates
: Thickness gaugings for the transverse section(applied for plates only)
: Thickness gaugings for the transverse section(including longitudinal members)
: Thickness gaugings in way of the ballast tank

1) At least one section is to include a ballast tank within 0.5 L amidships.

Table 12 Extent of thickness measurements at Special Survey - Double Hull Oil Tankers with ESP notation

No. of Special Survey	Extent and location of measurement
Special Survey No. 1	  (1) Suspect areas (2) One section of deck plating for the full beam of the ship within the cargo area (3) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey
Special Survey No. 2	  (1) Suspect areas (2) Within the cargo area, each deck plate (3) Within the cargo area, one transverse section (4) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey (5) Selected wind and water strakes outside the cargo area

Table 12 Extent of thickness measurements at Special Survey - Double Hull Oil Tankers with ESP notation (continued)

No. of Special Survey	Extent and location of measurement
Special Survey No. 3	 (1) Suspect areas (2) Within the cargo area, each deck plate (3) Within the cargo area, two transverse sections[1)] (4) Within the cargo area, all wind and water strakes (5) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey (6) Selected wind and water strakes outside the cargo area
Special Survey No. 4	 (1) Suspect areas (2) Within the cargo area, each deck plate (3) Within the cargo area, three transverse sections[1)] (4) Within the cargo area, each bottom plate (5) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey (6) All wind and water strakes, full length

(NOTES)

: Thickness gaugings for deck plates
: Thickness gaugings for side shell plates
: Thickness gaugings for the transverse section(applied for plates only)
: Thickness gaugings for the transverse section(including longitudinal members)
: Thickness gaugings in way of the ballast tank

1) At least one section is to include a ballast tank within 0.5 L amidships.

Table 13 Extent of thickness measurements at Special Survey - Double Skin Bulk Carriers with ESP notation

No. of Special Survey	Extent and location of measurement
Special Survey No. 1	(1) Suspect areas
Special Survey No. 2	 (1) Suspect areas (2) Within the cargo length, two transverse sections of deck plating outside line of cargo hatch openings (3) Wind and water strakes in way of the two transverse sections considered (2) above (4) Selected wind and water strakes outside the cargo length area (5) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey
Special Survey No. 3	 (1) Suspect areas (2) Within the cargo length, each deck plate outside line of cargo hatch openings (3) Within the cargo length, two transverse sections, one in the amidship area, outside line of cargo hatch openings (4) Within the cargo length, all wind and water strakes (5) Selected wind and water strakes outside the cargo length area (6) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey

Table 13 Extent of thickness measurements at Special Survey - Double Skin Bulk Carriers with ESP notation (continued)

No. of Special Survey	Extent and location of measurement
Special Survey No. 4	 (1) Suspect areas (2) Within the cargo length, each deck plate outside line of cargo hatch openings (3) Within the cargo length, three transverse sections, one in the amidship area, outside line of cargo hatch openings (4) Within the cargo length, each bottom plate (5) All wind and water strakes, full length (6) Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey
(NOTES) : Thickness gaugings for deck plates : Thickness gaugings for side shell plates : Thickness gaugings for the transverse section(applied for plates only) : Thickness gaugings for the transverse section(including longitudinal members)	

Table 14 Requirements for extent of thickness measurements at those areas of substantial corrosion - Bulk Carriers with ESP notation

1) Shell Structures

Structural Member	Extent of Measurement	Pattern of measurement
1. Bottom and Side Shell Plating	1) Suspect plate, plus four adjacent plates 2) See other tables for particulars on gauging in way tanks and cargo holds	1) 5 point pattern for each panel between longitudinals
2. Bottom/Side Shell Longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurement in line across web 3 measurement on flange

2) Transverse Bulkheads in Cargo Holds

Structural member	Extent of Measurement	Pattern of measurement
1. Lower Stool	1) Transverse band within 25 mm of welded connection to inner-bottom 2) Transverse band within 25 mm of welded connection to shelf plate	1) 5 point between stiffeners over 1 metre length 2) 5 point between stiffeners over 1 metre length
2. Transverse Bulkhead	1) Transverse band at approximately mid height 2) Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	1) 5 point pattern over 1 sq. metre of plating 2) 5 point pattern over 1 sq. metre of plating

3) Deck Structure including Cross Strips, Main Cargo Hatchways, Hatch Covers, Coamings and Topside Tanks

Structural Member	Extent of Measurement	Pattern of Measurement
1. Cross Deck Strip Plating	Suspect cross deck strip plating	5 point pattern between underdeck stiffeners over 1 metre length
2. Underdeck Stiffeners	1) Transverse members 2) Longitudinal member	1) 5 point pattern at each end and mid span 2) 5 point pattern on both web and flange
3. Hatch Covers	1) Side and end skirts, each 3 locations 2) 3 longitudinal bands, outboard strakes (2) and centerline strake (1)	1) 5 point pattern at each location 2) 5 point measurement each band
4. Hatch Coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5 point measurement each band i.e. end or side coaming
5. Topside Ballast Tanks	1) Watertight transverse bulkheads a) lower 1/3 of bulkhead b) upper 2/3 of bulkhead c) stiffeners 2) 2 representative swash transverse bulkheads a) lower 1/3 of bulkhead b) upper 2/3 of bulkhead c) stiffeners 3) 3 representative bays of slop plating a) lower 1/3 of tank b) upper 2/3 of tank 4) Longitudinals, suspect and adjacent	1) a) 5 point pattern over 1 sq. metre of plating b) 5 point pattern over 1 sq. metre of plating c) 5 point pattern over 1 metre length 2) a) 5 point pattern over 1 sq. metre of plating b) 5 point pattern over 1 sq. metre of plating c) 5 point pattern over 1 metre length 3) a) 5 point pattern over 1 sq. metre of plating b) 5 point pattern over 1 sq. metre of plating 4) 5 point pattern both web and flange over 1 metre length
6. Main Deck Plating	Suspect plates and adjacent (4)	5 point pattern over 1 sq. metre of plating
7. Main Deck Longitudinals	Minimum of 3 longitudinals where plating measured	5 point pattern on both web and flange over 1 metre length
8. Web Frames /Transverses	Suspect plates	5 point pattern over 1 sq. metre

Table 14 Requirements for extent of thickness measurements at those areas of substantial corrosion - Bulk Carriers with ESP notation (continued)

4) Double Bottom and Hopper Structure

Structural Member	Extent of Measurement	Pattern of Measurement
1. Inner/Double Bottom Plating	Suspect plate plus all adjacent plates	5 point pattern for each panel between longitudinals over 1 metre length
2. Inner/Double Bottom Longitudinals	Three longitudinals where plates measured	3 measurements in line across web and 3 measurements on flange
3. Longitudinal Girders or Transverse Floors	Suspect plates	5 point pattern over about 1 square metre
4. Watertight Bulkhead (W.T Floors)	1) lower 1/3 of tank 2) upper 2/3 of tank	1) 5 point pattern over 1 sq. metre of plating 2) 5 point pattern alternate plates over 1 sq. metre of plating
5. Web Frames	Suspect plating	5 point pattern over 1 sq. metre of plating
6. Bottom/Side Shell Longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurements in line across web 3 measurements on flange

5) Cargo Holds

Structural Member	Extent of Measurement	Pattern of Measurement
1. Side Shell Frames	Suspect frame and each adjacent frame	a) At each end and mid span : 5 point pattern of both web and flange b) 5 point pattern within 25 mm of welded attachment of both shell and lower slope plate

Table 15 Requirements for extent of thickness measurements at those areas of substantial corrosion - Oil Tankers, Ore/Oil Ships, Etc. with ESP notation

1) Bottom Structure

Structural Member	Extent of Measurement	Pattern of Measurement
1. Bottom Plating	Minimum of 3 bays across tank including aft bay Measurements around and under all bell mouths	5 point pattern for each panel between longitudinals and webs
2. Bottom Longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertically web
3. Bottom Girders and Brackets	At fore and aft transverse bulkhead bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements Two measurements across face flat5 point pattern on girder/bulkhead brackets
4. Bottom Transverse Webs	3 webs in bays where bottom plating measured, with measurements at both ends and middle	5 points pattern over 2 square metre area Single measurements on face flat
5. Panel Stiffening	Where provided	Single measurements

2) Deck Structure

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deck Plating	Two bands across tank	Minimum of three measurements per plate per band
2. Deck Longitudinals	Minimum of 3 longitudinals in each of two bands	3 measurements in line vertically on webs, and 2 measurements on flange (if fitted)
3. Deck Girders and Brackets	At fore and aft transverse bulk-head, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements Two measurements across face flat. 5 point pattern on girder/bulkhead brackets
4. Deck Transverse Webs	Minimum of two webs with measurements at middle and both ends of span	5 points pattern over about 2 square metre areas Single measurements on face flat
5. Panel Stiffening	Where provided	Single measurement

Table 15 Requirements for extent of thickness measurements at those areas of substantial corrosion - Oil Tankers, Ore/Oil Ships, Etc. with ESP notation (Continued)

3) Side Shell and Longitudinal Bulkheads

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deckhead and Bottom Strakes, and Strakes in way of Stringer Platforms	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
2. All Other Strakes	Plating between every 3rd pair of longitudinals in same 3 bays	Single measurement
3. Longitudinals-deckhead and Bottom Strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
4. Longitudinals - All Others	Every third longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
5. Longitudinals - Bracket	Minimum of three at top middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
6. Web Frames and Cross Ties	3 webs with minimum of three locations on each web, including in way of cross tie connections	5 point pattern over about 2 square metre area, plus single measurements on web frame and cross tie face flats

4) Transverse Bulkheads and Swash Bulkheads

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deckhead and Bottom Strakes, and Strakes in way of Stringer Platforms	Plating between pair of stiffeners at three locations - approx. 1/4, 1/2 and 3/4 width of tank	5 points pattern between stiffeners over 1 meter length
2. All Other Strakes	Plating between pair of stiffeners at middle location	Single measurement
3. Strakes in Corrugated Bulkheads	Plating for each change of scantling at centre of panel and a flange or fabricated connection	5 point pattern over about 1 square metre of plating
4. Stiffeners	Minimum of three typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection, and one at centre of span)For flange, single measurements at each bracket toe and at centre of span
5. Brackets	Minimum of three at top middle and bottom of tank	5 point pattern over areas of bracket
6. Deep Webs and Girders	measurements at toe of bracket and at centre of span	For web, 5 point pattern over about 1 square metre 3 measurements across face flat
7. Stringer Platforms	All stringers with measurements at both ends and middle	5 point pattern over 1 square metre of area plus single measurements near bracket toes and on face flats

Table 16 Requirements for extent of thickness measurements at those areas of substantial corrosion – Chemical Tankers with ESP notation

1) Bottom, Inner Bottom and Hopper Structure

Structure Member	Extent of Measurement	Pattern of Measurement
1. Bottom, Inner Bottom and Hopper Structure Plating	Minimum of three bays across double bottom tank, including aft bay. Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
2. Bottom, Inner Bottom and Hopper Structure Longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across the flange and three measurements on vertical web
3. Bottom Girders, including the watertight ones	At fore and aft watertight floor and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat where fitted.
4. Bottom Floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square metre area
5. Hopper Structure Web Frame Ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange
6. Hopper Structure Transverse Watertight Bulkhead or Swash Bulkhead	· Lower 1/3 of the bulkhead	· 5-point pattern over one square meter of plating
	· Upper 2/3 of the bulkhead	· 5-point pattern over two square metre of plating
	· Stiffeners(minimum of three)	· For web, 5-point pattern over span(two measurements across web at each end and one at centre of span) · For flange, single measurements at each end and centre of span
7. Panel Stiffening	Where applicable	Single measurements

2) Deck Structure

Structure Member	Extent of Measurement	Pattern of Measurement
1. Deck Plating	Two transverse bands across tank	Minimum of three measurements per plate per band
2. Deck Longitudinals	Every third longitudinal in each two bands with a minimum of one longitudinal	Three measurements in line vertically on webs and two measurements on flange(if fitted)
3. Deck Girders and Brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across flange. 5 point pattern on girder/bulkhead brackets
4. Deck Transverse Webs	Minimum of two webs, with measurements at both ends and middle of span	5-point pattern over one square metre area. Single measurements on flange
5. Vertical Web and Transverse Bulkhead in Wing Ballast Tank for double hull design(two metres from deck)	Minimum of two webs, and both transverse bulkheads	5-point pattern over one square metre area
6. Panel Stiffening	Where applicable	Single measurements

Table 16 Requirements for extent of thickness measurements at those areas of substantial corrosion – Chemical Tankers with ESP notation (continued)

3) Side Shell and Longitudinal Bulkheads

Structure Member	Extent of Measurement	Pattern of Measurement
1. Side Shell and Longitudinal Bulkhead Plating · Deckhead and Bottom Strakes, and Strakes in way of Horizontal Girders · All Other Strakes	· Plating between each pair of longitudinals in a minimum of three bays(along the tank) · Plating between every third pair of longitudinals in same three bays	· Single measurement · Single measurement
2. Side Shell and Longitudinal Bulkhead Longitudinals on: · Deckhead and Bottom Strakes · All Other Strakes	· Each longitudinal in same three bays · Every third longitudinal in same three bays	· 3 measurements across web and 1 measurement on flange · 3 measurements across web and 1 measurement on flange
3. Longitudinals - Brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
4. Vertical Web and Transverse Bulkheads of Double Side Tanks (excluding deckhead area): · Strakes in way of Horizontal Girders · Other Strakes	· Minimum of two webs and both transverse bulkheads · Minimum of two webs and both transverse bulkheads	· 5-point pattern over approx. two square metre area · Two measurements between each pair of vertical stiffeners
5. Web Frames and Cross Ties for Other Tanks than Double Side Tanks	Three webs with minimum of three locations on each web, including in way of cross tie connections and lower end bracket	5-point pattern over approximately two square metre area of webs, plus single measurements on flanges of web frame and cross ties
6. Horizontal Girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
7. Panel Stiffening	Where applicable	Single measurements

4) Transverse Watertight and Swash Bulkheads

Structure Member	Extent of Measurement	Pattern of Measurement
1. Upper and Lower Stool, where fitted	· Transverse band within 25 mm of welded connection to inner bottom/deck plating · Transverse band within 25 mm of welded connection to shelf plate	9-point pattern between stiffeners over one metre length
2. Deckhead and Bottom Strakes, and Strakes in way of Horizontal Stringers	Plating between pair of stiffeners at three locations: approximately 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over one metre length
3. All Other Strakes	Plating between pair of stiffeners at middle location	Single measurement
4. Strakes in Corrugated Bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5-point pattern over about one square metre of plating
5. Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (two measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
6. Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over area of bracket
7. Horizontal Stringers	All stringers with measurements at both ends and middle	5-point pattern over one square metre area, plus single measurements near bracket toes and on flanges
8. Deep Webs and Girders	Measurements at toe of bracket and at centre of span	For web, 5-point pattern over about one square metre. three measurements across face flat

Table 17 Requirements for extent of thickness measurements at those areas of substantial corrosion - Double Hull Oil Tankers with ESP notation

1) Bottom, Inner Bottom and Hopper Structure

Structural Member	Extent of Measurement	Pattern of Measurement
1. Bottom, Inner Bottom and Hopper Structure Plating	Minimum of three bays across double bottom tank, including aft bay. Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
2. Bottom, Inner Bottom and Hopper Structure Longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across flange and three measurements on vertical web
3. Bottom Girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements
4. Bottom Floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square metre area
5. Hopper Structure Web Frame Ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange
6. Hopper Structure Transverse Watertight Bulkhead or Swash Bulkhead	· Lower 1/3 of bulkhead	· 5-point pattern over two square metre of plating
	· Upper 2/3 of bulkhead	· 5-point pattern over two square metre of plating
	·Stiffeners (minimum of three)	· For web, 5-point pattern over span (two measurements across web at each end and one at centre of span). · For flange, single measurements at each end and centre of span
7. Panel Stiffening	Where applicable	Single measurements

2) Deck Structure

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deck Plating	Two transverse bands across tank	Minimum of three measurements per plate per band
2. Deck Longitudinals	Every third longitudinal in each of two bands with a minimum of one longitudinal	Three measurements in line vertically on webs and two measurements on flange (if fitted)
3. Deck Girders and Brackets (usually in cargo tanks only)	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across flange. 5-point pattern on girder/bulkhead brackets
4. Deck Transverse Webs	Minimum of two webs, with measurements at both ends and middle of span	5-point pattern over one square metre area. Single measurements on flange
5. Vertical Web and Transverse Bulkhead in Wing Ballast Tank (two metres from deck)	Minimum of two webs, and both transverse bulkheads	5-point pattern over one square metre area
6. Panel Stiffening	Where applicable	Single measurements

Table 17 Requirements for extent of thickness measurements at those areas of substantial corrosion - Double Hull Oil Tankers with ESP notation (continued)

3) Structure in Wing Ballast Tanks

Structural Member	Extent of Measurement	Pattern of Measurement
1. Side Shell and Longitudinal Bulkhead Plating : · Upper Strake and Strakes in way of Horizontal Girders · All Other Strakes	· Plating between each pair of longitudinals in a minimum of three bays (along the tank) · Plating between every third pair of longitudinals in same three bays	· Single measurement · Single measurement
2. Side Shell and Longitudinal Bulkhead Longitudinals on : · Upper Strake · All Other Strakes	· Each longitudinal in same three bays · Every third longitudinal in same three bays	· 3 measurements across web and 1 measurement on flange · 3 measurements across web and 1 measurement on flange
3. Longitudinals - Brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
4. Vertical Web and Transverse Bulkheads (excluding deckhead area) : · Strakes in way of Horizontal Girders · Other Strakes	· Minimum of two webs and both transverse bulkheads · Minimum of two webs and both transverse bulkheads	· 5-point pattern over approx. two square metre area · two measurement between each pair of vertical stiffeners
5. Horizontal Girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
6. Panel Stiffening	Where applicable	Single measurements

4) Longitudinal Bulkheads in Cargo Tanks

Structural Member	Extent of Measurement	Pattern of Measurement
1. Deckhead and Bottom Strakes, and Strakes in way of the Horizontal Stringers of Transverse Bulkheads	Plating between each pair of longitudinal in a minimum of three bays	Single measurement
2. All Other Strakes	Plating between every third pair of longitudinals in same three bays	Single measurement
3. Longitudinals on Deckhead and Bottom Strakes	Each longitudinal in same three bays	Three measurements across web and one measurement on flange
4. All Other Longitudinals	Every third longitudinal in same three bays	Three measurements across web and one measurement on flange
5. Longitudinals - Brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
6. Web Frames and Cross Ties	Three webs with minimum of three locations on each web, including in way of cross tie connections	5-point pattern over approximately two square metre area of webs, plus single measurements on flanges of web frame and cross ties
7. Lower End Brackets (opposite side of web frame)	Minimum of three brackets	5-point pattern over approximately two square metre area of brackets, plus single measurements on bracket flanges

Table 17 Requirements for extent of thickness measurements at those areas of substantial corrosion - Double Hull Oil Tankers with ESP notation (continued)

5) Transverse Watertight and Swash Bulkheads in Cargo Tanks

Structural Member	Extent of Measurement	Pattern of Measurement
1. Upper and Lower Stool, where fitted	· Transverse band within 25 mm of welded connection to inner bottom/deck plating · Transverse band within 25 mm of welded connection to shelf plate	5-point pattern between stiffeners over metre length
2. Deckhead and Bottom Strakes, and Strakes in way of Horizontal Stringers	Plating between pair of stiffeners at three locations : approximately 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over one metre length
3. All Other Strakes	Plating between pair of stiffeners at middle location	Single measurement
4. Strakes in Corrugated Bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5-point pattern over about one square metre of plating
5. Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (two measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
6. Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over area of bracket
7. Horizontal Stringers	All stringers with measurements at both ends and middle	5-point pattern over one square metre area, plus single measurements mear bracket toes and on flanges

Table 18 Requirements for extent of thickness measurements at those areas of substantial corrosion - Double Skin Bulk Carriers with ESP notation

1) Bottom, Inner Bottom and Hopper Structure

Structural Member	Extent of Measurement	Pattern of Measurement
1. Bottom, Inner Bottom and Hopper Structure Plating	Minimum of three bays across double bottom tank, including aft bay. Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
2. Bottom, Inner Bottom and Hopper Structure Longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across flange and three measurements on the vertical web
3. Bottom Girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements
4. Bottom Floors, including the watertight ones	Three floors in the bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square metre area
5. Hopper Structure Web Frame Ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange
6. Hopper Structure Transverse Watertight Bulkhead or Swash Bulkhead	· Lower 1/3 of bulkhead	· 5-point pattern over one square metre of plating
	· Upper 2/3 of bulkhead	· 5-point pattern over two square metre of plating
	· Stiffeners(minimum of three)	· For web, 5-point pattern over span(two measurements across web at each end and one at centre of span). · For flange, single measurements at each end and centre of span
7. Panel Stiffening	Where applicable	Single measurement

Table 18 Requirements for extent of thickness measurements at those areas of substantial corrosion - Double Skin Bulk Carriers with ESP notation (continued)

2) Deck Structure including Cross Strips, Main Cargo Hatchways, Hatch Covers, Coamings and Topside Tanks

Structural Member	Extent of Measurement	Pattern of Measurement
1. Cross Deck Strip Plating	Suspect cross deck strip plating	5-point pattern between underdeck stiffeners over 1 metre length
2. Underdeck Stiffeners	1) Transverse members 2) Longitudinal members	1) 5-point pattern at each end and mid span 2) 5-point pattern on both web and flange
3. Hatch Covers	1) Side and end skirts, each three locations 2) Three longitudinal bands, outboard strakes(2) and centerline strake(1)	1) 5-point pattern at each location 2) 5-point measurement each band
4. Hatch Coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5-point measurement each band i.e. end or sid coaming
5. Topside Ballast Tanks	1) Watertight transverse bulkhead a) Lower 1/3 of bulkhead b) Upper 2/3 of bulkhead c) Stiffeners 2) Two representative swash transverse bulkheads a) Lower 1/3 of bulkhead b) Upper 2/3 of bulkhead c) Stiffeners 3) Three representative bays of slope plating a) Lower 1/3 of tank b) Upper 2/3 of tank 4) Longitudinals, suspect and adjacent	1) a) 5-point pattern over 1 sq. metre of plating b) 5-point pattern over 1 sq. metre of plating c) 5-point pattern over 1 metre length 2) a) 5-point pattern over 1 sq. metre of plating b) 5-point pattern over 1 sq. metre of plating c) 5-point pattern over 1 metre length 3) a) 5-point pattern over 1 sq. metre of plating b) 5-point pattern over 1 sq. metre of plating 4) 5-point pattern on both web and flange over 1 metre length
6. Main Deck Plating	Suspect plates and adjacent(4)	5-point pattern over 1 sq. metre of plating
7. Main Deck Longitudinals	Suspect plates	5-point pattern on both web and flange over 1 metre length
8. Web Frames/ Transverse	Suspect plates	5-point pattern over 1 sq. metre of plating

Table 18 Requirements for extent of thickness measurements at those areas of substantial corrosion - Double Skin Bulk Carriers with ESP notation (continued)

3) Structure in Double Side Spaces(including Wing Void Spaces of Ore Carriers)

Structural Member	Extent of Measurement	Pattern of Measurement
1. Side Shell and Inner Plating : · Upper strake and strakes in way of horizontal girders · All other strakes	· Plating between each pair of transverse frames/longitudinals in a minimum of three bays(along the tank) · Plating between every third pair of longitudinals in same three bays	· Single measurements · Single measurements
2. Side Shell and Inner Side Transverse Frames/ Longitudinals on : · Upper strake · All other strakes	· Each transverse frame/longitudinal in same three bays · Every third transverse frame/longitudinal in same three bays	· Three measurements across web and 1 measurement on flange · Three measurements across web and 1 measurement on flange
3. Transverse Frames/Longitudinals Brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
4. Vertical Web and Transverse Bulkheads : · Strakes in way of horizontal girders · Other strakes	· Minimum of two webs and both transverse bulkheads · Minimum of two webs and both transverse bulkheads	· 5-point patterns over approx. two square metre area · Two measurements between each pair of vertical stiffeners
5. Horizontal Girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
6. Panel Stiffening	Where applicable	Single measurements

4) Transverse Bulkheads in Cargo Holds

Structural Member	Extent of Measurement	Pattern of Measurement
1. Lower Stool, where fitted	· Transverse band within 25 mm of welded connection to inner bottom · Transverse band within 25 mm of welded connection to shelf plate	· 5-point pattern between stiffeners over one metre length · 5-point pattern between stiffeners over one metre length
2. Transverse Bulkheads	· Transverse band at approximately mid height · Transverse band at part of bulkhead adjacent to upper deck of below upper stool shelf plate(for those ships fitted with upper stools)	· 5-point pattern over one square metre of plating · 5-point pattern over one square metre of plating

(NOTES)

1. This report form is to be used for recording the thickness measurement of :
   All strength deck plating within the cargo (length) area
   All keel, bottom shell plating and bilge plating within the cargo (length) area
   Side shell plating including selected wind and water strakes outside cargo (length) area
   All wind and water strakes within cargo (length) area
2. The strake position is to be clearly indicated as follow :
   2.1 For strength deck indicate the number of the strake of plating inboard from the stringer plate.
   2.2 For bottom plating indicate the number of the strake of plating outboard from the keel plate.
   2.3 For side shell plating give number of the strake of plating below sheerstrake and letter as shown on shell expansion.
3. For the ships which have no wide cargo openings i.e oil tankers all deck plating strakes are to be recorded, for the ships which have wide cargo openings i.e ore/oil ships and bulk carriers only the deck plating strakes outside line of openings are to be recorded.
4. Measurements are to be taken at the forward and aft areas of all plates and where plates cross ballast and cargo tank/hold boundaries separate measurements for the area of plating in way of each type of tank/hold are to be recorded.
5. The single measurements recorded are to represent the average of multiple measurements.
6. The maximum allowable diminution could be stated in an attached document.

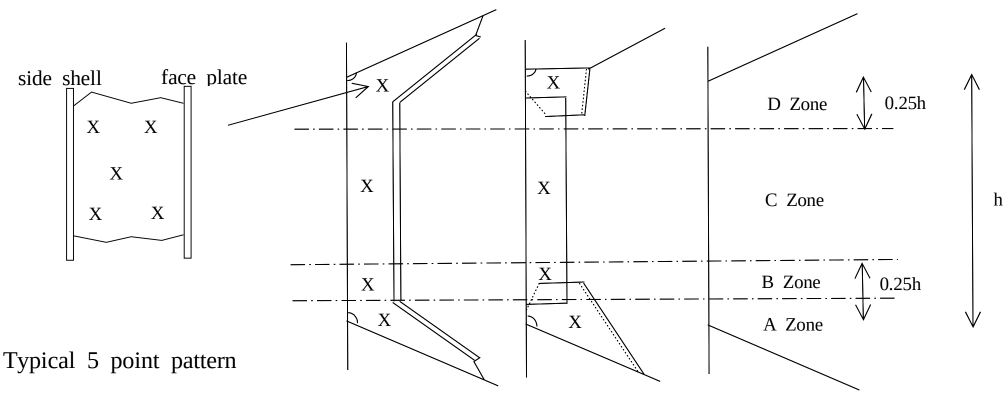
	mm	mm	mm	mm	mm	%	mm	mm	mm	mm	mm	%	mm	mm	mm	mm	mm	%	mm	mm	mm	mm	mm	%

Operators Signature : Surveyors Signature :

(NOTES)

1. This report is to be used for recording the thickness measurement of Cargo Hold Transverse Frames for application of UR S31
2. The gauging pattern for zones A, B & D are to be a five point pattern and for zone C may be measured by taking 3 reading over the length of zone C. If the web plating of zone C has general corrosion then it should be expanded to a five pattern. The gauging pattern is to be over the depth web and the same area vertically. The gauging report is to reflect the average reading.



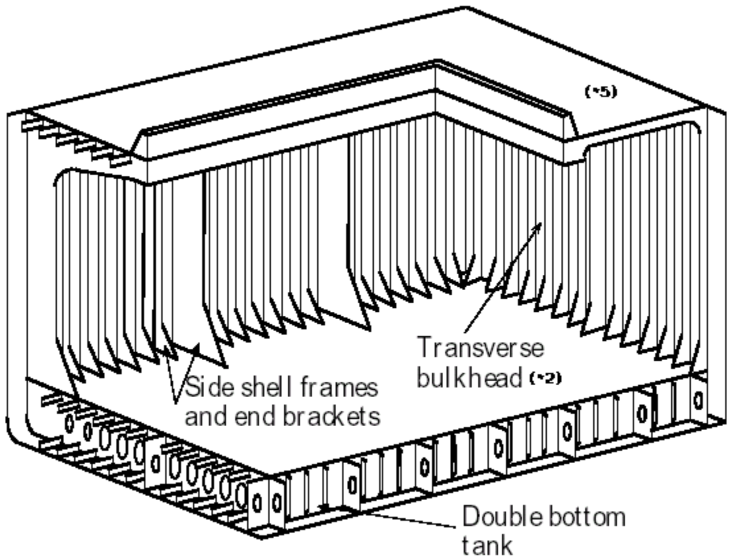
Typical 5 point pattern

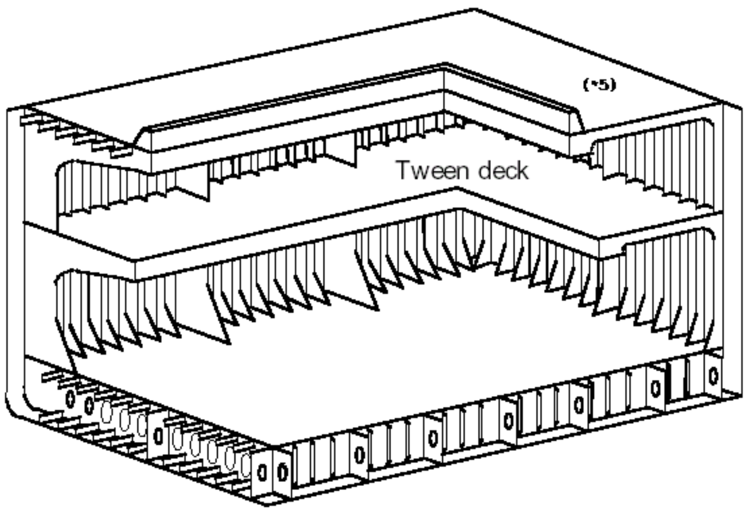
Typical Transverse Frame Non - Typical Transverse Frame

Annex 1-6 Areas of Close-up Survey, etc.

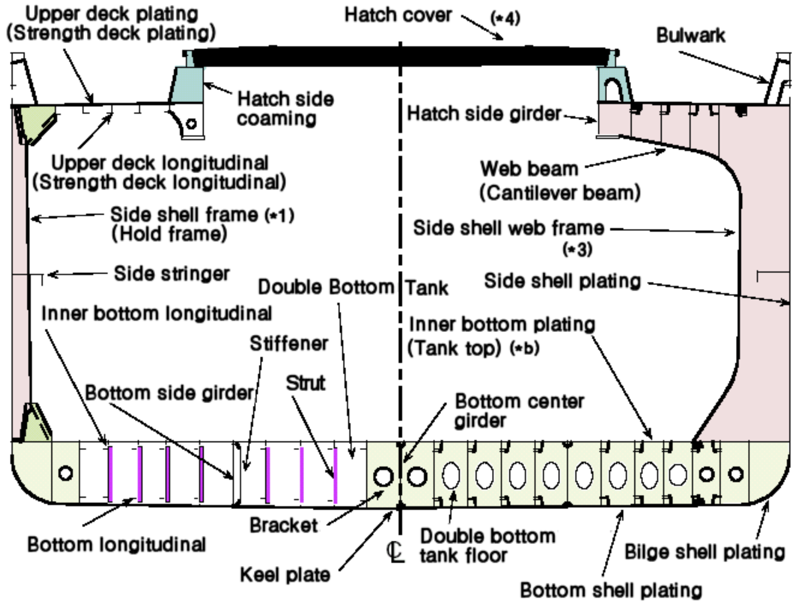
1. Guidance for areas of Close-up Survey for General Dry Cargo Ships, Bulk Carriers, Oil Tankers, Chemical Tankers, Double Hul Oil Tankers and Double Skin Bulk Carriers specified in **Table 1.2.8, Table 1.3.1, Table 1.3.4**, **Table 1.3.7, Table 1.3.10** and **Table 1.3.13** of the Rules are indicated on the diagrams as follows.

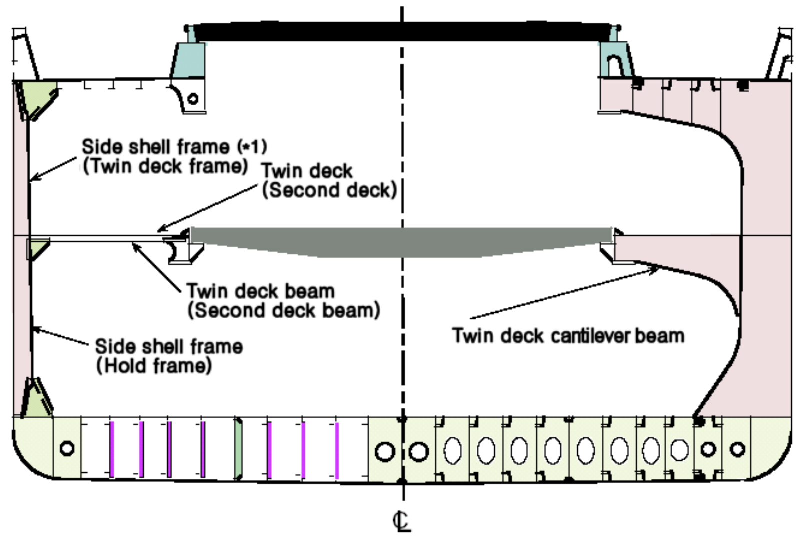
(1) Areas of Close-up Survey for General Dry Cargo Ships





(Continued)

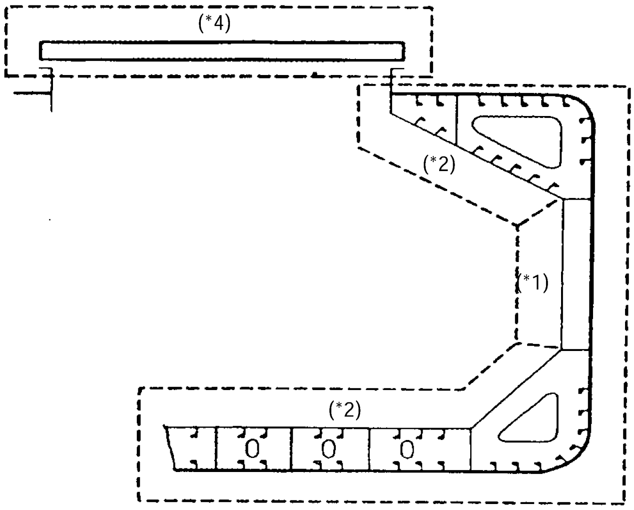




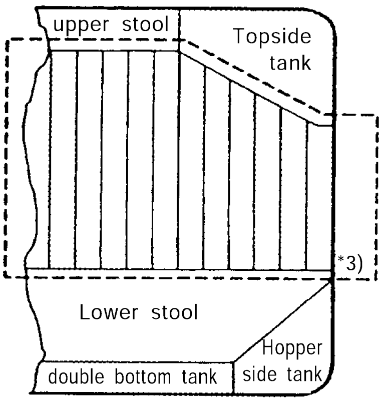
Note : (*1) through (*6) are as given in **Table 1.2.8** of the Rules

(2) Areas of Close-up Survey for Bulk Carriers with ESP notation

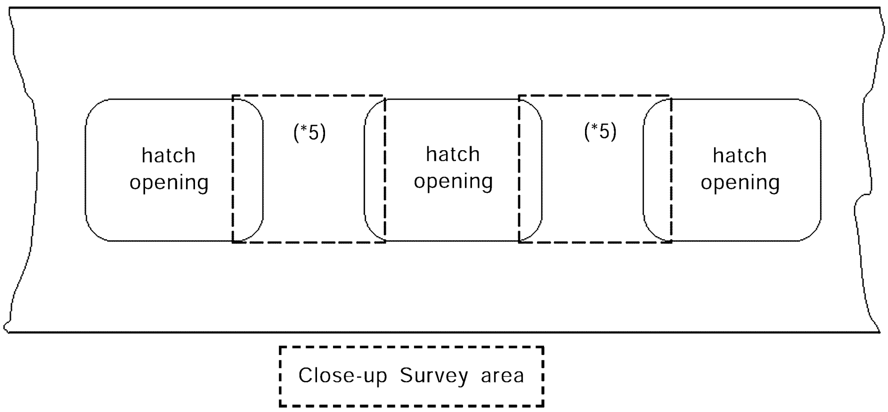
(Typical transverse section)



(Cargo hold, transverse bulkhead)



(Typical areas of deck plating inside line of hatch openings between cargo hold hatches)



Note : (*1) through (*5) are as given in **Table 1.3.1** of the Rules.

℄

LPG Carrier

Annex 1-7 Continuous Machinery Survey Procedure(CMS)

1. Application of CMS

(1) Where the CMS system is intended to be applied, the Shipowner is to submit the "Application for CMS" including "CMS programme". The CMS system, in principle, is applied to machinery installation items of established type. However, the CMS system is not to be applied to non-propelled vessels unless special consideration is given by the Society. And the CMS programme is to be complied with the requirements as follows,
  (A) In principle, all items for CMS are to be included in the programme.
  (B) Consecutive survey intervals of each item are not to exceed 5 years and approximately one-fifth of all items are to be examined every year.
  (C) Preferably, open-up schedules of machinery installations are to be planned to enable the attending Surveyor to evaluate the condition of the whole system from the open-up results of any survey.
  (D) The CMS programme above may be replaced with reference to the ship's maintenance programme. In cases where the ship's maintenance programme is modified in the process of implementation, the CMS programme on board may be partially or wholly amended.

(2) On the basis of the "CMS Programme" submitted by the Shipowner, the Society is to prepare the CMS status, thereafter. the CMS status is to be forwarded from the Head Office to the Shipowner after the completion of CMS. The CMS up-date status is to be kept on board for reference by the attending Surveyor.

(3) Items covered by the CMS system are, in principle, those shown in **Table 1** of the Guidance.

(4) In principle, it is preferable to conduct the open-up survey of essential auxiliaries(normally provided in duplicate or more) alternately at similar intervals. However, the surveys of diesel engines driving generators and bilge pumps is to be conducted, as far as practicable, simultaneous with the Special Survey or Intermediate Survey.

(5) When defects are found on a part during survey, a thorough examination may be required on other similar parts of machinery installations despite the "CMS programme" schedule.

2. Confirmatory Survey for CMS inspected by the Chief Engineer

(1) Qualification of Chief Engineer
  (A) The Chief Engineer is to have sailing experience of at least 3 years as a chief engineer or be certified as a first-grade engineer by the relevant government and
  (B) The Chief Engineer has at least 1 year sailing experience on a ship installed with a similar type of propulsion engine(internal combustion engine or steam turbine for main propulsion).

(2) Where CMS permissible for the Chief Engineer's inspection are as given in **Table 2** were overhauled(or open up) at sea and inspected by the Chief Engineer in routine maintenance works, the inspections may be accepted for the CMS. Whenever such an inspection was carried out by the Chief Engineer during the ship's stay in port(where the attendance of the Society's Surveyor is not easily available), the same process as above is applicable.

(3) The confirmatory survey by the Surveyor, in principle, is to be carried out within 5 months of the day when the CMS were inspected by the Chief Engineer under the attending Surveyor as follows,
  (A) inspection of operational condition.
  (B) reviewing relevant details of the engine log book or maintenance record(e.g. acceptable computer outputs) and hears the Chief Engineer's opinion. If review of the relevant log book and checking of oil and oil filter conditions indicate they are in good working condition, these may substitute for the open up survey of machinery installations listed below. Substitute items are to be recorded in the survey report.
    (a) Oil pumps(excluding cargo oil pumps) and oil heaters
    (b) Hydraulic pumps and motors for deck machinery
    (c) Oil tanks (having a capacity of 1 m^3 or less)

(C) Reporting submitted by the Chief Engineer including following contents
(a) Signature and license number of the Chief Engineer
(b) Inspection date and place
(c) Inspection items and results.
(D) If necessary, the attending Surveyor may request the overhauling(or open-up) survey of relevant machinery according to the results of the Confirmatory Survey.

3. Unification of names and numbers for CMS items

(1) If there are items of CMS used for same purpose each ship, their names are to be unified in accordance with **Table 3**.
(2) For items of CMS used for same purpose are provided in duplicate or more on board, if their serial numbers are not assigned or uncertain, it is recommended for shipyard or shipowner to assign as belows, however, at existing ship the serial numbers of CMS are to be identified with ones attached to name plates or using name on board.
(A) Numbering from Starboard to Port
(B) Numbering from Fore to After.
(C) Numbering from Upper to Lower.
(3) In case ships not applied to the CMS, (2) above may be applied to.

Table 1 Items Covered by the CMS System

Items	Details
1. Main diesel engines	(a) Cylinder covers, cylinder liners, pistons (including piston pins and piston rods), crossheads (including pins, bearings and guides), connecting rods, crank shafts and bearings, camshafts and their driving gears, turbo chargers, scavenge air pumps or blowers, air intercoolers, attached essential pumps (bilge, lubricating oil, fuel oil and cooling water)
2. Main steam turbines	(a) Turbine rotors, blades, bearings, casings, nozzles, nozzle valves and maneuvering valves
3. Power transmission systems and shafting systems	(a) Reduction gears, reversing gears, clutches and flexible couplings (b) Intermediate shafts, thrust shafts and their bearings
4. Auxiliary engines	(a) Auxiliary engines driving generators (excluding emergency generators) or auxiliary essential machinery are to be handled in accordance with the requirements applicable to main engines.
5. Auxiliary machinery	(a) Air compressors and blowers: main and auxiliary starting air compressors (excluding those for emergency use), air compressors for control system, forced draft fans for main boilers, gas compressors and gas blowers (b) Pumps for essential uses: - Cooling fresh water pumps, cooling sea water pumps, fuel oil pumps and lubricating oil pumps for main and auxiliary engines - Fuel oil pumps, feed water pumps and water circulating pumps for main boilers - Feed water pumps and water circulating pumps for auxiliary boilers - Thermal oil pumps- Condensing pumps for main engine - Sea water service pumps - Lubricating oil pumps for reduction gears - Lubricating oil pumps for stern tubes - Hydraulic oil pumps for controllable pitch propellers - Hydraulic oil pumps for steering gears - Hydraulic oil pumps for windlass and mooring winches - Bilge pumps (excluding those for oil separators), ballast pumps and fire pumps (excluding emergency fire pumps) - Cargo oil pumps (including chemical pumps and liquefied gas pumps), stripping pumps, spray pumps and tank cleaning pumps (c) Windlass and mooring winches (d) Cargo refrigerating installations (excluding those for provision storage): compressors, pumps, evaporators and condensers (e) Fresh water generators for main boilers (f) Fuel oil heaters (excluding those for purifiers) and tank cleaning heaters (g) Condensers and feed water heaters (h) Coolers (excluding those for air compressors) (i) Inert gas systems (j) Air reservoirs (excluding those for emergency use) and other pressure vessels for essential uses (k) Fuel oil tanks not form a part of the ship's structure (l) Other items considered to be applicable under the CMS by the Society

Table 2 Machinery Permissible for the Chief Engineers Inspection, etc.

	Items	Remarks
Machinery permissible for the Chief Engineers inspection	1. Main diesel engine 2. Auxiliary diesel engine(Refer to remarks) 3. Forced draft fans & burning pumps for main boiler 4. Auxiliary machinery (1) Air compressor (2) Auxiliary blower (3) Pump (4) Heat exchanger (5) Portable fuel oil tank (6) Fresh water generator (7) Deck machinery (8) Hydraulic pumps of steering gears ※ However, for each part of the main internal combustion engine and internal combustion engine to drive main generator among machinery permissible for the Chief Engineer's inspection, open-up survey by the Surveyor for at least one of two CMS cycles is to be carried.	● The Chief Engineer's inspection for auxiliary diesel engines ● The engine is completely opened up and a careful examination is made on all cylinder units, cylinder liners, cylinder covers, cylinder cover valves, pistons, piston rings, connecting rods and top and lower bearings, piston pins, camshaft driving gears, turbo-chargers, air-intercoolers, crankcase and crankcase doors, engine foundation bolts, and crank case safety valves. ● The top halves of all main bearings are removed and two bottom halves are taken out for examination. ● An examination is made on all crankpins and journals to detect cracks, especially at fillet and areas in the vicinity of oil holes and crank shaft oil grooves. ● Crank web deflections are measured and recorded. ● Wear downs of the cylinder liners are measured and recorded. ● The L.O. cooler attached to the engine, L.O. pumps, cooling water pumps, etc. of direct driven-type are opened up and examined. ● Verify through performance tests that safety devices are in good operating condition. ● The service hours of crank pin bolts are checked and recorded.
Machinery impermissible for the Chief Engineers inspection	1. Crank shaft and its bearing of main engine, crank pin bolts and camshaft driven equipment(Refer to remarks) 2. Steam turbine (main, auxiliary, etc.) 3. Power transmission gear 4. Shafting arrangements 5. Air reservoir 6. Other items not applied to CMS by the Society (1) Refrigeration installations for provision storage (2) Electrical installations (3) Boiler (4) Cargo handling gears(cargo winch) (5) Spare parts (6) Emergency compressors, emergency air tank, emergency generators, emergency fire pumps, etc. (7) Steering gears (8) Other items not considered subject to CMS by the Society	● Measurement of crank web deflection for main diesel engine and check of foundation bolts

Table 3 Table for Unified Name of Machinery

* The following unified expressions will be used in the Society's CMS system for the machinery which has the same purpose but are variously named from ship to ship.

System	Unified name of machinery to be used in CMS system	Various names of machinery actually used in ships
Cooling Sea Water System	Main Cooling S.W. Pump	- Main Cooling S.W. Pump - Main Condenser Cooling S.W. Pump
	Reserve Cooling S.W. Pump	- Reserve Cooling S.W. Pump - Stand-by Cooling S.W. Pump
	A/E Cooling S.W. Pump	- A/E Cooling S.W. Pump - Aux. Machinery Cooling S.W. Pump - Aux. G/T Cooling S.W. Pump
	Aux. Condenser Cooling S.W. Pump	- Aux Condenser Cooling S.W. Pump - Dumping Condenser Cooling S.W. Pump - Vacuum Condenser Cooling S.W. Pump - Atmospheric Condenser Cooling S.W. Pump - Drain Cooler Cooling S.W. Pump
	M/E F.W. Generator(Cooling) S.W Pump	
	S.W. Circulating Pump	
	I.G.G Cooling Water Pump	
Sea Water Service System	S.W. Service Pump	
Cooling Fresh Water System	M/E Cooling F.W. Pump	- M/E Cooling F.W. Pump - Main Cooling F.W. Pump
	M/E Reserve Cooling F.W. Pump	- Reserve Cooling F.W. Pump - Cooling F.W. Service Pump
	Aux. Cooling F.W. Pump	- Aux Cooling F.W. Pump - Air Intercooler Cooling F.W. Pump - Turbo Charger Cooling F.W. Pump
	M/E Jacket Cooling F.W. Pump	
	M/E Piston Cooling F.W. Pump	
	Central Cooling F.W. Pump	
	A/E Cooling F.W. Pump	- A/E Cooling F.W. Pump - Harbour Cooling F.W. Pump
Fuel Oil System	M/E F.O.V. Cooling Pump	- M/E F.O.V. Cooling Pump - M/E F.O.V. Cooling F.W (or Oil) Pump

Annex 1-8 Planned Maintenance System Procedure(PMS)

1. General

(1) At the request of Owner, PMS is to be approved by the Society in accordance with **Fig 1** and Information and Documents given in **Table 1** including the following items are to be submitted.
  (A) organization chart identifying areas of responsibility
  (B) documentation filling procedures
  (C) listing of equipment to be considered by the Society in PMS
  (D) machinery identification procedure
  (E) preventing maintenance sheets for each machine to be considered
  (F) listing and specifications of condition monitoring equipment
  (G) baseline data for equipment with condition monitoring,
  (H) listing and schedule of preventive maintenance procedure.
(2) In addition to the above documentation the following information shall be available on board:
  (A) the above (1) in an up-to-date fashion
  (B) maintenance inspection(manufacturer's and shipyard's)
  (C) condition monitoring data including all data since last opening of the machine and the original base line data
  (D) reference documentation (trend investigation procedure etc.)
  (E) records of maintenance including repairs and renewals carried out.
(3) An annual report covering the year's service, including the following information, shall be reviewed by the Society:
  (A) clauses (1) (C), (D), (E) and (G) as well as changes to other clause in the above (1)
  (B) clause (2) (C)
  (C) full trend analysis(including spectrum analysis for vibrations) of machinery displaying operating parameters exceeding acceptable tolerances.
(4) In general, the intervals for PMS shall not exceed those specified for CMS. However, for components where the maintenance is based on running hours longer intervals may be accepted as long as the intervals are based on the manufacturer's recommendations. However, if an approved condition monitoring system is in effect, the machinery survey intervals based on CMS cycle period may be extended
(5) The PMS shall be programmed and maintained by a computerized system. However, this may not be applied to the current already approved schemes. Computerized systems shall include back-up devices, such as disks/tapes, CDs, which are to be updated at regular intervals.

2. Chief Engineer's responsibility of PMS.

(1) Where a chief engineer is entitled to be complied with the following requirements, the Society is to issue the Chief Engineer Qualification Certificate.
  (A) First-grade licence issued in the relevant nation is to be provided.
  (B) To be recommended by the shipowner(or ship management company) and approved by the Society.
(2) The chief engineer shall be the responsible person on board in charge of the PMS.
(3) Documentation on overhauls of items covered by the PMS shall be reported and signed by the chief engineer.
(4) Access to computerized systems for updating of the maintenance documentation and maintenance program shall only be permitted by the chief engineer or other authorized person.
(5) PMS items to be maintained by Chief Engineer is to be complied with **Table 2** and to be retained on board the overhauled(or opened up) records. However, PMS items not permitted by Chief Engineer's records in **Table 2** are to be surveyed under the attending surveyor as far as practicable at Annual Survey. In single main diesel engine, where vibration characteristics indicating that there is no danger of damage from uneven explosions are to be retained on board and where operating parameters of **Table 3** are monitored, main crank shafts and their bearings may be maintained by the chief engineer subject to complying with the following inspection under the Surveyor.
  (A) review condition monitoring records(**Table 3** Machinery Operating Parameter to be monitored for condition based survey)

(B) review measurement records for weardown of main bearings or bearing clearance and crank web deflection. If necessary, to measure crank web deflection or bearing clearance under the attending Surveyor.
(C) examine white metal debris in the crankcase.
(D) in case of a built-up crank shaft, examine turn-circle mark of shrinkage fitting parts and verify that there is no movement.
(E) examine cracks inside and outside of bedplate and especially cross members
(F) hear the chief engineer's view about crank pins, journals and bearings.

3. Condition monitoring system(CM)

(1) When it is ascertained that the ship under the approved PMS has been installed with condition monitoring system, the inspection for the following items has been confirmed by the Surveyor at the periodical survey, the overhaul(or open-up) intervals on the PMS may be extended. However, the (B) below are to be submitted to the Surveyor.
(A) Conditions and functions of condition monitoring equipment.
(B) Measurements and analysis results obtained from condition monitoring equipment for each machine to be considered.(Refer to **Table 3**)
(C) Operating condition of each equipment
(2) Where the measurements and analysis results obtained from the previous paragraph are to be reviewed and they are found in unsatisfactory by the Surveyor, overhauling(or opening up) examination may be requested.
(3) The Implementation Survey after installation of the condition monitoring system is to be carried out.

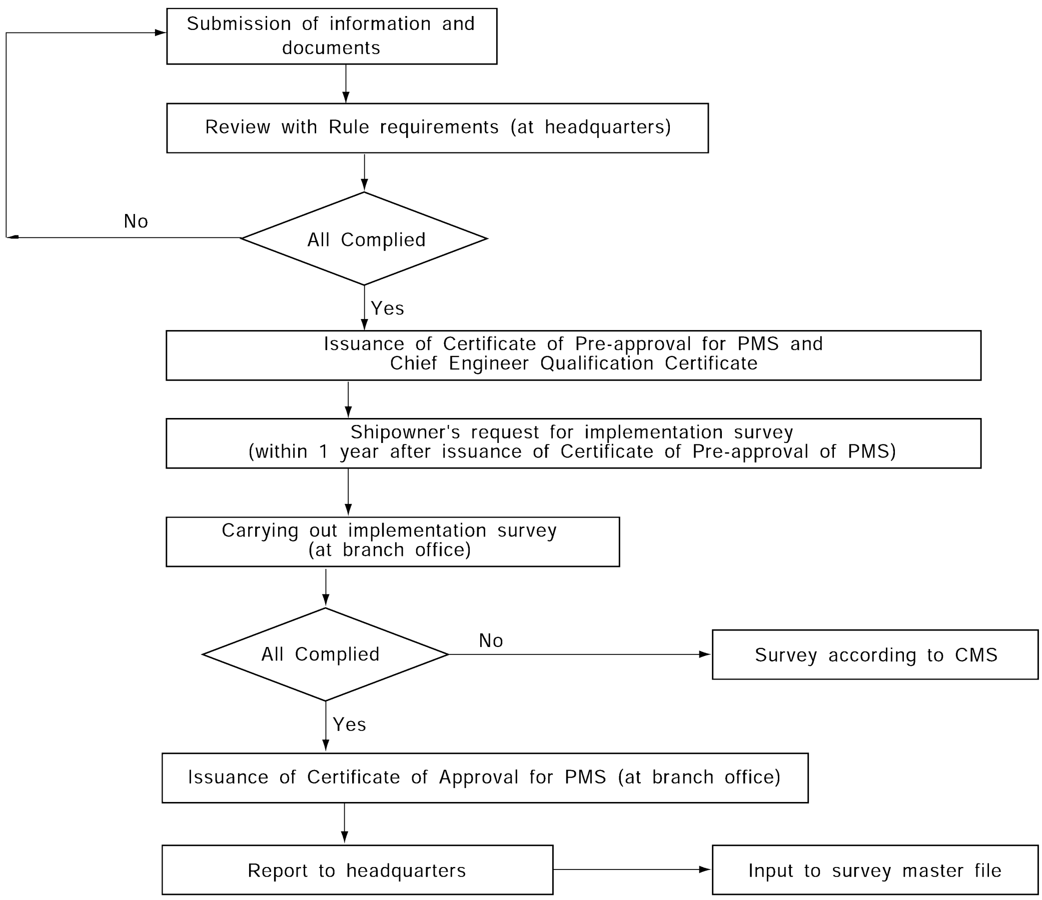

Fig 1 Flow chart for approval procedures

Table 1 Information and Documents to be submitted

Name and content	Remarks
(1) Machinery inventory content: Listing of machinery subjected to maintenance, and index or code for each machinery.	● Unify classification nomenclature for machinery to use the same names as far as possible. ● machinery index or code and CMS code. ● Identify and mark items not permitted by the chief engineer.
(2) Maintenance schedule: (A) It is to be stated for PMS of each item of machinery as follows: - Identification of overhaul survey, kind of inspection and test and content of measurement record - Intervals of overhaul survey, inspection and measurement (B) It is to be stated for CM as follows: - Layout of CM, maker, model and specification of CM equipment - Measuring points, names of measuring instruments and measuring parameters for each machinery - Intervals of measurement for each machinery - Acceptable limits for monitored condition for each machinery - Examples of input and output data	● To be satisfied the Rules requirements for overhaul survey, inspection, measurement, etc. of all machinery. ● To be overhauled with period not to exceed 5 year ● To be confirmed that quantity of machinery to be surveyed every year is not less than about 20 % of machinery covered by PMS. ● To be reviewed CM layout and feasibility of measuring parameters. ● To be sure that output format is easily recognizable by the chief engineer. ● To be reviewed the feasibility of acceptable limit.
(3) Reporting system: (A) To be stated in the program as follows: - Records of maintenance and repairs - Spare parts (B) A regular reporting system between the ship and the supporting land department of the ship company is to be stated.	● Ease in confirming that all reporting and recording procedures are carried out exactly.
(4) Documents for qualification requirements of the chief engineer: (A) Copy of chief engineer's licence (B) Chief engineer's resume	● To be satisfied with the requirements of chief engineer's qualification.

Table 2. Machinery with permission of maintenance by the chief engineer in PMS

System	Machinery with permission of maintenance by the chief engineer under a PMS	Not permission of maintenance by the chief engineer but subject to the attending Surveyor.
Main diesel engines	1. Cylinder covers 2. Valves and valve gears 3. Cylinder blocks and liners 4. Pistons and piston rods 5. Connecting rods, crossheads, top end bearings, guides, gudgeon pins and bushes 6. Crankshafts and bearings - single engine provided with CM equipment is surveyed in accordance with **Annex 1-8, 2** (5) of the Guidance satisfactorily in attendance of the Surveyor during the survey period only. - multiple engine 7. Scavenge pumps, blowers and air coolers 8. Camshafts and camshaft drives	1. Crankshafts and bearings - single engine except that the chief engineer's maintenance items in the left column. 2. Relief devices(Crankcase, scavenging air chamber, camshaft driving gear room, etc.) 3. Engine trial 4. Holding down bolts and chocks
Main Turbines	Casings, rotors, blades, bearing, nozzle, nozzle valve and control valve - with CM equipment whose monitoring of operating parameters and vibration measurement is found in satisfactory under the attending Surveyor only.	1. Holding down bolts and chocks 2. In case without CM equipment, it is to be surveyed after opening the top casing of turbine.
Auxiliary Engines	Auxiliary engines, auxiliary steam turbines and their associated coolers and pumps. - But, where those are used for driving generator, only in case that power can be supplied by at least the other 1 set to essential auxiliaries necessary for propulsion and safety of ship and cooling of refrigerated cargo, in case where any 2 sets do not work(for example; where 1 set is stand-by during the period of 1 set maintenance).	Auxiliary internal combustion engines or auxiliary steam turbines driving generators - In case of satisfying conditions in the left column, the chief engineer's maintenance may be permitted.
Shafting	1. Intermediate shafts and bearings 2. Thrust shafts and bearing(except solid type with crankshaft)	1. Reduction/increase gearing 2. Flexible couplings and clutches 3. Thrust shafts and bearing(solid type with crankshaft)
Remote Control and Automation System	Records for malfunction, abnormal alarms, etc., are to be made and submitted to the Society.	1. Main engine control system for bridge, centralized or automatic controls 2. Requirements for centralized controls or unattended machinery automations
Pressure vessels and auxiliaries	1. Pumps attached to main engine(bilge, L.O., F.O. and cooling water) 2. Independently driven pumps(bilge, ballast, F.W. cooling, S.W. cooling, L.O. and F.O. transfer) 3. Coolers and condensers (F.W. and L.O. coolers for main engine, main and auxiliary condensers and drain coolers) 4. Heaters(F.O., L.O. and feed water) 5. Other auxiliaries(air compressors including safety devices, windlasses, mooring winches, forced or induced draft fans and Independent F.O. tanks)	1. First start arrangement trial 2. All pressure vessels 3. Piping arrangements: steam pipes, sea connections and valves, maneuvering valves, bulkhead stop valves, bilge check-stop valves (including foot valves) 4. Steering gear 5. Electrical equipment Others
Others	IGS(scrubber units, blowers, independent gas generating units)	IGS(all components for inert gas system except for items covered by the chief engineer's maintenance)

Table 3. Machinery Operating Parameter for Condition monitoring System

Items	Operating Parameter
Main Diesel Engine	1. Shaft horse power 2. Engine and Shaft RPM 3. Cylinder pressure-time curves 4. Oil fuel injection pressure-time curves 5. Oil fuel temperature or viscosity 6. Charge air pressure 7. Exhaust gas temperatures 8. Engine cooling systems, temperatures and pressures 9. Engine lubricating oil system, temperatures and pressures 10. Turbo-charger RPM and vibration 11. Lubricating oil analysis data 12. Crankshaft deflections 13. Main bearing temperatures
Main Steam Turbine	1. Turbine rotor vibration 2. Turbine rotor axial displacement 3. Shaft horsepower 4. Shaft and turbine rotor FPM 5. Performance data; (1) Steam conditions at inlet and outlet of each turbine (2) Boiler performance data (3) Condenser vacuum (4) Sea temperatures (5) Steam conditions of other major steam consuming auxiliaries
Auxiliary Steam Turbine	Same as main steam turbine
Auxiliary Diesel Engine	1. Exhaust gas temperatures 2. Engine cooling systems temperatures and pressures 3. Engine L.O. system; temperatures and pressures 4. Turbo-charger RPM and vibration 5. Lub. oil analysis data 6. Crankshaft deflections
Auxiliaries	1. Cooler efficiency, inlet and outlet temperatures 2. Heater temperatures 3. Pumps and fans; vibration and performance 4. Differential pressure across filters

⚓

Annex 1-9 Guidance for Survey of Waterjet Propulsion Systems and Azimuth or Rotatable Thruster

1. The surveys for waterjet propulsion systems and azimuth or rotatable thruster are to comply with the following requirements.

(1) Waterjet propulsion systems

(A) Annual Surveys

At each Annual Survey, the following surveys and inspections are to be carried out.

(a) General inspection of the propulsion system
(b) Verification test of steering performance
(c) Operation test of the reverser
(d) General inspection of impeller

(B) Intermediate Surveys

At each Intermediate Survey, in addition to the all requirements for Annual Survey, the surveys and inspections are to be carried out as deemed necessary by the Surveyor.

(C) Special Surveys

At each Special Survey, in addition to the all requirements for Intermediate Survey, open-up inspections for major part of the hydraulic pump are to be carried.

(D) Docking Surveys

At each Docking Survey, the following surveys and inspections are to be carried out.

(a) The wearing condition of the bearing is to be verified with means deemed appropriate by the Society.
(b) General inspection of the forward sealing device
(c) General inspection of the impeller
(d) Deflector and reverser are to be inspected.

(E) Main Shaft Surveys

(a) General inspection of the main shaft and coupling bolts
(b) General inspection of the major parts of the forward and after main shaft bearings
(c) General inspection of the major parts of the forward main shaft sealing assembly
(d) Open-up inspection for thrust bearing
(e) Inspection of the contact faces of the impeller boss and main shaft(when installed with key and spline)
(f) General inspection of the impeller

(2) Azimuth or rotatable thruster

(A) Periodical Surveys and Docking Surveys

The relevant provisions for propeller shaft, propeller, steering gear and stern tube sealing device specified in **Ch 2, Sec 2** through **Sec 7** of the Rules are to be applied with the necessary modifications.

(B) Shaft Surveys and Gear unit open-up Surveys

Inspections and surveys specified in the following (a) through (b) are to be carried out.

(a) Open-up inspection for propeller shaft sealing device
(b) Efficient crack detection specified in **Ch 2, 702. 1** through **5** of the Rules
(c) General examination for each bearing
(d) Open-up inspection for gear unit

2. For the items which are not specified in **Par 1** above, the relevant provisions for propeller shaft, propeller, steering gear and stern tube sealing device specified in **Ch 2, Sec 2** through **Sec 7** of the Rules, are to be applied with the necessary modifications. ⚓

Annex 1-10 Loading Instrument on Stability

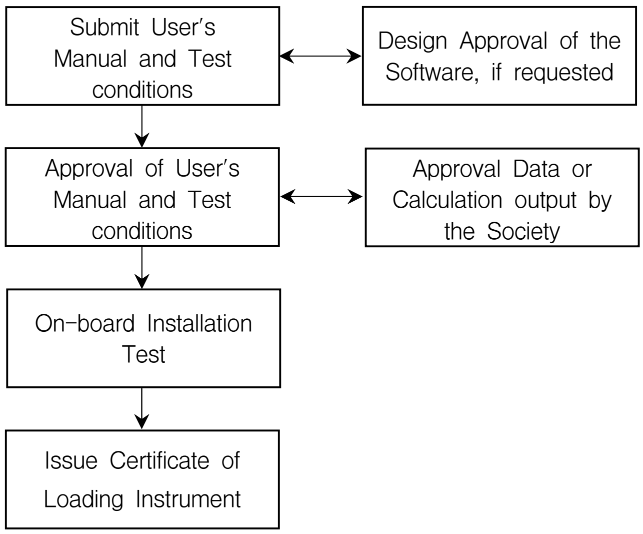
1. Application

(1) This requirement applies to ships having a length exceeding 24 metres when a loading instrument with a stability computation capability(hereinafter called "loading instrument on stability") is installed on a new ship or newly installed on an existing ship in accordance with the requirement in **Ch 1, 307.** of the Rules.

(2) For the purpose of this requirements, "new ship" means a ship for which the application for Classification Survey during Construction is made on or after 1 January 1997 and "existing ship" means a ship for the application for Classification Survey during Construction before 1 January 1997.

2. Approval procedure

(1) The procedure for approval of a loading instrument on stability is as illustrated in **Fig 1.**



* The approval of the software should be carried out in accordance with "**Guidance for Approval of Manufacturing Process and Type Approval, Etc.**"

Fig 1 Procedure for the approval of loading instrument on stability for a specific ship.

(A) User's operations manual and 3 copies of test conditions are to be submitted to Head Office. The loading instrument on stability may be approved provisionally if the stability information booklet is approved provisionally. A provisional certificate may be issued after on-board installation in this case.

(B) The requirements which are checked during approval of the user's operation manual and test conditions are as follows:
- the output of the loading instrument for the exampled test conditions are correct.
- the technical contents and forms of the user's operations manual is appropriate.

(2) Where the loading instrument on stability is intended for office use on shore(in such case it may be used for stability calculations for several different ships), this is acceptable provided that:
- the procedure in this appendix has been satisfactorily completed.
- the user's operations manual and test conditions have been approved for each of ships for which the instrument is used.
- operational performance of the hardware is to be tested but environmental testing is not normally required.
- the installation test is to be carried out and a certificate is issued if found appropriate.

3. Software for a specific ship

(1) General

(A) In order to apply the design approved software to a specific ship, details of the test conditions prepared using all relevant data used by the ship designer concerning hull form definition and compartment definition is to be submitted.

(B) The calculation result should include at least 4 test loading conditions covering the anticipated loading draughts, i.e. a maximum loading draught, a light condition draught and two intermediate draughts. In order for the Society to check the correctness of the calculation, the test conditions should be the same as presented in the stability information booklet submitted for approval. All test loading conditions must show all deadweight items and information on the free surface effect for each deadweight item.

(C) The drawings and data required to be submitted by (2) and (3) below need not be submitted if these are same that were submitted by the designers, etc.

(2) Intact Stability

(A) In order to the Society to verify the data submitted, the following information must be submitted:

- details of hull form definition, e.g., lines plans and/or offset tables, including all appendages.
- hydrostatic particulars including cross curve data
- details of compartment definition including list of volumes, center of gravity and free surface data
- details of position of down-flooding points.
- details of the relevant requirements and criteria against which the calculations must show compliance
- hard copy of output of results

(B) Hard copies of the full results for all test loading conditions are compared with the Society's calculation result(or approved stability information booklet) and the hard copies should include displacement, draughts, trim, VCG, LCG, GM, free surface correction and angle of down flooding.

The residual GZ distribution in curvilinear or tabulated form, is also to be produced for each case showing compliance with intact stability criteria.

(C) Hydrostatic and intact stability characteristics of the hull form and for each test loading condition produced by the software is to be checked against those derived by the Society's programs(or approved stability information booklet).

Characteristics to be checked will include:

- hydrostatic properties for full range of service draughts
- cross curves of stability embracing full range of service displacements
- properties of fully complied test loading conditions
- compliance with intact stability criteria
- relevant limiting $KG/GM/DWT$ values for full range of service draughts where appropriate

(3) Grain stability

(A) In addition to the documentation as specified in preceding (2) (A), the following should also be submitted for the assessment of grain stability calculations.

- Cargo hold drawings showing the structure abreast and beyond hatched including details of hatch end beams with feeding holes, if fitted
- Hatch cover details
- Details of longitudinal divisions, if applicable
- Details of the relevant regulations and criteria against which the calculation must show compliance, e.g., International Grain Code in addition to relevant intact stability criteria
- Hard copy of output of results

(B) Hard copies of the full results for all test loading conditions are to be submitted so that detailed comparisons may be made with the results from the Society's loading instrument program(or approved grain stability booklet). The output is to be include displacement, draughts, trim, VCG, LCG, GM, free surface correction, angle of down flooding, grain heeling moments and maximum allowable grain heeling moment. The residual GZ distribution, curvilinear or tabulated form, is also to be produced for each case showing compliance with intact and grain stability criteria.

(C) The results for each test condition produced by the software will be checked against those derived by the Society's programs(or approved grain stability booklet). The information to be assessed will include:
- curves or tables of grain heeling moments for every compartments, filled or partly filled, including the effects of temporary fittings
- tables of maximum permissible heeling moments or other information demonstrating compliance with the relevant requirements.

4. User's operations manual

(1) User's operations manual approved by the Society is to be provided for the loading instrument on stability. This manual should contain operating instructions for all stability calculations made by the loading instrument.

(2) The user's operations manual must be in a language readily understood by the users.
A English version, if not written in English language, should be provided if the ship on which the instrument is installed is engaged in the international voyage.

(3) The manual should contain general description of the stability software together with a full description of the operational procedure for stability calculations. In this connection, there should be a list of all terms, definitions, error messages and warnings likely to be encountered by the user.
In the case of error messages and warnings, there should be unambiguous user instructions for subsequent action to be taken in each case.

(4) In addition to the above, the following items should also be included in the user's operations manual.
- Lightship weight and co-ordinates of center of gravity
- Full deadweight description of each test loading condition
- Details of applicable Codes/Conventions, including limiting values etc.
- An example of a non-standard calculation well supported by illustrations and sample instrument output
- Hard copy of the results of each test loading condition
- Details of the frequency of testing of the instrument(The loading instrument with a stability computation capability should be handled by qualified personnel fully familiar with the instrument and it is recommended that the correct functioning of the instrument be verified by the ship's master at frequent intervals using the approved test conditions)
- Details of contingency measures in case of power failure
- Example printouts of every possible screen display, complete with explanatory text, to ensure that the user does not encounter any unfamiliar output

(5) In addition to the above, if the instrument performs also strength calculations, the manual should contain permissible values for still water bending moments and shear force and, if applicable, permissible local load for hatch covers, deck and double bottom structure, etc. ⚓

Annex 1-11 Procedural Requirements for Service Suppliers

1. General

The requirements in this Annex apply to assessment and approval of a service supplier(hereinafter referred to as the "supplier") who intends to supply a service (repairs, maintenance, inspection, tests, and measurements for survey) for a ship or mobile offshore (hereinafter referred to as the "ship") to be classed or have been classed to the Society and machinery, materials, etc (hereinafter referred to as the "products") which will be used on that ship.

(1) Firms engaged in thickness measurements on ships(except non-ESP ships less than 500 gross tonnage and all fishing vessels, and the separate requirements specified by the Society are to be applied to these ships)
(2) Firms engaged in tightness testing of hatches with ultrasonic equipment
(3) Firms carrying out in-water survey of ships and mobile offshore units
(4) Firms engaged in the examination of Ro-Ro ships bow, stern, side and inner doors
(5) Firms engaged in testing of coating systems in accordance with IMO Res.MSC.215(82) (Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in All Type of Ships and Double-side Skin Spaces of Bulk Carriers) and IACS PR34 (IACS Procedural Requirement on Application of the IMO Performance Standard for Protective Coatings(PSPC), Res.MSC.215(82), under IACS Common Structural Rules for Bulk Carriers and Oil Tankers)
(6) Other service firms

2. Procedure for approval and certification

(1) Document submission : The supplier is to submit a copy of the application together with two copies of each following data to the Society.
  (A) Quality manual and/or documentary procedure covering following requirements:
    (a) Code of conduct for the relevant activity
    (b) Maintenance and calibration of equipment
    (c) Training programmes for personnel(operators/technicians/inspectors)
    (d) Supervision and verification to ensure compliance with operational procedures
    (e) Recording and reporting of information
    (f) Quality management of subsidiaries and agents
    (g) Job preparation
    (h) Periodic review of work process procedures, complaints, corrective actions and issuance, maintenance and control of documents
    (i) A documented quality system in compliance with the most current version of (KS A)ISO 9000 series and including the above items, (a) to (h), would be considered acceptable.
  (B) Outline of company(e.g. organization and management structure including subsidiaries to be included in the approval/certification)
  (C) List of nominated agents, if any
  (D) Experience of the company in the specific service area, if any
  (E) List of personnel documented training and experience within the relevant service area, and qualifications according to recognised national, international or industry standards, as relevant
  (F) Description of equipment used for the particular service for which approval is sought and a guide for operators of such equipment
  (G) Check lists and record formats of the Society for reporting results of the services
  (H) Evidence of approval/acceptance by other bodies or other class, if any
  (I) Information on the other activities which may present a conflict of interest, if any
  (J) Record of customer claims and of corrective actions requested by certification bodies, if any
  (K) Where relevant, list and documentation of licenses granted by equipment's manufacturer
  (L) Other data deemed necessary by the Society for the approval

(2) Review and audit
(A) Documentation assessment
In the documentation assessment, the data submitted are investigated to confirm that the documents are in conformity with the requirements in **Par 2** (1) above.
(B) Field assessment
(a) Upon satisfactory outcome of the assessment of the documentation, a visit is made to evaluate the supplier's workshop(laboratory. etc.) and to verify the followings
(i) The supplier is duly organised and managed in accordance with the submitted documents.
(ii) It is considered in conformity with requirements in **Par 3, 4** & **5** and capable of conducting the services for which approval/certification is sought.
(b) When parts of services are produced by subcontractors, the Society may request the assessment of them for the purpose of confirming their Quality Control Standard.
(c) When an external person takes part in a service relating to quality of products at works, the Society may request the assessment of that person.
(d) When deficiencies are found, the supplier who is informed of such by documentation is to take the corrective action and report to the Society. Where deemed necessary, a visit by the Surveyor may be made to evaluate the validity of the corrective action.
(C) Renewal audit
(a) Renewal audit is to be carried out in accordance with (A) and (B) above before the expiry date of the Approval Certificate.
(b) Where deemed acceptable, the part of data to be submitted and an audit may be reduced.
(D) Occasional audit
(a) The Society may request the occasional audit if any of the following condition occurs:
(i) When important changes are made to the approved quality system
(ii) When services which were approved are changed or added
(b) In the occasional audit, it is to be confirmed by the Society that all the necessary requirement are in a satisfactory condition.
(E) Preparations for assessment and Others
(a) When the assessment is performed in accordance with the requirements specified in (A) through (D) above, the preparations are to be made by the supplier. On such occasions, service suppliers is also to be present at the assessment.
(b) In case necessary preparations have not been made or in case no responsible person is present at the assessment, the Society may suspend the assessment.
(3) Approval
Certification is conditional on a practical demonstration of the specific service performance as well as satisfactory reporting being carried out.
(A) Issuance of Approval Certificate
(a) Upon satisfactory completion of both the audit of the supplier and the demonstration test, if required, the Society issues the Certificate of Approval in accordance with the other requirements by the Society. The supplier is to be registered on the service suppliers list of the Society. The Certificate is to clearly state that the type and scope of services and any limitations or restrictions imposed.
(b) Where several servicing stations are owned by a supplier, each station is to be assessed and approved except as specified in **Par 4** (B) below.
(B) The term of validity for the Approval Certificate
(a) The valid term of an approval certificate is 3 years from the date of the initial or the renewal approval.
(b) In case where the renewal assessment is carried out within 3 months before the expiry date, the valid term of the certificate is three(3) years from the expiry date.
(c) In case where the extension of the valid term of the approval Certificate is requested by the supplier, the Society may extend the valid term within the period of three(3) months after expiration of the term of validity. However, in this case, the term of validity for the renewed approval certificate is the next day of the expiry date of the previous certificate.

(C) Change in the quality assurance system
(a) In case where any change to the company organization, the quality manual, etc. having effect on the quality system, it is to be immediately communicated to the Society by the supplier.
(b) Important changes having significant effect on the approved quality system are as follows:
(i) Overall alteration or abolition of the quality manual, etc.
(ii) Alteration of major management(Owner, director's committee, etc.)
(iii) Alteration of organization(consolidation of the quality system, etc.)
(iv) Alteration, abolition and transfer of the major facilities specified in quality manual
(D) Suspension and withdrawal of certification
(a) Where non-conformities in the approved quality system are found by the Surveyor, or where conditions for the issuance of the certificate or for its maintenance have deteriorated, the supplier is to correct the non-conformities. Such corrections are to be verified by the Society if necessary. In case corrective actions are not taken within the specified period, the Society may suspend the approved certificate for a given period. In case the corrective actions are not taken for the suspended period, the Society may withdraw the approval.
(b) The Society can withdraw the approval if any of the following conditions occur:
(i) Where the important changes having significant effect on the quality system is not communicated to the Society.
(ii) Where the occasional audit or renewal audit is not carried out in the relevant period.
(iii) Where a request for withdrawal is made by the supplier.
(iv) Where the service is carried out improperly or the result of inspection is reported improperly, and where the fact that the services provided are not in compliance with the approval condition are ascertained.
(v) Where the approval fees are not paid.
(vi) Where wilful acts or omissions are ascertained.
(c) A supplier whose approval has been cancelled, may apply for re-approval provided that the non-conformities which resulted in cancellation are corrected, and the Society is issue the approval certificate after it is confirmed that the corrective action has effectively been implemented.

3. General Requirements of the Suppliers

(A) Extent of approval
The supplier is to demonstrate, as required by (B) - (I), that it has the competence and control needed to perform the services for which approval is sought.
(B) Training of personnel
The supplier is responsible for the qualification and training of its personnel to a recognised national, international or industry standard as applicable. Where such standards do not exist, the supplier is to define standards for the training and qualification of its personnel relevant to the functions which are authorized to perform. The personnel is to also have an adequate experience and be familiar with the operation of any necessary equipment. The personnel is to have a minimum of one(1) year on-the-job training or equivalent experience. Where it is not possible to perform internal training, a program of external training may be considered as acceptable.
(C) Supervision
The supplier is to provide supervision for all services provided. The appointed supervisor is responsible for work performed and the final report. The responsible supervisor is to have minimum of two(2) years experience as a personnel within the approved activity of the supplier. For a supplier consisting of one person, that person shall meet the requirements of a supervisor.
(D) Personnel records
The supplier is to maintain the records of the approved personnel and submit them when the records are requested by the Surveyor. The record is to contain information on age, formal education, training and experience for the approved services.

(E) Equipment and facilities
The supplier is to have the necessary equipments and facilities for the service. A record containing information on maintenance and calibration of the equipments used is to be maintained.

(F) Procedures
The supplier is to have documented work procedures covering all services supplied.

(G) Subcontractors
The supplier is to submit the information on agreements and arrangements to the Society, if any parts of the services provided are subcontracted. Particular emphasis shall be given to quality management by the supplier in following-up of such subcontracts. Subcontractors providing any other than subcontracted personnel or equipment shall also meet the requirements of **Par 2** (1) (A) and **Par 3.**

(H) Verification
The supplier is to verify that the services provided are carried out in accordance with approved procedures.

(I) Reporting
The report is to be prepared in a form acceptable to the Society and it shall include a copy of the Certificate of Approval of the Society.

(J) Quality system
The supplier is to have a documented system covering at least the items in **Par 2** (1) (A) (a) to (h).

4. Service Suppliers in Relations with the Equipment Manufacturer

(A) A company which works as a service station for manufacturer(s) of equipment(and as a service supplier in this field), is to be assessed by the manufacturer(s) and nominated as their agent. The manufacturer is to ensure that appropriate instruction manuals, material etc. are available for the agent as well as of proper training of the agent's technicians. Such suppliers is to be approved either on a case by case basis, or in accordance with (B).

(B) If a manufacturer of equipment(and service supplier) applies to the Society for inclusion of his nominated agents and/or subsidiaries in the approval, then he must have implemented a quality system certified in accordance with the most current version of (KS A)ISO 9000 series, with effective controls of his agents and/or subsidiaries, and when these agents/subsidiaries have an equally effective quality system complying with the relevant requirements specified in the most current version of (KS A)ISO 9000 series. Such approvals shall be based upon an evaluation of the quality system implemented by the parent company against the most current version of (KS A)ISO 9000 series. The Society may require follow-up to confirm adherence to this quality system by performing audits on such agents or subsidiaries against the most current version of (KS A)ISO 9000 series.

5. Special Requirements for Various Categories of Service Suppliers

(1) Firms engaged in thickness measurements on ships

(A) Extent of engagement
Thickness measurement of structural material of ships except non-ESP ships less than 500 gross tonnage and all fishing vessels, and the separate requirements specified by the Society are to be applied to these ships.

(B) Supervisor and Personnel

(a) The responsible supervisor and personnels shall be qualified according to a recognised national or international industrial Non-Destructive Examination Standard(e.g. EN 473 level II or ISO 9712 level II).

(b) The supervisor and personnel are to have adequate knowledge of the Ship structures sufficiently to select a representative position for each measurements.

(C) Equipment
On coated surfaces, instruments using pulsed echo technique(either with oscilloscope or digital instruments using multiple echo, single crystal technique) are required. Single echo instruments may be used on un-coated surfaces, which have been cleaned and grinded.

(D) Procedures
Documented work procedures are at least to contain information on survey preparation, selection and identification of test locations, surface preparation, protective coating preservation, calibration checks, and report preparation and content.
(E) Report
(a) The report is to be made on the basis of the **Annex 1-5** of the Guidance.
(b) The report is to be documented and maintained by supplier for each separate ship with being signed by the Surveyor.

(2) Firms engaged in tightness testing of hatches with ultrasonic equipment
(A) Extent of engagement
The suppliers undertaking tightness tests of hatches by ultrasonic equipment as an alternative to hose testing with water.
(B) Personnel
The personnel is to have the following qualifications:
(a) Have knowledge of different hatch designs, their functioning and sealing features
(b) Have experience with operation and maintenance of different hatch designs
(c) Be able to document a theoretical and practical training onboard in using ultrasonic equipment specified
(C) Equipment
The ultrasonic equipment to be used is to be type approved by the Society. It should be demonstrated for the Surveyor that the equipment is fit for the purpose of detecting leakages in hatch covers.
(D) Procedures
The supplier is to have documented work procedures including the manual for the ultrasonic equipment specified, its adjustment, its maintenance, its operation and approval criteria.

(3) Firms carrying out in-water survey
(A) Extent of engagement
In-water survey of ships and mobile offshore units.
(B) Training of personnel
(a) The supplier is responsible for the qualification of his personnels and the diving equipment utilized when carrying out survey.
(b) Following knowledges for training of personnel are to be documented.
(i) Ship's underwater structure and appendages, tail shaft, propeller, rudder and its bearings, etc.
(ii) Under-water thickness gauging and non-destructive testing in accordance with a recognised national or international industrial NDT standard
(iii) Bearing clearance measurements on rudders and tail shaft
(iv) Under-water video monitoring with TV-monitors on deck, as well as still picture work
(v) Operation of under-water communication system
(vi) Special equipment and tools like hull cleaners, grinders, cutters, etc.
(c) Plan for training of personnel
A plan for training of personnel in the reporting system should be included the minimum Rule requirements for relevant ship types, ship's underwater structure, measuring of bearing clearances, the recognition of corrosion damage, buckling and deteriorated coatings, etc.
(C) Supervisor
The supervisor is to be qualified according to the supplier's general requirements and have minimum two(2) years experience as a personnel carrying out survey.
(D) Personnel carrying out survey
The personnel carrying out survey is to have at least one(1) year of experience as an assistant personnel carrying out survey(minimum 10 different assignments).
(E) Equipment
The followings are to be available:
(a) Closed circuit colour television with sufficient illumination equipment
(b) Two-way communication between diver and surface staff
(c) Video recording device connected to the closed circuit television
(d) Under water still photography camera
(e) Equipment for carrying out thickness gauging, non-destructive testing and measurements (e.g. clearances, indents, etc.) as relevant to the work to be performed.

(f) Equipment for cleaning of the hull

(F) Procedures and guidelines

The supplier is to have documented operational procedures and guidelines for how to carry out the survey and handle the equipment. These are to include:

(a) Two-way communication between diver and surface staff

(b) Video recording and closed circuit television operation

(c) Guidance of the diver along the hull to ensure complete coverage of the parts to be surveyed

(G) Verification

The supplier must have the surveyor's verification of each separate job, documented in the report by his signature

(4) Firms engaged in the examination of Ro-Ro ships bow, stern, side and inner doors

(A) Extent of engagement

Inspection of securing and locking devices, hydraulic operating system, electric control system for the hydraulics, electric indicator systems, and supporting, securing and locking devices and tightness testing.

(B) The supplier is to be certified in accordance with the relevant requirements specified in the most current version of (KS A)ISO 9000 series.

(C) Reference documents

The supplier is to have access to SOLAS 1974 as amended and IACS Internal Guidelines No.8 - Check-list for Surveys of Ro-Ro Ships Shell and Inner Doors Guidelines for Surveyors, or its equivalent, by the Society.

(D) In addition to **Par 3** (c), the Senior Service Engineer(Supervisor) is to have a minimum two(2) years education from a technical school.

(E) Required Equipment

(a) For Inspection of Supporting Securing and Locking Devices, Hinges and Bearings.

(i) Equipment for measuring clearances(i.e. feeler gauges, vernier calipers, micrometers).

(ii) Non-destructive examination(i.e. dye penetrant, magnetic particle inspection)

(b) For Tightness Testing

(i) Ultrasonic leak detector or equivalent

(c) For Inspection of Hydraulic Operating System

(i) Pressure gauges

(ii) Particle counter for analysing the quality of hydraulic fluid

(d) For Inspection of Electric Control System and Indication System

(i) Digital multi-meter

(ii) Earth fault detector

(F) Procedures and Instructions

(a) The supplier is to have access to drawings and documents, including the Operating and Inspection Manual.

(b) The supplier is to have access to the service history of the doors.

(c) The supplier is to use, complete and sign a checklist which has been found acceptable by the Society.

(G) Report

(a) After completion of the inspection, the report for each separate ship is to be made and verified by the Supplier.

(b) The report is to be signed by the Surveyor, documented and maintained.

(5) Firms engaged in testing of coating systems in accordance with IMO Res.MSC.215(82) and IACS PR34

(A) Laboratories

(a) Extent of Engagement

Testing of coating systems in accordance with IMO Res.MSC.215(82) and IACS PR34

(b) The supplier is to provide to the Society the following information:

(i) A detailed list of the Laboratory test equipment for the IMO Res.MSC.215(82) coating approval.

(ii) A detailed list of reference documents comprising a minimum those referred to in IMO Res.MSC.215(82) that are available in the laboratory.

(iii) Details of testing panel preparation, procedure of test panel identification, coating application, test procedures and a sample test report.

(iv) Details of exposure method and site for weathering primed test panels.

(v) A sample daily or weekly log/form for recording test condition and observations including unforeseen interruption of the exposure cycle with corrective actions.
(vi) Details of any sub-contracting agreements.
(vii) Comparison test report with an approved coating system or laboratory if available.

(c) Reporting - Reference is made to the following IACS Recommendations;
(i) Rec.101 : IACS Model Report for IMO Res.MSC.215(82) Annex 1 "Test Procedures for Coating Qualification"
(ii) Rec.102 : IACS Model Report for IMO Res.MSC.215(82) Annex 1 "Test Procedures for Coating Qualification", Section 1.7 - Crossover Test

(d) Audit of the test laboratory is to be based on this procedure and the standards listed in the IMO Res.MSC.215(82).

(6) Other service firms
Where the supplier providing the service other than (1) through (5) wishes to obtain the approval of the Society, other specified requirements are to be applied. ⚓

Annex 1-12 Hull Survey for Classification Survey during Construction

1. Scope

The scope of this Annex includes the following main activities:

(1) Examination of the parts of the ship covered by classification rules and by applicable statutory regulations for hull construction, to obtain appropriate evidence that they have been built in compliance with the rules and regulations, taking account of the relevant approved drawings.

(2) Appraisal of the manufacturing, construction, control and qualification procedures, including welding consumables, weld procedures, weld connections and assemblies, with indication of relevant approval tests.

(3) Witnessing inspections and tests as required in the classification rules used for ship construction including materials, welding and assembling, specifying the items to be examined and/or tested and how(e.g. by hydrostatic, hose or leak testing, non destructive examination, verification of geometry) and by whom.

(4) Appraisal of material and equipment used for ship construction and their inspection at works is not included in this Annex. Details of requirements for hull and machinery steel forgings and castings and for normal and higher strength hull structural steel are given in IACS UR W7(Hull and Machinery Steel Forging), W8(Hull and Machinery Steel Casting) and W11(Normal and High Strength Hull Structural Steels) respectively. Acceptance of these items is verified through the survey process carried out at the manufacturer's works and the issuing of the appropriate certificates.

2. Definitions

(1) The hull structure is defined as follows:

(A) hull envelope including all internal and external structures,

(B) superstructures, deckhouses and casings,

(C) welded foundations, e.g. main engine seatings,

(D) hatch coamings, bulwarks,

(E) all penetrations fitted and welded into bulkheads, decks and shell,

(F) the fittings of all connections to decks, bulkheads and shell, such as air pipes and ship side valves − all ILLC 1966, as amended, items.

(G) welded attachments to shell, decks and primary members, e.g. crane pedestals, bitts and bollards, but only as regards their interaction on the hull structure.

(2) Reference to documents also includes electronic transmission or storage.

(3) Definition of survey methods which the Surveyor is directly involved in: Patrol, Review, Witness

(A) Patrol, the act of checking on an independent and unscheduled basis that the applicable processes, activities and associated documentation of the shipbuilding functions identified in **Table 1** continue to conform to classification and statutory requirements.

(B) Review, the act of examining documents in order to determine traceability, identification and to confirm that processes continue to conform to classification and statutory requirements

(C) Witness is the attendance at scheduled inspections in accordance with the agreed Inspection and Test Plans or equivalent to the extent necessary to check compliance with the survey requirements.

3. Applications

(1) This Annex covers the survey of all new construction of steel ships intended for classification and for international voyages except for:

(A) those defined in SOLAS I/3

(B) High Speed Craft as defined in I/1.3.1 of the 2000 High Speed Craft Code

(C) Mobile Offshore Drilling Units as defined in I/1.2.1 of the MODU Code

(2) This Annex covers all statutory items, relevant to the hull structure and coating, i.e. Load Line and SOLAS Safety Construction.

(3) This Annex does not cover the manufacture of equipment, fittings and appendages regardless whether they are made inside or outside of the shipyard, examples being as follows. Evidence of acceptance shall be provided by accompanying documentation from class Surveyor at manufacturer and verified at the shipyard:
(A) hatch covers,
(B) doors and ramps integral with the shell and bulkheads,
(C) rudders and rudder stock,
(D) all forgings and castings integral to the hull.
(4) This Annex applies to the installation into the ship, welding and testing of:
(A) the items listed in (3) above
(B) equipment forming part of the watertight and weather tight integrity of the ship.
(5) This Annex applies to the hull structures and coating constructed at any of the following:
(A) shipbuilder’s facilities,
(B) sub-contractors at the shipbuilder’s facilities,
(C) sub-contractors at their own facilities or at other remote locations

4. Qualification and monitoring of personnel

(1) Exclusive Surveyors of the Society, as defined in IACS PR5(Definition of Exclusive Surveyor and Non-Exclusive Surveyor and Procedure for Employment and Control of Non-Exclusive Surveyors), are to confirm through patrol, review and witness as defined in **Par 2** (3), that the ships are built using approved plans in accordance with the relevant rules and statutory requirements. The Surveyors are to be qualified to be able to carry out the tasks and procedures are to be in place to ensure that their activities are monitored. Details are specified in PR6(Procedure for Activity Monitoring of Surveyors/ISM Code Auditor) and PR7(Procedure for Qualification and Training of Surveyors).

5. Survey of the hull structure

(1) **Table 1** provides a list of surveyable items for the hull structure and coating covered by this Annex, including:
(A) description of the shipbuilding functions
(B) classification and statutory survey requirements
(C) survey method required for classification
(D) relevant IACS and statutory requirement references
(E) documentation to be available for the Surveyor during construction
(a) the shipbuilder is to provide the Surveyors access to documentation required by classification, this includes documentation retained by the shipbuilder or other third parties
(b) the list of documents approved or reviewed by the Society for the specific new construction are as follows:
(i) plans and supporting documents
(ii) examination and testing plans
(iii) NDE plans
(iv) welding consumable details
(v) welding procedure specifications
(vi) welding plan or details
(vii) welder’s qualification records
(viii) NDE operator's qualification records
(F) Documents to be inserted into the ship construction file. Refer to **Par 10** for details
(G) A list of specific activities which are relevant to the shipbuilding functions. This list is not exhaustive and can be modified to reflect the construction facilities or specific ship type.
(2) Evidence is also to be made available, as required, by the shipbuilder, to the Surveyor whilst the construction process proceeds to prove that the material and equipment supplied to the ship has been built or manufactured under survey relevant to the classification rules and statutory requirements.

6. Review of the construction facility

(1) The Society is to familiarize themself with the yard's production facilities, management processes and safety for consideration in complying with the requirements of **Table 1** using "Shipyard review record" of **Annex 1-12-1** or equivalent prior to any steelwork or construction taking place in the following circumstances:
  (A) where the Society has none or no recent experience of the construction facilities − typically after a one year lapse - or when significant new infrastructure has been added,
  (B) where there has been a significant management or personnel re-structuring having an impact on the ship construction process,
  (C) or where the shipbuilder contracts to construct a vessel of a different type or substantially different in design.

7. Newbuilding survey planning

(1) Prior to commencement of surveys for any newbuilding project, the Society is to discuss with the shipbuilder at a kick off meeting the items listed in **Table 1**. The purpose of the meeting is to agree how the list of specific activities shown in **Table 1** is to be addressed. The meeting is to take into account the shipbuilder's construction facilities and ship type including the list of proposed subcontractors. A record of the meeting is to be made, based upon the contents of the **Table 1** − the **Table 1** can be used as the record with comments made into the appropriate column. If the Society has nominated a Surveyor for a specific newbuilding project then the Surveyor is to attend the kick off meeting. The builder is to be asked to agree to undertake ad hoc investigations during construction where areas of concern arise and for the builder to agree to keep the Society advised of the progress of any investigation. Whenever an investigation is undertaken, the builder is to be requested, in principle, to agree to suspend relevant construction activities if warranted by the severity of the problem.
(2) The records are to take note of specific published Administration requirements and interpretations of statutory requirements.
(3) The shipyard shall be requested to advise of any changes to the activities agreed at the kick off meeting and these are to be documented. E.g. if the shipbuilder chooses to use or change sub-contractors, or to incorporate any modifications necessitated by changes in production or inspection methods, rules and regulations, structural modifications, or in the event where increased inspection requirements are deemed necessary as a result of a substantial non-conformance or otherwise.
(4) Shipbuilding quality standards for the hull structure during new construction are to be reviewed and agreed during the kick-off meeting. Structural fabrication is to be carried out in accordance with IACS Recommendation 47, "Shipbuilding and Repair Quality Standard", or a recognized fabrication standard which has been accepted by the Society prior to the commencement of fabrication/construction. The work is to be carried out in accordance with the Rules and under survey of the Society.
(5) The kick-off meeting may be attended by other parties(owner, administrations, etc.) as defined in IACS PR3(Transparency of Classification and Statutory Information) subject to agreement by the shipbuilder.
(6) In the event of series ship production consideration may be given to waiving the requirement for a kick off meeting for the second and subsequent ships provided any changes are documented as required in (1) and (3) above.

8. Examination and test plan for newbuilding activities

(1) The shipbuilder is to provide plans of the items which are intended to be examined and tested. These plans need not be submitted for approval and examination at the time of the kick off meeting. They are to include:
  (A) proposals for the examination of completed steelwork - generally referred to as the block plan and are to include details of joining blocks together at the pre-erection and erection stages or at other relevant stages
  (B) proposals for fit up examinations where necessary
  (C) proposals for testing of the structure(leak and hydrostatic) as well as for all watertight and weathertight closing appliances

(D) proposals for non-destructive examination
(E) any other proposals specific to the ship type or to the statutory requirements.
(2) The plans and any modifications to them are to be submitted to the Surveyors in sufficient time to allow review before the relevant survey activity commences.

9. Proof of the consistency of surveys

(1) The Society is to be able to provide evidence, e.g. through records, check lists, inspection and test records, etc. that its Surveyors have complied with the requirements of the newbuilding survey planning and duly participated in the relevant activities shown in the shipbuilder's examination and test plans.

10. Ship Construction File

(1) The shipbuilder is to deliver documents for the Ship Construction File. In the event that items have been provided by another party such as the shipowner and where separate arrangements have been made for document delivery which excludes the shipbuilder, that party has the responsibility. The Ship Construction File shall be reviewed by the Surveyor for content in accordance with the requirements of (2) below.
(2) It is recognised that the purpose of documents held in the Ship Construction File on board the ship, is to facilitate inspection(survey) and repair and maintenance, and, therefore, is to include in addition to documents listed in **Table 1**, but not be limited to:
(A) as-built structural drawings including scantling details, material details, and, as applicable, wastage allowances, location of butts and seams, cross section details and locations of all partial and full penetration welds, areas identified for close attention(for general dry cargo ships, liquefied gas carriers and ships subject to the enhanced survey programme) and rudders,
(B) manuals required for classification and statutory requirements, e.g. loading and stability, bow doors and inner doors and side shell doors and stern doors − operations and maintenance manuals(IACS UR S8(Bow Doors and Inner Doors) and S9(Side Shell Doors and Stern Doors))
(C) ship structure access manual, as applicable,
(D) copies of certificates of forgings and castings welded into the hull(IACS UR W7(Hull and Machinery Steel Forging) and W8(Hull and Machinery Steel Casting)),
(E) details of equipment forming part of the watertight and weathertight integrity of the ship,
(F) tank testing plan including details of the test requirements(IACS UR S14(Testing Procedures of Watertight Compartments)),
(G) corrosion prevention specifications(IACS UR Z8(Corrosion Protection Coating for Salt Water Ballast Spaces) and Z9(Corrosion Protection Coatings for Cargo Hold Spaces on Bulk Carriers)),
(H) details for the in-water survey, if applicable, information for divers, clearances measurements instructions etc., tank and compartment boundaries,
(I) docking plan and details of all penetrations normally examined at drydocking.
(J) Coating Technical File, for ships subject to compliance with the IMO Performance Standard for Protective Coatings(PSPC) as a class requirement under the IACS Common Structural Rules.

Appendix 1-12-1 Shipyard review record
Table 1
Appendix 1-12-2 Ship Construction File Form Example

Appendix 1-12-1 Shipyard review record

Name of Shipyard	Date

1. Details of any management systems

Obtained Approval	Certified by	Expiry Date	Remarks (scope, etc.)
ISO-9001			
ISO 14001			
ISO 18001			
Other:			

2. Construction Equipment: (Documents such as a brochure of shipyard can be attached in lieu of completing this section.)

2.1 Building Berth (B) or Dock (D)

* In case of berth, Depth is not applicable.

B / D	Name	Length (m)	Width (m)	Depth* (m)	Building Capacity (Gross Tonnage)	Crane (Ton x No.)

2.2 Outfitting Quays

Name	Length (m)	Width (m)	Depth (m)	Berthing Capacity (Gross Tonnage)	Crane (Ton x No.)

2.3 Main Fabrication and Erection Facilities

(1) Marking and cutting of steel plates(including internal members)
- Marking method (Manual, Photo x ______, EPM x ______, NC x ______ others ______)
- NC cutting machine (Gas x ______, Plasma x ______, Laser x ______)
  Control procedure of NC (On-line, other)
- Cutting equipment (Edge planer x ______, Roll-shear x ______)

(2) Marking and cutting of section bar
- Marking method (Manual, NC) - Marking of reference curved line (Manual, NC)
- Cutting method (Manual, NC) - In case of NC (Gas x ______, Plasma x ______)

(3) One-side automatic welding machine (Yes, No)
- Type of welding machine (Flax Backing x ______, Flux and Copper Backing x ______ other ______)
- Existence of special surface plate for plate welding (Yes, No)

(4) Fillet welding machine (Gravity, Automatic) Percentage of automatization except gravity: about ____%
- Line welder (No, Yes: submerged arc x ______ heads, CO_2 x ______ heads)
- Small automatic fillet welding machine (No, Yes: Name: ______________________ x ______)
- Welding robot (No, Yes: Portal x ______, Rectangular x ______, Articulated x ______)

(5) Painting equipment
- Plate shot blasting/primer coating machine (No, Yes: Max. Width ______ m, Length ______ m)
- Section bar shot blasting/primer coating machine (No, Yes: Max. Length ______ m)
- Special coating factory (No, Yes: ______ m x ______ m x ______ sections)

(6) Vertical automatic welding machine (No, Yes: EG x ______, SEG x ______, ES x ______)
EG: Electrogas SEG: Simplified Electrogas ES: Electroslag

(7) Other main fabrication facilities

3. Shipyard control of Qualified Welders

(1) Normal steel

		certification	traceability	supervision	maintenance of qualification
Shipyard workers	confirm system in place	Yes/No	Yes/No	Yes/No	Yes/No
Subcontracted workers	confirm system in place	Yes/No	Yes/No	Yes/No	Yes/No

4. Feature of Construction Procedure

(1) Subcontract of hull blocks(weight)
- Sub members (No, Yes: Ratio of subcontracted works ______ %, No., of subcontractors ______)
- Blocks (No, Yes: Ratio of subcontracted works ______ %, No., of subcontractors ______)

(2) Method of plate block assembly
- Method fitting and welding longitudinals and transverse webs on jointed panels
- Method welding longitudinals on jointed panels prior to fitting and welding transverse webs
- Method fitting and welding a frame consists of longitudinals and transverse webs on jointed panels
- Method jointing panels with pre-assembled longitudinals by welding prior to fitting and welding transverse webs
- Other (please specify in (5) below)

(3) - pre-erection outfitting carried out
grand block/mega block adopted
Method of erection at building berth/dock
- Max. weight of loading block: ton
- Construction method in building dock/berth/land construction etc. (1 ship, 1.5 ships: Semi-tandem, dual entrance)
- Block loading process (single starting block, multi starting blocks, inserting block : No, Yes)

(4) Final dock (No, Yes: In-house, Other place of the same company, Use other company)

(5) Other feature of construction procedure

5. Quality Control System: (Refer to Quality Manual, if available.)

Item and description	Result	Remarks
(1) Existence of the organization chart including the departments of design, purchasing, manufacturing and quality assurance - Are the function, responsibility and competence of the organization clear?		
(2) Quality control organization - Existence of quality control organization - Number of employees in this organization - Existence of procedures or plans related to tests and inspections	______ persons including the chief	
(3) Pre-inspection system of shipyard - Is pre-inspection carried out prior to Class inspection? - Are pre-inspectors assigned? (Check the list.) - Number of pre-inspectors (related to hull only) - Are inspection results marked on the object and/or recorded in the checklist?	______ persons	
(4) Records of inspections and tests - Are records made and kept properly? - Does the responsible person verify the records? - Can the adoption of necessary corrective actions against non-conformity happened be checked?		
(5) Condition at the time of the surveys in the presence of class Surveyors - Is the schedule of the surveys changed often? - Are pre-inspection, shipyard inspection and repairs completed beforehand? - Are the sufficient preparations for surveys such as scaffoldings, lighting, cleaning made?		
(NOTES) Above-mentioned (3) and (4) include the acceptance inspection of subcontracted items.		

6. Measures for Safety and Health

Item and description	Result	Remarks
(1) Are conditions of scaffolding, nets, safety belt, lighting and ventilation good?		
(2) Does sufficient attention paid for radiographic examination and operation of cherry picker?		
(NOTES)		

7. Control System of Non-Destructive Examination(NDE)

Item and description	Result	Remarks
(1) Number of NDE supervisors in shipyard (including persons responsible for judging results)	______ persons	
(2) Dependence on subcontracted NDE work - Number of shipyard employees - Number of sub-contractors	 ______ persons ______ persons	
(3) NDE sub-contractor company's name and official technical qualifications	Name ___________________ (approved by) ___________ Name ___________________ (approved by) ___________	
(4) Grade and number of NDE employees with official technical qualifications in shipyard Specialized in radiography Specialized in ultrasonic Specialized in surface detection	 _____ Grade _____ persons _____ Grade _____ persons _____ Grade _____ persons	
(5) If non-destructive examinations are subcontracted, the grade and number of officially qualified persons Specialized in radiography Specialized in ultrasonic Specialized in surface detection	 _____ Grade _____ persons _____ Grade _____ persons _____ Grade _____ persons	
(6) Non-destructive examination equipment (in-house) - Number of radiographic equipment - Number of ultrasonic equipment	 ______ ______	
(NOTES) Even if all works are subcontracted, it is recommendable to attach the qualified person(s) who can verify the works.		

8. Quality Control on Production Line

Item and description	Result	Remarks
8.1 Preventive measures for misuse of materials		
(1) Job title of supervisor and person in charge of collating ordered steel and received steel, and checking of mill sheet	Title of supervisor: ______ Title of person in charge: ______	
(2) Are means for checking the material grade in hand prescribed for high-grade steels		
(3) Are regulations prescribed for checking the material grade for high-tensile steel and steel for low-temperature applications? Are there regulations for inscribing high tensile steel on the surface of the high tensile steel and special indication for steel for low temperature applications?		
(4) Are procedures for re-using of remaining cut-off mild steel?		
(5) Are there procedures for re-using of remaining cut-off high-tensile steel?		
(6) In the case of (4) and (5) above, can a collation be made with the mill sheet?		
(7) Section of controlling the lists of remaining cut-off steel	Name of section: ______	
(NOTES) - In case of high tensile steel, are means identifying different grades - In the case of (3) and (4) above, are the materials approved by other classes controlled similarly?		
8.2 Shot blasting/Primer coating		
(1) Existence of surface preparation standards		
(2) Existence of coating thickness control standards - Existence of thickness measurement records		
(NOTES) - The standard is to include the description related traceability after shot blasting and primer coating.		

8.3 Marking and cutting (Assembly work)

(1) Existence of standards for accuracy and periodical inspection of tape measures, tapes, stencils, etc.		
(2) Existence of standards for accuracy of cut dimensions and edge preparation		
(3) Existence of standards for finish of cutting face		
(4) What is the frequency and extent of maintenance and inspection carried out for ensuring accuracy of NC cutter and/or flame planer?		
(5) In case of NC, are the disks, tapes etc. maintained in good condition?		
(6) What are the measures adopted and guidance given to make the worker fully conversant with cutting work standards for maintaining accuracy?		

(NOTES)
- In case of (2) and (3) above, check items are to include confirmation of edge preparations free from piercing hole.
- NC for section bars is also to be in accordance with the above.

8.4 Bending and strain free

(1) Existence of standards for maximum heating temperatures during water cooling and at the time of bending and distortion removal of steel by quick heating and cooling		
(2) Existence of regulations for plate thickness and bending radius for flange processing		
(3) What are the measures adopted and guidance given to make the worker fully conversant with maintaining quality and accuracy during the bending process?		

(NOTES)

8.5 Control of Welding Procedure

(1) Are all welding procedures applied to the ships approved by the Society or other IACS members?		
(NOTES)		

8.6 Treatment of serious non-conformities

(1) Are repair plans submitted to the Society when serious non-conformities happened?		
(2) Were the NDE(RT/UT) plans submitted at appropriate timing?		
(3) Was the extent of tests extended considering the results of the test?		

(NOTES)

8.7 Hydrostatic and Watertight Tests

(1) Is the test plan submitted to the Society?		
(2) Are vacuum tests applied to?		
(3) Are local air injection tests during sub-assembly works applied to?		
(4) If (2) or (3) above is applied to, are the test procedures approved by the Society?		

(NOTES)

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
	Shipbuilding quality control function								
1	**Welding**								
1.1	**Welding consumables**	Classification approved separately at the manufacturer	Review approval status and patrol, verify storage, handling and treatment in accordance with manufacturer's requirements	UR W17		Consumable specification and approval status	Not required	Identify consumables against approved list	
								Verify temporary and permanent storage facilities	E.g. kept dry, covered, where applicable heated
								Verify traceability	E.g. random batch number checking
1.2	**Welder qualification**	Qualified welders	Review of welder certification and patrol	Rec 47		Shipyards records with individual's identification	Not required	Verify welder qualification standard, e.g. class or recognised standard approval	
								Verify welder approved for weld position	
								Verify validity of qualification certificate	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
1.3	**Welding – mechanical properties (welding procedures)**	All weld joint configurations, positions and materials to be covered by weld procedures approved by the classification society or by another IACS member available	Review and patrol	UR W28		Approved weld procedure specification and welding plan relevant to the ship project or process	Not required	Verify procedures are available at relevant workstations	
		The classification society witnesses all new weld procedure qualification tests carried out in the shipyard whenever the classification society is surveying in the shipyard	Witness					Verify weld procedures records have been approved and cover all weld processes and positions in accordance with classification or recognised standards and are available for the Surveyors reference	
1.3a	**Welding equipment**	Correctly calibrated and maintained	Patrol and review			Shipbuilders maintenance and calibration records	Not required	Verify condition of machinery and equipment	
								Verify machines are calibrated by appropriate staff	
								Verify calibration carried out in accordance with manufacturer's recommendations	
								Verify calibration in accordance with maintenance schedule	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
1.3b	**Welding environment**	Satisfactory environment	Patrol	Rec 47			Not required	Verify welding areas clean, dry, well lit	
								Confirm relevant measures taken for any pre or post heat treatment, drying of surfaces prior to welding	
								Confirm shielding gases, fluxes protected	
1.3c	**Welding supervision**	Sufficient number of skilled supervisors	Patrol	Rec 20 and 47				Verify supervision is effective	
1.4	**Welding-surface discontinuities**	Substantially free from significant indications, satisfactory profile and size	Visual examination, surface detection techniques, review of documents and patrol of operator	Rec 20 and 47		Shipbuilders and recognised standards and Rules as applicable, welding and NDE plans, NDE reports, operator qualifications	Not required	Identify workstations where NDE is carried out, e.g. panel line butt welds, castings into hull structure	
								Verify NDE carried out in accordance with approved plans where applicable	
								Verify suitability of NDE methods	
								Verify operators suitably qualified particularly where sub-contractors have been employed	
								Verify NDE is carried out according to the acceptable process	
								Review NDE records	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
1.5	**Welding – embedded discontinuities**	NDE is to be carried out by qualified operators capable of ensuring that welds are substantially free from significant indications.	Radiography and ultrasonic testing, review of documents and patrol of operator, examination of films	Rec 20 and 47		Shipbuilders and recognised standards and Rules as applicable, welding and NDE plans, NDE reports, operator qualifications	Not required	Identify workstations where NDE is carried out, e.g. panel line butt welds, castings into hull structure	
								Verify NDE carried out in accordance with approved plans where applicable	
								Verify suitability of NDE methods	
								Verify operators suitably qualified particularly where sub-contractors have been employed	
								Verify that records have been completed and in accordance with recognised standards, e.g. IQI(Image Qualify Indicator) and sensitivity recorded	
								Verify that reports and radiographs have been evaluated correctly by the shipbuilder. Systematic review of radiographs carried out by the Surveyor	
								Verify equipment calibration satisfactory and in accordance with manufacturers and recognised standards requirements	
								Verify NDE is carried out according to the acceptable process	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
2	Steel preparation and fit up								
2.1	Surface preparation, marking and cutting	Traceability and acceptability of material, check of steel plates & profiles materials type, scantling identification, testing marks	Patrol	Rec 47		Material certificates, shipbuilder's marking/cutting production documents at the workstage – documents retained at the facility	Not required	Verify stockyard storage satisfactory	
								Verify material traceability, e.g. stamping identification against material certification, archiving of records	
								Verify transfer marking after treatment line	
								Verify standard of shotblasting and priming	
								Verify suitability of primer	
								Verify that steel grades can be identified	
								Verify machinery adjusted to maintain within IACS or manufacturers recommendations	
								Verify accuracy of marking and cutting	
								Verify storage of piece parts	
2.2	Straightening	Approval of straightening methods/ procedures against deformation	Patrol and review	Rec 47		Recognised standards, approved procedures	Not required	Verify that straightening processes are approved for the grade and type of steel, e.g. tmcp, z plate	
								Verify that plates and sections are within recognised tolerances	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
2.3	**Forming**	Maintain material properties. Acceptance of forming method against unproper deformations	Patrol	Rec 47		Shipbuilders procedure for hot forming	Not required	Verify that temperature control is exercised by the operator	
								Verify that suitable methods of temperature control are available when forming special steels and materials	
								Verify that forming processes are acceptable	
2.4	**Conformity with alignment/fit up/gap criteria**	Check alignment/fit up/gap against reference standards	Patrol	Rec 47		Shipbuilders and recognised standards and Rules as applicable	Not required	Verify the processes to ensure satisfactory fit up and alignment at all workstations	
								Verify that edge preparations are re-instated where lost during fitting operations	
								Verify remedial procedures are in place to compensate for wide gaps and alignment deviations	
2.5	**Conformity for critical areas with alignment/fit up or weld configuration**	Check alignment/fit up/gap against approved drawings	Patrol and review	Rec 47		Shipbuilders and recognised standards and Rules as applicable, approved plan or standard, builder's records	Approved plans of critical areas if applicable	Verify that the information relevant to the latest approved drawings is available at the workstations	
								Verify the processes to ensure satisfactory fit up and alignment at all workstations	
								Verify that edge preparations are re-instated where lost during fitting operations	
								Verify remedial procedures are in place to compensate for wide gaps and alignment deviations	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
3	Steelwork process, e.g. sub assembly, block, grand and mega block assembly, pre-erection and erection, closing plates	Compliance with approved drawings, visual examination of welding and material, check alignment and deformations	Patrol of the process and witness of the completed item	Rec 47		Approved plans, shipbuilders inspection records, Shipbuilders and recognised standards and Rules as applicable, construction plan (steelwork sub-division)		Verify that the information relevant to the latest approved drawings is available at the workstations	
								Verify that correct weld sizes have been adopted	
								Verify operation of the welding processes at the different work stages is satisfactory	
								Verify that piece parts are identifiable	
								Verify that fit ups are within recognised tolerances	
								Verify that correct welding requirements specified in reference 1 of this table have been adopted	
								Verify processes for closing plates etc. are acceptable	
								Confirm that steelwork is in accordance with the approved plan	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
4	**Remedial work and alteration**	Welding, check against deformation, alignment	Review records and witness	Rec 47		Permanent record of shipyard surveyable item		Verify that records have been maintained of significant deviations from the approved plans, for situations such as mis cut openings, re-routing outfit items	
								Verify that all deviations brought to the attention of the classification society by the shipbuilder are acceptable	
5	**Tightness testing, including leak and hose testing, hydropneumatic testing**	Absence of leaks	Patrol of the process and witness of the test	UR S14	Reg. II-1/14 of SOLAS as amended	Approved tank testing plan, shipbuilders inspection records	Approved tank testing plan	Confirm that tank testing is carried out in accordance with the approved plan	
								Confirm the methods used to carry out leak testing	
								Confirm that correct test pressures maintained for leak, hose and hydro and hydropneumatic testing is satisfactory	
								Verify that adequate records of the tank testing have been maintained	
6	**Structural testing**	Structural adequacy of the design	Witness testing	UR S14	Reg. II-1/14 of SOLAS as amended	Approved tank testing plan, shipbuilders inspection records	Approved tank testing plan	Confirm that tank testing is carried out in accordance with the approved plan	
								Confirm that correct test pressures maintained for testing is satisfactory	
								Verify that adequate records of the tank testing have been maintained	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
7	Corrosion prevention systems, e.g. coatings, cathodic protection, impressed current except for coating system subject to PSPC	Salt water ballast tanks with boundaries formed by the hull envelope, and also bulk carrier hold internal surfaces, coamings and hatch covers shall have an efficient protective coating. Safety aspects of cathodic systems to be dealt with separately.	Review and report on builder's & manufacturer's documentation	UR Z8 and Z9, UI SC122, UR F1	Reg. II-1/3-2 of SOLAS as amended	Manufacturer's and builder's specification	Corrosion prevention specifications	Verify that applied coatings are approved and review records of application	
								Verify that adequate records have been maintained and copied to the ship construction file	
	Application Antifouling Systems		Review		AFS Convention	Painting Specification	Painting Specification and Mfg Declaration	Verify that adequate records have been maintained and copied to the ship construction file	
7.1	Application of Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers subject to PSPC	Monitor implementation of the coating inspection requirements	Patrol and review	UI SC223, PR34	Reg. II-1/3-2 of SOLAS as amended	Coating Standard	Coating Technical File	Verify that applied coatings are approved and review records of application in accordance with Chapter 7 of Annex to MSC.215(82)	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
8	Installation, welding and testing of the following								
8.1	Hatch covers	Tightness and securing	Witness	UR S14 & Rec 14	Reg. 13-14-15 and 16 of ILLC '66	Approved tank testing plan, shipbuilders inspection records	Details required, structural drawings	Confirm leak test of hatch covers	
								Confirm operation and securing test	
8.2	Doors and ramps integral with the shell and bulkheads	Tightness and securing	Witness	UR S14	Reg. II-1/18 of SOLAS as amended, Reg. 12 and 21 of ILLC '66	Approved tank testing plan, shipbuilders inspection records	Details required	Confirm leak test	
								Confirm operation and securing test	
								Confirm safety device operation	
								Ensure correct maintenance logs/manuals supplied with the ship construction file	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
8.3	Rudders	Fitting	Witness	UR S14		Approved plan, shipbuilders inspection records	Details required, structural drawings	Confirm alignment and mounting and fitting up to the connection to the tiller	
								Confirm function test	
								Verify fitting of pintles and all securing bolts	
								Verify all fit up records including all clearances maintained and placed into ship construction file	
8.4	Forgings and castings	Compliance with approved drawings, visual examination of welding and material, check alignment and deformations	Patrol of the process and witness of the completed item	UR W7 & W8		Approved plans, shipbuilders inspection records, Shipbuilders and recognised standards and Rules as applicable, construction plan (steelwork sub-division)	Copies of certificates of forgings and castings	Verify casting and forgings against material certificate	
								Verify that correct welding and fit up requirements specified in reference 1, 2.4 and 2.5 of this table have been adopted	
								Verify that material certificates are included in the ship construction file	
	Appendages							Verify that correct welding and fit up requirements specified in reference 1, 2.4 and 2.5 of this table have been adopted	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
8.5	Equipment forming the watertight and weathertight integrity of the ship, e.g. overboard discharges, air pipes, ventilators	Tightness and securing	Witness		Reg. II-1/19 of SOLAS as amended; Reg. 17-18-19-20-22-23 of ILLC '66	Approved tank testing plan, shipbuilders inspection records	Details required	Verify that correct welding and fit up requirements specified in reference 1, 2.4 and 2.5 of this table have been adopted	
								Verify Compliance with Load line Convention 1966 as amended - i.e. all fittings in accordance with the record of freeboard assignment	
				UR P3				Verify air pipes, vents etc closing device are approved type	
								Verify material certificates for overboard discharges where applicable	
								Verify record of freeboard assignment and all material certificates included in the ship construction file	
	Freeboard marks and draft marks	Within allowable tolerances and in accordance with the freeboard assignment	Witness	UI LL4	Reg. 4-5-6-7 and 8 of ILLC '66		Details required	Verify freeboard marks in accordance with load line assignment	
								Verify draft marks in accordance with the agreed tolerances specified by the builder unless more onerous flag state requirements	

Table 1

Reference	Shipbuilding function	Survey Requirements for Classification	Survey Method required for Classification	IACS reference*	Statutory requirements and relevant reference	Documentation available to classification Surveyor during construction	Documentation for ship construction file	Specific activities	Classification Society proposals for the project
	Principal dimensions	Within allowable tolerances	Review and witness	Rec 47			Details required	Verify principal dimensions in accordance with recognised standard	
								Verify dimensions included in ship construction file	
	Safety Construction certification	No outstanding imperfections or defects	Witness		Reg. 10 of SOLAS as amended			Verify that Administration requirements have been incorporated into the hull structure	

Shipbuilder's name	
Project	
Project duration	
Kick off meeting date	
Representing builder	
Representing Class Society	

* IACS Recommendations are not mandatory requirements.

< Supplement of Table 1 >

- Prior to commencement of survey for any newbuilding project, the Society is to discuss with the shipbuilder at a kick off meeting the items listed in **Table 1**. The purpose of the meeting is to agree how the list of specific activities shown in **Table 1** is to be addressed. The meeting is to take into account the shipbuilder's construction facilities and ship type including the list of proposed subcontractors.
- A record of the meeting is to be made, based upon the contents of the **Table 1** - the **Table 1** can be used as the record with comments made into the appropriate column.
- The shipyard shall be requested to advise of any changes to the activities agreed at the kick off meeting and these are to be documented.
  (E.g. if the shipbuilder chooses to use or change sub-contractors, or to incorporate any modifications necessitated by changes in production or inspection methods, rules and regulations, structural modifications, or in the event where increased inspection requirements are deemed necessary as a result of a substantial non-conformance or otherwise.)
- In the event of series ship production consideration may be given to waiving the requirement for a kick off meeting for the second and subsequent ships provided any changes are documented as required in the class rules.

- Additional meeting items, etc. :

No.	Items	Result	
1	If the Society has nominated a Surveyor for a specific newbuilding project then the Surveyor is to attend the kick off meeting.	A Surveyor has nominated and attended.	(Yes / No)
2	The kick-off meeting may be attended by other parties, such as owner, administrations, etc. subject to agreement by the shipbuilder.	Owner, administrations, etc. has attended.	(Yes / No)
		Attended by :	
3	The builder is to be asked to agree to undertake ad hoc investigations during construction where areas of concern arise and for the builder to agree to keep the Society advised of the progress of any investigation. (The builder is to be requested to agree to suspend relevant construction activities if warranted by the severity of the problem)	The builder was asked and agreed.	(Yes / No)
4	Shipbuilding quality standards for the hull structure during new construction are to be reviewed and agreed during the kick-off meeting.	Shipbuilding quality standards was reviewed and agreed.	(Yes / No)
		Shipbuilding quality standards :	
5	The records are to take note of specific published Administration requirements and interpretations of statutory requirements.	The specific published Administration requirements and interpretations of statutory requirements is exist and the relevant documents are attached.	(Yes / No)

Appendix 1-12-2 Ship Construction File Form Example

Ship Construction File

M / V	" "
IMO No.:	
Hull No.:	

Shipbuilder :

The shipbuilder is to deliver documents for the Ship Construction File. In the event that items have been provided by another party such as the shipowner and where separate arrangements have been made for document delivery which excludes the shipbuilder, that party has the responsibility.

It is recognized that the purpose of documents held in the Ship Construction File on board the ship, is to facilitate inspection(survey) and repair and maintenance, and therefore, is to include but not to limited to:

1. Final Drawings:

As-built structural drawings including scantling details, material details, and, as applicable, wastage allowances, location of butts and seams, cross section details and locations of all partial and full penetration welds, areas identified for close attention(for general dry cargo ships, liquefied gas carriers and ships subject to the enhanced survey programme) and rudders

And the followings are to be included.
(1) Approved plans of critical areas if applicable
(2) Hatch cover structural drawings and details if applicable
(3) Rudder structural drawings and details
(4) Freeboard marks and draft marks details
(5) Principal dimensions details

List of Final Drawings

Serial No.	DWG No.	Title of DWG	DWG Box No.

2. Manuals required for classification and statutory requirements, e.g. loading and stability, bow doors and inner doors and side shell doors and stern doors - operations and maintenance manuals(IACS UR S8(Bow Doors and Inner Doors) and S9(Side Shell Doors and Stern Doors)), including ship structures access manual, as applicable.

List of Manuals

Serial No.	Manual No.	Title of Manual	Manual Box No.

3. Copies of certificates of forgings and castings welded into the hull(IACS UR W7(Hull and Machinery Steel Forging) and W8(Hull and Machinery Steel Casting))

List of Copies of Certificates

Serial No.	Cert. No.	Title of Certificate	Remarks

(Note: Copies of Certificates are attached)

4. Details of equipment forming part of the watertight and weather tight integrity of the ship(e.g. overboard discharges, air pipes, ventilators)

List of Drawings or Copies of Certificates

Serial No.	DWG/Cert. No.	Title of DWG/Certificate	Box No.

(Note: Details(drawings, copies of certificates, etc.) of the relevant equipments are attached, or kept at specified box)

5. Tank testing plan including details of the test requirements(IACS UR S14(Testing Procedures of Watertight Compartments))

6. Corrosion prevention specifications(IACS UR Z8(Corrosion Protection Coating for Salt Water Ballast Spaces) and Z9(Corrosion Protection Coatings for Cargo Hold Spaces on Bulk Carriers))

7. Details for the in-water survey, if applicable, information for divers, clearances measurements instructions etc., tank and compartment boundaries.

8. Docking plan and details of all penetrations normally examined at drydocking.

9. Coating Technical File, for ships subject to compliance with the IMO Performance Standard for Protective Coatings(PSPC) as a class requirement under the IACS Common Structural Rules.

Annex 1-13 Owner's Hull Inspection and Maintenance Program

1. General

(1) The Owner's Hull Inspection and Maintenance Program is recommended as an assistant means for maintaining compliance with classification requirements between periodical surveys of the Society by means of owner's inspection and maintenance for the hull structure and corrosion prevention system on a regular basis. This program will not substitute the periodical survey to maintain the classification.
(2) This program can be applied to all type of ships at the request of the Owners. However, when an existing ship applies to enter the program, this program can be applied where deemed appropriate by the Society considering survey history, damage history and coating conditions, etc.
(3) The OHIMP notation shall be assigned as an additional special feature notation to ship comply with this Owner's Hull Inspection and Maintenance Program.
(4) The OHIMP notation and the application of this program may be cancelled by the Society if the program is not being satisfactorily carried out, should either the maintenance records or the general condition of the hull structure be determined to be unacceptable.
(5) In the case of a change of Owner, the application of this program is to be reconsidered.
(6) This program may be supported and maintained by a computerized system as deemed appropriate by the Society.

2. Requirements

(1) Outstanding recommendations/conditions of class related to the hull, should be completed prior to the ship being able to participate in this program.
(2) Surveys to maintain the classification are to be up-to-date, and without outstanding recommendations/conditions of class related to the hull structure and corrosion prevention system which would affect this program.
(3) In addition to the regular inspection and maintenance in accordance with the Owner's Hull Inspection and Maintenance Program, if there is a damage which may affect the classification at hull structure or corrosion prevention system, the occasional or additional inspections and maintenance are to be carried out and the damage is to be examined by the Society at the first port of call. If it necessary the voyage repairs are to be carried out in accordance with **Ch 2, 107. 5** of the Rules. The relevant details are to be recorded in the Owner's Hull Inspection and Maintenance Program as part of the report.

3. Approval and survey

(1) Documents and approval
The Owner is to submit a comprehensive Owner's Hull Inspection and Maintenance Program manual, which is to include the followings, to the Society for approval. The Society will issue an approval document for the Owner's Hull Inspection and Maintenance Program after review the presented documents.
(A) Safety policy and enclosed space entry procedures of the company.(For information only)
(B) General Arrangement
(C) Midship Section
(D) Complete list of each spaces and areas,(i.e., cargo holds, cargo tanks, ballast tanks, void spaces, cofferdams, pipe tunnels, etc.) covered by the Owner's Hull Inspection and Maintenance Program.
(E) Details of any corrosion prevention system and coating condition for each of the space and area specified in (D) above
(F) Inspection intervals corresponding to each space and area, or group of space and areas
(G) Maintenance descriptions detailing the minimum work necessary for the satisfactory inspection of the each space and area

(H) Sample reports and reporting procedures to confirm that the Owner's Hull Inspection and Maintenance Program is working properly onboard. There is to be a system for reporting the following information to the Owners office and for recording onboard;
(a) Details of the inspections carried out(details are to include proper structure identification such as tank/hold information, frame number, deck, shell plating, stringers, bulkheads and longitudinals as identified on the ship's drawings)
(b) The conditions as found
(c) Any findings, repairs or maintenance undertaken
(I) Selection of designated qualified inspector that conduct the inspection, including name, title and date of last related training
(J) Training information on qualified inspector to carry out these inspection
(K) Other documentations as deemed necessary by the Society

(2) Implementation survey
(A) The implementation survey is to be carried out within one year from the date of the approval of the Owner's Hull Inspection and Maintenance Program to verify that the Owner's Hull Inspection and Maintenance Program is implemented in accordance with the approval document.
(B) During the implementation survey, the attending Surveyor is to check the following items.
(a) An approval document for the Owner's Hull Inspection and Maintenance Program
(b) Documents specified in (1)
(c) Whether the Master and designated qualified inspectors are familiar with the Owner's Hull Inspection and Maintenance Program
(d) Check whether the Owner's Hull Inspection and Maintenance Program is operated satisfactorily.

(3) Annual audit
(A) An annual audit is to be carried out to check the operation of the Owner's Hull Inspection and Maintenance Program at Annual Survey
(B) At the annual audit the attending Surveyor is to check the following items.
(a) An approval document for the Owner's Hull Inspection and Maintenance Program
(b) Approved Owner's Hull Inspection and Maintenance Program manual
(c) Whether the Master and designated qualified inspectors are familiar with the Owner's Hull Inspection and Maintenance Program
(d) Ship's survey status and history
(e) The Owner's Hull Inspection and Maintenance Program information is being updated and the planned inspections are being carried and reported upon by a qualified inspector responsible for maintaining the detail of the program as required
(f) General review of the Owner's Hull Inspection and Maintenance Program inspections accomplished within the previous year is to be carried out
(g) If the inspection report(s) indicate damages or other defects that affect or may affect classification, then the affected area is to be examined.

4. Qualified inspector training

(1) The ship's designated inspector that will be carrying out the inspections for the Owner's Hull Inspection and Maintenance Program is to undergo training as deemed appropriate by the Society prior to being accepted as qualified inspector for this program.
(2) The training can be done either internally or externally as decided by the Owner. As a minimum, the training program is to include topics such as means of access, coating evaluation, terminology of ship structure, classification survey, typical hull defects and/or critical structural areas associated with the ship type, acceptance and evaluation criteria, reporting, etc. ⚓

Rules for the Classification of Steel Ships
Guidance Relating to the Rules for the Classification of Steel Ships

KOREAN REGISTER OF SHIPPING

Amendments to the Rules for the Classification of Steel Ships
(PART 2 MATERIALS AND WELDING, 2010 Edition)

Effective Date 1 July 2011

CHAPTER 1 MATERIALS

Section 1 General
- 101. 3. has been newly established.

Section 2 Test Specimens and Testing Procedures
- 202. 1. (5) and Table 2.1.2 have been amended

Section 3 Rolled Steels
- 301. 8. (3) has been amended.
- 308. 1. (4) has been newly established.

Section 4 Steel Tubes and Pipes
- Table 2.1.57 of 403. has been amended.

Section 5 Castings
- 501. 6. (2) has been amended.

Section 6 Steel Forgings
- Table 2.1.82 of 601. has been amended.

CHAPTER 2 WELDING

Section 3 Welding Work and Inspection
- Table 2.2.3 of 303. has been amended.

Section 4 Welding Procedure Qualification Tests
- 406. 2. (2) and (3) have been amended.

Section 5 Welders and Welder Performance Qualification Tests
- Table 2.2.13-1 and Table 2.2.13-2 of 502. 5. have been amended.
- Table 2.2.14 of 502. 6. has been amended.
- 503. 6. (2), (b) has been amended.

Section 6 Welding Consumables
- 601. 5. (1) has been amended and 601. 5. (2) has been deleted.
- 601. 6. (1) has been amended and 601. 6. (2) has been newly established.
- Table 2.2.16, Table 2.2.17, Table 2.2.18, Table 2.2.19, Table 2.2.20 and Table 2.2.21 of 602. have been amended.
- 602. 6. and Table 2.2.22 have been amended.

- Table 2.2.25, Table 2.2.28, Table 2.2.29, Table 2.2.30, Table 2.2.31 and Table 2.2.32 of 603. have been amended.
- 603. 6. (2) has been newly established.
- 603. 7. has been amended.
- Table 2.2.33, Table 2.2.35, Table 2.2.36 and Table 2.2.37 of 604. have been amended.
- Table 2.2.39, Table 2.2.41 and Table 2.2.42 of 605. have been amended.
- Table 2.2.45, Table 2.2.46 and Table 2.2.48 of 606. have been amended.
- 606. 5. has been amended.

CONTENTS

CHAPTER 1 MATERIALS

SECTION 1 General

101. Application

1. The requirements in this Chapter apply to the materials intended to be used for the components specified in each Part of hull construction, equipment and machinery.

2. The materials other than those prescribed in this Chapter may be used where specially approved in connection with the design. In such cases, the detailed data relating to the chemical compositions and mechanical properties, etc. of the materials are to be submitted for approval.

3. Reinforced plastic materials used for construction or repair of plastic pipes, FRP ships or composite vessel should be in accordance with the Guidance relating to the Rules specified by the Society.

102. Approval of manufacturing process and manufacturing control

1. Approval of manufacturing process

(1) The materials prescribed in this Chapter, unless otherwise specially provided, are to be manufactured by open-hearth, electric furnace, basic oxygen processes, or other processes at works approved by the Society. In this case, the manufacturer is to obtain the approval in accordance with the Guidance specially specified by the Society in advance concerning the process of manufacture (melting process, ingot casting, rolling, casting, forging and heat treating).
(2) The manufacturing process of semi-finished products such as ingots, slabs, blooms and billets for the normal and higher strength hull structural steels or forgings are to be approved in accordance with the Guidance specially specified by the Society in advance
(3) The rolled steel manufacturer supplied semi-finished products from other steel works or hot coil processor is required to obtain the approval of the manufacturing process according to the requirement of proceeding (1) as appropriate.
(4) The requirements specified in Pars (1) and (2) may be applied to the non-ferrous material prescribed in this Chapter.

2. Manufacturing control

(1) It is the manufacturer's responsibility to assure that effective process and production controls in operation are adhered to within the manufacturing specifications.
(2) Where control imperfection inducing possible inferior quality of product occurs, the manufacturer is to identify the cause and establish a countermeasure to prevent its recurrence. Also, the complete investigation report is to be submitted to the Surveyor.
(3) For further use, each product affected by previous (2) is to be tested to the Surveyor's satisfaction. The frequency of testing for subsequent products offered may be increased to gain confidence in the quality at the discretion of the Society.
(4) When steel is not produced at the works at which it is rolled, a certificate is to be supplied to the Surveyor at the rolling mill stating the process by which it was manufactured, the name of the manufacturer who supplied it, the number of the cast from which it was made and the ladle analysis. The Surveyor is to have access to the works at which the steel was produced.

103. Chemical composition

1. The chemical composition of samples taken from each ladle of each cast is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory and is to comply with the appropriate requirements for chemical composition provided in this Chapter.

2. The Manufacturer’s declared analysis will be accepted subject to occasional checks if required by the Surveyor.

3. Product analysis may be required where the final product chemistry is not well represented by the analysis from the cast.

104. Testing and inspection

1. The materials are to be tested and inspected in the presence of the Society's Surveyor except otherwise specially provided, and are to comply with the requirements in this Chapter.

2. The materials other than those prescribed in this Chapter are to be tested and inspected according to the specification for the testing approved in accordance with the requirements in **101. 2.**

3. The Society may accept to omit the tests for materials having the appropriate certificates.

4. Where the materials are manufactured by the approval of quality assurance scheme specially specified by the Society, a part or all of test and inspection in the presence of the Society's Surveyor may be omitted.

105. Execution of testing and inspection

1. The manufacturers shall afford the Surveyor all necessary facilities and access to all relevant parts of the works to enable him to verify that the approved process is adhered to, for the selection of test materials, and the witnessing of tests, as required by the Rules, and for verifying the accuracy of the testing equipment.

2. All tests and inspections are to be carried out at the place of manufacture before dispatch. The test specimens and procedures are to be in accordance with **Sec 2** of this chapter. All the test specimens are to be selected and stamped by the Surveyor and tested in his presence, unless otherwise agreed.

3. In the case of special order, the manufacturer is to show the order specifications, special requirements, etc. of the materials to the Surveyor prior to the material test.

4. Surface inspection and verification of dimensions are the responsibility of the steel maker. The acceptance by the Surveyor shall not absolve the steel maker from this responsibility.

106. Identification of materials

1. The manufacturer is to take a suitable measure for the identification of ingots, slabs, castings, forgings, and finished pieces, etc. which will enable the material to be traced to its original heat, roll, etc.

2. The steelmaker is to adopt a system for the identification of ingots, slabs and finished pieces which will enable the material to be traced to its original cast. The Surveyor is to be given full facilities for so tracing the material when required.

3. Where small products such as castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Society.

107. Test certificates

1. The Certificate for Materials Inspection is to be issued to the materials that have been satisfactorily tested and inspected in accordance with the requirements in this Chapter.

2. The Certificate for Materials Inspection is to contain in addition to the dimensions and weight of steels at least the following particulars;

(1) Purchaser's name or purchaser's order number and if known the hull number for which the material is intended.
(2) Identification of the cast and rolled piece.
(3) Identification of the steelworks.
(4) Material grade mark
(5) Chemical composition (ladle analysis values of elements controlled by the requirements) and carbon equivalent calculated by following a formula. (if required)

$$Ceq = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} (\%)$$

(6) Mechanical properties.
(7) Condition of heat treatment (e.g. normalized or controlled roll except for as rolled)
(8) Deoxidization procedure is to be stated. (rimmed steel only)

3. Notwithstanding the previous provisions, the accepted material may be omitted the issue of the Certificate for Materials Inspection where the manufacturer supplies the Mill Sheets stated the requirement of the previous **Par 2** for each accepted steel grade to the Surveyor for his signature. In this case, the manufacturer is to enter the following statement on the certificate to show that the steel material has been made by an approval process and that it has withstand satisfactory the required tests. The following form of declaration will be accepted if stamped or printed on each test certificate with the name of the steel works in English or Korean, and is to be signed by the personnel of the manufacturing shop in charge of product quality assurance or inspector.

"We hereby certify that the material has been made by an approval process and has been satisfactorily tested in accordance with the Rules of Korean Register of Shipping."

108. Quality and repair of defects

1. All materials are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

2. In the event of any material proving unsatisfactory during subsequent working or fabrication, such material may be rejected, notwithstanding any previous satisfactory testing and/or certification where the Surveyor considers necessary.

3. Welding or other means for the purpose of repairing defects is not permitted, unless the extent and method of repair (including welding procedure and heat treatment) are approved by the Surveyor. The repair of defects is to be carried out in the presence of the Surveyor, unless otherwise agreed.

4. Where repair by grinding is carried out then the remaining plate thickness below the ground area must be within the allowable under thickness tolerance.

109. Retest procedures

1. Where a part of the results of any test except impact test does not comply with the requirements, but the remainders are satisfactory, additional test specimens twice in number may be taken from the same material and retests for the failed test may be carried out. In such a case, all of the test specimens are to comply with the requirements.

2. Impact test

(1) Where the result of the impact test is unsatisfactory, additional tests may be carried out, with the exception of the cases specified in (i) and (ii) below, by taking a set of test specimens out of the same piece from which the above-mentioned test specimens have been taken.
  (i) The absorbed energy of all test specimens is under the required average absorbed energy.
  (ii) The absorbed energy of two of the test specimens is under 70 % the required average absorbed energy.

(2) In case of the previous (1), all pieces of the same lot from which the test specimens have been taken, may be accepted, provided that the average absorbed energy of the six test specimens, including those which have been rejected as unsatisfactory, is not less than the required average absorbed energy, and that not more than two individual results are lower than the required average absorbed energy and of these, not more than one result is below 70 % of the required average absorbed energy.

3. If a heat treated material fails to meet the requirements in any test, retest and heat treatment may be allowed two times(three times including the first test). In this case, however, the material is not to be considered as having complied with the requirements, unless all tests fully comply with the test requirements.

4. If the percentage of elongation of any tension test specimen is less than that specified and any part of fracture is outside the one-fourth of the gauge length from the centre of gauge length, the test is to be considered as invalid, and a retest for the material from which the first test specimen has been taken may be allowed.

110. Marking

1. Every material complying with the requirements is to be clearly stamped with the Society's brand 𝒦ℛ and material grade mark, and marked with the following particulars at least in one position by the maker:

(1) Name or mark to identify the steel works.
(2) Number or mark to identify the material.
(3) Name or mark to identify the purchaser. (if required by the purchaser)

2. Materials which have been specially approved by the Society in accordance with the requirements in **101. 2** are to have the letter "S" after the material grade mark.

3. Materials which are unsuitable for stamping may be marked with brands, seals or by other suitable means.

4. The marking particulars, but excluding the manufacturer's name or trade mark where this is embossed on finished products are to be encircled with paint or otherwise marked so as to be easily recognisable.

5. Materials which can not be stamped and marked in accordance with the requirements in **Pars 1** and **2** due to small size may be properly marked in the lump.

6. Where a number of light materials are securely fastened together in bundles the manufacturer may, subject to the agreement of the Society, brand only the top piece of each bundle, or alternatively, a firmly fastened durable label containing the brand may be attached to each bundle.

7. In the event of any material bearing the Society's brand failing to comply with the test requirements, the brand is to be unmistakably defaced by the manufacturer.

SECTION 2 Test Specimens and Testing Procedures

201. General

1. Application

(1) Test specimens and mechanical testing procedures for materials are to comply with the requirements of this Section, unless otherwise specially provided in each Section.

(2) Where test specimens and testing procedures differing from those prescribed in this Section are used, they are to be approved by the Society.

2. Testing machine

(1) The testing machines used for the tests relative to this Chapter are to be managed by competent personnel on machines.

(2) Tension/compression testing machines are to be calibrated in accordance with *KS B ISO* 7500-1 or other recognised standard.

(3) Impact testing machines are to be calibrated in accordance with *KS B ISO* 148-2 or other recognised standard.

(4) The accuracy of tensile test machines is to be within ±1%

3. Selection of test specimens

(1) The test specimens are to be selected according to each requirement in this Chapter.

(2) Except where otherwise specified or agreed with the Surveyor, test samples are not to be detached from the material until being stamped by the Surveyor.

(3) If test samples are cut from material by flame cutting or shearing, a reasonable margin is required to enable sufficient material to be removed from the cut edges during final machining.

(4) The preparation of test specimens is to be done in such a manner that test specimens are not subjected to any significant cold working or heating.

(5) If any test specimen shows defective machining or defects having no relation to the substantial nature, it may be discarded and substituted by another test specimen.

202. Form and dimension of test specimen

1. Tensile test specimen

(1) Tensile test specimens are classified as standard test specimen and proportional test specimen as shown in **Table 2.1.1** depend on the shape and dimension of test specimen.

Table 2.1.1 Kinds of tensile test specimen

Kind	Flat	Round	Pipe
Proportional	*R*14*B*	*R*14*A*	*R*14*B*, *R*14*C*
Standard	*R*1*A*, *R*1*B*, *R*5, *R*13*B*	*R*4, *R*8*C*, *R*10	-

(2) Tensile test specimens are to be of the forms and sizes given in **Fig 2.1.1**

(3) The gauge length may be rounded off the nearest 5 mm, provided that the difference between this length and L is less than 10 % of L.

<table>
<tr><th>Shapes</th><th>Kind</th><th>Type</th><th>Forms of specimen(1)</th><th>Size of specimen(2)</th><th>Materials to be applied</th></tr>
<tr><td rowspan="5">Flat(3)</td><td>Proportional</td><td>R 14B</td><td rowspan="5">

</table>

Fig 2.1.1 Types and forms of tensile test specimens (unit : mm)

Shapes	Kind	Type	Forms of specimen	Size of specimen	Materials to be applied
Pipe	Proportional	R 14B		a = t $W \geq 12$ mm $L = 5.65\sqrt{A}$ $P \cong L + 2W$ R = 25 mm	Steel tubes, copper and copper alloy pipes and tubes
		R 14C		$L = 5.65\sqrt{A}$ $P \cong L + 0.5D$ P is the distance between the grips	

NOTES:
(1) The notations used are defined as follows.
d : Diameter, A : Cross section, a : Thickness, R : Transition radius, W : Width
D : External tube diameter, L : Gauge length, t : Plate thickness, P : Parallel test length
(2) The both ends of the test specimens may be machined to such shapes as to fit the holder of the testing machine.
(3) When the capacity of the available testing machine is insufficient to allow the use of test specimen of full thickness, this may be reduced by machining one of the rolled surfaces.
(4) Gauge length L should preferably be greater than 20 mm.
(5) d ≥ 10 mm to 20 mm, preferably 14 mm
(6) For nodular cast iron and materials with a specified elongation less than 10%, R ≥ 1,5

Fig 2.1.1 Types and forms of tensile test specimens (unit : mm)

(4) The manufacturers may use the test specimens approved by the Society, besides those specified in (2). In this case, the elongation measured at the tensile tests is to be corrected by the following formula:

$$n = a \cdot E \left(\frac{\sqrt{A}}{L} \right)^b$$

where:

E = equivalent elongation for the proportional test specimens specified in (1) (%).

n = actual measured elongation of test specimen (%).

A = actual cross-sectional area of test specimen (mm^2).

L = actual gauge length of test specimen (mm).

a, b = constants given in bellow in accordance with the kind of materials.

Material \ Constant	a	b
Material 1	2.0	0.40
Material 2	2.6	0.55

NOTES:
1. Material 1 : For carbon and low alloy steels with a tensile strength not exceeding 590 N/mm^2 in the hot rolled, annealed, normalized or normalized and tempered conditions.
2. Material 2 : For carbon and low alloy steels in the quenched and tempered condition.
3. The values of a and b for other kinds of materials than Material 1 and Material 2 are to be as deemed appropriate by the Society.

(5) The machine-finished parallel part of test specimens is to be uniform throughout the entire length and the permissible variation (difference between the maximum and minimum values) is to be as specified in **Table 2.1.2.**

Table 2.1.2 Permissible Variation (unit : mm)

Round specimen		Flat specimen with thickness equal to or greater than 6 mm				Flat specimen with thickness less than 6 mm			
Nominal diameter (d)	Permissible variation	Nominal Thickness (t)	permissible variation	Nominal width (w)	permissible variation	Nominal Thickness (t)	permissible variation	Nominal width (w)	permissible variation
10≤d<12	0.025	6≤t<12	0.02	25≤w<40	0.05	0.6≤t<1.2	0.002	12.5≤w<25	0.02
12≤d<16	0.03	12≤t<20	0.04	40≤w	0.10	1.2≤t<2.5	0.004	25≤w	0.04
16≤d	0.04	20≤t	0.05			2.5≤t<6	0.01		

2. Bend test specimen

Bend test specimens are to be of size and dimensions given in **Fig 2.1.2** according to the kind of materials.

Kinds	Size of specimens	Dimensions	Materials to be applied
R 1		a = 20 W = 25 r = 1~2	Headers(**Ch 4, 405**)
		a = t W = 30 r = 1~2 Where the thickness of materials exceeds 25*mm*, the thickness of test specimen may be reduced to 25*mm* with its surface machined on compression side only.	Rolled steels(Steel plate) (**Ch 3**)
R 2		a = d Where the diameter or the width across flat of materials exceeds 35*mm*, they may be machined finished to a circular section of diameter not less than 35*mm*.	Rolled steels (Rolled steel bars for boiler) (**Ch 3, 307.**)

NOTES:
The following designations are used:
a : Thickness, diameter or width
r : Edge radius
D : Diameter of mandrel
d : Diameter or width
W : Width
t : Thickness of material

Fig. 2.1.2 Size and Dimensions of Bend Test Specimens (Unit: *mm*)

3. Impact test specimen

(1) Impact test specimens are to be provided in a set of three specimens, and the test specimens are to be machine finished to the forms and dimensions given in **Fig 2.1.3** and **Table 2.1.3**

unless the section thickness of the product is less than 12 mm

(2) The notch is to be cut in a face of the test specimen which was originally perpendicular to the rolled surface, casting surface and forging surface according to the kind of materials. The position of the notch is not to be nearer than 25 mm to a flame cut or sheared edge.

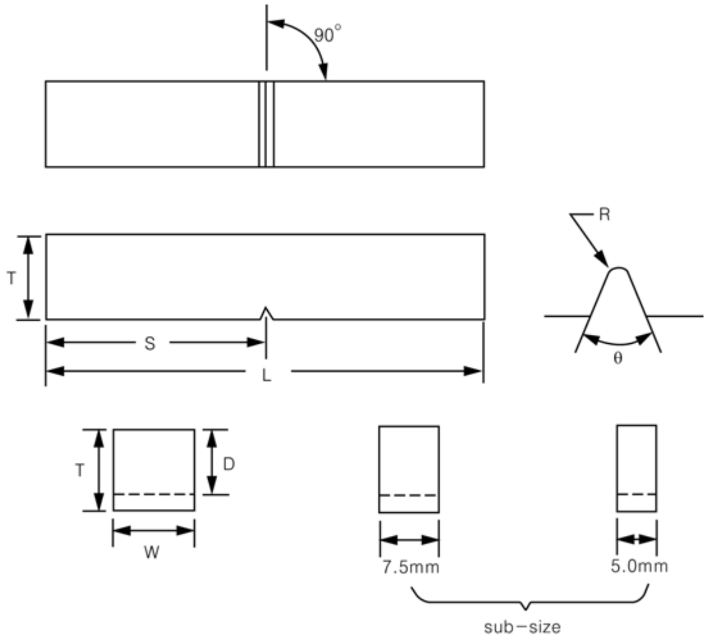

Fig 2.1.3 Impact test specimen

Table 2.1.3 Dimensions of impact Test Specimens

Dimensions	Kinds	Charpy V-notch test specimen
Length (mm)	L	55 ± 0.6
Width (mm)	W	10 ± 0.11
Thickness (mm)	T	10 ± 0.06
Angle of notch (mm)	θ	45 ± 2
Depth below notch (mm)	D	8 ± 0.06
Root radius of notch (mm)	R	0.25 ± 0.025
Distance of notch from end of test specimen (mm)	S	27.5 ± 0.42
Angle between plane of symmetry of notch and longitudinal axis of test specimen (deg)	-	90 ± 2

(3) Where the impact test specimens, having the size specified in (1) above for rolled steels, tubes and pipes cannot be taken, the width W may be the sub-size values given in **Table 2.1.4.** In this case, the average absorbed energy of rolled steels, tubes and pipes is not to be less than the value(by counting fractions of 0.05 and over as 0.1 and disregarding the rest) multiplying the absorbed energy by values given in **Table 2.1.4** in accordance with the width of the test specimens.

Table 2.1.4 Multiplier to Absorbed Energy

Thickness and width of sub-size specimen t×W (mm)	Multiplier for absorbed energy
	Average absorbed energy of 3 test specimens
10 × 5 ± 0.06	2/3
10 × 7.5 ± 0.11	5/6

(4) Where the thickness of a test specimen is less than 6 mm, and where impact test specimen having the sub-size specified in **Table 2.1.4** cannot be taken in welded parts of tubes and pipes, the impact test may be omitted.
(5) In all cases, the largest size charpy specimens possible for the material thickness shall be machined.

4. Confirmation for test specimen

The size and dimensions of test specimens are to be carefully inspected and verified by suitable means before testing.

203. Testing procedure

1. Tensile test

(1) When well-defined yield phenomena exists, the value of yield strength(yield stress) is to be measured at the first peak obtained during yielding. When no well defined yield phenomenon exists, the 0.2 % proof stress (Rp0.2) is to be determined. For austenitic and duplex stainless steel products, the 1 % proof stress (Rp1) may be determined in addition to Rp 0.2 as approved by the Society.
(2) Where the value of yield point or yield stress is measured at tensile test, the rate of loading shall be as specified in **Table 2.1.5.**

Table 2.1.5 Rate of loading

Modulus of Elasticity of the material (E) (N/mm^2)	Rate of stressing ($N/mm^2/sec$)	
	Min.	Max.
< 150,000	2	20
≥150,000	6	60

(3) After reaching the yield or proof load, for ductile material the machine speed during the tensile test is not to exceed that corresponding to a strain rate of $0.008s^{-1}$. For brittle materials, such as cast iron, the elastic stress rate is not to exceed 10 $N/mm^2/sec$

2. Impact test

The impact test is to be conducted on a Charpy impact testing machine having a capacity not less than 150 J and a striking velocity between 4.5 and 6 m/sec, with the test specimens at temperature controlled within +2℃ of the specified temperature.

SECTION 3 Rolled Steels

301. Rolled steels for hull structural

1. Application

(1) The requirements are to apply to hull structural rolled steels (hereinafter referred to as "steels") not exceeding 100 mm in thickness.
(2) Any requirement regarding steels over the thickness specified in **Table 2.1.5** is to be left to the discretion of the Society.
(3) Where improved through thickness properties are specified for plates and wide flats with thickness of 15 mm and over, the tensile test of through thickness property specified in **310.** is to be carried out in addition to the requirements of **301.**
(4) Steels other than those specified in **301.** are to be in accordance with the requirements of **101. 2.**

2. Kinds

Steels are classified as specified in **Table 2.1.5.**

Table 2.1.5 Grades of Rolled Steels for hull

Kinds		Grade	Thickness t (mm)
Normal strength steel(1)	Plates(3)	*A*, *B*, *D*, *E*	$t \leq 100$
	Sections and bars		$t \leq 50$
Higher strength steels(2)	Plates(3)	*AH* 32, *DH* 32, *EH* 32, *FH* 32 *AH* 36, *DH* 36, *EH* 36, *FH* 36 *AH* 40, *DH* 40, *EH* 40, *FH* 40	$t \leq 100$
	Sections and bars	*AH* 32, *DH* 32, *EH* 32, *FH* 32 *AH* 36, *DH* 36, *EH* 36, *FH* 36 *AH* 40, *DH* 40, *EH* 40, *FH* 40	$t \leq 50$

NOTE:
(1) Provision is made for four grades of normal strength steels based on the impact test requirements.
(2) For higher strength steels, provision is made for three strength levels(315, 355 and 390 N/mm^2) each subdivided into four grades(ex. : *AH* 32, *DH* 32, *EH* 32 and *FH* 32) based on the impact test temperature.
(3) Steel plates include flat bars not less than 600 mm in width.

3. Manufacturing process

(1) Where steel plates are manufactured from the continuous casting slabs, the maximum thickness for approval is to be determined, as a rule, with the roll ratio of 6 as standard. However, upon consideration of the manufacturing process, the roll ratio may be reduced to 4 (3 for steel plate thickness in excess of 50 mm).
(2) The deoxidation practice and chemical composition of each grade are to comply with the requirements given in **Table 2.1.6.** For steel plates and wide flats over 50mm thick and When thermo-mechanical controlled processing (hereinafter referred to as "TMCP") is used as heat treatment, slight deviations in the chemical composition may be allowed as approved by the Society.

4. Heat treatment

The heat treatment of each grade is to comply with the requirements given in **Table 2.1.8** and **Table 2.1.9.**

5. Mechanical properties

The mechanical properties of steels are to comply with the requirements given in **Table 2.1.7.**

Table 2.1.6 Deoxidation Practice and Chemical Composition

Kinds	Grade	Thickness, t(mm)	Deoxidation Practice	Chemical Composition (%) (5): C	Si	Mn	P	S	Cu	Cr	Ni	Mo	Al(8)	Nb	V	Ti	N

	FH 36																
	FH 40																

NOTES:
(1) For sections up to 12.5 mm in thickness inclusive, subject to a special approval by the Society, rimmed steel may be accepted.
(2) For steels above 25 mm in thickness, aluminium treatment is to be used as a fully killed, fine grain practice. However, killed steel up to 50 mm in thickness may be accepted at the discretion of the Society.
(3) For steel sections, maximum carbon content may be increased to 0.23 %.
(4) The value of $C + Mn/6$ is not to exceed 0.40 %.
(5) Where additions of any other element have been made as part of the steelmaking practice, the content is to be indicated on the test certificate.
(6) When an impact test as killed steels is conducted, the minimum manganese content may be reduced to 0.60 %.
(7) For steels up to 12.5 mm in thickness inclusive, the minimum manganese content may be reduced to 0.70 %.
(8) Aluminium content is to be represented by the acid soluble aluminium content, but may be determined by the total aluminium content. In such a case, the total aluminium content is not to be less than 0.020 %.
(9) Upon the approval by the Society, grain refining elements other than aluminium may be used.
(10) The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly, the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of each element is not applicable.
(11) The total niobium, vanadium and titanium content is to be less than 0.12 %.
(12) If Aluminium is present, the maximum content of nitrogen may be increased to 0.012 %.
(13) For TMCP steels, carbon equivalent values(*Ceq*) and/or cold cracking susceptibility(*Pcm*) of each steel is to be left to the discretion of the Society.

Table 2.1.7 Mechanical Properties

Grade	Tensile test			Impact test						
	Yield strength (N/mm²)	Tensile strength (N/mm²)	Elongation[6] ($L=5.65\sqrt{A}$) (%)	test temp (℃)	Average absorbed energy [1](J)

DH 40				-20						
EH 40				-40						
FH 40				-60						

NOTE:
(1) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to be failed.
(2) L (or T) denotes that the longitudinal axis of the test specimen is arranged parallel (or transverse) to the final direction of rolling.
(3) For all thickness of Grade *A* section, the upper limit of the specified tensile strength, may be exceeded.
(4) For Grade *A* steel over 50 mm in thickness with *ARS* or *CRS* heat treatment, impact tests are required. In this case, the average absorbed energy is to comply with the requirements of Grade *B* steel.
(5) For Grade *B* steels up to 25 mm in thickness, generally no impact testing is required.
(6) The minimum elongation for *R* 1*B* test specimen (L=200mm) is to be in compliance with the requirement given in the Table below.

Grade \ Thickness t (mm)	$3\le t\le 5$	$5<t\le 10$	$10<t\le 15$	$15<t\le 20$	$20<t\le 25$	$25<t\le 30$	$30<t\le 40$	$40<t\le 100$

		Sections and bars	*TMCP*<25> *N*<25> *CRS*<15> *ARS*<15>				

NOTES:

(1) Indication symbols used in heat treatment are as follows(the same holds henceforth in this Section):
AR : As Rolled *CR* : Controlled Rolling Condition *N* : Normalized Condition
TMCP : Thermo-Mechanical Controlled Processing
ARS : As Rolled Condition subject to special approval of the Society
CRS : Controlled Rolled Condition subject to special approval of the Society.

(2) In the Table, "marks" put at the end of each symbol for heat treatment stand for the volume of each lot. For examples, <50>, <25> and <15> each indicate that steels not greater than 50, 25 and 15 tonnes in weight (belonging to the same charge in the same manufacturing process) are to be taken as one lot; <P>, Piece, indicates that steel material rolled directly from one slab, billet or steel ingot is to be taken as one lot; and <-> indicates that no impact test is required. The term "piece" is understood to mean the rolled product from a single slab, billet or ingot if this is rolled directly into plates, sections or bars.

(3) *TMCP*, *N* or *CR* may be applied to instead of being left in a state of *AR*. In this case, steels are to be treated equivalent to those left in a state of *AR* with regard to the fundamental unit of lot.

(4) Steel plates include flat bars not less than 600 mm in width.

(5) For sections up to 12.5 mm in thickness, subject to a special approval by the Society, rimmed steel may be accepted.

(6) See Note (4) of **Table 2.1.7**

Table 2.1.9 Heat Treatment and Size of Lot for Impact Test Specimen for Higher Strength Steels

Grade	Deoxidation practice		Products[5]	Heat treatment and Size of Lot for Impact Test Specimen[1][2][3][4] — Thickness (mm): 0–12.5	12.5–20	20–25	25–35	35–50	50–100

			Sections and bars	*TMCP*<25> *N*<25> *QT*<25>					

NOTES:

(1) Indication symbols used in heat treatment are as follows (the same holds henceforth in this Section);
AR : As rolled *CR* : Controlled Rolling Condition *N* : Normalized Condition
TMCP : Thermo-Mechanical Controlled Processing *QT* : Quenched and Tempered Condition
ARS : As Rolled Condition subject to special approval of the Society
CRS : Controlled Rolled Condition subject to special approval of the Society.

(2) In the Table, "marks" put at the end of each symbol for heat treatment stand for the volume of each lot. For examples, <50>, <25> and <15> each indicate that steels not greater than 50, 25 and 15 tonnes in weight (belonging to the same charge in the same manufacturing process) are to be taken as one lot; <P>, Piece, indicates that steel material rolled directly from one slab, billet or steel ingot is to be taken as one lot; and <-> indicates that no impact test is required. The term "piece" is understood to mean the rolled product from a single slab, billet or ingot if this is rolled directly into plates, sections or bars.

(3) *TMCP*, *N* or *CR* may be applied to instead of being left in a state of *AR*. In this case, steels are to be treated equivalent to those left in a state of *AR* with regard to the fundamental unit of lot.

(4) Steel plates include flat bars not less than 600 mm in width.

(5) Niobium treatment stands for the addition of *Nb* either singly or in any combination, regardless of the Nb content, for grain refining. (Refer to Note (10) of **Table 2.1.6**)

6. Selection of test samples

(1) All material in a batch presented for acceptance tests is to be of the same product form e.g. plates, flats, sections, etc. from the same cast and in the same condition of supply. The test samples are to be fully representative of the material and, where appropriate, are not to be cut from the material until heat treatment has been completed.

(2) For the samples of steel from which tensile test specimens are cut, except where specially approved by the Society, steels not greater than 50 tonnes in mass (where the amount of scatter is to be less than 10 mm in thickness or diameter even when they belong to the same cast in the same manufacturing process) are to be treated as one lot, and the largest one in thickness or diameter is to be selected from each lot.

(3) For the samples of steel from which impact test specimens are cut, unless otherwise specially provided or except where specially approved by the Society, the thickest test sample is to be selected from each lot specified in **Table 2.1.8** and **Table 2.1.9,** according to the substance of deoxidation practices, type of products and kind of heat treatments

(4) The test samples are to be taken from the following portions according to the requirements (a) to (c) below and **Fig 2.1.4,** unless otherwise specified:

(a) *Plates and flat bars wider than 600* mm :
One end at a portion approximately 1/4 of the width from the flange end of the plates or flat bars.

(b) *Sections and flat bars not exceeding 600* mm *in width:*
One end at a portion approximately 1/3 of the width from the flange end. In case of channels, bulb plates and H-section, the test samples may be taken from the portion approximately 1/4 of the depth from the centre line of the web.

(c) *Bars:*
The test samples are to be taken so that the axis of each test specimen may lie as near as possible to the portion specified in (i) and (ii) below. This rule, however, does not apply when, because dimensions of cross section are insufficient for standard test specimens, a piece cut in a proper length from the product having the largest diameter of a certain lot is used as it is for a tensile test.

(i) For non-circular sections, at approximately 1/6 of the largest distance from the outside.
(ii) For circular section, at approximately 1/6 of the diameter from the outside.

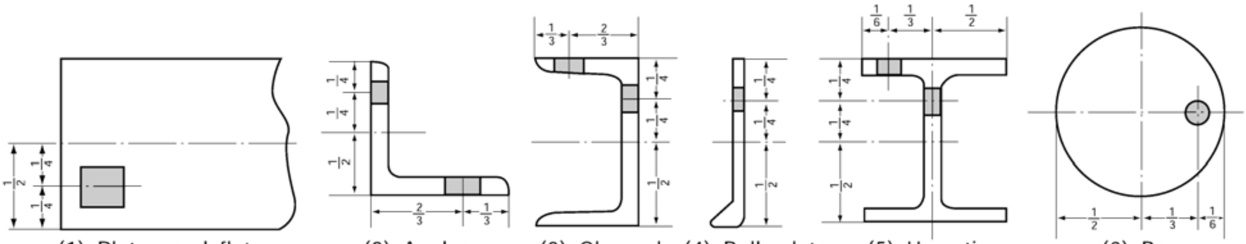

Fig. 2.1.4 Selection of Test Samples

7. Selection of test specimens

(1) Test specimens are not to be heat treated separately from the product.

(2) Tensile test specimens are to be taken according to (a) to (c) below.

(a) One test specimen is to be taken from one test sample.

(b) The test specimens are to be taken with their longitudinal axis normal to the final direction of rolling. For sections, bars and flat bars not exceeding 600 mm in width or when specially approved by the Society, however, they are to be taken with their longitudinal axis parallel to the final direction of rolling.

(c) Flat test specimens of full product thickness are, generally, to be used. Round test specimen may be used when the plates and shapes(except bars) thickness exceeds 40 mm or for bars. When tensile test specimens of bar type are taken from plates and shapes except bars, they are to be taken at a portion approximately 1/4 of the thickness from the surface.

(3) Impact test specimens are to be taken according to (a) to (c) below.
  (a) A set of test specimens is to be taken from one test sample.
  (b) The test specimens are to be taken with their longitudinal axis parallel (L direction) to the final direction of rolling. When deemed necessary by the Society, however, they are to be taken with their longitudinal axis normal (T direction) to the final direction of rolling.
  (c) When the product thickness does not exceed 40 mm, the test specimens are to be cut with their edge within 2 mm from the "as rolled" surface. When the product thickness exceeds 40 mm, the test specimen is to be taken at a portion where the axis of the test specimen corresponds to approximately 1/4 of the thickness (1/6 of the diameter of bars) from the surface.

8. Surface inspection and verification of dimensions

(1) The maximum permissible under thickness tolerance for plates and wide flats is -0.3 mm. Tolerances for over thickness may be taken from KS or proprietary specification which give reasonable equivalence. But the thickness tolerances for plates with thickness less than 5 mm may be specially agreed by the Society.
(2) Tolerances for rolled steel other than plates and wide flats may be specially agreed.
(3) Tolerances for length, width and flatness should be in accordance with a recognized national or international standard which specially agreed by the Society.
(4) The thickness is to be measured at random locations whose distance from longitudinal edge is to be at least 10 mm.

9. Quality and repair of defects

(1) The quality of finished steel is to be in accordance with the requirements specified in **101. 1.** and **2.** The steel is to be reasonably free from segregations and non-metallic inclusions.
(2) If plates and wide flats are ordered with ultrasonic inspection or required by the Society, the test procedure and acceptance criteria are to be made in accordance with an accepted standard at the discretion of the Society. However, the probe frequency is to be of 4MHz in general.
(3) The surface defects may be removed by local grinding. However, the procedure of removal of defect and repair is to be in accordance with the Guidance relating to the Rules specified by the Society.

10. Retest Procedures

(1) Where the tensile test fails to meet the requirements, two further tensile tests may be made from the same piece. If both of these additional tests meet all of the requirements, the piece and the remaining pieces from the same lot may be accepted.
(2) If one or both of the additional tests referred to above are unsatisfactory, the piece from which the above-mentioned test pieces have been taken is to be rejected. However, the remaining material from the same lot may be accepted, provided that two of the remaining pieces in the lot, selected in the same way, are tested with satisfactory results.
(3) (a) Where the result of the impact test is unsatisfactory, additional tests may be carried out, with the exception of the cases specified in (i) and (ii) below, by taking a set of test specimens out of the same piece from which the above-mentioned test specimens have been taken.
    (i) The absorbed energy of all test specimens is under the required average absorbed energy.
    (ii) The absorbed energy of two of the test specimens is under 70% the required average absorbed energy.
  (b) In case of the previous (a), all pieces of the same lot from which the test specimens have been taken, may be accepted, provided that the average absorbed energy of the six test specimens, including those which have been rejected as unsatisfactory, is not less than the required average absorbed energy, and that not more than two individual results are lower than the required average absorbed energy and of these, not more than one result is below 70 % of the required average absorbed energy.
(4) When the initial piece, representing a lot, gives unsatisfactory results from the additional Charpy V-notch impact tests referred to the preceding (3), this piece is to be rejected but the remaining material in the lot may be accepted provided that two of the remaining pieces in the lot are tested with satisfactory results. If unsatisfactory results are obtained from either of these two

pieces, then the lot of material is to be rejected. The pieces selected for these additional tests are to be the thickest remaining in the batch.

(5) If any test specimen fails because of faulty preparation, visible defects or (in the case of tensile test) because of fracturing outside the range permitted for the appropriate gauge length, the defective test piece may, at the Surveyors discretion, be disregarded and replayed by an additional test piece of the same type.

(6) Where the test pieces fail in the retests specified above, the piece from which the test pieces have been taken is to be rejected, However, at the consultation of the manufacturer and the orderer, the remaining pieces in the lot may be resubmitted individually for test and those pieces which give satisfactory results may be accepted.

(7) At the consultation of the manufacturer and the order, the rejected piece may be resubmitted after heat treatment of re-heat treatment, or may be resubmitted as any other grade of steel and then, may be accepted, provided that the required tests are satisfactory.

11. Marking

Steels which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.** and material supplied in the thermo-mechanical controlled processing condition is to have the letters TM added after the material grade mark. (e.g. *EH* 40*TM*)

302. Rolled steel plates for boiler

1. Application

(1) These requirements are to apply to the steel plates (hereinafter referred to as "steel plates") for boilers and pressure vessels to be used at high temperatures.

(2) Steel plates other than those specified in **302.** are to comply with the requirements in **101. 2.**

2. Kinds The steel plates are classified as specified in **Table 2.1.10.**

Table 2.1.10 Grades of Steel Plates

Grade	Max. thickness (mm)
RSP 42	200
RSP 46	
RSP 49	
RSP 46A	150
RSP 49A	

3. Heat treatment

(1) For steel plates of the "*RSP* 42, *RSP* 46 and *RSP* 49" grade with 50 mm or less and of the "*RSP* 46*A* and *RSP* 49*A*" grade with 38 mm or less in thickness, they are to be as rolled. They, however, may be heat treated(normalized or annealed for stress relieving) as deemed necessary by the manufacturer.

(2) For steel plates of the "*RSP* 42, *RSP* 46 and *RSP* 49" grade more than 50 mm and of the "*RSP* 46*A* and *RSP* 49*A*" grade more than 38 mm in thickness, they are to be either normalized to obtain the normal grain size or heated uniformly to such a temperature at the time of hot forming that an effect equivalent to normalizing can be achieved. In case of normalizing, it is, in principle, to be performed by the manufacturer.

4. Chemical composition

The chemical composition of steel plates is to comply with the requirements given in **Table 2.1.11.**

Table 2.1.11 Chemical Composition

<table>
<tr><th rowspan="2">Grade</th><th colspan="7">Chemical composition (%)</th></tr>

0.23 max.
0.25 max.
0.27 max.</td></tr>
<tr><td colspan="8">NOTES:
1. For RSP 46 with 25 mm and over in thickness, carbon and manganese content may be 0.30 % or less and 1.00 % or less, respectively.</td></tr>
</table>

5. Mechanical properties

The mechanical properties of steel plates are to comply with the requirements given in **Table 2.1.12.**

Table 2.1.12 Mechanical Properties

Grade	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%)	
			R1A	*R10*
RSP 42	225 min.	410 ~ 550	21 min.	25 min.
RSP 46	245 min.	450 ~ 590	19 min.	23 min.
RSP 49	265 min.	480 ~ 620	17 min.	21 min.
RSP 46*A*	255 min.	450 ~ 590	19 min.	23 min.
RSP 49*A*	275 min.	480 ~ 620	17 min.	21 min.

NOTE:
(1) *R1A* tensile test specimen is to be used for steel plate up to 50mm in thickness and *R*10 test specimen for steel plate more than 50 mm in thickness. However *R*10 test specimen can be used for steel plate more than 40 mm in thickness.
(2) For material under 8 mm in thickness, a deduction from the specified percentage of elongation of 1 % is to be made for each decrease of 1 mm of the specified thickness.
(3) For the plates over 90 mm in thickness, the elongation may be reduced from that mentioned in the above Table by 0.5 % for each increment of 12.5 mm or fraction thereof exceeding 90 mm in thickness. Such reduction, however, is limited to 3 %.
(4) In case where the elongation of *RSP*46*A* with thickness between 6mm and 20 mm exclusive and *RSP*49*A* steel plate is insufficient within 3 % of the specified value, It will be able to regard as satisfactory if the elongation of the gauge length 50 mm which includes a rupture part is of 25 % or more.

6. Selection and heat treatment of test samples

(1) For the steel plates which are not to be heat treated, one test sample is to be taken from each plate as rolled directly from one slab or ingot
(2) For the steel plates which are to be heat treated, one test sample is to be taken from every similarly heat treated plate as rolled directly from one slab or ingot.
(3) For steel plates to which stress relieving is required after welding or stress relieving is applied by the purchaser one or several times repeatedly during their working process, instruction of that effect is to be given at the time when they are placed for an order. In case where the procedure of stress relieving is not specified by the purchaser, a heat treatment is to be applied for the test samples by heating them slowly and uniformly to the temperature of 600℃ to 650℃, holding at that temperature for a period of over one hour per 25 mm of thickness, and then, to be cooled to 300℃ in the furnace before exposure in a still atmosphere.
(4) The test samples are to be taken from the portion approximately 1/4 of the width from the side end of the plates.

7. Selection of test specimens

Tensile test specimens are to be taken according to (1) to (3) below.
(1) One test specimen is to be taken from one test sample.
(2) The test specimens are to be taken with their longitudinal axis normal to the final direction of rolling.
(3) The test specimens of bar type are to be taken from the portion approximately 1/4 of the thickness from the surface.

8. Tolerance for thickness

Surface inspection and verification of dimensions are to be in accordance with the requirements in **301. 8.** The minus tolerance for the nominal thickness of plates is to be 0.25 mm.

9. Retest procedure

Where the tensile tests from the first test specimens selected fail to meet the requirements, additional tests may be conducted according to the requirements given in **109.**

10. Marking

(1) Steel plates which have satisfactorily complied with the required tests are to be marked with the identification mark relating to heat treatment in addition to the requirements in **110.**
(2) The marks relating to heat treatment are to be as specified in the following:
  (a) Where the plates are normalized : *N* (e.g. : *RSP* 46N)
  (b) Where the test specimens are normalized : *TN* (e.g. : *RSP* 46TN)
  (c) Where the test specimens are heat treated corresponding to the stress relieving to be applied : SR (e.g. : *RSP* 46N-SR, *RSP* 46TN-SR)

303. Rolled steel plates for pressure vessel

1. Application

(1) These requirements are mainly to apply to the steel plates for pressure vessels to be used at atmospheric temperature (hereinafter referred to as "steel plates")
(2) The steel plates having characteristics differing from those specified in **303.** are to comply with the requirements in **101. 2.**

2. Kinds

The steel plates are classified as specified in **Table 2.1.13.**

Table 2.1.13 Grades of Steel Plates

Grade	Max. thickness to be applied (mm)
RPV 24	200
RPV 32	100
RPV 36, *RPV* 46, *RPV* 50	75

3. Heat treatment

(1) *RPV* 24, *RPV* 32 and *RPV* 36 plates are to be as rolled. The plates, however, may be controlled-rolled, TMCP or properly heat treated as deemed necessary by the Society.
(2) *RPV* 46 and *RPV* 50 plates are to be quenched and tempered, But, they may be normalized, controlled-rolled, *TMCP* or as rolled under the approval by the Society.

4. Chemical composition

The chemical composition of steel plates is to comply with the requirements given in **Table 2.1.14.** Where deemed necessary, other elements than specified in **Table 2.1.14** may be added. In that case, such elements are to be stated in the test sheets.

Table 2.1.14 Chemical Composition

Grade	Chemical composition (%)						Carbon equivalent (%)	
	C		Si	Mn	P	S	$t \le 50$(mm)	$50 < t \le 75$(mm)
RPV 24	$t \le 100$ mm	0.18 max.	0.15~0.35	1.40 max.	0.030 max.	0.030 max.	-	-
	$t > 100$ mm	0.20 max.						
RPV 32	0.18 max.		0.15~0.55	1.50 max.			-	-
RPV 36	0.20 max.		0.15~0.55	1.60 max.			-	-
RPV 46	0.18 max.		0.15~0.75	1.60 max.			0.44 max.	0.46 max.
RPV 50	0.18 max.		0.15~0.75	1.60 max.			0.45 max.	0.47 max.

NOTE:
(1) Where deemed necessary, other elements than specified in **Table 2.1.14** may be added. In that case, such elements are to be stated in the test sheets.
(2) For *RPV*46 and *RPV*50 steel plates which not to be quenched and tempered, slight deviations in the chemical composition may be allowed as approved by the Society.

5. Mechanical properties

The mechanical properties of steel plates are to comply with the requirements given in **Table 2.1.15.**

Table 2.1.15 Mechanical Properties

Grade	Tensile test							Impact test		
	Yield strength (N/mm^2) Thickness of plate t (mm)			Tensile strength (N/mm^2)	Elongation(%) Thickness of plate t (mm)			Test temp. (℃)	Average absorbed energy(J)	Absorbed energy of individual test specimen(J)
	$t \le 50$	$50<t\le100$	$100<t\le200$		$t\le16$(2)	$16<t\le40$(2)	$40<t$(3)			
RPV 24	235 min.	215 min.	195 min.	400～510	17 min.	21 min.	24 min.	0	47 min.	27 min.
RPV 32	315 min.	290 min.	-	490～610	16 min.	20 min.	23 min.			
RPV 36	355 min.	335 min.(1)	-	520～640	14 min.	18 min.	21 min.			
RPV 46	450 min.	430 min.(1)	-	570～695	19 min.(4)	26 min.(4)	20 min.	-10		
RPV 50	490 min.	470 min.(1)		610～735	18 min.(4)	25 min.(4)	19 min.			

NOTE:
(1) To be applied for the plates 75 mm or less in thickness (2) To be tested with *R1A* test specimen.
(3) To be tested with *R4* test specimen. (4) To be tested with *R5* test specimen.

6. Selection of test samples

(1) For the steel plates which are not to be heat treated, one test sample is to be taken from each plate as rolled directly from one slab or ingot.
(2) For the steel plates which are to be heat treated, one test sample is to be taken from every similarly heat treated plate as rolled directly from one slab or ingot.
(3) For steel plates to which stress relieving is required after welding or stress relieving is applied by the purchaser, test samples are to be heat treated in accordance with the requirements in **302. 6** (3)
(4) The test samples are to be taken from the portion approximately 1/4 of the width from the side end of the plate.

7. Selection of test specimen

(1) Tensile test specimens are to be taken according to (a) to (c) below.
   (a) One test specimen is to be taken from one test sample.
   (b) The test specimens are to be taken with thier longitudinal axis normal to the final direction of rolling .
   (c) The test specimens of bar type are to be taken from the portion approximately 1/4 of the thickness from the surface.
(2) Impact test specimens is to be taken according to (a) to (c) below.
   (a) A set of test specimens are to be taken from one test sample.
   (b) The test specimens are to be taken with their longitudinal axis parallel (L direction) to the final direction of rolling. Where deemed necessary by the Society, however, they are to be taken with their longitudinal axis normal (T direction) to the final direction of rolling.
   (c) The test specimens are to be taken at a portion where the axis of the test specimen corresponds to approximately 1/4 of the thickness from the surface.

8. Tolerance for thickness

Surface inspection and verification of dimensions are to be in accordance with the requirements in **301. 8.** The minus tolerance for the nominal thickness of plates is to be 0.25 mm.

9. Retest procedures

Where the tensile test and impact tests from the first test specimen selected fails to meet the requirements, additional tests may be conducted according to the requirements given in **109.**

10. Marking

(1) Steel plates which have satisfactorily complied with the required tests are to be marked with the identification mark relating to heat treatment in addition to the requirements in **110.**
(2) The marks relating to heat treatment in (1) are to be as specified in the following:
   (a) Where the plates are controlled-rolled : *CR* (e.g.: *RPV* 36*CR*)
   (b) Where the plates are normalized : *N* (e.g. : *RPV* 32*N*)
   (c) Where the plates are quenched and tempered : *QT* (e.g. : *RPV* 46*QT*)
   (d) Where the plates are heat treated in *TMCP* condition : *TM* (e.g. : *RPV* 36*TM*)
   (e) Where the test specimens are normalized : *TN* (e.g. : *RPV* 32*TN*)
   (f) Where the test specimens are heat treated corresponding to the stress relieving to be applied : *SR* (e.g. : *RPV* 32*N-SR*, *RPV* 32*TN-SR*)

11. Steel plates equivalent to standard

(1) The mild steel plates of grade *RD* and *RE*, the high tensile steels of rolled steels for hull specified in **301.** are taken as equivalent to the plates specified in **303.,** in case where the test specimens are taken as required in **Pars 6** and **7** and test results comply with the requirements in **301.** In this case, "*PV*" is to be suffixed to the markings to indicate the kind of plates specified in **301.**
(2) Any requirements regarding heat treatment of steel plates specified in (1) is left to the discretion of the Society.

304. Rolled steels for low temperature service

1. Application

(1) The requirements are to apply to the rolled steels not exceeding 40 mm in thickness intended for tanks and ship's hull structures adjacent to tanks of liquefied gas carriers, and other parts such a hull structures of refrigerated cargo carrier which are exposed to low temperature (hereinafter referred to as "steels").
(2) Any requirement regarding the steels over 40 mm in thickness is left to the discretion of the Society.
(3) The requirements other than those specified in **304.** are applicable to the requirements in **301.**
(4) The steels other than those specified in **304.** are to comply with the requirements in **101. 2.**

2. Kinds

Steels are classified as specified in **Table 2.1.16.**

Table 2.1.16 Grades and Chemical Composition

<table>
<tr><th rowspan="2">Grade</th><th rowspan="2">Deoxidation</th><th colspan="6">Chemical composition (%)</th><th rowspan="2">Carbon equivalent (%)</th></tr>
<tr><th>C</th><th>Si</th><th>Mn</th><th>P</th><th>S</th><th>Ni</th></tr>

<tr><td>RL 24B</td><td>0.14 max.</td></tr>
<tr><td>RL 27</td><td>0.14 max.</td></tr>
<tr><td>RL 33</td><td>0.14 max.</td></tr>
<tr><td>RL 37</td><td>0.14 max.</td></tr>
<tr><td>RL 2N30</td><td>0.14 max.</td><td rowspan="5">0.30 max.</td><td rowspan="2">0.70 max.</td><td rowspan="5">0.025 max.</td><td rowspan="5">0.025 max.</td><td>2.10~2.50</td><td rowspan="5">-</td></tr>
<tr><td>RL 3N32</td><td>0.14 max.</td><td>3.25~3.75</td></tr>
<tr><td>RL 5N43</td><td>0.12 max.</td><td>1.50 max.</td><td>4.75~6.00</td></tr>
<tr><td>RL 9N53</td><td rowspan="2">0.10 max.</td><td rowspan="2">0.90 max.</td><td rowspan="2">8.50~9.50</td></tr>
<tr><td>RL 9N60</td></tr>
</table>

3. Heat treatment

The heat treatment of steels is to comply with the requirements given in **Table 2.2.17.**

4. Deoxidation practice and chemical composition

(1) The deoxidation practice and chemical composition of each grade are to comply with the requirements given in **Table 2.1.16.** When deemed necessary, chemical elements other than those given in the table may be added.
(2) When heat treatment has been conducted according to *TMCP*, the chemical composition of steels specified in **Table 2.1.16** may be modified subject to the approval by the Society.

5. Mechanical properties

The mechanical properties of steels are to comply with the requirements given in **Table 2.1.17.** Where deemed necessary by the Society. other tests on notch toughness may be required additionally.

6. Selection of test sample

(1) For steel plates, one test sample is to be taken from each plate as rolled directly from one slab or ingot.
(2) For test samples used in other steels than steel plates, steels not greater than 10 tonnes in mass (having the same cross-sectional dimensions and being from the same cast manufactured by the same process) are to be treated as one lot, and one test sample is to be taken from each lot.

(3) The requirements specified in **301. 6** (4) are to be applied to the selection of the test samples.

Table 2.1.17 Heat Treatment and Mechanical Properties

Grade	Heat treatment	Tensile test			Impact test [3][4]		
		Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%)[2] ($L = 5.65\sqrt{A}$)	Test temp.[5] (℃)	Average absorbed energy (J)	
						L	*T*
RL 24*A*	Normalized or *TMCP*	235 min.	400~510	20 min.	-40	41 min.	27 min.
RL 24*B*					-50		
RL 27		265 min.	420~540		-60		
RL 33	Quenched and tempered or *TMCP*	325 min.	440~560				
RL 37		360 min.	490~610	19 min.			
RL 2*N*30	Normalized or normalized and tempered[1]	295 min.	420~570		-70		
RL 3*N*32		315 min.	440~590		-95		
RL 5*N*43		420 min.	540~690		-110		
RL 9*N*53	Double normalized and tempered[1]	520 min.	690~830	18 min.	-196		
RL 9N60	Quenched and tempered[1]	590 min.	690~830				

NOTES:

(1) Heat treatment may be conducted according to *TMCP*, subject to the special approval by the Society.

(2) The minimum elongation for *R*1*B* test specimen (*L*=200mm) is to be in compliance with the requirements given in the Table below.

Minimum Elongation (%)

Grade \ Thickness *t* (mm)	$t \le 5$	$5 < t \le 10$	$10 < t \le 15$	$15 < t \le 20$	$20 < t \le 25$	$25 < t \le 30$	$30 < t \le 35$	$35 < t \le 40$
RL 24*A*, *RL* 24*B*, *RL* 27	13	14	15	16	17	18	18	19
RL 33	12	13	14	15	16	17	18	19
RL 37	11	12	13	14	15	16	17	18
RL 2*N*30, *RL* 3*N*32, *RL* 5*N*43	12	13	14	15	16	17	17	18
RL 9*N*53, *RL* 9*N*60	10	11	12	13	14	15	16	17

(3) *L* (or *T*) indicates that the longitudinal axis of the test specimen is arranged parallel (or transverse) to the final direction of rolling.

(4) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

(5) Impact test temperature for steels specified in **Pt 7, Ch 5** is to comply with the requirements given in **Table 2.1.18.**

Table 2.1.18 Impact Test Temperature of Steels Specified in Pt 7, Ch 5.

Grade	Thickness t (mm)	Test temp (℃)[1]
RL 24*A* *RL* 24*B* *RL* 27 *RL* 33 *RL* 37	$t \le 25$	-20 or (Td-5) [2]
	$25 < t \le 30$	-20 or (Td-10) [2]
	$30 < t \le 35$	-20 or (Td-15) [2]
	$35 < t \le 40$	(Td-20)
RL 2*N*30	$t \le 25$	-70
	$25 < t \le 30$	-70 or (Td-10) [2]
	$30 < t \le 35$	-70 or (Td-15) [2]
	$35 < t \le 40$	-70 or (Td-20) [2]
RL 3*N*32	$t \le 25$	-95
	$25 < t \le 30$	-95 or (Td-10) [2]
	$30 < t \le 35$	-95 or (Td-15) [2]
	$35 < t \le 40$	-95 or (Td-20) [2]
RL 5*N*43	$t \le 25$	-110
	$25 < t \le 30$	-110 or (Td-10) [2]
	$30 < t \le 35$	-110 or (Td-15) [2]
	$35 < t \le 40$	-110 or (Td-20) [2]
RL 9*N*53	$t \le 40$	-196
RL 9*N*60		

NOTES:
(1) Td is the design temperature (℃).
(2) The test temperature is to be the lower of those specified above.

7. Selection of test specimens

(1) Tensile test specimens are to be taken according to the requirements specified in **301. 7** (2).
(2) Impact test specimens are to be taken according to the following (a) and (b):
(a) The requirements specified in **301. 7** (3) are to apply.
(b) For steel plates, the test specimens are to be taken with their longitudinal axis normal (T direction) to the final direction of rolling; for other steels than steel plates, they are to be taken with their longitudinal axis parallel (L direction) to the final direction of rolling.

8. Surface inspection and verification of dimensions

Surface inspection and verification of dimensions are to be in accordance with the requirements in **301. 8.** The minus tolerance for the nominal thickness of plates is to be 0.25 mm.

9. Retest procedures

Where the tensile test and impact tests from the first test specimen selected fails to meet the requirements, additional tests may be conducted according to the requirements given in **109.**

10. Marking

Steels which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.** For steels to which the requirements given in Notes (1) and (5) of **Table 2.1.17** have been applied, "*TM*" and impact test temperature "*T*" are to be suffixed to the markings. (e.g. *RL* 33*TM*-50*T*)

305. Rolled stainless steels

1. Application

(1) These requirements are to apply to the rolled stainless steels (hereinafter referred to as "steels") for tanks in low temperature service or corrosion-resisting service.
(2) The requirements other than those specified in **305.** are applicable to the requirements in **301.**
(3) Steels other than those specified in **305.** are to comply with the requirements in **101. 2.**

2. Kinds

Steels are classified as specified in **Table 2.1.19.**

Table 2.1.19 Grades and Chemical Composition of Stainless Steels

</table>

3. Heat treatment

The steels are generally to receive a solid solution treatment.

4. Chemical composition

The chemical composition of steels is to comply with the requirements given in **Table 2.1.19.**

5. Mechanical properties

(1) The mechanical properties of steels are to comply with the requirements given in **Table 2.1.20.**

Table 2.1.20 Mechanical Properties of Stainless Steels

</table>

(2) The results of hardness test, according to the test method, are to comply with the requirements given in **Table 2.1.20.**

(3) Other tests on notch toughness or corrosion resistance may be required, where deemed necessary by the Society.

6. Selection of test samples

(1) One test sample is to be taken from every similarly heat treated plate as rolled directly from one slab or ingot.

(2) The requirements provided in **301. 6** (4) are to be applied to the selection of the test samples.

7. Selection of test specimens

(1) Tensile test specimens are to be taken according to the requirements specified in **301. 7** (2).

(2) The hardness test specimen may be a portion of tensile test specimen.

8. Tolerance for thickness

Surface inspection and verification of dimensions are to be in accordance with the requirements in **301. 8.** The minus tolerance for the nominal thickness of plates is to be 0.25 mm.

9. Marking

Steels which have satisfactorily complied with the required tests are to be marked with identification mark in accordance with the requirements in **110.**

306. Round bars for chain

1. Application

(1) These requirements are to apply to the rolled round bars (hereinafter referred to as "Chain bars") for chain specified in **Pt 4, Ch 8, Sec 4.**
(2) The requirements other than those specified in **306.** are applicable to the requirements in **301.**
(3) Chain bars having characteristics differing from those specified in **306.** are to comply with the requirements in **101. 2.**

2. Kinds

The chain bars are classified as specified in **Table 2.1.21.**

Table 2.1.21 Grades of Chain Bars

Grade		Application	used for
Grade 1 chain bar	*RSBC* 31	Un-studded chain Grade 1 chain	Ship's stud link anchor chain cables and accessories
Grade 2 chain bar	*RSBC* 50	Grade 2 chain	
Grade 3 chain bar	*RSBC* 70	Grade 3 chain	
Grade *R*3 chain bar	*RSBCR* 3	Grade R3 chain	Offshore mooring chain and accessories
Grade *R* 3*S* chain bar	*RSBCR* 3*S*	Grade R3S chain	
Grade *R* 4 chain bar	*RSBCR* 4	Grade R4 chain	

3. Deoxidation practice and chemical composition

The deoxidation practice and chemical composition of each grade are to comply with the requirements given in **Table 2.1.22.** Elements other than specified in **Table 2.1.22** may be added subject to a special approval by the Society.

Table 2.1.22 Deoxidation Practice and Chemical Composition (%)

Grade	Deoxidation	C	Si	Mn	P	S	Al(1)
RSBC 31	Killed	0.20 max.	0.15~0.35	0.40 min.	0.040 max.	0.040 max.	-
RSBC 50(2)	Fine-grained killed	0.24 max.	0.15~0.55	1.60 max.	0.035 max.	0.035 max.	0.020 min.
RSBC 70(2)		0.36 max.	0.15~0.55	1.00~1.90	0.035 max.	0.035 max.	0.020 min.
RSBCR 3	Fine-grained killed	(3)					
RSBCR 3*S*							
RSBCR 4							

NOTE:
(1) *Al* content is to be represented by the total *Al* content and may be replaced partly by other fine graining elements.
(2) If the Society agrees, additional alloying elements may be added.
(3) Detailed chemical composition is to be approved by the Society. For Grade *RSBCR* 4, the steel should contain a minimum of 0.2 % molybdenum.

4. Heat treatment

Chain bars are to be as rolled condition.

5. Mechanical properties

(1) The mechanical properties of chain bars are to comply with the requirements given in **Table 2.1.23.**

Table 2.1.23 Mechanical Properties

Grade	Tensile test				Impact test(1)(2)	
	Yield strength (N/mm^2)(3)	Tensile strength (N/mm^2)(3)	Elongation(%) ($L=5d$)	Reduction of area (%)	Test temp (℃)	Average absorbed energy (J)
RSBC 31	-	370~490(6)	25 min.	-	-	-
RSBC 50	295 min.	490~690	22 min.	-	0	27 min.(2)
RSBC 70	410 min.	690 min.	17 min.	40 min.	0(4)	60 min.(4)
RSBCR 3	410 min.	690 min.	17 min.	50 min.	-20(5)	40 min.(5)
RSBCR 3S	490 min.	770 min.	15 min.	50 min.	-20(5)	45 min.(5)
RSBCR 4	580 min.	860 min.	12 min.	50 min.	-20	50 min.

NOTES:
(1) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.
(2) For *RSBC* 50 which will be heat treated according to **Pt 4, Ch 8, 405.**, no impact testing is required.
(3) The yield ratio (the aim value of yield to tensile ratio) for grade *RSBCR* 3, *RSBCR* 3S, or *RSBCR* 4 is to be maximum 0.92.
(4) Impact test of RSBC 70 may be carried out at the temperature of -20℃ where approved by the Society. In this case, minimum mean absorbed energy is to be not less than 35 J.
(5) Impact test of grade *RSBCR* 3 and *RSBCR* 3S may be carried out at the temperature of 0℃ where approved by the Society. In this case, minimum mean absorbed energy is to be not less than 60*J* for grade *RSBCR* 3 and 65*J* for grade *RSBCR* 3S.
(6) Lower limit of tensile strength of *RSBC* 31 may be 300 N/mm^2 with the approval of the Society.

(2) Hydrogen embrittlement test is to be carried out in accordance with the following procedure:
(a) One tensile test specimen is to be tested within max. 3 hours after machining. Alternatively, tensile test specimen may be cooled to -60℃ immediately after machining and kept at that temperature for a period of max. 5 days.
(b) The other specimen is to be tested after baking at 250℃ for 4 hours.
(c) A slow strain rate not exceed $0.0003S^{-1}$ as far as practicable is used during the entire test, and tensile strength, elongation and reduction of area are to be measured.
(d) The test result is to comply with the following formula.

$$Z_{(1)} \ / \ Z_{(2)} \geq 0.85$$

$Z_{(1)}$ is the reduction of area measured by the test specified in (2) (a)
$Z_{(2)}$ is the reduction of area measured by the test specified in (2) (b)

6. Selection of test sample

(1) Chain bars not greater than 50 tonnes in weight (from the same cast manufactured by the same process) are to be treated as one lot, and one test sample largest in diameter is to be taken from each lot.
(2) Test sample mentioned in above (1), prior to sampling, must be subjected to the heat treatment provided for the finished chain cable. Details of the heat treatment must be indicated by the chain cable manufacturer. In case of no indication, heat treatment of the test sample is to comply with the requirements given in **Pt.4, Sec.8 406.** for each grade.

7. Selection of test specimens

(1) Test specimens are to be taken in accordance with the **Table 2.1.24**

Table 2.1.24 Number of test specimens

Grade	Number of tensile test specimens	Number of impact test specimens
RSBC 31	1 piece	-
RSBC 50	1 piece	1 set (3 piece)(1)
RSBC 70 *RSBCR* 3 *RSBCR* 3*S* *RSBCR* 4	1 piece	1 set (3 piece)

NOTES:
(1) In case where note (2) of **Table 2.1.23** is applied, no impact test specimen need to be taken.

(2) For grades *RSBCR* 3*S* and *RSBCR* 4 in addition to the test specimen required by (1), two tensile test specimens having a diameter of 20 mm in principle, are to be taken for the hydrogen embrittlement test. In this case, test specimen is to be taken from the central region of bar materials heat-treated in the same manner as (a) or (b).
(a) In case of continuous casting, test samples representing both the beginning and the end of the charge(except the mixed zone of the charge) shall be taken.
(b) In case of ingot casting test samples representing two different ingots shall be taken.
(3) The test specimens are to be taken with their longitudinal axis parallel to the final direction of rolling.
(4) The tensile and impact test specimens are to be taken from the test sample in the longitudinal direction at a depth of 1/6 diameter from the surface or as close as possible to this position. (See **Fig 2.1.5**)

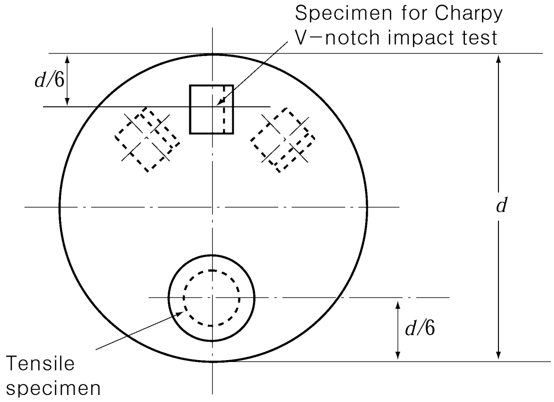

Fig 2.1.5 Selection of test specimens

(5) The longitudinal axis of the notch is to correspond approximately to the radial direction of each test specimen.

8. Surface inspection, non-destructive inspection and verification of dimensions

(1) Surface inspection for all grades is to be carried out and it is to be confimed that there are no harmful defects.
(2) For grades *RSBCR* 3, *RSBCR* 3*S* and *RSBCR* 4, all round bar for chains are subjected to ultrasonic examination at an appropriate stage of the manufacture and it is to be confirmed that there are no harmful defects.
(3) For grades *RSBCR* 3, *RSBCR* 3*S* and *RSBCR* 4, one hundred percent of round bars for chains is to be examined by magnetic particle or eddy current methods and it is to be confirmed by magnetic particle or eddy current methods and it is to be confirmed that there are no harmful defects.
(4) Notwithstanding the requirements of (2) and (3), the frequency of non-destructive inspection may be reduced where the quality control conditions of the manufacturer are satisfactorily met. However, non-destructive inspection of samples required in **5.** are to be carried out in every case.
(5) The diameter and roundness of all grades of chain bars are to be within the tolerances specified in **Table 2.1.25.**

Table 2.1.25 Dimensional tolerance

Nominal Diameter (mm) (1)	Tolerance on diameter (mm)	Tolerance on roundness (d_{max} - d_{min}) (mm) (2)
less than 25	-0, +1.0	0.6 max.
25 ~ 35	-0, +1.2	0.8 max.
36 ~ 50	-0, +1.6	1.1 max.
51 ~ 80	-0, +2.0	1.50 max.
81 ~ 100	-0, +2.6	1.95 max.
101 ~ 120	-0, +3.0	2.25 max.
121 ~ 160	-0, +4.0	3.00 max.

NOTES:
(1) For nominal diameter of bar materials which have more than 161 mm, dimensional tolerances are to be as deemed appropriate by the Society.
(2) d_{max} and d_{min} mean the maximum and minimum diameter of a round bar.

9. Retest procedures

(1) Where the tensile test and impact tests from the first test specimen selected fails to meet the requirements, additional tests may be conducted according to the requirements given in **109.**
(2) If failure to pass the tensile test or impact test is definitely attributable to improper heat treatment of the test sample, a new test sample may be taken from the same piece and reheat treated. The complete test (both tensile and impact test) is to be repeated; and the original results obtained may be disregarded.

10. Marking

Chain bars which have satisfactorily complied with the required tests are to be marked with identification marks in accordance with the requirements in **110.**

307. Rolled steel bars for boiler

1. Application

(1) These requirements are to apply to hot rolled steel bars intended to be used for the stay bolts for boilers (hereinafter referred to as "steel bars").
(2) The steel bars having characteristics differing from those specified in **307.** are to comply with the requirements of **101. 2.**

2. Kinds

The steel bars are classified as specified in **Table 2.1.26.**

Table 2.1.26 Grades and Chemical Composition

Grade	Chemical composition (%)		
	C	S	P
RSB 42	0.30 max.	0.04 max.	0.05 max.
RSB 46	0.33 max.		

3. Heat treatment

The heat treatment of steel bars is to be as deemed appropriate by the Society.

4. Chemical composition

The chemical composition of steel bars is to comply with the requirements given in **Table 2.1.26.**

5. Mechanical properties

The mechanical properties of steel bars are to comply with the following requirements.

(1) The tensile test of steel bars is to comply with the requirements given in **Table 2.1.27.**

(2) The bend test specimen is to stand being bent cold through 180 degrees without cracking on the outside of the bent portion to an inside redius given in **Table 2.1.28.**

Table 2.1.27 Mechanical Properties

Grade	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation(%) ($L=5.65\sqrt{A}$)
RSB 42	225 min.	410~490	24 min.
RSB 46	245 min.	450~540	22 min.
NOTE: The required value of yield strength for the steel bars exceeding 100 mm in diameter may be taken as 205 N/mm^2 for *RSB* 42 and 225 N/mm^2 for *RSB* 46, regardless of the above requirements.			

Table 2.1.28 Bend Test

<table>
<tr><th rowspan="2">Dia. of bar (mm)</th><th colspan="2">Ratio of inside radius of bend to diameter of test specimen</th></tr>
<tr><th>RSB 42</th><th>RSB 46</th></tr>
<tr><td>$d \le 25$</td><td>$\frac{3}{4}$</td><td>1</td></tr>
<tr><td>$25 < d \le 50$</td><td>1</td><td rowspan="2">$1\frac{1}{4}$</td></tr>
<tr><td>$50 < d \le 75$</td><td rowspan="2">$1\frac{1}{4}$</td></tr>
<tr><td>$75 < d$</td><td>$1\frac{1}{2}$</td></tr>
</table>

6. Selection of test samples

For the test samples of steel bars, steel bars which belong to the same cast manufactured by the same process and where the amount of scatter is to be less than 10 mm in diameter, are to be treated as one lot, and test samples are to be taken from each lot accord ing to the mass of the lot and to the requirements provided in **Table 2.1.29.**

7. Selection of test specimens

(1) Each one piece of tensile and bend test specimen is to be taken from one test sample.

(2) Test specimens are to be taken with their longitudinal axis parallel to the final direction of rolling.

(3) Tensile test specimens are to be taken from the sample in the longitudinal direction at a depth of 1/6 diameter from the surface or as close as possible to this position. (See **Fig 2.1.5**)

8. Tolerance for diameter

The tolerance for diameter of the steel bars is to comply with the requirements in **Table 2.1.30.**

9. Marking

Steel bars which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.**

Table 2.1.29 Number of Test Samples

Weight of group (ton)	Number of test samples
25 and under	1 each
Over 25 up to 30	2 each
Over 30	2 each plus 1 each for each 10 tons of excess or fraction thereof

Table 2.1.30 Tolerance for Diameter

Diameter of bar (mm)	Tolerance
$d < 16$	± 0.4 mm
$16 \le d < 28$	± 0.5 mm
$28 \le d$	± 1.8 %

308. High Strength Quenched and Tempered Steels for Welded Structures

1. Application

(1) The requirements given in **308.** are to apply to weldable high strength quenched and tempered steel plates and wide flats not exceeding 70 mm in thickness intended for mobile offshore units, tanks of liquefied gas carriers and process pressure vessels (hereinafter referred to as "steels")
(2) Any requirements regarding the steels over 70 mm in thickness are left to the discretion of the Society.
(3) Product forms other than plates and wide flats, such as section and tubulars, may be provided to the requirements given in **308.** when specially agreed to by the Society.
(4) Steels for hull structures should be in accordance with the Guidance specified by the Society.
(5) The requirements other than those specified in **308.** are applicable to the requirements in **301.**
(6) Steels having characteristics differing from those specified in **308.** are to comply with the requirements in **101. 2.**

2. Kinds

Steels are classified as specified in **Table 2.1.31.**

Table 2.1.31 Grade of Steels

Kind	Grade
Weldable high strength quenched and tempered steel	*AH* 43, *DH* 43, *EH* 43, *FH* 43
	AH 47, *DH* 47, *EH* 47, *FH* 47
	AH 51, *DH* 51, *EH* 51, *FH* 51
	AH 56, *DH* 56, *EH* 56, *FH* 56
	AH 63, *DH* 63, *EH* 63, *FH* 63
	AH 70, *DH* 70, *EH* 70, *FH* 70

3. Deoxidation practice and chemical composition

(1) The deoxidation practice and chemical composition of steels are to comply with the requirements given in **Table 2.1.32.** Where deemed necessary, other elements than specified in **Table 2.1.32** may be added.
(2) Where heat treatment has been conducted according to TMCP, the requirements given in **Table 2.1.32** may be modified subject to the special approval by the Society.
(3) The cold cracking susceptibility(*Pcm*) for evaluating weldability should be in accordance with the Guidance relating to the Rules specified by the Society. The maximum *Pcm* to be achieved is to be agreed with the Society and included in the approved specification.

4. Heat treatment

The steels shall be in the quenched and tempered condition. Special consideration may be given to the supply of those steels in thicknesses up to 50 mm in the TMCP condition subject to approval of the Society.

5. Mechanical properties

(1) The mechanical properties of steels are to comply with the requirements given in **Table 2.1.33.**
(2) In the case of other product forms where longitudinal tests are agreed, the elongation values are to be 2 percentage units above those listed in **Table 2.1.33.**
(3) Where deemed necessary by the Society, other test on notch-toughness and weldability may be required in addition to the tests specified in **Table 2.1.33.**

6. Selection of test samples

(1) One test sample is to be taken from every similarly heat treated plate as rolled directly from one slab or ingot.
(2) The requirements specified in **301. 6** (4) are to be applied to the selection of the test samples.

7. Selection of test specimens

(1) Tensile test specimens are to comply with the requirements shown in (a) to (c) below:

(a) Tensile test specimens are to be taken according to the requirements specified in **301. 7** (2).

(b) Normally flat tensile test specimens are to be prepared in such a manner as to maintain the rolling scale at least at one side.

(c) Where the thickness exceeds 40mm, full thickness specimens may be prepared but when instead a machined round tensile test specimen is used then the axis must be located at a position lying at a distance of t/4 from the surface or as near as possible to this position.

(2) Impact test specimens are to be taken according to the requirements specified in **304. 7** (2).

Table 2.1.32 Deoxidation Practice and Chemical Composition (%)

FH 70					-60		

NOTES:

(1) Heat treatment may be conducted according to TMCP, instead of quenching and tempering, subject to the special approval by the Society.

(2) L (or T) denotes that the longitudinal axis of each test specimen is parallel (or normal) to the final direction of rolling.

(3) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

(4) Impact test temperature for steels specified in **Pt 7, Ch 5** are given in **Table 2.1.34.**

(5) The minimum elongation for *R1B* test specimen (*L*=200mm) is to be in compliance with the requirements given in the Table below.

Grade	Thickness (mm)						
	$t \le 10$	$10 < t \le 15$	$15 < t \le 20$	$20 < t \le 25$	$25 < t \le 40$	$40 < t \le 50$	$50 < t \le 70$
AH 43, *DH* 43, *EH* 43, *FH* 43	11	13	14	15	16	17	18
AH 47, *DH* 47, *EH* 47, *FH* 47	11	12	13	14	15	16	17

AH 63, *DH* 63, *EH* 63, *FH* 63	9	11	12	12	13	14	15
AH 70, *DH* 70, *EH* 70, *EH* 70	9	10	11	11	12	13	14

Table 2.1.34 Impact Test Temperature for Steels specified in Pt 7, Ch 5

Grade	Thickness t (mm)	Impact test		
		Test temp (℃)	Average absorbed energy (J)	
			L	T
AH 43, DH 43, AH 47, DH 47 AH 51, DH 51, AH 56, DH 56 AH 63, DH 63, AH 70, DH 70	$t \le 20$	0	41	27
	$20 < t \le 40$	-20		
	$40 < t \le 50$	-30		
	$50 < t$	(1)		

NOTE: (1) Temperature is to be as deemed appropriate by the Society.

8. Surface inspection and verification of dimensions

(1) Surface inspection and verification of dimensions are the responsibility of the steel manufacturer and the minus tolerance in the nominal thickness of plates is to be 0.25 mm. For steels except steel plates, any requirement regarding the minus tolerance is left to the discretion of the Society.
(2) If required by the Society the manufacturer is to perform ultrasonic examinations in accordance with an approved standard.
(3) If required by the Society, through thickness tensile tests are to be performed in accordance with requirements specified in **310.**

9. Retest procedures

(1) Where the tensile test from the first test specimen selected fails to meet the requirements, additional tests may be conducted according to the requirements given in **109. 1.**
(2) Regarding the impact tests, additional tests are to be carried out according to the requirements given in **109. 2.**
(3) For other product forms the impact tests are to be in the longitudinal direction, the results of the tests are to comply with the appropriate requirements of **Table 2.1.33**
(4) Normally sub-surface test specimens will be taken, however, for material with a thickness in excess of 40mm, impact tests should be taken at the quarter thickness (t/4) location.

10. Marking

Steels which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.** For steels to which the requirements given in Note (4) of **Table 2.1.33** have been applied, the "impact test temperature T" are to be suffixed to the marking. (e.g. DH 63-25T)

309. Stainless clad steel plates

1. Application

(1) The requirements in **309.** are to apply to the stainless clad steels not exceeding 50 mm in thickness intended for tanks of ships carrying dangerous chemicals in bulk, tank circumference hull construction units and corrosion-resisting tanks (hereinafter referred to as "steel plates").
(2) The requirements other than those specified in **309.** are to be in accordance with the requirements in **301.**
(3) Steel plates over 50 mm in thickness and having characteristics differing from those specified in **309.** are to comply with the requirements in **101. 2.**

2. Process of manufacture

(1) Manufacture of steel plates is to comply with the processes shown in (a) to (e) below:
(a) Rolling
(b) Explosive pressing
(c) Overlay rolling
(d) Cast rolling
(e) Explosive rolling
(2) Application of any other process of manufacture than those specified in (1) is left to the discretion of the Society.

3. Structural metals

(1) Base and clad materials for steel plates are to be mild steel plates of rolled steels for hull specified in **301.** and steel plates of rolled stainless steels specified in **305.,** respectively. In case of overlay rolling or cast rolling, clad materials are to comply with the specified chemical composition of welding materials or stainless steel casting applied as a clad.
(2) The material grade marks are to be signified by a combination of base metal and clad material. (ex. *A* + *RSTS*316)

4. Heat treatment

The steel plates are to comply with the requirements for heat treatment of the base metal.

5. Mechanical properties

(1) The mechanical properties of steel plates are to comply with the requirements given in **Table 2.1.35.**

Table 2.1.35 Mechanical Properties

Grade	Tensile test(1)			Shearing strength test(3)	Impact test
	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%)	Shearing strength (N/mm^2)	
A *B* *D* *E*	235 min.	σ_B min.(2)	To be complied with requirement for base metal	200 min.	To be complied with requirement for base metal

NOTES:
(1) The tensile test specimen is to be *R*1*B* test specimen (*L*=200mm)
(2) σ_B is to be obtained from the following formula:

$$\sigma_B = \frac{t_1\sigma_1 + t_2\sigma_2}{t_1 + t_2}$$

where:
σ_B = Tensile strength of steel plates (N/mm^2)
σ_1 = Specified minimum tensile strength of base metal (N/mm^2)
σ_2 = Specified minimum tensile strength of clad material (N/mm^2)
t_1 = Thickness of base metal (mm)
t_2 = Thickness of clad material (mm)
(3) Any requirement for the procedure of shear strength test is left to the discretion of the Society. In case of overlay rolling, shear strength test may be omitted.

(2) Where deemed necessary by the Society according to the use of steel plates, tests on corrosion resistance may be required.

6. Selection of test samples

(1) One test sample is to be taken from each steel plate, being from the same manufacturing process, which belong to the plate as rolled from a slab or ingot of a certain base metal. In case of overlay rolling, a separate test sample which is applied the same condition of manufacturing process can be made.
(2) The requirements specified in **301. 6** (4) are to be applied to the selection of the test samples.

7. Selection of test specimens

(1) Tensile test specimens are to be taken according to the requirements specified in **301. 7** (2).
(2) Impact test specimens are to be taken according to the requirements specified in **301. 7** (3). In this case, the thickness of the test specimens is to agree with that of the base metal from which the clad material has been removed.

(3) Shearing strength test specimens are to be taken according to the requirements specified in the following (a) to (b):
(a) One test specimen is to be taken from one test sample.
(b) The size and dimensions of the test specimens, are to be determined according to **Fig 2.1.6.**

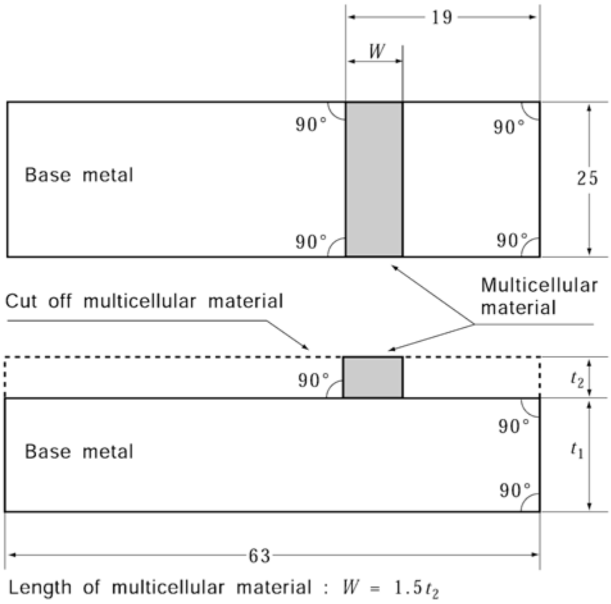

Fig 2.1.6 Size and Dimensions of Shearing Test Specimens (unit: mm)

8. Surface inspection and verification of dimensions

The minus tolerance for the nominal thickness of plates is left to the discretion of the Society.

9 Quality and repair of defects

(1) Each steel plate is to be subjected to ultrasonic testing. Any requirement for the test procedure is left to the discretion of the Society.
(2) Each cladding defects does not exceed 50 mm in length and 20 ㎠ in area. All defect areas do not exceed 1.5 % of the total surface in question.
(3) Any cladding defects over the length and area of (2) may be repaired by welding in accordance with the requirements given in **301. 9** (3)

10. Marking

(1) The test certificates are to comply with the requirements given in **107.** and are to contain the particulars as to the process of manufacture of steel plates and the thickness of the clad material.
(2) Steel plates which have satisfactorily complied with the required tests are to be suffixed with the following marks relating to the process of manufacture of the steel plates, in addition to the marks showing the kinds of the base and clad materials. (e.g. A + $RSTS$ 316 - R)

Rolling	:	[-R]
Cast rolling	:	[-ER]
Explosive pressing	:	[-B]
Explosive rolling	:	[-BR]
Overlay rolling	:	[-WR]

310. Additional requirements for through thickness properties

1. Application

(1) The requirements in **310.** are to apply to hull structural rolled steels and weldable high strength quenched and tempered steel plates and wide flats with thickness of 15 mm and over which is required improved through thickness properties to minimise the possibility of lamellar tearing during fabrication.
(2) The requirements are applicable to the other steels than the material specified in (2) above, where deemed appropriate by the Society.

2. Through thickness properties

The through thickness properties of steels are to comply with the requirements given in **Table 2.1.36** as the result of tensile tests whose specimens are taken in the through thickness direction of the product.

Table 2.1.36 Through thickness properties

Grade	Application	Reduction of area acceptance values(1)	
		Minimum average(%)	Minimum individual(%)
Z25	normal use	25	15
Z35	severe service condition	35	25

Note
(1) The minimum average value for the reduction of area of at least 3 tensile test specimens taken in the through thickness direction must be that shown for the appropriate grade given in Table. Only one individual value may be below the minimum average but not less than minimum individual value shown for the appropriate grade.

3. Deoxidation practice and chemical composition

In addition to the requirements of the appropriate steel specification given in **301.** or **308.**, the maximum sulphur content is to be 0.008% determined by the ladle analysis.

4. Selection of test specimens

(1) For steel, of same thickness, belonging to the same charge and same heat treatment condition, one test sample is to be taken from each lot specified in **Table 2.1.37.**

Table 2.1.37 Batch size dependent on product and sulphur content

Product	S > 0.005%	S≤0.005%
Plates	<P>	<50>
Wide flats of normal thickness ≤25mm	<10>	<50>
Wide flats of normal thickness >25mm	<20>	<50>

Note
(1) In the Table, <50>, <20> and <10> each indicate that steels not greater than 50, 20 and 10 tones are to be taken as one lot; <P> indicates that steel rolled directly from one slab or steel ingot is to be taken as one lot. The term "piece" is understood to mean the rolled product from a single slab or ingot if this is rolled directly into plates, sections or bars.

(2) The test samples are to be taken from one end (top of ingot when applicable) of the portion corresponding to the middle of the plates or flat bars as shown in **Fig 2.1.7.**

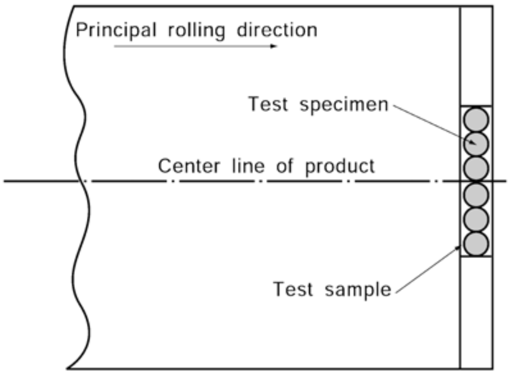

Fig 2.1.7 Selection of Test Samples

5. Selection of test specimens

(1) Three round tensile test specimens are to be taken from one test sample in the through thickness direction.

(2) The test specimens are to be taken according to the requirements for dimensions provided in **Table 2.1.38.**

Table 2.1.38 Dimensions of Specimen

Product thickness t (mm)	Diameter of test specimen d (mm)	Parallel length P (mm)
$15 \leq t \leq 25$	$d = 6$	$P \geq 2d$
$t > 25$	$d = 10$	$P \geq 2d$

(3) Where the product thickness does not allow to prepare specimens of sufficient length suitable for the gripping jaws of the testing machine, the ends of the specimens may be built up by suitable welding methods. The welding is not to impair the portion of the specimen within the parallel length.

6. Retest procedure

(1) Acceptance, rejection and retest criteria for the through thickness properties of steels are to comply with the requirements given in **Fig 2.1.8**

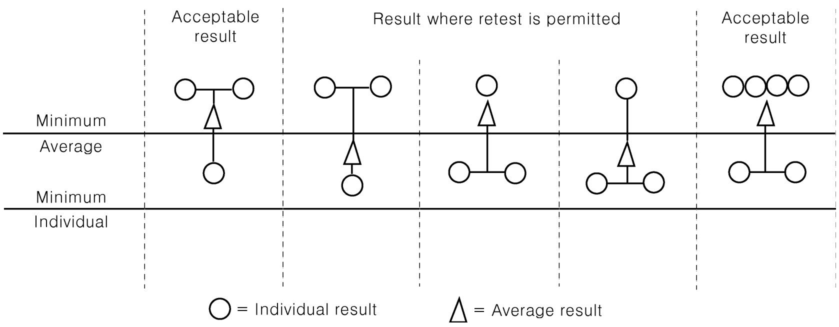

Fig 2.1.8 Acceptance, rejection and retest criteria for the through thickness properties of steels

(2) **Fig 2.1.8** shows the three cases where a retest situation is permitted. In these instances three more tensile tests are to be taken from the remaining test sample or remaining steel plates of same piece. The average of all 6 tensile tests is to be greater than the required minimum average with no greater than two results below the minimum average.

(3) In the case of failure after retest, either the lot represented by the piece is rejected or each piece within the lot is required to be tested.

(4) The test is considered invalid and further replacement test is required if the fracture occurs in the weld or heat affected zone.

7. Ultrasonic tests

(1) Ultrasonic testing should be carried out on each piece in the final supply condition.

(2) Any requirement for the test procedure and acceptance criteria are left to the discretion of the Society. However, the probe frequency is to be of 4MHz in general.

8. Marking

Steels which have satisfactorily complied with the requirements specified in **310.** are to have the notation Z25 or Z35 after the material grade mark. (e.g. *EH*36 *Z*25, *EH*36 *Z*35)

SECTION 4 Steel Tubes and Pipes

401. Steel tubes for boilers and heat exchangers

1. Application

(1) The requirements are mainly to apply to steel tubes intended for heat transfer at inside or outside of the tubes; for example, smoke tubes, water tubes, stay tubes, superheater tubes of boilers, other tubes for high temperature heat exchangers, etc. (hereinafter referred to as "steel tubes").

(2) Steel tubes other than those specified in (1) are to comply with the requirements in **101. 2.**

2. Kinds

The steel tubes are classified as specified in **Table 2.1.39.**

Table 2.1.39 Kinds

Description	Grade
Carbon steel tubes for boilers and heat exchangers	*RSTH* 35 *RSTH* 42 *RSTH* 52
Alloy steel tubes for boilers and heat exchangers	*RSTH* 12 *RSTH* 22 *RSTH* 23 *RSTH* 24

3. Heat treatment

The heat treatment of steel tubes is to comply with the requirements given in **Table 2.1.40.**

Table 2.1.40 Heat treatment

<table>
<tr><th rowspan="2">Grade</th><th colspan="2">Seamless steel tube</th><th colspan="3">Electric-resistance welded steel tube</th></tr>
<tr><th>Hot working</th><th>Cold working</th><th>As weld</th><th>Hot working</th><th>Cold working</th></tr>
<tr><td>RSTH 35</td><td rowspan="2">As drawn</td><td rowspan="2">Low temperature annealed, Normalized or full annealed</td><td rowspan="2">Normalized</td><td>As drawn</td><td rowspan="3">Normalized(1)</td></tr>
<tr><td>RSTH 42</td><td>Low temperature annealed</td></tr>
<tr><td>RSTH 52</td><td colspan="4">Normalized</td></tr>
<tr><td>RSTH 12</td><td colspan="5">Low temperature annealed, Isothermal annealed, Full annealed, Normalized or Normalized and tempered(2)</td></tr>
<tr><td>RSTH 22</td><td colspan="5">Low temperature annealed , Isothermal annealed, Full annealed or Normalized and tempered(2)</td></tr>
<tr><td>RSTH 23
RSTH 24</td><td colspan="2">Isothermal annealed, Full annealed or Normalized and tempered at 650℃ and over</td><td colspan="3">-</td></tr>
<tr><td colspan="6">NOTES
(1) Steel tubes which are normalized prior to cold working may be finished by annealing
(2) Low temperature annealing is not to be applied to electric resistance welded steel tube</td></tr>
</table>

4. Chemical composition

The chemical composition of steel tubes is to comply with the requirements given in **Table 2.1.41.**

Table 2.1.41 Chemical Composition

Grade	Chemical composition (%)						
	C	Si	Mn	P	S	Cr	Mo
RSTH 35	0.18 max.	0.10~0.35	0.30~0.60	0.035 max.	0.035 max.	-	-
RSTH 42	0.32 max.		0.30~0.80				
RSTH 52	0.25 max.		1.00~1.50				
RSTH 12	0.10~0.20	0.10~0.50	0.30~0.80				0.45~0.65
RSTH 22	0.15 max.	0.50 max.	0.30~0.60			0.80~1.25	
RSTH 23		0.50~1.00		0.030 max.	0.030 max.	1.00~1.50	
RSTH 24		0.50 max.				1.90~2.60	0.87~1.13

NOTE:
In case where approved by the Society, *RSTH* 35 and *RSTH* 42 may be the killed steel of below 0.10 % Si.

5. Mechanical properties

The mechanical properties of steel tubes are to comply with the following requirements.

(1) *Tensile test* : The tensile test of steel tubes is to comply with the requirements given in **Table 2.1.42.**

Table 2.1.42 Mechanical Properties

Grade	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%) ($L=5.65\sqrt{A}$)
RSTH 35	175 min.	340 min.	26 (22) min.
RSTH 42	255 min.	410 min.	21 (17) min.
RSTH 52	295 min.	510 min.	
RSTH 12	205 min.	380 min.	
RSTH 22 *RSTH* 23 *RSTH* 24		410 min.	

NOTES:
1. The values of elongation in parenthesis are applicable to the test specimens taken transversely. In this case, the sampling material is to be heated 600℃ to 650℃ after flattened and annealed in order to make it free from strain.
2. In case where test specimen of non-tubular section is taken from an electric-resistance welded steel tube, the test specimen is to be taken from the parts that do not include the welded line.

(2) *Flattening test* : A tubular section which is taken from the end of the steel tube is to stand being flattened cold between parallel plates, without cracking or showing flaw, until the distance between the plates becomes less than the value of H calculated by the following formula. In this case, the length L of steel tube is to be not less than 50 mm, however, not more than 100 mm. For electric-resistance welded steel tubes, however, the welded line is to be placed at right angle to the direction of the applied force as shown in **Fig 2.1.9** (a) For tubes, however, of 15 % of outside diameter and over in thickness, C-type test specimen may be used, having a part of its circumference discarded as shown in **Fig 2.1.9** (b)

$$H = \frac{(1+e)t}{e + \frac{t}{D}}$$

where:

H = Distance between flattening plates (mm).

t = Thickness of steel tube (mm).

D = Outside diameter of steel tube (mm).

e = Constant given in **Table 2.1.43** which varies according to the grade of steel tubes.

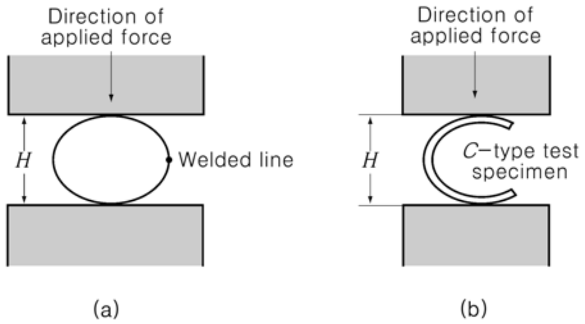

Fig 2.1.9 Flattening test

Table 2.1.43 Value of e

Grade	Value of e
RSTH 35	0.09
RSTH 42, *RSTH* 12, *RSTH* 22, *RSTH* 23, *RSTH* 24	0.08
RSTH 52	0.07

(3) *Flaring test* : A section of steel tube which is taken from its end is to stand being flared cold with a tool having an included angle of 60 degrees, until the steel tube at the mouth of the flare is expanded without cracking or showing flaw to the diameter shown in **Table 2.1.44.** The rate of penetration of the mandrel shall not exceed 50 mm/min. In this case, the length of test specimen is to be 1.5 D, however, not less than 50 mm.

Table 2.1.44 Outside Diameter of Steel Tube End after Flaring

Grade	Outside diameter of steel tube end
RSTH 35, *RSTH* 42, *RSTH* 52	1.2 times the outside diameter of steel tube
RSTH 12, *RSTH* 22, *RSTH* 23, *RSTH* 24	1.14 times the outside diameter of steel tube

(4) *Reverse flattening test* : A section of steel tube of 100 mm in length which is taken from the steel tube is to be slotted longitudinally on the opposite side of the welded line, opened and flattened without cracking or showing flaw on the inside of the welded line. There is also to be no misalignment, lack of penetration and overlap. But, this test is applied for electric-resistance welded steel tubes only.

(5) *Hydraulic test* :

(a) Steel tubes are to be hydraulically tested to a satisfactory result by 2 times and over the maximum working pressure at the mill. But the minimum test pressure is to be 7 MPa.

(b) The test pressure prescribed in (a) need not exceed the pressure calculated by the following formula:

$$P = \frac{2.0St}{D}(Mpa)$$

where:

t = Thickness of steel tube (mm)

D = Outside diameter of steel tube (mm)

S = 60 % of the prescribed minimum yield strength (N/mm^2)

(c) Where each steel tube is hydraulically tested as a regular procedure during the process of manufacturing at the mill, which makes a number of steel tubes continually, and the results are forwarded to the Surveyor, the test in the presence of the Surveyor may be dispensed with.

(d) A non-destructive inspection deemed appropriate by the Society may be substituted for the hydraulic test specified in (a).

6. Selection of test specimen

The test specimens are to be taken in accordance with the following requirements, from each grade and each size which has been heat treated at the same time in the same heating furnace for heat-treated tubes and from each grade and each size for non-heat-treated steel tubes respectively.

(1) *Seamless steel tubes*
One sampling steel tube is to be selected from each lot of 50 tubes or fraction thereof and each one specimen for tensile test, flattening test and flaring test is to be taken from each sampling steel tube.

(2) *Electric-resistance welded steel tubes*
For electric-resistance welded steel tubes, in addition to the requirements in (1), one sampling steel tube is to be selected from each lot of 100 tubes or fraction thereof, and one reverse flattening test specimen is to be taken from each of the sampling steel tubes.

7. Tolerance for dimensions

The tolerances for the outside diameter and thickness are to comply with the requirements in **Table 2.1.45.** and **Table 2.1.46.** respectively.

Table 2.1.45 Tolerance for Outside Diameter of steel Tubes

Outside diameter of steel tube D (mm)	Tolerance for Outside Diameter (mm)			
	Seamless steel tube		Electric-resistance welded steel tube	
	Hot finished	Cold working	Other than cold working	Cold working
D <25	+ 0.4 - 0.8	± 0.10	± 0.15	± 0.10
25≤ D <40		± 0.15	± 0.20	± 0.15
40≤ D <50		± 0.20	± 0.25	± 0.20
50≤ D <60		± 0.25	± 0.30	± 0.25
60≤ D <80		± 0.30	± 0.40	± 0.30
80≤ D <100		± 0.40	+ 0.40 - 0.60	± 0.40
100≤ D <120	+ 0.4 - 1.2	+ 0.40 - 0.60	+ 0.40 - 0.80	+ 0.40 - 0.60
120≤ D <160		+ 0.40 - 0.80	+ 0.40 - 1.00	+ 0.40 - 0.80
160≤ D <200	+ 0.4 - 1.6	+ 0.40 - 1.20	+ 0.40 - 1.20	+ 0.40 - 1.20
200≤ D	+ 0.4 - 1.8	+ 0.40 - 1.60	+ 0.40 - 1.60	+ 0.40 - 1.60

Table 2.1.46 Tolerance for thickness

Kind	Thickness t (mm) / Outside diameter D (mm)	t<2	2≤t<2.4	2.4≤t<3.8	3.8≤t<4.6	4.6≤t
Hot finished seamless steel tube	D < 100	-	+40 % 0 %	+35 % 0 %	+33 % 0 %	+28 % 0 %
	D ≥ 100		-			
Cold drawn seamless steel tube and Electric-resistance welded steel tube of cold working	D < 40	+0.4mm 0 mm	+22 % 0 %			
	D ≥ 40	+22 %, 0 %				
Electric-resistance welded steel tube of other than cold working	D < 40	+0.3mm 0 mm	+18 % 0 %			
	D ≥ 40	+18 %, 0 %				

NOTE:
For hot finished seamless steel tubes. the tolerance for deviation in wall thickness is to be 22.8 % and under of the thickness of the steel tube. But, for steel tubes of less than 5.6 mm in thickness, this note is not applied.

8. Quality

(1) Each steel tubes are hydraulically or non-destructively tested as a regular procedure during the process of manufacturing at the mill and are free from leakages or harmful defects.
(2) The steel tubes are to be of uniform quality. For electric-resistance welded steel tubes, deposit metal projected on outside of tubes is to be removed and finished smooth and that projected on inside of tubes is to be removed to have a height not more than 0.25 mm.

9. Retest procedures

Where the tensile test, *flattening test, flaring test* or *reverse flattening test* fails to meet the requirements, additional tests may be conducted according to the requirements given in **109.**

10. Marking

(1) The name or brand of the manufacturer, grade of tubes, size and symbol of the method of the manufacture relating to (2) below are to be legibly stamped or stenciled before shipment on each length steel tube in case of 30 mm and above in outside diameter and on each bundle or container of steel tubes in case of less than 30 mm in outside diameter. The Society''s brand indicating compliance with the requirements is to be stamped in the vicinity of the foregoing marks.
(2) The symbols indicating the method of manufacture are to be as specified in the following:
Hot finished seamless steel tube ········ *-S-H*
Cold drawn seamless steel tube ········ *-S-C*
Electric-resistance welded steel tube of other than hot and cold working ······ *-E-G*
Electric-resistance welded steel tube of hot working ········ *-E-H*
Electric-resistance welded steel tube of cold working ········ *-E-C*

402. Steel pipes for pressure piping

1. Application

(1) These requirements are mainly to apply to seamless steel pipes and electric-resistance welded steel pipes intended for use in piping which is prescribed in **Pt 5, Ch 6** (hereinafter referred to as "steel pipes").
(2) Steel pipes for general purpose specified in **102. 2** (4) of **Pt 5, Ch 6** are to comply with the requirements of *KS D* 3507(SPP) or equivalent thereto. However, tests in the presence of the Surveyor are not required.
(3) The steel pipes having characteristics differing from those specified in **402.** are to comply with the requirements in **101. 2.**

2. Kinds

The steel pipes are classified as specified in **Table 2.1.47.**

Table 2.1.47 Grades of Steel Pipes

<table>
<tr><th>Kind</th><th>Grade</th><th>Schedule applied</th></tr>

4. Chemical composition

The chemical composition of steel pipes is to comply with the requirements given in **Table 2.1.49.**

Table 2.1.49 Chemical Composition

Grade		Chemical composition (%)						
		C	*Si*	*Mn*	*P*	*S*	*Cr*	*Mo*
Grade 1	*RST* 138	0.25 max.	0.35 max.	0.30~0.90	0.040 max.	0.040 max.	-	-
	RST 142	0.30 max.		0.30~1.00				
Grade 2	*RST* 238	0.25 max.	0.10~0.35	0.30~1.10	0.035 max.	0.035 max.		
	RST 242	0.30 max.		0.30~1.40				
	RST 249	0.33 max.		0.30~1.50				
Grade 3	*RST* 338	0.25 max.		0.30~0.90				
	RST 342	0.30 max.		0.30~1.00				
	RST 349	0.33 max.						
Grade 4	*RST* 412	0.10~0.20	0.10~0.50	0.30~0.80				0.45~0.65
	RST 422	0.15 max.	0.50 max.	0.30~0.60			0.80~1.25	
	RST 423		0.50~1.00		0.030 max.	0.030 max.	1.00~1.50	
	RST 424		0.50 max.				1.90~2.60	0.87~1.13

5. Mechanical properties

The mechanical properties of steel pipes are to comply with the following requirements.

(1) *Tensile test* : The tensile test of steel pipes are to comply with the requirements given in **Table 2.1.50.**

Table 2.1.50 Mechanical Properties

Grade		Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%)($L = 5.65\sqrt{A}$)
Grade 1 Grade 2 Grade 3	*RST* 138 *RST* 238 *RST* 338	215 min.	370 min.	24 (20) min.
Grade 1 Grade 2 Grade 3	*RST* 142 *RST* 242 *RST* 342	245 min.	410 min.	21 (17) min.
Grade 2 Grade 3	*RST* 249 *RST* 349	275 min.	480 min.	19 (15) min.
Grade 4	*RST* 412	205 min.	380 min.	21(17) min.
Grade 4	*RST* 422 *RST* 423 *RST* 424		410 min.	

NOTES:

1. The requirements for elongation given in parentheses in the Table are applied for the case where test specimens are taken transversely. In this case, the test sample is to be stress relieved at the temperature of 600℃ to 650℃ after flattened.
2. In case where test specimen of non-tubular section is taken from electric-resistance welded steel pipes, the test specimen is to be taken from the part that does not include a welded line.

(2) *Flattening test*

(a) *Pipes other than Grade 1 of electric-resistance welded steel pipe*: A tubular section of steel pipe which is taken from the end of the steel pipe, is to stand being flattened between parallel plates, without cracking or showing flaw, until the distance between the plates becomes less than the value of H calculated by the following formula. In this case, the length of test specimen is to comply with the requirements in **401.5** (2). For steel pipes, however, of 15 % of outside diameter and above in thickness, C-type test specimen may be used, having a part of its circumference discarded as shown in **Fig 2.1.9 (b)**

$$H=\frac{(1+e)t}{e+\frac{t}{D}}$$

where:

H = Distance between flattening plates (mm).

t = Thickness of steel pipe (mm).

D = Outside diameter of steel pipe (mm).

e = Constant given in **Table 2.1.51** which varies according to the grade of steel tubes.

Table 2.1.51 value of e

Grade	*RST* 142, *RST* 242, *RST* 249, *RST* 342 *RST* 349	*RST* 138, *RST* 238, *RST* 338, *RST* 412 *RST* 422, *RST* 423, *RST* 424
e	0.07	0.08

(b) *Electric-resistance welded steel pipes Grade 1* :

$H=\frac{2}{3}D$ for welded line,

$H=\frac{1}{3}D$ for elsewhere.

In case of electric-resistance welded steel pipes, the welded line is to be placed at right angle to the direction of the applied force, as in **Fig 2.1.10.**

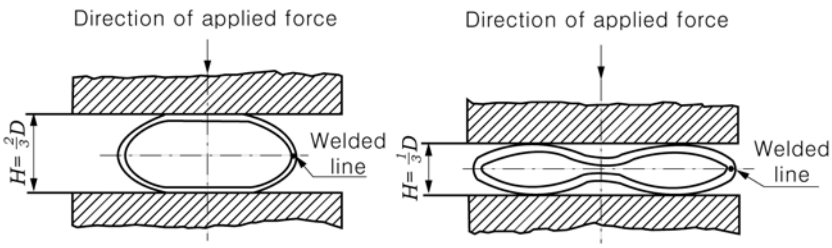

Fig 2.1.10 Flattening test of electric-resistance welded steel pipes Grade 1

(3) *Bend test* : For steel pipes of 50 mm and under in outside diameter, the specimen for flattening test may be substituted for that for bend test. In this case, a test specimen of tubular section which is taken from the end of the steel pipe and has sufficient length is to stand being bent cold, up to the specified value in **Table 2.1.52,** without cracking or showing flaw on the wall. But, for Grade 4, this test need not be carried out.

Table 2.1.52 Bend Test

Grade	Angle of bending	Inside bend radius
1, 2 and 3	90°	6 times the outside diameter of steel pipe
NOTE: Electric-resistance welded steel pipes are to be so bent as the welded line is placed widest.		

(4) *Hydraulic test*

(a) Grade 1 steel pipes are to be hydraulically tested with the pressure specified in **Table 2.1.53.**

(b) In case where the test pressure higher than prescribed in (a) is specified by the purchaser for Grade 2 through 4 steel pipes, the test is to be carried out with the specified pressure. In this case, test pressure need not exceed the pressure calculated by the following formula:

$$P = \frac{2.0St}{D} \text{(Mpa)}$$

where :

P = Hydraulic test pressure (MPa).

D = Outside diameter of steel pipe (mm).

t = Thickness of steel pipe (mm).

S = 60 % of the prescribed minimum yield strength (N/mm^2).

(c) When each steel pipe is hydraulically tested as a regular procedure during the process of manufacturing at the mill which makes a number of steel tubes continually, and the results are forwarded to the Surveyor, the test in the presence of the Surveyor may be dispensed with.

(d) A non-destructive inspection deemed appropriate by the Society may be substituted for the hydraulic inspection specified in (a).

6. Selection of test specimen

(1) *Grade 1* : Sampling steel pipes are to be selected as following requirements in connection with the nominal diameter of steel pipes specified in **Table 2.1.53** and each one specimen for tensile test, flattening test or bend test is to be taken from each sampling steel pipe.

(a) *For steel pipes less than 65A in nominal diameter* : One sampling steel pipe is to be selected from each lot of 1000 pipes or fraction thereof.

(b) *For steel pipes which a nominal diameter is 65A or above and less than 150A* : One sampling steel pipe is to be selected from each lot of 500 pipes or fraction thereof.

(c) *For steel pipes which a nominal diameter is 150A or above and less than 350A* : One sampling steel pipe is to be selected from each lot of 250 pipes or fraction thereof.

(d) *For steel pipes more than 350A in nominal diameter* : One sampling steel pipe is to be selected from each lot of 150 pipes or fraction thereof.

(2) *Grade 2* : One sampling steel pipe is to be selected from each lot of 50 pipes or fraction thereof, and each one specimen for tensile test and flattening test or bend test is to be taken from each sampling steel pipe.

(3) *Grade 3*

Selection of test specimen is to comply with the requirements in (2).

(4) *Grade 4* : One sampling steel pipe is to be selected from each lot of 50 pipes or fraction thereof, and each one specimen for tensile test and flattening test or bend test is to be taken from each sampling steel pipe.

Table 2.1.53 Schedule and Hydraulic Test Pressure

Nominal diameter (A)	Outside diameter (mm)	Nominal thickness (mm)

Hydraulic test pressure (MPa)	Grade 1	2.0	3.5	5.0	6.0	9.0	12.0	-	-	-	-
	Grade 2	-	-	-	6.0	9.0	12.0	15.0	18.0	20.0	20.0
	Grade 3 and Grade 4	2.0	3.5	5.0	6.0	9.0	12.0	15.0	18.0	20.0	20.0

NOTE:
The values of nominal thickness in parentheses are applicable to stainless steel pipes.

7. Tolerance for dimensions

Tolerances for the outside diameter and the thickness are to comply with the requirements in **Table 2.1.54.**

Table 2.1.54 Tolerance for Dimensions

Kind	Outside diameter of steel pipe D (mm)	Tolerance for outside diameter	Tolerance for wall thickness			
			Grade 1		Grade 2, 3 and 4	
Hot finished seam-less steel pipe	D < 50	± 0.5 mm	Thickness of steel pipe: Less than 4 mm	+ 0.6 mm - 0.5 mm	Thickness of steel pipe: Less than 4 mm	± 0.5 mm
	D ≥ 50	± 1 %	Thickness of steel pipe: 4 mm and over	+ 15 % - 12.5 %	Thickness of steel pipe: 4 mm and over	± 12.5 %
Cold drawn seam-less steel pipe and electric-resistance welded steel pipe	D < 40	± 0.3 mm	Thickness of steel pipe: Less than 3 mm	± 0.3 mm	Thickness of steel pipe: Less than 2 mm	± 0.2 mm
	D ≥ 40	± 0.80 mm	Thickness of steel pipe: 3 mm and over	± 10 %	Thickness of steel pipe: 2 mm and over	± 10 %

NOTE:
For hot finished seamless steel pipes Grades 2, 3 and 4, the tolerance for deviation in wall thickness is to be 20 % and under of the thickness of the pipes. But, for steel pipes less than 5.6 mm in thickness, this note is not applied.

8. Quality

(1) Each steel pipes are hydraulically or non-destructively tested and are free from leakages or harmful defects.
(2) The steel pipes are to be of uniform quality and free from harmful defects.

9. Retest procedures

Where the tensile test, *flattening test* or bend *test* fails to meet the requirements, additional tests may be conducted according to the requirements given in **109.**

10. Marking

(1) The name or brand of the manufacturer, grade of steel tubes, size and symbol of the method of the manufacture relating to (2) below are to be legibly stamped or stenciled before shipment on each length steel tube in case of 60 mm and above in outside diameter and on each bundle or container of steel tubes in case of less than 60 mm in outside diameter. The Society's brand indicating compliance with the requirements is to be in the vicinity of the foregoing marks.
(2) The symbols indicating the method of manufacture are to comply with the requirement in **401. 10** (2).

403. Stainless steel pipes

1. Application

(1) The requirements are to apply to the stainless steel pipes for low temperature service or corrosion-resistance service (hereinafter referred to as "stainless steel pipes").
(2) Stainless steel pipes having characteristics differing from those specified in **403.** are to comply with the requirements in **101. 2.**

2. Kinds

The stainless steel pipes are classified as specified in **Table 2.1.55**.

Table 2.1.55 Grades and Chemical Composition

<table>
<tr><th rowspan="2">Grade</th><th rowspan="2">solid solution treatment(℃)</th><th colspan="9">Chemical Composition (%)</th></tr>

</table>

3. Heat treatment

The stainless steel pipes are generally to receive a solid solution treatment. For RSTS 321TP and RSTS 347TP, stabilizing treatment may be required. In this case, heat treatment temperature is to be of 850~930℃.

4. Chemical composition

The chemical composition of stainless steel pipes is to comply with the requirements given in **Table 2.1.55.**

5. Mechanical properties

(1) The mechanical properties of stainless steel pipes are to comply with the following requirements.

(a) *Tensile test*
The tensile test of stainless steel pipes is to comply with the requirements given in **Table 2.1.56.**

(b) *Flattening test*
Flattening tests are to be carried out in accordance with the requirements in **402. 5** (2). However, where the requirements are applied, the value of e is to be taken as 0.09.

Table 2.1.56 Tensile Test

Grade	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%)($L=5.65\sqrt{A}$)	
			L	T
RSTS 304*TP*	205 min.	520 min.	26 min.	22 min.
RSTS 304*LTP*	175 min.	480 min.		
RSTS 309*STP*	205 min.	520 min.		
RSTS 310*STP*				
RSTS 316*TP*				
RSTS 316*LTP*	175 min.	480 min.		
RSTS 317*TP*	205 min.	520 min.		
RSTS 317*LTP*	175 min.	480 min.		
RSTS 321*TP*	205 min.	520 min.		
RSTS 347*TP*				

NOTES:
1. *L* (or *T*) denotes that the longitudinal axis of the test specimen is arranged parallel (or normal) to the final direction of rolling.
2. Where the nominal diameter of stainless steel pipes is 200 mm and over, tensile test specimens may be taken transversely.
3. Where test specimens of non-tubular section are taken from welded pipes, the test specimens are to be taken from the part that does not include the welded line.

(c) *Hydraulic test*

(i) Stainless steel pipes are to be hydraulically tested with the pressure specified in **Table 2.1.57.**

Table 2.1.57 Hydraulic Test Pressure

Schedule No.	Sch.10S	Sch.20S	Sch.40	Sch.80	Sch.120	Sch.160
Test pressure (MPa)	2.0	3.5	6.0	12.0	18.0	20.0

(ii) In case where the test pressure higher than prescribed in (a) is specified by the purchaser, the test is to be carried out with the specified pressure. In this case, the test pressure need not exceed the pressure calculated by the following formula:

$$P=\frac{2.0St}{D}\ (\text{Mpa})$$

where:

P = Hydraulic test pressure (MPa).

t = Thickness of stainless steel pipe (mm).

D = Outside diameter of stainless steel pipe (mm).

S = 60 % of the prescribed minimum yield strength (N/mm^2).

(iii) When each pipe is hydraulically tested as a regular during the process of manufacturing at the mill which makes a number of tubes continually, and the results are forwarded to the Surveyor, the test in the presence of the Surveyor may be dispensed with.

(iv) A non-destructive inspection deemed appropriate by the Society may be substituted for the hydraulic test specified in (i).

(2) The Society may require the impact test or corrosion resistance test according to purposes of stainless steel pipes.

6. Selection of test specimens

One sampling pipe is to be selected from each lot of 50 pipes or fraction thereof which are of the same charge, size and kind and are simultaneously heat treated, and each one specimen for tensile test and flattening test is to be taken from each sample pipe.

7. Tolerance for dimensions

Tolerances for the outside diameter and the thickness are to comply with the requirements in **Table 2.1.58.**

Table 2.1.58 Tolerance for Dimensions

Kind	Outside diameter of stainless steel pipe		Tolerance for wall thickness	
Hot-finished seamless stainless steel pipe	Less than 50	± 0.5 mm	Thickness of pipe: Less than 4 mm	± 0.5 mm
	50 and over	± 1 %	Thickness of pipe: 4 mm and over	± 12.5 %
Cold drawn seamless stainless pipe, automatic arc welded stainless steel pipe and electric-resistance welded stainless steel pipe	Less than 30	± 0.3 mm	Thickness of pipe: Less than 2 mm	± 0.2 mm
	30mm and over	± 1 %	Thickness of pipe: 2 mm and over	± 10 %
NOTE: For hot finished seamless stainless steel pipes, the tolerance for deviation in wall thickness is to be 20 % and under of the thickness of the pipes. But, for stainless steel pipes less than 5.6 mm in thickness, this note is not applied.				

8. Quality

(1) Each steel pipes are hydraulically or non-destructively tested and are free from leakages or harmful defects.
(2) The stainless steel pipes are to be of uniform quality and free from harmful defects.

9. Retest procedures

Where the tensile test or *flattening test* fails to meet the requirements, additional tests may be conducted according to the requirements given in **109.**

10. Marking

Stainless steel pipes which have satisfactorily complied with the required tests are to be marked with identification mark in accordance with the requirements in **402. 10.** However, the symbols indicating the manufacturing method of automatic arc welded steel pipes are to be as specified in the following:

Automatic arc welded steel pipe : *-A*
Automatic arc welded and cold finished steel pipe : *-A-C*
Automatic arc welded and machined steel pipe : *-A-B*

404. Steel pipes for low temperature service

1. Application

(1) These requirements are to apply to the seamless steel pipes and electric resistance welded steel pipes not exceeding 25 mm in thickness, intended to be used at the design temperature lower than 0℃ in liquefied gas carriers (hereinafter referred to as "steel pipes").

(2) Any requirement regarding the steel pipes over 25 mm in thickness is left to the discretion of the Society.
(3) Steel pipes having characteristics differing from those specified in **404.** are to comply with the requirements in **101. 2.**

2. Kinds

The steel pipes are classified as given in **Table 2.1.59.**

3. Deoxidation practice and chemical composition

The deoxidation practice and chemical composition of each grade are to comply with the requirements given in **Table 2.1.59.**

Table 2.1.59 Grades and Chemical Composition (%)

Grade	Deoxidation	*C*	*Si*	*Mn*	*P*	*S*	*Ni*
RLPA	Fully killed fine grain	0.23 max.	0.35 max.	1.60 max.	0.035 max.	0.035 max.	-
RLPB		0.18 max.	0.35 max.	1.60 max.	0.035 max.	0.035 max.	-
RLPC		0.18 max.	0.35 max.	1.60 max.	0.035 max.	0.035 max.	-
RLP 2		0.19 max.	0.10~0.35	0.90 max.	0.035 max.	0.035 max.	2.00~2.60
RLP 3		0.16 max.	0.10~0.35	0.90 max.	0.030 max.	0.030 max.	3.20~3.80
RLP 9		0.10 max.	0.10~0.35	0.90 max.	0.030 max.	0.030 max.	8.40~9.50

4. Heat treatment

The heat treatment of steel pipes is to comply with the requirements given in **Table 2.1.60.**

5. Mechanical properties

(1) The mechanical properties of steel pipes are to comply with the following (a) to (d).
(a) *Tensile test*
The tensile test of steel pipes is to comply with the requirements given in T**able 2.1.60.**
(b) *Impact test*
The impact test of steel pipes is to comply with the requirements given in **Table 2.1.60.**
(c) *Flattening test*
Flattening test is to be carried out in accordance with the requirements given in **402. 5** (2). Where this requirement is applied, the value of e is to be taken as 0.08. For steel pipes of 50 mm and under in outside diameter, the specimen for flattening test may be substituted for that for bend test. In this case, a test specimen of tubular section which is taken from the end of the steel pipe and has sufficient length is to stand being bent cold, up to the specified value in **Table 2.1.60**, without flaw and cracking on the outside of bent portion. Electric resistance welded steel pipes are to be bent at the place where the welded line is on the outside of bent portion.
(d) *Hydraulic test*
All steel pipes are to be subjected to hydraulic test in accordance with the requirements given in **402. 5** (4).
(2) Where deemed necessary by the Society, other tests may be required in addition to the tests specified in (1)

6. Selection of test specimens

(1) One sampling pipe is to be selected from each lot of 50 pipes or fraction thereof which are of the same charge, size and kind and are simultaneously heat treated. Each one specimen for tensile test and flattening test is to be taken from each sample pipe.

(2) One set of three specimens for impact test is to be taken from each sample pipe in accordance with **Fig 2.1.11.** Moreover, for electric resistance welded steel pipes, another set of three specimens is to be taken from the welded zone in accordance with **Fig 2.1.12.**

Table 2.1.60 Heat Treatment and Mechanical Properties

Grade	Heat treatment	Tensile test (1)(2)(3)				Bend test		Impact test	
		Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%) ($L=5.65\sqrt{A}$)		Inside radius of bend	Angle of bend (°)	Test temp. (℃)	Average absorbed energy (J)(4)
				L	*T*				
RLPA	Normalized, Normalized and tempered or Quenched and tempered	205 min.	380 min.	26 min.	19 min.	6 times the outside diameter of steel pipe	90	-40(5)	27 min.
RLPB								-50(5)	
RLPC								-60(5)	
RLP 2		245 min.	450 min.	20 min.	14 min.			-70	34 min.
RLP 3								-95	
RLP 9	Double normalized and tempered or Quenched and tempered	520 min.	690 min.	15 min.	11 min.			-196	41 min.

NOTES:
(1) *L* (or *T*) denotes that the longitudinal axis of the test specimen is arranged parallel (or normal) to the final direction of rolling.
(2) Where the nominal diameter of steel pipes is 200 mm and over, the tensile test specimen may be taken transversely.
(3) Where test specimen of non-tubular section is taken from electric resistance welded pipes, the test specimen is to be taken from the portion that does not include the welded line.
(4) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70% of the specified average absorbed energy, the test is considered to have failed.
(5) Impact test temperature for steel pipes specified in **Pt 7, Ch 5** is to be 5℃ below the design temperature or -20℃, whichever is the lower.

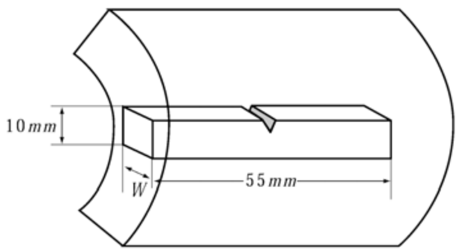

Fig. 2.1.11 The position of selection for impact test specimen taken from the seamless steel pipes and other portions than weld zone of electric-resistance welded steel pipes

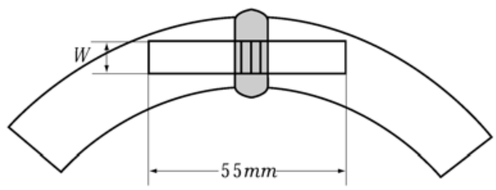

Fig. 2.1.12 The position of selection for impact test specimen taken from the weld zone of electric-resistance welded steel pipes

7. Tolerance for dimensions

The tolerances for outside diameter and wall thickness of steel pipes are to be in accordance with the requirements given in **Table 2.1.61.**

Table 2.1.61 Tolerance for Outside Diameter and Wall Thickness

Kind	Tolerance for outside diameter	Tolerance for wall thickness
Hot-finished seamless steel pipe	D < 50 : ± 0.5 mm 50 ≤ D < 250 : ± 1 % (maximum value 2.0 mm) 250 ≤ D : ± 0.8 %	t < 4 : ± 0.5 mm t ≥ 4 : ± 12.5 %
Cold-drawn seamless steel pipe and Electric-resistance welded steel pipe	± 0.8 % (max. value 0.3 mm)	t < 2 : ± 0.2 mm t ≥ 2 : ± 10 %
NOTE: For hot-finished seamless steel pipes, the tolerance for deviation in wall thickness is to be 20 % or less of wall thickness, but it shall not be applied to the pipes less than 5.6 mm in wall thickness.		

8. Quality

The steel pipes are to be of uniform quality and free from harmful defects.

9. Retest procedures

(1) Where other mechanical tests than impact tests fail to meet the requirements, additional tests may be carried out according to the requirements given in **109.**

(2) Regarding the impact tests, additional tests are to be carried out according to the requirements given in **301. 10** (3).

10. Marking

Marking for steel pipes is generally to comply with the requirements given in **402. 10.** and in case the requirement in Note (5) of **Table 2.1.60** has been applied, "impact test temperature T" is to be suffixed to the marking. (e.g. *RLPA*-25*T*)

405. Header

1. Application

(1) These requirements are to apply to the headers to be used for boilers.

(2) The headers having characteristics differing from those specified in **405.** are to comply with the requirements in **101. 2.**

2. Kinds

The headers are classified as specified in **Table 2.1.62.**

Table 2.1.62 Grades of Headers

Grade	Grade 1	Grade 2	Grade 3	Grade 4	Grade 5	Grade 6
	RBH 1	*RBH* 2	*RBH* 3	*RBH* 4	*RBH* 5	*RBH* 6

3. Heat treatment

Headers are to be heat treated by annealing or normalizing.

4. Chemical composition

The chemical composition of headers is to comply with the requirements given in **Table 2.1.63.**

Table 2.1.63 Chemical Composition

<table>
<tr><th rowspan="2">Grade</th><th colspan="7">Chemical composition (%)</th></tr>
<tr><th>C</th><th>Si</th><th>Mn</th><th>P</th><th>S</th><th>Cr</th><th>Mo</th></tr>
<tr><td>RBH 1</td><td>0.25 max.</td><td rowspan="2">0.10~0.35</td><td rowspan="3">0.30~0.80</td><td rowspan="2">0.040 max.</td><td rowspan="3">0.040 max.</td><td rowspan="3">-</td><td rowspan="2">-</td></tr>
<tr><td>RBH 2</td><td>0.30 max.</td></tr>
<tr><td>RBH 3</td><td rowspan="2">0.10~0.20</td><td rowspan="4">0.10~0.50</td><td rowspan="4">0.030 max.</td><td>0.45~0.65</td></tr>
<tr><td>RBH 4</td><td rowspan="3">0.30~0.60</td><td rowspan="3">0.030 max.</td><td rowspan="2">0.80~1.20</td><td>0.20~0.45</td></tr>
<tr><td>RBH 5</td><td rowspan="2">0.15 max.</td><td>0.45~0.65</td></tr>
<tr><td>RBH 6</td><td>2.00~2.50</td><td>0.90~1.10</td></tr>
</table>

5. Mechanical properties

(1) **Tensile test**: The tensile test of headers is to comply with the requirements given in **Table 2.1.64.**

Table 2.1.64 Mechanical Properties

<table>
<tr><th>Grade</th><th>Yield strength (N/mm^2)</th><th>Tensile strength (N/mm^2)</th><th>Elongation(%) ($L=5.65\sqrt{A}$)</th><th>Reduction of area (%)</th></tr>
<tr><td>RBH 1</td><td>205 min.</td><td>410 min.</td><td>24 min.</td><td>38 min.</td></tr>
<tr><td>RBH 2</td><td>225 min.</td><td>450 min.</td><td>23 min.</td><td rowspan="5">40 min.</td></tr>
<tr><td>RBH 3</td><td rowspan="4">205 min.</td><td>380 min.</td><td>22 min.</td></tr>
<tr><td>RBH 4</td><td rowspan="3">410 min.</td><td rowspan="3">21 min.</td></tr>
<tr><td>RBH 5</td></tr>
<tr><td>RBH 6</td></tr>
<tr><td colspan="5">NOTE:
When test specimens are taken crosswise to the rolled direction, the values of yield strength and tensile strength are to be as given in this Table and the elongation is to take the value reduced by 5 % from the percentage given in this Table. The value of reduction of area may be only remained on records for reference.</td></tr>
</table>

(2) **Bend test**: The test specimen is to stand being bent cold through 180" without flaw and cracking on the outside of bent portion to an inside radius of 12 mm. Where the test specimen of 20 mm in thickness can not be taken, the test specimen may be as original in thickness, in which case, however, the width of test specimen is not to be less than 1.5 times the thickness and the inside radius of bend is to be equal to the thickness.

6. Selection of test specimens

(1) Tensile test specimens are to be taken lengthwise or crosswise to the rolled direction and bend test specimens to be taken crosswise to the rolled direction each from the open ends of headers.

(2) For the headers of the same size made from the same melt and subjected to the heat treatment simultaneously in the same furnace, tensile and bend test specimens are to be selected in accordance with the requirements given in **Table 2.1.65.**

Table 2.1.65 Number of Test Specimens

Grade	Length of test specimens l (mm)	Number of test specimens
RBH 1 *RBH* 2	$3000 \leq l$	1 set for each one length
	$2000 \leq l < 3000$	1 set for each three lengths
	$2000 > l$	1 set for each five lengths
RBH 3 *RBH* 4 *RBH* 5 *RBH* 6	$3000 \leq l$	1 set from each end for each one lengths
	$3000 > l$	1 set for each one length

(3) Where the both ends of header are closed by reforging, the test samples of proper size may be cut from the open ends before reforging.
(4) Where test samples cut from circular headers, etc. are necessary to be flattened, the test samples are to be taken from the body before being subjected to the heat treatment and after flattening the test samples are to be heat treated simultaneously with the body in the same furnace, or the test samples are to be cut from the structures after being subjected to the heat treatment and after flattened cold, they are to be heated to the temperature of 600℃ to 650℃ for the purpose of removing the distortion due to the flattening, and the required test specimens are to be cut from the test samples.

7. Tolerance for thickness

The tolerance for thickness is to be +12.5 %. The tolerance, however, may not apply to the closed portions of circular or square headers, the side corners of square headers and the corrugated headers.

8. Quality

Headers are to be of uniform quality and free from harmful defects.

9. Marking

Headers which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **401. 10.**

SECTION 5 Castings

501. Steel castings

1. Application

(1) The requirements in **501.** are to apply to the steel castings intended to be used for the components specified in the relevant Parts of hull construction equipments and machinery, except that defined in **502., 503.** and **504.**
(2) Steel castings having characteristics differing from those specified in **501.** are to comply with the requirements in **101. 2.**

2. Kinds

The steel castings are classified as specified in **Table 2.1.66.**

Table 2.1.66 Grades and Mechanical Properties

Kind	Grade	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%) ($L=5.65\sqrt{A}$)	Reduction of area (%)
Carbon steel castings	*RSC* 410	205 min.	410 min.	24 min.	38 min.
	RSC 450	225 min.	450 min.	22 min.	29 min.
	RSC 480	245 min.	480 min.	20 min.	27 min.
	RSC 520	265 min.	520 min.	18 min.	25 min.
	RSC 560	305 min.	560 min.	15 min.	20 min.
	RSC 600	325 min.	600 min.	13 min.	20 min.
Low alloy steel castings	*RSC* 440*A*	245 min.	440 min.	22 min.	40 min.
	RSC 480*A*	275 min.	480 min.	17 min.	35 min.
	RSC 550*A*	345 min.	550 min.	16 min.	35 min.

NOTES:
1. For intermediate values of the tensile strength, the minimum values for yield strength, elongation and reduction of area may be obtained by interpolation and the value at the first decimal place is to be subjected to the method of counting fractions over 1/2 as one and disregarding the rest.
2. The upper limit of the tensile strength is to be within 150 N/mm^2 from minimum tensile strength of each grade.

3. Manufacture

(1) All flame cutting, scarfing or arc-air gouging to remove the risers and surplus metal is to be undertaken in accordance with recognized good practice and is to be carried out before the final heat treatment. Preheating is to be employed when necessitated by the chemical composition or thickness of the castings. If necessary, the affected areas are to be either machined or ground smooth.
(2) Where the surface of steel castings is hardened by induction hardening, nitriding, cold rolling or other methods, the proposed methods of manufacture are to be approved by the Society.
(3) When two or more castings are joined by welding to form a composite component, the proposed welding procedure is to be submitted for approval to the Society. If necessary, welding procedure qualification tests may be required.

4. Chemical composition

(1) All castings are to be made from killed steel and the chemical composition is to comply with the overall limits given in **Table 2.1.67.**
(2) The chemical composition of each heat is to be determined by the manufacturer on a sample taken preferably during the pouring of the heat. When multiple heats are tapped into a common ladle, the ladle analysis shall apply.

Table 2.1.67 Chemical Composition (%)

Steel Type	Application	Chemical composition (%)										
		C	Si	Mn	S	P	Residual elements					Total residuals
							Cu	Cr	Ni	Mo	W	
Carbon steel casting	Casting for non-welded construction	0.40 max.	0.60 max.	0.50-1.60	0.040 max.	0.040 max.	0.30 max.	0.30 max.	0.40 max.	0.15 max.	-	0.80 max.
	Casting for welded construction	0.23 max.(1)	0.60 max.	1.60 max.	0.040 max.	0.040 max.	0.30 max.	0.30 max.	0.40 max.	0.15 max.	-	0.80 max.
Low alloy steel casting		0.25 max.	0.60 max.	0.50 - 0.80	0.030 max.	0.030 max.	0.50 max.	1.50 max.	0.50 max.	1.20 max.	0.10 max.	1.00 max.

NOTES :
(1) The carbon content may be, subject to approval by the Society, increased above this level provided that the carbon equivalent (*Ceq*) is not more than 0.41 %

(3) Unless otherwise required suitable grain refining elements such as aluminium may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

5. Heat treatment

(1) Steel castings are to be annealed, normalized, normalized and tempered, or quenched and tempered. No annealed casting is to be removed from the furnace until the temperature of the entire furnace charge has fallen to or below a temperature of 455°C. The tempering temperature is to be not less than 550℃.

(2) Steel castings which are locally heated or subjected to any cold work after heat treatment, are to be stress-relieved.

(3) Castings for components such as crankshafts and engine bedplates, where dimensional stability and freedom from internal stresses are important, are to be given a stress relief heat treatment. This is to be carried out at a temperature of not less than 550℃ followed by furnace cooling to 300℃ or lower.

(4) Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole casting to be uniformly heated to the necessary temperature In the case of very large castings alternative methods for heat treatment will be specially considered by the Society.
Sufficient thermocouples are to be connected to the furnace charge to measure and record that its temperature is adequately uniform unless the temperature uniformity of the furnace is verified at regular intervals.

(5) The foundry is to maintain records of heat treatment identifying the furnace used, furnace charge, date, temperature and time at temperature. The records are to be presented to the Surveyor on request.

6. Mechanical properties

(1) The mechanical properties of the steel castings are to comply with the requirements given in **Table 2.1.66.**

(2) Impact tests should be required on carbon steel castings intended for welded construction such as cast sternframes, rudder horns and shoepieces. The results of impact test is to be in accordance with the Guidance relating to the Rules specified by the Society.

7. Selection of test specimens

(1) At least one test sample is to be provided for each casting. Unless otherwise agreed these test samples are to be either integrally cast or gated to the castings and are to have a thickness of not less than 30 mm. Test material, sufficient for the required tests and for possible retest purposes is to be provided for each casting or batch of castings. One tensile test specimen is to be taken from each test sample.

(2) The test samples are to be heat treated together with the castings which they represent and are not to be detached from the casting until the specified heat treatment has been completed and they have been properly identified.
(3) For castings where the method of manufacture has been specially approved by the Society in accordance with **3** (2), the number and position of test samples is to be agreed with the Society having regard to the method of manufacture employed.
(4) Number of test specimens is to comply with the requirements of **Table 2.1.68.**

Table 2.1.68 Number of Test Specimens

Condition of casting	Number of test specimens
Where the weight of one steel casting is between 1 ton and 10 tons inclusive	1 for each casting(1)
Where the casting is of complex design or where the finished weight exceeds 10 tons	2 for each casting(1)
Where large castings are made from two or more casts which are not mixed in a ladle prior to pouring.	Two or more corresponding to the number of casts involved(1)
Where a number of small castings with a weight of 1 ton or less which are to be of similar type and dimensions, made from one cast and heat-treated in the same furnace charge.	1 for each batch of castings(2)
NOTES: (1) These test samples are to be integrally cast at locations as widely separated as possible. (2) Test sample are to be separately casted and are to have suitable dimensions.	

8. Surface and dimension inspections

(1) When heat treatment and machining are finished and, if necessary, at a proper time during machining, surface inspection is to be carried out. Where applicable, this is to include the examination of internal surfaces. Testing methods and acceptance criteria are to be in accordance with the Guidance relating to the Rules specified by the Society.
(2) All castings are to be cleaned and adequately prepared for examination; suitable methods include pickling, caustic cleaning, wire brushing, local grinding, shot or sand blasting. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.
(3) The dimension inspection of the steel castings is to be conducted under the responsibility of the manufacturer, unless otherwise specified.

9. Quality

(1) All castings are to be free from surface or internal defects, which would be prejudicial to their proper application in service.
(2) In the event of any casting proving to be defective during subsequent machining or testing it is to be rejected notwithstanding any previous certification.

10. Non-destructive inspection

(1) The steel castings intended for stern frame, rudder post and other important structural members or the steel castings specified in **Pt 5, Ch 2, 201. 1** are to be subjected to ultrasonic tests at an appropriate stage of the manufacturing process and the test reports are to be showed or submitted to the Surveyor. Testing methods and acceptance criteria are to be in accordance with the Guidance relating to the Rules specified by the Society.
(2) The important parts of the following steel castings are to be subjected to magnetic particle tests at an appropriate stage of the manufacturing process. But, machining surfaces may be subjected to liquid penetrant tests. Testing methods and acceptance criteria are to be in accordance with the Guidance relating to the Rules specified by the Society.
(a) Steel castings intended for stern frame, rudder post and other important structural members.
(b) Steel castings specified in **Pt 5, Ch 2, 201. 1.**
(c) Propellers.
(d) Turbine castings.

(3) When required by the relevant construction Rules, castings are to be pressure tested before final acceptance. These tests are to be carried out in the presence of the Surveyor and are to be to their satisfaction.
(4) In place of the test methods specified in (1) and (2), the Society may accept the application of other non-destructive inspections considered adequate by the Society.
(5) The Society may require non-destructive inspections by radiographic test, ultrasonic test, magnetic particle test or penetrant test not only for the steel casting specified in (1) and (2) but also for the steel casting deemed necessary by the Society.
(6) The welding parts of steel castings used to welded construction are to be subjected to non-destructive inspections considered adequate by the Society.

11. Repair of defects

(1) *General*
(i) The approval of the Society is to be obtained where steel castings from which defects were removed are to be used with or without weld repair.
(ii) Procedure of removal of defect and weld repair is to be in accordance with the Guidance relating to the Rules specified by the Society.
(iii) Where the defective area is to be repaired by welding, the excavations are to be suitably shaped to allow good access for welding. The resulting grooves are to be subsequently ground smooth and complete elimination of the defective material is to be verified by magnetic particle test or liquid penetrant test.
(iv) Shallow grooves or depressions resulting from the removal of defects may be accepted provided that they will cause no appreciable reduction in the strength of the casting. The resulting grooves or depressions are to be subsequently ground smooth and complete elimination of the defective material is to be verified by magnetic particle test or liquid penetrant test.
(v) The manufacturer is to maintain full records detailing the extent and location of repairs made to each casting and details of weld procedures and heat treatments applied for repairs. These records are to be available to the Surveyor and copies provided on request.

(2) *Weld repairs*
When a casting can be repaired by welding, the following requirements apply:
(i) Before welding is started, full details of the extent and location of the repair, the proposed welding procedure, heat treatement and subsequent inspection procedures are to be submitted for approval.
(ii) All castings in low alloy steels and all castings for crankshafts are to be suitably pre-heated prior to welding. Castings in carbon steel may also require to be pre-heated depending on their chemical composition, the dimensions and position of the weld repairs.
(iii) Welding is to be done under cover in positions free from draughts and adverse weather conditions by qualified welders with adequate supervision. As far as possible, all welding is to be carried out in the downhand (flat) position.
(iv) The welding consumables used are to be of an appropriate composition, giving a weld deposit with mechanical properties similar and in no way inferior to those of the parent castings.
Welding procedure tests are to be carried out by the manufacturer to demonstrate that satisfactory mechanical properties can be obtained after heat treatment as detailed in **5.**
(v) After welding has been completed the castings are to be given either a suitable heat treatment in accordance with the requirements of previous **5** (1) or a stress relieving heat treatment at a temperature of not less than 550℃. The type of heat treatment employed will be dependent on the chemical composition of the casting and the dimensions, positions and nature of the repairs .
(vi) Subject to the prior agreement of the Society, special consideration may be given to the omission of postweld heat treatment or to the acceptance of local stress-relieving heat treatment where the repaired area is small and machining of the casting has reached an advanced stage.
(vii) On completion of heat treatment the weld repairs and adjacent material are to be ground smooth and examined by magnetic particle or liquid penetrant testing. Supplementary examination by ultrasonics or radiography may also be required depending on the dimensions and nature of the original defect. Satisfactory results are to be obtained from all forms of non-destructive testing used.

12. Retest procedure

(1) Where the tensile test fails to meet the requirements, additional test may be carried out in accordance with the requirements of **109.**

(2) The additional tests are to be taken, preferably from the same, but alternatively from another, test sample representative of the casting or batch of castings.

(3) At the option of the manufacturer, when a casting or batch of castings has failed to meet the test requirements, it may be reheat treated and re-submitted for acceptance tests.

13. Marking

(1) The grade of material and the manufacturer''s name or trade mark are to be cast or stamped on all steel castings. In addition, the cast number is to be stamped on all steel castings not less than 250 kg in mass. The Society's brand indicating satisfactory compliance with the requirements is to be stamped in the vicinity of the foregoing marks.

(2) For steel castings to which the requirements given in note 1 of the **Table 2.1.66**, the material symbols are specified as *RSC* - (or *RSC* - *A*) and the required tensile strength is to be filled in symbol " - ". (e.g. For carbon steel castings which the required tensile strength is 420 N/mm^2, *RSC* 420)

(3) Where carbon steel castings are intended for welded hull construction specified in **Table 2.1.67**, "W" is to be suffixed to the marking. (e.g, *RSC* 420-*W*)

14. Additional requirements for crank throw

(1) In case where semi-built-up crank throw for diesel engines is made of steel casting, the manufacturing procedure is to be approved by the Society.

(2) Where special manufacturing methods are adopted to reduce the size of crank throw according to the requirements in **Pt 5, Ch 2, 208**, the preliminary test instructed by the Society are to be carried out.

502. Steel castings for chains

1. Application

(1) These requirements are to apply to the steel castings used for anchor chain cables and accessories specified in **Pt 4, Ch 8** (hereinafter referred to as "steel castings").

(2) Steel castings having characteristics differing from those specified in **502.** are to comply with the requirements in **101. 2.**

2. Kinds

The steel castings are classified as specified in **Table 2.1.69**

Table 2.1.69 Grade of Steel Casting

Grade	Application
RSCC 50	Grade 2 chain
RSCC 70	Grade 3 chain
RSCCR 3	Grade *R* 3 chain
RSCCR 3*S*	Grade *R* 3*S* chain
RSCCR 4	Grade *R 4* chain

3. Heat treatment

(1) Steel castings are to be normalized, normalized and tempered, quenched and tempered or heat treated by the process approved by the Society.

(2) Steel castings which are locally heated or subjected to any cold work after heat treatment, are to be stress-relieved by the approved methods.

(3) Flame cutting or scarfing to remove risers and surplus metals is to be completed before final heat treatment of the steel castings.

4. Chemical composition

Chemical composition of steel castings is to be subjected to the special approval by the Society.

5. Mechanical properties

The mechanical properties of steel castings are to comply with the requirements given in **Table 2.1.70.**

Table 2.1.70 Mechanical Properties

Grade	Tensile test				Impact test[1]	
	Yield strength (N/mm^2) [2]	Tensile strength (N/mm^2) [2]	Elongation (%) ($L=5d$)	Reduction of area (%)	Testing temp. (℃)	Average absorbed energy (J)
RSCC 50	295 min.	490~690	22 min.	-	-	-
RSCC 70	410 min.	690 min.	17 min.	40 min.	0	60 min.
RSCCR 3	410 min.	690 min.	17 min.	40 min.	-20[3]	40 min.[3]
RSCCR 3*S*	490 min.	770 min.	15 min.	40 min.	-20[3]	45 min.[3]
RSCCR 4	580 min.	860 min.	12 min.	35 min.	-20	50 min.

NOTE:
(1) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.
(2) The yield ratio (the aim value of yield to tensile ratio) for grade *RSCCR* 3, *RSCCR* 3*S*, or *RSCCR* 4 is to be maximum 0.92.
(3) Impact test of grade *RSCCR* 3 and *RSCCR* 3*S* may be carried out at the temperature of 0 °*C* where approved by the Society. In this case, minimum mean absorbed energy is to be not less than 60*J* for grade *RSCCR* 3 and 65*J* for grade *RSCCR* 3*S*.

6. Selection of test specimens

(1) One test sample is to be taken from castings of similar dimensions originating from the same heat treatment charge and the same cast of steel. In this case, the test sample may be the test assembly cast with the body of casting and similar area. The tensile and impact test specimens are to be taken from the test sample in the longitudinal direction at a depth of 1/6 diameter from the surface specified in **Fig 2.1.5.**
(2) For *RSCC 50*, one tensile test specimen, and for other grades of chain castings, one tensile test specimen and one set (3 pieces) of impact test specimens are to be taken from the test sample.

7. Surface inspection

Steel castings are to be subjected to the surface inspection after completion of the final heat treatment.

8. Quality

Steel castings are to be of uniform quality and free from harmful defects.

9. Non-destructive inspection

(1) For grades *RSCCR* 3, *RSCCR* 3*S* and *RSCCR* 4, all steel castings are subjected to ultrasonic test at an appropriate stage of the manufacture after heat treatment and it is to be confirmed that there are no harmful defects.
(2) For grades *RSCC* 50 and *RSCC* 70, a suitable non-destructive inspection, such as an ultrasonic test, may be required where deemed necessary by the Society.

10. Repair of defects

The repair of defects for steel castings is generally to be carried out in accordance with the requirements in **501. 11.**

11. Retest procedure

Where the tensile test or impact test on the selected first test specimens fails to meet the requirements, additional tests may be conducted according to the requirements given in **306. 7.**

12. Marking

Steel castings which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **501. 13** (1).

503. Stainless steel castings

1. Application

(1) The requirements are to apply to the stainless steel castings for valves and pipe fittings in piping systems used at low temperature (-165℃ and over in design temperature) service or corrosion-resisting service (hereinafter referred to as "steel castings").
(2) Steel castings having characteristics differing from those specified in **503.** are to comply with the requirements in **101. 2.**

2. Kinds

The steel castings are classified as specified in **Table 2.1.71.**

3. Heat treatment

Steel castings are generally to receive a solid solution treatment.

4. Chemical composition

The chemical composition of steel castings is to comply with the requirements given in **Table 2.1.71.**

Table 2.1.71 Grades and Chemical Composition

<table>
<tr><th rowspan="2">Grade</th><th colspan="9">Chemical composition (%)</th></tr>
<tr><th>C</th><th>Si</th><th>Mn</th><th>P</th><th>S</th><th>Ni</th><th>Cr</th><th>Mo</th><th>Other</th></tr>

</table>

5. Mechanical properties

(1) The mechanical properties of steel castings are to comply with the requirements give in **Table 2.1.72.**
(2) Where deemed necessary by the Society, impact test or corrosion-resistance test may be required in addition to the specified tests.

Table 2.1.72 Mechanical Properties

<table>
<tr><th rowspan="2">Grade</th><th colspan="3">Tensile test</th><th>Hardness test</th></tr>

<tr><td>RSSC 19</td><td>390 min.</td><td>31 min.</td></tr>
<tr><td>RSSC 21</td><td>205 min.</td><td>440 min.</td><td>26 min.</td></tr>
</table>

6. Selection of test specimens

(1) Where a stainless steel casting is 500 kg and over in weight, one tensile test specimen and one hardness test specimen are to be taken from each casting.
(2) Where a number of stainless steel castings of similar form and size, each of which weight less than 500 kg, are cast from the same charge, two tensile test specimens and two hardness test specimens are to be taken from each group of castings simultaneously heat treated in the same furnace.
(3) Hardness test specimen may be a portion of tensile test specimen.

7. Marking

Steel castings which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.**

504. Steel castings for low temperature service

1. Application

(1) The requirements are to apply to the steel castings for valves and pipe fittings in piping systems intended to be used at the design temperature lower than 0℃ in liquefied gas carriers (hereinafter referred to as "steel castings").
(2) Steel castings other than specified in **504.** or those used in other parts than specified in (1) are to comply with the requirements given in **101. 2.**

2. Kinds

The steel castings are classified as given in **Table 2.1.73.**

Table 2.1.73 Grades and Chemical Composition

<table>
<tr><th rowspan="2">Grade</th><th rowspan="2">Deoxidation</th><th colspan="7">Chemical composition (%)</th></tr>
<tr><th>C</th><th>Si</th><th>Mn</th><th>P</th><th>S</th><th>Ni</th><th>Mo</th></tr>
<tr><td>RLCA</td><td rowspan="4">Fully killed fine grain</td><td>0.30 max.</td><td rowspan="4">0.60 max.</td><td>1.00 max.</td><td rowspan="2">0.035 max.</td><td rowspan="2">0.035 max.</td><td rowspan="2">-</td><td>-</td></tr>

<tr><td>RLC 3</td><td>0.15 max.</td><td>3.00~4.00</td></tr>
</table>

3. Heat treatment

Steel castings are to be normalized or normalized and tempered.

4. Deoxidation practice and chemical composition

The deoxidation practice and chemical composition of steel castings are to comply with the requirements given in **Table 2.1.73.**

5. Mechanical properties

(1) The mechanical properties of steel castings are to comply with the requirements given in **Table 2.1.74.**
(2) Where deemed necessary by the Society, other tests may be required in addition to the tests specified in (1).

Table 2.1.74 Mechanical Properties

Grade	Tensile test				Impact test (2)	
	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%) ($L=5d$)	Reduction of area (%)	Test temp. (℃)	Average absorbed energy (J)
RLCA	245 min.	450 min.	21 min.	35 min.	-40(1)	27 min.
RLCB					-50(1)	
RLC 2	275 min.				-70	34 min.
RLC 3					-95	

NOTES:
(1) Impact test temperature for castings specified in **Pt 7, Ch 5** is to be 5℃ below the design temperature or -20℃, whichever is the lower.
(2) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

6. Selection of test specimens

(1) Where a steel casting is 500 kg and over in weight, one tensile test specimen and one set of three impact test specimens are to be taken from each casting.
(2) Where a number of steel castings of similar form and size, each of which less than 500 kg in weight, are cast from the same charge, two tensile test specimens and two sets of six impact test specimens are to be taken from each group of castings simultaneously heat treated in the same furnace.

7. Retest procedures

(1) Where the tensile tests fail to meet the requirements, additional tests may be carried out according to the requirements given in **109.**
(2) Regarding the impact tests, additional tests are to be carried out according to the requirements given in **304. 9** (2).

8. Marking

Steel castings which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **501. 13** (1) and in case the requirement in Note (1) of **Table 2.1.74** has been applied, "impact test temperature T" is to be suffixed to the marking. (e.g. *RLCA* - 25*T*)

505. Stainless steel casting for propeller

1. Application

(1) These requirements are applicable to the manufacture of stainless steel casting(hereinafter referred to as "**steel propeller casting**") for propellers, blades and bosses. These requirements may also be used for the repair of propellers damaged in service, subject to prior agreement with the Society.

(2) Steel propeller castings having characteristics differing from those specified in **505.** are to comply with the requirements in **101. 2**.

2. Kinds

Steel propeller castings are classified as specified in **Table 2.1.75**.

3. Chemical composition

Chemical composition is classified as specified in **Table 2.1.75**.

Table 2.1.75 Kinds and Chemical Composition

Alloy type		Chemical composition (%)				
		C	*Mn*	*Cr*	*Mo*(1)	*Ni*
12*Cr* 1*Ni*	Martensitic	0.15 Max.	2.0 Max.	11.5 - 17.0	0.5 Max.	2.0 Max.
13*Cr* 4*Ni*		0.06 Max.	2.0 Max.	11.5 - 17.0	1.0 Max.	3.5 - 5.0
16*Cr* 5*Ni*		0.06 Max.	2.0 Max.	15.0 - 17.5	1.5 Max.	3.5 - 6.0
19*Cr* 11*Ni*	Austenitic	0.12 Max.	1.6 Max.	16.0 - 21.0	4.0 Max.	8.0 - 13.0

NOTE :
(1) Minimum values may be in accordance with recognised national or international standards, subject to prior agreement with the Society.

4. Heat treatment

Martensitic castings are to be austenitized(quenching) and tempered. Austenitic castings should be solution treated.

5. Mechanical properties

(1) The mechanical properties are to meet the requirements in **Table 2.1.76** These values refer to the test specimens machined from integrally cast test bars attached to the hub or on the blade.

Table 2.1.76 Mechanical Properties

Types	Tensile test				Impact test
	Yield strength (1) (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%)	Reduction area (%)	Average absorbed energy (J) (3)
12*Cr* 1*Ni*	440 Min.	590 Min.	15 Min.	30 Min.	20 Min.
13*Cr* 4*Ni*	550 Min.	750 Min.	15 Min.	35 Min.	30 Min.
16*Cr* 5*Ni*	540 Min.	760 Min.	15 Min.	35 Min.	30 Min.
19*Cr* 11Ni	180 Min.(2)	440 Min.	30 Min.	40 Min.	-

NOTES
(1) 0.2 % yield strength
(2) 1.0 % yield strength is min. 205 N/mm^2.
(3) Not required for general service and the lowest Ice class notation(Grade ID). For other Ice class notations, tests are to be made -10℃.

6. Selection of test samples and specimens

(1) Where possible, the test samples attached on blades are to be located in an area between 0.5 to 0.6 R, where R is the radius of the propeller.
(2) The test samples are not to be detached from the casting until the final heat treatment has been carried out. Removal is to be by non-thermal procedures.

(3) Separately cast test samples may be used subject to prior approval of the Society. The test samples are to be cast from the same heat as the castings represented and heat treated with the castings represented.
(4) At least one set of mechanical tests is to be made on material representing each casting. However, where a number of small propellers of about the same size, and less than 1 m in diameter, are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted using separately cast test samples of suitable dimensions. At least one set of mechanical tests is to be provided for each multiple of five castings in the batch.

7. Surface and dimension inspection

(1) Steel propeller castings are to be subjected to the surface inspection by the Society at the final process and other proper processing stages if necessary. The surveyor may require areas to be etched for the purpose of investigating weld repairs.
(2) Steel propeller castings are to be free from cracks, hot tears or other imperfections which, due to their nature, degree or extent, will interfere with the use of the castings.
(3) The dimensions are the responsibility of the manufacturer and the report on the dimensional inspection is to be handed over to the Surveyor, who may require checks to be made in his presence.

8. Non-destructive inspection

(1) The important parts of steel propeller casting are to be subjected to the liquid penetrant test in accordance with the Guidance relating to Rules specified by the Society.
(2) The division of severity zones of steel propeller casting is to be in accordance with the Guidance relating to Rules specified by the Society.
(3) Where serious doubt exists that the castings are not free from internal defects, further non-destructive inspections are to be carried out upon request of the Surveyor, e.g. radiographic and/or ultrasonic tests. The acceptance criteria are then to be agreed between the manufacturer and the Society.
(4) The foundry is to maintain records of inspections traceable to each propeller casting. These records are to be reviewed by the Surveyor. The foundry is also to provide the Surveyor with a statement confirming that non-destructive tests have been carried out with satisfactory results.

9. Repair of defects

(1) In general the repairs are to be carried out by mechanical means, e.g. by grinding or milling. Where the steel propeller castings from which defects where removed are used in that condition, the steel propeller castings are to be approved by the Surveyor.
(2) The resulting grooves are to be blended into the surrounding surface so as to avoid any sharp contours. Complete elimination of the defective material is to be verified by liquid penetrant testing.
(3) Weld repairs are to be undertaken only when they are considered to be necessary and have prior approval of the Surveyor. Welds having an area less than 5 cm^2 are to be avoided.
(4) The repair welding procedures are to have prior approval of the Surveyor in accordance with the Guidance relating to the Rules specified by the Society.
(5) All weld repairs are to be documented by means of sketches or photographs showing the location and major dimensions of the grooves prepared for welding. The documentation is to be presented to the Surveyor prior to repair welding.

10. Retest procedure

Where the results of tensile tests fail to meet the requirements, additional test may be carried out in accordance with the requirements of **109**.

11. Marking

Steel propeller castings which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110**.

506. Grey iron castings

1. Application

(1) These requirements are to apply to the grey iron castings (hereinafter referred to as "iron castings") intended to be used for propeller or important parts of machinery.
(2) Where deemed necessary by the Society, KS or equivalent thereto may be applied.

(3) Where small castings are produced in large quantities, the manufacturer may adopt alternative procedures for testing and inspection subject to the approval of the Society.

2. Manufacture

(1) The manufacturer has the necessary manufacturing and testing facilities and the manufacturing processes are to be approved by the Society.
(2) Suitable mechanical methods are to be employed for the removal of surplus material from castings. Thermal cutting processes are not acceptable, except as a preliminary operation to mechanical methods.
(3) Where castings of the same type are regularly produced in quantity, the manufacturer, subject to the approval of the Society, is to make any tests necessary to prove the quality of the prototype castings and is also to make periodical examinations to verify the continued efficiency of the manufacturing technique. The Surveyor is to be given the opportunity to witness these tests.

3. Grade and mechanical properties

Grey iron castings are to comply with the *KS D* 4301. However, the minimum tensile strength is to be not less than 200 N/mm^2

4. Chemical composition

(1) The chemical composition of the iron used is left to the discretion of the manufacturer, who is to ensure that it is suitable to obtain the mechanical properties specified for the castings.
(2) When required by the Societies the chemical composition of ladle samples is to be reported.

5. Heat treatment

(1) Except as required by (2) castings may be supplied in either the as cast or heat treated condition.
(2) For some applications, such as high temperature service or where dimensional stability is important, castings may require to be given a suitable tempering or stress relieving heat treatment

6. Selection of test samples and specimens

(1) Test material sufficient for the required tests and for possible re-tests is to be provided for each casting or batch of castings.
(2) Separately cast test samples are to be used in principle and are to be cast from the same ladle as the castings in moulds of the same type of material as the moulds for the castings
(3) Test samples are to be in the form of bars 30 mm in diameter and of a suitable length.
(4) When two or more test samples are cast simultaneously in a single mould, the bars are to be at least 50 mm apart as given in **Fig 2.1.13.**

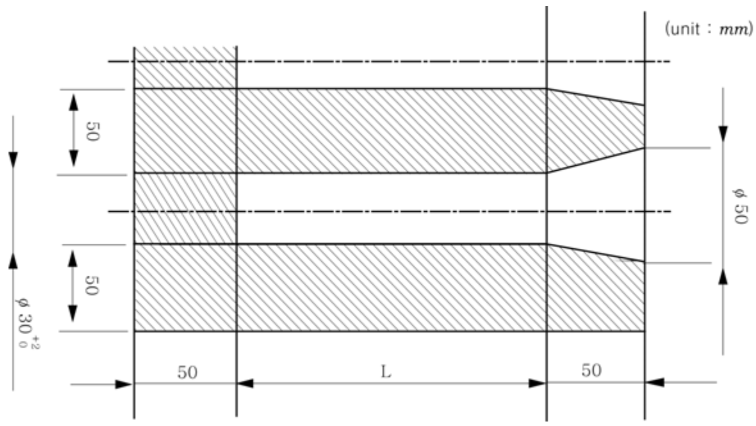

Fig 2.1.13 Sample distance

(5) Cast test samples are not to be stripped from the moulds until the metal temperature is below 500°C.
(6) Integrally cast samples may be used when a casting is more than 20 mm thick and its mass exceeds 200 Kg, subject to agreement between the manufacturer and the purchaser. The type and location of the sample are to be selected to provide approximately the same cooling conditions as for the casting it represents and also subject to agreement.

(7) The numbers of test specimen are as below:
  (a) With the exception of (d) below, at least one test sample is to be cast with each batch.
  (b) With the exception of (c) below, a batch consists of the castings poured from a single ladle of metal, provided that they are all of similar type and dimensions. A batch should not normally exceed two tonnes of fettled castings and a single casting will constitute a batch is its mass is 2 tonnes or more.
  (c) For continuous melting of the same grade of cast iron in large tonnages the mass of a batch may be increased to the output of 2 hours of pouring.
  (d) If one grade of cast iron is melted in large quantities and if production is carefully monitored by systematic checking of the melting process, such as chill testing, chemical analysis or thermal analysis, test samples may be taken at longer intervals.
(8) All test samples are to be suitably marked to identify them with the castings which they represent.
(9) Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent. For cast-on-test samples the sample shall not be cut off from the casting until after the heat treatment.
(10) One tensile test specimen is to be prepared from each test sample. Where test samples of other dimensions are specially required the tensile test specimens are to be machined to agreed dimensions.
(11) All tensile tests are to be carried out using test procedures in accordance with the requirements specified in **203. 1.**

7. Test and inspection

(1) All castings are to be cleaned and adequately prepared for examination. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.
(2) For grey iron castings, testing and inspection may not require the presence of the Society's surveyors, except where specially specified in connection with the design.
(3) For the steel propeller castings and spheroidal iron castings, testing and inspection may require the presence of the Society''s surveyor.
(4) When required by the relevant construction Rules, castings are to be pressure tested before final acceptance.
(5) Unless otherwise agreed, the verification of dimensions is the responsibility of the manufacturer.
(6) Supplementary examination of castings by suitable nondestructive testing procedures is generally not required except in circumstances where there is reason to suspect the soundness of the casting.

8. Rectification of defective casting

(1) At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.
(2) Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by impregnation with a suitable plastic filler, provided that the extent of the porosity is such that it does not adversely affect the strength of the casting.
(3) Repairs by welding are generally not permitted.

9. Retest procedure Where the tensile test fails to meet the requirements, additional test may be carried out in accordance with the requirements of **109.**

10. Marking Grey iron castings which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.**

507. Spheroidal or nodular graphite iron castings

1. Application

(1) These requirements are to apply to the Spheroidal or nodular graphite iron castings (hereinafter referred to as "iron castings") intended to be used for propeller or important parts of machinery.
(2) These requirements are applicable only to castings where the design and acceptance tests are related to mechanical properties at ambient temperature. For other applications additional requirements may be necessary, especially when the castings are intended for service at low or elevated temperatures.
(3) Where deemed necessary by the Society, KS or equivalent thereto may be applied.

(4) Where small castings are produced in large quantities, the manufacturer may adopt alternative procedures for testing and inspection subject to the approval of the Society.

2. Manufacture

(1) The manufacturer has the necessary manufacturing and testing facilities and the manufacturing processes are to be approved by the Society.
(2) Suitable mechanical methods are to be employed for the removal of surplus material from castings. Thermal cutting processes are not acceptable, except as a preliminary operation to mechanical methods.
(3) Where castings of the same type are regularly produced in quantity, the manufacturer, subject to the approval of the Society, is to make any tests necessary to prove the quality of the prototype castings and is also to make periodical examinations to verify the continued efficiency of the manufacturing technique. The Surveyor is to be given the opportunity to witness these tests.

3. Grade and mechanical properties Grade and mechanical properties of castings are to be as specified in **Table 2.1.77.** However, Brinell hardness values are intended for information purposes only.

Table 2.1.77 Grade and mechanical properties

Specified min. tensile strength (N/mm^2)		0.2% proof stress (N/mm^2)	Elongation (%) ($5.65\sqrt{A}$)	Brinell hardness values	Impact energy		Typical structure of matrix
					Test temp.(℃)	kV[(2)] (J) min	
Ordinary qualities	370 min.	230 min.	17 min.	120-180	-	-	Ferrite
	400 min.	250 min.	12 min.	140-200	-	-	Ferrite
	500 min.	320 min.	7 min.	170-240	-	-	Ferrite/Perlite
	600 min.	370 min.	3 min.	190-270	-	-	Ferrite/Perlite
	700 min.	420 min.	2 min.	230-300	-	-	Perlite
	800 min.	480 min.	2 min.	250-350	-	-	Perlite or Tempered
Special qualities	350 min.	220 min.	22 min.[(3)]	110-170	+20	17(14)	Ferrite
	400 min.	250 min.	18 min.[(3)]	140-200	+20	14(11)	Ferrite

NOTE
1. For intermediate values of specified minimum tensile strength, the minimum values for 0,2 % proof and elongation may be obtained by interpolation.
2. The average value measured on 3 Charpy V-notch specimens. One result may be below the average value but not less than the minimum shown in brackets.
3. In the case of integrally cast samples, the elongation may be 2 percentage points less.

4. Chemical composition

(1) The chemical composition of the iron used is left to the discretion of the manufacturer, who is to ensure that it is suitable to obtain the mechanical properties specified for the castings.
(2) When required by the Societies the chemical composition of ladle samples is to be reported.

5. Heat treatment

(1) Except as required by (2) castings may be supplied in either the as cast or heat treated condition.
(2) For some applications, such as high temperature service or where dimensional stability is important, castings may require to be given a suitable tempering or stress relieving heat treatment
(3) Heat treatment is to be carried out after any refining heat treatment and before machining. The special qualities with 350 N/mm^2 and 400 N/mm^2 nominal tensile strength and impact test shall undergo a ferritizing heat treatment.
(4) Where it is proposed to locally harden the surfaces of a spheroidal iron castings full details of the proposed procedure and specification are to be submitted for approval by the Society.

6. Selection of test samples and specimens

(1) Test material sufficient for the required tests and for possible re-tests is to be provided for each casting or batch of castings.

(2) The test samples are generally to be one of the standard types detailed in **Figs 2.1.14, 2.1.15** and **2.1.16** with a thickness of 25 mm. Test samples of other dimensions, as detailed in Figs **2.1.14** or **2.1.16** may, however, be specially required for some components.
(3) At least one test sample is to be provided for each casting and unless otherwise required may be either gated to the casting or separately cast. Alternatively test material of other suitable dimensions may be provided integral with the casting.
(4) Where separately cast test samples are used, they are to be cast in moulds made from the same type of material as used for the castings and are to be taken towards the end of pouring of the castings.
(5) The samples are not to be stripped from the moulds until the temperature is below 500°C.
(6) For large castings where more than one ladle of treated metal is used, additional test samples are to be provided so as to be representative of each ladle used.
(7) As an alternative to (3) above, a batch testing procedure may be adopted for castings with a fettled mass of 1 tonne or less. All castings in a batch are to be of similar type and dimensions, cast from the same ladle of treated metal. One separately cast test sample is to be provided for each multiple of 2,0 tonnes of fettled castings in the batch.
(8) All test samples are to be suitably marked to identify them with the castings which they represent.
(9) Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent.
(10) One tensile test specimen is to be prepared from each test sample.
(11) All tensile tests are to be carried out using test procedures in accordance with the requirements specified in **203. 1**. Unless otherwise agreed all tests are to be carried out in the presence of the Surveyors.
(12) Impact tests may additionally be required and in such cases a set of three test specimens of agreed type is to be prepared from each sample. Where Charpy V-notch test specimens are used, the dimensions and testing procedures are to be in accordance with the requirements specified in **202. 3** and **203. 2**.

	Standard sample	Alternative sample when specially required		
		Case 1	Case 2	Case 3
u(mm)	25	12	50	75

x(mm)	40	25	50	65
y(mm)	140	135	150	175
z	To suit testing machine			

Fig 2.1.16 Y-type test sample

7. Test and inspection

(1) All castings are to be cleaned and adequately prepared for examination. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

(2) Before acceptance, all castings are to be visually examined including, where applicable, the examination of internal surfaces. Unless otherwise agreed the verification of dimensions is the responsibility of the manufacturer.

(3) When required by the relevant construction Rules, castings are to be pressure tested before final acceptance.

(4) Supplementary examination of castings by suitable nondestructive testing procedures is generally not required except in circumstances where there is reason to suspect the soundness of the casting. However, cast crankshaft are to be subjected to a magnetic particle inspection. Crack like indications are not allowed.

(5) For crankshafts the metallographic examination is to be carried out as followings;

(a) When required, a representative sample from each ladle of treated metal is to be prepared for metallographic examination. These samples may conveniently be taken from the tensile test specimens but alternative arrangements for the provision of the samples may be adopted provided that they are taken from the ladle towards the end of the casting period.

(b) Examination of the samples is to show that at least 90 % of the graphite is in a dispersed spheroidal or nodular form. Details of typical matrix structures are given in **Table 2.1.77** and are intended for information purposes only.

8. Rectification of defective casting

(1) At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

(2) Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by impregnation with a suitable plastic filler, provided that the extent of the porosity is such that it does not adversely affect the strength of the casting.

(3) Repairs by welding are generally not permitted.

9. Retest procedure Where the tensile test fails to meet the requirements, additional test may be carried out in accordance with the requirements of **109.**

10. Marking Spheroidal iron castings which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.**

SECTION 6 Steel Forgings

601. Steel forgings

1. Application

(1) The requirements in **601.** are to apply to the steel forgings(except those specified in **602., 603.** and **604.**) intended to be used for the components of hull construction, equipments, and machinery specified in each Part, and where relevant, these requirements are also applicable to material for forging stock and to rolled bars intended to be machined into components of simple shape (hereinafter referred to as the "**steel forgings**").

(2) Steel forgings having characteristics differing from those specified in **601.** are to comply with the requirements in **101. 2.**

2. Kinds The steel forgings are classified as specified in **Table 2.1.81 and 2.1.82.**

3. Manufacturing process

(1) Steel forgings are to be manufactured from the killed steel.

(2) Adequate discards are to be made from the top and bottom of each ingot to ensure freedom from piping and harmful segregation in the finished forgings.

(3) Steel forgings are to be hot worked by press or hammer from ingots, blooms forged or rolled from ingots or blooms made from ingots by a combination of rolling and forging.

(4) Steel forgings are to be gradually and uniformly hot worked and are to be brought as nearly as possible to the finished shape and size. Where practicable, they are to be worked so as to cause metal flow in the most favourable direction having regard to the mode of stressing in service.

(5) The reduction ratio is to comply with the following;

(a) For components where the fibre deformation is mainly longitudinal; the total reduction ratio is to be not less than those shown in **Table 2.1.78.**

Table 2.1.78 Reduction Ratio

Method of manufacture	Description[1]	Total reduction[2][3]
Made directly from ingots or from forged blooms or billets	$L > D$ $L \leq D$	3 : 1 1.5 : 1
Made from rolled products	$L > D$ $L \leq D$	4 : 1 2 : 1

NOTES:
(1) L and D are the length and diameter respectively of the part of the forging under consideration.
(2) The reduction ratio is to be calculated with reference to the average cross-sectional area of the ingot. Where an ingot is initially upset, this reference area may be taken as the average cross-sectional area after this operation.
(3) For rolled bars used as a substitute for forgings the reduction ratio is to be not less than 6:1.

(b) *Disc type forgings such as gear wheels are made by upsetting*

(i) The thickness of any part of the disc is to be not more than one half of the length of the billet from which it was formed provided that this billet has received an initial forging reduction of not less than 1.5:1.

(ii) Where the piece used has been cut directly from an ingot or where the billet has received an initial reduction of less than 1.5:1, the thickness of any part of the disc is to be not more than one third of the length of the original piece.

(6) The shaping of forgings or rolled slabs and billets by flame cutting, scarfing or arc-air gouging is to be undertaken in accordance with recognized good practice and, unless otherwise approved, is to be carried out before the final heat treatment. Preheating is to be employed when necessitated by the composition and thickness of the steel. For certain components, subsequent machining of all flame cut surfaces may be required.

(7) When two or more forgings are joined by welding to form a composite component, the proposed welding procedure specification is to be submitted for approval to the Society. Welding procedure qualification tests may be required.

4. Heat treatment

(1) Except as provided in (5), after completion of all hot working operations, forgings are to be supplied in one of the conditions given in **Table 2.1.79.** to refine the grain structure and to obtain the required mechanical properties. No annealed forging is to be removed from the furnace until the temperature of the entire furnace charge has fallen to or below a temperature of 455°C. The tempering temperature is to be not less than 550℃.

Table 2.1.79 Heat Treatment

Kind	Heat treatment
Carbon steels	Annealed Normalized Normalized and tempered Quenched and tempered
Alloy steels	Quenched and tempered

(2) Alternatively, alloy steel forgings may be supplied in the normalized and tempered condition, in which case the specified mechanical properties are to be agreed with the Society.
(3) Steel forgings which are subjected to any hot work after heat treatment, are to be heat treated again.
(4) If a forging is locally reheated or any straightening operation is performed after the final heat treatment, consideration is to be given to a subsequent stress relieving heat treatment.
(5) Where induction hardening or nitriding is to be carried out, forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.
(6) Where carburizing is to be carried out, forgings are to be heat treated at an appropriate stage (generally either by full annealing or by normalizing and tempering) to a condition suitable for subsequent machining and carburizing.
(7) Where it is intended to surface harden forgings, full details of the proposed procedure and specification are to be submitted for the approval of the Society. For the purposes of this approval, the manufacture may be required to demonstrate by test that the proposed procedure gives a uniform surface layer of the required hardness and depth and that it does not impair the soundness and properties of the steel.
(8) Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole furnace charge to be uniformly heated to the necessary temperature. In the case of very large forgings alternative methods of heat treatment will be specially considered by the Society.
Sufficient thermocouples are to be connected to the furnace charge to measure and record that its temperature is adequately uniform unless the temperature uniformity of the furnace is verified at regular intervals.
(9) The forge is to maintain records of heat treatment identifying the furnace used, furnace charge, date, temperature and time at temperature. The records are to be presented to the surveyor on request.

5. Chemical composition

(1) The chemical composition of steel forgings is to comply with the requirements given in **Table 2.1.80.**
(2) The chemical composition of each heat is to be determined by the manufacturer on a sample taken preferably during the pouring of the heat. When multi heats are tapped into a common ladle, the ladle analysis shall apply.
(3) At the option of the manufacturer, suitable grain refining elements such as aluminium, niobium or vanadium may be added. The content of such elements is to be reported in the ladle analysis.

Table 2.1.80 Chemical Composition

Steel type		Chemical composition (%)									
		C	*Si*	*Mn*	*P*	*S*	*Cr*	*Mo*	*Ni*	*Cu*[3]	Total residual
Hull and General purpose steel forging[5]	Carbon steel	0.23[1][2] max.	0.45 max.	0.30-1.50	0.035 max.	0.035 max.	0.30[3] max.	0.15[3] max.	0.40[3] max.	0.30 max.	0.85 max.
Hull and General purpose steel forging[5]	Low alloy steel	[4]	0.45 max.	[4]	0.035 max.	0.035 max.	[4]	[4]	[4]	0.30 max.	-
Machinery steel forging	Carbon steel	0.65[1] max.	0.45 max.	0.30-1.50	0.035 max.	0.035 max.	0.30[3] max.	0.15[3] max.	0.40[3] max.	0.30 max.	0.85 max.
Machinery steel forging	Low alloy steel[6]	0.45 max.	0.45 max.	0.30-1.00	0.035 max.	0.035 max.	0.40[7] min.	0.15[7] min.	0.40[7] min.	0.30 max.	-

NOTES :
(1) The carbon content of carbon steel forgings intended for welded construction is to be 0.23 % maximum. The carbon content may be increased above this level provided that the carbon equivalent (*Ceq*) is not more than 0.41 %.
(2) The carbon content of carbon steel forgings not intended for welded construction may be 0.65 % maximum.
(3) Elements are considered as residual elements.
(4) Specification is to be submitted for approval.
(5) Rudder stocks and pintles should be of weldable quality.
(6) Where alloy steel forgings are intended for welded constructions, the proposed chemical composition is subject to approval by the Society.
(7) One or more of the elements is to comply with the minimum content.

6. Mechanical properties

(1) The mechanical properties of steel forgings are to comply with the requirements given in **Table 2.1.81.** and **2.1.82.**

(2) At the discretion of this Societies hardness tests may be required on the following: The results of hardness tests are to be reported and, for information purposes, typical Brinell hardness values are given in **Table 2.1.82.**

(i) Gear forgings after completion of heat treatment and prior to machining the gear teeth. The hardness is to be determined at four positions equally spaced around the circumference of the surface where teeth will subsequently be cut. Where the finished diameter of the toothed portion exceeds 2.5 m, the above number of test positions is to be increased to eight. Where the width of a gear wheel rim forging exceeds 1.25 m, the hardness is to be determined at eight positions at each end of the forging.

(ii) Small crankshaft and gear forgings which have been batch tested.
In such cases at least one hardness test is to be carried out on each forging.

(3) Hardness tests may also be required on forgings which have been induction hardened, nitrided or carburized. For gear forgings these tests are to be carried out on the teeth after, where applicable, they have been ground to the finished profile. The results of such tests are to comply with the approved specifications.

7. Selection of test specimens

(1) Except as provided in (10) and (11), the test specimens for steel forgings are, after final heat treatment, to be taken lengthwise from prolongations or through bolt holes having a sectional area not less than that of the body of forging. Where batch testing is permitted according to (10), the test material may alternatively be a production part or separately forged. Separately forged test material is to have a reduction ratio similar to that used for the forgings represented.

(2) "One set of test specimens" is to consist of one tensile test specimen and when required, three charpy-V notch impact test specimen.

Table 2.1.81 Kinds and Mechanical Properties for Hull Steel Forgings

Steel type	grades	Tensile test					
		Tensile strength (N/mm^2)	Yield strength (N/mm^2)	Elongation(%) ($L=5.65\sqrt{A}$) (minimum)		Reduction of area(%) (minimum)	
				L	*T*	*L*	*T*
Carbon steel forgings	*RSF* 400*H*	400 min.	200 min.	26	19	50	35
	RSF 440*H*	440 min.	220 min.	24	18	50	35
	RSF 480*H*	480 min.	240 min.	22	16	45	30
	RSF 520*H*	520 min.	260 min.	21	15	45	30
	RSF 560*H*	560 min.	280 min.	20	14	40	27
	RSF 600*H*	600 min.	300 min.	18	13	40	27
Low alloy steel forgings	*RSF* 550*AH*	550 min.	350 min.	20	14	50	35
	RSF 600*AH*	600 min.	400 min.	18	13	50	35
	RSF 650*AH*	650 min.	450 min.	17	12	50	35

Notes ;

(1) Where it is proposed to use a steel with a specified minimum tensile strength intermediate to those given, corresponding minimum values for the other properties may be obtained by interpolation and the value at the first decimal place is to be subjected to the method of counting fractions over 1/2 as one and disregarding the rest.

(2) For the upper limit of tensile strength, the following ranges for tensile strength may be additionally specified:

Specified minimum tensile strength (N/mm^2)	Range of upper limit(N/mm^2)
< 600	120
≥ 600	150

(3) In the case of large forgings requiring two tension tests, the range of tensile strength is not to exceed 70 N/mm^2

(4) *L* (or *T*) denotes that the longitudinal axis of the test specimen is arranged parallel (or tangential) to the direction of forging.

Table 2.1.82 Kinds and mechanical properties for machinery steel forgings

Steel type	Grades	Tensile test						Hardness test
		Tensile strength (N/mm^2)	Yield strength (N/mm^2)	Elongation(%) ($L=5.65\sqrt{A}$) (minimum)		Reduction of area(%) (minimum)		Hardness (H_B)
				L	*T*	*L*	*T*	
Carbon steel forgings	*RSF* 400*M*	400 min.	200 min.	26	19	50	35	110 - 150
	RSF 440*M*	440 min.	220 min.	24	18	50	35	125 - 160
	RSF 480*M*	480 min.	240 min.	22	16	45	30	135 - 175
	RSF 520*M*	520 min.	260 min.	21	15	45	30	150 - 185
	RSF 560*M*	560 min.	280 min.	20	14	40	27	160 - 200
	RSF 600*M*	600 min.	300 min.	18	13	40	27	175 - 215
	RSF 640*M*	640 min.	320 min.	17	12	35	27	185 - 230
	RSF 680*M*	680 min.	340 min.	16	12	35	24	200 - 240
	RSF 720*M*	720 min.	360 min.	15	11	35	24	210 - 250
	RSF 760*M*	760 min.	380 min.	14	10	35	24	225 - 265
Low alloy steel forgings	*RSF* 600*AM*	600 min.	360 min.	18	14	50	35	175 - 215
	RSF 700*AM*	700 min.	420 min.	16	12	45	30	205 - 245
	RSF 800*AM*	800 min.	480 min.	14	10	40	27	235 - 275
	RSF 900*AM*	900 min.	630 min.	13	9	40	27	260 - 320
	RSF 1000*AM*	1000 min.	700 min.	12	8	35	24	290 - 365
	RSF 1100*AM*	1100 min.	770 min.	11	7	35	24	320 - 385

NOTES :

(1) Where it is proposed to use a steel with a specified minimum tensile strength intermediate to those given, corresponding minimum values for the other properties may be obtained by interpolation and the value at the first decimal place is to be subjected to the method of counting fractions over 1/2 as one and disregarding the rest.

(2) For the upper limit of tensile strength, the following ranges for tensile strength may be additionally specified:

Specified minimum tensile strength (N/mm^2)	Range of upper limit (N/mm^2)
< 900	150
≥ 900	200

(3) *L* (or *T*) denotes that the longitudinal axis of the test specimen is arranged parallel (or tangential) to the direction of forging.

(4) For propeller shafts intended for ships with ice class notation except the lowest one(Grade ID), Charpy V-notch impact testing is to be carried out for all steel types at -10℃ and the average energy value is to be minimum 27 J (longitudinal test). One individual value may be less than the required average value provided that it is not less than 70 % of this average value. and, The impact test for important components for machinery is to be in accordance with the Guidance relating to the Rules specified by the Society.

(5) The hardness values are typical and are given for information purposes only.

(3) Test specimens are normally to be cut with their axes either mainly parallel (longitudinal test) or mainly tangential (tangential test) to the principal axial direction of each product.
(4) Unless otherwise agreed, the longitudinal axis of test specimens is to be positioned as follows. However the axis of transverse specimens may be located close to the surface of the forgings
  (a) for thickness or diameter up to maximum 50 mm, the axis of test specimens is to be at the mid-thickness or the center of the cross section.
  (b) for thickness or diameter greater than 50 mm, the axis is to be at one quarter thickness (mid-radius) or 80 mm, whichever is less, below any heat treated surface.
(5) Except as provided in (10), the number and direction of tests is to be as given in (a) through (h) of the following requirements:
  (a) *Hull components such as rudder stocks, pintles etc. General machinery components such as shafting, connecting rods, etc. :* One set of tests is to be taken from the end of each forging in a longitudinal direction except that, at the discretion of the manufacture, the alternative directions or positions as shown in **Fig 2.1.17.**, **Fig 2.1.18.** and **Fig 2.1.19** may be used. Where a forging exceeds both 4 tonnes in mass and 3 m in length, one set of tests is to be taken from each end.

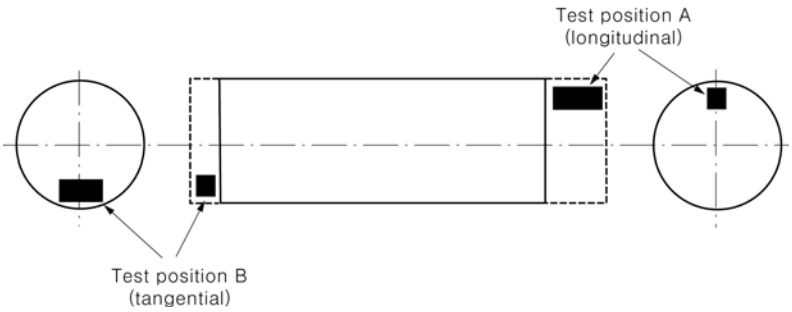

Fig 2.1.17 Plain shaft

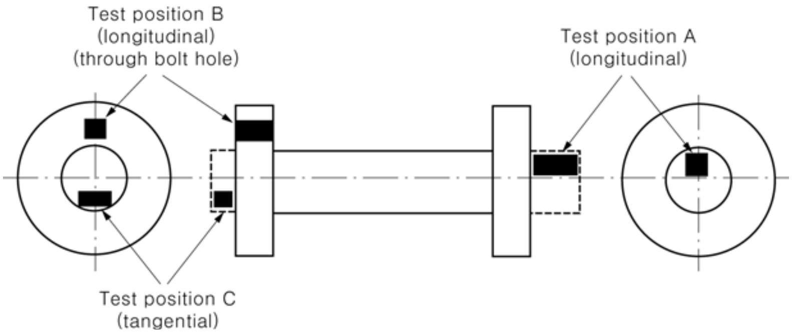

Fig 2.1.18 Flanged shaft

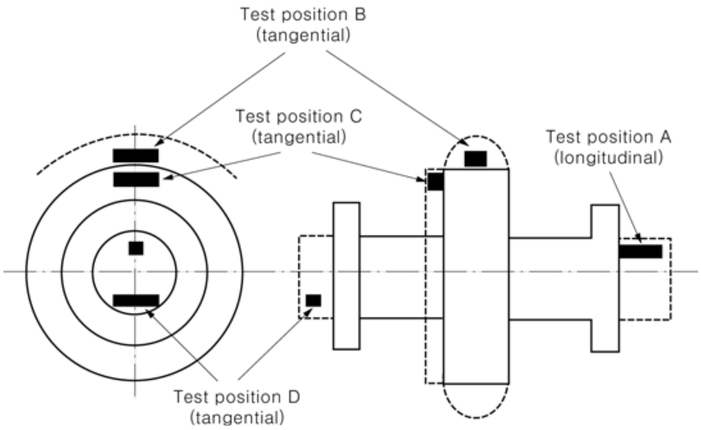

Fig 2.1.19 Flanged shaft with collar

(b) *Pinions* : Where the finished machined diameter of the toothed portion exceeds 200 mm one set of tests is to be taken from each forging in a tangential direction adjacent to the toothed portion (test position B in **Fig 2.1.20**) Where the dimensions preclude the preparation of tests from this position, tests in a tangential direction are to be taken from the end of the journal (test position C in **Fig 2.1.20**). If however, the journal diameter is 200 mm or less the tests are to be taken in a longitudinal direction (test position A in **Fig 2.1.20**). Where the finished length of the toothed portion exceed 1.25 m, one set of tests is to be taken from each end.

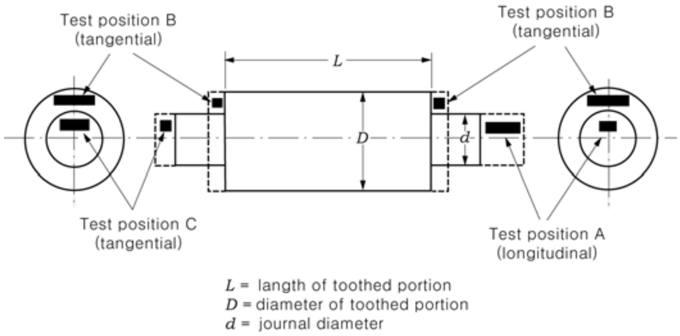

Fig 2.1.20 Pinion

(c) *Small pinions* : Where the finished diameter of the toothed portion is 200 mm or less one set of tests is to be taken in a longitudinal direction (test position A in **Fig 2.1.20**).
(d) *Gear wheels* : One set of tests is to be taken from each forging in a tangential direction (test position A or B in **Fig 2.1.21**).

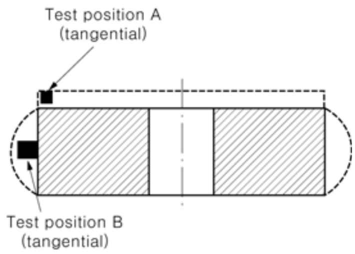

Fig 2.1.21 Gear wheel

(e) Rims intended for reduction gears and for cam shaft driving gears of diesel engine (see **Pt 5, Ch 2 201.1**) are to comply with the following requirements.
  (i) Where the finished diameter exceeds 2.5 m or the mass (as heat treated excluding test material) exceeds 3 tonnes, two sets of tests are to be taken from diametrically opposite positions (test positions A and B in **Fig 2.1.22**). The mechanical properties for longitudinal test are to be applied.

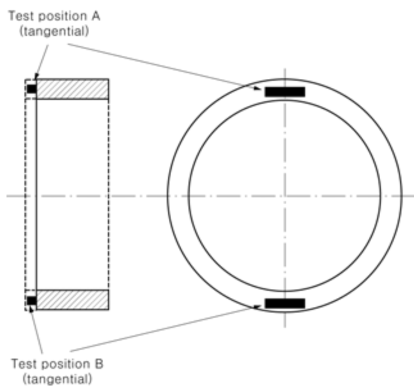

Fig 2.1.22 Gear rim (made by expanding)

(ii) Where the weight and finished diameter are different from those given in (a), one set of test specimens may be taken from one end of the rim.

(f) *Pinion sleeves* : One set of tests is to be taken from each forging in a tangential direction (test position A or B in **Fig 2.1.23**). Where the finished length exceeds 1.25 m one set of tests is to be taken from each end.

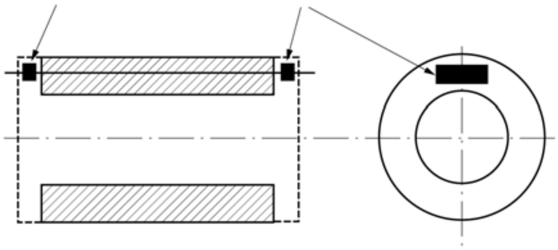

Fig 2.1.23 Pinion sleeve

(g) *Crankwebs* : One set of tests is to be taken from each forging in a tangential direction.

(h) *Solid open die forged crankshafts* : One set of tests is to be taken in a longitudinal direction from the driving shaft end of each forging (test position A in **Fig 2.1.24**). Where the mass (as heat treated but excluding test material) exceeds 3 tonnes tests in a longitudinal direction are to be taken from each end (test positions A and B in **Fig 2.1.24**). Where, however, the crankthrows are formed by machining or flame cutting, the second set of tests is to be taken in a tangential direction from material removed from the crankthrow at the end opposite the driving shaft end (test position C in **Fig 2.1.24**).

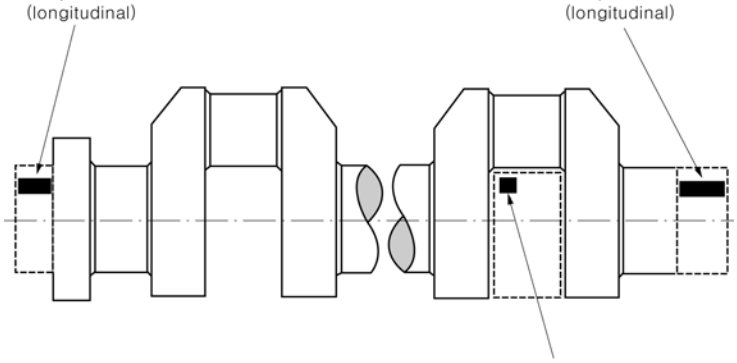

Fig 2.1.24 Solid forged crankshaft

(6) For closed die crankshaft forgings and crankshaft forgings where the method of manufacture has been approved by the Society, the number and position of test specimens is to be agreed with the Society having regard to the method of manufacture employed.

(7) When a forging is subsequently divided into a number of components, all of which are heat treated together in the same furnace charge, for test purposes this may be regarded as one forging and the number of tests required is to be related to the total length and mass of the original multiple forging.

(8) The test specimens are not to be separated from the body before the final heat treatment has been completed. In the case of stamp forging or other case of forging requiring the surface hardening process, the test specimens may be prepared at a proper stage before the final heat treatment providing that such is approved by the Surveyor.

(9) When forgings are to be carburized, sufficient test material is to be provided for both preliminary tests at the forge and for final tests after completion of carburizing. For this purpose duplicate sets of test material are to be taken from positions as detailed in (5) except that irrespective of the dimensions or mass of the forging, tests are required from one position only and, in the case of forgings with integral journals, are to be cut in a longitudinal direction.

This test material is to be machined to a diameter of D/4 or 60 mm, whichever is less, where D is the finished diameter of the toothed portion. For preliminary tests at the forge one set of test material is to be given a blank carburizing and heat treatment cycle simulating that which subsequently will be applied to the forging. For final acceptance tests, the second set of test material is to be blank carburized and heat treated along with the forgings which they represent. At the discretion of the forgemaster or gear manufacture test samples of larger cross section may be either carburized or blank carburized, but these are to be machined to the required diameter prior to the final quenching and tempering heat treatment. Alternative procedures for testing of forgings which are to be carburized may be specially agreed with the Society.

(10) Normalized forgings with mass up to 1000 kg each and quenched and tempered forgings with mass up to 500 kg each may be batch tested. A batch is to consist of forgings of similar shape and dimensions, made from the same heat of steel, heat treated in the same furnace charge and with a total mass not exceeding 6 tonnes for normalized forgings and 3 tonnes for quenched and tempered forgings, respectively.

(11) A batch testing procedure may also be used for hot rolled bars. A batch is to consist of either:
- (i) material from the same rolled ingot or bloom provided that where this is cut into individual lengths, these are all heat treated in the same furnace charge, or
- (ii) bars of the same diameter and heat, heat treated in the same furnace charge and with a total mass not exceeding 2.5 tonnes.

8. Surface inspection

(1) When heat treatment and final machining are completed and, if necessary, at a proper time during machining, surface inspection is to be carried out. Where applicable, this is to include the examination of internal surfaces and bores. Testing methods and acceptance criteria are to be in accordance with the Guidance relating to the Rules specified by the Society.

(2) Dimension inspection of the steel forgings is to be conducted under the responsibility of the manufacturer, unless otherwise specified.

9. Quality

(1) Steel forgings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

(2) When required by the conditions of approval for surface hardened forgings referred in **4** (7), additional test samples are to be processed at the same time as the forgings which they represent. These test samples are subsequently to be sectioned in order to determine the hardness, shape and depth of the locally hardened zone and which are to comply with the requirements of the approved specification.

(3) In the event of any forging proving defective during subsequent machining or testing, it is to be rejected notwithstanding any previous certification.

10. Non-destructive inspection

(1) The following steel forgings are to be subjected to ultrasonic test at an appropriate stage of the manufacturing process and the test reports are to be showed or submitted to the Surveyor. Testing methods and acceptance criteria are to be in accordance with the Guidance relating to the Rules specified by the Society.
- (a) Rudder stock and pintle.
- (b) Steel forgings given in **Pt 5, Ch 2, 201.1**.
- (c) Thrust shafts, intermediate shafts and propeller shafts.
- (d) Reduction gears and reduction gear shafts.
- (e) Turbine rotors, turbine discs and turbine blades.

(2) The important parts of the following steel forgings are to be subjected to magnetic particle or liquid penetrant test at an appropriate stage of the manufacturing process. Testing methods and acceptance criteria are to be in accordance with the Guidance relating to the Rules specified by the Society.
- (a) Steel forgings given in **Pt 5, Ch 2, 201.1.**
- (b) Propeller shafts.
- (c) Reduction gears.
- (d) Turbine rotors, turbine discs and turbine blades.

(3) The Society may require sulphur print test for the portion of gear teeth.

(4) In place of the test methods given above, the Society may accept the application of other non-destructive inspections considered adequate by the Society.
(5) The Society may require non-destructive inspection or the steel other than those specified in (1) and (2) when such is deemed necessary by the Society.
(6) The welded parts of steel forgings used for welded construction are to be subjected to the non-destructive inspections considered adequate by the Society.

11. Repair of defects

(1) Defects may be removed by grinding or chipping and grinding provided the component dimensions are acceptable.
(2) After removing the defects, adequate non-destructive inspections are to be carried out to ensure that all defects have been completely removed.
(3) The resulting grooves are to have a bottom radius of approximately three times the groove depth and are to be blended into the surrounding surface so as to avoid any sharp contours. Where the forgings from which defects where removed are used in that condition, the forgings are to be approved by the Surveyor.
(4) Repair welding of forgings except crankshaft forgings may be permitted subject to prior approval of the Society. In such cases, full details of the extent and location of the repair, the proposed welding procedure, heat treatment and subsequent inspection procedures are to be submitted for the approval.
(5) The manufacturer is to maintain full records detailing the extent and location of repairs made to each forging and details of weld procedures and heat treatments applied for repairs. These records are to be available to the Surveyor and copies provided on request.

12. Retest procedures

(1) Where the tensile test or hardness test fails to meet the requirements, additional test may be carried out in accordance with the requirements of **109.**
(2) Regarding the impact tests, additional tests are to be carried out according to the requirements given in **301. 10** (3).
(3) The additional tests are to be taken, preferably from material adjacent to the original tests, but alternatively from another test position or sample representative of the forging or batch of forgings.
(4) At the option of the manufacturer, when a forging or a batch of forgings has failed to meet the test requirements, it may be reheat treated and re-submitted for acceptance tests.

13. Marking

(1) Steel forgings which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.**
(2) For steel forgings to which the requirements given in note 1. of the **Table 2.1.81 and Table 2.1.82** applied, the material symbols are specified as *RSF* - (or *RSF* - *A*) and the specified tensile strength is to be filled in symbol " - ". (e.g. For Hull and General purpose steel forging which the specified tensile strength is 420 N/mm^2 : *RSF* 420H)
(3) Where carbon steel forgings are intended for welded construction specified in Note (1) of **Table 2.1.80**, "W" is to be suffixed to the marking. (e.g. *RSF* 440H-*W*, *RSF* 440M-*W*)
(4) The grade of Steel bars is to be indicated by suffixing a letter "B" to the symbol "*RSF*". (e.g. For Machinery steel forging which the specified tensile strength is 440 N/mm^2 : *RSFB* 440M)

14. Additional requirements for crank shafts

(1) Where solid crank shafts of 250 mm and over in finished diameter are manufactured by free forging, the heat treatment is normally to be carried out after crank parts are machined as nearly as possible to the finished shape.
(2) Where solid crank shafts, semibuilt-up crank throws and full built up crank arms are manufactured by special manufacturing processes, the preliminary tests instructed by the Society are to be carried out, in connection with the manufacturing processes and the selection of test specimens.
(3) Where special manufacturing processes are adopted to reduce the size of crank shaft (refer to the requirements in **Pt 5, Ch, 208.** the preliminary tests instructed by the Society are to be carried out.

15. Additional requirements for turbine rotors

(1) The test specimens for turbine rotors are to be taken in accordance with the following requirements:

(a) Where the turbine rotor is greater than 3 tons in weight, one set of longitudinal test specimens is to be taken from each end of the shaft portion and one set of transverse test specimens from the body portion respectively. (See **Fig 2.1.25**)
(b) Where the turbine rotor is not exceeding 3 tons in weight, one set of longitudinal test specimens is to be taken from one end of the shaft portion and one set of transverse test specimens from the body portion respectively.

(2) For each turbine disc, one set of transverse test specimens is to be taken from the boss portion. (See **Fig 2.1.26**)

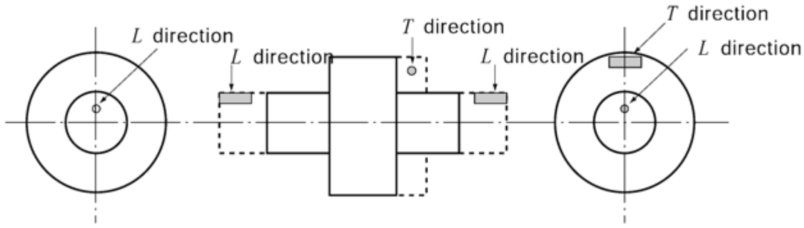

Fig 2.1.25 Selection of test specimen for turbine rotor

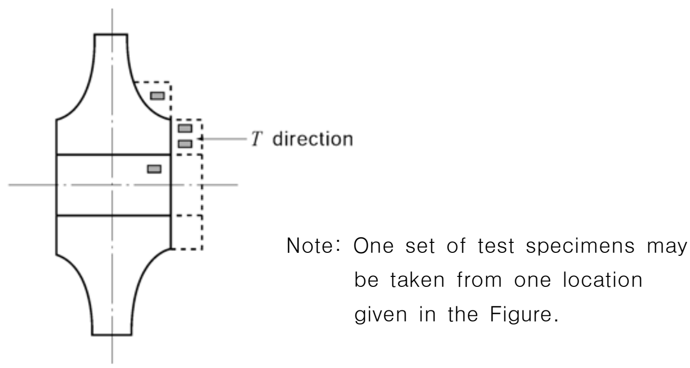

Fig 2.1.26 Selection of test specimen for turbine disc

(3) Solid forged turbine rotors intended for main propulsion service where the inlet steam temperature exceeds 400℃ are to be subjected to stability tests at least once at a suitable time after rough machining or heat treatment. This requirement is also applicable to rotors fabricated by welding. The method of stability test is to be approved by the Society prior to the test.

16. Additional requirements for turbine blades Turbine blades are to be tested in accordance with the approved test specification.

602. Stainless steel forgings

1. Application

(1) The requirements are to apply to the stainless steel forgings for valves and pipe fittings in piping systems used at low temperature (-165℃ and over in design temperature) service or corrosion-resisting service (hereinafter referred to as "steel forgings").
(2) Steel forgings having characteristics differing from those specified in **602.** are to comply with the requirements in **101. 2.**

2. Kinds Steel forgings are classified as specified in **Table 2.1.83.**

3. Heat treatment

Steel forgings are generally to receive a solid solution treatment.

4. Chemical composition

The chemical composition of steel forgings is to comply with the requirements given in **Table 2.1.83.**

Table 2.1.83 Grade and Chemical Composition

<table>
<tr><th rowspan="2">Grade</th><th colspan="8">Chemical composition (%)</th></tr>

</table>

5. Mechanical properties

(1) The mechanical properties of steel forgings are to comply with the requirements given in **Table 2.1.84.**

(2) Where deemed necessary by the Society, impact test or corrosion resistance test may be required in addition to the specified tests.

Table 2.1.84 Mechanical Properties

Grade	Tensile test			
	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation(%) ($L=5.65\sqrt{A}$)	Reduction of area (%)
RSSF 304*L*, *RSSF* 316*L*	175 min.	450 min.	37 min.	50 min.
Other forgings	205 min.	520 min.	37 min.	50 min.

6. Selection of the specimens

(1) The number of tensile test specimens is to be in accordance with the requirements in **601. 7.**

(2) Tensile test specimens are to be taken with their longitudinal axes parallel to the direction of forging, unless otherwise specially provided by the Society.

(3) Where tests are made in accordance with the requirements in **601. 7** (5), (c) and (d), the Surveyor may require hardness test for each forging.

7. Marking

Steel forgings which have satisfactorily complied with the required test are to be marked with the identification mark in accordance with the requirements in **110.**

603. Steel forgings for chains

1. Application

(1) These requirements are to apply to the steel forgings used for anchor chain cables and accessories specified in **Pt 4, Ch 8** (hereinafter referred to as "steel forgings").

(2) Steel forgings having characteristics differing from those specified in (1) are to comply with the requirements in **101. 2.**

(3) In addition to the requirements given in **603.,** general requirements may be considered by the Society.

2. Kinds

The steel forgings are classified as specified in **Table 2.1.85.**

Table 2.1.85 Grades of Steel Forgings

Grade		Application
Steel forging for Grade 2 chain	*RSFC* 50	Grade 2 chain
Steel forging for Grade 3 chain	*RSFC* 70	Grade 3 chain
Steel forging for Grade R3 chain	*RSFCR* 3	Grade *R*3 chain
Steel forging for Grade R3S chain	*RSFCR* 3*S*	Grade *R*3*S* chain
Steel forging for Grade R 4 chain	*RSFCR* 4	Grade *R*4 chain

3. Heat treatment

The steel forgings are to be normalized, normalized and tempered, quenched and tempered or heat treated by the process approved by the Society.

4. Deoxidation practice and chemical composition

The deoxidation practice and chemical composition of each grade are to comply with the requirements given in **Table 2.1.86.** Elements other than specified in **Table 2.1.86** may be added subject to a special approval by the Society.

Table 2.1.86 Deoxidation Practice and Chemical Composition (%)

Grade	Deoxidation	*C*	*Si*	*Mn*	*P*	*S*	*Al*(1)
RSFC 50	Fine-grained killed	0.24 max.	0.15~0.55	1.60 max.	0.035 max.	0.035 max.	0.020 min.
RSFC 70		0.36 max.	0.15~0.55	1.00~1.90	0.035 max.	0.035 max.	0.020 min.
RSFCR 3	Fine-grained killed	(2)(3)					
RSFCR 3*S*							
RSFCR 4							

NOTE:
(1) Al content is to be represented by the total Al content and may be replaced partly by other fine graining elements.
(2) Detailed chemical composition is to be approved by the Society.
(3) For Grade *RSFCR* 4, the steel should contain a minimum of 0.2 % molybdenum.

5. Mechanical properties

The mechanical properties of each grade are to comply with the requirements given in **Table 2.1.87.**

6. Selection of test specimens

(1) One test sample is to be selected from each lot of every 25 steel forgings or fraction thereof, which belong to the same heat. In case of steel forgings having small diameter, the number of test samples may be reduced subject to approval of the Society. Where specially approved by the Society, the test sample may be taken from the representative part of the steel forging at a proper time during manufacturing, or a separate sample forged to the forge ratio equivalent to that of the steel forgings. In this case, the test sample is to be heat treated simultaneously with the steel forgings.
(2) For Grade 1 and Grade 2 chain bars, one tensile test specimen is to be taken from the test sample; for Grade 3 chain bars, one tensile test specimen and one set (3 pieces) of impact test specimens are to be taken from the test sample.

Table 2.1.87 Mechanical Properties

Grade	Tensile test				Impact test (1)	
	Yield strength (N/mm^2) (2)	Tensile strength (N/mm^2) (2)	Elongation (%) ($L=5d$)	Reduction of area (%)	Test temp. (℃)	Average abs-orbed energy(J)
RSFC 50	295 min.	490~690	22 min.	-	-	-
RSFC 70	410 min.	690 min.	17 min.	40 min.	0	60 min.
RSFCR 3	410 min.	690 min.	17 min.	50 min.	-20(3)	40 min.(3)
RSFCR 3*S*	490 min.	770 min.	15 min.	50 min.	-20(3)	45 min.(3)
RSFCR 4	580 min.	860 min.	12 min.	50 min.	-20	50 min.

NOTE:
(1) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.
(2) The yield ratio (the aim value of yield to tensile ratio) for grade *RSFCR* 3, *RSFCR* 3*S*, or *RSFCR* 4 is to be maximum 0.92.
(3) Impact test of grade *RSFCR* 3 and *RSFCR* 3*S* may be carried out at the temperature of 0°C where approved by the Society. In this case, minimum mean absorbed energy is to be not less than 60J for grade *RSFCR* 3 and 65J for grade *RSFCR* 3*S*.

(3) The tensile and impact test specimens are to be taken from the test sample in the direction of forging at a depth of 1/6 diameter from the surface or as close as possible to this position. (see **Fig 2.1.5**)

7. Surface inspection

Surface inspection for all grades is to be carried out and it is to be confirmed that there are no harmful defects.

8. Non-destructive inspection

For grades *RSFCR* 3, *RSFCR* 3*S* and *RSFCR* 4, all steel forgings are subjected to ultrasonic test at an appropriate stage of the manufacture and it is to be confirmed that there are no harmful defects.

9. Retest procedure

Where the tensile test or impact test on the selected first test specimens fails to meet the requirements, additional tests may be carried out according to the requirements given in **306. 9.**

10. Marking

Steel forgings which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirement in **110.**

604. Steel forgings for low temperature service

1. Application

(1) The requirements are to apply to the steel forgings for valves and pipe fittings in piping systems intended to be used at the design temperature lower than 0℃ in liquefied gas carriers (hereinafter referred to as "steel forgings").
(2) Steel forgings other than those specified in **604.** are to comply with the requirements given in **101. 2.**

2. Kinds The steel forgings are classified as given in **Table 2.1.88.**

3. Heat treatment

The steel forgings are to be normalized, normalized and tempered, quenched and tempered or double normalized and tempered.

4. Deoxidation practice and chemical composition

The deoxidation practice and chemical composition of each grade are to comply with the requirements given in **Table 2.1.88.**

Table 2.1.88 Grades and Chemical Composition

Grade	Deoxidation	Chemical composition (%)								
		C	Si	Mn	P	S	Ni	Cr	Cu	Al
RLFA	Fully killed fine grain	0.23 max.	0.15~0.35	1.10 max.	0.030 max.	0.030 max.	-	-	-	-
RLFB		0.20 max.	0.15~0.35	1.60 max.						
RLFC		0.12 max.	0.10~0.35	0.55~1.00			0.50~0.95	0.50~0.95	0.40~0.75	0.04~0.30
RLF 3		0.20 max.	0.15~0.35	0.90 max.			3.25~3.75	-	-	-
RLF 9		0.10 max.	0.10~0.35	0.90 max.			8.50~9.60			

5. Mechanical properties

(1) The mechanical properties of steel forgings are to comply with the requirements given in **Table 2.1.89.**
(2) Where deemed necessary by the Society, other tests may be required in addition to the tests specified in (1).

Table 2.1.89 Mechanical Properties

Grade	Tensile test				Impact test (2)	
	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%) ($L = 5.65\sqrt{A}$)	Reduction of area (%)	Test temp. (℃)	Average absorbed energy (J)
RLFA	205 min.	410 min.	23 min.	40 min.	−40(1)	27 min.
RLFB	275 min.	490 min.	20 min.		−50(1)	
RLFC	205 min.	410 min.	23 min.		−60(1)	
RLF 3	275 min.	490 min.	23 min.	50 min.	−95	34 min.
RLF 9	520 min.	680 min.	19 min.	45 min.	−196	41 min.

NOTES:
(1) Impact test temperature for steel forgings specified in **Pt 7, Ch 5** is to be 5℃ below the design temperature or -20℃, Whichever is the lower.
(2) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

6. Selection of tests specimens

(1) The number of test specimens is to be in accordance with the requirements specified in **601. 7.**
(2) The test specimens for tensile and impact tests are to be cut with their longitudinal axes parallel to the direction of forging except where otherwise specially specified.
(3) Where tests are made in accordance with the requirements in **601. 7** (5), (c) and (d), the Surveyor may require a hardness test for each forging.

7. Retest procedures

(1) Where the tensile tests fail to meet the requirements, additional tests may be carried out according to the requirements given in **109.**

(2) Regarding the impact tests, additional tests are to be carried out according to the requirements given in **304. 9.**

8. Marking

Marking for steel castings is to comply with the requirements given in **601. 13.** (1) and in case the requirement in Note (1) of **Table 2.1.89.** has been applied, "impact test temperature T" is to be suffixed to the marking (e.g. $RLFA$ - 25T)

SECTION 7 Copper and Copper Alloy

701. Copper and copper alloy pipes and tubes

1. Application

(1) The requirements are to apply to the copper and copper alloy pipes and tubes.
(2) Copper and copper alloy pipes and tubes are to comply with the requirements in *KS D* 5301 or equivalent thereto.
(3) Copper and copper alloy pipes and tubes having characteristics differing from those specified in **701.** are to comply with the requirements in **101. 2.**

2. Kinds

Copper and copper alloy pipes and tubes are classified as specified in **Table 2.1.90.**

Table 2.1.90 Kinds and Grades

Kinds		Grades
Copper pipes and tubes.	Phosphorus deoxidized copper seamless pipes and tubes	*C* 1201, *C* 1220
Copper alloy pipes and tubes	Brass seamless pipes and tubes	*C* 2600, *C* 2700, *C* 2800
	Brass seamless pipes and tubes for condenser	*C* 4430, *C* 6870, *C* 6871, *C* 6872
	Cupro-nickel seamless pipes and tubes for condenser	*C* 7060, *C* 7100, *C* 7150

3. Mechanical properties

The mechanical properties of copper and copper alloy pipes and tubes are to comply with the requirements given in **Table 2.1.91.**

Table 2.1.91 Mechanical Properties

Kinds	Grade	Tensile test(1)	
		Tensile strength (N/mm^2)	Elongation (%)
Phosphorus deoxidized copper seamless pipes and tubes.	*C* 1201, *C* 1220	206 min.	40 min.
Brass seamless pipes and tubes	*C* 2600	275 min.	45 min.
	C 2700	294 min.	40 min.
	C 2800	314 min.	35 min.
Brass seamless pipes and tubes for condenser	*C* 4430	314 min.	30 min.
	C 6870, *C* 6871, *C* 6872	373 min.(2)	40 min.
		353 min.(3)	40 min.
Cupro-nickel seamless pipes and tubes for condenser	*C* 7060	275 min.	30 min.
	C 7100	314 min.	30 min.
	C 7150	363 min.	30 min.

NOTES :
(1) These properties are a measure of the mechanical quality of the metal in annealed condition.
(2) It is applicable to those having 5 mm and up to 50 mm in outside diameter.
(3) It is applicable to those having over 50 mm up to 200 mm in outside diameter.

4. Testing and inspection

Testing and inspection of pipes and tubes are to com ply with the requirements specified in *KS D* 5301. Those subjected to the maximum working pressure not exceeding 1 MPa may not require the presence of the Society"s Surveyor.

5. Marking

Copper and copper alloy pipes and tubes which have satisfactorily complied with the required tests are to be marked with the identification mark in accordance with the requirements in **110.**

702. Copper alloy castings

1. Application

(1) These requirements are to apply to the copper alloy castings to be used for propellers and propeller blades (hereinafter referred to as "propeller castings"). Also, upon special consideration of the Society, these requirements may also be applied for the repair and inspection of propellers becoming damaged during service.
(2) Copper alloy castings to be used for important parts differing from those specified in **702.** are to comply with the requirements of KS or equivalent thereto. The tests and inspections need in general to be made in the presence of the Surveyor where special requirements are given in connection with the design.
(3) Copper alloy castings characteristics differing from those specified in **702.** are to comply with the requirements in **101. 2.**

2. Kinds Propeller castings are classified as specified in **Table 2.1.92.**

Table 2.1.92 Kinds and Grades

Kinds	Grade
High strength brass casting, Grade 1	*CU* 1
High strength brass casting, Grade 2	*CU* 2
Aluminium bronze casting, Grade 3	*CU* 3
Aluminium bronze casting, Grade 4	*CU* 4

3. Moulding and casting

(1) The pouring must be carried out into dried moulds using degassed liquid metal.
(2) The pouring is to be controlled as to avoid turbulences of flow. Special devices and/or procedures must prevent slag flowing into the mould.
(3) Subsequent stress relieving heat treatment may be performed to reduce the residual stresses. For this purpose, the manufacturer shall submit a specification containing the details of the heat treatment to the Society for approval. The stress relieving temperatures and holding times should be in accordance with the Guidance relating to the Rules specified by the Society.

4. Chemical composition

(1) The chemical composition of propeller castings is to comply with the requirements given in **Table 2.1.93.**

Table 2.1.93 Chemical Composition (%)

Grade	Cu	Al	Mn	Zn	Fe	Sn	Ni	Pb
CU 1	52~62	0.5~3.0	0.5~4.0	35~40	0.5~2.5	0.1~1.5	1.0 max.	0.5 max.
CU 2	50~57	0.5~2.0	1.0~4.0	33~38	0.5~2.5	0.15 max.	3.0~8.0	0.5 max.
CU 3	77~82	7.0~11.0	0.5~4.0	1.0 max.	2.0~6.0	0.1 max.	3.0~6.0	0.03 max.
CU 4	70~80	6.5~9.0	8.0~20.0	6.0 max.	2.0~5.0	1.0 max.	1.5~3.0	0.05 max.

(2) For *CU* 1 and *CU* 2, it is also to comply with the followings:
(a) The zinc equivalent as specified below is not to exceed 45 %

$$\text{Zinc equivalent} = 100 - \frac{100 \times Cu(\%)}{100 + A}$$

Where A : $Sn + 5Al - 0.5Mn - 0.1Fe - 2.3Ni$ (%)

(b) Each tensile test specimen is to be examined metalographically, and the proportion of alpha-phase determined from an average of five counts is not to be less than 25 %.

5. Mechanical properties

(1) The mechanical properties of copper propeller casting are to comply with the requirements given in **Table 2.1.94.**
However, the requirements specified in this Table apply to specimens cut from separately cast samples, where specimens cut from propeller casting itself, the requirements are to be deemed appropriate by the Society

Table 2.1.94 Mechanical Properties

Grade	Yield strength(1) (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%) ($L = 5d$)
CU 1	175 min.	440 min.	20 min.
CU 2	175 min.	440 min.	20 min.
CU 3	245 min.	590 min.	16 min.
CU 4	275 min.	630 min.	18 min.

NOTE:
(1) Yield strength is measured as 0.2 % proof stress and is applicable to the case which is specially required considering the design by the Society.
(2) As for the materials of the propellers which used for the ship strengthened for navigation in ice, the elongation of the materials used is not to be less than 19 % for R14A test specimen specified in **Pt 2, Ch 1** and absorbed energy for the Charpy V notch impact test is not to be less than 21 J at -10°C

6. Selection of Test Samples and Specimens

(1) Generally, the specimens shall be taken from separately cast sample pieces. The test samples shall be cast in moulds made of the same material as the mould for the propeller and they must be cooled down under the same conditions as the propeller. If propellers are subjected to a heat treatment, the test samples are to be heat treated together with them.
(2) The shapes and dimensions of the test samples are to comply with those given in **Fig 2.1.27** The shape given by the dotted lines shown in the figure, however, may be acceptable.

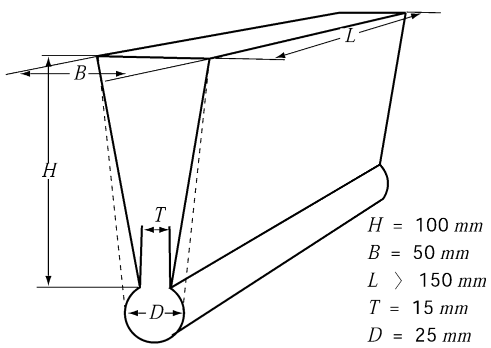

Fig 2.1.27 shapes and dimensions of the Test Samples

(3) One tensile test specimen is to be taken from each casting when integral test samples are provided and one tensile test specimen is to be taken from each ladle when separately-cast test samples are provided.
(4) For determining the proportion of alpha phase of alloy types CU 1 and CU 2. at least one specimen shall be taken from each heat. However tensile test specimen can be substitute for.
(5) When integral test samples are provided, the test samples shall be located on the blades in an area lying between 0,5 to 0,6 R (where R is the radius of the propeller). The test sample material must be removed from the casting by non thermal procedures.

7. Surface and dimension Inspection

(1) Propeller casting is to be subjected to a comprehensive visual inspection by the Surveyor at final process and other proper processing stages if necessary.
(2) The dimensions are to be checked by the manufacturer and the report on the dimensional inspection is to be handed over to the Surveyor, who may require checks to be made in his presence. Where straightening of a bent blade is carried out, the procedure for the straightening is to be in accordance with the Guidance relating to Rules specified by the Society.
(3) The Surveyor may be require areas to be etched (e.g. by iron chloride) for the purpose of investigating weld repairs.

8. Quality

All castings must have a workman like finish and must be free from defects liable to impair their use. Minor casting defects which may still be visible after machining such as small sand and slag inclusions, small cold shuts and scabs shall be trimmed off by the manufacturer.

9. Non-destructive inspection

(1) The important parts of propeller castings are to be subjected to the liquid penetrant test in accordance with the Guidance relating to Rules specified by the Society.
(2) The division of severity zones of propeller casting is to be in accordance with the Guidance relating to Rules specified by the Society.
(3) Where serious doubts exist that the castings are not free from internal defects, further non-destructive inspections are to be carried out upon request of the Surveyor, e.g. radiographic and/or ultrasonic tests. For this purpose, the acceptance criteria are to be agreed between the manufacturer and the Society in accordance with a recognized standard.
(4) All defects requiring welding repair on the propeller castings are to be documented preferably on drawings or special sketches showing their dimensions and locations. Furthermore, the inspection procedure is to be reported. The documentation is to be presented to the Surveyor prior to any repair weldings will be carried out.

10. Repair of defects

(1) In the event of finding defects in the propeller castings, the defects may be removed by grinding, etc. After removing the defects, liquid penetrant tests are to be carried out to ensure that all defects have been completely removed.
(2) Where the propeller castings from which defects where removed are used in that condition or after repaired by welding, the propeller castings are to be approved by the Surveyor.
(3) After weld repairs, the portions repaired by welding are to be subjected to the stress-relieving treatments.
(4) It is to be confirmed that the portions repaired by welding are free from harmful defects by the non-destructive inspections such as liquid penetrant test, etc.
(5) The repair welding procedures are to have prior approval of the Surveyor in accordance with the Guidance relating to the Rules specified by the Society.

11. Retest procedure

Where the results of tensile tests fail to meet the requirements, additional test may be carried out in accordance with the requirements of **109.**

12. Marking

(1) Prior to final inspection by the Surveyor each casting shall be marked by the manufacturer at least with the following symbols:
(a) Grade of cast material or corresponding abbreviated designation
(b) Manufacturer's mark

(c) Heat number, casting number or another mark enabling the manufacturing process to be traced back
(d) Specimen number
(e) Date of final inspection
(f) Number of the Society's test certificate
(g) Ice class symbol, where applicable
(h) Skew angle for high skew propellers.
(i) Manufacturer's certificate

(2) For each propeller the manufacturer must supply to the Surveyor a certificate containing the following details:
(a) Purchaser and order number
(b) Shipbuilding project number, if known
(c) Description of the casting with drawing number
(d) Diameter, number of blades, pitch, direction of turning
(e) Grade of alloy and chemical composition of each heat
(f) Heat or casting number
(g) Final weight
(h) Results of non-destructive tests and details of test procedure where applicable
(i) Portion of alpha-structure for CU 1 and CU 2 alloys
(j) Results of the mechanical tests
(k) Casting identification No.
(l) Skew angle for high skew propellers

SECTION 8 Aluminium Alloys

801. Aluminium alloys

1. Application

(1) These requirements are to apply to the aluminium alloy plates and extruded shapes(hereinafter referred to as "aluminium alloys") intended to be used in the construction of hulls, superstructures, other marine structures and tanks of liquefied gas carriers.

(2) Where aluminium alloys exceeding the maximum value of plate thickness or size specified in **Table 2.1.96** and **Table 2.1.97.** are manufactured, a new approval test is required by the Society.

(3) Aluminium alloys having characteristics differing from those specified in **801.** are to comply with the requirements in **101. 2.**

2. Kinds

The aluminium alloys are classified as specified in **Table 2.1.95.**

Table 2.1.95 Kinds

Product		Grades	Temper condition
Rolled	5000 series	5083*P*, 5086*P*, 5383*P*, 5059*P*, 5754*P*, 5456*P*	*O*, *H*112, *H*116, *H*321
Extruded Shapes	5000 series	5083*S*, 5383*S*, 5059*S*, 5086*S*	*O*, *H*111, *H*112
	6000 series	6005*AS*(1), 6061*S*(1), 6082*S*	*T*5, *T*6

NOTE :
(1) These alloy should not be used in direct contact with sea water unless protected by anodes and/or paint system.

3. Chemical composition

The chemical composition of aluminium alloys is to comply with the requirements given in **Table 2.1.96.**

Table 2.1.96 Chemical Composition

Grades	Chemical composition (%)										
	Si	*Fe*	*Cu*	*Mn*	*Mg*	*Cr*	*Zn*	*Ti*	*Others*(1)		*Al*
									Each	*Total*	
5083*P* 5083*S*	0.40max.	0.40max.	0.10max.	0.40~1.0	4.0~4.9	0.05~0.25	0.25max.	0.15max.	0.05max.	0.15max.	Remainder

NOTES :
(1) Includes Ni, Ga, V and listed elements for which no specific limit is shown. When the existence of the other elements is presumed in the course of routine analysis, further analysis thereof is to be conducted.
(2) $0.10 \leq Mn + Cr \leq 0.60$
(3) $0.12 \leq Mn + Cr \leq 0.50$
(4) Zr: maximum 0.20. The total for other elements does not include Zirconium.
(5) Zr: 0.05-0.25. The total for other elements does not include Zirconium.

4. Heat treatment

The heat treatment(hereinafter referred to as "temper condition") of the aluminium alloys is to comply with the requirements given in **Table 2.1.97** and **Table 2.1.98.**

5. Mechanical properties

(1) The mechanical properties in tension tests are to comply with the requirements given in **Tables 2.1.97.** and **2.1.98.**

Table 2.1.97 Mechanical Properties for Rolled Products(1)

Grades	Temper condition(2)	Thickness, t (mm)	Tensile test			
			Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation(%)	
					($L=5.65\sqrt{A}$)	($L=5d$)

		$12.5 < t \le 40$	215-305	305-385	-	10 min.
		$40 < t \le 50$	200-295	285-370	-	10 min.

NOTES :

(1) Aluminium alloy may be subject to any other standards in lieu of the requirements given in this Table where they are approved by the Society.

(2) Symbols used in temper condition are as follows :
O : Annealing
*H*112 : Work hardened
*H*116 : Stabilizing treatment after work hardened
*H*321 : Stabilizing treatment after work hardened

(3) 8 % for thicknesses up to and including 6.3 mm.

Table 2.1.98 Mechanical Properties for Extruded Shapes(1)

Grades	Temper condition(2)	Thickness, t (mm)	Tensile test

6005AS	$T5$	$3\le t\le 50$	215 min.	260 min.	9 min.	8 min.
	$T6$	$3\le t\le 10$	215 min.	260 min.	8 min.	6 min.
		$10<t\le 50$	200 min.	250 min.	8 min.	6 min.
6061S	$T6$	$3\le t\le 50$	240 min.	260 min.	10 min.	8 min.
6082S	$T5$	$3\le t\le 50$	230 min.	270 min.	8 min.	6 min.
	$T6$	$3\le t\le 5$	250 min.	290 min.	6 min.	-
		$5<t\le 50$	260 min.	310 min.	10 min.	8 min.

NOTES :

(1) Aluminium alloy may be subject to any other standards in lieu of the requirements given in this Table where they are approved by the Society.
(2) Symbols used in temper condition are as follows :
O : Annealing
$H111$: Work hardened
$H112$: Work hardened
$T5$: Artificial age hardening treatment after elevated temperature working and succeeding cooling
$T6$: Artificial age hardening treatment after solution treatment
(3) The values are applicable for longitudinal and transverse tensile test specimens as well.

(2) Where deemed necessary by the Society, other tests may be required in addition to the specified tests.

6. Selection of test samples

(1) For test samples for rolled products, if the weight of one lot exceeds 2 tonnes, one extra test specimen is to be taken from every 2 tonnes of the product or fraction thereof, in each lot except where specially approved by the Society.
One lot is made up of rolled products of the same alloy and from the same cast, of the same thickness, manufactured by the same process and having been submitted simultaneously to the same temper condition. For single plate or coil weighting more than 2 tonnes each, one lot is made up of a single plate or coil.

(2) For test samples for extruded shapes with a nominal weight of less than 1 kg/m, except where specially approved by the Society, one test specimen is to be taken from each 1 tonne, or fraction thereof, in each lot. For nominal weights between 1 and 5 kg/m, one test specimen is to be taken from each 2 tonnes or fraction hereof, in each lot. If the nominal weight exceeds 5 kg/m, one test specimen is to be taken for each 3 tonnes of the product or fraction thereof, in each lot.
One lot is made up of rolled products of the same alloy and from the same cast, of the same dimension, manufactured by the same process and having been submitted simultaneously to the same temper condition.

(3) Test samples are to be taken out of the place at one third of the width from a longitudinal edge of rolled products, or in the range 1/3 to 1/2 of the distance from the edge to the centre of the thickest part of extruded products.
(4) After removal of test samples, each test specimen is to be marked in order that its original identity, location and orientation is maintained.

7. Selection of test specimens

Tensile test specimens are to be taken according to (1) to (4) below.

(1) One test specimen is to be taken out of each test sample.
(2) For rolled products, the longitudinal axis of the test specimen is to be taken transversely to the rolling direction. If the width is insufficient to obtain transverse test specimen or in the case of strain hardening alloys, however, the longitudinal direction may be taken parallel to the rolling direction.
(3) For extruded shapes, the longitudinal axis of the test specimen is to be taken parallel to the extruding direction.
(4) For thickness of test sample up to and including 40 mm, the longitudinal axis of the test specimen is to be located at a distance from the surface equal to half of the thickness. For thickness of test sample over 40 mm, the longitudinal axis of the test specimen is to be located at a distance from one of the surfaces equal to one quarter of the thickness.

8. Corrosion testing

(1) For aluminium alloys specified in **Tables 2.1.97.** in the $H116$ and $H321$ tempers intended for use in marine hull construction or in marine applications where frequent direct contact with seawater is expected are to be corrosion tested with respect to exfoliation and intergranular corrosion resistance.
(2) For corrosion resistance test sample, one test sample is to be taken from each lot specified in **801. 6** (1). Test samples are to be selected from mid width at one end of a coil or random sheet or plate.
(3) Testing method and acceptance criteria is to be in accordance with the Guidance relating to the Rules specified by the Society.

9. Surface inspection and dimensional tolerance

(1) Surface inspection and verification of dimensions are left to the responsibility of the manufacturer.
(2) The under-thickness tolerances of rolled products are to comply with the requirements given in **2.1.99.**

Table 2.1.99 Under-thickness Tolerance for Rolled Products

Nominal thickness, t (mm)	Nominal width W (mm)		
	$W \leq 1500$	$1500 < W \leq 2000$	$2000 < W \leq 3500$
	Under-thickness tolerance (mm)		
$3 \leq t < 4$	0.10	0.15	0.15
$4 \leq t < 8$	0.20	0.20	0.25
$8 \leq t < 12$	0.25	0.25	0.25
$12 \leq t < 20$	0.35	0.40	0.50
$20 \leq t < 50$	0.45	0.50	0.65

(3) Dimensional tolerance except those specified in (2) above is left to the discretion of the Society.

10. Quality

(1) Aluminium alloys are to be of uniform quality and free from internal and surface harmful defects prejudicial to the use of the concerned material for the intended application.
(2) Slight surface imperfections may be removed by smooth grinding or machining as long as the thickness of the materials remains within the tolerances given in **Table 2.1.99.**

11. Retest procedures

(1) When the tensile test from the first piece selected fails to meet the requirements given in **Table 2.1.97** and **2.1.98,** two further tensile tests may be made from the same piece. If both of these additional tests meet all of the requirements, the piece and the remaining pieces from the same lot may be accepted.

(2) If one or both of the additional tests referred to above (1) are unsatisfactory, the piece is to be rejected. However, the remaining materials from the same lot may be accepted provided that two of the remaining pieces in the lot selected in the same way, are tested with satisfactory results.

12. Marking

(1) Aluminium alloys which have satisfied with the required tests are to be marked with the identification mark in accordance with the requirements in **110. 1.** In this case, the mark of temper conditions is to be put subsequent to the mark of material grade. (ex : 5083 *H*321)

(2) For aluminium alloy, which have satisfied with the corrosion resistance tests specified in 801.8, the mark of [M] is to be put subsequent to the mark of the temper condition (ex : 5083 *H*321 M) ⚓

CHAPTER 2 WELDING

SECTION 1 General

101. Application

1. Welding to be used in hull construction and important equipment is to be in accordance with the requirements in this Chapter unless otherwise specified.

2. The welding in boiler, pressure vessel, main engine, auxiliary engine and pipe arrangement is to be in accordance with the requirements in **Pt 5, Chs 2, 5** and **6** except where prescribed in this Chapter.

102. Matters to be approved

1. The welding is to be carried out in accordance with the procedures previously approved, with the electrodes, the wire and flux (hereinafter referred to as "**welding consumables**") or equivalent materials and by the welders qualified by the Society.

2. Where deemed appropriate by the Society, National Standards, internationally recognized Codes or Standards considered as equivalent for those may be applied instead of requirements of this Chapter.

103. Special weldings

Where special welding and material not complied with the requirements in this Chapter is used, the welding procedures and the welding consumables are to be specially approved by the Society.

104. Terms and definitions

1. The term manual welding is used to describe processes in which the weld is made manually by a welder using a manually fed electrode such as shield metal arc welding, etc.

2. The term semi-automatic is used to describe processes in which the weld is made manually by a welder holding a gun through which the electrode wire is continuously fed such as metal arc welding or flux-cored arc welding, etc.

3. The term automatic welding is used to describe processes in which the weld is made automatically by a welder using a continuously fed electrode wire such as submerged arc welding or electro-slag welding, etc.

SECTION 2 Test Specimens and Testing Procedures

201. General

1. Test specimens and mechanical testing procedures specified in this Chapter for welding procedure qualification tests, welders and qualification tests, approval test and periodical inspection of welding consumables are to comply with the requirements in this Section.

2. Where specimens and mechanical testing procedures differing from those prescribed in this Section are used, they are to be approved by the Society.

202. Selection of test specimens

1. Test specimens are to be selected according to respective requirements in each Section.

2. Except where otherwise specified or agreed with the Surveyor, test specimens are not to be detached from the test assembly until having been stamped by the Surveyor.

3. If test specimens are cut from test assemblies by flame cutting or shearing, a reasonable margine is required to enable sufficient material to be removed from the cut edges during final machining.

4. The preparation of test specimens is to be done in such a manner that test specimens are not subjected to any significant cold straining or heating.

5. If any test specimen shows defective machining or defects having no relation to the substantial nature, it may be discarded and substituted by another test specimen.

203. Size and dimensions of test specimens

1. Tensile test specimens

(1) Tensile test specimens are to be of size and dimensions given in **Table 2.2.1,** and the both ends of the test specimen may be machined to such a shape as to fit the holder of the testing machine.
(2) The upper and lower surfaces of weld are to be filed, ground or machined flush with the surface of plate.
(3) When the capacity of the available testing machine does not permit testing the full thickness specimen, two or more thinner than full thickness specimens may be prepared by cutting the full thickness specimens into section, each of which is to meet the requirements.

2. Bend test specimens

(1) Bend test specimens are to be of size and dimensions given in **Table 2.2.2** according to the kind of test assemblies.
(2) Where the thickness of test assemblies is greater than the thickness of the bend test specimen prescribed in **Table 2.2.2,** the face bend or root bend specimen may be machined on its compression side.
(3) Reinforcements and back straps are to be machined flush with base metal.

3. Impact test specimens

Impact test specimens are to be charphy V-notch impact test specimens specified in **Ch 1, 202. 3** and to be of size and dimensions given in **Fig 2.1.3, Tables 2.1.3** and **2.1.4.**

4. Confirmation for test specimens

The size and dimensions of test specimens are to be carefully inspected and verified by suitable means before testing

Table 2.2.1 Size and Dimensions of Tensile Test Specimens (Unit : mm)

Type	Size of specimen	Dimensions	Intended for
R 14A		d = 10 L = 50 P = 55 $R \geq$ 10 Alternatively. L = 5 d $P \cong L+0.5d$ R = 12	Deposited metal tensile test Longitudinal tensile test
R 10		t = 12 d = 6.0 L = 24 P = 32 $R \cong$ 6	Deposited metal tensile test(Welding consumables for stainless steel)
		t = 19~25 d = 12.5 L = 50 P = 60 $R \cong$ 15	
R 2A		a = t b = 12 ($t \leq$ 2) b = 25 (t > 2) P = B + 60 R > 25	Butt weld tensile test for plate
R 2B		a = t b = 38 ($t \leq$ 25) b = 25 (t > 25) P = B + 12 $R \geq$ 50	Butt weld tensile test for pipe

NOTE:
The notations used are defined as follows:
d : Diameter
a : Thickness
b : Width
L : Gauge length
P : Parallel test length
B : Width of weld
R : Transition radius
t : Thickness of material

Table 2.2.2 Size and Dimensions of Bend Test Specimens (Unit : mm)

Used for		Type	Size of specimen	Dimensions(1)	Intended for
Welding procedure qualification tests	Face and root bend specimen	*RB* 1		$t \leq 20$ $a = t$ $b = 30$ $L \geq 200$ $R = 1 \sim 2$	Butt weld bend test for plate Longitudinal bend test for plate(2)
	Side bend specimen	*RB* 2		$t > 20$ $a = t$ (3) $b = 10$ $L \geq 200$ $R = 1 \sim 2$	Butt weld bend test for plate or pipe
	Face and root bend specimen	*RB* 3		① $0 < t < 9$ $a = t$ $b = t + D/10$ $L \fallingdotseq 250$ $R \leq a/6$ ② $9 \leq t \leq 20$ $a = 9$ $b = 40$ $L \fallingdotseq 250$ $R \leq 1.5$	Butt weld bend test for pipe
Approval test and periodical inspection for welding consumables	Face and root bend specimen	*RB* 4		$a = t$ $b = 30$ $L \geq 200$ $R \leq 1.5$ Where the thickness of test assemblies exceeds 25 mm, the thickness of test specimen may be reduced to 25 mm with its surface machined on one side only(compression side)	Butt weld bend test
	Side bend specimen	*RB* 5		$a = t$ $b = 10$ $L \geq 200$ $R \leq 1.5$	Butt weld bend test (welding materials for electro-slag and electro-gas)
		RB 6		$a = t$ $b = 9$ $L \geq 200$ $R \leq 1.5$	Butt weld bend test (MIG double side, one layer each, butt welding for aluminium alloy)
Welder's qualification	Face and root bend specimen	*RB* 7		$t < 9.5$ $a = t$ $b = 40$ $L \fallingdotseq 150$ $R \leq 1.5$	Butt weld bend test for pipe

Table 2.2.2 Size and Dimensions of Bend Test Specimens (Continued) (Unit : mm)

Used for		Type	Size of specimen	Dimensions[1]	Intended for
Welder's qualification test	Side bend specimen	*RB*8		$t \geq 9.5$ $a = t^{(3)}$ $b = 9$ $L \fallingdotseq 150$ $R \leq 1.5$	Butt weld bend test for plate
	Face and root bend specimen	*RB*9		$t \leq 9.5$ $a = t$ $L \fallingdotseq 150$ $R \leq 1.5$ $b = 40$ $(D>100)$ or $25(D \leq 100)$	
		*RB*10		$t > 9.5$ $a = 10$ $L \fallingdotseq 150$ $R \leq 1.5$ $b = 40$ $(D>100)$ or $25(D \leq 100)$	Butt weld bend test for pipe
	Side bend specimen	*RB*11		$t \geq 9.5$ $a = t^{(3)}$ $b = 9$ $L \fallingdotseq 150$ $R \leq 1.5$	

NOTES:

(1) The following designations are used.
- a : Thickness
- b : Width
- R : Edge radius
- D : External pipe diameter
- t : Thickness of test assembly
- L : Length

(2) The specimen also applies to longitudinal bend test for welding consumables for 9 % Ni steel. The width of Specimen, b, is to be B+12 where breath of weld, B, is 26 mm and over.

(3) For plates over 40 mm thick, the side bend specimen may be subdivided, each part being at least 20 mm wide and each part may be tested.

204. Mechanical testing procedures

1. Tensile test and impact test

Tensile tests and impact tests are to be carried out in accordance with the procedures prescribed in **Ch 1, 203.**

2. Bend test

(1) Except where guided bend tests are required, bend test is roller bend test carried out by the jig of which the plunger has a bending radius specified in each Section with supporting rollers adjustable for their spans.
(2) Guided bend test jigs are to be as shown in **Figs 2.2.1** and **2.2.2.**
(3) Roller bend test jigs are to be as shown in **Fig 2.2.3.**

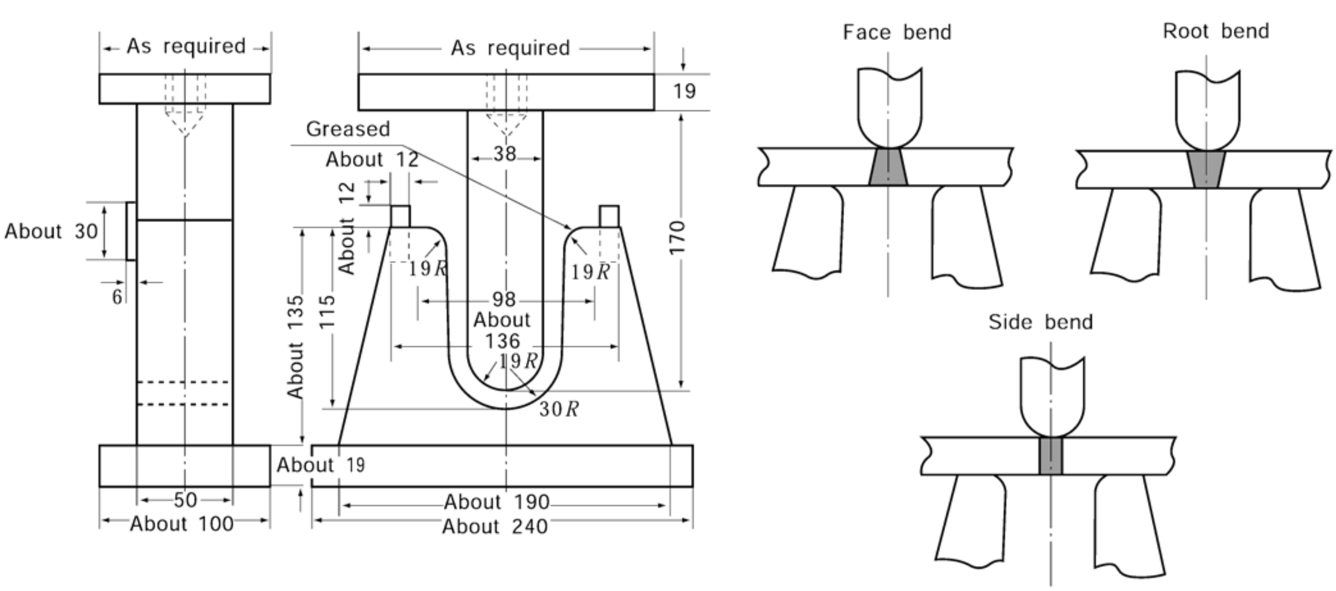

Fig. 2.2.1 Guided Bend Test Jig (For 9 *mm* in thick., Unit : *mm*)

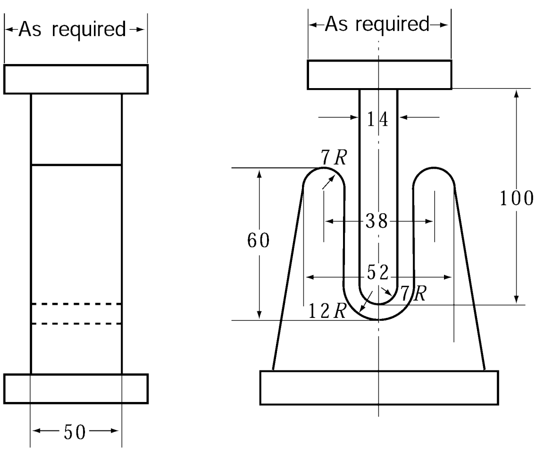

Fig. 2.2.2 Guided Bend Test Jig
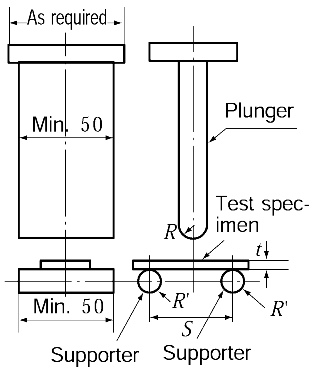
(For 3.2 *mm* in thick., Unit : *mm*)



t : Thickness of test specimen
R : Radius of plunger
R' : Radius of supporting roller (not specified)
S : Span between Supports{2 (*R* + *R'* + *t* + 2)}

Fig. 2.2.3 Jigs for Roller Bend Test (Unit: *mm*)

SECTION 3 Welding Work and Inspection

301. Details of joints

1. Application

The details of joints for manual welding are to be in accordance with the following Paragraphs. For other welding procedures such as automatic welding and in case where the specified details of joint are deemed unpracticable, full details of joint are to be submitted for approval.

2. Butt joints

(1) In general, edge preparations of butt welds are to be as shown in **Fig 2.2.4.**

(2) Butt welded joints of plates having difference over 4 mm in thickness are to be properly tapered at the end of thicker plate.

3. Butt joints of thick materials

The groove of thick materials, such as cast steel, is in general to be prepared as shown in **Fig 2.2.5.**

Thickness(*mm*)	Edge preparation	Dimensions
$t \leq 6.0$		$S \leq 3.0$ *mm*
$t > 6.0$		$S \leq 5.0$ *mm* $a \leq 3.0$ *mm* $\theta \geq 50°$

Fig 2.2.4 Edge preparation

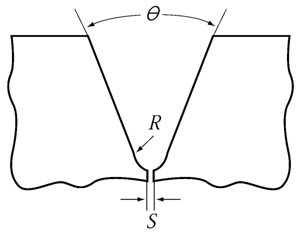


Fig 2.2.5 Butt Joint of Thick Material

4. Lap joints

(1) The breadth of overlap for lap joints which may be subjected to bending is not to be less than obtained from the following formula, but need not exceed 50 mm.

$$b = 2t + 25 \quad \text{(mm)}$$

where:

t = Thickness of the thinner plate (mm)

(2) Where plates are joggled, the breadth of overlap for joints which may be subjected to bending is not to be less than obtained from the following formula, but need not exceed 40 *mm*.

$$b = t + 25 \quad \text{(mm)}$$

where:

t = Thickness of the thinner plate (mm).

302. Welding Practice

1. Welding Practice, which is the detailed statement of the general welding works for hull structure, is to contain welding process, standard of welding and its quality control, application of welding consumables, welding procedures specification(WPS) and welding sequence of main hull structure and be submitted to the Society.

2. The welding procedure specification(WPS) specified above is to be those satisfactorily complying with the welding procedure qualification tests specified in **Sec 4.**

303. Application of welding consumables

Welding consumables used for welded joints of hull structure are to be of the grades as specified in the relevant Articles of **Sec 6** according to the following requirements:

(1) Application of welding consumables for welded joints of various grades of steel is to be as specified in **Table 2.2.3.**

(2) Welding consumables for lower toughness of steel may be used for welded joints of different toughness of steel of the same specified strength.

(3) In case of welding of steels of different specified strength, the welding consumables required for the steel of lower specified strength may be used, provided that adequate means for preventing cracks are considered.

(4) It is recommended that controlled low hydrogen type consumables are to be used when joining higher strength structural steel to the same or lower strength level, except that other consumables may be used at the discretion of the Society when the carbon equivalent is below or equal to 0.41 %. When other than controlled low hydrogen type electrodes are used, appropriate procedure tests for hydrogen cracking may be conducted at the discretion of the Society.

304. Preparation for Welding

1. Edge preparation

(1) The edge preparations are to be in accordance with the plans, and are to be free from moisture, grease, rust and paint which may cause injurious defects in welded joints.

(2) The edges to be welded shall be smooth, uniform and free from notches, laminations, cracks and other discontinuities which would adversely affect the quality or strength of the weld.

(3) Any injurious defects on the edges are to be removed. When weld repairs are required, controlled low hydrogen type welding consumables are to be used as far as practicable and grinding the complete weld smooth and flush with the adjacent surface.

2. Tack welding

(1) Tack welding is to be carried out by the welders qualified by the Society.

(2) Tack welding is to be removed before the main welding for joints of strength deck plating, sheer strakes, shell plating, and other important structural members or is to be carried out by the same procedure as the main welding without injurious defect in welded joints and made with the same or higher grade of welding consumables as intended to use for main welding.

(3) The minimum length and pitch of tack welds should be in accordance with the Guidance in relating to Rules.

(4) Injurious defects or any deviations from groove design due to tack welding to obstruct proceedings of main welding are to be completely removed.

(5) In case of tack welding higher strength steels, high strength quenched and tempered steels or joining under high restraint, preheating is to be taken as necessary prior to tack welding.

3. Fixtures

(1) Setting appliances to be used for welding fabrications are to be so arranged as to give restraint without cracks and other defects in welded joints.

(2) Tack welding for temporary fittings is not to leave any defect on base metal after the tack welds have been removed.

Table 2.2.3 Selection of welding consumables(rolled steel plates)

Kind and grade of steel to be welded			Grade of applicable welding consumables [1]
Rolled steels for hull	Mild steel	*A*	1, 2, 3, 1*Y*, 2*Y*, 3*Y*, 4*Y*, 5*Y*, 2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40, *L*1, *L*2, *L*3
		B, *D*	2, 3, 1*Y*, 2*Y*, 3*Y*, 4*Y*, 5*Y*, 2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40, *L*1, *L*2, *L*3
		E	3, 3*Y*, 4*Y*, 5*Y*, 3*Y*40, 4*Y*40, 5*Y*40, *L*1, *L*2, *L*3
	Higher strength low alloy steel	*AH*32, *AH*36	1*Y*(2), 2*Y*, 3*Y*, 4*Y*, 5*Y*, 2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40, *L*2(3), *L*3, 2*Y*42, 3*Y*42, 4*Y*42, 5*Y*42
		*DH*32, *DH*36	2*Y*, 3*Y*, 4*Y*, 5*Y*, 2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40, *L*2(3), *L*3, 3*Y*42, 4*Y*42, 5*Y*42
		*EH*32, *EH*36	3*Y*, 4*Y*, 5*Y*, 3*Y*40, 4*Y*40, 5*Y*40, *L*2(3), *L*3, 4*Y*42, 5*Y*42
		*FH*32, *FH*36	4*Y*, 5*Y*, 4*Y*40, 5*Y*40, *L*2(3), *L*3, 4*Y*42, 5*Y*42
		*AH*40, *DH*40	2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40, 3*Y*42, 4*Y*42, 5*Y*42, 2*Y*46, 3*Y*46, 4*Y*46, 5*Y*46
		*EH*40	3*Y*40, 4*Y*40, 5*Y*40, 3*Y*42, 4*Y*42, 5*Y*42, 3*Y*46, 4*Y*46, 5*Y*46
		*FH*40	4*Y*40, 5*Y*40, 4*Y*42, 5*Y*42, 4*Y*46, 5*Y*46
Rolled steels for low temperature services		*RL*24*A*	4*Y*, 4*Y*40, *L*1, *L*2, *L*3
		*RL*24*B*, *RL*27, *RL*33	5*Y*42, *L*2, *L*3(4)
		*RL*37	5*Y*42, *L*3
		*RL*9*N*53, *RL*9*N*60	*L*91, *L*92
High strength quenched and tempered steels for welded structures		*AH*43	2*Y*42, 3*Y*42, 4*Y*42, 5*Y*42, 2*Y*46, 3*Y*46, 4*Y*46, 5*Y*46, 2*Y*50, 3*Y*50, 4*Y*50, 5*Y*50
		*DH*43	3*Y*42, 4*Y*42, 5*Y*42, 3*Y*46, 4*Y*46, 5*Y*46, 3*Y*50, 4*Y*50, 5*Y*50
		*EH*43	4*Y*42, 5*Y*42, 4*Y*46, 5*Y*46, 4*Y*50, 5*Y*50
		*FH*43	5*Y*42, 5*Y*46, 5*Y*50
		*AH*47	2*Y*46, 3*Y*46, 4*Y*46, 5*Y*46, 2*Y*50, 3*Y*50, 4*Y*50, 5*Y*50
		*DH*47	3*Y*46, 4*Y*46, 5*Y*46, 3*Y*50, 4*Y*50, 5*Y*50
		*EH*47	4*Y*46, 5*Y*46, 4*Y*50, 5*Y*50
		*FH*47	5*Y*46, 5*Y*50
		*AH*51	2*Y*50, 3*Y*50, 4*Y*50, 5*Y*50, 2*Y*55, 3*Y*55, 4*Y*55, 5*Y*55
		*DH*51	3*Y*50, 4*Y*50, 5*Y*50, 3*Y*55, 4*Y*55, 5*Y*55
		*EH*51	4*Y*50, 5*Y*50, 4*Y*55, 5*Y*55
		*FH*51	5*Y*50, 5*Y*55
		*AH*56	2*Y*55, 3*Y*55, 4*Y*55, 5*Y*55, 2*Y*62, 3*Y*62, 4*Y*62, 5*Y*62
		*DH*56	3*Y*55, 4*Y*55, 5*Y*55, 3*Y*62, 4*Y*62, 5*Y*62
		*EH*56	4*Y*55, 5*Y*55, 4*Y*62, 5*Y*62
		*FH*56	5*Y*55, 5*Y*62
		*AH*63	2*Y*62, 3*Y*62, 4*Y*62, 5*Y*62, 2*Y*69, 3*Y*69, 4*Y*69, 5*Y*69
		*DH*63	3*Y*62, 4*Y*62, 5*Y*62, 3*Y*69, 4*Y*69, 5*Y*69
		*EH*63	4*Y*62, 5*Y*62, 4*Y*69, 5*Y*69
		*FH*63	5*Y*62, 5*Y*69
		*AH*70	2*Y*69, 3*Y*69, 4*Y*69, 5*Y*69
		*DH*70	3*Y*69, 4*Y*69, 5*Y*69
		*EH*70	4*Y*69, 5*Y*69
		*FH*70	5*Y*69

NOTES :

(1) The symbol of welding consumables listed above show the materials which are specified in **Table 2.2.16, Table 2.2.25, Table 2.2.33, Table 2.2.39,** and **Table 2.2.67.**

(2) When joining higher strength steels using Grade 1*Y* welding consumables, the material thicknesses should not exceed 25 mm.

(3) Welding consumables of "*L*2" is applicable to steel grade of *AH*32, *DH*32, *EH*32 or *FH*32.

(4) Welding consumables of "*L*3" is applicable to steel grade of *RL*33.

305. Welding sequence and direction of welding

1. Welding sequence and direction of welding are to be so determined as to prevent defects in welded joints and to minimize deformations caused by welding.

2. The joints which may cause excessive contraction by welding are to be welded as far as practicable prior to the joints which cause smaller contraction by welding.

3. Welding is to be proceeded to free ends of the joints as far as practicable and welding with direction of vertical-downward is not to be carried out, except the special approval of the Society.

306. Main welding

1. Welding is to be carried out so that no injurious defects may exist in the joints.

2. Welding is to be carried out under conditions of protection against the deleterious effect of moisture, rain, wind and snow, and is to be preheated in cold weather if found necessary.

3. The ends of important welded joints are to be fitted with run-off tabs or are to have proper extensions, which are to be cut off after finished welding.

4. Butt welded joints are to be back chipped to remove the defects in root of welds before applying the closing bead, except in case of one side welding or other approved procedures.

5. In case of welding under excessive restraint or welding for thick steel plate, cast steel or forged steel, special precaution is to be taken as necessary, such as preheating of the material, use of low hydrogen electrodes, etc. so as to prevent cracks.

6. In the parts subject to excessive stress concentration, the fillet welding is to be carried around the ends of member, but in other parts, the fillet welding may not be carried out around the ends, provided that the craters at the ends of welds are filled up.

7. Excessive gaps in butt joint are to be either deposited with welding on grooves, fitted with backing strips to the joints or partly replaced, and are not to be spanned with welding nor filled by slugging.

8. Where the gap between the members in fillet joints is not greater than 2 mm, the welding may be done with the given size of fillet. Where the gap is not less than 2 mm nor more than 5 mm, the welding is to be done with an increased size of fillet corresponding to the amount of gap. Where the gap exceeds 5 mm, the welding is to be done inserting a liner of suitable size or with a chill strip, or plates to be welded are to be partly renewed.

9. Preheating, intermediate temperature and post heat treatment are to be carried out in accordance with the welding procedure approved beforehand or the special approval of the Society.

307. Automatic welding

1. The grooves for automatic welding are to be finished in specially accurate dimensions.

2. Automatic welding is to be carried out within the inclination approved in the welding procedure qualification test.

3. In the cross but joints of 16 mm or over in thickness, one joint is to be welded after the automatic welding of the other joint has been completed on both sides.

4. Special precaution is to be taken as necessary for the automatic welding of rimmed steel to prevent cracks.

308. Welding for higher strength steel

1. Arc strikes are to be avoided as far as practicable.

2. Short bead, min. length of repair welds and line heating temperature, etc. are to be in accordance with the Shipbuilding Quality Standard recognized by the Society.

309. Quality of welds

1. The weld is to have a regular and uniform surface and it to be reasonably free from excessive reinforcements, injurious defects, such as undercuts, overlaps, etc.

2. Welded structures are to be reasonably free from welding deformation.

3. Non-destructive inspection is to be carried out for welded joints as the Guidance relating to the Rules specified elsewhere.

4. The welding defects found in an appropriate non-destructive inspection including the visual inspection or watertight test are to be removed and corrected by rewelding.

310. Repairs

1. The removal of weld defects shall be done by gouging, grinding, chipping, etc. with such a manner that the remaining weld metal or base metal is not damaged, however oxygen gouging is not to be used in high strength quenched and tempered steels.

2. The removed weld defects parts are to be so machined as not to affect repair welding and repair welding shall be carried out with low hydrogen type welding consumables and an electrode preferably smaller than that used for making the original weld.

3. Members distorted by welding may be straightened by mechanical means or localized heat treatment, however in case of localized heat treatment, the temperature of heated areas is to be so limited as not to affect the mechanical properties of base metal.

SECTION 4 Welding Procedure Qualification Tests

401. General

1. Application

(1) The welding procedures to be applied to hull construction specified in this Chapter as well as cargo tank, secondary barriers and piping arrangements in ships carrying liquefied gases in bulk, are to be those satisfactorily complying with the welding procedure qualification tests specified in this Section.
(2) The welding procedures qualification test for areas other than those specified in (1) is to be in accordance with the Guidance in relating to Rules.

2. Definitions

(1) Welding procedure specification(WPS)
A specification of materials, detailed methods, welding parameters etc. to be applied in the welding of a particular joint.
(2) Welding procedure qualification tests(WPQT)
A test carried out in order to demonstrate that a weld made according to a specific welding procedure specification meets the given requirements.
(3) Welding procedure qualification record(PQR)
The record of the actual parameters employed during welding of the qualification test piece according to the requirement of (2), and results from the non-destructive inspection and mechanical testing.

3. General requirements of WPQT

(1) The manufacturers are to obtain the approval of the welding procedure qualifications before the welding works in the following case specified in (a) through (b)
 (a) Where the welding procedure is first adopted for welding works specified in **1.**
 (b) Where the welding variables specified in **402. 2** (1) through (11) are changed beyond the extent of those described in the approved welding procedure specifications.
(2) For the approval of welding procedure qualification, the preliminary welding procedure specification specified in **402.** is to be reviewed by the Society and the welding procedure qualification test is to be carried out with satisfactory results. Welding procedure specifications are to refer to the test conditions and test results achieved during welding procedure qualification testing.

402. Welding procedure specification

1. A welding procedure specification (WPS) is to be prepared by the shipyard or manufacturer which intends to perform the welding procedure qualification test. This document is also referred to as a preliminary welding procedure specification (pWPS). The shipyard or manufacturer is to submit to the Society a pWPS for review prior to the tests.

2. The pWPS can be modified and amended during procedure tests as deemed necessary however it is to define, at least, the following welding variables.
(1) Kind of base metal
(2) Nominal thickness or diameter range(dimensions)
(3) Welding process
(4) Joint or groove designs with tolerances
(5) Welding position(s) and direction of progression
(6) Welding consumables(grade, shielded gas, backing, flux, etc.)
(7) Electrical characteristics(amperage, voltage and pole nature etc.)
(8) Travel speed and heat input ranges
(9) Preheat and maximum interpass temperature
(10) Post weld heat temperature (if any)
(11) Other conditions necessary for the welding procedure (ex. : welding speed, heat input etc.)

3. Welding consumables used in welding procedure qualification tests should be approved in accordance with the requirements specified in **Sec 6** of the Rules.

4. In case that the test pieces welded according to the pWPS show unacceptable results the pWPS is to be adjusted by the shipyard or manufacturer. The new pWPS is to be prepared and the test pieces welded in accordance with the new pWPS.

5. The WPS is to be used as a basis for the production welds, and upon satisfactory completion of the tests based on the pWPS, the Society may approve it as a WPS. In case that a WPS is approved by the Society the approval range is to be in compliance with the requirements in **407.**

403. Welding procedure qualification tests(WPQT)

1. Where procedure qualification test is required, the test assembly is to be welded in the same or similar environment and the qualification tests are to be carried out under the welding conditions given in the pWPS.

2. Welding of the test assemblies and testing of test specimens are to be witnessed by the Surveyor.

3. If tack welds and/or start and stop points are a condition of the weld process they are to be fused into the joint and are to be included in the test assemblies.

4. For qualification tests for stainless clad steels, the requirements specified in **404.** and **405.** are to be complied with. However the impact test may be dispensed with where other welding procedure qualification on the stainless clad steel base metal under the same welding condition has been approved.

5. Where materials other than those specified in this Section are used, the qualification tests are to be carried out in accordance with the testing standard approved by the Society.

6. Tests or test conditions other than those specified in this Section for the welding procedure qualification may be required, where deemed necessary by the Society.

404. Tests for butt welded joints

1. Application

The requirements stated hereunder apply to the butt joints welded by manual welding, semi-automatic welding or automatic welding.

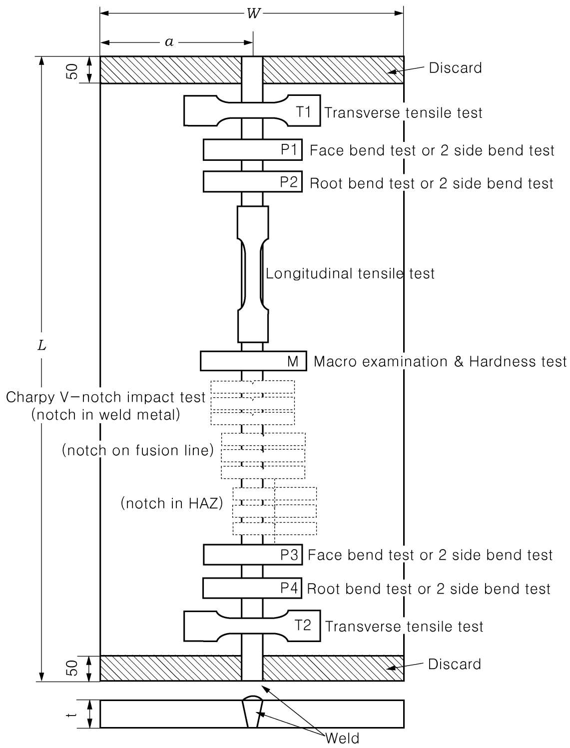
2. Kinds of test

According to the materials to be tested, kinds of test and number of test specimens are to be given in **Table 2.2.4.** Additional test may be required where found necessary by the Society.

3. Test assemblies

(1) Test assemblies are to be prepared with the same or equivalent meterial used in the actual work.

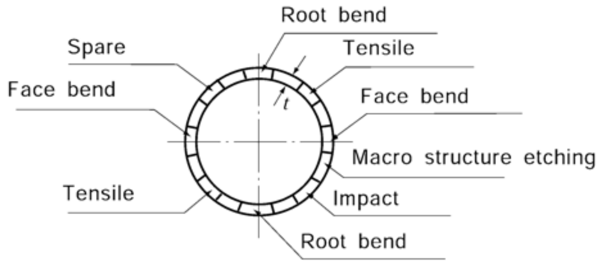
(2) The dimensions and types of test assembly are to be as indicated in **Fig 2.2.6.**



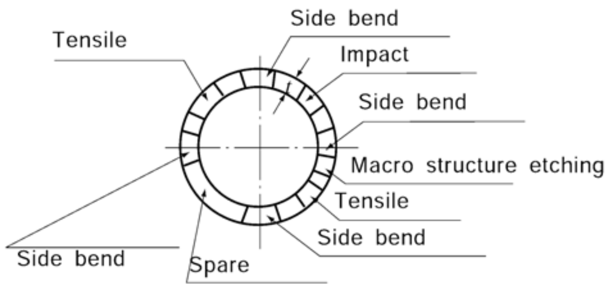
(Note)
The test assembly is to be of a size with the minimum dimensions:
(1) manual or semi-automatic welding:
Width(W) : min. 300mm
Length(L) : min. 350mm
(2) automatic welding
Width(W) : min. 400mm
Length(L) : min. 1,000mm

(A) Test assembly fot Hull Structural Steels, High Strength Quenching and Tempered Steels, Stainless Steels or Aluminium Alloys

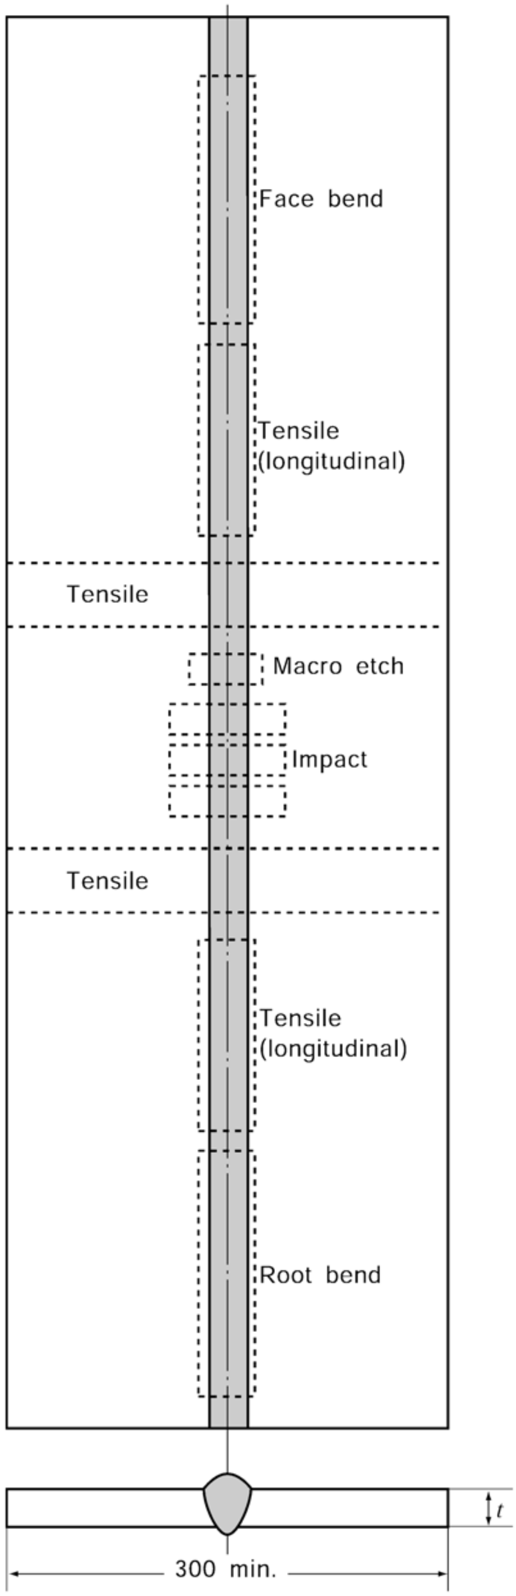
Fig 2.2.6 Welding procedure test assembly (Unit : mm) (cont'd)



(B) Test assembly for pipes up to 20mm in thickness



(C) Test assembly for pipes over 20mm in thickness



(D) Test Assembly for *RL*9*N*53 or *RL*9*N*60

Fig 2.2.6 Welding procedure test assembly (Unit : mm)

Aluminium alloys(7)	5000 series	5083*P*, 5383*P*, 5059*P*, 5086*P*, 5754*P*, 5083*S*, 5383*S*, 5059*S*, 5086*S*(8)			4(2)	-			
	6000 series	6005*AS*, 6061*S*, 6082*S*(9)							

NOTES:
(1) Where found necessary by the Society, microscopic test, hardness test and tests other than these may be required.
(2) Two root and two face bend specimens are to be tested. For thickness 12 mm and over, four side bend specimens may alternatively be tested.
(3) No. of test sets and position of notch are as shown in **Fig 2.2.7**.
(4) Internal inspections by radiographic examination or ultrasonic examination and surface inspections by magnetic particle examination or liquid penetrant examination are to be carried out.
(5) Two specimens are to be taken longitudinally and transversely respectively (See. **Fig 2.2.6**)
(6) Where found necessary by the Society, impact tests up to steels specially used for may be required.
(7) Material symbols of aluminium alloys include the symbols of which is the temper condition.
(8) Rolled products which have the same grade and temp condition may be used.
(9) Other rolled aluminium alloys of 6000 series with minimum tensile strength 260 N/mm^2 may be used.
(10) Where impact test is required.
(11) Hardness test(H_v10) is required for weldable high strength quenched and tempered steel and hull structural steel with specified minimum yield strength of $R_{eH} \geq 355\ N/mm^2$

(3) Test assemblies are to be welded in the same welding positions as the actual work.
(4) Test assemblies for the pipes over 500 mm in diameter at the actual work may be those for the plates.
(5) For butt welded joints of rolled steel plates, the direction of welding according to rolling direction is to be as follows.
  (a) When steel plates impact tested in longitudinal direction are used for test assemblies, the direction of welding of test assembly is perpendicular to the rolling direction of the two plates.
  (b) When steel plates impact tested in transverse direction are used for test assemblies, the direction of welding of test assembly is parallel to the rolling direction of the two plates.

4. Visual inspection

Welding surface is to be regular and uniform surface and is to be free from injurious defects, such as cracks, undercuts, overlaps, etc.

5. Tensile tests

(1) The number of tensile test specimens taken from each test assembly is to be as shown in **Table 2.2.4.**
(2) Tensile tests are to be carried out with the test specimen shown in **Table 2.2.1.** The tensile strength is not to be less than the minimum tensile strength specified for the base metal except for those specified in **Table 2.2.5.** When butt welds are made between plates of different grades, the tensile strength to be obtained on the welded assembly is to be in accordance with the requirements relating to the steel grade having lower strength.

Table 2.2.5 Tensile Test Requirements for Butt Welded Joint

Kind of testing materials	Grade of testing materials	Tensile strength (N/mm^2)	Yield strength (N/mm^2)
Rolled steels for lower temperature service	*RL* 9*N*53, *RL* 9*N*60	590 min.(1)	315 min.
		630 min.(2)	-
Steel pipes for low temperature service	*RLP* 9	630 min.	-
Aluminium alloys	5754	190 min.	-
	5086	240 min.	-
	5083	275 min.	-
	5383	290 min.	-
	5059	330 min.	-
	6005A, 6061, 6082(3)	170 min.	-

(Notes)
(1) For test specimen in longitudinal direction
(2) For test specimen in transverse direction
(3) See notes (9) of **Table 2.2.4.**

(3) In those cases where the consumables are not unavoidably approved by the Society, it is to be required additionally to prepare a *R* 14A deposited metal tensile test specimen as shown in **Table 2.2.1** in entirely weld metal and the tensile properties recorded for each specimen are not to be less than the minimum required for the approval of the appropriate grade of consumable. Where more than one welding process or type of consumable has been used to make the test weld, test specimens are to be taken from the area of the weld where each was used with the exception of those processes or consumables used to make the first weld run or root deposit.

6. Bend tests

(1) The number of bend test specimens taken from each test assembly is to be as shown in **Table 2.2.4,** and the position of specimen is to be as shown in **Fig 2.2.6.**

(2) The shape and dimension of face bend specimen, root bend specimen or side bend specimen are to be as indicated in *RB*1, *RB*2 or *RB*3 of **Table 2.2.2.** Bend test procedure and inside bend radius are to be as indicated in **Table 2.2.6.** There is to be no crack nor any other defect greater than 3 mm in length in any direction on the surface of bend specimen.

Table 2.2.6 Bend Test Requirements

Kind of testing materials	Grade of testing materials	Inside bend radius (mm)(1)	Bending angle
Steel pipes for low temperature service	*RLP* 9	$\frac{10}{3}t$	180°
weldable high strength quenched and tempered steel	*AH* 56, *DH* 56, *EH* 56, *FH* 56, *AH* 63, *DH* 63, *EH* 63, *FH* 63, *AH* 70, *DH* 70, *EH*7 0, *FH* 70	$\frac{5}{2}t$	
Aluminium alloys	5754, 5086, 5083, 5383, 5059, 6005*A*, 6061, 6082	(3)	
Other materials		$2t$	

NOTES :
(1) t is the thickness of the test specimen.
(2) See Notes (9) of the **Table 2.2.4.**
(3) The bend test specimens should be bent on a mandrel with maximum diameter as given in the formula below.

$$d = \frac{100 \times t_s}{A} - t_s$$

where d is the maximum former diameter
t_s is the thickness of the bend test specimen (this includes side bends)
A is the minimum tensile elongation required by the alloy grade, temper condition and thickness (for combination between different alloys, the lowest individual value should be used).

(3) For butt joints in heterogeneous steel plates, face and root longitudinal bend test specimens may be used instead of the transverse bend test specimens.

7. Impact tests

(1) *Normal and higher strength hull structural steels*
(a) The test specimen is to be charphy V-notch impact test specimen as shown in **Table 2.1.3** and to be taken from the position in **Fig 2.2.6.**
(b) The number of test specimens taken from test assemblies and the position of notch for the test specimen are as specified in **Fig 2.2.7.**
(c) Test specimen is to be sampled from 1 to 2 mm below the surface of the base metal, transverse to the weld and on the side containing the last weld run.
(d) Test temperature and absorbed energy are to be in accordance with Table 2.2.7.
(e) When butt welds are made between different steel grades/types, the test specimens are to be taken from the side of the joint with lower toughness of steel. Temperature and absorbed energy results are to be in accordance with the requirements for the lower toughness steel.
(f) Where more than one welding process or consumable has been used to make the test weld, impact test specimens are to be taken from the respective areas where each was employed. This is not to apply to the process or consumables used solely to make the first weld run or root deposit.
(g) Where the weld metal cross-section size or shape does not allow the charphy V-notch impact test specimen to be in deposited metal, the requirements in **202. 3** of **Ch 1** are to be applied.

(2) *High strength quenched and tempered steels*
   (a) Impact test is to be performed as described in the above (1).
   (b) Test temperature and absorbed energy are to be in accordance with the requirements of base metal
(3) *Weldable C and C-Mn hull steel castings and forgings*
   For base metal with specified impact values test temperature and absorbed energy are to be in accordance with the requirements of the base metal to be welded.

heat input	thickness	Locations of V-notch[3]
normal heat input $\leq$ 50 kJ/cm	t ≤ 50 mm[1]		t > 50 mm	high heat input > 50 kJ/cm	t ≤ 50 mm[2]		t > 50 mm	
Note:
(1) For one side single run welding over 20 mm notch location "a" is to be added on root side.
(2) For one side welding with thickness over 20 mm notch locations "a", "b" and "c" are to be added on root side.
(3) Notch locations:
   a : center of weld "WM"
   b : on fusion line "FL"
   c : in HAZ, 2 mm from fusion line
   d : in HAZ, 5 mm from fusion line
   e : in HAZ, 10 mm from fusion line in case of heat input > 200 kJ/cm

Fig 2.2.7 No. of test sets and locations of V-notch

<tr><td>DH 40</td><td>0</td></tr>
<tr><td>EH 40</td><td>-20</td></tr>
<tr><td>FH 40</td><td>-40</td></tr>
</table>

Note:
(1) For thickness above 50 mm impact test requirements are to be agreed by the Society.
(2) These requirements are to apply to test piece of which butt weld is perpendicular to the rolling direction of the plates.
(3) For Grade A and B steels average absorbed energy on fusion line and in heat affected zone is to be minimum 27 J.
(4) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

(4) *Steels for low temperature Service*
(a) The test specimen is to be charphy V-notch impact test specimen as shown in **Table 2.1.3** and to be taken from the position in **Fig 2.2.6.**
(b) The number of test specimens taken from test assemblies, the position of notch for the test specimen, test temperature and absorbed energy are as specified in **Table 2.2.8.**
(5) *Rolled stainless steels and stainless steel pipes*
(a) Where deemed necessary by the Society, impact test may be required.
(b) Test temperature and absorbed energy are to be in accordance with the requirements of base metal

8. Macro-structure inspection

(1) The test specimens are to be prepared and etched on one side to clearly reveal the weld metal, the fusion line and the heat affected zone. Macro examination is to include about 10 mm unaffected base metal.
(2) The examination is to reveal a regular weld profile, through fusion between adjacent layers of weld and base metal and the absence of defects such as cracks, lack of fusion etc.

9. Non-destructive inspection

(1) Test assemblies are to be examined for the whole length(excepting discard area of test assembly of **Fig 2.2.6**) by visual and by non-destructive testing prior to the cutting of test specimen. Non destructive examinations should be carried out after any required post weld heat treatment, natural or artificial ageing, and prior to the cutting of the test specimens.
(2) For high strength quenched and tempered steels with specified minimum yield strength of 420 N/mm^2 and above the non-destructive testing is to be delayed for a minimum of 48 hrs, unless heat treatment has been carried out.

<tr><td>RLP 9</td><td>− 196</td><td>41 min.</td></tr>
</table>

NOTES:
(1) Position of notch as shown in **Fig 2.2.7.**
(2) L(or T) indicates that the direction of welding is transverse (or parallel) to the rolling direction of test materials.
(3) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70% of the specified average absorbed energy, the test is considered to have failed.
(4) Where requirements in **Pt 7, Ch 5** apply, the impact test temperature is to be as given as follows:
  (a) Impact test temperature for RL 24A through RL 5N43 is to be the lower of the temperatures given in **Table 2.1.18** specified in **Pt 2, Ch 1.**
  (b) Impact test temperature for $RLPA$ through $RLPC$ is to be either 5℃ below the design temperature or -20℃ whichever is the lower.

(3) NDT procedures are to be agreed with the Society. The results of non-destructive testing are to show that there are no cracks or other injurious defects, and acceptance criteria is to be in accordance with the relevant requirements of the relevant Rules.

10. Hardness test

(1) For weldable high strength quenched and tempered steel and hull structural rolled steels with specified minimum yield strength of ReH ≥ 355 N/mm², hardness test(the vickers method Hv10) is to be carried out in accordance with the Guidance relating to the Rules specified by the Society.

(2) The results from the hardness test are not to exceed the following:
- Steel with a specified minimum yield strength ReH ≤ 420 N/mm² : 350 Hv10
- Steel with a specified minimum yield strength 420 N/mm² < ReH ≤ 690 N/mm² : 420 Hv10

405. Tests for fillet welded joints

1. Application

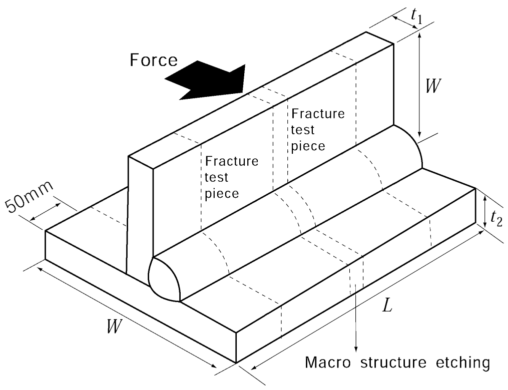
The requirements stated hereunder apply to the fillet joints welded by manual, semi-automatic or automatic welding in any welding position.

2. Kinds of test

Fillet weld joints are to be subjected to visual inspection, surface crack detection, macro-structure inspection, hardness test and fracture test. Additional tests may be required if found necessary by the Society.

3. Test assemblies and welding

(1) Test assembly is to be prepared with the same or equivalent material used in the actual work.
(2) Dimensions and type of test assembly are to be as indicated **Fig 2.2.8.**



NOTES :
1. The length of test specimen is as follows :
   (1) Manual and semi-automatic welding : Width W=3 x t, min.150 *mm*, Length L=6 x t, min.350 *mm*
   (2) Automatic welding : Width W=3 x t, min.150 *mm*, Length L= min.1000 *mm*
2. Thickness of webs and flanges of the test assembly, t_1 and t_2 are to be of ordinary thicknesses used in the actual work.
3. Tack weld may be applied to the test assembly.
4. The fillet length is to be of ordinary length used in the actual work.

Fig 2.2.8 Test assembly for fillet weld joint (unit : mm)

(3) Test assembly is to be welded in the same welding positions as the actual work.
(4) The assembly is to be welded on one side only, except in case deemed necessary by the surveyor.
(5) For single run manual and semi-automatic welding, a stop/restart is to be included in the test length and its position is to be clearly marked for subsequent examination.

4. Visual inspection

Fillet welding is to have a regular and uniform surface, and is to be free from cracks, undercuts, overlaps and other injurious defects.

5. Non-destructive inspection

(1) Test assemblies are to be examined by visual and by non-destructive testing prior to the cutting of test specimen. In case that any post-weld heat treatment is required or specified non-destructive testing is to be performed after heat treatment.
(2) For weldable high strength quenched and tempered steel with specified minimum yield strength of 420 N/mm^2 and above the non-destructive testing is to be delayed for a minimum of 48 hrs, unless heat treatment has been carried out.
(3) NDT procedures are to be agreed with the Society. The results of non-destructive testing are to show that there are no cracks or other injurious defects, and acceptance criteria is to be in accordance with the relevant requirements of the relevant Rules.

6. Macro-structure inspection

(1) The test specimen is to be taken from the position in **Fig 2.2.8.** However, in case of rolled steels for hull structural, weldable high strength quenched and tempered steel, and aluminium alloy, two specimens are to be taken. For manual welding and semi-automatic welding, one of the macro etched specimens is to be from the stop/restart position, if present.

(2) The test specimens are to be prepared and etched on one side to clearly reveal the weld metal, fusion line, root penetration and the heat affected zone. Macro examination is to include about 10 mm unaffected base metal.

(3) The examination is to reveal a regular weld profile, through fusion between adjacent layers of weld and base metal, sufficient root penetration and the absence of defects such as cracks, lack of fusion etc.

7. Hardness test

For weldable high strength quenched and tempered steel and hull structural rolled steels with specified minimum yield strength of ReH ≥ 355 N/mm^2, hardness test(Hv 10) is to be carried out in accordance with the requirement in **404. 10.**

8. Fracture tests

The remaining test assemblies after the macro-structure test specimen has been removed are to be broken by pressing as shown in **Fig 2.2.8** and there shall be no cracks, blow holes, poor penetrations and any other injurious defects in the fractured surface. However, where the sum of lengths having blow holes and poor penetration, except at both ends of the test specimen, is not greater than 10 % of the total welded length, the test may be regarded as satisfactory.

406. Retests and Procedure qualification records(PQR)

1. Retests

(1) Where visual inspection or non-destructive inspection fails to meet the requirements, the new test specimens welded under the same welding condition, are to be subject to retest and all of these test specimens are to pass the test. If this additional test piece does not comply with the relevant requirements, the pWPS is to be regarded as not capable of complying with the requirements without modification.

(2) Where the result of a tensile or bend test does not comply with the requirements, twice as many test specimens as the number of specimens of failed test are to be selected from either the first test material or test materials welded under the same welding conditions, and all of these test specimens are to be satisfactorily tested.

(3) If there is a single hardness value above the maximum values allowed, additional hardness tests are to be carried out (on the reverse of the specimen or after sufficient grinding of the tested surface). None of the additional hardness values is to exceed the maximum hardness values required.

(4) (a) Where the result of the impact test is unsatisfactory, additional tests may be carried out, with the exception of the cases specified in (i) and (ii) below, by taking a set of test specimens out of the same test material from which the above-mentioned test specimens have been taken.

(i) The absorbed energy of all test specimens is under the required average absorbed energy.

(ii) The absorbed energy of two of the test specimens is under 70 % the required average absorbed energy.

(b) In case of the previous (a), the test specimens may be accepted, provided that the average absorbed energy of the six test specimens, including those which have been rejected as unsatisfactory, is not less than the required average absorbed energy, and that not more than two individual results are lower than the required average absorbed energy and of these, not more than one result is below 70 % of the required average absorbed energy.

(5) Where there is insufficient welded assembly remaining to provide additional test specimens, a further assembly is to be welded using the same procedure to provide the additional specimens.

(6) Where the retest fails to meet the requirements, the test may be made over again. In this case, where the whole tests specified on the test assembly are carried out and are complied with requirements, the tests are accepted as successful.

2. Procedure qualification records(PQR)

(1) Three copies of the procedure qualification records showing the welding conditions for test assemblies and test results are to be submitted to the Society for approval. Forms of welding procedure test records are to be at the discretion of the Society.
(2) A statement of the results of assessing each test piece, including repeat tests, is to be made for each welding procedure test. The relevant items listed for the WPS of these requirements are to be included.
(3) A statement that the test piece was made according to the particular welding procedure is to be signed by the Surveyor witnessing the test and is to include the Society´s identification.

407. Validity of qualified welding procedure specification

1. General

(1) Welding procedures qualified at a manufacturer are valid for welding in workshops under the same technical and quality management.
(2) Qualification of a welding procedure remains valid provided the welding variables are kept within the qualified range during production welding. When one or more variables outside the qualified range given in **2.** occur, the welding procedure is to be respecified and requalified by welding procedure qualification tests.
(3) Shop primers may have an influence on the quality of fillet welds and is to be considered. Welding procedure qualification with shop primer will qualify those without but not vice versa.
(4) Validity of welding variables for the welding procedure specification of aluminium alloy is to be in accordance with the Guidance relating to Rules.

2. Validity of variables for qualified WPS is as follows. However, it may be considered as equivalent for the requirements of the standard internationally recognized(*AWS*, *ASME* etc.) are applied.

(1) **Base metal** Kind of base metal and their validity are as follows. Other materials not specified herein is to be in accordance with the requirements of the standard internationally recognized as deemed appropriate by the Society.

(a) **Normal and higher strength hull structural steels**

① Normal strength steel(*A*, *B*, *D* and *E*) or equivalent structural steels with tensile strength 400 ~ 520 N/mm^2.
② Higher strength steels(*AH* 32, *DH* 32, *EH* 32, *FH* 32, *AH* 36, *DH* 36, *EH* 36, *FH* 36, *AH* 40, *DH* 40, *EH* 40 and *FH* 40) or equivalent structural steels with minimum specified yield strength 315 ~ 390 N/mm^2.
③ Weldable high strength quenched and tempered steels (**Pt 2, Ch 1, 308.** of the Rules) or equivalent structural steels with minimum specified yield strength 420~690 N/mm^2.

(i) For each strength level, welding procedures are considered applicable to the same and lower toughness grades as that tested.
(ii) For each toughness grade of normal and higher strength hull structural steels, welding procedures are considered applicable to the same and two lower strength levels as that tested.
(iii) For each toughness grade of high strength quenched and tempered steels, welding procedures are considered applicable to the same and one lower strength level as that tested.
(iv) For applying the above (a) and (b) to high heat input processes above 50 kJ/cm, e.g. the two-run technique with either submerged arc or gas shielded metal arc welding, electro slag and electro gas welding, welding procedure is applicable to that toughness grade tested and one strength level below.
(v) The approval of quenched and tempered steels does not quality thermo-mechanically rolled steels (TMCP steels) and vice versa.

(b) **Weldable C and C-Mn hull steel castings** The approval of quenched and tempered hull steel castings does not quality other delivery conditions and vice versa.

(c) **Weldable C and C-Mn hull and general purpose steel forgings** The approval of quenched and tempered hull steel forgings does not quality other delivery conditions and vice versa.
(d) Rolled steels for low temperature service and Steel pipes for low temperature service
(e) Rolled stainless steels and Stainless steel pipes

(2) **Thickness and outer diameter of base metal**

(a) The qualification of a WPS carried out on a plate or pipe test assembly of thickness t is valid for the thickness range given in **Table 2.2.9**

Table 2.2.9 Qualified thickness range for butt, T-joint and fillet welds

Thickness of test piece, t (mm) (1)	Range of approval t(mm)	
	Butt and T-joint welds with single run or single run from both sides	Butt and T-joint welds with multi-run and fillet welds (2)
$t \leq 3$	$0.8t \sim 1.1t$	$t \sim 2t$
$3 < t \leq 12$	$0.7t \sim 1.1t$	$3 \sim 2t$
$12 < t \leq 100$	$0.7t \sim 1.1t$ (3)	$0.5t \sim 2t$ (max.150)
$100 < t$	$0.8t \sim 1.1t$ (3)	$0.5t \sim 1.5t$

Notes ;
(1) For multi process procedures, the recorded thickness contribution of each process is to be used as a basis for the range of approval for the individual welding process.
(2) For fillet welds, the range of approval is to be applied to both base metals.
(3) For high heat input processes over 50 kJ/cm, the upper limit of range of approval is to be 1.0 x t.

(b) In addition to the requirements of **Table 2.2.9**, the range of approval of throat thickness "a" for fillet welds is to be as follows:
(i) Single run ; "0.75 x a" to "1.5 x a"
(ii) Multi-run ; as for butt welds with multi-run (i.e. a=t)
(c) The qualification of a WPS carried out on a pipe test assembly is valid for the outer diameter range given in **Table 2.2.10**.

Table 2.2.10 Qualified outer diameter range for pipe welds

Outer diameter D (mm)	Qualified range
$D \leq 168.3$	$0.5D \sim 2D$
$D > 168.3$	$\geq 0.5D$

(d) For the vertical-down welding, the test piece thickness "t" is always taken as the upper limit of the range of application.
(e) For unequal plate thickness of butt welds the lesser thickness is ruling dimension.
(f) Notwithstanding the above, the approval of maximum thickness of base metal for any technique is to be restricted to the thickness of test assembly if three of the hardness values in the heat affected zone are found to be within 25 Hv of the maximum permitted, as stated **404. 10** (2) and **405. 7** of the Rules.

(3) **Welding positions**

Approval for a test made in any position is restricted to that position (see **Fig 2.2.9** and **Fig 2.2.10** of the Rules). To qualify a range of positions, test assemblies are to be welded for highest heat input position and lowest heat input position and all applicable tests are to be made on those assemblies.

(4) **Welding process**

(a) The approval is only valid for the welding process(es) used in the welding procedure test. It is not permitted to change from a multi-run to a single run.

(b) For multi-process procedures the welding procedure approval may be carried out with separate welding procedure tests for each welding process. It is also possible to make the welding procedure test as a multi-process procedure test. The approval of such a test is only valid for the process sequence carried out during the multi-process procedure test.

(5) **Welding consumables**

(a) Except high heat input processes over 50 kJ/cm, welding consumables cover other approved welding consumables having the same grade mark including all suffixes specified in **Pt 2, Ch 2, Sec 6** of the Rules with the welding consumable tested.

(b) Change in welding consumables specified in **Table 2.2.3**(Application of welding consumables) of **Pt 2, Ch 2** of the Rules.

(c) Change in shielding gas in accordance with **Pt 2, Ch 2, 603. 3** (4) of the Rules.

(6) **Welding condition**

(a) Change from short circuiting transfer to spray arc or pulsed arc or vice versa.

(b) Change of welding voltage, current and/or travel speed are to be at the discretion of the Society.

(c) The minimum preheating temperature is not to be 15℃ less than that used in the qualification. The maximum interpass temperature is not to be 56℃ higher than that used in the qualification

(d) The heat treatment used in the qualification test is to be maintained during manufacture. Holding time may be adjusted as a function of thickness.

(7) **Heat input**

(a) The upper limit of heat input approved is 25 % greater than that used in welding the test piece or 55 kJ/cm whichever is smaller, except that the upper limit is 10 % greater than that for high heat input processes over 50 kJ/cm.

(b) The lower limit of heat input approved is 25 % lower than that used in welding the test piece.

(8) **Type of joint**

(a) Range of approval depending on type of welded joints for test assembly is to be specified in **Table 2.2.11**

(b) A qualification test performed on a butt weld will also qualify for fillet welding within the thickness ranges specified for fillet welds specified in (2) (a) above.

Table 2.2.11 Range of approval for type of welded joint

Type of welded joint for test assembly				Range of approval
Butt welding	One side	With backing	A	A, C, D
		Without backing	B	A, B, C, D
	Both side	With gouging	C	C
		Without gouging	D	C, D

(c) Change of specified type of joint which may significantly affect penetration and fusion etc, of the weld. However decrease in the groove angle, decrease in the root opening or increase in root face is to be as deemed appropriate by the Society.

(9) **Others** The Validity relating to the welding variables other than previous (1) to (8) may comply with the requirements of the internationally recognized Code (*AWS, ASME, ISO, EN* etc.)

3. For changes other than previous **2**, the welding procedure qualification test may be dispensed with. In this case, the welding procedure specification to which the related procedure qualification record(PQR) is attached is to be requalified.

SECTION 5 Welders and Welder Performance Qualification Tests

501. General

1. Each welder intended to engage in the manual and semi-automatic welding work specified in this Section is to pass the performance qualification tests required according to the applicable welding process, welding position and kinds of materials to be welded and to have the performance qualification by the Society.

2. Welders engaged in tack welding should be qualified for either butt welds or fillet welds, for the welding process and the position corresponding to the joint to be welded. If requested, the Society may qualify those welders engaged in tack welding works only in accordance with the Guidance in relating to Rules.

3. Welding operators intended to engage in automatic welding work are to be those skillful for the actual welding work in which they will engage. If requested, the Society may qualify those welding operators engaged in automatic welding works only in accordance with the Guidance in relating to Rules.

4. The performance qualification test of welder intended to engage in the special material and welding work not prescribed in this Section are to be at the discretion of the Society.

5. The application of more suitable requirements instead of the requirements of this Section is left to the discretion of the Society.

502. Grades, and range of qualification

1. A welder should be qualified in relation to the variables such as base material, welding process, type of welded joint, plate thickness and welding position.

2. Welding processes

(1) The welding processes for welder''s qualification are to be classified in **Table 2.2.12-1.**

Table 2.2.12-1 Welding processes for welder''s qualification

Symbol	Welding process in actual welding works	
M	Manual welding	Shield Metal Arc Welding(SMAW)
S	Semi-automatic welding	(1) Flux Cored Arc Welding(FCAW) (2) Gas Metal Arc Welding(GMAW)
T	TIG welding	Gas Tungsten Arc Welding(GTAW)

(2) A welder intended to engage in the multi-process welding work is to pass the separate performance qualification tests for each welding process.

3. Types of welded joint

(1) The types of welded joint for welder's qualification are to be classified as shown in **Table 2.2.12-2** in accordance with the qualification test.
(2) A qualification test performed using butt welds automatically qualifies fillet welding.
(3) The Society may qualify the welders who are employed to perform fillet welding only. However, where such welders are engaged to weld fillet with groove they are to be qualified for butt welds.

Table 2.2.12-2. Types of welded joint for welder's qualification

Type of welded joint used in the test assembly for the qualification test(1)				Type of welded joint qualified
Butt weld	Single sided weld(2)	With backing	WB	WB, FW
		Without backing	NB	WB, NB, FW
Fillet weld		-	FW	FW

NOTES:
(1) A qualification test performed using butt weld test assembly for pipes automatically qualifies butt weld test for plates.
(2) A qualification test performed using single sided weld automatically qualifies double sided weld.

4. Base materials

(1) Base materials for qualification tests are grouped as follows;
  (a) Carbon and low alloy rolled steels, tubes and pipes, castings and forgings
  (b) Stainless rolled steels, tubes and pipes, castings and forgings
  (c) Aluminium alloy
  (d) Copper alloy castings
(2) A welder passed the qualification test with certain material in specific material group may be accepted to weld other materials in same material group.
(3) For welding with materials in different material groups, qualification approval may be carried out with separate qualification test for each material.

5. Thickness and outer diameter of base metal

(1) The welder qualification carried out on a plate or pipe test assembly of thickness T is valid for the thickness range given in **Table 2.2.13-1**

Table 2.2.13-1 Qualified thickness range for welder qualification

Grade	Thickness of test assembly, T(mm)	Qualified thickness range t(mm)
1	$T \leq 3$	$T \leq t < 2T$
2	$3 < T \leq 20$	$3 < t \leq 2T$
3(1)	$20 < T$	$5 < t$
3R	$12.5 < T$	$5 < t$

Note
(1) For aluminium alloy, the upper limit of qualified thickness range is to be 40mm. For aluminium alloy with thickness over 40mm, additional tests may be carried out as deemed necessary by the Society.

(2) The welder qualification carried out on a pipe test assembly is valid for the outer diameter range given in **Table 2.2.13-2.**

Table 2.2.13-2 Qualified outer diameter range for pipe welds

Grade	Outer diameter *D* (mm)	Qualified range
1	$D \leq 25$	D～2D
2	$25 < D \leq 150$	0.5D～2D(Min. 25mm)
3	$150 < D$	$\geq 0.5D$
3R(T, K and Y Joint)	$150 < D$	≥ 100mm

Note;
(1) Test assemblies for the pipes over 500 mm in diameter may be those for the plates.

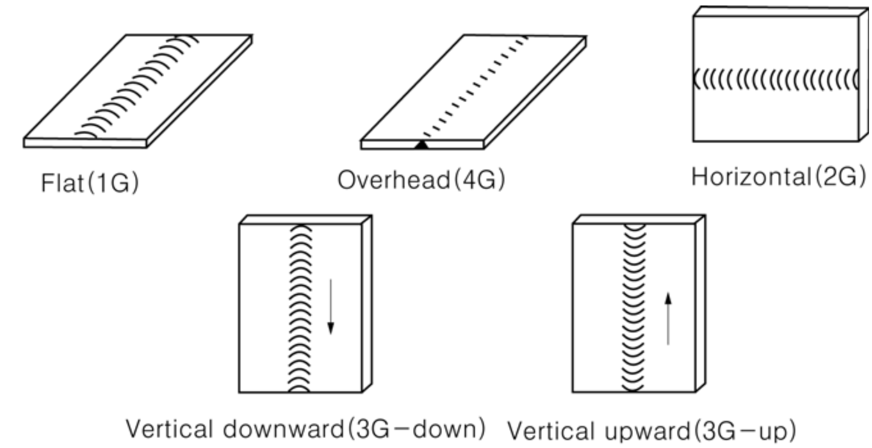
6 Positions

The positions for qualification test and positions qualified for actual welding work are to comply with the **Table 2.2.14.**

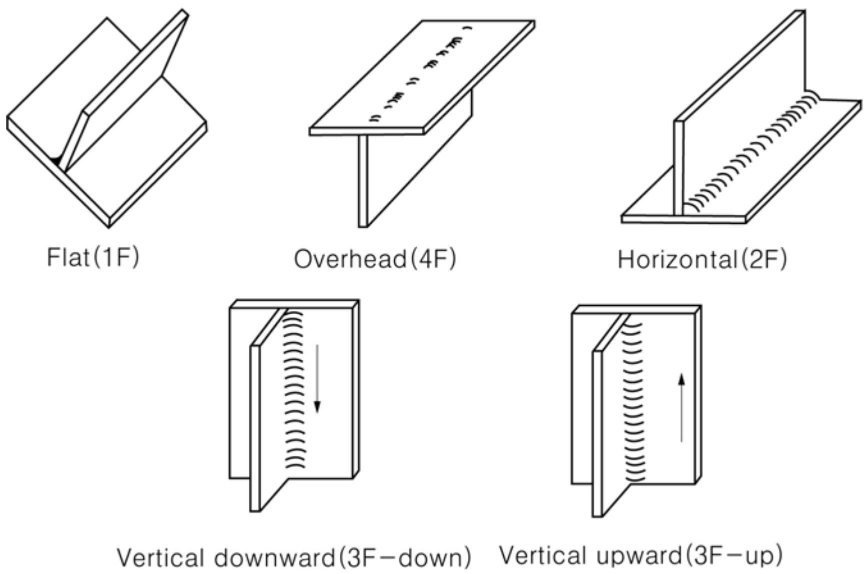
Table 2.2.14 Welding Positions for Welder Qualification

Grade	Test Positions(1)		Welding positions in actual welding work(2)			
			Plates		Pipes	
			Butt joint	Fillet joint	Butt joint	Fillet joint
For each grade of plates	Flat	1G	F	F, H	F(3)	F, H
		1F	-	F	-	F
	Horizontal	2G	F, H	F, H	F, H(3)	F, H
		2F	-	F, H	-	F, H
	Vertical-upward	3G-up	F, H, VU	F, H, VU	F, H, VU(3)	F, H, VU
		3F-up	-	F, H, VU	-	F, H, VU
	Vertical-downward	3G-down	F, VD	F, VD	-	-
		3F-down	-	F, VD	-	-
	Overhead	4G	F, H, OH	F, H, OH	F, OH(3)	F, H, OH
		4F	-	F, H, OH	-	F, H, OH
	3G-up+4G		All	All	All(3)	All
For each grade of pipes(7)	Horizontal-rolled	1G-P	F	F	F	F, H
		1F-P	-	F	-	F
	Vertical-fixed	2G-P	F, H	F, H	F, H	F, H
		2F-P	-	F, H	-	F, H
	Horizontal-fixed	5G-P	F, V, OH	F, V, OH	F, V, OH	F, V, OH
		5F-P	-	F, V, OH	-	F, V, OH
	Vertical-fixed+Horizontal-fixed (2G-P)+(5G-P)		All	All	All	All
	Inclined-fixed	6G-P	All	All	All	All
		6F-P	-	All	-	All
	Inclined-fixed with restriction ring (6GR-P)(4)		All	All	All	All

NOTES:
(1) Test positions are to comply with **Fig 2.2.9** and **Fig 2.2.10.**
(2) F=Flat, VU=Vertical-Up, VD=Vertical-Down, H=Horizontal, OH=Overhead
(3) Only qualified for pipe over 600 mm in diameter with backing strips or back gouging.
(4) Test in the 6GR-P position qualify welding in T, K & Y connection(Grade 3R) and welds with restricted access.



(a) Butt welds



(b) Fillet welds

Fig 2.2.9 Welding position of plates

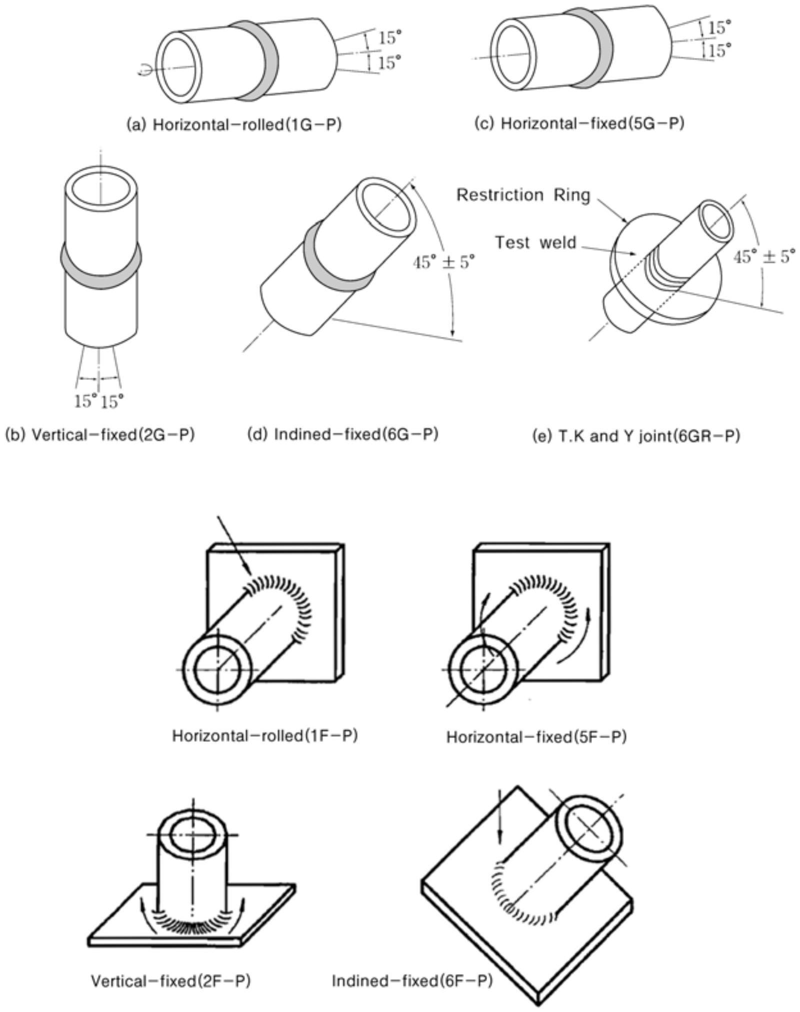


Fig 2.2.10 Welding position of pipes

503. Testing procedure

1. General

(1) Test assemblies may be welded with either alternating current or direct current.
(2) The test assemblies are not to be changed their up-and-down or right-and-left position throughout the welding operation.
(3) The welding is to be carried out only on one side and the back welding is not to be carried out unless specified otherwise.
(4) In general, the test assemblies for plates are to be so restrained or prestrained that the warping due to the welding does not exceed an angular distortion of 5 degrees.
(5) The test assemblies are not to be subjected to peening or heat treatment throughout the period before, during and after the welding.
(6) The backing strips of the test assemblies may be used steel plates, copper plate, ceramic or similar materials to obtain the enough penetration.
(7) Welding of the test assemblies and testing of test specimens should be witnessed by the Surveyor.

2. Test assemblies

(1) Test assemblies for butt welds and for fillet welds are to be prepared as shown in **Fig 2.2.11** to **Fig 2.2.15** in each qualification test.
(2) Materials used for tests are to be those specified in **502. 4** or those which are considered

equivalent by the Society.

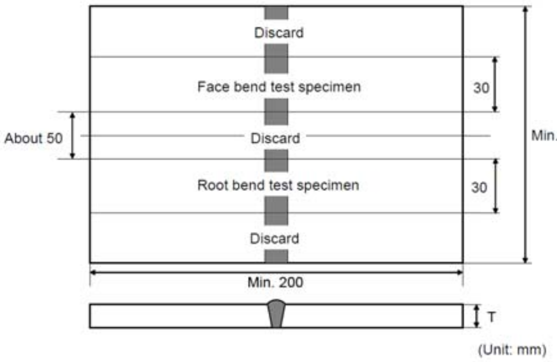

Fig 2.2.11 Dimensions and types of test assembly for butt welds

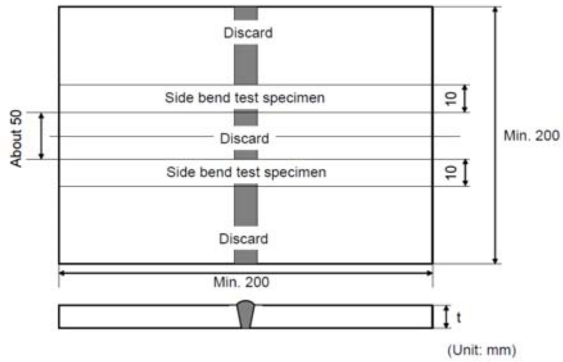

Fig 2.2.12 Dimensions and types of test assembly for butt welds(T≧12mm)

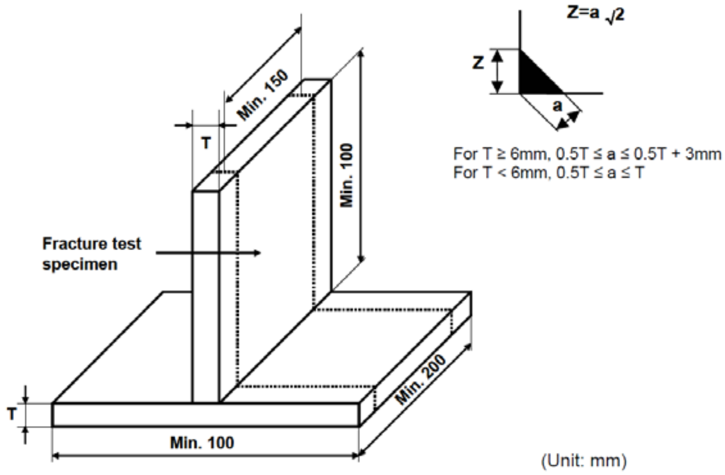

Fig 2.2.13 Dimensions and types of test assembly for fillet welds

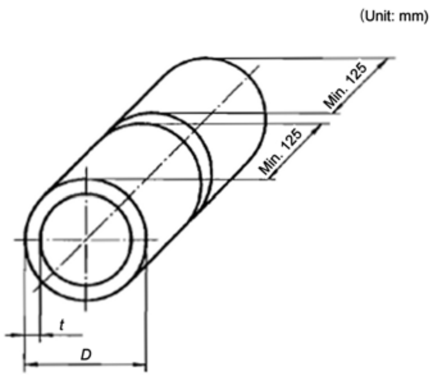

Fig 2.2.14 Dimensions and types of test assembly for pipe butt welds

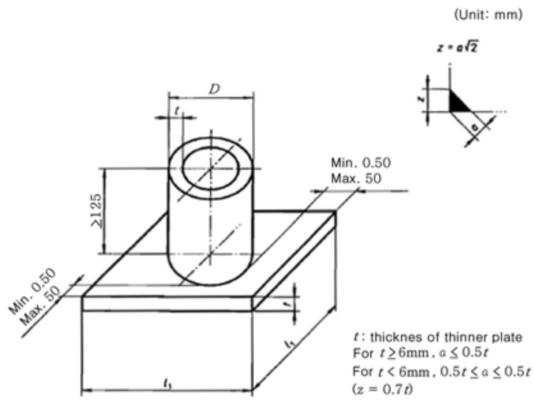

Fig 2.2.15 Dimensions and types of test assembly for pipe fillet welds

(3) The dimensions and types of welded joint are to be as indicated in **Fig 2.2.16** and **Fig 2.2.17** or those which are considered equivalent by the Society.

<table>
<tr><th>Materials</th><th>Mild steel and stainless steel</th><th>Aluminium alloy</th></tr>

Materials	Mild steel and stainless steel	Aluminium alloy
Grade 1		Grade 2		Grade 3		Grade 3R		

Fig 2.2.17 Dimensions and types of welded joint-pipes

(4) Welding consumables used in qualification tests should be type approved one or those which are considered equivalent by the Society.

3. Examination and test

(1) Examination and test are as specified in **Table 2.2.15.**

Table 2.2.15. Examination and test for Welder Qualification

Kinds	Examination and test(3)
Butt welds	Visual inspection, Bend test(1)
Fillet welds	Visual inspection, Fracture test(2)

NOTES
(1) Radiographic test may be carried out in lieu of bend test.
(2) Two macro sections may be taken in lieu of the fracture test.
(3) Additional tests may be required, at the discretion of the Society

(2) **Visual examination**
(a) The welds should be visually examined prior to the cutting of the test specimen for the bend test.
(b) The result of the examination is to show the absence of cracks or other serious imperfections. Imperfections detected are to be assessed in accordance with quality **level B** in **KS B ISO 5817**, except for imperfection typea such as excess weld metal, excess penetration, excessive convexity and excessive throat thickness for which level C applies

(3) **Bend test**
(a) One face bend test and root bend test specimen are to be tested. For thickness 12 mm and over, two side specimens may be tested as an alternative.
(b) Bend test specimens are to be of size and dimensions given in **Table 2.2.2** according to the kind of test assemblies.
(c) The mandrel diameter to thickness ratio (i.e. D/t) is to be that specified in each article of **Pt 2, Ch 2, Sec 6** of the Rules +1 except for aluminium alloy for which requirements in **Table 2.2.64** of **Pt 2, Ch 2, 608** of the Rules applies
(d) The test specimens are to be bent through 180 degrees. After the test, the test specimens should not reveal any open defects in any direction greater than 3mm. Defects appearing at the corners of a test specimen during testing should be investigated case by case.

(4) **Radiographic test**
When radiographic testing is used in lieu of bend test, test procedures and acceptance criteria are to be in accordance with the Guidance in relating to Rules.

(5) **Fracture test (Fillet welds)**
(a) The fracture test of fillet welds is to be carried out in accordance with the requirements specified in **Pt 2, Ch 2, 405. 8** of the Rules
(b) Evaluation should concentrate on cracks, porosity and pores, inclusions, lack of fusion and incomplete penetration. Imperfections that are detected should be assessed in accordance with **KS B ISO5817**, class B.

(6) **Macro examination**
When macro examination is used for fillet welds, examination procedures and acceptance criteria are to be as follows;
(a) The macro examination of fillet welds is to be carried out in accordance with the requirements specified in **Pt 2, Ch 2, 405. 6** of the Rules
(b) The test specimens are to be prepared and etched on one side to clearly reveal the weld metal, fusion line, root penetration and the heat affected zone.
(c) Macro sections should include about 10mm of unaffected base metal.
(d) The examination is to reveal a regular weld profile, through fusion between adjacent layers of weld and base metal, sufficient root penetration and the absence of defects such as cracks, lack of fusion etc.

4. Retest

(1) When a welder fails a qualification test, the following should apply.

(a) For the welder who fails to meet the requirements in a part of the tests, the retests as to the failed tests may be made on duplicate test specimens from the test assemblies welded within 1 month from the date of the failure and the welder may be treated to have passed the requirements where all test specimens fully comply with the test requirements.
(b) In cases where the welder fails to meet the requirements in all parts of the required tests or in the retest prescribed in (a) above, the welder should undertake further training and practice.

(2) Where any test specimen does not comply with dimensional specifications due to poor machining, a replacement test assembly should be welded and tested.

5. Certification

(1) Qualification certificates are normally issued to the applicants(shipbuilder or manufacturer) when the welder has passed the qualification test by the Society.
(2) The following items should be specified in the certificate:
(a) Range of qualification for materials, welding processes, types of welded joint, plate thicknesses and welding positions;
(b) Expiry date of the validity of the qualification;
(c) Name, date of birth, identification and the photograph of the welder;
(d) Name of shipbuilder / manufacturer.

6. General requirements for qualification validity

(1) Each shipyard and manufacturer should be responsible for the employment, training, testing, control of the validity of the certificate and the range of the approval of the welders.
(2) Where welder has not engaged in a particular process and equipment for a period exceeding six months, his qualification is automatically withdrawn. All the following conditions are fullfilled for maintaining welder's qualification.
(a) The welder should be engaged with reasonable continuity on welding work within the current range of approval. The welder's work should in general be in accordance with the technical conditions under which the approval test is carried out.
(b) The qualification validity of welder is to be confirmed at six-month intervals by the shipyards/manufacturers responsible for weld quality.
(c) The status of approvals of each individual qualification is to be demonstrated to the Classification Society when requested.

(3) The welder failed to meet the required qualify of the Society in welding work may be suspended his qualification.

SECTION 6 Welding Consumables

601. General

1. Application

(1) The covered electrodes for manual welding and gravity welding, wire/flux combinations for two run or multirun submerged arc welding, solid wire/gas combinations for arc welding, flux cored wires with or without gas for arc welding and consumables for use in electroslag and electrogas vertical welding specified in the Rules are to be approved by the Society in accordance with the requirements in this Section.
(2) The welding consumables which are used in welding processes differing from those specified in (1) or where it is considered impracticable to apply the requirements in this Section are to be of the type approved by the Society.
(3) The approval test for welding consumables which are not covered by this Section is to be left to the discretion of the Society.

2. Process of manufacture

The approved welding consumables are to be manufactured of uniform quality, under the manufacturer's responsibility, by the process approved by the Society, at works approved by the Society.

3. Test assemblies

(1) The test assemblies are to be prepared under the supervision of the Surveyor, and all tests are to be carried out in his presence.
(2) When a welded joint is performed, the edges of the plates are to be bevelled either by mechanical machining or by oxygen cutting; in the later case, a descaling of the bevelled edges is necessary.
(3) The welding conditions used such as amperage, voltage, travel speed, etc are to be within the range recommended by the manufacturer for normal good welding practice. Where a filler material is stated to be suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of the test assemblies.

4. Approval test

(1) The approved welding consumables are subject to the approval tests and inspections specified in **602.** to **609.** in this Section.
(2) Welding consumables are to be approved at each manufacturing plant and for each brand. However, where are specified in (a) and/or (b) below, a reduced test programme at least equivalent to annual tests is permitted if the manufacturer can certify that the materials used and the fabrication process are identical with those used in the main works. However, should there be any doubt, complete test-series may be required.
   (a) Where welding consumables which have been approved are intended to manufacture at manufacturing plants other than those of the manufacturers who manufacture the said welding consumables.
   (b) Where welding consumables which have been approved are intended to manufacture according to technical licensing agreements with those parties who manufacture the said welding consumables.
(3) Wire flux combination for submerged arc welding. If a unique powder flux is combined with different wires coming from several factories belonging to the same firm, it may be admitted to perform only one test-series if the different wires are conformable to the same technical specification, after approval of the Society.
(4) Where deemed necessary by the Society, tests other than those specified in this Section may be required.

5. Periodical inspection

The manufacturer of welding materials is to be subjected to the periodical inspection in the presence of Surveyor for each brands of the welding materials at each manufacturing plant in a period not exceeding 12 months.

6. Alterations to approved consumables

(1) In case when the particulars of the welding materials which being mentioned in the certificate

of approval, such as grade, welding position, maximum diameter of welding materials or shield gas, are changed, the manufacturer is to submit a copy of application form for change to the Society, and necessary additional approval tests are to be carried out accordingly.

(2) When the significant changes in compositions or manufacturing process of the wire and flux or removal of manufacturing plant is made, the manufacturer is to submit a single copy of notification of alternation in any preferred form to the Society, and necessary confirmation survey and test may be carried out accordingly.

(3) Upgrading and uprating of welding consumables will be considered only at manufacturer's request, preferably at the time of annual testing. Generally, for this purpose, tests from butt weld assemblies will be required in addition to the normal annual approval tests..

7. Retests

(1) *Tensile test and bend test*

(a) Where the tensile test and bend test fail to meet the requirements, twice as many test specimens as the number of specimens of failed test are to be selected from the first test material or from a test material welded under the same welding conditions, and if all of test specimens pass the tests, then the tests are considered to be successful.

(b) Where insufficient original welded assembly is available, a new assembly is to be prepared using welding consumables from the same batch.

(c) If the new assembly is made with the same procedure (particularly the number of runs) as the original assembly, only the duplicate re-test specimens needs to be prepared and tested. Otherwise, all test specimens should be prepared as for re-testing.

(2) *Impact test*

(a) Where the result of the impact test is unsatisfactory, additional tests may be carried out, with the exception of the cases specified in (i) and (ii) below, by taking a set of test specimens out of the same test material from which the above-mentioned test specimens have been taken.

(i) The absorbed energy of all test specimens is under the required average absorbed energy.

(ii) The absorbed energy of two of the test specimens is under 70 % the required average absorbed energy.

(b) In case of the previous (a), the test specimens may be accepted, provided that the average absorbed energy of the six test specimens, including those which have been rejected as unsatisfactory, is not less than the required average absorbed energy, and that not more than two individual results are lower than the required average absorb energy and of these, not more than one result is below 70 % of the required average absorbed energy.

(3) Where the retest fails to meet the requirements, the test may be made over again with changed welding conditions. In this case, if the whole tests specified for the test assembly are carried out and are in compliance with the requirements, the test is accepted as successful.

8. Revocation of approval

In the following cases, the approval of welding consumables by the Society shall be revoked, after notice is given to the manufacturer:

(1) When the Society has recognized that the quality is remarkably worse than that approved or is not uniform.

(2) When the welding consumables have failed the requirements in the annual inspections.

(3) When the welding consumables are not inspected annually as required by the Rules.

9. Data

The Society may require the submission of the data with respect to the properties of welding consumables if necessary.

10. Packings and markings

(1) The approved welding consumables are to be packed throughly to keep the quality during their transportation and storage.

(2) All packages of approved welding consumables are to clearly marked with the following descriptions together with the approved mark of the Society.

(a) Brand

(b) Name of manufacturer

(c) Kind of gas if used
(d) Grade or mark of welding consumables
(e) Electric current and its polarity
(f) Welding positions
(g) Date and number of production
(h) Sizes (diameter of core wire, length of elect rode, grain size of flux for submerged arc welding, etc.)
(i) Special notices on the treatment

602. Electrodes for manual arc welding for normal strength steels, higher strength steels and steels for low temperature service

1. Application

(1) Electrodes for manual arc welding for normal strength steels, higther strength steels and steels for low temperature service given in the following (a) and (b) (hereinafter referred to as "electrodes") are to be subjected to the approval test and annual inspections in accordance with the requirements in **602.**
(a) Electrodes for manual welding
(i) For butt welds
(ii) For fillet welds
(iii) For both butt welds and fillet welds
(b) Electrodes used in gravity welding or similar set-ups
(i) For fillet welds
(ii) For both butt welds and fillet welds
(2) Any requirements regarding one side welding without backing are left to the discretion of the Society.

2. Grades and marks of electrode

(1) Electrodes are classified as specified in **Table 2.2.16.**

Table 2.2.16 Grades and Marks

For normal strength steel	For higher strength steel	For steel for low temperature service
1, 2, 3	2*Y*, 3*Y*, 4*Y*, 5*Y*, 2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40	*L* 1, *L* 2, *L* 3, *L* 91, *L* 92

(2) For low hydrogen electrodes which have passed the hydrogen test specified in **Par 6,** the suffixes given in **Table 2.2.22** are to be added to the grade marks of the said electrodes. (e.g. 2*Y H*5)

3. General provisions for tests

(1) Kinds of test, number, thickness and dimension of test assemblies, diameter of electrodes used for welding, welding positions, grades and number of test specimens to be taken from each test assembly for electrodes given in **Par 1** (1) (a) (i) and (iii) are to be as given in **Table 2.2.17.** However, where deemed necessary by the Society, hot cracking tests may be required by the Society in addition to tests specified in this Table.
(2) Kinds of test, number, thickness and dimension of test assemblies, diameter of electrodes used for welding and welding positions, together with grades and number of test specimens to be taken from each test assembly for electrodes given in **Par 1** (1) (a) (ii), are to be as given in **Table 2.2.18.**
(3) Tests for electrodes given in **Par 1** (1) (b) are to be in accordance with the requirements in the following (a) and (b):
(a) For electrodes given in **Par 1** (1) (b) (i), tests given in **Table 2.2.18** specified in the preceding (2) are to be conducted.
(b) For electrodes given in **Par 1** (1) (b) (ii), tests specified in the preceding (a) and butt weld test given in **Table 2.2.17** specified in the preceding (1) are to be conducted.

Table 2.2.17 Kinds of Test for Electrode

Kind of test	Test assembly					Kind and No. of test specimens taken from test assembly
	Welding position	Diameter of electrode (mm)	No. of test assemblies	Dimensions of test assembly	Thickness (mm)	
Deposited metal test	Flat	4	1(1)	**Fig 2.2.18**	20	Tensile test specimen : 1 Impact test specimen : 3
		max. diameter	1(1)			
Butt weld test	Flat	First run. 4; Subsequent runs:5 or over; Last two runs. max. dia.	1	**Fig 2.2.20**	15~20	Tensile test specimen : 1 Face bend specimen : 1 Root bend specimen : 1 Impact test specimen : 3(5)
		First run. 4; Second run,5 or 6; Subsequent runs. max. dia.	1(2)			
	Horizontal (4)	First run. 4 or 5 Subsequent runs, 5	1			
	Vertical upward	First run. 3.2; Subsequent runs. 4 or 5	1			
	Vertical downward	(3)	1			
	Overhead	First run. 3.2; Subsequent runs. 4 or 5	1			
Fillet weld test(6)	Horizontal -Vertical	One side; max. dia. The other side; min. dia.	1	**Fig 2.2.21**	20	Macro structure test specimen : 3(8) Hardness test specimen : 3(8) Fracture test specimen : 2
Hydrogen test(7)	Flat	4	4	(9)	12	Hydrogen test specimen : 1

NOTES:
(1) Where the diameter of the manufactured electrodes is of one type, there is to be one test assembly.
(2) Where the tests are conducted solely in the downhand position, this test assembly has been added.
(3) Electrodes with diameters specified by the manufacturers are to be used.
(4) For electrodes which have passed butt weld tests in the downhand and vertical upward positions, test in the horizontal position may be omitted subject to approval by the Society.
(5) Impact tests are not to conduct for overhead welds.
(6) This test is added solely for electrodes used in both butt welds and fillet welds.
(7) This test is to conduct solely for low hydrogen electrodes.
(8) Test specimens used in macro structure test and hardness tests are considered to be the same.
(9) Dimensions of test assembly are to be as specified in **602. 6**.

(4) Where electrodes are intended to be used for both items specified in **Par 1** (1) (a) and (b), approval tests required for each electrode are to be conducted. However, deposited metal tests may be omitted for electrodes given in **Par 1** (1) (b).
(5) Steel plates to be used in preparation of test assemblies are to be as given in **Table 2.2.19** according to the grades of electrode.
(6) The welding conditions used such as amperage, voltage, travel speed, etc. are to be within the range recommended by the manufacturer for normal good welding practice. Where a filler metal is stated to be suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of the test assemblies.
(7) For the approval of electrodes, the tests specified in the preceding (1) to (4) are to be conducted for each brand of electrodes.
(8) After welding, the test assemblies are not to be subjected to any heat treatment.

L 91	*RL* 9*N*53 or *RL* 9*N*60
L 92	*RL* 9*N*53 or *RL* 9*N*60

NOTES:
(1) Notwithstanding the requirements in this Table normal strength or higher strength steel may be used for the deposited metal test assembly. In this case, test assemblies of grade *L* 91 and *L* 92 are to be appropriately buttered.
(2) The tensile strength of higher strength steels *AH* 32, *DH* 32 *EH* 32, and *FH* 32 used in butt weld test assemblies is to be greater than 490 N/mm^2.

(9) It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain that there are any defects in the weld prior to the preparation of test specimens.

4. Deposited metal test

(1) *Welding of deposited metal test assemblies*
  (a) Test assembly as shown in **Fig 2.2.18** is to be welded in the downhand position according to the normal practice.
  (b) The weld metal is to be deposited in single or multi-run layers according to normal practice, and the direction of each run is to alternate from each end of the plate, each run of weld metal being not less than 2 mm but not more than 4 mm thick.
  (c) After each run, the test assembly is to be left in still air until it has cooled to less than 250℃ but not below 100℃, the temperature being taken at the centre of the weld on the surface of seam.

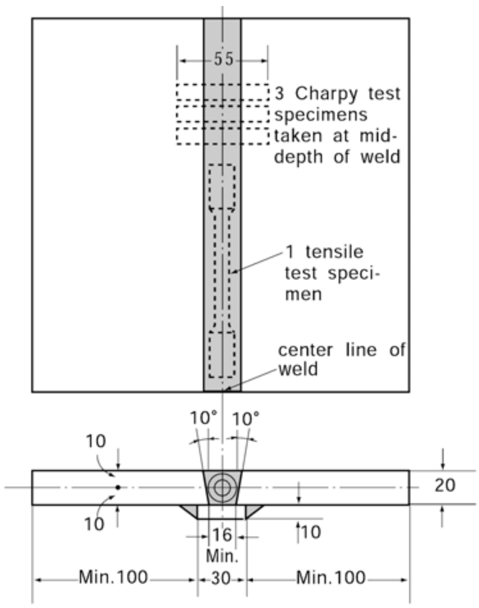

Fig. 2.2.18 Deposited Metal Test Assembly for Electrode for Manual Arc Welding (unit : *mm*)

(2) *Chemical analysis*
The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying element.

(3) *Deposited metal tensile test*
  (a) The tensile test specimen, one from each test assembly, is to be machined to dimensions R14A test specimen as shown in **Table 2.2.1**, care being taken that the longitudinal axis coincides with the centre of weld and the mid-thickness of plates.
  (b) The tensile test specimen may be subjected to a temperature not exceeding 250 ℃ for a period not exceeding 16 hours for hydrogen removal prior to testing.
  (c) The tensile strength, yield strength and elongation of each test specimen are to comply with the requirements given in **Table 2.2.20**, where the upper limit of tensile strength is exceeded, special consideration will be given to the approval of the electrode, taking into consideration of the other mechanical properties shown in the test results and the chemical composition of deposited metal.

(4) *Deposited metal impact tests*
  (a) One set of three impact test specimens, from each test assembly, are to be machined to dimensions charphy V-notch impact test specimen as shown in **Table 2.1.3.** The test specimen is to be cut with its longitudinal axis transverse to the direction of welding, and the test specimen is to coincide with the mid-thickness of the plate shown in Fig **2.2.19.**
  (b) The notch is to be positioned in the centre of weld and is to be cut in the face of test specimens perpendicular to the surface of plate.

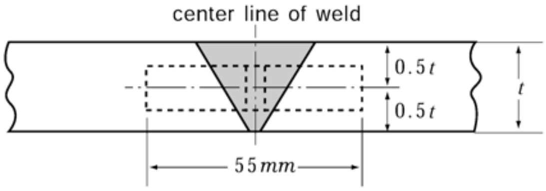

Fig 2.2.19 Position of Butt Weld Impact Test Specimen
(Unit : mm, t : plate thickness)

(c) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.20.**

Table 2.2.20 Tensile and impact Test Requirements for Deposited Metal

Grade of electrode	Tensile strength (N/mm^2)	Yield strength (N/mm^2)	Elongation (%)	Impact test	
				Test temp. (℃)	Average absorbed energy(J)
1	400 ~ 560	305 min.	22 min.	20	47 min.
2				0	
3				-20	
2*Y*	490 ~ 660	375 min.	22 min.	0	
3*Y*				-20	
4*Y*				-40	
5*Y*				-60	
2*Y*40	510 ~ 690	400 min.	22 min.	0	
3*Y*40				-20	
4*Y*40				-40	
5*Y*40				-60	
L 1	400 ~ 560	305 min.	22 min.	-40	34 min.
L 2	440 ~ 610	345 min.	22 min.	-60	
L 3	490 ~ 660	375 min.	21 min.	-60	
L 91	590 min.	375 min.(1)	25 min.	-196	27 min.
L 92	660 min.	410 min.(1)	25 min.	-196	

NOTE:
(1) 0.2 % Yield strength

(d) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

5. Butt weld test

(1) *Welding of butt weld test assemblies*

(a) Test assembly as shown in **Fig 2.2.20** is to be welded in each welding position (flat, horizontal-vertical, vertical-upward, vertical downward and overhead) which is recommended by the manufacturer, according to the normal practice.

(b) Test assembly is to be left in still air until it has cooled to less than 250℃ but not below 100℃, the temperature being taken at the centre of the weld on the surface of seam.

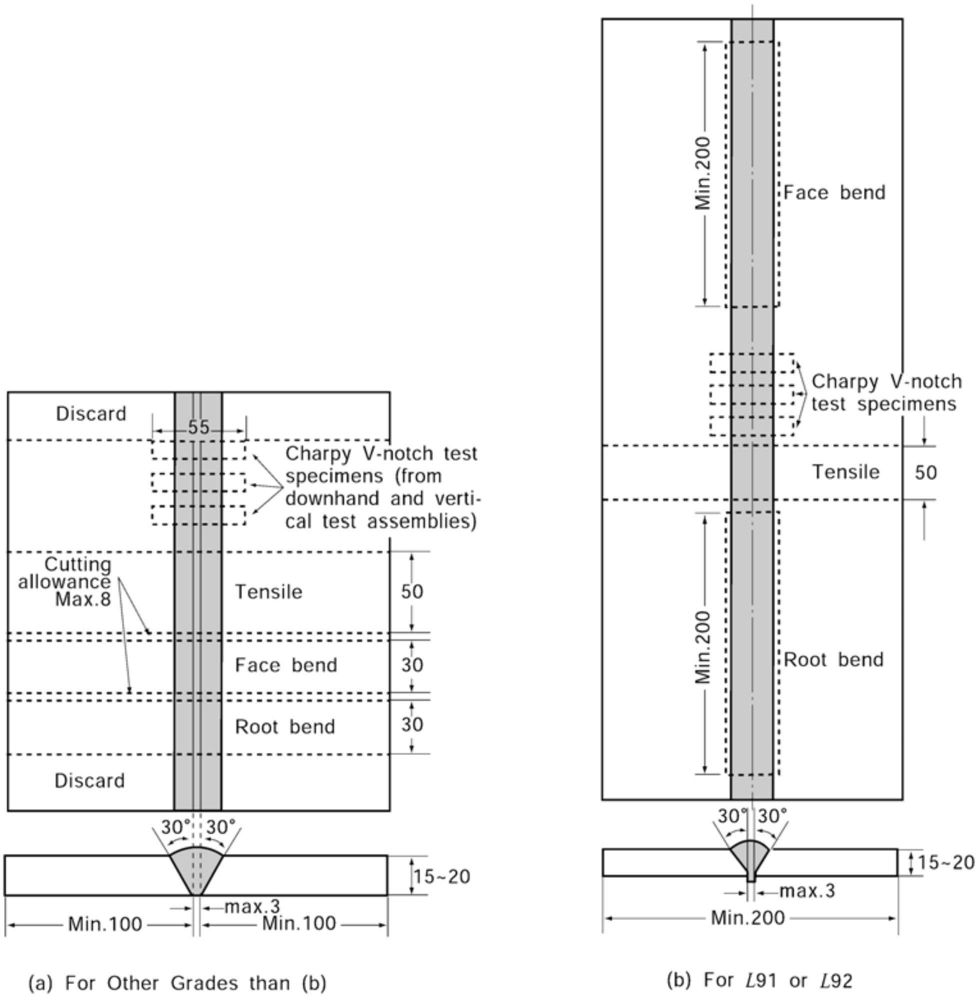

Fig 2.2.20 Butt weld Test Assembly for Electrode for Manual Arc Welding (Unit: mm)

(c) In all cases, the back sealing runs are to be made with 4 mm electrode in the welding position appropriate to each test assembly, after cutting out the root run to clean metal. For electrodes suitable for downhand welding only, the test assemblies may be turned over to carry out the back sealing run.

(2) *Butt weld tensile tests*

(a) The tensile test specimen is to be R 2A specimen shown in **Table 2.2.1** and the test specimen is to be taken from each test assembly.

(b) The surface of weld is to be machined flush with the surface of plate.

(c) The tensile strength of test specimen is to comply with the requirements given in **Table 2.2.21.**

(3) *Butt weld bend test*

(a) The face and root bend test specimens are to be *RB* 4 specimen shown in **Table 2.2.2,** and test specimens are to be taken from each test assembly. However, for *L* 91 or *L* 92, the face and root bend specimens are to be *RB* 1 specimen shown in **Table 2.2.2,** and test specimens are to be taken longitudinally from each test assembly.

(b) The upper and lower surfaces of the weld are to be filed, ground or machined flush with the Surface of the plate and the sharp corners of the specimens rounded to a radius not exceeding 2 mm.

(c) The test specimens are to be capable of withstanding, without crack exceeding 3 mm long on the outer surface of other defects, being bent through an angle of 120 degrees over a former having a radius of 1.5 times the thickness of test specimen. The radius and angle of the former for *L* 91 and *L* 92, however, are to be 2 times the thickness of the specimen and 180 degrees respectively.

Table 2.2.21 Tensile and impact Test Requirements for butt weld

Grade of electrode	Tensile strength (N/mm^2)	Impact test		
		Test temp. (℃)	Average absorbed energy (J)	
			Flat, Horizontal, Overhead	Vertical upward Vertical downward
1	400 min.	20	47 min.	34 min.
2		0		
3		-20		
2*Y*	490 min.	0		
3*Y*		-20		
4*Y*		-40		
5*Y*		-60		
2*Y*40	510 min.	0		39 min.
3*Y*40		-20		
4*Y*40		-40		
5*Y*40		-60		
L 1	400 min.	-40	27 min.	27 min.
L 2	440 min.	-60		
L 3	490 min.	-60		
L 91	630 min.	-196		
L 92	670 min.	-196		

(4) *Butt weld impact tests*
(a) One set of three impact test specimens, from each test assembly, are to be machined to dimensions charphy V-notch impact test specimens as shown in **Table 2.1.3.**
(b) The test specimens are to be prepared as shown in **Fig 2.2.19** and the dimensions, form, position and direction of notches are to be as specified in **Par 4.** (4)
(c) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.21,** appropriate to the grades of the electrode and welding position.
(d) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

6. Hydrogen test

The hydrogen test to be carried out by the mercury method or gas chromatographic method. The use of the glycerine method may be admitted at the Society discretion.

(1) The mercury method to be as specified in the Standard *KS B ISO* 3690
(2) The gas chromatographic method to be as specified in the Standard KS D0064(Method of Measurement for Hydrogen Evolved from Steel Welds)
(3) Glycerin method
(a) *Welding of test assemblies*
(i) As a rule, mild and high tensile steels are to be used for the test assembly, and four test specimens are to be prepared measuring 12 mm by 25 mm in cross section by about 125 mm in length. Before welding, the specimens are to be weighed to the nearest 0.1 *gram*. On the 25 mm surface of each test specimen, a single bead of welding is to be deposited, about 100 mm in length, by a 4 mm electrode, using about 150 mm of the electrode. The welding is to be carried out with as short an arc as possible and with a current of about 150 *amp*.
(ii) The electrodes, prior to welding, can be submitted to the normal drying process recommended by the manufacturer.

(b) After welding, each test specimen prepared to the hydrogen test specified in (a) above is to be quenched in water at a temperature of approximately 20℃ for 30 sec, after removing the slag within a period of 30 sec. Subsequently, the test specimens are to be cleaned and be sealed into a hydrogen collector by means of the glycerin replacement method.
The glycerin is to be kept at a temperature of approximately 45℃ during the test. The test time required for all the four test specimens from welding to the enclosure in the hydrogen collector is to be within 30 min. After immersing into glycerin for 48 hours, the test specimens are to be cleaned with water and alcohol and weighed with an accuracy of 0.1 g after being dried to measure the weight of the deposited metal. The volume of hydrogen gas collected is to be measured with an accuracy of 0.05 cm^3 and converted into that under the conditions 20℃ and 1 atmospheric pressure (760 mm Hg).

(4) Average diffusible hydrogen contents of the four specimens is to comply with the requirements given in **Table 2.2.22** according to the test procedures specified in preceding articles or the type of suffixes to be added to the grade marks.

Table 2.2.22 Requirements for Hydrogen Contents ($ml/100g$)

Mark	Mercury method	gas chromatographic method	Glycerine method
$H15$	15 max.	15 max.	10 max.
$H10$	10 max.	10 max.	5 max.
$H5$	5 max.	5 max.	-

7. Fillet weld test

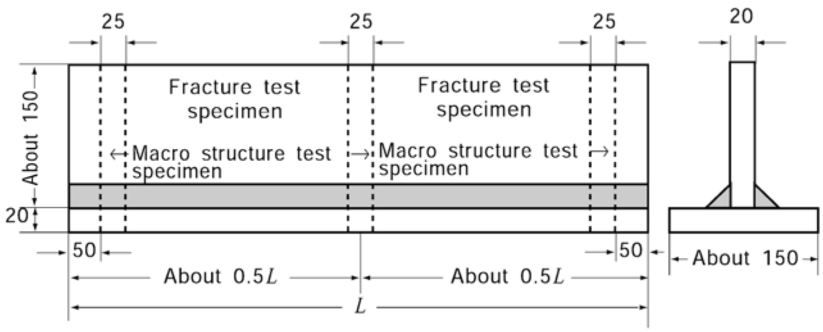
(1) *Welding of fillet weld test assemblies*

(a) Test assembly as shown in **Fig 2.2.21** is to be welded in each welding position (flat, horizon-vertical, vertical-up ward, vertical-downward and overhead) which is recommended by the manufacturer.

(b) The first side is to be welded using the maximum size of electrode manufactured and the second side is to be welded using the minimum size of electrode manufactured.

(c) The leg length of fillet welds may will in general be determined by the electrode size and the welding current employed during testing.

(d) In case of fillet welds using gravity or similar contact welding method, the fillet welding is to be carried out with electrodes of maximum length. Where approval is requested for the welding of both normal strength and higher strength steel, the assemblies are to be prepared using higher strength steel.



(The length of the test assemblies L is to be sufficient to allow at least the deposition of the entire length of the electrode being tested.)

Fig 2.2.21 Fillet Weld Test Assembly (Unit : mm)

(2) *Fillet weld macro-structure test*

(a) For macro-structure test specimens, those with breadths of 25 mm are selected from three places shown in **Fig 2.2.21.**

(b) The macro-etching test is conducted on the transverse section of fillet weld joint and welded joints are to be free from excessive difference of leg length between upper and lower, cracks and other injurious defects.

(3) *Fillet weld hardness test* The hardness of weld metal, heat affected zone and base metal are to be measured at places given in **Fig 2.2.22** for each test specimen which underwent the macro-etching test specified in preceding (1) and the respective hardnesses are to be in accordance with those deemed appropriate by the Society.

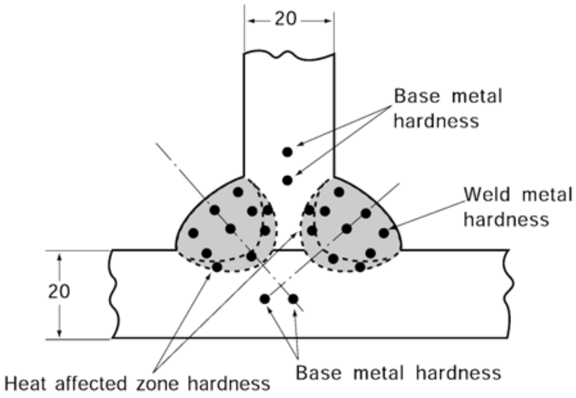


Fig 2.2.22 Hardness Test (Unit : mm)

(4) Fillet weld fracture test

(a) One of the remaining sections of the fillet weld is to have the weld on the first side gouged or machined to facilitate breaking the fillet weld as shown in Fig **2.2.23**, on the second side by closing the two plates together, submitting the root of the weld to tension. On the other remaining section the weld on the second side is to be gouged or machined and the section fractured using the same procedure.

(b) The fractured surfaces are to be examined and there should be no evidence of incomplete penetration, or internal cracking and they should be reasonably free from porosity.

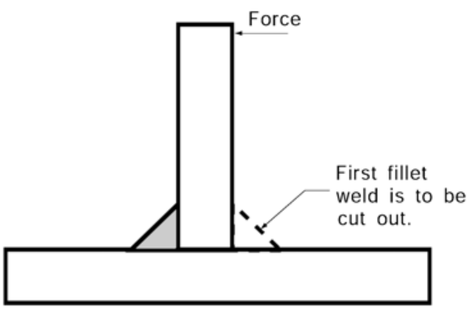

Fig 2.2.23 Fracture Test

8. Annual inspections

(1) In the annual inspections, tests specified in the following (2) and (3) are to be conducted for each brand of the approved electrodes and they are to be passed satisfactorily.

(2) The kinds of test, etc. in the annual inspections for manual arc welding electrodes are to be as given in **Table 2.2.23.**

(3) The kinds of test, etc. in the annual inspections of electrodes used in gravity welding or other welding using similar welding devices are to be as given in **Table 2.2.24.**

(4) The welding procedures and requirements for test assemblies of tests specified in the preceding (2) and (3) are to be as specified in **Par 4.**

Table 2.2.23 Kind of Test for Annual Inspection

Kind of test[2]	Test assembly					Kind and no. of test specimens taken from test assembly
	Welding position	Diameter of electrode (mm)	Number	Dimensions	Thickness (mm)	
Deposited metal test	Flat	4[1]	1	**Fig 2.2.18**	20	Tensile test specimen : 1 Impact test specimen : 3
		exceeding 4, 8 max.	1			

NOTES:
(1) Where deemed necessary by the Society, butt weld tests in the downhand or vertical (either upward or downward) welding position specified in **Table 2.2.17** may be requested in place of deposited metal tests of 4 mm diameter electrodes. In this case, impact test specimens (one set of three) are to be selected.
(2) For low hydrogen electrodes, an hydrogen test can also be required at the discretion of the Society.

Table 2.2.24 Kind of Test for Annual Inspection

Kind of test	Test assembly					Kind and no. of test specimens taken from test assembly
	Welding position	Diameter of electrode (mm)	Number	Dimensions	Thickness (mm)	
Deposited metal test	Flat	4 min.	1	**Fig 2.2.18**	20	Tensile test specimen : 1 Impact test specimen : 3

9. Changes in grades

(1) Where changes in the grades relating to the strength or toughness of electrodes approved are to be made, tests specified in the following (2) and (3) are to be carried out and satisfactorily passed in accordance with the requirements in **601. 5** (2).
(2) For changes in the grades relating to strength, the butt weld tests, specified in the annual inspection of **Par 8** and in the requirements of **Par 3** (1), are to be conducted.
(3) For changes in the grades relating to toughness, the butt weld impact tests, specified in the annual inspection of **Par 8** and in the requirements of **Par 3** (1), are to be conducted.

603. Automatic welding consumables for normal strength steels, higher strength steels and steels for low temperature service

1. Application

(1) Welding consumables for normal strength steels, higher strength steels and steels for low temperature service given in the following (a) through (c) (hereinafter referred to as "automatic welding consumables") are to be subjected to the approval tests and annual inspections in accordance with the requirements in **603.**
  (a) Submerged arc automatic welding consumables (Wire flux combinations)
  (b) Gas shielded arc automatic welding consumables(Flux cored wire and solid wire automatic welding consumables with shielding gas)
  (c) Self-shielded arc automatic welding consumables (flux-cored or flux-coated wires without a shielding gas)
(2) Wire-flux combinations for multiple electrode submerged arc welding will be subject to separate approval tests. They are to be carried out generally in accordance with the requirements in **603**.
(3) At the discretion of the Society, wires or wire-gas combinations approved for semi-automatic multirun welding may also be approved, without additional tests, for automatic multirun welding approval. This is generally the case when automatic multirun welding is performed in the same conditions of welding current and energy as semi automatic welding with the concerned wire-gas combination.

2. Grades and marks

(1) The automatic welding consumables are classified as specified in **Table 2.2.25.**

Table 2.2.25 Grade and Marks

For normal strength steel	For higher strength steel	For steel for low temperature service
1, 2, 3	1*Y*, 2*Y*, 3*Y*, 4*Y*, 5*Y* 2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40	*L* 1, *L* 2, *L* 3, *L* 91, *L* 92

(2) Automatic welding materials which have passed the tests for each welding process given in **Table 2.2.28** are to be appended with the suffixes shown in **Table 2.2.26** at the end of their marks.

(3) In the preceding (2), a suffix G will be added to the grade mark for gas shielded arc automatic welding consumables, and a suffix N will be added for self-shielded wire automatic welding consumables Further, the type of gas used is to be as specified in **Table 2.2.27,** and the suffix given in **Table 2.2.27** will be added after the suffix G. (e.g. 3*YTM* *G*(*M*1))

Table 2.2.26 Marks

Welding technique	Mark
Multi-run technique(1)	*M*
Two-run technique(2)	*T*
Multi-run and two-run technique	*TM*

NOTES:
(1) Multi-run technique refers to a welding process involving multiple passes.
(2) Two-run technique refers to a welding process involving a single pass on both sides.

Table 2.2.27 Kinds of Gas

Group	Type	Gas composition (*Vol*.%)			
		CO_2	O_2	H_2	*Ar*(1)(2)
M 1	*M* 11	1～5	−	1～5	Rest
	M 12	1～5	−	−	Rest
	M 13	−	1～3	−	Rest
	M 14	1～5	1～3	−	Rest
M 2	*M* 21	6～25	−	−	Rest
	M 22	−	4～10	−	Rest
	M 23	6～25	1～8	−	Rest
M 3	*M* 31	26～50	−	−	Rest
	M 32	−	11～15	−	Rest
	M 33	6～50	9～15	−	Rest
C	*C* 1	100	−	−	−
	C 2	Rest	1～30	−	−
I	*I* 1	−	−	−	100
E	*E* 1	Except above			

NOTE:
(1) Argon may be substituted by Helium up to 95 % of the Argon content.
(2) Approval covers gas mixtures with equal or higher Helium contents only.

3. General provisions for tests

(1) Steel plates to be used for test assemblies are to be as given in **Table 2.2.28,** appropriate to the kind of automatic welding consumables.
(2) Kinds of test, number, thickness and dimensions of test assemblies, grades and number of test specimens to be taken from each test assembly for automatic welding consumables are to be as given in **Table 2.2.29.**
(3) For the approval of automatic welding consumables, the tests specified in the preceding (2) are to be conducted for each brand of automatic welding consumables.
(4) For gas shielded arc automatic welding consumables, the test in the preceding (3) is to be performed for each type of gas given in **Table 2.2.27.** When the manufacturer of the material recommends gas types of the group of $M1$, $M2$, $M3$ or C in **Table 2.2.27** and the test is satisfactorily conducted in accordance with the preceding (3) on one of the gas type, the test on the other gas types belonging to the same group is allowed to be dispensed with at the discretion of the Society.
(5) Unless otherwise agreed by the Society, additional approval tests are required when a shielding gas is used other than that used for the original approval tests.
(6) The welding conditions used such as amperage, voltage, travel speed, etc. are to be within the range recommended by the manufacturer for normal good welding practice. Where a filler metal is stated to be suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of the test assemblies.

L 92	*RL* 9*N*53 or *RL* 9*N*60

NOTES:
(1) Notwithstanding the requirements in this Table, normal strength steel or higher strength steels may be used for deposited metal test assembly In this case, test assemblies of grade *L* 91 and *L* 92 are to be appropriately buttered.
(2) The tensile strength of higher strength steels *AH* 32, *DH* 32, *EH* 32 and *FH* 32 used in butt weld test assemblies is to be greater than 490 N/mm^2

				1		20 or acceptable maximum thickness	

NOTES:

(1) Thickness of test assemblies where applied maximum plate thickness is not more than 25 mm.

(2) Thickness of test assemblies where applied maximum plate thickness is more than 25 mm.

(3) Where thickness is restricted by welding process, thickness of test assemblies may be changed upon approval of the Society. Test assemblies shall then be welded using plates of 12 to 15 mm and 20 to 25 mm irrespective of the grade for which the approval is requested.

(4) The number of butt weld test assemblies for multi-run gas shielded and self-shielded arc welding techniques is to be one for each welding position. However, where there is more than one welding position, the number of tensile test specimens and bend test specimens selected from the test assemblies for each welding position may be half of the specified number.

(5) Test specimens are to be selected from only the thicker of two test assemblies.

(6) The number of face bend and root bend test specimens selected from the butt weld test assemblies for *L* 91 and *L* 92 is to be one each.

(7) Tests on both multi-run and two-run technique are to be conducted for multi-run and two-run welding respectively, and the number, dimensions and thickness of test assemblies, along with the grades and number of test specimens selected from each test assembly are to be according to each of the welding processes. However, the number of tensile test specimens in the deposited metal test for the multi-pass welding technique is to be one.

(8) The hydrogen test may be applied by request of the manufacturer.

(9) Where approval is requested for welding of both normal strength and higher strength steel two assemblies are to be prepared using higher strength steel. Two assemblies prepared using normal strength steel may also be required at the discretion of the Society.

(7) After welding, the test assemblies are not to be subjected to any heat treatment.
(8) It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain that there are any defects in the weld prior to the preparation of test specimens.

4. Deposited metal test with multi-run technique

(1) *Welding of deposited metal test assemblies*
(a) Test assemblies as shown in **Fig 2.2.24** are to be welded in the flat position by multirun technique according to the normal practice. The direction of deposition of each run is to alternate from each end of the plate. After completion of each run, the flux and welding slag is to be removed.
(b) The thickness of layer is not to be less than the diameter of wire nor less than 4 mm whichever is the greater for submerged arc automatic welding consumables. For gas shield and self-shielded are automatic welding consumables the thickness of layer is not to be less than 3 mm.
(b) After each run, the test assembly is to be left in still air until it has cooled to less than 250℃ but not below 100℃, the temperature being taken at the centre of the weld on the surface of seam.
(2) *Chemical analysis*
The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying element.

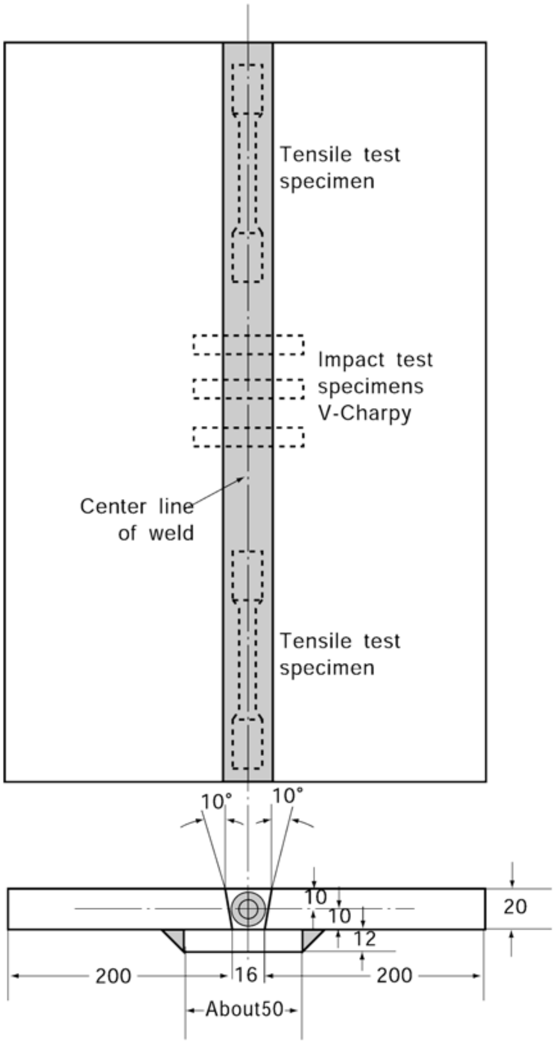

Fig. 2.2.24 Deposited Metal Test Assembly with Multi-run Technique (Automatic Welding, Unit : *mm*)

(3) *Deposited metal tensile test with multi-run technique*
(a) The tensile test specimens, two from each test assembly, are to be machined to dimensions R14A test specimen as shown in **Table 2.2.1**, care being taken that the longitudinal axis coincides with the centre of weld and the mid-thickness of plates.
(b) The tensile strength, yield point and elongation of each test specimen are to comply with the requirements given in **Table 2.2.30**, where the upper limit of tensile strength is exceeded, special consideration will be given to the approval of the electrode, taking into consideration of the other mechanical properties shown in the test results and the chemical composition of deposited metal.
(c) The tensile test specimens may be subjected to a temperature not exceeding 250 ℃ for a period not exceeding 16 hours for hydrogen removal prior to testing.
(4) *Deposited metal impact test with multi-run technique*
(a) One set of three impact test specimens, from each test assembly, are to be machined to dimensions *R* 4 test specimen as shown in **Table 2.1.3.** The test specimen is to be cut with its longitudinal axis transverse to the direction of welding, and the test specimen is to coincide with the mid-thickness of the plate shown in Fig **2.2.19.**
(b) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.30**.

Table 2.2.30 Tensile and Impact Test Requirements for Deposited Metal test

Grade of welding material	Tensile strength (N/mm^2)	Yield strength (N/mm^2)	Elongation (%)	Impact test	
				Test temp. (℃)	Average absorbed energy (J)
1	400 ~ 560	305 min.	22 min.	20	34 min.
2				0	
3				-20	
1*Y*	490 ~ 660	375 min.	22 min.	20	
2*Y*				0	
3*Y*				-20	
4*Y*				-40	
5*Y*				-60	
2*Y*40	510 ~ 690	400 min.	22 min.	0	39 min.
3*Y*40				-20	
4*Y*40				-40	
5*Y*40				-60	
L 1	400 ~ 560	305 min.	22 min.	-40	27 min.
L 2	440 ~ 610	345 min.	22 min.	-60	
L 3	490 ~ 660	375 min.	21 min.	-60	
L 91	590 min.	375 min.(1)	25 min.	-196	
L 92	660 min.	410 min.(1)	25 min.	-196	

NOTE:
(1) 0.2 % yield stress

(c) The notch is to be positioned in the centre of weld and is to be cut in the face of test specimens perpendicular to the surface of plate.
(d) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

5. Butt weld test with multi-run technique

(1) *Welding of butt weld test assemblies with multi-run technique*

(a) The face side of the test assemblies as shown in **Fig 2.2.25** is to be multi-pass welded in flat position, and the corresponding welding procedure is to follow the requirements of the preceding **4.** (1). However, for gas shield arc and self shielded arc wire automatic welding consumables, the welding position is to be as specified by the manufacturer.

(b) After completing the face welding in downhand position, back welding is performed. In this instance, back chipping may be carried out to expose sound deposited metal at the root.

(2) *Butt weld tensile test with multi-run technique*

(a) The tensile test specimens are to be prepared to *R* 2*A* specimen shown in **Table 2.2.1** and two test specimens are to be taken from each test assembly.

(b) The surface of weld is to be machined flush with the surface of plate.

(c) The tensile strength of test specimen is to comply with the requirements given in **Table 2.2.31.**

(3) *Butt weld bend test with multi-run technique*

(a) The face bend and root bend test specimens are to be *RB* 4 specimen shown in **Table 2.2.2,** and two test specimens are to be taken from each test assembly. However, for *L* 91 or *L* 92, the face bend and root bend specimens are to be *RB* 1 specimen shown in **Table 2.2.2,** and test specimens are to be taken longitudinally from each test assembly.

(b) The test specimens are to be capable of withstanding, without crack exceeding 3 mm long on the outer surface of other defects, being bent through an angle of 120 *degrees* over a former having a radius of 1.5 times the thickness of test specimen. The radius and angle of the former for *L* 91 and *L* 92, however, are to be 2 *times* the thickness of the specimen and 180 degrees respectively.

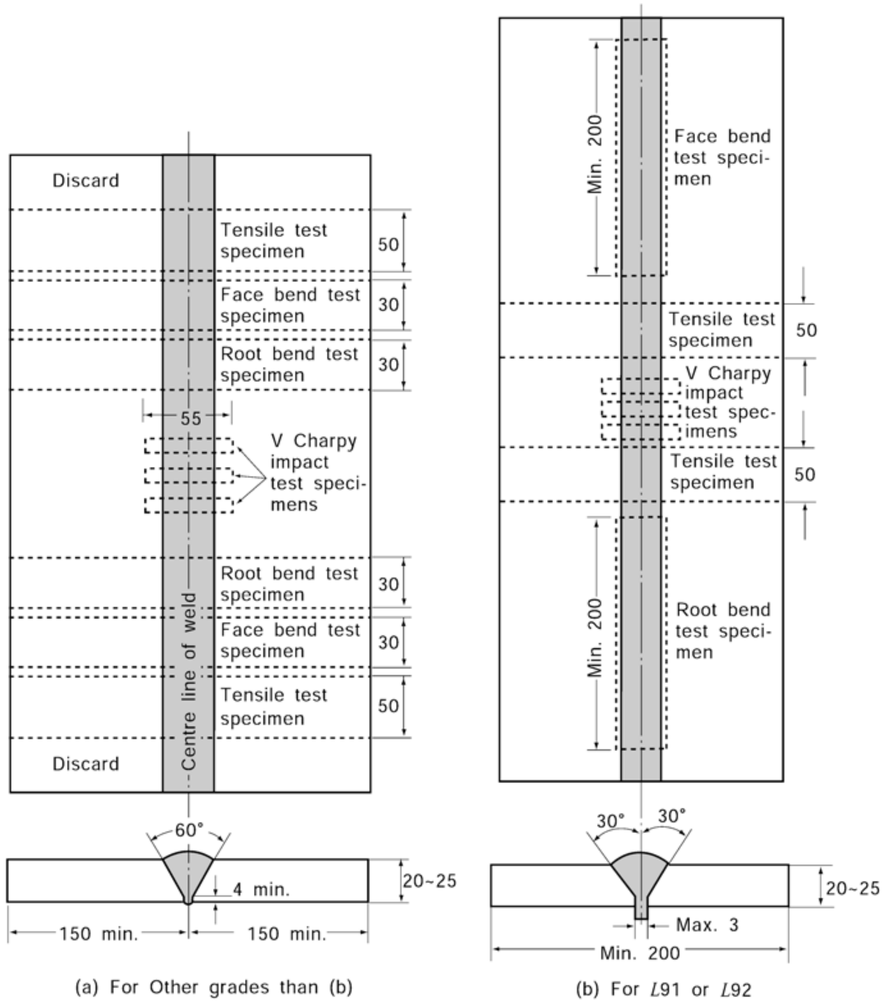

Fig 2.2.25 Butt Weld Test Assembly with Multi-run Technique (Automatic welding, Unit : *mm*)

Table 2.2.31 Tensile and Impact Test Requirements for butt weld test with multi-run technique

L 92	670 min.	− 196	

(4) *Butt weld impact test with multi-run technique*

(a) One set of three impact test specimens, from each test assembly, are to be machined to dimensions *R* 4 test specimens as shown in **Fig 2.1.3.** The test specimen is to be cut with its longitudinal axis perpendicular to the direction of welding, and the test specimen is to coincide with the mid-thickness of the plate shown in **Fig 2.2.19.**

(b) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.31.**

(c) The requirements in **Par 4.** (4), (c) and (d) are to correspondingly apply to this Paragraph.

6. Butt weld test with two-run technique

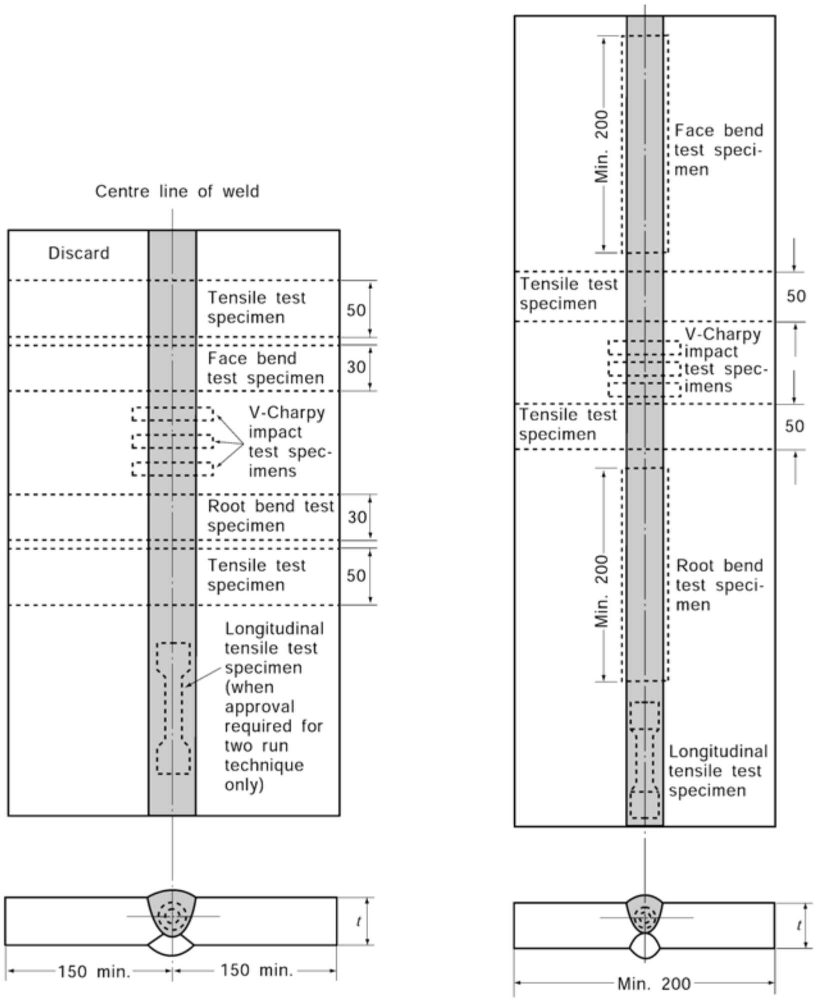
(1) *Welding of Butt weld test assemblies with two-run technique*

(a) Test assemblies are to be prepared as shown in **Fig 2.2.26,** and the diameter of wire and edge preparation are to be as shown in **Fig 2.2.27,** but some deviation may be allowed where accepted by the Society.

(b) Test assemblies are to be welded according to the normal practice in downhand position by two-run technique where each run is to be started alternately from each end of the plate. After completing the first run, the assembly is to be left in still air until it has cooled to 100℃ or below, the temperature being taken at the centre of weld on the surface of seam.

(2) *Chemical analysis*

The chemical analysis of the weld metal is to be supplied by the manufacturer, and is to include the content of all significant alloying elements.



(a) For Grades Other than (b)　　　(b) For L91 or L92

Fig. 2.2.26 Butt Weld Test Assembly with Two-run Technique (Automatic welding, Unit : *mm*, *t* : plate thickness)

(A) Submerged arc welding consumables			(B) Gas shielded arc and self shielded arc welding consumables		
Thickness of test assembly	Edge preparation(1)	Max. dia. of core	Thickness of test assembly	Edge preparation(2)	Max. dia. of wire
12~15		5	12~15		Maximum diameter of wire used is to be reported for information by manufacturer.
20~25		6			
30~35		7	20~25		

NOTES:
(1) Root gap is not to be greater than 1.0 *mm*.
(2) For assemblies using plate over 25 *mm* in thickness, the edge preparation used is to be specified by the manufacturer and the thickness of assembly is to comply with **Table 2.2.28.** (2).

Fig. 2.2.27 Edge Preparation of Butt Weld Test Assembly with Two-run Technique (*t* : plate thickness. Unit: *mm*)

(3) *Butt weld tensile tests with two-run technique*

(a) The tensile test specimens are to be R2A specimen shown in **Table 2.2.1** and two test specimens are to be taken from each welded assembly.

(b) The surface of weld is to be machined flush with the surface of plate.

(c) The tensile strength of test specimen is to comply with the requirements given in **Table 2.2.31.**

(d) One longitudinal tensile test specimen of R14A shown in **Table 2.2.1** is to be machined from the thicker of the test assembly specified in **Table 2.2.28** and the longitudinal direction of the test specimen is to be parallel to the weld line and the centre line of the test specimen is to coincide with the centre of second layer.

(e) The longitudinal tensile test specimen in the preceding (4) may be subjected to a temperature not exceeding 250℃ for a period not exceeding 16 hours for hydrogen removal prior to testing.

(f) The requirements of tensile test specified in the preceding (d) and (e) are to be as given in **Table 2.2.30.** Where the upper limit of tensile strength is exceeded, special consideration will be given to the approval of the welding consumables, taking into consideration of the other mechanical properties shown in the test results and the chemical composition of deposited metal.

(4) *Butt weld bend test with two-run technique*

(a) The face and root bend test specimens are to be RB4 or RB5 specimen shown in **Table 2.2.2** and test specimens are to be taken from each test assembly. However, for L91 and L92, the face and root bend test specimens are to be RB1 test specimens and test specimens shown in **Table 2.2.2** are to be taken longitudinally from each test assembly.

(b) The requirements in **Par 5.** (3), (b) are to correspondingly apply to this Paragraph.

(5) *Butt weld impact test with two-run technique*

(a) One set of three impact test specimens, from each test assembly, are to be machined to dimensions charphy V-notch impact test specimens as shown in **Table 2.1.3,** and the longitudinal direction of the test specimen is to be perpendicular to the weld line and the surface of weld about 2 mm apart is to coincide with the surface of specimen as shown in **Fig 2.2.28.**

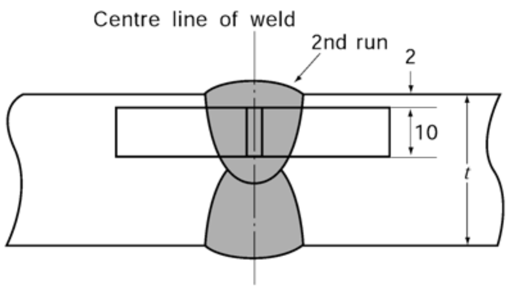


Fig 2.2.28 Position of impact Test Specimen for Butt Weld Test Assembly with Two-Run Technique (Unit : mm, t : plate thickness)

(b) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.31.**

(c) The requirements in **Par 4.** (4), (c) and (d) are to correspondingly apply to this Paragraph.

7. Hydrogen test

The hydrogen test is to be in accordance with **602. 6** of the Rules

8. Annual inspections

(1) In the annual inspection, tests specified in the following (2) are to be conducted for each brand of the approved consumables, and they are to be passed satisfactorily.

(2) The kinds of test, etc. involved in the annual inspections are to be as given in **Table 2.2.32.**

(3) The welding procedures and requirements for test assemblies of tests specified in the preceding (2) are to be as specified in **Pars 4** through **6.**

Table 2.2.32 Kinds of Test for Annual Inspection

Grade of welding consumables	Welding technique[(1)]	Kind of test		Test assembly: Number	Test assembly: Dimensions	Test assembly: Thickness (mm)	Kinds and no. of test specimens taken from test assembly
1, 2, 3 1Y, 2Y, 3Y, 4Y, 5Y 2Y40, 3Y40, 4Y40, 5Y40 L1, L2, L3, L91, L92	Multi-run technique	Deposited metal test		1	**Fig 2.2.24**	20	Tensile test specimen: 1 Impact test specimen: 3
	Two-run technique	Butt weld test	Submerged arc welding	1	**Fig 2.2.26**	20	Tensile test specimen: 1 Longitudinal tensile test specimen: 1 Face bend test specimen: 1 Root bend test specimen: 1 Impact test specimen: 3
			Gas shielded and self shielded arc welding	1		20~25	Tensile test specimen: 1 Longitudinal tensile test specimen: 1 Face bend test specimen: 1 Root bend test specimen: 1 Impact test specimen: 3

NOTE:
(1) Tests on both multi-run and two run technique are to be conducted for multi-run and two run welding respectively. However, longitudinal tensile test of two run technique are not required.

9. Changes in grades

(1) Where changes in the grades relating to the strength or toughness of automatic welding consumables approved are to be made, tests specified in the following (2), (3) and (4) are to be carried out and satisfactorily passed in accordance with the requirements in **601. 3** (3).

(2) Changes in grades relating to the strength or toughness of multi-run automatic welding consumables are to be in accordance with the requirements in the following (a) and (b).

(a) For changes in the grades relating to strength, the butt weld tests, specified in the annual inspection of **Par 8** and in the requirements of **Par 3** (1), are to be conducted.

(b) For changes in the grades relating to toughness, the butt weld impact tests, specified in the annual inspection of **Par 8** and in the requirements of **Par 3** (1), are to be conducted.

(3) Changes in grades relating to the strength or toughness of two-run automatic welding consumables are to be in accordance with the requirements in the following (a) and (b).

(a) For changes in the grades relating to strength, all tests specified in **Par 3** (1) are to be conducted.

(b) For changes in the grades relating to toughness, the butt weld impact tests, specified in the annual inspections of **Par 8** and in the requirements of the preceding (a), are to be conducted.

(4) Changes in the grades relating to the strength or toughness of automatic welding consumables for multi-run and two-run use are to be as specified in the preceding (2) and (3).

604. Semi-automatic welding consumables for normal strength steels, higher strength steels and steels for low temperature service

1. Application

Welding consumables for semi-automatic welding for normal strength steels, higher strength steels and steels for low temperature service given in the following (a) and (b) (hereinafter referred to as "semi-automatic welding consumables") are to be subjected to the approval test and annual inspections in accordance with the requirements in **604.**

(a) Gas shielded arc semi-automatic welding consumables(flux cored wire and solid wire semi-automatic welding consumables with shielding gas)

(b) Self-shielded arc semi-automatic welding consumables(solid wire and flux cored wire semi-automatic welding consumables without shielding gas).

2. Grades and marks

(1) The semi-automatic welding consumables are classified as specified in **Table 2.2.33.**

Table 2.2.33 Grades and Marks

For normal strength steel	For higher strength steel	For steel for low temperature service
1, 2, 3	1*Y*, 2*Y*, 3*Y*, 4*Y* 5*Y* 2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40	*L*1, *L*2, *L*3, *L*91, *L*92

(2) A suffix "S" will be added after the grade mark to indicate approval for semi-automatic multi-run welding. For wires intended for both semi-automatic and automatic welding, the suffixes will be added in combination.(eg. 3*YSM*)
(3) A suffix G will be added to the grade marks for semi-automatic welding consumables which use shield gas, and a suffix N will be added for semi-automatic welding consumables which do not use shield gas. Further, the type of shield gas used is to be as specified in **Table 2.2.24,** and the suffix given in **Table 2.2.24** will be added after the suffix G. (e.g. 3*YS G*(*M*1))
(4) For low hydrogen electrodes, which have passed the hydrogen test specified in **602. 6,** the suffixes given in **Table 2.2.22** are to be added to the end of the grade marks of the said electrode. (e.g. 3*YS H*5)

3. General provisions for tests

(1) Kinds of test, number, thickness and dimensions of test assemblies, diameter of wire used for welding, welding position, grades and number of test specimens to be taken from each test assembly, position for semi-automatic welding consumables used in butt welds or in both butt and fillet welds are to be as given in **Table 2.2.34.**
(2) Kinds of test, number, thickness and dimensions of test assemblies, diameter of wire used for welding, welding position, grades and number of test specimens to be taken from each test assembly for semi-automatic welding materials used in fillet welds only are to be as given in **Table 2.2.18.**
(3) Steel plates to be used for test assemblies are to be as given in **Table 2.2.35,** appropriate to the kind of semi-automatic welding consumables.
(4) For the approval of semi-automatic welding consumables, the test specified in the preceding (1) and (2) are to be conducted for each brand of semi-automatic welding consumables.
(5) For semi-automatic welding consumables, the test in the preceding (4) is to be performed for each type of gas given in **Table 2.2.27.** When the manufacturer of the material recommends gas types of the group of *M* 1, *M* 2, *M* 3 or C in **Table 2.2.27** and the test is satisfactorily conducted in accordance with the preceding (3) on one of the gas type, the test on the other gas types belonging to the same group is allowed to be dispensed with at the discretion of the Society.
(6) The welding conditions used such as amperage, voltage, travel speed, etc. are to be within the range recommended by the manufacturer for normal good welding practice. Where a filler metal is stated to be suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of the test assemblies.
(7) After welding, the test assemblies are not to be subjected to any heat treatment.
(8) It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain that there are any defects in the weld prior to the preparation of test specimens.

Table 2.2.34 Kinds of Test for Semi-automatic Welding Consumables

Kind of test[8]	Test assembly					Kinds and no. of test specimens taken from test assembly
	Welding position	Wire diameter (mm)	Number	Dimen-sions	Thickness (mm)	
Deposited metal test	Flat	maximum diameter	1[1]	**Fig 2.2.18**	20	Tensile test specimen: 1 Impact test specimen: 3
		minimum diameter	1[1]			
Butt weld test	Flat	First-run: minimum diameter Remaining-run: maximum diameter[4]	1[2]	**Fig 2.2.19**	15~20	Tensile test specimen: 1 Face bend test specimen :1 Root bend test specimen: 1 Impact test specimen: 3[3]
	Horizontal[5]		1			
	Vertical upward		1			
	Vertical downward		1			
	Overhead		1			
Fillet weld test[6]	Horizontal-vertical	One side: maximum diameter The other side: minimum diameter	1	**Fig 2.2.20**	20	Macro test specimen: 3[7] Hardness test specimen: 3[7] Fracture test specimen: 2

NOTES:

(1) Where the core diameter to be manufactured is of single variety, the number of test assembly is to be one.
(2) Where tests are conducted solely in the Flat position. one test assembly welded with wire of different diameters is to be added. Where only one diameter is manufactured, only one deposited metal assembly is to be prepared.
(3) Impact tests are not required for welding in overhead position.
(4) The butt weld assemblies in positions other than downhand, are to be welded using, for the first run, wire of the smallest diameter to be approved, and, for the remaining runs, the largest diameter of wire recommended by the manufacturer for the position concerned.
(5) For semi-automatic welding consumables which have passed butt weld tests in the downhand and vertical upward positions, the horizontal butt weld test may be omitted. at the discretion of the Society.
(6) This test is to be added solely against welding consumables for use in both butt and fillet weld.
(7) The test specimens used in the macro-etching test and hardness test are to be the same.
(8) For low hydrogen welding consumables, an hydrogen test may be conducted by the application of the manufacturer, and test assembly is to be as specified in **602. 6** (1).

Table 2.2.35 Grades of Steel for Test Assembly

Grade of welding consumables	Grade of steel for test assembly(1)(2)
1*S*	*A*
2*S*	*A*, *B* or *D*
3*S*	*A*, *B*, *D* or *E*
1*YS*	*AH* 32 or *AH* 36
2*YS*	*AH* 32, *AH* 36, *DH* 32 or *DH* 36
3*YS*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32 or *EH* 36
4*YS*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32, *EH* 36, *FH* 32 or *FH* 36
5*YS*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32, *EH* 36, *FH* 32 or *FH* 36
2*Y*40*S*	*AH* 40 or *DH* 40
3*Y*40*S*	*AH* 40, *DH* 40 or *EH* 40
4*Y*40*S*	*AH* 40, *DH* 40, *EH* 40 or *FH* 40
5*Y*40*S*	*AH* 40, *DH* 40, *EH* 40 or *FH* 40
L 1*S*	*E* or *RL* 24*A*
L 2*S*	*E*, *RL* 24*A*, *RL* 24*B*, *RL* 27 or *RL* 33
L 3*S*	*RL* 27, *RL* 33 or *RL* 37
L 91*S*	*RL* 9*N*53 or *RL* 9*N*60
L 92*S*	*RL* 9*N*53 or *RL* 9*N*60

NOTES;
(1) Notwithstanding the requirements in this Table, normal or higher strength steels may be used for deposited metal test assembly. In this case, test assemblies of grade *L* 91 and *L* 92 are to be appropriately buttered.
(2) The tensile strength of higher strength steels *AH* 32, *DH* 32, *EH* 32 and *FH* 32 used in butt weld test assemblies is to be greater than 490 N/mm^2.

4. Deposited metal test

(1) *Welding of Deposited metal test assemblies*
 (a) Test assembly as shown in **Fig 2.2.18** is to be welded in the flat position according to the normal practice.
 (b) Test assembly is to be welded in single or multi-run layers, and the direction of deposition of each run is to alternate from each end of the plate, each run of weld metal being not less than 2 mm but not more than 6 mm thick.
 (c) After each run, the test assembly is to be left in still air until it has cooled to less than 250℃ but not below 100℃, the temperature being taken at the centre of the weld on the surface of seam.

(2) *Chemical analysis*
The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying element.

(3) *Deposited metal tensile test*
 (a) The tensile test specimen, one from each test assembly, is to be machined to dimensions R14A test specimen as shown in **Table 2.2.1,** care being taken that the longitudinal axis coincides with the centre of weld and the mid-thickness of plates.
 (b) The tensile test specimen may be subjected to a temperature not exceeding 250℃ for a period not exceeding 16 hours for hydrogen removal prior to testing.

(c) The tensile strength, yield strength and elongation of each test specimen are to comply with the requirements given in **Table 2.2.36,** where the upper limit of tensile strength is exceeded, special consideration will be given to the approval of the electrode, taking into consideration of the other mechanical properties shown in the test results and the chemical composition of deposited metal.

Table 2.2.36 Tensile and Impact Test Requirements for Deposited Metal test

Grade of welding consumables	Tensile strength (N/mm^2)	Yield strength (N/mm^2)	Elongation (%)	Impact test	
				Test temp. (℃)	Average absorbed energy (J)
1*S*	400 ~ 560	305 min.	22 min.	20	47 min.
2*S*				0	
3*S*				− 20	
1*YS*	490 ~ 660	375 min.	22 min.	20	
2*YS*				0	
3*YS*				− 20	
4*YS*				− 40	
5*YS*				− 60	
2*Y*40*S*	510 ~ 690	400 min.	22 min.	0	
3*Y*40*S*				− 20	
4*Y*40*S*				− 40	
5*Y*40*S*				− 60	
L 1*S*	400 ~ 560	305 min.	22 min.	− 40	34 min.
L 2*S*	440 ~ 610	345 min.	22 min.	− 60	
L 3*S*	490 ~ 660	375 min.	21 min.	− 60	
L 91*S*	590 min	375 min.(1)	25 min.	− 196	27 min.
L 92*S*	660 min	410 min.(1)	25 min.	− 196	

NOTE:
(1) 0.2 % yield stress

(4) *Deposited metal impact tests*

(a) One set of three impact test specimens, from each test assembly, are to be machined to dimensions charphy V-notch impact test specimens as shown in **Table 2.1.3.** The test specimen is to be cut with its longitudinal axis transverse to the direction of welding, and the test specimen is to coincide with the mid-thickness of the plate shown in **Fig 2.2.21.**

(b) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.36.**

(c) The notch is to be positioned in the centre of weld and is to be cut in the face of test specimens perpendicular to the surface of plate.

(d) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

5. Butt weld test

(1) *Welding of butt weld test assemblies*

(a) Test assembly as shown in **Fig 2.2.20** is to be welded in each welding position (flat, horizontal-vertical, vertical-upward, vertical-downward and overhead) which is recommended by the manufacturer.

(b) After each run, the test assembly is to be left in still air until it has cooled to less than 250℃ but not below 100℃, the temperature being taken at the centre of the weld on the surface of seam.

(2) *Butt weld tensile tests*

(a) The tensile test specimen is to be *R* 2*A* test specimen shown in **Table 2.2.1** and the test specimen is to be taken from each test assembly.

(b) The surface of weld is to be machined flush with the surface of plate.

(c) The tensile strength of test specimen is to comply with the requirements given in **Table 2.2.37.**

Table 2.2.37 Tensile and Impact Test Requirements for Butt weld test

(3) *Butt weld bend test*

(a) The face and root bend test specimens are to be RB4 specimen shown in **Table 2.2.2,** and test specimens are to be taken from each test assembly. However, for *L* 91 or *L* 92, the face and root bend specimens are to be RB1 specimen shown in **Table 2.2.2,** and test specimens are to be taken longitudinally from each test assembly.

(b) The test specimens are to be capable of withstanding, without crack exceeding 3 mm long on the outer surface of other defects, being bent through an angle of 120 degrees over a former having a radius of 1.5 times the thickness of test specimen. The radius and angle of the former for *L* 91 and *L* 92, however, are to be 2 times the thickness of the specimen and 180 degrees respectively.

(4) *Butt weld Impact test*
(a) One set of three impact test specimens, from each test assembly, are to be machined to dimensions charphy V-notch impact test specimens as shown in **Table 2.1.3.** The test specimen is to be cut with its longitudinal axis transverse to the direction of welding, and the test specimen is to coincide with the mid-thickness of the plate shown in **Fig 2.2.19.**
(b) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.37.**
(c) The requirements in **Par 4** (4), (c) and (d) are to correspondingly apply to this Paragraph.

6. Fillet weld test assemblies

(1) *Welding of fillet weld test assemblies* The test assemblies are to be in accordance with the requirements in **602. 7** (1).
(2) *Fillet weld macro-structure test* The macro-structure test is to be correspondingly in accordance with the requirements in **602. 7** (2).
(3) *Fillet weld hardness test* The hardness test is to be correspondingly in accordance with the requirements in **602. 7** (3).
(4) *Fillet weld fracture test* The fracture test is to be correspondingly in accordance with the requirements in **602. 7** (4).

7. Hydrogen test

Flux-cored or flux-coated wires which have satisfied the requirements for Grades 2*S*, 2*YS*, 2*Y*40*S*, 3*S*, 3*YS*, 3*Y*40*S*, 4*YS* or 4*Y*40*S* may, at manufacturer's option, be submitted to the hydrogen test as detailed in **602. 6.** using the manufacturer's recommended welding conditions and adjusting the deposition rate to give a weight of weld deposit per sample similar to that deposited when using manual electrodes.

8. Annual inspections

(1) In the annual inspections, tests specified in the following (2) are to be conducted for each brand of the approved consumables, and they are to be passed satisfactorily.
(2) The kinds of test, etc. in the annual inspection are to be as given in **Table 2.2.38.**

Table 2.2.38 Kind of Test for Annual Inspection

Kind of test	Test assembly					Kind and no. of test specimens taken from test assembly
	Welding position	Diameter of wire (mm)	Number	Dimension	Thickness (mm)	
Deposited metal test	Flat	(1)	1	**Fig 2.2.18**	20	Tensile test specimen : 1 Impact test specimen : 3

NOTE:
(1) The diameters of the wire are to be within the range specified by the manufacturers.

(3) The welding procedures and requirements for test assemblies of tests specified in the preceding (2) are to be as specified in **Par 4.**

9. Changes in grades

(1) Where changes in the grades relating to the strength or toughness of welding consumables approved are to be made, tests specified in the following (2) and (3) are to be carried out and satisfactorily passed in accordance with the requirements in **601. 5** (2).
(2) For changes in the grades relating to strength, the butt weld tests, specified in the annual inspection of **Par 8** and in the requirements of **Par 3** (1), are to be conducted.
(3) For changes in the grades relating to toughness, the butt weld impact tests, specified in the annual inspection of **Par 8** and in the requirements of **Par 3** (1), are to be conducted.

605. Electro-slag and electro-gas welding consumables

1. Application

Electro-slag and electro-gas welding consumables for normal strength and higher strength steels (hereinafter referred to as "welding consumables") are to be in accordance with the requirements in 605.

2. Grades and marks

Welding consumables are classified as specified in **Table 2.2.39.**

Table 2.2.39 Grades and Marks

For normal strength steel	For higher strength steel
1*V*, 2*V*, 3*V*	1*YV*, 2*YV*, 3*YV*, 4*YV*, 5*YV* 2*Y*40*V*, 3*Y*40*V*, 4*Y*40*V*, 5*Y*40*V*

3. General provisions for tests

(1) Kinds of test, number, thickness and dimensions of test assemblies, grades and number of test specimens to be taken from each test assembly for welding consumables are to be as given in **Table 2.2.40.**

Table 2.2.40 Kinds of Test for Electro-Slag and Electro-Gas Welding Consumables

Kind of test	Test assembly(1)			Kinds and no. of test specimens taken from test assembly
	Number	Dimensions	Thickness (mm)(2)	
Butt weld test	1	**Fig 2.2.29**	20 ~ 25	Tensile test specimen: 2 Longitudinal tensile test specimen: 2 Side bend test specimen: 2 Impact test specimen: 6 Macro structure test specimen: 2
	1		35 ~ 40	

NOTE:
(1) Where approval is requested for welding of both normal strength and higher strength steel two assemblies are to be prepared using higher strength steel. Two assemblies prepared using normal strength steel may also be required at the discretion of each Classification Society.
(2) Where thickness is restricted by welding process, thickness of test assemblies may be changed upon approval of the Society. In this case, the maximum test thickness is to be taken as the maximum applicable thickness.

(2) Steel plates to be used for test assemblies are to be as given in **Table 2.2.41,** appropriate to the kind of welding consumables.
(3) For the approval of welding consumables, the tests specified in the preceding (1) are to be conducted for each brand of welding consumables.
(4) The welding conditions used such as amperage, voltage, travel speed, etc. are to be within the range recommended by the manufacturer for normal good welding practice. Where a filler metal is stated to be suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of the test assemblies.
(5) After welding, the test assemblies are not to be subjected to any heat treatment.
(6) It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain that there are any defects in the weld prior to the preparation of test specimens.

Table 2.2.41 Grades of Steel used for Test Assembly

Grade of welding material	Grade of steel used for test assembly(1)(2)
1*V*	*A*
2*V*	*A*, *B* or *D*
3*V*	*A*, *B*, *D* or *E*
1*YV*	*AH* 32 or *AH* 36
2*YV*	*AH* 32, *AH* 36, *DH* 32 or *DH* 36
3*YV*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32 or *EH* 36
4*YV*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32, *EH* 36, *FH* 32 or *FH* 36
5*YV*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32, *EH* 36, *FH* 32 or *FH* 36
2*Y*40*V*	*AH* 40 or *DH* 40
3*Y*40*V*	*AH* 40, *DH* 40 or *EH* 40
4*Y*40*V*	*AH* 40, *DH* 40, *EH* 40 or *FH* 40
5*Y*40*V*	*AH* 40, *DH* 40, *EH* 40 or *FH* 40

NOTE:
(1) The tensile strength of higher strength steels of *AH* 32, *DH* 32, *EH* 32 and *FH* 32 used in the test assemblies is to be greater than 490 N/mm^2.
(2) This is in respect of the content of grain refining elements, and if general approval is required, a niobium treated steel is to be used for the approval tests.

4. Butt weld test

(1) *Welding of butt weld test assemblies*

(a) Test assemblies as shown in **Fig 2.2.29** are to be welded upward in vertical position in one Pass.

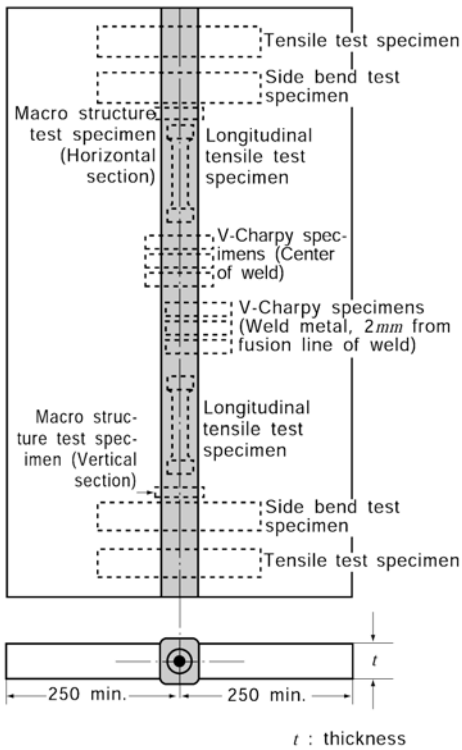

Fig. 2.2.29 Butt Weld Assembly (Electro-slag and electrod-gas welding, Unit :mm)

(b) The welding conditions and edge preparation are to be within the range recommended by the manufacturer.

(2) *Tensile test*

(a) Two tensile test specimens to be R2A specimen and two longitudinal tensile test specimens to be R14A specimen as shown in **Table 2.2.1** are to be taken from each test assembly. The longitudinal axis of test specimen coincides with the centre of weld and the mid-thickness of plates.

(b) The longitudinal tensile test specimens may be subjected to the heat treatment not exceeding 250℃ for a period not exceeding 16 hours for hydrogen removal prior to testing.

(c) Tensile strength of each test specimen R2A and tensile strength, yield strength and elongation of each longitudinal test specimen R14A are to comply with the requirements in **Table 2.2.42.** Where the upper limit of tensile strength is exceeded, special consideration will be given to the approval of the welding consumables, taking into consideration of the other mechanical properties shown in the test results and chemical composition of deposited metal.

Table 2.2.42 Tensile and Impact Test Requirements for Butt weld test

Grade of welding consumables	Tensile strength (N/mm^2)	Longitudinal Tensile Test			Impact test	
		Tensile strength (N/mm^2)	Yield strength (N/mm^2)	Elongation (%)	Test temp. (℃)	Average absorbed energy (J)
1*V*	400 min.	400 ~ 560	305 min.	22 min.	20	34 min.
2*V*					0	
3*V*					-20	
1*YV*	490 min.	490 ~ 660	375 min.	22 min.	20	
2*YV*					0	
3*YV*					-20	
4*YV*					-40	
5*YV*					-60	
2*Y*40*V*	510 min.	510 ~ 690	400 min.	22 min.	0	39 min.
3*Y*40*V*					-20	
4*Y*40*V*					-40	
5*Y*40*V*					-60	

(3) *Bend test*

(a) Bend test specimens are to be *RB* 6 specimens shown in **Table 2.2.2** and two side bend test specimens are to be taken from each test assembly.

(b) The test specimens are to be capable of withstanding, without crack exceeding 3 mm long on the outer surface of other defects, being bent through an angle of 180 degrees over a former having a radius of two times the thickness of test specimen.

(4) *Impact test*

(a) Two sets of six impact test specimens, from each test assembly, are to be machined to dimensions charphy V-notch impact test specimens as shown in **Table 2.1.3** and the longitudinal direction of the test specimen is to be perpendicular to the weld line and the surface of weld about 2 mm apart is to coincide with the surface of specimen as shown in **Fig 2.2.30.**

(b) The position of the notch is to be in accordance with **Fig 2.2.30** (a) and (b) respectively, and its longitudinal direction is to be perpendicular to the surface of the test assembly.

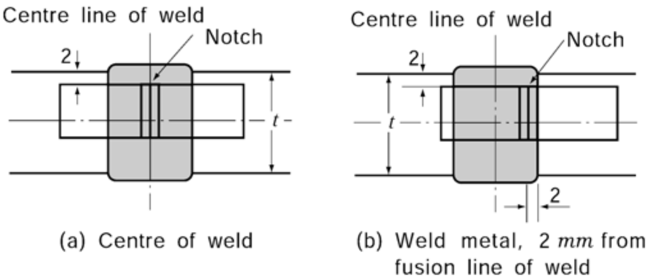

Fig 2.2.30 Position of Impact Specimen (Unit : mm, t = Plate thickness)

(c) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.42.**

(d) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

(5) *Macro-structure test*

(a) Two macro-structure test specimens are to be taken from the position shown in **Fig 2.2.29.** As for the surface to be tested, one is to be normal to the assembly surface and the other parallel to the assembly surface.

(b) Both the welded parts and the weld boundaries are to show complete fusion, penetration and sound metallurgical structure.

5. Annual inspections

(1) In the annual inspection, tests specified in the following (2) are to be conducted for each brand of the approved materials, and they are to be passed satisfactorily.

(2) The kinds of test, etc. in the annual inspections are to be as given in **Table 2.2.43.**

(3) The welding procedures and requirements for test assemblies of tests specified in the preceding (2) are to be as specified in **Par 4.**

Table 2.2.43 Kind of Test for Annual Inspection

Kind of test	Test assembly			Kinds and no. of test specimens taken from test assembly
	Number	Dimensions	Thickness (mm)(1)	
Butt weld test	1	**Fig 2.2.29**	20 ~ 25	Tensile test specimen: 1 Longitudinal Tensile test specimen: 1 Side bend test specimen: 2 Impact test specimen: 6(1)

NOTE:
(1) One set of three impact test specimens may be taken from the centre of welded part. where approved by the Society.

6. Changes in grades

Where changes in the grades relating to the strength or toughness of welding consumables approved are to be made, tests specified in **Par 3** (1) are to be conducted and satisfactorily passed in accordance with the requirements in **601. 5** (2).

606. One side welding consumables for normal strength steels, higher strength steels and steels for low temperature service.

1. Application

(1) Welding consumables for normal strength steels, higher strength steels and steels for low temperature service given in the following (a) through (c) (hereinafter referred to as "one side automatic welding consumables") are to be subjected to the approval tests and annual inspections in accordance with the requirements in **606**.
(a) Submerged arc one side automatic welding consumables
(b) Gas shielded arc one side automatic welding consumables (solid wire or flux cored wire with shielding gas)
(c) Self-shielded arc one side automatic welding consumables (flux cored wire or flux coated wire without shielding gas)
(2) Approval tests and annual inspections of one side covered electrodes for normal strength steels, higher strength steels and steels for low temperature service, and one side semi-automatic welding consumables are to be as deemed appropriate by the Society.
(3) Approval tests and annual inspections for one side automatic welding consumables of muitiple electrodes are to be as deemed appropriate by the Society.

2. Grades and marks

(1) One side automatic welding consumables are classified as specified in **603. 2.** Further, one side automatic welding consumables which have passed the tests for each welding procedure given in **Table 2.2.45** are to be appended with the suffixes given in **Table 2.2.44** at the end of their marks.
(2) In the preceding (1), a suffix G will be added to the grade mark for gas shielded arc one side automatic welding consumables, and a suffix N will be added for self-shielded wire one side automatic welding consumables. Further, the type of gas used is to be as specified in **Table 2.2.27** and the suffix given in **Table 2.2.27** will be added after the suffix G. (e.g. $3Y\ SMR\ G(M1)$)

Table 2.2.44 Marks

Welding technique[(1)]	Marks
One-run technique	SR
Multi-run technique	MR
One-run and multi-run technique	SMR

NOTE:
(1) One-run or multi-run technique refers to a welding process which performed in one pass or multiple passes respectively regardless of the number of electrodes.

3. General provisions for tests

(1) Kinds of test, number, thickness and dimensions of test assemblies, grades and number of test specimens to be taken from each test assembly for one side automatic welding consumables are to be as given in **Table 2.2.45.**
(2) Steel plates to be used for test assemblies are to be as given in **Table 2.2.46.**
(3) For the approval of one side automatic welding consumables, the tests specified in the preceding (1) are to be conducted for each brand of one side automatic welding consumables.
(4) For gas shield arc one side automatic welding consumables, the test in the preceding (3) is to be performed for each type of gas given in **Table 2.2.27.** When the manufacturer of the material recommends gas types of the group of $M1$, $M2$, $M3$ or C in **Table 2.2.27** and the test is satisfactorily conducted in accordance with the preceding (3) on one of the gas type, the test on the other gas types belonging to the same group is allowed to be dispensed with at the discretion of the Society.

Table 2.2.45 Kinds of Test for One-side Automatic Welding Consumables

Grade of welding consumables	Welding technique	Kind of test(4)	Test assembly			Kind and number of test specimens taken from test assembly
			Number	Thickness (mm)(1)	Dimension	
1, 2, 3, 1*Y*, 2*Y*, 3*Y*, 4*Y*, 5*Y*, 2*Y*40, 3*Y*40, 4*Y*40, 5*Y*40, *L*1, *L*2, *L*3, *L*91, *L*92	One-run technique	Butt weld test	1	12 ~ 15	**Fig 2.2.31**	Tensile test specimen: 2 Longitudinal tensile test specimen: 1 Face bend specimen: 1 Root bend specimen: 1 Impact test specimen: 6 Macro-structure test specimen: 1
			1	Maximum thickness		
	Multi-run technique		1	15 ~ 25		Tensile test specimen: 2 Longitudinal tensile test specimen: 1 Face bend specimen :1 Root bend Specimen: 1 Impact test specimen: 6 Macro-structure test specimen: 1
			1	35		
	One-run and Multi-run technique		1	Maximum thickness(2)		Tensile test specimen: 2 Longitudinal tensile test specimen: 1 Face bend specimen: 1 Root bend specimen: 1 Impact test specimen: 6 Macro-structure test specimen: 1
			1	35(3)		

NOTES:
(1) Where thickness is restricted by welding process, thickness of test assemblies may be changed upon approval of the Society. In this case, the maximum test thickness is to be taken as the maximum applicable thickness.
(2) Thickness of test assembly for one run technique.
(3) Thickness of test assembly for multi-run technique.
(4) The hydrogen test may be carried out according to the manufacturer's request.

Table 2.2.46 Grades of Steel used for Test Assembly

Grade of welding consumables	Grade of steel used for test assembly(1)
1	*A*
2	*A*, *B* or *D*
3	*A*, *B*, *D* or *E*
1*Y*	*AH* 32 or *AH* 36
2*Y*	*AH* 32, *AH* 36, *DH* 32 or *DH* 36
3*Y*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32 or *EH* 36
4*Y*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32, *EH* 36, *FH* 32 or *FH* 36
5*Y*	*AH* 32, *AH* 36, *DH* 32, *DH* 36, *EH* 32, *EH* 36, *FH* 32 or *FH* 36
2*Y*40	*AH* 40 or *DH* 40
3*Y*40	*AH* 40, *DH* 40 or *EH* 40
4*Y*40	*AH* 40, *DH* 40, *EH* 40 or *FH* 40
5*Y*40	*AH* 40, *DH* 40, *EH* 40 or *FH* 40
L 1	*E* or *RL* 24*A*
L 2	*E*, *RL* 24*A*, *RL* 24*B*, *RL* 27 or *RL* 33
L 3	*RL* 27, *RL* 33 or *RL* 37
L 91	*RL* 9*N*53 or *RL* 9*N*60
L 92	*RL* 9*N*53 or *RL* 9*N*60

NOTE:
(1) The tensile strength of higher strength steels *AH* 32, *DH* 32, *EH* 32 and *FH* 32 used in the test assemblies is to be greater than 490 N/mm^2

(5) The combination of one side automatic welding materials are classified as given in **Table 2.2.47,** appropriate to the welding procedure.

Table 2.2.47 Combinations of One Side Automatic Welding Consumables

Welding technique	Combinations of welding consumables
Submerged one side automatic welding	Wire + Flux + Iron powder + Backing
Gas shielded arc one side automatic welding	Wire + Gas + Iron powder + Backing
Self-shielded arc one side automatic welding	Wire + Iron powder + Backing

NOTE: Where iron powder is not used, iron powder is excluded in this Table.

(6) The welding conditions used such as amperage, voltage, travel speed, etc. are to be within the range recommended by the manufacturer for normal good welding practice. Where a filler metal is stated to be suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of the test assemblies.
(7) After welding, the test assemblies are not to be subjected to any heat treatment.
(8) It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain that there are any defects in the weld prior to the preparation of test specimens.

4. Butt weld test assemblies with one-run and multi-run technique

(1) *Welding of butt weld test assemblies with one-run and multi-run technique*

(a) Test assemblies are to be prepared as shown in **Fig 2.2.31,** and the diameter of wire, root gap and edge preparation are to be within the range specified by the manufacturer.

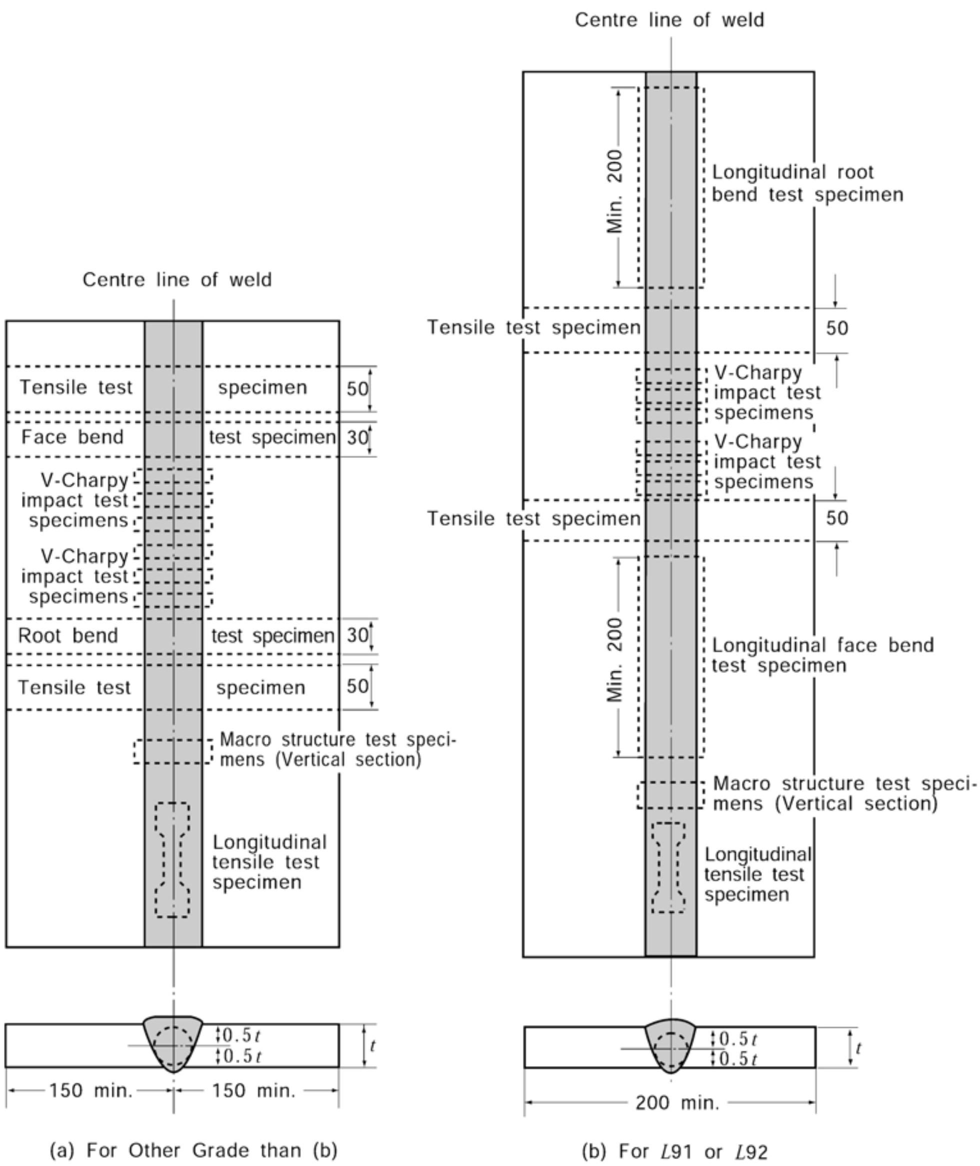

Fig. 2.2.31 Butt Weld Test Assembly with One-run and Multi-run Technique (Unit : *mm*, *t* = Plate thickness)

(b) Test assemblies are to be welded in downhand position by one-run technique or multi-run technique according to the procedures specified by the manufacturer. However, for gas shield and self-shielded arc one side automatic welding consumables, the welding position is to be specified by the manufacturer.

(c) After completing each run the test assembly is to be left in still air until it has cooled to less than 250℃ but not below 100℃, the temperature being taken at the centre of weld on the surface of seam.

(2) *Butt weld tensile test with one-run and multi-run technique*

(a) Tow tensile test specimens to be *R* 2*A* specimen and one longitudinal tensile test specimen to be *R*14*A* specimen as shown in **Table 2.2.1** are to be taken from each test assembly.
The longitudinal axis of test specimen coincides with the centre of weld and the mid-thick-

ness of plate.

(b) The longitudinal tensile test specimen may be subjected to a temperature not exceeding 250℃ for a period not exceeding 16 hours for hydrogen removal prior to testing.

(c) Tensile strength of each test specimen *R* 2*A* is to comply with the requirements in **Table 2.2.31.** Tensile strength, yield strength and elongation of longitudinal tensile test specimens *R* 14 are to comply with the requirements given in **Table 2.2.30.** Where the upper limit of tensile strength is exceeded, special consideration will be given to the approval of the welding consumables, taking into consideration of the other mechanical properties shown in the test results and chemical composition of deposited metal.

(3) *Butt weld bend test with one-run and multi-run technique* The bend tests are to comply with the requirements in **603. 6.** (3).

(4) *Butt weld impact test with one-run and multi-run technique*

(a) Two sets of impact test specimens, from each test assembly, are to be machined to dimensions *R* 4 test specimen as shown in **Table 2.1.3.** Longitudinal direction of the test specimen is to be perpendicular to the weld line as shown in **Fig 2.2.32.**

(b) Test temperature and average absorbed energy are to comply with the requirements given in **Table 2.2.31.**

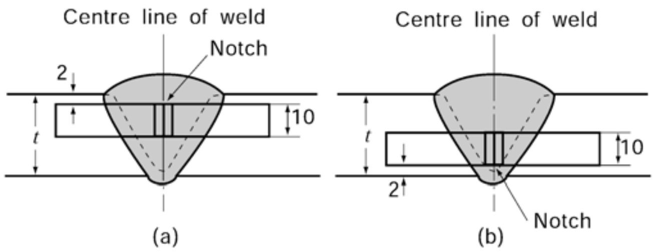

Fig. 2.2.32 Position of Impact Test Specimen for Butt Weld with One-run and Multi-run Technique
(Unit: mm, t = Plate thickness)

(c) The notch is to be positioned in the centre of weld and is to be cut in the face of test specimens perpendicular to the surface of plate.

(d) When the absorbed energy of two or more test specimens among a set of test specimens is less in value than the specified average absorbed energy or when the absorbed energy of a single test specimen is less in value than 70 % of the specified average absorbed energy, the test is considered to have failed.

(5) *Butt weld macro-structure test with one-run and multirun technique*

(a) Macro-structure test specimens are to be taken from the position shown in **Fig 2.2.31.** The surface to be tested is to be perpendicular to the surface of the test assembly.

(b) Both the welded parts and the weld boundaries are to show complete fusion, penetration and sound metallurgical structure.

5. Hydrogen test

The hydrogen test is to be in accordance with **602. 6** of the Rules

6. Annual inspections

(1) In the annual inspection, tests specified in the following (2) are to be conducted for each brand of the approved consumables, and they are to be passed satisfactorily.

(2) The kinds of test, etc. in the annual inspection are to be as given in **Table 2.2.48.**

Table 2.2.48 Kinds of Test for Annual Inspection

Grade of welding consumables	Welding technique	Kind of test	Test assembly			Kind and number of test specimens taken from test assembly
			Number	Dimension	Thickness (mm)(1)	
1, 2, 3, 1Y, 2Y, 3Y, 4Y, 5Y, 2Y40, 3Y40, 4Y40, 5Y40, L1, L2, L3, L91, L92	One-run technique	Butt weld test(2)	1	**Fig 2.2.31**	20	Tensile test specimen: 1 Longitudinal tensile test specimen: 1 Face bend specimen: 1 Root bend specimen: 1 Impact test specimen: 3(3)
	Multi-run technique		1		20~25	Tensile test specimen: 1 Longitudinal tensile test specimen: 1 Face bend specimen: 1 Root bend specimen: 1 Impact test specimen: 3(3)
	One-run and Multi-run technique		1		20~25	Tensile test specimen: 1 Longitudinal tensile test specimen: 1 Face bend specimen: 1 Root bend specimen: 1 Impact test Specimen: 3(3)

NOTES:
(1) Where the thickness of test assemblies is changed according to Note (1) of **Table 2.2.45**, the maximum test thickness for approval test is to be applied.
(2) The butt weld tests for one-run and multi-run technique are to be carried out by one-run technique.
(3) The positions of notch and selection of impact test specimens are to be as given in **Fig2.2.32** (b).

(3) The welding procedures and requirements of test assemblies for tests in the preceding (2) are to be as specified in **Par 4.**

7. Changes in grades

Where changes in the grades relating to the strength or toughness of one side automatic welding consumables approved are to be made, all the tests specified in **Par 3** (1) are to be carried out and satisfactorily passed in accordance with the requirements in **601. 5** (2).

607. Welding consumables for stainless steel

1. Application

Welding consumables for stainless steels specified in **Ch 1, Sec 3** (hereinafter referred to as "welding consumables") are to be subjected to the approval tests and annual inspections in accordance with the requirements in **607.**

2. Grades and marks

(1) Welding consumables are classified as specified in **Table 2.2.49.**
(2) Submerged arc welding consumables which have passed the tests for each welding process given in **Table 2.2.51** are to be appended with the suffixes shown in **Table 2.2.50** at the end of their marks.
(3) For flux cored wire semi-automatic welding consumables in the preceding (1), a suffix G will be added to the grade mark for welding consumables which use shield gas, and a suffix N will be added to the grade markes for welding consumables which do not used shield gas. Further, the type of shield gas used is to be as specified in **Table 2.2.27** and the suffix given in **Table 2.2.27** will be added after the suffix G. (e.g. *RW* 308*G* (C))

3. General provisions for tests

(1) Kinds of test, number, thickness and dimensions of test assemblies, diameter of wire used for welding, grades and number of test specimens to be taken from each test assembly in each welding position for welding consumables are to be as given in **Table 2.2.51.** However, additional tests appropriate to steels, such as test on corrosion-resistance test, impact test, macro etching test, etc., except the test given in **Table 2.2.51** may be required where deemed necessary by the Society.
(2) Steel plates to be used for test assemblies are to be as given in **Table 2.2.52** according to the grades of welding consumables.
(3) For the approval of welding consumables, the tests specified in the preceding (1) are to be conducted for each brand of welding consumables.
(4) For flux cored wire semi-automatic welding materials, which use shield gas, the test in the preceding (3) is to be performed for each type of gas given in **Table 2.2.27.** When the manufacturer of the consumables recommends gas types of the group of *M* 1, *M* 2, *M* 3 or C in **Table 2.2.27** and the test is satisfactorily conducted in accordance with the preceding (3) on one of the gas type, the test on the other gas types belonging to the same group is allowed to be dispensed with at the discretion of the Society.
(5) The welding conditions used such as amperage, voltage, travel speed, etc. are to be within the range recommended by the manufacturer for normal good welding practice. Where a filler metal is stated to be suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of the test assemblies.

Table 2.2.51 Kinds of Test of Welding Consumables for Stainless Steel

Kind of welding consumables	Kind of test	Test assembly: Thick-ness (mm)	No.	Welding position	Dia. of electrode or wire (1) (mm)	Dimen-sion	Kind and number of test specimens taken from test assembly

		19	1	Flat	4.0		Tensile test specimen: 1 Longitudinal tensile test specimen: 1 Face bend specimen: 1 Root bend specimen: 1

NOTES:
(1) Where approved by the Society, the diameter of electrodes or wires may be changed.
(2) Tests on both multi-run and two run technique are to be conducted for multi-run and two run welding respectively and the number, dimensions and thickness of test assemblies, along with the grades and number of test specimens selected from each test assembly are to be according to each of the welding processes. However, longitudinal tensile test of two run technique are not required.

NOTE:
(1) Notwithstanding the requirements in this table, mild steel or higher strength steel may be used for deposited metal test assembly. In this case, test assemblies are to be appropriately buttered.

(6) After welding, the test assemblies are not to be subjected to any heat treatment.
(7) It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain that there are any defects in the weld prior to the preparation of test specimens.

4. Deposited metal test

(1) *Welding of deposited metal test assemblies*
 (a) Test assemblies as shown in **Fig 2.2.33** are to be welded in the flat position according to the welding procedure recommended by the manufacturer.
 (b) After each run, the test assembly is to be left in still air until it has cooled to less than 150℃ but not below 15℃, the temperature being taken at the centre of the weld on the surface of seam.
(2) *Chemical composition*
 (a) Deposited metals of electrodes for manual arc welding and of welding consumables for flux cored wire semi-automatic welding and submerged arc welding are to have the chemical composition given in **Tables 2.2.53, 2.2.55** and **2.2.56** respectively.
 (b) TIG and MIG welding consumables are to have the chemical composition of ladle analysis value complied with the requirements as given in **Table 2.2.54.**
(3) *Deposited metal tensile test*
 (a) One tensile test specimens to be R10 shown in **Table 2.2.1** is to be taken from each test assembly. Further, where approved by the Society, one R14A tensile test specimen may be taken, the longitudinal axis of test specimen coincides with the centre of weld and the mid-thickness of plate.
 (b) The tensile test specimens may be subjected to a temperature not exceeding 250℃ for a period not exceeding 16 hours for hydrogen removal prior to testing.
 (c) Deposited metal tensile tests are to comply with the requirements in **Table 2.2.57.**

NOTE:
(1) Elongation of *RW* 309*MoL* is to be not less than 20 (%).

5. Butt weld test

(1) *Welding of butt weld test assemblies*
(a) Test assemblies as shown in **Figs 2.2.34** and **2.2.35** are to be welded in each welding position (flat, horizontal, vertical upward, vertical downward and overhead) which is recommended by the manufacturer.
(b) After each run, the test assembly is to be left in still air until it has cooled to less than 150℃ but not below 15℃, the temperature being taken at the centre of the weld on the surface of seam.
(2) *Butt weld tensile test*
(a) One tensile test specimens to be R2A shown in **Table 2.2.1** is to be taken from each test assembly.
(b) The tensile strength of each test specimen is to comply with the requirements given in **Table 2.2.58.**
(c) Submerged arc welding materials used only in the two-run technique are to be selected as one R14A tensile test specimen of **Table 2.2.1,** such that the longitudinal centre line of the test specimen coincides with the weld centre line of the test assemblies and centre of thickness.
(d) The longitudinal tensile test specimens specified in the preceding (3) may be subjected to the heat treatment not exceeding 250℃ for a period not exceeding 16 hours for hydrogen removal prior to testing.
(e) The tensile strength, yield point and elongation of the test specimens specified in the preceding (c) and (d) are to comply with the requirements given in **Table 2.2.57.**
(3) *Butt weld bend test*
(a) The face and root bend test specimens are to be RB4 specimen shown in **Table 2.2.2,** and test specimens are to be taken from each test assembly.
(b) The test specimens are to be capable of withstanding, without crack exceeding 3 mm long on the outer surface of the specimen or other defects, being bent through an angle of 120 degrees over a former having a radius of 1.5 times the thickness of test specimen.

(1) Where the test assembly is made of *RSTS* 317*L*, the tensile strength is not to be less than 480 N/mm^2.

6. Annual inspections

(1) In the annual inspections, tests specified in the following (2) are to be conducted for each brand of approved consumables, and they are to be passed satisfactorily.
(2) The kinds of test, etc. in the annual inspections are to be as given in **Table 2.2.59.**
(3) The welding procedures and requirements of test assemblies for tests in the preceding (2) are to be as specified in **Pars 4** through **5.**

Table 2.2.59 Kinds of Test at Annual Inspection

Kind of welding consumables		Kind of test	Welding procedure for test assembly					Kind and number of test specimens taken from test assembly
			Welding position	Dia. of electrode or wire (mm)	Number	Dimension	Thickness (mm)	
Electrode for manual arc welding		Deposited metal test	Flat	3.2 ~ 4.0	1	**Fig 2.2.33**	12 ~ 19	Tensile test specimen: 1
Consumables for TIG welding				2.4 ~ 3.2				
Consumables for MIG welding				1.2 ~ 1.6				
Flux cored wire for semi-automatic welding				1.2 ~ 3.2				
Consumables for submerged arc welding (1)	Multi-run technique	Deposited metal test	Flat	1.2 ~ 4.0	1	**Fig 2.2.33**	19 ~ 25	Tensile test specimen: 1
	Two-run technique	Butt weld test	Flat	2.4 ~ 4.0	1	**Fig 2.2.35**(b)	12 ~ 19	Tensile test specimen: 1 Longitudinal tensile test specimen: 1 Face bend specimen: 1 Root bend specimen: 1

NOTE:
(1) Tests on both multi-run and two run technique are to be conducted for multi-run and two run welding respectively and the number, dimensions and thickness of test assemblies, along with the grades and number of test specimens selected from each test assembly are to be according to each of the welding processes. However, longitudinal tensile test of two run technique are not required.

608. Welding consumables for aluminium alloys

1. Application

(1) Welding consumables used for aluminium alloys mentioned in the following (a) and (b)(hereinafter referred to as "welding consumables") are to be subjected to the approval tests and annual inspections in accordance with these requirements.

(a) Rod-gas combinations for tungsten inert gas arc welding (TIG welding) or plasma arc welding

(b) Wire electrode and wire-gas combinations for metal arc inert gas welding (MIG welding), tungsten inert gas arc welding(TIG welding) or plasma arc welding

(2) Where no special requirements are given herein, e.g. for the approval procedure or for the welding of test assemblies and testing, those as specified in **601.** through **605.** apply in analogous manner.

2. Grades and marks of welding consumables

(1) Grades and marks of welding consumables are classified as given in **Table 2.2.60.**

Table 2.2.60 Grades and Marks

Kind of welding consumables	Grade and Mark
Electrode	*RA, RB, RC, RD*
Wire	*WA, WB, WC, WD*

(2) Approval of a wire or a rod will be granted in conjunction with a specific shielding gas according to Table 2.2.58 with suffixed mark “G”(e.g. *RBG*(*I*-3)). or defined in terms of composition and purity of “special” gas to be designated with group sign “*S*”(eg. *RBS*(CO_2 100%). The composition of the shielding gas is to be reported. The approval of a wire or rod with any particular gas can be applied or transferred to any combination of the same wire or rod and any gas in the same numbered group as defined in **Table 2.2.61**, subject to the agreement of the Society.

Table 2.2.61 Kind of Gas

Group	Kinds	Gas composition(%)	
		He	Ar
I	I-1 I-2 I-3 I-4 I-5	- 100 > 0 - 33 > 33 - 66 > 66 - 95	100 - Rest Rest Rest
S		Others	

3. General provisions of tests

(1) Kinds of test, number, thickness and dimensions of test assemblies, kind and number of test specimen taken from each test assembly for welding consumables are to be as given in **Table 2.2.62.**

(2) The aluminium alloys used in preparation for test assembly corresponding to welding consumables are to be as given in **Table 2.2.63.**

(3) For the approval of welding consumables, the tests specified in (1) are to be successfully conducted for each brand of welding consumables.

(4) For welding consumables using a shielding gas, the tests specified in (1) are to be conducted for each kind of gas designated among **Table 2.2.61** by the manufacturer. However, where the manufacturer designates several kinds of gas which are classified into the group l in **Table 2.2.61** and the tests specified in (1) are to be conducted for any one kind of gas, the tests for the other kind of gas may be dispensed with subject to the approval of the Society.

Table 2.2.62 Kinds of Test for Welding Consumables

Kinds of test	Test assembly				Kinds and number of test specimens taken from test assembly
	Welding position	Number	Dimension	Thickness (mm)	
Deposited metal test (Chemical composition test)	Flat	1	**Fig 2.2.36**	-	-
Butt weld test	Flat	1	**Fig 2.2.37**	10 ~ 12	Tensile test specimen : 2 Face bend test specimen : 2 Root bend test specimen : 2 Macro structure test specimen : 1
	Horizontal	1[(1)]			
	Vertical upward	1			
	Overhead	1			
	Flat	1	**Fig 2.2.38**	20 ~ 25	Tensile test specimen : 2 Face bend test specimen : 2 Root bend test specimen : 2 Macro structure test specimen : 1

Note
(1) Welding consumables satisfying the requirements for flat and vertical upward positions may be dispensed with the tests for horizontal position subject to the approval of the Society.

Table 2.2.63 Grade of Aluminium Alloys used for Test Assembly

Grade of welding consumables	Grade of aluminium alloys used for test assembly	
RA, *WA*	5000 series	5754
RB, *WB*		5086
RC, *WC*		5083, 5383, 5456, 5059
RD, *WD*	6000 series	6005*A*, 6061, 6082

Note:
Approval on higher strength *AlMg* base materials(5000 series) covers also the lower strength *AlMg* grades and their combination with *AlSi* grades

(5) When the manufacturer designated the gas classified into the group "*S*" in the tests specified in (4), the composition of the shielding gas is to be reported to the Society.
(6) After welding, the test assemblies are not to be subjected to any heat treatment or peening.
(7) It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain that there are any defects in the weld prior to the preparation of test specimens.

4. Deposited metal test

(1) *Welding of deposited metal test assembly*
(a) The test assemblies as shown in **Fig 2.2.36** are to be welded in flat position in accordance with the welding process designated by the manufacturer.

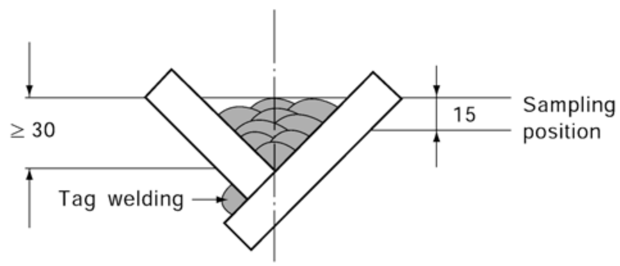

Fig. 2.2.36 Deposited Weld Metal Test Assembly
(Unit : *mm*)

(b) The size of test assembly corresponding to the welding consumables and welding process is to be taken a sufficient amount of pure weld metal for chemical analysis.

(2) *Chemical composition* The chemical composition of the welding consumables is to be determined by the analysis of the deposited weld metal specified in **Fig 2.2.36** and the results of the analysis are to comply with the limit value specified by the manufacturer.

5. Butt weld test

(1) *Welding of butt weld test assemblies*

(a) The test assemblies as shown in **Fig 2.2.37** are to be welded in each welding position designated by the manufacturer (downhand, horizontal, vertical-upward and overhead). The test assembly as shown by **Fig 2.2.38** is to be welded in the downhand position.

(b) On completion of each run, the test assemblies are to be allowed to cool naturally in air until the temperature measured at the surface of the centre of the welding joint is ambient temperature. However, the test assemblies for *RD* and *WD* are to be allowed to naturally ageing for a minimum period of 72 hours from the completion of welding before testing.

(2) *Butt weld tensile test*

(a) The tensile test specimens are to be *R* 2*A* specimen shown in **Table 2.2.1** and two test specimens are to be taken from each test assembly.

(b) The tensile strength is to comply with the requirements as given in **Table 2.2.64.**

Table 2.2.64 Requirements for the transverse tensile and bend tests

Grade of welding consumables	Base material used for the test	Tensile strength (N/mm^2)	Bend test	
			Former diameter (mm)	Bending angle
RA/WA	5754	190 min.	3 *t*(1)	180°
RB/WB	5086	240 min.	6 *t*(1)	
RC/WC	5083	275 min.		
	5383, 5456	290 min.		
	5059	330 min.		
RD/WD	6061, 6005A, 6082	170 min.		

Note
(1) *t* : Thickness of the test specimen

(3) *Butt Weld Bend Test*

(a) The face bend and root bend test specimens are to be *RB* 4 specimen shown in **Table 2.2.**2 and two test specimens are to be taken from each assembly.

(b) The test specimens are to sustain the face and root bend tests over 180" using a former having a diameter in accordance with **Table 2.2.64,** without cracks exceeding 3 mm in length and other any defects on the outer surface.

(4) *Butt weld macro structure test*

(a) One macro structure test specimen as shown in **Fig 2.2.37** and Fig **2.2.38** is to be taken from the butt weld test assembly.

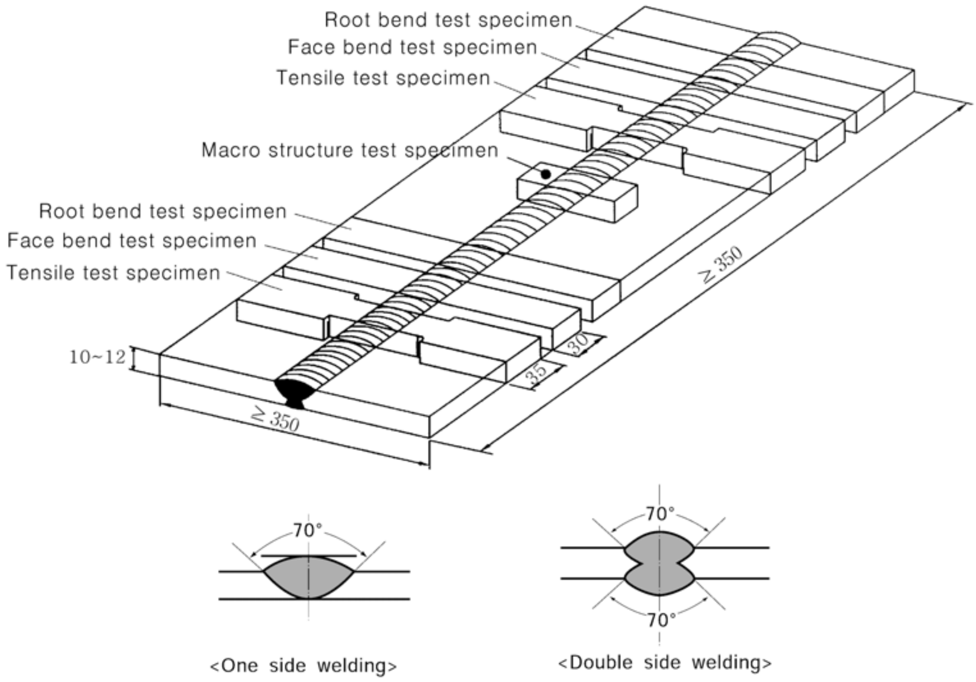
(b) The macro structure test specimen is to be examined that there are not any imperfections such as lack of fusion, poor penetration or cracks.

6. Annual inspections

(1) In the annual inspections, every approved welding consumables are to be subjected to the tests provided in (2) and are to be successfully examined.

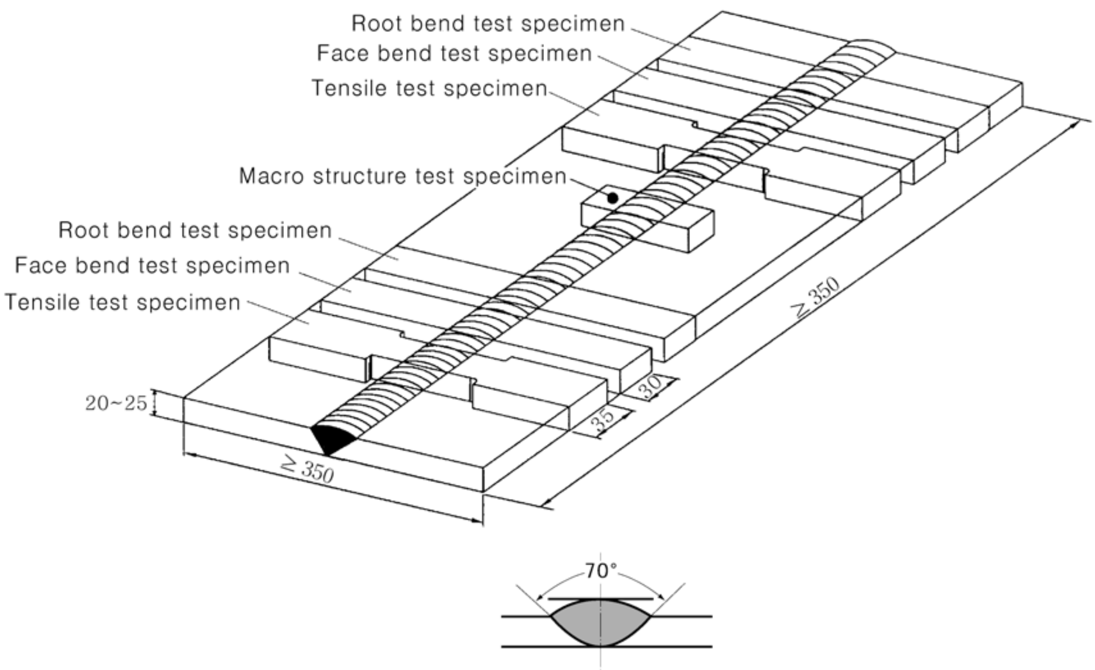
(2) Kinds of tests in the annual inspections are to be as given in **Table 2.2.65.**

(3) The welding procedure and requirements for test assemblies specified in (2) are to be in accordance with the requirements in **4.** to **5.**



(Note)
(1) Back sealing runs are allowed in single V weld assembly.
(2) In case of double V assembly both sides are to be welded in the same welding position.

Fig.2.2.37 Butt Weld Test Assembly for Aluminium Alloys
(A thickness of 10 to 12, unit : *mm*)



(NOTE)
(1) Back sealing runs are allowed.

Fig. 2.2.38 Butt Weld Test Assembly for Aluminium Alloys
(A thickness of 20 to 25, unit : *mm*)

Table 2.2.65 Kinds of Tests in Annual Inspections

Kinds of test	Test assembly				Kind and number of test specimens taken from test assembly
	Welding position	Number	Dimensions	Thickness (mm)	
Deposited weld metal test(Chemical composition Analysis)	Flat	1	**Fig 2.2.36**	-	-
Butt weld test	Flat	1	**Fig 2.2.37**	10 - 12	Tensile test specimen : 2 Face bend test specimen : 2 Root bend test specimen : 2 Macro structure test specimen : 1

609. Welding consumables for high strength quenched and tempered steels

1. Application

Welding consumables for high strength quenched and tempered steels, which are given in following (1) through (3) (hereinafter referred to as "welding consumables" in **609.**) the approval test and annual inspections are to be in accordance with the requirements specified in **609.**

(1) Electrodes for manual arc welding(specified in **602. 1** (1) and (2))
(2) Automatic welding consumables(specified in **603. 1** (1) and (2). However, in this case, used only for multi-run technique in principle.)
(3) Semi-automatic welding consumables

2. Grade and marks of welding consumables

(1) Grades and marks of welding consumables are classified as given in **Table 2.2.67.**
(2) Where the welding consumables have passed the test specified in **3** (1) below, the suffixes are to be added to the grade marks with the same methods as specified in **603. 2** (2) and (3) or **604. 2** (2) and (3) according to the grade of welding consumables.
(3) For low hydrogen electrodes which have passed the hydrogen test specified in **6.** the suffixes given in **Table 2.2.70** are to be added to the grade marks (eg. $3Y46S\ H5$).

3. General provisions for tests

(1) Kinds of test, number, thickness, and dimensions of test assembles, diameters of electrodes or wires used for welding and welding positions, together with kinds and number of test specimens taken from each test assembly for welding consumables are to be in accordance with the requirements specified in **602. 3., 603. 3.** or **604. 3.** However, note (4) of **Table 2.2.17** and note (5) of **Table 2.2.34** are not to be required. Provisions for automatic welding consumables are to be the requirements specified in multi run technique.
(2) The grades of steels used for tests are to be those given in **Table 2.2.66** corresponding to the grades of welding consumables, or those which are considered equivalent by the Society.

Table 2.2.66 Grade of Steels for Test Assembly

Grade of welding consumables	Grade of steel for assembly
2Y42, 2Y46, 2Y50, 2Y55, 2Y62, 2Y69	AH 43～AH 70
3Y42, 3Y46, 3Y50, 3Y55, 3Y62, 3Y69	AH 43～AH 70, DH 43～DH 70
4Y42, 4Y46, 4Y50, 4Y55, 4Y62, 4Y69	AH43～AH70, DH 43～DH 70, EH 43～EH 70
5Y42, 5Y46, 5Y50, 5Y55, 5Y62, 5Y69	AH 43～AH 70, DH 43～DH 70, EH 43～EH 70, FH 43～FH 70

NOTES:
Notwithstanding the requirements in this table, normal and higher strength steels may be used for deposited metal test assembly. In this case, appropriate buttering is to be carried out.

(3) For the approval of welding consumables, the tests specified in **602., 603.** or **604.** are to be conducted for each brand of welding consumables.
(4) After welding, the test assemblies are not to be subjected to any heat treatment or peening.
(5) It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain that there are any defects in the weld prior to the preparation of test specimens.

4. Deposited metal test

(1) *Welding of deposited metal test assembly*
Welding sequence of test assemblies are to be in accordance with the requirements specified in **602. 4** (1)**, 603. 4** (1) or **604. 4** (1) appropriate to the grade of the welding consumables.
(2) *Chemical composition*
(a) The chemical composition of the deposited weld metal shall be determined by the manufacturer and reported the results of the analysis to the Society. The report is also to include the main alloy elements.
(b) The results of the analysis shall not exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.
(3) *Deposited metal tensile test*
(a) Kinds, numbers and selection methods of the deposited metal tensile test specimens being taken from each test assembly are to comply with the requirements specified in **602. 4** (3), **603. 4** (3) or **604. 4** (3) according to the grade of the welding consumables.
(b) The tensile strength, yield strength and elongation of each test specimen are to comply with the requirements specified in **Table 2.2.67** according to the grade of the welding consumables.
(c) The provisions specified in the preceding **602. 4** (3) (b) may be applied to the tensile test specimens.
(4) *Deposited metal impact test*
(a) Kinds, numbers and selection methods of the deposited metal impact test specimens being taken from each test assembly are to comply with the requirements specified in **602. 4** (4), **603. 4** (4) or **604. 4** (4) according to the grade of the welding consumables.
(b) The test temperature and minimum mean absorbed energy are to comply with the requirements specified given in **Table 2.2.67** according to the grade of the welding consumables.
(c) The requirements specified in the preceding **602. 4** (4), (b) and (d) are to be applied to this test.

5. Butt weld test

(1) *Welding of butt weld test assembly*
Welding sequence of test assemblies are to be in accordance with the requirements specified in **602. 5** (1)**, 603. 5** (1) or **604. 5** (1) appropriate to the grade of the welding consumables.
(2) *Butt weld tensile test*
(a) Kinds and numbers of the butt weld tensile test specimens being taken from each test assembly are to comply with the requirements specified in **602. 5** (2), **603. 5** (2) or **604. 5** (2) according to the grade of the welding consumables.
(b) The tensile strength of each test specimen is to meet the requirements given in **Table 2.2.68** according to the grade of the welding consumables.

Table 2.2.68 Tensile Test Requirements for butt weld test

Grade of welding consumables	Tensile strength (N/mm^2)
2*Y*42, 3*Y*42, 4*Y*42, 5*Y*42	530 min.
2*Y*46, 3*Y*46, 4*Y*46, 5*Y*46	570 min.
2*Y*50, 3*Y*50, 4*Y*50, 5*Y*50	610 min.
2*Y*55, 3*Y*55, 4*Y*55, 5*Y*55	670 min.
2*Y*62, 3*Y*62, 4*Y*62, 5*Y*62	720 min.
2*Y*69, 3*Y*69, 4*Y*69, 5*Y*69	770 min.

Table 2.2.67 Test Requirements for Deposited Metal

Grade of welding consumables	Tensile test			Impact test	
	Tensile strength (N/mm²)(1)	Yield strength (N/mm²)	Elongation (%)	Test temp (℃)	Minimum mean absorbed energy(J)
2Y42	530 ~ 680	420 min.	20 min.	0	47 min.
3Y42				-20	
4Y42				-40	
5Y42				-60	
2Y46	570 ~ 720	460 min.	20 min.	0	
3Y46				-20	
4Y46				-40	
5Y46				-60	
2Y50	610 ~ 770	500 min.	18 min.	0	50 min.
3Y50				-20	
4Y50				-40	
5Y50				-60	
2Y55	670 ~ 830	550 min.	18 min.	0	55 min.
3Y55				-20	
4Y55				-40	
5Y55				-60	
2Y62	720 ~ 890	620 min.	18 min.	0	62 min.
3Y62				-20	
4Y62				-40	
5Y62				-60	
2Y69	770 ~ 940	690 min.	17 min.	0	69 min.
3Y69				-20	
4Y69				-40	
5Y69				-60	

Note
Tensile strength specified in the table may be alerted where deemed appropriate by the Society.

(3) *Butt weld bend test*

(a) Kinds and numbers of the butt weld face bend and root bend test specimens being taken hom each test assembly are to comply with the requirements specified in **602. 5** (3), **603. 5** (3) or **604. 5** (3) according to the grade of the welding consumables.

(b) The test specimens are to be subjected to face bend and root bend tests by using former having a radius given in **Table 2.2.69.** Outer surface of the specimens is to be free from any cracks exceeding 3 mm long or other defects when they are bent to the angle of 120 degrees.

Table 2.2.69 Bend Radius for Butt Weld Bend Test

Grade of welding consumable	Radius of plunger
2Y42～50, 3Y42～50, 4Y42～50, 5Y42～50	2.0 t
2Y55～69, 3Y55～69, 4Y55～69, 5Y55～69	2.5 t

(c) Where the bending angle 120° is not achieved, the specimen may be considered as fulfilling the requirements, if the bending elongation on a gauge length Lo shown in **Fig 2.2.39** fulfills the minimum elongation requirements stated in **Table 2.2.67** of the Rules

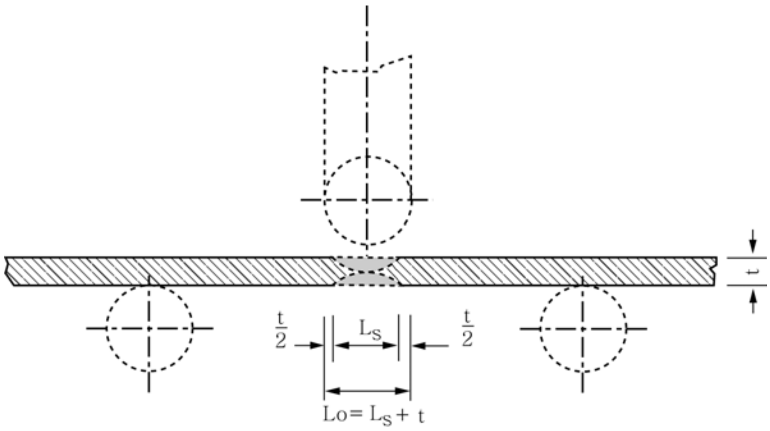


Fig 2.2.39 gauge length *Lo*

(4) *Butt weld impact test*
   (a) Kinds, numbers and selection method of the butt weld impact test specimens being taken from each test assembly are to comply with the requirements specified in **602. 5** (4), **603. 5** (4) or **604. 5** (4) according to the grade of the welding consumables.
   (b) Testing temperature and minimum mean absorbed energy are to comply with the requirements specified in **Table 2.2.67** according to the grade of the welding consumables.
   (c) The requirements specified in the preceding **602. 5** (4), (b) and (d) are to be applied to these tests.

6. Hydrogen test

(1) Hydrogen Test is to be carried out for welding consumables except gas shielded arc solid wire by the glycerine method, mercury method, gas chromatographic method or other methods deemed appropriate by the Society.
(2) The average volume of hydrogen is to comply with the requirements specified in **Table 2.2.70** according to the test procedures specified in preceding (1) or the type of suffixes to be added to the grade marks.

Table 2.2.70 Requirements for hydrogen Contents

Grade of welding consumable	Suffixes	Requirements for Hydrogen Contents (cm^3/g)		
		Glycerine method	Mercury method	Gas chromatographic method
2*Y*42～50, 3*Y*42～50, 4*Y*42～50, 5*Y*42～50	*H* 10	0.05 max.	0.10 max.	0.10 max.
2*Y*55～69, 3*Y*55～69, 4*Y*55～69, 5*Y*55～69	*H* 5	-	0.05 max.	0.05 max.

7. Fillet weld test assemblies

(1) *Welding of fillet weld test assemblies* The test assemblies are to be in accordance with the requirements in **602. 7** (1).
(2) *Fillet weld macro-structure test* The macro-structure test is to be correspondingly in accordance with the requirements in **602. 7** (2).
(3) *Fillet weld hardness test* The hardness test is to be correspondingly in accordance with the requirements in **602. 7** (3).
(4) *Fillet weld fracture test* The fracture test is to be correspondingly in accordance with the requirements in **602. 7** (4).

8. Annual inspections

Annual inspections are to comply with the requirements specified in **602. 8, 603. 8** or **604. 8** according to the grade of the welding consumables. However, in general, annual inspections for automatic welding consumables are to comply with the requirements specified for multi run technique.

9. Change in grades

The changes in grades relating to the strength or toughness of approved welding consumables are to comply with the requirements specified in **602. 9, 603. 9** or **604. 9** according to the grade of the welding consumables. ⚓

2011

Guidance Relating to the Rules for the Classification of Steel Ships

Part 2

Materials and Welding

GA-02-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance relating to the Rules for the Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidance as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

Amendments to the Guidance Relating to the Rules for the Classification of Steel Ships
(PART 2 MATERIALS AND WELDING, 2010 Edition)

Effective Date 1 July 2011

CHAPTER 1 MATERIALS

Section 1 General

- 101. 2. has been newly established.

CHAPTER 2 WELDING

Section 6 Welding Consumables

- 602. 2. has been deleted.
- 603. has been deleted.

ANNEX

Annex 2-7 Guidance for Non-destructive Testing of ship hull steel welds

- 1. (2), (E), (d) has been newly established.
- 1. (2), (F) has been amended.
- 3. (4) has been fully amended.

Annex 2-8 Reinforced plastic materials

- newly established.

CONTENTS

CHAPTER 1 MATERIALS

SECTION 1 General

101. Application

1. Seamless shells of boilers made of steel forgings are to comply with the **Annex 2-1.**

2. Reinforced plastic materials used for construction or repair of plastic pipes, FRP ships or composite vessel are to comply with the **Annex 2-8.**

102. Approval of manufacturing process and manufacturing control

"control imperfection" referred in **102. 2** (2) of the Rules includes the deviation from the programmed rolling schedules or normalizing or quenching and tempering procedures.

103. Chemical composition

1. The application to **103. 1** of the Rules is to be in accordance with the followings:

(1) The chemical composition analyses from each ladle are to be applied to steel.
(2) The chemical composition analyses from each cast are to be applied to non-ferrous metals.

2. The application to **103. 2** of the Rules is to be in accordance with the followings :

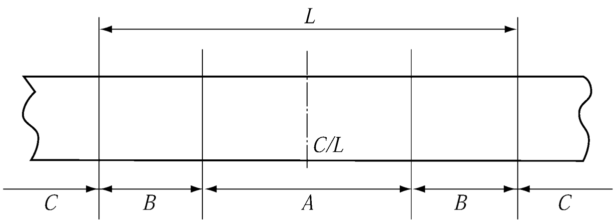
(1) Selection of samples for the check analyses
Samples for the check analyses are to be taken from specimens for mechanical tests or from the portion of the body adjacent to the part where mechanical specimens had been taken.
(2) Production analysis and its tolerance for steel
Production analysis and its tolerance for steel is to comply with *KS D*0228 (Production Analysis and its Tolerance for Wrought Steel).

104. Testing and inspection

"The approval of quality assurance scheme specially specified by the Society" referred in **104. 4** of the Rules means where the quality assurance scheme of material manufacturer has been already approved according to the requirements of **Ch 5** of "*Guidance for Approval of Manufacturing Process and Type approval etc*." by the Society.

109. Retest procedure

"Any part of fracture is outside the one-fourth of the gauge length from the centre of gauge length" specified in **109. 4** of the Rules means the parts of "B" and "C" as shown in **Fig 2.1.1** of the Guidance.



L : Gauge length
A : Inside the one-fourth of the gauge length from the centre of gauge length
B : Between outside the one-fourth of the gauge length from the centre of gauge length and inside gauge length
C : Over gauge length

Fig 2.1.1 Divisions for Fracture Parts of Tensile Specimen

SECTION 2 Test Specimens and Testing Procedures

201. General

1. Application

In case where test specimens or test procedures specified in the requirements of *ISO* or *KS* are adopted, the approvals by the Society may be dispensed with, notwithstanding the requirement in **201. 1** (2) of the Rules.

2. Selection of test specimens

"Where otherwise specified or agreed with the Surveyor" referred in **201. 3** (2) of the Rules means only where manufacturing process of the material has been already approved according to the requirements of **Ch 2** of *"Guidance for Approval of Manufacturing Process and Type Approval, etc"* by the Society

202. Form and dimension of test specimen

1. Tensile test specimen

(1) The gauge length of the *R* 14*B* tensile test specimens specified in **Fig 2.1.1** of the Rules may be used as given in **Table 2.1.1** of Guidance in accordance with **201. 1** (2) of the Rules.

Table 2.1.1 Rounding of Gauge Length

Thickness of test specimen t (mm)	Width of test specimen W (mm)	Gauge length L (mm)
$3 \leq t \leq 4$	25	50
$4 < t \leq 5$		60
$5 < t \leq 7$		70
$7 < t \leq 10$		80
$10 < t \leq 15$		100
$15 < t \leq 20$		120
$20 < t \leq 30$		140
$30 < t \leq 40$		160

(2) In application to **202. 1** (4) of the Rules, corrections for elongation are to be in accordance with the followings :

(A) Stainless steel and aluminium alloys are to be considered as Material 1 in **Table 2.1.1** of the Rules. However, corrections for elongation specified in **202. 1** (4) of the Rules may not be required in the case of copper alloy.

(B) In case where the corrections by the requirements of **202. 1** (4) of the Rules are deemed troublesome because of a great number of test specimens, the value of specified elongation may be corrected by using the following formula. In such case, the corrected specified elongation is to be recorded in the certificates of the material test.

$$E = n \cdot F$$

where

E = Elongation equivalent to where the proportional specimens ($L = 5.65\sqrt{A}$) specified in **Fig 2.1.1** of the Rules are used.

n = Elongation where optional test specimens are used.

F = Coefficient of correction for elongation are shown in **Table 2.1.2** of the Guidance according to the gauge length.

Table 2.1.2 Values of F

Gauge length (L)	Material 1	Material 2
$8D$	1.21	1.29
$8\sqrt{A}$	1.15	1.21
$4D$	0.91	0.88
$4\sqrt{A}$	0.87	0.82
D : Diameter of the test specimen A : Sectional area of the test specimen		

2. Impact test specimen

(1) In application to **202. 3** (3) of the Rules, the sub-size specimens permitted according to thickness of the steels are to be as follows;

Steel thickness	Width of the sub-size specimen
$6\text{mm} \le t < 9\text{mm}$	5 mm
$9\text{mm} \le t < 12\text{mm}$	7.5 mm

(2) In application to **202. 3** (5) of the Rules, in case where the capacity of impact tester limits the use of normal impact test specimens, sub-size specimens can be used provided that the test results using sub-size specimens are to comply with the requirements specified for the normal impact test specimens.

SECTION 3 Rolled Steels

301. Rolled steels for hull

1. Manufacturing process

(1) The term of "thermo-mechanical controlled processing($TMCP$)" in **301. 3** of the Rules is defined in the following **2** of this Guidance.

(2) The carbon equivalent value of higher strength steels supplied in $TMCP$ condition in Remarks (13) to **Table 2.1.6** of **301. 3** of the Rules is to comply with the requirements of **Table 2.1.3** of the Guidance.

Table 2.1.3 Carbon Equivalent of Higher Strength Steels supplied in TMCP Condition

Grade	Carbon Equivalent(%)	
	$t \leq$ 50 mm	50 $<$ t $\leq$ 100 mm
AH 32, DH 32, EH 32, FH 32	0.36 max.	0.38 max.
AH 36, DH 36, EH 36, FH 36	0.38 max.	0.40 max.
AH 40, DH 40, EH 40, FH 40	0.40 max.	0.42 max

(3) The cold cracking susceptibility (P_{cm}) calculated by following a formula instead of carbon equivalent of previous (2) may be required to be submitted when deemed necessary by the Society.

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

2. Heat treatment

The definition of heat treatment mentioned in Remarks (1) to **Table 2.1.8** and **Table 2.1.9** of **301. 4** of the Rules are as follows : (Refer to **Fig 2.1.2**)

(1) **As rolled, *AR***
This procedure involves the rolling of steel at high temperature followed by air cooling. The rolling and finishing temperatures are typically in the austenite recrystallization region and above the normalising temperature. The strength and toughness properties of steel produced by this process are generally less than steel heat treated after rolling or than steel produced by advanced processes.

(2) **Normalising, *N***
Normalising involves heating rolled steel above the critical temperature, A_{C3}, and in the lower end of the austenite recrystallization region followed by air cooling. The process improves the mechanical properties of as rolled steel by refining the grain size.

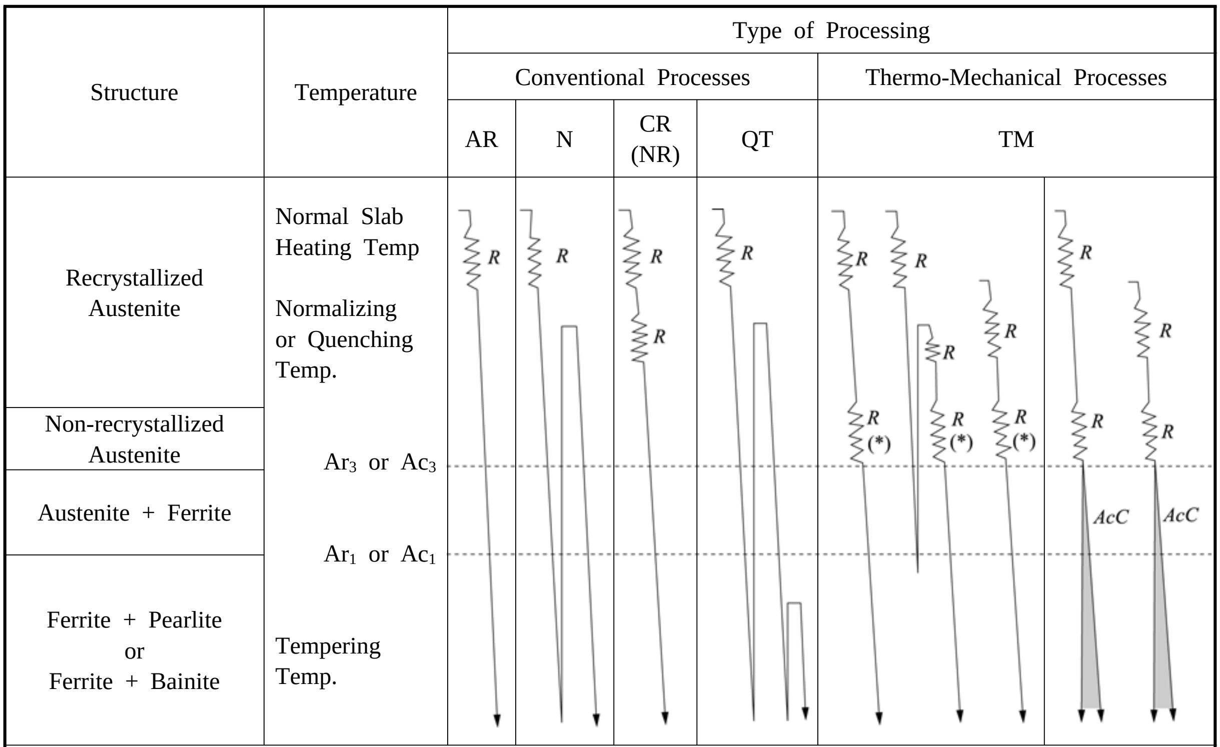
(3) **Controlled Rolling(Normalising Rolling), *CR*(*NR*)**
A rolling procedure in which the final deformation is carried out in the normalising temperature range, resulting in a material condition generally equivalent to that obtained by normalising.

(4) **Quenching and Tempering, *QT***
Quenching involves a heat treatment process in which steel is heated to an appropriate temperature above the A_{C3} and then cooled with an appropriate coolant for the purpose of hardening the microstructure. Tempering subsequent to quenching is a process in which the steel is reheated to an appropriate temperature not higher than the A_{C1} to restore toughness properties by improving the microstructure.

(5) **Thermo-mechanical Rolling(Thermo-mechanical Controlled Processing), *TM*(*TMCP*)**
This is a procedure which involves the strict control of both the steel temperature and the rolling reduction. Generally a high proportion of the rolling reduction is carried out close to the A_{r3} temperature and may involve the rolling in the dual phase temperature region. Unlike controlled rolled (normalised rolling) the properties conferred by $TM(TMCP)$ cannot be reproduced by subsequent normalising or other heat treatment. The use of accelerated cooling on completion of TM-rolling may also be accepted subject to the special approval of the Society.

(6) **Accelerated Cooling Processing, *AcC***

Accelerated cooling is a process, which aims to improve mechanical properties by controlled cooling with rates higher than air cooling in the range of Ar_3 temperature or below. However, direct quenching is excluded from accelerated cooling.



(Note)
R : Reduction AR : As rolled
N : Normalising CR(NR) : Controlled Rolling(Normalising Rolling)
AcC : Accelerated cooling
TM(TMCP) : Thermal-mechanical rolling (Thermal-Mechanical Controlled Process))
(*) : Where final rolling is carried out in austenite-ferrite duplex.

Fig 2.1.2 Rolled Processes for Rolled Steels for Hull

3. Selection of test samples

"Where specially approved by the Society" specified in **301. 6** (3) of the Rules may be dealt with as follows :

(A) Impact tests for *AH* 32 and *AH* 36 may be dispensed with as far as periodical examinations are carried out in the presence of the Society's Surveyor, except otherwise specially specified on the approval of the manufacturing process.

(B) “Periodical” in (A) above means once a month. In this case, impact tests specified are carried out for a set (3 pieces) of specimens and the results of which are to be confirmed in compliance with the specifications.

(C) In case where the result does not comply with the specifications, retests for the lot of steel material to which the failed specimens are belonging may be carried out in accordance with the requirements in **301. 10** of the Rules.

(D) Where the result of the retest does not comply with the requirements, impact tests provided in **Table 2.1.8** and **2.1.9** of **301. 6** of the Rules are to be carried out for all the steels manufactured thereafter. Where the test results during 6 months are confirmed as being satisfactory, the procedure specified in (B) above may be applied again.

(E) Every manufacturer is to submit the annual report compiling the results of the impact tests to the Society.

4. Surface inspection and verification of dimensions

The application to **301. 8** of the Rules is to be in accordance with the follows :

(1) The Society may require the surface inspection of rolled steels to confirm in compliance with the quality same as that of those days of approval of the manufacturing process.

(2) Criteria of surface inspection for flaw, pin hole and blow hole of steel plate is to comply with *KS D*0208 (Method of macro-streak-flaw test for steel).

(3) Tolerance for rolled steel other than under thickness tolerance for plate is to comply with *KS D* 3051(Dimensions weight and permissible variations of hot rolled steel bar in coil), *KS D* 3052(Shape, dimensions, weight and tolerance of hot rolled steel flats), *KS D*3500 (Dimensions weight and permissible variations of hot rolled steel plates, sheets and strips) and *KS D*3502 (Dimensions, weight and tolerances of hot rolled steel sections).

5. Quality and repair of defects

(1) Ultrasonic test procedures and acceptance criteria, specified in **301. 9** (2) of the Rules, are to be in accordance with either *EN* 10160 *Level S1/E1*, *ASTM A* 578 *Level C* or accepted standard at the discretion of the Society.

(2) The application to **301. 9** (3) of the Rules is to be in accordance with the followings:

(A) The surface defects may be removed by local grinding, in the presence of the Surveyor, provided:

(a) the nominal product thickness will not be reduced by more than 7 % or 3 mm, whichever is the less

(b) each single ground area does not exceed 0,25 m^2 and all ground areas do not exceed 2 % of the total surface in question.

(c) Ground areas lying opposite each other on both surfaces must not decrease the product thickness by values exceeding the limits as stated above (a)

(d) Complete elimination of the defects may be verified by a magnetic particle or dye penetrant test procedure at the Surveyor's discretion.

(e) Where necessary, the entire surface may be ground to a depth as given by the under thickness tolerances of the product. Ground areas lying in a distance less than their average breadth to each other are to be regarded as one single area.

(B) Local defects which cannot be repaired by grinding as stated above may be repaired with the Surveyor's consent by chipping and/or grinding followed by welding subject to the following conditions:

(a) Any single welded area shall not exceed 0,125 m^2 and the sum of all areas shall not exceed 2 % of the surface side in question. The distance between two welded areas shall not be less than their average width.

(b) The weld preparation must not reduce the thickness of the product below 80 % of the nominal thickness.

(c) the welding is to be carried out by an approved procedure, by the welder qualified by the Society, with approved electrodes, And the electrodes shall be of low hydrogen type and must be dried in accordance with the manufacturer's requirements and protected against rehumidification before and during welding.

(d) All weldings are to be of reasonable length and must have at least 3 parallel welding beads. Weld metal is to have at least 1.6 mm reinforcement, which is to be removed by grinding or chipping and grinding flush with the rolled surface, and is to present a workmanlike finish.

(e) The deposited metal must be sound without any lack of fusion, undercut, cracks and other defects which could impair the workability or use of the product. The finished products are to be presented to the Surveyor for acceptance. The soundness of the repair may be verified by ultrasonic, magnetic particle or dye penetrant methods at the Surveyor's discretion.

(f) Products which are to be supplied in a heat treated condition are to be welded prior to the heat treatment; otherwise, a new heat treatment may be required. Products supplied in the controlled rolled (*CR*) or as rolled (*AS*) condition may require a suitable heat treatment after welding. However, the post weld heat treatment may be omitted provided the manufacturer has demonstrated by a procedure test that the required properties will be maintained without heat treatment.

(g) For every welding repair the manufacturer must provide the Surveyor with a written report and a sketch showing sizes and location of the defects and full details of the repair procedure including the welding consumables, post weld heat treatment and non-destructive testing.

(C) Shapes may be conditioned by the manufacturer for the removal of surface defects in accordance with the following limitations.

(a) For material less than 9.5 mm thickness, in which the defects are not more than 0.8 mm in depth, the defects may be removed by grinding or chipping.

(b) For material 9.5 mm and over in thickness, in which the defects are not more than 1.6 mm in depth, the defects may be removed by grinding or chipping.

(c) Surface defects which are greater in depth than the limits shown above (a) and (b) may be removed by chipping or grinding and then depositing weld metal, in the presence of the Surveyor, subject to the following conditions.

(i) The total area of the chipped or ground surface of any piece is not to exceed 2 % of the total surface area of that piece.

(ii) After removal of any defect preparatory to welding, the thickness of the shape is not to be reduced by more than 30 % of the nominal thickness, nor is the depth of depression prior to welding to exceed 12.5 mm in any case.

(D) Before repair works prescribed in above (B) or (C) (c), the following documents are to be submitted to the Society for approval.

(a) Specifications of repairing procedure which state about kind of surface defects, the way of chipping, grinding and welding, etc.

(b) Reports on results of tensile test, bend test, impact test, macro-structure inspection and hardness test on test samples repaired according to the procedure specified in above (a).

302. Rolled steel plates for boilers

1. Selection of test samples

In application to **302. 6** of the Rules, selections of test samples in case that where the purchasers carry out normalizing specified in **302. 3** (2) of the Rules at their factories are to comply with the following requirements :

(1) The manufacturer is to carry out normalizing of the test sample conforming to the requirements by the purchaser. Where no requirements have been given by the purchaser, the manufacturer may carry out normalizing as considered preferable. In this case, the manufacturer is to inform the purchaser the conditions of normalizing which had been carried out.

(2) The test samples is taken from the steel plates normalized at purchasers factory or normalized together with the steel plates simultaneously.

(3) The mechanical properties obtained by the test specimens specified in (1) and (2) above are to comply with the provisions in **Table 2.1.12** of the Rules.

2. Marking

The markings related to the heat treatment of the steel plates provided in **302. 1** of the Rules are to be "*TN*" showing the case where normalizing is carried out for test samples only.

303. Rolled steel plates for pressure vessels

1. Selection of test samples

In application to **303. 6** of the Rules, selections of test samples in case that where the purchasers carry out normalizing specified in **303. 3** (2) of the Rules at their factories are to comply with the following requirements :

(1) The manufacturer is to carry out normalizing of the test sample conforming to the requirements by the purchaser. Where no requirements have been given by the purchaser, the manufacturer may carry out normalizing as considered preferable. In this case, the manufacturer is to inform the purchaser the conditions of normalizing which had been carried out.

(2) The test samples is taken from the steel plates normalized at purchasers factory or normalized together with the steel plates simultaneously.

(3) The mechanical properties obtained by the test specimens specified in (1) and (2) above are to comply with the provisions in **Table 2.1.15** of the Rules.

2. In **303. 7** (2) of the Rules, the application to "deemed necessary by the Society" is to be in accordance with the follows :

(1) Where the steel plates are used for spherical tanks or end plates, etc. of cylindrical tanks to contain cold liquefied gas at normal temperature, the impact test specimens are to be taken with their longitudinal axis normal (T direction) to the final direction of rolling.

(2) In previous (1), the specified values of the impact tests are to be in accordance with **Table 2.1.15** of the Rules.

3. Marking

The markings related to heat treatments of the steel plates provided in **303. 1** of the Guidance are to be "*TN*" showing case where normalising is carried out for test samples only.

304. Rolled steels for low temperature service

1. Mechanical properties

Minimum elongation where the *R*5 specimen instead of *R* 1*B* specimen mentioned in Remarks (2) to **Table 2.1.17** of the Rules is used may apply to the values of **Table 2.1.4** of the Guidance.

Table 2.1.4 Minimum Elongation (%)

Grade \ Thickness t (mm)	$t \le 5$	$5 < t \le 10$	$10 < t \le 15$	$15 < t \le 20$	$20 < t \le 25$
RL 24*A*, *RL* 24*B*, *RL* 27	22	24	26	28	30
RL 33	23	26	29	32	35
RL 37	21	24	27	30	33
RL 2*N*30, *RL* 3*N*32, *RL* 5*N*43		23	25	27	29
RL 9*N*53, *RL* 9*N*60	19	22		28	31

305. Rolled stainless steels

1. Application

In application to **305. 1** (3) of the Rules, the grade, chemical composition and mechanical properties of austenitic-ferritic stainless steel (hereinafter referred to as "duplex stainless steels") not exceeding 75 mm in thickness are to be as specified on the followings.

(1) **Grades and chemical composition**
The grade and chemical composition of duplex stainless steels are to comply with the provisions in **Table 2.1.5** of the Guidance.

Table 2.1.5 Grades and chemical composition

Grade	Chemical composition(%)								
	C	*Si*	*Mn*	*P*	*S*	*Ni*	*Cr*	*Mo*	*N*
*S*31803	0.030 max.	1.00 max.	2.00 max.	0.035 max.	0.015 max.	4.5～6.5	21.0～23.0	2.5～3.5	0.10～0.22
*S*32750						6.0～8.0	24.0～26.0	3.0～4.5	0.24～0.35

(2) **Mechanical properties**
The mechanical properties of duplex stainless steels are to comply with the provisions in **Table 2.1.6** of the Guidance.

Table 2.1.6 Mechanical properties

Grade	Tensile test			Impact test		
	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation(%) ($L=5.65\sqrt{A}$)	Test temp. (℃)	Average absorbed energy(J)	
					L	T
*S*31803	460 min.	640 min	25 min	- 20	41	-
*S*32750	530 min	730 min	25 min		-	27

2. Mechanical properties

In application to **305. 5** (1) of the Rules, the minimum yield strength specified in **Table 2.1.20** of the Rules may be altered to other values subject to the approval of the Society. In this case, minimum yield strength and indication symbol of heat treatment specified in **301. 2** of the Guidance will be added after the steel grade mark.(eg. : *RSTS* 316*LN* - 400*TM*)

308. High Strength Quenched and Tempered Steels for Welded Structures

1. Deoxidation practice and chemical composition

(1) In application to **308. 3** (3) of the Rules, the cold cracking susceptibility(P_{cm}) for evaluating weldability is to be calculated from the ladle analysis in accordance with the formula specified in **301. 1** (3) of the Guidance.

(2) The maximum P_{cm} for high strength quenched and tempered steels is to comply with the requirements of **Table 2.1.7** of the Guidance.

Table 2.1.7 Grades and Cold Cracking Susceptibility

Grades	Cold Cracking Susceptibility (P_{cm})(%)	
	Thickness t (mm)	
	$t \leq 50$	$50 < t \leq 70$
AH 43, *DH* 43, *EH* 43, *FH* 43	0.25 max.	0.27 max.
AH 47, *DH* 47, *EH* 47, *FH* 47	0.26 max.	0.28 max.
AH 51, *DH* 51, *EH* 51, *FH* 51	0.26 max.	0.28 max.
AH 56, *DH* 56, *EH* 56, *FH* 56	0.28 max.	0.30 max.
AH 63, *DH* 63, *EH* 63, *FH* 63	0.29 max.	0.31 max.
AH 70, *DH* 70, *EH* 70, *FH* 70	0.30 max.	0.32 max.

309. Stainless clad steel plates

1. Mechanical properties

Shearing strength test method complies with *KS D*0234.(Testing methods for clad steel)

2. Quality and repair of defects

Ultrasonic test generally complies with *KS D*3693 (Stainless-clad steel) and *KS D*0234.(Testing methods for clad steel)

310. Additional requirements for through thickness properties

1. Ultrasonic tests

(1) Ultrasonic test procedures and acceptance criteria, specified in **310. 7** (2) of the Rules, are to be in accordance with either *EN* 10160 *Level S1/E1*, *ASTM A* 578 *Level C* or accepted standard at the discretion of the Society

SECTION 4 Steel Tubes and Pipes

401. Steel tubes for boilers and heat exchangers

1. The definition of heat treatment mentioned in **Table 2.1.40** of **401. 3** of the Rules are as follows

(1) **Low temperature annealing** : An annealing treatment which is performed to eliminate internal stress or reduce quenching strain .

(2) **Normalizing** : Heating a ferrous alloy to a suitable temperature above A_3 or A_{cm} and then cooling in still air to a temperature substantially below A_1. Is performed to refine the crystal structure and eliminate internal stress.

(3) **Full Annealing** : An annealing treatment in which a steel is austenitized by heating to a temperature above the upper critical temperature (A_3 or A_{cm}) and then cooled slowly to room temperature.

(4) **Isothermal Annealing** : A process in which a ferrous alloy is heated to produce a structure partly or wholly austenitic, and is then cooled to and held at a temperature that causes transformation of the austenite to a relatively soft ferrite-carbide aggregate.

2. Chemical composition

The chemical composition of *RSTH*33 is to comply with the requirements given in **Table 2.1.8.**

Table 2.1.8. Chemical composition

Grade	chemical composition (%)				
	C	*Si*	*Mn*	*P*	*S*
RSTH 33	0.18max.	0.35max	0.25～0.60	0.035max	0.035max

3. Heat treatment and mechanical properties

(1) The heat treatment of *RSTH*33 is to be same as the requirement for *RSTH*35

(2) The mechanical properties of *RSTH*33 are to comply with the following requirements.

(a) *Tensile test* : The tensile test of *RSTH*33 is to comply with the requirements given in **Table 2.1.9.**

Table 2.1.9 Mechanical properties

Grade	Yield strength (N/mm^2)	Tensile strength (N/mm^2)	Elongation (%) ($L=5.65\sqrt{A}$)
RSTH 33	175 min	325 min	26(22) min

NOTES:
1. The values of elongation in parenthesis are applicable to the test specimens taken transversely. In this case, the sampling material is to be heated 600℃ to 650℃ after flattened and annealed in order to make it free from strain.
2. In case where test specimen of non-tubular section is taken from an electric-resistance welded steel tube, the test specimen is to be taken from the parts that do not include the welded line.

(b) *Flattening test* : The flattening test of *RSTH*33 is to comply with the requirements given in **401. 5** (2) of the Rules. However, the value of e is to be 0.09

(c) *Flanging test* : A section of steel tube which is taken from its end is to be turned over cold so as to have a flange, the outside diameter of which is not less than specified in **Table 2.1.10,** at right angle to the axis without cracking or showing flaw. In this case, the flanging test specimen is to be of length L such that after testing the remaining cylindrical portion is not less than 0.5D. But, this test is to be made only for *RSTH* 33 tubes having wall thickness not more than 1/10 of its outside diameter and not more than 5 mm.

Table 2.1.10 Outside Diameter of Flange after Flanging

Outside diameter of steel tube	Outside diameter of flange
Less than 63 mm	1.3 times the outside diameter of steel tube
63 mm and over	Outside diameter of steel tube + 20 mm

(d) *Crushing test* : Where required by the Surveyor, a crushing test is to be made on a section of steel tube of 65 mm in length which is to stand crushing longitudinally without cracking or splitting to the height specified in **Table 2.1.11.**

Table 2.1.11 Height of Section after Crushing

Thickness of steel tube t (mm)	Height of section after crushing
$t \leq 3.4$	19 mm or until outside folds are in contact
$t > 3.4$	32 mm

(e) *Reverse flattening test* : The reverse flattening test of *RSTH*33 is to comply with the requirements given in **401. 5** (4) of the Rules.
(f) *Hydraulic test* : The hydraulic test of *RSTH*33 is to comply with the requirements given in **401. 5** (5) of the Rules.

(3) The non-destructive inspection, substituted for the hydraulic tests, specified in **401. 5** (5), (d) of the Rules are to be either ultrasonic tests or eddy current tests.
(a) Ultrasonic test is to comply with *KS D* 0250 (Ultrasonic examination for steel pipes and tubes). Steel tubes and pipes not to be detected the signal equivalent to that to be detected at artificial holes of reference block from detection sensitivity UD are accepted.
(b) Eddy current test is to comply with *KS D* 0251 (Eddy current examination for steel pipes and tubes). Steel tubes and pipes not to be detected the signal equivalent to that to be detected at artificial holes of reference block from detection sensitivity EY are accepted.

4. Selection of test specimen

The test specimens of *RSTH*33 are to be taken in accordance with the following requirements, from each grade and each size which has been heat treated at the same time in the same heating furnace for heat-treated tubes and from each grade and each size for non-heat-treated steel tubes respectively.

(1) *Seamless steel tubes* : One sampling steel tube is to be selected from each lot of 100 tubes or fraction thereof, and one tension, one flattening and one flanging or flaring test specimens are to be taken from each of the sampling steel tubes.
(2) *Electric-resistance welded steel tubes* : In addition to the requirements in (1), one sampling steel tube is to be selected from each lot of 50 tubes or fraction thereof for 100 and less steel tubes, and each lot of 100 tubes or fraction thereof for 100 over steel tubes, and one reverse flattening test specimen is to be taken from each of the sampling steel tubes.

402. Steel pipes for pressure piping

1. Mechanical properties

“The non-destructive inspection deemed appropriate by the Society" specified in **402. 5** (4), (d) of the Rules are dealt with according to the provisions in **401. 3** (3) of the Guidance.

SECTION 5 Castings

501. Steel castings

1. Chemical composition

(1) In application to **501. 4** of the Rules, the chemical composition of special carbon steel casting with higher toughness requirements such as high holding power anchors etc. is to comply with the requirements of **Table 2.1.12** of the Guidance.
The suitable grain refining elements such as aluminium etc. are to be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

Table 2.1.12 Chemical Composition

Materials	Chemical composition (%)						
	C	*Si*	*Mn*	*P*	*S*	*Al*	others
Special carbon steel casting	0.23 max.	0.60 max.	1.60 max.	0.035 max.	0.035 max.	0.015～0.08	to comply with **Table 2.1.67** of the Rules

(2) "Subject to approval by the Society," referred in note (1), **Table 2.1.67** of **501. 4** of the Rules means only where welding procedure qualification test of the casting for welded construction with same chemical composition has been satisfied by the Society

2. Mechanical properties

In application to **501. 6** (2) of the Rules, the results of impact test is to comply with the requirements of **Table 2.1.13** of the Guidance.

Table 2.1.13 Impact Test Requirements

Grade	Impact test	
	Test temp.(℃)	Average absorbed energy(J)
RSC 410, *RSC* 450, *RSC* 480, *RSC* 560, *RSC* 600	0	27 min.

3. Surface and dimension inspection

The surface inspection of stern frames, rudder frames and crank shaft specified in **501. 8** of the Rules are to be dealt with as follows :

(1) The surface inspection of stern frame and rudder frame are to comply with the **Annex 2-2.**
(2) The surface inspection of crank shafts made of steel castings are to comply with the **Annex 2-3.**

4. Non-destructive inspection

The non-destructive inspection for steel castings specified in **501. 10** (1) and (2) of the Rules are to be dealt with as follows :

(1) The non-destructive inspection of stern frame and rudder frame are to comply with the **Annex 2-2.**
(2) The non-destructive inspection of crank shafts made of steel castings are to comply with the **Annex 2-3.**

5. Repair of defects

Repairs by welding for steel casting specified in **501. 11** (1), (b) of the Rules are to be dealt with as follows :

(1) Repairs by welding of crank throws made of steel castings are to comply with the **Annex 2-4.**
(2) Repairs by welding of steel alloy castings are to comply with **7.** (the preparatory tests) of the **Annex 2-4.**
(3) Repairs of steel castings such as stern frame, rudder frame and others intended for important parts of hull structure are to comply with the **Annex 2-2, 8.**

505. Stainless steel casting for propeller

1. Non-destructive inspection

(1) The liquid penetrant test of steel propeller casting specified in **505. 8** (1) of the Rules is to comply with **Annex 2-6.**
(2) The division of severity zones of steel propeller casting specified in **505. 8** (2) is to comply with the **Figs. 1** and **2** of **Annex 2-6.**

2. Repair of defects

In application to **505. 9** (4) of the Rules, the repair welding procedure is to comply with the followings

(1) The limits of repair welding are to comply with **Annex 2-6, 3** (2) to (4).
(2) **Repair welding procedure**
When steel propeller casting is repaired by welding in accordance with the previous (1), the following requirements apply.
(A) Before welding is started, a detailed welding procedure specification is to be submitted covering the weld preparation, welding positions, welding parameters, welding consumables, preheating, post weld heat treatment and inspection procedures to the Society. The welding procedure qualification tests are to carried out in accordance with following (3).
(B) All weld repairs are to be made by welders qualified as deemed appropriate by the Society.
(C) Welding is to be done under controlled conditions free from draughts and adverse weather.
(D) The welding consumables used in the welding procedure qualification tests are to be used. The welding consumables are to be stored and handled in accordance with the manufacturer's recommendations.
(E) The martensitic steels are to be furnace re-tempered after weld repair. Subject to prior approval of the Society, however, local stress relieving may be considered for minor repairs.
(F) On completion of heat treatment the weld repairs and adjacent material are to be ground smooth. All weld repairs are to be liquid penetrant tested.
(G) The foundry is to maintain records of welding, subsequent heat treatment and inspections traceable to each casting repaired. These records are to be reviewed by the Surveyor.
(3) **Welding procedure qualification test**
(A) *Preparation of test sample*
The test sample is to be as shown **Fig 2.1.3** of the Guidance. The edge preparation, in principle, to be V-shape and bevel angle is to be not less than 60°.
(B) *Non-destructive testing*
The test sample is to be visually inspected and liquid penetrant tested.
(C) *Macro-structure examination*
Two macro-sections shall be prepared. No pores greater than 3 mm and cracks in welded sections is permitted.

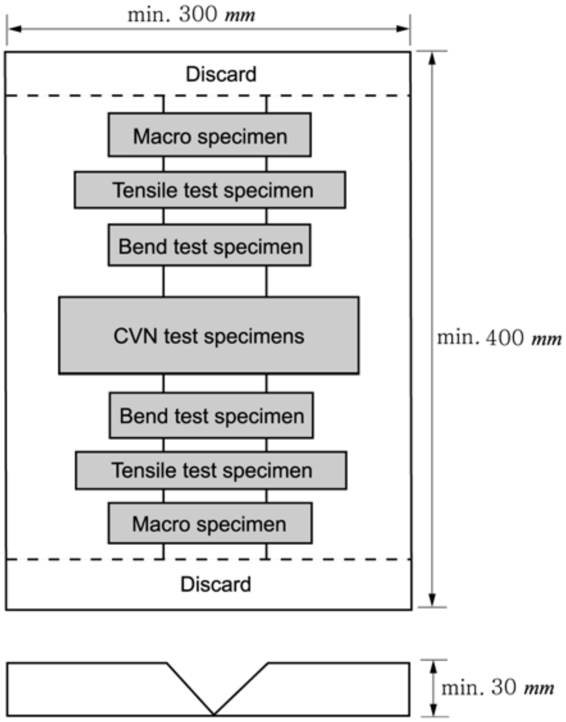


Fig 2.1.3 Test Sample for Butt Welding Test

(D) *Tensile testing*

Two flat transverse tensile test specimens shall be prepared. The tensile strength shall meet the specified minimum value of the base material. The location of fracture is to be reported, i.e. weld metal, HAZ or base material.

(E) *Bend testing*

Two transverse side bend test specimens shall be prepared . The former diameter shall be 4 x thickness except for austenitic steels, in which case the former diameter shall be 3 x thickness.

The test specimen, when visually inspected after bending, shall show no surface imperfections greater than 2 mm in length.

(F) *Impact testing*

Impact test is not required, except where the base material is impact tested. Two sets shall be taken, one set with the notch positioned in the center of the weld and one set with the notch positioned in the fusion line, respectively. The test temperature, and impact energy shall comply with the requirement specified for the base material.

(G) *Hardness testing*

One of the macro-sections shall be used for Hv5 hardness testing. At least three individual indentations in the weld metal, the HAZ (both sides) and in the base material. The values are to be reported for information.

506. Grey iron casting

1. Test samples

The chill test specified in **506. 6** (7), (d) of the Rules is to comply with *ASTM A*367-60(Standard test methods of chill tests of cast iron

SECTION 6 Steel Forgings

601. Steel Forgings

1. Manufacturing process

(1) The application to the requirements of **601. 3** (5), (a) of the Rules is to be in accordance with the following :
For crankshafts, where grain flow is required in the most favourable direction having regard to the mode of stressing in service, the proposed method of manufacture may require special approval by the Society. In such cases, tests may be required to demonstrate that a satisfactory structure and grain flow are obtained.

(2) The application to the requirements of **601. 3** (6) of the Rules is to be in accordance with the following :
These requirements apply to where gas workings are being carried out on the parts subjected to high stress such as mass removal of crankshaft. The data related to the processes (including preheating) and change of material due to working are to be submitted approval of the Society.

2. Heat treatment

The application to **601. 4** (1) of the Rules is to be in accordance with the following :

(1) Overall length of the product is not afforded to be heat treated simultaneously, it is requested that an approval of the surveyor be obtained beforehand. In this case, one set of test specimens is to be taken from each end of the product. Degree of heterogeneity in micro structure at the boundary zone caused by such a heat treatment is to be examined by the method deemed appropriate by the Society and ultrasonic test.

3. Mechanical properties

In application to **601. 6** Note (4) of **Table 2.1.82** of the Rules, the kinds and average absorbed energy for low alloys steel forgings intended to be used for important parts of machinery which the impact test may be required are to comply with the requirements of **Table 2.1.14** of the Guidance.

Table 2.1.14 Kinds and Average Absorbed Energy for Low Alloys Steel Forgings

Grades	Low Alloys Steel forging applied	Charpy V notch Impact test Average absorbed energy(J)	
		L	T
RSF 600AM	- Crankshaft - Forgings for gears	41 min.	24 min.
RSF 700AM		32 min.	22 min.
RSF 800AM		32 min.	20 min.
RSF1000AM		25 min.	16 min.
RSF1100AM		21 min.	13 min.
(Note) Impact tests are to be carried out at ambient temperature (18~25 $^\circ c$).			

4. Selection of test specimen

Selection of the test specimens for forgings subjected to surface hardening, except for carburizing, specified in **601. 7** (9) of the Rules and hardness test are to comply with the following requirements.

(1) **Induction hardened or nitrized gears**
(A) *Tensile and impact test specimens*
The test specimens are to be taken from the product after the final heat treatment and before the surface hardening in accordance with the requirements specified in **601. 7** (3), (b) through (e) of the Rules
(B) *Depth of the hardened layer*
(a) In case of induction hardening
The depth of the hardened layer of the product is to be measured when the gear is produced for the first time, and tests thereafter may be dispensed with.
(b) In case of nitrization
(i) Selection of test samples
Test samples are to be made of the same material as the product having been processed under the same conditions.
(ii) Size of test samples
The size of the test samples may be optional.
(iii)Heat treatments of test samples
The test samples are to be heat treated and nitrized simultaneously together with the product.
(iv)Measurements of depth of hardened layer
The depth of hardened layer is to be measured every lot of same nitrization.
(2) The hardness tests of the surface hardened gears are to be dealt with as follows :
(A) The requirements for the measurement of hardness after surface hardening processes have been required related to the Shafting and Power Transmission Systems in **Pt 5, Ch 3** of the Rules, and the measured hardness value is to be approved by the Society in relation of the approval of the manufacturing processes.
(B) In case where the measurements of hardness for every forged products are difficult owing to their sizes and shapes, the hardness may be measured at appropriate locations considered to be representative in respect to the value of hardness resulted from the approval tests for the manufacturing processes referred to in (A) above.

5. Surface inspection

The requirements specified in **601. 8** of the Rules are to be dealt with as follows :
(1) The surface inspection of steel forgings is to comply with the **Annex 2-5, 2.**

6. Non-destructive inspection

(1) Non-destructive inspection of steel forgings specified in **601. 10** (1) and (2) of the Rules are to be dealt with as follows:
(A) The non-destructive inspection of steel forgings are to comply with the **Annex 2-5, 2** and **3.**
(2) Operator intended to engage in the ultrasonic test is to have sufficient technique and experience for the testing of the forgings prescribed in **601. 10** (1), (C) of the Rules means the operators of ultrasonic tests who correspond to either of the following (A) or (B).
(A) Those who belong to the manufacturing factory of the steel forgings, occupied in ultrasonic test operation of steel forgings under the system of manufacturing schedule control and quality considered appropriate by the Society and deemed to have sufficient understanding of characteristics and nature of steel forgings.
(B) Those having official qualification considered appropriate by the Society.

7. Repair of defects

The application to **601. 11** (4) of the Rules is to be accordance with the following:
(1) Repair by welding in order of correct shapes for the portions not subjected to high stress may be accepted.

8. Additional requirements for crank shafts

(1) In **601. 14** (1) of the Rules, where the heat treatments of the crank throws of solid crank shafts are carried out without mass removal, one set of test specimens are to be taken from the removed mass of the central crank throw at the part neighboring the pin, as shown in **Fig 2.1.4** of the Guidance after the heat treatment.

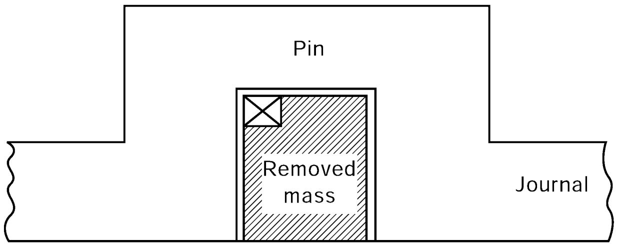

Fig 2.1.4 Location of Test Specimens

(2) In relation to the tests for semibuilt-up crank throws specified in **601. 14** (2) of the Rules, following requirements are to be complied with.

(A) Test specimens are to be taken, in general, one set from each arm in the longitudinal direction.

(B) In case where either the process of manufacturing those approved are intended to be changed or cranks larger than ever approved are intended to be manufactured, the tests instructed by the Society are to be newly carried out.

SECTION 7 Copper and Copper Alloys

702. Copper alloy castings

1. Manufacturing process

In application to **702. 3** (3) of the Rules, the stress relieving temperatures and holding times are to comply with the **Annex 2-6.**

2. Mechanical properties

The wording " specially required considering the design by the Society" in **Table 2.1.94,** Note 1 of **702. 5** of the Rules means in case where the requirements specified in **Pt 5, Ch 3, 305. 2** (1) (g) of the Guidance are applied.

3. Surface and dimension inspection

In application to **702. 7** (2) of the Rules, procedure for straightening of propeller casting is to comply with **Annex 2-6.**

4. Non-destructive inspection

(1) The liquid penetrant test of steel propeller casting specified in **702. 9** (1) of the Rules is to comply with **Annex 2-6.**
(2) The division of severity zones of steel propeller casting specified in **702. 9** (2) is to comply with the **Fig 1** and **2** of **Annex 2-6.**

5. Repair of Defects

In application to **702. 10** (5) of the Rules, repair welding of propeller castings is to comply with **Annex 2-6.**

SECTION 8 Aluminium Alloys

801. Aluminium alloys

1. Mechanical properties

(1) In connection with the **801. 5** (2) of the Rule, for verification of proper fusion of press welds for closed profiles, the Manufacturer has to demonstrate by drift expansion tests of closed as follows;

(a) Batches of five profiles or less shall be sampled one profile. Each profile sampled will have two samples cut from the front and back end of the production profile. The test specimens are to be cut with the ends perpendicular to the axis of the profile.

(b) Profiles with lengths exceeding 6 m shall be sampled every profile in the start of the production. The number of tests may be reduced to every fifth profile if the results from the first 3-5 profiles are found acceptable.

(c) The size of the specimen and testing procedure are to be in accordance with the requirements in **401. 5** (3) of the Rule.

(d) The sample is considered to be unacceptable if the sample fails with a clean split along the weld line which confirms lack of fusion.

2. Heat treatment

In application to **801. 4,** Note (2) of **Table 2.1.97** and **Table 2.1.98** of the Rules, definitions of the symbols used in temper condition are to comply with the requirements in **Table 2.1.19** of the Guidance.

Table 2.1.19 Definition of the symbols used in temper condition

Symbols	Definition (1)	Application(1)
O	Annealing	Applies to wrought alloys which are annealed to obtain the softest temper
H111, H112 and H116	Work hardened only.	Applies to products which are strain-hardened to achieve the strength desired without additional thermal treatment
H321	Stabilizing treatment after work hardened(2)	Applies to alloys that are strain-hardened and whose mechanical properties are stabilized by a low temperature thermal treatment that results in slightly lowered tensile strength and improved ductility.
T5	Artificial age hardening only(3)	Applies to alloys which are not cold worked after cooling from an elevated temperature shaping process
T6	Artificial age hardening treatment(3) after solution treatment(4)	Applies to alloys which are not cold worked after solution heat-treatment

Note
(1) Refer to KS D0049(Ferrous products－Heat treatments－Vocabulary) and KS D0004(Temper Designation for Aluminium and Aluminium Alloys)
(2) Stabilising is the relief of residual internal stresses by heating to a predetermined temperature, usually in the region of 250ºC, then cooling slowly.
(3) Age hardening is the increasing the hardness of an alloy by a relatively low-temperature heat treatment that causes precipitation of components or phases of the alloy from the supersaturated solid solution.
(4) Solution treatment is the heating and holding an alloy at a temperature at which one (or more) constituent enters into solid solution, then cooling the alloy rapidly to prevent the constituent from precipitating

3. Corrosion testing

In connection with the **801. 8** (3) of the Rule, corrosion testing methods and acceptance criteria are to be in accordance with the followings:

(1) **Micro-structure test**
Micro-structure test is to be in accordance with *ASTM B928* or equivalent standards agreed by the Society.

(2) **Corrosion tests**
(a) Corrosion tests with respect to exfoliation and intergranular corrosion resistance are to be in accordance with *ASTM G66* and *G67* or equivalent standards agreed by the Society.
(b) The samples have exhibited no evidence of exfoliation corrosion and a pitting rating of PB or better when subjected to the test described in *ASTM G66*.
(c) The samples shall also have exhibited resistance to intergranular corrosion at a mass loss no greater than 15 mg/cm^2, when subjected to the test described in *ASTM G67*.

4. Surface inspection and dimensional tolerance

"Dimension tolerance except those specified in previous (2)" given in requirements of **801. 8** (3) of the Rules may comply with a recognized national or international standard accepted by the Society. ⚓

CHAPTER 2 WELDING

SECTION 1 General

103. Special weldings

Production weld test for tanks of ships carrying liquefied gases in bulk, and tank circumference hull construction units.

1. Application

When welding is made for independent tanks of ships carrying liquefied gases in bulk, the production weld tests are to be carried out for each position of welding in accordance with the following requirements, in addition to the welding procedure qualification tests specified in **Ch 2, Sec. 4** of the Rules.

(1) For Type A independent tanks, the production weld test is to be carried out on at least one test sample for every 50 m of welding length of butt joints of principal structural members.
However, consideration may be given for reduction of the number of test sample or omission of the production weld test by taking into account the past records and the actual state of quality control system of the manufacturer.

(2) For Type B independent type tanks, the production weld tests are to be carried out on at least one test sample for every 50 m of welding length of butt joints of principal structural members. However, the number of test sample may be reduced to one test sample for every 100 m of welding length by taking into account the past records and the actual state of quality control system of the manufacturer. In this case, however, at least one or more test specimens are to be selected for one tank.

(3) For Type C independent type tanks, the production weld tests are to be carried out on at least one test sample for every 30 m of welding length of butt joints of principal structural members. However, the number of test sample may be reduced to one test sample for every 50 m of welding length by taking into account the past records and the actual state of quality control system of the manufacturer.
Remark : The definitions of type A, B and C independent tank comply with the requirements in the **Pt 7, Ch 5, 402. 4** of the Rules.

2. Test procedure

(1) The production weld tests are to be carried out for every welding length specified in the above **1.** for welded joints made under the same welding procedure, position of welding and welding conditions.

(2) Test samples are, in principle, to be located on the same line as the welded joints of the body and to be welded at the same time of welding of the body.

3. Kind of test

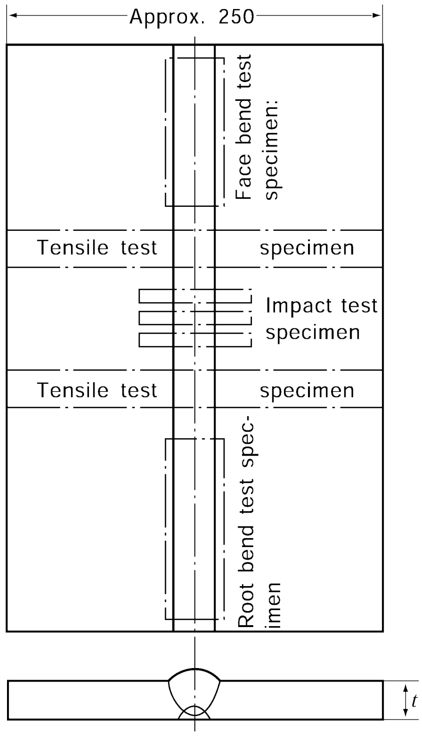
Kinds of the test are to be as given in **Table 2.2.1** of the Guidance.

Table 2.2.1 Kind of Test

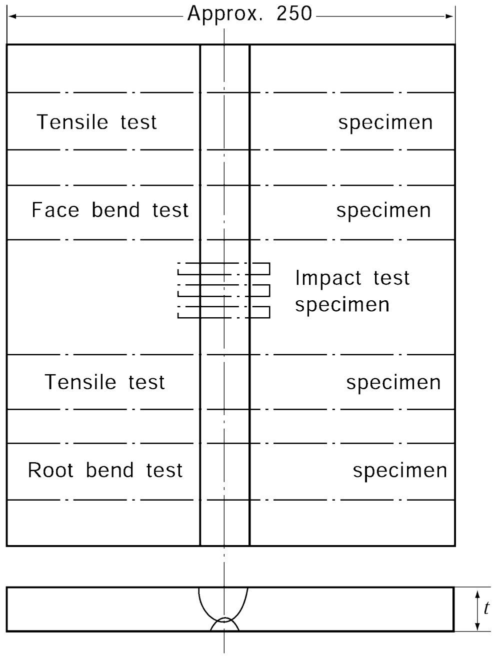
Material	Kind of Test
9 % Ni steel	Tensile test, bend test and impact test
Stainless steel	Tensile test and bend test
Aluminium alloys	Tensile test and bend test
Steel for low temperature service (excluding 9 % Ni steel)	Tensile test, bend test and impact test

4. Test assemblies

The shape and size of test assemblies are to be as shown in **Fig 2.2.1** of the Guidance. In cases of Type A and Type B independent tanks, tensile test may not be required.



(a) Test specimen of 9% *Ni* steel



(b) Test specimens of materials other than (a)

Fig 2.2.1 Test Specimens for Production Weld Test (Units : *mm*, thickness *t*)

5. Test specimens

(1) The shape and size of tensile test specimens are to be of the *R* 2*A* test specimen specified in **Table 2.2.1** of the Rules.
(2) The shape and size of bend test specimens are to be of the *RB* 1 or *RB* 2 test specimens specified in **Table 2.2.2** of the Rules. For test specimens with a thickness exceeding 19 mm, side bend test specimens are to be substituted for face bend and root bend test specimens.
(3) Impact test specimens are to be the R4 test specimen specified in **Table 2.1.3** of the Rules. In the impact test, one set of test specimens comprising three pieces are to be taken from every test assembly. The test specimens are to be taken alternately from the position "a" and from a position among "b" through "e" where the lowest value is recorded in the welding procedure qualification test, shows in **Fig 2.2.7** of the Rules. This means that one set of three test specimens are taken from a test assembly at the position "a", hence other set of three test specimens are taken in the subsequent test assembly from the position among "b" through "e" where the lowest value is recorded, and this procedure is repeated. No impact test specimens is required in cases of stainless steel and aluminium alloy.

6. Tensile test

(1) The tensile strength of 9 % Ni steels is to be 630 N/mm^2 or more.
(2) The tensile strength of stainless steels, aluminium alloys and steels for low temperature service (excluding 9 % Ni steels) is to be more than the specified value of the base metal.

7. Bend test

(1) The bend test specimen is to be bent up to an angle of 180° by a test jig with an inner radius of double (three and a third times for aluminium alloys) the thickness of the test specimen.
(2) The results of the bend test are to be as free from cracks exceeding 3 mm in length in any direction on the outer bent surface and from other significant defects.

8. Impact test

The specified values for the impact test are as given in **Table 2.2.8** of the Rules.

SECTION 3 Welding Works and Inspection

303. Application of welding consumables

Hydrogen cracking test specified in **303.** (4) of the Rules is to comply with *KS B* 0870 or equivalent.

304. Preparation for Welding

1. Tack welding

(1) The application to **304. 2.** (3) of the Rules is to be in accordance with the followings:

(A) The bead length of tack welds is to comply with **Table 2.2.2** of the Guidance.

Table 2.2.2 Bead length of tack welds

Steel grade	Kinds	Required Bead length	Remark
Higher strength- low alloy steel Steel casting	Ceq>0.36%	≥ 50 mm	including TMCP
	Ceq≤0.36%	≥ 30 mm	
grade E mild steel		≥ 30 mm	

(B) The pitch of tack welds should generally be approximately 400 mm or shorter.

305. Welding sequence and direction of welding

1. "The special approval of the Society" specified in **305. 3** of the Rules means the fillet weld to satisfy the following.

(1) The welding procedure qualification tests specified in **Sec. 4** of the Rules are accepted as successful.

(2) The welding consumables are to be those for welding with direction of vertical-downward approved by the Society.

(3) The joints of steels which welding with direction of vertical- downward is restricted, in general, is to comply with **Table 2.2.3-1** of the Guidance.

Table 2.2.3-1 Joints of Steels which Welding with Direction of Vertical Downward is restricted

Grade of steels	Welded joints
Rolled steels for hull	Joints of any E grade to any E grade(E, EH32 and EH36)
Rolled steels for low temperature services	Joints of any steels for low temperature service to any steels for low temperature service, Joints of any steels for low temperature service to any grade of steels
High Strength Quenched and Tempered Steels for Welded Structures	Joints of any high strength quenched and tempered steels to any high strength quenched and tempered steels, Joints of any high strength quenched and tempered steels to any grade of steels
Stainless clad steel plates	Joints of any stainless clad steel plates to any stainless clad steel plates, Joints of any stainless clad steel plates to any grade of steels
Rolled stainless steels	Joints of any rolled stainless steels to any rolled stainless steels, Joints of any rolled stainless steels to any grade of steels

(4) The zones where welding with direction of vertical- downward is restricted to hull structure, in general, is to comply with **Table 2.2.3-2** of the Guidance.

2. Notwithstanding the provisions of **1** (3) and (4), the other plans presented by shipbuilder or manufacturer may be accepted provided that the quality control system of shipbuilder and the importance of the welds are considered and deemed appropriate by the Society.

Table 2.2.3 Zones where Welding with Direction of Vertical Downward is restricted

Divisions	Locations and members
Fillet welded joints of primary strength member	- The welds of BHD(See **Fig 2.2.2,** (a) of the Guidance) - Cross hatching areas of **Fig 2.2.2,** (c) of the Guidance within connection areas of solid floor and girder - Connection areas of primary strength member and bottom shell, side shell, upper deck and double bottom tank top
Areas where water, oil and air tightness are required	- Boundary line where water, oil and air tightness are required - The area whose distance from the end of tight collar plate shall be at least 50mm (See **Fig 2.2.2,** (d) of the Guidance)
Areas where structural continuity is required or where high concentrated stress is expected	- The end of heavy bracket (See **Fig 2.2.2,** (b) of the Guidance) - Longitudinal strength members (See **Fig 2.2.2**, (e) of the Guidance)
Areas where high concentrated loads is expected	- The lower part of crane post - The lower part of crane pedestal
Specified areas	- The lower part of main engine : Connection areas of main engine girder and follr - Hatch cover : Connection area of side plate and end plate - Hatch coaming : Connection areas of main plate and top plate, Connection areas of main plate main plate - Shaft bed - Rudder horn : Connection areas of casting steels and normal strength steels - Rudder : Connection areas of rudder main pieces and rudder stocks, Connection areas of casting forging steels and normal strength steels - Bracket toe
(Note) Harmful defects such as cracks may, if necessary, be inspected by magnetic particle inspection or liquid penetrant inspection and, where the condition of the quality is serious, the welding work is to discontinue until measures for importance are planned.	

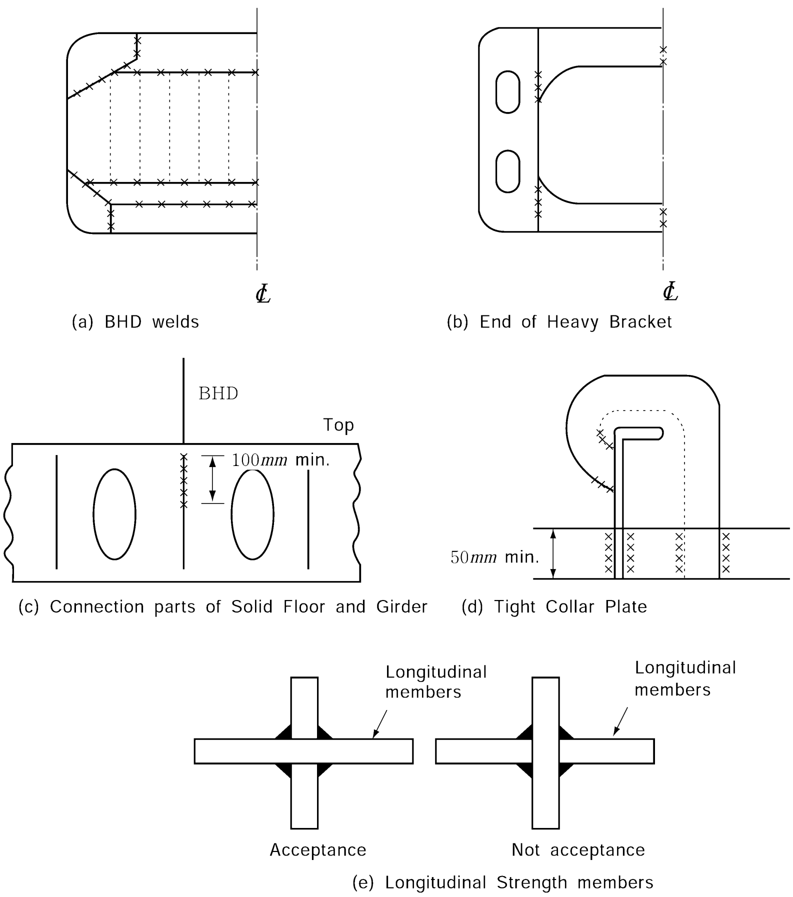


Fig 2.2.2 Zones where Welding with Direction of Vertical Downward is restricted (Cross hatching zone of Fig)

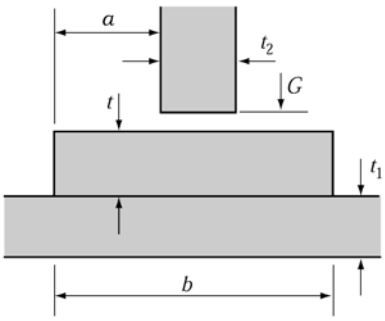
306. Main welding

1. In application of **306. 2** of the Rules, minimum preheating temperature for welding hull steels at low temperature is to comply with **Table 2.2.4** of the Guidance.

Table 2.2.4 Preheating for Welding Hull Steels at Low Temperature

Grades	Standard	
	Base metal temperature needed preheating	Minimum preheating temperature
Normal strength steels (*A*, *B*, *D*, *E*)	below 0℃	20℃ or over (1)
Higher strength steels (*AH* 32, *DH* 32, *EH* 32, *AH* 36, *DH* 36, *EH* 36)		
Note : (1) This level of preheat is to be applied unless the approved welding procedure specifies a higher level		

2. "The welding inserting a liner of suitable size" in **306. 8** of the Rules complies with the **Fig 2.2.3** of the Guidance.



(Notes)

1. Welding size is to comply with the following:
   $t_2 \leq t \leq t_1$
   $G \leq 2mm$
   $a = 5mm$ + fillet leg length
2. Not to be used in cargo area or areas of tensile stress perpendicular to liner

Fig 2.2.3 Fillet Welding inserting a Liner

309. Quality of welds

In **309. 3** of the Rules, the application to the non-destructive inspection specified elsewhere is to comply with **Annex 2-7.**

SECTION 4 Welding Procedure Qualification Tests(WPQT)

401. General

1. Application

In application to **401. 1** (2) of the Rules, the welding procedure qualification tests on materials for machinery installations are to be as follows.

(1) **Application**
(A) The requirements are to apply to the welding procedure qualification tests for boiler, pressure vessels and piping system.
(B) The requirements, other than this requirement, are to be in accordance with **Ch 2, Sec 4** of the Rules,

(2) **General requirements of WPQT**
(A) The manufacturers are to conduct the welding procedure qualification tests, if they plan to carry out for the first time the welding word as follows.
(i) Welding work for boiler, Class 1 and Class 2 pressure vessels
(ii) Welding work for principal components of machinery (the principal components specified in **Table 5.2.1** of **Pt 5, Ch 2** and **Ch 3** of the Rules) and piping system
(iii)Welding work using special materials
(iv)Welding work using special welding process
(B) Where the procedure qualification test is required, the following data and information in connection with the welding procedure qualification tests are, in general, to be submitted and reviewed. :
(i) Outline of plant facilities and equipment (outline of plant installations, type and number of important welding machines, outline of facilities for heat treatment and installations for test and inspection)
(ii) Qualification and number of welders
(iii) Production records of welded constructions
(iv) Data covering the welding quality control system and working process standards
(v) Welding procedure intended to be tested, and type or name of product to which the welding procedure is to be applied
(vi) Maximum plate thickness of above product, kind and specification of material
(vii)Draft proposal for welding procedure qualification tests(type of test, sampling procedure of test specimens and dimensions of test specimens etc, are to be specified)

(3) **Welding procedure qualification tests**
(A) Where procedure qualification test is required, the test assembly is to be welded in the same or similar environment and the qualification tests are to be carried out under the welding conditions given in the welding procedure specifications.
(B) The qualification test is to be carried out in the presence of the Society's surveyor.

(4) **Tests for butt and fillet welded joints**
(A) Kinds of test and number of specimens taken from test assembles
The kinds of test and number of specimens are to comply with **Table 2.2.5** of the Guidance.
(B) Test assemblies, test specimens and testing procedure
The dimensions and types of test assemblies and test specimens, and testing procedure are to comply with **Pt 2, Ch 2, Sec 4** of the Rules.

404. Butt welded joints

1. Tensile test

(1) In application to **404. 7** (1) (e) of the Rules, "lower toughness grade of steel" means grade *D* of **Fig 2.2.4**, (1) of the Guidance.
(2) In application to **404. 5** (2) of the Rules, "lower strength grade of steel" means grade *E* of **Fig 2.2.4**, (2) of the Guidance.
(3) "Where the consumables are avoidably applied" of **404. 5** (3) of the Rules means as follows.
(a) For the urgency of the corresponding work schedule
(b) For a small quantity of welding consumables with the rare frequency of the survey in future

Table 2.2.5 Kinds of Test and Number of Specimens taken from Test Assemblies

Divisions		Kinds of test and number of specimens taken from test assembles (1)(2)										
		Butt welded joints								Fillet welded joints		
		Visual inspection	radiographic examination	Macro-structure inspection	Hard-ness test	Tensile test	Bend test(4)	Impact test(5)(6) No. of sets	Impact test(5)(6) Position of notch	Macro-structure inspection	Visual insp.	Fracture test
Welding of boiler and pressure vessel	Boiler and class 1 pressure vessel	welding position	welding position	1	1	2	4	3	a, b, c	1	welding position	2
	Class 2 pressure vessel			1	1	2	4	-	-			
	Class 3 pressure vessel	The tests may be omitted according to the discretion of the Surveyor.										
Welding of piping(8)	The pipes for ordinary piping	welding position	welding position(3)	1	1	2	4	-	-	-	-	-
	The pipes used for high temperature and high pressure(7)			1	1	2	4	1	a			

Notes :

(1) In a case where special materials are used, special welding procedure is employed or where deemed necessary by the Society, the other tests or test conditions than those specified in this Section for the welding procedure qualification may be required

(2) For the welding procedure qualification tests on materials used at high temperature, the Society may require a creep test or high temperature tensile test.

(3) For those with an outer diameter of 130 mm or above, and with a design working pressure 30 kgf/cm^2 or above, and further with maximum design temperature over 400℃. However, even for the pipes having an outer diameter of less than 130 mm, radiographic examination depending on material and working condition may be required.

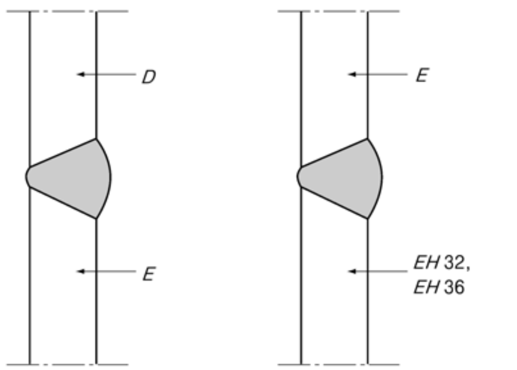
(4) Where preparation of the above test specimens is not possible depending on pipe's diameter, test specimens for face bend test and root bend test may be reduced to one set each for those of 19 mm thickness or less, and for side bend test may be reduced to one set for those of over 19 mm.

(5) Position of notch is as shown in **Fig 2.2.7** of the Rules.

(6) In a case where preparation of impact test specimens is not possible depending on pipe's dimensions or in case where welding is made with a base metal having no impact value required, impact test may be omitted subject to the approval of the Society.

(7) For steam pipes and flanges to be used in the place where the design pressure is not less than 30 kgf/cm^2 and the design temperature exceeds 400℃.

(8) Regardless of the above, as for those of less than 50 mm in outer diameter, test assemblies are to be prepared by two sets, one for tensile test, the other for macro, micro structure and hardness distribution examinations to be carried out respectively.



(1) Welded jonts of steels of same specified strength

(2) Welded joint of steels of same specified toughness(same specified impact test temperature)

Fig 2.2.4 Butt Welds between Different Steel Grades

2. Non-destructive inspection

In application to **404. 9** of the Rules, the relevant Rules for the acceptance criteria of non-destructive inspection are to be in accordance with the following. However, if agreed by the Society, imperfections detected by visual or non-destructive testing may be assessed in accordance with *ISO* 5817, class B.

(1) Rolled steels for hull - **Annex 2-7**
(2) High strength quenched and tempered steels for welded structures - **Annex 2-7** or **Pt 7, Ch 5** of the Rules
(3) Rolled steels for low temperature service - **Pt 7, Ch 5** of the Rules
(4) Materials for machinery installation(boilers, pressure vessel and piping system) - **Pt 5, Ch 5** or **Ch 6** of the Rules

3. Hardness test

The hardness test specified in **404. 10** of the Rules is to be as follows.

(1) Hardness distribution at positions shown in **Fig 2.2.5** of the Guidance is to be measured.

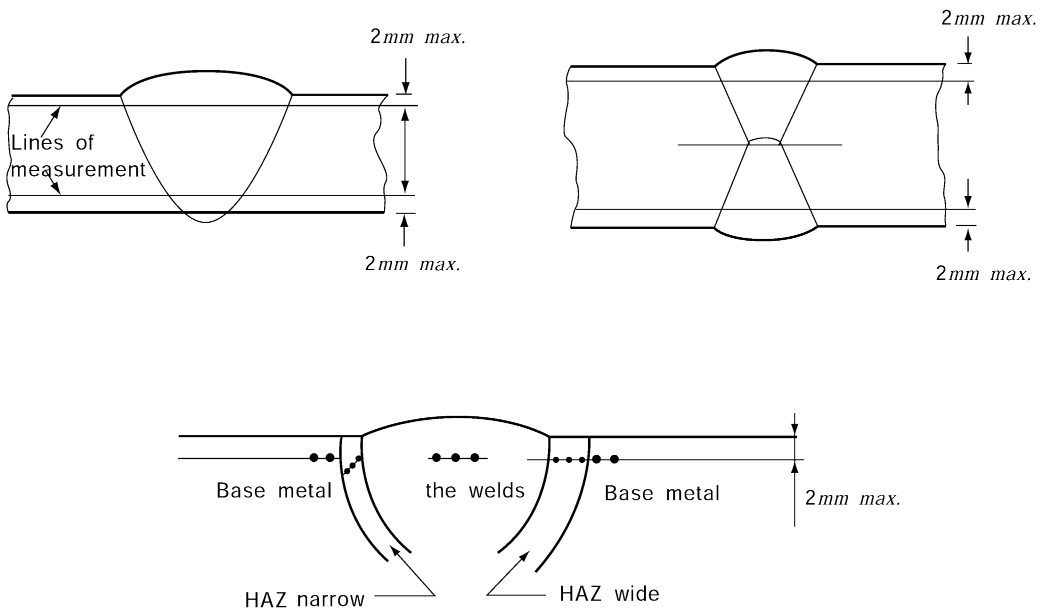


Fig 2.2.5 Hardness Test (Units : mm)

(2) Hardness test is required for steel for low temperature service(*Ni* steels).
(3) Measuring load is to be 10 kg vickers and measuring intervals are to be 1 mm.

405. Test for fillet welded joints

1. Hardness test

In application to **405. 7** of the Rules, hardness test, if required, is to comply with the following requirements :

(1) Hardness test is to be carried out in accordance with **Fig 2.2.6** of the Guidance.
(2) Hardness test is required for steel for low temperature service(*Ni* steels).
(3) Measuring load is to be 10 kg vickers and measuring intervals are to be 1 mm.

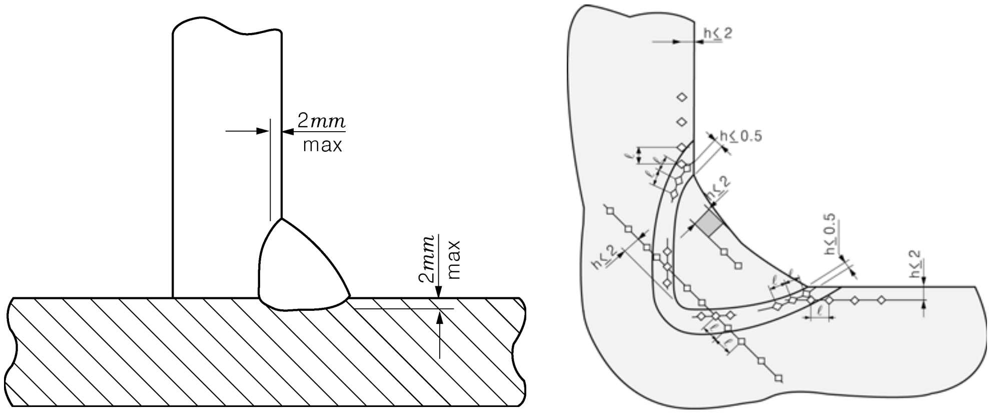

Fig 2.2.6 Hardness test for fillet welded joint (unit : mm)

407. Validity of qualified welding procedure specification

1. Validity of qualified welding procedure specification for aluminium alloy

In application to **407. 1** (3) of the Rules, the validity of qualified welding procedure specification for aluminium alloy is to comply with the followings:

(1) **General**

(a) The approval of the WPS obtained by a shipyard or a manufacturer is valid for welding in all its workshops under the same technical and quality control.

(b) All the conditions of validity stated below should be met independently of each other. Changes outside of the ranges specified may require a new welding procedure test.

(2) **Base metal**

(a) The aluminium alloys are grouped into three groups:

(i) Group A: aluminium-magnesium alloys with *Mg* content = 3.5 % (alloy 5754)

(ii) Group B: aluminium-magnesium alloys with 4% = *Mg* = 5.6 % (alloys 5059, 5083, 5086, 5383 and 5456)

(iii) Group C: aluminium-magnesium-silicon alloys (alloys 6005A, 6061 and 6082)

(b) For each Group, the qualification made on one alloy qualifies the procedure also for the other alloys of the same Group with equal or lower specified tensile strength after welding.

(c) The qualification made on Group B alloy qualifies the procedure also for Group A alloys.

(3) **Thickness**

(a) The qualification of a WPS carried out on a test assembly of thickness t is valid for the thickness range given in **Table 2.2.6.**

Table 2.2.6. Range of qualification for parent material thickness

Thickness of the test piece t (mm)	Range of approval
t ≤ 3	0.5t ~ 2t
3 < t ≤ 20	3 ~ 2t
t > 20	≥ 0.8t

(b) In case of butt-joints between dissimilar thickness, t is the thickness of the thinner material. In case of fillet joints between dissimilar thickness, t is the thickness of the thicker material.

(c) In addition to the requirements of **Table 2.2.6**, the range of qualification of the throat thickness a is given in **Table 2.2.7.**

Table 2.2.7. Range of qualifications for the throat thickness of fillet welds

Throat thickness of the test piece, a(mm)	Range of qualifications
a < 10	0.75a ~ 1.5a
a ≥ 10	≥ 7.5

(d) Where a fillet weld is qualified by means of a butt weld test, the throat thickness range qualified should be based on the thickness of the deposited weld metal.
(e) Where the majority of production work is fillet welding, an additional fillet weld test may be required.

(4) **Welding position**
Provided that comparable welding parameters are used for the included welding positions a test in any one position qualifies for welding in all positions except for vertical downwards (PG) position where in any case separate welding procedure test is required.

(5) **Type of joint**
The range of approval for the types of joint in relation to the type of joint used in the procedure qualification test is as follows:
(a) butt-joint welded from one side with backing qualifies also for welding from both sides with gouging;
(b) butt-joint welded from one side without backing qualifies also for welding from one side with backing, from both sides with gouging and from both sides without gouging;
(c) butt-joint welded from both sides with gouging only qualifies that condition,
(d) butt-joint welded from both sides without gouging qualifies also for welding from both sides with gouging and from one side with backing.

(6) **Welding process**
(a) The approval is valid only for the welding process used in the welding procedure test.
(b) It is not permitted to change a multi run deposit into a single run (or single run on each side) or vice versa for a given process.
(c) In the case of a multi-process procedure, the approval is only valid for applying the processes in the order used during the procedure qualification tests.
(d) For multi-process procedures each welding process may be approved separately or in combination with other processes.

(7) **Welding consumables**
The welding consumable used in the qualification tests qualifies:
(a) Approved welding consumables of the same strength as the consumable used in the procedure qualification tests.
(b) Approved welding consumables of higher strength than the consumable used in the procedure qualification tests.
(c) The qualification given to shielding gas and backing gas is restricted to the gas/gas mixture used in the welding procedure test, see *ISO* 14175 or other recognised standards for gas designations.

(8) **Type of current**
Changes in the type of current (*AC*, *DC*, pulsed) and polarity require a new welding procedure qualification.

(9) **Preheat and interpass temperature**
The lower limit of approval is the preheat temperature applied at the start of the welding procedure test. The upper limit of approval is the interpass temperature reached in the welding procedure test.

(10) **Post-weld heat treatment or ageing**
Addition or deletion of post weld heat treatment or ageing is not permitted except that artificial ageing for 6000 series alloys gives approval for prolonged natural ageing.

SECTION 5 Welders and Welder Performance Qualification Tests

501. General

1. Qualification of tack welder

Qualification tests for tack welder, specified in **501. 2** of the Rules, are to be carried out in accordance with the followings:

(1) Test assembly is to comply with **Fig 2.2.7** of the Guidance. The leg length of tack welds will not be more than 6 mm. The bead length of tack welds may be of about 50 mm

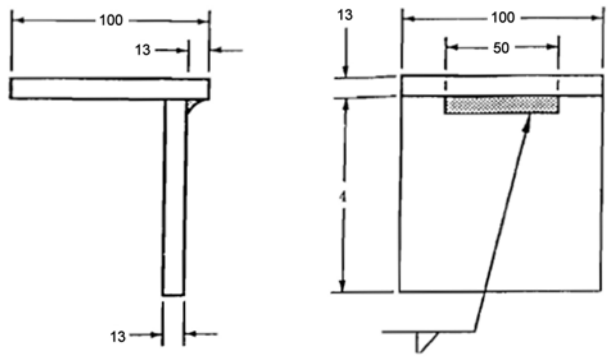

Fig 2.2.7 Type and dimension of test assembly for qualification of tack welder

(2) Visual inspection is to comply with **Pt 2, Ch 2, 503. 3** (2) of the Rules and fracture test is to comply with **Pt 2, Ch 2, 503. 3** (5) of the Rules.

2. Qualification of welding operator

Qualification of welding operator specified in **501. 3** of the Rules are to be carried out as follows:

(1) Test assembly is to comply with **Pt 2, Ch 2, 404. 3** of the Rules. The width of test assembly is not to be less than 300 mm and the length not to be less than 400 mm.
(2) Tests and inspections are to comply with **Pt 2, Ch 2, 503. 3** of the Rules.

3. Qualification of Gas welders

In application to **501. 4** of the Rules, the Qualification of gas welder is to comply with the followings:

(1) Gas welders are to have the qualification in **Table 2.2.12, 2.2.13** and **2.2.14** of the Rules according to the kind of welding material, plate thickness and welding position.
(2) Test assemblies used in the qualification test are to be of without backing, and gas welding rods are to be those for mild steel complying with a *KS D*7005 (Gas welding rods for mild steel) or those considered appropriate by the Society.
(3) To the kind and procedure of the qualification tests, the requirements specified in **Sec 5** of the Rules are to be applied. For roller bend test, the radii of the plunger of the jig and support roller are to be 10 mm, and the roller spans to be 53 mm.
(4) The qualifications for gas welders is to represent "symbol *G*".

4. qualification test for 9 % Ni steel

In application to **501. 4** of the Rules, the Qualification test for 9 % *Ni* steel is to comply with the followings:

(1) *Qualification*

(a) Welders are to have the qualification given in **Table 2.2.12, 2.2.13** and **2.2.14** of the Rules according to the actual welding procedure, and the thickness of welding materials and welding position. However, the requirements equivalent to mild steel apply to welder having the qualification for all positions.

(b) Any applications who intends to be qualified for each Grade and each Kind of 9 % *Ni* steel are to have performance qualification of the corresponding Kind and Grade of mild steel.

(c) The kinds of welding procedure are shield metal arc welding (hereinafter referred to "SMAW") and semi-automatic welding. The welders are to be pass the performance qualification test required according to the each applicable procedure.

(d) Notwithstanding the requirements given in (c), welder having the qualification for SMAW who intended to be qualified for semi-automatic welding may make the performance qualification test for semi-automatic welding of the corresponding and lower qualification with the his SMAW qualification by the Society's approval.

(2) *Kinds and procedures*

The welding procedure, welding position and test procedure for welders are to be in accordance with **Table 2.2.12** and **Table 2.2.13** of the Rules, respectively. In the test procedure for plates, longitudinal face bend test may be substituted for face bend test and root bend test, and longitudinal face bend test for side bend test. In the test procedure for pipes, radiographic inspection may be substituted for bend test.

(3) *Test assemblies and welding consumables*

(a) The test assemblies for plates are to be of *RL* 9*N*53 or *RL* 9*N*60 specified in **Ch 1** of the Rules or those considered equivalent by the society.

(b) The test assemblies for pipes are to be of *RLP* 9 specified in **Ch 1** of the Rules or those considered equivalent by the Society.

(c) Welding consumables used in the test are to be those for 9 % *Ni* steel recognized by the Society.

(4) *Test assemblies for plates*

The shape and size of the test assemblies of plates are to be in accordance with **Fig 2.2.8-1** of the Guidance.

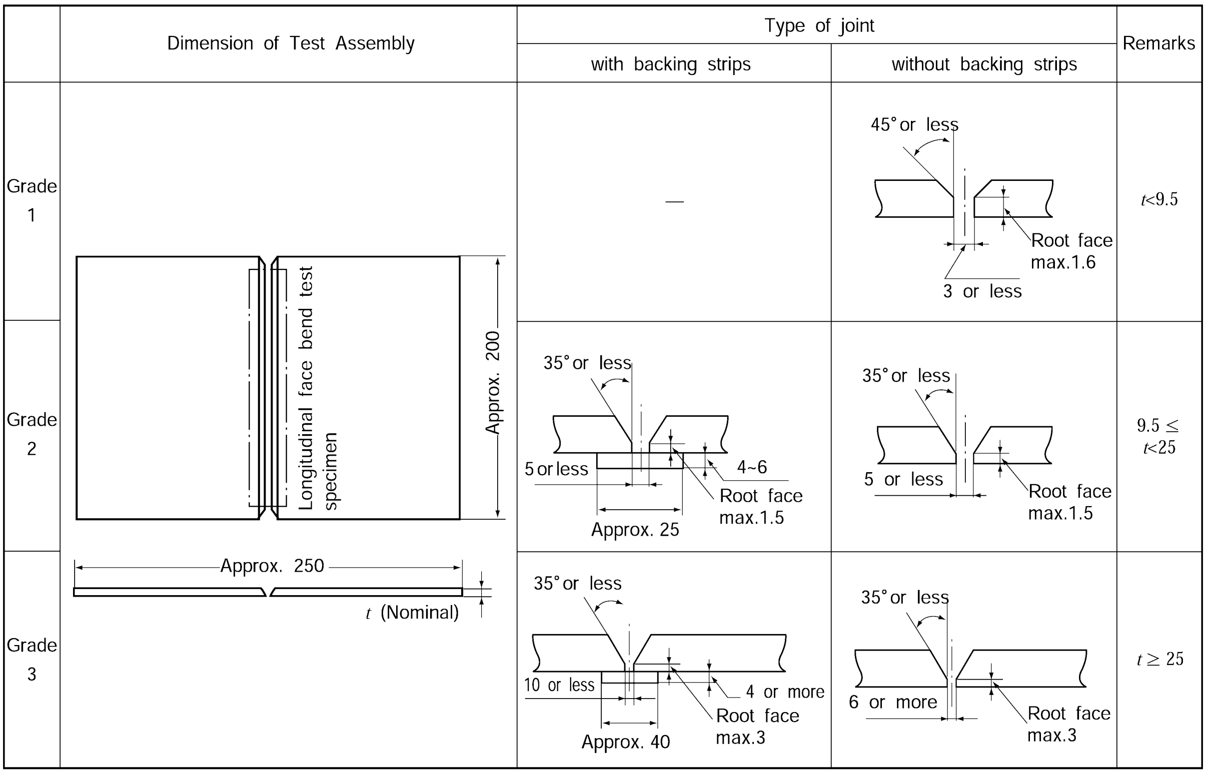

Fig 2.2.8-1 Dimensions and Types of Plate Test Assembly of the Qualification Test for 9% Ni Steel (Units : mm)

(5) *Test assemblies for pipes*

The shape and size of the test assemblies for pipe welding are to comply with **Fig 2.2.8-2** of the Guidance.

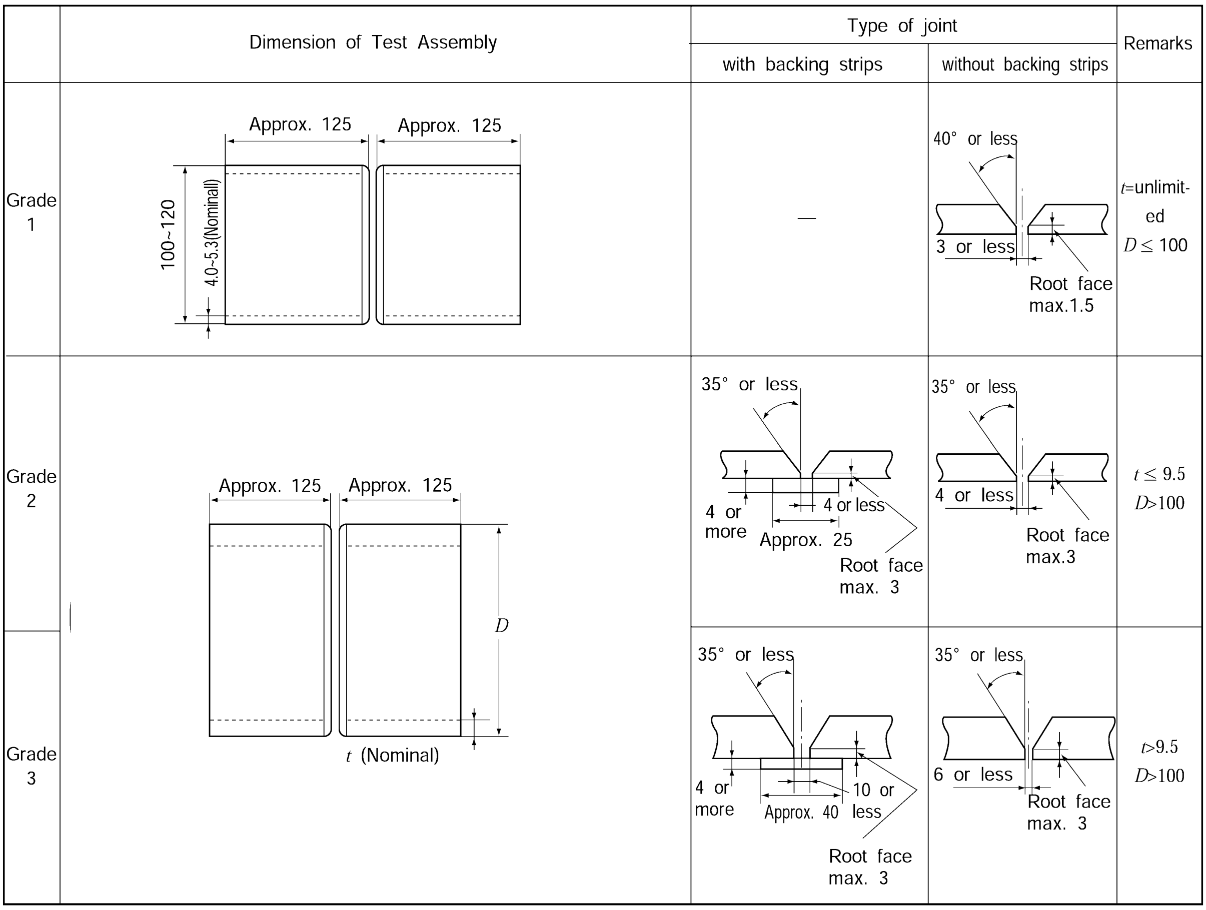

Fig 2.2.8-2 Dimensions and Types of Pipe Test Assembly of the Qualification Test for 9% Ni Steel (Units : mm)

(6) *Longitudinal bend test*

The shape and size of the longitudinal bend test specimen are to be of *RB* 1 in **Table 2.2.2** of the Rules. The test specimen is to be face bent jig shown in **Fig 2.2.1** or **2.2.2** of the Rules, and no cracks of 3 mm or more in length in any direction or no remarkable defect are to exist on the bent outer surface.

(7) *Radiographic test*

Radiographic test is to be carried out on all welding lines of the pipe test assemblies where no significant defects are to exist.

5. Application of equivalent standards

In application to **501. 5** of the Rules, it may be considered as equivalent for that the requirements of the standard internationally recognized(*AWS*, *ASME* etc) or considered as equivalent for those by the Society instead of the requirements for welder performance qualification of this section are applied.

503. Testing procedure

1. Test assembly

In application to **503. 2** (3) of the Rules, the test position, dimensions of test assembly and edge preparation for welding in 2G position are to comply with **Fig 2.2.9** of the Guidance.

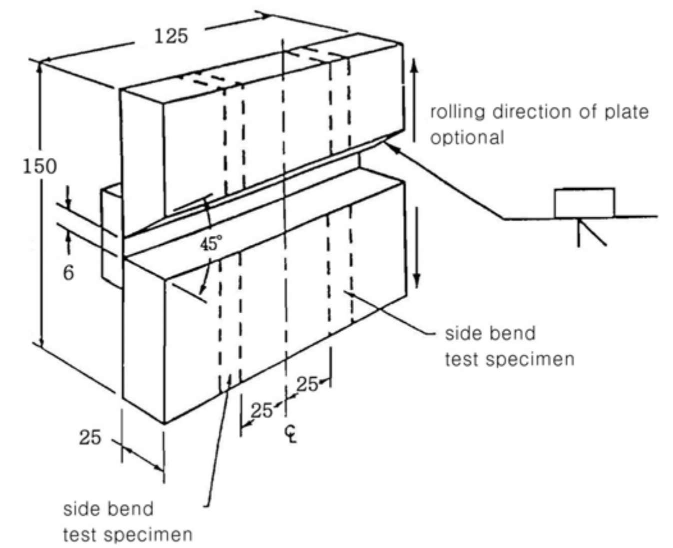

Fig 2.2.9 Dimensions of test assembly and edge preparation in 2G position

2. Radiographic testing

In application to **503. 3** (4) of the Rules, the radiographic testing procedures and acceptance criteria are to be in accordance with the followings :

(1) Where deemed the excess of the amount of heat input by visual inspection after welding, bend tests other than radiographic testing may be required additionally.

(2) The acceptance criteria for radiographic examination is to comply with the requirements specified in **3** (3) of **Annex 2-7**.

3. General requirements for qualification validity

(1) In application to **503. 6** (3) of the Rules, the suspension of welder qualification is to be in accordance with the followings.

(A) When welder quits his job from the company where he had employed and certified.

(B) Where there is some specific reason to question a qualified welder's ability.

(2) The effectiveness of qualification of welder who has switched his job may be considered as remaining, provided that the followings are satisfied

(A) It is to be proved that the welders have kept performance qualification at previous company.

(B) It is to be proved that welding condition is similar to those of previous company, and the welders carried out qualified work with acceptance welding performance.

(C) When welders have not used a particular process and equipment for a period excessing six months.

SECTION 6 Welding Consumables

602. Electrodes for manual arc welding for normal strength steels, higher strength steels and steels for low temperature service. General provision for tests

1. General provisions for tests

Hot cracking test specified in **602. 3** (1) of the Rules is to be done as follows :

(1) Test assemblies are to be T-joint shape as shown in **Fig 2.2.9** of the Guidance. The bottom of the vertical plate is to grind straight, and adhere closely on the surface of horizontal plate. All surface rough(凹凸) on the plate is to be removed before welding. The tack welds in preparation for the fillet welds is to make at the both ends of the plate. Three transverse stiffeners are to reinforce the horizontal plate to prevent welding deformation.

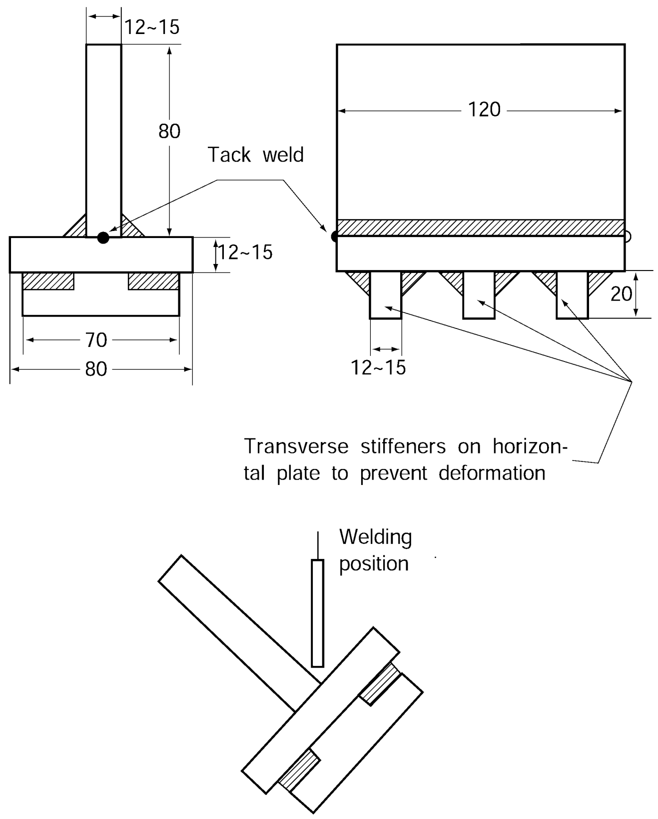

Fig 2.2.9 Hot Cracking Test Assemblies (Units : mm)

(2) The number of test assembly is to be prepared for every each diameter (4 mm, 5 mm or 6 mm) of electrodes.
(3) The fillet welding is to be carried out in the downhand position in one pass on each side and the welding current used is to be the maximum of the range recommended by the manufacturer for the size of electrode used.
(4) The second fillet weld is to be started immediately after the completion of the first fillet weld from the end of the test specimen at which the first fillet weld was finished. Both fillet welds are to be executed at a constant speed and without weaving.
(5) Length of fused electrode in hot cracking test are to be as shown **Table 2.2.9** of the Guidance according to the diameter of electrodes.
(6) After welding, the slag is to be removed from the fillet welds and after complete cooling, they are to be examined for cracks by a magnifying glass or by using penetrant fluids.

(7) The first fillet weld is then to be removed by machining or gouging and the second weld broken by closing the two plates together, subjecting the root of the weld to tension (See **Fig 2.2.10** of the Guidance). The weld is then to be examined for evidence of hot cracking.

Table 2.2.9 Length of Fused Electrode in Hot Cracking Test (Units : mm)

Diameter of electrode	Length of fused electrode	
	1st fillet	2nd fillet
4	Approx. 200	Approx. 150
5	Approx. 150	Approx. 100
6	Approx. 100	Approx. 75

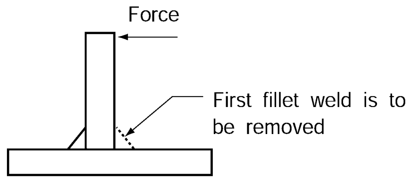

Fig 2.2.10 Hot Cracking Test

(8) There is to be no cracking in the fillet welds either superficial or internal except crater crack. ⚓

Annex 2-1 Guidance for seamless forged steel drums

1. Seamless forged steel drums

1.1 Application

(1) This requirements apply to seamless forged steel drums intended for boiler construction (hereinafter referred to as "forged drums").
(2) Items differing from those specified in this Guidance are to comply with the requirements in **Pt 2, Ch 1, Sec. 1** and **2** of the Rules.

1.2 Kind

The forged drums are classified into grades as given in **Table 1.**

Table 1 Kind

Grades
RSFB 410
RSFB 520

1.3 Mechanical properties

The forged drums are to comply with the following requirements.

(1) **Tensile test**
The forged drums are to conform to the requirements given by **Table 2** in the tensile test.

Table 2 Tensile Test

Grade	Yield strength (N/mm^2]	Tensile strength (N/mm^2]	Elongation (%) (L = 5D)	Reduction of area (%)
RSFB 410	205 min.	410 min.	24 min.	38 min.
RSFB 520	255 min.	520 min.	22 min.	40 min.

(2) **Bend test**
The test specimen is to stand being bent cold through l80 degrees without cracking outside to the inside radius given in **Table 3.**

Table 3 Bend Inside Radius

Grades	*RSFB* 410	*RSFB* 520
Bend inside radius	Tensile strength not more than 490 N/mm^2 : 6 mm	Tensile strength not more than 560 N/mm^2 : 9.5 mm
	Tensile strength over 490 N/mm^2 : 9.5 mm	Tensile strength over 560N/mm^2 : 16 mm

1.4 Selection of test specimens

(1) One set specimens each for tensile test and bend test are to be taken from each end of the forged drum, perpendicular to the centreline of the forged drum as well as opposite side each other with the centreline.
(2) Only in the case where ends of the forged drums are closed by reforging after machining, the test coupon may be cut from the forged drum before the reforging and heat treated simultaneously with the forged drum. In such a case, the forged drum is to be heat treated again after reforging. The latter heat treatment is to be annealing at a temperature above the critical temperature but not above the temperature of the first annealing when the former heat treatment is annealing, and to be same treatment as the former when the former heat treatment is normalizing and tempering. ⚓

Annex 2-2 Guidance for non-destructive examination of marine steel castings

1. Application

(1) The requirements in this Guidance is intended to give general guidance on the extent, methods and recommended quality levels applicable to the non-destructive examinations (NDE), of marine steel castings(hereinafter referred to as "castings") specified in **Pt 2, Ch 1, 501. 8** and **10** of the Rules, except in those cases where alternative criteria have been otherwise approved or specified.

(2) Although no detailed Guidance are given for machinery components, the requirements in this Guidance may apply correspondingly considering their materials, kinds, shapes and stress conditions being subjected.

2. Personnel Requirements

(1) Personnel carrying out NDE are generally to be qualified and certified to Level II of a recognised certification scheme such as *KS B ISO* 9712, *SNT-TC-1A*, *EN* 473, *ASNT Central Certification Program* (*ACCP*) or equivalent.

(2) Personnel responsible for the NDE activity including approval of procedures should be qualified and certified to Level III.

(3) Personnel qualifications are to be verified by certification.

3. Casting Condition

(1) Non-destructive examinations applied for acceptance purposes should be made after the final heat treatment of the casting. Where intermediate inspections have been performed the manufacturer shall furnish the documentation of the results upon request of the Surveyor.

(2) Castings are to be examined in the final delivery condition free from any material such as scale, dirt, grease or paint that might affect the efficacy of the inspection. A thin coating of contrast paint is permissible when using magnetic particle techniques.

(3) Unless otherwise specified in the order, magnetic particle test shall be carried out within 0.3 mm of the final machined surface condition for *AC* techniques or within 0.8 mm for *DC* techniques.

(4) Ultrasonic testing is to be carried out after the castings have been ground, machined or shot blasted to a suitable condition. The surfaces of castings to be examined should be such that adequate coupling can be established between the probe and the casting and that excessive wear of the probe is avoided.

4. Extent of Examinations

(1) **Castings to be examined**

Castings to be examined by NDE methods are identified in **Fig 1** to **Fig 3** of this Guidance. Criteria for the examination of other castings not identified in **Fig 1** to **Fig 3** of this Guidance will be subject to agreement.

(2) **Zones to be examined**

(A) Zones to be examined in nominated castings are identified in **Fig 1** to **Fig 3** of this Guidance. Examinations are to be made in accordance with an inspection plan approved by the Society. The plan should specify the extent of the examination, the examination procedure, the quality level or, if necessary, level for different locations of the castings.

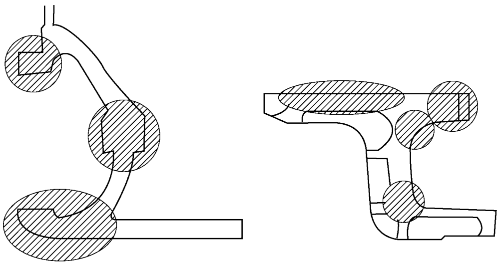
(B) In addition to the areas identified in **Fig 1** and **Fig 2** of this Guidance, surface inspections shall be carried out in the following locations:

(a) at all accessible fillets and changes of section,
(b) in way of fabrication weld preparation, for a band width of 30mm,
(c) in way of chaplets,
(d) in way of weld repairs,
(e) at positions where surplus metal has been removed by flame cutting, scarifying or arc-air gouging.

(C) Ultrasonic testing shall be carried out in the zones indicated in **Fig 1** and **Fig 3** of this Guidance and also at the following locations:

(a) in way of all accessible fillets and at pronounced changes of section,
(b) in way of fabrication weld preparations for a distance of 50 mm from the edge,
(c) in way of weld repairs where the original defect was detected by ultrasonic testing.
(d) in way of riser positions,

(e) in way of machined areas particularly those subject to further machining such as bolt hole positions.

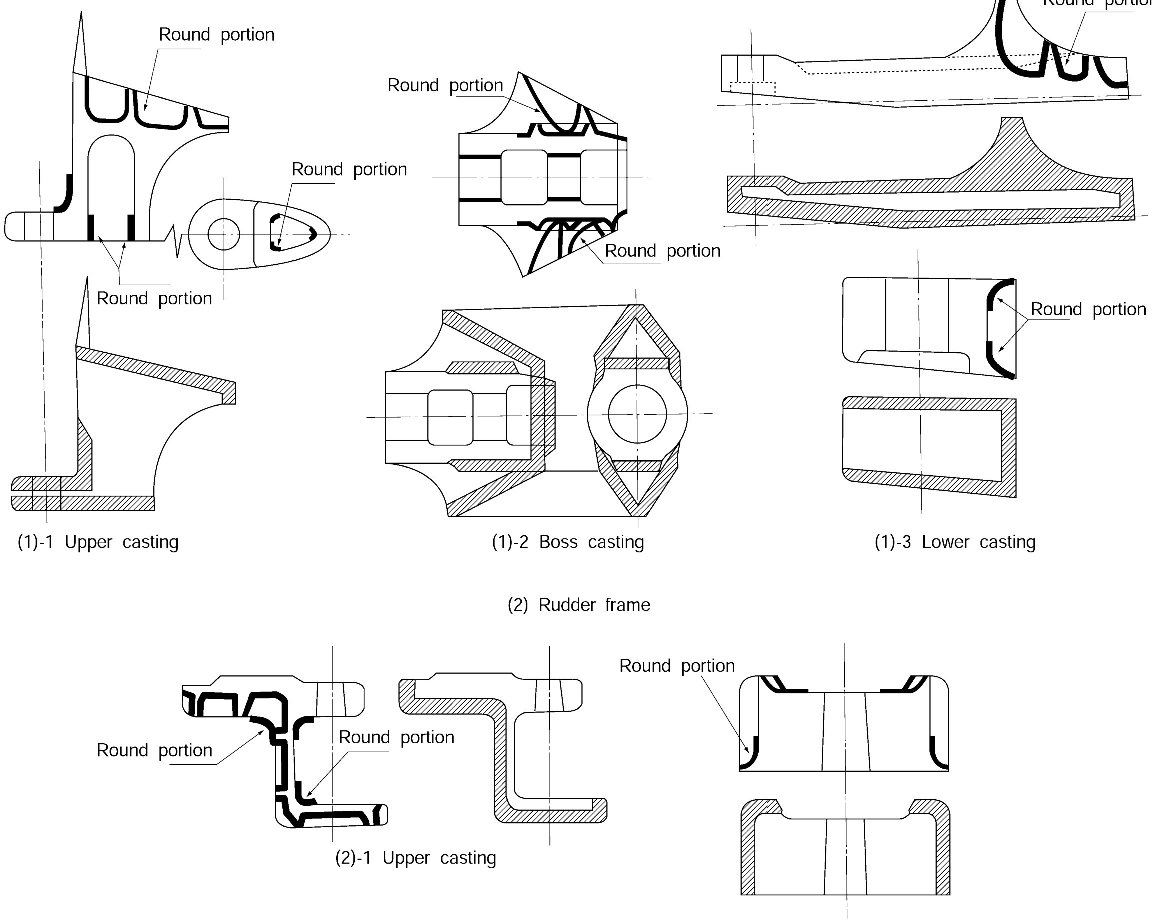


(a) Stern frame (b) Rudder frame

(Cross hatched area shows the outline drawings)

Fig 1 Detection Area for Non-destructive Test

(1) Stern frame



(Notes)
1. The entire edge preparation shown with the hatched area and the 100 mm width from the areas outside are to be subjected to the tests.
2. The portions shown in thick lines are also to be subjected to the test.
3. The portions of feeding heads and gates of the castings are to be subjected to the test.

Fig 2 Example of Application of Magnetic Particle Tests

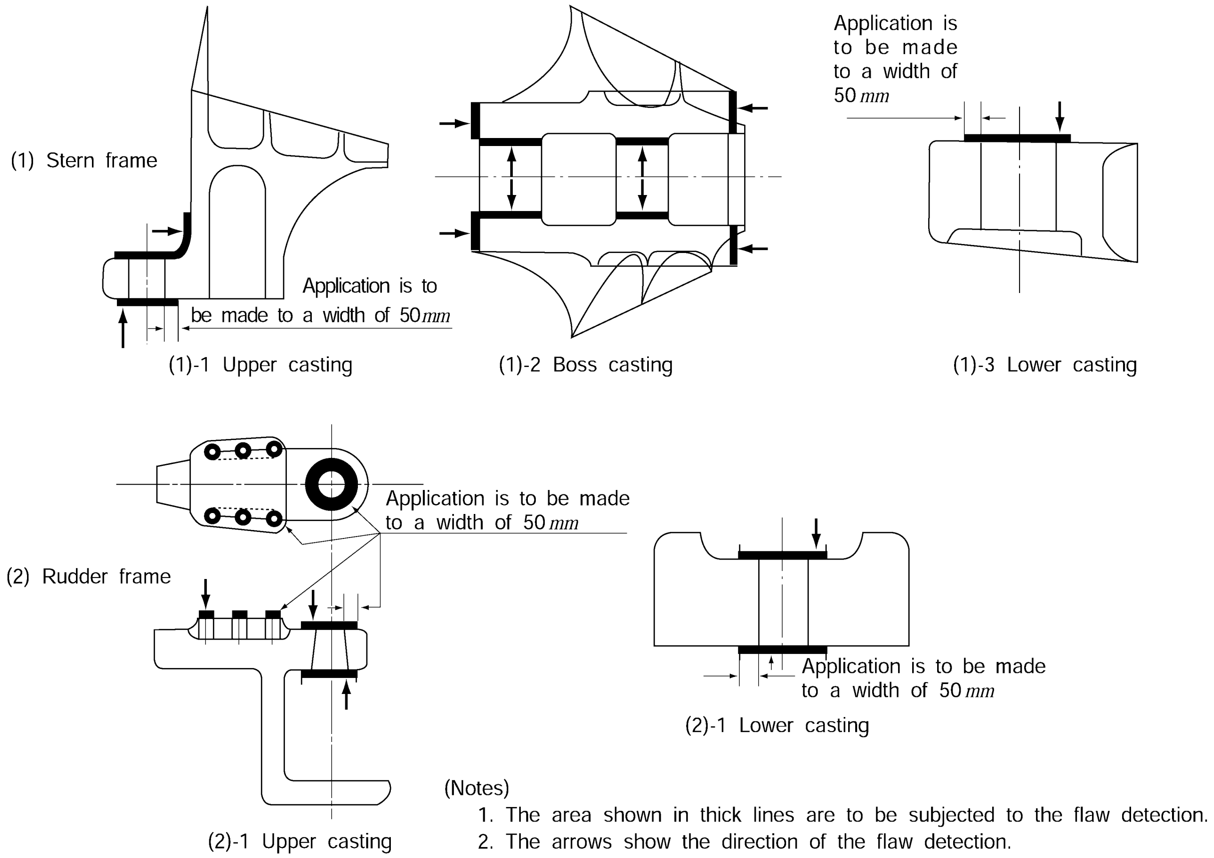


Fig 3 Examples of Application of Ultrasonic Tests

5. Examination Procedures

(1) **Visual Inspection**

Steel castings nominated for NDE shall be subjected to a 100% visual examination of all accessible surfaces by the Surveyor. Lighting conditions at the inspected surfaces shall be in accordance with a nationally or internationally recognised standard. Unless otherwise agreed, the visual and surface crack detection inspections are to be carried out in the presence of the Surveyor.

(2) **Surface Crack Detection**

(a) Magnetic particle inspection will be carried out in preference to liquid penetrant testing except in the following cases;
  (i) austenitic stainless steels,
  (ii) interpretation of open visual or magnetic particle indications,
  (iii) at the instruction of the Surveyor.

(b) The testing procedures, apparatus and conditions of magnetic particle testing and liquid penetrant testing other than those specified in this Guidance are to comply with recognised national or international standards.

(c) Magnetic particle testing is to be carried out along two directions so that magnetic field can be directed at an right angle each other by means of the wet prod methods or the yoke method. In making magnetization by the prod method, the distance between prods is to be 200～300 mm. The magnetizing current is to be DC 800～1200 A for the prod method. For the yoke method, lifting power is to be 4.5 kg for AC, 18 kg over for DC.

(d) For magnetic particle testing attention is to be paid to the contact between the casting and the clamping devices of stationary magnetisation benches in order to avoid local overheating or burning damage in its surface. Prods shall not be permitted on finished machined items. Note that the use of solid copper at the prod tips must be avoided due to the risk of copper penetration.

(e) When indications have been detected as a result of the surface inspection, acceptance or rejection is to be decided in accordance with **Art 6.**

(3) **Ultrasonic testing**

(a) Volumetric inspection in accordance with these guidance is to be carried out by ultrasonic testing using the contact method with straight beam and/or angle beam technique. The testing procedures, apparatus and conditions of ultrasonic testing are to comply with the recognised national or international standards. Radiographic testing may be carried out on the basis of prior agreement with the Society.

(b) Only those areas shown in the agreed inspection plan need to be tested. The plan should include those locations nominated in **4.** (2), (c) together with the scanning zones identified for the relevant casting in **Fig 1** to **Fig 3.**

(c) Ultrasonic scans are to be made using a normal probe of 1~4 MHz (usually 2 MHz) frequency. Whenever possible scanning is to be performed from both surfaces of the casting and from surfaces perpendicular to each other.

(d) The back-wall echo obtained on parallel sections should be used to monitor variations in probe coupling and material attenuation. Any reduction in the amplitude of the back-wall echo without evidence of intervening defects should be corrected. Attenuation in excess of 30dB could be indicative of an unsatisfactory annealing heat treatment.

(e) Machined surfaces, especially those in the vicinity of riser locations and in the bores of stern boss castings, should also be subject to a near surface (25 mm) scan using a twin crystal 0o probe. Additional scans on machined surfaces are of particular importance in cases where bolt holes are to be drilled or where surplus material such as 'padding' has been removed by machining thus moving the scanning surface closer to possible areas of shrinkage. Also, it is advisable to examine the machined bores of castings using circumferential scans with 70° probes in order that axial radial planar flaws such as hot tears can be detected. Fillet radii should be examined using 45°, 60°, or 70° probes scanning from the surfaces/direction likely to give the best reflection.

(f) In the examinations of those zones nominated for ultrasonic examination the reference sensitivity is to be established against a 6mm diameter disk reflector. Sensitivity can be calibrated either against 6mm diameter flat bottomed hole(s) in a reference block (or series of blocks) corresponding to the thickness of the casting provided that a transfer correction is made, or, as a preferred alternative, by using the *DGS* (distance-gain-size) method. The DGS diagrams issued by a probe manufacturer identify the difference in dB between the amplitude of a back wall echo and that expected from a 6mm diameter disk reflector. By adding this difference to the sensitivity level initially set by adjusting a back wall echo to a reference height eg 80 %, the amended reference level will be representative of a 6mm diameter disk reflector. Similar calculations can be used for evaluation purposes to establish the difference in dB between a back wall reflector and disk reflectors of other diameters such as 12 or 15 mm.

(g) Having made any necessary corrections for differences in attenuation or surface condition between the reference block and the casting any indications received from the nominated zones in the casting that exceed the 6mm reference level should be marked for evaluation against the criteria given in **6.** (3) below. Evaluation should include additional scans with angle probes in order that the full extent of the discontinuity can be plotted.

6. Acceptance Criteria

(1) **Visual Testing**

(a) All castings shall be free of cracks, crack-like indications, hot tears, cold shuts or other injurious indications. Thickness of the remains of sprues or risers is to be within the casting dimensional tolerance.

(b) Additional magnetic particle, dye penetrant or ultrasonic testing may be required for a more detailed evaluation of surface irregularities at the request of the Surveyor.

(2) **Surface Crack Detection**

(A) The following definitions relevant to indications apply:

(a) Linear indication : an indication in which the length is at least three times the width.

(b) Non-linear indication : an indication of circular or elliptical shape with a length less than three times the width.

(c) Aligned indication : three or more indications in a line, separated by 2 mm or less edge-to-edge.

(d) Open indication : an indication visible after removal of the magnetic particles or that can be detected by the use of contrast dye penetrant.
(e) Non-open indication : an indication that is not visually detectable after removal of the magnetic particles or that cannot be detected by the use of contrast dye penetrant.
(f) Relevant indication : an indication that is caused by a condition or type of discontinuity that requires evaluation. Only the indications which have any dimension greater than 1.5 mm shall be considered relevant.

(B) For the purpose of evaluating indications, the surface is to be divided into reference band length of 150 mm for level MT1/PT1 and into reference areas of 225 cm^2 for level MT2/PT2. The band length and/or area shall be taken in the most unfavourable location relative to the indications being evaluated.

(C) The following quality levels recommended for magnetic particle testing (MT) and/or liquid penetrant testing (PT) are;

Level MT1/PT1 - fabrication weld preparation and weld repairs.
Level MT2/PT2 - other locations nominated for surface crack detection in **Fig 1** and **Fig 2**

The allowable numbers and sizes of indications in the reference band length and/or area are given in **Table 1.** The required quality level should be shown on the manufacturer's inspection plan. Cracks and hot tears are not acceptable.

Table 1 Allowable number and size of indications in a reference band length/area

Quality Level	Max. number of indications	Type of indication	Max. number for each type	Max. dimension of single indication, (mm)(2)
MT1/PT1	4 in 150 mm length	Non-linear Linear Aligned	4(1) 4(1) 4(1)	5 3 3
MT2/PT2	20 in 22500 mm^2 area	Non-linear Linear Aligned	10 6 8	7 5 5

Notes:
(1) 30 mm min. between relevant indications.
(2) In weld repairs, the maximum dimension is 2 mm.

(3) **Ultrasonic testing**

(A) Acceptance criteria for ultrasonic testing are identified in **Table 2** as UT1 and UT2. As stated in **4** (2), (a), the quality levels applicable to the zones to be examined are to be identified on an inspection plan. The following quality levels are nominated for the castings identified in **Fig 1** and **Fig 3.**

(B) Level UT1 is applicable to:
(a) fabrication weld preparations for a distance of 50 mm,
(b) 50 mm depth from the final machined surface including bolt holes and fillet radii to a depth of 50 mm and within distance of 50 mm from the radius end,
(c) castings subject to cyclic bending stresses e.g. rudder horn, rudder castings and rudder stocks - the outer one third of thickness in the zones nominated for volumetric examination by **Fig 1** and **Fig 3.**
(d) discontinuities within the examined zones interpreted to be cracks or hot tears.

(C) Level UT2 is applicable to:
(a) other locations nominated for ultrasonic testing in **Fig 1** and **Fig 3** or on the inspection plan.
(b) positions outside locations nominated for level UT1 examination where feeders and gates have been removed
(c) castings subject to cyclic bending stresses - at the central one third of thickness in the zones of nominated for volumetric inspection by **Fig 1** and **Fig 3.**

(D) Ultrasonic acceptance criteria for other casting areas not nominated in **Fig 1** and **Fig 3** will be subject to special consideration based on the anticipated stress levels and the type, size and position of the discontinuity.

Table 2 Ultrasonic Acceptance Criteria for steel castings

Quality Level	Allowable disc shape according to $DGS^{(1)}$ (mm)	Max. number of indications to be registered$^{(2)}$	Allowable length of linear indications (mm)$^{(3)}$
UT1	> 6	0	0
UT2	12-15 > 15	5 0	50 0

Notes:
(1) DGS: distance-gain size.
(2) grouped in an area measuring 300 x 300 mm
(3) measured on the scanning surface

7. Reporting

(1) All reports of non-destructive examinations should include the following items;
(a) Date of testing.
(b) Names and qualification level of inspection personnel.
(c) Type of casting.
(d) Product number for identification.
(e) Grade of steel.
(f) Heat treatment.
(g) Stage of testing.
(h) Locations for testing.
(i) Surface condition.
(j) Test standards used.
(k) Results.
(l) Statement of acceptance / non-acceptance.
(m) Locations of reportable indications.
(n) Details of weld repairs including sketches.
(2) In addition to the items listed in **7** (1), reports of surface crack detection inspections are to include at least the following items:
(a) for liquid penetrant testing; the consumables used,
(b) for magnetic particle testing: method of magnetising, test media and magnetic field strength.
(3) In addition to the items listed in **7** (1), reports of ultrasonic inspection should include at least the following items:
(a) flaw detector, probes, calibration blocks and couplant used.

8. Rectification of Defects

(1) **General**
(a) Defects and unacceptable indications must be repaired as indicated below.
(b) In either case where, after removing defects, the steel castings are used as they are or repair welding are carried out approval of the surveyor is to be obtained. In case where the depth of the recess after removing the defects is not larger than 15 mm (or 10 % of the thickness of the steel castings, whichever is smaller) and the length is not more than 100 mm, the steel castings may be used without repair welding.
(2) **Rectification of Defects**
Defective parts of material are to be completely removed either by grinding, or by chipping and grinding, or by arc air-gouging and grinding and to be repaired by either of the following methods. Thermal methods of metal removal should only be allowed before the final heat treatment.

(A) **In case of no repair welding being carried out**

The portions required no repair welding after removing defects, are to be finished with a grinder etc. in accordance with the following:

(a) All grooves shall have a bottom radius of approximately three times the groove depth.

(b) Grooves and their vicinity are to be finished smoothly avoiding abrupt changes in configuration.

(c) The portions where defects have been removed are to be verified that they are free from harmful defects by liquid penetrant test or magnetic particle test after finishing of the surface configuration.

(B) The portions required repair welding are to be suitably shaped and verified that they are free from harmful defects by nondestructive tests specified in (2) (A) (c) above and also repaired in accordance with the requirements in **3.** of this Appendix. Weld repairs should be suitably classified as follows.;

(a) *Major repairs*

(i) where the depth is greater than 25 % of the wall thickness or 25 mm whichever is less,

(ii) where the total weld area on a casting exceeds 2 % of the casting surface noting that where a distance between two welds is less than their average width, they are to be considered as one weld.

(iii) Major repairs require the approval of the Society before the repair is carried out. The repair should be carried out before final furnace heat treatment.

(b) *Minor repairs*

(i) where the total weld area (length x width) exceeds 500 mm^2

(ii) Minor repairs do not usually require the approval of the Society but should be recorded on a weld repair sketch as a part of the manufacturing procedure documents. These repairs should be carried out before final furnace heat treatment.

(c) *Cosmetic repairs*

(i) all other welds.

(ii) Cosmetic repairs do not require the approval of the Society but should be recorded on a weld repair sketch. These repairs may be carried out after final furnace heat treatment but are subject to a local stress relief heat treatment.

(3) **Procedure of repair welding**

The procedure of repair welding is to be as follows.

(A) **Welders**

Welders intended to engage in repair work by welding are to pass the qualification tests of the Society.

(B) **Welding consumables**

The welding consumables are to be either low hydrogen type approved by the Society or those deemed equivalent.

(C) **Preheating**

(a) In cases where the carbon equivalent of the steel castings exceeds 0.44 %, the portions of repair welding and their vicinity are to be preheated to a temperature higher than 200°C. In this case, the carbon equivalent is to be calculated by the following formula.

$$C_{eq}(\%) = C + \frac{Mn}{6} + \frac{Si}{24} + \frac{Ni}{40} + \frac{Cr}{5} + \frac{Mo}{4} + \frac{V}{14}$$

(b) Even in case where carbon equivalent is 0.44 % or less, preheating may be required taking into account the shape and size of the steel castings.

(D) **Position of welding**

The positions of welding are to be as given in the following **Table 3** in general.

Table 3 Position of Welding

Kind \ Position welding	Flat	Vertical	Horizontal	Overhead
Manual welding	○	○	○	○
Semi-automatic welding	○	—	○	—

(E) **Post weld heat treatment**

(a) Post weld heat treatment may be exempted in the following cases, provided that the carbon equivalent does not exceed 0.44 %.

(i) In case where the depth of chipping after the removal of defects is not more than 25 mm (or 20 % of the thickness, whichever is smaller) and the length is not more than 200 mm.

(ii) In cases where the depth of chipping after the removal of defects is not more than 15 mm and also the area is not more than 250,000 mm^2

(b) Post weld heat treatment is to be carried out in furnaces. The holding temperature is to be 550℃ ~ 650℃ and the period is to be not less than one hour per every 25 mm of welding depth. In case where annealing in furnace is impossible depending on the final condition of the steel castings to be finished, etc. or where the welding depth is not more than 50 mm as well as the length is not more than 300 mm, partial post weld heat treatment may be accepted as an alternative. By the partial post weld heat treatment, the welded portions and their vicinity within 100 mm therefrom are to be heated to a temperature not lower than 600℃ and kept at the temperature in a period not less than 10 minutes per every 25 mm of the welding depth, and then to be cooled gradually.

(F) **Finishing after repair welding**

The portions repaired by welding are to be finished by grinding, etc. so that inspection can be available.

(G) **Inspection after repair welding**

Parts which are repaired should be examined by the same method as at initial inspection as well as by additional methods as required by the Surveyor. ⚓

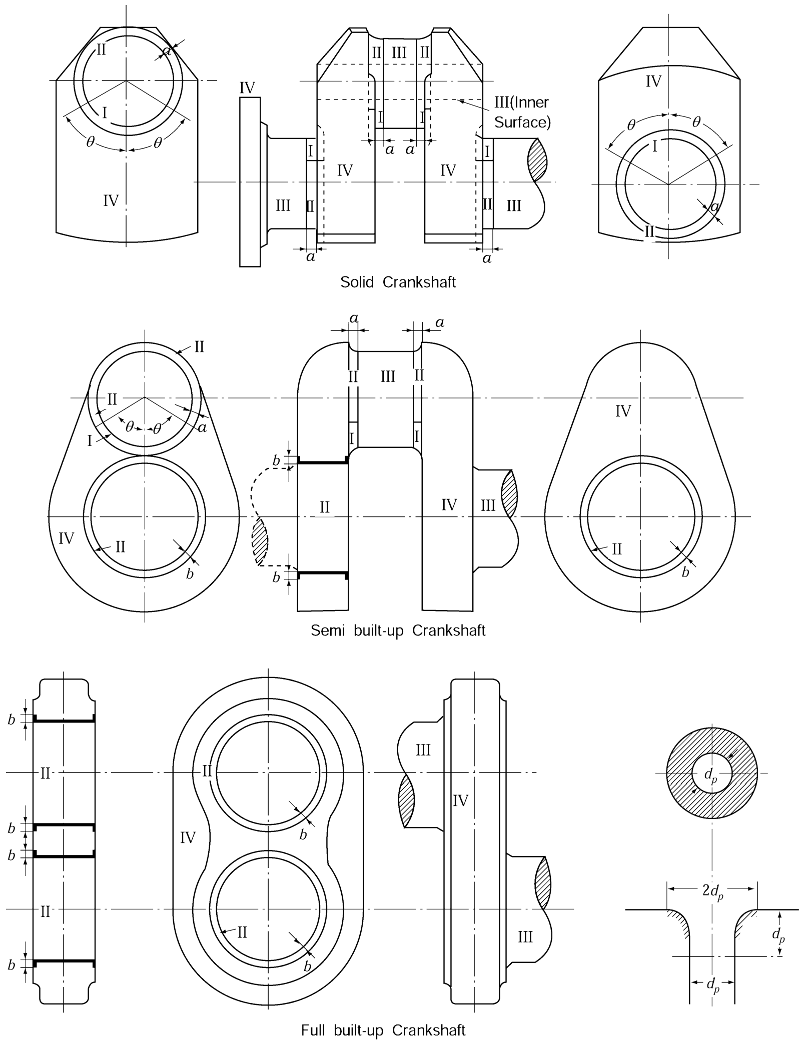
Annex 2-3 Guidance for surface inspection of cast steel crankshafts

1. Application

(1) This Guidance provides for the surface inspection of the cast steel crankshaft to be carried out on completion of machining (for shrunk parts, before shrinkage).
(2) The surface inspection is to be carried out by the methods specified in **3.** Where defects were found as a result of the inspection, the Surveyor is to decide pass or rejection of the crankshaft by the standards for allowable limit of defects prescribed in **6.**
(3) The inspection during the intermediate stage under construction is to be carried out actively by the manufacturer. The inspection methods are prescribed in **4.**
(4) NDE personnel requirements and inspection plans are to comply with the requirements specified in **Annex 2-2, 2** and **4** (2) (a) of this Guidance.

2. Divisions for inspection surface

The inspected surface of the crankshaft is divided into the following I to IV zones as shown in **Fig 1.** The inspection methods and standards are specified depending on the zones respectively.



(Notes)
1. Where the crankpin or journal has oil holes, the circumferential surface of the oil holes should be divided into division II (See the figure).
2. d ; Diameter of crankshaft, θ = 60°, a = 0.1d, b = 0.05d (but not less than 25 mm)

Fig 1 Divisions for Inspection Surface

3. Methods of inspection

(1) The surface is to be inspected as under in accordance with Divisions for inspection surface prescribed in **2.** But where CC defects (refer to **Table 1**) have been detected as a result of the inspection, the Surveyor may demand ultrasonic inspection additionally.

Kinds	Inspections
Zone I and II	Magnetic particle inspection or dye penetrant inspection
Zone III and IV	Visual inspection

(Notes)

1. Regarding the parts used as forged or cast condition, it is to be subjected to magnetic particle inspection notwithstanding the above requirement.
2. Regarding the Zone III of the crankshaft to which quenching and tempering heat treatments are applied, or the same zone of the crankshaft to which surface hardening treatment is applied, it is to be subjected to either magnetic particle inspection or dye penetrant inspection notwithstanding the above requirement.

(2) The methods of magnetic particle inspection, dye penetrant inspection and visual inspection are to be as deemed appropriate by the Society.

4. Inspection during intermediate stage

(1) The manufacturer is recommended to carry out actively ultrasonic inspection for the crankshaft at the appropriate stage during the manufacturing process and prove that the crankshaft has no harmful defects internally.
(2) The manufacturer should carry out actively the surface inspection at each stage under production. As the results when harmful defects of the material were found, the manufacturer is to inform the Surveyor of the facts and obey his instruction. Regarding cast steel crankshafts, when accepted by the Surveyor, defects can be remedied by welding according to the **Annex 2-4.**
(3) Regarding the crankshaft which surface hardening treatment is taken, the manufacturer is actively to inspect the surface. The records of surface inspection are to be submitted to the Surveyor when he requires.

5. Standards for surface inspection

(1) When defects have been detected as a result of the surface inspection prescribed in **3**, pass or rejection is to be decided by the following **6**, considering the results of the inspection of **4.** But even those which have failed to comply with these limits may be taken as passed, if in consideration with the position, size, direction and nature of the defects as well as the shape and dimension of such crankshafts, and the Surveyor accepted justifiable. Conversely, even those which have complied with these limits would be disqualified if they should contain such numerous defects as to make them unsuitable as crankshaft from the nature, distribution and direction of the defects.
(2) The treatment of defects for surface inspection is to be as the followings:
  (A) The lengths of the defects in the Standards are the actual lengths appeared by visual inspection.
  (B) The defects can be removed after acceptance of the Surveyor.
  (C) Removal of defects is to be carried out by grinding.
  (D) Where two defects spaced less than 5 mm apart, these are to be removed regarding as one defect.
  (E) The grooves caused by removing are to be smoothly rounded off by as large radius as possible toward the shaft surface.
  (F) The size of grooves caused by removing means the size before rounding off
  (G) Regarding cast steel crankshafts, when accepted by the Surveyor, defects can be remedied by welding according to the **Annex 2-4.**
  (H) When defects were removed, it is to be confirmed that the defects have been completely removed by magnetic particle inspection or dye penetrant inspection.

(I) Regarding the crankshaft which defects are left and removed, the manufacturer is to make detailed inspection records and submit the same to the Surveyor. In these inspection records, the position, size, direction and nature of the defects on the inspected surface and the position and size of grooves caused by removing the defects is to be recorded.

6. Standards for allowable limit of defects for surface inspection

(1) *Application*

(a) The standards are to be applied to the semi builtup cast steel and full built up crankshafts.

(b) Defects specified in this Guidance are Grade CC shown in (B).

(2) *Classification of material defects*

The surface defects are classified as the following **Table 1**, but Grade CA and CB defects are excluded from consideration by this Guidances.

Table 1 Classification of Material Defects

Classification	Names of defects
Grade CA defects	Microscopic non-metal inclusion
Grade CB defects	Pin hole and inclusion which do not exceed 0.2 mm in length
Grade CC defects	· Exceed 0.2 mm in length, Pin-hole, blowhole, sand-inclusion, slag inclusion · Shrinkage cavity, · Hot tear, cold crack

(3) *Standards*

For Standards, **Table 2** is to be applied.

Table 2 Standards

Divisions	Standards
I	All defects which are detected are to be removed. The depth of grooves caused by such removing is to be less than $0.01d$. In this case, the fillet parts are to be so finished that the original shape is retained. For parallel and plane parts, the grooves are to be so rounded off that the bottom radius of the grooves is not less than three times the depth of the groove.
II	All defects which are detected are to be removed, except the following defects: (i) Defects not exceeding 1 mm which are not crowded. (ii) Defects not exceeding 3 mm with sufficient spacing between each two. The depth of grooves caused by such removing is to be less than $0.01\ d$, and the grooves are to be so rounded off that the bottom radius of the grooves is not less than three times the depth of the groove, and in no case it shall be less than twice the depth.
III	All defects which are detected are to be removed, except the following defects: (i) Defects not exceeding 3 mm which are not crowded. (ii) Defects not exceeding 5 mm with sufficient spacing between each two. The depth of grooves caused by such removing is to be less than $0.01\ d$, and the grooves are to be so rounded off that the bottom radius of the grooves is not less than twice the depth of the groove.
IV	All defects which are detected are to be removed, except those not exceeding 8 mm. The depth of grooves caused by such removing is to be such that it does not affect the strength of the zone, and for the depth, it is necessary to receive the Surveyor's approval.

Annex 2-4 Guidance for repairs by welding for cast steel crank throws

1. Applications

(1) Where defects are discovered in the crank throws of cast steel crankshafts under manufacture (including full built-up crank webs: hereafter called, the crank throws), repairs by welding may be carried out in accordance with the following standards. However where the depth of the depression from which all defects have been removed is less than 0.05t (t is the web s thickness), it is recommended that no repairs by welding be carried out. In this case the finishing of the base part of the depression shall be such that the rounding there is over twice the depth of the depression, and the angle between it and surface is sufficiently rounded up.

(2) When the manufacturer desires to carry out repairs by welding, he shall apply in advance to the Surveyor for approval. In the case the Surveyor has found that such repairs by welding are not suitable or has perceived that there are too many places to be welded in such repairs, he will not approve the application, advising scrapping of the crank throw in question.

(3) When the manufacturer desires to carry out repairs by welding, he shall arrange in advance for the crank throw to be subjected to the preliminary tests stipulated in **7** below.

2. The scope and conditions permitting repairs

(1) The base part of the pin and web : Repairs by welding are not to be carried out the crosshatch zones marked on **Fig 1.**

(2) The depth of the depression from which all defects have been removed is to be less than 0.1 t.

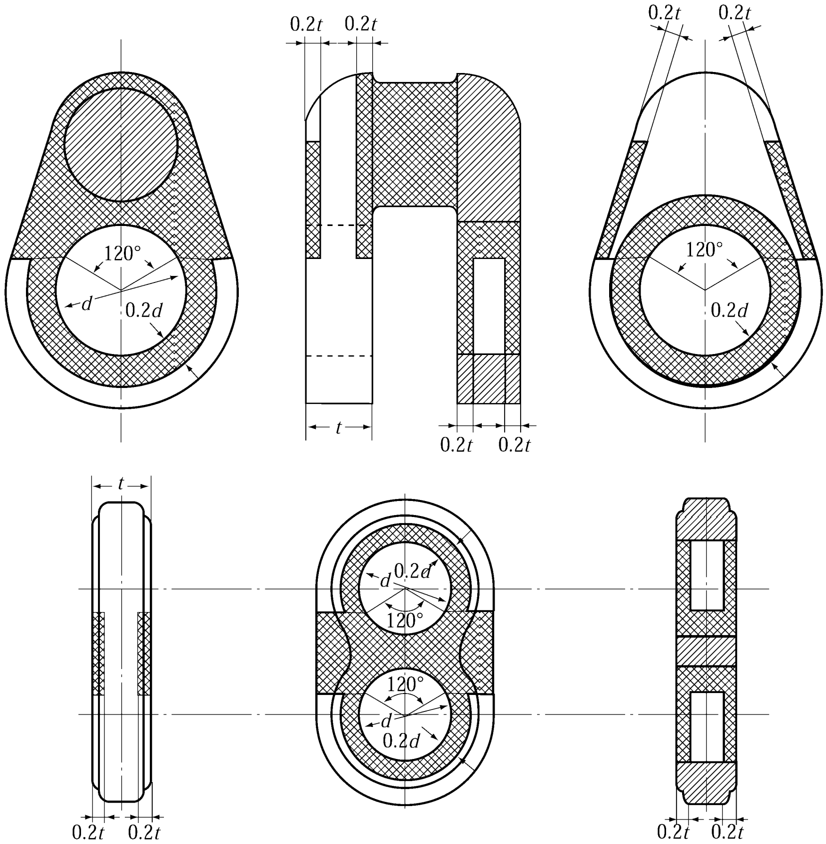


Fig 1 Zones where Repairs of Welding should not be carried out (Cross hatching zone)

3. Timing for repairs

Repairs by welding are to be carried out before the crank throws being given a formal heat treatment. However when approved by the Surveyor the weld repairing of comparatively minor defects may be carried out after the formal heat treatment.

4. Methods of repairs

Repairs by welding are to be carried out in conformity with the requirements of the following items:

(1) **Welder**
The welder engaging in repairs shall be the one who has passed the qualification tests of the Society and who has further had the experience in the preliminary tests stipulated in **7** below.

(2) **Removal of defects**
After defects have been removed by grinding or gouging, the depression is to be made shapely so as to fit for welding; while it is to be confirmed that the defects have been completely removed by means of the magnetic particle inspection or dye penetrant inspection.

(3) **Preheating**
The part undergoing the weld repairing and its neighbourhood are to be preheated to temperatures exceeding 200℃.

(4) **Welding method**
Welding is to be the downhand electric arc welding.

(5) **Electrode**
The low hydrogen electrode approved by the Society is to be used.

(6) **Post heating**
On completion of welding the crank throws are to be heat-treated as specified, but those heat-treated formally previous to repairs by welding with the approval of the Surveyor may require the annealing process only used 600 - 650℃ for stress relief.

(7) **Finish after repairs**
The repaired part shall be finished smoothly by grinding.

5. Inspection after repairs

It is to be confirmed by means of the magnetic particle inspection that the welded part and its neighbourhood are free from harmful defects.

6. Records

The manufacturer is to make a documentation of the records including sketches of the positions and dimensions of the welded repairs, methods of repairs, details the heat treatment and inspection results for submission to the Surveyor.

7. Preliminary test

The manufacturer shall arrange for the following preliminary tests to be given before repairs by welding; provided however except the cases where change has been made in the material used, welding conditions or welders or where the Society has recognized the necessity specifically, these tests need not be repeated on every occasion.

(1) **Mold cavity weld test**

(A) *Test piece*
Material of same quality with the crank throw.

(B) *Shape of test piece and main point of repairs by welding*
The dimensions of test piece are shown in **Fig 2** Make the cavities as shown there, and then carry out padding welding.

(a) Sizes cavities
Proper sizes within the scope permitting free use of the operating electrode.

(b) Distribution of cavities
Distribution of cavities and distance of each cavity of the edge of test piece shall be such that these simulate the actual situation in the crank throw to be welded.

(c) Welding process
Same as in the actual welding.

(d) Electrode
The welding rod same as in the actual welding shall be used.

(e) Preheating and post heating
Similar heat treatments to those applied for the crank throw.

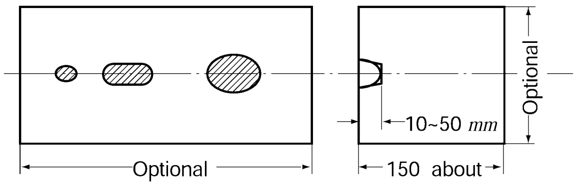

Fig 2 Dimensions and Shape of Test Coupon (Units : mm)

(C) *Tests*

(a) Macro-structure test

After heat treatment cut down the test piece at the place where the welded part is included, confirming that there is no penetration in the root part of weld nor is any crack.

(b) Hardness test

Check and confirm that there are no changes in the hardness of the weld metal, base metal and the boundary part between them.

(c) Micro-structure

Check and confirm that there are no changes in the structure of the weld metal, base metal and boundary part between them.

(2) **Butt weld test**

(A) *Test coupon*

Material of same quality with the crank throw.

(B) *Shape of test coupon and main point of repairs by welding*

Dimensions and shape of test coupon are shown in **Fig 3.** The welding conditions and heat treatment are same as in (I) above.

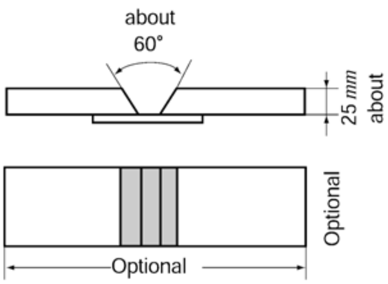

Fig 3 Dimensions and Shape of Test Coupon

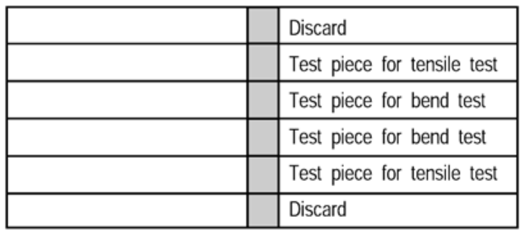

Fig 4 Test Assembly

(C) *Test*

Each two test pieces are to be prepared for tension test and bending test respectively as shown in **Fig 4** from the test coupon described in **Fig 3.**

(a) Tensile test

Tensile test is to be carried out with the welded metal at the center part of the gauge length. The value obtained is not to be less than the specified minimum value of the base metal. (Test piece dimension = 14 mm $\phi \times$ 70 mm)

(b) Bending test

Place the welded metal on the center part of test piece, bending to 180° with the inside radius of 25 mm, and confirm that no defects have appeared in the welded part and heat affecting part.

(Test piece dimension = 25 mm × 19 mm × any given length) ⚓

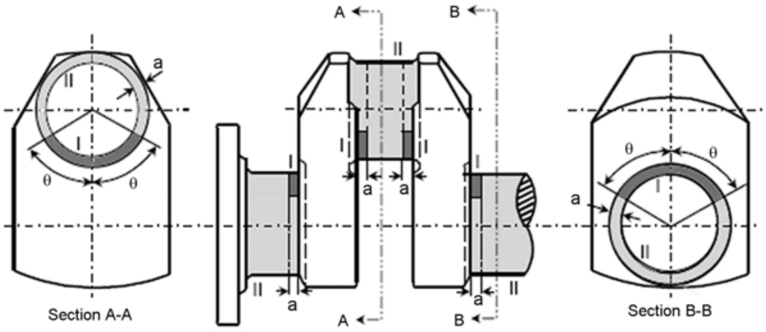
Annex 2-5 Guidance for non-destructive examination of hull and machinery steel forgings

1. Application

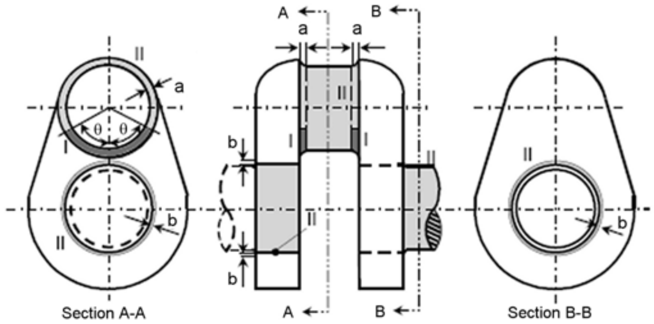
(1) The requirements in this Guidance is intended to give general guidance on the extent, methods and recommended quality levels applicable to the non-destructive examinations (NDE) of steel forgings(hereinafter referred to as "forgings") specified in **Ch 1, 601. 8** and **10** of the Rules.
(2) For steel forgings(e.g. components for couplings, gears, boilers and pressure vessels) other than those specified in this Guidance, the requirements in this Guidance may apply correspondingly considering their materials, kinds, shapes and stress conditions being subjected.
(3) Forgings should be examined in the final delivery condition. Where intermediate inspections have been performed the manufacturer shall furnish a documentation of the results upon the request of the Surveyor.
(4) Where a forging is supplied in semi finished condition, the manufacturer shall take into consideration the quality level of final finished machined components.
(5) NDE personnel requirements and inspection plans are to comply with the requirements specified in **Annex 2-2, 2** and **4** (2), (a) of this Guidance.

2. Surface Inspections

(1) **General**
(a) Surface inspections in this Guidance are to be carried out by visual examination and magnetic particle testing or liquid penetrant testing.
(b) The testing procedures, apparatus and conditions of magnetic particle testing and liquid penetrant testing are to comply with the recognized national or international standards.
(c) Personnel engaged in visual examination is to have sufficient knowledge and experience. Personnel engaged in magnetic particle testing or liquid penetrant testing is to be qualified in accordance with the Society's Rules. The qualification is to be verified by certificates.
(2) **Products**
(A) The steel forgings specified in **Pt 2, Ch 1, 601.** shall be subjected to a 100 % visual examination by the Surveyor. For mass produced forgings the extent of examination is to be as deemed appropriate by the Society.
(B) Surface inspections by magnetic particle and/or liquid penetrant methods generally apply to the following steel forgings:
(a) crankshafts with minimum crankpin diameter not less than 100 mm;
(b) propeller shafts, intermediate shafts, thrust shafts and rudder stocks with minimum diameter not less than 100 mm;
(c) connecting rods, piston rods and crosshead with minimum diameter not less than 75 mm or equivalent cross section,
(d) bolts with minimum diameter not less than 50 mm, which are subjected to dynamic stresses such as cylinder cover bolts, tie rods, crankpin bolts, main bearing bolts, propeller blade fastening bolts.
(3) **Zones for Surface Inspections**
Magnetic particle or where permitted liquid penetrant testing, shall be carried out in the zones I and II as indicated in **Figs 1** to **4.**
(4) **Surface Condition**
The surfaces of forgings to be examined are to be free from scale, dirt, grease or paint.

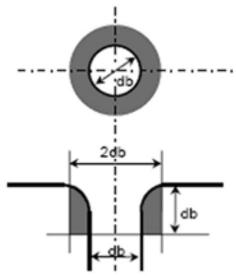


(a) Solid crankshaft



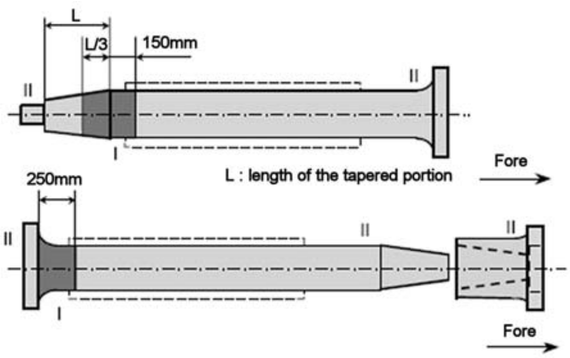
(a) Semi built−up crankshaft

Notes)
1. Where the crankpin or journal has oil holes, the circumferential surfaces of the oil holes are to be treated as Zone I. (See the figure in the right.)
2. In the above figures, "θ", "a" and "b" mean:
   θ = 60°
   a = 1.5 r
   b = 0.05 d (circumferential surfaces of shrinkage fit)
   where,
   r : fillet radius
   d : journal diameter
3. Identification of the Zones (Similar in Figs. 1 thru 4):
   : Zone I
   : Zone II



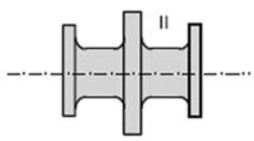
db : oil hole bore diameter

Fig 1 Zones for magnetic particle / liquid penetrant testing on crankshafts



(a) Propeller shaft

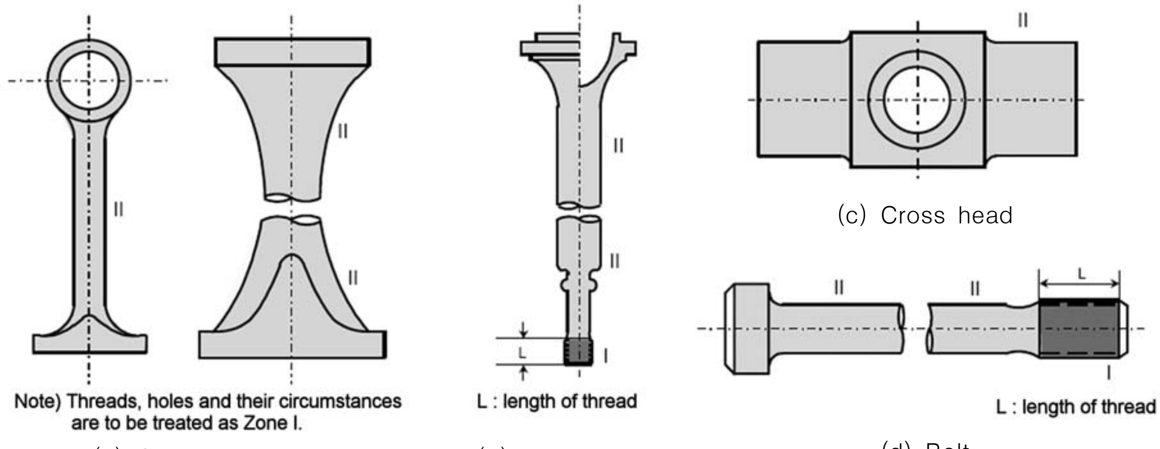
(b) Intermediate shaft



(c) Thrust shaft

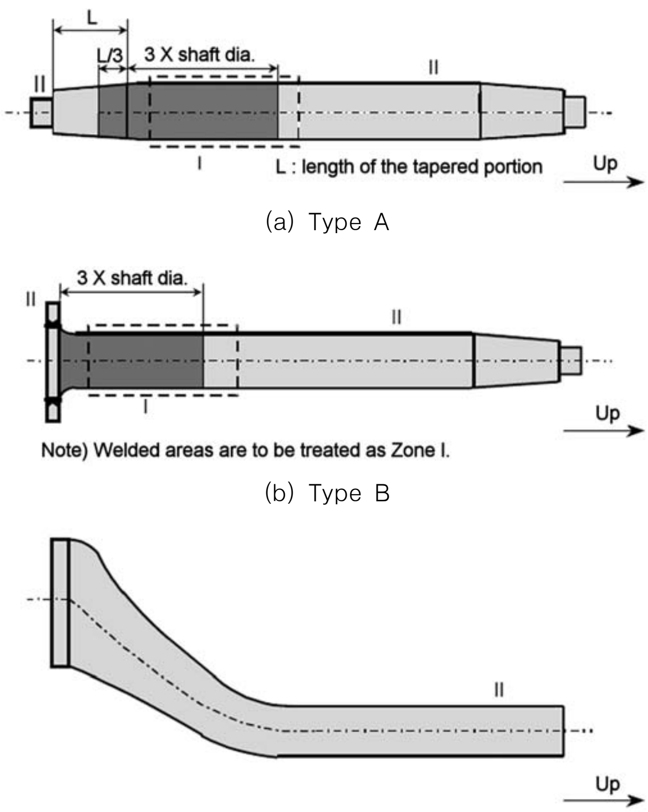
Note) For propeller shaft, intermediate shafts and thrust shafts, all areas with stress raisers such as radial holes, slots and key ways are to be treated as Zone I.

Fig 2 Zones for magnetic particle / liquid penetrant testing on shafts



(a) Connecting rod (b) Piston rod (c) Cross head (d) Bolt

Fig 3 Zones for magnetic particle / liquid penetrant testing on machinery components



(a) Type A

(b) Type B

(c) Type C

Fig 4 Zones for magnetic particle / liquid penetrant testing on rudder stocks

(5) **Surface Inspection**

(a) Where indicated by **Figs 1** to **4**, magnetic particle inspection will be carried out with the following exceptions, when liquid penetrant testing will be permitted :
- austenitic stainless steels;
- interpretation of open visual or magnetic particle indications,
- at the instruction of the Surveyor.

(b) Unless otherwise specified in the order, the magnetic particle test shall be performed on a forging in the final machined surface condition and final thermally treated condition or within 0.3 mm of the final machined surface condition for *AC* techniques (0.8 mm for *DC* techniques).

(c) Unless otherwise agreed, the surface inspection is to be carried out in the presence of the Surveyor. The surface inspection is to be carried out before the shrink fitting, where applicable.

(d) For magnetic particle testing, attention is to be paid to the contact between the forging and the clamping devices of stationary magnetization benches in order to avoid local overheating or burning damage in its surface. Prods shall not be permitted on finished machined items.

(e) When indications were detected as a result of the surface inspection, acceptance or rejection is to be decided in accordance with clause (6)

(6) **Acceptance Criteria and Rectification of Defects**

(A) *Acceptance Criteria Visual Inspection*

(a) All forgings shall be free of cracks, crack-like indications, laps, seams, folds, or other injurious indications. At the request of the Surveyor, additional magnetic particle, liquid penetrant and ultrasonic testing may be required for a more detailed evaluation of surface irregularities.

(b) The bores of hollow propeller shafts are to be visually examined for imperfections uncovered by the machining operation. Machining marks are to be ground to a smooth profile.

(B) *Acceptance Criteria Magnetic Particle Testing and Liquid Penetrant Testing*

(a) The following definitions relevant to indications apply:

(i) Linear indication : an indication in which the length is at least three times the width;

(ii) Nonlinear indication : an indication of circular or elliptical shape with a length less than three times the width;

(iii) Aligned indication : three or more indications in a line, separated by 2 mm or less edge-to-edge;

(iv) Open indication : an indication visible after removal of the magnetic particles or that can be detected by the use of contrast dye penetrant;

(v) Non-open indication : an indication that is not visually detectable after removal of the magnetic particles or that cannot be detected by the use of contrast dye penetrant,

(vi) Relevant indication : an indication that is caused by a condition or type of discontinuity that requires evaluation. Only indications which have any dimension greater than 1.5 mm shall be considered relevant.

(b) For the purpose of evaluating indications, the surface is to be divided into reference areas of 225 cm^2. The area shall be taken in the most unfavorable location relative to the indication being evaluated.

(c) The allowable number and size of indications in the reference area is given in **Table 1** for crankshaft forgings and in **Table 2** for other forgings, respectively. Cracks are not acceptable. Irrespective of the results of non-destructive examination, the Surveyor may reject the forging if the total number of indications is excessive.

(C) *Rectification of Defects*

(a) Defects and unacceptable indications must be rectified as indicated below and detailed in (i) thru (v)

(i) Defective parts of material may be removed by grinding, or by chipping and grinding. All grooves shall have a bottom radius of approximately three times the groove depth and should be smoothly blended to the surface area with a finish equal to the adjacent surface.

(ii) To depress is to flatten or relieve the edges of a non-open indication with a fine pointed abrasive stone with the restriction that the depth beneath the original surface shall be 0.08 mm minimum to 0.25 mm maximum and that the depressions be blended into the bearing surface. A depressed area is not considered a groove and is made only to prevent galling of bearings.

(iii) Non-open indications evaluated as segregation need not be rectified.

(iv) Complete removal of the defect is to be proved by magnetic particle testing or penetrant testing, as appropriate.

(v) Repair welding is not permitted for crankshafts. Repair welding of other forgings is subjected to prior approval of the individual Class Society.

(b) *Zone I in crankshaft forgings*
Neither indications nor repair are permitted in this zone.
(c) *Zone II in crankshaft forgings*
(i) Indications must be removed by grinding to a depth no greater than 1.5 mm.
(ii) Indications detected in the journal bearing surfaces must be removed by grinding to a depth no greater than 3.0 mm. The total ground area shall be less than 1 % of the total bearing surface area concerned.
(iii) Non-open indications, except those evaluated as segregation, shall be depressed but need not be removed.

Table 1 - Crankshaft forgings ; Allowable number and size of indications in a reference area of 225 cm²

Inspection Zone	Max. number of indications	Type of indication	Max. number for each type	Max. dimension (mm)
I (critical fillet area)	0	Linear Nonlinear Aligned	0 0 0	- - -
II (important fillet area)	3	Linear Nonlinear Aligned	0 3 0	- 3.0 -
III (journal surfaces)	3	Linear Nonlinear Aligned	0 3 0	- 5.0 -

Table 2 - Steel forgings excluding crankshaft forgings ; Allowable number and size of indications in a reference area of 225 cm²

Inspection Zone	Max. number of indications	Type of indication	Max. number for each type	Max. dimension (mm)
I	3	Linear Nonlinear Aligned	0(1) 3 0(1)	- 3.0 -
II	10	Linear Nonlinear Aligned	3(1) 7 3(1)	3.0 5.0 3.0

Note:
(1) Linear or aligned indications are not permitted on bolts, which receive a direct fluctuating load, e.g. main bearing bolts, connecting rod bolts, crosshead bearing bolts, cylinder cover bolts.

(d) *Zone I in other forgings*
Indications must be removed by grinding to a depth no greater than 1.5 mm. However, grinding is not permitted in way of finished machined threads.
(e) *Zone II in other forgings*
Indications must be removed by grinding to a depth no greater than 2 % of the diameter or 4.0 mm, whichever is smaller.
(f) *Zones other than I and II in all forgings*
Defects detected by visual inspection must be removed by grinding to a depth no greater than 5 % of the diameter or 10mm, whichever is smaller. The total ground area shall be less than 2 % of the forging surface area.

(7) **Record**

Test results of surface inspections are to be recorded at least with the following items:

(a) Date of testing;
(b) Names and qualification level of inspection personnel;
(c) Kind of testing method;
- for liquid penetrant testing : test media combination
- for magnetic particle testing : method of magnetizing, test media and magnetic field strength

(d) Kind of product;
(e) Product number for identification;
(f) Grade of steel;
(g) Heat treatment;
(h) Stage of testing;
(i) Position (zone) of testing;
(j) Surface condition;
(k) Test standards used;
(l) Testing condition;
(m) Results;
(n) Statement of acceptance/non acceptance,
(o) Details of weld repair including sketch;

3. Ultrasonic testing

(1) **General**

(a) Volumetric inspection in this Guidance is to be carried out by ultrasonic testing using the contact method with straight beam and/or angle beam technique.

(b) The testing procedures, apparatus and conditions of ultrasonic testing are to comply with the recognized national or international standards. Generally the *DGS*(distance-gain size) procedure is to be applied using straight beam probes and/or angle beam probes with 2 to 4 MHz and inspection should be carried out using a twin crystal 0° probe for near surface scans (25 mm) plus an 0o probe for the remaining volume. Fillet radii should be examined using 45°, 60° or 70° probes.

(c) Personnel engaged in ultrasonic testing is to be qualified in accordance with the Society’s Rules. The qualification is to be verified by certificates.

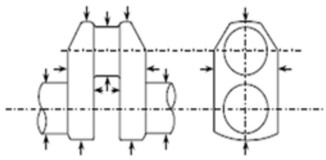
(2) **Products**

(A) Volumetric inspections by ultrasonic testing generally apply to the following steel forgings :

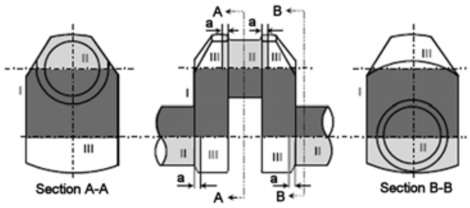
(a) crankshaft with minimum crankpin diameter not less than 150 mm;
(b) propeller shafts, intermediate shafts, thrust shafts and rudder stocks with minimum diameter not less than 200 mm,
(c) connecting rods, piston rods and crosshead with minimum diameter not less than 200 mm or equivalent cross section.

(3) **Zones for ultrasonic testing**

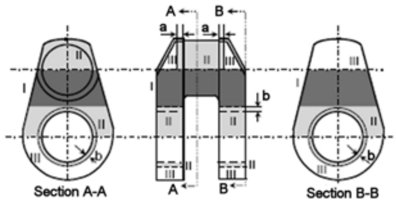
(A) Ultrasonic testing shall be carried out in the zones I to III as indicated in **Figs 5** to **8**. Areas may be upgraded to a higher zone at the discretion of the Surveyors.



Scanning direction



(a) Solid crankshaft

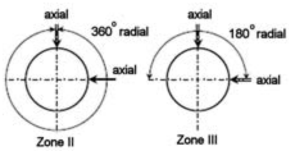


(b) Semi built-up crankshaft

Note)
1. In the above figures, "a" and "b" mean:
   a = 0.1d or 25mm, whichever greater
   b = 0.05d or 25mm, whichever greater (circumstances of shrinkage fit)
   where,
   d : pin or journal diameter
2. Core areas of crank pins and/or journals within a radius of 0.25d between the webs may generally be coordinated to Zone II.
3. Identification of the Zones (Similar in Figs. 5 thru 8.):

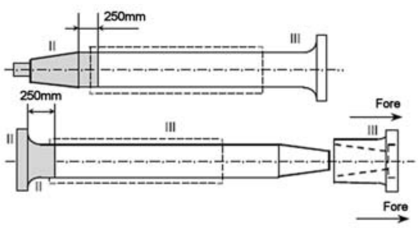
: Zone I
: Zone II
: Zone III

Fig 5 Zones for ultrasonic testing on crankshafts

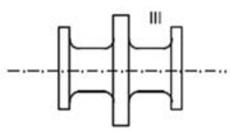


Scanning direction

(b) Intermediate shaft



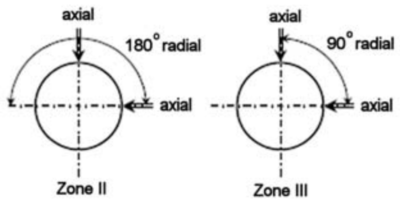
(a) Propeller shaft



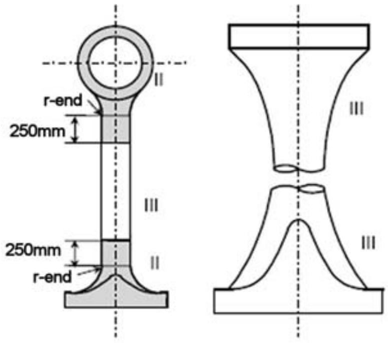
(c) Thrust shaft

Notes)
1. For hollow shafts, 360° radial scanning applies to Zone III.
2. Circumferences of the bolt holes in the flanges are to be treated as Zone II.

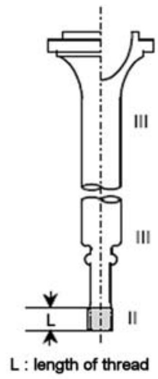
Fig 6 Zones for ultrasonic testing on shafts



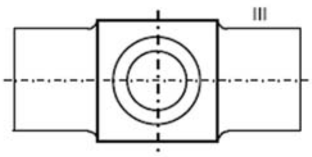
Scanning direction



(a) Connecting rod

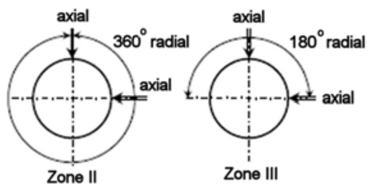


(b) Piston rod

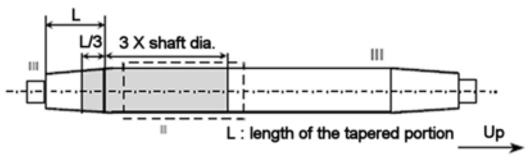


(c) Cross head

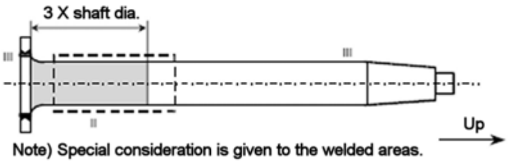
Fig 7 Zones for ultrasonic testing on machinery components



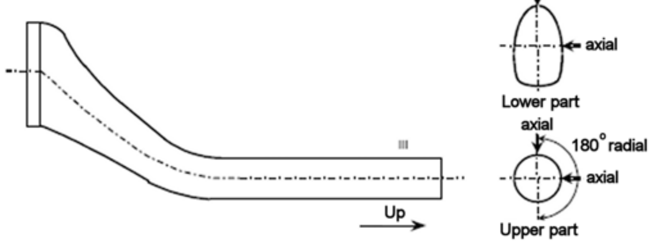
Scanning direction for Type A and Type B



(a) Type A



(b) Type B



(c) Type C Scanning direction Type C

Fig 8 Zones for ultrasonic testing on rudder stocks

(4) **Surface Condition**

(a) The surfaces of forgings to be examined are to be such that adequate coupling can be established between the probe and the forging and that excessive wear of the probe can be avoided. The surfaces are to be free from scale, dirt, grease or paint.

(b) The ultrasonic testing is to be carried out after the steel forgings have been machined to a condition suitable for this type of testing and after the final heat treatment , but prior to the drilling of the oil bores and prior to surface hardening. Black forgings shall be inspected after removal of the oxide scale by either flame descaling or shot blasting methods.

(5) **Acceptance Criteria**

(a) Acceptance criteria of volumetric inspection by ultrasonic testing are shown in **Table 3** and **4.**

Table 3 - Acceptance Criteria for Crankshafts

Type of Forging	Zone	Allowable disc shape according to *DGS*(1)	Allowable length of indication(2)	Allowable distance between two indications(3)
Crank shaft	I	d ≤ 0.5 mm	-	-
	II	d ≤ 2.0 mm	≤ 10 mm	≥ 20 mm
	III	d ≤ 4.0 mm	≤ 15 mm	≥ 20 mm

Notes :
(1) *DGS* : Distance Gain Size evaluation system
(2) The transference distance of the probe in the range where the echo height exceeds 50% of DGS line is taken as the length of indication.
(3) In case of accumulations of two or more isolated indications which are subjected to registration the minimum distance between two neighboring indications must be at least the length of the bigger indication. This applies as well to the distance in axial direction as to the distance in depth. Isolated indications with less distances are to be determined as one single indication.

Table 4 - Acceptance Criteria for Shafts and Machinery Components

Type of Forging	Zone	Allowable disc shape according to *DGS*(1)(2)	Allowable length of indication(3)	Allowable distance between two indications(4)
Propeller shaft, intermediate shaft Thrust shaft, Rudder stock	II	outer: d≤2 mm inner: d≤4 mm	≤ 10 mm ≤ 15 mm	≥ 20 mm ≥ 20 mm
	III	outer: d≤3 mm inner: d≤6 mm	≤ 10 mm ≤ 15 mm	≥ 20 mm ≥ 20 mm
Connecting rod, Piston rod, Crosshead	II	d≤2.0 mm	≤ 10 mm	≥ 20 mm
	III	d≤4.0 mm	≤ 10 mm	≥ 20 mm

Notes :
(1) *DGS* : Distance Gain Size evaluation system
(2) Outer part means the part beyond one third of the shaft radius from the center, the inner part means the remaining core area.
(3) The transference distance of the probe in the range where the echo height exceeds 50% of *DGS* line is taken as the length of indication.
(4) In case of accumulations of two or more isolated indications which are subjected to registration the minimum distance between two neighboring indications must be at least the length of the bigger indication.

(6) **Record**

Test results of volumetric inspection are to be recorded at least with the following items:

(a) Date of testing;
(b) Names and qualification level of inspection personnel;
(c) Kind of testing method;
(d) Kind of product;
(e) Product number for identification;
(f) Grade of steel;
(g) Heat treatment;
(h) Stage of testing;
(i) Position (zone) of testing;
(j) Surface condition;
(k) Test standards used;
(l) Testing condition;
(m) Results,
(n) Statement of acceptance/non acceptance; ⚓

Annex 2-6 Guidance for liquid penetrant inspection and repair of defects of copper alloy propeller castings

1. Applications

This requirement applies to the liquid penetrant inspection and repair of defects of propeller castings. Repair method for propeller differing from those specified in this Guidance are to comply with the discretion of the Society.

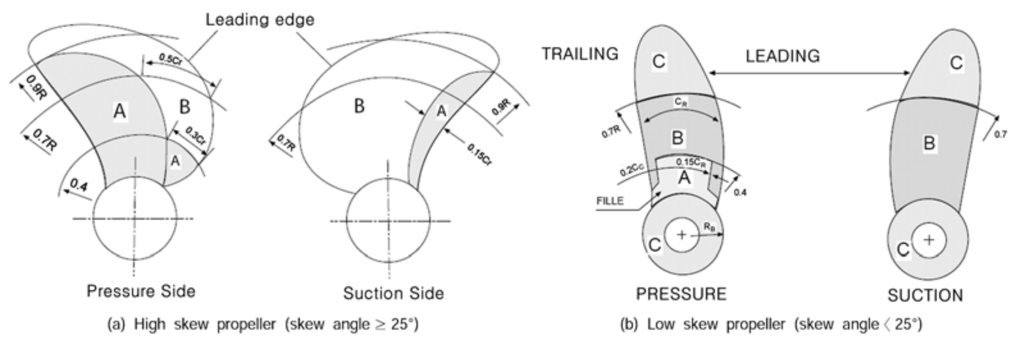
2. The liquid penetrant inspection

(1) **Area of test (Severity zones)**

(a) In order to relate the degree of inspection to the criticality of defects in propeller blades and to help reduce the risk of failure by fatigue cracking after repair, propeller blades are divided into the three zones designated A, B and C as shown in **Fig 1** and **Fig 2**

(b) The severity zones "A" are to be subjected to a dye penetrant inspection in the presence of the Surveyor. In zones "B" and "C" the dye penetrant inspection is to be performed by the manufacturer and may be witnessed by the Surveyor upon his request.

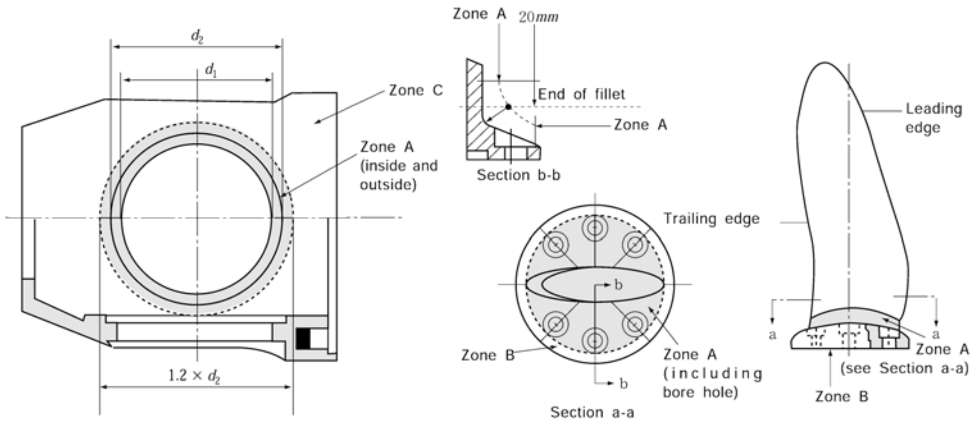
(c) If repairs have been made either by grinding or by welding the repaired areas are additionally to be subjected to the dye penetrant inspection independent of their location and/or severity zone.



*The definition of skew angle comply with the requirements in the **Pt 5, Ch 3, 303.** of the Guidances

(Notes)
1. R : The radius of the propeller, l : The cord length at any radius
2. The boss area of an integrally cast propeller is regarded as Zone C.
3. Where stress distribution on propeller blade surface is estimated in detail, the non-destructive inspection zones different from those shown in this figure may be applied subject to this Society's approval.

Fig 1 Zones for Non-destructive Inspection of Propeller Castings



(a) Zones for non-destructive Inspection for controllable pitch propeller boss
(b) The zones for non-destructive inspection of the root area of the controllable pitch or build up propeller blades

Fig 2 Zones for Non-destructive Inspection on the Root Area of the Controllable Pitch or Build up Propeller Blades and Controllable Pitch Propeller Boss

(2) **Methods of testing**

(a) The methods of testing are to conform to the standard of *KS B* 0816 or equivalent.

(b) In the dye penetrant inspection an indication is the presence of detectable bleed-out of the penetrant liquid from the material discontinuities appearing at least 10 minutes after the developer has been applied.

(c) Where indications of defects appear, the type of defects and the size of the indications are to be recorded in detail. These records are to be presented to the Surveyor. For reference, the true size of the defects are also to be confirmed.

(3) **Types of defects**

The defects detected by the liquid penetrant test are divided into following types of (A) to (D).

(A) Cracks : the defects regarded as a crack.

(B) Circular defects : the defects other than crack, in which the length is less than 3 times the width.

(C) Linear defects : the defects other than crack, in which the length is equal to or greater than 3 times the width.

(D) Aligned defects : Aligned defects consisting of two or more linear or circular defects which are almost aligned and the spacings between them do not exceed 2 mm. The length of an aligned defect is to be equal to the sum of the lengths of a1l individual defects and all spacings between them.

(4) **Acceptance criteria**

(A) Where cracks or other defects which do not meet the acceptance criteria given in **Table 1** are detected by the penetrant test, the defects are to be repaired in accordance with the requirements in **3.**

Table 1 Acceptance Criteria

Are of test	Type of Defect (excluding crack)	Acceptance Criteria		
		Max. total number of all defects(1)	defects of same type	
			Max. number of each type(II)	Max. size for each indication(III) (mm)
Zone A	Circular	7	5	4
	Linear		2	3
	Aligned		2	3
Zone B	Circular	14	10	6
	Linear		4	6
	Aligned		4	6
Zone C	Circular	20	14	8
	Linear		6	6
	Aligned		6	6

(Notes)
(1) The defects are to be repaired when they do not meet one or more criteria of (I) through (III) in this table.
(2) The counting of the number of defects is to be conducted at the most unfavourable location relative to the indication being evaluated. The area of a reference zone is to be 100 cm^2
(3) Singular circular indications less than 2 mm for zone A and less than 3 mm for other zones may be disregarded.
(4) Where only circular defects were detected, all defects(I) are to be repaired for the judgement.

(B) Areas which are prepared for welding are independent of their location always to be assessed according to zone A. The same applies to the welded areas after being finished machined and/or grinded.

(C) Indications exceeding the acceptance standard of **Table 1**, cracks, shrinkage cavities, sand, slag and other non-metallic inclusions, blow holes and other discontinuities which may impair the safe service of the propeller are defined as defects and must be repaired in accordance with the requirements specified in **3** below.

3. Repair of defects

(1) **Repair procedures**

(A) In general, the repairs are to be carried out by mechanical means, e. g. by grinding, chipping or milling. After milling or chipping, grinding is to be applied for such defects.

(B) The contour of the ground depression is as smooth as possible in order to avoid stress concentrations or to minimize cavitation corrosion.

(2) **Repair of defects in zone A**

(a) In zone A of **Fig 1** and **Fig 2**, repair welding will generally not be allowed unless specially approved by the Society.

(b) Grinding may be carried out to an extent which maintains the blade thickness of the approved drawing.

(c) The possible repair of defects which are deeper than those referred to above is to be considered by the Society.

(3) **Repair of defects in zone B**

(a) In zone B of **Fig 1** and **Fig 2**, defects that are not deeper than dB = (t/40) mm (t = min. local thickness in mm according to the Rules) or 2 mm (whichever is greatest) below min. local thickness according to the Rules should be removed by grinding.

(b) Those defects that are deeper than allowable for removal by grinding may be repaired by welding.

(c) Where the propellers in zone B in accordance with the requirements specified in previous (b) are repaired by welding, the limits of the repair welding are to be as shown in **Table 2.**

Table 2 Limits of Repair Welding (2)(3)

	Pressure side	Suction side
Each area of repair welding(1)	75 cm^2 or 0.006 S whichever is larger	150 cm^2 or 0.01 S whichever is larger
Total area of repair welding	200 cm^2 or 0.02 S whichever is larger	
Depth of welding(cm)	0.1 t basically	0.15t basically

Notes:
(1) Welding of areas less than 5 cm^2 is to be avoided.

(2) $S = \frac{\pi D^2 \cdot B}{4n} (cm^2)$
D = Diameter of the propeller (cm)
n = Number of propeller blade
B = Developed area ratio

(3) t is the thickness of the blade at the portion of repair welding.(cm)

(4) **Repair of defects in zone C**

In zone C of **Fig 1** and **Fig 2**, repair welds are generally permitted.

4. Repair Welding

Repair welding which permitted in accordance with the requirements in **3** (3) and (4) above is to comply with the following;

(1) **General**

(a) Companies wishing to carry out welding work on propellers must have at their disposal the necessary workshops, lifting gear, welding equipment, preheating and, where necessary, annealing facilities, testing devices.

(b) All welding work is to be carried out preferably in the shop free from draughts and influence of the weather.

(2) **Welder**

The welders are to have qualifications deemed appropriate by the Society.

(3) **Edge preparation**

(a) Defects to be repaired by welding are to be ground to sound material according to the requirements as given under para **3** (1). To ensure complete removal of the defects the ground areas are to be examined by dye penetrant methods in the presence of the Surveyor.

(b) The edge preparation for repair welding after removing the defects is to be as shown in **Fig 3** and **4.**

(4) **Propeller drawing out**

For heating the boss to draw out the propeller, propeller is to be heated slowly and below 150℃. In this case, the heating method which the heat is concentrated is not be used. A heat source such as electric heater and steams recommended.

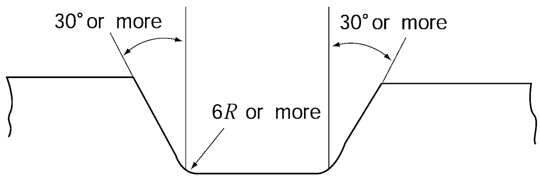


Fig 3 Edge Preparation after Removing Defects

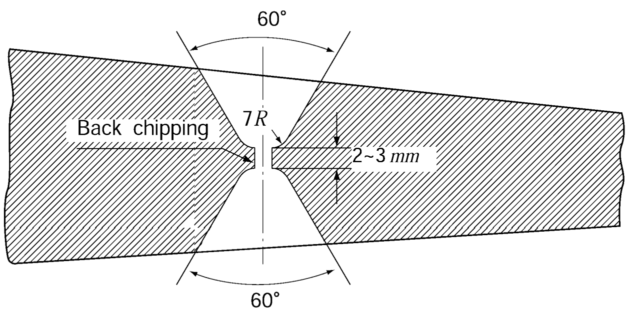

Fig 4 Edge Preparation for Repair Welding of Blade Edge

(5) **Welding repair procedure**

(a) Arc welding with coated electrodes and gas-shielded metal arc process ($GMAW$) are generally to be applied. Argon-shielded tungsten welding ($GTAW$) should be used with care due to the higher specific heat input of this process.

(b) For material thickness less than 30 mm, gas welding may give a satisfactory weldment for CU 1 and CU 2 materials.

(c) Recommended filler metals, pre-heating and stress relieving temperatures are listed in **Table 3.** However, the welding consumables are to be approved by the approval tests for welding procedure specified in (5).

(d) All propeller alloys are generally to be welded in down-hand (flat) position. Where this cannot be done, gas-shielded metal arc welding should be carried out.

(e) The section to be welded is to be clean and dry. Flux-coated electrodes are to be dried before welding according to the maker's instructions.

(f) Adequate pre-heating is to be carried out with care to avoid local overheating, c.f. **Table 3.**

(g) Slag, undercuts and other defects are to be removed before depositing the next run.

(h) To minimize distortion and the risk of cracking, interpass temperatures are to be kept low. This is especially the case with CU 3 alloys.

Table 3 Recommended filler metals and heat treatments

Alloy type	Filler metal	Preheat temperature (℃)	Interpass temperature (℃)	Stress relief temperature (℃)
CU 1	*Al*-bronze[(1)] *Mn*-bronze	150 min	300 max	350～500
CU 2	*Al*-bronze *Ni*-*Mn*-bronze	150 min	300 max	350～550
CU 3	*Al*-bronze *Ni*-*Al*-bronze[(2)] *Mn*-*Al*-bronze	50 min	250 max	450～550
CU 4	*Mn*-*Al*-bronze	100 min	300 max	450～600

Notes:
(1) *Ni*-*Al*-bronze and *Mn*-*Al*-bronze are acceptable.
(2) Stress relieving not required, if filler metal *Ni*-*Al*-bronze is used.

(i) With the exception of alloy *CU* 3 (*Ni*-*Al*-bronze) all weld repairs are to be stress relief heat treated, in order to avoid stress corrosion cracking. However, stress relief heat treatment of alloy *CU* 3 propeller castings may be required after major repairs in zone B (and specially approved welding in Zone A) or if a welding consumable susceptible to stress corrosion cracking is used. In such cases the propeller is to be either stress relief heat treated in the temperature 450 to 500°C or annealed in the temperature range 650-800°C, depending on the extent of repair, c. f. **Table 3.**

(j) The soaking times for stress relief heat treatment of copper alloy propellers should be in accordance with **Table 4.** The heating and cooling is to be carried out slowly under controlled conditions. The cooling rate after any stress relieving heat treatment shall not exceed 50°C/h until the temperature of 200°C is reached.

Table 4 Soaking times for stress relief heat treatment of copper alloy propellers

Stress relief Temp.	Alloy grade *CU*1 and *CU*2		Alloy grade *CU*3 and *CU*4	
	Hours per 25 mm thickness	Max. recommended total time hours	Hours per 25 mm thickness	Max. recommended total time hours
350	5	15	-	-
400	1	5	-	-
450	1/2	2	5	15
500	1/4	1	1	5
550	1/4	1/2	1/2	2
600	-	-	1/4	1

(6) **Welding procedure qualification test**

The manufacturer of propellers intending to carry out repair welding in zone B and zone C is to pass the welding procedure qualification test as shown below. The qualification test is also to be in accordance with the requirements specified in **Pt 2, Ch 2, Sec 4** of the Rules, in addition to the following requirements:

(a) *Tests for butt welding*

(i) Test assembly

The test assembly as specified in **Fig 5** is to be prepared by means of butt welding. The edge preparation is, in principle, to be either the V shape or an appropriate shape and the bevel angle is to be not less than 60°.

(ii) Welding procedure
The welding procedures are to comply with the requirements in (5) above.

(iii) Visual inspection
The welded surface is to be regular and uniform and free from harmful defects such as cracks and undercuts.

(iv) Tensile test
Tensile tests are to be carried out using the two test specimens taken in accordance with **Fig 5**, and the values obtained are to be less than those given in **Table 5.** The form of the test specimens are to comply with **Fig 6.**

Table 5 Tensile Test Requirements for Approval Test

Material	Tensile Strength (N/mm^2)
CU 1	370 min.
CU 2	410 min.
CU 3	500 min.
CU 4	550 min.

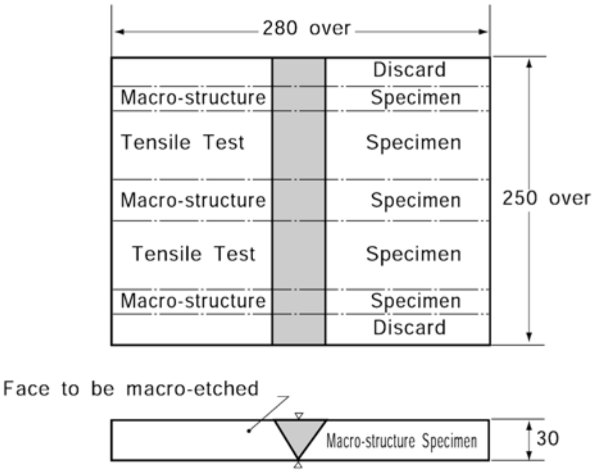

Fig 5 Test Assembly (Unit: mm)

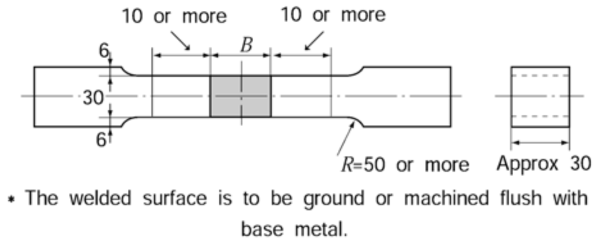

Fig 6 Size of Tensile Test Specimen (Unit : mm)

(v) Non-destructive inspection
Welded joint is to be tested for the whole length by liquid penetrant test, and is to show that there are no crack and other injurious defects.

(vi) Macro-structure inspection
Macro etched test specimen is to be prepared as shown in **Fig 5.** Pores greater than 3 mm and cracks not permitted.

(b) *Test of mold cavity welding*

(i) Test piece and dimension of test piece
Test piece is to be of the material of same quality as the actual propeller. The dimensions of test piece are shown in **Fig 7.** The cavities are made as shown in the figure and then welding same as condition in the actual welding is carried out.

(ii) Sizes of cavities
Proper sizes permitting free operation of electrode.

(iii) Distribution of cavities
Distribution of cavities and distance of each cavity from the edge of test piece is to be such that these simulate the actual condition in the propeller to be welded.

(iv) Welding process
To be same as in the actual welding.

(v) Macro structure test
Macro structure test is to confirm that no defects such as crack exist in the cross sections of weld parts.

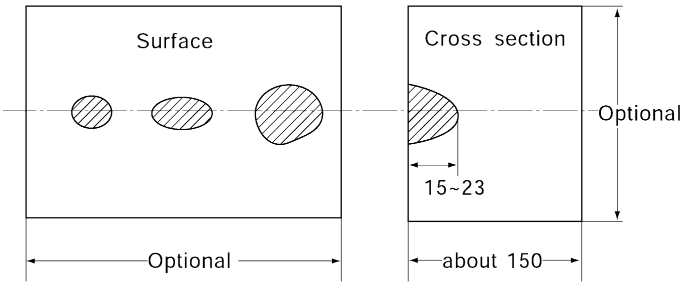

Fig 7 Test of mold cavity welding (Unit : mm)

(vi) Hardness test
Hardness test is to confirm that there is no unacceptable fluctuation in hardness between the deposit metal, base metal and heat-affected zones.

(vii)Non-destructive inspection
Welded joint is to be tested by liquid penetrant inspection or ultrasonic inspection and is to free from any crack and other harmful defects.

(c) *Additional tests*
Where deemed necessary, additional tests may be requested by the Society.

5. Straightening

(1) **Hot straightening**

(a) Straightening of a bent propeller blade or pitch modification is to be carried out after heating the bent region and approximately 500 mm wide zones on either side of it to the suggested temperature range given in **Table 6.** The heating is to be slow and uniform and the concentrated flames such as oxy-acetylene and oxy-propane is not used.

(b) Sufficient time is to be allowed for the temperature to become fairly uniform through the full thickness of the blade section. The temperature must be maintained within the range given in **Table 6** through the straightening operation.

Table 6 Temperature Range for hot Straightening

Material	*CU* 1	*CU* 2	*CU* 3	*CU* 4
Temperature of hot straightening (℃)	500～800	500～800	700～900	700～850

(c) A thermocouple instrument or temperature indicating crayons are to be used for measuring the temperature.

(d) The area heated is to be enclosed with asbestos or similar material to reduce the cooling speed after straightening.

(2) **Cold straightening**
Cold straightening is to be used for minor repairs of tips and edge only. Cold straightening on *CU* 1, *CU* 2 and *CU* 4 are to be followed by a stress relieving heat treatment(See **Table 3** and **Table 4**)

(3) **Application of load**
For hot straightening, static loading and dynamic loading are to be used, but for cold straightening, static loading is to be used only. ⚓

Annex 2-7 Guidance for non-destructive testing of ship hull steel welds

1. General

(1) **Application**

(A) This Guidance applies to the Non-destructive inspection for all hull welds of ships whose, in general, length exceeds 30 m to confirm the quality of the hull welds.

(B) In ships of less than 30m in length, the range of the inspection, the members to be inspected and the number of checkpoints are to be determined by the Surveyor based on consultation with the manufacturer.

(C) The quality levels given in this Guidance refer to production quality and not to fitness for-purpose of the welds examined.

(D) The non-destructive testing is normally to be performed by the Shipbuilder or its subcontractors in accordance with this Guidance. Surveyor may require to witness some testing.

(E) It should be the Shipbuilder's responsibility to assure that testing specifications and procedures are adhered to during the construction and the report is made available to the Society on the findings made by the NDT.

(F) This Guidance is intented to apply to welds of irons and nonferrous metals. Other marine structures may be applied subject to the approval by the Society. However, in case of ultrasonic inspection, the transducer design and calibration block material used are appropriate to the material under inspection.

(2) **Means of Non-destructive Inspection**

(A) Applicable methods for testing of the different types of weld joints are given in **Table 1.**

Table 1 Applicable methods for testing of weld joints

Weld Joint	Parent material thickness(mm)	Applicable testing methods
Butt welds with full penetration	t≤10	VT, PT, MT, RT
	t>10	VT, PT, MT, UT, RT
Tee joints, corner joints and cruciform joints with full penetration	t≤10	VT, PT, MT
	t>10	VT, PT, MT, UT
Tee joints, corner joints and cruciform joints without full penetration and fillet welds	All	VT, PT, MT, UT(1)
Note: (1) UT can be used to monitor the extent of penetration in tee, corner and cruciform joints.		

(B) All welds should be subject to visual testing by personnel designated by the Shipyard.

(C) Non-destructive inspection for detection of surface imperfections of weld joints of hull construction is, in principle, to be magnetic particle testing specified in **2** (2) However liquid penetrant testing can be applied under consideration of this Society.

(D) Non-destructive inspection for detection of internal imperfections is, in principle, to be radiographic testing specified in **3.**

(E) For welded joints of hull construction in thickness of 6mm and above, a part or all of radiographic inspection may be replaced by the Ultrasonic Inspection based on the requirements given in **4**, in case that the shipyard submitting ultrasonic testing specifications containing information on the items mentioned below

(a) Approval of inspection manual

Prior to carrying out the inspection, the shipyard has to submit the inspection manual containing the items mentioned below, and have the manual approved by the Society.

(i) Type of ultrasonic detector and kind of probe (nominal frequency and material, dimension, type and nominal angle of refraction of transducer), and the applicable range of the testing (thickness, welding process, etc.)

(ii) Calibration block and reference block for calibration

(iii)Kind of ultrasonic test process (Angle beam technique is to be of standard one), and extent of the measurements and method for sensitivity adjustment for the process

(iv)Judgement criteria for ultrasonic test (The criteria for angle beam technique test is to be in accordance with **Table 11**. For the other kind of ultrasonic test process, judgement criteria are to be described in detail.)
(v) Record of the results of ultrasonic test
(vi)List of operators and judges

(b) The capability of shipyard
The capability of shipyard about the reliability of the test methods is to judged by the items mentioned below.
(i) Qualification of engineers
(ii) Quality control conditions
(iii)Reliability
(iv)Keeping the Standards and their application ability
(v) Documents for type, extent and repair of defects

(c) Confirmation by radiographic inspection
(i) When the initial ultrasonic inspection is carried out according to this Guidance, ultrasonic testing for 1/10 of welds to be subject, based on the instructions of the Surveyor, to radiographic testing of at least three ships to confirm that the results match those of (a) (iv) and is approved by the Society for the consistence. However the confirmation by radiographic inspection can be waived for the shipyard which has the records to carry out confirmation inspection more than 3 ships.
(ii) Non-destructive inspection such as radiographic inspection may be required at random in important locations such as those specified (ii) at the discretion of the Surveyor.

(d) Alternative means to the radiographic inspection
(i) In case where shipyard intend to apply the new advanced NDT technologies such as Phased array UT (PAUT) or Time of Flight Diffraction (TOFD) in lieu of radiographic inspection, the shipyard has to submit the inspection manual as specified above (a) and have the manual approved by the Society.
(ii) Additional test and/or data for comparison of alternative means with radiographic inspection may be required when deemed necessary by the Society.

(F) Although radiographic inspection was replaced by the ultrasonic inspection according to (E), 20 % of total numbers of checkpoints are to be examined by the radiographic or alternative means approved by the Society.

(G) The additional non-destructive inspection required for workmanship control of welded joints of hull is to be in accordance with the requirements specified in **3** (2), (C).

(3) **Testing apparatus**
The testing apparatus of radiographic and ultrasonic Inspection are to be calibrated and/or corrected in accordance with the recognised national or international standards.

(4) **Personnel requirements**
(a) Personnel carrying out non-destructive inspection are generally to be qualified and certified to Level II or above in *KS B ISO* 9712, *SNT-TC-1A*, *EN* 473, *ASNT Central Certification Program* (ACCP) or equivalent. However, the personnel qualified to Level I can engage in the testing under supervision of those qualified for Level II 2 or above.
(b) Personnel responsible for the radiographic and/or ultrasonic Inspection activity including approval of procedures should be qualified and certified to Level III.
(c) Periodic re-evaluations of test personnel are to be conducted in accordance with *KS B ISO* 9712 or equivalent to verify that such capability is maintained.

(5) **NDE plan**
(a) The Shipbuilder should submit a plan for approval by the Society, specifying the areas to be examined and the extent of testing with reference to the NDT procedures to be used according to the ship design, ship type and welding processes used. Particular attention should be paid to highly stressed areas.
(b) The plan should only be released to the personnel in charge of the NDT and its supervision.
(c) The identification system should identify the exact locations of the lengths of weld examined.
(d) Welded connections of large cast or forged components (stern frame, stern boss, rudder parts, shaft brackets...) should be tested over their full length using MT or PT and at agreed locations using RT or UT.

(e) All start/stop points in welds made using automatic (mechanised) welding processes should be examined using RT or UT except for internal members where the extent of testing should be agreed.

(6) **Timing of NDT**

(a) NDT should be conducted after welds have cooled to ambient temperature and after post weld heat treatment where applicable.

(b) For steels with specified minimum yield stress of 420 N/mm^2 and above, NDT should not be carried out before 48 hours after completion of welding. Where post weld heat treatment (PWHT) is carried out the requirement for testing after 48 hours may be relaxed.

(7) **Performance and responsibility**

(A) The non-destructive testing is normally to be performed by the Shipbuilder or its subcontractors in accordance with inspection manual and NDE plan approved by the Society. The Surveyor may require to witness some testing.

(B) It should be the Shipbuilder's responsibility to assure that testing specifications and procedures are adhered to during the construction and the report is made available to the Society on the findings made by the NDT.

(8) **Surface inspections**

(a) Surface inspections shall be carried out as bellows;

(b) The surface of welds to be radiographed are to be sufficiently free from irregularities that may mask or interfere with interpretation

(c) The test surface (within I skip distance from welds edge) to be ultrasonic tested are free from spatter, floating scales, painting film, remarkable rust which prevent transmission of ultrasonic wave and the likes. They are removed if existed.

2. NDT for detection of surface imperfections

(1) **Visual testing**

(a) The welds examined should be clean and free from paint.

(b) Acceptance criteria are given in **Table 2.**

Table 2 Acceptance criteria for visual testing, magnetic particle and liquid penetrant testing

Surface discontinuity	Acceptance criteria for visual testing
Crack	not accepted
Lack of fusion	not accepted
Incomplete root penetration in butt joints welded from one side	not accepted
Surface pore	Single pore diameter d ≤ 0.25t(1) for butt welds (d ≤0.25a(1) for fillet welds) with maximum diameter 3mm; 2.5d as minimum distance to adjacent pore.
Undercut in butt welds	depth ≤ 0.5mm whatever is the length depth ≤ 0.8mm with a maximum continuous(2) length of 90mm
Undercut in fillet welds	depth ≤ 0.8mm whatever is the length

Note:
(1) “t” is the plate thickness of the thinnest plate and “a” is the throat of the fillet weld.
(2) Adjacent undercuts separated by a distance shorter than the shortest undercut should be regarded as a single continuous undercut.

(2) **Magnetic particle testing**

(a) Methods of inspection not specified in this Guidance are to comply with the *KS B ISO* 9934-1 or other recognized standard subject to the approval by the Society.

(b) The Shipbuilder should submit a procedure for approval by the Surveyor, specifying the surface preparation, magnetizing equipment, calibration methods, detection media and application, viewing conditions and post demagnetization.

(c) The surface to be examined should be free from scale, weld spatter, oil, grease, dirt or paint and should be clean and dry.

(d) When using current flow equipment with prods, care shall be taken to avoid local damage to the material. Copper prod tips must not be used. The prod tips should be lead, steel, aluminium or aluminium-copper braid.
(e) To ensure detection of discontinuities of any orientation, the welds are magnetized in two directions approximately perpendicular to each other with a maximum deviation of 30°. Adequate overlapping shall ensure testing of the whole zone.
(f) Continuous wet particle method should be used as far as practicable.
(g) magnetic particle testing should cover a minimum weld length of 500 mm.
(h) Acceptance criteria are given in **Table 2**. Only the indications which have any dimension greater than 2 mm should require evaluation.

(3) **Liquid penetrant testing**
(a) Methods of inspection not specified in this Guidance are to comply with the *KS B ISO* 3452 or other recognized standard subject to the approval by the Society.
(b) The Shipbuilder should submit a procedure for approval by the Surveyor, specifying the calibration equipment, surface preparation, cleaning and drying prior to testing, temperature range, type of penetrant, cleaner and developer used, penetrant application and removal, penetration time, developer application and development time and lighting conditions during testing.
(c) The surface to be examined should be clean and free from scale, oil, grease, dirt or paint and should include the weld bead and base metal for at least 10 mm on each side of the weld, or the width of the heat affected zone, whichever is greater.
(d) The temperature of parts examined should be typically between 5°C and 50°C, outside this temperature range special low/high temperature penetrant and reference comparator blocks should be used.
(e) The penetration time should not be less than 10 minutes and in accordance with the manufacturer’s specification. The development time should not be less than 10 minutes and in accordance with the manufacturer’s specification, normally between 10-30 minutes.
(f) magnetic particle testing should cover a minimum weld length of 500 mm.
(g) Acceptance criteria are given in **Table 2.** Only the indications which have any dimension greater than 2 mm should require evaluation.

(4) **Survey records**
(A) In addition to generic items, reports of magnetic particle testing should include the following specific items and their records are to be filed to compare the inspection locations with their results.
(a) type of magnetization
(b) magnetic field strength
(c) detection media
(d) viewing conditions
(e) demagnetization, if required
(B) In addition to generic items, reports of liquid penetrant testing should include the following specific items and their records are to be filed to compare the inspection locations with their results.
(a) type of penetrant, cleaner and developer used
(b) penetration time and development time

3. Radiographic Inspection

(1) **Methods of radiography**
(A) Methods of inspection not specified in this Guidance are to comply with the *KS B* 0845(Methods of radiographic examination for welded joints in steel) or other recognized standard subject to the approval by the Society.
(B) Test range of radiographic inspection is to be not less than 250 mm or overall length of the welds inspected, whichever is smaller.
(C) Processed films should display hull no., frame no., weld boundary indicators, Port/Starboard, location (or film serial number) and date as radiographic image.
(D) **Film density**
Film density through the area of interest shall be within 1.8 to 4.0 except for the defect images.
(E) **Penetrameter**
(a) The penetrameter is to be a wire type image quality indicator specified in the *KS A*

4054 (Radiographic image quality indicators for non-destructive testing - Principles and identification)

(b) The penetrameters including wire having minimum perceptible diameter are to be placed across a weld and near the both edge (end) of the weld, facing the radiation source. However, if the length under examination is less than three times the width of penetrameter, only one penetrameter may be laid on the center of the weld length.

(c) Minimum perceptible wire diameter of penetrameter on the radiographic films are to be less than the value specified in **Table 3.**

(d) When using IQI's of wire type, the image of a wire is considered visible on the film if a continuous length of at least 10 mm is clearly visible in a section of uniform optical density.

Table 3 Minimum perceptible wire diameter of penetrameter (Unit : mm)

Thickness of base metal	Minimum perceptible wire diameter of penetrameter (mm)	Thickness of base metal	Minimum perceptible wire diameter of penetrameter (mm)
$t \leq 4.0$	0.10	$32.0 < t \leq 40.0$	0.63
$4.0 < t \leq 6.3$	0.16	$40.0 < t \leq 63.0$	0.80
$6.3 < t \leq 10.0$	0.20	$63.0 < t \leq 80.0$	1.00
$10.0 < t \leq 12.5$	0.25	$80.0 < t \leq 125$	1.25
$12.5 < t \leq 16.0$	0.32	$125 < t \leq 200$	1.60
$16.0 < t \leq 20.0$	0.40	$200 < t \leq 320$	2.00
$20.0 < t \leq 32.0$	0.50	$320 < t$	2.50

(2) **Extent of survey**

(A) *Survey of welded joints of the shell and deck plating in ships*

(a) The number of checkpoints

The minimum number of radiographic check points for the welded joints of the shell and deck plating in ships is to be governed by the following equation or the same as the length of the ship(m), (round off), whichever is the greater.

$$N = \frac{L(B+D)}{46.5}$$

where,

N = minimum number of checkpoints

L = length specified in **Pt 3, Ch 1, 102.** of the Rules (m)

B = breadth specified in **Pt 3, Ch 1, 104.** of the Rules (m)

D = depth specified in **Pt 3, Ch 1, 106.** of the Rules (m)

(b) Survey location and distribution of checkpoints

(i) Survey location and distribution of checkpoints are to comply with the requirements in **Table 4.** These inspection spots are not to adjoin each other.

(ii) In the distribution of checkpoints, the selection of inspection locations is to be considered the followings and carried out by the field Surveyor.

① Welds in high stressed areas

② Welds which are inaccessible or very difficult to inspection in service

③ Intersections of field erected welds

(iii) If the welds to be inspected can not be inspected because of the structure, other possible welds in the vicinity of that weld are to be subjected to radiographic inspection.

Table 4 Survey location and distribution of checkpoints for the welded joints of the shell and deck plating in ships

Survey location	distribution of checkpoints	
	Butt welds within 0.6 L midship	Butt welds outside 0.6 L midship
(1) Strength deck(excluding the area within hatch side lines) (2) Sheer strake, (3) Side shell plating, (4) bilge strake (5) Bottom shell plating, (including flat plate keel.) (6) Hatch side coaming(including the top plate)(1)	$N^{(2)}$	$\frac{1}{10}N$
Note (1) Butt joints of the hatch side coaming exceeding 0.15L in length. (2) one-third of the number of checkpoints is to be the intersections of weld lines.		

(B) *Survey of welded joints of internal structural members of ships*
   (a) Survey location and distribution of checkpoints are to comply with **Table 5.** These inspection spots are not to adjoin each other.
   (b) Distribution of checkpoints is to be as specified in (2), (A), (b), (ii)

Table 5 Survey location and distribution of checkpoints for the welded joints of internal structural members of ships

Survey location	distribution of checkpoints(1)(2)	
	within 0.6L midship	outside 0.6L midship
	Butt welds	
(1) Web and face plates of longitudinal members on the strength deck (deck longitudinal, girders under deck and above deck).(longitudinal on the deck within the side lines of a cargo hatch opening are excluded.)	$\frac{1}{8}L$	$\frac{1}{40}L$
(2) Uppermost steel plate of longitudinal bulkheads.	$\frac{1}{8}L$	
(3) Lowermost plate of the longitudinal bulkhead.	$\frac{1}{16}L$	
(4) Web and face plates of longitudinal members (longitudinal frames, centerline girder plate, etc.) on sheer strake, shell plating, turn of bilge strake and keel plate.	$\frac{1}{16}L$	
(5) Web and face plates of transverse and horizontal girders.	$\frac{1}{16}L$	
Note (1) Number of inspections is to round up decimal places per joints of each members subject to inspections. (2) Distribution of number of inspections may change in consideration of the type of ship, structural arrang ement, welding process, arrangement of joints, etc.		

(C) *Workmanship control of welded joints of hull*
   (a) In addition to preceding (A) and (B), non-destructive testing may be required additionally for parts of start, interrupted and end points of automatic welded joints, welded joints of hatch corner, connections of stern frame or rudder horn made of casting steel to rolled steels for hull, welded joints of insert plate for working holes and welded joints in the vicinity of parts where stress is concentrated.
   (b) In addition to (a) above, non-destructive testing may be required additionally for the

areas where welding workmanship is suspect, the areas where new welding methods have been adopted, the areas where defects are liable to occur easily, the welds which are inaccessible or very difficult to inspect in service and other appropriate areas deemed necessary by the Surveyor to encourage good welding work.

(c) The locations of and the number of joints to be inspected additionally according to (a) and (b) above are to be appropriately decided by the Surveyor according to the actual status of workmanship of the shipyard.

(D) *Addition/Reduction in the number of checkpoints*

(a) If it is deemed necessary in considering the results of visual inspection for welds of the members, the Surveyor may require, additional non-destructive inspections for welds other than those subject to non-destructive inspection, or alteration of non-destructive inspection procedure.

(b) If the survey results (before repair) of a previously constructed ship show that the number of welds that need to be repaired exceeds 20 % of the total number of locations, then the number of checkpoints is to be a minimum of twice the number required.

(c) If automatic welding has been carried out at joints to be surveyed and the results of the survey verify that the quality of the welding procedure is consistent satisfactory quality, the number of checkpoints may appropriately be reduced.

(d) If a weld that needs to be repaired is found from automatically welded joints whose number has been reduced in accordance with (c), additional radiographs amounting to the number of checkpoints as prescribed in (c), are to be taken immediately. The number of checkpoints is not to be reduced until an appropriate period has elapsed and the quality is verified to be stable and satisfactory.

(e) For ships whose length 120 m or under, the survey locations and the number of checkpoints can be reduced.

(3) **Acceptable Criteria of Radiographic Inspections**

In radiographic testing, the Surveyor is to decide whether or not the results are acceptable when the test records specified in **3.** (5) The judgement may be required to the engineers of the shipbuilder (personnel with qualifications) but the results of its judgement frequently are to be verified. Where deemed necessary by the society, all radiographic films related with the ship are to be submitted.

(A) *Classification of Defects*

(a) Classification of defects is to be as given in **Table 6.**

Table 6 Classification of defects

Types of defects	Kind of defects
Type 1	Porosity(blow hole) and similar defects
Type 2	Elongated slag inclusion, pipe, incomplete penetration, incomplete fusion, and similar defects
Type 3	Crack and similar defects

(b) Where it is difficult to classify the defects into type 1 or type 2, classify respective defects into type 1 or type 2, and then decide whether or not the results are acceptable.

(c) In case of butt welded joints between plates with different thickness, thickness of the thinner plate is taken.

(B) *Defect of Type 1*

(a) Size of defect of type 1 is to be represented by score and maximum length of the defect. The test field vision specified in **Table 8** is to be selected from radiographic so that the defects of maximum size exists and the sum of size of defects is maximum. Where the flaw falls on the boundary of the test field of vision, the part outside the test field of vision shall be included for measurement.

(b) The score of defect in the case of single defect of type 1 shall be determined by using the value in **Table 7** according to the dimension of the major diameter of the defect. The score of defect for two or more defect of type 1 shall be the grand total of the score for each defect in the test field of vision.

Table 7 Score of defect Units : mm

Major diameter of flaw (mm)	Up to and incl. 1.0	Over 1.0, up to and incl. 2.0	Over 2.0, up to and incl. 3.0	Over 3.0, up to and incl. 4.0	Over 4.0, up to and incl. 6.0	Over 6.0, up to and incl. 8.0	Over 8.0
Score	1	2	3	6	10	15	25

(c) The defects of type 1 are to be judged unacceptable, if the size of the defects exceeds the value of acceptable criteria specified in **Table 8.**

Table 8 Acceptance criteria for type 1 defect

	Thickness of base metal t(mm)	t ≤ 10	10 < t ≤25	25 < t ≤50	50 < t ≤ 100
	Test field of vision	10 mm × 10 mm		10 mm × 20 mm	
Acceptance criteria	Maximum size of single defect (mm)	4	5	t/5	10
	Total score of defect	6	12	24	30
Note (1) Where the thickness of base metal is not more than 25 mm, the defects of not more than 0.5 mm may be ignored. Where the thickness of base metal is more than 25 mm, the defects of n ot more than 0.7 mm may be ignored.					

(C) *Defect of Type 2*

(a) Size of defect of type 2 is to be represented by length of the defect. Where defects are present in a row and the distance between the mutual defects does not exceed the length of larger defect, the sizes of all defects including the spaces between the mutual defects is to be considered as the length of the defect.

(b) The defects of type 2 are to be judged unacceptable, if the length of a defect exceeds the value of acceptable criteria specified in **Table 9.**

(c) Incomplete root penetration is not accepted in butt joint welded from one side

Table 9 Acceptance criteria for type 2 defect

	Thickness of base metal t (mm)	t ≤ 12	12 < t ≤ 50	50 < t
Acceptance criteria	Sum of size of defect (mm)	6 or under	t/2 or under	24 or under

(D) *Defect of Type 3*

Any defect of type 3 is to be judged unacceptable.

(E) *In Case of Coexistence of Defects of Type 1 and Type 2*

Where two or more types of defects are coexistent, the defects are to be judged unacceptable, provided the size of defects of each type are more than half of the size specified in **Table 8** and **Table 9** respectively.

(4) **Repair and Treatment after the Repair**

(A) Unacceptable indications should be eliminated and repaired where necessary. The repair welds should be examined on their full length using magnetic particle and ultrasonic or radiographic testing method.

(B) When unacceptable indications are found, additional areas of the same weld length should be examined unless the indication is judged isolated without any doubt. In case of automatic welded joints, additional NDT should be extended to all areas of the same weld length. Same weld length mean the locations where, for manual and semi-automatic welding, identical person, identical postures and identical time and, for automatic welding, identical welding method, and identical time.

(C) The extent of testing can be extended at the surveyor's discretion when repeated non-acceptable discontinuities are found.

(D) The Shipbuilder should take appropriate actions to monitor and improve the quality of welds to the required level. The repair rate at which corrective action is to be instigated should be identified in the builder''s QA system.

(5) **Survey records**

(A) The survey results are to be recorded to the survey records such as followings and their records are to be filed to compare the inspection locations with their results.

(a) Radiation source, type and focal spot size
(b) Geometry of radiographic setup
(c) Film type
(d) Intensifying screens
(e) Film coverage
(f) Image quality indicators
(g) Film identification marking
(h) Exposure conditions
(i) Film processing
(j) Film density
(k) Film viewing conditions
(l) The result of judgement for acceptance
(m) Name of personnel performed the radiographic inspection
(n) Name of personnel performed the radiographic review

(B) The Society may require to duplicate some radiographs in order that some processed films are handed over to the Society together with testing reports. Alternative method to duplicate the processed film can be agreed with the Society.

4. Ultrasonic Inspection

(1) **Methods of ultrasonic inspection**

(A) *General*

(a) The inspection methods other than those specified in this Guidance are to comply with *KS B* 0896 (Method for ultrasonic examination for welds of ferritic steel) except in those cases where alternative criteria have been otherwise approved or specified.

(b) In general, the scanning of weld is performed by using angle beam technique. However, normal beam technique is appled to the place where the application of angle beam technique is difficult or the place specially specified as that where the other technique are more suitable than angle beam technique for detecting a discontinuity.

(c) The stage of the test is the time when the final heat treatment is completed, in the case where heat treatment or the like after completion of weld has been specified in the document.

(d) The test of parent materials of the part through which ultrasonic waves pass when angle beam technique is performed, are previously tested normal technique to detect a discontinuity such as lamination etc.

(e) The probes may be affixed to suitable wedges designed to induce beam waves in the material under test at the selected angles.

(f) The couplant, in general, is to be used the glycerine-water solution of 75 % or more. The kinds and temperature of the couplant used for test are to be equivalent to those used for calibration of ultrasonic test instrument.

(g) The weld reinforcement is adequately finished in case where its form affects the results of the test.

(B) *Checking the overall performance characteristics of ultrasonic equipment*

(a) The vertical linearity is to be checked in accordance with the 4.1 of the *KS B* 0534 (Method for Assessing the Overall Performance Characteristics of Ultrasonic pulse echo instrument) and the result is to be within ±3% of full scale.

(b) The linearity of the time base is to be measured in accordance with the 4.2 of the *KS B* 0534 and the result is to be within ±1% of full scale.

(c) A margin of gain control is to be measured in accordance with the 4.3 of the *KS B* 0534 and the result is to be not less than 40dB.

(d) Periodical checks of ultrasonic test instrument are to be performed not less once every year. However, The check of the test instrument immediately is to be performed in the case that the repair relating to the performance characteristics of the ultrasonic test instrument was performed within this period.

(C) *Probes*

(a) In general, the scanning of weld is performed by using probes of angle beam technique. In case where normal probe is used, the standard is to comply with the *KS B* 0896.

(b) The frequency to be used for angle beam technique is in accordance with **Table 10.** However, the frequency lower than the value specified in **Table 10** may be used for the test of test object with remarkable ultrasonic attenuation and the frequency higher than the value specified in **Table 10** may be used for improving the resolution.

Table 10 Nominal Frequency to be used for Angle Beam Technique

Plate thickness of parent materials (mm)	Nominal frequency (MHz)
75 or less	5 or 2
over 75	2

(c) The refraction angle of probe to be used is to comply with **Table 11** according to the thickness of parent materials. Where deemed appropriate by the Society, the different refraction angle of probe may be used.

Table 11 Nominal Refraction Angle of Probe used

Plate thickness of parent materials (mm)	Nominal refraction angle
40 or less	70°
Over 40 to 60 incl.	70° or 60°
Over 60	70° and 45° or 60° and 45°

(D) *Adjustment of ultrasonic test instrument*

(a) Measurement of probe index
The probe index is measured by using A1 calibration block or A3 calibration block specified in *KS B* 0831. The probe index is measured in precision of ±1% and to be indicated on the both sides of probe.

(b) Measurement of refraction angle
Refraction angle is measured in unit of 0.5° by using A1 calibration block or A3 calibration block

(c) Adjustment of time base range and correction of the starting point
The adjustment of time base range is performed in precision of ±1% by using A1 calibration block or A3 calibration block and the starting point is corrected.

(d) The equipment (instrument and probes) should be verified by the use of appropriate standard calibration blocks at suitable time intervals.

(E) *Making of curve for dividing echo height*

(a) Curve for dividing echo height
The height for evaluation of the depth is made for four regions specified in **Fig 2.** The positions of probe for making the curves for dividing echo height using the distance amplitude characteristic curve are to comply with **Fig 1.**

(b) Determination of H line, M line and L line
The curve for dividing echo height by working sensitivity of (d) is selected to take it as H line, and the curve for dividing echo height lower than H line by 6 dB is taken as M line and the curve lower than H line by 12 dB is taken as L line. H line is of over 40 %.

(c) Regions
The regions divided by H, M and L line are designated as given in **Table 12** and the examples of regional division are indicated as given in **Fig 2.**

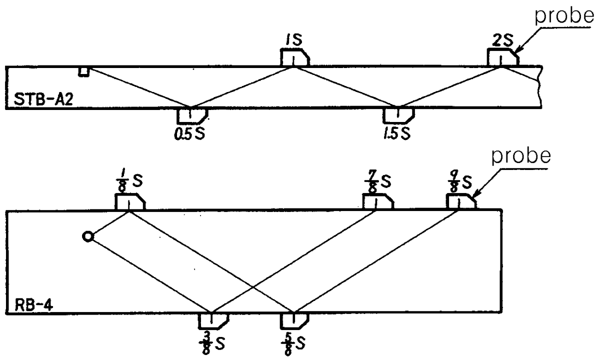

Fig 1 Position of Probe for making the Curves for Dividing Echo Height

An example in which the third dividing line from the lowest is taken as H line in the case where the time base range is 125*mm* and path length used for evaluation is 85*mm*.

Probe used : 5Z10 x 10A70

An example in which the third dividing line is taken as H line in the case where the time base range is 125*mm* and path length used for evaluation is 75*mm* to 115mm.

Probe used : 5Z10 x 10A70

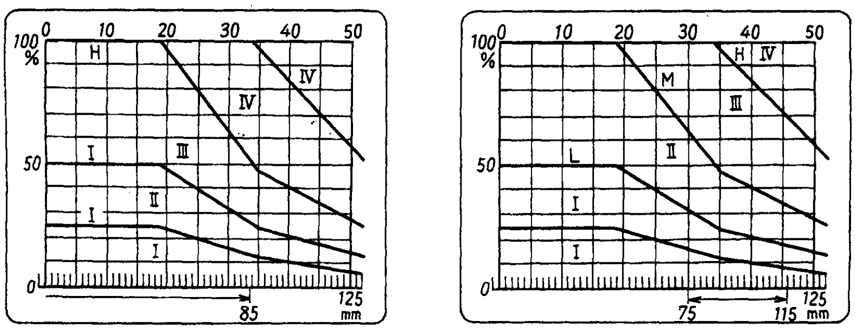

Fig 2 Examples for Drawing Curves for Dividing Echo Height

Table 12 Designation of Regional Division of Echo Height

Range of echo height	Region of echo height
L line or less	I
Over L to M line incl.	II
Over M to H line incl.	III
Over H line	IV

(F) *Working sensitivity*

(a) Using the A2 calibration block
In the case of using nominal refraction angle of 60° or 70°, the gain of instrument is adjusted so that the echo height of the standard hole of ϕ 4 x 4 mm agrees with H line. In the case of using nominal refraction angle of 45°, the gain of instrument is increased by 6 dB after it is adjusted so that the echo height of the standard hole of ϕ 4 x 4 mm agrees with H line. In both case, where deemed appropriate by Society, sensitivity compensation calculated according to Annex of *KS B* 0896 to be added.

(b) Using the RB-4 reference block
The gain of instrument is adjusted so that the echo height of the standard hole agrees with H line.

(c) Where deemed appropriate by the Society, other blocks considered as equivalent for block specified in (a) and (b) may be used.

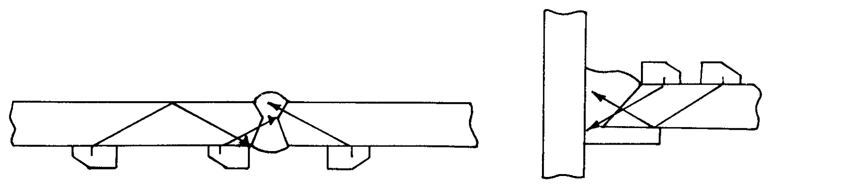
(d) The range and sensitivity should be set prior to each testing and checked at regular intervals as per the procedure and whenever needed.

(G) *Position and direction of scanning*

(a) In general, the scanning of weld is performed by using angle beam technique and scanning method is comply with the **Table 13** and **Fig 3** depending on the type of joints and plate thickness. However, for welds in which the surfaces have been ground, the probe is placed on the weld surface and moved along the weld axis with the sound beam directed parallel to the weld.

Table 13 Position and direction of scanning

Type of Joints	Plate thickness (mm)	Position and direction of scanning	Scanning methods
butt joints	t ≤ 100	both side of single face	Directed and 1 skip reflected.
	t > 100	both side of both face	Directed
T joints, corner joints	t ≤ 60	single side of single face	Directed and 1 skip reflected.
	t > 60	single side of both face	Directed



(a) Scanning of butt joint (b) Scanning of T and corner joint

Fig 3 Position and Direction of Scanning

(b) The scanning technique should be determined to allow the testing of the entire volume of the weld bead and base metal for at least 10 mm on each side of the weld, or the width of the heat affected zone, whichever is greater.

(H) *Ultrasonic discontinuity length and presentation of location of discontinuity*

(a) Ultrasonic discontinuity length

(i) The position indicating the maximum echo height is taken as center of scanning, the transference distance of the probe in the range where the echo height exceeds L line is measured by scanning its circumference is taken as the ultrasonic discontinuity length. The measurement is performed by unit of 1 mm.

(ii) In the case where the plate thickness of part where the probe is contacted is not less than 75 mm, nominal frequency is 2 MHz and the probe with transducer size of 20 x 20 mm is used, the transference distance of the probe in the range where the echo height exceeds one half of the height of the maximum echo is taken as the ultrasonic discontinuity length.

(b) Presentation of location of discontinuity

The discontinuity location in the transverse section [depth(*d*) and distance(*k*) from weld centerline] is presented by the probe location(*Xp*) where the maximum echo can obtain. The discontinuity location in the plane is presented by both ends((*Xs* and *Xe*) of ultrasonic discontinuity length(*l*)

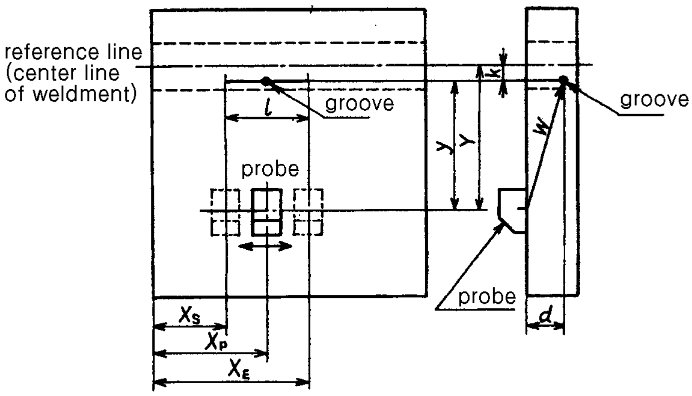


Fig 4 Presentation of location of discontinuity

(2) **Extent of survey**

(A) *Survey of welded joints of the shell and deck plating in ships*

(a) The survey location and distribution of checkpoints are to comply with the requirements given in (A) of **3.**, (2).

(b) The length of checkpoint is entire length of the joint or 750 mm, whichever is smaller.

(B) *Survey of welded joints of internal structural members of ships*

(a) The Survey location and distribution of checkpoints are to comply with the requirements given in (B) of **3.**, (2).

(b) The length of checkpoint is entire length of the joint or 300 mm, whichever is smaller.

(C) *Workmanship control of welded joints of hull*

(a) The survey location and distribution of checkpoints for Workmanship control of welded joints of hull are to comply with the requirements given in (C) of **3** (2).

(b) The length of checkpoint is to comply with the requirements given in (B) above).

(D) *Addition/Reduction in the number of checkpoints*

Addition/reduction in the number of checkpoints is to comply with the requirements given in (D) of **3** (2).

(3) **Acceptance Criteria of ultrasonic inspections**

(A) Defects detected by ultrasonic inspection are to be judged in accordance with **Table 14**

Table 14 Acceptance criteria for defects detected by ultrasonic inspection

	Thickness of base metal t (mm)	t ≤ 50	50 < t	t ≤ 50	50 < t
	Region of maximum echo heights	II and III		IV	
Acceptance Criteria	length of defect (mm)	t or less	50 or less	t/2 or less	25 or less

Note:
1. (1) The symbol t is plate thickness (mm) of the parents materials of the groove side. However, in the case of butt joint weld with different plate thickness of the parents materials, the thinner plate thickness is adopted.
2. In applying this table, in the case where the distance between discontinuities is smaller or equal to the length of the discontinuity with longer ultrasonic discontinuity length that the depth considered to be same, these discontinuities are regarded as same discontinuity group and treated as a continuous discontinuity including such distance. In the case where the distance between discontinuities is longer than the larger one out of the both ultrasonic discontinuity lengths, these discontinuities are regarded as independent from each other. The examination results of straddle scanning, parallel scanning by slanted probe and longitudinal scanning on the weld line are classified in accordance with the agreement between the parties concerned.

(B) Where kind of defect is considered as cracks from welding process, location of defects, etc., the defects are to be judged unacceptable.

(4) **Repair and Treatment after the Repair**
Repair and treatment after the repair is to comply with the requirements given in **3** (4).

(5) **Records**

(A) *Making the records*
The records after test are to be made.

(B) *Items of Records*
The records are to be included the followings.

(a) Name of the work and manufacturer
(b) Number and name of ship
(c) Name and qualification of personnel engaged in the test
(d) Date of the test
(e) Calibration and reference blocks used
(f) Performance of test instrument (identity, probe type, size, frequency, angle etc)
(g) Unusual condition of weld bead
(h) Method of welding and form of groove
(i) Materials and dimension
(j) Location and length of the welds inspected
(k) Length and location of discontinuity
(l) Classification
(m) Kind of couplant
(n) Working sensitivity
(o) Other items(designated items, subject of discussion, witness, sampling method etc.)

(c) *Evaluation of records*
The ultrasonic test reports is to be made under condition of rigid quality control and is to be to the satisfaction of the Surveyor.

5. Improvement of qualification

Where the faulty welds are more than 10 % of the number of inspection specified in **Table 4** or **5**, the results of investigation on the substantial cause and the measures to improve the quality are to be submitted to the Surveyor.

Annex 2-8 Reinforced plastic materials

1. General

(1) **Application**

(A) This Guidance applies to the base materials such as thermosetting resins, fiber reinforcements and core materials (hereinafter refer to FRP materials) used in the construction or repair of FRP ships, composite vessels and other marine structures which are to be certified or are intended for classification.

(B) FRP materials or hybrid materials other than those prescribed in this Guidance may be used where specially approved in connection with the design. In such cases, the detailed data relating to the manufacturing process and mechanical properties, etc. of the materials are to be submitted for approval.

(2) **Approval**

(A) FRP materials such as thermosetting resins, fiber reinforcements, core materials, etc. are to be type approved in accordance with this Guidance and the Guidance specially specified by the Society in advance

(B) The manufacturing process of of FRP ships, composite vessels or other marine structures which are to be certified or are intended for classification is to be approved in accordance with the Guidance specially specified by the Society in advance

(C) In order that a FRP materials can be approved, the manufacturer is required to demonstrate to the satisfaction of the Society that the necessary manufacturing and testing facilities are available and are supervised by qualified personnel.

(3) **Manufacturing control**

(A) It is the manufacturer's responsibility to assure that effective process and production controls in operation are adhered to within the manufacturing specifications.

(B) Where control imperfection inducing possible inferior quality of FRP materials occurs, the manufacturer is to identify the cause and establish a countermeasure to prevent its recurrence. Also, the complete investigation report is to be submitted to the Surveyor.

(C) For further use, each FRP material affected by previous (B) is to be tested to the Surveyor's satisfaction. The frequency of testing for subsequent products offered may be increased to gain confidence in the quality at the discretion of the Society.

(D) The manufacturer is to provide the material producer with such information as is essential to ensure that the FRP materials to be used are in accordance with the approval requirements and the product specification. This information is to include any survey requirements for the materials.

(E) Post-cure heating is to be carried out in properly constructed ovens which are efficiently maintained and have adequate means for control and recording of temperature. The oven is to be such as to allow the whole item to be uniformly heated to the necessary temperature. In the case of very large components which require post-cure heating, alternative methods will be specially considered.

(4) **Testing and inspection**

(A) The FRP materials are to be tested and inspected in accordance with this Guidance and the Guidance specially specified by the Society in advance in the presence of the Society‘s Surveyor except otherwise specially provided, and are to comply with the requirements in this Guidance.

(B) Where the FRP materials are manufactured by the approval of quality assurance scheme specially specified by the Society, a part or all of test and inspection in the presence of the Society's Surveyor may be omitted.

(5) **Execution of testing and inspection**

(A) The manufacturers shall afford the Surveyor all necessary facilities and access to all relevant parts of the works to enable him to verify that the approved process is adhered to, for the selection of test materials, and the witnessing of tests, as required by this Guidance, and for verifying the accuracy of the testing equipment.

(B) In the case of special order, the manufacturer is to show the order specifications, special requirements, etc. of the FRP materials to the Surveyor prior to the material test.

(C) Before final acceptance, all test materials are to be confirmed as typical of the manufactured product and be submitted to the specified tests and examinations under conditions acceptable to the Surveyors. The results are to comply with the specification and this Guidance and are

to be to the satisfaction of the Surveyors.
(D) All tests and inspections are to be carried out at the place of manufacture before dispatch. The test specimens and procedures are to be in accordance with **2.** thru **4.** of this Guidance. All the test specimens are to be selected and stamped by the Surveyor and tested in his presence, unless otherwise agreed.
(E) All FRP material samples for testing are to be prepared under conditions that are as close as possible to those under which the product is to be manufactured. Where this is not possible, a suitable procedure is to be agreed with the Surveyor.
(F) During production, check test samples are to be provided as requested by the Surveyor. Should the taking of these samples prove impossible, model samples are to be prepared concurrently with production. The procedure for the preparation of these samples is to be agreed with the Surveyor.
(G) Where materials are manufactured in quantity by semi-continuous or continuous processes under closely controlled conditions, an alternative system for testing and inspection may be adopted, subject to the agreement of the Surveyors.

(6) **Retest procedure**
(A) Where test material fails to meet the specified requirement, two additional tests of the same type may be made at the discretion of the Surveyor.
(B) Where an individual test result in a group (minimum five) deviates from the mean by more than two standard deviations in either the higher or lower direction, the result is to be excluded and a re-test made. Excluded results of tests are to be reported with confirmation that they have been excluded. Only one exclusion is acceptable in any group of tests.

(7) **Quality**
(A) FRP materials are to be free from surface or internal defects which would be prejudicial to their proper application in service.
(B) In the event of any material proving unsatisfactory during subsequent working or fabrication, such material may be rejected, notwithstanding any previous satisfactory testing and/or certification where the Surveyor considers necessary.

(8) **Identification and marking of materials**
(A) The manufacturer of approved FRP materials is to identify each batch with an unique number or code.
(B) The manufacturer of FRP products is to adopt a system of identification which will enable all finished products to be traced to the original batches of base materials. Surveyors are to be given full facilities for tracing any component or material when required.

(9) **Certification**
The manufacturer is to provide the purchaser with test reports or certificates of conformity for each batch of FRP material supplied indicating the relevant values are to comply with this Guidance.

2. Thermosetting resins

(1) The data listed in **Table 1** is to be provided by the manufacturer for each type of thermosetting resin.
(2) The following tests are to be carried out on each type of thermosetting resin:
(A) Tensile strength (stress at maximum load) and stress at break.
(B) Tensile strain at maximum load.
(C) Tensile secant modulus at 0,5 per cent and 0,25 per cent strain respectively.
(D) Temperature of deflection under load.
(E) Barcol hardness.
(F) Determination of water absorption.
(G) Volume shrinkage after cure.
(H) Specific gravity of cast resin.
(3) In addition, for gel coat resins the stress at break and modulus of elasticity in flexure are to be determined.
(4) The test methods for thermosetting resin are to be in accordance with the Guidance specially specified by the Society.

Table 1 Data requirements for thermosetting resins

Data	Type of resin		
	Polyester(3)	Epoxide	Phenolic
Specific gravity of liquid resin	O	O	O
Viscosity	O	O	O
Gel time	O	O	X
Appearance	O	O	O
Mineral content(1)	O	O	X(2)
Volatile content	O	X	X
Acid value	O	X	X
Epoxide content	X	O	X
Free phenol	X	X	O
Free formaldehyde	X	X	O

Notes :
(1) This is to be the total filler in the system, including thixotrope, filler, pigments, etc., and is to be expressed in parts by weight per hundred parts of pure resin.
(2) If the resin is pre-filled, the mineral content is required.
(3) Vinylesters are to be treated as equivalent to polyesters.

(5) Minimum property values of gel coat resins are to comply with the values specified in **Table 2.**

Table 2 Minimum property values of gel coat resins

Properties	Minimum value
Tensile strength (stress at maximum load)	40 N/mm^2
Tensile stress at break	40 N/mm^2
Tensile strain at maximum load	2.5 %
Modulus of elasticity in tension	As measured
Flexural strength (stress at maximum load)	80 N/mm^2
Modulus of elasticity in flexure	As measured
Barcol hardness	35
Determination of water absorption.	60 ℃
Water absorption	60 mg(max.)
Specific gravity of cast resin	As measured

(6) Minimum property values of cast thermosetting resins are to comply with the values specified in **Table 3.**

Table 3 Minimum property values of cast thermosetting resins

Properties	Minimum value
Tensile strength (stress at maximum load)	40 N/mm^2
Tensile stress at break	40 N/mm^2
Tensile strain at maximum load	2.0 %
Modulus of elasticity in tension	As measured
Flexural strength (stress at maximum load)	70 N/mm^2
Modulus of elasticity in flexure	As measured
Barcol hardness	35
Determination of water absorption.	60 ℃
Water absorption	70 mg(max.)
Specific gravity of cast resin	As measured

3. Fiber reinforcements

(1) The following data is to be provided, where applicable, for each type of fiber reinforcement:
   (A) Reinforcement type.
   (B) Fibre type for each direction.
   (C) Fibre tex value.
   (D) Fibre finish and/or treatment.
   (E) Yarn count in each direction.
   (F) Width of manufactured reinforcement.
   (G) Weight per unit area of manufactured reinforcement.
   (H) Weight per linear metre of manufactured reinforcement.
   (I) Compatibility (e.g. suitable for polyesters, epoxides, etc.).
   (J) Constructional stitching −details of yarn, specific gravity, type, frequency and direction.
   (K) Weave type.
   (L) Binder type and content.
   (M) Density of the fibre material.
(2) The following tests are to be made on each fiber reinforcement:
   (A) Tensile strength (stress at maximum load).
   (B) Tensile strain at break.
   (C) Tensile secant modulus at 0,5 per cent and 0,25 per cent strain respectively.
   (D) Compressive strength (stress at maximum load).
   (E) Compressive modulus.
   (F) Flexural strength (stress at maximum load).
   (G) Modulus of elasticity in flexure.
   (H) Apparent interlaminar shear.
   (I) Fibre content.
   (J) Determination of water absorption.
(3) The test methods for Fiber reinforcements are to be in accordance with the Guidance specially specified by the Society
(4) Minimum property values of laminates are to comply with the values specified in **Table 4.**

Table 4 Minimum property values of laminates

Material type	Property	Min. value
Chopped strand mat	Tensile strength (stress at maximum load)(N/mm^2) Modulus of elasticity in tension(kN/mm^2)	200Gc+25 15Gc+20
Bi-directional reinforcement	Tensile strength (stress at maximum load)(N/mm^2) Modulus of elasticity in tension(kN/mm^2)	400Gc-10 30Gc-0.5
Uni-directional reinforcement	Tensile strength (stress at maximum load)(N/mm^2) Modulus of elasticity in tension(kN/mm^2)	100Gc-1400Gc+510 130Gc-114Gc+39
All	Flexural strength (stress at maximum load)(N/mm^2) Modulus of elasticity in flexure(kN/mm^2) Compressive strength (stress at maximum load)(N/mm^2) Compressive modulus(kN/mm^2) Interlaminar shear strength(N/mm^2) Water absorption(mg) Glass content(% by weight)	520Gc+106.8 33.4Gc+2.2 150Gc+72 40Gc-6 22-13.5Gc(min. 15) 70(max.) As measured
Notes: (1) After water immersion, the values shall be a minimum of 75 % of the above. (2) Where materials have reinforcement in more than two directions, the requirement will be subject to individual consideration dependent on the construction. (3) Gc : glass fraction by weight.		

4. Core materials

(1) The following data is to be provided for each type of core material:
- (A) Type of material.
- (B) Density.
- (C) Description (block, scrim mounted, grooved).
- (D) Thickness and tolerance.
- (E) Sheet/block dimensions.
- (F) Surface treatment.
- (G) Full application procedure for use of the product.

(2) For each type of test sample the following data are to be reported, together with the submission of a representative test sample showing the mode of failure for each density of core material:
- (A) Skin and core thickness, and core type and density.
- (B) Resin/catalyst/accelerator ratio.
- (C) Skin construction, including types and weight of reinforcements, resin(s), etc.
- (D) Details of production method and curing conditions (temperature and times).
- (E) Where additional preparation of the foam is involved, for example the use of primers or bonding pastes, full details are to be provided.
- (F) Actual span between base supports for each type of test sample.

(3) Specific requirements for end-grain balsa
- (A) The supplier is to provide a signed statement that the balsa (ochroma lozopus) is cut to end-grain, is of good quality, being free from unsound or loose knots, holes, splits, rot, pith and corcho, and that it has been treated against fungal and insect attack, shortly after felling, followed by homogenization, sterilization and kiln drying to an average moisture content of no more than 12 per cent.
- (B) The following tests are to be carried out on the virgin material, both parallel to and perpendicular to the grain. The density of the virgin material is also to be tested.
  - (a) Compressive strength (stress at maximum load).
  - (b) Compressive modulus of elasticity.
  - (c) Tensile strength (stress at maximum load).
- (C) Where the balsa is mounted on a carrier material (e.g. scrim), any adhesive used is to be of a type compatible with the proposed resin system.
- (D) The test methods for end-grain balsa are to be in accordance with the Guidance specially specified by the Society
- (E) Minimum property values of end-grain balsa are to comply with the values specified in **Table 5.**

Table 5. Minimum property values of end-grain balsa

Apparent density (kg/mm^3)	Strength (stress at maximum load)(N/mm^2)					Compressive modulus of elasticity (N/mm^2)		Shear modulus of elasticity (N/mm^2)
	Compressive		Tensile		Shear			
	Direction of stress					Direction of stress		
	Parallel to grain	Perpendicular to grain	Parallel to grain	Perpendicular to grain		Parallel to grain	Perpendicular to grain	
96	5.0	0.35	9.00	0.44	1.10	2300	35.2	105
144	10.6	0.57	14.6	0.70	1.64	3900	67.8	129
176	12.8	0.68	20.5	0.80	2.00	5300	89.6	145

(4) Specific requirements for rigid foams (PVC, Polyurethane and other types)
- (A) The foam is to be of the closed cell type and compatible with the proposed resin system (e.g. polyester, epoxide, etc.).
- (B) Foams are to be of uniform cell structure.
- (C) Data is to be provided on the dimensional stability of the foam by measurement of the shrinkage.

(D) The following test data is to be submitted for each type of foam:
  (a) Density.
  (b) Tensile strength (stress at maximum load).
  (c) Tensile modulus of elasticity.
  (d) Compressive strength (stress at maximum load).
  (e) Compressive modulus of elasticity.

(E) Additionally the compressive properties (see (D) (d) and (e)) are to be determined at a minimum of five points over the temperature range ambient to maximum recommended service or 70 °C, whichever is the greater.

(F) The test methods for rigid foams are to be in accordance with the Guidance specially specified by the Society

(G) Minimum characteristics and mechanical properties of rigid expanded foams are to comply with the values specified in **Table 6.**

Table 6 Minimum characteristics and mechanical properties of rigid expanded foams at 20 °C

Material	Apparent density (kg/mm^3)	Strength (stress at maximum load) (N/mm^2)			Modulus of elasticity (N/mm^2)	
		Tensile	Compressive	Shear	Compressive	Shear
Polyurethane	96	0.85	0.60	0.50	17.20	8.50
Polyvinylchloride	60					

(H) Other types of foam will be subjected to individual consideration. A minimum core shear strength of 0.5 N/mm^2 is to be achieved. ⚓

RA-03-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF PART 3 "HULL STRUCTURES"

1. Unless expressly specified otherwise, the requirements in the Rules apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date : 1 July 2011

CHAPTER 1 GENERAL

Section 2 General

- 209. 2 (2) (E) and (F) have been amended.
- Table 3.1.1 has been amended.

Section 8 General

- 803. has been amended.

CHAPTER 2 STEMS AND STERN FRAMES

Section 2 Stern Frames

- 207. 1 (3) has been amended.

CHAPTER 5 DECKS

Section 3 Deck Plating

- 307. has been new added.

CHAPTER 6 SINGLE BOTTOMS

Section 1 General

- 101. has been amended.

CHAPTER 14 WATERTIGHT BULKHEADS

Section 2 Arrangement of Watertight Bulkheads

- 201. 1 has been amended.

Section 4 Watertight Doors

- 401. 2 and 402. 2 have been amended.
- 404. 3 has been deleted.

CHAPTER 16 SUPERSTRUCTURES

Section 1 General

- 101. 1 has been amended.

CONTENTS

CHAPTER 1 GENERAL

Section 1 Definitions

101. Application

The definitions of symbols and terms used in the Rules, except otherwise specified, are to be in accordance with this Section.

102. Length

The length of ship (L) is the distance in *metres* on the load line defined in **110.,** from the fore side of stem to the after side of rudder post in case of a ship with rudder post, or to the axis of rudder stock in case of a ship without rudder post or stern post. L is not to be less than 96 % and need not be greater than 97 % of the extreme length on the load line.

103. Length for freeboard

The length of ship for freeboard (L_f) is 96 % of the length in *metres* measured from the fore side of stem to the aft side of aft end shell plate on the waterline at 85 % of the least moulded depth measured from the top of keel, or the length in *metres* measured from the fore side of stem to the axis of rudder stock on that waterlines, whichever is the greater. However, where the stem contour is concave above the waterline at 85 % of the least moulded depth, the forward terminal of this length is to be taken at the vertical projection to this waterline of the aftermost point of the stem contour. The waterline on which this length is measured is taken to be parallel to the load line defined in **110.**

104. Breadth

The breadth of ship (B) is the horizontal distance in *metres* from the outside of frame to the outside of frame measured at the broadest part of the hull.

105. Breadth for freeboard

The breadth of ship for freeboard (B_f) is the maximum horizontal distance in *metres* from the outside of frame to the outside of frame measured at the middle of L_f.

106. Depth(the least moulded depth)

The depth of ship (D) is the vertical distance in *metres* at the middle of L measured from the top of keel to the top of the freeboard deck beam at side. Where watertight bulkheads extend to a deck above the freeboard deck and are to be registered as effective to that deck, D is the vertical distance to that bulkhead deck.

107. Depth for strength computation

The depth of ship for strength computation (D_s) is the vertical distance in *metres* from the top of keel to the top of beam at side of the superstructure deck at the middle of L, for the part where the superstructure deck is strength deck, or the freeboard deck for other parts. Where the deck does not cover midship, the depth is to be measured at the imaginary deck line which is extended to the middle of L along the strength deck line.

108. Midship

The midship means the part covering $0.4L$ amidships.

109. Fore and aft end part

The fore and aft end part means the part covering $0.1L$ from the fore and aft end of the ship.

110. Load line

The load line is the waterline corresponding to the designed summer load draught in case of a ship which is required to be marked with load lines and the waterline corresponding to the designed maximum draught in case of a ship which is not required to be marked with load lines.

111. Load draught

The load draught (d) is the vertical distance in *metres* from the top of keel to the load line measured at the middle of L_f in case of a ship which is required to be marked with load lines and at the middle of L in case of a ship which is not required to be marked with load lines.

112. Full load displacement

The full load displacement ($\triangle$) is the displacement (including shell plating and appendages, etc.) in *tons* at the summer load line.

113. Block coefficient

The block coefficient (C_b) is the coefficient obtained by dividing the moulded volume corresponding to $\triangle$ by $L \times B \times d$.

114. Freeboard deck

1. The freeboard deck is normally the uppermost continuous deck. However, in cases where openings without permanent closing means exist on the exposed part of the uppermost continuous deck or where openings without permanent watertight closing means exist on the side of the ship below that deck, the freeboard deck is the continuous deck below that deck.

2. In a ship having a discontinuous freeboard deck, the lowest line of the exposed deck and the continuation of that line parallel to the upper part of the deck is taken as the freeboard deck.

3. Where the designed load draught is less than the draught determined assuming the existing deck below the freeboard deck as the freeboard deck in accordance with the provision in **Pt 1, Ch 1, 1202.** the existing lower deck is taken as the freeboard deck in the application of the Rules. In this case, the lower deck is to be continuous at least between the machinery space and peak bulkheads and continuous athwartships. Where a lower deck in stepped, the lowest line of the deck and the continuation of that line parallel to the upper part of the deck is taken as the freeboard deck.

115. Bulkhead deck

The bulkhead deck is the highest deck to which the watertight transverse bulkheads except both peak bulkheads extend and are made effective.

116. Strength deck

The strength deck at a part of ship's length is the uppermost deck at that part to which the shell plates extend. However, in way of superstructures, except sunken superstructures, not exceeding $0.15L$ in length, the strength deck is the deck just below the superstructure deck. The deck just below the superstructure deck may be taken as the strength deck even in way of the superstructure exceeding $0.15L$ in length at the option of the designer.

117. Raised deck

The raised deck is the sunken superstructure deck below which no deck, is provided.

118. Superstructure

The superstructure is a decked structure on the freeboard deck, extending from side to side of the ship or having its side walls at the position not farther than $0.04B_f$ from the side of ship. Raised quarter deck is to be considered as a superstructure.

119. Enclosed superstructure

An enclosed superstructure is a superstructure complying with the following conditions:
(1) Enclosed by bulkheads of efficient construction.
(2) Access openings in these bulkheads are fitted with doors complying with the requirements of **Ch 16, 301.** or equivalent.
(3) All other openings in sides or ends of the superstructure are fitted with efficient weathertight means of closing.
(4) Access means, which are available at all times when bulkhead openings are closed, are provided for the crew to reach machinery and other working spaces within a bridge or poop.

120. Speed of ship

The speed of ship (V) is the designed speed in knots obtainable with clean bottom at calm sea and at the designed summer load line with the engine running at maximum continuous rating.

121. Light weight

The Light Weight (LW) is the displacement in tons excluding cargoes, fuel oil, lubricating oil, ballast and fresh water in tanks, stored goods, crew and their properties.

122. Deadweight tonnage

The deadweight (DW) is the difference in tons between full load displacement and light weight.

123. Fore end and Aft end

The fore end is the start point of forward side, where measuring the length of ship L in **102.,** and after end is the end point of afterward side of L.

124. Section modulus ratio

The section modulus ratios (f_D and f_B) are as following formulae. However, f_B is not to be less than 0.85 or $0.0015L+0.5$, whichever is the lesser.

$$f_D = \frac{Z_{DM\,req}}{Z_{D\,act}}, \quad f_B = \frac{Z_{BM\,req}}{Z_{B\,act}}$$

where:

$Z_{DM\,req}$ and $Z_{BM\,req}$ = required section moduli at the deck and bottom of transverse sections of the hull determined according to the requirements in **Ch 3, 201**. respectively when mild steel material symbol A, B, D and E specified in **Pt 2, Ch 1, 301. Par 3** is used (cm^3).

$Z_{D\,act}$ and $Z_{B\,act}$ = actual section moduli at the deck and bottom of transverse sections of the hull respectively (cm^3).

125. Net thickness

Net thickness is the thickness that does not include corrosion addition and voluntary addition.

Section 2 General

201. Application

1. The requirements in this Part unless otherwise specified elsewhere, are framed for hull structural arrangement and scantlings of ships not less than 90 m in length, of normal form and proportion, and intended for unrestricted service.

2. Hull construction, equipment and scantlings of ships to be classed for restricted service may be appropriately modified according to the condition of service.

3. In the application of relevant provisions in the Rules to ships which are not required to be marked with load lines, L_f is to be read as L and B_f as B.

202. Exception in application

In ships of which length is specially long or in ships to which requirements in the Rules for some special reasons, are not directly applicable, hull construction, equipment, arrangement and scantlings are to be in accordance with the discretion of the Society, notwithstanding the provisions in **201.**

203. Ships of unusual form or proportion, or intended for carriage of special cargoes

In ships of unusual form or proportion, or intended for carriage of special cargoes, the requirements concerning hull construction, equipment, arrangement and scantlings will be decided individually basing upon the general principle of the Rules instead of the requirements in the Rules.

204. Passenger ships

Hull construction, equipment, arrangement and scantlings of passenger ships are to be specially considered with respect to the design features in addition to the requirements in **201.** to **203.**

205. Equivalency

Alternative hull construction, equipment, arrangement and scantlings will be accepted by the Society, provided that the Society is satisfied that such construction, equipment, arrangement and scantlings are equivalent to those required in the Rules.

206. Direct strength calculation

1. Where approved by the Society, scantlings of structural members may be determined basing upon direct strength calculation. Where the calculated scantlings based on direct strength calculation exceed the scantlings required in this Part, the former is to be adopted.

2. Where the direct strength calculation specified in the preceding **Par 1** is carried out, the data necessary for the calculation are to be submitted to the Society.

207. Stability of ship

The requirements in the Rules are framed for ships having appropriate stability in all conceivable conditions. The Society emphasizes that the special attention be paid to the stability by the builders in design and construction stage and by the masters while in service.

208. Carriage of oil

1. The requirements for construction and arrangement for carriage of fuel oils specified in **Pts 3, 4** and **7** are to be applied to the case intended to carry fuel oils having a flash point 60°C or above at a closed cup test.

2. The construction and arrangement for carriage of fuel oils having a flash point below 60°C at a closed cup test, are to be in accordance with the requirements provided in **Pts 3, 4** and **7** or the special requirements are to be applied.

3. The construction and arrangement of deep oil tanks intended to carry cargo oils are to be correspondingly in accordance with the requirements in **Pt 7, Ch 1** or **Pt 7, Ch 10.**

209. Structural testing, leak testing and hose testing

In the Classification Survey during construction, structural testing, leak testing and hose testing are to be carried out in accordance with the following:

1. General

(1) Application
The following requirements determine the testing conditions for :
- gravity tanks, excluding independent tanks of less than 5 m^3 capacity.
- watertight or weathertight structures.
(A) The purpose of these tests is to check the tightness and/or the strength of structural elements at time of ships construction and on the occasion of major repairs.
(B) Tests are to be carried out in the presence of the Surveyor at a stage sufficiently close to completion so that any subsequent work would not impair the strength and tightness of the structure.
(C) For the general testing requirements, see items **Par 3** and **4.**

(2) Definitions
(A) Shop primer is a thin coating applied after surface preparation and prior to fabrication as a protection against corrosion during fabrication.
(B) Protective coating is a final coating protecting the structure from corrosion.
(C) Structural testing is a hydrostatic test carried out to demonstrate the tightness of the tanks and the structural adequacy of the design. Where practical limitations prevail and hydrostatic testing is not feasible(for example when it is difficult, in practice, to apply the required head at the top of the tank), hydropneumatic testing may be carried out instead. When a hydropneumatic testing is performed, the conditions should simulate, as far as practicable, the actual loading of the tank.
(D) Hydropneumatic testing is a combination of hydrostatic and air testing, consisting in filling the tank with water up to its top and applying an additional air pressure. The value of the additional air pressure is to be at least as defined in **2** (2).
(E) Leak testing is an air or other medium test carried out to demonstrate the tightness of the structure.
(F) Hose testing is carried out to demonstrate the tightness of structural items not subjected to hydrostatic or leak testing and to other components which contribute to the watertight or weathertight integrity of the hull.

2. Testing methods

(1) Structural testing
(A) Structural testing may be carried out after application of the shop primer. Structural testing may be carried out after the protective coating has been applied, provided that one of the following two conditions is satisfied:
(a) all the welds are completed and carefully inspected visually to the satisfaction of the Suyrveyor prior to the application of the protective coating.
(b) leak testing is carried out prior to the application of the protective coating.
(B) Regardless the previous (A), the protective coating may be applied prior to the structural testing of the following (a), (b) and (c), provided that the tightness of them are confirmed with the next (E) and (F) of (2).
(a) all erection welds, both manual and automatic
(b) all manual fillet weld connections on tank boundaries
(c) manual penetration welds

(2) Leak testing
(A) Where leak testing is carried out, in accordance with **Table 3.1.1,** an air pressure of 0.15 x 10^5 Pa (0.15 kg/cm^2) is to be applied during the test. Prior to inspection, it is recommened that the air pressure in the tank is raised to 0.20 x 10^5 Pa (0.2 kg/cm^2) and kept at this level for about 1 hour to reach a stabilized state, with a minimum number of personnel in the vicinity of the tank, and then lowered to the test pressure.
(B) The test may be conducted after the pressure has reached a stabilized state at 0.20 x 10^5 Pa

($0.2\ kg/cm^2$), without lowering the pressure, provided they are satisfied of the safety of the personnel involved in the test.

(C) Welds are to be coated with an efficient indicating liquid.

(D) A U-tube filled with water up to a height corresponding to the test pressure is to be fitted to avoid overpressure of the compartment tested and verify the test pressure. The U-tube should have a cross section larger than that of the pipe supplying air. In addition, the test pressure is also to be verified by means of one master pressure gauge. The Society may accept alternative means which are considered to be equivalently reliable.

(E) Leak testing is to be carried out, prior to the application of a protective coating on following welds:

(a) all fillet weld connections on tank boundaries and penetrations welds

(b) erection welds on tank boundaries excepting welds made by automatic processes and FCAW (Flux Cored Arc Welding) semi-automatic full penetration butt welds, provided that careful visual inspections show continuous uniform weld profile shape, free from repairs, and the results of selected NDE testing show no significant defects.

(F) Selected locations of automatic and FCAW semi-automatic erection welds and pre-erection manual or automatic welds may be required to be similarly tested at the discretion of the Surveyor taking account of the quality control procedures operating in the shipyard. For other welds, leak testing may be carried out, after the protective coating has been applied, provided that these welds were carefully inspected visually to the satisfaction of the Surveyor.

(G) Any other recognized method may be accepted to the satisfaction of the Surveyor.

(3) Hose testing

When hose testing is required to verify the tightness of the structures, as defined in **Table 3.1.1,** the minimum pressure in the hose, at least equal to 2×10^5 Pa ($2.0\ kg/cm^2$), is to be applied at a maximum distance of 1.5 m. The nozzle diameter is not to be less than 12 mm.

(4) Hydropneumatic testing

When hydropneumatic testing is performed, the same safety precautions as for leak testing(see previous (2)) are to be adopted.

(5) Other testing methods

Other testing methods may be accepted, at the discretion of the Society, based upon equivalency considerations.

3. General testing requirements

General requirements for testing are given in **Table 3.1.1.**

4. Additional requirements for special type vessels/tanks

In addition to the requirements of **Table 3.1.1,** particular requirements for testing of certain spaces within the cargo area of liquefied gas carriers, edible liquid carriers and chemical carriers, are given in **Table 3.1.2.** These requirements intend generally to verify the adequacy of the structural design of the tank, based on the loading conditions which prevailed when determining the tank structure scantlings.

Table 3.1.1 General testing requirements

Item number	Structure to be tested	Type of testing	Test pressure	Remarks
1	Double bottom tanks	Structural testing (1)	The greater of the following : - head of water up to the top of overflow - head of water up to the margin line	Tank boundaries tested from at least one side
2	Double side tanks	Structural testing (1)	The greater of the following : - head of water up to the top of overflow - 2.4 m head of water above highest point of tank	Tank boundaries tested from at least one side
3	Tank bulkheads, deep tanks	Structural testing (1)	The greater of the following : (2) - head of water up to the top of overflow - 2.4 m head of water above highest point of tank - setting pressure of safety relief valves, where relevant	Tank boundaries tested from at least one side
	Fuel oil bunkers	Structural testing		
4	Ballast holds in bulk carriers	Structural testing (1)	The greater of the following : - head of water up to the top of overflow - 0.9 m head of water above top of hatch	–
5	Fore peak and after peak used as tank	Structural testing	The greater of the following : - head of water up to the top of overflow - 2.4 m head of water above highest point of tank	Test of the after peak carried out after the stern tube has been fitted
	Fore peak not used as tank	Refer to **SOLAS Ch.II-1 Reg.14**	–	–
	After peak not used as tank	Leak testing	–	–
6	Cofferdams	Structural testing (3)	The greater of the following : - head of water up to the top of overflow - 2.4 m head of water above highest point of tank	–
7	Watertight bulkheads	Refer to **SOLAS Ch.II-1 Reg.14** (4)	–	–
8	Watertight doors below freeboard or bulkhead deck	Refer to **SOLAS Ch.II-1 Reg.16**	–	–
9	Double plate rudders	Leak Testing	–	–
10	Shaft tunnel clear of deep tanks	Hose testing	–	–
11	Shell doors	Hose testing	–	–

Table 3.1.1 General testing requirements (continued)

Item number	Structure to be tested	Type of testing	Test pressure	Remarks
12	Watertight hatchcovers of tanks in bulk carriers	Hose testing	–	–
	Watertight hatchcovers of tanks in combination carriers	Structural testing (1)	The greater of the following : - 2.4 m head of water above the top of hatch cover - setting pressure of safety relief valves, where relevant	At least every 2nd hatch cover is to be tested
13	Weathertight hatchcovers and closing appliances	Hose testing	–	–
14	Chain locker(if aft of collision bulkhead)	Structural testing	Head of water up to the top	–
15	Independent tanks	Structural testing	Head of water up to the top of overflow, but not less than 0.9 m	–
16	Ballast ducts	Structural testing	Ballast pump maximum pressure	–

Notes :

1. (1) Leak or hydropneumatic testing may be accepted under the conditions specified in **Par 2** (2), provided that at least one tank for each type is structurally tested, to be selected in connection with the approval of the design. In general, structural testing need not be repeated for subsequent vessels of a series of identical new buildings. However, the following spaces are to be structurally tested.
   (a) cargo space boundaries in tankers and combination carriers
   (b) tanks for segregated cargoes or pollutants
   If the structural test reveals weakness or severe faults not detected by the leak test, all tanks are to be structurally tested.
   (2) Where applicable, the highest point of tank is to be measured to the deck and excluding hatches. In holds for liquid cargo or ballast with large hatch covers, the highest point of tank is to be taken at the top of the hatch.
   (3) Leak testing may be accepted under the conditions specified in **Par 2** (2) except that structural testing or hydropneumatic testing may be required at the Society discretion.
   (4) When hose test cannot be performed without damaging possible outfitting (machinery, cables, switchboards, insulation, etc.) already installed, it may be replaced, at the Society discretion, by a careful visual inspection of all the crossings and welded joints; where necessary, dye penetration test or ultrasonic leak test may be required.
2. Tests on hull piping will be as specified in **Pt 5, Ch 6.**

Table 3.1.2 Additional testing requirements for spaces within the cargo area of certain types of ships

Item number	Types of ships	Structure to be tested	Testing requirements	Structural test pressure	Remarks
1	Liquefied gas carriers	Integral tanks	Refer to **Pt 7, Ch 5, 410. 6**	–	–
		Hull structure supporting membrane or semi-membrane tanks	Refer to **Pt 7, Ch 5, 410. 7**	–	–
		Independent tanks type A	Refer to **Pt 7, Ch 5, 410. 10,** (1)	–	–
		Independent tanks type B	Refer to **Pt 7, Ch 5, 410. 10,** (2)	–	–
		Independent tanks type C	Refer to **Pt 7, Ch 5, 410. 10,** (3)	–	–
2	Edible liquid carriers	Independent tanks	Structural testing	Head of water up to the top of overflow without being less than 0.9 m	–
3	Chemical tankers	Integral or independent tanks	Structural testing of cargo tanks boundaries from at least one side	The greater of the following : - 2.4 m head of water above highest point of tank - setting pressure of safety relief valves, where relevant	–

Section 3 Approval of Plans and Documents

301. Plans and documents for approval

When it is intended to build a ship for Classification, the following plans and documents are to be submitted for the approval of the Society before the work is commenced.

(1) Midship section
(2) Construction profile
(3) Shell expansion
(4) Watertight and oiltight bulkheads
(5) Deck plans
(6) Stem, sternframe and rudder
(7) Single bottoms and double bottoms
(8) Superstructure end bulkheads
(9) Fore and aft bodies
(10) Pillars and deck girders
(11) Shaft tunnels
(12) Foundations and the relevant structure plan of boilers, main engines, thrust and plummer blocks, generators, and other heavy weight auxilary machinery.
(13) Machinery casings
(14) Deckhouses
(15) Masts, derrick posts and derrick booms and the relevant structure plans
(16) Final stability data
(17) Loading manual
(18) Other plans and documents deemed necessary by the Society

302. Plans and documents for reference

1. When it is intended to build a ship for Classification, the following plans and documents for reference are to be submitted in addition to the plans and documents for approval in **301.**

(1) General arrangement
(2) Specification
(3) Calculation sheets for midship section modulus
(4) Where special cargoes are to be loaded, the plans showing their distribution and loading arrangements.
(5) Calculation sheets for masts, derrick booms, boat davits, and similar structures requiring strength.
(6) Preliminary stability data.
(7) Other plans and documents deemed necessary by the Society.

2. Lines, hydrostatic curves, capacity plans, records of sea trials and various tests are to be submitted before the delivery of the ship.

303. Plans and documents for assignment of load lines

Where load lines are to be assigned the following plans and documents are to be submitted. But submission of plans and documents already submitted for the Classification Survey during construction may be dispensed with.

(1) General arrangement
(2) Midship section
(3) Construction profile
(4) Superstructures and superstructure end bulkheads
(5) Lines
(6) Hydrostatic curves
(7) If the timber load lines are to be assigned, the plans showing the height of timber deck cargo and the arrangements of lashing and fixing
(8) Other plans and documents deemed necessary by the Society.

Section 4 Materials

401. Standard of materials

The materials used for hull construction and equipment are to be those complying with the requirements in **Pt 2, Ch 1,** unless otherwise specified.

402. Materials outside the Rules

Where materials other than those specified in the Rules are used, the use of such materials and corresponding, scantlings are to be specially approved by the Society.

403. High tensile steels

1. Where high tensile steels are to be used for hull construction, the drawings showing the scope and locations of the used place together with the type and scantlings are to be submitted for the approval of the Society.

2. Where high tensile steels are used for hull construction, material factor K (hereinafter refer to as K in this Part and **Pt 7**) according to steels being used is as specified in **Table 3.1.3.**

Table 3.1.3 Material factor K

Steel grades	K
A, B, D and E	1.0
AH 32, DH 32 and EH 32	0.78
AH 36, DH 36 and EH 36	0.72
AH 40, DH 40 and EH 40	0.68

404. Ships of restricted service area

Materials for hull construction and equipment for ships intended for Classification with the condition of restricted service areas are to be in accordance with the discretion of the Society.

405. Application of steels

1. The steels used for hull structures are to be of the grades provided in **Pt 2, Ch 1** in accordance with the requirements given in **Tables 3.1.4** to **3.1.9.** In applying these requirements, B, D or E may be substituted for A; D or E for B; E for D; DH 32 or EH 32 for AH 32; EH 32 for DH 32; DH 36 or EH 36 for AH 36; and EH 36 for DH 36, DH 40 or EH 40 for AH 40; and EH 40 for DH 40, respectively.

2. For strength members not mentioned in **Table 3.1.4,** grade A, AH 32, AH 36 and AH 40 may generally be used. As for rounded gunwale, the single strake is to have breadth to the satisfaction of the Society.

The steel grade is to correspond to the as-built plate thickness when this is greater than the rule requirement.

3. Plating materials for sternframes, rudder horns, rudders and shaft brackets are not to be of lower grades than corresponding to class II. However, for rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudder (D and E in **Fig 4.1.1** of **Pt 4, Ch 1**) or at upper part of space rudder (C in **Fig 4.1.1** of **Pt 4, Ch 1**)) class III is to be applied.

4. The steels with the thickness above 50 mm up to 100 mm used for stern frame may be of the grades E, EH32, EH36 or EH40.

5. The grades of steel to be used in the hull construction are to be clearly indicated on the hull structural plans.

Table 3.1.4 Material Classes

Structural member category	Material class/grade
○ Secondary: A1. Longitudinal bulkhead strakes, other than that belonging to the Primary category A2. Deck plating exposed to weather, other than that belonging to the Primary or Special category A3. Side plating	- Class I within 0.4L amidships - Grade A/AH outside 0.4L amidships
○ Primary: B1. Bottom plating, including keel plate B2. Strength deck plating, excluding that belonging to the Special category B3. Continuous longitudinal members above strength deck, excluding hatch coamings B4. Uppermost strake in longitudinal bulkhead B5. Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank	- Class II within 0.4L amidships - Grade A/AH outside 0.4L amidships
○ Special: C1. Sheer strake at strength deck (1) C2. Stringer plate in strength deck (1) C3. Deck strake at longitudinal bulkhead, excluding deck plating in way of inner-skin bulkhead of double-hull ships (1)	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships
C4. Strength deck plating at outboard corners of cargo hatch openings in container carriers and other ships with similar hatch opening configurations	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships - Min. Class III within cargo region
C5. Strength deck plating at corners of cargo hatch openings in bulk carriers, ore carriers combination carriers and other ships with similar hatch opening configurations	- Class III within 0.6L amidships - Class II within rest of cargo region
C6. Bilge strake in ships with double bottom over the full breadth and length less than 150 m (1)	- Class II within 0.6L amidships - Class I outside 0.6L amidships
C7. Bilge strake in other ships (1)	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships
C8. Longitudinal hatch coamings of length greater than 0.15L C9. End brackets and deck house transition of longitudinal cargo hatch coamings	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships - Not to be less than Grade D/DH

(Note)
(1) Single strakes required to be of class Ⅲ within 0.4L amidships are to have breadths not less than $800+5L$ (mm), need not be greater than 1800 mm, unless limited by the geometry of the ship's design.
(2) The symbols in the table mean the grades of steel as follows :
AH : AH 32, AH 36 and AH 40
DH : DH 32, DH 36 and DH 40
EH : EH 32, EH 36 and EH 40

Table 3.1.5 Minimum material grades for ships with length exceeding 150m and single strength deck

Structural member category	Material grade
Longitudinal strength members of strength deck plating	Grade B/AH within 0.4L amidships
Continuous longitudinal strength members above strength deck	Grade B/AH within 0.4L amidships
Single side strakes for ships without inner continuous longitudinal bulkheads between bottom and the strength deck	Grade B/AH within cargo region

Table 3.1.6 Minimum Material Grades for ships with length exceeding 250 m

Structural member category	Material grade
Shear strake at strength deck (1)	Grade E/EH within 0.4L amidships
Stringer plate in strength deck (1)	Grade E/EH within 0.4L amidships
Bilge strake (1)	Grade D/DH within 0.4L amidships
(Note) (1) Single strakes required to be of Grade E/EH and within 0.4L amidships are to have breadths not less than 800+5L (mm), need not be greater than 1800 (mm), unless limited by the geometry of the ship's design.	

Table 3.1.7 Minimum Material Grades for single-side skin bulk carriers subjected to SOLAS regulation XII/6.5.3

Structural member category	Material grade
Lower bracket of ordinary side frame (1), (2)	Grade D/DH
Side shell strakes included totally or partially between the two points located to 0.125 l above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate (1)	Grade D/DH
(Note) (1) The term "lower bracket" means webs of lower brackets and webs of the lower part of side frames up to the point of 0.125 l above the intersection of side shell and bilge hopper sloping plate or inner bottom plate. (2) The span of the side frame, l, is defined as the distance between the supporting structures.	

Table 3.1.8 Minimum material grades for ships with ice strengthening

Structural member category	Material grade
Shell strakes in way of ice strengthening area for plates	Grade B/AH

Table 3.1.9 Steel grades

Thickness(mm) \ Class	I		II		III	
	MS	HT	MS	HT	MS	HT
$t \le 15$	A	AH	A	AH	A	AH
$15 < t \le 20$	A	AH	A	AH	B	AH
$20 < t \le 25$	A	AH	B	AH	D	DH
$25 < t \le 30$	A	AH	D	DH	D	DH
$30 < t \le 35$	B	AH	D	DH	E	EH
$35 < t \le 40$	B	AH	D	DH	E	EH
$45 < t \le 50$	D	DH	E	EH	E	EH

Note:
The symbols in the table mean the grades of steel as follows:

AH : AH 32, AH 36 and AH 40
DH : DH 32, DH 36 and DH 40
EH : EH 32, EH 36 and EH 40

MS : Mild steels
HT : High tensile steels

406. Special requirements for application of steels

For vessels intended to operate for longer period in areas with low temperatures or to carry refrigerated cargoes, and for the cases where deemed necessary, the Society may require the grade of higher toughness, regardless of the requirements in **405.**

Section 5 Weldings

501. General

1. Arrangements

Special attention is to be paid to the arrangements of hull structural members so that welding may be carried out without much difficulty.

2. Structural details

(1) Structural discontinuities and the abrupt changes of cross sections are to be avoided as far as practicable, and welded joints are to be properly shifted from places where the stresses are highly concentrated.
(2) Corners of all openings are to be well rounded.
(3) Where rigid structural members with small sectional area, such as brackets, are welded on relatively thin plate, at least the toes of members are to be welded just on other rigid members.
(4) Upper ends of sheer strakes for midship part are to be finished smoothly, and bulwark or equipment is not to be directly welded to the sheer strakes.

3. Tee joints

The kinds and sizes of fillet welds are to be in accordance with **Table 3.1.10** and their application to the hull construction parts is to be as required by **Table 3.1.11.**

4. Slot weld

(1) The slot weld is to have adequate shape to permit a thoroughly fused bead to be applied all around the bottom edge of the opening.
(2) The fillet sizes of slot welds are to be F1 and the spacing of slots is to be as determined by the Society.

Section 6 Scantlings

601. General

1. The midship scantlings and scantlings specified in the Rules are to be applied for the parts which specified in **108.** and **109.**

2. The reduction from the midship scantlings to the end scantlings is to be applied for the parts within $0.1L$ from the fore and aft ends.

602. Section modulus

Unless otherwise specially specified, the section moduli of members required by the Rules are those including the steel plates with the effective breadth of $0.1\,l$ on either plate side of the members. However, the breadth of $0.1\,l$ is not to exceed one-half of the spacing of member, l is the length specified in the relevant Chapter.

603. Built-up sections

Where flat bars, bulb plates, inverted angles or flanged plates are welded to form beams, frames or stiffeners for which section moduli are specified, they are to be of suitable depth and thickness in proportion to the section modulus.

Table 3.1.10 Kinds and sizes of fillet weld (Unit : mm)

Kind of fillet weld / Thickness of members	Lap joint Tee joint Measurement of weld length and pitch 					
	continuous fillet weld		Intermittent fillet weld			
	size of fillet f		Size of fillet f	Length of fillet w	Pitch p	
	F1	F2			F3	F4

21						
22	10	7	10			
23						
24						
25						
from 26 to 40	11	8	11			

NOTE:
1. The size of fillet "f" for tee joints is in general to be determined according to the thickness of webs in case of connections of beams, frames, stiffeners and girders to deck plating, inner bottom plates, bulkhead plates, shell plating or face plates, and the thickness of the thinner plate in case of connections of other members.
2. Lap joints are to have the fillet size of F1 determined according to the thickness of thinner plate
3. The throat thickness of fillet is to be $0.7f$
4. In general F2 is to be minimum fillet size.
5. Intermittent fillet welds are to be staggered and w at the ends is to be welded on both sides.
6. The minus tolerance of fillet size is to be 10 % of the nominal size.

Table 3.1.11 Application of fillet weld

Line No.	Item			Application		Kind of weld
1	Rudders	Rudder frames		Rudder plates		F3
2				Vertical frames forming main pieces		F1
3				Rudder frames (except above)		F2

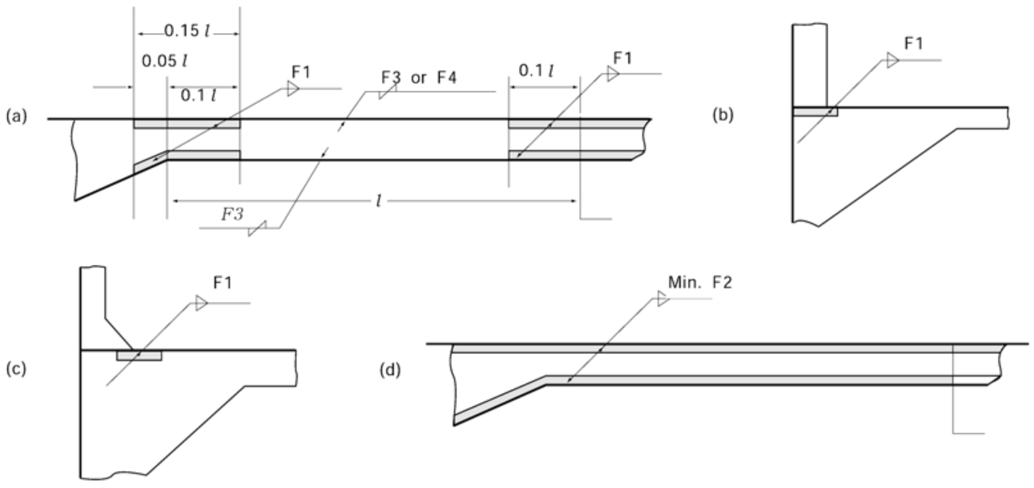
83			Inner bottom plates or shell	In seatings for main engine or thrust bearings	F2
84			Girder plates	In seatings for main engine or thrust bearings	F1

Table 3.1.11 Application of fillet weld (continued)

85	Web beams, web frames, side stringers, deck girders and girders on bulkheads	Web plates or girder plates	Shell, decks or bulkhead	In tanks, web frames for 0.125L from fore end and side stringers		F2
86				Elsewhere		F3
87			End connections of web or girder plates to shell, decks, inner bottom plates or bulkheads			F1
88			Webs or face plates of webs	In tanks, web frames for 0.125L from fore end and side stringers		F2
89				Elsewhere	Where face area exceeds 65 cm^2	F2
90					Where face area does not exceed 65 cm^2	F3
91		Tripping brackets on webs or girder plates	Boundaries			F2
92		Serrations of webs or girder plates	Webs of frames, beams or stiffeners			F2
93	Brackets at ends of members		Connections of members to brackets(except otherwise specified)			F1

NOTES:
1. Where longitudinal strength members are mutually, connected by fillet weld, the fillet sizes are to be in accordance with **Table 3.1.10** and this **Table,** except that the total throat areas of fillet joints are not to be less than the minimum sectional area of the members.
2. Where the ends of frames, beams and stiffeners are directly fillet welded to decks, shell, inner bottom plates or bulkhead plates, the fillet sizes are not to be less than 0.7 times the web thickness of members.
3 Where beams, frames, stiffeners and girders are intermittently welded to decks, shell, inner bottom plates and bulkhead plates, the fillet welds are to be partly continuous as shown in **Fig (a).** Where members are fitted at the opposite side of brackets as shown in **Fig (b)** or **(c),** the fillet welds are to be continuous for proper length at the ends of members or at the toe of brackets of members. The fillet weld may be as shown in **Fig (d),** where the whole lengths of the joints are light continuously welded with the fillet size not less effective than F2
4. Where the rider plates or inner bottom plates consist of bed plates of main engine seating or important seatings, the kind of fillet is to in accordance with the requirements for the seatings.
5. As to the connections not specified in double bottoms with longitudinal framing, the requirements for transverse framing are to be applied.



604. Scantlings of end brackets

1. Secondary members, such as longitudinals, beams, frames and stiffeners forming part of the hull structure, are generally to be connected at their ends by the brackets of thickness not to be less than that obtained from the following formula, Where it is desired to adopt bracketless connections, the proposed arrangements will be individually considered.

$$t_b = C_1 \sqrt{Z} + 4.5 \quad \text{(mm)}$$

where:

Z = section modulus in cm^3 specified in the following (a) to (c):

(a) Bracket connecting stiffener to primary member, section modulus of the stiffener.

(b) Bracket at the head of main transverse frame where frame terminated, section modulus of frame

(c) Elsewhere the lesser section modulus of the members being connected by the bracket.

C_1 = factor depending on the flange of bracket is as following:

C_1 = 0.27 : without flange

C_1 = 0.23 : with flange

2. Where a flange is fitted, its breadth is not to be less than that obtained from following formula. Where the length of longer arm exceeds 800 mm, the free edge of brackets are to be stiffened by flanges or other means, except where tripping brackets or the like are provided.

$$w_f = \frac{Z}{33} + 45 \quad \text{(mm)}$$

where:

Z = as specified in **Par 1.**

3. The length of bracket arm measured from shown in **Fig 3.1.1** is not to be less than that obtained from the following formula. The lengths of bracket arms of tank side and hopper side are to be 20 percent greater than that required above.

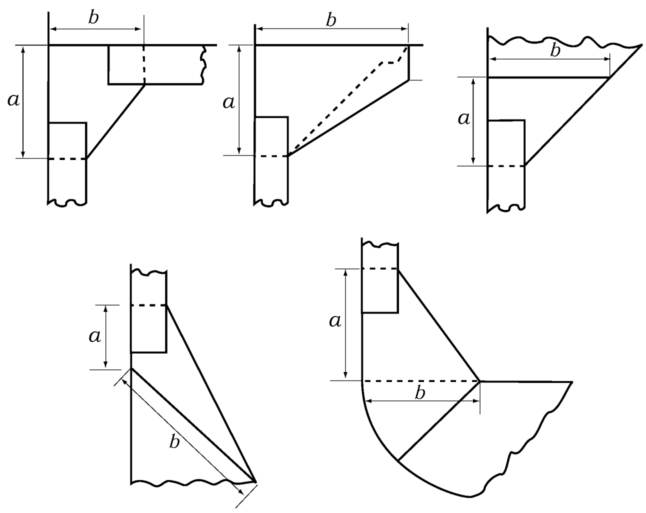


Fig 3.1.1 Measurement of a and b for arms

$a+b \geq 2.0l$

a and $b > 0.8l$

where:

l = as given by the following formula, but in no case is to be taken as less than twice the web depth of the stiffener on which the bracket scantlings are to be based.

$$l = 180\sqrt{\frac{Z}{14+\sqrt{Z}}} - 90$$

Z = as specified in **Par 1.**

605. Modification of l

Where brackets of not less thickness than that of the girder plates were provided, the value of l specified in **Chs 9, 11, 12, 14** and **15** may be modified in accordance with the following:

(1) Where the face area of the bracket is not less than one-half that of the girder and the face plates or flange on the girder is carried to the bulkhead, deck, tank top, etc., the length l may be measured to a point 0.15 m inside the toe of bracket.(See **Fig 3.1.2**(a))

(2) Where the face sectional area of the bracket is less than one-half that of the girder and the face plate or flange on the girder is carried to the bulkhead, deck, tank top, etc., l may be measured to a point where the sum of sectional area of the bracket outside the line of girder and its free flanges equal to the sectional area of free flanges of girder, or to a point 0.15 m inside the toe of bracket, whichever is the greater.(See **Fig 3.1.2**(b))

(3) Where brackets are provided and the face plate or flange on the girder are extended along the brackets to the bulkhead, deck, tank top, etc., the face plate or flange of bracket may be curved, but l is to be measured to the toe of bracket.

(4) Brackets are not to be considered effective beyond the point where the arm on the girder is 1.5 *times* the length of arm on the bulkhead, deck, tank top, etc.

(5) In no case is the allowance in l at either end to exceed one-quarter of the overall length of the girder.

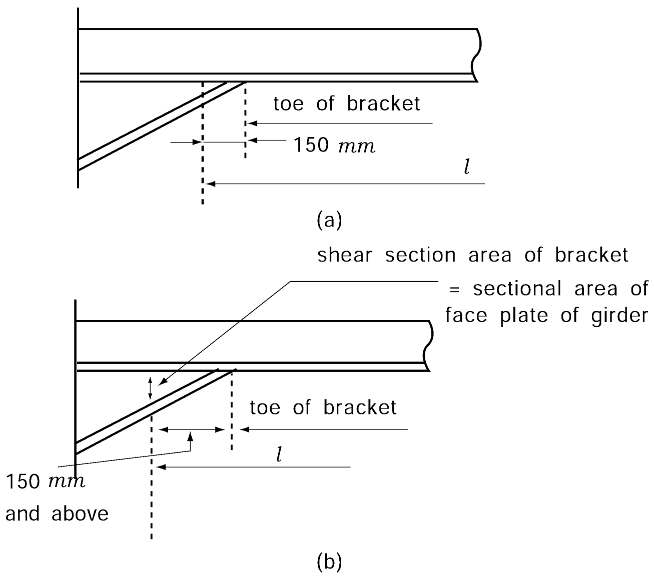

Fig 3.1.2 Modification of l

Section 7 Workmanship

701. General

1. The workmanship is to be of the best quality.

2. During the construction, the builder is to supervise and inspect in detail every job performed in shed or yard and prepare the necessary records.

702. Caulking

Caulking edges are to be finished by edge planing, gas cutting, chipping or other appropriate methods.

703. Penetrating parts

Where frames or beams pass through watertight deck or bulkhead, the deck or bulkhead is to be constructed watertight without the use of wooden materials or cement.

704. Welding

The welding is to be applied in **Pt 2, Ch 2.**

705. Heating

1. In the hot work of steel, the steel is not to be overheated and it is to be hammered or bent in the proper heated condition.

2. Steel which is burnt is not to be used.

Section 8 Corrosion Control

801. Reduction of scantlings due to corrosion control

1. Where an approved measure of corrosion control is applied to deep tanks, double bottom tanks, peak tanks or fuel oil tanks, the required scantlings of structural members in the tanks may be reduced at the discretion of the Society.

2. Where it is intended to apply a system of corrosion control to tanks the plans showing the description and scope of such control, the required scantlings in the Rules and the scantlings intended to be reduced are to be submitted to the Society for approval.

802. Notation for corrosion control

Where an approved measure of corrosion control is applied to a ship, the notation "CoC" will be added and entered in the Record.

803. Corrosion protection coating

1. For ships not intended to receive a corrosion control notation specified in **801.** and **802.,** all sea water ballast spaces having boundaries formed by the hull envelope are to have an effective corrosion protection coating in accordance with the manufacturer's requirements.

2. Corrosion protection coating for dedicated sea water ballast tanks in all types of Ships and double-side skin space of bulk carriers are to be in accordance with the requirements as specially prepared by the Society. ⚓

CHAPTER 2 STEMS AND STERN FRAMES

Section 1 Stems

101. Plate stems

1. The thickness of steel plate stems at the load waterline is not to be less than that obtained from the following formula. Above and below the load waterline, the thickness may be gradually tapered toward the stem head and the keel. And at the upper end of stem it may be equal to the thickness of the side shell plating (at the fore end part) of the ship, and at the lower end of stem, it is to be equal to the thickness of plate keel.

$$t = 1.5\sqrt{L' - 50} + 2.0 \quad \text{(mm)}$$

where:

L' = length of ship (m), where, however, L exceeds 230 m, L' is to be taken as 230 m

2. Horizontal ribs are to be provided on the stem plates at an interval preferably not exceeding 1 m and where the radius of curvature at the fore end of stem is large, proper reinforcement is to be made by providing with a centre line stiffener or by other means.

Section 2 Stern Frames

201. Application

The requirements in this Section apply only to stern frames without rudder post.

202. General

1. Stern frames may be cast, forged, or fabricated of plates and are to be of the shape suitable for the stream line of the stern part of the hull.

2. Cast or plate stern frames are to be fitted with transverse ribs of suitable spacing and where the curvature is large a centre line stiffener is to be fitted.

3. Care is to be taken to avoid any sudden change in thickness or sectional area along the frame.

203. Propeller post

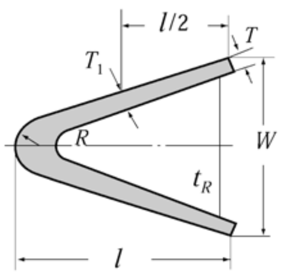
1. The scantlings of propeller post are not to be less than those obtained from the formulae given in **Table 3.2.1.**

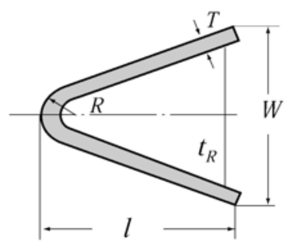
2. The propeller post may be built up of plates welded to a suitable bar steel of circular or rectangular cross section at the after end.

3. The scantlings of propeller post below the propeller boss are to be gradually increased to suit the strength of the shoe piece.

4. In ships with relatively high speed for their length, and in ships exclusively engaged in towing purposes, the scantlings of various parts of propeller posts are to be suitably increased.

Table 3.2.1 Standards of propeller posts

Cast steel	Steel plate
$W = 30\sqrt{L}$ (mm) $l = 40\sqrt{L}$ (mm) $T = \dfrac{3\sqrt{L}}{\sqrt{K^{(1)}}}$ (mm) $T_1 = \dfrac{3.7\sqrt{L}}{\sqrt{K^{(1)}}}$ (mm) $t_R = 0.6\,T$ (mm) $R_{min} = 40$ (mm)	$W = 37\sqrt{L}$ (mm) $l = 53\sqrt{L}$ (mm) $T = \dfrac{2.4\sqrt{L}}{\sqrt{K^{(2)}}}$ (mm) $t_R = 0.55\,T$ (mm) $R_{min} = 40$ (mm)
	




Note :
(1) Material factor K for the Propeller post of cast steel is to be as **Pt 4, Ch 1, Table 4.1.1.**
(2) Material factor K for the Propeller post of steel plate is to be as **Pt 4, Ch 1, Table 4.1.2.**

204. Propeller boss

The thickness of propeller boss is not to be less than that obtained from the following formula:

$$t = 0.23\,d_p + 30 \quad \text{(mm)}$$

where:

d_p : diameter (mm) of propeller shaft specified in **Pt 5, Ch 3, 204.**

205. Shoe piece

1. The scantlings of each cross section of the shoe piece are to be determined by the following formula (1) to (4) considering the bending moment and shear force acting on shoe piece when the rudder force specified in **Pt 4, Ch 1, 201.** is applied to the rudder.

(1) The section modulus Z_z around Z-axis(axis of depthwise) is not to be less than that obtained from the following formula:

$$Z_z = \frac{MK_{sp}}{80} \quad (\text{cm}^3)$$

where:

M = bending moment at the section considered, which is obtained from the following formula.(N-m):

$$M = Bx \quad \text{(N-m)}$$

$$M_{max} = B\,l \quad \text{(N-m)}$$

B = supporting force in the pintle bearing as given in **Pt 4, Ch 1, 401**.(N).

x = distance from mid-point of the length of pintle bearing to section considered (m).(See **Fig 3.2.1**).

l = distance from mid-point of the length of pintle bearing to fixed point of the shoe piece (m).(See **Fig 3.2.1**).

K_{sp} = material factor for the shoe piece as given in **Pt 4, Ch 1, 102.**

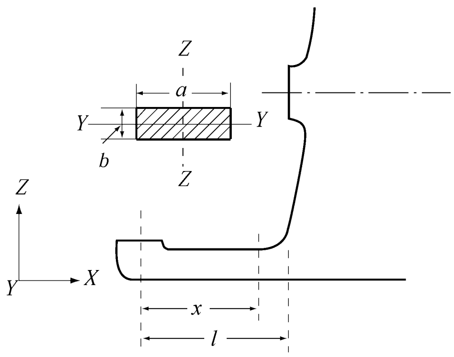


Fig 3.2.1 Shoe piece

(2) The section modulus Z_y around Y-axis(axis of breadthwise) is not to be less than that obtained from the following formula:

$$Z_y = 0.5\,Z_z \quad \text{(cm}^3\text{)}$$

where:

Z_z = as specified in (1)

(3) The total section area A_s in Y-axis is not to be less than that obtained from the following formula:

$$A_s = \frac{BK_{sp}}{48} \quad \text{(mm}^2\text{)}$$

where:

B and K_{sp} = as specified in (1).

(4) At no section within the length of shoe piece, the equivalent stress σ_e is to be exceed 115/K_{sp}(N/mm^2). The equivalent stress σ_e is to be determined by the following formula:

$$\sigma_e = \sqrt{\sigma_b^2 + 3\tau^2} \quad \text{(N/mm}^2\text{)}$$

where:

σ_b = bending stress acting on shoe piece is to be determined by the following formula (N/mm^2):

$$\sigma_b = \frac{M}{Z_z(x)} \quad (\text{N/mm}^2)$$

τ = shear stress acting on shoe piece is to be determined by the following formula (N/mm^2):

$$\tau = \frac{B}{A_s(x)} \quad (\text{N/mm}^2)$$

$Z_z(x)$ = actual section modulus of shoe piece around Z-axis at the section considered.(cm^3)

$A_s(x)$ = actual section area of shoe piece in Y-axis at the section considered.(mm^2)

M and B = as specified in (1).

2. The thickness of steel plates forming the main part of shoe piece of steel plate stern frame is not to be less than that of steel plates forming the main part of propeller post. Ribs are to be arranged in the shoe piece below the propeller post, under brackets and at other suitable positions.

206. Heel piece

Heel piece of stern frame is to be of length at least 3 *times* the frame space at that part and is to be strongly connected to the keel.

207. Rudder horn

1. The scantlings of each cross section of the rudder horn are to be determined by the formulae in (1) to (3) considering the bending moment, shear force and torsional moment acting on rudder horn when the rudder force as given in **Pt 4, Ch 1, 201**. is applied to the rudder.

(1) Section modulus Z_x around X-axis(axis of lengthwise) is not to be less than that obtained from the following formula:

$$Z_x = \frac{MK_{rh}}{67} \quad (\text{cm}^3)$$

where:

M = bending moment at the section considered, which is obtained from the following formula (N-m) (See **Fig 3.2.2**):

$$M = Bz \quad (\text{N-m})$$

$$M_{\max} = Bd \quad (\text{N-m})$$

B = supporting force in the pintle bearing (N) as given in **Pt 4, Ch 1, 401.**

z = distance (m) from mid-point of length of the pintle bearing to the section considered (see **Fig 3.2.2**).

d = distance (m) from mid-point of length of pintle bearing to the supporting point of rudder horn (See **Fig 3.2.2**).

K_{rh} = material factor for rudder horn as given in **Pt 4, Ch 1, 102.**

(2) The total section area A_h in Y-axis is not to be less than that obtained from following formula:

$$A_h = \frac{BK_{rh}}{48} \quad (\text{mm}^2)$$

where:

B and K_{rh} = as specified in (1).

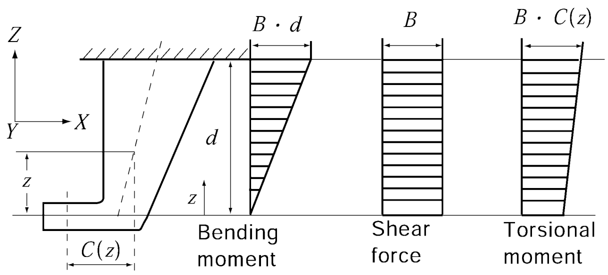

Fig 3.2.2 Rudder horn

(3) At no section within the total height of rudder horn d, the equivalent stress σ_e is to exceed $120/K_{rh}$(N/mm^2). The equivalent stress σ_e is determined by following formula:

$$\sigma_e = \sqrt{\sigma_b^2 + 3(\tau^2 + \tau_t^2)} \quad (\text{N/mm}^2)$$

where:

σ_b = bending stress acting on rudder horn is determined by the following formula:

$$\sigma_b = \frac{M}{Z_{xa}} \quad (\text{N/mm}^2)$$

τ = shear stress acting on rudder horn is determined by the following formula:

$$\tau = \frac{B}{A_h(z)} \quad (\text{N/mm}^2)$$

τ_t = torsional stress acting on rudder horn is determined by the following formula:

$$\tau_r = \frac{1000\,T_h}{2A_t t_h} \quad (\text{N/mm}^2)$$

T_h = torsional moment at the section considered is determined by the following formula:

$$T_h = BC(z) \quad (\text{N-m})$$

A_t = area in horizontal section enclosed by the rudder horn (mm^2)

t_h = thickness of rudder horn plate (mm)

M, B and K_{rh} = as specified in (1).

$A_h(z)$ = actual section area (mm^2) in Y-axis at the section considered.

Z_{xa} = actual section modulus (cm^3) around X-axis at the section considered.

$C(z)$ = distance (m) from section considered to the centre of rudder stock.

2. At the connection between the rudder horn and the hull structure, special consideration is to given to structural continuity.

208. Attachment to floor plates

The stern frame is to be extended upward at the part of the propeller post and to be connected strongly to the transom floor of thickness not less than that obtained from the following formula:

$$t = 0.035L + 7.5 \quad \text{(mm)}$$

209. Gudgeon

1. The bearing length of pintle, l_p , is to be such that

$$d_p \leq l_p \leq 1.2d_p \quad \text{(mm)}$$

where:

d_p = diameter of pintle (mm)

2. The length of the pintle housing in the gudgeon is not to be less than the pintle diameter d_p.

3. The thickness of the pintle housing is not to be less than 0.25 d_p. For ships specified in **Pt 4, Ch 1, 103.,** however, the thickness of the pintle housing is to be appropriately increased. ⚓

CHAPTER 3 LONGITUDINAL STRENGTH

Section 1 General

101. Application

1. The requirements in this Chapter apply to ships of 90 m in length and above in unrestricted service. For ships having one or more of the following characteristics, special additional considerations will be given by the Society.

(1) Proportion $L/B \leq 5$, $B/D_s \geq 2.5$
(2) Length $L \geq 500$ m
(3) Block coefficient $C_b < 0.6$
(4) Large deck opening
(5) Ships with large flare or high speed ships
(6) Carriage of heated cargoes
(7) Unusual type or design

2. Notwithstanding the requirements in **Par 1,** the requirements specified in **103.** and **104.** are applied to the ships of 65 m and above in L_f.

102. Continuity of strength

Longitudinal members are to be so arranged as to maintain as good continuity of strength as practicable.

103. Loading manual

1. For ships of 65 m in length and above in L_f, in order to enable the ship master to adjust the loading of cargo and ballast to avoid the occurrence of unacceptable stress in the ship's structure, the ship is to be provided with a loading manual approved by the Society. However, a ship may not be provided with a loading manual where deemed unnecessary by the Society.

2. In the loading manual, as required in the preceding paragraph, at least the following items are to be included.

(1) Loading conditions on the basis of which the ship is designed, and the allowable limits of longitudinal still water bending moment and still water shear force.
(2) Results of calculation longitudinal still water bending moment and still water shear force corresponding to the standard loading conditions.
(3) Data and calculation examples to calculate the still water bending moment and the still water shear force for the loading conditions other than standard loading conditions. This requirement, however, may be dispense with to the ships with which the loading instruments specified in **104.** is provided.
(4) Allowable limits of local loads applied to hatch covers, deck, double bottom construction, etc., where deemed necessary by the Society.

104. Longitudinal strength loading instrument

1. In addition to loading manual as specified in **103.** the following ships of 100 m in length and above in L_f are to be provided with loading instrument(Longitudinal strength loading instrument), together with its operating manual, by means of which the still water bending moments, still water shear forces and still water torsional moments, etc. where applicable, in any loading or ballast condition can be easily and quickly ascertained. However, a ship may not be provided with a loading instrument where deemed unnecessary by the Society.

(1) Ships with large deck openings where combined stresses due to vertical and horizontal hull girder bending and torsional and lateral loads have to be considered.
(2) Ships liable to carry non-homogeneous loadings, where the cargo and/or ballast may be unevenly distributed. Ships less than 120 m in length, when their design takes into account uneven distribution of cargo or ballast, are deemed unnecessary.

(3) Chemical tankers and gas carriers.

2. The loading instrument specified in **Par 1** is to be approved by the Society and tested at the presence of the surveyor in accordance with the approved test reports after installation on board.

Section 2 Bending Strength

201. Bending strength at amidships

1. The section moduli of the transverse sections of the hull calculated in accordance with the requirements in **203,** at the midship part are not to be less than the values of Z_1 obtained from the formulae given in **Table 3.3.1** at the transverse sections under consideration along the length of hull for all design cargo and ballast loading condition.

2. Notwithstanding the requirements of **Par 1,** the section modulus of the transverse section of hull at $0.4L$ part is not to be less than the value of Z_{min} obtained from formula given in **Table 3.3.1.**

3. Moment of inertia of the transverse section of hull at the middle point of L is not to be less than the value of I_{min} obtained from the formula given in **Table 3.3.1.** and the calculation method for moment of inertia of the actual transverse section is to be correspondingly in accordance with the requirements in **203.**

4. Scantlings of all continuous longitudinal members of hull girder based on the section modulus requirement in **Par 2** and **3** are to be maintained within $0.4L$ amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the end of the $0.4L$ part, where deemed necessary by the Society.

202. Bending strength at sections other than amidships

1. The bending strength of hull at sections other than $0.4L$ amidships is to be determined according to the requirements of **Ch 5, Sec 2.**

2. Where the Society considers that the application of requirements of the preceding paragraph is inappropriate, the bending strength at sections other than $0.4L$ amidships is to be determined according to **201. 1**. with necessary modifications.

203. Calculation of hull section modulus

As for calculation of the hull section modulus, the following (1) through (6) are to be applied:

(1) All longitudinal members which are considered effective to the longitudinal strength of the ship may be included in the calculation.

(2) Deck openings on the strength deck are to be deducted from the sectional area used in the section modulus calculation. However, small openings not exceeding 2.5 m in length or 1.2 m in breadth need not be deducted, provided that the sum of their breadths in one transverse section is not more than $0.06(B-\Sigma b)$. Where, Σb is the sum of breadths of large openings (m). (See **Fig 3.3.3**)

(3) Notwithstanding the requirement in (2), deck openings on the strength deck need not be deducted, provided that the sum of their breadths in one transverse section is not reducing the section modulus at deck or bottom by more than 3 %.

(4) Deck openings prescribed in (2) and (3) include shadow area which is obtained by drawing two tangential lines with an opening angle of 30 *degrees* having the focus on the longitudinal line of the ship. (See **Fig 3.3.3**)

Table 3.3.1 Section modulus of transverse section of hull, etc.

Item	Requirement
Section modulus	$Z_1 = \frac{\lvert M_s + M_w(+) \rvert}{\sigma} \times 10^3$ (cm^3), $Z_1 = \frac{\lvert M_s + M_w(-) \rvert}{\sigma} \times 10^3$ (cm^3)
Minimum section modulus	$Z_{min} = C_1 L^2 B(C_b + 0.7) K$ (cm^3)
Minimum moment of inertia	$I_{min} = 3 C_1 L^3 B(C_b + 0.7)$ (cm^4)

M_s = longitudinal bending moment in still water (kN-m) at the transverse section under consideration along the length of hull, which is calculated by the method deemed appropriate by the Society. The value of M_s is defined as positive which is obtained assuming that downward loads are taken as positive and are integrated in the forward direction from the aft end of the ship. Sign of positive M_s is shown in **Fig 3.3.1.**

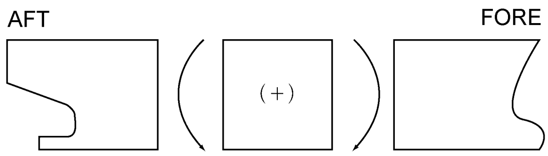

Fig 3.3.1 Sign convention of bending moment

$M_w(+)$ and $M_w(-)$ = wave induced longitudinal bending moments (kN-m) at the transverse section under consideration along the length of hull, which are obtained from the following formulae,

$$M_w(+) = +0.19 C_1 C_2 L^2 B C_b \quad \text{(kN-m)}$$
$$M_w(-) = -0.11 C_1 C_2 L^2 B(C_b + 0.7) \quad \text{(kN-m)}$$

σ = allowable bending stress obtained from the following formula.

$$\sigma = 175/K$$

C_1 = coefficient given by the following table.

L(m)	C_1
$90 \le L \le 300$	$10.75 - \left(\frac{300 - L}{100} \right)^{1.5}$
$300 < L \le 350$	10.75
$350 < L \le 500$	$10.75 - \left(\frac{L - 350}{150} \right)^{1.5}$

C_2 = distribution factor specified along the length of L at positions where the transverse section of the hull is under consideration, as given in **Fig 3.3.2.**

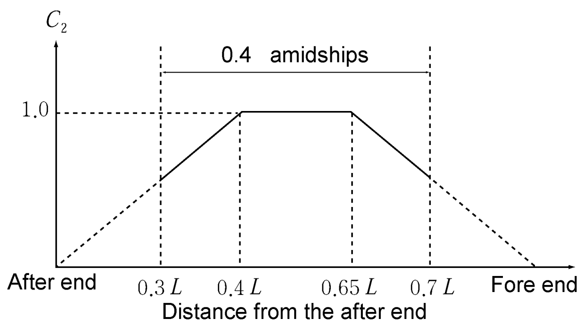

Fig 3.3.2 Value of coefficient C_2

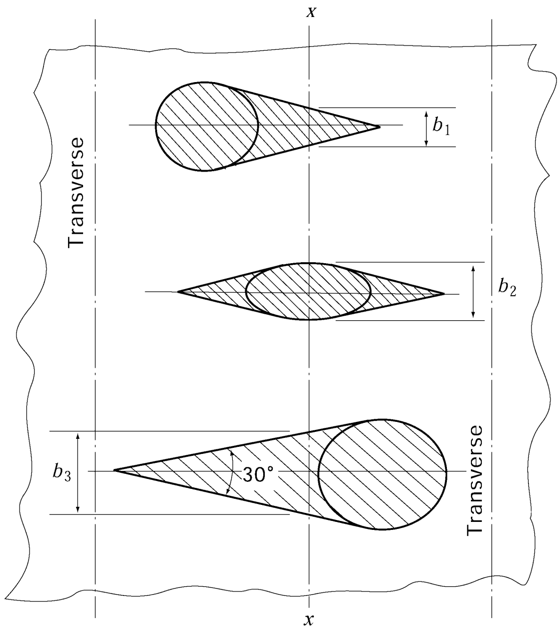
C_b = block coefficient, however, to be taken as 0.6, where it is less than 0.6.



$$\Sigma b_i = b_1 + b_2 + b_3$$

Fig 3.3.3 Deck openings on the strength deck

(5) Continuous trunks and longitudinal hatch coamings are to be included in the longitudinal sectional area provided they are effectively supported by longitudinal bulkheads or deep girders. And the section modulus at the strength deck is to be calculated by dividing the moment of inertia of the athwartship section about its horizontal neutral axis by the following distance (a) or (b), whichever is the greater.

(a) Vertical distance from the neutral axis to the top of the strength deck beam at side.
(b) Distance obtained from the following formula:

$$Y\left(0.9 + 0.2\frac{X}{B}\right)$$

where:

X = horizontal distance from the top of continuous strength member to the centre line of the ship (m).

Y = vertical distance from the neutral axis to the top of continuous strength member (m).

X and Y are to be measured to the point giving the largest value of the above formula.

(6) The section modulus at the bottom is to be calculated by dividing the moment of inertia of the athwartship section about its horizontal neutral axis by the vertical distance from the neutral axis to the top of keel.

Section 3 Shear Strength

301. Thickness of side shell of ships without the effective longitudinal bulkhead

1. Thickness of side shell plating of ships without the effective longitudinal bulkhead is not to be less than the values obtained from the following formulae the transverse section under consideration along the length of hull for all conceivable loading and ballasting conditions.

$$t = \frac{0.5|F_s + F_w(+)|}{\tau} \times \frac{Q}{I} \times 10^2 \quad \text{(mm)}, \qquad t = \frac{0.5|F_s + F_w(-)|}{\tau} \times \frac{Q}{I} \times 10^2 \quad \text{(mm)}$$

I = moment of inertia (cm^4) of the transverse section under consideration about its horizontal neutral axis, where the requirements in **203.** are to be applied to the calculation method.

Q = at the transverse section under consideration, moment of area about the horizontal neutral axis (cm^3) for the longitudinal members above the horizontal line passing through the considered position of side shell plating in case the considered position is above the horizontal axis, or for the longitudinal members under the horizontal line in case the considered position is under the horizontal neutral axis, where the requirements in **203.** are to be applied to the calculation method.

τ = allowable shear stress obtained from the following formula.

$$\tau = 110/K \quad \text{(N/mm}^2\text{)}$$

F_s = shear force in still water (kN) at the transverse section under consideration which is calculated by the method deemed appropriate by the Society. The value of F_s, is defined as positive which is obtained assuming that downward loads are taken as positive and are integrated in the forward direction from the aft end of the ship. Sign of F_s shown in **Fig 3.3.4** is taken as positive.

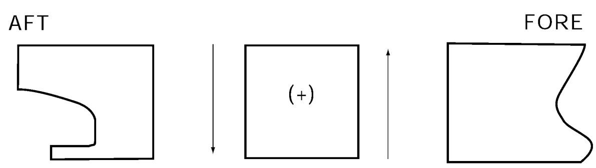


Fig 3.3.4 Sign covention of shear force

$F_w(+)$ and $F_w(-)$ = wave induced shear forces (kN) at the transverse section under consideration along the length of hull, which are obtained from the following formulae.

$$F_w(+) = +0.30 C_1 C_3 L B (C_b + 0.7) \quad \text{(kN)}, \qquad F_w(-) = -0.30 C_1 C_4 L B (C_b + 0.7) \quad \text{(kN)}$$

C_1, C_b = as specified in **Table 3.3.1.**

C_3 and C_4 = distribution factor to be determined at the position of the transverse section under consideration along the length of the ship, where the value is to be as specified in **Fig 3.3.5** and **3.3.6.**

2. In case of ships which have bilge hopper tanks or top side tanks, or ships of which other longitudinal members below the strength deck are considered to share a part of the shear force effectively, the thickness of side shell plate required by **Par 1** may be reduced at the discretion of the Society.

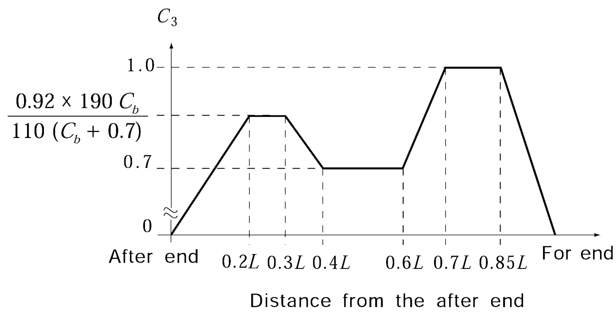

Fig 3.3.5 Value of distribution factor C_3

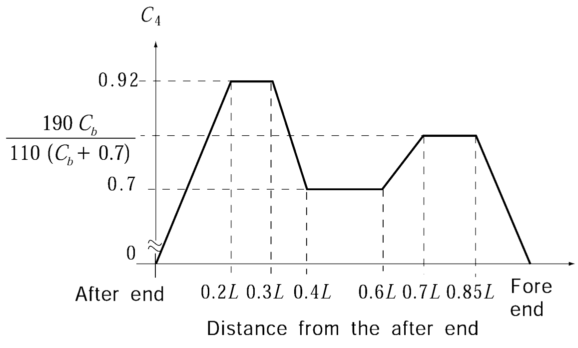

Fig 3.3.6 Value of distribution factor C_4

302. Thickness of side shell and longitudinal bulkhead plating of ships having one to four rows of longitudinal bulkheads

Thickness of side shell and longitudinal bulkhead plating of ships specified **Fig 3.3.7** is not to be less than the value obtained from the following formula at the transverse section under consideration along the length of hull for all conceivable loading and ballasting conditions. Where, however, ships with double side hull construction provided with bilge hoppers in double side hull structure are to be as deemed appropriate by the Society.

$$t = \frac{FQ}{\tau I} \times 10^2 \quad \text{(mm)}$$

where:

τ, I and Q = as specified in **301.**

F = shear force acting on the side shell plating or longitudinal bulkhead plating, the value of which is to be the following $F(+)$ or $F(-)$, whichever is the greater (kN):

$$F(+) = |\alpha(F_s + F_w(+)) + \triangle F| \;, \qquad F(-) = |\alpha(F_s + F_w(-)) + \triangle F|$$

F_s, $F_w(+)$ and $F_w(-)$ = as specified in **301.**

α = sharing factor of shear force shared by the side shell and longitudinal bulkhead, the value of which is to be deemed appropriate by the Society. However, unless otherwise specially specified, α may be obtained from the formulae in **Table 3.3.2.**

ΔF= shear force acting on side shell and longitudinal bulkhead due to local load (kN) the value of which is to be as deemed appropriate by the Society. However, unless otherwise specially specified, ΔF may be obtained from the formulae in **Table 3.3.2.**

Table 3.3.2 Values of α and ΔF

Ship Type	Application	$\alpha(=\alpha_1\times\alpha_2)$		$\Delta F(=n_i(R-\alpha f))$	
		α_1	α_2	R	f
A	Side shell	$0.5-\frac{0.575k_1A_L}{2A_s+A_L}$	1	$4.9W_bbS$	$19.6W_bbS$
	Longitudinal bulkhead	$\frac{0.575k_1A_L}{2A_s+A_L}$	2	$9.8W_bbS$	
B	Side shell	$0.5-\frac{0.55k_1A_L}{A_s+A_L}$	1	$4.9W_bbS$	$19.6(W_aa+W_bb)S$
	Longitudinal bulkhead	$\frac{0.55k_1A_L}{A_s+A_L}$		$9.8(\beta W_aa+0.5W_bb)S$	
C	Side shell	0.5	$1-\frac{1.06k_2A_{DL}}{A_s+A_{DL}}$	$4.9(\beta W_aa+W_cc)S$	$19.6(W_aa+W_cc)S$
	Longitudinal bulkhead		$\frac{1.06k_2A_{DL}}{A_s+A_{DL}}$		
D	Side shell	$0.5-\frac{0.675k_1A_L}{2(A_s+A_{DL})+A_L}$	$1-\frac{1.05k_2A_{DL}}{A_s+A_{DL}}$	$4.9(0.5W_bb+W_cc)S$	$19.6(W_bb+W_cc)S$
	Outer longitudinal bulkhead		$\frac{1.05k_2A_{DL}}{A_s+A_{DL}}$		
	Centre longitudinal bulkhead	$\frac{0.675k_1A_L}{2(A_s+A_{DL})+A_L}$	2	$9.8W_bbS$	
E	Side shell	$0.5-\frac{0.615k_1A_L}{A_s+A_{DL}+A_L}$	$1-\frac{1.04k_2A_{DL}}{A_s+A_{DL}}$	$4.9(0.5W_bb+W_cc)S$	$19.6(W_aa+W_bb+W_cc)S$
	Outer longitudinal bulkhead		$\frac{1.04k_2A_{DL}}{A_s+A_{DL}}$		
	Inner longitudinal bulkhead	$\frac{0.615k_1A_L}{A_s+A_{DL}+A_L}$	1	$9.8(\beta W_aa+0.5W_bb)S$	

NOTE:

k_1 = value is to be as specified in (a) to (c) below for longitudinal bulkheads other than those provided in double side hull.

k_2 = value is to be as specified in (a) to (c) below for longitudinal bulkheads provided in double side hull.

Where, however, values of k_1, and k_2 may be suitably modified for cases where members considered to share part of shear force are provided:

(a) 0, for the part not provided with longitudinal bulkhead

(b) 1.0, for the part provided with longitudinal bulkhead excluding the length of $0.5D_s$ respectively from both ends.

(c) Value obtained by linear interpolation for the intermediate parts between those specified in (a) and (b).

A_s, A_L, and A_{DL} = sectional area of side shell plating amidships, longitudinal bulkhead plating provided other than in double side hull, and longitudinal bulkhead plating in double side hull, respectively at midship part(mm^2).

W_a, W_b, and W_c = value obtained from the following formula, respectively:

$$W_a=h_a+h_d-d'$$
$$W_b=h_b+h_d-d'$$
$$W_c=h_c+h_d-d'$$

d' = draught at the part concerned in the loading condition under consideration(m).

h_a, h_b, h_c, and h_d = water head converted from the pressure of cargo or ballast in the centre tanks, wing tanks, double side hull tanks(excluding double bottom parts) and double bottom tank in the loading conditions under consideration, respectively(m). In this connection, even in case where the double hull forms one single tank, the requirements apply separately to a portion of the double side hull tank and portion of double bottom tank. In case where the double bottom tank is divided within either a, b or c, h_d is to be determined for respective ranges of the tank divided.

Table 3.3.2 Values of α and ΔF (continued)

NOTE:

a , b and c = half breadth of the centre tank, breadth of wing tanks, and breadth of double side hull tanks (m).

S = spacing of floors in double bottom(m).

n_i = number of floors in double bottom from the mid-point of transverse bulkheads to the section under consideration in double bottom. The sign of n_i is negative when counted afterward and positive when counted forward. Where, however, a swash bulkhead with an opening ratio of not less than 20 % is not to be considered as a transverse bulkhead. When a floor is provided at mid-point between transverse bulkheads, n_i in this case, is to be obtained counting the floor as 0.5.

β = as specified by the following table.

Description	β
where effective centre girder is provided	0.7
where no effective centre girder is provided	1.0

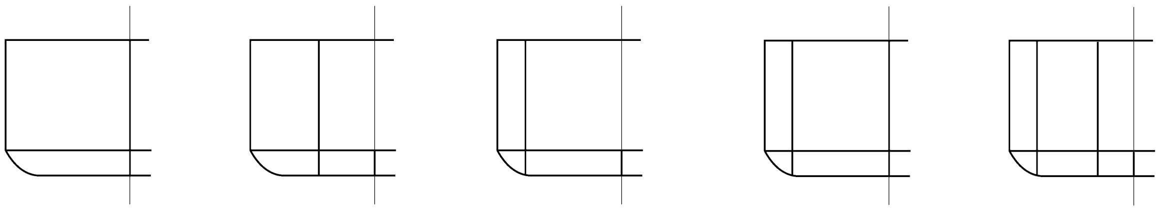

Fig 3.3.7 Types of a ship with longitudinal bulkheads

303. Compensation for opening

Where openings are provided in the shell plating, sufficient consideration is to be paid to the shear strength and suitable compensation is to be made as necessary.

Section 4 Buckling Strength

401. Apllication

The requirements in this section apply to the buckling strength of panels and longitudinal frames subject to hull girder bending stress and shear stress.

402. Working stress

1. Compression stresses

The compression stress σ_{act} (N/mm^2) acting on the members under consideration are given in the following formula, however, minimum value is not to be less than $30/K$:

$$\sigma_{act} = \frac{(M_s + M_w)}{I} y \times 10^5 \quad (\text{N/mm}^2)$$

where:

M_s = as specified in **Table 3.3.1.** For strength deck, value of M_s is taken 0 in case that M_s is always positive.

M_w = wave bending moment as given in **Table 3.3.1.** For the members above the neutral axis of transverse section of hull, value of M_w is taken $M_w(-)$ and for the members under, value of M_w is taken $M_w(+)$.

y = distance(m) from the neutral axis of transverse section of hull to the considered point.

I = as specified in **301. 1**.

2. Shear stresses

The shear stress τ_{act} (N/mm^2) acting on the members under consideration are given in the following formula:

(1) For ships not provided the effective longitudinal bulkheads

$$\tau_{act} = \frac{0.5|F_s + F_w|}{t} \times \frac{Q}{I} \times 10^2 \quad (\text{N/mm}^2)$$

where:

F_s, Q and I = as specified in **301. 1.**

F_w = absolute value of $F_w(+)$ or $F_w(-)$ as given in **301. 1.,** whichever is the greater.

t = actual thickness of the considered plate (mm).

(2) For ships having one to four row longitudinal bulkheads.

$$\tau_{act} = \frac{FQ}{tI} \times 10^2 \quad (\text{N/mm}^2)$$

where:

Q = as specified in **301. 1.**

F = as specified in **302.**

t and I = as specified in (1).

403. Elastic buckling stresses

1. Elastic buckling of plates

(1) Compression

The ideal elastic buckling stress σ_E (N/mm^2) is determined by the following formula:

$$\sigma_E = 0.9kE\left(\frac{t_b}{1000b}\right)^2 \quad (\text{N/mm}^2)$$

where:

k = value is determined by the following formulae depending on direction of working stress:

(a) longitudinal framing panel:

$$k = \frac{8.4}{\varphi + 1.1}$$

(b) transverse framing panel:

$$k = C\left\{1+\left(\frac{b}{a}\right)^2\right\}^2 \frac{2.1}{\varphi+1.1}$$

E = modulus of elasticity of material. For steels, $E = 2.06\times 10^5$ (N/mm^2)

t_b = net thickness of plate (mm), considering standard deductions equal to the values given in **Table 3.3.3.**

b = length of shorter side of panel (m)

a = length of longer side of panel (m)

C = factor depending on kind of stiffeners on longer side of panel is as following:
When plating stiffened by floors or deep girders : C = 1.3
When stiffeners are angles or T-section : C = 1.21
When stiffeners are bulb plates : C = 1.10
When stiffeners are flat bar : C = 1.05

φ = ratio between smallest and largest compression stress σ_{act} when linear variation across panel. $0 \le \varphi \le 1$

(2) Shear
The ideal elastic buckling stress τ_E (N/mm^2) is determined by the following formula:

$$\tau_E = 0.9 k_t E\left(\frac{t_b}{1000b}\right)^2 \quad \text{(N/mm2)}$$

where:

k_t = factor depending on aspect ratio of panel is determined by the following formula:

$$k_t = 5.34 + 4\left(\frac{b}{a}\right)^2$$

E, t_b, b and a = as specified in (1)

Table 3.3.3 Standard deduction

Structure	Standard deduction (mm)	Limit values min-max (mm)
- Compartments carrying dry bulk cargoes - One side exposure to ballast and/or liquid cargo Vertical surfaces and surfaces sloped at an angle greater than 25° to the horizontal line	$0.05t$	$0.5 \sim 1$ mm
- One side exposure to ballast and/or liquid cargo Horizontal surfaces and surfaces sloped at an angle less than 25° to the horizontal line - Two side exposure to ballast and/or liquid cargo Vertical surfaces and surfaces sloped at an angle greater than 25° to the horizontal line	$0.10t$	$2 \sim 3$ mm
- Two side exposure to ballast and/or liquid cargo Horizontal surfaces and surfaces sloped at an angle less than 25° to the horizontal line	$0.15t$	$2 \sim 4$ mm

2. Ideal elastic buckling of longitudinals

The ideal elastic buckling of longitudinals is calculated by the method deemed appropriate by the Society.

404. Critical buckling stresses

1. Compression

The critical buckling stresses σ_c in compression is determined as following:

$$\sigma_c = \sigma_E \qquad \text{for : } \sigma_E \le 0.5\sigma_y$$

$$\sigma_c = \sigma_y\left(1 - \frac{\sigma_y}{4\sigma_E}\right) \qquad \text{for : } \sigma_E > 0.5\sigma_y$$

where:

σ_y = yield stress of material of the member considered, which are given as follows (N/mm^2) :

235 = for mild steels as specified in **Pt 2, Ch 1**

315 = for high tensile steels AH 32, DH 32, EH 32 or FH 32 as specified in **Pt 2, Ch 1**

355 = for high tensile steels AH 36, DH 36, EH 36 or FH 36 as specified in **Pt 2, Ch 1**

390 = for high tensile steels AH 40, DH 40, EH 40 or FH 40 as specified in **Pt 2, Ch 1**

σ_E = ideal elastic buckling stress calculated according to **403., 1** (1) (N/mm^2).

2. Shear

The critical buckling stress τ_c in shear is determined as following:

$$\tau_c = \tau_E \qquad \text{for} \quad \tau_E \le 0.5\tau_y \ ,$$

$$\tau_c = \tau_y\left(1 - \frac{\tau_y}{4\tau_E}\right) \qquad \text{for} \quad \tau_E > 0.5\tau_y$$

where:

τ_y = shear stress of material, in N/mm^2, τ_y is to be determined as $\sigma_y / \sqrt{3}$

τ_E = ideal elastic buckling stress calculated to **401. 1** (2) (N/mm^2).

σ_y = as specified in **Par 1.**

405. Scantling criteria

1. The critical buckling stress σ_c of panel and longitudinal frames in compression calculated according to **404. 1** is to comply with the following formula:

$$\sigma_c \ge \beta\sigma_{act}$$

where:

β = safety factor is as following:

For plate panel and web plating of stiffeners: $\beta = 1.0$

For stiffeners: $\beta = 1.1$

σ_{act} = working stress as given in **402.**

2. The critical buckling stress τ_c of panel and longitudinal frames in shear calculated according to **404. 2** is to comply with the following formula:

$$\tau_c \geq \tau_{act}$$

where:

τ_{act} = working stress as given in **402.** ⚓

CHAPTER 4 PLATE KEELS AND SHELL PLATINGS

Section 1 General

101. Consideration for corrosion

The thickness of shell plating at such parts that the corrosion considered excessive due to the location and/or special service condition of the ship is to be properly increased over that required in this Chapter.

102. Special consideration for contact with the quay, etc.

In cases where the service condition of the ship is considered to be such that there is possibility of indent of shell plating due to contact with the quay, etc., special consideration is to be given to the thickness of shell plating.

103. Consideration for ship with unusually large freeboard

Correction from the requirements in this Chapter will be specially considered where the ship has an unusually large freeboard.

104. Consideration for buckling

With regard to the prevention of buckling of the shell, in addition to complying with the requirements in **Ch 3, Sec 4.** sufficient consideration is to be paid to the prevention of buckling due to compression.

105. Continuity in thickness of the shell plating

Sufficient consideration is to be paid to the continuity in the thickness of shell plating and to the avoidance of remarkable difference between the thickness of the shell plating under consideration and that of the adjacent shell plating.

Section 2 Plate Keels

201. Breadth

The breadth of plate keel over whole length of the ship is not to be less than that obtained from the following formula:

$$b = 2L + 1000 \quad \text{(mm)}$$

202. Thickness

The thickness of plate keel over whole length of the ship is not to be less than the thickness of the bottom shell for the midship part obtained from the requirements in **304.** increased by 2.0 mm. This thickness, however, is not to be less than that of the adjacent bottom shell plating.

Section 3 Shell Plating below Strength Deck

301. Minimum thickness

The thickness of shell plating below the strength deck is not to be less than that obtained from the following formula:

$t = \sqrt{KL}$ (mm)

302. Thickness of side shell plating

The thickness of side shell plating other than the sheer strake of the strength deck of the midship part is to be as required in the following formula, in addition to the requirement specified in **301.**

$$t = C_1 C_2 S \sqrt{d - y + 0.05L' + h_1} + 1.5 \quad \text{(mm)}$$

where:

S = spacing of frames (m).

L' = length of ship (m). Where, however, L exceeds 230 m, L is to be taken as 230 m.

y = vertical distance (m) from the top of keel to the lower edge of plating. Where, however, y is more than d, y is to be taken as d.

h_1 = as given in (a) or (b).

(a) For 0.3L from the fore end : $2.25\ (17 - 20C_b')(1 - x)^2$

(b) For elsewhere except (a) : 0

C_b' = block coefficient. Where, however, C_b exceeds 0.85, C_b' is to be taken as 0.85.

C_1, C_2 and x = coefficient given in **Table 3.4.1.**

303. Sheer strakes for midship part

The thickness of sheer strakes at the strength deck for midship part is not to be less than 0.75 *times* that of the stringer plate of the strength deck. In no case, however, is the thickness to be less than that of the adjacent side shell plating.

304. Thickness of bottom shell plating

The thickness of bottom shell plating for the midship part is not to be less than that obtained from the following formula.

$$t = C_1 C_2 S \sqrt{d + 0.035L' + h_1} + 1.5 \quad \text{(mm)}$$

where:

S = spacing of transverse frames or longitudinals (m).

L', C_1, h_1 = as specified in **302.**

C_2 = coefficient given in **Table 3.4.2.**

Table 3.4.1 Coefficients C_1 and C_2

Framing	C_1	C_2
Transverse	$L \leq 230$ m : 1.0 $L \geq 400$ m : 1.07 For intermediate values of L, C_1 is to be obtained by linear interpolation	$91\sqrt{\dfrac{K}{576-\alpha^2K^2x^2}}$
Longitudinal		$13\sqrt{\dfrac{K}{24-\alpha Kx}}$ But, in no case is it to be less than $3.78\sqrt{K}$

α = either α_1 or α_2 according to value of y. However, value of α is not to be less than β.

$$\alpha_1 = 15.0 f_D\left(\frac{y-y_B}{Y'}\right) \quad y_B \leq y \qquad \alpha_2 = 15.0 f_B\left(\frac{y_B-y}{y_B}\right) \quad y_B > y$$

y_B = vertical distance from the top of keel at midship to the horizontal neutral axis of the athwartship section of hull (m).

y = distance(m) from the top of keel to the lower edge of plating when the platings under consideration are under y_B and to the upper edge of plating when the platings under consideration are above y_B, respectively.

Y' = the greater of the value specified in **Pt 3, Ch 3, 203.,** (5) (a) or (b)

β = coefficient determined according to values of L as specified below:

$\beta = 6/a$ when L is 230 m and under
$\beta = 10.5/a$ when L is 400 m and above

For intermediate values of L, β is to be obtained by liner interpolation.

a = $\sqrt{K}$ when high tensile steels are used for not less than 80 % of side shell plating at the transverse section amidship and 1.0 for other parts.

x = as given by the following formula.

$$x = \frac{X}{0.3L}$$

X = distance from the fore end to the part under consideration for the side shell plating afore the midship, or from the after end to the part under consideration for the side shell plating after the midship (m). Where, however, X is less than $0.1L$, X is to be taken as $0.1L$ and where X exceeds $0.3L$, X is to be taken as $0.3L$.

Table 3.4.2 Coefficient C_2

Framing	C_2
Transverse	$91\sqrt{\dfrac{K}{576-(15.0 f_B Kx)^2}}$
Longitudinal	$13\sqrt{\dfrac{K}{24-(15.0 f_B Kx)}}$ But, in no case is it to be less than $3.78\sqrt{K}$.
x = as specified in **Table 3.4.1**	

305. Bilge plates

1. The thickness of bilge plates is not to be less than that obtained from the following formula. However, it is not to be less than the thickness of the adjacent bottom plating.

$$t=\left\{5.22(d+0.035L')\left(R+\frac{a+b}{2}\right)^{\frac{3}{2}}l\right\}^{\frac{2}{5}}+1.5 \quad \text{(mm)}$$

where:

R = bilge radius (m). (see **Fig 3.4.1**)

a, b = distance from the lower and upper turns of bilge to the longitudinal frames nearest to the turns respectively, taking the distance outward from the bilge part as positive (m). Where, however, $(a+b)$ is negative, $(a+b)$ is to be taken as zero. (see **Fig 3.4.1**)

L' = as specified in **302.**

l = spacing of solid floors, bottom transverses or bilge brackets (m).

2. Where some of longitudinal frames at bilge part in longitudinal framing system is omitted, longitudinal frames are to be provided as near to the turns of bilge as practicable and suitably constructed to maintain the continuity of strength.

3. Where longitudinal frames are provided at bilge part at nearly the same spacing as that of bottom longitudinals, the bilge plates may be in accordance with the requirements in **304.** irrespective of the requirements in **Par 1.**

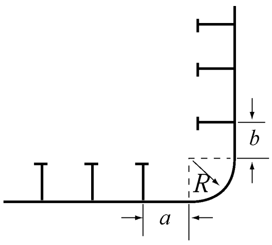

Fig 3.4.1 Measurement of *a* and *b*

Section 4 Special Requirements for Shell Plating

401. Large flared ship

With regard to the shell plating at a location where flare is specially large, sufficient consideration is to be paid to the reinforcement against panting impact, etc. at bow.

402. Shell plating stiffened in a spacing remarkably different from the frame spacing

Where the stiffener spacing measured along the shell plating supported by frames is remarkably different from the frame spacing, the shell plating is to be reinforced in consideration of the stiffener spacing, for example, by suitably increasing in thickness.

403. Aft part of ships with specially high power engines

With regard to the shell plating at the aft part of ships with specially high power engines compared with the ship length, sufficient consideration is to be paid to the reinforcement against vibration.

404. Strengthened bottom forward

1. The thickness of shell plating at the strengthened bottom forward in ships having the bow draught at the ballast condition is not to be less than that obtained from the formula given in **Table 3.4.3.**

Table 3.4.3 Thickness of shell plating at the strengthened bottom forward

Bow draft d_F	Thickness (mm)
$d_F \le 0.025L'$	$t = 0.9CS\sqrt{PK} + 1.5$
$d_F \ge 0.037L'$	$t = 1.34S\sqrt{L'K} + 1.5$

L' = as defined in **302.**
S = spacing of frames, girders or longitudinal shell stiffeners, whichever is the smallest (m).
P = slamming impact pressure specified in **Ch 7, 804.**
C = coefficient given in following formula.

$$C = \left(1.1 - 0.25\frac{S}{l}\right)^2$$

Where, however, $\frac{S}{l}$ is less than 0.4, C is to be taken as 1.0 and where $\frac{S}{l}$ is 1.0, C is to be taken as 0.72.
l = spacing of frames, girders or longitudinal shell stiffeners, whichever is greater (m).

NOTES:
In ships having intermediate value of the bow draught at the ballast condition specified in the above Table, the thickness is to be obtained by linear interpolation.

2. Notwithstanding the requirements in **Par 1,** in ships of which L and C_b are not more than 150 m and 0.7 respectively and $V/\sqrt{L}$ (kt/m) is 1.4 and over, the thickness of shell plating at the strengthened bottom forward is to be increased to a value deemed appropriate by the Society.

405. Spectacle bossings and stern frames

The thickness of shell plating fitted up on spectacle bossings and sternframes is not to be less than that obtained from the following formula. Where, however, the spacing of transverse frames in afterpeak exceeds 610 mm or the length of ship exceeds 200 m, the thickness of shell plating concerned is to be in accordance with the satisfaction of the Society.

$$t = 0.09L + 3.5 \quad \text{(mm)}$$

Section 5 Side Plating in way of Superstructure

501. Superstructure deck not designed as strength deck

Where the superstructure deck is not designed a strength deck, the thickness of superstructure side plating is not to be less than that obtained from the formula given in **Table 3.4.4,** but not less than 5.5 mm. Side plating of superstructures exceeding $0.15L$ in length, except at the end parts, is to be suitably increased in thickness.

Table 3.4.4 Thickness of superstructure side plating

Location	Thickness (mm)
For $0.25L$ from the fore end	$t = 1.15S\sqrt{KL} + 1.0$
Elsewhere	$t = 0.94S\sqrt{KL} + 1.0$
S = spacing of longitudinals or transverse frames (m).	

Section 6 Compensation at ends of Superstructure

601. Strengthening method

Breaks of superstructures are to be strengthened according to the following requirements:

(1) The sheer strakes of the strength deck, clear of the superstructure, are to be extended well into the superstructure and to be increased in thickness by not less than 20 % above the normal thickness of sheer strakes, for a distance well inside and outside the superstructure end.

(2) The side plating of the superstructure is to be tapered into upper deck sheer strakes to avoid abrupt change of the form at the breaks. The thickness of side plating at the superstructure end is to be increased approximately by 20 % above the normal thickness of superstructure side plating.

(3) For the breaks of superstructures located at fore and after end parts, the requirements in (1) and (2) may be suitably modified.

602. Openings in shell

Gangway ports, large freeing ports and other openings in the shell or bulwarks are to be kept well clear of the break. Where holes are necessarily provided in the plating near breaks, they are to be kept as small as possible and to be circular or oval in form.

Section 7 Local Compensation of Shell Plating

701. Openings in shell

All openings in the shell plating are to have well rounded corners and to be compensated as necessary.

702 Thickness of sea chest

In case where a sea chest is provided in the shell plating for sea suction or discharge the thickness of sea chest is not to be less than that obtained from the following formula and to be suitably stiffened so as to provide sufficient rigidity as necessary. The thickness, however, is not to be less than the thickness of shell plating where the sea chest is installed.

$$t = \sqrt{L} + 1.0 \quad \text{(mm)}$$

703. Location of openings

Openings for cargo ports, coaling ports, etc. are to be kept well clear of discontinuous parts in the hull construction, and they are to be locally compensated so as to maintain the longitudinal and transverse strengths of the hull.

704. Hawse pipes and the plating below

The shell plating fitted with hawse pipes and the plating below is to be increased in thickness or to be doubled, and their longitudinal seams are to be protected against damages by anchors or cables. ⚓

CHAPTER 5 DECKS

Section 1 General

101. Steel deck plating

Decks are to be plated from side to side of the ship except deck openings, etc. Decks, however, may be provided with only stringer plates and tie plates, subject to the approval by the Society.

102. Watertightness of decks

Weather decks are to be made watertight.

103. Continuity of steps of decks

Where strength deck or effective decks (the decks below the strength deck which are considered as strength members in the longitudinal strength of hull) change in level, the change is to be accomplished by gradually sloping, or each of structural members which form deck is to be extended, and is to be effectively tied together by diaphragms, girders, brackets, etc. and special care is to be taken for the continuity of strength.

104. Compensation for openings

Hatchways or other openings on strength or effective decks are to have well rounded corners, and compensation is to be suitably provided as necessary.

105. Rounded gunwales

Rounded gunwales, where adopted, are to have a sufficient radius for the thickness of plates.

Section 2 Effective Sectional Area of Strength Deck

201. Definition

The effective sectional area of strength deck is the sectional area, on each side of the ship's centre line, of steel plating, longitudinal beams, longitudinal girders, etc. extending for $0.5L$ amidships.

202. Effective sectional area of strength deck

1. The effective sectional area for the midship part is to be so determined as not to give less modulus of athwartship section of the hull specified in **Ch 3.**

2. Beyond the midship part, the effective sectional area may be gradually reduced, however, at $0.15L$ from each end it is not to be less than 40 % for ships with machinery amidship and 50 % for ships with machinery aft, of the area required for the midship part.

3. Where the section modulus of the hull at $0.15L$ from each end is calculated and approved by the Society, the requirements specified in **Par 2** may not be applied.

203. Strength deck beyond 0.15L from each end

Beyond $0.15L$ from each end, the effective sectional area and the thickness of strength deck may be gradually reduced avoiding abrupt change.

204. Long poop

Notwithstanding the requirements of **202.,** the effective sectional area of strength deck within long poop may be properly modified.

205. Superstructure deck designed as strength deck

Where the superstructure deck is designed as strength deck, the strength deck plating clear of the superstructure is to extend into the superstructure for about $0.05L$ without reducing the effective sectional area, and may be gradually reduced within.

Section 3 Deck Plating

301. Thickness

1. The thickness of deck plating is to be as specified in **Table 3.5.1,** however, within such enclosed spaces as superstructures, deckhouses, etc., the thickness may be reduced by 1 mm.

Table 3.5.1 Thickness of deck plating

<table>
<tr><th>Kind of deck</th><th>Location</th><th>Framing</th><th>Thickness (mm)</th></tr>
<tr><td rowspan="3">Strength deck</td><td rowspan="2">Outside the line of openings for the midship part</td><td>Longitudinal Systems</td><td>$t = 1.47SC\sqrt{Kh} + 1.5$</td></tr>
<tr><td>Transverse Systems</td><td>$t = 1.63SC\sqrt{Kh} + 1.5$</td></tr>
<tr><td>Elsewhere</td><td colspan="2" rowspan="2">$t = 1.25SC\sqrt{Kh} + 1.5$</td></tr>
<tr><td colspan="2">Other deck</td></tr>
<tr><td colspan="4">S = spacing of longitudinal or transverse beams.
C = coefficient obtained from the following formula:
$C = 0.905 + \frac{L'}{2430}$
L' = length of ship (m). Where, however, L is 230 m and under, L' is to be taken as 230 m, and where L is 400 m and above, L' is to be taken as 400 m.
h = deck load as specified in Ch 10, 201. (kN/m^2)</td></tr>
</table>

2. Where strength deck is transversely framed, or decks inside the line of openings are longitudinally framed, sufficient care is to be taken to prevent buckling of the deck plating.

302. Thickness of the top of tanks

The thickness of deck plating forming the top of tanks is not to be less than that required in **Ch 15, 208.** for deep tank bulkhead plating, taking the beam spacing as the stiffener spacing.

303. Thickness of the bulkhead recesses

The thickness of deck plating forming the top of shaft tunnels, thrust recesses or bulkhead recesses is not to be less than that required in **Ch 14, 309.** for watertight bulkhead plating, taking the beam spacing as the stiffener spacing.

304. Under boilers or refrigerated cargoes

1. The thickness of effective deck plating under boilers is to be increased by 3 mm above the normal thickness.

2. The thickness of deck plating under refrigerated cargoes is to be increased by 1 mm above the normal thickness. Where special means for the protection against the corrosion of the deck is provided, the thickness need not be increased.

305. Loaded by wheeled vehicles

The thickness of deck plating loaded by wheeled vehicles is to be determined by considering the concentrated loads from the wheeled vehicles.

306. Deck plating carrying unusual cargoes

The thickness of deck plating subjected to cargo loads which can not be treated as even distributed loads is to be determined taking account of load distribution for particular cargoes.

307. Deck plating for helicopter landing

Where decks for Helicopter taking off and landing are provided, the requirements are to be in accordance with the Guidance relating to the Rules.

Section 4 Wood Decks and Deck Compositions

401. Quality of wood planks

1. Planks of wooden decks are to be of good quality, thoroughly seasoned, free from rot, sap and shakes and reasonably free from bad knots.
2. Teaks and similar woods are treated as hard wood, and cedars and similar woods as soft wood.

402. Scantlings of wood planks

Hard wood planks are not to be less than 50 mm in thickness and soft wood planks not less than 63 mm. They are to be effectively arranged and fastened. For decks used for accommodation or navigation spaces, the thickness may be properly reduced.

403. Deck composition

The deck composition is to be non-destructive to steel, or to be effectively insulated from the steel by a suitable protecting covering. The composition is to be effectively laid on the deck so that the composition may not cause cracks, exfoliation, etc. ⚓

CHAPTER 6 SINGLE BOTTOMS

Section 1 General

101. Application

1. The requirements in this Chapter apply to the single bottoms of ships whose double bottom is omitted partially or wholly in accordance with the requirements in **Ch 7, 101. 2** or **3.**

2. The bottom constructions in way of fore and after peaks are to be in accordance with the requirements in **Ch 13, 201.** and **301.**

Section 2 Centre Keelsons

201. Arrangement and construction

All single bottom ships are to have centre keelsons composed of girder plates and rider plates, and the centre keelsons are to extend as far forward and afterward as practicable.

202. Centre girder plates

1. The thickness of continuous plates or intercostal plates of centre keelsons is not to be less than that obtained from the following formula. Beyond the midship part, the thickness may be gradually reduced and it may be 85 % of the midship value at the ends of the ship.

$t = 0.065L + 4.2$ (mm)

2. The girder plates are to extend to the top of floors.

203. Rider plates

The rider plates are to extend from the collision bulkhead to the aft peak bulkhead and the thickness is not to be less than that required for the continuous centreline plates amidships. The breadth of rider plates is not to be less than that obtained from the following formula or 400 mm whichever is the greater, and where it is more than 400 mm the breadth may be gradually reduced beyond the midship part to the ends where it may be 80 % of the required breadth or 400 mm, whichever is the greater.

$b = 16.6L - 200$ (mm)

204. Centre keelsons in boiler rooms

The thickness of the members forming the centre keelson is to be increased by 1.5 mm in boiler rooms.

Section 3 Side Keelsons

301. Arrangements

1. Side keelsons are to be so arranged that their spacing is not more than 2.15 m between the centre keelson and the lower turn of bilge.

2. At least one row of shell stiffener of proper size is to be provided within $0.4L$ amidships between the centre keelson and the side keelson, between the side keelsons, and between the side keelson and the lower turn of bilge.

3. In the space between the collision bulkhead and the position $0.05L$ after the strengthened bottom forward, the spacing of side keelsons is not to exceed 0.9 m.

302. Construction

Side keelsons are to be composed of intercostal plates and rider plates and are to be extended as far forward and aftward as practicable.

303 Intercostal plates

1. The thickness of intercostal plates of side keelson is not to be less than that given by the following formula for the midship part. Beyond the midship part, the thickness may be gradually reduced to 85 % at the ends of the ship.

$$t = 0.042L + 4.8 \quad \text{(mm)}$$

2. In the machinery room the thickness of intercostal plates is not to be less than that required for the continuous centreline plates in **202.**

304. Rider plates

The thickness of rider plates for side keelson is not to be less than that of the midship intercostal plates and the sectional area of rider plates in the midship part is not to be less than that obtained from the following formula. The sectional area may be gradually reduced to 90 % of the midship value at the ends of the ship.

$$A = 0.454L + 8.8 \quad (\text{cm}^2)$$

305. Side keelsons in boiler rooms

In the boiler rooms, the thickness of intercostal and rider plates is to be 1.5 mm greater than those required in **303.** and **304.** respectively.

Section 4 Floor Plates

401. Arrangements and scantlings

1. Floor plates are to be provided on every frame and the scantlings are not to be less than that obtained from the following formulae, but the thickness needs not exceed 12 mm.

Depth at the centre line: $d_0 = 62.5l$ (mm)

Thickness: $t = 0.01\,d_0 + 3$ (mm)

where:

l = span between the toes of frame brackets measured amidships plus 0.3 mm. Where curved floors are provided, the length l may be suitably modified. (See **Fig 3.6.1**)

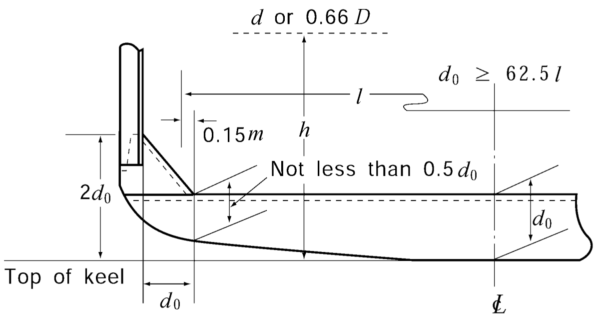

Fig 3.6.1 Shape of floors

2. Beyond $0.5L$ amidships, the thickness of floor plates may be gradually reduced and at the end parts of the ship it may be 0.90 times the value specified in **Par 1.** In the flat part of bottom forward, this reduction is not to be made.

3. Floors under engines and thrust seats are to be of ample depth and to be specially strengthened. Their thickness is not to be less than that of the continuous centre girder plates.

4. The thickness of floors under boilers is to be increased by at least 2 mm above the thickness of midship floors. Where boilers are less than 457 mm clear of the floors, the thickness is to be further increased. This requirement may, however, be modified if the boiler is remote from floor plates or if the boiler is of such a type as well prevent excessive heat to the structures in the vicinity.

402. Depth of floors

1. Upper edges of floor plates at any part are not to be below the level of upper edge at the centre line.

2. In the midship part, the depth of floors measured at a distance d_0 specified in **401. 1** from the inner edge of frames along the upper edge of floors, is not to be less than $0.5d_0$. Where frame brackets are provided, the depth of floors at the inner edge of brackets may be $0.5d_0$. (See **Fig 3.6.1**)

3. In ships having unusually large rise of floor, the depth of floor plates at the centre line is to be suitably increased.

403. Scantlings

1. Where face plates are fitted, the thickness of the face plate is not to be less than that required for the floor plate of that place. The sectional area of the face plates is not to be less than that given by the following formula:

$$A = 42.7\frac{Shl^2}{d_0} - \frac{d_0 t}{600} \quad (\text{cm}^2)$$

where:

l = as defined in **401.1.**

S = frame spacing (m).

h = d or $0.66D$, whichever is the greater (m).

d_0 = depth of floor plates at centre line (mm).

t = thickness of floor plates (mm).

2. Where the upper edge of floor plates is flanged, the breadth of flange is not to be less than that obtained from the following formula:

$$b = \frac{100A}{t} + 1.5t \quad \text{(mm)}$$

where:

A = sectional area of face plates defined in **Par 1.** (cm^2).

t = thickness of floor plates (mm).

3. The sectional areas of face plates are to be doubled for engine and boiler bearer floors. Flanging of floors at these parts is to be avoided.

404. Strengthened bottom forward

In the strengthening of bottom forward the floors are to be increased in their depth or the sectional areas of the face plates are to be doubled.

405. Frame brackets

The scantlings of frame brackets are to be determined in accordance with the requirements of the following. The free edge of the bracket is to be flanged.

(1) The height of the bracket measured from the top of keel is not to be less than twice the required depth of the floor plate at the centreline of the ship. (See **Fig 3.6.1**)

(2) The arm of the bracket measured along the upper edge of the floor plate from the inner edge of frame is not to be less than the depth of the floor plate required at the centreline of the ship. (See **Fig 3.6.1**)

(3) The thickness of frame brackets is not to be less than that of floor plates.

406. Drainage holes

Drainage holes are to be provided on the floor plates on both sides of the centreline and for ships with flat bottom also at the low parts of the turn of bilge.

407. Lightening holes

Lightening holes may be provided in floor plate. Where the holes are provided, appropriate strength compensation is to be made by increasing the floor depth or by some other suitable means.

408. Floor plates forming part of bulkheads

Floor plates forming part of bulkheads are to be in accordance with the requirements in **Chs 14** and **15.** ⚓

CHAPTER 7 DOUBLE BOTTOMS

Section 1 General

101. Application

1. Ships, in principle, are to be provided with double bottoms extending from the collision bulkhead to the after peak bulkhead. The longitudinal system of framing is, in general, to be adopted.

2. Where, for the structural configuration, hull form, purpose etc., it is desired to omit double bottom partially or wholly, the concerned parts to be calculated for flooding with the method as appropriate by the Society.

3. Double bottoms may be omitted in way of tanks of moderate size used exclusively for the carriage of liquids subject to the approval by the Society.

4. The scantlings of double bottom may be determined with the method as appropriate by the Society, in case of special construction such as having inclined side shell or double side shell, where longitudinal bulkheads are provided, or for the parts beyond the midship part.

5. The scantlings of members in double bottom tanks intended to be deep tanks are to be correspondingly in accordance with the requirements in **Ch 15.** However, the thickness of inner bottom plating needs not be increased by 1 mm as given **Ch 15, 208.** for the top plating of deep tanks.

6. The requirements in this Chapter are to be applied, where the apparent specific gravity of cargoes in the loaded hold, γ is 0.9 and under. The requirements in **Pt 7, Ch 3** are to be correspondingly applied, where γ is more than 0.9, or to the holds which are empty in fully loaded condition, or to the ships which are provided with bilge hoppers. However, the specific gravity of cargoes, γ, is to be as obtained from the following formula:

$$\gamma = \frac{W}{V} \quad (\text{t/m}^3)$$

where:

W = mass of cargoes for the hold (t)

V = volume of the hold excluding its hatchway (m^3)

7. Double bottom structure of holds is to be subjected to special consideration, where intended to carry heavy cargoes or where the ratio of cargo weight per unit area (kN/m^2) of the inner bottom plating to d is less than 5.40 or where cargo loads can not be treated as even distributed loads. Where the value of cargo weight per unit area as given in t/m^2, the value in kN/m^2 should be obtained from the product of the value in t/m^2 and 9.81.

102. Manholes and lightening holes

1. Manholes and lightening holes are to be provided in all non-watertight members to ensure access and ventilation except in way of pillars and where such openings are not permitted by the Rules. The size of holes should not in general exceed 50 % of the double bottom height, unless edge reinforcement is provided, and are to be shown in the plans submitted for approval. The edges of openings are to be made smooth.

2. Care is to be taken for locating the manholes in tank tops to avoid possibility of interconnection of main subdivision compartments through the double bottom so far as practicable.

3. Manhole covers in tank tops are to be of steel, and where no ceiling is provided in the cargo holds, the covers and their fittings are to be effectively protected against damages by cargoes.

103. Drainage

1. The bilge well in suitable size are to be provided for draining water which may gather on the double bottom.

2. The bottoms of bilge wells, except after the tunnel well, are to be situated at a distance of at least 460 mm from the top of keel.

3. The bilge well specified in **Par 2** are not to be formed by shell platings. Where, however, the bilge well are inevitably formed by shell platings due to the hull arrangements subject to the Society, the thickness of the shell platings forming of bilge well is to be increased by 2.5 mm to that of the adjacent shell plating.

104. Drain and air holes

Drain and air holes sufficient for the pumping rates are to be provided in all non-watertight members of the double bottom structure to give efficient passage of drain and air from all parts of the tank to the suction heads and air pipes.

105. Cofferdams

1. The following dedicated tanks are to be separated from adjacent tanks by cofferdams. However, these cofferdams may be omitted provided that the common boundaries of lubricating oil and fuel oil tank have full penetration welds.

(1) Fuel oil
(2) Lubricating oil
(3) Vegetable oil
(4) Fresh water

2. The cofferdams in **Par 1** are to be provided with the air pipes to comply with the requirements in **Pt 5, Ch 6, 201.** and with the manholes of adequate size which are well accessible.

106. Striking plates

Striking plates of adequate thickness or other approved arrangements are to be provided under sounding pipes to prevent from injuring the ship's bottom plating by striking of the sounding rod.

107. Strengthening under boilers

In the boiler room the thickness of structures in the tank under boilers are to be suitably increased. This requirement may, however, be modified if the boiler is remote from the tank top or if the boiler is of such a type as will prevent excessive heat to the structures in the vicinity.

108. Continuity of strength

1. Where the longitudinal system of framing is transformed into the transverse system, or the depth of double bottom changes suddenly, special care is to be taken for the continuity of strength by means of additional intercostal girders or floors.

2. In double bottoms under pillars or the toes of end brackets for bulkhead stiffeners, suitable reinforcement is to be provided by means of additional local side girders or floors.

109. Minimum thickness

No member of the double bottom structure is to be less than 6 mm in thickness.

Section 2 Centre Girders and Side Girders

201. Arrangement and construction

1. Centre girders are to be extended as far forward and afterward as practicable and centre girder plates are to be continuous for $0.5L$ amidships.

2. Where double bottoms are used for carriage of fuel oil or fresh water, the centre girders are to be watertight and may be suitably modified in narrow tanks at the end parts of the ship or where other watertight longitudinal girders are provided at about $0.25B$ from the centre line or where deemed appropriate by the Society.

3. Side girders in $0.5L$ amidships and aft are to be so arranged that the distance from the centre girder to the first side girder, between girders, or from the outermost girder to the margin plate does not exceed approximately 4.6 m and to extend as far afterwards as practicable.

4. In the strengthened bottom forward of ships, side girders and half-height girders are to be provided as required by **802.**

5. Adequate strengthening is to be made under main engines and thrust seatings by means of additional full or half-height girders.

202. Depth of centre girders

The depth of centre girders is not to be less than that obtained from the following formula unless specially approved by the Society.

$$d_0 = 62.5B \quad \text{(mm)}$$

203. Thickness

The thickness of centre girder plates and side girder plates is not to be less than that obtained from the following requirements (1) and (2), whichever is the greater:

(1) The thickness is to be obtained from the following formula depending on the location in the hold:

$$t = C_1 K \frac{SBd}{d_0 - d_1}\left(2.6\frac{x}{l_H} - 0.17\right) \times \left\{1 - 4\left(\frac{y}{B}\right)^2\right\} + 1.5 \quad \text{(mm)}$$

where:

S = distance between the centres of two adjacent spaces from the centre or side girder under consideration to the adjacent longitudinal girders or the line of toes of tank side brackets (m).

d_0 = depth of the centre or side girder under consideration (mm).

d_1 = depth of the opening at the point under consideration (mm).

l_H = length of the hold (m).

x = longitudinal distance between the centre of l_H of each hold and the point under consideration (m). Where, however, x is under 0.2 l_H, x is to be taken as 0.2 l_H, and where x is 0.45 l_H and over, x may be taken as 0.45 l_H.

y = transverse distance from the centre line of ship to the longitudinal girder (m).

C_1 = coefficient given by the following formulae Where, however B/l_H is 1.4 and over, B/l_H is to be taken as 1.4, and where B/l_H is under 0.4, B/l_H is to be taken as 0.4.

$$\text{Longitudinal framing : } C_1 = \frac{\left(3 - \frac{B}{l_H}\right)}{0.103}$$

$$\text{Transverse framing : } C_1 = \frac{\left(3 - \frac{B}{l_H}\right)}{0.09}$$

(2) The thickness is to be obtained from the following formula:

$$t_2 = \frac{C_1' d_0}{1000\sqrt{K}} + 1.5 \quad \text{(mm)}$$

where:

d_0 = depth of the girder at the point under con sideration (mm). Where, however, horizontal stiffeners are provided at the half way of the depth of girder, d_0 is the distance from the horizontal stiffener to the bottom shell plating or inner bottom plating or the distance between the horizontal stiffeners (mm).

C_1' = coefficient obtained from **Table 3.7.1** depending on S_1/d_0. For intermediate values of S_1/d_0, C_1' is to be obtained by linear interpolation.

S_1 = spacing of the brackets or stiffeners provided on the centre girders or the side girders (mm).

Table 3.7.1 Coefficient C_1'

S_1/d_0	C_1'	
	Centre girders	Side girders
0.3 and under	4.4	3.6
0.4	5.4	4.4
0.5	6.3	5.1
0.6	7.1	5.8
0.7	7.7	6.3
0.8	8.2	6.7
0.9	8.6	7.0
1.0	8.9	7.3
1.2	9.3	7.6
1.4	9.6	7.9
1.6 and over	9.7	8.0

204. Brackets

1. Where longitudinal framing system is adopted in the double bottom, transverse brackets are to be provided between the solid floors with a spacing not more than 1.75 m connecting the centre girder plates to the bottom shell plating as well as the adjacent bottom longitudinals. Where, however, the spacing of these brackets exceeds 1.25 m, additional stiffeners are to be provided on the centre girder plates.

2. The thickness of the brackets specified in **Par 1** is not to be less than that obtained from the following formula. However, it need not be greater than that of the solid floors at the same location.

$$t = 0.6\sqrt{L} + 1.5 \quad \text{(mm)}$$

3. The stiffener specified in **Par 1** is to be a flat bar having the same thickness as that of the girder plates and the depth not less than $0.08d_0$, where d_0 is the depth of centre girder in (mm) or equivalent thereto.

205. Thickness of half-height girders

The thickness of half-height girders is not to be less than that obtained from the formula specified in **204. 2.**

206. Vertical stiffeners and struts

1. Vertical stiffeners are to be provided to side girders at every open floor where the double bottom is framed transversely or at a suitable distance where the double bottom is framed longitudinally and vertical struts are to be provided on half-height girders at every open floor.

2. The vertical stiffeners required by the previous **Par 1** are to be a flat bar having the same thickness as that of the girder plates and the depth not less than $0.08d_0$ or the equivalent, where d_0 is the depth of the side girder at the point under consideration (m).

3. The sectional area of vertical struts required by **Par 1** is not to be less than that correspondingly in accordance with the requirements in **404.**

Section 3 Solid Floors

301. Arrangements

1. Solid floors are to be provided at a spacing not exceeding 3.5 m.

2. In addition to complying with the requirements in **Par 1,** solid floors are to be provided at the following locations:

(1) At every frame in the main engine room. Solid floors may, however, be provided at alternate frames outside the engine seatings, if the double bottom is framed longitudinally.
(2) Under thrust seatings and boiler bearers.
(3) Under transverse bulkheads.
(4) At the location specified in **803.** between the collision bulkhead and the after end of the strengthened bottom forward.
(5) Every frame where the height of double bottom changes.

3. Watertight floors are to be so arranged that the subdivision of the double bottom generally corresponds to that of the ship.

302. Thickness

The thickness of solid floors is not to be less than that obtained from the following requirements (1) and (2), whichever is the greater:

(1) The thickness is to be obtained from the following formula depending on the location in the hold:

$$t_1 = C_2 K \frac{SB'd}{d_0 - d_1}\left(\frac{2y}{B''}\right) + 1.5 \quad \text{(mm)}$$

where:

S = spacing of solid floors (m).

B' = distance between the lines of toes of tank side brackets at the top of inner bottom plating at the midship part (m).

B'' = distance between the lines of toes of tank side brackets at the top of inner bottom plating at the position of the solid floor (m).

y = transverse distance from the centre line to the point under consideration (m). Where, however, y is under $B''/4$, y is to be taken as $B''/4$, and where y is $B''/2$ and over, y may be taken as $B''/2$.

d_0 = depth of the solid floor at the point under consideration (mm).

d_1 = depth of the opening at the point under consideration (mm).

C_2 = coefficient obtained from **Table 3.7.2** depending on B/l_H.

l_H = length defined in **203.**

Table 3.7.2 Coefficient C_2

B/l_H		and above		0.4	0.6	0.8	1.0	1.2
		below	0.4	0.6	0.8	1.0	1.2	
C_2	Longitudinal framing		29	27	24	22	19	17
	Transverse framing	Where solid floors are provided at every frame	29	27	24	22	19	17
		Elsewhere	20	19	17	15	13	12

(2) The thickness is to be obtained from the following formula depending on the location in the hold:

$$t_2 = 0.086\sqrt[3]{\frac{H^2 d_0^2}{C_2' K}(t_1 - 1.5)} + 1.5 \quad \text{(mm)}$$

where:

t_1 = thickness obtained from the requirement in Sub-paragraph (1).

d_0 = depth defined in Sub-paragraph (1).

C_2' = coefficient given in **Table 3.7.3** depending on the ratio of the spacing of stiffeners S_1 (mm) to d_0.

H = value obtained from **Table 3.7.4.**

Table 3.7.3 Coefficient C_2'

S_1/d_0	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C_2'	64	38	25	19	15	12	10	9	8	7
For intermediate values of S_1/d_0, the value of C_2' is to be determined by linear interpolation										

Table 3.7.4 Value of H

Case	H
(a) Where slots are provided on solid floors without reinforcement	$\sqrt{4.0\frac{d_1}{S_1}} - 1.0$ but, where d_1/S_1 is 0.5 and under, H is to be 1.0.
(b) Where openings are provided on solid floors without reinforcement	$0.5\frac{\phi}{d_0}+1$
(c) Where slots and openings are provided on solid floors without reinforcement	Product of the values given by (a) and (b)
(d) Except where (a), (b) and (c) are applied	1.0
d_1 = depth of slot without reinforcement provided at the upper and lower parts of solid floors, whichever is the greater (mm). ϕ = major diameter of the openings (mm).	

303. Vertical stiffeners

Vertical stiffeners are to be provided on the solid floors at a suitable spacing in case of the double bottom framed transversely, and at every longitudinal in case of the double bottom framed longitudinally. The vertical stiffener is to be a flat bar having the same thickness as that of the floor plate and the depth not less than $0.08d_0$ or the equivalent, where d_0 is the depth of the floor at the point under consideration (mm).

Section 4 Bottom Longitudinals

401. Construction

Longitudinals are to be continuous through floors or to be attached to floors by brackets so as to effectively develop the resistance to tension and bending.

402. Spacing

The standard spacing of longitudinals is obtained from the following formula, but it is recommended not to exceed 1 m.

$$S = 2L + 550 \quad \text{(mm)}$$

403. Section modulus

1. The section modulus of bottom longitudinals is not to be less than that obtained from the following formula:

$$Z_b = \frac{CKSl^2}{24 - 15.0 f_B K}(d + 0.026L') \quad (\text{cm}^3)$$

where:

C = coefficient given in **Table 3.7.5.**

L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.

l = spacing of solid floors (m).

S = spacing of longitudinals (m).

Table 3.7.5 Coefficient C

Case		C
In case where no strut specified in **404.** is provided midway between floors		100
In case where a strut specified in **404,** is provided midway between floors	Lower part of deep tanks	62.5
	Elsewhere	50
NOTE: Where, however, the width of vertical stiffeners provided on floors and that of struts are specially large, the coefficient may be properly reduced.		

2. The section modulus of inner bottom longitudinals is not to be less than that obtained from the following formula. However, the section modulus of inner bottom longitudinals is not to be less than 0.75 times that of the bottom longitudinals as specified in **Par 1** at the same location.

$$Z_i = \frac{CKShl^2}{24 - 11.4 f_B K} \quad (\text{cm}^3)$$

where:

C = coefficient obtained from **Table 3.7.6.**

l, S = as specified in **Par 1.**

h = vertical distance from the top of inner bottom plating to the lowest deck at centre line (m). Where, however, the cargo is carried exceeding the lowest deck, h is to be taken from the top of inner bottom plating to the deck just above the top of cargo at centre line.

Table 3.7.6 Coefficient C

Case	C
In case where no strut specified in **404.** is provided midway between floors	90
In case where a strut specified in **404,** is provided midway between floors	54
NOTE: Where, however, the width of vertical stiffeners provided on floors and that of struts are specially large, the coefficient may be properly reduced.	

404. Vertical struts

1. Vertical struts are to be rolled sections other than flat bars or bulb plates and to be well overlapped with the webs of bottom and inner bottom longitudinals.

2. The sectional area of the above-mentioned vertical struts is not to be less than that obtained from the following formula:

$$A = 1.8CKSbh \quad (\text{cm}^2)$$

where:

S = spacing of longitudinals (m).

b = breadth of the area supported by the strut (m).

h = as obtained from the following formula (m). In no case is h to be less than d.

$$h = \frac{d + 0.026L' + h_i}{2}$$

L' = as specified in **403.1.**

h_i = 0.9 times the value of h specified in **403. 2.** (m). However, under deep tanks, h is not to be less than the vertical distance from the upper surface of inner bottom to the midpoint between the top of overflow pipe and the top of inner bottom or 0.7 times the vertical distance from the upper surface of inner bottom to the point of 2.0 m above the top of overflow pipe, whichever is the greater (m).

C = coefficient obtained from the following formula. In no case is the value of coefficient to be less than 1.43.

$$C = \frac{1}{1 - 0.5\frac{l_s}{\sqrt{K}k}}$$

l_s = length of struts (m).

k = minimum radius of gyration of struts obtained from the following formula (cm).

$$k = \sqrt{\frac{I}{A}}$$

I = the least moment of inertia of the struts (cm^4).

A = sectional area of the struts (cm^2).

Section 5 Inner Bottom Plating, Margin Plates and Bottom Shell Plating

501. Thickness of inner bottom plating

1. The thickness of inner bottom plating is not to be less than that obtained from the following formula, whichever is the greater:

$$t_1 = \frac{CKB^2d}{d_0} + 1.5 \quad \text{(mm)}$$

$$t_2 = C'S\sqrt{hK} + 1.5 \quad \text{(mm)}$$

where:

d_0 = height of centre girders (mm).

S = spacing of inner bottom longitudinals for longitudinal framing or frame spacing for transverse framing (m).

h = as specified in **403. 2.**

C = coefficient obtained from **Table 3.7.7.**

C' = coefficient obtained from **Table 3.7.8.**

2. Where cargoes whose specific gravity is especially low are carried, the thickness of inner bottom plating may be suitably modified.

3. The thickness of inner bottom plating under hatchway, where no ceiling is provided, is to be increased by 2 mm above that obtained from the second formula in **Par 1** or that specified in **101. 5,** whichever is the greater, except where the provision in **Par 4** is applied.

4. In ships in which cargoes are handled by grabs or similar mechanical appliances, the thickness of inner bottom plating is to be increased by 2.5 mm above that specified in **Par 1** or in **101. 5,** whichever is the greater, except where ceiling is provided.

5. The thickness of inner bottom plating in main engine room is to be increased by 2 mm above that specified in **Par 1** or in **101. 5,** whichever is the greater.

502. Thickness of margin plates

The thickness of margin plates is to be increased by 1.5 mm above that obtained from the second formula in **501.** However, the thickness of margin plates is not to be less than that of the inner bottom plating at the location.

503. Arrangements of margin plates

1. It is recommended that the margin plates are to be of sufficient height to protect the bottom up to the turn of bilge and for forward $0.2L$ from the stem the margin plates are to extend to the ship' s sides horizontally as far as practicable.

2. Margin plates are to be of adequate breadth and to extend well inside from the line of toes of tank side brackets.

504. Margin brackets

1. Where the double bottom is framed longitudinally, transverse brackets are to be provided at every hold frame extending from the margin plate to the adjacent bottom and inner bottom longitudinals.

2. The thickness of brackets specified in **Par 1** is not to be less than that obtained from the formula in **204. 2** and free edges are to be strengthened by flanging or other suitable method.

505. Bottom shell plating

The thickness of bottom shell plating of cargo holds in way of double bottom is not to be less than that obtained from the formula in **Ch 4, 304.** or from the first formula in **501. 1,** whichever is the greater. However, in application of the latter formula, α is to be as given by the following formula:

$$\alpha = \frac{13.8}{24 - 15.0 f_B K}$$

Table 3.7.7 Coefficient C

$\frac{B}{l_H}$	C
$\frac{B}{l_H} < 0.8$	b_0
$0.8 \le \frac{B}{l_H} < 1.2$	b_0 or αb_1, whichever is the greater
$1.2 \le \frac{B}{l_H}$	αb_1

l_H = as specified in **203.**
α = as given by the following formula.

$$\alpha = \frac{13.8}{24 - 10.6 f_B K}$$

b_0, b_1 = as given by the following table according to the value of B/l_H. However, for transverse framing, b_1 is to be **1.1** times the value given in this Table.

$\frac{B}{l_H}$	b_0	b_1
$\frac{B}{l_H} < 0.4$	4.4	—
$0.4 \le \frac{B}{l_H} < 0.6$	3.9	—
$0.6 \le \frac{B}{l_H} < 0.8$	3.3	—
$0.8 \le \frac{B}{l_H} < 1.0$	2.2	2.2
$1.0 \le \frac{B}{l_H} < 1.2$	1.6	2.1
$1.2 \le \frac{B}{l_H} < 1.4$	—	1.9
$1.4 \le \frac{B}{l_H} < 1.6$	—	1.7
$1.6 \le \frac{B}{l_H}$	—	1.4

Tabie 3.7.8 Coefficient C'

$\frac{l}{S}$	C'
$1.0 \le \frac{l}{S} < 3.5$	$0.43\frac{l}{S} + 2.5$
$3.5 \le \frac{l}{S}$	4.0

l = distance between floors for longitudinal framing or distance between girders for transverse framing (m).

Section 6 Hold Frame Brackets

601. Thickness and scantlings

1. The thickness of brackets connecting hold frames to margin plates is to be increased by 1.5 mm above that obtained from the formula in **204. 2.** The free edges of brackets are to be flanged.

2. Where the shape of ship requires exceptionally long brackets, the thickness of brackets is to be increased or additional stiffness is to be provided by fitting angles longitudinally across the top of flanges, or by other suitable means.

602. Gusset plates

Hold frame brackets and margin plates are to be connected by gusset plates of the same thickness as the margin plates. The gusset plates may be omitted where deemed dispensable in relation to structural arrangements.

Section 7 Open Floors

701. Arrangement

Where the double bottom is framed transversely, open floors composed of brackets fitted at centre girder and margin plate, and main frames and reverse frames are to be provided at every hold frame between solid floors.

702. Main frames

The section modulus of main frames is not to be less than that obtained from the following formula:

$$Z_b = CKShl^2 \quad (\text{cm}^3)$$

where:

l = distance between the brackets attached to the centre girder and the margin plate (m). Where side girders are provided, l is the greatest distance among the distances between the vertical stiffeners on side girders and brackets. (See **Fig 3.7.1**).

S = spacing of frames (m).

h = $d+0.026L$ (m)

L' = as specified in **403. 1.**

C = coefficient given in **Table 3.7.9.**

703. Reversed frames

The section modulus of reverse frames is not to be less than that obtained from the following formula:

$$Z_i = C'KShl^2 \quad (\text{cm}^3)$$

where:

l, S = as specified in **702.**

h = as specified in **403. 2.**

C' = coefficient given in **Table 3.7.10.**

Table 3.7.9 Coefficient C

Case		C
In case where no vertical strut specified in **705.** is provided		6.67
In case where vertical struts specified in **705.** are provided	For holds which are used as deep tanks	4.17
	For holds which become empty in the full load condition	
	Elsewhere	3.33

Table 3.7.10 Coefficient C'

Case	C'
In case where no vertical strut specified in **705.** is provided	6.0
In case where vertical struts specified in **705.**. are provided	3.6

704. Brackets

1. Frames and reverse frames are to be connected to the centre girder and margin plates by brackets of not less than thickness obtained from the formula in **204. 2.**

2. The breadth of brackets specified in **Par 1** is not to be less than $0.05B$ and the brackets are to be well overlapped with frames and reverse frames. The free edges of brackets are to be flanged.

705. Struts

Vertical struts are to be rolled sections other than flat bars or bulb plates and to be well overlapped with the frames and reverse frames. The sectional area of the struts is to be in accordance with the requirements of **404.**

Section 8 Construction of Strengthened Bottom Forward

801. Application

1. In ships having bow draught under $0.037L'$ at the ballast condition, the construction of strengthened bottom forward is to be in accordance with the requirements of this Section, where L' is as defined in **403. 1.**

2. In ships having unusually small draught in the ballast condition and having specially high speed length ratio, special consideration is to be paid to the construction of strengthened bottom forward.

3. In ships having bow draught not less than $0.037L'$ at the ballast condition, the construction of strengthened bottom forward may be as specified in **Sec. 2** to **4.**

802. Definition

1. The strengthened bottom forward is the part of the ship's bottom up to a height of $0.05d_F$(d_F : Bow draught at the ballast condition) from the top of keel at forward from the position specified in **Table 3.7.11.**

Table 3.7.11 Range of strengthened bottom forward

$V/\sqrt{L}\,(=a)$	Position(from Fore Perpendicular)
$a \leq 1.1$	$0.15L$
$1.1 < a \leq 1.25$ $1.25 < a \leq 1.4$	$0.175L$ $0.2L$
$1.4 < a \leq 1.5$ $1.5 < a \leq 1.6$	$0.225L$ $0.25L$
$1.6 < a \leq 1.7$ $1.7 < a$	$0.275L$ $0.3L$

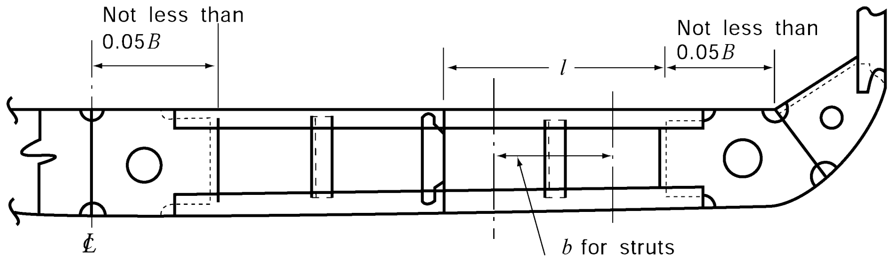

Fig 3.7.1 Open floors

2. Notwithstanding the requirement in **Par 1,** in case of ships of which C_b and especially small, the ships of which the draft in the ballast condition are especially small, and so on, the extent of the strengthened bottom forward is to be extended up to the satisfaction of the Society.

803. Construction

1. Between the collision bulkhead and $0.05L$ abaft the aft end of strengthened bottom forward, side girders are to be provided with a spacing not more than 2.3 m. Where transverse framing system is adopted between the collision bulkhead and $0.025L$ abaft the aft end of strengthened bottom forward, half height girders or longitudinal shell stiffeners are to be provided between the side girders.

2. Between the collision bulkhead and the aft end of strengthened bottom forward, solid floors are to be provided at every frame in transverse framing system, and at alternate frames in longitudinal framing system.

3. The solid floors are to be strengthened by fitting vertical stiffeners in way of half-height girders or longitudinal shell stiffeners except where the shell stiffeners are spaced considerably close and the solid floors are adequately strengthened, the vertical stiffeners may be provided on alternate shell stiffeners.

4. In ships having bow draught more than $0.025L'$ but less than $0.037L'$ at the ballast condition, where the construction and arrangement of strengthened bottom forward are impracticable to comply with each above mentioned requirement, suitable compensation is to be provided for floors and side girders.

804. Scantlings

1. In ships having bow draught not more than $0.025L'$ at the ballast condition, the section modulus of longitudinal shell stiffeners or bottom longitudinals in way of the strengthened bottom forward is not to be less than that obtained from the following formula:

$$Z = 0.53\,KCPal^2 \quad (\text{cm}^3)$$

where:

l = spacing of solid floors (m).

a = $0.774l$. Where, however, the spacing of longitudinal shell stiffeners or bottom longitudinals in not more than 0.774 l, a is to be taken as the spacing.

C = coefficient obtained from the following formula:

$$C = \frac{L}{1.9L - 45d_F}$$

Where, however, C is 1.0 or over, C is to be taken as 1.0.

P = slamming impact pressure obtained from the following formula:

$$P = 2.48 \times \frac{LC_1C_2C_3C_4}{\beta} \quad \text{(kPa)}$$

C_1 = coefficient given in **Table 3.7.12.** For intermediate values of $V/\sqrt{L}$, C_1 is to be obtained by linear interpolation.

C_2 = coefficient given in **Table 3.7.13.**

C_3 = coefficient given in the following value.

$C_3 = 1.0$, when x is x_1 and above.

$C_3 = 0.5 + \frac{0.5x}{x_1}$, when x is less than x_1.

x = longitudinal distance from F.P. to cross section considered (m)

x_1 = as given in the following value.

x_1 = $0.1L$ (m), when C_b is less than 0.7.

x_1 = $(0.1 - 0.5(C_b - 0.7)L$ (m), where C_b is greater than 0.7 and less than 0.8.

x_1 = $0.05L$(m), when C_b is 0.8 and above.

C_4 = coefficient obtained from the following formula:

$$C_4 = 1.9 - 0.9\left(\frac{d_F}{0.02L}\right)$$

Where, however, C_4 is less than 1.0, C_4 is to be taken as 1.0.

d_F = bow draught at the ballast condition.

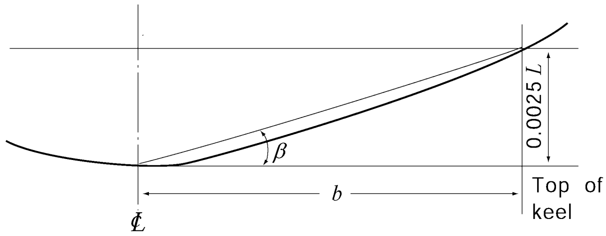
β = slope of the ship's bottom obtained from the following formula, but C_2/β need not be taken as greater than 11.43.

$$\beta = \frac{0.0025L}{b}$$

b = horizontal distance measured at the station 0.2L from the stem, from the center line of ship to the intersection of the horizontal line 0.0025L above the top of keel with the shell plating(m). (See **Fig 3.7.2**)

β = slope of the ship's bottom obtained from the following formula, but C_2/β need not be taken as greater than 11.43.

b = horizontal distance measured at the station $0.2L$ from the stem, from the centre line of ship to the intersection of the horizontal line $0.0025L$ above the top of keel with the shell plating (m). (See **Fig 3.7.2**)



(Hull section at the station $0.2L$ from the stem)

Fig 3.7.2 Measurement of *b*

Table 3.7.12 Value of C_1

$\frac{V}{\sqrt{L}}$	1.0 and under	1.1	1.2	1.3	1.4	1.5 and above
C_1	0.12	0.18	0.23	0.26	0.28	0.29

Table 3.7.13 Value of C_2

$\frac{V}{\sqrt{L}}$	less than 0.9	greater than 0.9 and less than 1.3	1.3 and above
C_2	0.333	$0.667\frac{V}{\sqrt{L}} - 0.267$	$1.5\frac{V}{\sqrt{L}} - 1.35$

2. In ships having bow draught more than $0.0025\,L$ but less than $0.037\,L'$ at the ballast condition, the section modulus of longitudinal shell stiffeners or bottom longitudinals in way of the strengthened bottom forward is to be obtained by linear interpolation from the values given by the requirements in **Par 1** and **Sec 4.** ⫝

CHAPTER 8 FRAMES

Section 1 General

101. Application

The requirements in this Chapter apply to ships having transverse strength due to bulkheads not less effective than that specified in **Ch 14.** Where the transverse strength due to bulkheads is less effective, additional stiffening is to be made by means of increasing the scantlings of frames, the number of web frames, etc.

102. Frames in way of deep tanks

The strength of frames in way of deep tanks are not to be less than those required for stiffeners on deep tank bulkheads.

103. Frames in way of tank tops

Frames are not to extend through tops of tanks, unless the effective watertight or oiltight arrangements are specially submitted and approved.

104. Increase of scantlings due to holes

Where large holes are cut in the webs of frames or holes are cut in the flanges of frames, the scantlings of the frames are to be appropriately increased.

105. Frames in boiler spaces and in way of bossing

1. In boiler spaces, the scantlings of frames and side stringers are to be appropriately increased.

2. The construction and scantlings of frames in way of bossing are to be to the satisfaction of the Society.

106. Frames and stringers fitted up at extremely small angles

Where the angle between the web of frames and shell plating is extremely small, the scantlings of frames are to be suitably increased above the normal requirements and where necessary, appropriate supports are to be provided to prevent tripping.

107. Lower end construction of frames

Thorough considerations are to be given to stress concentration, etc. at lower end construction of frames.

108. Frames at a location where flare is specially large

The transverse frames, side longitudinals and web frames supporting side longitudinals, which are fitted in the bow flare position considered to endure large wave impact pressure, are to be properly strengthened taking care of the effectiveness of their end connections.

109. Direct strength calculation

Where approved by the Society, the scantlings of frames may be determined basing upon direct strength calculation as specified in **Ch 1, 206.**

Section 2 Frame Spacing

201. Transverse frame spacing

1. The standard spacing of transverse frames is obtained from the following formula:

$S = 2L + 450$ (mm)

2. Transverse frame spacing in peaks or cruiser sterns is not to exceed 610 mm.

3. Transverse frame spacing between 0.2L from the fore end and the collision bulkhead is not to exceed 700 mm or the standard spacing specified in **Par 1,** whichever is the smaller.

4. The requirements in **Par 2** and **3** may be modified, where structural arrangement or scantlings are suitably considered.

202. Longitudinal frame spacing

The standard spacing of longitudinal frames is obtained from the following formula:

$S = 2L + 550$ (mm)

203. Maximum frame spacing

Frame spacing is recommended not to exceed 1 m.

204. Consideration for frame spacing exceeding the standard

Where the spacing of frames is equal to or above the spacing of 250 mm greater than the standard spacing in **201.** and **202.,** the scantlings and structural arrangement of single and double bottoms and of other relevant structures are to be specially considered.

Section 3 Hold Frames

301. Application

1. The transverse hold frame is the frame provided below the lowest deck from the collision bulkhead to the aft peak bulkhead, including the machinery space.

2. The provisions in **302.** to **304.** are applicable to the transverse hold frames of ordinary construction.

3. The transverse hold frames of ships which have hopper side tanks, top side tanks, or which have a special construction such as inner hulls, will be specially considered.

4. Special considerations are to be given to the scantlings of transverse hold frames, where the specific gravity of cargoes γ defined in **Ch 7, 101. 7** in the loaded hold exceeds 0.9.

302. Scantlings of transverse hold frames

1. The section modulus of transverse hold frames is not to be than that obtained from **Table 3.8.1.**

2. Where the depth of double bottom centre girder is less than $B/16$, the scantlings of frames are to be suitably increased.

3. Where long hatchways or multi-row hatchways are provided on the deck at the top of frames, special considerations are to be given to the scantlings of transverse hold frames and their upper end construction of frames.

303. Hold frames supported by web frames and side stringers

1. Where transverse hold frames are supported by web frames and side stringers specified in **Ch 9,** the section modulus of frames is not to be less than that obtained from the following formula:

$$Z = C_0 CKShl^2 \quad (\mathrm{cm}^3)$$

where:

S = spacing of frames (m).

h = as specified in **302. 1.**

l = vertical distance from the top of inner bottom plate at side to the line of the lowest side stringers (m) and it is to be measured at the measuring point for l stipulated in **301. 1.** Where this distance is less than 2 m, l is to be 1 m greater than one half of the distance. (See **Fig 3.8.1** and **3.8.2** (c))

C_0 = coefficient given in **Table 3.8.2.**

C = as obtained from the following formula, but to be taken as 1.0, where C is less than 1.0.

$$C = \left\{ \alpha_1 \left(3 - \frac{l_2}{l} \right) - \alpha_2 \frac{e}{l} \right\} C_4$$

l_2 = vertical distance at side from the lowest side stringer to the one immediately above or to the deck (m). (See **Fig 3.8.2.** (c)).

e = height of the lower bracket measured from the lower end of l, where, however, this height exceeds 0.25 l, e is to be taken as $0.25l$ (m). (See **Fig 3.8.2** (c))

α_1, α_2 = as given in **Table 3.8.3.**

C_4 = as obtained from the following formula, but to be taken as 1.0, where C_4 is less than 1.0, and as 2.2 where C_4 exceeds 2.2.

$$C_4 = 2\frac{H}{H_0} - 1.5$$

H_0 = vertical distance from the top of inner bottom plate at side to the lowest deck (m). (See **Fig 3.8.2** (c))

H = vertical distance from the lower end of H_0 to the freeboard deck at side (m). (See **Fig 3.8.2** (c))

2. The difference between any two adjacent unsupported spans of the frames in the preceding paragraph is not to be more than 25 % nor is it to be more than 50 % between the largest and smallest spans in case of more than two stringers.

3. Where the height of lower brackets of frames is less than 0.05 times l specified in **Par 1,** special considerations are to be given to the scantlings of transverse hold frames and their lower end construction of frames.

Table 3.8.1 Section modulus

Location	Section modulus (cm^3)
(1) Between $0.15L$ from the fore end and the after peak bulkhead	$Z = KC_0 CShl^2$
(2) Between $0.15L$ from the fore end and the collision bulkhead	$Z = 1.3C_0 CShl^2$
(3) For the frames under deck transverse supporting deck longitudinals	$Z = 2.4Kn\left\{0.17 + \frac{1}{9.81}\frac{h_1}{h}\left(\frac{l_1}{l}\right)^2 - 0.1\frac{l}{h}\right\}Shl^2$

S = frame spacing (m).

l = vertical distance from the top of inner bottom plating at side to the top of deck beams above the frames (m). For frames abaft $0.25L$ from the fore end, l is to be measured at midship. For frames between $0.25L$ and $0.15L$ from the fore end, l is to be measured at $0.25L$ from the fore end. For frames provided to the shell with a remarkable flare, l is to be the unsupported length of frames. Where the length of frames is markedly different from that measured at the aforementioned place on account of discontinuity in the lowest deck or change in the height of double bottom, lines extended from the lowest deck or the top of double bottom in parallel with the upper deck or keel respectively are to be taken as the lowest deck or double bottom top and l is to be measured at the corresponding place of measurement. (see **Fig 3.8.1** and **Fig 3.8.2**).

h = vertical distance from the lower end of l at the place of measurement to a point of $d + 0.038L'$ above the top of keel (m). (see **Fig 3.8.2**).

L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.

C_0 = coefficient obtained from the following formula, but not to be less than 0.85.

$$C_0 = 1.25 - 2\frac{e}{l}$$

e = height of the tank side bracket measured from the lower end of l (m).

n = ratio of the deck transverse spacing to the frame spacing.

h_1 = deck load stipulated in **Ch 10, Sec 2** for the deck transverse at the top of frame (kN/m^2).

l_1 = total length of the transverse web beam (m). (see **Fig 3.8.2** (a)).

C = coefficient obtained from the following formula:

$$C = C_1 + C_2$$

Framing systems	C_1	C_2
For ordinary framing systems without top side tanks	$2.1 - 1.2\frac{l}{h}$	$0.022 - k\alpha\frac{d}{h}$
For framing systems with top side tanks	$3.4 - 2.4\frac{l}{h}$	$0.27\alpha\frac{d}{h}$ (*1)

(*1) Where B/l exceeds 4.0, the value of C_2 is to be suitably increased.

α = coefficient given in the following table. For intermediate values of B/l_H, α is to be obtained by linear interpolation.

l_H = length of hold (m)

B/l_H	0.5 and under	0.6	0.8	1.0	1.2	1.4 and over
α	2.3	1.8	1.0	0.6	0.34	0.2

k = coefficient given in the following table according to the number of layers of deck:

No. of layers of deck	k	Value of B/l (*2)
For single deck systems	13	2.8
For double deck systems	21	4.2
For triple deck systems	50	5.0

(*2) Where B/l exceeds the value given in the above table according to the deck systems, the value of k is to be suitably increased:

NOTE:
Where the ratio of the depth of frame to the length measured from the deck at the top of frame to the toe of lower bracket is less than 1/24 and 1/22 in case of the frame prescribed in line (1) and of that in line (2) respectively, the scantlings of such frames are to be suitably increased.

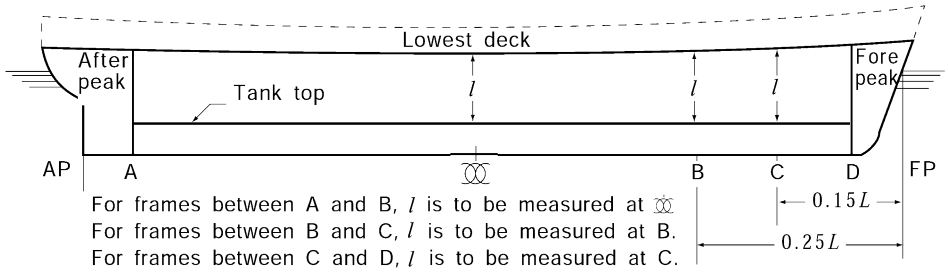


Fig 3.8.1 Measuring points of l for hold frames

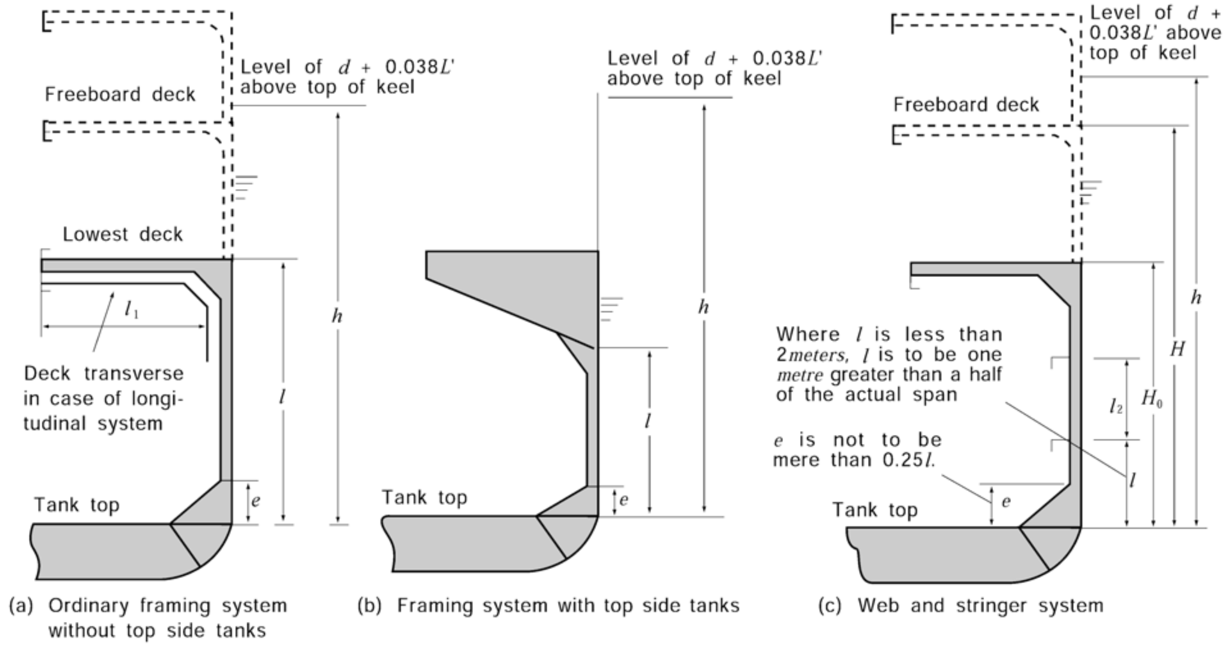

Fig 3.8.2 Measurement of $l, h, H,$ etc.

Table 3.8.2 Coefficient C_0

Location of frames	C_0
Between 0.15L from the fore end and the after peak bulkhead	2.1
Between 0.15L from the fore end and the collision bulkhead	3.2

Table 3.8.3 Values of α_1 and α_2

Nos. of side stringers provided below the lowest deck	α_1	α_2
1	0.75	2.0
2	0.90	1.8
3 and more	1.25	1.3

304. Connection

1. Transverse hold frames are to be overlapped with tank side brackets by at least 1.5 times the depth of frame sections and are to be effectively connected thereto.

2. The upper ends of transverse hold frames are to be effectively connected by brackets with the deck and deck beams, and where the deck at the top of frames is longitudinally framed, the upper end brackets are to be extended and connected to the deck longitudinals adjacent to the frames.

Section 4 Side Longitudinals

401. Section modulus

The section modulus of side longitudinals in the midship part below the freeboard deck is not to be less than that obtained from the following formula, whichever is the greater:

$Z_1 = 100CShl^2$ (cm^3), $Z_2 = 2.9K\sqrt{L}Sl^2$ (cm^3)

where:

S = spacing of longitudinals (m).

l = distance between the web frames or between the transverse bulkhead and the web frame including the length of connection (m).

h = vertical distance from the side longitudinal concerned to a point $d+0.038L'$ above the top of keel (m).

L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.

C = coefficient given by the following formula:

$$C = \frac{K}{24-\alpha K}$$

α = either α_1 or α_2 according to value of y. However, value of α is not to be less than β.

$$\alpha_1 = 15.0 f_D\left(\frac{y-y_B}{Y'}\right) \quad \text{for} \quad y \geq y_B, \qquad \alpha_2 = 15.0 f_B\left(\frac{y_B-y}{Y_B}\right) \quad \text{for} \quad y < y_B$$

β = coefficient determined according to value of L as specified below:

$\beta = 6/a$ when L is 230 m and under

$\beta = 10.5/a$ when L is 400 m and above

For intermediate values of L, β is to be obtained by linear interpolation.

Y' = the greater of the value specified in **Pt 3, Ch 3, 203.,** (5) (a) or (b)

a = $\sqrt{K}$, when high tensile steels are used for not less than 80 % of side shell platings at the transverse section amidship and 1.0 for other parts.

2. Beyond the midship part, the section modulus of side longitudinals may be gradually reduced towards the ends of ships, and may be 0.85 times that obtained from the formula in **Par 1** at the ends. However, the section modulus of side longitudinals between 0.15L from the fore end and the collision bulkhead is not to be less than that obtained from the formula in **Par 1.**

3. The depth of flat bars used for longitudinals is not to exceed 15 times the thickness of flat bars.

4. Side longitudinals on sheer strakes in the midship part are to be, as far as possible, of slenderness ratio not greater than 60.

5. The section modulus of bilge longitudinals need not exceed that of bottom longitudinals.

402. Attachment

1. Side longitudinals are to be continuous at transverse bulkheads or to be attached thereto by brackets so as to provide adequate fixity and continuity of longitudinal strength.

2. Webs of longitudinals and web frames are to be attached to each other.

Section 5 Tween Deck Frames

501. General

The scantlings of tween deck frames are based on the standard structural arrangement which the maintenance of general transverse stiffness is kept by means of efficient tween deck bulkheads provided above the hold bulkheads or by web frames extended to the tops of superstructures at proper intervals. Tween deck frames are to be considered in relation to hold frames and care is to be given to the maintenance of continuity of strength in the framing from the bottom to the top of hull.

502. Scantlings of tween deck frames

The section modulus of tween deck frames is not to be less than that obtained from **Table 3.8.4.**

503. Special care to tween deck frames

1. Care is to be taken so that the strength and stiffness of framing at the ends of ship may be increased in proportion to the actual unsupported length of frame as well as the vertical height of tween decks.

2. In ships having specially large freeboard, the scantlings of tween deck frames may be properly reduced.

504. Superstructure frames

1. Superstructure frames are to be provided at every frame located below.

2. Superstructure frames for four frame spaces at the ends of bridges and of detached superstructures within $0.5L$ amidships are to be of the section modulus obtained from the formula in **Table 3.8.4** (2) using 0.74 as the coefficient C.

3. Web frames or partial bulkheads are to be provided above the bulkheads or at other positions such as may be considered necessary to give effective transverse rigidity to the superstructures.

Table 3.8.4 Section modulus

Locations	Section modulus (cm^3)
(1) Tween deck frames below the freeboard deck	$Z = 6KShl^2$
(2) Tween deck frames except those specified in (1)	$Z = CKSlL$
(3) Tween deck frames supporting deck transverse	$Z = 2.4K\left(0.143n\dfrac{h_1}{h} + 1.0\right)Shl^2$

S = frame spacing (m).
l = tween deck height (m).
h = vertical distance from the middle of l to the point $d + 0.038L'$ above top of keel (m). Where, however, h is less than $0.03L$(m), h is to be taken as $0.03L$(m).
L' = length of ship (m). Where, however, L exceeds 230 m , L' is to be taken as 230 m .
h', n = as specified in **Table 3.8.1.**
C = coefficient given in the following table.

Description of tween deck frames	C
Superstructure frames (excluding the (following two lines)	0.44
Superstructure frames for $0.125L$ from aft end	0.57
Superstructure frames for $0.125L$ from fore end and cant frames at stem	0.74

NOTES:
1. The scantlings of tween deck frames below the freeboard deck within $0.15L$ from the fore end and within $0.125L$ from the after end are to be appropriately increased above those given by line (1).
2. The section modulus of tween deck frames supporting web beams is not to be less than that obtained from the above line (1).

505. Frames of cruiser sterns

Cruiser sterns are to have frames of section modulus not less than 86 % of that required for frames under freeboard deck in aft peak in **Ch 13, 302.** ⚓

CHAPTER 9 WEB FRAMES AND SIDE STRINGERS

Section 1 General

101. Application

1. The requirements in **Sec 2** and **3** apply to the structures stiffened by side stringers supporting the transverse ordinary frames specified in **Ch 8, 303.** and web frames supporting side stringers.

2. The requirements in **Sec 4** apply to the structures stiffened by side transverse supporting the longitudinal frames specified in **Ch 7, 401.**

102. Arrangement

1. Web frames and side stringers are to be arranged to provide effective stiffness to the ship side structures.

2. Side stringers are to be in line with bulkhead stringers, if fitted, as far as possible.

103. Minimum strength

The strength of web frames and side stringers in way of deep tanks is not to be less than that required for vertical or horizontal girders on deep tank bulkheads.

104. Web frames and side stringers at a location where flare is specially large

The side stringers supporting transverse frames and web frames supporting these side stringers, which are fitted in the bow flare position considered to endure large wave impact pressure, are to be properly strengthened taking care of the effectiveness of their end connections.

105. Direct strength calculation

Where approved by the Society, the scantlings of structural members may be determined basing upon direct strength calculation as specified in **Ch 1, 206.**

Section 2 Web Frames

201. Scantlings

1. The scantlings of web frames supporting side stringers are not to be less than those obtained from the following formulae:

Depth : $d = 125\, l$ (mm)

Section modulus : $Z = C_1 KSh\, l^2$ (cm^3)

Thickness of web : t_1 or t_2, whichever is the greater.

$$t_1 = \frac{C_2 KShl}{d_0} + 1.5 \quad \text{(mm)}, \qquad t_1 = 0.086 \sqrt[3]{\frac{d_0^2 (t_1 - 1.5)}{kK}} + 1.5 \quad \text{(mm)}$$

where:

S = web frame spacing(m).

l = unsupported length of web frame (m)

h = vertical distance from the lower end of l to a point $d + 0.038L'$ above the top of keel (m).

L' = length of ship (m). Where, however, L exceeds 230 m, L is to be taken as 230 m.

d_0 = depth of web frame (mm). Where the webs are provided with vertical stiffeners, the divided web depth may be used for d_0 in the formula for t_2.

C_1, C_2 = coefficients given in **Table 3.9.1.**

k = coefficient given in **Table 3.9.2** according to the ratio of S_1 (mm) to d_0, where S_1 is the spacing of stiffeners or tripping brackets provided on web plates of web frames. For the intermediate values of S_1/d_0, k is to be obtained by linear interpolation.

Table 3.9.1 Coefficients C_1 and C_2

Location	C_1	C_2
For web frames abaft $0.15L$ from the fore end	3.0	23
For web frames between $0.15L$ from the fore end and the collision bulkhead	3.8	28

Table 3.9.2 Coefficient k

S_1/d_0	k
0.3 and under	60.0
0.4	40.0
0.5	26.8
0.6	20.0
0.7	16.4
0.8	14.4
0.9	13.0
1.0	12.3
1.5	11.1
2.0 and over	10.2

2. Where the web frames are in the close proximity to boilers, the thickness of webs and face bars is to be suitably increased.

202. Stiffeners of webs

1. Stiffeners or tripping brackets are to be provided on deep webs as may be required.

2. Tripping brackets are to be arranged at an interval of about 3 m. Where the breadth of face plates on either side of the web exceeds 180 mm, the tripping brackets are to be arranged to support the face bars.

203. Continuity of transverse strength

Tween deck web frames are to be provided below the bulkhead deck over the hold web frames as may be required, to provide continuity of transverse strength above the main web frames in holds and machinery space.

204. Beams at the top of web frames

Beams at the top of web frames are to be suitably increased in both strength and stiffness.

Section 3 Side Stringers

301. Scantlings

1. The scantlings of side stringers are not to be less than those obtained from the following formulae:

Depth : $d_0 = 125\,l$ (mm) added by one quarter of the depth (mm) of slot for ordinary frames.

Section modulus : $Z = C_1 KShl^2$ (cm^3)

Thickness of web : t_1 or t_2, whichever is the greater

$$t_1 = \frac{C_2 KShl}{d_0} + 1.5 \quad \text{(mm)}, \qquad t_2 = 0.086 \sqrt[3]{\frac{d_0^2(t_1 - 1.5)}{kK}} + 1.5 \quad \text{(mm)}$$

where:

S = distance between the mid-points of the spaces from the side stringer concerned to the adjacent side stringers or to the top of inner bottom plating at side or to the top of deck beams at side (m).

l = web frame spacing (m). Where, however, effective brackets are provided, the span l may be modified as specified in **Ch 1, 605.**

h = vertical distance from the middle of S to a point $d + 0.038L'$ above the top of keel (m). Where, however, h is less than $0.05L$(m), h is to be taken as $0.05L$ (m).

L' = as specified in **201. 1.**

d_0 = depth of side stringer (mm). Where, however, the depth of the web is divided by providing a stiffener in parallel to the face bar, the divided depth may be taken as d_0 in the calculation of t_2.

C_1, C_2 = coefficients given in **Table 3.9.3.**

k = coefficient given in **Table 3.9.2** according to the ratio of S_1(mm) to d_0, where S_1 is the spacing of stiffeners or tripping brackets provided on web plates of side stringers. For the intermediate values of S_1/d_0, k is to be obtained by linear interpolation.

Table 3.9.3 Coefficients C_1 and C_2

Location	C_1	C_2
For web frames abaft $0.15L$ from the fore end	5.1	42
For web frames between $0.15L$ from the fore end and the collision bulkhead	6.4	52

2. In boiler spaces, the thickness of web plates, face bars, etc. of stringer plates is to be suitably increased.

302. Stiffeners on webs

Stiffeners, the length of which is equal to the web depth, are to be provided on the webs of side stringers at alternate frames.

303. Tripping brackets

1. Tripping brackets are to be provided on side stringers at an interval of about 3 m.

2. Where the breadth of face bar on either side of the side stringer exceeds 180 mm, tripping brackets are to be arranged to support the face bars.

304. Connections

1. Connection of side stringers to web frames is to extend for the full depth of web frame.

2. Where stringers are of the same depth as web frames, the face bars of side stringers are to be connected with the face bars of web frames by efficient gussets.

3. Side stringers are to be effectively connected to the transverse bulkheads by brackets of proper size.

Section 4 Side Transverse

401. Arrangements

Side transverses supporting the side longitudinal frames are to be provided at places where solid floors are located.

402. Scantlings

The scantlings of side transverses are not to be less than that obtained from the following formulae:

Depth : $d_0 = 100l$ (mm)or 2.5 times the depth of slot for the longitudinals, whichever is the greater.

Section modulus : $Z = C_1 KShl^2$ (cm^3)

Thickness of web : t_1 or t_2, whichever is the greater.

$$t_1 = \frac{C_2 KShl}{d_0} + 1.5 \quad \text{(mm)}, \qquad t_2 = 0.086\,\frac{\sqrt[3]{d_0^2(t_1 - 1.5)}}{kK} + 1.5 \quad \text{(mm)}$$

where:

S = side transverses spacing (m).

l = unsupported length of side transverse (m).

d_0 = depth of side transverses (mm). In the calculation of t_1, however, the depth of slots for side longitudinals, if any, is to be deducted from the web depth. Where the depth of webs is divided by vertical stiffeners, the divided depth may be taken as d_0 in the calculation of t_2.

h = vertical distance from the lower end of l to a point $d + 0.038L'$ above the top of keel (m), where, however, the distance is less than 1.43 l (m), h is to be taken a 1.43 l (m).

L' = as specified in **201. 1.**

C_1, C_2 = coefficients given in **Table 3.9.4.**

k = coefficient given in **Table 3.9.2** according to the ratio of S_1(mm) to d_0, where S_1 is the spacing of stiffeners or tripping brackets provided on web plates (mm). For the intermediate values of S_1/d_0, k is to be obtained by linear interpolation.

Table 3.9.4 Coefficients C_1 and C_2

Location	For side transverses abaft $0.15L$ from the fore end	For side transverses between $0.15L$ from the fore end and the collision bulkhead
C_1	$6.6\left(1-0.4\frac{l}{h}\right)$	$8.6\left(1-0.4\frac{l}{h}\right)$
C_2	$35\left(1.43-0.43\frac{l}{h}\right)$	$45.5\left(1.43-0.43\frac{l}{h}\right)$

403. Tripping brackets

1. Side transverses are to be provided with tripping brackets at an interval of above 3 m.

2. Where the breadth of face plates of side transverses exceeds 180 mm on either side of the web, the tripping brackets are to support the face plates as well.

404. Attachments

1. A stiffener is to be provided on the web at every longitudinal except for the middle part of the span of where stiffeners may be provided at alternate longitudinals.

2. Webs of longitudinals and side transverses are to be connected each other.

Section 5 Cantilever Beams

501. Scantlings

Cantilever beams are to comply with the following requirements:

(1) The root depth of cantilever beams measured at the toes of end brackets at side is not to be less than one fifth of the horizontal distance from the inboard end of cantilever beam to the toe of end bracket at side.

(2) The depth of cantilever beams may be gradually tapered from the root towards the inboard end where it may be reduced to about a half of the root depth.

(3) The section modulus of cantilever beams at the toe of end brackets is not to be less than that obtained from the following formula: (see **Fig 3.9.1**)

$$Z=7.1KSl_0\left(\frac{1}{2}b_1h_1+b_2h_2\right) \quad (\text{cm}^3)$$

where:

S = cantilever beam spacing (m).

l_0 = horizontal distance from the inboard end of cantilever beams to the toe of end brackets (m).

b_1 = horizontal distance from the inboard end of cantilever beams to the inner edge of beam knees or end brackets of transverse beams at side (m). Where, however, the deck is framed longitudinally and no deck transverse is provided between the cantilever beams, b_1 is to be taken as l_0.

b_2 = one-half of the breadth of hatch opening in the deck supported by the cantilever beams (m).

h_1 = deck load stipulated in **Ch 10, Sec 2** for the deck transverses of the deck supported by the cantilever beams (kN/m^2).

h_2 = load on hatch covers of the deck supported by the cantilever beams which is not to be less than that obtained from the following (a) to (c), depending on the type of the deck (kN/m^2):

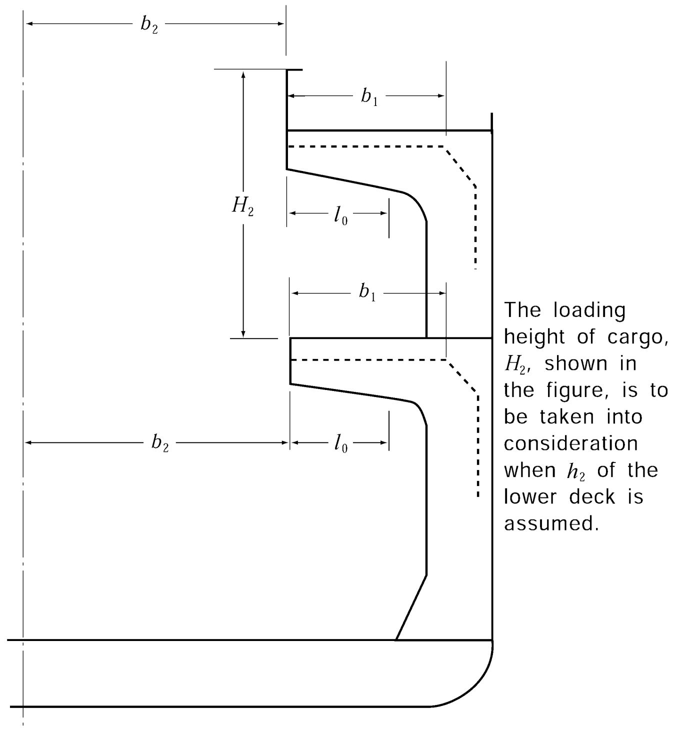

Fig 3.9.1 Measurement of l_0, b_1, b_2, etc

(a) For the weather deck, h_2 is the deck load stipulated in **Ch 10, 201. 2** for the deck transverses or the maximum design cargo weight on hatches per unit area (kN/m^2), whichever is the greater. In **Ch 10, 201. 2** (1), the value of y may be taken as the vertical distance from the load line to the upper edge of hatch coaming. In either case, h_2 is not to be less than 17.5 (kN/m^2) for hatches at Position I and 12.8 (kN/m^2) for those at Position II, specified in **Pt 4, Ch 2,** respectively.

(b) For decks other than the weather deck where ordinary cargoes or stores are intended to be carried, h_2 is the deck load stipulated in **Ch 10, 201.1.**

(c) For decks other than those specified in (a) or (b) above, h_2 is the value equal to h_1.

(4) The sectional area of face bars of cantilever beams may be gradually tapered from the inner edge of end brackets towards the inboard end of cantilever beams, where it may be reduced to 0.60 times that at the inner edge of end brackets.

(5) The web thickness of cantilever beams at any place of it is not to be less than that obtained from the following formula, whichever is the greater:

$$t_1 = 9.5\frac{S\left(\frac{1}{2}b_1h_1 + b_2h_2\right)\sqrt{K}}{d_c} + 1.5 \quad \text{(mm)}, \qquad t_2 = 0.058\sqrt[3]{\frac{d_c^2(t_1 - 1.5)}{K}} + 1.5 \quad \text{(mm)}$$

where:

S, b_1, b_2, h_1, h_2 = as stipulated in (3). Where, however, the deck is framed longitudinally and no deck transverse is provided between the cantilever beams, $b_1/2$ is to be substituted by the horizontal distance in *metres* from the inboard end of cantilever beams to the section under consideration in the formula for t_1.

d_c = depth of the cantilever beam at the section under consideration (mm). In the calculation of t_1, however, the depth of slots for deck longitudinals, if any, is to be deducted from the depth of cantilever beams. Where the webs are provided with horizontal stiffeners, the divided web depth may be used for d_c in the formula for t_2.

(6) Cantilever beams are to be provided with tripping brackets at an interval of about 3 m. Where the breadth of face bars of cantilever beams exceeds 180 mm on either side of the web, the tripping brackets are to support the face bars as well. And a stiffener is to be provided on the web at every deck longitudinal adjacent to the root of cantilever beams and at alternate longitudinals elsewhere.

(7) Web plates adjacent to the inner edge of end brackets are to be specially reinforced.

502. Web frames

Web frames supporting cantilever beams are to comply with the following requirements:

(1) The depth of web frames is not to be less than one eighth the length including the length of connection at both ends.

(2) The section modulus of web frames is not to be less than that obtained from the following formula. Where, however, a tween deck web frame in association with cantilever beam supporting the deck above is provided at the top of web frame, the value of the formula may be reduced to 60 %.

$$Z = 7.1KSl_1\left(\frac{1}{2}b_1h_1 + b_2h_2\right) \quad (\text{cm}^3)$$

where:

S = web frames spacing (m).

l_1 = horizontal distance from the end of supported cantilever beams to the inside of web frames (m).

b_1, b_2, h_1, h_2 = as stipulated in **501.** (3) for the supported cantilever beams, where, however, the deck is framed longitudinally and no deck transverse is provided between the cantilever beams, l_1 is to be substituted for b_1.

(3) The section modulus of tween deck web frames is to be in accordance with the requirements in (2), and additionally, it is not to be less than that obtained from the following formula:

$$Z = 7.1KSl_1\left(\frac{1}{2}b_1h_1 + b_2h_2\right) \quad (\text{cm}^3)$$

where:

S, l_1, b_1, b_2, h_1, h_2 = as stipulated in (2).

C_1 = coefficient obtained from the following formula:

$$C_1 = 0.5\left(\frac{\frac{1}{2}b'_1h'_1 + b'_2h'_2}{\frac{1}{2}b_1h_1 + b_2h_2}\right) + 0.15$$

b'_1, b'_2, h'_1, h'_2 = b_1, b_2, h_1, and h_2 respectively stipulated in (2) in respect of cantilever beams to be provided below the web frames concerned.

(4) The web thickness is not to be less than that obtained from the following formula, whichever is the greater:

$$t_1 = 9.5K\frac{C_2 S\left(\frac{1}{2}b_1 h_1 + b_2 h_2\right)}{d_w} \times \frac{l_1}{l} + 1.5 \quad \text{(mm)}, \qquad t_2 = 0.058\sqrt[3]{\frac{d_w^2(t_1 - 1.5)}{K}} + 1.5 \quad \text{(mm)}$$

where:

S, b_1, b_2, h_1, h_2 l_1 = as stipulated in (2).

d_w = the smallest depth of web frame (mm). In the calculation of t_1, however, the depth of slots for side longitudinals, if any, is to be deducted from the web depth. Where the depth of webs is divided by vertical stiffeners, in the calculation of t_2, the divided depth may be used for d_w.

l = length of web frame including the length of connections at both ends (m).

C_2 = coefficient given in **Table 3.9.5,** where, however, C_1, as specified in (3).

Table 3.9.5 Coefficient C_2

Location		C_2
For hold web frames	Where web frame in association with cantilever beam supporting the deck above is provided at the top of them	0.9
	Elsewhere	1.5
For tween deck web frames		$C_1 + 0.6$

(5) Where web frames supporting cantilever beams also support side longitudinals or side stringers, the scantlings are to comply with the following requirements in addition to those in **Ch 2, Ch 3** and **Ch 4.**

(a) The section modulus is not to be less than that obtained from the formula in (2), multiplied by the following coefficient:

Where tween deck web frame together with cantilever beam is provided above:

$$\alpha = 9.81\left\{\frac{0.05hl^2 + 0.09h_u l_u^2}{1.4\left(\frac{1}{2}b_1 h_1 + b_2 h_2\right)l_1}\right\} + 0.6$$

Elsewhere: $\alpha = 1.0$

where:

l = length of hold web frame including the length of connections at both ends (m).

l_u = length of tween deck web frame provided directly above, including the length of connections at both ends (m).

h = vertical distance from the middle of l to a point $d + 0.038L'$ above the top of keel (m).

h_u = vertical distance from the middle of l_u to a point to which h is to be measured (m). Where, however, the point is below the middle of l_u, h_u is to be taken as zero.

L' = as specified in **201. 1.**

b_1, b_2, h_1, h_2 l_1 = as given by (2).

(b) The web thickness is not to be less than that given by (4), in which the value of t_1 is to be increased by the amount obtained from the following formula:

$$\beta = 25.5 \frac{Shl}{d_w} \quad \text{(mm)}$$

where:

S = web frame spacing (m).

h , l = as stipulated in (a) above.

d_w = as stipulated in (4).

(6) Web frames are to be provided with tripping brackets at an interval of about 3 m. Where the breadth of face bars of web frames exceeds 180 mm on either side of the web, the tripping brackets are to support the face bars as well. And a stiffener is to be provided on the webs at every side longitudinal except for the middle part of the span of web frames where stiffeners may be provided at alternate longitudinals. Webs of longitudinals and web frames are to be connected each other.

(7) Web frames are to be effectively connected with those located beneath or solid floors so as to maintain strength continuity.

503. Connections

Cantilever beams and their supporting web frames are to be effectively connected by brackets to meet the following requirements:

(1) The radius of curvature of the free edges of brackets is not to be less than the depth of cantilever beams at the toe of brackets.

(2) The thickness of brackets is not to be less than that of webs of cantilever beams or web frames, whichever is the greater.

(3) The brackets are to be sufficiently strengthened by stiffeners.

(4) The free edges of brackets are to have face bars of sectional area not less than that of cantilever beams or web frames, whichever is the greater, and the face bars are to be connected with those of cantilever beams and web frames. ⚓

CHAPTER 10 BEAMS

Section 1 General

101. Standard camber

The standard camber of weather decks is $0.02B$ at midship.

102. Connections of ends of beams.

1. Longitudinal beams are to be continuous or to be connected with brackets at their ends in such a manner as to effectively develop the sectional area and to have sufficient strength to bending and tension.
2. Transverse beams are to be connected to frames by brackets.
3. Transverse beams provided at positions where frames are omitted in tween decks or superstructures, are to be connected to the side plating by brackets.
4. Transverse beams on boat decks, promenade decks, etc. may be connected by clips at their ends.

103. Beams on bulkhead recesses and others

The section modulus of beams at deck forming the top of bulkhead recesses, tunnels and tunnel recesses is not to be less than that obtained from the formula in **Ch 14, 309.,** using h measured from the top of beams to the top of bulkhead deck at the centre line of ship. Where, however, h is less than 6.0 m, h is to be taken as 0.8 times the actual height plus 1.2 m.

104. Beams on the top of deep tanks

The section modulus of beams at deck forming the top of deep tanks is to be in accordance with this Chapter, and not to be less than that obtained from the formula in **Ch 15, 203.,** taking the top of deck beams as the lower end of h and beams as stiffeners.

105. Special heavy loads

The deck beams supporting special heavy loads or arranged at the ends of superstructures or deckhouses, in way of masts, winches, windlasses and auxiliary machineries, etc. are to be properly reinforced by increasing the scantlings of beams, or by the additional deck girders or pillars.

106. Long machinery opening

For unusually long machinery opening, suitable strengthening is to be made by means of adequate cross ties provided at each level of deck or equivalent arrangement.

107. Loaded by wheeled vehicles

The section modulus of beams on deck loaded by wheeled vehicles is to be determined by considering the concentrated loads from the wheeled vehicles.

108. Continuity of strength

In parts where longitudinal systems are transformed to transverse systems, special care is to be taken to keep the continuity of strength.

109. Beams on deck carrying unusual cargoes

The section modulus of beams on deck subjected to cargo loads which can not be treated as evenly distributed loads is to be determined taking account of load distribution for particular cargoes.

Section 2 Deck Load

201. Value of h

1. Deck load h (kN/m^2) for decks intended to carry cargoes or stores, etc. on them is to be as specified in the following (1) to (3):

(1) h is to be equivalent to the standards given by 7 times the tween deck height at side of the space (m), or 7 times the height from the deck concerned to the upper edge of hatch coaming of the above deck (m). However, h may be specified as the maximum design cargo weight per unit area of deck (kN/m^2). In this case, the value of h is to be determined by considering the loading height of cargo.

(2) Where timber and other cargoes are intended to be carried on the weather deck, h is cargo weight per unit area of the deck (kN/m^2) or the value stipulated in **Par 2,** whichever is the greater.

(3) Where cargoes are suspended from the deck beams, or deck machinery is installed, h is to be suitably increased.

2. Deck load h (kN/m^2) for the weather deck is to be as specified in the following (1) to (4):

(1) h for the freeboard deck and the superstructure deck and the top of deckhouses on the freeboard deck is not to be less than that obtained from the following formula:

$$h = a(bf - y) \quad (\text{kN/m}^2)$$

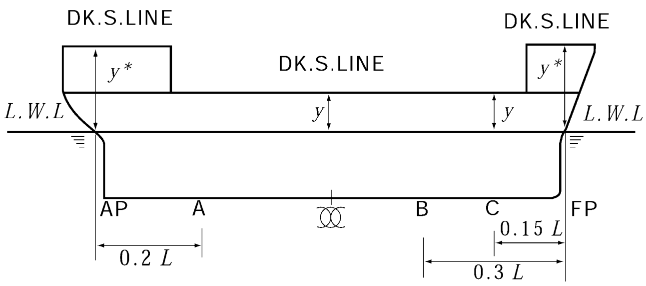
where:

a, b = as given by **Table 3.10.1** according to the position of decks.

C_{b1} = block coefficient, however, where C_b is less than 0.6, C_{b1} is to be taken as 0.6, and where C_b is 0.8 and over, C_{b1} is to be taken as 0.8.

f = as given in **Table 3.10.2.** (see **Fig 3.16. 1**):

y = vertical distance from the load line to weather deck at side (m), and y is to be measured at fore end for deck forward of 0.15L abaft the fore end; at 0.15L abaft the fore end for deck between 0.3L and 0.15L abaft the fore end; at midship for deck between 0.3L abaft the fore end and 0.2L afore the aft end; and at aft end for deck aftward of 0.2L afore the aft end (see **Fig 3.10.1**):



Abaft A — y is to be measured at AP.
Between A and B — y is to be measured at ⊗ .
Between B and C — y is to be measured at C.
Afore C — y is to be measured at FP.
y^* : In case of no superstructure, y is the distance to the upper deck.

Fig 3.10.1 Position of measuring y

Table 3.10.1 Values of a and b

Line	Position of deck	a			
		Beams[(1)], Deck plating	Pillars	Deck girders	b
I	Forward of 0.15L abaft the fore end	14.7	4.90	7.35	$1+\dfrac{0.338}{(C_{b1}+0.2)^2}$
II	Forward of 0.15L and 0.3L abaft the fore end	11.8	3.90	5.90	$1+\dfrac{0.158}{(C_{b1}+0.2)^2}$
III	Between 0.3L abaft the fore end and 0.2L afore the aft end	6.90	2.25	2.25[(2)] 3.45[(3)]	1.0
IV	Afterward of 0.2L afore the aft end	9.80	3.25	4.90	$1+\dfrac{0.123}{(C_{b1}+0.2)^2}$

NOTE:
(1) Where L is 150 m or less, value a may be multiplied by the value of following formula:
$C=0.0055L+0.175$
(2) In case of longitudinal deck girders outside the line of hatchway opening of the strength deck for mid-ship part.
(3) In case of deck girders other than (2).

Table 3.10.2 Coefficient f

Length of ship	f
$L<150$ m	$\dfrac{L}{10}e^{-\frac{L}{300}}+\left(\dfrac{L}{150}\right)^2-1.0$
150 m $\leq L<$300 m	$\dfrac{L}{10}e^{-\frac{L}{300}}$
300 m $\leq L$	11.03

Table 3.10.3 Minimum Values of h

Line	Position of deck	h[(1)]	C	
			Beams[(2)], Deck plating	Pillars, Deck girders
I and II	Forward of 0.3L abaft the fore end	$C\sqrt{L'+50}$	4.20	1.37
III	Between 0.3L abaft the fore end and 0.2L afore the aft end		2.05	1.18
IV	Afterward of 0.2L afore the aft end	$C\sqrt{L}$	2.95	1.47
Second tier superstructure deck above the freeboard deck			1.95	0.69

NOTES:
(1) L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.
(2) Where L is 150 m or less, value C may be multiplied by the value of following formula:.

$0.0055L+0.175$

(2) h for deck in Line II in **Table 3.10.1,** need not exceed that in Line I.
(3) h is not to be less than that obtained from the formulae in **Table 3.10.3,** irrespective of the provisions in (1) and (2).
(4) Value of h is to be in accordance with the discretion of the Society, where the ship has an unusual large freeboard.

3. For an enclosed part of superstructure decks and of top of deckhouses in accommodation or navigation spaces, at the first and second tier above the freeboard deck, h is to be **12.8.**

Section 3 Longitudinal Beams

301. Spacing

1. The standard spacing of the longitudinal beams is obtained from the following formula:

$$S = 2L + 550 \quad \text{(mm)}$$

2. It is recommended that the spacing of the longitudinal beams should not exceed 1 m.

302. Proportion

1. Longitudinal beams are to be supported by deck transverses of appropriate spacing. In midship part of the strength deck, the slenderness ratio of deck longitudinals is not to exceed 60. This requirement may, however, be suitably modified where longitudinal beams are given a sufficient strength to prevent buckling.

2. Flat bars used for longitudinals are not to be of depth-thickness ratio exceeding 15.

303. Section modulus

1. The section modulus of longitudinal beams outside the line of openings of the strength deck for the midship part is not to be less than that obtained from the following formula:

$$Z = 1.14KShl^2 \quad (\text{cm}^3)$$

where:

S = spacing of longitudinal beams (m).

h = deck load specified in **Sec 2** (kN/m^2).

l = horizontal distance between bulkhead and deck transverse or between deck transverses (m).

2. The section modulus of longitudinal beams outside the line of openings of strength deck at $0.1L$ from fore end and aft end is not to be less than that obtained from the following formula:

$$Z = 0.43KShl^2 \quad (\text{cm}^3)$$

where:

S, h, and l = as specified in **Par 1.**

3. The section modulus of longitudinal beams outside the line of openings of strength deck for the parts forward and aftward the midship part may be gradually reduced from the value given in **Par 1,** and may be taken as **Par 2** at $0.1L$ from fore end and aft end.

304. Deck transverses

In single deck ships, the deck transverses are to be provided in line with the solid floors in double bottom, and in two deck ships, the transverses are also to be provided in line with the solid floors in double bottoms as far as practicable.

Section 4 Transverse Beams

401. Arrangements

Transverse beams are to be provided on every frame.

402. Proportion

It is preferable that the length-depth ratio of transverse beams be 30 or less at the strength deck, and 40 or less at effective decks (the decks below the strength deck which are considered as strength members in the longitudinal strength of hull) and superstructure decks as far as practicable.

403. Section modulus

The section modulus of transverse beams is not to be less than that obtained from the following formula:

$$Z = 0.43 K S h l^2 \quad (\text{cm}^3)$$

where:

S = spacing of transverse beams (m).

h = deck load specified in **Sec 2** (kN/m^2).

l = horizontal distance from the inner edge of beam brackets to the longitudinal deck girder, or between the longitudinal deck girders (m). ⚓

CHAPTER 11 DECK GIRDERS

Section 1 General

101. Application

Transverse deck girders supporting longitudinal deck beams and longitudinal deck girders supporting transverse deck beams are to be in accordance with the requirements in this Chapter.

102. Arrangement

In way of the bulkhead recesses and the top of tanks, deck girders are to be arranged at an interval not exceeding 4.6 m as far as practicable.

103. Construction

1. Deck girders are to be composed of face plates provided along the lower edge.

2. Tripping brackets are to be provided at an interval of about 3 m and where the breadth of face plates exceeds 180 mm on either side of the girder, these brackets are to be so arranged as to support the face plates as well.

3. The thickness of face plates forming girders is not to be less than that of web plates and the width of the face plates is not to be less than that obtained from the following formula:

$$b = 2.7\sqrt{d_0 l} \quad \text{(mm)}$$

where:

d_0 = depth of webs (mm).

l = span of girders specified in **201.** (m).

4. The depth of girders is more than 2.5 times that of slots for beams, and is to be kept constant between two adjacent bulkheads for the longitudinal girders.

5. The girders are to have a sufficient rigidity to prevent excessive deflection of decks and excessive additional stresses in deck beams.

104. End connection

1. End connections of deck girders are to be in accordance with the requirements in **Ch 1, 604.**

2. Bulkhead stiffeners or girders at the ends of deck girders are to be suitably strengthened to support deck girders.

3. Longitudinal deck girders are to be continuous or to be effectively connected so as to maintain the continuity at ends.

Section 2 Longitudinal Deck Girders

201. Section modulus

1. The section modulus of longitudinal deck girders outside the lines of hatchway opening of the strength deck for midship part is not to be less than that obtained from the following formula:

$$Z = 1.29Kl(bhl + kW) \quad (\text{cm}^3)$$

where:

l = distance between supporting points (m). Where the deck girder is effectively bracketed to bulkhead, l may be modified as specified in **Ch 1, 605.** (See **Fig 3.11.1**)

b = distance between the centres of two adjacent spans of beams supported by the girders or the frames (m). (See **Fig 3.11.1**)

h = deck load specified in **Ch 10, Sec 2** for the deck supported (kN/m^2).

W = deck load supported by the tween deck pillar as specified in **Ch 12, 201.** (kN).

k = as specified in the following (a) and (b):

(a) Coefficient obtained from the following formula according to the ratio of the horizontal distance from the pillar or bulkhead supporting the deck girder to the tween deck pillar a (m) and l. (See **Fig 3.11.1**)

$$12\frac{a}{l}\left(1-\frac{a}{l}\right)^2$$

(b) Where there is only one tween deck pillar, k is to be obtained basing upon the smaller value of a. Where there are two or more tween deck pillars, a is to be measured from the same end of l for each tween deck pillar, and the sum of kW is to be used for the computation of the formula. In this case, the greater value between the sums of kW obtained basing upon a measured from each end of l is to be used.

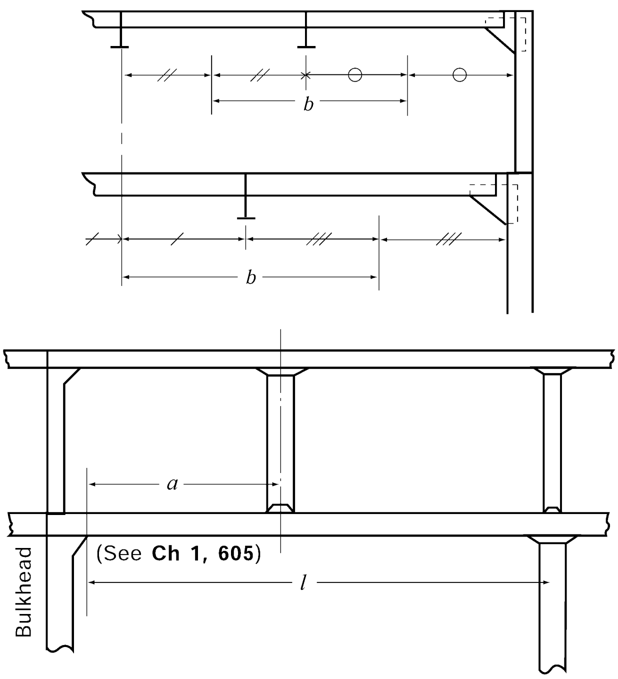


Fig 3.11.1 Measurement of *b*, *l* and *a*

2. The section modulus of longitudinal deck girders outside the lines of hatchway opening of the strength deck for the parts forward and afterward the midship part may be gradually reduced. In no case, however, is the section modulus to be less than that obtained from the following formula:

$$Z = 0.484Kl(bhl + kW) \quad (\text{cm}^3)$$

where:

l, b, h, W, k = as specified in **Par 1.**

3. The section modulus of longitudinal deck girders for the parts other than that stipulated in **Par 1** and **2** is not to be less than obtained from the formula in **Par 2.**

4. Where a deck carrying cargoes which loads can not be treated as evenly distributed loads, deck load supported by a pillar is to be determined taking account of load distribution for particular cargoes. Where cargo loads can be treated as concentrated loads acting on specific points, the provisions of **1.** to **3.** above may be applied so that such concentrated loads are treated as deck loads supported by the upper tween deck pillar(W).

202. Moment of inertia

It is advised that the moment of inertia of girders is not to be less than that obtained from the following formula:

$$I = CZl \quad (\text{cm}^4)$$

where:

C = coefficient obtained from the following formulae:

For deck girders arranged outside the line of deck openings of strength deck of midship part of ship -- 1.6

For other deck girders --------------------------- 4.2

Z = required section modulus of girders specified in **201.** (cm^3).

l = as specified in **201. 1.**

203. Thickness of web plates

1. The thickness of web plates of longitudinal deck girders outside the line of openings of strength deck amidship is not to be less than that obtained from the following formula. This thickness, however, is not to be less than that obtained from the formula in **Par 2.:**

$$t = 10 S_1 \sqrt{f_D} + 1.5 \quad (\text{mm})$$

where:

S_1 = spacing of web stiffeners or depth of girders, whichever is the smaller (m).

2. The thickness of web plates of longitudinal deck girders other than those in parts specified in **Par 1** is not to be less than that obtained from the following formula:

$$t = 10 \frac{S_1}{\sqrt{K}} + 1.5 \quad (\text{mm})$$

where:

S_1 = as specified in **Par 1.**

3. The thickness of web plates at both end parts of $0.2\,l$ is not to be less than that specified in **Par 1, 2** or that obtained from the following formula in (1) and (2) according to kinds of steel, whichever is the greatest:

(1) For mild steel

$$t = \frac{4.43 K b h l}{d_0} + 1.5 \quad (\text{mm})$$

where:

d_0 = depth of webs (mm).

b, h and l = as specified in **201. 1.**

(2) For high tensile strength steel, this thickness, however, is not to be less than that obtained from (1).

$$t = 8.13\sqrt[3]{\frac{bhlS_1^2}{d_0}} + 1.5 \quad \text{(mm)}$$

where:

S_1 = as specified in **Par 1.**

d_0, b, h and l = as specified in (1).

Section 3 Transverse Deck Girders

301. Section modulus

1. The section modulus of transverse deck girders is not to be less than that obtained from the following formula:

$$Z = 0.484Kl(bhl + kW) \quad \text{(cm}^3\text{)}$$

where:

l = distance between the centres of pillars or from the centre of pillar to the inner edge of beam bracket (m).

b = distance between the centres of two adjacent girders or bulkhead (m).

h, W, k = in accordance with **201.**

2. Where a deck carrying cargoes which loads can not be treated as evenly distributed loads, deck load supported by a pillar is to be determined taking account of load distribution for particular cargoes. Where cargo loads can be treated as concentrated loads acting on specific points, the provisions of **1.** above may be applied so that such concentrated loads are treated as deck loads supported by the upper tween deck pillar(W).

302. Moment of inertia

It is advised that the moment of inertia of girders is not to be less than that obtained from the following formula:

$$I = 4.2Zl \quad \text{(cm}^4\text{)}$$

where:

Z = required section modulus of girders specified in **301.** (cm^3).

l = as specified in **301.**

303 Thickness of web plates

The thickness of web plates is to be in accordance with the requirements in **203.**

Section 4 Deck Girders in Tanks

401. Section modulus

The section modulus of deck girders in tanks is to be in accordance with the requirements in **201.** or **301.,** and is to be in compliance with the requirements in **Ch 15, 204. 1** as well.

402. Moment of inertia

The moment of inertia of girders is to be in accordance with the requirement in **Ch 15, 204. 2.**

403. Thickness of web plates

The thickness of web plates is to be in accordance with the requirements in **203.** or **303.** and is to be in compliance with the requirements in **Ch 15, 204. 3** as well.

Section 5 Hatch Side Girders

501. Deep coamings on decks

Where deep coamings are provided on decks as in the case of hatchway on weather deck, the horizontal coaming stiffener and the coaming up to its stiffener may be included in the calculation of the section modulus, subject to the approval by the Society.

502. Strength continuity

At hatchway corners, the face plates of hatch coamings and longitudinal deck girders or their extension parts and the face plates on both sides of hatch end girders are to be effectively connected so as to maintain the strength continuity.

Section 6 Hatch End Girders

601. Scantling

The scantlings of hatch end girders are to be in accordance with the requirements in **Sec 2** to **5.**
⚓

CHAPTER 12 PILLARS

Section 1 General

101. Pillars in tween decks

Pillars in tween decks are to be arranged directly above those under the deck, or effective means are to be provided for transmitting their loads to the supports below.

102. Pillars in holds

Pillars in holds are to be provided in line with the keelsons or double bottom girders or as close thereto as practicable, and the structure under pillars is to be of ample strength to provide effective distribution of the load.

103. End connection of pillars

The head and heel of pillars are to be secured by thick doubling plates and brackets as necessary. Where the pillars which may be subjected to tensile loads such as under bulkhead recesses, tunnel tops or deep tank tops, the head and heel of pillars are to be efficiently secured to withstand the tensile loads.

104. Reinforcements

Where the pillars are connected to the deck plating, the top of shaft tunnels, or the frames, these structures are to be efficiently strengthened.

Section 2 Scantling of Pillars

201. Sectional area

1. The sectional area of pillars is not to be less than that obtained from the following formula:

$$A = \frac{0.223\,W}{2.72 - \dfrac{l}{k_0\sqrt{K}}} \quad (\mathrm{cm}^2)$$

where:

l = distance from the top of inner bottom, deck or other structures on which the pillars are based to the underside of beam or girder supported by the pillars (m). (See **Fig 3.12.1**)

k_0 = minimum radius of gyration of the section of pillars (m).

W = deck load (kN) supported by the pillar obtained from the following formula:

$$W = k w_0 + S b h \quad (\mathrm{kN})$$

S = distance between the mid-points of two adjacent spans of girders supported by the pillars or the bulkhead stiffeners or bulkhead girders (m). (See **Fig 3.12.1**)

b = mean distance between the mid-points of two adjacent spans of beams supported by the pillars or the frames (m). (See **Fig 3.12.1**)

h = deck load specified in **Ch 10, Sec 2** for the deck supported ($\mathrm{kN/m}^2$).

w_0 = deck load supported by the upper tween deck pillar (t).

k = as obtained from the following formula according to the ratio of the horizontal distance a_i(m) from the pillar to the tween deck pillar above to the distance l_j(m) from the pillar to the pillar or bulkhead. (See **Fig 3.12.1**)

$$k = 2\left(\frac{a_i}{l_j}\right)^3 - 3\left(\frac{a_i}{l_j}\right)^2 + 1$$

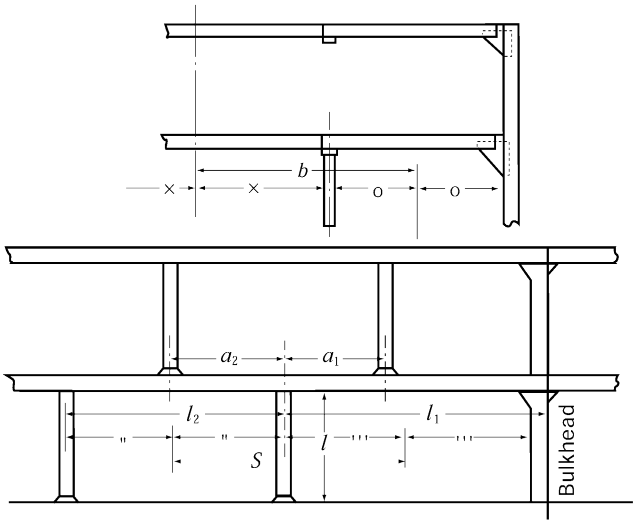

Fig 3.12.1 Measurement of *S*, *b*, *l*, etc.

2. Where there are two and over tween deck pillars provided on the deck girder supported by a line of lower pillars, the lower pillar is to be of the scantlings required by **Par 1,** taking kw_0 for each tween deck pillar provided on two adjacent spans supported by the lower pillars.

3. Where tween deck pillars are shifted from the lower pillars in athwartship direction, the scantlings of lower pillars are to be determined in accordance with the principle in **Par 1** and **2.**

4. Where a deck carrying cargoes which loads can not be treated as evenly distributed loads, deck load supported by pillar is to be determined taking account of load distribution for particular cargoes. Where cargo loads can be treated as concentrated loads acting on specific points, the provisions of **1.** and **2.** above may be applied so that such concentrated loads are treated as deck loads supported by the upper tween deck pillar(w_o).

202. Thickness

1. The plate thickness of tubular pillars is not to be less than that obtained from the following formula. This requirement may, however, be suitably modified for the pillars provided in accommodation spaces.

$$t = 0.022d_p + 3.6 \quad \text{(mm)}$$

where:

d_p = outside diameter of the tubular pillar (mm).

2. The thickness of web and flange plates of built-up pillars is to be sufficient for the prevention of local buckling.

203. Outside diameter of round pillars

The outside diameter of solid round pillars and tubular pillars is not to be less than 50 mm.

204. Pillars provided in deep tank

1. Pillars provided in deep tank are not to be tubular pillars.

2. The sectional area of pillars is not to be less than that specified in **201.** or that obtained from the following formula, whichever is the greater.

$$A = 1.09\,Sbh \quad (\text{cm}^2)$$

where:

S and b = as specified in **201.**

h = 0.7 times the vertical distance from the top of deep tank to the point of 2 m above the top of overflow pipe (m).

205. Longitudinal bulkheads and others provided in lieu of pillars

The transverse bulkheads supporting longitudinal deck girders and the longitudinal bulkheads provided in lieu of pillars are to be stiffened in such a manner as to provide supports not less effective than required for pillars.

206. Casings provided in lieu of pillars

The casings provided in lieu of pillars are to be of sufficient scantlings to withstand the deck load and side pressure. ⚓

CHAPTER 13 ARRANGEMENTS TO RESIST PANTING

Section 1 General

101. Application

In way of the spaces from the fore end of ship to a proper place beyond the collision bulkhead and from the aft end of ship to a proper place beyond the aft peak bulkhead, suitable arrangements to resist panting are to be provided according to the ship form at the place.

102. Swash plate

In fore and aft peak tanks to be used as deep tanks, effective swash plates are to be provided at the centre line of ship or the scantlings of structural members are to be suitably increased.

103. Stringers fitted up with extremely small angle

Where the angle between the web of stringers and the shell plating is extremely small, the scantlings of stringers are to be suitably increased above the normal requirements and, where necessary, appropriate supports are to be provided to prevent tripping.

Section 2 Arrangements to Resist Panting forward the Collision Bulkhead

201. Arrangement and construction

1. Deep centre girders, etc. are to be provided forward the collision bulkhead.

2. In fore peaks of transverse framing, floors of sufficient height are to be arranged at the frame spacing stipulated in **Ch 8, 201. 2** and side girders are to be arranged at an interval not exceeding about 2.5 m. Transverse frames are to be supported by the structures specified in **203. 2** at an interval not exceeding 2.5 m.

3. In fore peaks of longitudinal framing, bottom transverses supporting bottom longitudinals and side transverses supporting side longitudinals are to be arranged at an interval not exceeding about 2.5 m. Bottom transverses and side transverses are to be effectively connected each other and deck transverses are to be arranged on the deck in the same section to providing structures.

202. Floors and centre girders

1. The thicknesses of floors and centre girders in fore peaks are not to be less than those obtained from the following formula:

$$t = 0.6\sqrt{L} + 3 \quad \text{(mm)}$$

2. Floors are to extend to such a height as being necessary to give adequate stiffness to the structure and are to be properly stiffened with stiffeners as may be required.

3. The upper edges of the floors and centre girders are to be properly stiffened.

4. The thickness of side girders is to be approximately equal to that of centre girders and side girders are to extend to such a proper height as may be required according to the height of floors.

203. Transverse framing

1. Transverse frames below the freeboard deck.

The section modulus of transverse frames below the freeboard deck is not to be less than that obtained from the following formula.

$Z = 8Shl^2$ (cm^2)

where:

S = frame spacing (m).

l = distance between the supports of transverses (m), but to be taken as 2.15 m where the height is less than 2.15 m.

h = vertical distance from the midpoint of l to a point of 0.12L above the top of keel (m), but to be taken as 0.06L where the height is less than 0.06L.

2. Side construction to resist panting

(1) Where panting beams are provided at alternate frames together with stringer plates connected to the shell plating:

(a) Panting beams are to be angles or channel sections of sectional area not less than that obtained from the following formula, being connected effectively with frames by means of brackets having the thickness not less than that of the frames. And further, the panting beams are to be sufficiently connected vertically and longitudinally at the centre line of ship by means of angles as may be required in consideration of the span.

$A = 0.3L$ (cm^2)

(b) The scantlings of stringer plates are not to be less than those obtained from the following formula, and their inner edges are to be suitably stiffened by flanging or by angle sections.

Breadth: $b = 2.5L + 500$ (mm)

Thickness: $t = 0.02L + 5.5$ (mm)

(c) The frames to which no panting beam is provided are to be connected to the stringer plates by brackets. The length of each arm of brackets is to be at least equal to one half of the breadth of stringer plates required in (b) and the thickness of brackets at least equal to that of the stringer plates. In this case, the stringer plates are to be stiffened by providing flat bars extending from the toe of brackets to the inner edge of stringer plates.

(d) Stringer plates are to be connected by effective brackets to the breast hooks and the horizontal girders of transverse bulkhead.

(2) Where panting beams are provided at every frame together with perforated steel plates completely fitted up thereon from side to side:

(a) The sectional area of panting beams is not to be less than that obtained from the following formula:

$A = 0.1L + 5$ (cm^2)

(b) The thickness of perforated steel plates completely plated on the panting beams is not to be less than that obtained from the following formula:

$t = 0.02L + 4.5$ (mm)

(3) Where transverse frames are supported by side stringers:

(a) The scantlings of side stringers are not to be less than those obtained from the following formula:

Web depth: $d_1 = 200l$ (mm), $2.5L + 500$ (mm) or 2.5 times the depth of slot for the transverse frames, whichever is the greatest.

Section modulus : $Z = 8Shl^2$ (cm^3)

Web thickness : t_1 or t_2, whichever is the greater.

$$t_1 = 42\frac{Shl}{d_0} + 1.5 \quad \text{(mm)}, \qquad t_2 = 0.11\sqrt[3]{\frac{d_0^2(t_1 - 1.5)}{k}} + 1.5 \quad \text{(mm)}$$

where:

S = spacing of side stringers (m).

l = horizontal distance between the supporting points of side stringers (m).

h = vertical distance from the middle of S to a point $0.12L$ above the top of keel (m). Where, however, h is less than $0.06L$(m), h is to be taken as $0.06L$(m).

d_0 = depth of side stringers (mm). ln the calculation of t_1, however, the depth of slot for longitudinals, if any, is to be deducted from the depth of side stringers. Where the depth of side stringers is divided by horizontal stiff-eners, the divided depth may be taken as d_0 in the calculation of t_2.

k = coefficient given in **Table 3.13.1** according to the ratio of S_1 to d_0, where S_1 (mm) is the spacing of stiffeners or tripping brackets provided on web plates of side stringers. For the intermediate values of S_1/d_0, k is to be obtained by linear interpolation.

Table 3.13.1 Coefficient k

S_1/d_0	k
0.3 and under	60.0
0.4	40.0
0.5	26.8
0.6	20.0
0.7	16.4
0.8	14.4
0.9	13.0
1.0	12.3
1.5	11.1
2.0 and over	10.2

(b) Side stringers are to be provided with tripping brackets at an interval of about 3 m. Where the breadth of face bars of side stringers exceeds 180 mm on either side of the web the tripping brackets are to support the face bars as well. And stiffeners are to be provided on the webs at every longitudinal except for the middle part of the span of side stringers where they may be provided at alternate transverse frames.

(c) Where the side stringers are supported by cross ties, the scantlings of cross ties are not to be less than those obtained from the formula given in **Table 3.13.2.**

Table 3.13.2 Scantlings of cross ties

$\frac{l}{k_0}$	Sectional area (cm^2)	Web thickness (mm)
$\frac{l}{k_0} \geq 0.6$	$A = \dfrac{0.77Sbh}{1-0.5\frac{l}{k_0}}$	$t_w = 0.016\, d_w \sqrt{\dfrac{Sbh}{A}}$
$\frac{l}{k_0} < 0.6$	$A = 1.1\, Sbh$	

S = spacing of side stringers (m).
b = breadth of area supported by the cross tie (m)
h = vertical distance from the middle of b to a point $0.12L$ above the top of keel (m). Where, however, h is less than $0.06L$(m), h is to be taken as $0.06L$(m).
l = length of cross tie (m).
k_0 = minimum radius of gyration of cross tie, obtained from the following formula (cm).

$$k_0 = \sqrt{\frac{I}{A}}$$

I = the least moment of inertia of cross tie (cm^4)
A = sectional area of cross tie (cm^2).
d_w = web depth of cross tie (mm). Where, however, stiffeners are fitted up horizontally, the largest divided web depth may be taken as d_w.

(d) Cross ties are to be effectively connected with the side stringers by brackets or by other suitable arrangements and the side stringers are to be provided with tripping brackets in way of the cross ties.
(e) Where the breadth of face bars of cross ties on either side of the web exceeds 150 mm, stiffeners are to be provided on the webs at a suitable interval, to be connected with the face bars and to support the face bars.

204. Longitudinal framing

1. Longitudinal frames below the freeboard deck are to comply with the following requirements:

(1) The section modulus is not to be less than that obtained from the following formula. However, the section modulus obtained from the formula is to be increased by 25 % between $0.15D$ and $0.15D$ from the top of keel and 50 % below $0.05D$ from the top of keel.

$$Z = 8Shl^2 \quad (cm^3)$$

where:

S = longitudinal frame spacing (m).

l = distance between side transverse or between side transverse and transverse bulkhead (m), but where it is less than 2.15 m, l is to be taken as 2.15 m.

h = vertical distance from longitudinal frames to a point $0.1L$ above the top of keel (m), but where it is less than $0.06L$(m), h is to be taken as $0.06L$(m).

(2) Longitudinal frames are to be connected at each end to breast hooks or transverse bulkheads by efficient brackets.

2. The side transverses supporting longitudinal frames are to comply with the following requirements. However, where these are found impractical to apply these requirement are to be to the satisfaction of the Society.

(1) Side transverses on both sides are to be connected providing cross ties at a vertical interval not greater than that obtained from the following formula:

$S = 0.0125L + 2.5$ (m)

(2) The scantlings of transverses are not to be less than those obtained from the following formula:

Web depth : $d_1 = 200l$ (mm), $2.5L + 500$ (mm) or 2.5 times the depth of slots for longitudinals, whichever is the greatest.

Section modulus : $Z = 8Shl^2$ (cm^3)

Web thickness : t_1 or t_2, whichever is the greater.

$$t_1 = 42\frac{Shl}{d_0} + 1.5 \quad \text{(mm)}, \qquad t_2 = 0.11\sqrt[3]{\frac{d_0^2(t_1 - 1.5)}{k}} + 1.5 \quad \text{(mm)}$$

where

l = vertical distance between supporting points of side transverses (m).

S = spacing of side transverses (m).

h = vertical distance from the middle of l to a point $0.12L$ above the top of keel (m). Where, however, h is less than $0.06L$(m), h is to be taken as $0.06L$(m).

d_0 = depth of side transverse (m). In the calculation of t_1, however, the depth of slot for longitudinals, if any, is to be deducted from the depth of transverses. Where the depth of side transverses is divided by vertical stiffeners, the divided depth may be taken as d_0 in the calculation of t_2.

k = coefficient given in **Table 3.13.1** according to the ratio of S_1 to d_0, where S_1 (mm) is the spacing of tripping brackets or stiffeners provided on web plates of side transverses. For the intermediate values of S_1/d_0, k is to be obtained by linear interpolation.

(3) Side transverses are to be connected effectively with the bottom transverses. Where side transverses are connected with bottom transverses, the scantlings of webs and face bars in the lowest span are to be so decided as to provide strength continuity in the transient from side to bottom transverse; the sum of effective sectional area of web and area of face bar in the lower half of the lowest span is not to be less than the required sectional area of web of the bottom transverse.

(4) Side transverses are to be provided with tripping brackets at an interval of about 3 m. Where the breadth of face bars of side transverses exceeds 180 mm on either side of the web, the tripping brackets are to support the face bars as well. And stiffeners are to be provided on the webs at every longitudinal, except that these stiffeners may be provided at alternate longitudinals in the middle part of spans other than the lowest span.

3. Cross ties specified in **Par 2** (1) are to comply with the requirements in items **203. 2** (3) (c), (d) and (e). In this case, side stringers of quotable paragraph are to be replaced with side transverse. Where, however, it is found impracticable to apply these requirements, the constructions are to be at the discretion of the Society.

4. Bottom transverses supporting bottom longitudinals are to be of the construction specified in (1) to (6) or to be of that deemed equivalent thereto by the Society. In case of ships capable of maintaining adequate fore draught in rough seas, however, the section modulus of transverses and the sectional area of webs specified in (1) to (3) may be reduced by 10 % respectively.

(1) The scantlings of bottom transverses are not to be less than that obtained from the following formula, and the bottom transverses are to be supported by struts at the centre line, and further the adjacent bottom transverses are to be connected each other by a centre girder of about the same scantlings as those of the bottom transverses or to be supported by a specially deep centre girder or a longitudinal bulkhead.

Web depth : $d_0 = 5.5L + 450$

Section modulus : $Z = 1.2SLl^2$ (cm^3)

Web thickness : $t_w = 0.6\sqrt{L} + 3$ (mm)

where:

S = spacing of bottom transverses (m).

l = distance between the supporting points of bottom transverses (m).

(2) Where bottom transverses and centre girders are of scantlings exceeding those obtained from the following formula, notwithstanding the requirements in (1), the centre line struts may be arranged at alternate bottom transverses.

(a) Centre girders:

Web depth : $d_0 = 8L + 680$ (mm)

Web thickness : $t_w = 0.65\sqrt{L} + 3.5$ (mm)

Section modulus : Value obtained from the formula in (1). In the formula, however, the average load bearing width (m) of the centre girder is to be taken as S and the distance between the supporting points of the centre girder (m) as l.

(b) Bottom transverses :

Web depth : $d_0 = 5.5L + 450$ (mm)

Web thickness : $t_w = 0.65\sqrt{L} + 3.5$ (mm)

Section modulus :Value obtained from the formula in (1).

(3) Where the scantlings of bottom transverses are greater than those obtained from the following formula, notwithstanding the requirements in (1) the centre line struts or longitudinal bulkheads may be dispensed with. In this case, the scantlings of web plates of centre girders are not to be less than those required in (1) for bottom transverses and free edges of web plates are to be suitably stiffened.

Web depth : $d_0 = 8L + 680$ (mm)

Web thickness : $t_w = 0.7\sqrt{L} + 4$ (mm)

Section modulus : Value obtained from the formula in (1).

(4) Where the web depths of bottom transverses and centre girders are greater than those obtained from (3) their thicknesses may be reduced from the thicknesses prescribed in (3) notwithstanding the requirements in (3). However, in no case is the thickness to be less than that obtained from the following formula:

$t_w = 0.55\sqrt{L} + 2.5$ (mm)

(5) Where the length of bottom transverses measured between their supporting points at each side exceeds 0.045L(m) or the spacing of bottom transverses exceeds 2.5 m, the scantlings of bottom transverses and centre girders prescribed in (1) to (4) are to be suitably increased.

(6) Bottom transverses are to be provided with tripping brackets at an interval of about 3 m. Where the breadth of face bars of bottom transverses exceeds 180 mm on either side of the web, the tripping brackets are to support the face bars as well. And stiffeners are to be provided on the webs at every longitudinal.

5. The struts stipulated in **4** (1) and (2) are not to be less effective than those required by the following (1) to (3) or equivalent thereto.

(1) The scantlings of struts are not to be less than that obtained from the formula given in **Table**

3.13.3.

Table 3.13.3 Scantlings of struts

$\frac{l}{k_0}$	Sectional area (cm^2)	Web thickness (mm)
$\frac{l}{k_0} \geq 0.6$	$A = \frac{0.115 S b L}{1 - 0.5 \frac{l}{k_0}}$	$t_w = 0.0062 d_w \sqrt{\frac{S b L}{A}}$
$\frac{l}{k_0} < 0.6$	$A = 0.164 S b L$	

S = length in longitudinal direction of the area supported by strut (m).
b = breadth of the area supported by strut (m).
l = length of strut (m).
k_0 = minimum radius of gyration of struts, obtained from the following formula (cm).

$$k_0 = \sqrt{\frac{I}{A}}$$

I = the least moment of inertia of strut (cm^4).
A = sectional area of strut (cm^2).
d_w = breadth of web (mm). Where, however, the web is provided with stiffeners along the length of strut, the maximum spacing of such stiffeners is to be taken as d_w.

(2) As a rule, the struts are to extend to the lowest deck, and are to be effectively connected with the cross ties by brackets.
(3) Where the breadth of face bars on either side of the webs exceeds 150 mm, stiffeners are to be provided on the webs and so arranged as to support the face bars at a suitable interval.

6. Side girders are to be provided in line with those abaft collision bulkhead in order to give additional stiffness to the structure of flat bottom.

205. Bulbous bow

Structural arrangements at the fore end part of ship having bulbous bow or other similar unusual form of bow section will be specially considered by the Society.

Section 3 Arrangements to Resist Panting abaft Aft-peak Bulkhead

301. Floors

The scantling and arrangement of floors in aft-peak are to be in accordance with the requirements in **202.** of this Chapter. The floors are to extend well above the stern tubes.

302. Frames

1. The section modulus of transverse frames below the freeboard deck is not to be less than that obtained from the following formula:

$$Z = 8 S h l^2 \quad (\text{cm}^3)$$

where:

S = frame spacing (m).

l = unsupported length of frame (m). Where, however, the length is less than 2.15 m, l is to be taken as 2.15 m.

h = vertical distance from the middle of l to a point $d+0.038L'$ above the top of keel (m). Where, however, the distance is less than $0.04L$(m), h is to be taken as $0.04L$(m).

L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.

2. Where the speed of ship exceeds 14 kts, the section modulus of side frames is to be increased over the value required by **Par 1** at the rate of 2 % per knot excess, but the increase need not exceed 12 %.

303. Panting beams and stringers

1. The structure below the lowest deck is to be effectively stiffened by means of panting beams and stringers as required for the fore peak in **203. 2.**

2. Where the distance between supports at any part of the girth of the frame exceeds 2.5 m, the scantlings of frames are to be increased, or side stringers or struts are to be additionally provided to give adequate stiffness to the structure.

304. Cruiser sterns

Cruiser sterns are to be strengthened by means of web frames, side stringers, etc. as may be required.

Section 4 Arrangements to Resist Panting between Both Peaks

401. Abaft collision bulkhead

Between the collision bulkhead and $0.15L$ from the fore end, side stringers are recommended to be provided in line with stringer plates or side stringers in way of the fore peak tanks, in association with web frames provided at a suitable interval. Even in case where no web frame and side stringer are provided, brackets, etc. are to be provided to provide continuity at sections where side stringers or perforated steel plates in the fore peak tanks are located.

402. Forward after peak bulkhead

As for forward of the aft peak bulkhead, side stringers are to be provided or the frames are to be increased in size in a similar manner as prescribed in the preceding Article, where the frames have specially long unsupported spans as compared with the span amidships. ⚓

CHAPTER 14 WATERTIGHT BULKHEADS

Section 1 General

101. Application

In general all ships are to be provided with strength and watertight bulkheads in accordance with the requirements in this Chapter. In ships of special types, arrangements where it is impracticable to be in accordance with the requirements of this Chapter, are to be specially approved by this Society.

102. Symbols

Watertight bulkheads constructed in accordance with the requirements in this Chapter will be recorded in the Register Book as *WT* the symbols being prefixed in each case by the number of such bulkheads.

Section 2 Arrangement of Watertight Bulkheads

201. Collision bulkheads

1. All ships are to have a collision bulkhead, at a position not less than $0.05L_f$ or 10 m, whichever is the lesser, but not more than $0.08\,L_f$ or $0.05\,L_f + 3$ m, whichever is the greater except where the larger distance be accepted by the Society due to special structural reasons from the forward terminal of the length for freeboard. However, where any part of the ship below the waterline at 85 % of the least moulded depth extends forward beyond the forward terminal of the length for freeboard, the above-mentioned distance is to be measured from a point either: (See Fig **3.14.1**)

(a) at the mid-length of such extension; or
(b) at a distance of $0.05L_f$ forward from the above mentioned forward terminal; or
(c) at a distance of 3 m forward from the forward terminal; whichever gives the smallest measurement.

2. For ships having a collision bulkhead with steps or recesses, the measurement of the distance may be observed in accordance with **Fig 3.14.1** (B).

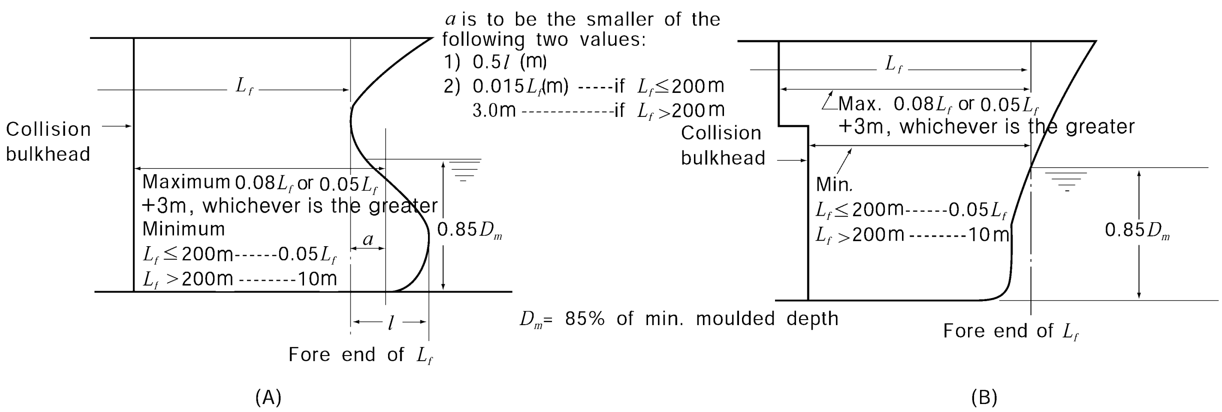

Fig 3.14.1 Measuring positions of collision bulkhead location

3. Arrangement of collision bulkhead in a ship provided with bow door is to be at the discretion of the Society. However, where a sloping ramp forms a part of the collision bulkhead above the freeboard deck, the part of the ramp which is more than 2.3 m above the freeboard deck may extend forward of the limit specified in the above **Par 1.** In this case, the ramp is to be weathertight over its complete length.

202. Aft peak bulkheads

1. All ships are to have an after peak bulkhead situated at a suitable positions.

2. The stern tube is to be enclosed in a watertight compartment by the after peak bulkhead or other suitable arrangements.

203. Machinery bulkheads

1. Watertight bulkhead is to be provided at each end of the machinery space.

2. In ships having the machinery room at aft body, aft end bulkhead of machinery room specified in **Par 1** may be regarded as aft peak bulkhead specified in **202.**

204. Hold bulkheads

1. Cargo ships of ordinary type, are to have hold bulkheads in addition to the bulkheads specified in **201.** to **203.** at a reasonable interval so that the total number of the watertight bulkheads including the bulkheads specified in **201.** to **203.** may not be less than that given by **Table 3.14.1.**

Table 3.14.1 Number of watertight bulkheads

Length of ship (m)	Total number of bulkhead	
	Ships with machinery room at aft body	Elsewhere
$90 \le L < 102$	4	5
$102 \le L < 123$	5	6
$123 \le L < 143$	6	7
$143 \le L < 165$	7	8
$165 \le L < 186$	8	9
$186 \le L$	to be considered individually	

2. The requirements in **Par 1** may be not applied to the arrangements of bulkhead subject to the approval of the Society.

205. Height of watertight bulkheads

The watertight bulkheads required in **201.** to **204.** are the extend to the freeboard deck with the following exceptions:

(1) A watertight bulkhead in way of raised quarter or sunken forecastle deck is to extend up to the said deck.

(2) Where a forecastle having openings without closing appliances led to a space below the freeboard deck is provided, or where a forecastle of $0.25L_f$ or above in length is provided, the collision bulkhead is to extend up to the forecastle deck. However, the extended part above freeboard deck may have steps within the limit of bulkhead position specified in **201.** and may be weathertight.

(3) Aft peak bulkhead may terminate at a deck above the load line, provided that this deck is made watertight to stern or to watertight stern floor of the ship.

206. Construction

1. Where the watertight bulkheads required in **201.** to **204.** are not extended up to the strength deck, deep webs or partial bulkheads situated immediately or nearly above the main watertight bulkheads are to be provided so as to maintain the transverse strength and stiffness of the hull.

2. Where the length of a hold exceeds 30 m, suitable means are to be provided so as to maintain the transverse strength and stiffness of the hull.

207. Chain lockers

1. Chain lockers located abaft the collision bulkhead or in forepeak tanks are to be watertight and to be provided with means for effective drainage by pumps.

2. Chain lockers are to be subdivided by centre line screen walls.

Section 3 Construction of Watertight Bulkheads

301. Thickness

1. The thickness of bulkhead plating is not to be less than that obtained from the following formula:

$$t = 3.2S\sqrt{hK} + 1.5 \quad \text{(mm)}$$

where:

S = spacing of stiffeners (m).

h = vertical distance from the lower edge of plate to the bulkhead deck at centre (m). but in no case is it to be less than 3.4 m.

2. Notwithstanding the requirements in **Par 1**. In no case is the thickness of watertight bulkhead platings to be less than that obtained from following formula:

$$t_{min} = 5.9S + 1.5 \quad \text{(mm)}$$

where:

S = as specified in **Par 1.**

302. Increase of thickness

1. The thickness of lowest strake of plating is not to be less than that obtained from the above formula given in **301.** plus 1 mm.

2. The lowest strake of bulkhead plating is to extend at least 610 mm above the top of inner bottom plating in way of double bottom or 915 mm above the top of keel in way of single bottom. Where the double bottom is provided only on one side of the bulkhead, the extension of the lowest strake is to be of the greater value among the two cases above.

3. The bulkhead platings in way of bilge wells are to be at least 2.5 mm thicker than given by **301.**

4. The bulkhead plating is to be doubled or increased in thickness in way of stern tube opening, notwithstanding the requirements in the preceding Article.

303. Stiffeners

The section modulus of bulkhead stiffeners is not to be less than that obtained from the following formula:

$$Z = CKShl^2 \quad (\text{cm}^3)$$

where:

l = span measured between the adjacent supports of stiffeners including the length of connection (mm). Where girders are provided, it is the distance from the heel of end connection to the first girder or the distance between the girders.

S = spacing of stiffeners (m).

h = vertical distance measured from the midpoint of l for vertical stiffeners, and from the midpoint of distance between the adjacent stiffeners for horizontal stiffeners, to the top of bulkhead deck at the centre line of ship (mm). Where the vertical distance is less than 6.0 m, h is to be taken as 0.8 times the vertical distance plus 1.2 m.

C = coefficient given in **Table 3.14.2** according to the type of end connection.

Table 3.14.2 Valua of C

<table>
<tr><td rowspan="6">Vertical Stiffener</td><td rowspan="2">Upper end / Lower end</td><td rowspan="2">Lug-connection or supported by horizontal girders</td><td colspan="2">Connection</td><td rowspan="2">End of stiffener unattached</td></tr>

<tr><td>End of stiffener unattached</td><td colspan="2">3.78</td><td colspan="2">5.60</td></tr>
<tr><td colspan="6">NOTES:
1. "Lug-connection" is such a connection as both web and face bar of stiffener are effectively attached to the bulkhead plating, decks or inner bottoms which are strengthened by effective supporting members on the opposite side of plating.
2. "Connection-Type A" of vertical stiffeners is a connection by bracket to the longitudinal members or to the adjacent members, in line with the stiffeners, of the same or larger sections, (See Fig 3.14.2 (a))
3. "Connection-Type B" of vertical stiffeners is a connection by bracket to the transverse members such as beams, or other connections equivalent to the connections mentioned above. (See Fig, 3.14.2 (b))</td></tr>
</table>

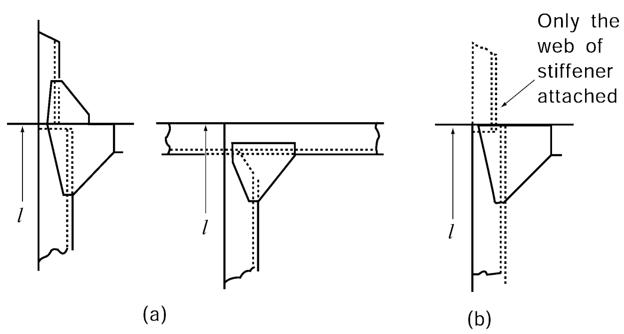

Fig 3.14.2 Types of end connection

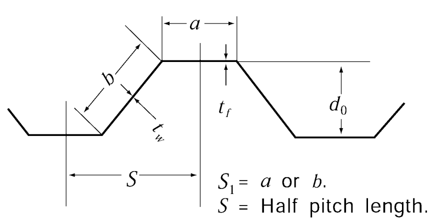

Fig 3.14.3 Measurement of S

304. Corrugated bulkheads

1. The plate thickness of corrugated bulkheads is not to be less than that obtained from the following formula, whichever is the greater:

$$t_1 = 0.0034 C S_1 \sqrt{hK} + 1.5 \quad \text{(mm)}$$
$$t_2 = 0.0059 C S_1 + 1.5 \quad \text{(mm)}$$

where:

h = as specified in **301.**

S_1 = breadth of face part and web part, respectively (mm), indicated as a and b in **Fig 3.14.3.**

C = coefficient given below:

Face part: $C = \dfrac{1.5}{\sqrt{1 + \left(\dfrac{t_w}{t_f}\right)^2}}$

Web part: $C = 1.0$

t_f , t_w = thickness of plates of face part and web part, respectively (mm).

2. The section modulus per half pitch of corrugated bulkheads is not to be less than that obtained from the following formula:

$$Z = 3.6 CKShl^2 \quad (\text{cm}^3)$$

where:

S = half pitch length of the corrugation (m). (See **Fig 3.14.3**)

h = as specified in **303.**

l = length between the supports (m), as indicated in **Fig 3.14.4.**

C = coefficient given in **Table 3.14.3,** according to the type of end connection.

3. Where the end connection of corrugated bulkheads is remarkably effective, the value of C specified in **Par 2** may be adequately reduced.

4. The thickness of plates at end parts for $0.2\,l$ in line with l is not to be less than that obtained from the following formulae respectively:

Web part : $t_1 = 41.7 \dfrac{CKShl}{d_0} + 1.5 \quad \text{(mm)}$

In no case is the web thickness to be less than that obtained from the following formula:

$$t_1 = 0.174 \sqrt[3]{\frac{CShlb^2}{d_0}} + 1.5 \quad \text{(mm)}$$

Face part, except the upper end part of vertically corrugated bulkheads:

$$t_1 = \frac{0.012a}{\sqrt{K}} + 1.5 \quad \text{(mm)}$$

where:

S, h, l, d_0 = as specified in **Par 2.**

a, b = breadth of face part and web part, respectively (mm).

C = coefficient given in **Table 3.14.4.** Where the vertically corrugated bulkheads are constructed with single span, the value of C may be taken as the value for the uppermost span in the Table.

Tale 3.14.3 Values of C

Line	One end of bulkhead / The other end of bulkhead	Supported by rule horizontal or vertical girders	Upper end welded directly to deck	Upper end welded to stool efficiently supported by ship structure
(1)	Supported by rule horizontal or vertical girders or lower end of bulkhead welded directly to decks or inner bottoms	$\dfrac{4}{2+\dfrac{Z_1}{Z_0}+\dfrac{Z_2}{Z_0}}$	$\dfrac{4}{2.2+\dfrac{Z_2}{Z_0}}$	$\dfrac{4}{2.6+\dfrac{Z_2}{Z_0}}$
(2)	Lower end of bulkhead welded to stool efficiently supported by ship structure	$\dfrac{4.8\left(1+\dfrac{l_H}{l}\right)^2}{2+\dfrac{Z_1}{Z_0}+\dfrac{d_H}{d_0}}$	$\dfrac{4.8\left(1+\dfrac{l_H}{l}\right)^2}{2.2+\dfrac{d_H}{d_0}}$	$\dfrac{4.8\left(1+\dfrac{l_H}{l}\right)^2}{2.6+\dfrac{d_H}{d_0}}$
		In no case is the value of C less than that obtained from (1).		

Z_0 = minimum section modulus per half pitch of mid part for $0.6l$ of the corrugated bulkhead (cm^3).
Z_1, Z_2 = section modulus per half pitch of end part (cm^3). In case of vertical corrugation, Z_1 is the section modulus of the upper end part and Z_2 is that of lower end part. Where the plate thickness is increased in accordance with **Par 5** the section modulus is to be that for the plate thickness reduced by the increment.
l_H = height of stool measured from the inner bottom (m).
d_H = breadth of stool measured on the inner bottom plating (mm).
d_0 = depth of corrugation (mm).

Tale 3.14.4 Values of C

Position		Upper end	Lower end
Vertically corrugated bulkhead	Uppermost span	0.4	1.6
	Other spans	0.9	1.1
Both ends of horizontally corrugated bulkhead		1.0	

e = 0.5A or 0.5B. whichever is the smaller.

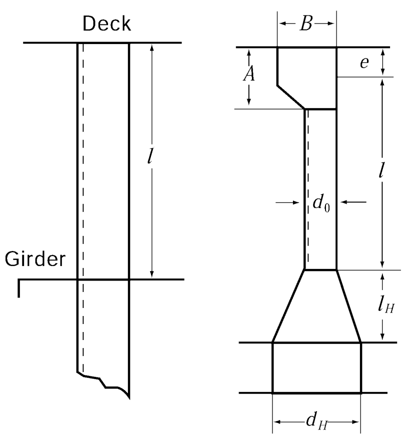

Fig 3.14.4 Measurement of l

5. The thickness of the plates specified in the preceding Paragraphs are to be in accordance with **302.**

6. The actual section modulus per half pitch of corrugated bulkheads is to be calculated by the following formula:

$$Z_a = \frac{a t_f d_0}{2} + \frac{b t_w d_0}{6} \quad (\text{cm}^3)$$

where:

a, b = breadth of face part and web part respectively (m).

t_f, t_w = thickness of plates of face part and web part respectively (mm).

d_0 = depth of corrugation (mm).

305. Collision bulkheads

For collision bulkheads, the plate thickness and section modulus of stiffeners are not to be less than those specified in **301., 303**. and **304.** taking h as 1.25 times the specified height.

306. Girders

1. The section modulus of girders supporting bulkhead stiffeners (hereinafter referred to as girder) is not to be less than that obtained from the following formula:

$$Z = 4.75 K S h l^2 \quad (\text{cm}^3)$$

where

S = breadth of the area supported by the girder (mm).

h = vertical distance measured from the midpoint of l for vertical girders, and from the mid-point of S for horizontal girders, to the top of bulkhead deck at the centre line of ship (m). Where the vertical distance is less than 6.0 m, h is to be taken as 0.8 times the vertical distance plus 1.2 m.

l = span measured between the adjacent supports of girders (m). l may be modified in accordance with **Ch 1, 605.** Where brackets with curved free edge are attached the effective arm length of the brackets is to be taken as b indicated in **Fig 3.14.5.**

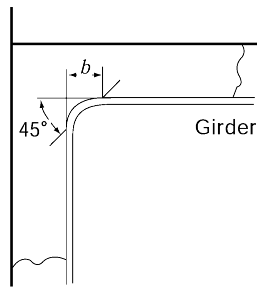

Fig 3.14.5 Measurement of *b*

2. The moment of inertia of girders is not to be less than that obtained from the following formula. In no case is the depth of girders to be less than 2.5 times the depth of slots for stiffeners.

$$I = 10hl^4 \quad (cm^4)$$

where:

h, l = as specified in **Par 1.**

3. The thickness of web plates is not to be less than that obtained from the following formula:

$$t = 0.01S_1 + 1.5 \quad (mm)$$

where:

S_1 = spacing of web stiffeners or depth of girders, whichever is the smaller (mm).

4. The thickness of web plates at both end parts for 0.2 l is not to be less than that obtained from the following formulae, whichever is the greater:

$$t_1 = 41.7\frac{CKShl}{d_0} + 1.5 \quad (mm), \qquad t_2 = 0.174\sqrt{\frac{CShlS_1^2}{d_0}} + 1.5 \quad (mm)$$

where:

S, h, l = as specified in **Par 1.**

d_0 = depth of girders (mm).

S_1 = as specified in **Par 3.**

C = as specified in **304. 4.**

5. Tripping brackets are to be provided at an interval of about 3 m and where the breadth of face plates exceeds 180 mm on either side of the girder, these brackets are to be so arranged as to support the face plates.

6. The actual section modulus and moment of inertia of girders are to be calculated in association with the steel plates specified in **Ch 1, 602.** Where stiffeners are provided within the effective breadth, they may be included in the calculation.

307. Brackets

The scantlings of the effective brackets at the ends of bulkhead stiffener are to be in accordance with the requirement in **Ch 1, 604. 2.**

308. Strengthening of bulkhead plating, deck plating, etc.

Platings of bulkheads, decks, inner bottoms, etc. are to be, if necessary, strengthened at the location of the end brackets of stiffeners and the end of girders.

309. Bulkhead recesses

1. In way of bulkhead recesses, beams are to be provided at every frame and under the upper bulkhead in accordance with the requirements in **Ch 10, 403.** and **Ch 14, 303.** taking the beam spacing as the stiffener spacing. Where the lower end of upper bulkhead is specially strengthened, the beam under the upper bulkhead may be dispensed with.

2. The thickness of deck plating in way of bulkhead recesses is to be at least 1 mm greater than that given by **301.,** regarding the deck plating as bulkhead plating and the beams as stiffeners respectively. In no case is the thickness to be less than that required for deck plating in that location.

3. The thickness of pillars supporting bulkhead recesses are to be determined taking account of the water pressure which might be applied on the upper surface of recesses, and their end connections are to be sufficient to withstand the water pressure which might be applied on the under surface.

310. Construction of bulkheads in way of watertight doors

Where stiffeners are cut or the spacing of stiffeners is increased in order to provide the watertight door in the bulkhead, the opening is to be suitably framed and strengthened as to maintain the full strength of the bulkhead. In this case the door frames are not to be considered as stiffeners.

Section 4 Watertight Doors

401. General

1. Any access openings, doors, manholes or ducts for ventilation, etc. are not to be cut in the collision bulkhead below freeboard deck. The number of openings in collision bulkheads above the freeboard deck is to be kept to a minimum as possible and all such openings are to be provided with weathertight means of closing.

2. Watertight doors(or access hatch cover) are to be provided for all access openings in the watertight bulkheads or openings to ensure the watertight integrity of the inner decks in accordance with the requirements in the following **402.** to **405.**

402. Type of watertight doors

1. Watertight doors are to be of sliding type. Hinged or rolling type may, however, be accepted having regard to the position or the service condition of the door.

2. Notwithstanding the provisions in **1.** above, where watertight door is as small as crew can pass, the watertight door may be of hinged type or rolling type, except where the doors are required to be capable of being closed remotely in accordance with **404. 2.**

3. Notwithstanding the provisions in **1.** above, watertight doors in large cargo hold division may be of a type other than sliding type provided that such doors are permanently closed at sea.

4. Doors which are closed by dropping or by the action of a dropping weight are not permitted.

403. Strength and watertightness

1. Watertight doors are to be of ample strength and watertightness for water pressure to a head up to the bulkhead deck, and door frames are to be effectively secured to the bulkheads. Where deemed necessary by the Society, watertight doors are to be tested by water pressure before they are fitted.

2. Where watertight doors are provided in cargo spaces, such doors are to be protected against damages due to cargoes, etc. by suitable means.

404. Control

1. All watertight doors, except those which are to be permanently closed at sea, are to be capable of being opened and closed by hand locally, from both sides of the doors, with the ship listed of 30 degrees to either side.

2. In addition to the requirements of **1.** above, watertight doors which are used at sea or normally open at sea, are to be capable of being remotely closed by power from the navigation bridge.

3. It is not to be possible to remotely open any watertight door. In addition, watertight doors which are applying to the provisions of **402. 3** are not to be remotely controlled.

405. Indication

1. Watertight doors, except those permanently closed at sea, are to be provided with position indicators showing whether the doors are open or closed at all operating positions.

2. In addition to the requirements of **1.** above for watertight doors which are to be capable of being remotely closed, an indication is to be placed locally showing that the door is in remote control mode.

406. Alarms

Watertight doors which are capable of being remotely closed are to be provided with an audible alarm which will sound at the door position whenever such a door is remotely closed.

407. Source of power

1. The remote controls, indications and alarms required in **404.** to **406.** are to be operable in the event of main power failure.

2. Electrical installations for devices specified in **1.** except water-proof type approved by the Society are to be not provided with under freeboard deck.

3. Cables for devices specified in 1. are to comply with the requirements of **Pt 6, Ch 1 Sec 4.** of the Rules.

408. Notices

1. Watertight doors which are to be normally closed at sea are to have notices fixed to both sides of the doors stating "**To be kept closed at sea**".

2. Watertight doors which are to be permanently closed at sea are to have notices fixed to both sides stating "**Not to be opened at sea**". Such doors which are accessible during the voyage are to be fitted with a device which prevents opening.

409. Sliding doors

1. Sliding watertight doors are to be capable of being operated from an accessible position above the bulkhead deck and are to have an index at the operating positon showing whether the door is open or closed. This remote control of the door may, however, be omitted where the Society is satisfied with such an arrangement having regard to the service condition of the door.

2. Where the above control means is operated by rods, the lead of operating rods is to be as direct as possible and the screw is to work in a nut of gun-metal or other approved material.

3. Sliding doors controlled from remote positions are also to be capable of being operated at the position of the door.

4. The frames of vertically sliding watertight doors are to have no groove at the bottom in which dirt might lodge and prevent the door from closing.

410. Hinged and rolling doors

1. For hinged and rolling watertight doors, the hinge pins and the wheel axle of these doors are to be of gun-metal or other approved materials.

2. Hinged and rolling watertight doors except those are to be permanently closed at sea, are to be of quick acting or single acting type which is capable of being closed and secured from both sides of the doors.

411. Others

For fitting of valves or cocks to a watertight bulkhead, see **Pt 5, Ch 6, 107. 11.** For pipes passing through bulkheads, see **Pt 5, Ch 6, 107. 8** and **10.** For electric cables passing through bulkhead, see Pt **6, Ch 1, 408.1** to **3.** ⚓

CHAPTER 15 DEEP TANKS

Section 1 General

101. Definition

A deep tank is a tank used for carriage of water, fuel oil and other liquids, forming a part of the hull in holds. The deep tanks used for carriage of oil are designated as "deep oil tanks", if necessary.

102. Application

1. The constructions of all deep tanks are to be in accordance with the requirements in this Chapter. Where the bulkhead of deep tank partly serves as a watertight bulkhead, the part of the bulkhead is to be in accordance with the requirement in **Ch 14.**

2. The requirements in **Pt 7, Ch 1** are to be applied to the bulkheads of the deep tanks for carriage of oils having flash a point below 60°C, in addition to those in this Chapter.

103. Divisions in tanks

1. Deep tanks are to be of proper size and to be provided with such longitudinal watertight divisions as necessary to meet the requirements for stability in service conditions as well as while the tanks are being filled or discharged.

2. Tanks for fresh water or fuel oil or those which are not intended to be kept entirely filled in service conditions are to have additional divisions or deep wash plates as necessary to minimize the dynamic forces acting on the structure.

3. Where it is impracticable to comply with the requirements in **Par 2,** the scantlings required in this Chapter are to be properly increased.

4. Longitudinal watertight divisions which will be subjected to pressure from both sides, in tanks which are to be entirely filled or emptied in service conditions, may be of the scantlings required for ordinary watertight bulkheads by **Ch 14.** In such cases, the tanks are to be provided with deep hatches, etc., fitted with inspection plugs in order to ensure that the tanks are kept full in service conditions.

104. Minimum thickness

In wing tanks and hold tanks with the length or breadth which exceeds $0.1L+5.0$ (mm) and in topside tanks and hopper tanks, the thickness of girders, struts and the brackets and bulkhead plates is not to be less than that given by **Table 3.15.1** in accordance with the length of ship.

105. Additional strengthening of bulkheads in large tanks

As for large tank boundaries, the scantlings of bulkhead plates, stiffeners, girders and cross ties are not to be less than that obtained from the relevant formulae in **202.** to **205.** and **207.,** where the value of h is the one specified in each requirement or that given by the following formula, whichever is the greater.

$$H=0.85(h+\Delta h) \quad \text{(m)}$$

where:

h = water head as specified in each requirement

Δh = additional water head given by the following formula:

$$\Delta h = \frac{16}{L}(l_t - 10) + 0.25(b_t - 10) \quad \text{(m)}$$

l_t = tank length (m). It is not to be less than 10 m.

b_t = tank breadth (m). It is not to be less than 10 m. but may be $\frac{2}{3}B$ in case of ballast hold of bulk carrier with top side tanks.

Table 3.15.1 Minimum thickness

Length of ship (m)	Thickness (mm)
$90 \le L < 105$	8.0
$105 \le L < 120$	8.5
$120 \le L < 135$	9.0
$135 \le L < 150$	9.5
$150 \le L < 165$	10.0
$165 \le L < 180$	10.5
$180 \le L < 195$	11.0
$195 \le L < 225$	11.5
$225 \le L < 275$	12.0
$275 \le L < 325$	12.5
$325 \le L < 375$	13.0
$375 \le L$	13.5

Section 2 Bulkheads of Deep Tanks

201. Application

The construction of bulkheads and decks forming boundaries of deep tanks is to be in accordance with the requirements in **Ch 14,** unless otherwise specified in this Chapter.

202. Bulkhead plates

The thickness of deep tank bulkhead plating is not to be less than that obtained from the following formula:

$$t = 3.6S\sqrt{hK} + 2.5 \quad \text{(mm)}$$

where:

S = spacing of stiffeners. (m).

h = distance given below, whichever is the greater:

(1) Vertical distance measured from the lower edge of plate to the midpoint of the distance between the top of tanks and the top of overflow pipes (m).

(2) 0.7 times the vertical distance measured from the lower edge of plate to the point of 2.0 m above the top of overflow pipes (m).

203. Bulkhead stiffeners

The section modulus of bulkhead stiffeners is not to be less than that obtained from the following formula:

$$Z = CKShl^2 \quad (\text{cm}^3)$$

where:

S and l = as specified in **Ch 14, 303.**

h = vertical distance given below, whichever is the greater, the lower end being regarded as the midpoint of l for vertical stiffeners and as the midpoint of distance between the adjacent stiffeners for horizontal stiffeners.

(1) Vertical distance measured from the lower end to the mid-point of the distance between the top of tanks and the top of overflow pipes (m).

(2) 0.7 times the vertical distance measured from the lower end to the point of 2.0 m above the top of overflow pipes (m).

C = coefficient given in **Table 3.15.2** according to the type of end connections.

Table 3.15.2 Value of C

The other end of stiffeners \ One end of stiffeners	Connection Type A	Connection Type B	Supported by rule girders or lug connection	Snip
Connection Type A	4.90	8.05	5.95	9.10
Connection Type B	8.05	5.95	9.10	8.05
Supported by rule girders or lug connection	5.95	9.10	7.00	10.50
Snip	9.10	8.05	10.50	10.50

NOTES:
1. "Connection Type A" is a connection by bracket to the double bottoms or to the adjacent members, such as longitudinals or stiffeners in line, of the same or larger sections, or a connection by bracket to the equivalent members mentioned above. (see **Fig, 3.14.2** (a))
2. "Connection Type B" is a connection by bracket to the transverse members such as beams or equivalent thereto. (see **Fig, 3.14.2** (b))

204. Girders supporting bulkhead stiffeners

1. The section modulus of girders supporting bulkhead stiffeners (hereinafter referred to as "girder") is not to be less than that obtained from the following formula:

$$Z = 7.13KShl^2 \quad (\text{cm}^3)$$

where:

S = breadth of the area supported by the girders (m).

h = vertical distance measured from the midpoint of S for horizontal girders, and from the mid-point of l for vertical girders, to the top h specified in **203.** (m).

l = span specified in **Ch 14, 306** (m).

2. The moment of inertia of girders is not to be less than that obtained from the following formula.

The depth of girders is not to be less than 2.5 times the depth of slots for stiffeners.

$$I = 30Khl^4 \quad (\text{cm}^4)$$

where:

h, l = as specified in preceding Paragraph.

3. The thickness of plates of web part is not to be less than that obtained from the following formulae, whichever is the greater:

$$t_1 = 41.7\frac{CKShl}{d_1} + 2.5 \quad (\text{mm}), \qquad t_2 = 0.174\sqrt{\frac{CShlS_1^2}{d_1}} + 2.5 \quad (\text{mm}), \qquad t_3 = 0.01S_1 + 2.5 \quad (\text{mm})$$

where:

S, h and l = as specified in **Par 1.**

S_1 = spacing of web stiffeners or the depth of girders, whichever is the greater (mm).

d_1 = depth of the girder at the location considered, reduced by the depth of slots for stiffeners (mm)

C = coefficient obtained from the following formulae. It is not to be less than 0.5.

For horizontal girders : $C = \left|1 - 2\frac{x}{l}\right|$

For vertical girders : $C = \left|1 + \frac{1}{5} \times \frac{1}{h} - \left(2 + \frac{l}{h}\right)\frac{x}{l} + \frac{l}{h}\left(\frac{x}{l}\right)^2\right|$

x = distance measured from the end of l for horizontal girders, and from the lower end l for vertical girders, to the location considered (m)

4. The actual section modulus and moment of inertia of girders are to be calculated in accordance with the provisions in **Ch 14, 306. 6.**

205. Cross ties

1. Where efficient cross ties are provided across deep tanks connecting girders on each side of the tanks, the span l of girders specified in **204.** may be measured between the end of girder and the centre line of cross tie or between the centre lines of adjacent cross ties.

2. The sectional area of cross ties is not to be less than that obtained from the following formula:

$$A = 1.3Sb_sh \quad (\text{cm}^2)$$

where :

S, h = as specified in **204.**

b_s = breadth of the area supported by the cross ties (m).

3. The end of cross ties are to be bracketed to girders.

206. Brackets

The scantlings of effective brackets on both end of stiffeners are to be in accordance with the requirements in **Ch 14, 307.**

207. Corrugated bulkheads

1. The thickness of plates of corrugated bulkheads is not to be less than that obtained from the following formula:

$$t = 0.0036 C S_1 \sqrt{hK} + 2.5 \quad \text{(mm)}$$

where:

S_1, t_f and t_w = as specified in **Ch 14, 304. 1.**

h = as specified in **202.**

C = coefficient given below:

For face part : $C = \dfrac{1.4}{\sqrt{1 + \left(\dfrac{t_w}{t_f}\right)^2}}$

For web par t: $C = 1.0$

2. The section modulus per half pitch of corrugated bulkheads is not to be less than that obtained from the following formula:

$$Z = 7 CKShl^2 \quad \text{(cm}^3\text{)}$$

where:

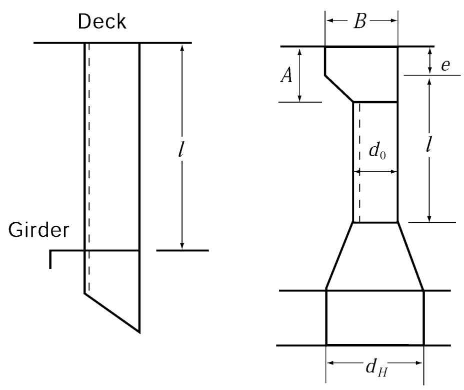
S = as specified in **Ch 14, 304. 2.**

l = length between the supports (m), as indicated in **Fig 3.15.1.**

h = as specified in **203.**

C = coefficient given in **Table 3.15.3,** according to the type of end connection.

As for bulkheads with lower stools of which the width in longitudinal direction at the lower end, d_H is less than 2.5 times of web depth of the bulkhead, d_0 (See **Fig 3.15.1**), the measurement of l and the values of C are to be at the discretion of the Society.



$$e = A - \frac{d_0}{2B} \cdot A$$

Fig 3.15.1 Measurement of *l*

Table 3.15.3 Values of C

Column	Upper end / Lower end	Supported by Girders	Welded directly to deck	Welded to stool efficiently supported by ship structure
(1)	Supported by girders or welded directly to deck or inner bottoms	1.00	1.50	1.35
(2)	Welded to stool efficiently supported by ship structure	1.50	1.20	1.00

3. The thickness of plates at end parts for $0.2l$ in line with l is not to be less than that obtained from the following formulae :

Thickness of web part : $t = 41.7\dfrac{CKShl}{d_0} + 2.5$ (mm)

It is not to be less than that obtained from the following formula :

$$t_{\min} = 0.174\sqrt[3]{\frac{CKShl}{d_0}} + 2.5 \quad \text{(mm)}$$

Thickness of the face part except the upper end part of vertically corrugated bulkheads:

$$t_f = \frac{0.012a}{\sqrt{K}} + 2.5 \quad \text{(mm)}$$

where:

h = as specified in **203.**

C, l = as specified in **Par 2.**

S, d_0, a and b = as specified in **Ch 14, 304. 4.**

208. Top and bottom construction

The scantlings of the members forming the top or the bottom of deep tanks are to be in accordance with the requirements in this Chapter, regarding the members as the members forming the deep tank bulkheads at the location. They are not to be less than that required for the deck plating or the bottom plating at the location. For top plating of deep tanks the thickness of plates is to be at least 1 mm greater than the thickness specified in **202.**

209. Scantling of members not in contact with sea water

The thickness of plates of bulkheads and girders which are not in contact with sea water in service conditions may be reduced from the requirements in **202., 204.** and **207.** by the values given below:

For the plates of which only side is in contact with sea water .... 0.5 mm

For the plates of which neither side is in contact with sea water .... 1.0 mm

However, bulkhead plate in way of the location such as bilge wells are to be regarded as the plates in contact with sea water.

Section 3 Fittings of Deep Tanks

301. Limbers and air holes

Limbers and air holes are to be cut suitably in the structural members to ensure that air or water does not remain stagnated in any part of the tank.

302. Drainage

Efficient arrangement is to be made for draining bilge water on the top of deep tanks.

303. Inspection plug

The inspection plugs provided on deep tank tops as required in **103. 4** are to be located in readily accessible positions.

304. Cofferdam

1. The following dedicated tanks are to be separated from adjacent tanks by cofferdams. However, these cofferdams may be omitted provided that the common boundaries of lubricating oil and fuel oil tank have full penetration welds.

(1) Fuel oil
(2) Lubricating oil
(3) Vegetable oil
(4) Fresh water

2. The cofferdams in **Par. 1** are to be provided with the air pipes to comply with the requirements in **Pt 5, Ch 6, 201** and with the manholes of adequate size which are well accessible.

3. Crew spaces and passenger spaces are not to be directly adjacent to the tanks for carriage of fuel oil. Such compartments are to be separated from the fuel oil tanks by cofferdams which are well ventilated and is not less than 600 mm in width for easy access. Where the top of fuel oil tanks has no opening and is coated with incombustible coverings of 38 mm and over in thickness, the cofferdam between such compartments and the top of fuel oil tanks may be omitted. ⚓

CHAPTER 16 SUPERSTRUCTURES

Section 1 General

101. General

1. All ships are to have forecastles, or increased sheer so that the vertical distance at FP measured from the summer load water line to the top of exposed deck at side is not to be less than that obtained from the following formula. However, for ships to which timber freeboard are assigned, the summer freeboard(and not the timber summer freeboard) is to be assumed when applying this requirement.

$$H = (6075(L/100) - 1875(L/100)^2 + 200(L/100)^3) \times (2.08 + 0.609\,C_b - 1.603\,C_{wf} - 0.0129(L/d_1))$$

d_1 : Draft at 85 % of the least moulded depth

C_{wf} : Waterplane area coefficient forward of $L/2$, $C_{wf} = A_{wf}/(L/2) \times B)$

A_{wf} : Waterplane area forward of $L/2$ at draft d_1 (m^2)

2. The length of forecastles is to be extended to a point not less than 0.07L abaft the forward perpendicular. Where an increase of sheer is adopted in lieu of forecastle, the sheer is to continue to a point not less than 0.15L abaft the forward perpendicular.

102. Application

1. The construction and scantlings of superstructures are to be in accordance with the relevant Chapters in addition to this Chapter.

2. The requirements in this Chapter are prescribed for the superstructures up to the third tier above the freeboard deck. As for the superstructures above the third tier, the construction and scantlings thereof are to be as deemed appropriate by the Society.

3. As for the superstructures in ships with specially large freeboard, the construction of end bulkheads may be suitably modified subject to the approval by the Society.

Section 2 Superstructure End Bulkheads

201. Head of water

1. The head of water for the calculation of the scantlings of superstructure end bulkheads is not to be less than that obtained from the following formula:

$$h = a(bf - y) \quad \text{(m)}$$

where:

a = as given in **Table 3.16.1.**

b = as given in **Table 3.16.2.**

f = as given by **Fig 3.16.1.**

y = vertical distance from the summer waterline to the mid-point of span of stiffener in case where the scantlings of stiffeners are determined, and to the mid-point of plate in case where the thickness of bulkhead plating is determined (m).

Table 3.16.1 Values of a

Bulkhead	Superstructure	a
Exposed front bulkhead	First tier	$\frac{L'}{120}+2.0$
	Second tier	$\frac{L'}{120}+1.0$
	Third tier	$\frac{L'}{150}+0.5$
Protected end bulkheads of the all tiers		
Aft bulkhead	Afterward of the midship	$\frac{L'}{1000}-0.8\frac{x}{L}+0.7$
	Forward of the midship	$\frac{L'}{1000}-0.4\frac{x}{L}+0.5$

L' = length of ship (m). Where, however, L exceeds 300 m, L' is to be taken as 300 m.
x = distance from the bulkhead to the after perpendicular (m).

Table 3.16.2 Values of b

$\frac{x}{L}$	b
$\frac{x}{L}<0.45$	$\left(\frac{0.45-\frac{x}{L}}{C_{b1}+0.2}\right)^2+1.0$
$\frac{x}{L}\geq 0.45$	$1.5\left(\frac{\frac{x}{L}-0.45}{C_{b1}+0.2}\right)^2+1.0$

x = distance from the bulkhead to the after perpendicular (m).
C_{b1} = block coefficient. Where, however, C_b is less than 0.6, C_{b1} is to be taken as 0.6, and where C_b is 0.8 or over, C_{b1} is to be taken as 0.8. And in calculating b for aft bulkhead located forward of the midship, C_{b1}, is to be taken as 0.8.

2. The head of water is not to be less than that obtained from the formulae in **Table 3.16.3,** irrespective of the provisions in **Par 1.**

Table 3.16.3 Head of water, h (m)

Length of ship	Exposed front bulkhead of the first tier superstructure	Others
$L\leq 250$ m	$\frac{L}{100}+2.5$	$\frac{L}{200}+1.25$
$L>250$ m	5.0	2.5

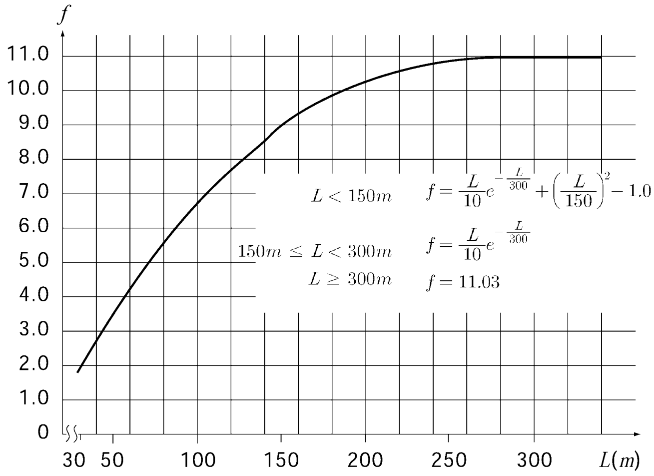


Fig 3.16.1 Value of f

202. Thickness

1. The thickness of superstructure end bulkhead plating is not to be less than that obtained from the following formula:

$$t = 3S\sqrt{hK} \quad \text{(mm)}$$

where:

h = head of water specified in **201.** (m).

S = spacing of stiffeners. (m)

2. The thickness of bulkhead plating is not to be less than that obtained from the following formula, irrespective of the provisions in **Par 1.**

Bulkhead plating of the first tier superstructure : $t = \dfrac{L'}{100} + 4.0$ (mm)

Plating of other bulkheads : $t = \dfrac{L'}{100} + 3.0$ (mm)

where:

L' = as specified in **Table 3.16.1.**

203. Stiffeners

1. The section modulus of stiffeners on superstructure end bulkheads is not to be less than that obtained from the following formula:

$$Z = 3.5KShl^2 \quad (\text{cm}^3)$$

where:

S, h = as specified in **202.**

l = tween deck height (m). Where, however, l is less than 2 m, l is to be taken as 2 m.

2. Both ends of stiffeners on the exposed bulkheads of superstructures are to be connected to the deck by welding except where otherwise approved by the Society.

204. End bulkheads of raised decks

1. The fore ends of the raised decks are to be provided with intact bulkheads.

2. The thickness of plating and the scantlings of stiffeners of the bulkhead specified in **Par 1** are not to be less than those required in **202.** and **203.** taking this bulkhead as that of the first-tier superstructure.

Section 3 Access Openings in Superstructure End Bulkheads

301. Closures for access openings

1. The doors to be provided on the access openings in the end bulkheads of enclosed superstructures are to be in accordance with the requirements in (1) through (5).

(1) The doors are to be made of steel or other equivalent materials and to be permanently and rigidly fitted up to the bulkheads;
(2) The doors are to be rigidly constructed, to be of equivalent strength to that of intact bulkhead and to be weathertight when closed;
(3) The means for securing weathertightness are to consist of gaskets and clamping devices or other equivalent devices and to be permanently fitted up to the bulkhead or the door itself;
(4) The doors are to be operated from the both sides of the bulkheads;
(5) Hinged doors are, as a rule, to open outward.

2. The height of sills of access openings specified in **Par 1** is not to be less than 380 mm above the upper surface of the deck except where higher sills may be required when deemed necessary by the Society. ⚓

CHAPTER 17 DECKHOUSES

Section 1 General

101. Application

1. The construction and scantlings of deckhouses are to be in accordance with the relevant Chapters in addition to this Chapter.

2. The requirements in this Chapter are prescribed for the deckhouses up to the third tier above the freeboard deck. As for the deckhouses above the third tier, the construction and scantlings thereof are to be as deemed appropriate by the Society.

3. As for the deckhouses in ships with specially large freeboard the construction of bulkhead may be suitably modified subject to the approval by the Society.

Section 2 Construction

201. Head of water

1. The head of water for the calculation of the scantlings of boundary walls of deckhouses is not to be less than that obtained from the following formula:

$$h = ac(bf - y) \quad \text{(m)}$$

where:

a = as given by **Table 3.17.1.**

b = as given by **Table 3.17.2.**

Table 3.17.1 Values of a

<table>
<tr><th>Walls</th><th>Location</th><th>a</th></tr>
<tr><td rowspan="3">Exposed front wall</td><td>First tier</td><td>$\frac{L'}{120}+2.0$</td></tr>
<tr><td>Second tier</td><td>$\frac{L'}{120}+1.0$</td></tr>
<tr><td>Third tier</td><td rowspan="2">$\frac{L'}{150}+0.5$</td></tr>
<tr><td colspan="2">Side walls and protected front walls of the all tiers</td></tr>

<tr><td>Forward of the midship</td><td>$\frac{L'}{1000}-0.4\frac{x}{L}+0.5$</td></tr>
<tr><td colspan="3">L' and x = as specified in Table 3.16.1</td></tr>
</table>

Table 3.17.2 Values of b

<table>
<tr><th>$\frac{x}{L}$</th><th>b</th></tr>
<tr><td>$\frac{x}{L} < 0.45$</td><td>$\left(\frac{0.45-\frac{x}{L}}{C_{b1}+0.2}\right)^2 + 1.0$</td></tr>
<tr><td>$\frac{x}{L} \geq 0.45$</td><td>$1.5\left(\frac{\frac{x}{L}-0.45}{C_{b1}+0.2}\right)^2 + 1.0$</td></tr>
<tr><td colspan="2">x = distance from the end wall to the after perpendicular, however, in case of side wall, distance from the mid-point of side wall to the after perpendicular (m). Where, however, the length of side wall exceeds $0.15L$, the side wall is to be nearly equally subdivided as not to exceed $0.15L$ and the distance from the mid-point of the subdivision to the after perpendicular to be taken.
C_{b1} = block coefficient. Where, however, C_b is 0.6 and under, C_{b1} is to be taken as 0.6 and where C_b is 0.8 and over, C_{b1} is to be taken as 0.8. And, in calculating b for the aft wall located forward of the midship, C_{b1} is to be taken as 0.8.</td></tr>
</table>

f = as given in **Fig 3.16.1.**

c = as given by the following formula, where, however, b'/B' is less than 0.25, b'/B' is to be taken as 0.25.

$$c = 0.7\frac{b'}{B'} + 0.3$$

b' = breadth of deckhouse at the position under consideration (m).

B' = breadth of ship on the exposed deck at the position under consideration (m).

y = vertical distance from the summer waterline to the mid-point of span of stiffener in case where the scantlings of stiffeners are determined, and to the mid-point of plate in case where the thickness of boundary wall plating is determined (m).

2. The head of water is not to be less than that obtained from the requirements in **Ch 16, Table 3.16.3,** irrespective of the provisions in **Par 1.**

202. Scantlings

1. The thickness of boundary wall plating and the scantlings of stiffeners are not to be less than those required in **Ch 16, 202.** and **203.** taking the head of water specified in **201.** as h.

2. Both ends of stiffeners on exposed boundary walls of deckhouses are to be connected to the deck by welding except where otherwise approved by the Society.

203. Closing means

Access openings of deckhouses protecting companionways giving access to the spaces under the freeboard deck or the spaces in the enclosed superstructures are to be provided with the closing means at least complying with the requirements in **Ch 16, 301.** Where, however, stairways are enclosed with boundary walls fitted with closing means complying with the requirements in **Ch 16, 301.** the external doors need not be weathertight.

204. Reinforcement of construction under deckhouses

1. Where transverse bulkheads are provided under deckhouses, special consideration is to be paid not to have discontinuity in the construction of deckhouses just above the transverse bulkheads as far as practicable.

2. On the side walls and end walls of large deckhouses, partial bulkheads or special stiffeners are to be arranged at intervals not exceeding about 9 m just above the bulkheads, web frames or under deck girders underneath.

3. In the vicinity of both ends of long deckhouses, special consideration is to be paid to the construction connecting boundary walls of deckhouses to the decks. The side walls are to be suitably constructed so as to maintain strength continuity and to avoid stress concentration.

4. The connections between deckhouses supporting crane post and deck structure are to be of appropriate construction such that beams or longitudinal members are arranged beneath surrounding wall of deckhouses, etc. to avoid stress concentration.

205. Loaded with heavy equipment articles

Deckhouses under the spaces loaded with specially heavy equipment articles such as lifeboats, deck machineries and so on are to be suitably strengthened.

206. Deckhouses on the upper tiers of deck

As for deckhouses on the upper tiers of deck, suitable measures are to be taken to prevent vibration in such a manner as to arrange the side walls and pillars of respective tiers of deckhouses in a same plane as far as practicable. ⚓

CHAPTER 18 MACHINERY SPACES AND ENGINE CASINGS

Section 1 General

101. Application

The construction of machinery space in addition to this Chapter is to be in accordance with the requirements in relevant Chapters.

102. Compensation

Machinery space is to be sufficiently strengthened by means of web frames, strong beams and pillars or other suitable arrangements.

103. Construction

Machineries, shafting, etc. are to be efficiently supported and the adjacent structures are to be adequately stiffened.

104. Twin screw ships and others of high power

In twin screw ships and others of high power, the structure and attachments of the seatings are to be specially strengthened in relation to the proportion of the height of engines to their length or width, weight, power, type, etc.

105. Means of escape

1. In each engine room and boiler room, at least two means of escape are to be provided. These means are to be formed by steel ladders as widely separated as possible leading to doors in the casing similarly separated and from which an access is provided to the lifeboat embarkation deck.

2. Where a watertight door is available as a means of escape from each engine room or boiler room to other spaces from which an access is provided to the embarkation deck, one of the means specified in the preceding Paragraph may be dispensed with.

3. In case of ships of less than 2000 tons gross, where it is difficult to separate ladders or doors from each other, the requirement in **Par 1** may be suitably modified.

Section 2 Main Engine Foundation

201. Single bottoms

In ships with single bottoms, the main engine are to be seated upon thick seat plates laid on heavy foundation girders efficiently bracketed and stiffened and having sufficient strength in proportion to the power and size of engines. Transverse rigidity of the seat plates is to be provided by means of tripping brackets fitted at the position of each floor.

202. Double bottoms

In ships with double bottoms, the main engines are to be seated directly upon thick inner bottom plating or thick seat plates on top of heavy foundation girders so arranged as to effectively distribute the weight. Transverse rigidity of the seat plates is to be provided by means of tripping brackets fitted at the position of each floor.

Section 3 Construction of Boiler Rooms

301. Boiler foundations

1. Boilers are to be supported by deep saddle type floors or by transverse or longitudinal girders so arranged as to effectively distribute the weight.

2. Where boilers are supported by transverse saddles or girders, the floors in way of same are to be specially stiffened.

302. Boiler location

1. Boilers are to be so placed as to ensure accessibility and proper ventilation.

2. Boilers are to be at least 457 mm clear of tank tops, etc. The thickness of adjacent members is to be increased as may be required where the clear space is unavoidable less. The available clearance is to be indicated on the plans submitted for approval.

3. Hold bulkheads and decks are to be kept well clear of the boilers and uptakes, or provided with suitable insulating arrangements.

4. Side sparrings are to be provided on the bulkheads adjacent to the boilers, keeping suitable clearance on **502.** their hold sides.

Section 4 Thrust Blocks and Foundations

401. Thrust blocks and foundations

1. Thrust blocks are to be bolted to efficient foundations extending well beyond the thrust blocks and so arranged as to effectively distribute the loads into the adjacent structures.

2. Additional intercostal girders are to be provided in way of the foundations as necessary.

402. Plummer blocks and auxiliary machinery seats

Plummer blocks and auxiliary machinery seats are to be of ample strength and stiffness in proportion to the weight supported and to the height of foundations.

Section 5 Engine Casings

501. Plates

1. The thickness of casing plates on exposed decks or within not enclosed superstructures is not to be less than that obtained from the requirements in **Ch 17, 201.** and **202**. with such modifications that 1.0 is substituted for c.

2. The thickness of casing plates below the freeboard deck or within enclosed superstructures is not to be less than 6.5 mm in cargo spaces and not to be less than 4.5 mm in accommodation spaces. Where the spacing of stiffeners exceeds 760 mm, the thickness is to be increased at the rate of 0.5 mm per 100 mm excess in spacing.

502. Stiffeners

1. The section modulus of stiffeners of the casings on exposed decks or within not enclosed superstructures is not to be less than that obtained from the requirements in **Ch 17, 201.** and **202.** with such modifications that 1.0 is substituted for c. The ends of stiffeners are to be attached to decks.

2. The stiffeners of casings below the freeboard deck or within enclosed superstructures are to be provided at the position of every deck beam in cargo spaces and their section modulus is not to be less than that obtained from the following formula:

$$Z = 1.2Sl^3 \quad (\mathrm{cm}^3)$$

where:

l = tween deck height (m).

S = spacing of stiffeners (m).

503. Casing top

The thickness of top plating of exposed casings is not less than that obtained from the following formulae:

Position I $t = 6.3S + 1.5$ (mm)

Position II $t = 6.0S + 1.5$ (mm)

where:

S = spacing of stiffeners (m). ⚓

CHAPTER 19 TUNNELS AND TUNNEL RECESSES

Section 1 General

101. Arrangement

1. In ships with machinery amidships, the shafting is to be enclosed by watertight tunnels of sufficient dimensions.

2. Watertight doors are to be provided at the fore end of the tunnel. The closing and construction of the watertight doors are to be as required in **Ch 14.**

3. In tunnels which are provided with watertight doors in accordance with the requirement in the preceding paragraph, escape trunks are to be provided at a suitable location and they are to be led to the bulkhead deck or above.

102. Flat side plating

The thickness of plating on flat sides of tunnel is not to be less than that obtained from the following formula:

$$t = 2.9S\sqrt{h} + 1.5 \quad \text{(mm)}$$

where:

S = spacing of stiffener (m).

h = vertical distance at the mid-length of each hold from the lower edge of the side wall plating to the bulkhead deck at the centre line of ship (m).

103. Flat top plating

1. The thickness of flat plating on the top of tunnels or tunnel recesses is not to be less than that obtained from the formula given in **102.** h being taken as the height from the top plates to the bulkhead deck at the centre line of ship.

2. Where the top of the tunnel or tunnel recess forms part of deck, the thickness is to be increased by at least one mm above that obtained from the requirements in **Par 1,** but in no case is it to be less than that required for the deck plating at the same position.

104. Curved top or side plating

The thickness of curved top or side plating is to be determined by the requirements in **102.** in association with stiffener spacing reduced by 150 mm from the actual spacing.

105. Top plating under hatchways

Top plating of tunnel under hatchways is to be increased by at least 2 mm or to be protected by wood sheathing not less than 50 mm in thickness.

106. Wood sheathings

The wood sheathing prescribed in **105.** is to be so secured as to keep watertightness of tunnel where it might be damaged by cargo.

107. Stiffeners

1. Stiffeners are to be provided not more than 915 mm apart on the top and side plating of tunnels.

2. The section modulus of stiffeners is not to be less than that obtained from the following formula.

$$Z = 4Shl^2 \quad (\text{cm}^3)$$

where:

l = distance from the heel of the lower edge of side wall to the top of flat side (m).

S = spacing of stiffeners (m).

h = vertical distance at mid-length of each hold from the mid-point of l to the bulkhead deck (m).

3. Where the ratio of the radius of the rounded tunnel top to the distance between the bottom and top of the tunnel is comparatively large, the section modulus of the stiffeners is to be adequately increased over that specified in the preceding Paragraph.

4. The lower ends of stiffeners over 150 mm in depth are to be connected to the inner bottom plating, etc. by lug connection.

108. Construction under masts, stanchions, etc.

Where masts, stanchions, etc. are based upon tunnels or tunnel recesses, local strengthening is to be provided in proportion to the weight carried.

109. Construction under top of tunnels or tunnel recesses

Beams, pillars and girders under the top of tunnels or tunnel recesses are to be of the scantlings as required for similar members of bulkhead recesses.

110. Ventilators and escape trunks

Escape trunks and ventilators provided on tunnels or tunnel recesses are to be made watertight up to the bulkhead deck and are to be strong enough to withstand the pressure to which they may be subjected.

111. Tunnels in water or oil tanks

Tunnels in water or oil tanks are to be of equivalent construction and strength to those required for deep tank bulkheads.

112. Watertight tunnels

Where watertight tunnels similar to the shaft tunnels are provided, they are to be of similar construction to the shaft tunnels.

113. Tunnels of curved form

Where the tunnels of curved form pass through deep tanks, the thickness of the plating in way of the tanks is not to be less than that obtained from the following formula.

$$t = 0.134 d_t h + 8.1 \quad (\text{mm})$$

where:

d_t = diameter of tunnel (m).

h = vertical distance measured from the bottom of tunnel to the mid-point between the top of tanks and the top of overflow pipes, or 0.7 times the vertical distance measured from the bottom of tunnel to the point of 2.0 m above the top of overflow pipes, whichever is the greater (m)⫝

CHAPTER 20 STRENGTHENING FOR NAVIGATION IN ICE

Section 1 General

101. Application

1. The construction and equipment of ship intended to be registered and classed as the ship strengthened for navigation in ice are to be in accordance with the requirements in this Chapter in addition to those in other Chapters of this Part.

2. Where an ice class notation is desired, the main propelling machinery, etc. are to be in accordance with the requirements in this Chapter in addition to those in **Part 5**.

3. The requirements in this chapter are framed for the ice strengthening of ships which are intended to navigate in the Northern Baltic complying with the **Finnish-Swedish Ice Class Rules 2008** or in the Canadian Arctic complying with the **Arctic Shipping Pollution Prevention Regulations.** However, where the ships are intended to navigate in other sea areas, this Chapter may be applied.

4. The low temperature of the ship's ambience is to be considered for designing structures, equipment and arrangements essential for the safety and operation of the ship, e.g. the functioning of hydraulic systems, hazard of freezing of water piping and tanks, starting of emergency diesels, etc.

5. In ships of unusual proportions, hull form or propulsion arrangements, the Society may make special requirements in addition.

102. Documentation

1. Forward region, midship region, aft region, ice belt, UIWL and LIWL defined in **202.** are to be indicated in the Shell Expansion.

2. The engine output defined in **202.,** the displacement defined in **203. 3** and the dimensions necessary for the engine output calculation required in **204.** are to be described in the General Arrangement.

Section 2 Ice Strengthening

201. Classification of Ice Strengthening

1. Strengthening for navigation in ice is classified into the following 5 classes dependent on the degree of reinforcement and engine output of the ship.

(1) IA Super : ships with such structure, engine output and other properties that they are normally capable of navigating in difficult ice conditions without the assistance of icebreakers
(2) IA : ships with such structure, engine output and other properties that they are capable of navigating in difficult ice conditions, with the assistance of icebreakers when necessary
(3) IB : ships with such structure, engine output and other properties that they are capable of navigating in moderate ice conditions, with the assistance of icebreakers when necessary
(4) IC : ships with such structure, engine output and other properties that they are capable of navigating in light ice conditions, with the assistance of icebreakers when necessary
(5) ID : ships that have a steel hull and that are structurally fit for navigation in the open sea and that, are capable of navigating in very light ice conditions with their own propulsion machinery

2. It is the responsibility of the Owner to determine which class in **Par 1** is most suitable for this requirement.

202. Definitions

The definitions of terms which appear in this Chapter are to be specified as the following, unless otherwise specified elsewhere.

1. The forward, midship, and aft regions in way of hull part are defined for ships of ice classes IA Super, IA, IB and IC and the forward region is defined for ships of ice class ID as follows:

(1) Forward region: From the stem to a line parallel to and $0.04L$ aft of the forward borderline of the part of the hull where the waterlines run parallel to the centerline. For ice classes IA Super and IA the overlap over the borderline need not exceed 6 m, and for ice classes IB, IC and ID this overlap need not exceed 5 m.

(2) Midship region: From the aft boundary of the Forward region to a line parallel to and $0.04\,L$ aft of the aft borderline of the part of the hull where the waterlines run parallel to the centreline. For ice classes IA Super and IA the overlap over the borderline need not exceed 6 m, and for ice classes IB and IC this overlap need not exceed 5 m.

(3) Aft region: From the aft boundary of the Midship region to the stern.

2. The ice belt is the part of the shell plating which has to be reinforced. (see **Fig 3.20.1**)

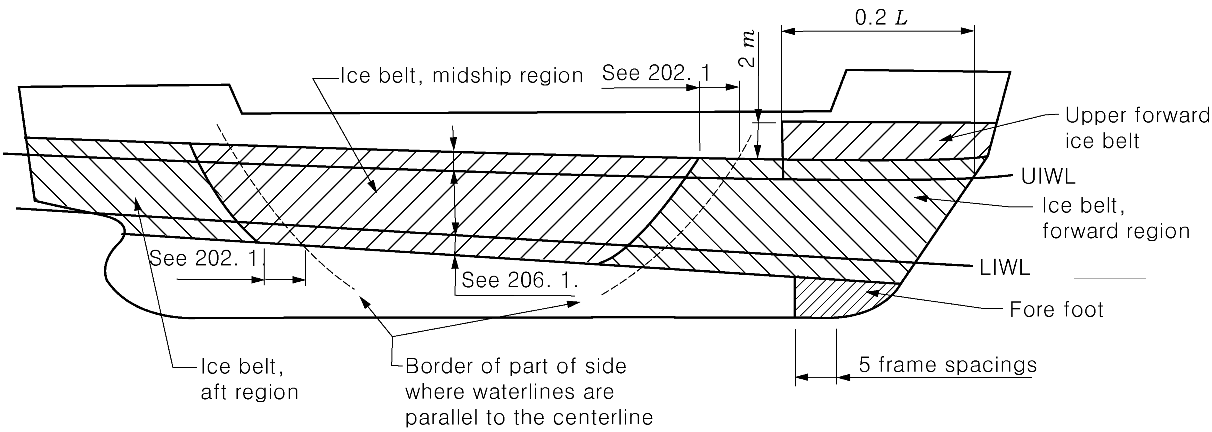

Fig 3.20.1 Ice Belt at each region

3. The upper ice waterline (UIWL) shall be the highest waterline at which the ship is intended to operate in ice. The line may be a broken line. The lower ice waterline (LIWL) shall be the lowest waterline at which the ship is intended to operate in ice. The maximum and minimum ice class draughts at fore and aft perpendiculars shall be determined in accordance with the upper and lower ice waterlines.

4. Restrictions on draughts when operating in ice shall be documented and kept on board readily available to the master. The maximum and minimum ice class draughts fore, amidships and aft shall be indicated in the classification certificate. For ships built on or after 1 July 2007, if the summer load line in fresh water is located at a higher level than the UIWL, the ship's sides are to be provided with a warning triangle and with an ice class draught mark at the maximum permissible ice class draught amidships. Ships built before 1 July 2007 shall be provided with such a marking, if the UIWL is below the summer load line, not later than the first scheduled dry docking after 1 July 2007.

5. The draught and trim, limited by UIWL, must not be exceeded when the ship is navigating in ice. The salinity of sea water along the intended route shall be taken into account when loading the ship.

203. Security of Minimum Draught

1. Any ballast tank, situated above the LIWL and needed to load down the ship to this water line is to be equipped with proper devices to prevent the water from freezing.

2. The propeller is to be fully submerged, if possible, entirely below the ice.

3. The minimum forward draught is not to be less than that obtained from the following formula, which need not exceed $4h_0$.

$$d_f = (2.0 + 0.00025\Delta)h_0 \quad \text{(m)}$$

Δ = the displacement (ton) of ship on the maximum ice-class draught according to **202. 3**

h_0 = level ice thickness given in **Table 3.20.1**

Table 3.20.1 Level ice thickness h_0

Ice Class	h_0 (m)
IA Super	1.0
IA	0.8
IB	0.6
IC	0.4
ID	0.4

Section 3 Engine Output

301. Definition of engine output

The engine output P is the maximum output the propulsion machinery can continuously deliver to the propeller(s). If the output of the machinery is restricted by technical means or by any regulations applicable to the ship, P shall be taken as the restricted output.

302. Required engine output for ice classes IA Super, IA, IB, IC and ID

The engine output shall not be less than that determined by the formula below and in no case less than 1000 kW for ice class IA, IB, IC and ID, and not less than 2800 kW for IA Super.

1. Definitions

The dimensions of the ship and some other parameters are defined below:

L = length of the ship between the perpendiculars (m)

L_{BOW} = length of the bow (m)

L_{PAR} = length of the parallel midship body (m)

B = maximum breadth of the ship (m)

T = actual ice class draughts of the ship according to **302. 2** (m)

A_{wf} = area of the waterline of the bow (m^2)

α = the angle of the waterline at B/4 (deg)

ϕ_1 = degree the rake of the stem at the centerline (deg)

ϕ_2 = degree the rake of the bow at B/4 (deg)

D_p = diameter of the propeller (m)

H_M = thickness of the brash ice in mid channel (m)

H_F = thickness of the brash ice layer displaced by the bow (m)

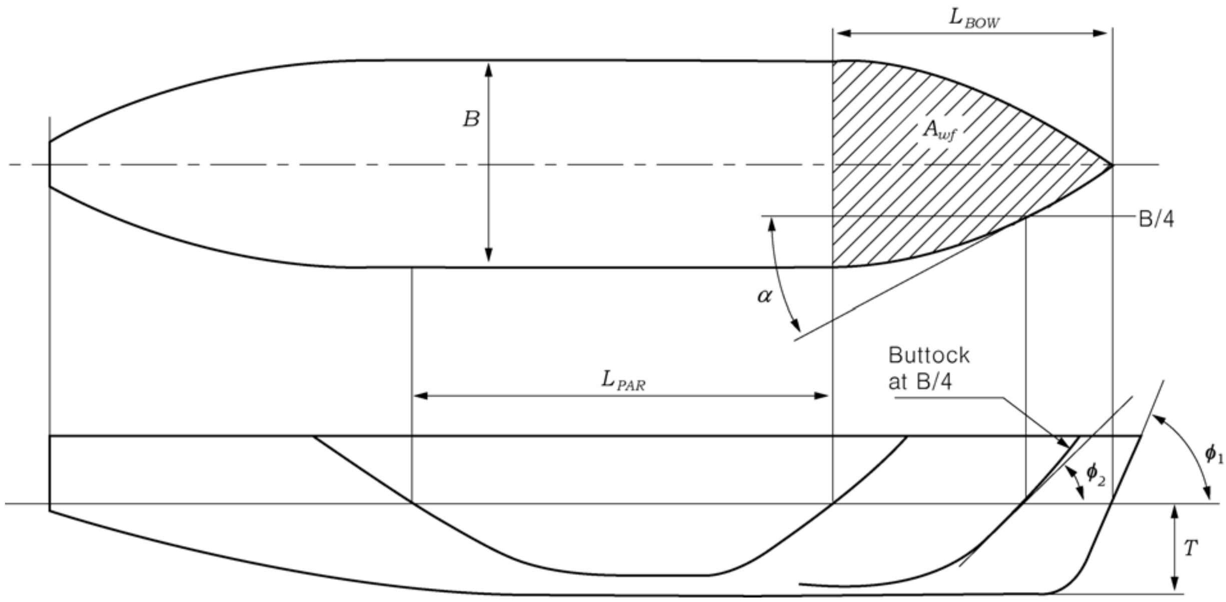

Fig 3.20.2 Determination of the geometric quantities of the hull. If the ship has a bulbous bow, then ϕ_1 = 90°.

2. New ships

To be entitled to ice class IA Super, IA, IB, IC or ID a ship the keel of which is laid or which is at a similar stage of construction on or after 1 September 2003 is to comply with the following requirements regarding its engine output. The engine output requirement is to be calculated for two draughts. Draughts to be used are the maximum draught amidship referred to as UIWL and the minimum draught referred to as LIWL, as defined in **202.** In the calculations the ship's parameters which depend on the draught are to be determined at the appropriate draught, but L and B are to be determined only at the UIWL. The engine output is not to be less than the greater of these two outputs.

$$P = K_e \frac{(R_{CH}/1000)^{3/2}}{D_P} \text{ [kW]},$$

where K_e : as given in **Table 3.20.2**

Table 3.20.2 Values of constant K_e

Number of Propeller	CP or electric or hydraulic propulsion machinery	FP propeller
1 propeller	2.03	2.26
2 propellers	1.44	1.60
3 propellers	1.18	1.31

These K_e values apply for conventional propulsion systems. Other methods may be used for determining the required power for advanced propulsion systems (see **302. 4**).

RCH is the resistance in Newton of the ship in a channel with brash ice and a consolidated surface layer:

$$R_{CH} = C_1 + C_2 + C_3 C_\mu (H_F + H_M)^2 (B + C_\psi H_F) + C_4 L_{PAR} H_F^2 + C_5 \left(\frac{LT}{B^2}\right)^3 \frac{A_{wf}}{L}$$

where

$C_\mu = 0.15\cos\phi_2 + \sin\psi \sin\alpha$, C_μ is to be taken equal or larger than 0.45.

$C_\psi = 0.047\psi - 2.115$, and C_ψ = 0 if $\psi \leq 45$.

$H_F = 0.26 + (H_M B)^{0.5}$

H_M = 1.0 for ice class IA and IA Super
= 0.8 for ice class IB
= 0.6 for ice class IC
= 0.5 for ice class ID

C1 and C2 = coefficients obtained by taking into account a consolidated upper layer of the brash ice

For ships of ice classes IA, IB, IC and ID : $C_1 = 0$, $C_2 = 0$

For ships of ice classes IA Super

$$C_1 = f_1 B L_{PAR} / (2T/B + 1) + (1 + 0.021\phi_1)(f_2 B + f_3 L_{BOW} + f_4 B L_{BOW})$$
$$C_2 = (1 + 0.063\phi_1)(g_1 + g_2 B) + g_3 (1 + 1.2T/B) B^2 / \sqrt{L}$$

For a ship with a bulbous bow, ϕ_1 is to be taken as 90°.

$f_1, f_2, f_3, f_4, g_1, g_2, g_3, C_3, C_4$ and C_5 = values given in **Table 3.20.3**

Table 3.20.3 $f_1, f_2, f_3, f_4, g_1, g_2, g_3, C_3, C_4$ and C_5

f_1(N/m^2)	23	g_1(N)	1530	C_3(kg/(m^{2}s^2))	845
f_2(N/m)	45.8	g_2(N/m)	170	C_4(kg/(m^{2}s^2))	42
f_3(N/m)	14.7	g_3(N/m$^{1.5}$)	400	C_5(kg/s^2)	825
f_4(N/m^2)	29				

ψ = $\arctan(\tan\phi_2/\sin\alpha)$

$\left(\frac{LT}{B^2}\right)^3$ is not to be taken as less than 5 and not to be taken as more than 20.

Further information on the validity of the above formulas can be found in Annex I together with sample data for the verification of powering calculations. If the ship's parameter values are beyond the ranges defined in **Table 1-1 of Annex I**, other methods for determining R_{CH} shall be used as defined in **302. 5.**

3. Existing ships of ice class IB or IC

To be entitled to retain ice class IB or IC a ship, the keel of which has been laid or which has been at a similar stage of construction before 1 September 2003, is to comply with the following requirements regarding its engine output. The engine output is not to be less than that determined by the formula below and in no case less than 740 kW.

$$P = f_1 \cdot f_2 \cdot f_3(f_4\Delta + P_0) \text{ [kW]}$$

where

f_1 = 1.0 for a fixed pitch propeller

= 0.9 for a controllable pitch propeller

f_2 = $\phi_1/200 + 0.675$ but not more than 1.1,

where,

ϕ_1 is the rake of the stem at the centerline [degrees] (see **Fig 3.20.2**)

The product $f_1 \times f_2$ shall not be taken as less than 0.85.

$f_2 = 1.1$ for a bulbous bow

$f_3 = 1.2B/\Delta^{1/3}$ but not less than 1.0

f_4 and P_0 shall be taken as follows:

Table 3.20.4 Value f_4 or P_0

Ice Class	IB	IC	IB	IC
Displacement	D<30000		D≥30000	
f_4	0.22	0.18	0.13	0.11
P_0	370	0	3070	2100

Δ is displacement [t] of the ship on the maximum ice class draught according to **202. 1.** It need not be taken as greater than 80,000 t.

4. Existing ships of ice class IA Super or IA

To be entitled to retain ice class IA Super or IA a ship, the keel of which has been laid or which has been at a similar stage of construction before 1 September 2003, shall comply with the requirements in **302. 2** above at the following dates:

- 1 January 2005 or
- 1 January in the year when 20 years has elapsed since the year the ship was delivered, whichever occurs the latest.

When, for an existing ship, values for some of the hull form parameters required for the calculation method in section **302. 2** are difficult to obtain, the following alternative formulae can be used:

$$R_{CH} = C_1 + C_2 + C_3(H_F + H_M)^2(B + 0.658H_F) + C_4LH_F^2 + C_5\left(\frac{LT}{B^2}\right)^3\frac{B}{4}$$

Where,

For ships of ice classes IA, $C_1 = 0$, $C_2 = 0$

For ships of ice classes IA Super without a bulbous bow, C_1 and C_2 is to be calculated as follows;

$$C_1 = f_1 \frac{BL}{(2T/B+1)} + 1.84(f_2 B + f_3 L + f_4 BL)$$

$$C_2 = 3.52(g_1 + g_2 B) + g_3\left(1 + 1.2\frac{T}{B}\right)\frac{B^2}{\sqrt{L}}$$

For ships of ice classes IA Super with a bulbous bow, C_1 and C_2 is to be calculated as follows;

$$C_1 = f_1 \frac{BL}{(2T/B+1)} + 2.89(f_2 B + f_3 L + f_4 BL)$$

$$C_2 = 6.67(g_1 + g_2 B) + g_3\left(1 + 1.2\frac{T}{B}\right)\frac{B^2}{\sqrt{L}}$$

$f_1, f_2, f_3, f_4, g_1, g_2, g_3, C_3, C_4$ and C_5 = values given in **Table 3.20.5**

Table 3.20.5 Values of $f_1, f_2, f_3, f_4, g_1, g_2, g_3, C_3, C_4$ and C_5

f_1(N/m^2)	10.3	g_1(N)	1530	C_3(kg/(m^{2}s^2))	460
f_2(N/m)	45.8	g_2(N/m)	172	C_4(kg/(m^{2}s^2))	18.7
f_3(N/m)	2.94	g_3(N/m$^{1.5}$)	400	C_5(kg/s^2)	825
f_4(N/m^2)	5.8				

$\left(\frac{LT}{B^2}\right)^3$ is not to be taken as less than 5 and not to be taken as more than 20.

5. Other methods of determining Ke or R_{CH}

For an individual ship, in lieu of the K_e or R_{CH} values defined in **302. 2** and **302. 3**, the use of K_e or R_{CH} values based on more exact calculations or values based on model tests may be approved. Such an approval will be given on the understanding that it can be revoked if experience of the ship's performance in practice motivates this.

The design requirement for ice classes is a minimum speed of 5 knots in the following brash ice channels:

IA Super H_M = 1.0 m and a 0.1 m thick consolidated layer of ice
IA = 1.0 m
IB = 0.8 m
IC = 0.6 m
ID = 0.5 m

Section 4 Hull Structural Design

401. Design ice pressures

1. Design ice pressure P_d is not to be less than that obtained from the following formula:

$$P_d = C_d C_1 C_a P_0 \quad \text{(MPa)}$$

$$C_d = \frac{ak+b}{1000}$$

$$k = \frac{\sqrt{\Delta P}}{1000}$$

Δ = displacement (ton) of the ship specified in **203. 3.**
P = engine output (kW).
a and b = as given in **Table 3.20.6** according to the region under consideration and the value of k

Table 3.20.6 Value of a and b

	Forward region		Midship region and Aft region	
	$k \le 12$	$k > 12$	$k \le 12$	$k > 12$
a	30	6	8	12
b	230	518	214	286

C_1 = a factor which takes account of the probability that the design ice pressure occurs in a certain region of the hull for the ice class in question, as given in **Table 3.20.7** according to the ice class and the region.
P_0 = the nominal ice pressure; the value 5.6 MPa is to be used.
C_a = a factor which takes account of the probability that the full length of the area under consideration will be under pressure at the same time, as given by the following formula. Where, however, C_a is less than 0.6, C_a is to be taken as 0.6 and where C_a exceeds 1.0, C_a is to be taken as 1.0.

$$C_a = \frac{47-5l_a}{44}$$

l_a = to be taken as specified in **Table 3.20.8** according to the structural member under consideration.

Table 3.20.7 Coefficient C_1

Ice class	Forward region	Midship	Aft region
IA Super	1.00	1.00	0.75
IA	1.00	0.85	0.65
IB	1.00	0.70	0.45
IC	1.00	0.50	0.25
ID	1.00	-	-

Table 3.20.8 Value of l_a

Structure	Type of framing	l_a (m)
Shell	Transverse	Frame Spacing
	Longitudinal	2 frame Spacing
Frames	Transverse	Frame Spacing
	Longitudinal	span of frame
ice stringer	-	span of stringer
web frame	-	2-spacing of web frames

2. h is the height of the area under the ice pressure P_d specified in **Par 1** and is to be as given in **Table 3.20.9** according to the ice class.

402. Shell plating

1. The vertical extension of ice belt is to be as given in **Table 3.20.10** according to the ice class and is to comply with the following requirements.

Table 3.20.9 Value of h

Ice Class	h (m)
IA Super	0.35
IA	0.30
IB	0.25
IC	0.22
ID	0.22

Table 3.20.10 Vertical extension of the Ice belt b

Ice Class	Above UIWL	Below LIWL
IA Super	0.6 m	0.75 m
IA	0.5 m	0.6 m
IB	0.4 m	0.5 m
IC	0.4 m	0.5 m
ID	0.4 m	0.5 m

(1) Fore foot
For ice class IA Super the shell plating below the ice belt from the stem to a position five main frame spaces abaft the point where the bow profile departs from the keel line is to have at least the thickness required in the ice belt in the midship region.
(2) Upper forward ice belt
For ice classes IA Super and IA on ships with an open water service speed equal to or exceeding 18 kt, the shell plate from the upper limit of the ice belt to 2 m above it and from the stem to a position at least 0.2 L abaft the forward perpendicular, is to have at least the thickness required in the ice belt in the midship region. A similar strengthening of the bow region is to apply to a ship with lower service speed, when it is, e.g. on the basis of the model tests, evident that the ship will have a high bow wave.
(3) Side scuttles are not to be situated in the ice belt.
(4) If the weather deck in any part of the ship is situated below the upper limit of the ice belt, the bulwark and the construction of the freeing ports are to be given at least the same strength as is required for the shell in the ice belt.

2. The thickness of shell plating in the ice belt is not to be less than that obtained from the following formula:

For the transverse framing : $t = 667S\sqrt{\dfrac{f_1 P_{PL}}{\sigma_y}} + 2.0$ (mm)

For the longitudinal framing : $t = 667S\sqrt{\dfrac{P_{PL}}{f_2 \sigma_y}} + 2.0$ (mm)

S : frame spacing (m)

P_{PL}: 0.75 P_d (MPa)

P_d : as specified in **401. 1**

f_1 : as given in the following formula. Where, however, f_1 is greater than 1.0, f_1 is to be taken as 1.0

$$f_1 = 1.3 - \frac{4.2}{(h/S + 1.8)^2}$$

f_2 : as given by the following formula depending on the value of h/S

Where $h/S < 1.0$: $f_2 = 0.6 + \frac{0.4}{h/S}$

Where $1.0 \le h/S < 1.8$: $f_2 = 1.4 - 0.4(h/S)$

h : as specified in **Table 3.20.9.**

σ_y : yield stress of the material of the member considered, which are given as follows (N/mm^2)

235 : for mild steels as specified in **Pt 2, Ch 1**

315 : for high tensile steels AH 32, DH 32, EH 32 or FH 32 as specified in **Pt 2, Ch 1**

355 : for high tensile steels AH 36, DH 36, EH 36 or FH 36 as specified in **Pt 2, Ch 1**

390 : for high tensile steels AH 40, DH 40, EH 40 or FH 40 as specified in **Pt 2, Ch 1**

403. Frames

1. Vertical extension of ice strengthening

(1) The vertical extension of ice strengthening of the framing is to be at least as given in **Table 3.20.11** according to the respective ice classes and regions. Where an upper forward ice belt is required in **402. 1** (2) the ice strengthening part of the framing is to be extended at least to the top of this ice belt. Where the ice strengthening would go beyond a deck or a tanktop by no more than 250 mm, it can be terminated at that deck or tanktop.

(2) Within the ice strengthening area all frames are to be effectively attached to all the supporting structures. A longitudinal frame is to be attached all the supporting web frames and bulkheads by brackets. When a transverse frame terminates at a stringer or deck, a bracket or similar construction is to be fitted. When a frame is running through the supporting structure, both sides of the web plate of the frame are to be connected to the structure by direct welding, collar plate or lug. When a bracket is installed, it is to have at least the same thickness as the web plate of the frame and the edge is to be appropriately stiffened against buckling.

(3) For ice class IA Super in all region, for ice class IA in the forward and midship regions and for ice classes IB, IC and ID in the forward regions, followings are to apply in the ice strengthening area.

(A) Frames which are at a small angle to the shell, are to be supported against tripping by brackets, intercostals, stringers or similarly at a distance preferably not exceeding 1.3 m.

(B) The frames are to be attached to the shell by double continuous welds. No scalloping is allowed except when crossing shell plate butts.

(C) The web thickness of the frames is to be at least one half of the thickness of the shell plating and at least 9 mm.

(D) Where there is a deck, tanktop or bulkhead in lieu of a frame, the plate thickness of this is to be as per the preceding in (C), to a depth corresponding to the height of adjacent frames.

Table 3.20.11 Vertical extension of the ice strengthening of framing

Ice Class	Region		Above UIWL (m)	Below LIWL (m)
IA Super	forward	from stem to 0.3L abaft it	1.2	to double bottom or below top of floors
		abaft 0.3L from stem	1.2	1.6
	midship		1.2	1.6
	aft		1.2	1.2
IA IB IC	forward	from stem to 0.3L abaft it	1.0	1.6
		abaft 0.3L from stem	1.0	1.3
	midship		1.0	1.3
	aft		1.0	1.0
ID	forward	from stem to 0.3L abaft it	1.0	1.6
		abaft 0.3L from stem	1.0	1.3

2. Transverse frames

(1) The section modulus Z of a main or intermediate transverse frame specified in **403. 1** is to be not less than that obtained from the following formula. Where less than 15 % of the span of the frame is situated within the ice strengthening zone for frames, ordinary frame scantlings may be used.

$$Z = \frac{P_d S h l}{m_t \sigma_y} \times 10^6 \quad \text{(cm3)}$$

P_d = as specified in **401. 1.**

S = frame spacing (m).

h = as specified in **Table 3.20.9.**

l = span of the frame (m).

m_t = as given by the following formula : $m_t = \dfrac{7m_0}{7-5h/l}$

m_0 = as specified in **Table 3.20.12.** The boundary conditions are those for the main and intermediate frames. Load is applied at mid span.

σ_y = as specified in **402. 2.**

(2) The upper end of the strengthening part of a main frame and of an intermediate frame are to be attached to a deck or an ice stringer as specified in **404.** Where a frame terminates above a deck or a stringer (hereinafter, referred to as the lower deck in this section) which is situated at or above the upper limit of the ice belt, the part of the frame above the lower deck is to be in accordance with the followings:

(A) the part of the main frame and the intermediate frame may have the scantlings required by the ordinary frame

(B) the upper end of the main frame and the intermediate frame is to be connected to a deck which situated above the lower deck (hereinafter, referred to as the higher deck in this section). However, the upper end of the intermediate frame may be connected to the adjacent main frames by a horizontal stiffener having the same scantlings as the main frame. Where a intermediate frame is outside the forward region and the higher deck is situated more than 1.8 m above the ice belt, an upper termination of such an intermediate frame may be decided as appropriately.

(3) The lower end of the strengthened part of a main frame and of an intermediate ice frame is to

be attached to a deck, tanktop or ice stringer specified in **404.** Where an intermediate frame terminates below a deck, tanktop or ice stringer which is situated at or below the lower limit of the ice belt, the lower end may be connected to the adjacent main frames by a horizontal member of the same scantlings as the frames.

Table 3.20.12 Value of m_0

Boundary condition	m_0	Example
Both ends fixed 	7.0	Frames in a bulk carrier with top side tanks
One side fixed and one side simple support 	6.0	Frames extending from the tank top to a single deck
Multi point simple support 	5.7	Continuous frames between several decks or stringers
Both ends simple support 	5.0	Frames extending between two decks only

3. Longitudinal frames

(1) The spacing of longitudinal frames in the extension specified in **403. 1** is not to exceed 0.35 m for ice classes IA Super and IA, and is to be in no case exceed 0.45 m. Where deemed as necessary by the Society, larger frame spacing may be permitted.

(2) The section modulus Z and shear area A of a longitudinal frame in the extension specified in **403. 1** are not to be less than that obtained from the following formula:

$$Z = \frac{f_3 f_4 P_d h l^2}{m \sigma_y} \times 10^6 \quad \text{(cm3)}, \qquad A = \frac{\sqrt{3} f_3 P_d h l}{2 \sigma_y} \times 10^4 \quad \text{(cm2)}$$

f_3 = factor which takes account of the load distribution to adjacent frames given by following formula:

$$f_3 = \left(1 - \frac{0.2h}{S}\right)$$

h = as specified in **Table 3.20.9.**

S = frame spacing (m).

f_4 = factor which takes account of the concentration of load to the point of support ; f_4 = 0.6

P_d = as specified in **401. 1.**

l = span of the longitudinal frame (m).

σ_y = as specified in **402. 2.**

m = Boundary condition factor is to be taken as 13.3. Where the boundary conditions deviate significantly from those of a continuous beam, a smaller boundary factor is to be adapted.

404. Ice stringers

1. The section modulus Z and the shear area A of a stringer situated within the ice belt are to be not less than that obtained from the following formula:

$$Z = \frac{f_5 P_d h l^2}{m \sigma_y} \times 10^6 \ (\mathrm{cm}^3), \qquad A = \frac{\sqrt{3} f_5 P_d h l}{2\sigma_y} \times 10^4 \ (\mathrm{cm}^2)$$

P_d = as specified in **401. 1.**

h = as specified in **Table 3.20.9.** However, the product $P_d h$ is not to be taken as less than 0.3.

l = span of the stringer (m).

m = boundary condition factor; m = 13.3

f_5 = Factor which takes account of the distribution of load to the transverse frames is to be taken as 0.9.

σ_y = as specified in **402. 2.**

2. The section modulus Z and the shear area A of a stringer situated outside the ice belt but supporting ice strengthened frames are not to be less than that obtained from the following formula:

$$Z = \frac{f_6 P_d h l^2}{m \sigma_y}(1 - h_s/l_s) \times 10^6 \ (\mathrm{cm}^3), \qquad A = \frac{\sqrt{3} f_6 P_d h l}{2\sigma_y}(1 - h_s/l_s) \times 10^4 \ (\mathrm{cm}^2)$$

P_d = as specified in **401. 1.**

h = as specified in **Table 3.20.9.** However, the product $P_d h$ is not to be taken as less than 0.3.

l = span of the stringer (m).

m_s = boundary condition factor; m_s = 13.3

l_s = the distance to the adjacent ice stringer (m).

h_s = the shortest distance from the considering stringer to the ice belt (m).

f_6 = Factor which takes account of load to the transverse frames is to be taken as 0.95.

σ_y = as specified in **402. 2.**

3. Narrow deck strips abreast of hatches and serving as ice stringers are to comply with the section modulus and shear area requirements in **Par 1** and **2** respectively. In the case of very long hatches, the product $P_d h$ may be taken as less than 0.3 but in no case less than 0.2. Regard is to be paid to the deflection of the ship's sides due to ice pressure in way of very long hatch openings, when designing weatherdeck hatchcovers and their fittings.

405. Web frames

1. The load F transferred to a web frame from an ice stringer or from longitudinal framing is not to be less than that obtained by the following formula. However, In case the supported stringer is outside the ice belt, the load F may be reduced by multiplying $(1-h_s/l_s)$.

$$F = P_d\, hS \text{ (MN)}$$

P_d = ice pressure (MPa) as specified in **401. 1** in calculating C_a however, l_a is to be taken as $2S$.

h = as specified in **Table 3.20.9.** However, the product $P_d h$ is to be more than 0.3.

S = web frame spacing (m).

h_s, l_s: As specified in **404. 2.**

2. When a web frame can be represented by the structure model shown in **Fig 3.20.3** the section modulus Z and shear area A may be obtained from the following formula:

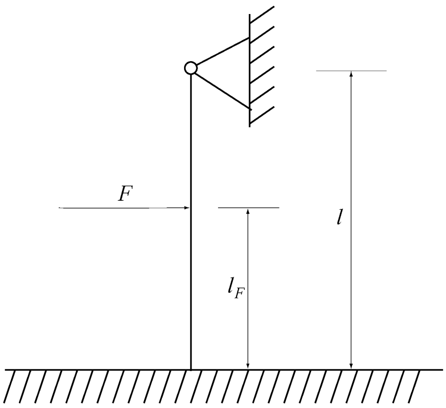

Fig 3.20.3 Structural model of web frame

$$Z = \frac{k_2 F l}{\sigma_y \sqrt{1-(\gamma A_k/A_a)^2}} \times 10^6 \text{ (cm}^3\text{)}, \qquad A = \frac{\sqrt{3}\,\alpha k_1 F}{\sigma_y} \times 10^4 \text{ (cm}^2\text{)}$$

l = span of web frame (m).

k_1 = the value is not to be less than that obtained from the following formula, whichever is greater. For the lower part of the web frame the smallest l_F within the ice belt is to be used. For the upper part the biggest l_F within the ice belt is to be used.

$$k_1 = 1 + 0.5(l_F/l)^3 - 1.5(l_F/l)^2 \;, \qquad k_1 = 1.5(l_F/l)^2 - 0.5(l_F/l)^3$$

l_F = distance from the lower support of the web frame to the stringer or longitudinal in question (m).

α and γ = as given in **Table 3.20.13.** For intermediate values of A_f/A_w is to be obtained by linear interpolation.

F = as specified in **Par 1.**

σ_y = as specified in **402. 2.**

k_2 = as given in the following formula : $k_2 = 0.5(l_F/l)^3 - 1.5(l_F/l)^2 + (l_F/l)$

A_k = required shear area (cm^2) obtained by using

$$k_1 = 1 + 0.5(l_F/l)^3 - 1.5(l_F/l)^2$$

A_a = actual cross sectional area of the web frame (cm^2)

Table 3.20.13 Value of α and γ

A_f/A_w	0.00	0.20	0.40	0.60	0.80	1.00	1.20	1.40	1.60	1.80	2.00
α	1.50	1.50	1.23	1.16	1.11	1.09	1.07	1.06	1.05	1.05	1.04
γ	0.00	0.44	0.62	0.71	0.76	0.80	0.83	0.85	0.87	0.88	0.89

Note:
A_f = cross section area of free flange (cm^2)
A_w = cross section area of web plate (cm^2)

3. For other web frame configurations and boundary conditions specified in **Par 2,** a direct stress calculation is to be carried out. The concentrated load on the web frame is specified in **Par 1.** The point of application is in each case to be chosen in relation to the arrangement of stringers and longitudinal frames so as to obtain the maximum shear forces and bending moments. Allowable stresses are specified in **Table 3.20.14.**

406. Bow

1. Stem

(1) A sharp edged stem as shown in **Fig 3.20.4** or equivalent improves the manoeuvability of the ship in ice and is recommended particularly for smaller ships with a length below 150 m.

(2) The plate thickness of a shaped plate stem and in the case of a blunt bow, any part of the shell which forms an angle of 30 degrees or more to the centre line in a horizontal plane, is to be obtained from the formula in **402. 2** using the following values ;

S = spacing of elements supporting the plate (m).

P_{PL} = as specified in **401.** (MPa).

l_a = spacing of vertical supporting elements (m).

(3) The stem and the part of a blunt bow specified in **Par 2** is to be supported by floors or brackets spaced not more than 0.6 m apart and having a thickness of at least half the plate thickness.

(4) The reinforcement of the stem is to be extended from the keel to a point 0.75 m above UIWL or, in case an upper forward ice belt is required in **402. 1** to the upper limit of this.

Table 3.20.14 Allowable stresses

Stress	Allowable stress
Shear stress (τ)	$\sigma_y / \sqrt{3}$
Bending stress (σ_b)	σ_y
Equivalent stress ($\sigma = \sqrt{\sigma_b^2 + 3\tau^2}$)	σ_y
Note: σ_y = as specified in **206. 2.**	

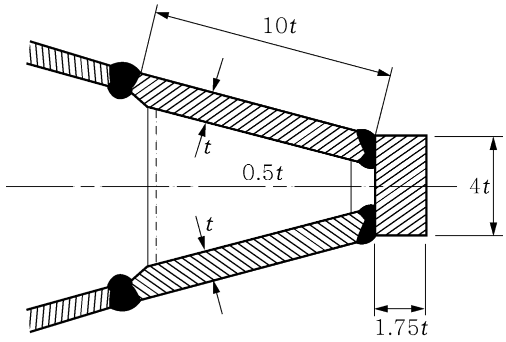

Fig 3.20.4 Sharp edged stem

2. Arrangements for towing

(1) A mooring pipe with an opening not less than 250 by 300 mm, a length of at least 150 mm and an inner surface radius of at least 100 mm is to be fitted in the bow bulwark at the centre line.
(2) A bitt or other means for securing a towline, dimensioned to stand the breaking force of the towline of the ship is to be fitted.
(3) On ships with a displacement not exceeding 30,000 tons the part of the bow which extends to a height of at least 5 m above the UIWL and at least 3 m back from the stem, is to be strengthened to take the stresses caused by fork towing. For this purpose intermediate frames are to be fitted and the framing is to be supported by stringers or decks.

407. Stern

1. The clearance between the propeller blade tip and the stern frame is to be sufficient to prevent from occurring high loads on the blade tip.

2. On twin and triple screw ships, the ice strengthening of the shell and framing are to be extended to the double bottom for 1.5 m forward and aft of the side propellers.

3. On twin and triple screw ships, the shafting and stern tubes of side propellers are to be normally enclosed within plated bossings. If detached struts are used, their design, strength and attachment to the hull are to be duly considered.

4. A wide transom stern extending below the UIWL will seriously impede the capability of the ship to back in ice. Therefore a transom stern is not to be extended below the UIWL, if this can be avoided. If unavoidable, the part of the transom stern below the UIWL is to be kept as narrow as possible. The part of a transom stern situated within the ice belt is to be strengthened as for the midship region.

408. Bilge keel

1. The connection of bilge keels to the hull is to be so designed that the risk of damage to the hull, in case a bilge keel is ripped off, is minimized.

2. It is recommended that bilge keels are cut up into several shorter independent lengths.

Section 5 Rudder and Steering Arrangements

501. Rudder and steering arrangements

1. The scantlings of rudder post, rudder stock, pintles and steering gear, etc. are to comply with requirements in **Pt 4, Ch 1** and **Pt 5, Ch 7.** In this case, the maximum service speed of ship to be used in these calculations is not to be taken less than that given in the **Table 3.20.16.**

2. For the ice classes IA Super and IA, the rudder stock and the upper edge of the rudder are to be protected against ice pressure by the ice knife or equivalent means.

3. For ships of ice classes IA Super and IA, the rudders and steering arrangements are to be designed as follows to endure the loads that work on the rudders by the ice when backing into an ice ridge.
(1) Relief valves for hydraulic pressure is to be effective.
(2) The components of the steering gear are to be dimensioned to stand the yield torque of the rudder stock.
(3) Where possible, rudder stoppers working on the blade or rudder head are to be fitted.

Section 6 Propulsion Machinery

601. Application

The requirements in this Section apply to propulsion machinery covering open- and ducted-type propellers with controllable pitch or fixed pitch design for the ice classes IA Super, IA, IB, IC and ID. The given loads are the expected ice loads for the whole ship's service life under normal operational conditions, including loads resulting from the changing rotational direction of FP propellers. However, these loads do not cover off-design operational conditions, for example when a stopped propeller is dragged through ice. This requirements also apply to azimuthing and fixed thrusters for main propulsion, considering loads resulting from propeller-ice interaction. However, the load models in the strength calculation of this Section do not include propeller/ice interaction loads when ice enters the propeller of a turned azimuthing thruster from the side (radially) or load case when ice block hits on the propeller hub of a pulling propeller. Ice loads resulting from ice impacts on the body of thrusters have to be estimated with suitable methods, but ice load formulae are not available in this Section.

602. Symbols

c = chord length of blade section (m)

$c_{0.7}$ = chord length of blade section at 0.7R propeller radius (m)

CP = controllable pitch

D = propeller diameter (m)

d = external diameter of propeller hub (at propeller plane) (m)

$D_{\lim}$ = limit value for propeller diameter (m)

EAR = expanded blade area ratio

F_b = maximum backward blade force for the ship's service life (kN)

F_{ex} = ultimate blade load resulting from blade loss through plastic bending (kN)

F_f = maximum forward blade force for the ship's service life (kN)

F_{ice} = ice load (kN)

$(F_{ice})_{\max}$ = maximum ice load for the ship's service life (kN)

FP = fixed pitch

h_0 = depth of the propeller centerline from lower ice waterline (m)

H_{ice} = thickness of maximum design ice block entering to propeller (m)

I = equivalent mass moment of inertia of all parts on engine side of component under consideration (kgm^2)

I_t = equivalent mass moment of inertia of the whole propulsion system (kgm^2)

k = shape parameter for Weibull distribution

LIWL = lower ice waterline (m)

m = slope for S-N curve in log/log scale

M_{BL} = blade bending moment (kNm)

MCR = maximum continuous rating

n = propeller rotational speed (rev./s)

n_n = nominal propeller rotational speed at MCR in free running condition (rev./s)

N_{class} = reference number of impacts per propeller rotational speed per ice class

N_{ice} = total number of ice loads on propeller blade for the ship's service life

N_R = reference number of load for equivalent fatigue stress (10^8 cycles)

N_Q = number of propeller revolutions during a milling sequence

$P_{0.7}$ = propeller pitch at 0.7R radius (m)

$P_{0.7n}$ = propeller pitch at 0.7R radius at MCR in free running condition (m)

$P_{0.7b}$ = propeller pitch at 0.7R radius at MCR in bollard condition (m)

Q = Torque (kNm)

Q_{emax} = maximum engine torque (kNm)

$Q_{\max}$ = maximum torque on the propeller resulting from propeller-ice interaction (kNm)

Q_{motor} = electric motor peak torque (kNm)

Q_n = nominal torque at MCR in free running condition (kNm)

Q_r = maximum response torque along the propeller shaft line (kNm)

Q_{smax} = maximum spindle torque of the blade for the ship's service life (kNm)

R = propeller radius (m)

r = blade section radius (m)

T = propeller thrust (kN)

T_b = maximum backward propeller ice thrust for the ship's service life (kN)

T_f = maximum forward propeller ice thrust for the ship's service life (kN)

T_n = propeller thrust at MCR in free running condition (kN)

T_r = maximum response thrust along the shaft line (kN)

t = maximum blade section thickness (m)

Z = number of propeller blades

α_i = duration of propeller blade/ice interaction expressed in rotation angle (deg)

γ_ε = the reduction factor for fatigue; scatter and test specimen size effect

γ_ν = the reduction factor for fatigue; variable amplitude loading effect

γ_m = the reduction factor for fatigue; mean stress effect

ρ = a reduction factor for fatigue correlating the maximum stress amplitude to the equivalent fatigue stress for 10^8 stress cycles

$\sigma_{0.2}$ = proof yield strength of blade material (MPa)

$\sigma_{\exp}$ = mean fatigue strength of blade material at 10^8 cycles to failure in sea water (MPa)

σ_{fat} = equivalent fatigue ice load stress amplitude for 10^8 stress cycles (MPa)

σ_{fl} = characteristic fatigue strength for blade material (MPa)

σ_{ref} = reference stress $\sigma_{ref} = 0.6 \cdot \sigma_{0.2} + 0.4 \cdot \sigma_u$ (MPa)

σ_{ref2} = reference stress (MPa)

$\sigma_{ref2} = 0.7 \cdot \sigma_u$ or $\sigma_{ref2} = 0.6 \cdot \sigma_{0.2} + 0.4 \cdot \sigma_u$ whichever is less

σ_{st} = maximum stress resulting from F_b or F_f (MPa)

σ_u = ultimate tensile strength of blade material (MPa)

$(\sigma_{ice})_{bmax}$ = principal stress caused by the maximum backward propeller ice load (MPa)

$(\sigma_{ice})_{fmax}$ = principal stress caused by the maximum forward propeller ice load (MPa)

$(\sigma_{ice})_{\max}$ = maximum ice load stress amplitude (MPa)

Table 3.20.15 Definition of loads

	Definition	Use of the load in design process
F_b	The maximum backward force on a propeller blade resulting from propeller/ice interaction for the ship's service life, including hydrodynamic loads on that blade. The direction of the force is perpendicular to 0.7R chord line. See **Figure 3.20.5**.	Design force for strength calculation of the propeller blade.
F_f	The maximum forward force on a propeller blade resulting from propeller/ice interaction for the ship's service life, including hydrodynamic loads on that blade. The direction of the force is perpendicular to 0.7R chord line.	Design force for calculation of strength of the propeller blade.
Q_{smax}	The maximum spindle torque on a propeller blade resulting from propeller/ice interaction for the ship's service life, including hydrodynamic loads on that blade.	In designing the propeller strength, the spindle torque is automatically taken into account because the propeller load is acting on the blade as distributed pressure on the leading edge or tip area.
T_b	The maximum thrust on propeller (all blades) resulting from propeller/ice interaction for the ship's service life. The direction of the thrust is the propeller shaft direction and the force is opposite to the hydrodynamic thrust.	Is used for estimation of the response thrust T_r. T_b can be used as an estimate of excitation for axial vibration calculations. However, axial vibration calculations are not required in the rules.
T_f	The maximum thrust on propeller (all blades) resulting from propeller/ice interaction for the ship's service life. The direction of the thrust is the propeller shaft direction acting in the direction of hydrodynamic thrust.	Is used for estimation of the response thrust T_r. T_f can be used as an estimate of excitation for axial vibration calculations. However, axial vibration calculations are not required in the rules.
$Q_{\max}$	The maximum ice-induced torque resulting from propeller/ice interaction on one propeller blade, including hydrodynamic loads on that blade.	Is used for estimation of the response torque (Q_r) along the propulsion shaft line and as excitation for torsional vibration calculations.
F_{ex}	Ultimate blade load resulting from blade loss through plastic bending. The force that is needed to cause total failure of the blade so that plastic hinge is caused to the root area. The force is acting on 0.8R. Spindle arm is to be taken as 2/3 of the distance between the axis of blade rotation and leading/trailing edge (whichever is he greater) at the 0.8R radius.	Blade failure load is used to dimension the blade bolts, pitch control mechanism, propeller shaft, propeller shaft bearing and trust bearing. The objective is to guarantee that total propeller blade failure should not cause damage to other components.
Q_r	Maximum response torque along the propeller shaft line, taking into account the dynamic behavior of the shaft line for ice excitation (torsional vibration) and hydrodynamic mean torque on propeller.	Design torque for propeller shaft line components.
T_r	Maximum response thrust along shaft line, taking into account the dynamic behavior of the shaft line for ice excitation (axial vibration) and hydrodynamic mean thrust on propeller.	Design thrust for propeller shaft line components.

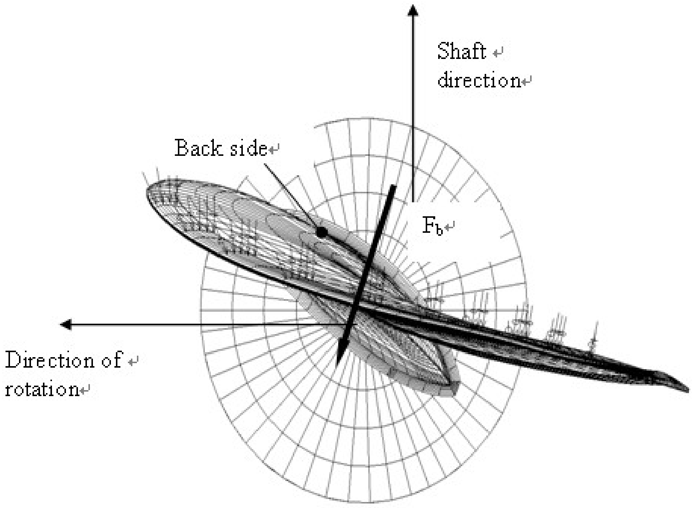

Fig 3.20.5 Direction of the backward blade force resultant taken perpendicular to chord line at radius 0.7R. (Ice contact pressure at leading edge is shown with small arrows)

603. Design ice conditions

In estimating the ice loads of the propeller for ice classes, different types of operation as given in **Table 3.20.16** were taken into account. For the estimation of design ice loads, a maximum ice block size is determined. The maximum design ice block entering the propeller is a rectangular ice block with the dimensions $H_{ice} \cdot 2H_{ice} \cdot 3H_{ice}$. The thickness of the ice block (H_{ice}) is given in **Table 3.20.17**.

Table 3.20.16 Type of operation of the ship per ice classes

Ice class	Operation of the ship
IA Super	Operation in ice channels and in level ice. The ship may proceed by ramming
IA, IB, IC, ID	Operation in ice channels

Table 3.20.17 The thickness of the ice block (H_{ice})

Ice class	IA Super	IA	IB	IC	ID
Thickness of the design maximum ice block entering the propeller (H_{ice})	1.75 m	1.5 m	1.2 m	1.0 m	1.0 m

604. Materials

1. Materials exposed to sea water

Materials of components exposed to sea water, such as propeller blades, propeller hubs, and thruster body, are to have an elongation of not less than 15 % on a test specimen, the gauge length of which is five times the diameter. A Charpy V impact test is to be carried out for materials other than bronze and austenite steel. An average impact energy value of 20 J taken from three tests is to be obtained at minus 10 ℃.

2. Materials exposed to sea water temperature

Materials exposed to sea water temperature are to be of ductile material. An average impact energy value of 20 J taken from three tests is to be obtained at minus 10 ℃. This requirement applies to blade bolts, CP mechanisms, shaft bolts, strut-pod connecting bolts etc. This does not apply to surface hardened components, such as bearings and gear teeth.

605. Design loads

1. The given loads are intended for component strength calculations only and are total loads including ice-induced loads and hydrodynamic loads during propeller/ice interaction.

2. The values of the parameters in the formulae in this Section is to be given in the units shown in **602.**

3. If the propeller is not fully submerged when the ship is in ballast condition, the propulsion system is to be designed according to ice class IA for ice classes IB, IC and ID.

4. Design loads on propeller blades

F_b is the maximum force experienced during the ship's service life that bends a propeller blade backwards when the propeller mills an ice block while rotating ahead. F_f is the maximum force experienced during the ship's service life that bends a propeller blade forwards when the propeller mills an ice block while rotating ahead. F_b and F_f originate from different propeller/ice interaction phenomena, not acting simultaneously. Hence they are to be applied to one blade separately.

(1) Maximum backward blade force F_b for open propellers

when $D \leq D_{\lim}$, $F_b = -27 \cdot [n \cdot D]^{0.7} \cdot \left[\frac{EAR}{Z}\right]^{0.3} \cdot D^2$ (kN)

when $D > D_{\lim}$, $F_b = -23 \cdot [n \cdot D]^{0.7} \cdot \left[\frac{EAR}{Z}\right]^{0.3} \cdot D \cdot H_{ice}^{1.4}$ (kN)

where,

$D_{\lim} = 0.85 \cdot [H_{ice}]^{1.4}$ (m)

n is the nominal rotational speed (at MCR free running condition) for a CP propeller and 85 % of the nominal rotational speed (at MCR free running condition) for a FP propeller.

(2) Maximum forward blade force F_f for open propellers

when $D \leq D_{\lim}$, $F_f = 250 \cdot \left[\frac{EAR}{Z}\right] \cdot D^2$ (kN)

when $D > D_{\lim}$, $F_f = 500 \cdot \left[\frac{1}{(1-\frac{d}{D})}\right] \cdot H_{ice} \cdot \left[\frac{EAR}{Z}\right] \cdot D$ (kN)

where,

$D_{\lim} = \left[\frac{2}{(1-\frac{d}{D})}\right] \cdot H_{ice}$ (m).

(3) Loaded area on the blade for open propellers
Load cases 1-4 have to be covered, as given in **ANNEX 3-5 Table 1** of the Guidance, for CP and FP propellers. In order to obtain blade ice loads for a reversing propeller, load case 5 also has to be covered for FP propellers.

(4) Maximum backward blade force F_b for ducted propellers

when $D \le D_{\text{lim}}$, $F_b = -9.5 \cdot \left[\frac{EAR}{Z}\right]^{0.3} \cdot [n \cdot D]^{0.7} \cdot D^2$ (kN)

when $D > D_{\text{lim}}$, $F_b = -66 \cdot \left[\frac{EAR}{Z}\right]^{0.3} \cdot [n \cdot D]^{0.7} \cdot D^{0.6} \cdot [H_{ice}]^{1.4}$ (kN)

where,

$D_{\text{lim}} = 4 \cdot H_{ice}$

n is the nominal rotational speed (at MCR in free running condition) for a CP propeller and 85 % of the nominal rotational speed (at MCR in free running condition) for an FP propeller

(5) Maximum forward blade force F_f for ducted propellers

when $D \le D_{\text{lim}}$, $F_f = 250 \cdot \left[\frac{EAR}{Z}\right] \cdot D^2$ (kN)

when $D > D_{\text{lim}}$, $F_f = 500 \cdot \left[\frac{EAR}{Z}\right] \cdot D \cdot \frac{1}{\left[1 - \frac{d}{D}\right]} \cdot H_{ice}$ (kN)

where,

$D_{\text{lim}} = \frac{2}{\left[1 - \frac{d}{D}\right]} \cdot H_{ice}$ (m)

(6) Loaded area on the blade for ducted propellers
Load cases 1 and 3 have to be covered as given in **ANNEX 3-5 Table 2** of the Guidance for all propellers, and an additional load case (load case 5) for an FP propeller, to cover ice loads when the propeller is reversed.

(7) Maximum blade spindle torque Qsmax for open or ducted propellers
The spindle torque Q_{smax} around the axis of the blade fitting is to be determined both for the maximum backward blade force F_b and forward blade force F_f, which are applied as in **ANNEX 3-5 Table 1** and **Table 2** of the Guidance.
If the above method gives a value which is less than the default value given by the formula below, the default value is to be used.

Default Value $Q_{smax} = 0.25 \cdot F \cdot c_{0.7}$ (kNm)

where,

$c_{0.7}$ is the chord length of the blade section at 0.7R radius and F is either F_b or F_f, whichever has the greater absolute value.

(8) Load distributions for blade loads

The Weibull-type distribution (probability that F_{ice} exceeds $(F_{ice})_{\max}$), as given in **Fig 3.20.6**, is used for the fatigue design of the blade.

$$P\left(\frac{F_{ice}}{(F_{ice})_{\max}} \geq \frac{F}{(F_{ice})_{\max}}\right) = e^{\left(-\left(\frac{F}{(F_{ice})_{\max}}\right)^k \cdot \ln(N_{ice})\right)}$$

where k is the shape parameter of the spectrum, N_{ice} is the number of load cycles in the spectrum, and F_{ice} is the random variable for ice loads on the blade, $0 \leq F_{ice} \leq (F_{ice})_{\max}$. The shape parameter $k = 0.75$ is to be used for the ice force distribution of an open propeller blade and the shape parameter $k = 1.0$ for that of a ducted propeller blade.

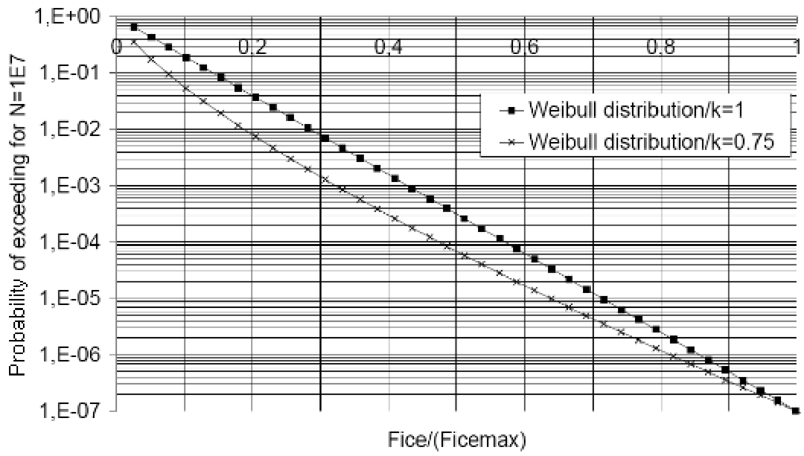

Figure 2.30.6 The Weibull-type distribution (probability that (F_{ice} exceeds $(F_{ice})_{max}$) that is used for fatigue design.

(9) Number of ice loads

The number of load cycles per propeller blade in the load spectrum is to be determined according to the formula:

$$N_{ice} = k_1 \cdot k_2 . k_3 . k_4 \cdot N_{class} n,$$

where,

Reference number of loads for ice classes N_{class}

Class	IA Super	IA	IB	IC	ID
impacts for the ship's service life $/n$	$9 \cdot 10^6$	$6 \cdot 10^6$	$3.4 \cdot 10^6$	$2.1 \cdot 10^6$	$2.1 \cdot 10^6$

Propeller location factor k_1

Location	Center propeller	Wing propeller
k_1	1	1.35

Propeller type factor k_2

type	open	ducted
k_2	1	1.1

Propulsion type factor k_3

type	fixed	azimuthing
k_3	1	1.2

The submersion factor k4 is determined from the equation

$$k_4 = 0.8 - f \quad \text{when } f < 0$$
$$= 0.8 - 0.4 \cdot f \quad \text{when } 0 \le f \le 1$$
$$= 0.6 - 0.2 \cdot f \quad \text{when } 1 < f \le 2.5$$
$$= 0.1 \quad \text{when } f > 2.5$$

where the immersion function f is:

$$f = \frac{h_0 - H_{ice}}{D/2} - 1$$

where h_0 is the depth of the propeller centerline at the lower ice waterline (LIWL) of the ship.

For components that are subject to loads resulting from propeller/ice interaction with all the propeller blades, the number of load cycles (N_{ice}) is to be multiplied by the number of propeller blades (Z).

5. Axial design loads for propellers

(1) Maximum ice thrust on propeller T_f and T_b for propellers

The maximum forward and backward ice thrusts are:

$$T_f = 1.1 \cdot F_f \quad \text{(kN)}$$
$$T_b = 1.1 \cdot F_b \quad \text{(kN)}$$

(2) Design thrust along the propulsion shaft line for propellers
The design thrust along the propeller shaft line is to be calculated with the formulae below. The greater absolute value of the forward and backward direction loads is to be taken as the design load for both directions. The factors 2.2 and 1.5 take into account the dynamic magnification resulting from axial vibration.

In a forward direction $T_r = T + 2.2 \cdot T_f$ (kN)

In a backward direction $T_r = 1.5 \cdot T_b$ (kN)

If hydrodynamic bollard thrust, T, is not known, T is to be taken as follows:

Table 3.20.18 Propeller bollard thrust T

Propeller Type	T
CP propellers (open)	$1.25 \cdot T_n$
CP propellers (ducted)	$1.1 \cdot T_n$
FP propellers driven by turbine or electric motor	T_n
FP propellers driven by diesel engine (open)	$0.85 \cdot T_n$
FP propellers driven by diesel engine (ducted)	$0.75 \cdot T_n$

T_n = nominal propeller thrust at MCR at free running open water conditions

6. Torsional design loads

(1) Design ice torque on propeller $Q_{\max}$ for open propellers
$Q_{\max}$ is the maximum torque on a propeller resulting from ice/propeller interaction.

when $D \le D_{\lim}$, $Q_{\max} = 10.9 \cdot [1-\frac{d}{D}] \cdot [\frac{P_{0.7}}{D}]^{0.16} \cdot [nD]^{0.17} \cdot D^3$ (kNm)

when $D > D_{\lim}$, $Q_{\max} = 20.7 \cdot [1-\frac{d}{D}] \cdot [\frac{P_{0.7}}{D}]^{0.16} \cdot [nD]^{0.17} \cdot D^{1.9} \cdot H_{ice}^{1.1}$ (kNm)

where

$D_{\lim} = 1.8 \cdot H_{ice}$ (m).

n is the rotational propeller speed in bollard condition. If not known, n is to be taken as follows:

Table 3.20.19 The rotational propeller speed at bollard condition value n

Propeller type	Rotational speed n
CP propellers	n_n
FP propellers driven by turbine or electric motor	n_n
FP propellers driven by diesel engine	$0.85 \cdot n_n$

Here, n_n is the nominal rotational speed at MCR in free running condition.

For CP propellers, propeller pitch, $P_{0.7}$ is to correspond to MCR in bollard condition. If not known, $P_{0.7}$ is to be taken as $0.7 \cdot P_{0.7n}$, where $P_{0.7n}$ is propeller pitch at MCR in free running condition.

(2) Design ice torque on propeller $Q_{\max}$ for ducted propellers
$Q_{\max}$ is the maximum torque on a propeller resulting from ice/propeller interaction.

when $D \le D_{\lim}$, $Q_{\max} = 7.7 \cdot [1-\frac{d}{D}] \cdot [\frac{P_{0.7}}{D}]^{0.16} \cdot [nD]^{0.17} \cdot D^3$ (kNm) when $D > D_{\lim}$, $Q_{\max} = 14.6 \cdot [1 - \frac{d}{D}] \cdot [\frac{P_{0.7}}{D}]^{0.16} \cdot [nD]^{0.17} \cdot D^{1.9} \cdot H_{ice}^{1.1}$ (kNm)

where

$D_{\lim} = 1.8 \cdot H_{ice}$ (m)

n is the rotational propeller speed in bollard condition. If not known, n is to be taken as follows:

Table 3.20.20 The rotational propeller speed at bollard condition value n

Propeller type	Rotational speed n
CP propellers	n_n
FP propellers driven by turbine or electric motor	n_n
FP propellers driven by diesel engine	$0.85 \cdot n_n$

Here, n_n is the nominal rotational speed at MCR in free running condition.

For CP propellers, propeller pitch, $P_{0.7}$ is to correspond to MCR in bollard condition. If not known, $P_{0.7}$ is to be taken as $0.7 \cdot P_{0.7n}$, where $P_{0.7n}$ is propeller pitch at MCR in free running condition.

(3) Ice torque excitation for propellers
The propeller ice torque excitation for shaft line transient torsional vibration analysis is to be described by a sequence of blade impacts which are of a half sine shape; see **ANNEX 3-5 Fig 2** of the Guidance.
The torque resulting from a single blade ice impact as a function of the propeller rotation angle is then

$Q(\varphi) = C_q \cdot Q_{\max} \cdot \sin(\varphi(180/\alpha_i))$ when $\varphi = 0 ... \alpha_i$

$Q(\varphi) = 0$ when $\varphi = \alpha_i .....360$

where C_q and α_i parameters are given in table below. α_i is duration of propeller blade/ice interaction expressed in propeller rotation angle.

Table 3.21.21 C_q and α_i parameters

Torque excitation	Propeller-ice interaction	C_q	α_i
Case 1	Single ice block	0.75	90
Case 2	Single ice block	1.0	135
Case 3	Two ice blocks (phase shift 360/2/Z deg.)	0.5	45

The total ice torque is obtained by summing the torque of single blades, taking into account the

phase shift 360deg./Z. In addition, at the beginning and at the end of the milling sequence a linear ramp functions for 270 degrees of rotation angle shall be used.
The number of propeller revolutions during a milling sequence is to be obtained with the formula:

$$N_Q = 2 \cdot H_{ice}$$

The number of impacts is $Z \cdot N_Q$ for blade order excitation.

(4) Design torque along propeller shaft line
If there is not any relevant first blade order torsional resonance within the designed operating rotational speed range extended 20% above the maximum and 20% below the minimum operating speeds, the following estimation of the maximum torque can be used.

$$Q_r = Q_{emax} + Q_{\max} \cdot \frac{I}{I_t} \quad \text{(kNm)}$$

Where, I is equivalent mass moment of inertia of all parts on engine side of component under consideration and It is equivalent mass moment of inertia of the whole propulsion system, all the torques and the inertia moments are to be reduced to the rotation speed of the component being examined.
If the maximum torque, Q_{emax} , is not known, it is to be taken as follows:

Table 3.20.22 the maximum torque Q_{emax}

Propeller type	Q_{emax}
Propellers driven by electric motor(FP and CP)	Q_{motor}
CP propellers driven by prime movers other than electric motor	Q_n
FP propellers driven by turbine	Q_n
FP propellers driven by diesel engine	$0.75 \cdot Q_n$

Here, Q_{motor} is the electric motor peak torque.

If there is a first blade order torsional resonance within the designed operating rotational speed range extended 20 % above the maximum and 20 % below the minimum operating speeds, the design torque (Q_r) of the shaft component is to be determined by means of torsional vibration analysis of the propulsion line.

7. Blade failure load

The ultimate load resulting from blade failure as a result of plastic bending around the blade root is to be calculated with the formula below. The ultimate load is acting on the blade at the 0.8 R radius in the weakest direction of the blade. For calculation of the extreme spindle torque, the spindle arm is to be taken as 2/3 of the distance between the axis of blade rotation and the leading/trailing edge (whichever is the greater) at the 0.8 R radius.

$$F_{ex} = \frac{300 \cdot c \cdot t^2 \cdot \sigma_{ref}}{0.8 \cdot D - 2 \cdot r} \quad \text{(kN)}$$

where,

$\sigma_{ref} = 0.6 \cdot \sigma_{0.2} + 0.4 \cdot \sigma_u$

c, t, and r are, respectively, the length, thickness, and radius of the cylindrical root section of the blade at the weakest section outside the root filet.

606. Design

1. Design principle

The strength of the propulsion line is to be designed according to the pyramid strength principle. This means that the loss of the propeller blade shall not cause any significant damage to other propeller shaft line components.

2. Propeller blade

(1) Calculation of blade stresses
The blade stresses is to be calculated for the design loads given in Section **605. 4**. Finite element analysis is to be used for stress analysis for final approval for all propellers. The following simplified formulae can be used in estimating the blade stresses for all propellers at the root area ($r/R < 0.5$). The root area dimensions based on following formula can be accepted even if the FEM analysis would show greater stresses at the root area.

$$\sigma_{st} = C_1 \cdot \frac{M_{BL}}{100 \cdot ct^2} \text{ (MPa)}$$

where,

constant C_1 is the $\frac{actual\ stress}{stress\ obtained\ with\ beam\ equation}$.

If the actual value is not available, C_1 should be taken as 1.6.

$M_{BL} = (0.75 - r/R) \cdot R \cdot F$, for relative radius $r/R < 0.5$

F is the maximum of F_b and F_f, whichever is greater absolute value.

(2) Acceptability criterion
The following criterion for calculated blade stresses has to be fulfilled.

$$\frac{\sigma_{ref2}}{\sigma_{st}} \geq 1.5$$

where,

σ_{st} is the calculated stress for the design loads. If FEM analysis is used in estimating the stresses, von Mises stresses are to be used.

σ_{ref2} is the reference stress, defined as:

$\sigma_{ref2} = 0.7 \cdot \sigma_u$ or $\sigma_{ref2} = 0.6 \cdot \sigma_{0.2} + 0.4 \cdot \sigma_u$, whichever is less.

(3) Fatigue design of propeller blade
The fatigue design of the propeller blade is based on an estimated load distribution for the service life of the ship and the S-N curve for the blade material. An equivalent stress that produces the same fatigue damage as the expected load distribution shall be calculated and the acceptability criterion for fatigue should be fulfilled as given in this Section. The equivalent stress is normalized for 10^8 cycles.
If the following criterion is fulfilled, fatigue calculations according to this Section are not required.

$$\sigma_{\exp} \geq B_1 \cdot \sigma_{ref}^{B_2} \cdot \log(N_{ice})^{B_3}$$

where, B_1, B_2 and B_3 coefficients for propellers are given in the table below.

Table 3.20.23 B_1, B_2 and B_3 coefficients

	Open propeller	Ducted propeller
B_1	0.00270	0.00184
B_2	1.007	1.007
B_3	2.101	2.470

For calculation of equivalent stress two types of S-N curves are available.
- Two slope S-N curve (slopes 4.5 and 10), see **Fig 3.20.7**.
- One slope S-N curve(the slope can be chosen), see **Fig 3.20.8**.

The type of the S-N curve is to be selected to correspond to the material properties of the blade. If S-N curve is not known, the two slope S-N curve is to be used.

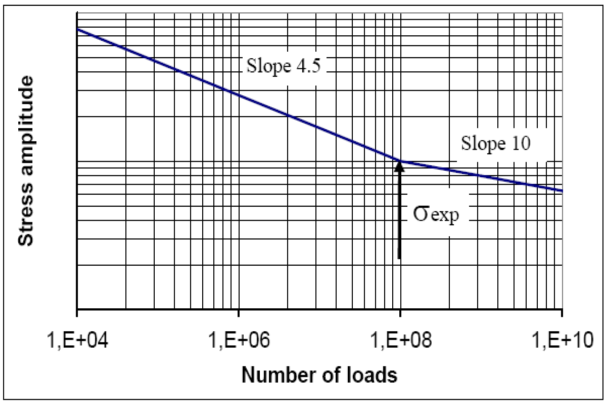

Fig 3.20.7 Two-slope S-N curve

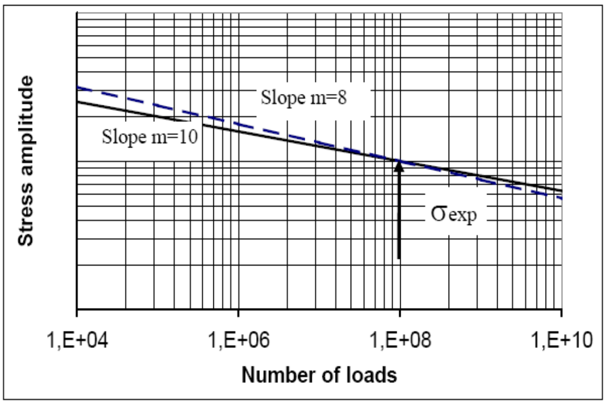

Fig 3.20.8 Constant-slope S-N curve

(A) Equivalent fatigue stress
The equivalent fatigue stress for 10^8 stress cycles which produces the same fatigue damage as the load distribution is:

$$\sigma_{fat} = \rho \cdot (\sigma_{ice})_{\max}$$

where,

$(\sigma_{ice})_{\max} = 0.5 \cdot [(\sigma_{ice})_{f\max} - (\sigma_{ice})_{b\max}]$

$(\sigma_{ice})_{\max}$ is the mean value of the principal stress amplitudes resulting from design forward and backward blade forces at the location being studied

$(\sigma_{ice})_{f\max}$ is the principal stress resulting from forward load

$(\sigma_{ice})_{b\max}$ is the principal stress resulting from backward load

In calculation of $(\sigma_{ice})_{\max}$, case 1 and case 3 (or case 2 and case 4) in **ANNEX 3-5** of the Guidance are considered as a pair for $(\sigma_{ice})_{f\max}$, and $(\sigma_{ice})_{b\max}$ calculations. Case 5 is excluded from the fatigue analysis.

(B) Calculation of ρ parameter for two-slope S-N curve
The parameter ρ relates the maximum ice load to the distribution of ice loads according to

the regression formulae.

$$\rho = C_1 \cdot (\sigma_{ice})_{\max}^{C_2} \cdot \sigma_{fl}^{C_3} \cdot \log(N_{ice})^{C_4}$$

where,

$\sigma_{fl} = \gamma_\varepsilon \cdot \gamma_\nu \cdot \gamma_m \cdot \sigma_{\exp}$,

where,

γ_ε is the reduction factor for scatter and test specimen size effect

γ_ν is the reduction factor for variable amplitude loading

γ_m is the reduction factor for mean stress

$\sigma_{\exp}$ is the mean fatigue strength of the blade material at 10^8 cycles to failure in seawater.

The following values should be used for the reduction factors if actual values are not available: γ_ε = 0.67, γ_ν = 0.75, and γ_m = 0.75.

The coefficients C_1, C_2, C_3, and C_4 are given in **Table 3.20.24**.

Table 3.20.24 The coefficients C_1, C_2, C_3, and C_4

	Open propeller	Ducted propeller
C_1	0.000711	0.000509
C_2	0.0645	0.0533
C_3	- 0.0565	- 0.0459
C_4	2.22	2.584

(C) Calculation of ρ parameter for constant-slope S-N curve

For materials with a constant-slope S-N curve(see **Fig 3.20.8**), the ρ factor is to be calculated with the following formula:

$$\rho = \left(G \cdot \frac{N_{ice}}{N_R}\right)^{1/m} (\ln(N_{ice}))^{-1/k}$$

where,

k is the shape parameter of the Weibull distribution k = 1.0 for ducted propellers and k = 0.75 for open propellers.

N_R is the reference number of load cycles (=10^8)

Values for the G parameter are given in **Table 3.20.25**.

Linear interpolation may be used to calculate the G value for other m/k ratios than given in the **Table 3.20.25**.

Table 3.20.25 Value for the G parameter for different m/k ratios

m/k	G	m/k	G	m/k	G
3	6	5.5	287.9	8	40320
3.5	11.6	6	720	8.5	119292
4	24	6.5	1871	9	362880
4.5	52.3	7	5040	9.5	1.133E6
5	120	7.5	14034	10	3.623E6

(4) Acceptability criterion for fatigue
The equivalent fatigue stress at all locations on the blade has to fulfil the following acceptability criterion.

$$\frac{\sigma_{fl}}{\sigma_{fat}} \geq 1.5$$

where,

$$\sigma_{fl} = \gamma_\varepsilon \cdot \gamma_\nu \cdot \gamma_m \cdot \sigma_{\exp}$$

where,

γ_ε is the reduction factor for scatter and test specimen size effect

γ_ν is the reduction factor for variable amplitude loading

γ_m is the reduction factor for mean stress

$\sigma_{\exp}$ is the mean fatigue strength of the blade material at 10^8 cycles to failure in seawater.

The following values should be used for the reduction factors if actual values are not available: γ_ε = 0.67, γ_ν = 0.75, and γ_m = 0.75.

3. Propeller bossing and CP mechanism

The blade bolts, the CP mechanism, the propeller boss, and the fitting of the propeller to the propeller shaft is to be designed to withstand the maximum and fatigue design loads, as defined in **605**. The safety factor against yielding is to be greater than 1.3 and that against fatigue greater than 1.5. In addition, the safety factor for loads resulting from loss of the propeller blade through plastic bending as defined in **605. 7** is to be greater than 1.0 against yielding.

4. Propulsion shaft line

The shafts and shafting components, such as the thrust and stern tube bearings, couplings, flanges and sealings, are to be designed to withstand the propeller/ice interaction loads as given in **605.** The safety factor is to be at least 1.3.

(1) Shafts and shafting components
The ultimate load resulting from total blade failure as defined in **605. 7** should not cause yielding in shafts and shaft components. The loading shall consist of the combined axial, bending, and torsion loads, wherever this is significant. The minimum safety factor against yielding is to be 1.0 for bending and torsional stresses.

5. Azimuthing main propulsors

In addition to the above requirements, special consideration is to be given to those loading cases which are extraordinary for propulsion units when compared with conventional propellers. The estimation of loading cases has to reflect the way of operation of the ship and the thrusters. In this respect, for example, the loads caused by the impacts of ice blocks on the propeller hub of a pulling propeller have to be considered. Furthermore, loads resulting from the thrusters operating at an oblique angle to the flow have to be considered. The steering mechanism, the fitting of the unit, and the body of the thruster are to be designed to withstand the loss of a blade without damage. The loss of a blade is to be considered for the propeller blade orientation which causes the maximum load on the component being studied. Typically, top-down blade orientation places the maximum bending loads on the thruster body.

Azimuth thrusters are to also be designed for estimated loads caused by thruster body/ice interaction. The thruster body has to stand the loads obtained when the maximum ice blocks, which are given in **603.**, strike the thruster body when the ship is at a typical ice operating speed. In addition, the design situation in which an ice sheet glides along the ship's hull and presses against the thruster body should be considered. The thickness of the sheet should be taken as the thickness of the maximum ice block entering the propeller, as defined in **603.**

6. Vibrations

The propulsion system is to be designed in such a way that the complete dynamic system is free from harmful torsional, axial, and bending resonances at a 1-order blade frequency within the designed running speed range, extended by 20 percent above and below the maximum and minimum operating rotational speeds. If this condition cannot be fulfilled, a detailed vibration analysis has to be carried out in order to determine that the acceptable strength of the components can be achieved.

607. Alternative design procedure

1. Scope

As an alternative to **605.** and **606.**, a comprehensive design study may be carried out to the satisfaction of the society. The study has to be based on ice conditions given for different ice classes in **603.** It has to include both fatigue and maximum load design calculations and fulfil the pyramid strength principle, as given in **606. 1.**

2. Loading

Loads on the propeller blade and propulsion system are to be based on an acceptable estimation of hydrodynamic and ice loads.

3. Design levels

(1) The analysis is to indicate that all components transmitting random (occasional) forces, excluding propeller blade, are not subjected to stress levels in excess of the yield stress of the component material, with a reasonable safety margin.
(2) Cumulative fatigue damage calculations are to indicate a reasonable safety factor. Due account is to be taken of material properties, stress raisers, and fatigue enhancements.
(3) Vibration analysis is to be carried out and is to indicate that the complete dynamic system is free from harmful torsional resonances resulting from propeller/ice interaction.

Section 7 Miscellaneous Machinery Requirements

701. Starting arrangements

1. The capacity of the air receivers is to be sufficient to provide without reloading not less than 12 consecutive starts of the propulsion engine, if this has to be reversed for going astern, or 6 consecutive starts if the propulsion engine does not have to be reversed for going astern.

2. If the air receivers serve any other purposes than starting the propulsion engine, in addition to the capacity required by **Par 1**, they are to have a sufficient capacity for these purposes.

3. The capacity of the air compressors is to be sufficient for charging the air receivers from at-mo-spheric to full pressure in one (1) hour as specified in **Pt 5, Ch 6, 1101.**, except for a ship with the ice class IA Super, if its propulsion engine has to be reversed for going astern, in which case the compressor is to be able to charge the receivers in half an hour.

702. Sea inlet and cooling water systems

1. The cooling water system is to be designed to ensure supply of cooling water when navigating in ice.

2. To satisfy **Par 1**, at least one cooling water inlet chest is to be arranged as follows. However, the ship with ice class ID may not comply with the requirements in (2), (3) and (5).

(1) The sea inlet is to be situated near the centerline of the ship and well aft if possible.
(2) As guidance for design, the volume of the chest is to be about 1 m^3 for every 750 kW engine output of the ship including the output of auxiliary engines necessary for the ship's service.
(3) The chest is to be sufficiently high to allow ice to accumulate above the inlet pipe.
(4) A pipe for discharge cooling water, allowing full capacity circulate, is to be connected to the chest.
(5) The open area of the strainer plates is not to be less than four (4) times the inlet pipe sectional area.

3. If there are difficulties to meet the requirements of **Par 2** (2) and (3), two smaller chests may be arranged for alternating intake and discharge of cooling water. In this case, the requirements in **Par 2** (1), (4) and (5) are to be complied with.

4. Heating coils may be installed in the upper part of the sea chest.

5. Arrangements for using ballast water for cooling purposes may be useful as a reserve in ballast condition but cannot be accepted as a substitute for sea inlet chest as described above. ⚓

CHAPTER 21 ADDITIONAL REQUIREMENTS TO SHIPS FOR NAVIGATION IN POLAR WATERS

The ships constructed of steel and intended for navigation in ice-infested polar waters are to be specially considered as deemed appropriate by this Society. ⚓

CHAPTER 22 VESSELS FOR POLAR AND ICE BREAKING SERVICE

The vessels for polar and ice breaking service are to be specially considered as deemed appropriate by this Society. ⚓

KOREAN REGISTER

2011

Guidance Relating to the Rules for the Classification of Steel Ships

Part 3

Hull Structures

GA-03-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF the Guidance

This "Guidance relating to the Rules for the Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF PART 3 "HULL STRUCTURES"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date : 10 January 2011

Chapter 15 DEEP TANKS

Section 2 Bulkheads of Deep Tank
- 202. and 203. 4 have been newly added.

Effective Date : 1 July 2011

Chapter 1 GENERAL

Section 8 Corrosion protection coating
- 803. has been amended.

Chapter 4 PLATE KEELS AND SHELL PLATINGS

Section 1 General
- 103. has been amended.

Chapter 5 DECKS

Section 3 Deck plating
- 307. has been newly added.

Chapter 7 DOUBLE BOTTOMS

Section 1 General
- 101. 8 has been amended.

Chapter 20 STRENGTHENING FOR NAVIGATION IN ICE

Section 2 Ice strengthening
- 201. has been amended.

Section 5 Rudder and steering arrangements
- has been newly added.

Chapter 21 ADDITIONAL REQUIREMENTS TO SHIPS FOR NAVIGATION IN POLAR WATERS

Section 1 Polar class descriptions and application
- 104. has been amended.

Annex 3-2 GUIDANCE FOR THE DIRECT STRENGTH ASSESSMENT

III Guidance for the Hold Analysis

- 3. 5 (C) has been amended.

Annex 3-4 GUIDANCE FOR THE HULL CONSTRUCTION MONITORING PROCEDURE

- 3. (3) (E) has been amended.
- 4. (1) (F) has been deleted.
- 4. (3) (D) has been amended.

CONTENTS

<ANNEX>

CHAPTER 1 GENERAL

Section 1 Definitions

101. Application

L, B, D, D_s, d and other significant scantlings have two significant figures and third figure is raised to a unit. However, scantling depth D and scantling draft d for freeboard have three significant figures and fourth figure is raised to a unit.

102. Length

1. When the length of ship is measured, the end of stern is from the midpart of the rudder stock regarded as which has not a rudder post when it is not elongated from the upper part of stern post to heel part. In case of simplex rudder, end of stern is from the midpart of rudder stock.

2. For the length of ship for freeboard, when 96 % of the length is larger than L_{pp}, end part of L is the 0.96 L_{WL} abaft part from the end of stern.

3. For ships which have not rudder post or rudder stock, (for example, ships having Voith-Schneider propeller) L is the 96 % of length for freeboard and end of stern is as follows above mentioned **Par 2.**

4. When the difference is not much than 300 mm between designed load line and draft of assigned freeboard, the length of ship and overall length of load line are regarded as a designed load line. And when the difference is not less than 300 mm, those are regarded as assigned draft.

5. When the difference is not much than 300 mm between the scantling draft (d_s) and designed load line, the length of ship and overall length of load line are regarded as a designed load line. And when the difference is not less than 300 mm, those are regarded as d_s.

104. Breadth

For ships having inclined shipline, breadth(B) used of the Rules is as following;

1. Double bottom

b in **Fig 3.1.1** is to be used instead of breadth B

2. Longitudinal strength

B_w on the same line to load line is to be used instead of breadth B

3. Equipment number

The breadth of ship B is to be used.

106. Depth

1. For the depth of ships having a rounded gunwale, depth is the distance to the conjunction point of the elongated line to end point of R and elongated line to inside face of side plate.(See **Fig 3.1.2**)

2. For the ships having multiple deck, "freeboard deck", specified in **114. 3** of the Rules, only used for calculating depth in accordance with the Rules. Freeboard deck used for assigning load line may use the upper deck than the above mentioned deck.

107. Depth for strength computation

If the lowest point of sheer is not located in the center of L, depth for strength calculation (D_s) is the minimum depth to strength deck between 0.4L of the midship.

Section 2 General

201. Application

For the ships classed for restricted service area, special consideration for hull construction and equipment of the ship is to be as followings.

1. Decreasing for scantlings of structural members is in accordance with **Table 3.1.1** in this Guidance and for the other members may be properly decreased in accordance with **Table 3.1.1.** However, for scantlings of the beams be loaded the cargo on, the weather deck beams be loaded timber cargoes on, the inner bottom and longitudinals attached to inner bottom and deep tanks, is not to be decreased.

2. The height of sills of access opening is to be in accordance with the following **Table 3.1.2.** However, ships engaged in international voyage are not applied to.

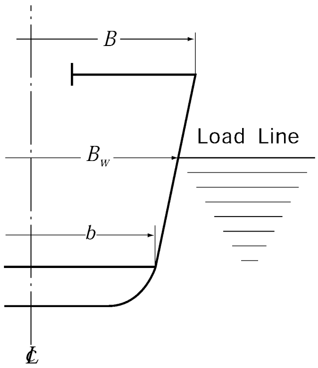

Fig 3.1.1

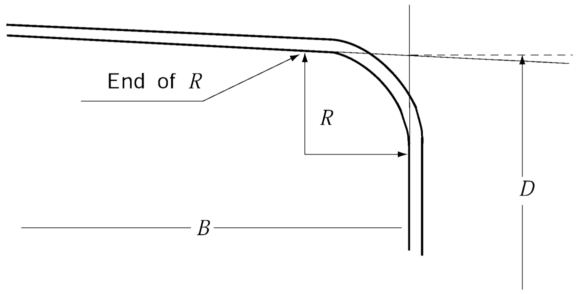

Fig 3.1.2

Table 3.1.1 Minimum dimension and lightening of the members

Items		Coastal services	Smooth water services	Minimum dimension
Longitudinal strength	Wave load(M_w & F_w)	20 %	30 %	—
	Z_{min}	10 %	15 %	—
Shell plating (including plate keels)		5 %	10 %	6 mm (excluding superstructure)
Min. thickness of deck		1 mm	1 mm	5 mm
Section modulus of frame		10 %	20 %	30 cm^3
Section modulus of deck beam		15 %	15 %	—
Section modulus of girder under deck		15 %	15 %	—
Plate thickness of double bottom		1 mm	1 mm	5.5 mm
Plate thickness. of single bottom		0.5 mm	10% or 1 mm whichever is smaller	—
Plate thickness of B.H.D of superstructure end and section modulus of B.H.D stiffeners		10 %	1 0 %	—

Note:
1. For the ships engaging in international services may not be lightened the thickness of B.H.D of superstructure end and section modulus of B.H.D stiffeners.
2. Z_{min} & M_w : refer to **Table 3.3.1** of the Rules
   F_w : refer to **Ch 3, 301** of the Rules.

Table 3.1.2 Height of door sills of hatch coaming and access doors.

Service area \ Type \ Position		General hatch opening	Small hatch opening(Area)		Elevator door E/R entrance	Access door of superstructure end	Ventilation tunnel
			$0.45 \sim 1.5\ m^2$	Not exceeding 0.45 m2			
Smooth sea water area	I	600	450	380	450	380	900
	II	450	380	230	300	300	760
Fresh water area	I	450	380	230	300	300	760
	II	300	230	180	100	100	450

3. Equipment and equipment number is to be in accordance with **Pt 4, Ch 8** of the Rules.

203. Ships of unusual form or proportion, or intended for carriage of special cargoes

1. Timber carrier

(1) Ships marked timber load line, when the difference between timber load line and d in **110.** of the Rules is not much than 300 mm, may be use L, Δ and C_b corresponding to the value of d. However, if the difference is not less than 300 mm, ships is to be used L, Δ and C_b corresponding to the timber load line.

(2) Ships intended for carrying timber cargoes without timber load line mark, is to be complied with the following (3).

(3) For the hull structure of timber carrier is to be protected with complying to the followings. However, for timber carrier only carrying the packaged timber, the followings may be properly considered excepting (H).

(A) Welding structure (**Ch 1, Sec 5** of the Rules)
For the welding of the member impacted by the cargoes, it is to be double continuous welding(at least F2). However, when the bottom ceilings are provided, welding for structural member of double bottom tank top is not to be continuous welding.

(B) Deck girders and hatch end girders (**Ch 11** of the Rules)
For deck girders and hatch end girders of side hatch, tripping bracket having 1.5 m spacing is to be provided and free edges are to be flanged.

(C) Protection of watertight bulkhead (**Ch 14** of the Rules)
Hold bulkhead of ships of 130 m or less in length is preferably not to be of corrugated type but of plane type. One side of plane type bulkhead not fitted with stiffeners and on both sides of corrugated type bulkhead, special protection is to be made by providing square section wooden bars(250 mm × 250 mm) or steel angle bars, etc. at proper intervals. Protection of bulkhead stiffeners is to be in accordance with the following (F).

(D) The structure of hatch opening, machinery opening(**Pt 4, Ch 2** of the Rules) and hatch coamings of other deck opening is to be strongly constructed.

(E) Bulwarks (**Pt 4, Ch 4** of the Rules)
It is recommended that area of freeing ports provided on bulwarks is to be as small as possible in way of hatchway and the area is to be increased in other parts so as to maintain the total required freeing port area.

(F) Protection of hold frames
Protection method of hold frames is to be in accordance with the following. However, this protection may be dispensed with for ships exceeding 130 m in length.

(a) Hold frames are to be stiffened by one of the followings.

(i) Longitudinal stiffeners or tripping brackets are to be fitted at intervals of about 2 m.

(ii) Angle bars are to be fitted longitudinally at intervals of about 1.5 m on flange surface of hold frames.

(iii) Flat bars of about 150 mm wide × 10 mm thick are to be fitted longitudinally at intervals of about 0.5 m on flange surface of hold frames.

(b) Angle bars or flat bars (in case of flat bars, at least 2 tiers) are to be fitted longitudinally on flange surface of tank side brackets or of the lower bracket of hold frames of bulk carrier type ships. However, the above requirements may be dispensed with where thickness and breadth of flange of hold frames of bulk carrier type ships are not less than that determined by the followings.

(i) Thickness of bracket t is in accordance with **604.** of the Rules. However, the length of bracket arms is to be in accordance with **Fig 3.1.3.**

(ii) Breadth of free edges of bracket is to be obtained from the following formula.

$$b = 128\sqrt{d_0 l} \quad \text{(mm)}$$

d_0 = depth of throat of bracket as specified in **Fig 3.1.3.** (m)

l = length of flange of bracket as specified in **Fig 3.1.3.** (m)

(iii) For abaft and aft peaks and other parts, where the frames is provided beneath of hatch, it is to be properly compensated.

(iv) Where the projected part is large as like as deep frames in the hold, special consideration is to be given for the dimension and provision of tripping bracket.

(G) Painting
For the inside of hold, all hull structural members below the point of 150 mm above the top of tank side brackets (including shell plate and piping) are to be coated with tarepoxy paint or other similar paint of good quality not easily peeling off.

(H) Air pipes, ladders, weathertight doors and equipment fitted on hull structural members which are liable to cause damage due to impact of cargoes are to be properly protected.

(I) Protection of hatch covers
Hatch covers are to be protected from timber by dunnage, etc. and to be fitted with the devices to prevent from moving due to the ship's motion such as rolling, pitching, etc. In case of hatch covers with gasket, the devices for preventing gasket from excessive compression by timber loads are to be provided.

2. Ships having an unusual large freeboard and an unusual large height from the load line to strength deck.

(1) "Ships having an unusual large freeboard" is the ships having a actual summer freeboard f_s (corresponding to the assigned load line) which is not less than the sum of minimum summer freeboard f (See **Fig 3.1.4**) and standard height of superstructure h_s (See **Reg 33.** of "**1966 International Convention on Load Line**").

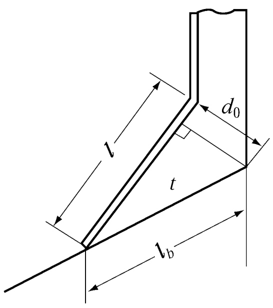

Fig 3.1.3 Measurements of bracket arm

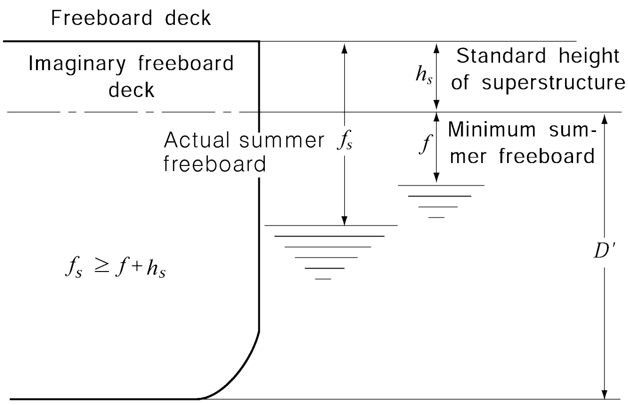

Fig 3.1.4 Ships having specially large freeboard

(2) The dimension of member is to be comply with the followings in addition to the Rules. However, for the Type B ship in the **1966 International Convention on Load Line,** under mentioned treatments are not apply to ships whose assigned freeboards are B-60 or B-100 type.

(A) Single bottom
For the sectional area of floor, the value of D may be replaced instead of D' for the formula specified in **Ch 6, 403** of the Rules.

(B) Frames (**Ch 8** of the Rules)
Where the deck supporting frames above an imaginary freeboard deck, those frames may be regarded as superstructure frames

(C) Deck Load (**Ch 10** of the Rules)
In the provision of "h" specified in **Ch 10, Table 3.10.3** in the Rules, a weather deck may be regarded as follows in accordance with the vertical distance from an imaginary freeboard deck to the weatherdeck at side. In other Chapters of the Rules, this deck load "h" may be treated in the same manner.

$h_s \le H_D < 2h_s$ = Superstructure deck of first tier above an imaginary freeboard deck

$2h_s \le H_D < 3h_s$= Superstructure deck of second tier above an imaginary freeboard deck

$3h_s \le H_D$ = Superstructure deck of third tier above an imaginary freeboard deck

(D) Plate keels and shell platings (**Ch 4** of the Rules)
The thickness of side shell platings above than freeboard deck (imaginary freeboard deck for which is regarded as a freeboard deck) is in accordance with **Ch 4, 103** of the Guidance.

(E) Hatch openings and bulwarks (**Pt 4, Ch 2** and **Ch 4** of the Rules)
For the following items, provision to providing on freeboard deck may be released to provision to providing on superstructure deck and provision to providing on superstructure deck may be released to upper deck.
(a) Height of hatch coamings, scantlings and height of hatch covers
(b) Sill height of openings in the exposed machinery space casings
(c) Sill height of openings in deckhouses enclosing deck openings or sills of companionways.
(d) Height of ventilation duct coamings
(e) Height of air pipe
(f) Type of side scuttles

206. Direct strength calculation

1. When the scantlings of hull structural members is decided by the direct strength calculation specified in **206.** of the Rules, it is to be in accordance with **Annex 3-2 "Guidance for the Direct Strength Assessment".** However, if it is not applicable to comply with this Guidance, the analysis method, loading and allowable stress are to be in accordance with the discretion of the Society.

2. Buckling stress of each structural member is to be reviewed based on the results of direct strength calculation. Analysis method and allowable stress are to be in accordance with **Annex 3-2 "Guidance for the Direct Strength Assessment".**

3. If it is deemed to be necessary by the Society that fatigue analysis of the connection parts of ship structure, discontinuous parts of the structure and stress concentrated parts are to be reviewed, data for the analysis method and loading is to be submitted.

209. Structural testing, leak testing and hose testing

"where deemed necessary by the Society" in note number [3] of **Table 3.1.1** of the Rules means where the quality in relation to the construction techniques and the welding procedures adopted is not certified and where hydrostatic testing or hydropneumatic testing is specially required in the Rules and the Guidelines.

Section 4 Materials

401. Standards of material

1. When the stainless steels are used for plate, use of the materials and their scantling are to be subject to the followings.

(1) Stainless steel being used in the structural members is to be complied with **Pt 2, Ch 1, 305.** and **309.** of the Rules.
(2) This section is to be applied to structural members using stainless steels irrelevant to corrosion prevention is provided or not.

(3) When the stainless steel are used in the structural members, it is to be complied with buckling strength criteria in **Ch 3, Sec 4** in the Guidance and Rules.

(4) Material factor(K_s) are obtained from the following formula but not less than 0.72

$$K_s = f\{8.81(\sigma_s/1000)^2 - 7.56(\sigma_s/1000) + 2.29\}$$

σ_s : The minimum value of yield strength or proof stress of stainless steel or stainless clad steel specified in **Pt 2, Ch 1, 305.** and **309.** of the Rules. (N/mm^2)

f : To be given by the following formula. Where T is more than 100℃, the value is at the discretion of the Society.

$$f = 0.0025(T-60) + 1.00$$

T : The maximum cargo temperature in (°C) to be contacted by the materials. Where the temperature is less than 60°C, T is to be taken as 60°C.

Where the members do not come in contact with the sea water the values of following (A) and (B) may be reduced from the scantlings required by the relevant requirements.

(A) For stainless steel, the values is to be given as follows.
- Where the scantling is required of the thickness of plate: 1.0 mm
- Where the scantling is required of the section modulus: 5%

(B) For stainless clad steel, the values is to be given as follows.
- Where the scantling is required of the thickness of plate: 0.5 mm

403. High tensile steels

1. Where high tensile steels are used for the longitudinal strength members, it is to be in accordance with the followings.

(1) Application
For the mid part of ships having strength deck and bottom with longitudinal structure, where the section modulus of vertical section is reduced by the using high tensile steels in accordance with **403.** of the Rules, longitudinal strength members are to in accordance with the followings

(2) Extents of use of high tensile steels
High tensile steels are to be used in the following parts.

(A) Longitudinal strength members within the ranges from the strength deck or the bottom down or up to the points specified below respectively. (See **Fig 3.1.5** and **3.1.6**)

(a) Strength deck

$$b_D = y_D\left(1 - \frac{1}{f_D}\right) \quad \text{(m)}$$

y_D = distance from the neutral axis of the cross section of hull to the strength deck (m)

(b) Bottom

$$b_B = y_B\left(1 - \frac{1}{f_B}\right) \quad \text{(m)}$$

y_B = distance from the neutral axis of the cross-section of hull to the top of keel (m)

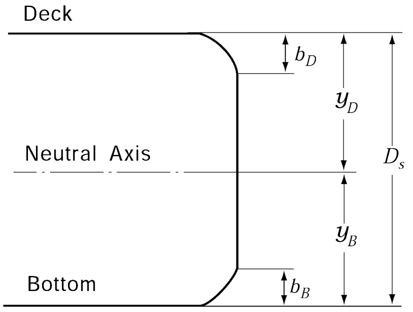

Fig 3.1.5 For the case that high tensile steels are used for deck and bottom

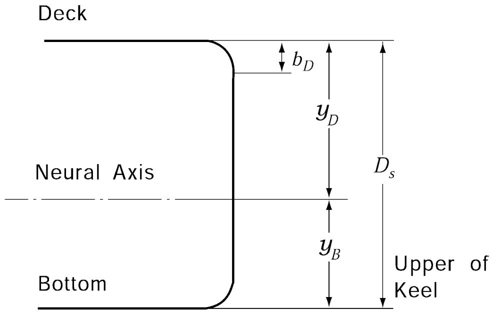

Fig 3.1.6 For the case that high tensile steels are used for deck

(B) Longitudinal strength members on strength deck
(C) Portions as shown in **Fig 3.1.7** of deck inside the line of openings
(D) Hatch coamings and their horizontal stiffeners within the extents shown in **Fig 3.1.8.**

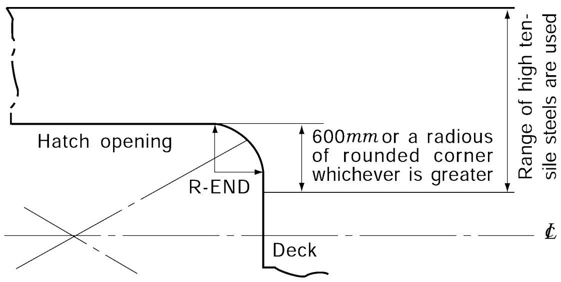

Fig 3.1.7. Deck

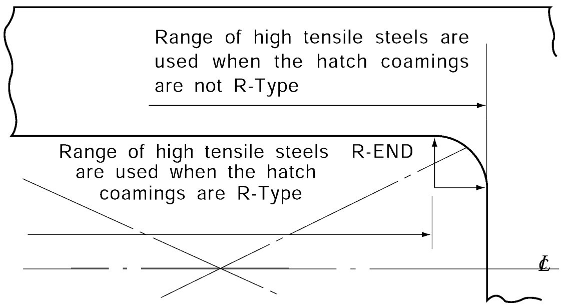

Fig 3.1.8 Hatch coaming

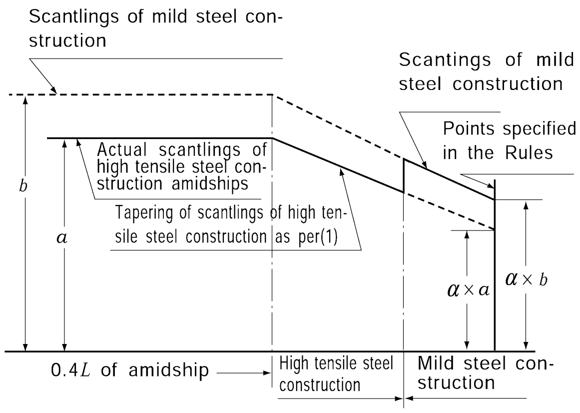
(E) Gutter bars and bilge keels welded to high tensile steel materials. Where bilge keels are welded to shell plating need not be of high tensile steel.
(F) Doubling plates fitted to the longitudinal strength members of high tensile steel for reinforcing openings, etc.
(G) It is recommended that the range of $0.5L$ amidship be constructed of high tensile steel. If the range of $0.5L$ amidship is not covered by high tensile steel, special consideration should be given to the continuity of section modulus of hull girder between the range of $0.4L$ and $0.5L$ amidship.

(3) Tapering of longitudinal strength members
(A) The manner of tapering of longitudinal strength members of high tensile steel is to comply with the provisions of the Rules, assuming that the entire hull be constructed of high tensile steel.
(B) Where the midship part is constructed of high tensile steel, the scantlings of mild steel members forward of and abaft the midship part are to be in accordance with **Fig 3.1.9.**
(C) At the connection of high tensile and mild steel materials, due consideration should be so given to the continuity of strength that appreciable difference of plate thickness may be avoided.



α = lightening at the point specified of the Rules
a = real dimension of high tensile steels at the midship
b = dimension of members used mild steels. thickness t and area A are to be followings.

(A) Thickness of shell plating and longitudinal bulkheads

$$t = \frac{1}{\sqrt{K}}(a - t_c) + t_c \ (mm)$$

t_c : oil tankers = 2.0 mm
others = 1.5 mm

(B) Sectional area of longitudinal strength members of the strength deck

$$A = \beta a$$

β is in accordance with **Table 3.1.3.** However, in case the effective sectional area of longitudinal strength members of the strength deck in the middle of L has been determined, where mild steel construction is assumed, the value may be given as follows;

$$\beta = \frac{\text{Effective sectional area of strength deck at the middle of } L\text{, where mild steel construction is assumed}}{\text{Effective sectional area of strength deck at the middle of } L\text{, for ships made of high tensile steels}}$$

(C) Sectional modulus of stiffeners of longitudinal frames, beams and bulkheads

$$Z = a/K$$

Fig 3.1.9

Table 3.1.3

Material \ Ship	Oil tanker	Others
HT32	1.27	1.34
HT36	1.38	1.45

2. The followings are to be considered when high tensile steels used.

(1) When the steels having different stiffness are used for ship structure, stress of low stiffness steel nearby high stiffness steel is specially considered.

(2) When the girder is constructed with high tensile steel, stiffness of girder or scantlings of tripping brackets are to be specially considered for preventing to occur excessive stress to tripping brackets.

(3) For the members constructed with high tensile steels, special consideration is to be given to the members for preventing of excessive stress concentration.

(4) When the high tensile steels used in a wide scope, detailed strength review is to be given and submitted the results to the Society.

405. Application of steels

1. The steels used for the rounded gunwale are to be treated as shear strake. In such a case, width of a strake plate is to be not less than 1,300 mm for ship length L up to 100 m and 2,600 mm for L being not less than 250 m. When the ship length is between 100 m and 250 m, breadth is not to be less than the value which is obtained by interpolation.

2. Where the steels with the thickness above 50 mm up to 100 mm used for hull structures, the steels are to be provided in **Pt 2, Ch 1** Rules in accordance with **Table 3.1.4** of the Rules and **3.1.4** of the Guidance.

Table 3.1.4 Steel grades (50 mm < t ≤ 100 mm)

Thickness(mm) \ Class	I		II		III	
	MS	*HT*	*MS*	*HT*	*MS*	*HT*
$50 < t \le 60$	*D*	*DH*	*E*	*EH*	*E*	*EH*
$60 < t \le 100$	*E*	*EH*	*E*	*EH*	*E*	*EH*

Note:
The symbols in the table mean the grades of steel as follows:
DH : *DH* 32, *DH* 36 and *DH* 40, *MS* : Mild steels
EH : *EH* 32, *EH* 36 and *EH* 40, *HT* : High tensile steels

406. Special requirements for application of steels

1. For the ships carrying low temperature cargo, the application of steels which is exposed to low temperature cargo is in accordance with **Table 3.1.5.** However, if the structure can be released the thermal stress, it is to be in accordance with the discretion by the Society.

Table 3.1.5 (1)

Designed temp T (°C)	Thickness of steels t (mm)						
	$t \le 10$	$10 < t \le 15$	$15 < t \le 20$	$20 < t \le 25$	$25 < t \le 30$	$30 < t \le 40$	$40 < t \le 50$
$-10 \le T$	*A*			*B*		*D*	*E*
$-20 \le T < -10$	*B*	*D*		*E*			
$-30 \le T < -20$	*E*				*RL* 24*A*		*RL* 24*B*
$-40 \le T < -30$	*RL* 24*A*			*RL* 24*B*			(2)
$-50 \le T < -40$	*RL* 24*B*			(2)			

NOTE
(1) For the members having designed temperature under -50°C, or strength deck exposed low temp, they may be needed steels having more higher tenacity by due to thickness of plate and structure.
(2) It is to be in accordance with the discretion by the Society.

2. The application of steels for ships designed to operate in area with low air temperatures is to comply with the following requirements:

(1) For ships intended to operate in areas with low air temperatures (below and including -20°C), e.g. regular service during winter seasons to Arctic or Antarctic waters, the materials in exposed structures are to be selected based on the design temperature t_D, to be taken as defined in (5). Materials in the various strength members above the lowest ballast water line (BWL) exposed to air are not to be of lower grades than those corresponding to classes Ⅰ, Ⅱ and Ⅲ, as given in **Table 3.1.6,** depending on the categories of structural members(SECONDARY, PRIMARY and SPECIAL). For non-exposed structures and structures below the lowest ballast water line, see **405.** of the Rules.

Table 3.1.6 Application of material classes and grades – Structures exposed at low temperatures

Structural member category	Material class	
	Within 0.4L amidships	Outside 0.4L amidships
○ SECONDARY: - Deck plating exposed to weather, in general - Side plating above BWL - Transverse bulkheads above BWL	I	I
○ PRIMARY: - Strength deck plating [1] - Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings - Longitudinal bulkhead above BWL - Top wing tank bulkhead above BWL	II	I
○ SPECIAL: - Sheer strake at strength deck [2] - Stringer plate in strength deck [2] - Deck strake at longitudinal bulkhead [3] - Continuous longitudinal hatch coamings [4]	III	II

Notes :
[1] Plating at corners of large hatch openings to be specially considered. Class Ⅲ or grade E, EH 32, EH 36 and EH 40 to be applied in positions where high local stresses may occur.
[2] Not to be less than grade E, EH 32, EH 36 and EH 40 within 0.4L amidships in ships with length exceeding 250 m
[3] In ships with a breadth exceeding 70 m at least three deck strakes to be class Ⅲ.
[4] Not to be less than grade D, DH 32, DH 36 and DH 40.

(2) The material grade requirements for hull members of each class depending on thickness and design temperature are defined in **Table 3.1.7.** For design temperatures t_D < -55°C, materials are to be in accordance with the discretion of the Society.

(3) Single strakes required to be of class Ⅲ or of grade E, EH 32/EH 36/EH 40 and FH 32/FH 36/FH 40 are to have breadths not less than the values given by the following formula, maximum 1800 mm.

$$b = 5L + 800 \quad \text{(mm)}$$

(4) Plating materials for stern frames, rudder horns, rudders and shaft brackets are not to be of lower grades than those corresponding to the material classes given in **405. 3** of the Rules.

(5) The design temperature is to be taken as the lowest mean daily average air temperature in the area of operation. For seasonally restricted service the lowest value within the period of operation applies.

Table 3.1.7 Material grade requirements for classes I, II and III at low temperatures

Class I

501. General

1. Arrangement

When the ship having hatchs are fall under the following (1) to (4), detailed review of the fatigue strength for strength deck at hatch corner and end parts of hatch is to be completed and the cross section is not to be changed radically or scantlings of hatch side coaming are to be increased.

(1) Ships with hatch in the mid part, where the breadth of the hatch exceeds $0.7B$.
(2) Ships having strength deck which is constructed with high tensile steels in accordance with **403.** of the Rules.
(3) Ships with unusual high hatch coamings
(4) Ships with strength deck constructed with special shape or hatch opening constructed with special structure.

Section 8 Corrosion Control

803. Corrosion protection coating

1. Corrosion protection coating for sea water ballast tanks and double-side skin spaces arranged in bulk carriers

(1) Where ships engaging in international voyage and not less than 500 gross tonnage are relevant to (A) or (B), all dedicated seawater ballast tanks and double-side skin spaces arranged in bulk carriers of 150 m in length and upward are to be in accordance with **IMO Res. MSC. 215(82) PSPC**(Performance Standard for Protective Coatings). However, tankers or bulk carrier whose keels are laid after 1 July 2008 and before the date specified in (A) are to be in accordance with **IMO Res. 798(19)**.
(A) for which the building contract is placed on or after 1 July 2008 (in the absence of a building contract, the keels of which are laid or which are at a similar stage of construction on or after 1 January 2009); or
(B) the delivery of which is on or after 1 July 2012.

(2) Maintenance of the protective coating system shall be included in the overall ship’s maintenance scheme. The effectiveness of the protective coating system shall be verified during the life of a ship by the Administration or an organization recognized by the Administration, based on the guidelines developed by the Organization. ⚓

CHAPTER 2 STEMS AND STERN FRAMES

Section 1 Stems

101. Plate stems

1. The thickness of plate stems may be same as that of side shell plating at the level of freeboard deck and same as that of forecastle-side shell in the range of forecastle.

2. Where the plate stem with a large radius of curvature at its fore end is not fitted with a centreline stiffener or is not reinforced by using thicker plate than that in accordance with **101. 1** of the Rules, horizontal breast-hooks are to be provided at a space not exceeding 600 mm apart for reinforcement.

Section 2 Stern Frames

202. General

1. Welding of cast steel stern frames

(1) When cast steel stern frames is constructed with dividing 2 or 3 pieces, shape of weld is based on **Fig 3.2.1.**

(2) Connection of cast steel stern frame and shell plating is in accordance with **Fig 3.2.2.** However, if the welding procedure is approved, it may be in accordance with that procedure.

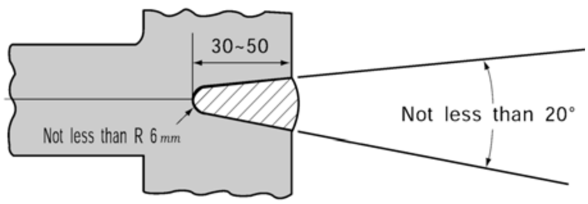

Fig 3.2.1 Welding of cast steel stern frames

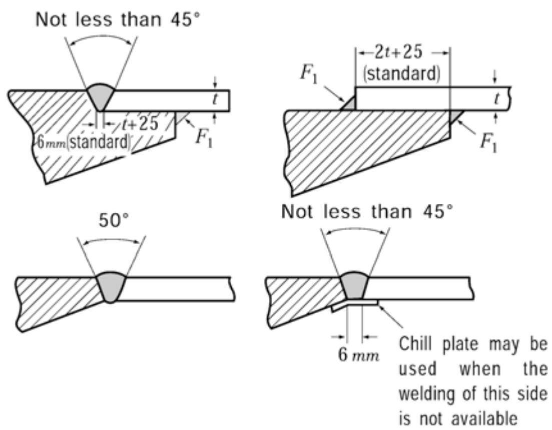

Fig 3.2.2 Connection with shell plating and cast steel stern frames

203. Propeller post

1. Connection of cast steel boss and plate parts of built up stern frame

The connection of cast steel boss and built-up stern frame is to be well grooved and welded with full penetrations at the root as shown in **Fig 3.2.3.**

2. Length of shaft hole of propeller boss

The length of shaft hole of the propeller boss is to be greater than 1.25 times the inside diameter of the boss hole.

3. Round bars used for built-up stern frame

In case that a round bar is used as the aft edge of a built-up stern frame, its radius is, as a standard, to be more than 70 % of R prescribed in **Table 3.2.1** of the Rules. At the connection of round bar to cast steel part or at the connection of round bars, the depth of bevel for welding is to be at least 1/3 of the diameter of round bar. The thickness of ribs fitted to the stern frame is, as a standard, to be 75 % of the stern frame plate. (See **Fig 3.2.4**)

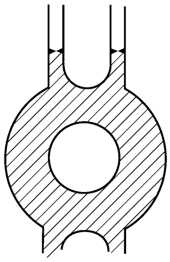

Fig 3.2.3 Connection with steel and propeller boss

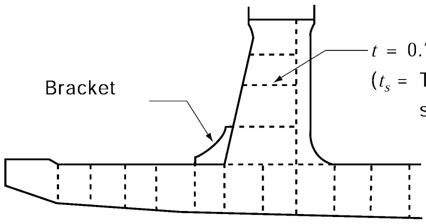

Fig 3.2.4

205. Shoe Piece

1. Connection of shoe pieces and propeller posts

The top plate of shoe piece is to be extended forward beyond the aft end of propeller post. A bracket of the same thickness as the stem frame is to be fitted at the connection of the shoe piece and the aft end of propeller post to keep a sufficient continuity of strength. (See **Fig 3.2.4**)

2. Steel bolts for fixing zinc slabs to the shoe piece must not be directly screwed into the shoe piece but they are to be directly welded to the shoe piece or screwed into steel plates welded to the shoe piece.

3. Shoe pieces of built-up construction are to be made watertight and the inside coated with effective coating material. Where no coating is applied to the inside of built-up shoe piece, the thickness of the shoe piece is to be increased by 1.5 mm.

206. Heel Piece

1. Determination of length of heel pieces

(1) In built-up stern frames, the length of heel pieces may be equal to twice the frame spacing at the position of heel pieces providing that the thickness of flat keels connected to the heel pieces is increased by about 5 mm.
(2) The length of heel piece is to be measured as shown in **Fig 3.2.5.**

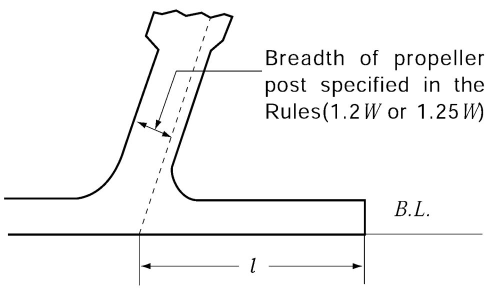

Fig 3.2.5 Measurements of l

(3) The thickness of ribs fitted to the heel piece is, as a standard, to be 75% of the ribs. ⚓

CHAPTER 3 LONGITUDINAL STRENGTH

Section 1 General

101. Application

1. Transverse section modulus of ship which is completed corrosion control with an approved measure

For deck or longitudinal strength members which is consist with one of a cargo tanks, ballast tanks, if they are completed the approved measure of corrosion control in accordance with **Ch 1, 801.** of the Rules, transverse section modulus may be reduced 5% to the value of specified in **201.** of the Rules. However, transverse minimum second moment of inertia ($I_{\min}$) is not to be less than the value specified in **Table 3.3.1** of the Rules.

2. Transverse section modulus of ships with unusual proportion

For the ships with $L/B \leq 5$ or $B/D_s \geq 2.5$, all strength excepting longitudinal strength is to be adequately considered.

3. Ships with especially large hatches

For ships breadth of whose hatches exceeds $0.7B$ in midship part, according to the requirements in **Pt 7, Ch 4, Sec 2,** bending and torsional strength is to be specially considered.

4. Ships with large flare and high speed ships

According to the value of K_v and K_f obtained from the following (1) and (2), wave induced longitudinal bending moment M_w is to be increased.

$$K_v = \frac{0.2V}{\sqrt{L}}, \qquad K_f = \frac{A_d - A_w}{Lh_B}$$

where

A_d = projected area onto a horizontal plane of exposed deck from the fore end extending to 0.2L aft of fore end including the part forward of fore end (m^2), Where a forecastle is provided, the horizontal project area of the forecastle is overlapped to the fore mentioned area.

A_w = water plane area corresponding to designed maximum load line within the forward $0.2L$ (m^2)

h_B = vertical distance from designed maximum load line to exposed deck at the side of fore end (m)

(1) In case that K_v exceeds 0.28
C_2 specified in **Fig 3.3.2** of the Rules is to be replace with the value given in **Table 3.3.1** in accordance with K_v and x(m) which is the distance from aft end of L to the position of considered hull transverse section. Where the K_v and/or x become intermediate, the value is to be determined by interpolation.

(2) In case that $(K_v + K_f)$ exceeds 0.4
C_2 specified in **Fig 3.3.2** of the Rules is to be replaced with the value given in **Table 3.3.2.** for the under M_w (-) condition. However, where the $(K_v + K_f)$ and/or x become intermediate, the value is to be determined by interpolation.

Table 3.3.1 Coefficient of C_2

K_v \ x	$0.65L$	$0.75L$	$1.0L$
0.28	1.0	5/7	0.0
0.32 over	1.0	0.80	0.0

Table 3.3.2 Coefficient of C_2

$K_v + K_f$ \ x	$0.65L$	$0.75L$	$1.0L$
0.4	1.0	5/7	0.0
0.5 over	1.0	0.80	0.0

103. Loading manual

1. "a ships may not be provided with a loading manual where deemed unnecessary by the Society" in **103. 1** of the Rules means the ships with length less than 90 m (L_f) in which the deadweight does not exceed 30 % of the displacement at the summer loadline draft and with arrangement giving small possibilities for variation in the distribution of cargo and ballast, and ships on regular and fixed trading pattern.

2. The loading manual to be approved by the Society according to **103.** of the Rules, are to be prepared in accordance with **Annex 3-1 "Guidance for Preparation and Survey of Loading Manual".** They are to be written with a language easily understood by the shipmaster and if it is not English, English version is to be attached.

3. In addition, Bulk carriers of 150 m in length and above in L_f, where one or more cargo holds are bounded by the side shell only, which were contracted for construction before 1st July 1998 are to be provided with an approved loading manual with Guidance for typical loading/unloading sequences where the vessel is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, alternate conditions and relevant part load conditions where applicable. (see **Table 4** of **Annex 3-1**) The followings are to be included in the guidance.

(1) The minimum acceptable number of typical sequences is ;
  (A) one homogeneous full load condition
  (B) one full load alternate hold condition, if the ship is approved for alternate hold loading.
  (C) one part load condition where relevant, such as block loading or two port unloading.
(2) The shipowner/operator should select actual loading/unloading sequences, where possible, which may be port specific or typical.
(3) The results of the calculations of bending moments, shear force for each step from initial loading to full loading
(4) For each load condition in above mentioned in (1), the summary for all steps is to include the followings.
  (A) How much cargo is filled in each hold during the different steps.
  (B) How much ballast is discharged from each ballast tank during the different steps.
  (C) The maximum still water bending moment and shear at the end of each step
  (D) The ship's trim and draught at the end of each step
(5) Approved guidance for loading /unloading is to be attached to loading manual or to be placed on board ship in annex of the manual.
(6) The form of guidance for loading/unloading is referred to **Table 4** in **Annex 3-1.**

4. Application for providing of loading manual is to be in accordance with **Table 3.3.3.**

104. Longitudinal strength loading instruments

1. "a ships may not be provided with a loading manual where deemed unnecessary by the Society" in **104. 1** of the Rules means the ships with arrangement giving small possibilities for variation in the distribution of cargo and ballast, and ships on regular and fixed trading pattern and with suitable Guidance are included in loading manual

2. Bulk carriers, ore carriers and combination carriers of 150 m in length and above, which are contracted for construction before 1st July 1998 are to be provided with an approved loading instruments for longitudinal strength with satisfaction of the requirements of this Society.

3. Application for providing of loading instruments for longitudinal strength is to be in accordance with **Table 3.3.3.**

4. The followings are to be included in loading instruments for longitudinal strength for bulk carriers, ore carriers and combination carriers of 150 m in length and above, which are contracted for construction on or after 1st July 1998.

(1) the mass of cargo and double bottom contents in way of each hold as a function of the draught at mid-hold position.
(2) the mass of cargo and double bottom contents of any two adjacent holds as a function of the draught at mid-part of these holds.
(3) the still water bending moment and shear forces in the hold flooded conditions in accordance with **Pt 7, Ch 3, Sec 10** of the Rules.

Table 3.3.3 For the case of ships, loading manual and longitudinal loading instruments are to be installed

Application \ Kind of ship		Category 1-1		Category 1-2		Category 1-3		Category 2	
		Loading Manual	Longitudinal loading instruments	Loading Manual	Longitudinal loading instruments	Loading Manual	Longitudinal loading instruments	Loading Manual	Longitudinal loading instruments
①	Ships under survey during (after) construction before 1992/11/1	$L_f \geq 100$ m	NA	$L_f \geq 100$ m	NA(C)	$L_f \geq 100$ m	NA	NA	NA
②	Ships under survey during (after) construction after 1992/11/1	$L_f \geq 100$ m	NA	$L_f \geq 100$ m	NA(C)	$L_f \geq 65$ m	NA	NA	NA
③	Ships under survey during (after) construction before 1993/5/1	$L_f \geq 100$ m	$L_f \geq 100$ m	$L_f \geq 100$ m	$L_f \geq 120$ m	$L_f \geq 65$ m	$L_f \geq 65$ m	NA	NA
④	Ships under survey during (after) construction before 1998/7/1	$L_f \geq 65$ m	$L_f \geq 65$ m	$L_f \geq 65$ m	$L_f \geq 65$ m(A)	$L_f \geq 65$ m	$L_f \geq 65$ m	$L_f \geq 65$ m(B)	NA
⑤	Ships contracted for construction on or after 1st January 2003.	$L_f \geq 65$ m	$L_f \geq 100$ m	$L_f \geq 65$ m	$L_f \geq 100$ m(A)	$L_f \geq 65$ m	$L_f \geq 100$ m	$L_f \geq 65$ m(B)	NA

1. All ships engaged in under the coastal services may not be installed the loading manual and longitudinal loading instruments.
2. Kind of ships
   (1) Category 1-1 = For ships having large opening on the deck and are to be considered for combined stress of bending moment and torsional moment
   (2) Category 1-2 = For ships having non-homogeneous cargo and ballast loading
   (3) Category 1-3 = Chemical tankers and Ships carrying liquified gases in bulk.
   (4) Category 2 = For ships having homogeneous cargo and ballast loading in usual as followings
      (A) ships having no loadline mark
      (B) ships not carrying out cargoes
      (C) cargo vehicle carrier
      (D) ships having homogeneous cargo loading
3. For the application ① to ⑤, they means application date for the ships under the survey of during construction and construction date for the ships under the survey after construction.
4. (A) : For the ships having not exceeding 120 m in length and reflected in design for non-homogeneous cargo loading, it is specified in category 2 and longitudinal loading instrument may be not installed.
5. (B) : For the ships in category 2 with not exceeding 90 m in length and dead weight is not exceed 30 % of fully loaded displacement, longitudinal loading instrument may be not installed.
6. (C) : For all bulk carriers, ore carriers and combination carriers, longitudinal loading instrument is to be installed until 1 Jan 1999.
7. For the ships exempted the installation of longitudinal loading instrument may be not installed, when the instruments is installed, they are to be complied with related regulations.

5. “Approval by the Society" in **104. 2** of the Rules means each of the followings.

(1) It is recommended that software for longitudinal strength loading instrument is taken design approval. Regardless of the design approval to be of the software for longitudinal strength loading instrument, test result of typical service condition is to be submitted to the Society for approval and the software installed on board ship is to be approved by Society in accordance with test result.

(2) Where type approved hardware is installed, one instrument may install, and otherwise two instruments are to be installed.

Section 2 Bending Strength

201. Bending strength at amidships

1. The calculation of Longitudinal bending moment in still water is to be as follows.

(1) When performing the calculation of longitudinal bending moment in still water (M_s) specified in **Table 3.3.1** of the Rules, the method of calculation used is, upon submission of necessary documents, to be approved before hand by the Society.

(2) For ships desired to be built under the survey of the Society's Surveyors, calculation sheets for longitudinal strength in still water corresponding to the actual loading plans and the set of data necessary for the calculation are to be submitted to the Society.

(3) In the Classification Survey longitudinal strength calculations in still water are to be performed at the time of completion of the ship on each type of operating condition, and the necessary sets of data and the results of these calculations are to be included in the loading manual specified in **301.** of the Rules.

202. Bending strength at sections other than amidship

For those ships categorized in the following (1) or (2), the coefficient C_2 in the formula for M_w, specified in **Table 3.3.1** of the Rules is obtained from the value in accordance with the dotted line in **Fig 3.3.2** of the Rules and the same provision is to be applied.

(1) Ships with C_b of less than 0.7

(2) Ships whose longitudinal bending moments in still water at the parts other than the midship part are equal to or greater than the value at the midship part

203. Calculation of hull section modulus

1. Unit of hull section modulus

The section modulus Z(cm^3)is to have five significant figures.

2. Members included in longitudinal strength

The ratio of inclusion of members effective for longitudinal strength is to be as follows.

(1) Intercostal plates may be included in 100% if the fillet welding complies with **Ch 1,** Notes 1 in **Table 3.1.7** of the Rules.

(2) For new building ship, the Area of doubling plate may be included **1007.** in the rate of inclusion of member and for the ship fitted during conversion or addition, it may be included 90 %.

(3) For side stringers, slots for frames are to be deducted.

(4) Scallops complying with the following conditions need not be deducted from the sectional area. (See **Fig 3.3.1**)

(A) d_s not exceeding $d/4$ nor exceeding $7t$, but maximum 75 mm

(B) S more than $5b$ and more than $10d_s$

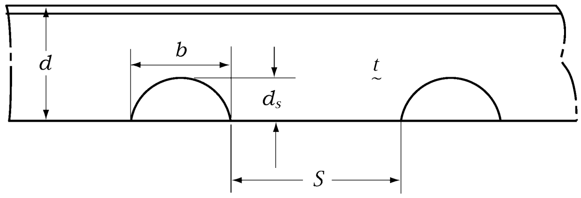

Fig 3.3.1 S, b and d_s of scallops

(5) Lightening holes and draining holes in longitudinals or longitudinal girders need not be deducted from the sectional area provided that the height of the holes does not exceed 25 % of the web depth.
(6) As for the longitudinal continuous decks between hatch ways of ships having 2 or 3 rows of cargo hatches, the ratio of sectional area to be included in the calculation of section modulus of hull girder is to be obtained from **Table 3.3.4.**
(7) Where sectional area of longitudinals, which are unable to be continued due to the arrangement of small hatch openings, etc., are compensated by adjacent ones, they may be included in the calculation of section modulus of hull girders.

Table 3.3.4 Ratio of inclusion of sectional area

ξ \ l/L \ No of holds	2			3 and over		
	0.10	0.20	0.30	0.10	0.15	0.20
0.0	0.96	0.85	0.70	0.96	0.91	0.85
0.5	0.65	0.57	0.48	0.89	0.80	0.69
1.0	0.48	0.43	0.36	0.83	0.73	0.62
2.0	0.32	0.29	0.25	0.73	0.63	0.53
3.0	0.24	0.22	0.18	0.65	0.57	0.47
4.0	0.19	0.17	0.14	0.59	0.51	0.43
5.0	0.16	0.14	0.12	0.53	0.47	0.39

NOTE:
1. ξ is to be in accordance with followings

$$\xi = \frac{ab^3}{lI_c}\left\{\frac{1+2\mu}{6(2+\mu)} \times 10^4 + 2.6\frac{I_c}{a_c b^2}\right\}$$

I_c = moment of inertia of deck between hatches, including hatch coaming(cm^4)
a_c = effective shear area of deck between hatches (cm^2)
a = sectional area of continuous deck between hatches(one side) (cm^2)
l = length of hatch (m)
μ and b = as specified in **Fig 3.3.2** (m)
2. ξ or l/L may obtained from the interpolation.
3. When the value of ξ is over 5.0, it may be obtained extrapolation.

(8) The car deck platings of Pure Car Carriers, in case they are intermittently welded in lap joint, are not to be included in the calculation.

4. Openings in strength deck

Openings in strength decks outside the line of hatch openings are to be treated as mentioned below.

(1) Where the shape and dimensions do not meet the conditions in **Table 3.3.5** reinforcement by menas of rings, thicker plates, etc. is required (See **Fig 3.3.3** and **3.3.4**)

(2) Where the intervals between centres of holes do not meet the conditions in **Fig 3.3.5** reinforcement as per (1) above is needed.

Table 3.3.5 Opening

	Elliptic hole	Circular hole
Oil tanker	$\frac{a}{b} \leq \frac{1}{2}$, $a \leq 0.06B$ (max. 900 mm)	$a \leq 0.03B$ (max. 450 mm)
Cargo ships	$\frac{a}{b} \leq \frac{1}{2}$, $a \leq 0.03B(B - b_H)$ (max. 450 mm)	$a \leq 0.015(B - b_H)$ (max. 200 mm)

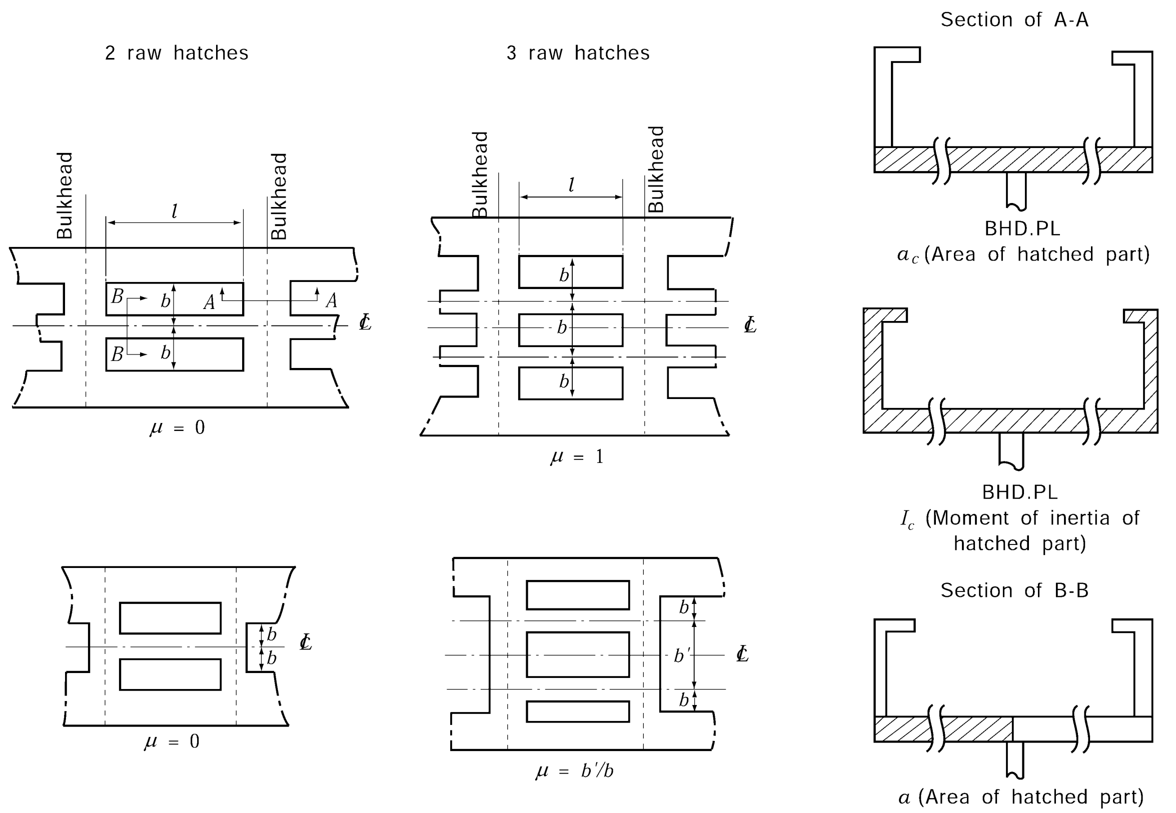

Fig 3.3.2 l, b and μ

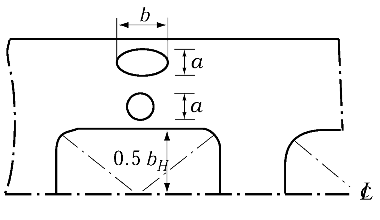

Fig 3.3.3 Where elliptical hole and circular hole are in same cross-section

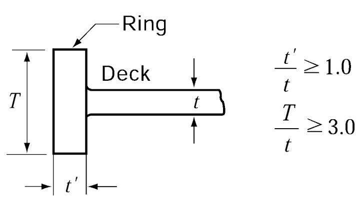

Fig 3.3.4 Reinforcements by ring

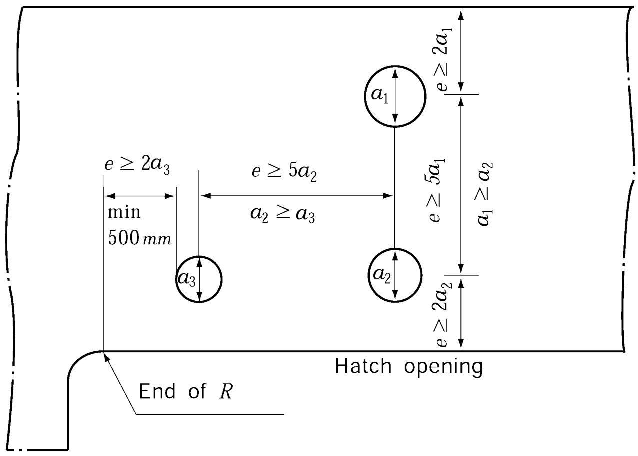

Fig 3.3.5 Spacing of opening

Section 3 Shear Strength

301. Thickness of side shell of ships without the effective longitudinal bulkhead

1. Ships with bilge hopper tanks or top side tanks

Where the sloping plates of the bilge hopper tank and topside tank are joined to the side shell plating and are considered to be effective to carry a part of the shearing force, the shear current at the transverse section of the hull under consideration may be calculated directly and the thickness of the side shell plating forming a part of the bilge hopper tank and topside tank may be determined. However, when performing this direct strength calculation and determining the thickness of plating, shearing force given in (1) is made to act on the transverse section of the hull, and shearing stresses which develop in the side shell plating forming a part of the bilge hopper tank and topside tank and in the sloping plates are obtained, and these values are to be less than the allowable stress given in (2).

(1) The value of shearing force acting on the transverse section of hull is obtained from the following formula, whichever is greater.

$$F = |F_s + F_w(+) - \Delta F_c| \quad \text{(kN)}, \qquad F = |F_s + F_w(-) - \Delta F_c| \quad \text{(kN)}$$

where

F_s, $F_w(+)$ and $F_w(-)$ = still water shear force and wave induced shear force specified in **Table 3.3.2**

ΔF_c = as specified in the following **2.**

(2) Allowable stress of sloping plate and side shell plate inside of bilge hopper tanks or topside tanks

$90/K$ (N/mm^2)

2. Modification of shearing force in still water in case where cargo is loaded in every other hold

Where a loaded hold (or a ballast hold) adjoins an empty hold by a transverse bulkhead, the shearing force in still water at the transverse section of hull under consideration may be determined as following F_c.

$F_c = F_s - \Delta F_c$ (kN)

F_c = still water shear force specified in **Table 3.3.2** (kN)

ΔF_c = the value obtained from the following formula by the distance form the transverse section and fore/aft end of hold

(1) At the bulkhead aft of hold

$$-C(F_{SF} - F_{SA} - F_T)$$

(2) At the bulkhead fore of hold

$$C(F_{SF} - F_{SA} - F_T)$$

(3) At a section in the hold

The value obtained by applying the linear interpolation of the values of (1) and (2) depending on the distance between the transverse section under consideration and the bulkhead aft or fore of the hold which contains the transverse section.

F_{SF}, F_{SA} = shearing force in still water(F_S) at the bulkhead aft and fore of the hold, respectively, in the loading condition concerned, applying the calculation method as specified in **301.** of the Rules(kN).

F_T = mass of ballast in the topside tank which is contained in the hold concerned (kN)

C = Coefficient which depends on the values of k as specified in **Pt 7, Ch 3, Sec 201, 4** of the Rules and B/l_h as given in the **Table 3.3.6.** For intermediate value of k linear interpolation is to be applied.

Table 3.3.6 Coefficient C

k \ B/l_h	0.4 under	0.4–0.6	0.6–0.8	0.8–1.0	1.0–1.2	1.2–1.4	1.4–1.6	1.6–1.8	1.8–2.0	2.0–2.2	2.2–2.4	2.4 over
10.0	0.092	0.115	0.159	0.197	0.230	0.255	0.275	0.289	0.300	0.308	0.314	0.317
5.0	0.088	0.110	0.152	0.190	0.223	0.250	0.270	0.286	0.298	0.307	0.313	0.315
2.0	0.081	0.101	0.140	0.177	0.210	0.238	0.261	0.279	0.293	0.302	0.310	0.312
1.0	0.075	0.094	0.131	0.166	0.200	0.230	0.254	0.273	0.288	0.300	0.307	0.310
0.0	0.063	0.079	0.112	0.145	0.179	0.211	0.238	0.261	0.279	0.291	0.302	0.306

3. Simplified formula for Q/I

The ratio of Q and I specified in **301.** of the Rules may be simplified to $1/(90D_s)$.

302. Thickness of side shell and longitudinal bulkhead plating of ships having one to four rows of longitudinal bulkheads

For double hull ships with bilge hopper tanks, α_2 and R specified in **Table 3.3.2** of the Rules is in accordance with **Table 3.3.7** of the Guidance. However, the thickness of the side shell plating and slant plates forming bilge hoppers is not to be less than 1.2 times the values determined by the requirements of the Rules.

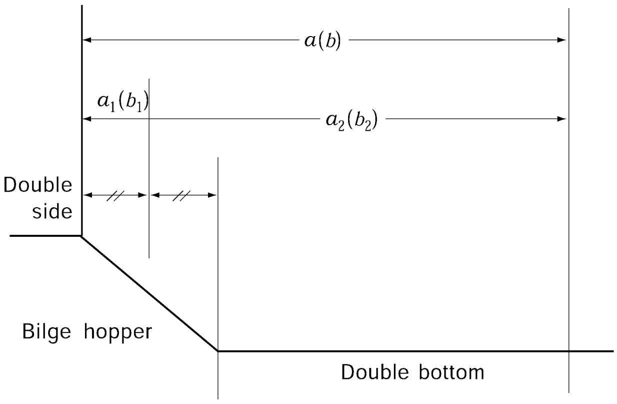

Fig 3.3.6 Measurements of a_1, a_2, b_1 and b_2

Table 3.3.7 α_2 and R of the ships having bilge hopper tanks

Type	Application		α_2	R

Section 4 Buckling Strength

401. Apllication

Carlings (100×10 FB as standard type) are to be fitted in the longitudinal direction at the carling spaces which satisfy the following formula, on the part of midships, of strength deck plating of transverse framing system, and/or of side shell plating of transverse framing system connecting with strength deck and bottom both having same system as side shell plating. Where, however, an approval by the Society is obtained, the following requirements may not be applied.

$$16.6\left(\frac{t}{10S}\right)^2\left(1+\frac{S^2}{C^2}\right)^2 \geqq \alpha\gamma$$

t = thickness of deck or shell plating (mm)

C = spacing of carling (m)

S = spacing of transverse beams (m)

α = as given by the followings:

$$\frac{-(M_{S\min}+M_W(-))}{Z_D}\times 10^3 \ (\text{N/mm}^2) \quad \text{for strength deck}$$

$$\frac{(M_{S\max}+M_W(+))}{Z_B}\times 10^3 \ (\text{N/mm}^2) \quad \text{for bottom shell}$$

$M_{S\min}$ and $M_{S\max}$ = min. and max. values respectively, of longitudinal bending moment in still water as required in **201.** of the Rules

$M_W(-)$ and $M_W(+)$ = as specified in **201.** of the Rules

Z_D and Z_B = actual section moduli of transverse section of hull whose values are determined against the strength deck and ship bottom according to the requirements in **203.** of the Rules

γ : 1.0 for strength deck plating and bottom shell plating, and the value given by the following for side shell plating:

$\frac{y_1}{y_D}$ = for members located above the neutral axis of athwartship considered

$\frac{y_1}{y_B}$ = for members located below the neutral axis of athwartship considered

y_D = vertical distance from neutral axis to deck (m)

y_B = vertical distance from base line to neutral axis (m)

y_1 = vertical distance from neutral axis to upper edge of each strake (m), but need not be greater than y_D

y_2 = vertical distance from neutral axis to lower edge of each strake (m), but need not be greater than y_B

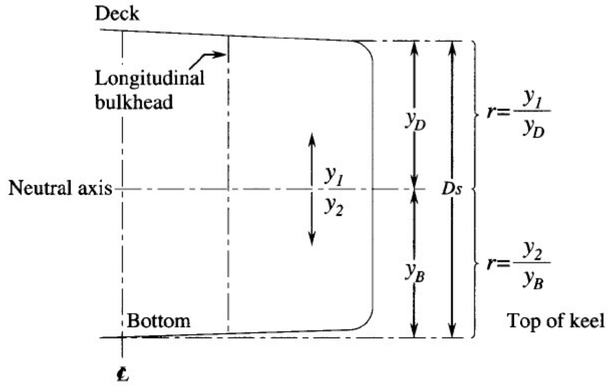

Fig 3.3.7

403. Elastic buckling stress

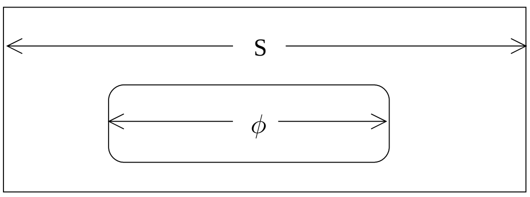
1. When examining the buckling strength of plate with an opening, the elastic buckling stress σ_E' or τ_E' obtained from following formulae is to be used in place of σ_E or τ_E for determination of critical buckling stress in **404.** of the Rules:

$$\sigma_E' = \gamma \sigma_E \quad (\mathrm{N/mm^2})$$
$$\tau_E' = \gamma \tau_E \quad (\mathrm{N/mm^2})$$

γ = reduction factor due to the opening, given by the following. When the opening is reinforced properly, it may be taken as 1.0:

$$\gamma = \frac{1}{\{1+\phi/(2S)\}^{2}}$$

ϕ = span of the major axis of the opening
S = span of the side of the panel along the major axis of the opening



2. Elastic buckling stress for longitudinal frames is to be obtained from the following formulae
(1) Buckling of pillars without torsion
Elastic buckling stress of pillar σ_E (N/mm^2) for pillar buckling mode is to be obtained from the following formula.

$$\sigma_E = 0.001E\frac{I_a}{Al^2} \quad (\mathrm{N/mm^2})$$

I_a and A = second moment of inertia (cm^4) and sectional area (cm^2) of longitudinal frame including plate flange. The breadth of flange is in accordance with **Ch 1, Sec 602** of the Rules.

l = length of longitudinal frame (m)

(2) Buckling of pillars with torsion
Elastic buckling stress of pillar σ_E (N/mm^2) for torsional buckling mode is to be obtained from the following formula.

$$\sigma_E = \frac{\pi^2 E I_w}{10^4 I_p l^2}\left(m^2 + \frac{k^2}{m^2}\right) + 0.385 E \frac{I_t}{I_p} \quad (\text{N/mm}^2)$$

k = coefficient, it is to be obtained from the following formula.

$$k = \frac{C l^4}{\pi^4 E I_W} \times 10^6$$

m = the number of half-waves of buckling mode is to be in accordance with the value of k in **Table 3.3.8.**

I_t = St. Venant moment of inertia for the section (cm^4), as specified in **Table 3.3.9.** However, flange of plate is not considered.

I_p = polar moment of inertia of connection point with plate, as specified in **Table 3.3.9.** However, flange of plate is not considered.

I_w = sectorial moment of inertia for the section of connection point with plate (cm^6), as specified in **Table 3.3.9.**

l = the length of tripping brackets (m)

S = spacing between tripping brackets (m)

C = coefficient of spring stiffness of tripping brackets supporting plate panels, as obtained from the following formula

$$C = \frac{k_p E t_p^3}{3S\left(1 + \frac{1.33 k_p h_w t_p^3}{1000 S t_w^3}\right)} \times 10^{-3}$$

k_p = coefficient obtained from the following formula. However, it is not less than 0 and may not be less than 0.1 for the inverted angles with flange compensated

$$k_p = 1 - \frac{\sigma_{act}}{\sigma_E}$$

σ_{act} = compression stress acting on longitudinal frames, as specified in **402. 1** of the Rules.

σ_E = elastic buckling stress of supporting plate, as specified in (1) of item **1.**

t_p = thickness of plate excepting standard deduction specified in **Table 3.3.3** of the Rules.

Table 3.3.8 The number of half-waves of buckling mode

	$0 < k \le 4$	$4 < k \le 36$	$36 < k \le 144$	$(m-1)^2 m^2 < k \le m^2(m+1)^2$
m	1	2	3	m

Table 3.3.9 I_t, I_p and I_w

Sectional shape	I_t (cm^4)	I_p (cm^4)	I_w (cm^6)
Flat steel	$\dfrac{h_w t_w^3}{3} \times 10^{-4}$	$\dfrac{h_w^3 t_w}{3} \times 10^{-4}$	$\dfrac{h_w^3 t_w^3}{36} \times 10^{-4}$
T section steel	$\dfrac{1}{3}\left(h_w t_w^3 + b_f t_f^3\left(1 - 0.63\dfrac{t_f}{b_f}\right)\right) \times 10^{-4}$	$\left(\dfrac{h_w^3 t_w}{3} + h_w^2 b_f t_f\right) \times 10^{-4}$	$\dfrac{t_f b_w^3 h_w^2}{12} \times 10^{-6}$
L section steel or bulb section steel			$\dfrac{b_f^3 h_w^2}{12(b_f + h_w)^2}\left[t_f(b_f^2 + 2b_f h_w + 4h_w^2) + 3t_w b_f h_w\right] \times 10^{-6}$

Notes:
h_w : web height (mm)
t_w : web thickness excluding standard deduction specified in **Table 3.3.3** of the Rules (mm)
b_f : flange breadth (mm)
t_f : thickness of flange excluding standard deduction specified in the Rules. For bulb section steel, it is a average thickness.

(3) Buckling of web and flange

(A) Ideal elastic buckling stress for the web of longitudinal frames is to be obtained from the following formula

$$\sigma_E = 3.8E\left(\frac{t_w}{h_w}\right)^2 \quad (\text{N/mm}^2)$$

t_w = thickness of webs (mm)
h_w = depth of webs (mm)

(B) The ratio of breadth of flange to longitudinal frames b_f and thickness of flange t_f is not more than 15. However, t_f is the half-breadth for T type section and breadth of L type section flange. ⚓

CHAPTER 4 PLATE KEELS AND SHELL PLATINGS

Section 1 General

103. Consideration for ship with unusually large freeboard

Where the distance from the designed maximum load line to strength deck is usually large, the thickness of side shell plating of superstructures and in the range between the imaginary freeboard deck specified in **Ch 1, Sec 203, 2** (1) of the Guidance and the strength deck (hereinafter referred to as "super structure side plating") is obtained from the followings. However, where this requirement is applied, the requirements in **Sec 301.** of the Rules do not need to be applied to shell plate above the freeboard deck.

(1) The thickness of superstructure side shell plating from the freeboard deck (or imaginary freeboard deck in ships where the imaginary deck is regarded as the freeboard deck) to the level at a height of $2h_s$ above the freeboard deck is to be obtained from the formulas in **302.** of the Rules, where $(d - y + 0.05L' + h_1)$ may be replaced by $\{(d - y + 0.05L' + h_1)D\}/(D + 2h_s)$. In this formula, h_s is decided by the L and is to be obtained from the followings,

L = 90 m ----------- 1.95

$L \geq$ 125 m ----------- 2.30

(2) The thickness of superstructure side plating from the level at a height equal to twice h_s as per (1) above the freeboard deck to the strength deck is not to be less than that obtained from the following formula, but need not be greater than that obtained from (1).

$$t = 0.7\sqrt{L+50} \quad \text{(mm)}$$

(3) The thickness of superstructure side plating from the freeboard deck to the level at a height h_s as per (1) above the freeboard deck forward from $0.25L$ aft from the F.P. is not to be less than obtained from (1) above or **501.** of the Rules. whichever is greater.

Section 3 Shell Plating below Strength Deck

303. Sheer strakes for midship part

Attentions to be paid as to sheer strakes

(1) The upper edges of sheer strakes are to be properly smoothed.

(2) Bulwarks are not to be directly welded to sheer strakes in the range of $0.6L$ amidships. Further, fixtures, such as eye plates, are not to be directly welded on the upper edge of sheer strake, except in the fore and aft end parts.

(3) Special care should be taken where fixtures, gutter bar ends, etc. are directly welded to the curved parts of round gunwales.

(4) At least for $0.6L$ amidship the manner of the welding construction of T type joints between sheer strakes and stringer plates of strength deck is, in general, to be as shown in **Fig 3.4.1** as a standard. However, where the thickness of stringer plates is less than 13 mm, fillet weld of F1 grade may be acceptable without edge preparation.

305. Bilge plate

1. Where, in the midship part, longitudinal frames are omitted in the bilge part, the distance from the end of bilge curvature to the nearest longitudinal frame outside the curved part is not to exceed 1/2 of the spacing of longitudinal frames.

2. In determining the thickness of bilge strake in the midship part according to the formula in **305. 1** of the Rules, the following condition is to be met.

$$\frac{1000R}{t} \geq 2\left(\frac{l}{R}\right)^2$$

where R = radius of bilge circle (m)

l = spacing of solid floor, bottom transverse or bilge brackets (m)

t = thickness of bilge strake (mm)

3. The bilge strake in the midship part are to be carefully worked so that deformations of the bilge circle may not exceed 1/3 of thickness of bilge strake amidships.

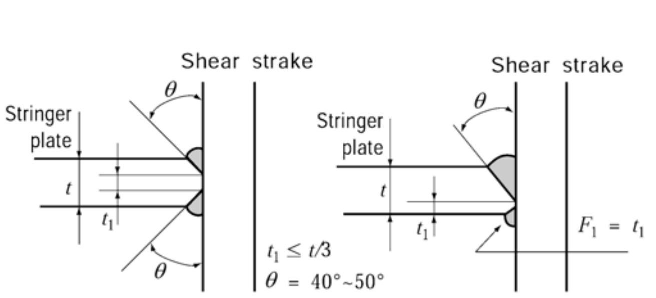


Fig 3.4.1 Welding construction of joints between sheer strakes and stringer plates of strength deck

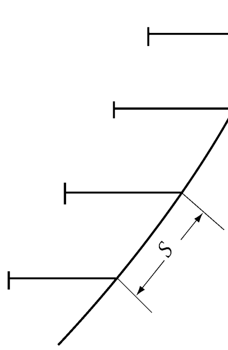

Fig 3.4.2 Measurements and shell plating stiffened in a spacing S

4. Where bilge keel plates are fitted, the plates welded directly to bilge strakes are to be of same kind of bilge strakes. However, grade of the plates may be generally of A-grade in any kind of steel plating.

Section 4 Special Requirements for Shell Plating

401. Shell plating at a location where flare is specially large

For pure car carriers, the thickness of shell plate above the load line for 0.1L forward is not to be less than that obtained from the following formula:

$$S\sqrt{\frac{\psi P}{\sigma_y} \times 10^3} \quad \text{(mm)}$$

S = spacing of frames, or spacing of girders or longitudinal shell stiffeners, whichever is the smaller. (mm)

σ_y = specified yield stress of materials (N/mm^2)

ψ = as obtained from following formula

$$\psi = \frac{3\eta^2 - 2\sqrt{1+3\eta^2} + 2}{12\eta^2}$$

η = spacing of frames, or spacing of girders or longitudinal shell stiffeners, whichever is the greater(m), divided by S.

P = slamming impact pressure as specified in **Ch 8, 108.**(kPa)

402. Shell plating stiffened in a spacing remarkably different from the frame spacing

Where the spacing of stiffening members on shell plating is remarkably different from the spacing, actual spaces is to be used in calculating the thickness of shell plating.(See **Fig 3.4.2**)

404. Strengthened bottom forward

In ships of which L and C_b are not more than 150 m and 0.7 respectively and $V/\sqrt{L}$ is 1.4 and over, the thickness of shell plating at the strengthened bottom forward is not to be less than the value determined in accordance with **404.** of the Rules using slamming pressure in **Ch 7, Sec 801, 2** (2) (A).

405. Spectacle bossings and stern frame

In case where the spacing of transverse frames in the aft-peak exceeds 610 mm or the length of ship exceeds 200 mm, the thickness of shell plating adjacent to stem frame or in way of spectacle bossing is to be equivalent to the standards given by **Table 3.4.1.**

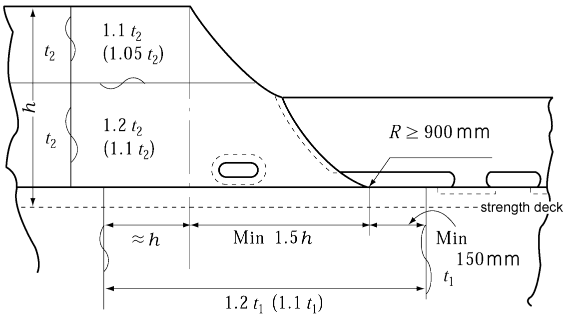
Table 3.4.1 Standard thickness of shell plating adjacent to stern frame or in way of spectacle bossing

Spacing of trans frame (mm)	Length of Ship L (m)				
	90	150	200	250	300
610	12.5	18.0	22.5	26.0	29.0
700	14.5	20.0	24.5	27.0	30.0
800	17.0	22.5	27.0	29.5	32.0
900	20.0	25.0	30.0	32.5	35.0
Notes : When the value is between the above values, it may be obtained by the interpolation.					

Section 6 Compensation at end of Superstructure

601. Strengthening method

(1) The side shell plating of superstructure is to be well extended beyond the end of superstructure to terminate with an ample radius($R \geq 900$ mm).
(2) Butt welding joint of sheer strake at the strength deck is to be off at least 150 mm from the R-end.
(3) The rate of thickening of shell plating in the region of $0.4L$ amidships is to be as shown in **Fig 3.4.3** and **3.4.4** The rate of thickening is to be zero in the region of $0.2L$ from the fore and aft ends of the ship, and at the intermediate points, the ratio is to be determined by linear interpolation.
(4) Where the superstructure is set in, increasing of thickness of shell plating is not needed.



Notes:
1. t_1 : thickness of shear strake
2. t_2 : thickness of superstructure side plating
3. Figures without brackets ( ) show the case where the superstucture deck is regarded as the strength deck
4. Figures in brackets ( ) show the case where the superstucture deck is not the strength deck

Fig 3.4.3 Construction of end part of superstructure(without expansion joints)

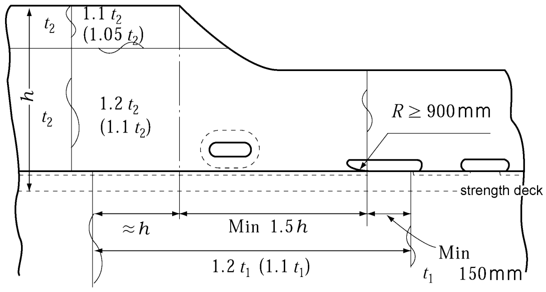


Fig 3.4.4 Construction of end part of superstructure(with expansion joints)

Section 7 Local Compensation of Shell Plating

701. Opening in shell

1. Opening of shell plate of 300 mm or more in size are to be compensated by doubling plate or increasing thickness.

2. In the end parts of hull, proper modification may be accepted for the manners of compensation for opening.

3. The radius at the corners of openings is to be at least 100 mm.

702. Thickness of sea chest

As for compensation for openings which is acting for sea water suction, **701.** of the Guidance is to be referred to.

703. Locations of openings

As for compensation for openings, **701** of the Guidance is to be referred to. ⚓

CHAPTER 5 DECKS

Section 1 General

101. Steel deck plating

Steel decks are not plated

1. Stringer plate

Decks not fully plated are to have stringer plates of an appropriate breadth and of a thickness not less than that determined for deck plating in accordance with the requirements in **Sec 3** of the Rules for the positions concerned. The stringer plates of effective decks are to be effectively connected to the shell plating.

2. Tie plates

Tie plates are to be provided along the hatch sides, in way of pillars, on the under-deck girders and under deckhouse coamings. These tie plates are to have an appropriate breadth and a thickness not less than that determined for deck plating in accordance with the requirements in **Sec 3** of the Rules for the positions concerned.

3. In way of transverse bulkheads and at the ends of deck openings

In way of transverse bulkheads and at the ends of deck openings, the deck is to be suitably plated with steel plates.

102. Watertightness of decks

Where the rudder stock penetrates the deck lower than the point located 1.5 m above the load line, special attention is to be given to the watertightness at the penetration.

104. Compensation for openings

All corners of openings in decks, such as hatchways, are to be well rounded and reinforced, as necessary, by increasing of thickness the deck plating or by means of doubling plates.

(1) Regions where thicker plating or doubling plates are required
Strength deck = within $0.75L$
Effective 2nd deck = within $0.6L$
3rd deck and lower decks = In substance, no doubling needed
Superstructures and long deckhouse = Doubling needs within $0.6L$ for decks immediately above the strength deck

(2) Plate thickening and doubling plates may be properly reduced depending upon their locations. (See **Fig 3.5.1**)

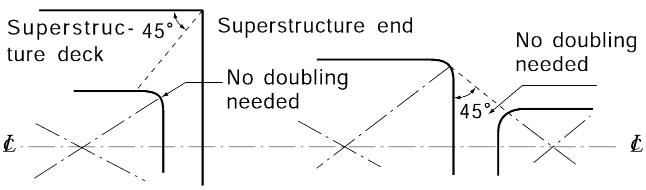

Fig 3.5.1

(3) The dimensions and thickness of doubling plates or ranges of thickening are to be determined in consideration of the degrees of stress concentration around the openings.

(4) The minimum value of R at the corners are to be as follows.
Within $0.5L$ midpart of strength deck = 250 mm
Elsewhere = 200 mm
The value of R at the 4 corners may be suitably reduced for small openings and small steel

ship. For companionways and similar small openings, the radius at the corners may be 150 mm in the strength deck outside the line of openings and 75 mm or so elsewhere.

(5) For corners of openings having radius not less than 600 mm or having elliptical or similar shape, neither doubling plates nor thickening of plating is required. The recommended corner shape is as shown in **Fig 3.5.2.**

(6) No welded joints are permitted at the corners of openings in the strength deck and the welded joints are to be off properly form the end of curvature. (See **Fig 3.5.3**)

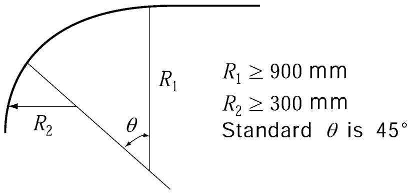

Fig 3.5.2

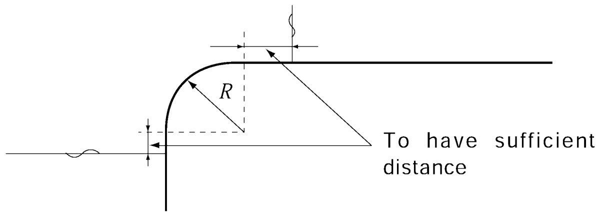

Fig 3.5.3

105. Rounded gunwales

Where round gunwales are made of steel plate of Grade D or Grade E, the inner radius of curvature is not to be less than 20 times the thickness of gunwale plate, except that the radius may be reduced down to 15 times the plate thickness where the width of sheer strake to be bent to form round gunwale is not less than the plate width of a strake prescribed in **Ch.1, Sec 405** of the Guidance plus 500 mm, or the method of bending work is specially approved by the Society.

Section 2 Effective Sectional Area of Strength Deck

202. Effective sectional area of strength deck

1. Tapers of stem/stern part to strength deck may tapered with average value of sectional area as **Fig 3.5.4.** However, thickness of plate is not be reduced rapidly.

2. Where rounded gunwales are provided, the sectional area is to be calculated assuming that the plate of round gunwale be horizontally extended to the ship's side.

204. Long poop

The effective sectional area of strength deck within long poop which is not deal with strength deck is to be in accordance with **Fig 3.5.5.**

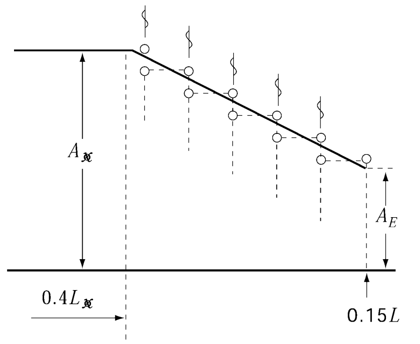
205. Superstructure deck designed as strength deck

When the poop deck is deal with strength deck, the sectional area of deck within poop is to be in accordance with **Fig 3.5.6.**

Section 3 Deck Plating

301. Thickness

When strength deck is framed longitudinally, deck inside the line of openings are desirable to be transversely framed as **Fig 3.5.7.**



$A_{갑}$: effective sectional area of strength deck in midship part of L

A_E : for ships with machinery in midship part 0.4 $A_{갑}$
for ships with machinery in aft end of ship 0.5 $A_{갑}$

Fig 3.5.4

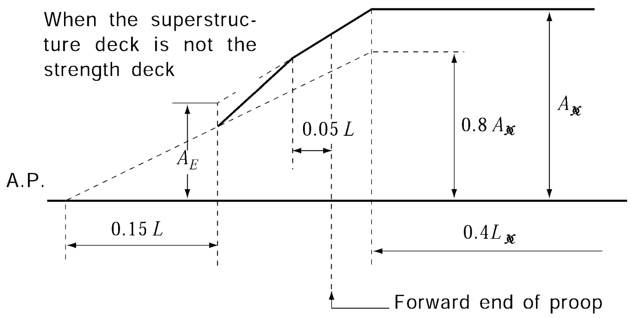


Fig 3.5.5

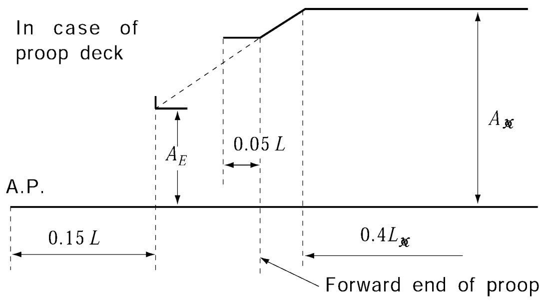

Fig 3.5.6

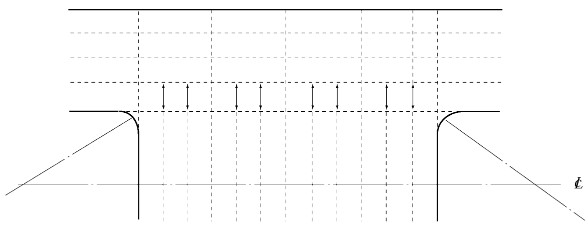

Fig 3.5.7

307. Deck plating for helicopter landing

1. For

$$t = 4.6\sqrt{K}\sqrt{\frac{(2S-b)}{(2S+a)} \times \frac{P}{9.81}} + 1.5 \qquad \text{(mm)}$$

where,

S : spacing between deck beam (m)

a, b : length of wheel print measured in parallel and perpendicular to beam (m)(See the **Fig 7.7.2** of **Guidance Pt 7, Ch 7**) Unless otherwise specified elsewhere, a × b is to be 0.3 m × 0.3 m.

P : As for the deck loads in the range where a helicopter takes off or lands, a load of 75 % of the helicopter maximum take-off weight(MTOW) is to be taken on each of two square areas. But where the emergency condition is considered, a load of 100 % of the MTOW is to be used. (kN)

K : material factor

2. When the scantling of stiffeners are calculated, simple support beam is to be assumed and allowable stress, 235/K (N/mm^2) and P obtained fram **1.** are to be used. But where the arrangement of stiffeners or etc. are considered, continuous beam may be assumed. ⚓

CHAPTER 7 DOUBLE BOTTOMS

Section 1 General

101. Application

1. For the ships subject to **SOLAS** or **Korean Ship Safety Act**., inner bottom is to be continued out to the ship's sides in such a manner as to protect the bottom to the turn of the bilge. And the inner bottom is not to be lower at any part than a plan parallel with the keel line and which is located not less than a vertical distance h measured from the keel line, as calculated by the formula:

$$h = B/20$$

However, in no case is the value of h to be less than $0.76\ \mathrm{m}$, and need not be taken as more than $2.0\ \mathrm{m}$.

2. The method for flooding calculation as defined **Ch 7, 101. 2** to be followed by **IMO MSC 194(80), Reg.9, 8.**

3. A double bottom may be omitted in way of watertight tanks, including dry tanks of moderate size, provided it is satisfied for flooding calculation of **2.**

4. For ships with special structure, the scantlings of structural members are to be in accordance with the followings.

(1) Double hull ship (See **Fig 3.7.1**)
B may replaced with the $0.5(B+b)$.
(2) For ships with inclined sides
B may replaced with the length between intersection of extension of inner bottom plate and conjunction point with side shell plate (See **Fig 3.1.1**)
(3) For ships, the breadth of which becomes particularly narrow in fore and/or aft part in comparison with the breadth in midship part.
The distance b between the intersection of inner bottom and shell plating at centre of hold length may be used in place of B (See **Fig 3.7.2**)
(4) In spite of the (1) through (3), the scantlings may be determined by direct calculation method.

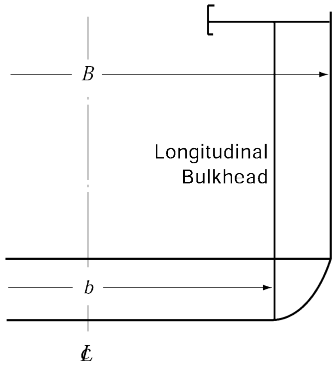

Fig 3.7.1

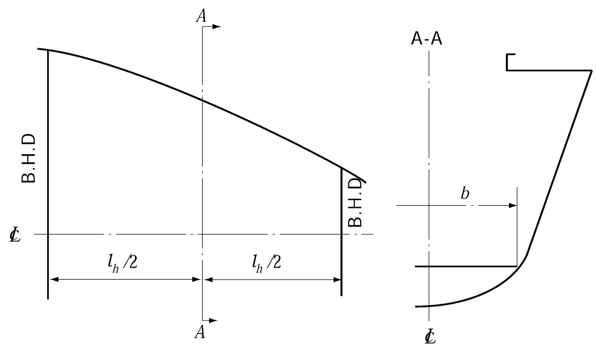

Fig 3.7.2 For ships, the breadth of which becomes particularly narrow in fore and/or aft part

5. In holds with pillars, the thickness of centre girder, side girders, solid floor, inner bottom plating and bottom shell plating may be reduced in accordance with the results of direct strength calculation.

6. Scantlings of structural members of double bottom for ships intended to carry out the steel coils are recommended to comply with the following requirement in addition to **Ch 7** of the Rules.

(1) This calculation method is a standard means of securing steel coils as like to **Fig 3.7.3.**

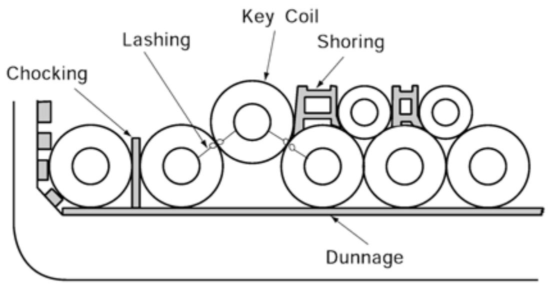

Fig 3.7.3 Standard means of securing steel coils

(2) Thickness of inner bottom plate in longitudinal framed structure is to be not less than the value obtained from the following formula.

$$t=\sqrt{1.65QK\{(1.65\beta-2.3)\alpha-6\beta+12.2\}}+0.5 \quad \text{(mm)}$$

α = aspect ratio of panel of inner bottom platings. When a exceeds 3.0, α is to be taken as 3.0

$$\beta=\frac{C}{a}$$

β = as obtained from the following formula.
a = spacing of floors (m)
C = distance between load points in ship length direction per panel of inner bottom (m). According to the value of n_2 and n_3, it is to be in accordance with **Table 3.7.1** of the Guidance.

Q = mass of steel coils which is supported by the one inner bottom panel. It is to be obtained from the following formulae. However, in case where steel coils are lined up in one tier with a key coil, Q is to be of 1.4 times to the formula.

$$Q=Wn_1\frac{n_2}{n_3} \quad \text{(ton)}$$

W = mass of a steel coil (ton)
n_1 = number of tiers of steel coils
n_2 = number of load points per panel of inner bottom plates, as given in **Table 3.7.2** according to the value of n_3 and $a\,/\,l_s$
n_3 = number of dunnages supporting one steel coil
l_s = breadth of steel coil (m)

Table 3.7.1. Spacing of longitudinal direction of loaded point to one panel (C)

8	$4.1 < a/l_s \leq 4.8$	$2.73 < a/l_s \leq 3.07$	$1.95 < a/l_s \leq 2.40$	$1.6 < a/l_s \leq 1.8$
9	$4.8 < a/l_s \leq 5.3$	$3.07 < a/l_s \leq 3.60$	$2.40 < a/l_s \leq 2.65$	$1.8 < a/l_s \leq 2.0$
10	$5.3 < a/l_s \leq 6.0$	$3.60 < a/l_s \leq 3.93$	$2.65 < a/l_s \leq 2.90$	$2.0 < a/l_s \leq 2.4$

(4) Section modulus of inner bottom longitudinal frames is not to be less than the value required in the extent of elastic in accordance with the following conditions.
(A) Boundary condition : Fixed at solid floor, simply supported at strut
(B) Allowable stress

$$\sigma = 8.2(24 - 11.4Kf_B)/K \quad (\text{N/mm}^2)$$

(C) Loading condition : Concentrated load at the position of dunnages where the steel coils are loaded just on longitudinals.
(5) Compressive buckling strength against steel coil load is to be examined for solid floor and girder plates.

7. Where the double bottom is constructed, intersection of exterior edge of margin plate and side shell of bilge is to be through the point which is the distance with $B/2$ from the midship on the base line and is to be in the above horizontal surface which is through the intersection of oblique line with 25° angle from the base line and side shell (See **Fig 3.7.4**)

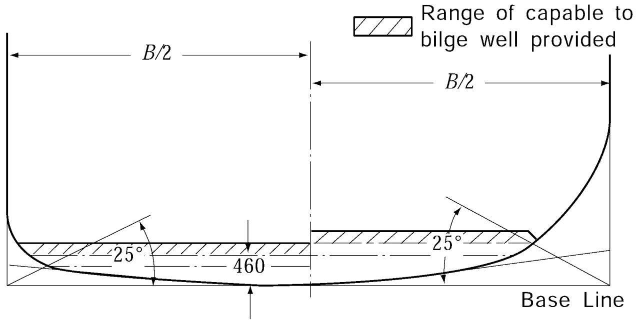

Fig 3.7.4 Structure of double bottom and position of bilge well

8. With respect to the provisions of **101. 7** of the Rules, where the ratio of cargo weight per unit area (kN/m^2) of the inner bottom plating to d is less than 5.40, double bottom structures are to be in accordance with **203. 1**, **302. 1**, **501. 2** and **505. 1**. Where cargo loads can not be treated as evenly distributed loads, scantlings of double bottom structures are to be determined by taking account of load distribution for particular cargoes. Where concentrated loads act on specific points of double bottoms, scantlings of center girders, side girders, floors, inner bottom plates and bottom plates and their stiffeners are to be determined by an appropriate strength assessment such as direct calculations.

103. Drainage

1. Bilge well on the double bottom constructed in passenger ship, in addition to **103.** of the Rules, is not to be constructed under the horizontal surface specified in **101. 7.** of the Guidance. (See **Fig 3.7.4**)

2. Small wells constructed in the double bottom in connection with drainage arrangements of holds are not to be extend downward more than necessary. A well extending to the outer bottom is, however, permitted at the after end of the shaft tunnel.

3. Other wells (e.g., for lubricating oil under main engines) may be permitted by the Society if satisfied that the arrangements give protection equivalent to that afforded by a double bottom complying with this Chapter.

4. For the ships subject to **SOLAS** or **Korean Ship Safety Act.**, except a well at the end of the shaft tunnel, the vertical distance from the bottom of such a well to a plane coinciding with the keel line is not to be less than 0.5m.

107. Strengthening under boilers

Considering the corrosive environment due to high temperature, thickness of all members under boiler is to be increased according to the following standards. However, where the effective means for preventing corrosion or overheating are provided, increasing of thickness is not be needed. Above mentioned effective preventing for overheating means the case which temperature of the upper surface of inner bottom plate is 40°C or less in usual condition.

Structural member	Increasement
Centre girder	3.0 mm
Side girder	
Solid floors	
Inner bottoms	3.5 mm
Vertical stiffener	1.5 mm
Section modulus of reverse frames of open floors and inner bottom longitudinals	15 %
Section modulus of frames of open floors and bottom longitudinal	7 %
Sectional area of vertical strut	10 %

Section 2 Centre Girders and Side Girders

201. Arrangement and construction

1. Where side girders are unable to extend forward and/or aftward because of the breadth of double bottom becoming narrow in fore and/or aft part, the side girders are to be sufficiently lapped over the adjacent girders in order to keep continuity of strength.

2. Girders or half height girders are to be provided under longitudinal bulkheads for proper strengthening of double bottom.

203. Thickness

1. Where the ratio of load per square meter of double bottom (kN/m^2) to d is less than 5.40, C_1 in the formula in **203.** (1) of the Rules is to be obtained from the following formula.

$$C_1{}' = nab$$

n = coefficient, as obtained from the following

(1) For holds adjacent to each other and being loaded or empty simultaneously; Where B/l_H is 1.4 and over, it is to be taken as 1.4, and where B/l_H is less than 0.4, it is to be taken as 0.4

$$n = \frac{1}{1.4}\left(3 - \frac{B}{l_H}\right)$$

(2) Other cargo holds : n = 1.0

l_H = as specified in **203.** of the Rules

a = as obtained from the following formula

$$a = 1.35 - \frac{h\gamma}{d}$$

h = as specified in **403. 2** of the Rules

γ = as specified in **101. 6** of the Rules

b = coefficient,

for the longitudinal framed construction = 17

for the transversely framed construction = 20

2. For the double hull construction, C_1 specified in **203.** (1) is to be obtained from the following formulae.

$$C_1'' = na(b - \beta b')$$

n = coefficient, As specified in **Table 7.3.2** of the Rules
a = as specified in **1.** above. But not to be less than 0.8
b = as specified in **1.** above.
b' = for the longitudinal framed construction = 4
for the transversely framed construction = 5
β = coefficient to be obtained from the following formula. However, where the hold is unusually long or where the sides are constructed on the transverse framing system and the spacing of side transverses is unusually large, special consideration is to be given.

$$\beta = \frac{1}{1 + \frac{2t_0 d_0^2 H_s}{3t_s d_s^2 B_0}}$$

t_0 = mean thickness of inner bottom plating and bottom shell plating (mm)
t_s = mean thickness of longitudinal bulkhead and side shell plating
d_0, d_s, B_0 and H_s = distance (m), shown in **Fig 3.7.5**

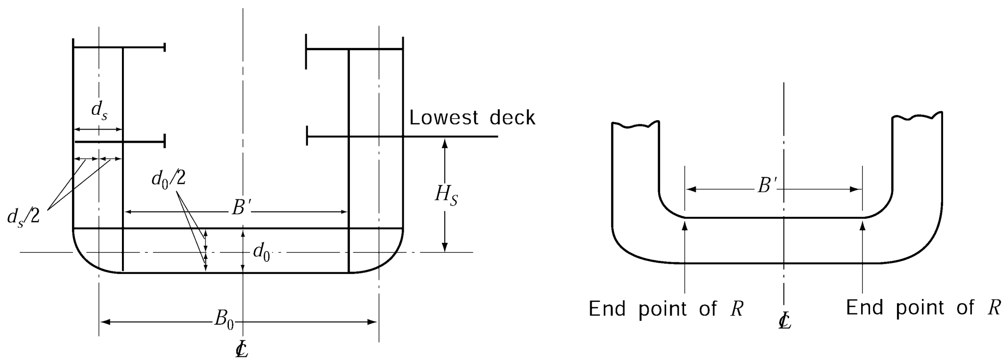

Fig 3.7.5 Double side structure

204. Brackets

The thickness, size, form, etc. of brackets specified in **204.** of the Rules are to be determined by taking into consideration of the height of centre girders and their buckling strength. As the examples, **Fig 3.7.6** is shown.

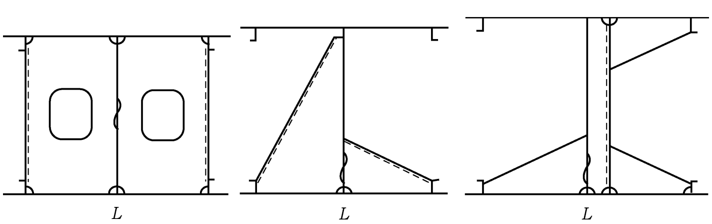

Fig 3.7.6 Forms of docking brackets

Section 3 Solid Floors

302. Thickness

1. Where the ratio of load per square metre of double bottom to d is less than 5.40, the coefficient C_2 in the formula in **302.** (1) of the Rules is to be obtained from the following formula.

$$C_2' = ab$$

a = as specified in **203. 1** of the Rules
b = value is specified in **Table 3.7.3** of the Guidance according to the value of B/l_H
l_H = as specified in **203.** of the Rules

Table 3.7.3 Coefficient b

</table>

2. The thickness of solid floors of ships of double hull construction is to be obtained according to the following prescriptions.

(1) B' and B'' in the formula in **302.** (1) of the Rules are to be as follows.
B' = distance between longitudinal bulkheads at the top of inner bottom plating at amidship (m) (See **Fig 3.7.5**)
B'' = distance between longitudinal bulkheads at the top of inner bottom plating at the position of solid floor (m)

(2) The coefficient C_2 in the formula in **302.** (1) of the Rules is to be obtained from the following formula.

$$C_2 = a(b + \beta b')$$

a = as specified in **203. 1** of the Guidance. However, it is not to be less than 0.8
b = value is specified in **Table 3.7.3** of the Guidance according to the value of B/l_H
b' = value is specified in **Table 3.7.4** of the Guidance according to the value of B/l_H
β = as specified in **203. 2** of the Guidance
l_H = as specified in **203.** of the Rules

Section 4 Bottom Longitudinals

403. Section modulus

1. Where the apparent specific gravity γ of cargoes in loaded holds exceeds 0.9, the coefficient C in the formula in **403. 1.** of the Rules is to be as follows

(1) where no strut as per **404.** of the Rules is provided midway between the floors-------100
(2) where a strut as per **404.** of the Rules is provided midway between the floors
Under deep tanks-------------- 62.5
Elsewhere------------------------ $30\gamma + 20$
In no case is C to be less than 50.
γ = As specified in **101. 7.** of the Rules.

2. In case where the width of vertical stiffeners fitted on solid floors and vertical struts is unusually large, the coefficient C in **403. 1.** and **2.** of the Rules may be multiplied by the value obtained from the following formula.

$$\left(1-\frac{a}{l}\right)^2\left(1-\frac{b}{l}\right)$$

l = distance between floors (m)

a = width of vertical stiffeners on floors (m). a is to be zero, if the vertical stiffeners are not well fixed to longitudinals by means of lug connection.

b = width of vertical strut (m) (See **Fig 3.7.7**)

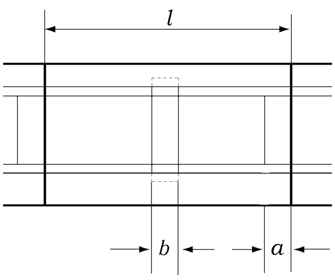

Fig 3.7.7

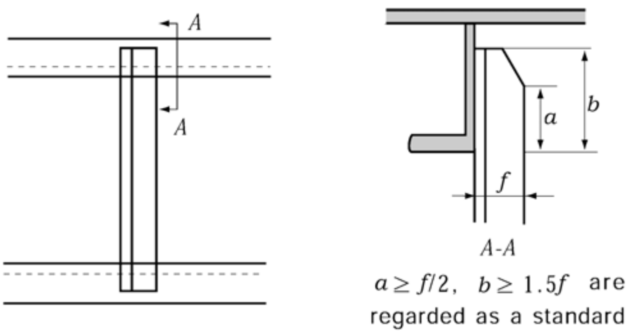

Fig 3.7.8 Details of lap of strut and longitudinal frame

404. Struts

Depth of lapped parts of vertical struts over web of longitudinals is to be of 1.5 times as large as the breadth of face plates of struts as a standard. Where the sufficient depth of lapped parts is unable to be taken due to weld ability, throat of fillet weld is to be properly increased. (See **Fig 3.7.8**)

Section 5 Inner Bottom Plating, Margin Plates and Bottom Shell Plating

501. Thickness of inner bottom plating

1. Where the height of centre girder is less than $B/16$, the thickness of inner bottom plating and bottom shell plating are to be increased so that the moment of inertia of the double bottom obtained from the following formula may be equivalent to that corresponding to the case where the centre girder has the required height.

$$I = 1.23 \frac{t_1 t_2}{t_1 + t_2} d_0^2$$

d_0 = height of centre girder (m)

t_1 = thickness of bottom shell plating (mm)

t_2 = thickness of inner bottom plating (mm)

2. Where the ratio of load per square metre of double bottom to d is less than 5.40, the coefficient C in the formula of **501. 1.** of the Rule is to be obtained from the following formula.

$$C' = ab$$

a = as specified in **203. 1.** of the Guidance

b = coefficient b_0 or αb_1 as specified in the followings according to the value of B/l_H

$B/l_H < 0.8$; b_0

$0.8 \leq B/l_H < 1.2$; αb_1 or b_0, whichever is greater.

$1.2 \leq B/l_H$; αb_1

l_H = as specified in **203.** of the Rules.

b_0 and b_1 = as specified in **Table 3.7.5** according to the value of B/l_H. However, for the transversely framed construction, the value b_1 specified in the Table, is to be multiplied by 1.1.

α = as obtained from the following formula

$$\alpha = \frac{13.8}{24 - 11.4 f_B K}$$

Table 3.7.5 Coefficient b_0 and b_1

B/l_H	Not less than	0.4	0.6	0.8	1.0	1.2	1.4	1.6
	Not much than 0.4	0.6	0.8	1.0	1.2	1.4	1.6	
b_0	5.5	4.9	4.1	2.8	2.0	—	—	—
b_1	—	—	—	2.8	2.6	2.4	2.2	1.8

3. For the ships with double hull construction, C in the formula t_1 in **501. 1.** of the Rules, is to be obtained from the following formula, whichever is greater.

$$C_1 = a(b_0 - \beta b'_0)$$
$$C_2 = a\alpha(b_1 - \beta b'_1)$$

a = coefficient, is to be in accordance with **203. 1.** of the Guidance. However, it is not to be less than 0.8

b_0, b_1 and α = as obtained from the above mentioned **2.**

b'_0 and b'_1 = as specified in **Table 3.7.6** according to the value of B/l_H. However, for the transversely framed construction, the value b'_1 specified in the Table, is to be multiplied by 1.1.

l_H = as specified in **203.** of the Rules

β = It is to be in accordance with **203. 2** of the Guidance.

Table 3.7.6 Coefficient b'_0 and b'_1

B/l_H	Not less than	0.4	0.6	0.8	1.0	1.2	1.4	1.6
	Not much than 0.4	0.6	0.8	1.0	1.2	1.4	1.6	
b'_0	3.1	2.5	1.8	1.0	0.5	—	—	—
b'_1	—	—	—	1.1	1.1	0.8	0.7	0.4

4. In case forklift is used for unloading operation, thickness of inner bottom plate is to be also in accordance with **Ch 5, 305.** of the Rules.

5. Butt joints of inner bottom plating in the midship part are generally not to be arranged at the knuckle line of the inner bottom.

505. Bottom shell plating

1. Where the ratio of load per square metre of double bottom to d is less than 5.40, the thickness of bottom shell plating is to be determined as follows.

In the region of double bottoms under cargo holds, the thickness of bottom shell plating is not to be less than obtained from the formula in **Ch 4, 304.** of the Rules or from the first formula in **Ch 7, 501. 3** of the Rules whichever is greater. In applying the latter formula, coefficient C' is described in **501. 3** of the Guidance. However, In applying the first formula in **501. 1** of the Rules, α is to be obtained from the following formula.

$$\alpha = \frac{13.8}{24 - 15.0 f_B K}$$

2. In the region of double hull construction, the thickness of bottom shell plating is not to be less than obtained from the formula in **Ch 4, 304.** of the Rules or from the first formula in **501, 3.** of the Rules whichever is greater. In applying the latter formula, coefficient C described in **501. 2** of the Guidance. However, In applying the first formula in **501. 1** of the Rules, α is to be obtained from the following formula.

$$\alpha = \frac{13.8}{24 - 15.0 f_B K}$$

Section 8 Construction of Strengthened Bottom Forward

801. Application

1. Here, the ballast condition means the ordinary ballast condition where only the ballast tanks such as clean ballast tanks, segregated ballast tanks and ballast holds are ballasted. This ballast condition excludes an exceptional case where cargo tanks are ballasted only in the heavy weather condition to assure the safety of the ship.

2. In ships of which L and C_b are not more than 150 m and 0.7 respectively and $V/\sqrt{L}$ is 1.4 and over, the construction of bottom forward is to be as required in the followings.

(1) Construction

Construction of strengthened bottom forward is to be in accordance with **803.** of the Rules. However, the vertical stiffeners for the solid floors specified in **803. 3** of the Rules are to be provided on all shell stiffeners. Where the bottom longitudinals or longitudinal shell stiffeners are extended through the solid floors, slots are to be reinforced with collar plates.

(2) Scantlings of longitudinal shell stiffeners or bottom longitudinals

(A) In ships having bow draught not more than $0.025L$ at the ballast condition, the section modulus (Z) of longitudinal shell stiffeners or bottom longitudinals in way of the strengthened bottom forward is not to be less than that obtained from the following formula

$$Z = 0.53\,Pal^2 \quad (\text{cm}^3)$$

l = spacing of solid floor (m)

a = 0.774 l (m) However, where the spacing of longitudinal shell stiffeners or bottom longitudinals is not more than $0.774l$, is to be taken as the spacing (m).

P = slamming pressure obtained from the following formula

$$P = \frac{2.48LC_1C_2C_3C_4}{\beta} \quad (\text{kPa})$$

C_1 = as specified in **Table 3.3.7** of the Guidance. For the intermediate value $V/\sqrt{L}$ is to be obtained by linear interpolation.

Table 3.7.7 Coefficient C_1

$V/\sqrt{L}$	1.4	1.5	1.6	1.7	1.8
C_1	0.31	0.33	0.36	0.38	0.40

C_2 = coefficient obtained from the following formula

$V/\sqrt{L} \leq 1.0$; 0.4
$1.0 < V/\sqrt{L} \leq 1.3$; $0.667V/\sqrt{L} - 0.267$
$1.3 \leq V/\sqrt{L}$; $1.5V/\sqrt{L} - 1.35$

β = slope of ship's bottom obtained from the following formula, but C_2/β is greater than 11.43, it is to be taken as 11.43.

$$\beta = \frac{0.0025L}{b}$$

b = horizontal distance measured at the station $0.2L$ from the stem, from the centre line of ship to the intersection of the horizontal line $0.0025L$ above the top of keel with the shell plating (m) (See **Fig 3.7.2**)

C_3 = as obtained from the following formula

$$C_3 = 1.9 - 0.9\left(\frac{d_f}{0.025L}\right)$$

d_f = minimum bow draught at the ballast conditions.

C_4 = coefficient obtained from the followings.

$x_1 \leq x$; 1.0

$x < x_1$; $0.5 + \frac{0.5x}{x_1}$

x = length to longitudinal direction from end of stem to transverse section (m)

x_1 = as obtained from the followings

$C_b < 0.7$; $0.1L$

$0.7 \leq C_b < 0.8$; $(0.1 - 0.5(C_b - 0.7))L$ (m)

$0.8 \leq C_b$; $0.05L$

(B) In ships having bow draught more than $0.025L$ but less than $0.037L$ at the ballast condition, the section modulus of longitudinal shell stiffeners or bottom longitudinals in way of the strengthened bottom forward is to be obtained by the linear interpolation from the values given by the requirements in (A) and the values in **403. 1** of the Rules.

(3) Thickness of solid floors

Thickness of solid floors is obtained from the following (A) and (B), whichever is greater.

(A) The thickness of solid floors in 1/2 spacing of both sides of bottom longitudinals is to be obtained from the following formula. (See **Fig 3.7.9**)

$$t = \frac{PSbK}{196(b - d_1)} + 1.5 \quad \text{(mm)}$$

P = slamming pressure given by (2)(A). In ships having bow draught more than $0.025L$ but less than $0.037L$ at the ballast condition, this requirement is to be applied using actual bow draught at the ballast condition.

S = spacing of solid floors (m)

b = breadth of panel (m)

d_1 = sum of breadth of panel opening (m), where the opening compensated with double plates, sectional area may be properly considered.

(B) Thickness of solid floors is to be obtained from the following formula.

$$t = 1.1\sqrt[3]{PSb^2} + 1.5 \quad \text{(mm)}$$

P and S = as specified in (A)

b = spacing of bottom longitudinal (m)

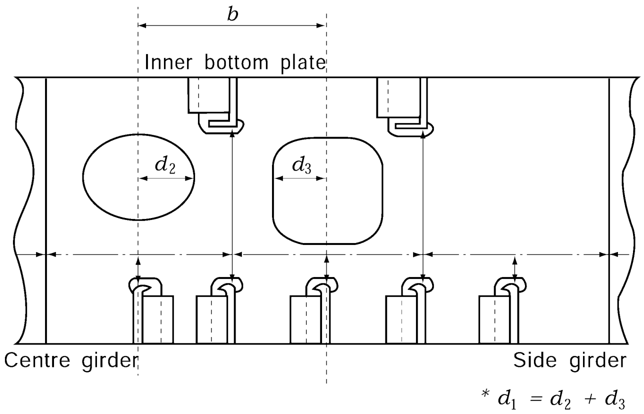

Fig 3.7.9 Solid floor of strengthened bottom forward

3. With respect to the requirements of **801.** of the Rules, ships of which L and C_b are 150 m or more and 0.7 or more respectively may apply to the followings.

(1) Slamming impact pressure P specified in **804. 1** of the Rules**,** may be given by the following formula. In this case, the slamming impact pressure is to be calculated at the mid-span point for each longitudinal shell stiffeners or bottom longitudinals.

$$P = 1.14\frac{\nu^2}{\beta} \quad \text{(kPa)}$$

β = as given by the following formula. In no case, the value of $1/\beta$ is greater than 11.43.

$$\beta = \frac{0.0025L}{b}$$

b = in considering transverse section, horizontal distance (m) from the ship's center line to the intersection of the horizontal line of 0.025L above the ship's base line and the ship's moulded line of shell.

ν = relative speed (m/s)between the ship's bottom of considered position and sea surface as given by the following formula.

$$\nu = C_0\left(\frac{2\pi}{T_P}\left(\sqrt{C_4} + 0.45H_w\cos\phi + 0.18\cos\lambda\,\sin\phi\right) + 0.51C_7\,V\sin\phi\right)$$

C_0 = as given by the following formula.

$$C_0 = 1 - 0.015\left(\frac{L-150}{150}\right)$$

C_4 = as given by the following formula. In no case, the value is less than zero.

$$C_4 = (l + 0.05L)^2\phi_0^2 - (0.025L')^2$$

l = longitudinal distance (m) from the midship to the considered position.

ϕ_0 = pitch angle (rad) as given by the following formula.

$$\phi = \frac{3.3(C_7 V + 5)^{0.2}}{L^{1.2}\sqrt{C_b}} H_W$$

H_W = significant wave height (m) as given by the following formula. However, this value may not be greater than the maximum value of 0.055L and 11.5.

$$H_W = C_5 C_6$$

C_5 = as given by the following formula.

$$L \le 300 \ : \ C_5 = 10.75 - \left(\frac{300 - L}{100}\right)^{1.5}$$

$$300 < L \le 350 \ : \ C_5 = 10.75$$

$$350 < L \ : \ C_5 = 10.75 - \left(\frac{L - 350}{150}\right)^{1.5}$$

C_6 = As given by the following formula.

$$C_6 = \sqrt{\frac{L + \lambda - 25}{L}}$$

C_7 = as given by the following formula. In any case, this value is not to be less than 0 and not to be greater than 1.

$$C_7 = \frac{V/\sqrt{L} - 1.1}{0.4}$$

λ = wave length as given by the following formula.

$$\lambda = 0.6\left(1.5 + \frac{(0.0075L + 0.025L')}{2d}\right)L \quad \text{(m)}$$

T_P = natural period of pitch motion as given by the following formula.

$$T_P = \sqrt{\frac{2\pi\lambda}{g}} \quad \text{(sec)}$$

ϕ = as given by the following formula. However, this value may not be greater than $0.015 + \phi$

$$\phi = 0.015 + \tan^{-1}\left(\frac{0.025L'}{l + 0.05L}\right) \quad \text{(rad)}$$

(2) For the examination of the position within ballast tanks which are to be filled up by sea water in the ballast conditions, the slamming impact pressure P specified in (1) above may be reduced by ΔP as given by the following formula. In this case, it is to be stated in the ship's loading manual that such ballast tanks are to be filled up in the heavy weather condition.

$$\Delta P = 5h \quad \text{(kPa)}$$

h = depth of the ballast tank (m)

4. In way of strengthened bottom forward, structural arrangements other than those specified in **803.** of the Rules may be adapted subject to the following (1) to (3).

(1) The thickness of solid floors in the longitudinal stiffened system and girders in the transverse stiffened system is to apply to the provisions of **801. 2** (3). For the thickness of solid floors in the longitudinal stiffened system, the slamming impact pressure P may be corrected by multiplying the coefficient C_9 specified in (3) the below.

(2) The thickness of solid floors and girders is not to be less than the value obtained by the following (A) and (B), whichever is the greater.

(A) $t_1 = K\dfrac{C_8 PSl}{226(d_0 - d_1)} + 2.5$ (mm)

P = the considered slamming impact pressure as specified in **804. 1** of the Rules, **801. 2**. or 801.3. In ships having bow draught more than 0.025 L' but less than 0.037 L' at the ballast condition, the slamming impact pressure is to be obtained by linear interpolation from the above value and the value obtained by the following formula as the pressure when the bow draught is 0.037 L'. The slamming impact pressure is not to be less than the value obtained by the following formula.

$$P = 1.015L \quad \text{(kPa)}$$

C_8 = as given by the following formula. In any case, this value is not to be less than 0.1 and not to be greater than 1.

$$C_8 = \frac{3}{A}$$

A = area (m^2) considered in the strength examination, in this case, as given by the following formula

$$A = S \times l$$

S = spacing (m) at solid floors or girders for themselves under the consideration

l = spacing (m) at girders or solid floors for members crossing those under the consideration

d_0 = depth (m) of the floors or the girders at the considered position

d_1 = depth (m) of the opening in the floors or the girders at the considered position.

(B) The value given by the requirements of **302.** (2) of the Rules, using the value of t_1 as given by the above (a), in the mentioned requirements. For the application to girders, the wording 'solid floors' specified in **302.** (2) of the Rules is to be read as 'girders'.

(3) For scantlings of longitudinal shell stiffeners and bottom longitudinals, the slamming impact pressure P may be corrected by multiplying the coefficient C_9 as given by the following formula. In any case, the coefficient C_9 is not to be less than 0.1 and not to be greater than 1.

$$C_9 = \frac{3}{l}$$

l = as given in **804. 1** of the Rules

802. Definition

In ships of which L and C_b are less than 150 m and 0.7 respectively and bow draught is less than $0.02L$ at the ballast condition, the area of strengthened bottom forward of the ship is to be expended as follows.

(1) The after end of strengthened area is to be extended the following distance a afterwards from the position required in **Table 3.7.11** of the Rules.

$a = 0$, where $C_b = 0.7$

$a = 0.05L$, where $C_b < 0.6$

For intermediate values of C_b, a is to be obtained by linear interpolation.

(2) In addition to (1) above, bottom areas of which tangential slope to the base line is less than 25° are required to be strengthened. (See **Fig 3.7.10**). ⚓

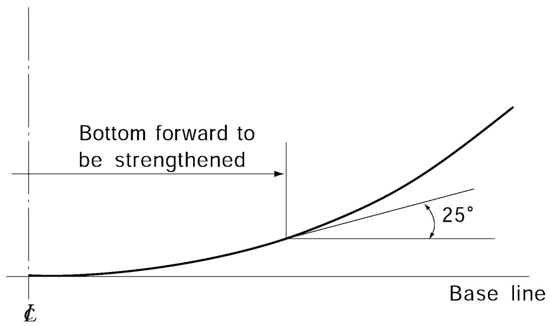

Fig 3.7.10 Range of transverse direction of strengthened bottom forward

CHAPTER 8 FRAMES

Section 1 General

108. Frames at a location where flare is specially large

1. For pure car carriers, the plastic section modulus Z_p of transverse frames and side longitudinals, which are fitted in the bow flare position considered to endure large wave impact pressure, above the load line for 0.1 L forward is not to be less than that obtained from the following formula.

Required plastic section modulus : $Z_p = \frac{PSl_s^2}{16\sigma_y \cos\theta_s} \times 10^3$ (cm^3)

Where,

S = frame spacing (m)

l_s = unsupported length of frame as obtained from the following formula (m)

$$l_s = l - l_{b1} - l_{b2}$$

l = refer to **Fig 3.8.1**

l_{b1} and l_{b2} = bracket length for span correction as obtained from the following formulae

$$l_{b1} = b_1(1 - \frac{h_0}{h_1}) \times 10^{-3}$$

$$l_{b2} = b_2(1 - \frac{h_0}{h_2}) \times 10^{-3}$$

b_1, b_2, h_0, h_1 and h_2 = refer to **Fig 3.8.1**

σ_y = specified yield stress of the material (N/mm^2)

θ_s = frame list angle to side shell (deg), refer to **Fig 3.8.2**

P = slamming impact pressure as obtained from the following formula (kPa)

$$P = \frac{1}{2}\rho C_e K_P (\frac{\nu_n}{\cos\beta_0})^2$$

ρ = sea water density, 1.025 (t/m^3)

β_0 = relative impact angle between wave surface and a point under consideration on ship's surface as obtained from the following formula (deg)

$$\beta_0 = \phi + \phi_h^* - 35$$

ϕ = as obtained from the following formula (deg)

$$\phi = \tan^{-1}(\frac{1}{\tan\beta_k \cos\gamma})$$

β_k = as obtained from the following formula (deg)

$$\beta_k = \beta_{k1} - \sqrt{40-\beta} \quad (\beta \le 40^o)$$
$$\beta_k = \beta_{k1} + \sqrt{\beta-40} \quad (\beta > 40^o)$$

β = shell angle at the section under consideration (deg) (see **Fig 3.8.3**)
β_{k1} = as obtained from the following formula (deg)

$$\beta_{k1} = 40\{1.2(0.8-X/L)(1.2-X/L)+1\} - 0.02(D_z-d)(D_z-d-20)$$

X = longitudinal distance from the aft end of L to the section under consideration (m)
D_z = vertical distance from base line at the middle of L to the section under consideration (m)

γ = shell angle at the section under consideration (deg) (see **Fig 3.8.3**)
ϕ_h^* = angle of heel as obtained from the following formula

$$\phi_h^* = 0 \qquad \text{(where, } \frac{(D_1-d)^2}{BdC_b} \le 0.5\text{)}$$
$$\phi_h^* = \{7.8\frac{(D_1-d)^2}{BdC_b} - 3.9\}\cos\gamma \text{ (deg)} \qquad \text{(where, } \frac{(D_1-d)^2}{BdC_b} > 0.5\text{)}$$

D_1 = vertical distance, at the midship, from the top of keel to the top of uppermost continuous deck beam (m)

K_P= coefficient obtained from the formula in **Table 3.8.1**
C_e = coefficient obtained from the following formula

$$C_e = \frac{\beta_0}{40} + 0.25 \qquad \text{(where, } \beta_0 \le 30^o\text{)}$$
$$C_e = 1.0 \qquad \text{(where, } \beta_0 > 30^o\text{)}$$

ν_n = maximum relative velocity between wave surface and a point under consideration on ship's surface as obtained from the following formula (m/s)

$$\nu_n = \frac{\nu_x \tan\beta_k + \nu_z \tan\alpha \tan\beta_k}{\sqrt{\tan^2\alpha + \tan^2\beta_k + \tan^2\alpha \tan^2\beta_k}}$$

ν_x = longitudinal relative velocity at a point under consideration on ship's surface as obtained from the following formula (m/s)

$$\nu_x = (1-C_1)\nu_{xo}$$

C_1 = coefficient obtained from the formula in **Table 3.8.2**

ν_{x0} = longitudinal relative velocity at the waterline as obtained from following formula (m/s)

$$\nu_{x0} = \nu_s + C_2\sqrt{Lg}$$

ν_s = 0.36 V (m/s)
V = speed of ship (kt)
g = gravity acceleration, 9.81 (m/s^2)
C_2 = coefficient obtained from the formula in **Table 3.8.2**

ν_z = relative velocity at a point under consideration on ship's surface in the direction of ship's depth as obtained from the following formula (m/s)

$$\nu_z = (1 - C_3)\nu_{zo}$$

C_3 = coefficient obtained from the formula in **Table 3.8.2**
ν_{z0} = relative velocity at the waterline in the direction of ship's depth as obtained from the following formula (m/s)

$$\nu_{z0} = C_4\sqrt{Lg}$$

C_4 = coefficient obtained from the formula in **Table 3.8.2**

α = as obtained from the following formula

$$\alpha = \tan^{-1}\left(\frac{\tan\beta_k}{\tan\gamma}\right)$$

Z_P = plastic section modulus of frame, where the frame is joined to shell plate with a right angle, as obtained from the following formula. (cm^3)

$$Z_P = 0.1A_f h + \frac{1}{2000}h^2 t_w$$

A_f = sectional area of flange (cm^2)
h = depth of web plate (mm)
t_w = thickness of web plate (mm)

Table 3.8.1 Coefficient K_p

β_0	K_p
$\beta_0 < 3^0$	255.85
$3^0 \le \beta < 4^0$	$758.60\ e^{-0.3623\beta_0}$
$4^0 \le \beta < 6^0$	$453.91\ e^{-0.2339\beta_0}$
$6^0 \le \beta < 10^0$	$335.41\ e^{-0.1835\beta_0}$
$10^0 \le \beta < 15^0$	$173.61\ e^{-0.1176\beta_0}$
$15^0 \le \beta < 18^0$	$80.523\ e^{-0.0664\beta_0}$
$18^0 \le \beta_0$	$1+\frac{\pi}{4}cot^2\beta_0$

Table 3.8.2 Coefficient C_1, C_2, C_3 and C_4

C_1	$(4.40\xi - 6.31)\zeta$
C_2	$0.100\xi + 0.435F_n - 0.162$
C_3	$(\frac{6.37}{\xi - 0.449} + 10.73)\zeta^2$
C_4	$(-1.270F_n + 0.410)\xi + 0.758F_n - 0.038$

Note :

ξ = $x/(L/2)$, however, ξ is to be greater than 0.8
x = longitudinal distance to the section under consideration from the midship (m)
ζ = $z/(L/2)$, however, ζ is to be greater than 0
z = height from the load line to the section under consideration (m)
F_n = $\nu_s/\sqrt{Lg}$

2. For pure car carriers, the scantling of web frames supporting side longitudinals, which are fitted in the bow flare position considered to endure large wave impact pressure, above the load line for 0.1 L forward is to be in accordance with requirements of side stringers supporting transverse frames in **Ch 9, 104.**

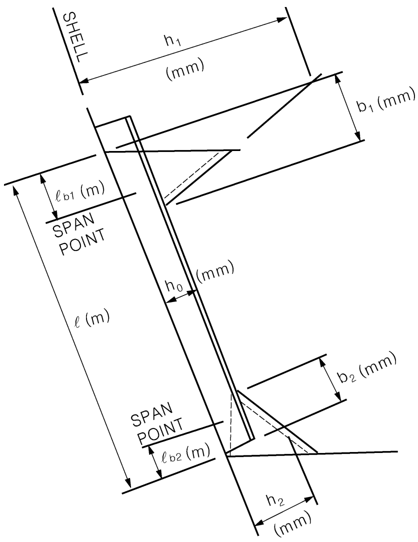

Fig 3.8.1 Modified Span Length of Frames

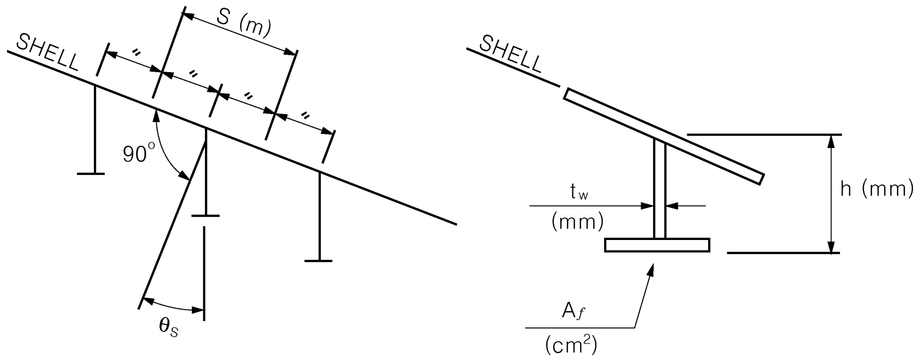

Fig 3.8.2

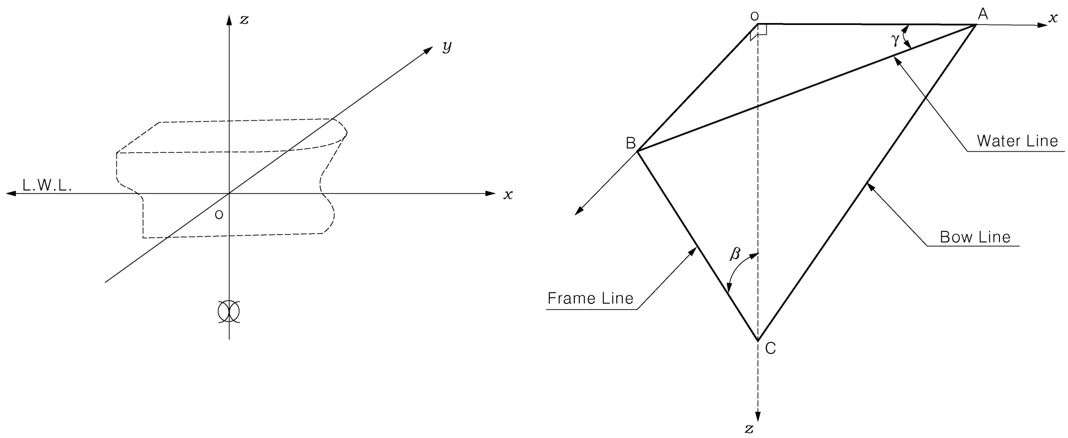

Fig 3.8.3 Shell Angle

Section 3 Hold Frames

302. Scantlings of transverse hold frames

The scantlings of hold frames which are considered to support the loads from steel coils at ship's rolling are recommended to be determined in accordance with not only **302.** of the Rules but also mentioned below based on calculation in elastic range.

(1) Boundary condition ; Simply supported at deck and fixed at inner bottom
(2) Allowable stress ; $196/K$ (N/mm^2)
(3) Loading condition ; Hydraulic pressure of ship's side by h specified in **Table 3.8.1** of the Rules and mass of steel coils(P) calculated by the following formula
(A) In case of loading steel coils lined up in one tier.

$$P = \frac{C_1 \, Wk \, \sin\theta}{n} \quad \text{(ton)}$$

W = mass of one steel coil (ton)

θ = maximum heeling angle (deg)

n = number of frame supporting one steel coil

k = coefficient according to acceleration direction due to ship's rolling, to be normally taken 1.0

C_1 = coefficient according to the arrangements of key coil as obtained from the followings.

Where the key coils are arranged at second from ship side -- 4.0

Where the key coils are arranged towards center line than second steel coil form ship side -- 2.5

(B) In case of loading steel soils lined up in two tiers

$$P = \frac{C_2\ Wm\ \sin\theta}{n} \quad \text{(ton)}$$

$W,\ \theta,\ n$ = as specified in (A)

m = total number of steel coils loaded in the relevant transverse frame section

C_2 = coefficient defined according to arrangement of steel coil, in general, to be taken 0.7. However, where steel coils in lower tier are arranged so closely that the contact pressure of each other is considered large enough to be reduced, the value may be reduced.

303. Transverse hold frames supported by web frames and side stringers

Where the arrangement of side stringers are not complies with **303. 2** of the Rules, the scantlings of frames are to be applied in **303. 1.** of the Rules. However, if it is reviewed and decided the scantlings with proper manner, the scantlings of frames may not be applied in **303. 1** of the Rules. (see **Fig 3.8.4**)

(1) Where the difference between unsupported spans of any adjacent frames is more than 25 %

(A) In case that the value of $l_2/l \geq 1.25$, $l_2/1.25$ is to be used instead of l.

(B) In case that the value of $l_3/l_2 \geq 1.25$ and $l_2/l < 1.25$, modification is not required.

(2) Where the difference between the largest and smallest span is more than 50 %.

(A) In case the lowest span is smallest, (maximum span)/1.5 to be used instead of l.

(B) In other cases than above, no modification required.

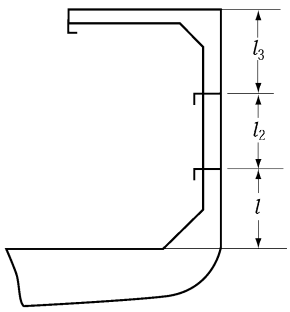

Fig 3.8.4 Transverse hold frames supported by side stringers specially arranged

Section 5 Tween Deck Frames

502. Scantlings of tween deck frames

Where ends of tween deck frames are connected with brackets, the size of which is bigger than $l/8$, the requirements of **502.** of the Rules may be applied as the manner shown in **Fig 3.8.5.**

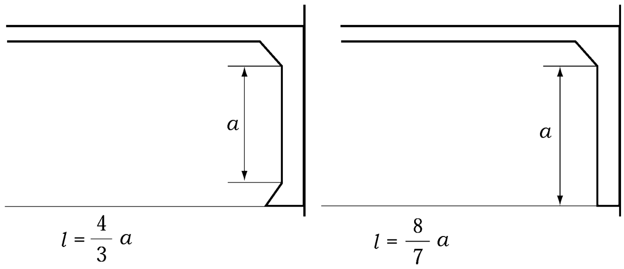

Fig 3.8.5 Frames between decks fixed by the bracket

503. Special consideration to tween deck frames

1. In ships having multi-decks like as Pure Car Carriers, where freeboard is less than the value given in **Table 3.8.1,** the tween deck frames above freeboard deck are to be generally reinforced according to the ship's length as follows.

Table 3.8.1 Standard freeboard

Length of ship L(m)	$L < 75$	$75 \leq L < 125$	$125 \leq L$
Standard freeboard (m)	0.36	0.40	0.46

(1) Range of reinforcement is at least up to the between deck frames of the first tier counted from freeboard deck.

(2) The section modulus of tween deck frames is applied to the following requirements.

(A) Tween deck frame is arranged toward of forward the collision bulkhead : It is to be applied to **Ch 13, 204 .1** of the Rules.

(B) Tween deck frame is arranged afterward of abaft aft peak bulkhead : It is to be applied to **Ch 13, 302.** of the Rules.

(C) Others : It is to be applied (2) in **Table 3.8.4** in **502.** of the Rules. However for coefficient C of **Table 3.8.4** in **502.** of the Rules, 0.57, 0.74 and 0.89 should be substituted for 0.44, 0.57 and 0.74 respectively.

2. Tween deck frames, which are fitted in the bow flare position considered to endure large wave impact pressure, are to be properly strengthened taking care of the effectiveness of their end connections. ⚓

CHAPTER 9 WEB FRAMES AND SIDE STRINGERS

Section 1 General

104. Web frames and side stringers at a location where flare is specially large

1. For pure car carriers, the thickness t_{wG} of web plate and section modulus Z_G, of side stringers supporting transverse frames and web frames supporting these side stringers, which are fitted in the bow flare position considered to endure large wave impact pressure, above the load line for 0.1 L forward are not to be less than those obtained from the following formulae.

Required thickness of web plate : $t_{wG} = \dfrac{433 P S_G l_G}{d_{wG}\,\sigma_y \cos\theta_G}$ (mm)

Required section modulus : $Z_G = \dfrac{P S_G l_G^2}{24\sigma_y \cos\theta_G} \times 10^3$ (cm^3)

where,

P = slamming impact pressure as specified in **Ch 7, 108.** (kPa)

S_G = spacing of girder (m)

l_G = unsupported length of girder taking into account geometry of girder at end parts (m). Where form of girder at end parts is arc form such as **Fig 3.8.1** this length is to be modified considering it triangle, as follows.

(1) To join R-ENDs together. (AB)
(2) To draw tangent line $A'B'$ with arc, parallel to AB.
(3) To put point A'' so that $AA'' = (2/3)AA'$ and to put B'' so that $BB'' = (2/3)BB'$, and triangle $OA''B''$ is considered as bracket of triangle.

$$l_G = l - l_{b1} - l_{b2}$$

l : refer to **Fig 3.8.1**

l_{b1} and l_{b2} = bracket length for span correction as obtained from the following formulae (m)

$$l_{b1} = b_1\left(1 - \frac{d_{wG}}{h_1}\right) \times 10^{-3}$$

$$l_{b2} = b_2\left(1 - \frac{d_{wG}}{h_2}\right) \times 10^{-3}$$

b_1, b_2, h_1 and h_2 : refer to **Fig 3.9.1**

d_{wG} = depth of web plate (mm)

σ_y = specified yield stress of the material (N/mm^2)

θ_s = angle between girder and vertical axis of shell plate (deg). Refer to **Fig 3.9.2**

Z_G = section modulus of girder as obtained from the following formula. (cm^3)

$$Z_G = 0.1 A_{fG} d_{wG} + \frac{1}{3000} d_{wG}^2 t_{wG}$$

A_{fG} = sectional area of flange (cm^2)

2. Buckling strength of girder webs at end parts in above **1.** is to be in accordance with followings (1) and (2).

(1) Shearing stress τ for the web plates of girders at end parts is not to exceed the critical value τ_{cr}^* obtained from the following.

$$\tau_{cr}^* = \tau_{cr} \quad (\text{N/mm}^2), \text{ where } \quad \tau_{cr} \le \frac{\tau_F}{2}$$

$$\tau_{cr}^* = \tau_F\left(1 - \frac{\tau_F}{4\tau_{cr}}\right) \quad (\text{N/mm}^2), \quad \text{where} \quad \tau_{cr} > \frac{\tau_F}{2}$$

$$\tau_F = \frac{\sigma_y}{\sqrt{3}}$$

σ_y = specified yield stress of the material (N/mm^2)

τ_{cr} = shear buckling stress for web plates of girders at end parts as obtained from the following formula

$$\tau_{cr} = 0.9 k_s E\left(\frac{t_{wG}^*}{d_{wG}^*}\right) \quad (\text{N/mm}^2)$$

k_s = coefficient as obtained from Table 3.9.1 depending on a_G/d_{wG}^*. For intermediate values of a_G/d_{wG}^*, k_s is to be obtained by linear interpolation.

a_G = length of web plate at end parts (mm) See **Fig 3.9.3**

E = modulus of elasticity, 2.06×10^5 (N/mm^2)

t_{wG}^* = thickness of web plate of girder at end parts (mm)

d_{wG}^* = mean depth of web plate of girder at end parts (mm)

τ = shear stress for web plate at end parts as obtained from the following formula

$$\tau = \frac{250 P S_G l}{d_{wG}^* t_{wG}^* \cos\theta_G} \quad (\text{N/mm}^2)$$

Table 3.9.1 Coefficient k_s

a_G/d_{wG}^*	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
k_s	64	38	25	19	15	12	10	9	8	7

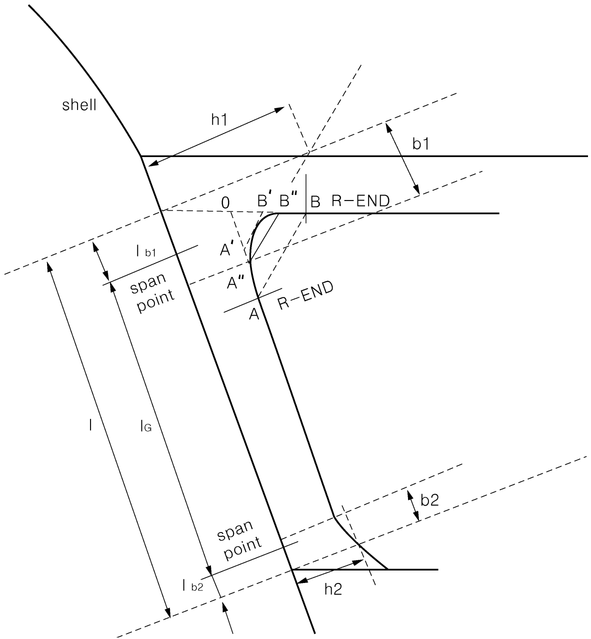

Fig 3.9.1

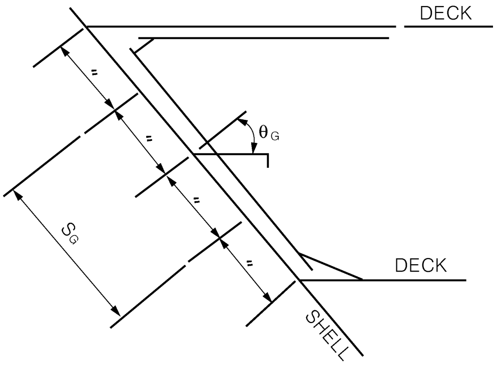

Fig 3.9.2

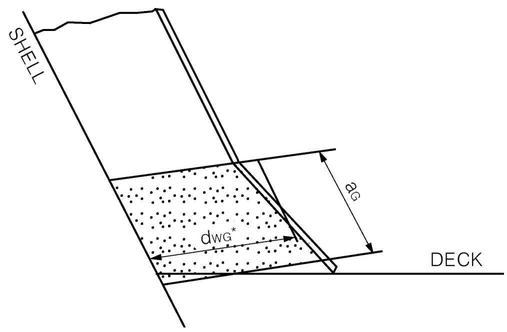

Fig 3.9.3

(2) Bending stress σ_b for the web plates at end parts is not to exceed the critical value σ^*_{bcr} obtained from the following.

$$\sigma^*_{bcr} = \sigma_{bcr} \quad (\text{N/mm}^2), \quad \text{where } \sigma_{bcr} \le \frac{\sigma_y}{2}$$

$$\sigma^*_{bcr} = \sigma_y\left(1 - \frac{\sigma_y}{4\,\sigma_{bcr}}\right) \ (\text{N/mm}^2), \quad \text{where } \sigma_{bcr} > \frac{\sigma_y}{2}$$

σ_y = yield stress of the material (N/mm^2)

σ_{bcr} = bending buckling stress (N/mm^2) of web as obtained from following

$$\sigma_{bcr} = 0.9\,k_b\,E\left(\frac{t^*_{wG}}{d^*_{wG}}\right)^2 \qquad (\text{N/mm}^2)$$

k_b = coefficient as obtained from **Table 3.9.2** depending on a_G/d^*_{wG}. For intermediate values of a_G/d^*_{wG}, k_b is to be obtained by linear interpolation.

σ_b = bending stress working on web as obtained from the following formula

$$\sigma_b = \frac{P S_G l_G^2}{24 Z^*_G \cos\theta_G} \times 10^3 \quad (N/mm^2)$$

Z^*_G = sectional modulus of web plate at end parts (cm^3)

$$Z^*_G = 0.1 A_{fG} d^*_{wG} + \frac{1}{3000} d^{*2}_{wG} t^*_{wg}$$

Table 3.9.2 Coefficient k_b

a_G/d^*_{wG}	0.5 and under	0.6	0.7	0.8	0.9 and over
k_b	12	10	8.8	8.0	7.8

Section 5 Cantilever Beams

503. Connections

1. To prevent the buckling of end brackets of cantilever beams connected with web frames, stiffeners are to be fitted to the brackets with at suitable spacing in order to make their panels smaller as shown in **Fig 3.9.4.**

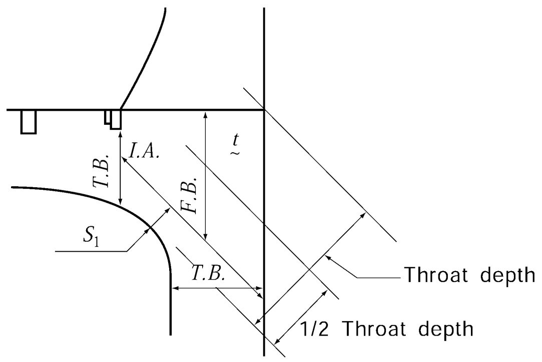

Fig 3.9.4 Compensation of bracket

2. Within the range of 1/2 of the throat depth of the end bracket from the side of face plate, stiffeners such as inverted angle are to be arranged in the direction of compression at the spacing(S_1) obtained from the following formula as the standard.

$$S_1 = 35(t - 2.5) \quad (mm)$$

t = thickness of bracket (mm) ⚓

CHAPTER 10 BEAMS

Section 1 General

102. Connections of ends of beams

1. The standards of end connection of longitudinal beams are as shown below.

2. The standards of end connection of transverse beams by means of brackets are as shown below.

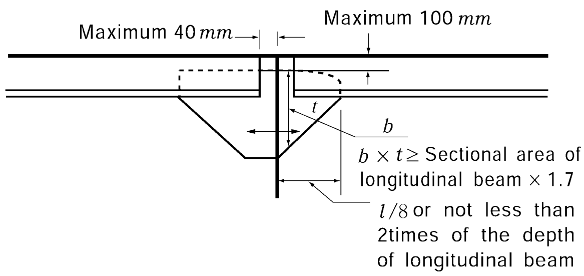

Fig 3.10.1

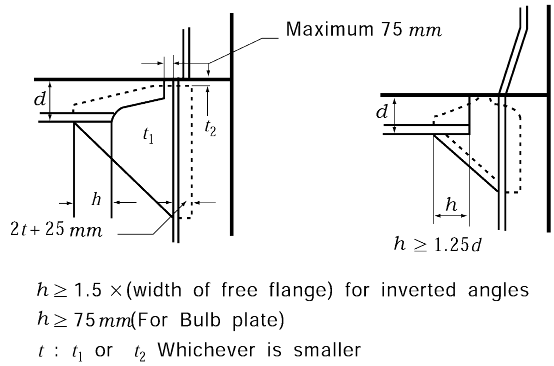

Fig 3.10.2

106. Long machinery opening

Where the length of machinery opening is not less than 20 m, a cross tie is to be provided at middle of opening.

Section 2 Deck Load

201. Value of h

The value of h is to be prescribed in suitable documents like as loading manual specified in **Ch 3, 103.** of the Rules to aid the ship's master.

Section 3 Longitudinal Beams

303. Section modulus

The section modulus of longitudinal beams outside the line of hatchway openings of the strength deck for the parts forward and afterward the midship part of ship may be determined by the interpolation between the requirements of **303. 1** and **2** of the Rules. In general the interpolation may be made at the mid position of each building block in ship lengthwise. However, where the length of block is over 15 m, it may be properly divided.

Section 4 Transverse Beams

402. Proportion

1. In case where the span/depth ratio of transverse beams exceeds 30 in strength decks or 40 in effective decks and superstructure decks, the second moduli of beams are to be increased in the corresponding ratios.

2. In bulk carrier, ore carrier, etc. over 200 m in their length, the slenderness ratio of transverse beams inside the line of hatchway openings of the strength deck is recommended that is to be below 60. ⚓

CHAPTER 11 DECK GIRDERS

Section 1 General

103. Construction

1. At the upper and lower ends of pillars and other places where concentrated loads are expected, girders are to be fitted with tripping brackets and slots in girders are to be fitted with collars. Under the end bulkheads of superstructures, only collars are required. Collars are also to be fitted at the slots near the toe of end bracket.

2. Butt joints of girder webs are to be avoided at corners of slots. Butt joints of face plates are to be likewise avoided at knuckled parts. If butt joints of face plates are inevitably placed at knuckled parts, butt straps are to be provided as shown in **Fig 3.11.1.** The depth of slots is not to exceed $0.4d_G$. If this limit is exceeded, collars are to be fitted with the depth not exceeding $0.5d_G$. These requirements may be suitably modified for superstructures.

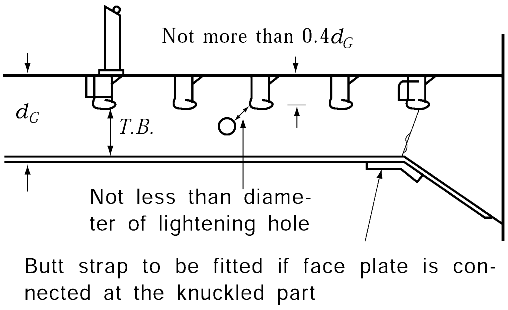

Fig 3.11.1

3. Sizes of lightening holes are to be as follows.

Where slots are provided, $d \le \frac{d_G}{4}$

Where slots are not provided, $d \le \frac{d_G}{3}$

d_G = depth of girder

d = diameter of lightening holes

4. In RO-RO ships, etc., the scantlings of girders may be determined by the direct strength calculation.

5. Where the value obtained from the following formulas equal to or greater than 1.6, special consideration is to be given to the beams on the shell side or bulkhead side in the region of mid-span of girders because of added stress due to forced deflection.

$$\frac{I_b l^4}{I_g S b^3}$$

I_b and I_g = actual moment of inertia of beams and girders (cm^4)

b and l = span of beams and girders (m)

S = spacing of beams (m)

104. End connection

1. Where a girder stops at a bulkhead, a bracket is to be fitted on the reverse side. (See **Fig 3.11.2**)

2. Continuity of deck girders

(1) The depth of bracket is, as a standard, to be equal to twice the depth of web. If the depth of bracket is smaller than this standard, suitable equivalent means, such as gusset plate, is to be provided.(See **Fig 3.11.3**)

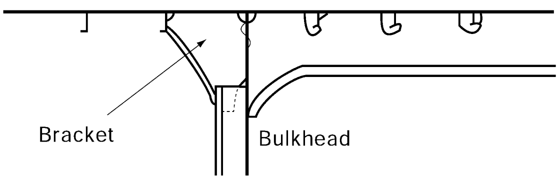

Fig 3.11.2

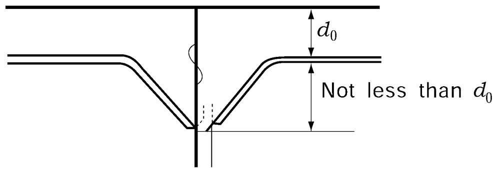

Fig 3.11.3

(2) Girders to be considered for the section modulus calculation of hull girder are to penetrate bulk-heads as a whole including the web and face plate, or to be so connected at the ends as to give an equivalent effectiveness. (See **Fig 3.11.4**)

(3) Where deck girders are discontinuous, they are be sufficiently overlapped. (See **Fig 3.11.5**) ⫝

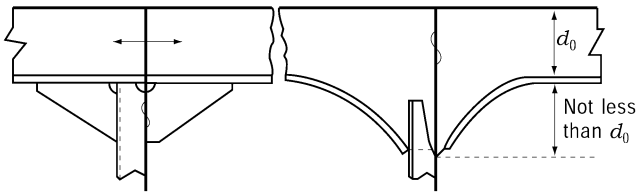

Fig 3.11.4

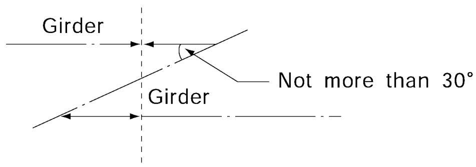

Fig 3.11.5

CHAPTER 12 PILLARS

Section 1 General

102. Pillars in holds

Compensation of under pillars is to be as shown in **Fig 3.12.1.**

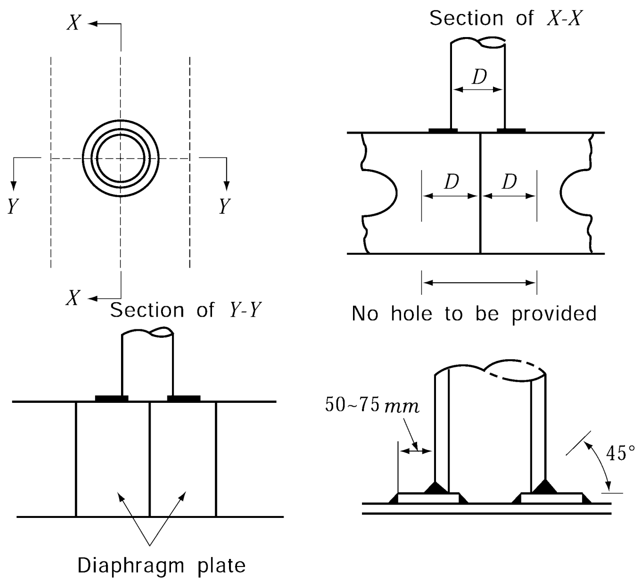

Fig 3.12.1 Compensation of under pillars

Section 2 Scantling of Pillars

201. Sectional area

Sectional area of pillars which is regarded as fixed ends may be obtained from the following formula.

$$A = \frac{0.223\,W}{2.72 - \dfrac{0.5\,l}{k_0}} \quad (\mathrm{cm}^2)$$

CHAPTER 13 ARRANGEMENTS TO RESIST PANTING

Section 1 General

102. Swash plate

Scantlings of swash plates which are used for deep tanks at fore and aft peak tanks are to be complied with **203. 2** (2) of the Rules.

103. Stringers fitted up with extremely small angle

In case the angle between webs of girders and shell plating is not more than 75°, substantially the following treatment (1) and (2) are to be required (See **Fig 3.13.1**). And where the webs of girder is inclined provided to shell plating, actual section modulus of girder is to be calculated against neutral axis parallel to shell plating.
(1) Face plate is to be fitted on the side of open bevel
(2) Tripping brackets are to be fitted in suitable spacing

Section 2 Arrangements to Resist Panting forward the Collision Bulkhead

204. Longitudinal framing

For the applying **204. 2** (2) of the Rules, where the side transverses are supported by side stringers or panting stringers, d_2 in the formula for the depth of side stringers is not applied.

Section 4 Arrangements to Resist Panting between Both Peaks

401. Abaft collision bulkhead

The reinforcement is recommended such that, between the $0.15L$ from the fore end, side stringers are provided in line with stringer plates or side stringers in way of the fore peak tank in association with web frames provided at a suitable interval. Even in case where it is impracticable to provide with frame and side stringer, at least the reinforcement as the followings is to be provided.

1. Appropriate range of scantlings of hold frames abaft the collision bulkhead are to be reinforced to not less than the value in **302.** of the Rules by gradually increasing scantlings of hold frames from the prescribed **Table 3.8.1** of the Rules.

2. Solid brackets are to be provided and firmly connected with collision bulkhead and hold frame abaft the collision bulkhead at appropriate positions in way of depth of ship. ⚓

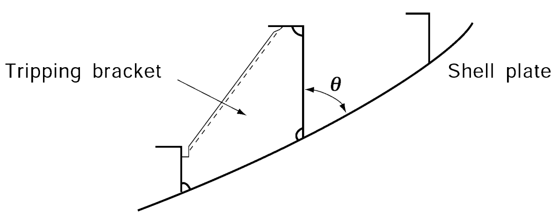

Fig 3.13.1 In case the angle between webs of girders and shell plating is small

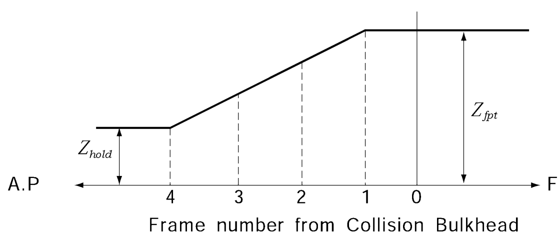

Z_{hold} : the section modulus of hold frames required in **Table 3.8.1** of the Rules

Z_{fpt} : the section modulus of frames forward collision bulkhead obtained from the formula in **302.** of the Rules

Fig 3.13.2

CHAPTER 14 WATERTIGHT BULKHEAD

Section 2 Arrangements of Watertight Bulkheads

201. Collision bulkheads

1. In ships with bow doors, the collision bulkhead under the deck just above the freeboard deck is to comply with the **201., 202.** and **205.** of the Rules.

2. The expression "accepted by the Society" means that an application submitted together with calculations verifying that no part of the bulkhead deck will be immersed even when the compartment forward of collision bulkhead is flooded under the loading condition (without trim) corresponding to the load line.

204. Hold bulkheads

1. The expression "to the approval of the Society" in **204. 2** of the Rules means that the ships are complied with the International convention or relative Laws of flag state for damage stability and subdivision regulation, for other ships are to be complied with the following **2.**

2. Omission standard

(1) The arrangement of watertight bulkheads may be different from that specified of the Rules, provided that, under the loading condition corresponding to the load line, the final waterline will not exceed the upper surface of bulkhead deck at side even after any one compartment, except the machinery space, has been flooded. In this case, the ratio of flooding used in the flooding calculations are to be as follows.

Cargo Space
empty hold ………………………………………… 0.95
loaded with general cargoes ……………………… 0.60
loaded with timber…………………………………… 0.55
loaded with ore……………………………………… 0.50

loaded with car or containers……………………… $0.95 - 0.35 \times \dfrac{V_C}{V_0}$

Where, V_C is the volume occupied by cars and/or containers, and V_0 the moulded volume of the compartment.

Deep tanks
filled out with liquid ……………………………… 0
empty tanks ………………………………………… 0.95

(2) In case the spacing between bulkheads is not more than $0.7\sqrt{L}$ (m), these bulkheads are regarded as one bulkhead

3. For the ships which is not less than 186 m in length, the number of hold bulkheads is not to be less than that determined by the above mentioned **2.**

207. Chain lockers

This Requirement is applicable to ships with a length of 24 m and above built in accordance with the **1966 Load Line Convention** or the **1988 Protocol to the Load Line Convention** and the keels of which are laid or which are at a similar stage of construction on or after **1 July 2003.**

- Spurling pipes and cable lockers are to be watertight up to the weather deck. Bulkheads between separate cable lockers (see **Fig 3.14.1 Arrangement 1**), or which form a common boundary of cable lockers (see **Fig 3.14.1 Arrangement 2**), need not however be watertight.
- Where means of access is provided, it is to be closed by a substantial cover and secured by closely spaced bolts.
- Spurling pipes through which anchor cables are led are to be provided with permanently attached closing appliances to minimize water ingress.

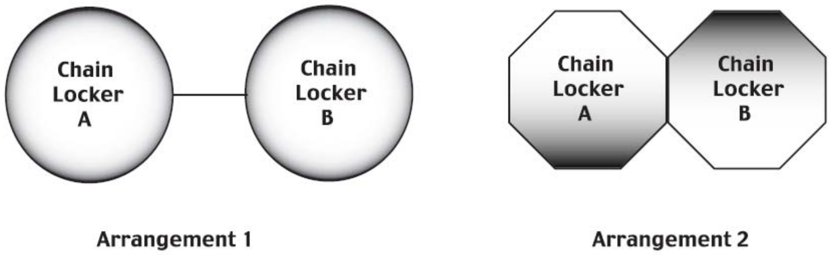

Fig 3.14.1 Arrangements of chain Locker

Section 3 Construction of Watertight Bulkhead

303. Stiffeners

1. Scantlings of bulkheads stiffeners just under deck girders

The scantlings of bulkhead stiffeners supporting under deck girders are to comply with the following formula.

$$C\frac{Z_0}{Z}+\frac{W}{A}\le C$$

Z_0 = required section modulus of stiffener (cm^2)
Z = actual section modulus (cm^3)
A = sectional area of stiffener (cm^2)
(including effective breadth)
W = axial load of stiffener obtained from the following formula.

$$W = Sbh \quad \text{(kN)}$$

S = distance between mid-spaces of adjacent girders supported by stiffeners (See **Fig 3.14.2**)
b and h = as specified in **Ch 11, 201.** of the Rules. However, in ships having two or more decks, W may not be considered.
C = 17.7

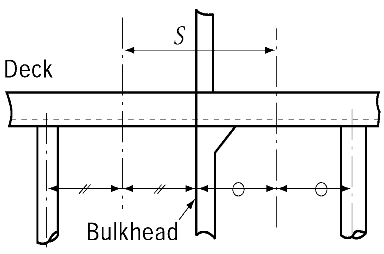

Fig 3.14.2 Measurements of S

2. Scantlings of bulkheads stiffeners just under cargo gears and deck girders.

The scantlings of bulkhead stiffeners just under cargo gears and deck girders are to comply with the above **1.** using the value obtained from following formula as axial load to stiffener. Where the stiffeners support only tare weight of cargo gears, the first term in the formula may be of zero.

$$W = Sbh + P \quad \text{(kN)}$$

S, b, h = as specified in above **1.**

P = tare weight of cargo gears (kN)

In case of derrick systems, it may be acceptable to use the value shown in **Table 3.14.1** of the Guidance.

Table 3.14.1 Tare weight of derrick system

Arrangement of derrick booms \ Type of derrick post	Independent Type	Gate Type
Booms arranged only on fore or aft side	$2.0w$	$2.3w$
Booms arranged on both sides	$2.7w$	$3.0w$
Note; w is a safe working load (kN) of each boom. However, in case of booms are arranged in both sides, average value is to be taken		

3. Scantlings of brackets of stiffeners is to be in accordance with **3.14.2.**

4. Where a deck terminates at the bulkhead, the stiffeners are to have ribs at the level of the deck. (See **Fig 3.14.4**)

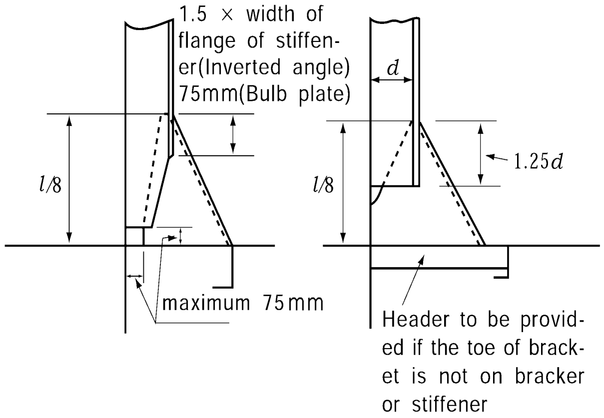

Fig 3.14.3

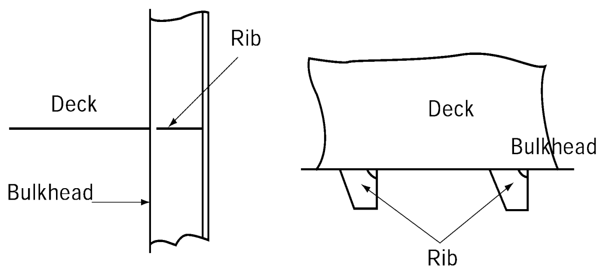

Fig 3.14.4 Rib

304. Corrugated bulkheads

1. Section modulus of corrugated bulkheads

(1) Where the end connection of corrugated bulkhead is specially strong, the coefficient C in **304.** of the Rules may be the value taken from **Table 3.14.2** in calculating the section modulus per half pitch. The term "specially strong end connection" means one of the followings.

(A) connection of upper end of corrugated bulkhead to deck, where the m_1 specified below is greater than 0.2

(B) connection of upper end of corrugated bulkhead to stool, where the m_2 specified below is greater than 0.6

(C) connection of lower end of corrugated bulkhead to stool, where the plate thickness of stool is not less than 1/2 of the thickness of face plate of corrugated bulkhead.

2. Construction of corrugated bulkheads

(1) Stiffeners are to be provided at the ends of under deck girders.

(2) Where the brackets are fixed to the bulkhead plate, pads or headers are to be fitted at the bracket toe.

(3) The angle of corrugation is to be not less than 45

(4) Girders fitted to corrugated bulkheads are to be balanced girders, except where the strength of such girders is at least equivalent to that of girders fitted to flat bulkheads. In calculating the actual section modulus of girder, the depth of girder is taken as shown in **Fig 3.14.7.** The bulkhead plate of corrugated bulkhead is not to be included into the section modulus of the girder as effective attached plate.

(5) The lower end of corrugated bulkhead is to be constructed as shown **Fig 3.14.8** (A) or (B). The construction of the upper end is recommended to follow the construction of the lower end.

Table 3.14.2 Value of C

Col	One end / Another end	Supported by girder	Upper end connected to deck	Upper end connected to stool
1	Supported by girder, or lower end connected to deck or to double bottom	As per Rules	$\dfrac{4}{2+m_1+\dfrac{Z_2}{Z_0}}$	$\dfrac{4}{2+m_2+\dfrac{Z_2}{Z_0}}$
2	Lower end connected to stool	$\dfrac{4.8\left(1+\dfrac{l_H}{l}\right)^2}{2+\dfrac{Z_1}{Z_0}+\dfrac{Z_H}{Z_0}}$	$\dfrac{4.8\left(1+\dfrac{l_H}{l}\right)^2}{2+m_1+\dfrac{Z_H}{Z_0}}$	$\dfrac{4.8\left(1+\dfrac{l_H}{l}\right)^2}{2+m_2+\dfrac{Z_H}{Z_0}}$
		However, it is not to be less than the value of column 1.		

NOTE:

Z_0, Z_1, Z_2, lH and l are to be in accordance with the Rules

m_1 = It is to be obtained from the following formula for the upper.

$$\frac{1}{Z_0}\left\{Z_S+\left(\frac{l_L+d_0}{l_L-d_0}+1.0\right)Z_L\right\}$$

Z_S = the section modulus of the continuous stiffener at the upper end (cm^3)

l_L, Z_l = span and section modulus of the longitudinal member connected to the upper end (See **Fig 3.14.5**)

d_0 = as specified of the Rules

m_2 = as obtained from the following formula, whichever is smaller.

$$\frac{1}{Z_0}\times\frac{1.050At}{n}, \qquad 3.6\left(\frac{l}{l_0}\right)^2-3$$

A = area enclosed into upper stool (See **Fig 3.14.6**)

t = average plate thickness of upper stool (mm) (See **Fig 3.14.6**)

n = number of pitches of corrugation supported by upper stool (m) (See **Fig 3.14.6**)

l_0 = distance between insides of upper and lower stool (m) (See **Fig 3.14.6**)

Z_H = section modulus per half pitch of lower end of lower stool (See **Fig 3.14.6**)

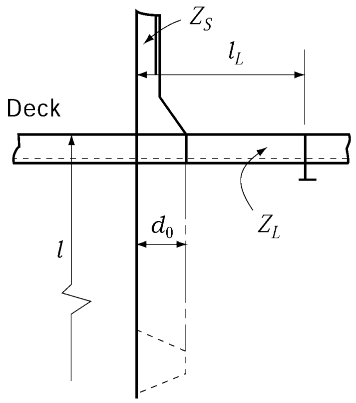

Fig 3.14.5

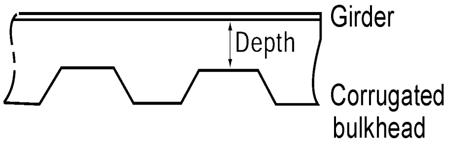

Fig 3.14.7 Measurements of depth of girder

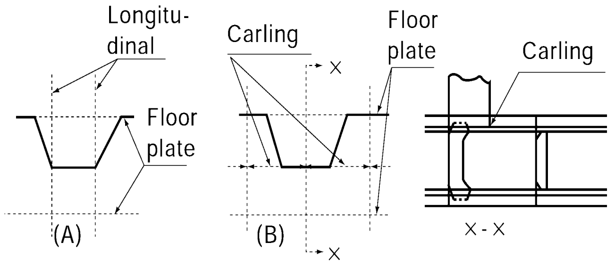

Fig 3.14.8

Section 4 Watertight Door

401. General

1. Watertight doors are categorized as the following (1) to (4) corresponding to its purpose and frequency of use.

(1) Watertight doors which are to be Permanently Closed at Sea:
Such doors are open in port and closed before the ship leaves port. The time of opening/closing such doors is to be entered in the log-book. (e.g. Bulkhead doors for loading/unloading)

(2) Watertight doors which are to be Normally Closed at Sea:
Such doors are kept closed at sea but may be used if authorized by the officer of the watch and to be closed again after use.

(3) Watertight doors which are Normally Open at Sea:
Such doors may be left open provided those are always ready to be immediately closed.

(4) Watertight doors which are Used at Sea:
Such doors are normally used and may be left open provided those are ready to be immediately closed.

402. Type of watertight doors

Watertight doors provided in watertight bulkheads are to be sliding type as far as practicable. If hinged doors are used, they are to be accessible at any time and, further, to be protected against damages due to cargoes, etc. by suitable means.

403. Strength and watertightness

The term of “where deemed necessary by the Society” in **403. 1** of the Rules means cases other than those specified in the following (1) to (3):

(1) Prototype of such doors which have been tested by design water pressure.

(2) Design of such doors has been verified to have enough strength and watertightness by direct structural analysis: Where those watertight doors utilize gasket seals, a prototype pressure test to confirm that the compression of the gasket material is capable of accommodating any deflection, revealed by the structural analysis, is to be carried out.

(3) Doors complying with a standard deemed appropriate by the Society.

404. Control

1. Where it is necessary to operate the power unit for remote operation of the watertight door required by **404.** of the Rules, means to operate the power unit are also to be provided at remote control stations.

2. Remote controls required by **404.** of the Rules, are to be in accordance with the followings.

(1) The operating console at the navigation bridge is to have a “master switch” with following two modes of control. This switch is normally to be in the “local control” mode. The “remote control” mode is only used in an emergency or for testing purposes. Special consideration is to be given to the reliability of the “master switch”.

(a) A “local control” mode: This mode is to allow any door to be locally opened and locally closed after use without automatic closure.

(b) A “remote control” mode: This mode is to permit doors to be able to opened locally but is to be automatically reclose the doors upon release of the local control mechanism.

(2) The operating console at the navigation bridge is to be provided with a diagram showing the location of each door, with visual indicators to show whether each door is opened or closed. A red light is to indicate a door is fully opened and a green light is to indicate a door is fully closed. When the door is being closed remotely, the red light is to indicate the intermediate position by flashing. The indicating circuit is to be independent of the control circuit for each door.

3. Where remote control is required by **404.** of the Rules, signboard/instructions are to be placed in way of the door advising how to act when the door is in “remote control” mode.

4. With respect to the provisions of **404.** of the Rules, where a watertight door is located adjacent to a fire door, both doors are to be capable of independent operation, remotely if required and from both sides of the each door.

5. The wording “navigation bridge” stated in **404.** of the Rules means the place always served by a watch officer and it normally represents the navigation bridge deckhouse.

6. With respect to the provisions of **404. 1** of the Rules, an operation capability of the ship listed of 30 degrees to either side is to be verified by prototype tests, etc.

7. With respect to the provisions of **404. 1** of the Rules, power operated doors are also to be capable of being opened and closed by power, as well as to by manual.

405. Indication

1. For watertight doors with dogs/cleat for securing watertightness, position indicators required by **405. 1** of the Rules are to be provided to show whether all dogs/cleats fully and properly engage or not.

2. With respect to the provisions of **405. 1** of the Rules, a position indicator may not be required for doors which are designed to confirm easily whether the doors are open or closed and, if applicable, all dogs/cleats fully and properly engage or not.

3. The door position indicating system required by **405.** of the Rules is to be of self-monitoring type and the means for testing of the indicating system are to be provided at the position where the indicators are fitted.

4. An indication required by **405. 2** of the Rules is to be placed locally showing that the door is in the “remote control” mode specified in **404. 2** (i.e. red light).

406. Alarm

An audible alarm required by **406.** of the Rules is to sound from the door begins to move and continue to sound until the door is completely closed.

407. Source of power

The term of “electrical installations” stated in **407. 2** of the Rules means electrical motors for opening and closing the doors and their control components, indicators whether the doors are opened or closed, audible alarms, limit switches to confirm the door position and their associated cables.

408. Notice

Locking device for closing apparatus itself or a box of operation device by the key is acceptable as "a device which prevents unauthorized opening" required in **408. 2** of the Rules.

409. Sliding doors

The section modulus of stiffeners adjacent to both sides of sliding doors (the one asterisked in **Fig 3.14.9**) are to be determined by the formula for stiffeners of deep tank bulkheads. the upper end of h in the formula is to be the bulkhead deck at the centreline of hull. ⚓

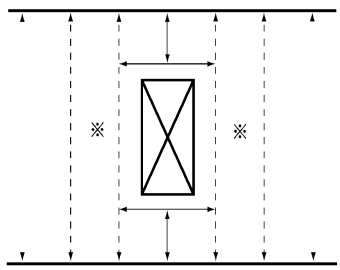

Fig 3.14.9

CHAPTER 15 DEEP TANKS

Section 1 General

103. Swash bulkhead

1. The length of deep tanks is not to exceed the following limits.

(1) Where longitudinal bulkhead is not provided or longitudinal bulkhead is provided in the centreline only; 0.15 L_f (m) or 10 m, whichever is greater.

(2) Where two or more bulkheads are provided
0.2 L_f (m). However, 0.15 L_f (m) in the bow and stern parts of bulk carriers. Further, where the breadth of wing tank is less than $4L+500$ (mm), the inner wall is not be regarded as a longitudinal bulkhead.

2. Swash bulkhead

(1) Except in the bow and stern parts, longitudinal bulkheads are to be provided through the whole breadth from side to side in deep tanks of the ship. However, when it can be confirmed by the safety data of ship that such bulkheads will be unnecessary.
