(3) The total stored energy of all capacitors in an enclosure is not to exceed 20J in normal operation.
(4) In case where there is a limitation for use in order to maintain an explosion protecting performance, the approval for use by the Society is to be necessary.

6. Oil immersion type electrical equipment

(1) The oil level indicating device is to be provided so that the liquid level can easily checked in service.
(2) Live parts of the electrical equipment are to be immersed to a depth of not less than 25mm below the surface of protective liquid.
(3) Where connecting cables are dipped into protective liquid, they are to be of oil resistant type.
(4) In case where there is a limitation for use in order to maintain an explosion protecting perform-

ance, the approval for use by the Society is to be necessary.

7. Encapsulation type electrical equipment

(1) Where some protection components are installed in order to limit a temperature rise, the setting value is not to be changed.
(2) In case where there is a limitation for use in order to maintain an explosion protecting performance, the approval for use by the Society is to be necessary.

8. Non-sparking type electrical equipment

(1) Non-sparking type electrical equipment applied to electrical equipment such that, in normal operation and in certain specified regular expected occurrences, it is not capable of igniting a surrounding explosive gas atmosphere.
(2) It shall not produce an operational arc or spark unless that arc or spark is prevented from causing ignition of a surrounding explosive gas atmosphere separately.
(3) Degree of protection is to be more than either of the followings
 (A) IP 54 where there are bare live parts, or IP 44 where there are insulated live parts
 (B) IP 4X where there are bare live parts, or IP 2X where there are insulated live parts where the equipment is intended for installation only in locations providing adequate protection against the entry of solid foreign objects or water capable of impairing safety.

Section 10 Lighting Fittings, Heating Appliances and Wiring Accessories

1001. General

Lighting fitting, heating appliances, etc., as a rule, are to comply with Korean Industrial Standard or equivalent thereto.

1002. Lighting fittings

1. Construction and location

In application to **1002. 1** (3) of the Rules, a guard for globes made by materials other than glass materials may be omitted according to the discretion of the Society.

2. In application to **1002. 2** (4) and **3** of the Rules, the following requirements shall be complied with. However type approval may be omitted subject to the Society's permission, in this case, they are to comply with KS or equivalent thereto.

(1) Application standard
 (A) (KS C) IEC 60092-306 (electrical installations in ships, equipment, luminaries and accessories)
 (B) KS C8100 (electronic ballast stabilizer for fluorescent lighting)
 (C) KS standard or equivalent thereto for safety and function requirements of LED lighting in ships.
 (D) In application to the above (A) and (B), in case that there are different contents about the same requirements, (KS C) IEC 60092-306 shall be complied with.
 (E) Other equivalent KS or IEC standard
(2) Test
 Test is to be carried out in accordance with **Table 3.23.1** of **Ch 3, Sec 23** of **Guidance for Approval of Manufacturing Process and Type Approval, etc** and (KS X) IEC 60945 (maritime navigation and radiocommunication equipment and systems - general requirements - methods of testing and required test results) are to be complied with. However, test may be partly exempted when the Society considers necessary.

1003. Heating appliances

1. Protection guard for heating elements is to be fixed firmly and to be prevented from touching the live parts, and an opening parts of protection guard are to be minimized for preventing standard test finger from touching the heating elements.

2. Live parts of cooking heater are to be prevented cooking appliances from touching cooking appliances.

3. Where the heating element is employed in liquid, it is to be protected by anti-corrosive metal sheath.

4. In case of heating appliance used for a bath, heating elements are to be arranged to avoid electrical shock in bath, and operating switches are to be of multi pole connection type and to be provided with indicating lamp and name plate.

5. Portable cooking heaters are to be of construction not falling over sideways.

Section 11 Internal Communications

1102. Essential internal communication systems

1. Essential internal communication and signal systems are to be inclusive of the followings.

(1) Navigation lights, signalling lamps and signal alarms required in International Convention
(2) Internal communications
  (A) Communications between the following
    (a) Between navigation bridge and main engine control station
    (b) Between navigation bridge and steering gear room
    (c) Engineer's alarm
    (d) Available communications between navigation bridge, centralized control room, engine control station and engineer's accommodation at failure of main power.
(3) Internal signal alarms
  (A) General emergency alarm
  (B) Fire alarm
  (C) CO_2 release alarm
(4) Steering gear control system and rudder angle indicator
(5) Navigation equipment required in International Convention as deemed necessary by the Society
(6) Other internal communications, signal alarms and navigation equipment

1105. General emergency alarm system

Where circuit breakers for overcurrent protection are provided for feeder circuits of general emergency alarm system, the notice of "To be always kept 'ON'" is to be posted. It is, however, not necessary to post the notice if protected by fuses.

1106. Public address system

1. A public address system is not be required in the spaces such as under deck passage way, bosun's locker, hospital and pump room.

2. Where an individual loudspeaker has a device for local silencing, an override arrangement from the control stations, including the navigating bridge, shall be in place

3. In application to **1106. 6** (1) of the Rules, the sound pressure levels for cabin and state rooms shall be attained as required, during sea trials.

4. In application to **1106. 7** of the Rules, the method to minimize the effect of a single failure is as follows :

(1) The use of segregated cable routes to public rooms, alleyways, stairways and control stations
(2) The use of multiple amplifiers
(3) The use of more than one device for generating electronic sound signals
(4) The use of electrical protection for individual loudspeakers against short circuits.

Section 12 Semi-Conductor Rectifiers for Power

1205. Testing and inspection

1. Temperature test

In application to **1205. 2** of the Rules, the appropriateness for requirements in **1203. 2** of the Rules may be identified by temperature measuring of cooling pin, case, refrigerant, etc. But, where the temperature rising limit for cooling pin, case, refrigerant, etc. is in the limit, it is presumed the temperature of joining parts as the designated case not exceeded the allowable maximum temperature.

2. Operation test

In application to **1205. 3** of the Rules, operation test for protection devices means interlocking test between cooling fan and switch, and destructive test such as protection fuse test for rectifier elements may be omitted.

Section 13 Accumulator Batteries

1301. Applicable Standards

1. Accumulator batteries are to comply with Korean Industrial Standards.

2. In case where accumulator batteries are made by foreign manufacturer, the accumulator batteries are to comply with the standards recognized by the nation and to comply with ship's stores.

3. Accumulator batteries of an adequate discharge rate are to be selected according to their application.

4. In case where alkali batteries are used, the specification including the construction, performance, method of installation, etc. is to be submitted at each time to the Society for obtaining approval.

5. In application to **1301. 2** of the Rules, a valve-regulated sealed battery is the one in which the cells are closed but have an arrangement(valve) that allows the emission of gas if the internal pressure exceeds a predetermined value. The electrolyte cannot normally be replaced. Valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the following ventilation requirements are complied with.

(1) The ventilation rate for compartments containing valve-regulated sealed batteries may be reduced to 25 percent of that given in **1306. 1**.
(2) Equipment that may produce arcs, sparks or high temperatures in normal operation is not to be in close proximity to battery vent plugs or pressure relief valve outlets.
(3) Where valve-regulated sealed batteries are installed, the charging facilities are to incorporate independent means such as overvoltage protection to prevent gas emission in excess of the manufacturer's design quantity.
(4) Boost charge facilities, where provided, are to be arranged such that they are automatically disconnected when the battery compartment ventilation system fail.

1303. Location

1. In application to **1304. 4** of the Rules, the term "large batteries" means the accumulator batteries connected to battery charging facilities with an output of 2 kW or more. The output of battery charging facilities is to be the product of the rated current of the rectifier and nominal voltage of battery group.

2. Accumulator batteries connected to battery charging facilities with a capacity in a range from 0.5 kW to 2 kW are to be placed in a battery box installed within a battery compartment or on the upper deck or upward.

3. Accumulator batteries connected to battery charging facilities with a capacity in a range 0.5 kW or less may be installed as followings:

(1) To be placed in a storage box or locker installed at an adequate area.

(2) To be placed in an open state within the machinery space.
(3) To be placed in a compartment with good air ventilation.

1304. Electrical installation in battery compartment

In application to **1304. 1** of the Rules, the explosion-protected electrical equipment may be things used in explosible mixture gas or equivalent.

1306. Ventilation

1. The capacity of exhaust ventilation of a battery compartment is to be of the value obtained by the following formula or more:

$Q = 110 \times I \times n$ (l/h)

Q : Exhaust capacity

I : Maximum charging current at end (where no specific limitation is specified, the charging current in 10 hours is to be regarded as the standard)

n : Number of batteries

2. It is recommended that the ventilation system for a compartment containing accumulator batteries connected to battery charging facilities with an output of 2 kW or more is to be of the mechanical exhaust-ventilation.

Section 14 Emergency Electrical Equipment

1401. Application

1. In application to **1401. 4** of the Rules, "exceptionally" whilst the vessel is at sea, means the following:

(1) Blackout situation
(2) Dead-ship situation
(3) Routine use for testing
(4) Short-term parallel operation with the main source of electrical power for the purpose of load transfer

2. The emergency generator may be used during lay time in port for the supply of the ship mains, provided the requirements as per items (1) and (2) below are complied with.

(1) Requirements
(A) To prevent the generator or its prime mover from becoming overloaded when used in port, arrangements are to be provided to shed sufficient non-emergency loads to ensure its continued safe operation.
(B) The prime mover is to be arranged with fuel oil filters and lubrication oil filters, monitoring equipment and protection devices as required for the prime mover for main power generation and for unattended operation.
(C) The fuel oil supply tank to the prime mover is to be provided with a low level alarm, arranged at a level ensuring sufficient fuel oil capacity for the emergency services for the period of time as required by SOLAS.
(D) The prime mover is to be designed and built for continuous operation and should be subjected to a planned maintenance scheme ensuring that it is always available and capable of fulfilling its role in the event of an emergency at sea.
(E) Fire detectors are to be installed in the location where the emergency generator set and emergency switchboard are installed.
(F) Means are to be provided to readily change over to emergency operation.
(G) Control, monitoring and supply circuits, for the purpose of the use of the emergency generator in port are to be so arranged and protected that any electrical fault will not influence the operation of the main and emergency services. When necessary for the safe operation, the emergency switchboard is to be fitted with switches to isolate the circuits.

(2) Instructions are to be provided on board to ensure that when the vessel is under way all control

devices(e.g. valves, switches) are in a correct position for the independent emergency operation of the emergency generator set and emergency switchboard. These instructions are also to contain information on required fuel oil tank level, position of harbour/sea mode switch if fitted, ventilation openings, etc.

1402. Capacity of emergency source of power

1. The power supply period for the navigation lights (masthead lights, side lights and stern lights) specified in **1402. 2** (3) of the Rules, may be reduces to 3 hours under the acceptance of the domestic regulations of flag state of the ship.

2. In application to **1402. 2** (5) (A) of the Rules, "Internal communication equipment" means the following:

(1) Engine telegraph
(2) Communication equipment between the navigation bridge and the main engine control stations other than main control station
(3) Engineers´ alarm
(4) Communication other than general telephone between the navigation bridge and the steering gear compartment
(5) Other internal communication equipment as deemed necessary by the Society
(A) In case of passenger ships, the following requirements are to be complied with.
(a) The means of communication which is provided between the officer of the watch and the person responsible for closing any watertight door which is not capable of being closed from a central control station.
(b) The public address system or other effective means of communication which is provided throughout the accommodation, public and service spaces.
(c) The means of communication which is provided between the navigating bridge and the main fire control station.

3. In application to **1402. 2** (5) (B) of the Rules, in case where domestic regulations of flag of the ship accept, the capacity of emergency source of power may be in accordance with the following:

(1) Ships having gross tonnage 5000 tons or more may be reduced to the service period of rudder angle indicator specified in **Pt 5, Ch 7, 206.** (2) of the Rules.
(2) Ships having gross tonnage less than 5000 tons are to be in accordance with the followings:
(A) It is not required to supply emergency source the following navigation equipment.
(a) Gyro-compass
(b) Echo-sounding device
(c) Device to indicate speed and distance through the water
(d) Rudder angle indicator, revolution meter of each propeller, propellers and the pitch and operational mode of controllable pitch propellers
(B) Service period for navigation radar may be reduced to the period by domestic regulations of flag of the ship (until 3 hours in case of having Korean flag ship).

4. In case where domestic rules of flag of ship are accepted, the service period of the load in **1402. 2** (5) (d) and fire alarm system in **1402. 2** (5) (c) of the Rules may be reduced until 30 minutes.

1403. Kind and performance of emergency source of electrical power

1. In application to **1403.** (2) (A) of the Rules, where the inverter or converter is connected to the output circuit of the batteries (consumer side), the maximum permitted voltage fluctuations may be taken as those specified in **Table 6.1.1** (a) or (b) in **106.** of the Rules respectively, notwithstanding the voltage drop on the battery.

2. The requirements of uninterruptible power system(UPS) units

In application to **1403.** (3) of the Rules, the requirements which the Society considers appropriate are to be as follows;

(1) Application
These requirements are to apply to interruptible power system (hereinafter referred to as “UPS”) units installed in ships as an emergency source of electrical power.
(2) Definitions

(A) UPS means a source of electrical power with converters, switches and batteries, constituting for maintaining continuity of load power in case of input power failure.
(B) Off-line UPS unit means an electrical power where under normal operation the output load is powered from the bypass line and only transferred to the inverter if the bypass supply fails or goes outside preset limits.
(C) Line interactive UPS unit means a system specified in (B) above where the bypass line switch to stored energy power when the input power goes outside the preset voltage and frequency limits.
(D) On-line UPS unit means a system where under normal operation the output load is powered from the inverter, and will therefore continue to operate without break in the event of the supply input failing or going outside preset limits.

(3) Design and Construction
(A) UPS units are to be constructed in accordance with (KS C) IEC 62040 or an acceptable and relevant national or international standard.
(B) The operation of the UPS units is not to depend on external services.
(C) The type of UPS unit (off-line, line-interactive, on-line) is to be appropriate to the power supply requirements of the connected load equipment.
(D) UPS units are to have an external bypass circuit.
(E) UPS units are to have a self-monitoring function, and audible and visual alarms are to be activated in the space where crews normally attend in the following cases.
(a) Power supply failure (abnormal voltage or frequency)
(b) Earth fault
(c) Operation of battery protective device
(d) Discharge of battery
(e) Operation of bypass circuit for on-line UPS units

(4) Arrangement
(A) UPS units are to be suitably located for use in an emergency condition.
(B) UPS units utilizing valve regulated sealed batteries may be located in compartments with normal electrical equipment, provided the ventilation arrangements are in accordance with the requirements of (KS C) IEC 62040 or an acceptable and relevant national or international standard.

(5) Performance
(A) The output power is to be maintained for the duration time required for the connected equipment as specified in 1402 of the Rules.
(B) No additional circuits are to be connected to the UPS unit without verification that the UPS unit has adequate capacity. The UPS battery capacity is, at all times, to be capable of supplying the designated loads for the time specified in the regulations.
(C) On restoration of the input power, the rating of the charge unit shall be sufficient to recharge the batteries while maintaining the output supply to the load equipment.

(6) Testing and inspection
(A) UPS units of 50 kVA and over are to be tested by this Society at the manufacturer's works or at other works.
(B) Appropriate test is to be carried out to demonstrate that the UPS unit is suitable for its intended environment. This is expected to include as a minimum the following tests:
(a) Functionality, including operation of alarms
(b) Temperature rise
(c) Ventilation rate
(d) Battery capacity
(C) In case where input power failure of UPS is happened, if the continuous power supply is necessary without power interruption, this operation condition is to be verified after installation by practical test.

3. Starting from dead ship condition

In application to **1403.** (4) of the Rules, the followings are to be complied with.

(1) The emergency generator and other means needed to restore the propulsion are to have a capacity such that the necessary propulsion starting energy is available within 30 minutes of blackout/dead ship condition. Emergency generator stored starting energy is not to be directly used for starting the propulsion plant, the main source of electrical power and/or other essential auxiliaries(emergency generator excluded).

(2) For steam ships, the 30 minute time limit can be interpreted as time from blackout/dead ship condition defined above to light-off of the first boiler.

1404. Transitional source of emergency electrical power

In application to **1404.** (1) of the Rules, where the inverter or converter is connected to the output circuit of the batteries(consumer side), the requirements specified in **1403. 1** may be applied.

1406. Starting arrangements for emergency generating sets

1. The starting devices specified in **1406. 2** of the Rules are to be comply with the following requirements:

(1) The source of stored energy is to be capable of starting the prime mover at least six times.
(2) In case where the automatic starting system is of the consecutive starts, the number of starts is to be three or less.
(3) For the automatic starting system, means are to be provided to hold such an allowance of source of energy capable of starting the prime mover three times further after making the initial consecutive starts.

Section 16 High Voltage Electrical Installations

1601. General

1. The supply voltages and frequency specified in the followings are recognized as a standard.

System nominal voltage (kV)	Commercial frequency (Hz)
3(3.3)	50 or 60
6(6.6)	50 or 60
10(11)	50 or 60
15	50 or 60

1602. System design

1. Standards applied to high voltage equipment

The following equipment is to comply with the relevant IEC Pub. or equivalent and above.

(A) Circuit breakers : IEC 62271-100
(B) Switches : (KS C) IEC 60265
(C) Fuses : (KS C) IEC 60282
(D) Contactors : IEC 60470
(E) Current transformers for instruments : (KS C) IEC 60044
(F) Voltage transformers for instruments : (KS C) IEC 60044
(G) Relays : (KS C) IEC 60255
(H) Rotating machinery : (KS C) IEC 60529 and 60034-5

1605. Cables

1. Application

In application to **1605** of the Rules, (KS C) IEC 60183 may apply.

1606. Switchgear and controlgear assemblies

1. In application to **1606. 4**, the high voltage test procedure is to be in accordance with the IEC 62271-200, or equivalent and above, data proving that the assembly will withstand an internal arc is to be submitted to the Society for information service.(e.g. testing in accordance with Appendix A of IEC 62271-200)

1607. Installation

In application to **1607. 1** (3) of the Rules, “safe and effective measures” means the followings.
(1) Pressure-release flaps are to be installed.
(2) Ducts of sufficient cross-section are to be provided.
(3) Combustible materials and electrical equipments are not admissible in the area of coming out gases.

Section 19 Spare Parts, Tools and Instruments

1901. Spare parts

1. For the electric or electro-hydraulic steering gears equipped with two or more steering gear motors or motor generators, the spare armature or stator specified in **1901. 1** (4) of the Rules may be omitted.

2. The requirements in **1901. 1** (4) of the Rules do not apply to electric motors for steering control systems. ⚓

CHAPTER 2 CONTROL SYSTEMS

Section 2 System and Control

201. System design

1. In application to **201. 7** (1) of the Rules, examples of computer-based systems are shown in the **Table 6.2.1**. Where independent effective backup or other means of averting danger is provided, the system category Ⅲ may be downgraded to category Ⅱ.

Table 6.2.1 Example of computer based system

Category	Examples
Ⅰ	- Maintenance support systems - Information and diagnostic systems
Ⅱ	- Alarm and monitoring equipment - Tank capacity measuring equipment - Control systems for auxiliary machinery - Main propulsion remote control systems - Fire detection systems - Fire extinguishing systems - Bilge systems - Governor control systems - Other systems considered necessary by the Society
Ⅲ	- Machinery protection systems/equipment - Burner control systems - Electronic fuel injection for diesel engines - Control systems for propulsion and steering - Synchronising units for switchboards - Other systems considered necessary by the Society

202. Automatic and remote control of main engines or controllable pitch propellers

1. Application

In case where the local control handle fitted to main propulsion machinery is moved to the main control station, the requirements in **202.** of the Rules may not apply except the following case:

(1) when the main control station is provided outside the space where main propulsion machinery is installed.

(2) When the main control station is provided inside the space where main propulsion machinery is installed, and environmental enclosure.

2. Remote control devices for main engines or controllable pitch propellers

(1) At the remote control station for the main propulsion machinery, alarm devices which come into action on the following cases is to be provided.

(A) Lubricating oil low pressure

(B) Cooling fresh water low pressure (or high temperature, cooling water pump stop, etc.)

(C) Low pressure of hydraulic oil or air for remote control system, or failure of electrical source

(D) Starting of emergency stopping devices.

(2) For the remote control station for propulsion motors, alarm devices activating on the following cases are to be provided in addition to those specified in (1) above:

(A) Insulation resistance drop of supply circuits

(B) An abnormal stopping of cooling fan for semi-conductor electric power converter

(C) Pressure drop of cooling water for semi-conductor electric power converter (temperature rising or stopping of cooling water pump)

(D) Starting of semi-conductor safety devices for semi-conductor electric power converter

(3) Visual alarm specified in (1) and (2) above is to be capable of identifying kind of abnormal conditions and the related equipment. However, in case of ships remote-controlled in bridge and the other space, visual alarm installed in bridge does not apply this requirement. And visual alarms discriminated easily by the other gauges and meters in engine room do not apply this requirement.

(4) For the remote control system of main propulsion steam turbine, means for automatic opening of astern intermediate valves at the operation into astern maneuvering are to be provided.

(5) In case where control devices specified in above (2) are installed, the local control equipment for the main engine can be omitted. However, in case where control equipment is installed in main control station, it is recommended that the emergency local control equipment for main propulsion machinery be installed.

(6) Countermeasure for the event of failure of the source (electric power, pneumatic pressure and hydraulic pressure) for remote control system due to the failure of main engine remote control system is to be provided.

(7) Main engine starting by remote control system for main propulsion machinery and starting air low pressure alarm are in accordance with the followings:

(A) In case where the low pressure alarm activate after satisfying the number of starting specified in **Pt 5, Ch 6, 1101. 1** of the Rules, startings after this are be controlled at the main control station.

(B) In case where the low pressure alarm activate before satisfying the number of starting specified in **Pt 5, Ch 6 1101. 1** of the Rules, the next startings is to be capable at the remote control station and the number of starting is to be satisfied in the requirements.

3. Bridge Control Devices

(1) It is recommended that the operating handle (or button) of the bridge control devices is linked with the engine room telegraph.

(2) In application to **202. 3** (3) of the Rules, where override may result in total failure of the engine and/or propulsion equipment within a short time is as followings.

(A) All diesel engines
(a) Overspeed
(b) Failure of lubricating oil system
(c) Crankcase explosive condition

(B) All steam turbine
(a) Failure of lubricating oil system
(b) Overspeed
(c) Back-pressure for auxiliary turbines

(C) All boiler
(a) Failure of flame
(b) Failure of flame scanner
(c) Low water level
(d) Failure of forced draft pressure
(e) Failure of control power

(D) All reduction gears
Shutdown prime movers upon failure of reduction gear lubricating oil system

(E) Generators
For generators fitted with forced lubrication system only: shutdown prime movers upon failure of generator lubricating oil system

4. Safety Measures

For the remote control devices for the main propulsion machinery, inter-locking devices are to be provided so as not to allow main propulsion machinery to start on the following conditions:

(1) When the turning gear is engaged.
(2) When the lubricating oil pressure is low.

Section 3 Tests

301. Shop tests

1. Type approval

(1) In application to **301. 1** of the Rules, "automatic equipment" to be type-approved are , in principle, as follows:
(A) Alarm and monitoring systems
(B) Control systems for, main engine, generators, boilers and essential auxiliary machinery, etc.
(C) Computer-based systems
(D) Fire detection systems
(E) Gas detection systems
(F) Electronic governor systems
(G) Speed and shaft horsepower sensing equipment
(H) Controller
(I) Flow, level, limit, pressure, temperature switches
(J) Oil mist detectors
(K) UPS
(L) Electrical and electronic indicators
(M) Electric power converters for electric propulsion unit
(N) Optical sensors and optical application device applied to the above (A) ~ (M)
(O) Those considered necessary by the Society

(2) "Test methods approved by the Society" specified in **301. 1** of the Rules means the requirements specified in **Ch 3, Sec 23** of the「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」

2. Shop tests of automation system

In application to **301. 2** (1) (C) of the Rules, test products including the circuits (electronic products or PCB card, etc), for which applying test voltage is undesirable, are allowed to be tested after isolating the relevant circuits. However, in case that the relevant circuits' construction is difficult to be isolated, insulation resistance test and high voltage test may be exempted by admitting the record of type approval test. ⚓

KOREAN REGISTER OF SHIPPING

APPLICATION OF PART 7 "SHIPS OF SPECIAL SERVICE"

1. Unless expressly specified otherwise, the requirements in these Rules apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date : 1 July 2011

CHAPTER 3 BULK CARRIERS

Section 16 Electrical Equipment of Coal Carriers

- 1602. has been newly added.
- 1603. 2 (2) has been deleted.

CHAPTER 4 CONTAINER SHIPS

Section 8 Welding

- 801. and 802. have been newly added.

CONTENTS

CHAPTER 1 OIL TANKERS

Section 1 General

101. Application

1. The requirements in this Chapter apply to oil tankers which were contracted for construction after 1 April 2006, excluding the vessels which should be applied **Pt 12** (Common Structural Rules for Double Hull Oil Tankers) and **Pt 7, Ch 10** (Double Hull Tanker). However, **Sec 10** (Piping Systems and Venting Systems for Oil Tankers) and **Sec 11** (Electrical Equipment) apply to oil tankers including the vessels which should be applied **Pt 12** (Common Structural Rules for Double Hull Oil Tankers) and **Pt 7, Ch 10** (Double Hull Tanker).

2. The construction and equipment of ships intended to be registered and classed as tanker are to be in accordance with the requirements in this Chapter, where a tanker means a ship intended to carry crude oil, petroleum products having a vapour pressure (absolute pressure) less than 0.28 MPa at 37.8℃ or other similar liquid cargoes in bulk.

3. Except where specifically required in this Chapter, the general requirements for steel ships are to be applied.

4. The requirements in this Chapter are framed for tankers with machinery aft, having one or more rows of longitudinal bulkheads, single decks, single bottoms and longitudinal framing.

5. In tankers intended to carry liquid cargoes other than crude oil and petroleum products, having a vapour pressure (absolute pressure) less than 0.28 MPa at 37.8 ℃ and having no hazard as poisonous, corrosive, etc. and moreover less inflammability than that of crude oil and petroleum products, the structural arrangements and scantlings are to be to the satisfaction of the Society, having regard to the properties of the cargoes to be carried.

102. Arrangement of bulkheads

In cargo oil tanks, longitudinal and transverse oiltight bulkheads and wash bulkheads are to be arranged suitably.

103. Cofferdams

1. Cofferdams of airtight construction and having sufficient width as required for ready access are to be provided at the forward and after ends of cargo oil spaces and between cargo oil spaces and accommodation spaces. In tankers intended to carry oils having a flash point exceeding 60℃, however, the preceding requirements may be modified.

2. The cofferdams described in the preceding Paragraph may be used as pump rooms.

3. Ullage plugs, sighting ports and tank cleaning openings are not to be arranged in enclosed spaces.

4. Fuel oil or ballast water tanks may be concurrently used as the cofferdams to be provided between cargo oil tanks and fuel oil or ballast water tanks, subject to the approval by the Society.

5. Location and separation of spaces in tankers of 500 tons gross and above carrying oils having a flash point not exceeding 60℃ are to be in accordance with the requirements in **Pt 8, Ch 2, 104.**

104. Airtight bulkheads

Airtight bulkheads are to be provided for the isolation of all cargo oil pumps and pipings from spaces containing stoves, boilers, propelling machinery, electric installations other than those of explosion-proof type specified in **Pt 6, Ch 1, Sec 9** or machinery space where source of ignition is normally present. In tankers carrying oils having a flash point exceeding 60℃, however, the preceding requirements may be modified.

105. Ventilation

1. Efficient ventilation is to be provided in spaces adjacent to cargo oil tanks. Air holes are to be cut in every part of the structure where there might be a chance of gases being pocketed.

2. Efficient means are to be provided for clearing oil tanks and pump rooms of dangerous vapours by means of mechanical ventilation or by steam.

3. In tankers carrying oils having a flash point exceeding 60℃ the capacity of ventilation in the pump rooms specified in **1004.** may be modified.

4. The requirements in **1004.** are applied to the ventilation fans and wire mesh screens for the spaces adjacent to the cargo oil tank specified in **Par 1**.

106. Openings for ventilation

Ventilation inlets and outlets are to be arranged so as to minimize the possibilities of vapours of cargoes being admitted to an enclosed space containing a source of ignition, or collecting in the vicinity of deck machinery and equipment which may constitute an ignition hazard. Especially, openings of ventilation for machinery spaces are to be situated as far afterwards apart from the cargo spaces as practicable.

107. Openings of superstructure and deckhouse

The arrangement of openings on the boundaries of superstructure and deckhouse are to be such as to minimize the possibility of accumulation of vapours of cargoes. Due consideration in this regard is to be given when the ship is equipped to load or unload at the stern. Side scuttles to the poop front or other similar walls are to be of fixed type. Such openings of tankers of 500 tons gross and above carrying oils having a flash point not exceeding 60℃ are to be in accordance with the requirements in **Pt 8, Ch 2, 104.2.**

108. Thickness of structural members in cargo oil spaces

The thickness of structural members in cargo oil spaces is to be in accordance with the following:

(1) The thickness of shell plating is not to be less than that obtained from the formulae in **Pt 3, Ch 4, 302., 304., 305.** and **404.** using 2.0 in lieu of 1.5 in the formulae.

(2) The thickness of deck plating of freeboard deck is not to be less than that obtained from the formulae in **Pt 3, Ch 5, 301**. using 2.0 in lieu of 1.5 in the formulae.

(3) Where frames, beams, stiffeners and other members for which the scantlings are specified by the section modulus only consist of flanged plates, special sections or web and face plates, the thickness of web plates is not to be less than that obtained from the following formula. Where the depth of web plates, however, is specially made deeper due to the reason from other than strength, the preceding requirements may be modified.

$$t = 0.015 k_0 d_0 + 2.5 \quad \text{(mm)}$$

where:

d_0 = depth of web plates (mm)

k_0 = as given in the following formulae. However, value of f_B and f_D is not to be less than 1.0.

Longitudinals located not more than 0.25D above top of keel : $k_0 = \sqrt{\frac{1}{4}\left(3f_B + \frac{1}{K}\right)}$

Longitudinals located not less than 0.25D below deck : $k_0 = \sqrt{\frac{1}{4}\left(3f_D + \frac{1}{K}\right)}$

Other members : $k_0 = \sqrt{\frac{1}{4}\left(3 + \frac{1}{K}\right)}$

(4) Various girders, longitudinal, transverse, vertical or horizontal, the cross ties and end connecting brackets thereof and various bulkhead platings are not to be of less thickness than determined from **Table 7.1.1** according to the length of ship.

Table 7.1.1 Minimum Thickness

Length of ship (m)	Thickness (mm)
$L < 105$	8.0
$105 \le L < 120$	8.5
$120 \le L < 135$	9.0
$135 \le L < 150$	9.5
$150 \le L < 165$	10.0
$165 \le L < 180$	10.5
$180 \le L < 195$	11.0
$195 \le L < 225$	11.5
$225 \le L < 275$	12.0
$275 \le L < 325$	12.5
$325 \le L < 375$	13.0
$375 \le L$	13.5

(5) The thickness of flat bar and tripping bracket, etc. fitted up on web of longitudinal girders, transverses and girders of bulkheads is not to be less than that obtained from the following formula. The thickness need not, however, exceed that of web plates to which they are connected.

$$t = 0.5\sqrt{L} + 2.5 \quad (\text{mm})$$

(6) In no case is the thickness of structural members to be less than 7 mm.

109. Direct strength calculation

Where approved by the Society, the scantlings of structural members may be determined basing upon direct strength calculation defined in **Pt 3, Ch 1, 206.**

Section 2 Hatchways, Gangways and Freeing Arrangements

201. Ships having unusually large freeboard

Relaxation from the requirements specified hereunder will be considered to ships having an extra-ordinarily large freeboard.

202. Hatchways to cargo oil tanks

1. The thickness of coaming plates is not to be less than 10 mm. Where the length and coaming height of a hatchway exceed 1.25 m and 760 mm respectively, vertical stiffeners are to be provided to the side or end coamings and the upper edge of coamings is to be suitably stiffened.

2. Hatchway covers are to be of steel or other approved materials. The construction of steel hatchway covers is to comply with the following requirements. The construction of hatchway covers of materials other than steel is to be in accordance with the discretion of the Society.

(1) The thickness of cover plates is not to be less than 12 mm. In ships not more than 60 m in length, however, the requirement may be modified.
(2) Where the area of a hatchway exceeds 1 m^2 but does not exceed 2.5 m^2, cover plates are to be stiffened by flat bars of 100 mm in depth spaced not more than 610 mm apart. Where, however, the cover plates are 15 mm or more in thickness, the stiffeners may be dispensed with.
(3) Where the area of a hatchway exceeds 2.5 m^2, cover plates are to be stiffened by flat bars of 125 mm in depth spaced not more than 610 mm apart.
(4) Covers are to be secured oiltight by fastenings spaced not more than 457 mm apart in circular hatchways or 380 mm apart and not more than 230 mm far from the corners in rectangular hatchways.

3. In small ships, the requirements in the preceding Paragraph may be suitably modified.

4. The cover is to be provided with an opening at least 150 mm in diameter which is to be so constructed as to be capable of being closed oiltight by means of a screw plug or a cover of peep hole.

5. Hatchway coamings are to be provided with gas cocks or other suitable exhausting devices.

203. Hatchways to spaces other than for cargo oil tanks

In exposed positions on the freeboard and forecastle decks or on the tops of expansion trunks, hatchways serving spaces other than cargo oil tanks are to be provided with steel watertight covers having scantlings complying with the requirements in **Pt 4, Ch 2, Sec 2.**

204. Permanent gangway and passage

1. A fore and aft permanent gangway complying with the requirements of **Pt 4, Ch 4, 503.** is to be provided at the level of the superstructure deck between the midship bridge or deck house and the poop or aft deck house, or equivalent means of access is to be provided to carry out the purpose of the gangway, such as passage below deck. Elsewhere and in ships without midship bridge or deck house, arrangements to the satisfaction of the Society are to be provided to safeguard the crew in reaching all parts used in the necessary work of the ship.

2. Safe and satisfactory access from the gangway level is to be available between crew accommodations and machinery space or between separated crew accommodations.

205. Freeing arrangements

1. Ships with bulwarks are to have open rails fitted for at least a half of the length of the exposed part of the freeboard deck or other effective freeing arrangements. The upper edge of sheer strake is to be kept as low as practicable.

2. Where superstructures are connected by trunks, open rails are to be provided for the whole length of the exposed parts of the freeboard deck.

Section 3 Longitudinal Frames and Beams in Cargo Oil Spaces

301. General

Longitudinal frames and beams provided in permanent ballast water tanks and cargo oil spaces including void spaces and pump rooms are to be in accordance with the requirements stated hereunder.

302. Scantlings

1. The section modulus of bottom longitudinals and side longitudinals including bilge frames is not to be less than that obtained from the formulae given in **Table 7.1.2.**

Table 7.1.2 Section modulus of bottom and side longitudinals

Position	Section modulus (cm^3)	
	Bottom longitudinals	Side longitudinals including bilge frames
Midship part and between a point $0.15L$ from the fore end and the collision bulkhead	$Z = 110 C_1 C_2 KShl^2$	$Z = 110 C_1 C_2 KShl^2$ $Z_{min} = 3.2K\sqrt{L}Sl^2$
Forward and afterward end parts	$Z = 93.5 C_1 C_2 KShl^2$	$Z = 93.5 C_1 C_2 KShl^2$ $Z_{min} = 2.72K\sqrt{L}Sl^2$

l = spacing of bottom transverses (m).
S = spacing of longitudinals (m).
h = distance from the bottom longitudinal under consideration to the point h' above the top of keel given in the following table (m).
C_1, h', C_2 = as given by the following table.

	C_1	h' (m)	C_2
Bottom longitudinals	$\frac{1}{24 - 15.0 f_B K}$	$h' = d + 0.026L'$	1.0 : Where L is 230 m and under. 1.07 : Where L exceeds 400 m. For the intermediate values of L, C_2 is to be obtained by linear interpolati
Side longitudinals including bilge frames	$\frac{1}{24 - \alpha K}$	$h' = d + 0.038L'$	

L' = length of ship (m). Where, however, L exceeds 230 m. L' is to be taken as 230 m.
α = either α_1 or α_2 according to value of y. However, value of α is not to be less than β.

$$\alpha_1 = 15.0 f_D \left(\frac{y - y_B}{Y'} \right) \quad \text{for} \quad y \geq y_B$$

$$\alpha_2 = 15.0 f_B \left(\frac{y_B - y}{y_B} \right) \quad \text{for} \quad y < y_B$$

β = coefficient determined according to values of L as specified below :
$\beta = 6/a$ when L is 230 m and under
$\beta = 10.5/a$ when L is 400 m and above
For intermediate values of L, β is to be obtained by linear interpolation.
y = vertical distance (m) from the top of keel to the lower edge of plating when the platings under consideration are under y_B and to the upper edge of plating when the platings under consideration are above y_B, respectively.
Y' = the greater of the value specified in **Pt 3, Ch 3, 203.,** (5) (a) or (b).
a = $\sqrt{K}$, when high tensile steels are used for not less than 80 % of side shell plating at the transverse section amidship and 1.0 for other parts.

2. The section modulus of longitudinal beams is not to be less than 1.1 times that obtained from the formula in **Pt 3, Ch 10, 303.**

3. Notwithstanding the provisions in **Pars 1** and **2,** the section modulus of longitudinal frames and beams is not to be less than that obtained assuming them as stiffeners on deep tank bulkhead and taking the distance up to the top of hatchway as h.

4. Longitudinal beams and side longitudinals attached to sheer strake are to be of such dimensions as to have slenderness ratio not exceeding 60 at the midship part as far as practicable. This requirement, however, may be suitably modified for small vessels.

5. As for flat bars used for longitudinal beams and frames, the ratio of depth to thickness is not to exceed 15.

6. The extreme width of face plates of longitudinal beams and frames is not to be less than that obtained from the following formula:

$$b = 2.2\sqrt{d_0 l} \quad (\text{mm})$$

where:

d_0 = depth of web of longitudinal beams or frames (mm).

l = spacing of transverses (m).

303. Attachment

Longitudinal frames and beams are to be continuous or to be attached at their ends in such a manner as to effectively develop the sectional area and the resistance to bending.

Section 4 Girders, Transverses and Cross Ties in Cargo Oil Spaces

401. General

1. The requirements specified hereunder are intended to be applied to structures consisting of two to five transverses arranged at approximately equal intervals between transverse bulkheads or between the transverse bulkhead and the wash bulkhead.

2. Girders or transverses in the same plane are to be so arranged that abrupt change in the strength and rigidity is avoided; they are to have brackets of sufficient scantling and with properly rounded corners at their ends.

3. The depth of girders or transverses is not to be less than 2.5 times that of slots for frames, beams and stiffeners.

4. As for the face plates composing girders, the thickness is not to be less than that of web plates and the width of the face plates is not to be less than that obtained from the following formula:

$$b = 2.7\sqrt{d_0 l} \quad (\text{mm})$$

where:

d_0 = depth of girder (mm). In case where it is a balanced girder, d_0 is the depth from the surface of plate to the face plate (mm).

l = distance between supports of girder (m). Where, however, effective tripping brackets are provided, they may be taken as supports.

5. The requirements of **401.** to **406.** are also to be applied to pump rooms, ballast water tanks or void spaces in the midship part so far as practicable.

402. Transverses and girders provided in centre or side tanks in ships having two or more longitudinal bulkheads

1. Bottom transverses and bottom girders:

(1) The depth, web thickness and section modulus of bottom transverses and the web thickness and section modulus of bottom girders provided in the middle between longitudinal bulkheads are not to be less than those obtained from the given in **Table 7.1.3** respectively.

(2) Where one or two intercostal side girders are provided between longitudinal bulkhead and bottom girders provided at mid-distance of longitudinal bulkheads, and the bottom transverses are

of the reduced scantlings in accordance with (3) below, the sectional area of web plates and moment of inertia of side girders are not to be less than those obtained from the following formulae:

Sectional area of web plates : $A = \alpha_1 \dfrac{L_0}{B_0} d_0 t_0 \quad (\mathrm{cm}^2)$

Moment of inertia : $I = \alpha_2 \left(\dfrac{L_0}{B_0}\right)^3 I_0 \quad (\mathrm{cm}^4)$

where:

α_1, α_2 = coefficients given in **Table 7.1.4.**

I_0 = moment of inertia of bottom transverses (cm^4).

L_0, B_0, d_0, t_0 = as specified in **Table 7.1.3.**

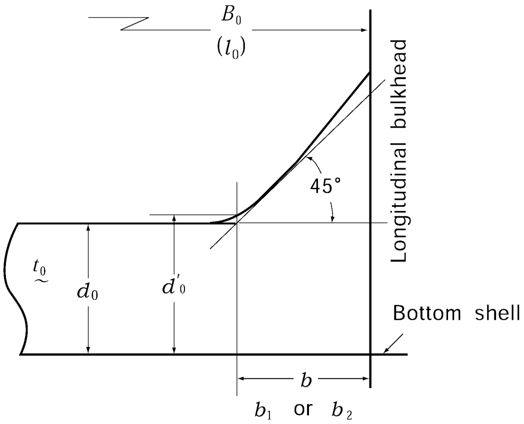

Fig 7.1.1 Measurement of b, d_0, d'_0 etc.

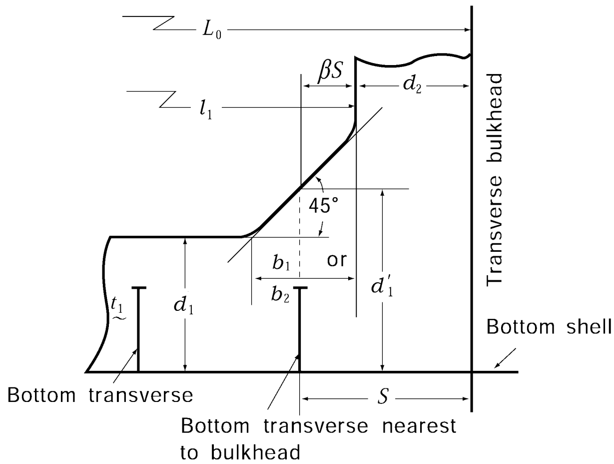

Fig 7.1.2 Measurement of d_1, d'_1, d_2, S etc.

Table.7.1.4 Coefficients α_1 and α_2

Number of side girders	Coefficient	
	α_1	α_2
1	0.0085	0.67
2	0.0045	0.42

(3) Where intercostal side girders are provided in accordance with (2), the bottom transverses and girders may be of the scantlings obtained from the formulae in (1), using coefficients C_0, C_1, C_2, C_3 and C_4 reduced by 10 % where two transverses are provided and 5 % where three transverses are provided.

(4) In ships without longitudinal centre line bulk heads, a centre girder with brackets at proper intervals is to be provided so as to maintain sufficient strength where the ship is drydocked on keel blocks.

Table 7.1.3 Scantlings of bottom transverses and bottom girders

	Depth (mm)	Web thickness (mm)	Section modulus (cm^3)
Bottom transverses	$d = C_0 l_0$	Thickness at the inner edge of bracket attached to longitudinal bulkhead $t = \left(C_1 - 87\frac{b}{l_0}\right)\frac{KQ}{d_0' - a} + 2.5$	$Z = C_2 K k^2 Q l_0$
Bottom girders	-	$t = C_3 \frac{\eta KQ}{d_1} + 2.5$	$Z = C_4 K k Q l_1$

Q = $\alpha S h_1 l_0$
α = 1.0 where L is 230 m and under
1.2 where L exceeds 400 m.
For the intermediate values of L, a is to be obtained by linear interpolation.
h_1 = as given by the following formula:
$d + 0.026L'$ (m).
L' = length of ship (m). Where, however, L exceeds 230 m, L is to be taken as 230 m.
S = spacing of transverses (m), (see **Fig 7.1.2**)
l_0 = overall length of transverses (m). Which is equal to B_0 or $(B_0 - d_3)$ where d_3 depth of vertical web attached to the centre line bulkhead (m).
b = length of horizontal arm of bracket connecting transverse to longitudinal bulkhead (m). (see **Fig 7.1.1**)
d_0' = depth of transverse at the inner edge of the above mentioned bracket (mm). (see **Fig 7.1.1**)
a = depth of slot (mm). Where, however, the slots near the inner edge of brackets are provided with collar plates, a may be taken as zero.
d_1' = depth of girder including bracket at the transverse nearest to the bulkhead (mm). (see **Fig 7.1.2**)
l_1 = overall length of girder, which is equal to $(L_0 - d_2)$(m), where d_2 is depth of vertical web on transverse bulkhead (m). (see **Fig 7.12**)
k = correction factor due to bracket given by the following formula:

$$k = 1 - \frac{0.65(b_1 + b_2)}{l}$$

b_1, b_2 = arm length of brackets at both ends of girders and transverses respectively (m).
l = overall length of girders and transverses (m), which is equal to l_0 or l_1.
η = as given by the following table.

Number of transverses	$\beta = \frac{S - d_2}{S}$	η
Two rows	$0 \leq \beta < \frac{2}{3}$ (See **Fig 7.1.2**)	$\eta = 2 - 1.5\beta$
	$\frac{2}{3} \leq \beta$	$\eta = 1.0$
Three to five rows	$0 \leq \beta < 0.5$	$\eta = 1.6 - 1.2\beta$
	$0.5 \leq \beta$	$\eta = 1.0$

d_0, t_0 = depth (mm) and web thickness (mm) of transverses respectively.
d_1, t_1 = depth (mm) and web thickness (mm) of girders respectively.
B_0 = distance between longitudinal bulkheads (m).
L_0 = distance between transverse bulkheads (m).
C_0, C_1, C_2, C_3, C_4 = as obtained from the following table according to K_0 respectively.

Table 7.1.3 Scantlings of bottom transverses and bottom girders (continued)

Number of transverses	Coef-ficient	$K_0 = \frac{d_0 t_0}{d_1 t_1} \times \frac{L_0}{B_0}$									
		$K_0 \leq 0.2$	$0.2 < K_0 \leq 0.3$	$0.3 < K_0 \leq 0.4$	$0.4 < K_0 \leq 0.5$	$0.5 < K_0 \leq 0.6$	$0.6 < K_0 \leq 0.7$	$0.7 < K_0 \leq 0.8$	$0.8 < K_0 \leq 1.0$	$1.0 < K_0 \leq 1.2$	Where no girder is provided
Two rows	C_0	0.090	0.095	0.100	0.105	0.115	0.115	0.120	0.125	0.135	0.160

	C_4	15.64	13.56	12.50	11.46	10.16	9.12	8.08	6.78	4.69	-

NOTES :
1. Where strong vertical girders are provided on transverse bulkheads at one side only in case of four or five transverses, coefficient C_4 is to be increased appropriately.
2. Where the depth of centre line bottom girder is of extremely large depth, coefficient, coefficient C_4 may be suitably modified.

2. Deck transverses and girders

(1) The depth and section modulus of deck transverses are not to be less than those obtained from the following formulae:

Depth of transverses : $d = C_0 l_0$ (m)

Section modulus of transverses : $Z = CKk^2\sqrt{L}Sl_0^2$ (cm^3)

where:

C_0, C = coefficients given in **Table 7.1.5** respectively.

d_0, t_0 = depth (mm) and web thickness (mm) of transverses respectively.

d_1, t_1 = depth (mm) and web thickness (mm) of girders respectively.

L_0, B_0, S, k = as specified in **Table 7.1.3.**

l_0 = overall length of transverses (m), which is equal to B_0 or $(B_0 - d_3)$, where d_3 is depth of vertical web on centre line bulkhead (m).

Table 7.1.5 Coefficients C_0 and C

Number of transverses	$K_0 = \frac{d_0 t_0}{d_1 t_1} \times \frac{L_0}{B_0}$	C_0	C
Two and three	$K_0 \leq 0.5$	0.07	0.79
	$K_0 \geq 1.5$	0.10	1.82
Four	$K_0 \leq 0.4$	0.07	0.79
	$K_0 \geq 1.4$	0.10	1.82
Five	$K_0 \leq 0.3$	0.07	0.79
	$K_0 \geq 1.3$	0.10	1.82
NOTE: For intermediate values of K_0, C_0 and C are to be obtained by linear interpolation.			

(2) Deck girders provided at the mid-distance of longitudinal bulkheads may be of scantlings determined in relation to those of deck transverse specified in (1). Where deck girders from a ring system together with strong vertical webs on transverse bulkheads as specified in **505.,** the depth of girders is not to be less than that obtained from the following formula.

$$d = \frac{L_0 D}{9B_0} \quad (\mathrm{m})$$

where:

B_0, L_0 = as specified in **Table 7.1.3.**

3. Transverses provided on longitudinal centre line bulkheads are not to be of less scantling than determined in accordance with **403. 2**(2) for transverses on longitudinal bulkheads in wing tanks.

403. Transverses and girders provided in wing tanks in ships having two or more longitudinal bulkheads

1. Side transverses

(1) Symbols used in this Paragraph are defined as follows:

$$Q = \alpha S h l_0$$

α = 1.0 where L is 230 m and under,
1.2 where L exceeds 400 m
For intermediate values of L, α is to be obtained by linear interpolation.

h = distance from the mid-point of l_0 to the point H_2 above the top of keel (m).

h_s = distance from the mid-point of b_s to the point H_2 above the top of keel (m).

$$H_2 = d + 0.038L' \quad (\mathrm{m})$$

L' = length of ship (m). Where L' exceeds 230 m, L' is to be taken as 230 m.

l_0 = overall length of side transverses (m), which is equal to the distance between the inner surfaces of face plates of bottom transverses and deck transverses. (See **Fig 7.1.3**)

S = spacing of transverses (m).

S' = spacing of stiffeners provided depthwise on the web plates of transverses at the portion where cross ties are connected (m).

k = as specified in **Table 7.1.3.**

b = length of arm of the lowest bracket (m). (See **Fig 7.1.3**)

b_s = width of the area supported by cross ties (m). (See **Fig 7.1.3**)

d_0' = depth of side transverses at the inner edge of the lowest bracket (mm). (See **Fig 7.1.3**)

a = depth of slot in the vicinity of inner edge of the lowest bracket. Where, however, the slots are provided with collar plates, a may be taken as zero.

A = section area effective to support the axial force from cross tie (cm^2), which is to be taken as follows:

(a) Where the face plates of cross ties are continuous to the face plates of transverses in an arc form or a similar form, A is the total sum of the sectional area of the web plate of transverse at the portion between the contact points of the tangents to the arc or the similar curve making an angle of 45° to the direction of cross tie, that of the stiffener provided in the axial direction of cross tie on the web plate between the contact points, and 0.50 times that of the face plates at the contact points. (See **Fig 7.1.4** (a))

(b) Where the face plates of cross ties are continuous to the face plates of transverses in the form of straight line with rounded corners, A is the total sum of the sectional area of the web plate of transverse at the portion between the midpoints of the intersections of the extensions of the lines of inner surface of face plates of both cross tie and transverse with the lines making an angle of 45° to the direction of cross tie in contact with the inner surface of face plates at the transforming parts, that of the stiffener provided in the axial direction of cross tie on the web plate between the above mentioned mid-points and 0.50 times that of the face plates at the mid-points. (See **Fig 7.1.4** (b))

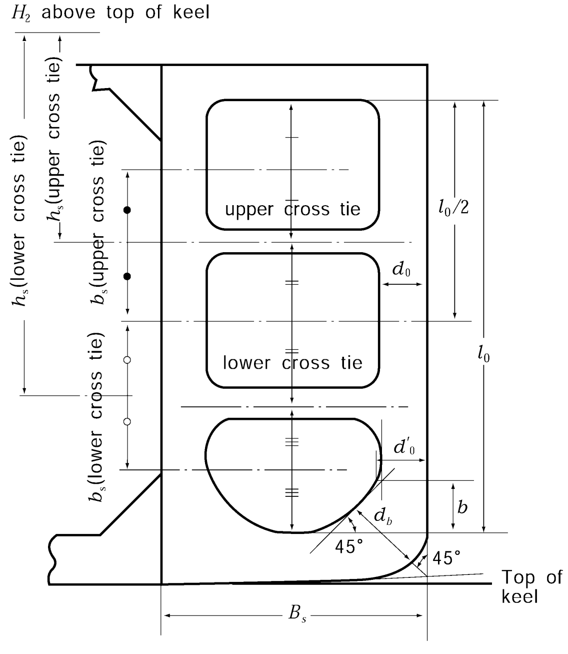

Fig 7.1.3 Measurement of l_0, d'_0, b, b_s, etc.

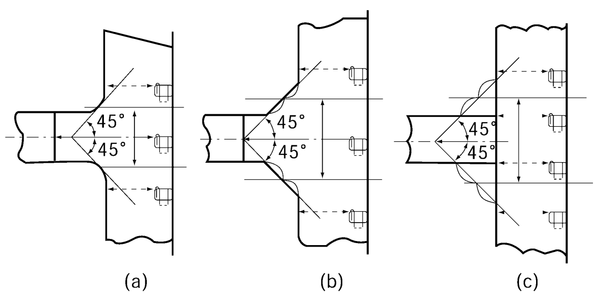

Fig 7.1.4 Extent for total sectional area

(c) Where the face plates of cross ties are joined directly to the face plates of transverses with a right or nearly right angle and both face plates are connected with brackets and further, stiffeners are provided on the web plate of transverses on the extended lines of face plates of cross tie, A is the total sum of the sectional area of the web plate of transverse at the portion between the mid-points of the intersections of the extensions of lines of inner surface of face plates of both cross tie and transverse with the lines making an angle of 45° to the direction of cross tie in contact with the free edge lines of brackets, and that of the stiffeners provided as mentioned above. (See **Fig 7.1.4** (c))

C_0, C_1, C_2 = coefficients given in **Table 7.1.6** according to the number of cross ties respectively.

Table 7.1.6 Coefficients C_0, C_1, C_2 and C_2'

Number of cross ties	C_0	C_1	C_2	C_2'
0	0.150	55.7	5.07	7.14
1	0.110	44.8	2.70	4.42
2	0.100	39.4	2.28	3.74
3	0.095	36.2	2.12	3.49

(2) The depth of transverses is not to be less than $C_0 l_0$ (m) at the mid-point of l_0. Where the transverses are of tapered form, the reduction in depth at the upper end is not to exceed 10 % of the depth at the mid-point of l_0, and the rate of increase in depth at the lower end is not to be less than that of reduction at the upper end.

(3) The web thickness of transverses at the inner edge of brackets at the lower ends is not to be less than that obtained from the following formula. Where, however, bottom transverses and longitudinal bulkheads in centre tanks or inner tanks are connected with large brackets extending to the lowest cross ties, the web thickness of side transverses may be properly reduced.

$$t = \left(C_1 - 148\frac{b}{l_0}\right)\frac{KQ}{d_0' - a} + 2.5 \quad \text{(mm)}$$

(4) The web thickness of transverses at the portion where cross ties are connected is not to be less than that obtained from the following formula. Where slots are provided in the web at the portion where cross ties are connected, the slots are to be effectively covered with collar plates.

$$t = 16\sqrt{\frac{\alpha S b_s h_s}{A}} \times S' \quad \text{(mm)}$$

(5) The section modulus of transverses at the span is not to be less than that obtained from the following formula :

$$Z = C_2 K k^2 Q l_0 \quad (\text{cm}^3)$$

2. Vertical webs on longitudinal bulkheads

(1) Vertical webs on longitudinal bulkheads connected to side transverses with effective cross ties are to be of the scantlings required in **Par 1** for side transverses with cross ties.

(2) Vertical webs on longitudinal bulkheads without cross ties are generally to be of the scantlings required in **Par 1** for side transverses without cross ties. However, h is to be the distance from the mid-point of l_0 to the top of hatches of inner tanks or centre tanks (m).

3. Bottom transverses

(1) The rigidity of bottom transverses is to be well balanced with that of side transverses.

(2) The section modulus of bottom transverses at the span is not to be less than that obtained from the following formula:

$$Z = 9.3 K \alpha k^2 S h_1 l_1^2 \quad (\mathrm{cm}^3)$$

where:

α, k, S = as specified in **Par 1** (1).

h_1 = as specified in **Table 7.1.3.**

l_1 = overall length of bottom transverses (m), which is equal to the distance between the inner surface of face plates of bottom transverses and that of vertical webs on longitudinal bulkheads.

(3) The section modulus of transverses at bilge and at the lower end of longitudinal bulkheads is not to be less than that obtained from the following formula. Where, however, bottom transverses and vertical webs on longitudinal bulkheads in centre tanks or inner tanks are connected with large brackets extending to the lowest cross ties, the section modulus of transverses specified above may be properly reduced. In calculating the section modulus, the neutral axis of section is to be taken as located at the middle of the depth d_b (See **Fig 7.1.3**) of transverses.

$$Z = C_2' K Q l_0 \quad (\mathrm{cm}^3)$$

where:

Q, l_0 = as specified in **Par 1** (1) respectively.

C_2' = coefficient given in **Table 7.1.6** according to the number of cross ties.

4. Deck transverses

(1) The rigidity of deck transverses is to be well balanced with that of side transverses.

(2) The section modulus of deck transverses is not to be less than that obtained from the following formula:

$$Z = 3 K k^2 S \sqrt{L}\, l_2^{\,2} \quad (\mathrm{cm}^3)$$

where:

k, S = as specified in **Par** 1(1) respectively.

l_2 = overall length of deck transverses (m), which is equal to the distance between the inner edges of face plates of side transverses and that of vertical webs on longitudinal bulkheads.

5. Transverses and girders where longitudinal girders are provided on ship's side and on longitudinal bulkheads

The requirements in this Paragraph are intended to be applied to the structures consisting of one, two or three side stringers or horizontal girders and three transverses in association with cross ties provided only at the crossing point of middle transverses and side stringers to connect ships sides to longitudinal bulkheads.

(1) The scantlings of side transverses and the section modulus of transverses at bilge are not to be less than those obtained from the formulae given in **Pars 1** and **3** respectively, using C_0, C_1, C_2, and C_2' as given in **Table 7.1.7** according to the value of K given by the following formula:

$$K = \frac{d_0}{d_1}\left(\frac{l_1}{l_0}\right)^2$$

where:

d_0 = mean depth of side transverses (mm).

l_0 = as specified in **Par 1**(1).

d_1 = mean depth of side stringers (mm).

l_1 = overall length of side stringers (m), which is equal to the distance between transverse bulkheads minus the depth of horizontal girders on transverse bulkheads.

Table 7.1.7 Coefficients C_0, C_1, C_2, C_2', C_3 and C_4

Number of girders	Coefficient	$K=\frac{d_0}{d_1}\left(\frac{l_1}{l_0}\right)^2$											
		$K \le 0.2$	$0.2 < K \le 0.3$	$0.3 < K \le 0.4$	$0.4 < K \le 0.5$	$0.5 < K \le 0.6$	$0.6 < K \le 0.7$	$0.7 < K \le 0.8$	$0.8 < K \le 0.9$	$0.9 < K \le 1.0$	$1.0 < K \le 1.2$	$1.2 < K \le 1.4$	$1.4 < K \le 1.6$

NOTE:

1. Where two side stringers are provided, $1.2C_3$ and $1.2C_4$ are to be used for the lower stringer, and $0.8C_3$ and $0.8\ C_4$ for the upper stringer, in place of C_3 and C_4 respectively.
2. Where three side stringers are provided, $1.3C_4$ is to be used for the lowest stringer, and $0.7C_4$ for the uppermost stringer, in place of C_4 respectively.

(2) The section modulus of side stringers and the web thickness of side stringers in the span from the end of side stringer to the crossing point of side stringer and side transverse at the end are not to be less than those obtained from the following formulae respectively. Where three side stringers are provided, the web thickness of the uppermost stringers may be properly reduced.

Web thickness : $t = C_3 K \frac{Q}{d_1} + 2.5$ (mm)

Section modulus of side stringer : $Z = C_4 K k Q l_1$ (cm^3)

where:

Q, k = as specified in **Par 1** (1) respectively.

d_1, l_1 = as specified in (1) respectively.

C_3, C_4 = coefficients given in **Table 7.1.7** according to the value of K.

(3) The web thickness of transverses and side stringers at the portion where cross ties are connected is not to be less than that determined in accordance with **Par 1** (4). However, in the formula therein:

S = a half of l_1 specified in (1).

S' = spacing of stiffeners provided in depthwise on webs of side transverses and vertical webs on longitudinal bulkheads, or on side stringers and stringers on longitudinal bulkheads respectively at the portion where the cross ties are connected (m).

A = effective sectional area to support the axial force from cross ties (cm^2). Where cross ties consist of the members provided both on web plate of transverses and stringers, the area is equal to the total sectional area of these members which are to be determined in general as required in **Par 1** (1).

(4) Vertical webs and horizontal girders on longitudinal bulkheads are not to be of less scantlings than determined in accordance with (1) and (2).

(5) Where n tiers of horizontal girders are provided, the distances between the girders, the girder and the deck, and the girder and the top of keel are not to be less than 0.85 $D/(n+1)$ nor more than 1.15 $D/(n+1)$ as far as practicable.

(6) Where two or more horizontal girders are provided, the uppermost girder may, if properly arranged, be of the depth reduced by not more than 10% from the mean depth of the girders.

404. Cross ties

1. In ships having two or more longitudinal bulkheads where side transverses and vertical webs on longitudinal bulkheads in wing tanks are connected with cross ties and where the structural arrangements are as given in **403. 5,** the cross ties are to be in accordance with the following requirements.

2. As regards the spacing of cross ties, the requirements in **403. 5** (5) are to be applied in general.

3. The sectional area of cross ties connecting side transverses to vertical webs on longitudinal bulkheads in wing tanks is not to be of less than section area obtained from the formula given in **Table 7.1.8.**

4. (1) Brackets are to be provided at the ends of cross ties to connect to transverses or girders.
(2) Transverses are to be provided with tripping brackets at the junction with cross ties.
(3) Where the breadth of face plates forming cross ties exceeds 150 mm on one side of the web, stiffeners connected to web and face plates are to be fitted at proper intervals.

Table 7.1.8 Section area of cross tie and thickness of web

Section area (cm^2)	Thickness of web (mm)
Whichever is the greater : $A=\dfrac{0.77K\alpha Sb_s h_s}{1-0.5\dfrac{l}{k\sqrt{K}}}$, $A=1.1K\alpha Sb_s h_s$	$t=16\sqrt{\dfrac{\alpha Sb_s h_s}{A}}\times d_0$

α = as specified in **403. 1** (1).
S = spacing of transverses (m). Where, however, constructed as specified in **403. 5,** S is to be taken as a half of l_1 specified in **403. 5** (1) (m).
b_s = width of the area supported by cross ties (m). (See **Fig 7.1.3**).
h_s = distance from the mid-point of b_s to the point H_2 specified in **403. 1** (1) above the top of keel (m).
l = length of cross ties measured between the inner edges of the side transverses (or stringers) and the vertical webs (or horizontal girders) on longitudinal bulkheads (m).
k = $\sqrt{I/A}$ (cm)
I = the least moment of inertia of cross ties (cm^4).
A = sectional area of cross ties (cm^2).
d_0 = depth of web plates (mm). Where, however, stiffeners are provided lengthwise on the web plates, the depth may be considered to be divided by the stiffeners.

405. Minimum thickness of web plates, scantling of stiffeners

1. (1) The web thickness of girders situated below the position of approximately $0.25D$ above the top of keel is not to be less than that required by **108.** (4) or that obtained from the following formula, whichever is the greater.

$$t=13.2\frac{Cd_0}{\sqrt{K}}+2.5 \quad (\mathrm{mm})$$

where:

d_0 = depth of web plates (m). Where stiffeners are provided horizontally on the midpart of web plates, distance between the stiffener and shell plating or face plate (m), or between the stiffeners (m).

C = coefficient which is determined from **Table 7.1.9** according to the ratio of S to d_0 where S is the spacing of stiffeners provided on web plates in the depthwise (m).

Table 7.1.9 Coefficient C

S/d_0	C
$\dfrac{S}{d_0}\geq 1.0$	1.0
$\dfrac{S}{d_0}< 1.0$	$\sqrt{\dfrac{S}{d_0}}$

(2) The web thickness of girders situated above the position of approximately $0.25D$ below the lower edge of deck at ships sides is not to be less than that required by **108.** (4) or that obtained from the following formula, whichever is the greater:

$$t = 11.0\frac{Cd_0}{\sqrt{K}} + 2.5 \quad (\text{mm})$$

where:

d_0, C = as specified in (1).

(3) The web thickness of transverse girders and longitudinal girders other than those specified in the above (1) and (2) is not to be less than that required by **108.** (4) or that obtained from the following formula, whichever is the greater. The girders situated higher than $D/3$ above the top of keel or the lower edge of face plate at the lower side of the second cross ties from deck, whichever is the lower, may have the web thickness as obtained from the formula with its first term multiplied by 0.85, subject to the requirements of (i) and (ii) in this Sub-paragraph (b).

$$t = \frac{Cd_0}{\sqrt{K}} + 2.5 \quad (\text{mm})$$

where:

d_0 = as specified in (1).

C = coefficient determined from **Table 7.1.10,** according to the ratio of S to d_0 and the stiffened panel arrangement, where S is the spacing of stiffeners provided on web plates in the depthwise (m). For the intermediate value of S/d_0, C is to be obtained by linear interpolation.

Table 7.1.10 Coefficients C_1, C_2 and C_3

S/d_0	C_1	C_2	C_3
0.2 or less	2.6	2.1	3.7
0.4	4.5	3.7	6.7
0.6	5.6	4.9	8.6
0.8	6.4	5.8	9.6
1.0	7.1	6.6	9.9
1.5	7.8	7.4	10.3
2.0	8.2	7.8	10.4
2.5 or more	8.4	8.0	10.4

(a) Where no stiffener is provided in parallel with face plates ...... C_1
Where, however, slots are provided, C_2 is to be used and the web thickness is not to be less than that obtained by applying the requirements of (i) in this sub-paragraph.

(b) Where stiffeners are provided in parallel with face plates,
For panel between face plate and stiffener or between stiffeners ...... C_3
However, the thickness need not exceed the value obtained by using coefficient C_1, Subject to no stiffener in parallel to face plate and no slot being provided. For panel between stiffener and shell plating ...... C_2

(i) Where slots are provided on webs with no reinforcement, the first term of the formula is to be multiplied by the following factor:

$$\sqrt{4.0\frac{d_1}{S}-1.0}$$

where d_1/S is 0.5 or less, the multiplier is to be taken as 1.0.

where:

d_1 = depth of slots (m).

(ii) Where openings are provided on webs with no reinforcement, the first term of the formula is to be multiplied by the following factor:

$$1+0.5\frac{\phi}{a}$$

where:

a = length at the longer side of the panel surrounded by the web stiffeners (m).

ϕ = diameter of openings (m). Where openings are of oblong, ϕ is to be the length of the longer diameter (m).

(4) The depth of flat bar stiffeners provided on girders and transverses is not to be less than 0.08 d_0. Where, however, the stiffeners are fitted to the full depth of girders, d_0 is to be taken as the depth of girders, and where the stiffeners are fitted to the length from the top of longitudinal frames which penetrate girders to the face plate of girders, d_0 is to be taken as the depth of girders minus the height of longitudinal frames, and where the stiffeners are fitted in parallel with face plates, d_0 is to be taken as the spacing of tripping brackets.

(5) Tripping brackets are to be provided on the web plate of transverses at the inner edge of end brackets and at the connecting part of crossties, etc. and also at the proper intervals in order to support transverses effectively. Where the breadth of face plates exceeds 180 mm on one side of the web, the tripping brackets are to be connected to face plates as well.

2. Where horizontal flat bar stiffeners are provided on bottom and deck girders, the stiffeners are not to be of less depth than 0.06 l, notwithstanding the requirements in **Par 1** (4). For strong bottom girders supporting bottom transverses, however, the horizontal stiffeners are not to be of less depth than 0.08 l, where l is the spacing of transverses (m), except that where brackets extending for the full depth of girders are provided at the midpoint of l, l may be taken as a half of the spacing of transverses.

3. Where flat bar stiffeners are connected at their ends to face plates, tripping brackets, etc., the depth of stiffeners as specified in **Par 1** (4) and **Par 2** may be properly reduced.

406. Special consideration on stiffening girders, webs and end connection brackets

Connecting brackets of bottom transverses to web plates on longitudinal bulkheads and the web plates in the vicinity of the inner edge of connecting brackets, and connecting brackets of bottom girders to web plates on transverse bulkheads (oiltight, watertight and wash) and the web plates in the vicinity of the inner edge of connecting brackets which are respectively situated in centre tanks or inner tanks, and side transverses and connecting brackets at the lower end of vertical webs on longitudinal bulkheads and the web plates in the vicinity of the inner edge of connecting brackets, and connecting brackets of side stringers to web plates on transverse bulkheads and the web plates in the vicinity of the inner edge of connecting brackets which are respectively situated in wing tanks, are to be specially provided with stiffeners in a close spacing. Further, on the web plates at the portions specified above is to be given a special consideration to prevent buckling, where the plates are unavoidably lap jointed.

Section 5 Bulkheads in Cargo Oil Spaces

501. Sectional area of transverse bulkhead plating in centre tanks

The sectional area of transverse bulkhead plating in the depthwise direction of ship in centre tanks is not to be less than that obtained from the following formula :

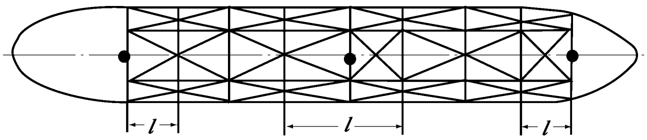
$$A = 0.95KS(h - 0.32d)(l - S)\left(C + \frac{Y}{l - S}\right) \quad (\mathrm{cm}^2)$$

where:

S = spacing of bottom transverses (m).

h = distance from the top of keel to the top of hatches in centre tanks (m).

l = distance between two bulkheads of watertight, oiltight or wash, which are situated respectively forward and afterward of the bulkhead concerned (m). Where the bulkhead concerned, however, is situated at the fore or after end of cargo oil spaces, l is to be the distance from such end bulkhead to the bulkhead of watertight, oiltight or wash, which is situated forward or afterward of the bulkhead respectively (m). (See **Fig 7.1.5**)



● marks show the bulkheads concerned

Fig 7.1.5 Measurement of l

Y = distance measured athwartship from ship's centre line (m).

C = coefficient which is to be taken as zero where no centre line girder is provided in the bottom structure of centre tanks, and to be obtained from the following formula where centre line girder is provided :

$$C = \frac{0.175}{1 + 131.0\dfrac{a}{D}\left(\dfrac{1.5K_b^3}{1 + 15.6K_b^2} + \dfrac{K_d^3}{1 + 15.6K_d^2}\right)} \times \frac{a}{S}$$

where:

a = half-breadth of centre tanks (m).

K_b, K_d = ratio of h_b/l and h_d/l, respectively, where h_b is the height of centre line bottom girder (m) and h_d is the height of centre line deck girder (m).

502. Thickness of bulkhead plating

1. The thickness of bulkhead plating is not to be less than that obtained from the formula in Pt 3, **Ch 15, 202.** for deep tank bulkhead plating, using h measured from the lower edge of plating to the top of hatches (m) or $0.3\sqrt{L}$ (m), whichever is the greater.

2. The breadth of the uppermost and lowest strakes of longitudinal bulkhead plating is not to be less than $0.1D$ and the thickness of these is not to be less than that obtained from the following formulae :

For lowest strakes : $t = 1.1S\sqrt{KL} + 2.5$ (mm)

For uppermost strakes : $t = 0.85S\sqrt{KL} + 2.5$ (mm)

where:

S = spacing of stiffeners (m).

3. The thickness of longitudinal bulkhead plating is to comply with the requirements of **Pt 3, Ch 3, Secs 3** and **4.**

503. Stiffeners

1. The section modulus of stiffeners is not to be less than that obtained from the formula in **Pt 3, Ch 15, 203.** and **207.** for deep tank bulkhead stiffeners, using h measured from the midpoint of l in case of vertical stiffeners or from the centre of the width of plating supported by the stiffener in case of horizontal stiffeners to the top of hatches (m) or $0.3\sqrt{L}$ (m), whichever is the greater.

2. Horizontal stiffeners provided on upper and lower parts of longitudinal bulkhead plating are to be of increased scantling above those specified in the preceding Paragraph.

3. The full width of face plates of horizontal stiffeners on longitudinal bulkhead is not to be less than that required in **302. 6.**

504. Strong vertical webs

Where strong vertical webs are provided in support of horizontal girders on transverse bulkheads at the mid-distance of longitudinal bulkheads, the vertical webs are to be in accordance with the following requirements, according to the case where transverse bulkhead is of vertical stiffener system or horizontal stiffener system.

(1) In the case of vertical stiffener system, the depth, web thickness and section modulus of strong vertical webs supporting horizontal girders are not to be less than those obtained from the following formulae respectively. (See **Fig 7.1.6**)

Depth of webs : $d = 3\left(\frac{l_1}{B_0}\right)^2 d_0$ (mm)

Web thickness :

Web thickness of vertical webs in the portion between the top of face plate of bottom girder and the horizontal girder just above the bottom girder, and web thickness of vertical webs in the portion between the said horizontal girder and the horizontal girder just above it in case where the said horizontal girder is provided within 1/3 length of vertical arm of bracket at the lower end of vertical webs above the face plate of bottom girder:

In case of one horizontal girder :

$$t_1 = \frac{87}{d_l} KW_1 \left(\frac{a_1}{l_1}\right)^2 \left(1 + \frac{2a_2}{l_1}\right) + 2.5 \quad \text{(mm)}$$

In case of two horizontal girders :

$$t_2=\frac{87}{d_l}K\left[W_1\left(\frac{a_1}{l_1}\right)^2\left\{1+\frac{2(a_2+a_3)}{l_1}\right\}\right]$$

In case of three horizontal girders :

$$t_3=\frac{87}{d_l}K\left[W_1\left(\frac{a_1}{l_1}\right)^2\left\{1+\frac{2(a_2+a_3+a_4)}{l_1}\right\}+W_2\left(\frac{a_1+a_2}{l_1}\right)^2\left\{1+\frac{2(a_3+a_4)}{l_1}\right\}\right.$$
$$\left.+W_3\left(\frac{a_1+a_2+a_3}{l_1}\right)^2\left(1+\frac{2a_4}{l_1}\right)\right]+2.5\quad(\mathrm{mm})$$

In case of n horizontal girders : $t_n=\frac{87}{d_l}K\left[\sum_{i=1}^{n}W_i\left(\sum_{j=1}^{i}\frac{a_j}{l_1}\right)^2\left(1+2\sum_{k=i+1}^{n+1}\frac{a_k}{l_1}\right)\right]+2.5\quad(\mathrm{mm})$

Thickness of vertical webs in the portion between the lower surface of face plate of deck girders and the horizontal girder just below the said face plate.

In case of one horizontal girder : $t_1=\frac{87}{d_u}KW\left(\frac{a_2}{l_1}\right)^2\left(1+\frac{2a_1}{l_1}\right)+2.5\quad(\mathrm{mm})$

In case of two horizontal girders :

$$t_2=\frac{87}{d_u}K\left[W_1\left(\frac{a_1+a_2}{l_1}\right)^2\left(1+\frac{2a_1}{l_1}\right)+W_2\left(\frac{a_3}{l_1}\right)^2\left\{1+\frac{2(a_1+a_2)}{l_1}\right\}\right]+2.5\quad(\mathrm{mm})$$

In case of three horizontal girders :

$$t_3=\frac{87}{d_u}K\left[W_1\left(\frac{a_2+a_3+a_4}{l_1}\right)^2\left(1+\frac{2a_1}{l_1}\right)+W_2\left(\frac{a_3+a_4}{l_1}\right)^2\left\{1+\frac{2(a_1+a_2)}{l_1}\right\}\right.$$
$$\left.+W_3\left(\frac{a_4}{l_1}\right)^2\left\{1+\frac{2(a_1+a_2+a_3)}{l_1}\right\}\right]+2.5\quad(\mathrm{mm})$$

In case of n horizontal girders : $t_n=\frac{87}{d_u}K\left[\sum_{i=1}^{n}W_i\left(\sum_{j=i+1}^{n+1}\frac{a_j}{l_1}\right)^2\left(1+2\sum_{k=1}^{i}\frac{a_k}{l_1}\right)\right]+2.5\quad(\mathrm{mm})$

Section modulus of webs : $Z=4Kk^2B_0hl_1^2\quad(\mathrm{cm}^3)$

where:

l_1 = overall length of vertical webs (m), which is equal to the distance between the inner surface of face plates of bottom and deck girders. In case where horizontal girder is provided within 1/3 of the length of vertical arm of bracket at the lower end of vertical webs above the top of bottom girders, l_1 is to be the distance between the said horizontal girder and the inner surface of face plate of deck girders (m).

B_0 = distance between longitudinal bulkheads (m)

d_0 = mean depth of horizontal girders (m).

d_l = depth of webs at the lower portion of vertical webs considered (mm).

d_u = depth of webs at the upper portion of vertical webs considered (mm).

n = number of horizontal girders provided within the length of l_1.

W_i (i = 1, 2,...n) = load which vertical webs receive from the number n horizontal girder counting from the top of l_1 and which is obtained from the following formulae :

In case of one horizontal girder : $W_1 = \frac{B_0}{4}(a'_1 + a'_2)\left(h' + \frac{3}{4}a'_1 + \frac{1}{4}a'_2\right)$ (t)

In case of two horizontal girders :

$$W_1 = \frac{B_0}{4}(a'_1 + a_2)\left(h' + \frac{3}{4}a'_1 + \frac{1}{4}a_2\right) \quad \text{(t)}$$

$$W_2 = \frac{B_0}{4}(a_2 + a'_3)\left(h' + a'_1 + \frac{3}{4}a_2 + \frac{1}{4}a'_3\right) \quad \text{(t)}$$

In the case of three horizontal girders :

$$W_1 = \frac{B_0}{4}(a'_1 + a_2)\left(h' + \frac{3}{4}a'_1 + \frac{1}{4}a_2\right) \quad \text{(t)}$$

$$W_2 = \frac{B_0}{4}(a_2 + a_3)\left(h' + a'_1 + \frac{3}{4}a_2 + \frac{1}{4}a_3\right) \quad \text{(t)}$$

$$W_3 = \frac{B_0}{4}(a_3 + a'_4)\left(h' + a'_1 + a_2 + \frac{3}{4}a_3 + \frac{1}{4}a'_4\right) \quad \text{(t)}$$

In case of n horizontal girders :

$$W_1 = \frac{B_0}{4}(a'_1 + a_2)\left(h' + \frac{3}{4}a'_1 + \frac{1}{4}a_2\right) \quad \text{(t)}$$

$$W_i = \frac{B_0}{4}(a_i + a_{i+1})\left(h' + \sum_{j=1}^{i-1}a_j + \frac{3}{4}a_i + \frac{1}{4}a_{i+1}\right) \quad \text{(t)} \qquad (i = 2, 3 \ldots\ldots, n\text{-}1)$$

$$W_n = \frac{B_0}{4}(a_n + a'_{n+1})\left(h' + \sum_{j=1}^{n-1}a_j + \frac{3}{4}a_n + \frac{1}{4}a'_{n+1}\right) \quad \text{(t)}$$

Where

j = 1 in the above formulae for W_i and W_n, a_i is to be taken as a'_1.

where :

a_i (i = 1, 2, ..., n) = distance between the top of l_1 and the horizontal girder just below the top, distance between the adjacent horizontal girders or distance between the bottom of l_1 and the horizontal girder just above the bottom (m). (i is to be counted from the top.)

a'_1 = distance between the lower surface of deck longitudinals and the uppermost horizontal girder (m).

a'_{n+1} = distance from the lowest horizontal girder within the length of l_1 to the horizontal girder just below it or to the upper surface of bottom longitudinals (m).

h = distance from the mid-point of l_1 to the top of hatchways in centre tanks (m).

h' = distance from the lower surface of deck longitudinals to the top of hatchways in centre tanks (m).

k = correspondingly as specified in **Table 7.1.3.**

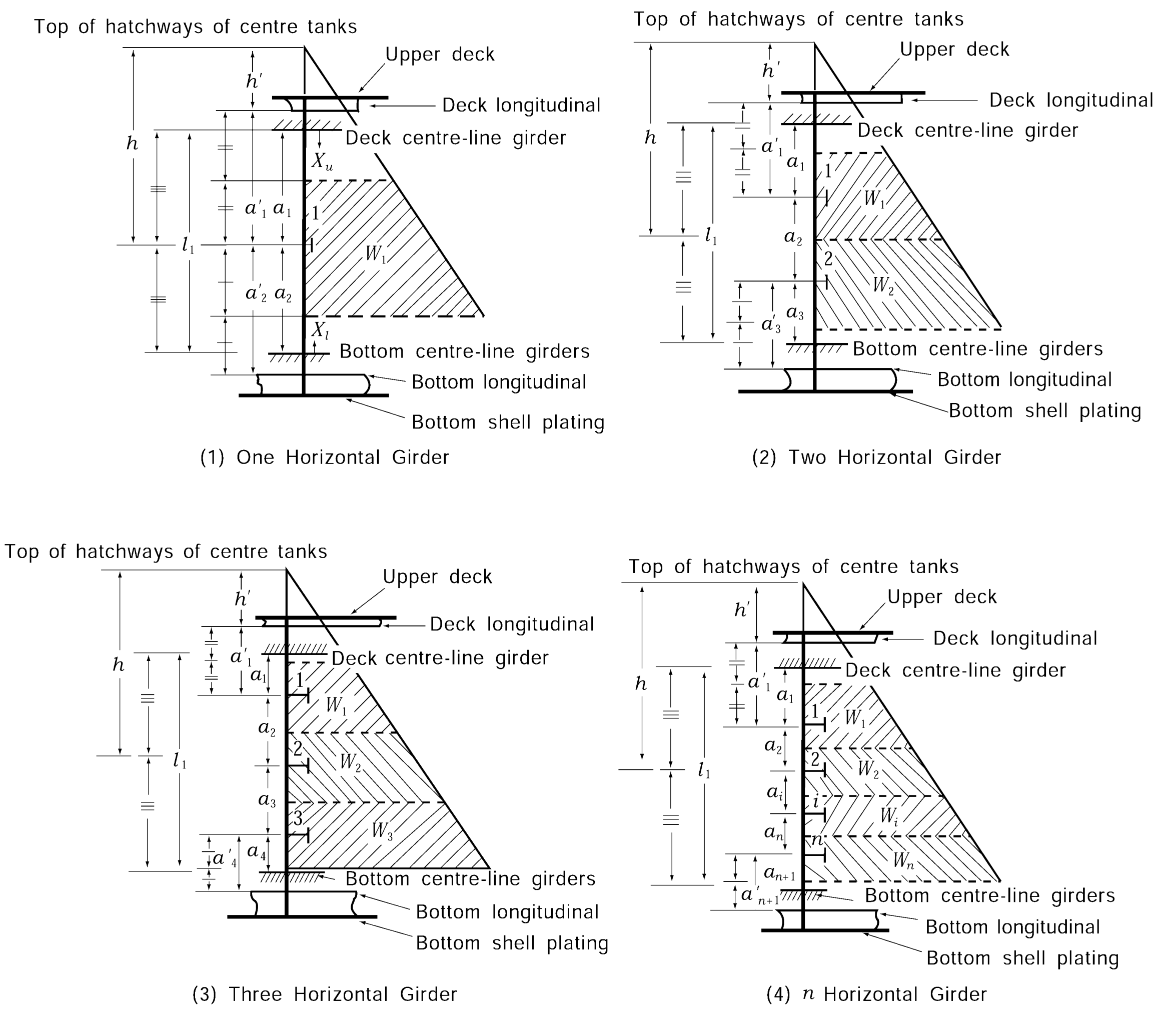


Fig 7.1.6 Measurement of each dimension and load

(2) In case where one horizontal girder is provided, the depth, web thickness and section modulus of strong vertical webs supporting the horizontal girder are not to be less than those obtained from the following formulae respectively:

Depth of webs : $d = 3\left(\frac{l_1}{B_0}\right)^2 d_0$ (mm)

Web thickness :

Web thickness of vertical webs in the portion between the top of face plates of bottom girders and the horizontal girders :

$$t_1 = \frac{87}{d_l - a} K\left[\frac{1}{4} B_0 h l_1 \left\{\frac{1}{2} - \frac{X_l}{l_1} + \frac{l_1}{2h}\left(\frac{1}{5} - \frac{X_l}{l_1} + \frac{X_l^2}{l_1^2}\right)\right\} + W_1\left(\frac{a_1}{l_1}\right)^2\left(1 + \frac{2a_2}{l_1}\right)\right] + 2.5 \quad \text{(mm)}$$

Web thickness of vertical webs in the portion between the lower surface of face plates of deck girders and the horizontal girders :

$$t_2=\frac{87}{d_u-a}K\left[\frac{1}{4}B_0hl_1\left\{\frac{1}{2}-\frac{X_u}{l_1}-\frac{l_1}{2h}\left(\frac{1}{5}-\frac{X_u}{l_1}+\frac{X_u^2}{l_1^2}\right)\right\}+W_1\left(\frac{a_2}{l_1}\right)^2\left(1+\frac{2a_1}{l_1}\right)\right]+2.5 \quad (\mathrm{mm})$$

Section modulus of webs : $Z=5.2Kk^2B_0hl_1^2 \quad (\mathrm{cm}^3)$

where :

X_l = distance measured upward from the top of face plates of bottom girders (m).

X_u = distance measured downward from the lower surface of face plates of deck girders (m).

$$W_1=\frac{B_0}{8}(a'_1+a'_2)\left(h'+\frac{3}{4}a'_1+\frac{1}{4}a'_2\right) \quad (\mathrm{t})$$

l_1, B_0, d_0, d_l, d_u, a_1, a_2, a_1', a'_2, h, h', k = as specified in (1) respectively.

a = depth of slot (m). Where, however, the slots are effectively covered by collar plates, a may be taken as zero.

505. Vertical webs supported by horizontal girders

Where vertical webs provided on transverse bulkhead are supported by the horizontal girders specified in **506.**, the depth, web thickness and section modulus of vertical webs are not to be less than those obtained from the following formulae respectively.

Depth of webs : $d=143l \quad (\mathrm{mm})$ or $2.5a \quad (\mathrm{mm})$, whichever is the greater.

Web thickness : $t=C_1K\frac{Shl}{d_0-a}+2.5 \quad (\mathrm{mm})$

Section modulus of webs : $Z=C_2Kk^2Shl^2 \quad (\mathrm{cm}^3)$

where :

a = depth of slots (mm).

l = overall length between the points of support of vertical webs (m), which is equal to the distance from the inner surface of face plates of bottom girders to the horizontal girder just above it, that between the horizontal girders, or that from the inner surface of face plates of deck girders to the horizontal girders just below it.

S = spacing of vertical webs (m).

h = distance from the mid-point of l to the top of hatchways of the tanks concerned (m) or $0.3\sqrt{L}$ (m), whichever is the greater.

d_0 = depth of webs at the point under consideration (mm).

k = correspondingly as specified in **Table 7.1.3.**

C_1, C_2 = coefficients given by the following formulae respectively:

$$C_1 = 87\left\{\frac{1}{2} - \frac{X}{l} + \frac{1}{2}\,\frac{l}{h}\left(\frac{1}{5} - \frac{X}{l} + \frac{X^2}{l^2}\right)\right\},$$

$$C_2 = 8\left(1 + \frac{l}{10h}\right)$$

X = distance measured upward from the lower end of l (m).

506. Horizontal girders supporting vertical webs

Where vertical webs are supported by horizontal girders provided on transverse bulkheads, the depth, web thickness and section modulus of horizontal girders are not to be less than those obtained from the following formulae respectively. The section modulus, however, is not to be less than that obtained from the formulae taking the starting point of a_i each end of the girders, whichever is the greater. (See **Fig 7.1.7**)

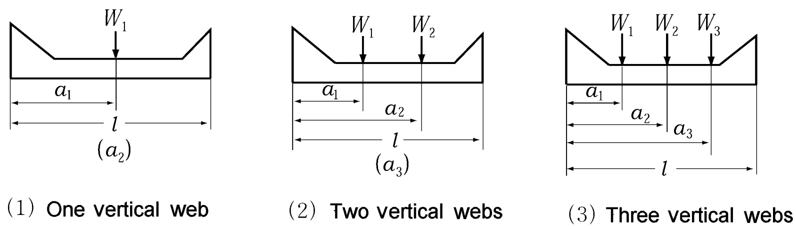

Fig 7.1.7 Measurement of l, a_1, a_2, etc.

Depth of girders : $d = 143l$ (mm)

Web thickness in the portion between the ends of horizontal girders and the vertical webs at ends :

In case of one vertical web : $t_1 = \frac{87}{d_0} K W_1 \left(1 - \frac{a_1}{l}\right)^2 \left(1 + \frac{2a_1}{l}\right) + 2.5$ (mm)

In case of two vertical webs :

$$t_2 = \frac{87}{d_0} K \left[W_1 \left(1 - \frac{a_1}{l}\right)^2 \left(1 + \frac{2a_1}{l}\right) + W_2 \left(1 - \frac{a_2}{l}\right)^2 \left(1 + \frac{2a_2}{l}\right)\right] + 2.5 \quad \text{(mm)}$$

In case of three vertical webs :

$$t_3 = \frac{87}{d_0} K \left\{ W_1 \left(1 - \frac{a_1}{l}\right)^2 \left(1 + \frac{2a_1}{l}\right) + W_2 \left(1 - \frac{a_2}{l}\right)^2 \left(1 + \frac{2a_2}{l}\right) + W_3 \left(1 - \frac{a_3}{l}\right)^2 \left(1 + \frac{2a_3}{l}\right)\right\} + 2.5 \quad \text{(mm)}$$

Section modulus of girders :

In case of one vertical web : $Z_1 = 85.5Kk\, W_1 a_1 \left(1 - \frac{a_1}{l}\right)^2$ (cm^3)

In case of two vertical webs : $Z_2 = 85.5Kk \left\{ W_1 a_1 \left(1 - \frac{a_1}{l}\right)^2 + W_2 a_2 \left(1 - \frac{a_2}{l}\right)^2 \right\}$ (cm^3)

In case of three vertical webs :

$$Z_3 = 85.5Kk \left\{ W_1 a_1 \left(1 - \frac{a_1}{l}\right)^2 + W_2 a_2 \left(1 - \frac{a_2}{l}\right)^2 + W_3 a_3 \left(1 - \frac{a_3}{l}\right)^2 \right\} \quad (\text{cm}^3)$$

where:

l = overall length between the points of support of horizontal girders (m), which is equal to the distance between side shell plating and longitudinal bulkhead or that between the longitudinal bulkheads (m). Where, however, side stringers and longitudinal girders on longitudinal bulkheads are provided, the distance between the face plates of longitudinal girders is to be taken as l and where the strong vertical webs specified in **504.** are provided in the middle between the longitudinal bulkheads, a half of the distance between the longitudinal bulkheads is to be taken as l.

W_i (i = 1,2,3) = load which horizontal girders receive from the vertical web of number i counting from the end of l, which is given by the following formulae :

$$W_1 = \frac{1}{2} a_2 \, b \, h \quad (\mathrm{t})$$

$$W_2 = \frac{1}{2} (a_3 - a_1) \, b h \quad (\mathrm{t})$$

$$W_3 = \frac{1}{2} (l - a_2) bh \quad (\mathrm{t})$$

b = width of the area to be supported by horizontal girders (m).

h = distance from the mid-point of b to the top of hatchways of the tanks concerned (m) or $0.3\sqrt{L}$ (m), whichever is the greater.

a_i (i = 1,2,3) = distance from the end of l to the vertical web of number i counting from the end of l (m).

k = correspondingly as specified in **Table 7.1.3.**

507. Horizontal girders supporting vertical stiffeners

Where vertical stiffeners are supported by horizontal girders provided on transverse bulkheads, the depth, web thickness and section modulus of horizontal girders are not to be less than those obtained from the following formulae respectively :

Depth of girders : $d = 143\, l$ (mm) or $2.5\, a$ (mm), whichever is the greater.

Web thickness : $t = CK \dfrac{S h l}{d_1 - a} + 2.5 \quad (\mathrm{mm})$

Section modulus of girders : $Z = C' K k^2 S h l^2$

where :

a = depth of slots (mm).

l = overall length between points of support of horizontal girders (m), which is equal to the distance between side shell plating and longitudinal bulkhead or that between longitudinal bulkheads. Where, however, side stringers and longitudinal girders on longitudinal bulkhead are provided, the distance between the face plates of longitudinal girders is to be taken as l.

S = width of area to be supported by girders (m).

h = distance from the mid-point of S to the top of hatchways of the tanks concerned (m) or $0.3\sqrt{L}$ (m), whichever is the greater.

d_1 = depth of girders at the point under consideration (mm).
k = correspondingly as specified in **Table 7.1.3.**
C = coefficient given by the following formula:

$$C = \left| 87\left(\frac{1}{2} - \frac{X}{l}\right) \right|$$

X = distance measured from the end of l (m).
C' = coefficient given in **Table 7.1.11.**

Table 7.1.11 Coefficient C'

	Where side stringers and vertical webs on longitudinal bulkheads are provided	Others
Wing tank	7	10
Centre tank	7	$10\frac{B_S}{B_C}$

NOTES:
B_S = width of wing tanks (m), Which is equal to the distance between side shell plating and longitudinal bulkhead.
B_C = width of centre tanks (m), which is equal to the distance between longitudinal bulkheads. Where, however, B_S/B_C exceed 1.0, B_S/B_C is to be taken as 1.0 and where less than 0.7, to be taken as 0.7.

508. Web plates, face plates and stiffeners of girders

1. The thickness of vertical webs and horizontal girders provided on transverse bulkheads is not to be less than that required by the following:

(1) The web thickness of strong vertical webs specified in **504.** is to be as required in **405. 1** (1) in general. However, for the upper 2/3 of l_1, excluding the portion nearby the top of vertical arm of lower bracket of vertical webs, the formula may have its first term multiplied by 0.85.

(2) The web thickness of those webs and girders specified in **505.** to **507.** is to be as required in **405. 1** (3) in general.

2. The thickness and breadth of face plates forming vertical webs and horizontal girders specified in **Par 1** is not to be of less scantlings than required in **401. 4.** However, the depth of girders of corrugated bulkheads is to be measured from the middle of the depth of corrugation.

3. The girders specified in **Par 1** are to be provided with flat bar stiffeners, applying the requirements of **405.**

509. Special stiffening of web plates and end connection brackets

As regards the strong vertical webs specified in **504.** the lower brackets and the web plates between the top of face plate of bottom girders and the horizontal girders situated directly above the bottom girders, including the web plates up to the horizontal girder situated directly above the said horizontal girder in case where the said girder is situated within 1/3 the length of vertical arm of brackets above face plate of bottom girders, are to be provided with stiffeners specially in close spacing. Regarding the horizontal girders specified in **506.** and **507.,** the end brackets and the web plates in the vicinity of the inner edge of brackets are also to be provided with stiffeners in close spacing. Further, a special consideration is to be given to the web plates at the portion specified above to be protected from buckling, in case where the said plates are unavoidably lap jointed.

510. Additional strengthening of bulkhead in large tanks

As for large tank boundaries, the scantlings of bulkhead plates, stiffeners, vertical and horizontal girders are not to be less than those obtained from relevant formulae in **501.** to **507.,** where the value of h or h' is the one specified in each requirement or that given by the following formula, whichever is the greater.

$$H = 0.85(h + \Delta h) \quad (\mathrm{m})$$

where:

h = h or h' as specified in each requirement.

Δh = as specified in **Pt 3, Ch 15,105.**

511. Wash bulkheads

1. Stiffeners and girders are to be of adequate strength in conformity with the size and opening ratio of tanks.

2. The sectional area of wash bulkhead plating to the depthwise direction of the ship in centre tanks is not to be less than that required in **501.** as far as practicable.

3. The thickness of bulkhead plating is not to be less than that required by **108.** (4) or that obtained from the following formula, whichever is the greater. The thickness of the lowest strake of transverse wash bulkheads is to be properly increased.

$$t = 0.3S\sqrt{(L+150)K} + 2.5 \quad (\mathrm{mm})$$

where:

S = spacing of stiffeners (m).

4. The breadth and thickness of the uppermost and the lowest strakes in centre line wash bulkheads are to be as required in **502. 2** as far as practicable.

5. It is recommended that a special consideration be given to the thickness of wash bulkhead plating to prevent the plating from shear buckling.

Section 6 Relative Deformation of Wing Tanks

601. Relative deformation of wing tanks

As regards wing tanks, where the value obtained from the following formula exceeds 0.15, a special consideration is to be given to the structure of wing tanks.

$$\delta = \frac{h - 0.32d}{n_b K_b + n_s \eta_s K_S + n_t \eta_t K_t} \times \frac{a}{b} l$$

where:

a = half-breadth of centre tanks (m).

b = breadth of wing tanks (m).

h = distance from the top of keel to the top of hatches of centre tanks (m).

l = length of one tank situated between oil-and/or water-tight bulkheads in centre tanks (m).

n_b, n_s, n_t = number of transverse bulkheads, wash bulkheads and transverse rings in wing tanks located within l, respectively. The bulkheads at the fore and aft ends of l are to be counted 1/2, respectively.

η_s, η_t = values given in **Table 7.1.12** in accordance with the opening ratio. For intermediate value of opening ratio, η_s and η_t are to be obtained by linear interpolation.

Table 7.1.12 Coefficients η_s and η_t

Opening ratio (%)	η_s and η_t
0	1.00
5	0.95
10	0.80
20	0.55
30	0.35
40	0.23
50	0.15
60	0.10
70	0.06

K_b, K_s, K_t = values obtained from the following formula : $81.0\dfrac{Dt}{\alpha b}$ (t/cm)

where:

t = mean thickness of transverse bulkhead plating in wing tanks (mm), in obtaining K_b value.
mean thickness of wash bulkhead plating in wing tanks (mm), in obtaining K_s value.
mean thickness of transverse rings in wing tanks (mm), in obtaining K_t value.

α = value obtained from the following formulae, in case where transverse bulkheads or wash bulkheads in wing tanks are of corrugated form, in accordance with the case where the corrugation is vertical or horizontal:

For vertical corrugation : $\dfrac{Girth\ length\ of\ ship\ in\ athwartships\ (\mathrm{m})}{b}$

For horizontal corrugation : $\dfrac{Girth\ length\ of\ ship\ in\ depthwise\ (\mathrm{m})}{D}$

For the case other than above, the value is to be 1.0.

Section 7 Welding

701. Welding

1. The welding in tankers is to be in accordance with the requirements given in **Pt 3, Ch 1, Table 3.1.6** except where specially prescribed in this Article for cargo oil tanks.
2. The application of the fillet welding is to be as given in **Table 7.1.13.**

Table 7.1.13 Fillet welding

Section 8 Supplementary Provisions for Tankers Having Longitudinal Bulkhead at Centre Line Only

801. Application

The requirements specified hereunder apply to tankers not exceeding 120 m in length having longitudinal bulkhead at the centre line only. As regards the matters not specially provided in these requirements, the requirements in each previous Articles concerned are to be applied. Application of **406.** and **509.**, however, may be dispensed with.

802. Trunks

1. The thickness of trunk top and side plating is not to be less than that obtained from the following formula :

$$t = 6.5\frac{S}{\sqrt{K}} + 2.0 \quad (\mathrm{mm})$$

where:

S = spacing of longitudinal stiffeners (m).

2. The section modulus of longitudinal stiffeners provided on trunks is not to be less than that obtained from the following formula :

$$Z = 2K\sqrt{L}Sl^2 \quad (\mathrm{cm}^3)$$

where:

l = spacing of transverses (m).

S = spacing of longitudinal stiffeners (m).

803. Transverses in cargo oil spaces

1. Transverses in cargo oil spaces are to be in accordance with the requirements of **401.** to **406.** except those specially specified in this Article. In small ships, however, the brackets at ends of transverses may be dispensed with, subject to the approval by the Society.

2. The depth and section modulus of bottom transverses are not to be less than those obtained from the following formulae respectively :

Depth of transverses : $d = 0.16 l_0$ (m)

Section modulus of transverses : $Z = 9.7Kk^2(d + 0.026L')Sl_0^2$ (cm^3)

where:

l_0 = overall length of transverses (m), which is equal to the distance from the inner surface of face plates of side transverses to the inner surface of face plates of vertical webs on centre line bulkhead.

S = spacing of transverses (m).

k = correspondingly as specified in **Table 7.1.3.**

3. The depth and section modulus of side transverses are not to be less than those obtained from the following formulae respectively. Where the transverses are of tapered from, the requirements in **403. 1** (2) are to be applied.

Depth of transverses : $d = 0.15 l_0$ (m)

Section modulus of transverses : $Z = 8.7Kk^2Shl_0^2$ (cm^3)

where:

l_0 = overall length of side transverses (m), which is equal to the distance between the inner surfaces of face plates of bottom transverses and deck transverses. (See **Fig 7.1.3**)

S = spacing of transverses (m).

h = distance from the mid-point of l0 to the point high as given by the following formula above the top of keel (m):

$h = d + 0.038L$ (m)

k = correspondingly as specified in **Table 7.1.3.**

4. The section modulus of transverses at bilge is not to be less than that obtained from the following formula. However, in calculating the section modulus of transverses, the neutral axis of section is to be assumed as to situate at the mid-point of the depth of transverses d_b. (See **Fig 7.1.3**)

$$Z = 7.8KShl_0^2 \quad (\text{cm}^3)$$

where:

S, h, l_0 = as specified in **Par 3** respectively.

5. Deck transverses

(1) The depth and section modulus of deck transverses in ships having no trunk are not to be less than those determined correspondingly in accordance with the requirements in **402. 2** (1).

(2) In trunk ships, it is a standard arrangement that transverses extending from side to side of the ship across the trunk are provided In this case, the depth of deck transverses regarded as being supported by trunks may be $0.03B$.

6. As for vertical webs provided on the centre line bulkhead, the requirements in **Par 3** for side transverses are to be correspondingly applied, but the depth and section modulus of deck transverses are not to be less than those obtained from the formulae with each coefficient multiplied by 0.8 respectively.

804. Stiffening transverse

Trunks are to be provided with stiffening transverses in line with the deck transverses. The section modulus of stiffening transverses is not to be less than that obtained from the following formula :

$$Z = 1.4K\sqrt{L}Sl^2 \quad (\text{cm}^3)$$

where:

l = half-breadth of trunks (m).

S = spacing of stiffening transverses (m).

Section 9 Special Requirements for Wing Tanks at Fore Parts

901. Application

In case of oil tankers of 200 *metres* and over in length, the members provided in wing tanks not being ballasted at full load condition which are located between $0.15L$ from the bow and the collision bulkhead are to comply with the requirements specified hereunder as well as the requirements in each previous Articles concerned.

902. Side longitudinal frames

1. The section modulus of side longitudinal frames is not to be less than that obtained from the following formula :

$$Z = 9KShl^2 \quad (\text{cm}^3)$$

where:

l = spacing of transverses (m).

S = spacing of longitudinal frames (m).

h = distance measured from the frame concerned to the point of the height which is to be obtained from the following formula above the top of keel : $h' = 0.7d + 0.05L$ (m)
In any case, however, the distance is not to be less than that obtained from the following formula : $h = 0.2\sqrt{L} + 0.03L$ (m)

2. Where side longitudinal frames are connected to transverse by brackets, the section modulus may be taken as the value obtained from the formula in the preceding Paragraph multiplied by the following factor :

Where C is obtained from the following formulae : $(1-C)^2$

In case where brackets are provided at both ends : $C=\frac{b_1+b_2-0.3}{l}$

In case where a bracket is provided at one end : $C=\frac{b-0.15}{l}$

b, b_1, b_2 = arm length of brackets on longitudinal frames respectively (m). In case, C is negative, C is to be taken as zero. (See **Fig 7.1.8**)

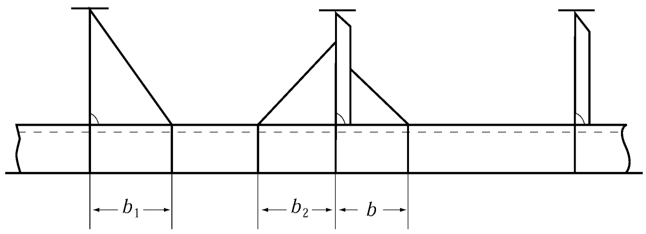

Fig. 7.1.8 Measurement of *b*, *b*$_1$ and *b*$_2$

903. Side transverses

1. The section modulus of side transverses is to be in accordance with the requirement in **403. 1** (5). In applying the formula, however, h is the distance from the mid-point of l_0 to $0.1L$ above the top of keel (m).

2. The thickness of webs of side transverses at inner edge of brackets at lower ends is to be in accordance with the requirements in **403. 1** (3). In applying the formula, however, h is the distance from the midpoint of l_0 to $0.1L$ above the top of keel (m).

3. The thickness of webs between cross ties is not to be less than that obtained from the following formula :

$$t=43.5\,CK\frac{Sh_il_i}{d_i-a_i}+2.5 \quad (\text{mm})$$

where:

S = spacing of transverses (m).

d_i = depth of web at the mid-point of each span (mm).

a_i = maximum depth of slots in each span (mm). The depth, however, may be taken as zero where the slots are provided with collar plates.

l_i = span of each transverse (m). However, for the part between cross ties and bottom or deck transverses. l_i is the distance between the centre of cross ties and the face plate of bottom or deck transverses; for the part between cross ties, the distance between centres of cross ties. (See **Fig 7.1.9**)

h_i = distance from the mid-point of each l_i to the point $0.1L$ above the top of keel. Where, however, the distance is less than $0.06L$(m), h_i is to be taken as $0.06L$(m).

C = coefficient given by the following formula :

$$C=1.2-\frac{2b_i-0.3}{l_i}$$

b_i = arm length of brackets at both ends of span, whichever is the smaller (m). (See **Fig 7.1.9**)

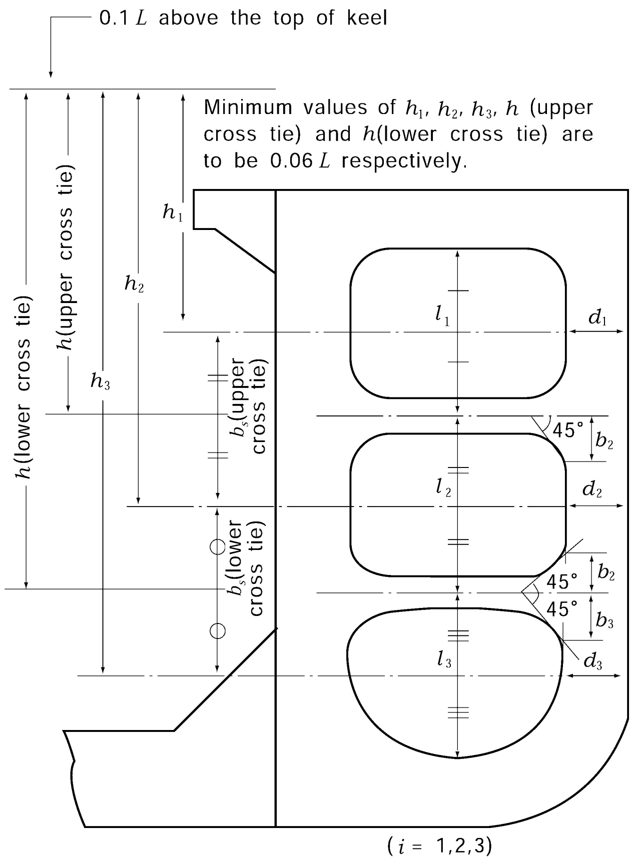

Fig. 7.1.9 Measurement of l, b, etc.

4. The thickness of web at the portion where cross ties are connected is to be as required in **403. 1** (4). In applying the formula, however, h is the distance from the mid-point of b_s to the point 0.1 L above the top of keel (m), except that h is to be taken as $0.06L$(m) where the distance is less than $0.06L$(m).

904. Special stiffening of web plates at ends of transverses

The upper and lower end brackets connected to side transverses and vertical webs on longitudinal bulkheads, and the web plates of transverses at the inner edge of the brackets and in the vicinity of the portion where cross ties are connected, are to be provided with stiffeners in specially close spacing.

905. Cross ties

The cross sectional area of cross ties and web thickness are to be in accordance with the requirements in **404.** In applying the formula, however, h is the distance from the mid-point of b_s to the point $0.1L$ above the top of keel (m), except that h is to be taken as $0.06\ L$(m), where the distance is less than $0.06L$(m).

906. Vertical webs on longitudinal bulkheads

The scantlings of vertical webs on longitudinal bulkheads are not to be less than generally those determined in accordance with the requirements for side transverses.

Section 10 Piping Systems and Venting Systems for Oil Tankers

1001. General

1. Application

(1) The requirements in this Section apply to the piping systems and venting systems for ships intended to be registered as oil tankers.
(2) The requirements in this Section apply to oil tankers which have all the following features. The piping systems and venting systems for other types of oil tankers will be considered by the Society in each case.
  (a) Tankers carrying crude oil, petroleum products having a flash point not exceeding 60°C (closed cup test) or other similar liquid cargoes
  (b) Tankers of which the machinery spaces and cargo oil tanks (including slop tanks, the same being referred hereinafter in this Section) are arranged in accordance with the requirements in **Pt 8, Ch 2, 104.**
  (c) Tankers of which the cargoes are loaded by land facilities and unloaded by cargo pumps on board ship.
(3) In addition to the requirements in this section, the requirements in **Pt 8, Ch 2, 104.** and **Pt 8, Ch 3, 505.** are to be complied with.

2. Drawings and Data

Drawings and data to be submitted are generally as follows.

(1) Drawings and data for approval (with materials, dimensions, design pressures, etc. of pipes, valves, etc. and the arrangement of devices to prevent the passage of flame)
  (a) Piping diagram of cargo oil pipes and instrumentation
  (b) General arrangement of bilge systems and ventilation systems of a cargo oil pump room
  (c) General arrangement of venting systems for cargo vapours, etc.
  (d) Other drawings and data considered necessary by the Society
(2) Drawings and data for reference
  (a) Capacity calculation sheet for pressure/ vacuum valves and overpressure protective device of cargo oil tanks
  (b) Other drawings and data considered necessary by the Society

3. Special type

Where ships are equipped with new types of pumps and/or piping systems, specifications and detailed drawings are to be submitted to the Society for approval. The Society may require additional detailed investigations or tests of their own, where deemed necessary by the Society.

1002. Cargo oil pumps and piping systems

1. Cargo oil pumps

(1) Cargo oil pumps are to comply with the following (a) to (e).
  (a) Each pump is to be so designed as to minimize the risk of sparking and oil leakage at the seal.
  (b) Where machinery is driven by shafting passing through a bulkhead or deck, shafting is to be provided with flexible couplings, and gastight seals with efficient lubrication or other means of ensuring the permanence of the gastight seal are to be fitted in way of the bulkhead or deck. If a bellows piece is incorporated in the design, it is to be pressure tested before fitting. The gastight seals or other means are to be so designed as to minimize the risk of sparking, and the sealing parts contacted with the shafting are to be material that will not initiate sparks.
  (c) Cargo oil pumps are to comply with the requirements in **Pt 8, Ch 2, 104. 10**(1).
  (d) A stop valve is to be provided on the delivery side of the pump. However, such stop valve may be omitted, provided that the cargo oil pipe on the delivery side of the pump is provided with a stop valve in a proper position.
  (e) Where a relief valve is provided on the delivery side of the pump, the arrangement is to be such that the escaped oil is led to the suction side of the pump.

(f) A pressure measuring device is to be fitted on the delivery side of each pump. Where the pump is driven by a prime mover which is installed in the space other than the pump room, an additional pressure measuring device is to be fitted at a suitable position visible from the controlling position.

(2) Where prime movers, other than steam engines or hydraulic motors, for driving the cargo oil pumps are installed in the cargo oil pump room, descriptions and construction of the prime movers and the driving system are to be submitted for the approval by the Society.

(3) Where deep well pumps, submerged pumps, etc. are installed, construction of the pumps and driving systems are to be submitted for approval by the Society.

(4) In general, cargo oil pumps are not to be used for other purposes than transferring cargo oil or ballast in cargo oil tanks, transferring tank cleaning water for cargo oil tanks, discharging bilge as specified in **1003. 1**(2), or discharging ballast as specified in **1003. 2** (2).

2. Arrangement of cargo oil piping systems

(1) Cargo oil pipes are classified into Class Ⅲ, except where considered necessary by the Society.

(2) Each cargo oil tank is to be provided with a cargo oil suction pipe(s) so arranged that cargo unloading can be carried out with one of the cargo oil pumps out of use.

(3) Cargo oil pipes are to be so arranged as to be capable of loading cargo oil to cargo oil tanks without passing through cargo oil pumps. Where loading pipes are led directly to the tanks from above the deck, the opening ends of these pipe are to be led to the lower part of the tanks as far as practicable to prevent the accident caused by the generation of static electricity.

(4) Where sea suction pipes for ballasting purpose are connected to cargo oil pipes, stop valves are to be provided between the sea suction valves and the cargo piping.

(5) Slip joints used in the cargo oil pipes are to be in compliance with **Pt 5, Ch 6, 104. 5.**

(6) Sea suction pipes and discharge pipes for permanent ballast tanks are not to be connected to the sea suction pipes and discharge pipes for cargo oil tanks.

3. Alternative use of tanks

Where cargo oil tanks are so designed that they can also be used as ballast tanks or fuel oil tanks, the tanks are to be provided with devices which the Society requires, and approved drawings or documents having descriptions on a detailed operating manual for the alternative use are to be provided on board the ship.

4. Separation of cargo oil pumps and cargo oil pipes

(1) Cargo oil pipes are to be entirely separated from other pipes, except where permitted in **1002. 2** (2) and **1003. 1** and **2.**

(2) Cargo oil pipes are not to be led through fuel oil tanks nor engine room and accommodation spaces where sources of vapour ignition are normally present. In addition, these pipes are not to be led to spaces forward the collision bulkhead or after the front bulkhead of the engine room.

(3) Cargo oil pipes on the weather deck are to be arranged sufficiently apart from the accommodation spaces.

(4) Where a ship is equipped with bow and/or stern loading and unloading of cargo oil outside the cargo area, the connections of the cargo lines leading to the cargo hose connection therein are to be of welded joints except valve connections and the cargo lines are to be clearly identified and segregated by following means of (A) or (B) situated in the cargo area. The open ends of the cargo lines are to be provided with a blank flange at the bow and/or stern end connections.

(A) Two valves which can be secured in the closed position and provided that the efficiency of the segregation can be checked

(B) One valve together with another closing appliances providing an equivalent standard of segregation such as a removable spool piece or spectacle flange

(5) Cargo oil pipes and similar pipes to cargo oil tanks are not to pass through ballast tanks. However, these pipes may pass through the ballast tanks provided that these pipes in ballast tanks are of short length and the connections of these pipes are of welded joints or flanged joints which have no risk of leakage.

(6) Notwithstanding preceeding (5), for oil tankers other than double hull tankers, cargo oil pipes may pass through the ballast tanks provided that the connections of these pipes are of welded joints or flanged joints which have no risk of leakage. Expansion bends only, not glands, are permitted in these lines within ballast tanks.

5. Bulkhead valves of cargo oil piping systems

(1) Cargo oil pipes passing through oiltight bulkheads between cargo oil tanks and pump rooms are to be provided with stop valves as close to the bulkhead as practicable.
(2) Where the valves prescribed in (1) are located inside the pump room, they are to be made of steel or cast iron products with an elongation of 12 % and above. These values are to be capable of being closed at the position of the valves and from a readily accessible position outside the compartment in which they are located. However, if the valves operated at a position above the deck are fitted on each cargo oil branch pipe, the valves located inside the pump room may be of cast iron products with an elongation of less than 12 % without remote control device.
(3) Where the valves prescribed in (1) are located inside the tank, the valves may be of cast iron and need not be capable of being closed at the position of the valves, but they are to be provided with remote control devices, and the pipes are to be provided with another valve in the pump room.
(4) Where the valves are required to be remote controlled according to the requirements in (2) and (3), means are to be provided to show whether they are open or closed.

6. Valve operation rod penetrating through decks

Stuffing boxes are to be provided at positions at which operating rods from cargo valves pass through gastight or oiltight decks.

7. Piping in cargo oil tanks

(1) Pipes other than cargo oil pipes, cargo oil heating pipes, ballast pipes of cargo tanks and pipes permitted in (2) to (4) are not to pass through cargo oil tanks nor to have any connection to these spaces.
(2) Pipes for remote control of cargo oil piping systems, and vapour discharge pipes, tank cleaning pipes and sounding devices of cargo oil tanks may be led to cargo oil tanks.
(3) Scupper pipes, sanitary pipes, etc. may be led through cargo oil tanks subject to the approval by the Society.
(4) Ballast pipes and other pipes such as sounding and vent pipes to ballast tanks are not to pass through cargo oil tanks. However, these pipes may pass through the cargo oil tanks provided that these pipes in cargo oil tanks are of short length and the connections of these pipes are of welded joints or flanged joints which have no risk of leakage.
(5) Notwithstanding preceeding (4), for oil tankers other than double hull tankers, ballast pipes of ballast tanks adjacent to a cargo oil tanks may pass through cargo oil tanks provided that the connections of these pipes are of welded joints or flanged joints which have no risk of leakage. Expansion bends only, not glands, are permitted in these lines within cargo oil tanks.

8. Sounding devices of cargo oil tanks

A suitable sounding device approved by the Society is to be fitted onto any cargo oil tank. The sounding device is to be designed or arranged to prevent any outflow of flammable gases into spaces such as engine room, accommodation spaces, etc. where sources of vapour ignition are normally present.

9. Steam pipes

(1) The cargo oil heating steam supply and return pipes are not to penetrate the cargo oil tank plating, other than at the top of the tank, and the main supply pipes are to be run above the weather deck.
(2) Isolating shut-off valves or cocks are to be provided at the inlet and outlet connections to the heating circuit(s) of each tank.
(3) The cargo oil heating steam return pipes are to be led to an observation tank or other oil detectors in a position well-ventilated and well-lighted part of the space as apart as possible from hot surfaces such as boilers and ignition sources for the detection of contaminated oil in steam drain.
(4) The steam temperature in steam pipes arranged in cargo oil pump rooms and cargo oil heating steam pipes is not to exceed 220℃.
(5) In the cargo oil pump rooms, drain pipes from steam or exhaust pipes or from the steam cylinders of the pumps are to terminate well above the bilge wells.
(6) Each branch connection of cleaning steam pipes of cargo oil tanks or other tanks to which a cargo oil pipe is led is to be provided with a screw-down non-return valve or two stop valves.

10. Thermal oil pipes

(1) The thermal oil piping arrangement for the cargo oil tanks is to comply with following requirements:
  (A) All joints in the cargo oil tanks are to be of butt-welded type.
  (B) Isolating shut-off valves or cocks are to be provided at the inlet and outlet connections to the cargo oil tanks. Where the thermal oil pipe penetrates the oiltight bulkhead between a cargo oil tank and the pump room, shut-off valves or cocks may be installed as close to the bulkhead as practicable.
  (C) The system is to be so arranged that the pressure in the coil is at least 3 m water head above the static head of the cargo when the circulating pump is not operating.
  (D) For the ships only carrying oils having a flash point not exceeding 60 ℃, the requirement in **Pt 5, Ch 6, 1004.** is to be applied.
(2) The thermal oil temperature in the cargo area is not to exceed 220 ℃.

11. Heating plants for asphalts cargo

(1) Heating plants for asphalt tanks are to be arranged.
(2) Heating coils in asphalt tanks are to be sufficient thickness with fully welded joint.
(3) Pumps and valve systems are to be suitable for the type of cargo to be transported.
(4) Heating system for cargo pumps and cargo lines is to be arranged.
(5) Temperature gauges are to be arranged in each cargo tanks enabling the recording of temperatures at bottom, midway between bottom and deck and at deck level in order to prevent overheating of cargo.

12. Integrated cargo oil and ballast driving systems

Emergency stopping devices and control systems of integrated hydraulic and/or electric system used to drive both cargo oil and ballast pumps including active control and safety systems(hereinafter referred to as「integrated cargo oil and ballast driving system」) are to comply with following requirements.

(1) Emergency stopping devices of integrated cargo oil and ballast driving system are to be independent from control systems. A single failure in the emergency stopping devices or the control systems is not to render the integrated cargo oil and ballast driving system inoperative.
(2) Manual emergency stops of cargo oil pumps are to be arranged in a way that they are not to cause the stop of the hydraulic power source.
(3) The control systems are to be provided with backup power supply, which may be satisfied by a duplicate power supply from the main switch board.
The failure of any power supply is to provide audible and visible alarm activation at each location where the control panel is fitted.
(4) Manual overriding or redundant arrangements are to be provided within the control systems to be made available for the operation of the integrated cargo oil and ballast driving system in the event of failure of the automatic or remote control systems.

1003. Piping systems for cargo oil pump rooms, cofferdams and tanks adjacent to cargo oil tanks

1. Bilge piping systems, etc. for cargo oil pump rooms and cofferdams adjacent to cargo oil tanks

(1) Bilge piping system consisting of a power driven pump or eductor is to be provided to discharge bilge in the cargo oil pump room and cofferdams adjacent to a cargo oil tank. The bilge in these spaces is not to be led to the engine room.
(2) Cargo oil pumps may be used for bilge drainage purpose specified in (1), provided that each bilge suction is provided with a screw-down non-return valve, and a stop valve or cock is fitted on the suction side of the pump and, in addition, a stop valve is fitted between the cargo oil pipe and the overboard discharge valve.
(3) Bilge pipes for a cofferdam adjacent to a cargo oil tank are to be entirely separate from those for spaces not adjacent to a cargo oil tank. However, a common bilge pump (except cargo oil pump) may be used for bilge drainage purpose of these spaces subject to the approval by the Society, provided that the bilge pipe for spaces not adjacent to a cargo oil tank has a non-return valve.

(4) Sounding pipes of cofferdams adjacent to a cargo oil tank is not to be less than 38 mm in internal diameter and unless otherwise approved by the Society to be led to above the weather deck.
(5) The bilge system serving the cargo oil pump room is to be operable from outside the cargo oil pump room.
(6) Intrinsically safe type bilge level alarm devices are to be provided in the bilge well of the cargo oil pump room so as to activate an audible and visible alarm in the cargo control room and on the navigation bridge.
(7) The cargo oil pump room is to comply with the requirements in **Pt 8, Ch 2, 104. 10** (3).

2. Ballast tanks adjacent to cargo oil tanks

(1) The requirements in this Paragraph are also applied to ballast tanks used as cofferdams at the fore and after ends of cargo oil tanks in accordance with the requirements in **103. 4.**
(2) Ballast pipes of ballast tanks adjacent to a cargo oil tank are to be separated from other pipes and are not to be led to the engine room. For this purpose, an exclusive pump for ballasting and deballasting these tanks is, generally, to be provided in the pump room. However, where specially approved by the Society, the cargo pumps may be used for the purpose of only de-ballasting in an emergency. In case ballast tanks are not adjacent to cargo oil tank and qualified as being safe, other requirements by the Society will be applied.
(3) Each air pipe to ballast tanks adjacent to a cargo oil tank is to be provided with an easily renewable flame screen at their outlets. In case where approved by the Society, the requirement in **Pt 5, Ch 6, 201. 4** (1) for the dimension of the air pipes will be properly modified.
(4) Sounding pipes of ballast tanks adjacent to a cargo oil tank are to be led to above the weather deck, unless otherwise approved by the Society.

3. Fore peak ballast tank

The fore peak ballast tank ballasted with the system serving other ballast tanks within the cargo area are to be meet the following requirements:

(1) The vent pipe openings are to be located on open deck 3 m away from sources of ignition.
(2) Means are to be provided on the open deck to allow measurement of flammable gas concentrations within the fore peak tank by a suitable portable instrument.
(3) The sounding arrangement to the fore peak tank is to be direct from open deck.
(4) The access to the fore peak tank is to be direct from open deck. Alternatively, indirect access from the open deck to the fore peak tank through an enclosed space may be accepted provided that :
  (A) In case the enclosed space is separated from cargo tanks by cofferdams, the access is to be through a gas tight bolted manhole located in the enclosed space and a warning sign is to be provided at the manhole stating that the fore peak tank may only be opened after;
    (a) it has been proven to be gas free; or
    (b) any electrical equipment which is not certified safe in the enclosed space is isolated.
  (B) In case the enclosed space has a common boundary with the cargo tanks and is therefore hazardous, the enclosed space is to be well ventilated.

4. Fuel oil tanks adjacent to cargo oil tanks

Sounding pipes of fuel oil tanks adjacent to a cargo oil tank are to be led to above the weather deck, unless otherwise approved by the Society.

5. Pump arrangement for forward compartment

A pump used for bilge drainage or transfer of ballast water or fuel oil in a compartment forward of the cargo oil tanks is to be exclusive and unless otherwise approved by the Society to be installed in the forward part of the ship. However, where approved by the Society, other suitable pumps than specified above may be used for the bilge drainage or transfer of ballast water in a compartment forward of the cargo oil tanks.

1004. Ventilation systems in cargo oil pump rooms

1. The capacity, structure and etc. of ventilation systems are to comply with the requirements in **Pt 8, Ch 2, 104. 4**(1).

2. The ducts are to be arranged, to permit ventilation from the vicinity of the pump room bilge, above the transverse floor plate or bottom longitudinals. An emergency intake located nearly 2 m above the pump room lower grating is to be arranged to the ducts, and this emergency intake is to have a damper which is capable of being opened or closed from the weather deck and lower grating level.

3. The foregoing exhaust system is to be in association with open grating floor plates to allow the free flow of air.

1005. Venting systems of cofferdams adjacent to cargo oil tanks

Effective venting systems are to be provided to cofferdams adjacent to a cargo oil tank. Where air pipes are provided for this purpose, each air pipe is to be provided with an easily renewable flame screen at their outlets, and they are not to be less than 50 mm in internal diameter. Where ventilation system is provided, the construction of the ventilation fan and the wire mesh screens fitted on the exhaust ducts are to comply with the requirements in **1004.** Air holes are to be cut in every part of the structure where there might be a change of gases being pocketed.

1006. Positions of openings of machinery spaces, deck houses, etc. and electrical equipment, etc.

The arrangement of ventilation inlets and outlets and other deckhouse and superstructure boundary space openings is to be such as to complement the requirements in **Pt 8, Ch 2, 104. 3.** Such vents especially for machinery spaces are to be situated as far aft as practicable. Due consideration in this regard is to be given when the ship is equipped to load or discharge at the stern. Sources of ignition such as electrical equipment are to be so arranged as to avoid an explosion hazard.

1007. Tankers carrying only oils having a flash point exceeding 60 °C

For tankers intended only for the carriage of oils having a flash point exceeding 60 ℃ the requirements in this Section applies as follows;

1. The requirements in **1001. 2** to **1002. 9, 1003. 1**(3) to (7), **1003. 2**(1), **1003. 3** & **5, 1005.** to **1006.** may be properly modified.

2. The requirements in **1002. 11, 12** & **1003. 1**(2) are to be satisfied.

3. Bilges of the cargo oil pump room and cofferdams adjacent to a cargo oil tank may be led to the engine room (See **1003. 2**(1)).

4. Ballast pipes of ballast tanks adjacent to a cargo oil tank may be led to the engine room (See **1003. 2**(2)). The wire gauze to prevent the passage of flame required for the outlets of the air pipes to the ballast tanks may be omitted (See **1003. 2**(3)). The sounding pipes of these tanks may be arranged to have openings below the weather deck (See **1003. 2**(4)).

5. The sounding pipes of fuel oil tanks adjacent to a cargo oil tank may not be led to above the weather deck (See **1003. 4**).

6. The requirements in **1004.** are to be satisfied. However, The capacity and structure of fan are to be in accordance with the guidance considered by the Society.

1008. Testing and inspection

After the manufacture of piping systems and ventilating systems of oil carriers, the following tests are to be conducted in addition to the requirements in **Pt 5, Ch 6, Sec 12.**

1. Tests on board

(1) Cargo oil pipes, after the completion of their piping, are to be subjected to a leak test at a pressure of 1.25 times the design pressure or greater.

(2) Heating pipes inside cargo oil tanks are to be subjected to a leak test at a pressure of 1.5 times the design pressure or greater.

2. After installation inboard, auxiliaries and piping systems are to be subjected to the following tests :

(1) A test on the functioning of cargo oil pumps.
(2) A test on the functioning of ventilating systems.
(3) A test on the functioning of various systems concerning safety measures specified in this Section.

Section 11 Electrical Equipment

1101. General

1. Application

Electrical equipment for ships carrying crude oil, petroleum products or other similar liquid cargoes is to comply with the requirements in this Section, (KS C) IEC 60092-502 and all applicable requirements in **Pt 6, Ch 1.**

2. Dangerous spaces

(1) In tankers carrying flammable liquids having a flash point not exceeding 60°C(closed cup test), the following spaces and zones are to be considered as dangerous spaces.
- (A) Zone 0
  - (a) Cargo tanks
  - (b) Slop tanks
  - (c) Interior of pipes for pressure-relief or venting systems for cargo and slop tanks
  - (d) Interior of cargo pipes
- (B) Zone 1
  - (a) Void spaces adjacent to integral cargo tanks
  - (b) Hold spaces containing independent cargo tanks
  - (c) Cofferdams and segregated ballast tanks adjacent to cargo tanks
  - (d) Cargo pump rooms
  - (e) Enclosed or semi-enclosed spaces, immediately above cargo tanks (for example, between decks) or having bulkheads above and in line with cargo tank bulkheads
  - (f) Spaces, other than cofferdam, adjacent to and below the top of a cargo tank(for example, trunks, passageways and hold)
  - (g) Areas on open deck or semi-enclosed spaces on open deck, within a sphere of 3m radius from any ventilation outlets, cargo tank openings, gas or vapour outlets(for example, cargo tank hatches, sight ports, tank cleaning openings, sounding pipe openings, etc., the same being referred hereinafter), cargo manifold valve, cargo valve, cargo pipe flange and cargo pump-room ventilation outlets for pressure release which permits the flow of small volumes of gas or vapour caused by thermal variation.
  - (h) Areas on open deck or semi-enclosed spaces on open deck, within a vertical cylinder of unlimited height and 6m radius from the outlet centre, and within a hemisphere of 6m radius below the outlet which permits the flow of large volumes of gas or vapour during loading, discharging or ballasting
  - (i) Areas on open deck or semi-enclosed spaces on open deck, within 1.5m from cargo pump room entrances, within a sphere of 1.5m radius from of cargo pump room ventilation inlet and openings specified (B) Zone 1
  - (j) Areas on open deck within spillage coamings surrounding cargo manifold valves and 3m beyond these, up to a height of 2.4m above the deck
  - (k) Areas on open deck over all cargo tanks(including all ballast tanks within the cargo tank block) where structures are restricting the natural ventilation and to the full breadth of the ship plus 3m fore and aft on open deck, up to a height of 2.4m above the deck
  - (l) Compartments for cargo hoses
  - (m) Enclosed or semi-enclosed spaces in which pipes containing cargoes are located
- (C) Zone 2
  - (a) Areas on open deck or semi-enclosed spaces on open deck, within 1.5m surrounding the areas specified in (B)
  - (b) Spaces within 4m surrounding the areas specified in (B) (h)
  - (c) Spaces forming an air-lock between the areas specified in (B) and non-hazardous areas

(d) Areas on open deck within spillage coamings intended to keep spillages clear of accommodation and service spaces and 3m beyond these, up to a height of 2.4m above the deck
(e) Areas on open deck over all cargo tanks where unrestricted natural ventilation is guaranteed and to the full breadth of the ship plus 3m fore and aft on open deck, up to a height of 2.4m above the deck surrounding open or semi-enclosed spaces of (B)
(f) Spaces forward of the open deck specified in (e) and (B) (k), below the level of the main deck, and having an opening on to the main deck or at a level less than 0.5m above the main deck, unless ;
(i) the entrances to such spaces do not face the cargo tank area and, together with all other openings to the spaces, including ventilating system inlets and exhausts, are situated at least 5m from the foremost cargo tank and at least 10m measured horizontally from any cargo tank outlet or gas or vapour outlet ; and
(ii) the spaces are mechanically ventilated
(g) Ballast pump room adjacent to cargo tanks

(2) In tankers carrying flammable liquids having a flash point exceeding 60°C(closed cup test), the following spaces and zones are to be considered as dangerous spaces.
(A) In tankers carrying cargoes that are heated more than temperature which is 15°C lower than the flash point, the classification of hazardous areas and spaces are the same as the requirements specified in (1)
(B) In tankers carrying cargoes that are heated less than temperature which is 15°C lower than the flash point or cargoes that are not heated, the hazardous areas are classified in Zone 2 as follows
(a) Cargo tanks
(b) Slop tanks
(c) Interior of pipes for pressure-relief or venting systems for cargo and slop tanks
(d) Interior of cargo pipes

3. System of supply

(1) The system of power supply is to be one of the following systems:
Two-wire insulated for *d.c.*
Two-wire insulated for single-phase *a.c.*,
Three-wire insulated for three-phase *a.c.*,
(2) Generator circuits, power supply and distribution circuits are not to be earthed, nor to depend on hull return system except the following:
(a) Impressed current cathodic protection system for outer hull protection only,
(b) Earth indication devices or other alternative means, however, in no case the circulation current to exceed 30 mA,
(c) Limited and locally earthed systems, such as starting and ignition systems of internal combustion engines,
(d) Electrical circuits having no fear of causing hull current in the dangerous spaces, subjected to the approval of the Society.

4. Isolating means

Distribution circuits for the electrical equipments installed in dangerous spaces are to be provided on each circuit with multipole linked isolation switches in a safe space. In addition, the isolation switches are to be clearly labelled to identify the electrical equipment to be connected with, and further effective means are to be provided to avoid danger due to unauthorized operation of the isolation switches.

5. Earth detection

Excluding intrinsically safe circuits, the feeders and distribution circuits to be connected to the electrical equipments in the dangerous spaces or to run through the dangerous spaces are to be provided with such devices that keep monitoring the insulation levels and will give an alarm in case of abnormally low level.

1102. Wirings in dangerous spaces

1. General

Cables are generally not to be installed in the dangerous spaces specified in **1101. 2.** Where installation of cables in such spaces is unavoidable, it is to comply with the following requirements.

2. Selection of cables

Cables are to be one of the following. Where corrosion may be expected, a non-metallic impervious sheath is to be applied over metallic sheath or armour of cables for corrosion protection.

(1) Mineral insulated and metallic sheathed.
(2) Lead sheathed and armoured.
(3) Non-metallic impervious sheathed and armoured.

3. Installation of cables

(1) Cables are to be installed as close to the hull center line as practicable.
(2) Cables are to be installed sufficiently distant from decks, bulkheads, tanks and various kinds of pipes.
(3) Cables which are installed on the fore and aft gangways and the decks are to be protected against mechanical damage. Further, the cables and their supports are to be fitted in such a manner as to withstand expansion and contraction and other effects of the hull structure.
(4) The penetration part of the cables or cable pipes through decks and bulkheads of the dangerous spaces is to be constructed so as to maintain gastightness and liquid-tightness as the case may require.
(5) When mineral insulated cables are used, special precautions are to be taken to ensure sound terminations.

4. Earthing of cables

All metallic protective coverings of power and lighting cables passing through dangerous spaces, or connected to equipment in such spaces, are to be earthed at least at each end.

5. Intrinsically safe circuits

(1) The cables for intrinsically safe circuits associated with intrinsically safe type electrical equipment are to be of exclusive use, being installed separately from cables for general circuits.
(2) Intrinsically safe circuits associated with different kinds of intrinsically safe type electrical equipment are generally to be wired individually using different cables. Where it is necessary to use a multi-core cable in common, a cable which has shields by each core or each pair of cores is to be used, having such shields earthed effectively.

1103. Electrical equipment in dangerous spaces

1. General

(1) Electrical equipment is generally not to be installed in the dangerous spaces specified in **1101. 2.** Where installation of electrical equipment is unavoidable, it is to comply with the following requirements.
(2) Explosion-protected electrical equipment is to comply with the requirements in **Pt 6, Ch 1, Sec 9.**
(3) Electrical measuring, monitoring, control and communication apparatus are to be of intrinsically safe type.
(4) Portable lamps are to be of intrinsically safe or flameproof type with self-contained battery or of air-driven type with pressurized enclosure.
(5) Lighting fittings of increased safety type are to be of a type accepted by the Society for oil tankers.

2. All dangerous spaces specified in 1101. 2

Intrinsically safe type electrical equipment may be installed.

3. Cathodic protection

(1) Impressed current systems are not to be permitted in oil cargo tanks.

(2) Magnesium or magnesium alloy anodes are not to be permitted in oil tanks.
(3) Aluminium anodes are only permitted in cargo tanks of tankers in locations where the potential energy does not exceed 275 N-m. Aluminium anodes are not to be located under tank hatches or Butterworth openings in order to avoid any metal parts falling on the fitted anodes, unless protected by adjacent structure.
(4) There is no restriction on the position of zinc anodes.
(5) The anodes are to have steel cores and these are to be sufficiently rigid to avoid resonance in the anode support and be designed so that they retain the anode even when it is wasted.
(6) The steel inserts are to be attached to the structure by means of a continuous weld of adequate section. Alternatively they may be attached to separate supports by bolting, provided a minimum of two bolts with locknuts are used. However, approved mechanical means of clamping will be accepted.
(7) The supports at each end of an anode are not to be attached to separate items which are likely to move independently.
(8) When anode inserts or supports are welded to the structure, they are to be arranged so that the welds are clear of stress raisers.

4. Cofferdams, double bottoms and duct-keels adjoining cargo tanks

(1) The transducers of navigation instruments such as electric depth sounding devices may be installed. The transducers are to be of totally-enclosed type and to be housed in a gastight enclosure clear of the cargo tank. The cables to the transducers are to be installed in heavy gauge galvanized steel pipes with gastight joints up to the main deck.
(2) Where the anodes or electrodes and the cables of an impressed current cathodic protection system for outer hull protection are installed in such spaces, the requirements in the preceding (1) are to be applied.
(3) Lighting fittings of flameproof type or of air-driven type with pressurized enclosure may be installed in double bottoms and ductkeels equipped with machinery which is to be manned for operation and watch. The lighting fittings are to be arranged on at least two independent circuits.

5. Dangerous spaces specified in 1101. 2 (1) (B) (e)

(1) Lighting fittings of flameproof type or of air-driven type with pressurized enclosure may be installed. Lighting fittings in the spaces which are normally attended by the personnel are to be supplied by at least two independent circuits.
(2) Cables may be run through in these spaces.

6. Dangerous spaces specified in 1101. 2 (1) (B) (f) and ballast tanks adjoining cargo tanks

(1) Electrical equipment specified in **Par 3** may be installed.
(2) Lighting fittings of flameproof type or air-driven type with pressurized enclosure may be installed in the spaces equipped with machinery which is to be manned for operation and watch.
(3) Through-runs of cables are to be subjected to the approval of the Society.

7. Dangerous spaces specified in 1101. 2 (1) (B) (d)

(1) Electrical equipment specified in **Par 3** may be installed.
(2) Lighting fittings of flameproof type of air-driven type with pressurized enclosure may be installed. Lighting fittings are to be arranged on at least two independent circuits.
(3) Where cables are run through cargo pump room entrances, they are to be installed in heavy gauge steel pipes or steel ducts with gastight joints.

8. Dangerous spaces specified in 1101. 2 (1) (B) (m), (l)

(1) Lighting fittings of flameproof type or air-driven type with pressurized enclosure may be installed.
(2) Where cables are run through these spaces, they are to be installed in heavy gauge steel pipes or steel ducts with gastight joints.

9. Dangerous spaces specified in 1101. 2 (1) (B) (g), (h), (k) and (1) (C) (b), (e)

(1) Electrical equipment of flameproof type, pressurized protected type and increased safety type may be installed.
(2) Cables may be run through the spaces. However, no cable expansion bends are to be provided in the spaces specified in **1101. 2** (8) as far as practicable.

10. Enclosed and semi-enclosed spaces having a direct opening in 1101. 2

These spaces are to be taken as equivalent to the adjacent dangerous spaces having direct openings, and the electrical installations are to be in compliance with the corresponding requirements in the preceding **Pars 1** to **8.**

11. Electric motors driving equipment in cargo pump room

Electric motors driving equipment located in cargo pump room spaces are to be installed in the space partitioned from these spaces by a gastight bulkhead and deck. In addition, suitable stuffing boxes are to be fitted where shafts pass through gastight bulkheads and decks.

12. Lighting in dangerous spaces

(1) Where dangerous spaces are illuminated through glazed ports, these are to be effectively protected from mechanical damage and are to have strong covers secured from the side of the safe spaces. Glazed ports are to be so constructed that glass and sealing will not be impaired by the working of the ship.
(2) The glass and the protection of the light fitting in the preceding (1) are not to impair the integrity of the bulkhead and are to be of equivalent strength. The fitting is to have the same resistance to fire and smoke as the unpierced bulkhead.
(3) To discourage personnel from entering the cargo pump room when the ventilation is not in operation, one of the following means is to be applied.
 (A) Lightings in cargo pump room are to be interlocked with ventilation system such that ventilation systems are to be in operation to energize the lighting. Failure of the ventilation systems should not cause the lighting to go out. Emergency lighting, if fitted, is not to be interlocked.
 (B) Audible and visible alarms located at the door to the cargo pump room are to provide a warning if the door is opened when the cargo pump room ventilation is not in operation. A notice is to be prominently displayed on or adjacent to the pump room door to the effect that the alarms indicate that the pump room ventilation is not in operation, that the pump room atmosphere may therefore be hazardous, and that the pump room is not to be entered until verified safe. The audible alarm is also to sound on the navigation bridge. Reset of the alarm is to be provided from the navigation bridge only.

13. Electric motors driving ventilators for dangerous spaces

Electric motors driving the ventilators for cargo pump rooms and the exhaust ventilators for other dangerous spaces are not to be installed in the ventilation ducts.

1104. Earthing and bonding of cargo tanks, process plant and piping systems for the control of static electricity

1. Bonding straps are required for cargo tanks and process plant, piping systems which are not permanently connected to the hull of the ship as the followings.

(1) Independent cargo tanks
(2) Cargo tanks and piping systems which are electrically separated from the hull of the ship
(3) Pipe connections arranged for the removal of spool pieces

2. Where bonding straps are required, they are to comply with the followings.

(1) The bonding straps are to be clearly visible so that any shortcomings can be clearly detected.
(2) The bonding straps are to be designed and sited so that they are protected against mechanical damage and, as far as possible, they are not affected by high resistivity contamination(corrosive products or paint).
(3) The bonding straps are to be easy to install and replace. ⚓

CHAPTER 2 ORE CARRIERS

Section 1 General

101. Application

1. The construction and equipment of ships intended to be registered and classed as "Ore Carriers" are to be in accordance with the requirements in this Chapter or equivalent thereto.

2. Except where specially required in this Chapter, the general requirements for the construction and equipment of steel ships are to be applied.

3. The requirements in this Chapter are framed for ships not less than 120 m and up to 230 m in length and of usual form, having single deck, machinery aft, two rows of longitudinal watertight bulkheads, and also having double bottoms under ore holds, decks and bottoms with longitudinal framing.

4. Ore carriers which are different construction from the scope of application given above or the length of which exceeds 230 m and the requirements in this Chapter are considered to be not applicable, matters are to be determined as deemed appropriate by the Society.

5. Except where specially required in this Chapter, the requirements in Chapter 3 are to be applied.

102. Direct strength calculation

When the scantlings of each members are determined based upon direct calculations defined **Pt 3, Ch 1, 206.** of the Rules, concerned members, load cases, the scope of strength calculation and permissible stresses are to be at the discretion of the Society.

103. Drainage

1. In general, one bilge suction opening is to be provided on each side of the ship at the after end of the each hold. Where the length of ore hold in ships having only one hold exceeds 66 meters, additional bilge suction opening is to be arranged in a suitable position in the forward half-length of the hold.

2. Bilge wells are to be provided at suitable positions so as to protect the cover plates from the direct strike of ore and to be provided with rose boxes or other suitable means so that the suction openings may not be choked by ore dust, etc.

3. Where bilge pipes are led through double bottoms, side tanks or void spaces, non-return valves, or stop valves capable of being closed from a readily accessible position, are to be provided at their open ends.

4. Bilge suction branch pipes may be of inside diameter obtained from the formula in **Pt 5, Ch 6, 404. 2,** taking B as the mean breadth of the ore hold.

Section 2 Construction and Dimension

201. Subdivision

1. The distance between longitudinal watertight bulkheads and ship's side is not to be less than that obtained from the following formula even at the narrow parts at the ends of the ship:

$$l = 4L + 500 \quad (\text{mm})$$

2. At least one transverse watertight bulkhead is to be provided between longitudinal watertight bulkheads at a position somewhat forward of the middle of the length of the ore cargo space, except where the Society is satisfied with the omission of such bulkhead.

202. Double bottoms

1. The height of double bottoms is to be determined in such a manner that the centre of gravity of the ship is sufficiently high in full load condition. The standard height is to be $0.2D$ (m).

2. The thickness of centre girders is not to be less than that obtained from the following formula :

$$t = 0.04L + 6.0 \quad (\text{mm})$$

3. Floor plates or bottom transverses are to be arranged at the positions of bulkheads or transverses in side tanks or void spaces.

4. Where longitudinal framing is adopted in the inner bottom, the thickness of the floor plates is not to be less than that obtained from the following formula. The sum of the depth of lightening holes, slots, etc. is not to exceed a half of the depth of the floor at the part $b/4$ or more from the ends of the floor and a quarter of the depth of the floor at $b/8$ from the ends of the floor. Where suitable reinforcement is provided, lightening holes over the preceding limits may be permitted.

$$t = 62.5K\frac{SbH}{d_0} + 1.5 \quad (\text{mm})$$

where:

S = spacing of floor plates (m).

b = breadth of floor plates (m).

H = value obtained from the following formulae :

Where floor plates only are arranged : $H = 2h - d$ (m)

Where one transverse is ar ranged between adjacent floor plates to support inner bottom longitudinals : $H = 1.6h - d$ (m)

h = vertical distance from the upper surface of inner bottom plates to the upper deck measured at the centre line of the ship (m).

d_0 = depth of floor plates (mm).

5. Stiffeners are to be provided on the centre girder plates and floor plates in the spacing not greater than that obtained from the following formula :

$$l = 100t - 250 \quad (\text{mm})$$

where:

t = thickness of centre girders or floor plates (mm).

6. The thickness of inner bottom plates is not to be less than that obtained from the following formulae, whichever is the greater :

$$t_1 = CS\sqrt{Kh} + 4 \quad (\text{mm})$$
$$t_2 = 0.28(M_{GR} + 50)\sqrt{SK} + 5 \quad (\text{mm})$$

where:

C = coefficient obtained from the following formulae, depending on the value of l/S

$\left(0.46\dfrac{l}{S}+2.64\right)\sqrt{\gamma}$: for $1 \le \dfrac{l}{S} < 3.5$

$4.25\sqrt{\gamma}$: for $3.5 \le \dfrac{l}{S}$

l = spacing of solid floor(m)

γ = specific gravity of cargoes

$$\gamma = \frac{W}{V}$$

W = mass of cargoes for the hold under consideration (ton)

V = volume of the hold excluding its hatchway(m^3)

However, the value of γ is not to be less than 1.2 times the ratio of the designed deadweight(t) to the total capacity(m^3) of all holds

S = spacing of inner bottom longitudinals (m).

h = as specified in **Par 4.**

M_{GR} = mass of grab (t)

7. The section modulus of inner bottom longitudinals is not to be less than that obtained from the following formula :

$$Z = \frac{2KShl^2}{1.2\sigma_y - \sigma_x K} \times 10^3 \quad (cm^3)$$

where:

S = spacing of inner bottom longitudinals (m).

h = as specified in **Par 4.**

l = spacing of floor plates or transverses (m).

σ_y = 235 (N/mm^2)

$$\sigma_x = \frac{(M_s + M_w)y}{I} \times 10^5 \quad (N/mm^2)$$

M_s, M_w, I = as specified in **Pt 3, Ch 3, Table 3.3.1**

y = vertical distance from top of the inner bottom to neutral axis at centre line (m)

203. Construction and scantlings of wing tanks or void spaces

1. Longitudinal frames and beams are to be as required in the provisions of **Pt 10, Sec 3** and **Sec 7.**

2. Construction and scantlings of transverses, girders, webs and cross ties are to be as required in the following provisions.

(1) The thickness of transverses, girders, webs and cross ties are not to be less than those given by **Ch 10, Table 7.10.1** according to the length of the ship.

(2) Girders and transverses in the same plane are to be so arranged that abrupt change in the strength and rigidity is avoided. They are to have brackets of sufficient scantlings and with properly rounded corners at their ends.

(3) The depth of girders and transverses is not to be less than 2.5 times that of slots for frames, beams and stiffeners.

(4) As for the face plates composing girders, the thickness is not to be less than that of web plates and the full width is not to be less than that obtained from the following formula.

$$85.4\sqrt{d_0 l} \qquad (\mathrm{mm})$$

Where,

d_0 : Depth of girder(m). In case where the girder is a balanced girder, d_0 is the depth from the surface of plate to the face plate(m).

l : Distance between supports of girder(m). Where, however, effective tripping brackets are provided, they may be taken as supports.

(5) Transverses are to be effectively stiffened according to the **Ch 1, 405. 1** (4) and (5), and lower brackets of transverses on longitudinal bulkheads and side shell and web plates in the vicinity of the edge of the brackets are to be provided stiffeners in a closer spacing.

(6) The scantlings of transverses are to be as required in the provisions of **Ch 1, 403. 1**. (Refer to **Fig 7.2.1**)

(7) The scantlings of transverses on longitudinal bulkheads are to be as required in the provisions of **Ch 1, 403. 2**.

(8) The scantlings of bottom transverses are to be as required in the provisions of **Ch 1, 403. 3**. (Refer to **Fig 7.2.1**)

(9) The scantlings of deck transverses are to be as required in the provisions of **Ch 1, 403. 4**.

(10) The web thickness of transverse is not to be less than that obtained from the formula for t_3 given in **Ch 10, 405. 3**.

(11) Where side transverses and transverses on longitudinal bulkheads are connected with cross ties, the cross ties are to be as required in the following provisions.

(A) The construction of cross ties is to be as required in the following provisions.

(i) Brackets are to be provided at the ends of cross ties to connect cross ties with transverses.

(ii) Where the breadth of face plates forming cross ties exceeds 150 mm on one side of the web, stiffeners are to be provided at proper intervals to support the face plates as well.

3. The construction and scantlings of bulkheads are to comply with the requirements in **Ch 10, 103.** and **Sec 2**. When applying the requirements in **Ch 10, Sec 2**, h_1, h_2 and h_3 are to be substituted for those applicable to deep tank bulkhead.

4. The thickness of longitudinal watertight bulkhead plating at the lower part of the ore hold is to be properly increased in relation to the thickness of inner bottom plating.

5. The thickness of longitudinal watertight bulkheads is to be in accordance with the requirements in **Pt 3, Ch 3, 302., 303.** as well as **Sec 4.**

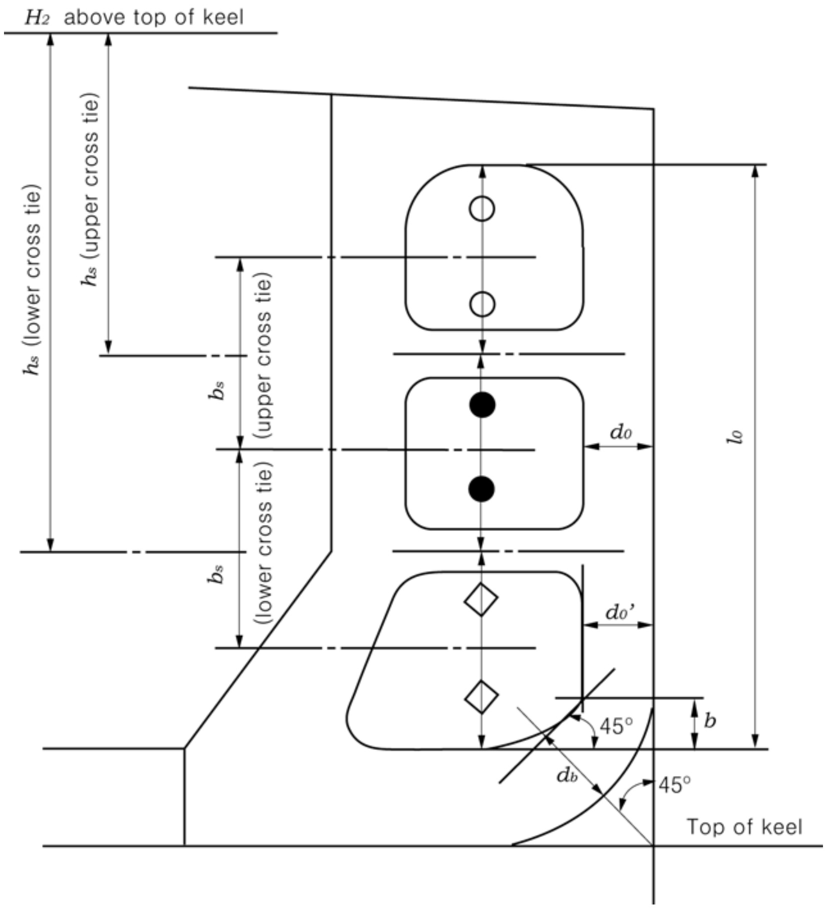

Fig 7.2.2 Measurement of l_0, d_0, b, b_s

204. Transverse bulkheads in ore holds

1. The scantlings of the members of the transverse bulkheads in ore holds are to be in accordance with the requirements in **Pt 3, Ch 15, Sec 2.** Where, however, in application of these requirements, h in the formula is to be substituted for $0.72h'$, h' is to be in accordance with the following.

(1) Bulkhead platings:
Vertical distance (m) from the lower edge of the bulkhead plate to the upper deck at the centre line of the ship.

(2) Stiffeners:
Vertical distance (m) from the midpoint of l for vertical stiffeners or from the midpoint of distance between the adjacent stiffeners for horizontal stiffeners to the upper deck at centre line. Where, however, the distance is less than 6 metres, h' is to be at least 0.8 times the distance plus 1.2 m, l is as specified in **Pt 3, Ch 15, 203.**

(3) Girders:
Vertical distance (m) from the mid-point of l for vertical girders or from the mid-point of S for horizontal girders, to the upper deck at centre line. Where, however, the distance is less than 6 metres, h' is to be at least 0.8 times the distance plus 1.2 m, l and S are as specified in **Pt 3, Ch 15, 204.**

2. Notwithstanding the requirements in **Par 1**, the thickness of the transverse bulkhead platings is not to be less than 7 mm.

3. The thickness of the lowest strake of bulkhead plating is to be appropriately increased referring to the thickness of inner bottom plating.

205. Relative deformation of wing tanks

As for wing tanks, where the value obtained from the following formula exceeds 0.18, a special consideration is to be given to the structure of the wing tanks :

$$\delta = \frac{2h - 0.65d}{n_b K_b + n_s \eta_s K_s + n_t \eta_t K_t} \cdot \frac{a}{b} l$$

where:

h = vertical distance between the top of inner bottom plating and the upper deck at the centre line of the ship (m).

l = length of one ore hold (m).

$a, b, n_b, n_s, n_t, \eta_s, \eta_t, K_b, K_s, K_t$ = values to be obtained by applying the requirements in **Ch 1, 601,** respectively.

206. Ore/Oil carriers

1. Such ore carriers as intended to carry oils in the ore holds and/or wing tanks (hereinafter referred to as “ore/oil carriers”) are to comply with the relevant requirements in **Ch 1,** in addition to those in this Section.

2. In addition to the requirements in this Section, special requirements may be given as deemed necessary for ore/oil carriers by the Society.

207. Slop tanks in ore/oil carriers

1. Cofferdams are to be provided between slop tanks and machinery spaces in accordance with the requirements of **Ch 1, 103.** In addition, cofferdams are to be provided between slop tanks and ore holds, except where the slop tanks are cleaned and gas freed at any time prior to loading ore cargoes.

2. The cofferdams specified in **Par 1** are to be capable of being flooded, except where the cofferdams are used concurrently as pump rooms, fuel oil tanks or water ballast tanks, or cargo oil tanks (in case of cofferdams between slop tanks and ore holds only).

3. Adequate ventilation is to be provided for the spaces surrounding the slop tanks.

4. Notice boards are to be errected at suitable points detailing the precautions to be observed prior to loading or unloading, or whilst carrying ore cargo with oily water in the slop tanks.

5. It is recommended to provide an inert gas system for the slop tanks. ⚓

CHAPTER 3 BULK CARRIERS

Section 1 General

101. Application

1. The requirements in this Chapter apply to bulk carriers which were contracted for construction after 1 April 2006, excluding the vessels which should be applied **Pt.11** (IACS Common Structural Rules for Bulk Carriers). However, the requirements in **Sec 14** and **Sec 16** apply to bulk carriers including the vessels which should be applied **Pt 11**.

2. The construction and equipment of ships intended to be registered as "Bulk Carriers" are to be in accordance with the requirements in this Chapter or equivalent thereto.

3. Except where specially required in this Chapter, the general requirements for the construction and equipment of steel ships are to be applied.

4. The requirements in this Chapter are framed for ships not less than 100 m and up to 250 m in length and of usual form, having single deck, machinery aft, bilge hopper tanks and topside tanks, and also double bottoms under cargo holds, and decks and bottoms with longitudinal framing.

5. Ships with different construction from the scope of application given above or larger ships to which the requirements in this Chapter are not applicable, are to be at the discretion of the Society.

6. Bulk carriers, which were contracted for construction before 1 July 1998, and the keels of which were laid or which were at a similar stage of construction before 1 July 1999, are to be determined at the discretion of the Society.

102. Plans and documents for approval

Plans and documents submitted for approval are to indicate kinds of cargo and/or ballast, loading capacity, level of liquid, etc in each of the holds at service.

103. Direct strength calculation

Where approved by the Society, the scantlings of structural members may be determined based upon direct strength calculation specified in **Pt 3, Ch 1, 206.**

104. Drainage of bulk holds

1. In general, one bilge suction opening is to be arranged on each side of the ship at the after end of the each hold.

2. Bilge wells are to be arranged at suitable positions so as to protect the cover plates from the direct strike of bulk cargoes and to be provided with mud boxes or other suitable means so that the suction openings may not be choked by bulk dust, etc.

3. Where bilge pipes are led through double bottoms, side tanks or void spaces, non-return valves or stop valves capable of being closed from a readily accessible position, are to be provided at their open ends.

4. Where scupper pipes on topside tanks are led over board, stop valves capable of being operated at deck and automatic non-return valves attached to shell plating are to be provided.

105. Coal transportation

For ships intended for transport of coal, care is to be taken to the following:
(1) Structure between holds and other compartments is to be airtight.
(2) Trimming hatches are recommended to be provided outside superstructures and deckhouses.
(3) Ventilation of holds is to be made by a ventilation system provided on the weather part.

106. Minimum thickness

1. The thickness of inner bottom plating, bulkhead plates, floor plates, girders and bracket plates in double bottom bilge hopper tanks, topside tanks, side tanks, hold tanks etc. are not to be less than those required by **Table 7.3.1** according to the length of ships.

Table 7.3.1 Minimum thickness

Length of ships(m)	Minimum thickness(mm)
$L < 105$	8.0
$105 \leq L < 120$	8.5
$120 \leq L < 135$	9.0
$135 \leq L < 150$	9.5
$150 \leq L < 165$	10.0
$165 \leq L < 180$	10.5
$180 \leq L < 195$	11.0
$195 \leq L < 225$	11.5
$225 \leq L < 275$	12.0
$275 \leq L < 325$	12.5
$325 \leq L < 375$	13.0
$375 \leq L$	13.5

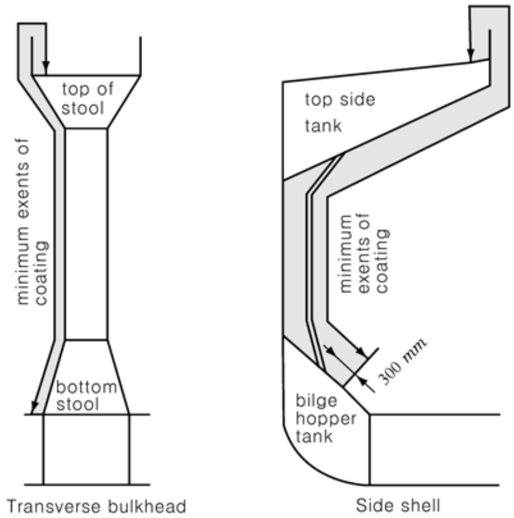

Fig 7.3.1 Minimum extent of corrosion protection coating for cargo hold

2. The minimum thickness of side shell plating located between hopper and upper wing tanks is not to be less than t_{min} in mm, given by :

$$t_{min} = \sqrt{L} \quad (mm)$$

3. The minimum thickness of frame webs within the cargo area except the foremost cargo hold is not to be less than :

$$t_{min} = 0.03L + 7 \quad (mm)$$

Where L is the length of ships in meters, but need not be taken greater than 200 m. The thickness of the frame lower bracket is not to be less than the greater of the fitted thickness of the side frame web and $t_{min} + 2$ (mm). The thickness of the frame upper bracket is not to be less than the greater of the fitted thickness of the side frame web and t_{min}.

4. The minimum thickness of frame webs in way of the foremost hold is not to be less than 1.15 times of thickness as specified in **Par 3.** The thickness of the frame lower bracket in way of the foremost hold is not to be less than the greater of the fitted thickness of the side frame web and $1.15\, t_{min} + 2$ (mm). The thickness of the frame upper bracket is not to be less than the greater of the fitted thickness of the side frame web and $1.15\, t_{min}$.

107. Corrosion protection coatings for cargo hold spaces

All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of the cargo holds, excluding the flat tank top areas and the hopper tankers sloping plating approximately 300 mm below the side shell frame and brackets, are to have an efficient protective coating (epoxy coating or equivalent) applied in accordance with the manufacturers recommendation.(See **Fig 7.3.1**)

108. Longitudinal Strength

1. The longitudinal strength of bulk carriers is to comply with the requirements in **Pt 3, Ch 3.**

2. In addition to the requirements in **Par 1**, all bulk carriers of 150 m in length and above, intending to carry cargoes having bulk density of 1.0 t/m^3, or above are to be in accordance with the requirements in **Sec 10.**

Section 2 Harmonised Notations and Corresponding Design Loading Conditions

201. General

1. General

A bulk carrier may in actual operation be loaded differently from the design loading conditions specified in the loading manual, provided limitations for longitudinal and local strength as defined in the loading manual and loading instrument onboard and applicable stability requirements are not exceeded.

2. Application

(1) The requirements are applicable to "Bulk Carrier" of usual form, having single deck, machinery aft, bilge hopper tanks and topside tanks, and also double bottoms under cargo holds, and deck and bottoms with longitudinal framing, and length as defined in **Pt. 3, Ch 1, 102.** of 150 m or above and contracted for new construction on or after 1 July 2003.
(2) The loading conditions listed under **Par 4**. are to be used for the checking of rules criteria regarding longitudinal strength, local strength, capacity and disposition of ballast tanks and stability.
(3) The loading conditions listed under **Par 5.** are to be used for the checking of rule criteria regarding local strength. The local strength is to be in accordance with the requirements of **Pt 3, Annex 3-2 Guidance for the Direct Strength Assessment.**
(4) For the purpose of applying the conditions given in the requirement, maximum draught is to be taken as moulded summer load line draught.

3. Harmonised notations and annotations

Bulk Carriers are to be assigned one of the following notations:

BC-A : for bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with specified holds empty at maximum draught in addition to BC-B conditions.
BC-B : for bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with all cargo holds loaded in addition to BC-C conditions.
BC-C : for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 t/m^3.

The following additional notations and annotations are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design in the following cases:

(1) additional notations;
(max cargo density ... t/m^3) for notations BC-A and BC-B if the maximum cargo density is less than 3.0 t/m^3
(no MP) for all notations when the vessel has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in **Par 5.** (3)
(2) annotations;
(allowed combination of specified empty holds) for notation BC-A.

4. Design loading conditions (General)

(1) BC-C
Homogeneous cargo loaded condition where the cargo density corresponds to all cargo holds, including hatchways, being 100% full at maximum draught with all ballast tanks empty.
(2) BC-B

As required for BC-C, plus:
Homogeneous cargo loaded condition with cargo density 3.0 t/m^3, and the same filling rate (cargo mass/hold cubic capacity) in all cargo holds at maximum draught with all ballast tanks empty.
In cases where the cargo density applied for this design loading condition is less than 3.0 t/m^3, the maximum density of the cargo that the vessel is allowed to carry is to be indicated with the additional notation (max cargo density ... t/m^3).

(3) BC-A
As required for BC-B, plus:
At least one cargo loaded condition with specified holds empty, with cargo density 3.0 t/m^3, and the same filling rate (cargo mass/hold cubic capacity) in all loaded cargo holds at maximum draught with all ballast tanks empty.
The combination of specified empty holds shall be indicated with the annotation (Holds Nos. ... may be empty).
In such cases where the design cargo density applied is less than 3.0 t/m^3, the maximum density of the cargo that the vessel is allowed to carry shall be indicated within the annotation, e.g. (Holds Nos. ... may be empty, with max cargo density ... t/m^3).

(4) Ballast conditions (applicable to all notations)
(A) Ballast tank capacity and disposition
All bulk carriers are to have ballast tanks of sufficient capacity and so disposed to at least fulfill the following requirements:
(a) Normal ballast condition
Normal ballast condition for the purpose of this requirement is a ballast (no cargo) condition where :
(i) the ballast tanks may be full, partially full or empty. Where partially full option is exercised, the conditions in the last paragraph of **Pt 3, Annex 3-1 3.** (1) (G) of the Guidance are to be complied with.
(ii) any cargo hold or holds adapted for the carriage of water ballast at sea are to be empty.
(iii) the propeller is to be fully immersed, and
(iv) the trim is to be by the stern and is not to exceed $0.015L$, where L is the length between perpendiculars of the ship.
In the assessment of the propeller immersion and trim, the draughts at the forward and after perpendiculars may be used.
(b) Heavy ballast condition
Heavy ballast condition for the purpose of this Requirement is a ballast (no cargo) condition where :
(i) the ballast tanks may be full, partially full or empty. Where partially full option is exercised, the conditions in the last paragraph of **Pt 3, Annex 3-1 3.** (1) (G) of the Guidance are to be complied with.
(ii) at least one cargo hold adapted for carriage of water ballast at sea, where required or provided, is to be full,
(iii) the propeller immersion I/D is to be at least 60%, where
I = the distance from propeller centerline to the waterline
D = propeller diameter, and
(iv) the trim is to be by the stern and is not to exceed $0.015L$, where L is the length between perpendiculars of the ship.
(v) the moulded forward draught in the heavy ballast condition is not to be less than the smaller of $0.03L$ or 8 m
(B) Strength requirements
All bulk carriers are to meet the following strength requirements :
(a) Normal ballast condition
(i) the structures of bottom forward are to be strengthened in accordance with the **Pt 3, Ch 4, Sec. 4 404.** against slamming for the condition of (A) (a) at the lightest forward draught.
(ii) the longitudinal strength requirements are to be met for the condition of (A) (a) and
(iii) in addition, the longitudinal strength requirements are to be met with all ballast tanks 100% full.

(b) Heavy ballast condition
(i) the longitudinal strength requirements are to be met for the condition of (A) (b)
(ii) in addition to the condition in (B) (b) (i), the longitudinal strength requirements are to be met under a condition with all ballast tanks 100% full and one cargo hold adapted and designated for the carriage of water ballast at sea, where provided, 100% full, and
(iii) where more than one hold is adapted and designated for carriage of water ballast at sea, it will not be required that two or more holds be assumed 100% full simultaneously in the longitudinal strength assessment, unless such conditions are expected in the heavy ballast condition. Unless each hold is individually investigated, the designated heavy ballast hold and any/all restrictions for the use of other ballast hold(s) are to be indicated in the loading manual.

(5) Departure and arrival conditions
Unless otherwise specified, each of the design loading conditions defined in **4.** (1) to **4.** (4) is to be investigated for the arrival and departure conditions as defined below:
- Departure condition : with bunker tanks not less than 95% full and other consumables 100%
- Arrival condition : with 10% of consumables.

5. Design loading conditions (for local strength)

(1) Definitions
The maximum allowable or minimum required cargo mass in a cargo hold, or in two adjacently loaded holds, is related to the net load on the double bottom. The net load on the double bottom is a function of draft, cargo mass in the cargo hold, as well as the mass of fuel oil and ballast water contained in double bottom tanks.
The following definitions apply:
M_H : the actual cargo mass in a cargo hold corresponding to a homogeneously loaded condition at maximum draught.
M_{Full} : the cargo mass in a cargo hold corresponding to cargo with virtual density (homogeneous mass/hold cubic capacity, minimum 1.0 t/m^3) filled to the top of the hatch coaming. M_{Full} is in no case to be less than M_H.
M_{HD} : the maximum cargo mass allowed to be carried in a cargo hold according to design loading condition(s) with specified holds empty at maximum draft.

(2) General conditions applicable for all notations
(A) Any cargo hold is to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at maximum draught.
(B) Any cargo hold is to be capable of carrying minimum 50% of M_H, with all double bottom tanks in way of the cargo hold being empty, at maximum draught.
(C) Any cargo hold is to be capable of being empty, with all double bottom tanks in way of the cargo hold being empty, at the deepest ballast draught.

(3) Conditions applicable for all notations, except when notation {no MP} is assigned
(A) Any cargo hold is to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of maximum draught.
(B) Any cargo hold is to be capable of being empty with all double bottom tanks in way of the cargo hold being empty, at 83% of maximum draught.
(C) Any two adjacent cargo holds are to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of the maximum draught. The requirement to the mass of cargo and fuel oil in double bottom tanks in way of the cargo hold applies also to the condition where the adjacent hold is filled with ballast, if applicable.
(D) Any two adjacent cargo holds are to be capable of being empty, with all double bottom tanks in way of the cargo hold being empty, at 75% of maximum draught.

(4) Additional conditions applicable for BC-A notation only
(A) Cargo holds, which are intended to be empty at maximum draught, are to be capable of being empty with all double bottom tanks in way of the cargo hold also being empty.
(B) Cargo holds, which are intended to be loaded with high density cargo, are to be capable of carrying M_{HD} plus 10% of M_H, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom being empty

in way of the cargo hold, at maximum draught. In operation the maximum allowable cargo mass shall be limited to M_{HD}.

(C) Any two adjacent cargo holds which according to a design loading condition may be loaded with the next holds being empty, are to be capable of carrying 10% of M_H in each hold in addition to the maximum cargo load according to that design loading condition, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at maximum draught.

In operation the maximum allowable mass shall be limited to the maximum cargo load according to the design loading conditions.

(5) Additional conditions applicable for ballast hold(s) only Cargo holds, which are designed as ballast water holds, are to be capable of being 100% full of ballast water including hatchways, with all double bottom tanks in way of the cargo hold being 100% full, at any heavy ballast draught. For ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty.

(6) Additional conditions applicable during loading and unloading in harbour only

(A) Any single cargo hold is to be capable of holding the maximum allowable sea-going mass at 67% of maximum draught, in harbour condition.

(B) Any two adjacent cargo holds are to be capable of carrying M_{Full}, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in he double bottom in way of the cargo hold being empty, at 67% of maximum draught, in harbour condition.

(C) A reduced draught during loading and unloading in harbour, the maximum allowable mass in a cargo hold may be increased by 15% of the maximum mass allowed at the maximum draught in sea-going condition, but shall not exceed the mass allowed at maximum draught in the sea-going condition. The minimum required mass may be reduced by the same amount.

(7) Hold mass curves

Based on the design loading criteria for local strength, as given in preceding **5.** (2) to **5.** (6) (except **5.** (5)), hold mass curves are to be included in the loading manual and the loading instrument, showing maximum allowable and minimum required mass as a function of draught, in seagoing condition as well as during loading and unloading in harbour.

At other draughts than those specified in the preceding design loading conditions, the maximum allowable and minimum required mass is to be adjusted for the change in buoyancy acting on the bottom. Change in buoyancy is to be calculated using water plane area at each draught. Hold mass curves for each single hold, as well as for any two adjacent holds, are to be included.

Section 3 Double Bottoms

301. General

1. Except where required in this Section, the requirements in **Pt 3, Ch 7** are to be applied.

2. The scantlings of structural members in double bottom tanks intended to be deep tanks are to be correspondingly in accordance with the requirements in **Pt 3, Ch 7,** as well as the requirements in this Section. However, the thickness of inner bottom plating need not be increased by 1 mm as given in **Pt 3, Ch 15, 208.** for the top plating of deep tanks.

3. Specific gravity of cargoes described in this Section is as defined by the following formula :

$$\gamma = \frac{W}{V}$$

where:

W = mass of cargoes for the hold under consideration (t).

V = volume of the hold excluding its hatchway (m^3)

4. The coefficient specified in **302.** to **304.** is to be obtained from the following formula. Where, however, the angle between hopper plate and horizontal plane, β, is very large, the value of k is to be at the discretion of the Society. (See **Fig 7.3.2**)

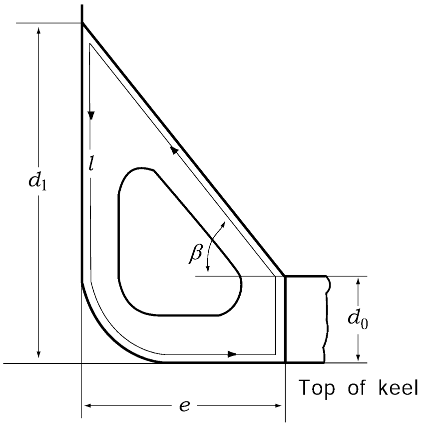

Fig 7.3.2 Measurement of l, e, d_0, d_1 etc.

$$k = 2.1 \frac{l\, l_h}{e^2 \left(1 + \frac{d_1}{d_0}\right)^2}$$

where:

l_h = length of hold (m). Where stools are provided at transverse bulkheads, l_h may be reduced to the distance between the toes.

l = total girth length of hopper plate, side girder and shell plating composing the bilge hopper (m).

e = width of bilge hopper (m)

d_1 = distance from the top of keel to the top of bilge hopper (m).

d_0 = depth of centre girder (m).

5. In addition to the requirements in this **Sec**, all single side skin bulk carriers of 150 m in length and above, intending to carry cargoes having bulk density of 1.0 t/m^3 or above, are to be in accordance with the requirements in **Sec 11.**

302. Centre girders and side girders

1. Side girders are to be provided at the toes of bilge hoppers. In addition, side girders are to be arranged between the centre girder and the side girder at the toe of bilge hoppers at intervals approximately not exceeding the distance obtained from the given in **Table 7.3.2.** Where, however, the value given by the formula exceeds 4.6 metres, the distance is to be taken as 4.6 metres.

2. Except where specially approved by the Society, the thickness and depth of centre girders are not to be less than those obtained from the formula given in **Table 7.3.2.** In any case, however, the depth is not to be less than $B/20$.

3. Where duct keels are provided, their spacing is not to be larger than 1.8 m. Sufficient consideration is to be paid to strength continuity of solid floors and stiffness of shell plating and inner bottom plating between duct keels.

4. Where the distance from the top of inner bottom plating to the top of overflow pipes is more than 15 m, brackets are to be provided at both ends of vertical stiffeners on watertight side girders and to be connected with inner bottom plating and bottom longitudinals.

303. Floor plates

1. Solid floors are to be provided with spacing not more than that obtained from the formulae given in **Table 7.3.3.** However, the spacing is to be 3.65 m even if the value obtained exceeds 3.65 m, and the spacing may be 2.5 m where the value obtained is less than 2.5 m. Solid floors are to be provided at the foot of the sloping plates of lower stools attached to transverse bulkhead.

2. The thickness of solid floors is not to be less than that obtained from the formula given in **Table 7.3.3.**

304. Inner bottom plating

1. The thickness of inner bottom plating is not to be less than that obtained from the following formulae, whichever is the greater :

$$t_1 = C_3 \frac{KB^2 d}{d_0} + 1.5 \quad (\mathrm{mm})$$

$$t_2 = C_3' S \sqrt{hK} + 1.5 \quad (\mathrm{mm})$$

where:

d_0 = height of centre girders (mm).

S = spacing of inner bottom longitudinals (m).

h = vertical distance from the top of inner bottom plating to the upper deck at centre line (m).

C_3 = coefficient given by the following formula. However, for adjacent holds simultaneously loaded or empty, and specially short holds, the value obtained from the following formula is to be multiplied by 1.2 :

$$C_3 = ab$$

a = as specified in **Table 7.3.2.**

b = b_0 or αb_1 given below according to the value of B/l_h.

b_0 for $\frac{B}{l_h} < 0.8$

b_0 or αb_1, whichever is the greater for $0.8 \leq \frac{B}{l_h} < 1.2$

αb_1 for $1.2 \leq \frac{B}{l_h}$

b_0, b_1 = as given in **Table 7.3.4** according to the values of k and B/l_h.

k, l_h = as specified in **301. 4** respectively.

α = as given by the following formula :

$$\alpha = \frac{13.8}{24 - 10.6 f_B K}$$

C_3' = coefficient obtained from the following formulae, depending on the value of l/S :

$\left(0.46\frac{l}{S}+2.64\right)\sqrt{\gamma}$ for $1 \leq \frac{l}{S} < 3.5$

$4.25\sqrt{\gamma}$ for $3.5 \leq \frac{l}{S}$

l = distance between floors (m).

γ = as specified in **301. 3.** However, the value of γ is not to be less than 1.2 times the ratio of the designed deadweight (t) to the total capacity of all holds (m^3).

2. The thickness of inner bottom plating under hatchway, where no ceiling is provided, is to be 2 mm greater than that obtained from the second formula in **Par 1,** except where **Par 3** is applied.

3. In ships in which cargoes are handled by grabs or similar mechanical appliances, thickness of inner bottom plating is to be 2.5 mm greater than that specified in **Par 1,** except where ceiling is provided.

305. Longitudinals

The section modulus of bottom and inner bottom longitudinals is not to be less than that obtained from the formulae given in **Table 7.3.5,** respectively.

Table 7.3.2 Dimension of centre girders and side girders

Item	Scantlings
(1) Spacing of side girders	(a) For loaded holds $l = 5.7 - 1.6\gamma$ (m)
	(b) For empty holds when the ship is fully loaded $l = 3.5$ (m)
(2) Depth of centre girders	$H = 15\sqrt{\frac{L_h BD}{m}}$ (mm)
(3) Thickness of centre girders and side girders	The thickness obtained from the following formula according to the location in the hold, whichever is the greater : $t_1 = \frac{C_1 KSBd}{d_0 - d_1}\left(2.6\frac{x}{l_h} - 0.17\right)\left\{1 - 4\left(\frac{y}{B}\right)^2\right\} + 1.5$ (mm) $t_2 = \frac{C_1' d_2}{1000\sqrt{K}} + 1.5$ (mm)

γ = as specified in **301. 3.**
L_h = total length of all cargo holds, excluding pump rooms and cofferdams (m).
m = number of holds
S = distance between the centres of two adjacent spaces from the centre or side girder under consideration to the adjacent longitudinal girders (m).
d_0 = depth of the centre or side girder under consideration (mm).
d_1 = depth of the opening at the point under consideration (mm).
d_2 = depth of the girder at the point under consideration (mm). Where, however, horizontal stiffeners are provided in way of the depth of girder, d_0 is the distance from the horizontal stiffener to the bottom shell plating or inner bottom plating or the distance between the horizontal stiffeners (mm).
l_h = length defined in **301. 4.**
x = longitudinal distance between the centre of l_h of each hold and the point under consideration (m). Where, however, x is less than $0.2\,l_h$, x is to be taken as $0.2\,l_h$, and where x exceeds $0.45\,l_h$, x may be taken as $0.45\,l_h$.
y = transverse distance from the centre line of ship to the longitudinal girder (m).
S_1 = spacing of the brackets or stiffeners provided on the centre girders or the side girders under consideration (m).
C_1' = coefficient given in the following table according to S_1/d_2. For intermediate values of S_1/d_2, C_1' is to be obtained by linear interpolation.

S_1/d_2	C_1'	
	Centre girder	Side girder
0.3 and under	4.4	3.6
0.4	5.4	4.4
0.5	6.3	5.1
0.6	7.1	5.8
0.7	7.7	6.3
0.8	8.2	6.7
0.9	8.6	7.0
1.0	8.9	7.3
1.2	9.3	7.6
1.4	9.6	7.9
1.6 and over	9.7	8.0

Table 7.3.2 Dimension of centre girders and side girders (continued)

$C_1 = nab$

n : coefficient given by the following table.

Location	n
For adjacent holds simultaneously loaded or empty, and specially short holds such as pump room located in the area of cargo holds	$\frac{1}{3}\left(7-2\frac{B}{l_h}\right)^{(*1)}$
For other holds	1.0

(*1) B/l_h exceeds 1.8, B/l_h is to be taken as 1.8, and where B/l_h is under 0.5, B/l_h is to be taken as 0.5.

a = coefficient given by the following table.

Position	$h\gamma/d$	a
For loaded holds	$\frac{h\gamma}{d} < 0.55$	$0.026\frac{L'}{d} - \frac{h\gamma}{d} + 1$
	$0.55 \le \frac{h\gamma}{d} \le 1.45$	$0.026\frac{L'}{d} + 0.45$
	$\frac{h\gamma}{d} > 1.45$	$0.026\frac{L'}{d} + \frac{h\gamma}{d} - 1$
For empty holds under full load condition		$0.026\frac{L'}{d} + 1$

h = vertical distance from the top of inner bottom plating to the upper deck at centre line (m).
L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.
b = value given in the following table, depending on k and B/l_h specified in **301. 4.** For intermediate values of k, b is to be obtained by linear interpolation.

k \ B/l_h	and over less than 1.4	1.4 1.6	1.6 1.8	1.8 2.0	2.0 2.2	2.2 2.4	2.4
10.0 and over	17	16	15	14	13	12	11
5.0	16	15	14	13	12	11	11
2.0	15	15	14	13	12	11	11
1.0	14	14	14	13	12	11	11
0	13	13	13	12	12	11	11

NOTE :
Where a partial intermediate side girder with suitable thickness is provided at a location between a transverse bulkhead, or a stool in case where it is provided at the lower part of a bulkhead and the solid floor located at a position 20 % or more of the hold length far from the end of the hold, 35 % each of its sectional area of the intermediate side girder may be added to the sectional area of the adjacent girders respectively. Where a stool is provided at the lower part of a transverse bulkhead, a side girder is to be provided under the stool to counter-balance this partial intermediate side girder.

Table 7.3.3 Spacing and thickness of floor plates

Item	Scantlings
(1) Spacing of floor plates	(a) For loaded holds $l = 5.6 - 2.8\gamma$ (m)
	(b) For empty holds under full loaded condition $l = 2.5$ (m)
(2) Thickness of solid floors	The thickness obtained from the following formula according to the location in the hold, whichever is the greater: $t_1 = \frac{C_2 K S B' d}{d_0 - d_1}\left(\frac{2y}{B''}\right)\left\{1 - 2\left(\frac{x}{l_h}\right)^2\right\} + 1.5$ (mm) $t_2 = 0.086\sqrt[3]{\frac{H^2 d_0^2}{C_2' K}(t_1 - 1.5)} + 1.5$ (mm)

γ = as specified in **301. 3.**
S = spacing of solid floors (m).
B' = distance between the lines of bilge hoppers at the top of inner bottom plating at the midship part (m).
B'' = distance between the lines of toes of bilge hoppers at the top of inner bottom plating at the position of the solid floor under consideration (m).
l_h = length defined in **301. 4.**
y = transverse distance from the centre line of ship to the point under consideration at the position of the solid floor under consideration (m). Where, however, y is less than $B''/4$, y is to be taken as $B''/4$, and where y exceeds $B''/2$, y may be taken as $B''/2$.
x = longitudinal distance from the middle of l_h of the respective hold to the floor under consideration (m).
d_0 = depth of the solid floor at the point under consideration (mm).
d_1 = depth of the opening at the point under consideration (mm).
C_2 = coefficient obtained from the following table.

Position	C_2
For cargo hold	ab
For adjacent holds simultaneously loaded or empty	0.9 ab

a = coefficient specified in **Table 7.3.2.**
b = value given in the following table, according to k and B/l_h which are defined in **301. 4.** For intermediate values of k, the value of b is to be determined by linear interpolation

k \ B/l_h	and over less than 0.4	0.4 0.6	0.6 0.8	0.8 1.0	1.0 1.2	1.2 1.4	1.4 1.6	1.6 1.8	1.8 2.0	2.0 2.2	2.2 2.4	2.4
10.0 and over	40	38	34	31	26	23	21	18	16	15	14	12
5.0	40	40	37	33	30	26	24	22	18	18	16	15
2.0	41	40	38	35	33	30	28	25	23	21	18	17
1.0	41	40	40	39	37	34	32	29	26	24	23	21
0	41	41	41	41	41	40	37	33	32	30	26	25

C_2' = coefficient given in the following table, according to the ratio of the spacing of stiffeners S_1 (mm) to d_0. For intermediate values of S_1/d_0, C_2' is to be determined by linear interpolation.

S_1/d_0	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C_2'	64	38	25	19	15	12	10	9	8	7

Table 7.3.3 Spacing and thickness of floor plates (continued)

H : value obtained from the following table.

Kinds	H
(a) Where slots without reinforcement are provided on solid floors	$\sqrt{4.0\frac{d_2}{S_1}-1.0}^{(*1)}$
(b) Where openings without reinforcement are provided on solid floors	$0.5\frac{\phi}{d_0}+1$
(c) Where slots and openings without reinforcement are provided on solid floors	Product of the values given by (a) and (b).
(d) Except for (a), (b) and (c)	1.0

(*1) Where d_2/S_1 is less than 0.5, H is to be taken as 1.0.

d_2 = depth of slots without reinforcement provided at the upper and lower parts of solid floors (mm), whichever is the greater.
ϕ = major diameter of the openings (mm).

NOTE :
Where a partial intermediate solid floor with suitable thickness is provided between the outermost side girder and the side girder located not less than 20% of B'' far from the former, 35% each of its sectional area may be added to the sectional area of the adjacent solid floors respectively. In this case, diaphragms, girders or brackets are to be provided in the bilge hopper tank to counter-balance this partial intermediate solid floor.

Table 7.3.4 Coefficient b_0 or b_1

B/l_h (and over)	B/l_h (less than)	k / b_0 or b_1	10.0 and over	5.0	2.0	1.0	0

NOTE:
For intermediate values of k, b_0 and b_1 are to be obtained by linear interpolation.

Table 7.3.5 Section modulus of bottom and inner

Longitudinals	Section modulus (cm^3)
Bottom longitudinals	$Z_b = \frac{CKSl^2}{24-15.0f_B K}(d+0.026L')$
Inner bottom longitudinals	$Z_i = \frac{CKShl^2}{24-11.4f_B K}$ (However, $Z_{min} = 0.75Z_b$)

γ = as specified in **301. 3.**
l = spacing of solid floors (m).
S = spacing of bottom longitudinals or inner bottom longitudinals (m).
L' = length of ship (m). Where, however, L exceeds 230 m, L is to be taken as 230 m.
h = as specified in **304.1.**
C = coefficient given in the following table.

<table>
<tr><th rowspan="2">Case</th><th colspan="2">C</th></tr>
<tr><th>Bottom longitudinals</th><th>Inner bottom longitudinals</th></tr>
<tr><td>In case where no strut specified in 307. is provided midway between floors</td><td>100</td><td>100 γ
(However, $C \geq 90$)</td></tr>
<tr><td rowspan="3">In case where a strut specified in 307. is provided midway between floors</td><td>a) Lower part of the holds which be-come empty in a fully loaded condition and that of deep tanks: 62.5</td><td rowspan="2">60 γ
(However, $C \geq 54$)</td></tr>
<tr><td>b) Elsewhere: 30 γ + 20 (However, $C \geq 50$)</td></tr>
<tr><td colspan="2">And further, where the width of vertical stiffeners provided on floors and that of struts are specially large, the coefficient may be properly reduced.</td></tr>
</table>

306. Vertical struts

1. Where vertical struts are provided, they are to be rolled sections other than flat bars or bulb plates and to be well overlapped with the webs of bottom and inner bottom longitudinals.

2. The sectional area of the above-mentioned vertical struts is not to be less than that obtained from the following formula. Where the double bottom is deep, sufficient care is to be taken against buckling.

$$A = 1.8\,CKSbh \quad (cm^2)$$

where:

S = spacing of longitudinals (m).

b = breadth of the area supported by the strut (m).

h = as obtained from the following formula. In no case is h to be less than d.

$$h = \frac{d + 0.026L' + h_i}{2} \quad (\mathrm{m})$$

L' = as specified in **Table 7.3.2.**

h_i = γ times the value of h specified in **304. 1** (m). However, under deep tanks, h is not to be less than the vertical distance from the upper surface of inner bottom to the mid-point between the top of overflow pipe and the top of inner bottom or 0.7 times the vertical distance from the upper surface of inner bottom to the point of 2.0 metres above the top of overflow pipe, whichever is the greater (m).

γ = as specified in **301. 3.**

C = coefficient obtained from the following formula. In no case is the value of coefficient to be less than 1.43.

$$C = \frac{1}{1 - 0.5\dfrac{l_s}{k\sqrt{K}}}$$

l_s = length of strut (m).

k = minimum radius of gyration of vertical struts, obtained from the following formula (cm).

$$k = \sqrt{\frac{I}{A}}$$

I = the least moment of inertia of the strut (cm^4).

A = sectional area of the strut (cm^2).

307. Double bottom structure under lower stools at bulkheads

The inner bottom plating, centre girders, side girders and bottom longitudinals under lower stools at bulkheads are to be connected with those of holds just before and behind the bulkheads properly extending them. The floors are to be equivalent to those of holds.

Section 4 Hopper Tanks

401. General

1. Compartments of hopper tanks are to be in coincidence with those of holds as far as practicable.

2. Special care is to be taken for the continuity of strength at fore and aft ends of hopper tank structure.

3. The scantlings of structural members in hopper tanks are to be in accordance with the requirements in this Section and also those in **Pt 3, Ch 15.**

402. Thickness of hopper plates

1. The thickness of hopper plates of hopper tanks is not to be less than that obtained from the following formula.

$t = CS\sqrt{hK} + 1.5$ (mm)

where:

S = length of the shorter side of the panel enclosed by stiffeners, etc. (m)

h = vertical distance from the lower end of the hopper plate to the upper deck at centre line (m).

C = coefficient obtained from the following formula. However, in no case is it to be less than 3.2.

$$C = 4.25\, C_1\, C_2 \sqrt{\gamma}$$

C_1 = coefficient obtained from the following formula

where $1 \le \frac{l}{S} < 3.5$ $C_1 = \left(0.11\frac{l}{S} + 0.615\right)$

where $3.5 \le \frac{l}{S}$ $C_1 = 1$

l = length of the longer side of the panel enclosed by stiffeners, etc. (m)

C_2 = coefficient obtained from the formula in **Table 7.3.6.**

Table 7.3.6 Coefficient C_2

Angle β (degree)	C_2
$\beta \le 40°$	1.0
$40° < \beta < 80°$	1.4 - 0.01 β
$\beta \ge 80°$	0.6

γ = as specified in **301. 3.** However, in no case is the value of γ to be less than 1.2 times the ratio of the designed total cargo mass (t) to the total volume of all cargo holds (including hatchways) (m^3).

2. In ships in which cargoes are handled by grabs or similar mechanical appliances, the thickness of hopper plate is to be increased by following thickness above that determined in the preceding **1.** or determined by **401. 3,** whichever is the grater.

Hopper plate under hatchway------------- 2.5 mm

Hopper plate other than the above------ 1.0 mm

3. Where transverse stiffeners are provided on the hopper plates is to be sufficient against buckling.

403. Stiffeners

1. The section modulus of longitudinal stiffeners provided on the hopper plates is not to be less than that obtained from the following formula :

$Z = CKShl^2$ (cm^3)

where:

S = spacing of stiffeners (m).

h = vertical distance from the stiffener to the upper deck at centre line (m).

l = length of longitudinal stiffener between transverse webs (m).

C = coefficient obtained from the following formula:

$$C=\frac{\alpha}{24-15.0f_B K\frac{y}{y_B}}$$

α = coefficient obtained from the formula given in **Table 7.3.7** according to β, acute angle between the hopper plate and the horizontal plate and γ specified in **301. 3.**

Table 7.3.7 Coefficient α

Angle β (degree)	α
$\beta \leq 40^\circ$	130 γ
$40^\circ < \beta < 80^\circ$	(214-2.1 β)γ
$\beta \geq 80^\circ$	46 γ

y = vertical distance from the neutral axis of transverse section of hull to the longitudinal stiffener concerned (m).

y_B = vertical distance from the neutral axis of transverse section of hull to the top of keel (m).

2. The section modulus of transverse stiffeners provided on hopper plates is not to be less than that obtained from the following formula :

$$Z = CKShl^2 \quad (\text{cm}^3)$$

where:

S = spacing of transverse stiffeners (m).

l = distance between the supports of stiffeners (m).

h = vertical distance from the mid-point of l to the upper deck at centre line (m).

C = coefficient obtained from the formula given in **Table 7.3.8.** according to b, acute angle between the hopper plate and the horizontal plate and γ specified in **301. 3.**

Table 7.3.8 Coefficient C

Angle β (degree)	C
$\beta \leq 40^\circ$	7.8 γ
$40^\circ < \beta < 80^\circ$	(12.8 - 0.125β) γ
$\beta \geq 80^\circ$	2.8 γ

3. Bottom longitudinals in bilge hopper tanks are to be in accordance with the requirements in **Pt 3, Ch 7, 403.** Side longitudinals are to be in accordance with the requirements in **Pt 3, Ch 8, 401. 1,** in which case l in the formula is to be taken as the distance between transverse webs in meters. The section modulus of bilge longitudinals need not exceed that specified for bottom longitudinals.

404. Transverse webs

1. In hopper tanks, a transverse web or diaphragm is to be provided at every solid floor.

2. The scantlings of transverse webs provided on hopper plates are not to be less than those obtained from the formulae given in **Table 7.3.9.**

3. Flat bar stiffeners are to be provided on transverse webs or diaphragms at the positions through which longitudinals pass and tripping brackets are to be provided at a spacing of approximately 3 meters as well.

Table 7.3.9 Scantlings of transverse webs

Transverse webs		Scantlings
(1) Webs	Depth	l/5 or 2.5 times the depth of slot for longitudinal stiffener, whichever is the greater.
	Thickness	The thickness obtained from the following formulae, whichever is the greater. $t_1 = 0.01 d_0 + 1.5 \quad (\mathrm{mm})$ $t_2 = \dfrac{C_1 K S h l}{d_0 - a} + 1.5 \quad (\mathrm{mm})$ within 0.2 l from ends $t_3 = 0.0502 \sqrt[3]{\dfrac{C_1 S h l S_1^2}{d_0 - a}} + 1.5 \quad (\mathrm{mm})$
(2) Section modulus		$Z = C_2 K S h l^2 \quad (\mathrm{cm}^3)$
(3) Face bars	Breadth	$d = 2.7 \sqrt{d_0 l_1} \quad (\mathrm{mm})$
	Thickness	Above formulae t_1 or t_2, whichever is the greater.

d_0 = depth of transverse web s (mm).
a = depth of slots (mm). Where effective collar plates are provided within 0.25 l from each end of l, a may be modified depending on the size of collar plates, a may be taken as zero for 0.5 l at the middle part of l.
S = breadth of the area supported by transverse webs (m).
h = vertical distance from the mid-point of l to the upper deck at centre line (m).
l = overall length of transverse web (m). Where the transverse webs are connected with effective brackets at ends. l may be modified in accordance with the requirements in **Pt 3, Ch 1, 605.**
l_1 = distance between supports of transverse web (m). Where, however, effective tripping brackets are provided, they may be taken as supports.
S_1 = the spacing of stiffeners of transverse webs or depth of web(m), whichever is smaller.
C_1, C_2 = coefficient obtained from the formulae given in the following table according to β, acute angle between the hopper plate and the horizontal plane and γ specified in **301. 3.** Where γ is less than 0.7, γ is to be taken as 0.7.

Angle (β)	C_1 (*1)	C_2 (*2)
$\beta \leq 40^\circ$	41.7 γ	7.1 γ
$40^\circ < \beta < 80^\circ$	(68.5 - 0.67 β) γ	(11.5 - 0.11 β) γ
$\beta \geq 80^\circ$	14.9 γ	2.7 γ

(*1) Where the value, C_1, obtained from the above formula is less than 27.8, C_1 is to be taken as 27.8.
(*2) Where the value, C_2, obtained from the above formula is less than 4.75, C_2 is to be taken as 4.75. Where an effective support is provided at the mid-point of girder, one-half of C_2 obtained from the above formula may be taken as C_2.

Section 5 Topside Tanks

501. General

1. Compartments of topside tanks are to be in coincidence with those of holds as fas as practicable. Except for the foremost hold, however, adjacent two compartments may be made one compartment.

2. Special care is to be taken for the continuity of strength at the fore and after ends of topside tank structure.

3. The scantlings of members in topside tanks are not to be less than those specified in **Pt 3, Ch 15,** where h is not to be less than a half of the breadth of tanks at midship section.

4. As for the flat bars used for longitudinal stiffeners, the ratio of the depth to the thickness is not to be greater than 15. As for longitudinals near the strength deck, the slenderness ratio is not to exceed 60 as far as possible at the midship part of the ships.

502. Thickness of sloping plates

1. The thickness of sloping plates of topside tanks is not to be less than that obtained from the following formula :

$$t = 4.6S\sqrt{Kh} + 1.5 \quad (\mathrm{mm})$$

where:

S = spacing of longitudinal or transverse stiffeners (m).

h = distance from the lower edge of sloping plate to the top of over-flow pipe or a half of the breadth of topside tank at midship part, whichever is the greater (m).

2. Where transverse stiffeners are provided on the sloping plates of topside tanks, the thickness of sloping plates is to be sufficient against buckling.

503. Stiffeners provided on sloping plates

1. The section modulus of longitudinal stiffeners provided on the sloping plates of topside tanks is not to be less than that obtained from the following formula :

$$Z = CKShl^2 \quad (\mathrm{cm}^3)$$

where:

S = spacing of longitudinal stiffeners (m).

h = vertical distance from the stiffener to the top of overflow pipe or one-half of the breadth of topside tank at midship part, whichever is the greater (m).

l = length of longitudinal stiffeners between transverse webs (m).

C = coefficient obtained from the following formula :

$$C = \frac{100}{24 - 15 f_D K \frac{y}{y_D}}$$

y_D = vertical distance from the neutral axis of transverse section of hull to the top of beams at side (m).

y = vertical distance from the neutral axis of transverse section of hull to the longitudinal stiffener concerned (m).

2. The section modulus of transverse stiffeners provided on the sloping plates of topside tanks is not to be less than that obtained from the following formula :

$$Z = 6.8 K S h l^2 \quad (\text{cm}^3)$$

where:

S = spacing of transverse stiffeners (m).

l = unsupported length of stiffener (m).

h = vertical distance from the mid-point of l to the top of overflow pipe or one-half of the breadth of topside tank at midship part, whichever is the greater (m).

504. Longitudinal beams

The section modulus of longitudinal beams in topside tanks is not to be less than that obtained from the requirement in **Pt 3, Ch 10, 303.** Where, h is the deck load (kN/m^2) specified in **Pt 3, Ch 10, Sec 2** or one-half of the breadth of topside tank at midship part multiplied by 9.81, whichever is the greater (m).

505. Side frames

1. The section modulus of side longitudinals in topside tanks is not to be less than that obtained from the formula in **Pt 3, Ch 8, 401. 1,** taking l and h as follows :

l = distance between transverse webs (m).

h = as specified in **Pt 3, Ch 8, 401. 1,** but is not to be less than one-half of the breadth of topside tank at midship part (m).

2. Where transverse frames are provided on the side shell plating in way of topside tanks, the section modulus is not to be less than that obtained from the following formula :

$$Z = 6 K S h l^2 \quad (\text{cm}^3)$$

where:

S = spacing of frames (m).

l = vertical distance from the bottom of sloping plate of topside tank to the upper deck at side (m).

h = vertical distance from the mid-point of l to the point $d + 0.038L'$ above the top of keel, or one-half of the breadth of topside tank at midship part, whichever is the greater (m). Where, however, the value is less than $0.3\sqrt{L}$ (m), h is to be taken as $0.3\sqrt{L}$ (m).

L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.

506. Transverse webs

1. Transverse webs or diaphragms are to be provided at a spacing not exceeding 5 m in topside tanks.

2. The scantlings of transverse webs are not to be less than those obtained from the formulae in **Table 7.3.10.**

Table 7.3.10 Scantlings of transverse webs

Transverse webs		Scantlings
(1) Webs	Depth	(a) Where struts are provided at an intermediate position of transverse webs : $l/6$ (b) Elsewhere : $l/5$ or 2.5 times the depth of slots through which longitudinals pass, whichever is the greater.
	Thickness	The thickness obtained from the following formulae, whichever is the greater: $t_1 = 0.01 d_0 + 1.5$ (mm) $t_2 = 41.7 K \frac{Shl}{d_0 - a} + 1.5$ (mm) within 0.2 l from ends $t_3 = 0.174 \sqrt[3]{\frac{Shl S_1^2}{d_0 - a}} + 1.5$ (mm)
(2) Section modulus		(a) Where struts are provided at an intermediate position of transverse webs: $Z = 3.57 KShl^2$ (cm^3) (b) Elsewhere : $Z = 7.14 KShl^2$ (cm^3)
(3) Face bars	Breadth	$b = 2.7 \sqrt{d_0 l_1}$ (mm)
	Thickness	Above formulae t_1 or t_2, whichever is the greater.

d_0 = depth of transverse webs (mm).
a = depth of slots (mm). Where effective collar plates are provided within 0.25 l from each end of l, a may be modified depending on the size of collar plates. a may be taken as zero for 0.5 l at the middle part of l.
S = breadth of the area supported by transverse webs (m).
h = vertical distance from the midpoint of l to the top of overflow pipe, or a half of the breadth of topside tank, whichever is the greater (m)
l = overall length of transverse webs (m). Where a longitudinal diaphragm is provided at an intermediate position of transverse webs, l is to be the distance from the longitudinal diaphragm to the heel of bracket provided at the end of transverse webs (m). In any case where effective brackets are provided, l may be modified as specified in **Pt 3, Ch 1, 605.**
l_1 = distance between supports of transverse web (m). Where, however, effective tripping brackets are provided, they may be taken as supports.
S_1 = the spacing of stiffeners of transverse webs or depth of web (m), whichever is smaller.

3. Flat bar stiffeners are to be provided on transverse webs or diaphragms at the positions through which longitudinal frames or longitudinal stiffeners pass and brackets are to be provided at a spacing of approximately 3 metres as well.

4. Where heavy cargoes are loaded on the deck, web plates or diaphragms are to be suitably reinforced.

507. Large topside tanks

1. Where topside tanks are large, special consideration is to be given to the structure such as providing longitudinal diaphragms at around the midpoint of the breadth of topside tanks.

2. The thickness of longitudinal diaphragms, where provided, is not to be less than that specified in **106.,** or that obtained from the following formula, whichever is the greater. However, value of f_D is not to be less 1.0.

$$t = 19.8 S \sqrt{\frac{y f_D}{D}} + 1.5 \quad (\mathrm{mm})$$

where:

S = spacing of longitudinals (m).

y = vertical distance from $D/2$ at midship section to the mid-point of panel between the stiffeners under consideration (m).

3. Where longitudinal stiffeners are provided on longitudinal diaphragms, depth of stiffeners is not to be less than 0.06 l, where l is the distance between the girders provided on the longitudinal diaphragms. Where longitudinal stiffeners are connected with tripping brackets at ends, depth of the stiffeners may be properly reduced.

4. Where transverse stiffeners are provided on longitudinal diaphragms, the thickness of longitudinal diaphragms is to be sufficient against buckling. The scantlings of the stiffeners are to be equivalent to those specified in **Pt 3.**

Section 6 Transverse Bulkheads and Stools

601. Transverse bulkheads

1. The scantlings of structural members of transverse bulkheads are to be in accordance with the requirements in **Pt 3, Ch 15, Sec 2.** Where, however, in application of these requirements, h in the formulae is to be substituted by $0.36\gamma h'$, where γ is as specified in **301. 3.** Where, however, γ is less than 1.5, γ is to be taken as 1.5, and h' is to be in accordance with the following :

(1) In case of bulkhead platings, vertical distance from the lower edge of bulkhead plate to the upper deck at centre line of ship (m).

(2) Vertical distance from the mid-point of l for vertical stiffeners on bulkhead or from the mid-point of distance between the adjacent stiffeners for horizontal stiffeners to the upper deck at centre line of ship (m). l is as specified in **Pt 3, Ch 15, 203.**

(3) Vertical distance from the mid-point of l for vertical webs supporting stiffeners or from the midpoint of S for horizontal girders to the upper deck at centre line of ship (m). l and S are as specified in **Pt 3, Ch 15, 204.**

2. Notwithstanding the requirements in **Par 1**, the scantlings of structural members of transverse bulkheads are not to be less than those specified in **Pt 3, Ch 14.**

3. For transverse bulkhead without lower stool, the thickness of the lowest strake of bulkhead plating is to be appropriately increased referring to the thickness of inner bottom plating.

4. Plating of transverse bulkheads to which the sloping plates of topside tanks are connected, is to be properly strengthened, by increasing its thickness, or by any other means.

5. In addition to the requirements in this **Sec,** any cargo hold of bulk carriers of 150 m in length(L_f) and above, with single deck, topside tanks and hopper tanks, and of single side or double side skin construction, intending to carry solid bulk cargoes having a density of 1.0 t/m^3, or above, with vertically corrugated transverse watertight bulkheads, which are contracted for construction on or after 1 July 2006 is to be in accordance with the requirements in **Sec 12.**

602. Lower and upper stools at transverse bulkheads

1. The thickness of hopper plate of the lower stool of transverse bulkhead is not to be less than that obtained from the formula in **402. 1.** using the value of coefficient C reduced by 10 %. In ships in which cargoes are handled by grabs or similar mechanical appliances, the thickness is to be increased by 1 mm.

2. The section modulus of horizontal stiffeners provided on sloping plates of lower stool is not to be less than that obtained from the formula for stiffeners or hopper plates given in **403. 1,** where the coefficient C of the first term is to be reduced by 10 %. Where vertical stiffeners are provided, the section modulus is not to be less than that specified in **403. 2.**

3. Girders are to be provided in lower stools in the positions of centre girders and side girders in double bottoms. Scantlings of girders are not to be less than those specified in **404.**

4. Where holds are so designed as to be loaded with ballast water, cargo oil or heavy cargo, girders specified in the preceding Paragraph are to be sufficient against shear, for instance, by adopting diaphragms.

5. The scantlings of the members of upper stools are not to be less than those specified in **Pt 3, Ch 14.**

6. In addition to the requirements in this **Sec,** any cargo hold of bulk carriers of 150 m in length(L_f) and above, with single deck, topside tanks and hopper tanks, and of single side or double side skin construction, intending to carry solid bulk cargoes having a density of 1.0 t/m^3, or above, with vertically corrugated transverse watertight bulkheads, which are contracted for construction on or after 1 July 2006 is to be in accordance with the requirements in **Sec 12.**

Section 7 Hold Frames

701. Hold frames

1. The section modulus of hold frames is not to be less than that obtained from the formulae given in **Table 7.3.11.**

2. The thickness of webs near the top and bottom end connections of hold frames is to be sufficient against shearing.

3. For holds loaded with cargoes of specially large specific gravity, special care is to be taken such as increasing scantlings of hold frames specified in **Pars 1** and **2.**

4. Frames are to be fabricated symmetrical sections with integral upper and lower brackets and are to be arranged with soft toes.

5. In ships less than 190 m in length, mild steel frames may be asymmetric and fitted with separate brackets. The face plate or flange of the bracket is to be sniped at both ends. Brackets are to be arranged with soft toes.

6. The side frame flange is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature is not to be less than r, given by : (See, **Fig 7.3.4**)

$$r = \frac{0.4 b_f^2}{t_f} \quad (\mathrm{mm})$$

b_f = flange width of the brackets (mm).

t_f = thickness of the brackets (mm).

7. The web depth to thickness ratio of frames is not to exceed the following values.

(1) Symmetrical flanged frames : $60\sqrt{K}$

(2) Asymmetrical flanged frames : $50\sqrt{K}$

K is the material factor, as specified in **Pt 3, Ch 1, Sec 4, Table 3.1.2.**

8. The outstanding flange is not to be exceed $10\sqrt{K}$ times the flange thickness.

7.3.11 Section modulus of hold frames

Location	Section modulus (cm^3)
Between 0.15L from the fore end and the after peak bulkhead	$Z = CKShl^2$
Between 0.15L from the fore end and the collision bulkhead	$Z = 1.25KCShl^2$

S = spacing of frames (m).
h = vertical distance from a point $d + 0.038L'$ above the top of keel to the top of bilge hopper at side (m).
L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.
l = distance between the top of bilge hopper at side and the bottom of top side tank (m). (See **Fig 7.3.3**).
C = coefficient obtained from the following formula:

$$C = \left(3.3 - 2.5\frac{l}{h}\right) + (25.7\lambda_1 + 44.5)\alpha\frac{d}{h}$$

$$\lambda_1 = \frac{l_1}{l}$$

l_1 = vertical distance from the mid-point of depth of centre girder to the top of bilge hopper at side (m). (See **Fig 7.3.3**)
α = coefficient given in the following table. For intermediate values of B/l_h the values of α are to be determined by linear interpolation. For the holds which are empty in fully loaded condition, the value of α is to be 1.8 times the value determined from the table.

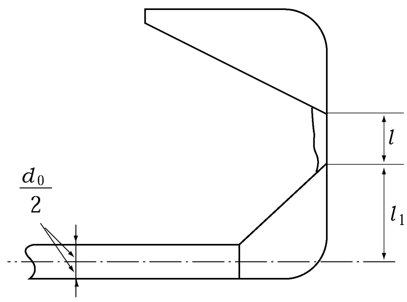

Fig 7.3.3 Measurement of l, l_1, etc

B/l_h	α
0.4 and under	0.0288
0.6	0.0207
0.8	0.0144
1.0	0.0099
1.2	0.0069
1.4	0.0048
1.6	0.0034
1.8 and over	0.0025

702. Top and bottom end connections of frames

1. The toes of brackets connecting frames with hopper plates and topside tank sloping plates are not to coincide with bracket ends in the tanks.
2. The section modulus of the frame and bracket or integral bracket, and associate shell plating, at the locations shown in **Fig 7.3.4,** is not to be less than twice the section modulus required for the frame midspan area. The dimensions of the lower and upper brackets are not to be less than those shown in **Fig 7.3.6.**
3. Structural continuity with the upper and lower end connection of side frames is to be ensured within topside and hopper tanks by connecting brackets as shown in **Fig 7.3.5.** The brackets are to be stiffened against buckling.

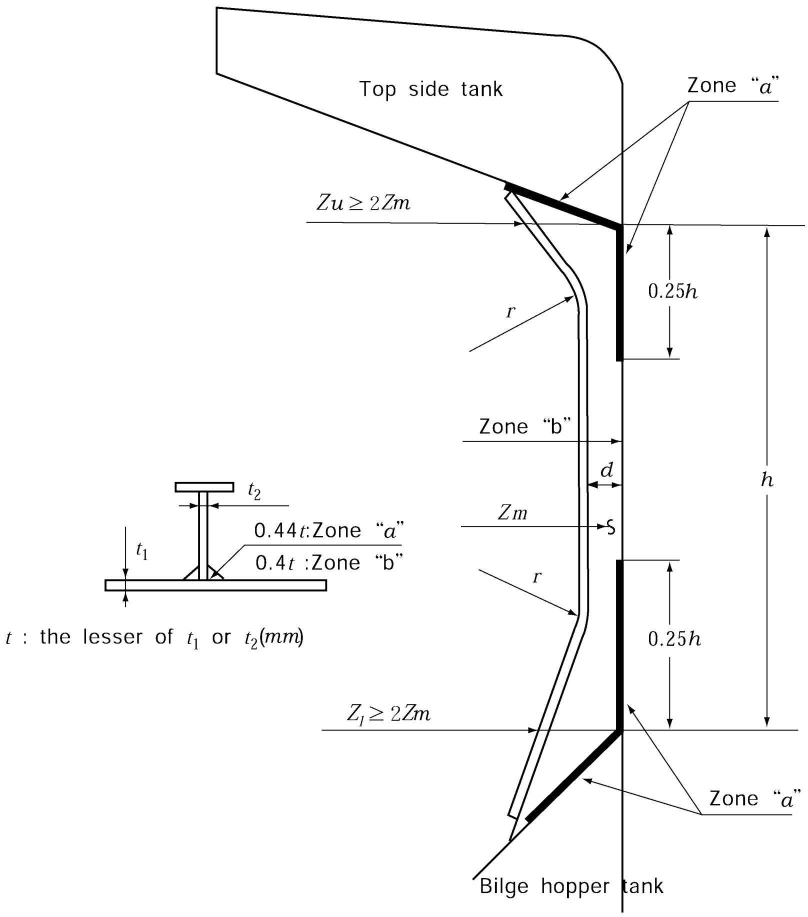

Fig 7.3.4 Figure of frame and bracket

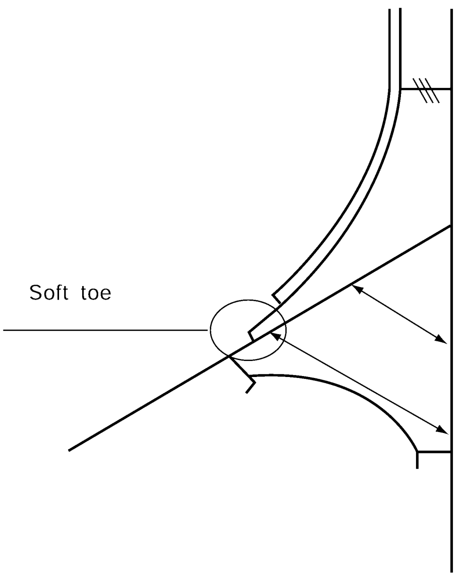

Fig 7.3.5 Bracket

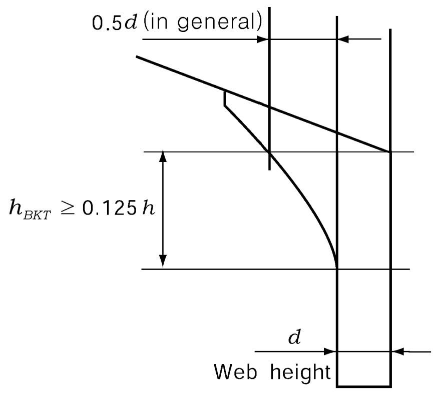

h : As shown in **Fig 7.3.4**

Fig 7.3.6 The dimension of the lower and upper brackets.

4. Double continuous welding is to be adopted for the connections of frames and brackets to side shell, hopper and hopper wing tank plating and web to face plate. For this purpose, the weld throat is to be : (See, **Fig 7.3.4**)

Zone "a" : 0.44 t, Zone "b" : 0.4 t,

Where, t is the thinner of the two connected members.

5. Where the hull form is such to prohibit an effective fillet weld, edge preparation of the web of frame and bracket may be required, in order to ensure the same efficiency as the weld connection stated in **Par. 4.**

703. Side structure in the foremost hold

The scantlings of side hold frames immediately adjacent to the collision bulkhead are to be increased in order to prevent excessive imposed deformation on the shell plating. As an alternative, supporting structures are to be fitted which maintain the continuity of forepeak stringers within the foremost hold.

704. Tripping brackets

In way of the foremost hold, side frames of asymmetrical section art to be fitted with tripping brackets at every two frames, as shown in **Fig 7.3.7.**

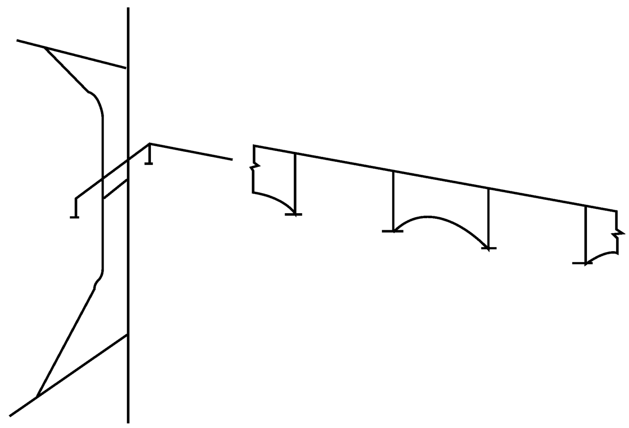

Fig 7.3.7 Tripping brackets to be fitted in way of foremost hold

Section 8 Decks and Shell Platings

801. Deck plating outside the line of openings

The cross sectional area of deck plating outside the line of openings, where topside tanks are not provided, is to determined in consideration of the continuity of longitudinal strength.

802. Deck plating inside the line of openings

1. Hatch end coamings are to be provided in coincidence with the positions of girders in topside tanks. If not coincident, sufficient care is to be taken for the continuity of strength at the connection of hatch end coamings with topside tanks.

2. Deck plating inside the line of openings is recommended to be provided with transverse beams. Where longitudinal beams are provided, special care is to be taken against buckling.

803. Side shell plating

Where a loaded hold and an empty hold are adjacent to each other across a transverse bulkhead, the thickness of side shell plating may be properly reduced from that specified in **Pt 3, Ch 3, 301.** considering that the transverse bulkhead under consideration withstands a part of shear forces on ship s hull in still water.

804. Bottom shell plating

The thickness of bottom shell plating of cargo holds in way of double bottom is not to be less than that obtained from the formula in **Pt 3, Ch 4, 304.** or from the first formula in **304. 1,** whichever is the greater. However, in application of the latter formula, α is to be as given by the following formula :

$$\alpha = \frac{13.8}{24 - 15.0 f_B K}$$

Section 9 Hatch Covers and Hatch Coamings of Cargo Holds

901. Application and definitions

1. These requirements apply to all bulk carriers, ore carriers and combination carriers, and are for all cargo hatch covers and hatch forward and side coamings on exposed decks in position Ⅰ, as defined in **Pt 4, Ch 2, Sec. 1 101.** These requirements applies to ships contracted for construction on or after 1 January 2004.

2. The strength requirements are applicable to hatch covers and hatch coamings of stiffened plate construction.

3. The secondary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

4. The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed 1/3 of the span of primary supporting members. The secondary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

5. These requirements are in addition to the requirements of the ICLL.

6. The net minimum scantlings of hatch covers are to fulfil the strength criteria of the followings where adopting the load model given in **902.** :

(1) **903. 3**, for plating,
(2) **903. 4**, for secondary stiffeners,
(3) **903. 5** for primary supporting members,
(4) **903. 6** the critical buckling stress,
(5) **903. 7** the rigidity criteria.

7. The net minimum scantlings of hatch coamings are to fulfil the strength criteria of the followings where adopting the load model given in **904. 1**:

(1) **904. 2** for plating,
(2) **904. 3** for secondary stiffeners,
(3) **904. 4** for coaming stays,

8. The net thicknesses, t_{net}, are the member thicknesses necessary to obtain the minimum net scantlings required by **903.** and **904.**

The required gross thicknesses are obtained by adding the corrosion additions, t_s, given in **906.** to t_{net}.

9. Material for the hatch covers and coamings is to be steel according to **Pt 3, Ch 1, Sec. 4.**

10. Where t_{net} are used for member scantlings, they are to be noted on the drawings.

902. Hatch cover load model

1. The pressure P, in kN/m^2, on the hatch covers panels is given as follows.

Table 4.2.3 Wave pressures on hatch covers

Ware Pressure P (kN/m^2)			
Length for freeboard, L_f	Location	Position I	Position II
$L_f \geq 100$ m	$0.75 < x/L_f < 1$	$34.3 + (14.8 + a(L_f - 100))(4\frac{x}{L_f} - 3)$	
	$0 \leq x/L_f \leq 0.75$	34.3	25.5
$L_f < 100$ m	$0.75 < x/L_f < 1$	$12.2 + \frac{L_f}{9}(5\frac{x}{L_f} - 2) + 3.6\frac{x}{L_f}$	
	$0 \leq x/L_f \leq 0.75$	$14.9 + 0.195L_f$	$11.3 + 0.142L_f$

Note
(1) a : coefficient taken equal to :
a = 0.0726 for Type B freeboard ships
a = 0.356 for Type B-60 or Type B-100 freeboard ships.
(2) L_f : Length for freeboard defined in **Pt 3 Ch 1 Sec 1** (m). But need not be taken greater than 340 m.
(3) x(m) : Distance from the end of stern to the center of hatch cover that should be considered.
(4) Where two or more panels are connected by hinges, each individual panel is to be considered separately.

903. Hatch cover strength criteria

1. Allowable stress checks

(1) The normal and shear stresses σ and τ in the hatch cover structures are not to exceed the allowable values, σ_a and τ_a , in N/mm^2, given by:

$$\sigma_a = 0.80\sigma_y$$
$$\tau_a = 0.46\sigma_y$$

where,

σ_y = being the minimum upper yield stress, in N/mm^2, of the material.

(2) The normal stress in compression of the attached flange of primary supporting members is not to exceed 0.8 times the critical buckling stress of the structure according to the buckling check as given in **903. 6.**

(3) The stresses in hatch covers that are designed as a grillage of longitudinal and transverse primary supporting members are to be determined by a grillage or a FEM analysis.

(4) When a beam or a grillage analysis is used, the secondary stiffeners are not to be included in the attached flange area of the primary members.

(5) When calculating the stresses σ and τ, the net scantlings are to be used.

2. Effective cross-sectional area of panel flanges for primary supporting members

The effective flange area A_f, in cm^2, of the attached plating, to be considered for the yielding and buckling checks of primary supporting members, when calculated by means of a beam or grillage model, is obtained as the sum of the effective flange areas of each side of the girder web as appropriate:

$$A_f = \sum_{nf}(10 b_{ef} t) \quad (cm^2)$$

where,

nf = 2 if attached plate flange extends on both sides of girder web
= 1 if attached plate flange extends on one side of girder web only

t = net thickness of considered attached plate, in mm

b_{ef} = effective breadth, in m, of attached plate flange on each side of girder web
= b_p, but not to be taken greater than 0.165 l

b_p = half distance, in m, between the considered primary supporting member and the adjacent one

l = span, in m, of primary supporting members

3. Local net plate thickness

The local net plate thickness t, in mm, of the hatch cover top plating is not to be less than:

$$t = 15.8 F_p S \sqrt{\frac{P}{0.95\sigma_y}} \quad (mm)$$

but to be not less than 1% of the spacing of the stiffener or 6 mm if that be greater.

where,

F_P = factor for combined membrane and bending response
= 1.50 in general
= $1.90\ \sigma/\sigma_a$, for $\sigma/\sigma_a \geq 0.8$, for the attached plate flange of primary supporting members

S = stiffener spacing, in m

p = pressure, in kN/m^2, as defined in **902.**

σ = as defined in **903. 5.**

σ_a = as defined in **903.1**.

σ_y = as defined in **903.1**.

4. Net scantlings of secondary stiffeners

(1) The required minimum section modulus, Z, in cm^3, of secondary stiffeners of the hatch cover top plate, based on stiffener net member thickness, are given by:

$$Z = \frac{1000\, l^2 SP}{12\sigma_a} \quad (cm^3)$$

where,

l = secondary stiffener span, in m, to be taken as the spacing, in m, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all secondary stiffener spans, the secondary stiffener span may be reduced by an amount equal to 2/3 of the minimum brackets arm length, but not greater than 10% of the gross span, for each bracket.

S = secondary stiffener spacing, in m

p = pressure, in kN/m^2, as defined in **902.**

σ_a= as defined in **903.1**

(2) The net section modulus of the secondary stiffeners is to be determined based on an attached plate width assumed equal to the stiffener spacing.

5. Net scantlings of primary supporting members

(1) The section modulus and web thickness of primary supporting members, based on member net thickness, are to be such that the normal stress σ in both flanges and the shear stress τ, in the web, do not exceed the allowable values σ_a and τ_a, respectively, defined in **903.1.**

(2) The breadth of the primary supporting member flange is to be not less than 40% of their depth for laterally unsupported spans greater than 3.0 m. Tripping brackets attached to the flange may be considered as a lateral support for primary supporting members.

(3) The flange outstand is not to exceed 15 times the flange thickness.

6. Critical buckling stress check

(1) Hatch cover plating

(A) The compressive stress σ in the hatch cover plate panels, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{C1}, to be evaluated as defined below:

$$\sigma_{C1} = \sigma_{E1} \qquad \text{when } \sigma_{E1} \le \frac{\sigma_y}{2}$$

$$= \sigma_y\left[1 - \frac{\sigma_y}{4\sigma_{E1}}\right] \qquad \text{when } \sigma_{E1} > \frac{\sigma_y}{2}$$

where,

σ_y = minimum upper yield stress, in N/mm^2, of the material

$\sigma_{E1} = 3.6E\left(\frac{t}{1000S}\right)^2$

E = modulus of elasticity, in N/mm^2

= 2.06 x 10^5 (N/mm^2) for steel

t = net thickness, in mm, of plate panel

S = spacing, in m, of secondary stiffeners

(B) The mean compressive stress, σ, in each of the hatch cover plate panels, induced by the bending of primary supporting members perpendicular to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{C2}, to be evaluated as defined below:

$$\sigma_{C2} = \sigma_{E2} \qquad \text{when } \sigma_{E2} \le \frac{\sigma_y}{2}$$

$$= \sigma_y\left[1 - \frac{\sigma_y}{4\sigma_y}\right] \qquad \text{when } \sigma_{E2} > \frac{\sigma_y}{2}$$

where,

σ_y = minimum upper yield stress, in N/mm^2, of the material

$\sigma_{E2} = 0.9\, m\, E\left(\frac{t}{1000\, S_s}\right)^2$

$m = c\left[1 + \left(\frac{S_s}{l_s}\right)^2\right]^2 \frac{2.1}{\psi + 1.1}$

E = modulus of elasticity, in N/mm^2

= 2.06×10^5 for steel

t = net thickness, in mm, of plate panel

S_s = length, in m, of the shorter side of the plate panel

l_s = length, in m, of the longer side of the plate panel

ψ = ratio between smallest and largest compressive stress

c = 1.3 when plating is stiffened by primary supporting members

= 1.21 when plating is stiffened by secondary stiffeners of angle or T type

= 1.1 when plating is stiffened by secondary stiffeners of bulb type

= 1.05 when plating is stiffened by flat bar

(C) The biaxial compressive stress in the hatch cover panels, when calculated by means of FEM shell element model, is to be in accordance with the satisfaction of the Society as deemed equivalent to the above criteria.

(2) Hatch cover secondary stiffeners

(A) The compressive stress σ in the top flange of secondary stiffeners, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{CS}, to be evaluated as defined below:

$$\sigma_{CS} = \sigma_{ES} \qquad \text{when} \quad \sigma_{ES} \le \frac{\sigma_y}{2}$$

$$= \sigma_y \left[1 - \frac{\sigma_y}{4\sigma_{ES}}\right] \qquad \text{when} \quad \sigma_{ES} > \frac{\sigma_y}{2}$$

where,

σ_y = minimum upper yield stress, in N/mm^2, of the material

σ_{ES} = ideal elastic buckling stress, in N/mm^2, of the secondary stiffener

= minimum between σ_{E3} and σ_{E4}

$$\sigma_{E3} = \frac{0.001 E I_a}{A l^2}$$

E = modulus of elasticity, in N/mm^2

= 2.06×10^5 for steel

I_a = moment of inertia, in cm^4, of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners

A = cross-sectional area, in cm^2, of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners

l = span, in m, of the secondary stiffener

$$\sigma_{E4} = \frac{\pi^2 E I_w}{10^4 I_p l^2}\left(m^2 + \frac{K}{m^2}\right) + 0.385 E \frac{I_t}{I_p}$$

$$K = \frac{C l^4}{\pi^4 E I_w} \times 10^6$$

m = number of half waves, given by the following table:

	$0 < K < 4$	$4 < K < 36$	$36 < K < 144$	$(m-1)^2 m^2 < K \le m^2 (m+1)^2$
m	1	2	3	m

I_w = sectorial moment of inertia, in cm^6, of the secondary stiffener about its connection with the plating

= $\frac{h_w^3\ t_w^3}{36} \times 10^{-6}$ for flat bar secondary stiffeners

= $\frac{t_f\ b_f^3\ h_w^2}{12} \times 10^{-6}$ for "Tee" secondary stiffeners

= $\frac{b_f^3\ h_w^2}{12(b_f + h_w)^2}\left[t_f\,(b_f^2 + 2b_f\ h_w + 4h_w^2) + 3t_w\ b_f\ h_w\right] \times 10^{-6}$ for angles and bulb secondary stiffener

I_p = polar moment of inertia, in cm^4, of the secondary stiffener about its connection with the plating

= $\frac{h_w^3\ t_w}{3} \times 10^{-4}$ for flat bar secondary stiffeners

= $\left(\frac{h_w^3\ t_w}{3} + h_w^2\ b_f\ t_f\right) \times 10^{-4}$ for flanged secondary stiffeners

I_t = St Venant's moment of inertia, in cm^4, of the secondary stiffener without top flange

= $\frac{h_w\ t_w^3}{3} \times 10^{-4}$ for flat bar secondary stiffeners

= $\frac{1}{3}\left[h_w\ t_w^3 + b_f\ t_f^3\left(1 - 0.63\frac{t_f}{b_f}\right)\right] \times 10^{-4}$ for flanged secondary stiffeners

h_w , t_w = height and net thickness, in mm, of the secondary stiffener, respectively

b_f , t_f = width and net thickness, in mm, of the secondary stiffener bottom flange, respectively

C = spring stiffness exerted by the hatch cover top plating

$$= \frac{k_p\ E\ t_p^3}{3S\left(1 + \frac{1.33k_p\ h_w\ t_p^3}{1000\,St_w^3}\right)} \times 10^{-3}$$

S = spacing, in m, of secondary stiffeners

k_p = $1 - \eta_p$, to be taken not less than zero

for flanged secondary stiffeners, k_p need not be taken less than 0.1

η_p = $\frac{\sigma}{\sigma_{E1}}$

σ = as defined in **903. 5**

σ_{E1} = as defined in **903. 6.** (1)

t_p = net thickness, in mm, of the hatch cover plate panel

(B) For flat bar secondary stiffeners and buckling stiffeners, the ratio h / t_w is to be not greater than $15\ k^{0.5}$,

where:

h / t_w = height and net thickness of the stiffener, respectively

k = $235/\sigma_y$

σ_y = minimum upper yield stress, in $\mathrm{N/mm^2}$, of the material.

(3) Web panels of hatch cover primary supporting members

(A) This check is to be carried out for the web panels of primary supporting members, formed by web stiffeners or by the crossing with other primary supporting members, the face plate (or the bottom cover plate) or the attached top cover plate.

(B) The shear stress τ in the hatch cover primary supporting members web panels is not to exceed 0.8 times the critical buckling stress τ_C, to be evaluated as defined below:

$$\tau_C = \tau_E \qquad \text{when } \tau_E \le \frac{\tau_F}{2}$$

$$= \tau_F\left[1 - \frac{\tau_F}{4\tau_E}\right] \qquad \text{when } \tau_E > \frac{\tau_F}{2}$$

where,

$\tau_F = \dfrac{\sigma_y}{\sqrt{3}}$

σ_y = minimum upper yield stress, in N/mm^2, of the material

$\tau_E = 0.9\, k_t\, E \left[\dfrac{t_{pr,n}}{1000\, d}\right]^2$

E = modulus of elasticity, in N/mm^2

= 2.06×10^5 for steel

$t_{pr,n}$ = net thickness, in mm, of primary supporting member

$k_t = 5.35 + \dfrac{4.0}{(a/d)^2}$

a = greater dimension, in m, of web panel of primary supporting member

d = smaller dimension, in m, of web panel of primary supporting member.

(C) For primary supporting members parallel to the direction of secondary stiffeners, the actual dimensions of the panels are to be considered.

(D) For primary supporting members perpendicular to the direction of secondary stiffeners or for hatch covers built without secondary stiffeners, a presumed square panel of dimension d is to be taken for the determination of the stress τ_C. In such a case, the average shear stress τ between the values calculated at the ends of this panel is to be considered.

7. Deflection limit and connections between hatch cover panels

(1) Load bearing connections between the hatch cover panels are to be fitted with the purpose of restricting the relative vertical displacements.

(2) The vertical deflection of primary supporting members is to be not more than 0.0056 l, where l is the greatest span of primary supporting members.

8. Primary supporting members of variable cross-section

The net section modulus of primary supporting members with a variable cross-section is to be not less than the greater of the value obtained from the following formulae and the use of these formulae is limited to the determination of the strength of primary supporting members in which abrupt changes in the cross-section do not occur along their length. :

$$Z = Z_{CS} \quad (cm^3)$$

$$Z = \left(1 + \frac{3.2\alpha - \psi - 0.8}{7\psi + 0.4}\right) Z_{CS} \quad (cm^3)$$

Z_{CS} : Net section modulus calculated with considering the net thickness, in cm^3, for a constant cross-section, complying with the checking criteria in **903. 6 (3)**.

$$\alpha = \frac{l_1}{l_0}$$

$$\psi = \frac{Z_1}{Z_0}$$

l_1 : Length of the variable section part, in m (see the following figure.)

l_0 : Span measured, in m, between end supports (see the following figure.)

Z_1 : Net section modulus calculated with considering the net thickness at end, in cm^3 (see the following figure.)

Z_0 : Net section modulus calculated with considering the net thickness at mid-span, in cm^3 (see the following figure.)

Moreover, the net moment of inertia of primary supporting members with a variable cross-section calculated with considering it's net thickness is to be not less than the greater of the values obtained, in cm^4, from the following formulae :

$$I = I_{CS} \quad (\text{cm}^4)$$

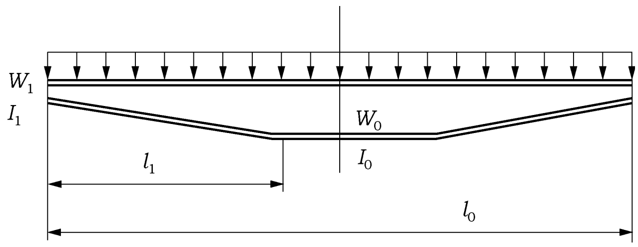
$$I = \left\{1 + 8\alpha^3\left(\frac{1-\phi}{0.2+3\sqrt{\phi}}\right)\right\} I_{CS} \quad (\text{cm}^4)$$

I_{CS} : Net moment of inertia with a constant cross-section calculated with considering the net thickness, in cm^4, complying with **903. 7** (2)

$$\phi = \frac{I_1}{I_0}$$

I_1 : Net moment of inertia calculated with considering the net thickness at end with considering the net thickness, in cm^4 (see the following figure.)

I_0 : Net moment of inertia calculated with considering the net thickness at mid-span with considering the net thickness, in cm^4 (see the following figure.)



Variable cross-section stiffener

9. Buckling stiffeners on webs of primary supporting members

For buckling stiffeners on webs of primary supporting members, the ratio h_w/t_w is to comply with the following formulae :

$$\frac{h_w}{t_w} \le 15\sqrt{\frac{235}{\sigma_y}}$$

h_w : Web height of the stiffener (mm)
t_w : Net thickness of the stiffener (mm)

904. Hatch coamings and local details

1. Load model

The pressure P_{coam}, in kN/m^2, on the No. 1 forward transverse hatch coaming is given by:

$P_{coam} = 220$, when a forecastle is fitted in accordance with **Pt 7, Ch 3, Sec. 13**
$= 290$ in the other cases

The pressure P_{coam}, in kN/m^2, on the other coamings is given by:

$P_{coam} = 220$

2. Local net plate thickness

(1) The local net plate thickness t, in mm, of the hatch coaming plating is given by:

$$t = 14.9\,S\sqrt{\frac{P_{coam}}{\sigma_{a,coam}}S_{coam}}$$

where,

S = secondary stiffener spacing, in m
P_{coam} = pressure, in kN/m^2, as defined in **904. 1**
S_{coam} = safety factor to be taken equal to 1.15
$\sigma_{a,coam} = 0.95\sigma_y$

(2) The local net plate thickness is to be not less than 9.5 mm.

3. Net scantlings of longitudinal and transverse secondary stiffeners

The required section modulus Z, in cm^3, of the longitudinal or transverse secondary stiffeners of the hatch coamings, based on net member thickness, is given by:

$$Z = \frac{1000\,S_{coam}\,l^2\,S P_{coam}}{m\,c_P\,\sigma_{a,coam}}$$

where,

m = 16 in general
= 12 for the end spans of stiffeners sniped at the coaming corners
S_{coam} = safety factor to be taken equal to 1.15
l = span, in m, of secondary stiffeners
S = spacing, in m, of secondary stiffeners
P_{coam} = pressure in kN/m^2 as defined in **904.1**
c_P = ratio of the plastic section modulus to the elastic section modulus of the secondary stiffeners with an attached plate breadth, in mm, equal to 40 t, where t is the plate net thickness
= 1.16 in the absence of more precise evaluation,
$\sigma_{a,coam} = 0.95\sigma_y$

4. Net scantlings of coaming stays

(1) The required minimum section modulus, Z, in cm^3, and web thickness, t_w, in mm, of coamings stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (see **Fig 7.3.8** and **7.3.9**) at their connection with the deck, based on member net thickness, are given by:

$$Z = \frac{1000 H_C^2 S P_{coam}}{2 \sigma_{a,coam}}$$

$$t_w = \frac{1000 H_C S P_{coam}}{h \ \tau_{a,coam}}$$

where,

H_C = stay height, in m

S = stay spacing, in m

h = stay depth, in mm, at the connection with the deck

P_{coam} = pressure, in $\mathrm{kN/m^2}$, as defined in **904. 1**

$\sigma_{a,coam} = 0.95 \sigma_y$

$\tau_{a,coam} = 0.5 \sigma_y$

(2) For calculating the section modulus of coaming stays, their face plate area is to be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it.

(3) For other designs of coaming stays, such as, for examples, those shown in **Fig 7.3.10** and **7.3.11**, the stress levels in **903. 1** are to be applied and checked at the highest stressed locations.

5. Local details

(1) The design of local details is to be determined at the discretion of with the Society for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below.

(2) Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

(3) Underdeck structures are to be checked against the load transmitted by the stays, adopting the same allowable stresses specified in **904. 4**

(4) Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the Society requirements.

(5) Double continuous welding is to be adopted for the connections of stay webs with deck plating and the weld throat is to be not less than 0.44 t_w, where t_w is the gross thickness of the stay web.

(6) Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15% of the stay width.

905. Closing arrangements

1. Securing devices

The strength of securing devices is to comply with the following requirements:

(1) Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

(2) Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

(3) The net sectional area of each securing device is not to be less than:

$$A = 1.4 a / f \quad (\mathrm{cm}^2)$$

where,

a = spacing, in m, of securing devices, not being taken less than 2 m

$f = (\sigma_y / 235)^e$

σ_y = specified minimum upper yield stress, in N/mm^2, of the steel used for fabrication, not to be taken greater than 70% of the ultimate tensile strength.

$e = 0.75$ for $\sigma_y > 235 (N/mm^2)$

$= 1.0$ for $\sigma_y \leq 235 (N/mm^2)$

(4) Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

(5) Between cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weather tightness is to be maintained by the securing devices.

(6) For packing line pressures exceeding 5 N/mm, the cross section area is to be increased in direct proportion. The packing line pressure is to be specified.

(7) The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, I, of edge elements is not to be less than:

$$I = 6pa^4 \quad (cm^4)$$

where:

p = packing line pressure in N/mm, minimum 5 N/mm

a = spacing in m of securing devices.

(8) Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

(9) Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

(10) Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

2. Stoppers

(1) Hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m^2.

(2) With the exclusion of No.1 hatch cover, hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.

(3) No. 1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m^2, but this pressure may be reduced to 175 kN/m^2 when a forecastle is fitted in accordance with **Pt 7, Ch 3, Sec. 13.**

(4) The equivalent stresses in stoppers and their supporting structures, and calculated in the throat of the stopper welds are not to exceed the allowable value of $0.8\sigma_y$.

3. Materials and welding

Stoppers or securing devices are to be manufactured of materials, including welding electrodes, meeting this class requirements.

906. Corrosion addition and steel renewal

1. Hatch covers

(1) For all the structure (plating and secondary stiffeners) of single skin hatch covers, the corrosion addition t_s is to be 2.0 mm.

(2) For pontoon hatch covers, the corrosion addition is to be:

2.0 mm for the top and bottom plating
1.5 mm for the internal structures.

(3) For single skin hatch covers and for the plating of pontoon hatch covers, steel renewal is required where the gauged thickness is less than $t_{net}+0.5\text{mm}$.
(4) Where the gauged thickness is within the range $t_{net}+0.5\text{mm}$ and $t_{net}+1.0\text{mm}$, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.
(5) Coating is to be maintained in GOOD condition, as defined in **Pt 1, Ch 2, Sec. 1. 16.**
(6) For the internal structure of pontoon hatch covers, thickness gauging is required when plating renewal is to be carried out or when this is deemed necessary, at the discretion of the Society's Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is less than t_{net}.

2. Hatch coamings

(1) For the structure of hatch coamings and coaming stays, the corrosion addition t_s is to be 1.5 mm
(2) Steel renewal is required where the gauged thickness is less than $t_{net}+0.5\text{mm}$.
(3) Where the gauged thickness is within the range $t_{net}+0.5\text{mm}$ and $t_{net}+1.0\text{mm}$, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.
(4) Coating is to be maintained in GOOD condition, as defined in **Pt 1, Ch 2, Sec. 1, 16.**

Section 10 Longitudinal Strength of Hull Girder in Flooded Condition for Bulk Carriers

1001. Application

1. These requirements are to be complied with in respect of the flooding of any cargo hold of bulk carriers, as defined **Pt 1, Annex 1-1, Remarks (11-2)**, with notation BC-A and BC-B, as defined in **Pt 7, Ch 3, Sec. 2,** which are contracted for construction on or after 1 July 2006.

Such ships are to have their hull girder strength checked for specified flooded conditions, in each of the cargo and ballast loading conditions defined in **Pt 3, Annex 3-1** of the Guidance and in every condition considered in the intact longitudinal strength calculations, including those and unloading transitory conditions in port and loading conditions encountered during ballast water exchange need not be considered. (Refer to the **Annex 7-7**)

1002. Flooding criteria

1. To calculating the weight of ingressed water, the following assumptions are to be made.
(1) The permeability of empty cargo spaces and volume left in loaded cargo spaces above any cargo is to be taken as 0.95.
(2) Appropriate permeabilities and bulk densities are to be used for any cargo carried.

(a) Iron ore : bulk density = 3.0 t/m^3, permeability = 0.3
(b) Cement : bulk density = 1.3 t/m^3, permeability = 0.3

(3) permeability for solid cargo means the ratio of the floodable volume between the particles, granules or any larger pieces of the cargo, to the gross volume of the bulk cargo.

2. For packed cargo conditions (such as steel mill products), the actual density of the cargo should be used with a permeability of zero.

1003. Flooding conditions

1. Floodable holds

Each cargo hold is to be considered individually flooded up to the equilibrium waterline.

2. Loads

The still water loads in flooded conditions are to be calculated for the above cargo and ballast loading conditions.
The wave loads in the flooded conditions are assumed to be equal to 80% of those given in **Pt 3, Ch 3, Sec. 2 Table 3.3.1** and **Sec. 3 301. 1.**

1004. Stress assessment

1. The actual hull girder bending stress σ_{fld} at any location is given by :

$$\sigma_{fld} = \frac{M_{sf} + 0.8M_w}{Z} \times 10^3 \quad (\mathrm{N/mm^2})$$

where,

M_{sf} = still water bending moment in the flooded conditions for the section under consideration (kN-m).

M_w = wave bending moment as given in **Pt 3, Ch 3, Table 3.3.1.**

Z = section modulus for the corresponding location in the hull girder ($\mathrm{cm^3}$).

2. The shear strength of the side shell and the inner hull(longitudinal bulkhead) if any, at any location of the ship, is to be checked according to the requirements specified in **Pt 3, Ch 3, 301.** and **302.** in which F_s and F_w are to be replaced respectively by F_{SF} and F_{WF}, where :

F_{SF} = still water shear force, in kN, in the flooded conditions for the section under construction

F_{WF} = 0.8 F_w

F_w = wave shear force, in kN, as given in **Pt 3, Ch 3, 301.** for the section under construction

1005. Strength criteria

The damaged structure is assumed to remain fully effective in resisting the applied loading. Permissible stress and axial stress buckling strength are to be in accordance with **Pt 3, Ch 3, Table 3.3.1** and **Pt 3, Ch 3, 301.**

Section 11 Evaluation of Allowable Hold Loading for Bulk Carriers Considering Hold Flooding

1101. Application

1. These requirements are to be complied with in respect of the flooding of any cargo hold of bulk carriers of 150 m in length(L_f) and above, with single deck, topside tanks and hopper tanks, and of single side or double side skin construction intending to carry solid bulk cargoes t/m^3 having a density of 1.0 , or above, on or after 1 July 2006. (Refer to the **Annex 7-7**)

2. The loading in each hold is not to exceed the allowable hold loading in flooded condition, calculated as per **1104.,** using the loads given in **1102.** and the shear capacity of the double bottom given in **1103.**

3. In no case is the allowable hold loading, considering flooding, to be taken greater than the design hold loading in intact condition.

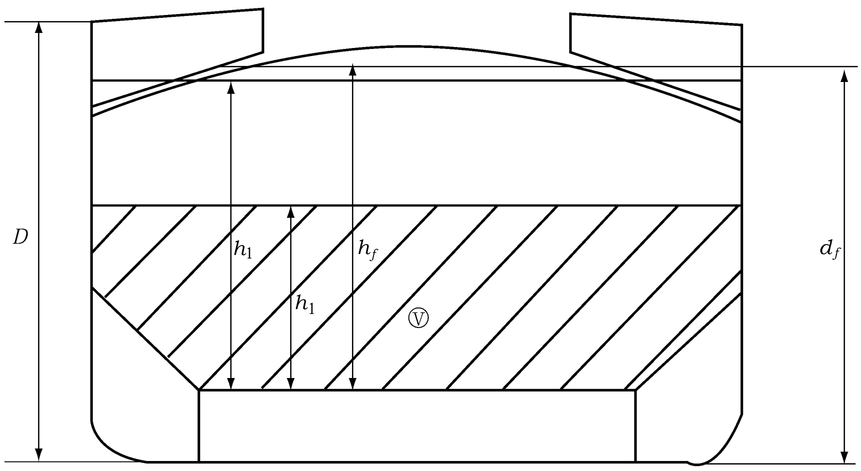
1102. Loading model

1. General

(1) The loads to be considered as acting on the double bottom are those given by follows.
  (a) External sea pressures
  (b) Combination of the cargo loads with those induced by the flooding of the hold which the double bottom belongs to.
(2) The most severe combinations of cargo induced loads and flooding loads are to be used, depending on the loading conditions included in the loading manual :
  (a) Homogeneous loading condition.
  (b) Non-homogeneous loading condition.
  (c) Packed cargo conditions (such as steel mill products).
(3) For each loading condition, the maximum bulk cargo density to be carried is to be considered in calculating the allowable hold loading limit.

2. Inner bottom flooding head

The flooding head h_f is the distance measured vertically with the ship in the upright position, from the inner bottom to a level located at a distance d_f(m) from the baseline equal to :
(1) For ships less than 50,000 tonnes deadweight with Type B freeboard :
  (a) For the foremost hold : d_f = 0.95D
  (b) For the other holds : d_f = 0.85D
(2) In general
  (a) For the foremost hold : d_f = 1.0D
  (b) For the other holds : d_f = 0.9D



V : Volume of cargo

Fig. 7.3.12 Measurement of d_1, d_f, h_1 and h_f

1103. Shear capacity of the double bottom

1. The shear capacity C of the double bottom is defined as the sum of the shear strength at each end of :

(1) All floors adjacent to both hoppers, less one half of the strength of the two floors adjacent to each stool or transverse bulkhead if no stool is fitted (See **Fig 7.3.13**).

(2) All double bottom girders adjacent to both stools, or transverse bulkheads if no stool is fitted.

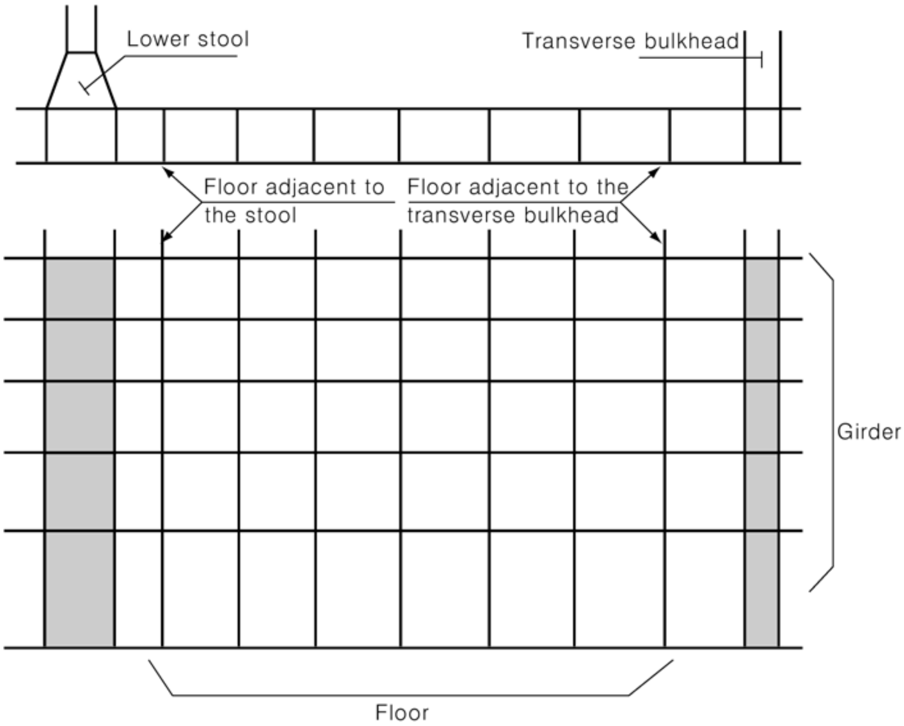


Fig 7.3.13 Floor and girder

2. Where in the end holds, girders or floors run out and are not directly attached to the boundary stool or hopper girder, their strength is to be evaluated for the one end only.

3. Note that the floors and girders to be considered are those inside the hold boundaries formed by the hoppers and stools (or transverse bulkheads if no stool is fitted). The hopper side girders and the floors directly below the connection of the bulkhead stools (or transverse bulkheads if no stool is fitted) to the inner bottom are not to be included.

4. When the geometry and/or the structural arrangement of the double bottom are such to make the above assumptions inadequate, the shear capacity C of double bottom is to be calculated according to the Society's discretion.

5. In calculating the shear strength, the net thickness of floors and girders is to be used. The net thickness $t_{\neq t}$ is given by :

$$t_{\neq t} = t - 2.5 \quad (\mathrm{mm})$$

t = thickness of floors and girders (mm).

6. Floor shear strength

The floor shear strength in way of the floor panel adjacent to hoppers S_{f1}(kN) and the floor shear strength in way of the openings in the outmost bay (i.e. that bay which is closer to hopper) S_{f2}(kN), are given by :

$$S_{f1} = A_f \frac{\tau_a}{\eta_1} \times 10^{-3} \quad \text{(kN)}$$

$$S_{f2} = A_{f,h} \frac{\tau_a}{\eta_2} \times 10^{-3} \quad \text{(kN)}$$

A_f = sectional area of the floor panel adjacent to hoppers (mm^2).

$A_{f,h}$ = net sectional area of the floor panels in way of the openings in the outmost bay (i.e. that bay which is closer to hopper) (mm^2).

τ_a = the allowable shear stress to be taken equal to the lesser of following formulae (N/mm^2).

$$\tau_{a1} = \frac{162\sigma_y^{0.6}}{(S/t_{\neq t})^{0.8}} \quad (N/mm^2), \qquad \tau_{a2} = \frac{\sigma_y}{\sqrt{3}} \quad (N/mm^2)$$

For floors adjacent to the stools or transverse bulkheads, τ_a may be taken as $\sigma_y / \sqrt{3}$

σ_y = minimum upper yield stress of the material (N/mm^2).

S = spacing of stiffening members of panel under consideration (mm).

η_1 = 1.1

η_2 = 1.2, may be reduced, to the Society's discretion, down to 1.1, where appropriate reinforcements are fitted to the Society's satisfaction.

7. Girder shear strength

The girder shear strength in way of the girder panel adjacent to stools (or transverse bulkheads, if no stool is fitted) S_{g1}, and the girder shear strength in way of the largest opening in the outmost bay (i.e. that bay which is closer to stool, or transverse bulkhead, if no stool is fitted) S_{g2} are given by :

$$S_{g1} = A_g \frac{\tau_a}{\eta_1} \times 10^{-3} \quad \text{(kN)}$$

$$S_{g2} = A_{g,h} \frac{\tau_a}{\eta_2} \times 10^{-3} \quad \text{(kN)}$$

A_g = minimum sectional area of the girder panel adjacent to stools (or transverse bulkheads, if no stool is fitted) (mm^2).

$A_{g,h}$ = net sectional area of the girder panel in way of the largest opening in the outmost bay (i. e. that bay which is closer to stool, or transverse bulkhead, if no stool is fitted) (mm^2).

τ_a = allowable shear stress as given in **Par 6** (N/mm^2).

η_1 = 1.1

η_2 = 1.15, may be reduced, to the Society's discretion, down to 1.1 where appropriate reinforcements are fitted to the Society's satisfaction.

1104. Allowable hold loading

The allowable hold loading W is given by :

$$W = \rho_c V \frac{1}{F} \quad \text{(ton)}$$

F = 1.1 in general, and may be 1.05 for steel mill products.
ρ_c = Bulk cargo density (t/m^3).
V = Volume (m^3), occupied by cargo at a level h_1.

$$h_1 = \frac{X}{\rho_c g}$$

X = for bulk cargoes, the lesser of X_1 and X_2 given by :

$$X_1 = \frac{Z + \rho g(E - h_f)}{1 + \frac{\rho}{\rho_c}(perm - 1)}$$

$$X_2 = Z + \rho g(E - h_f\, perm)$$

X = X_1 using $perm = 0$, for steel products
ρ = sea water density (t/m^3).
g = gravity acceleration (= 9.81 m/s^2).
E = ship immersion (m), for flooded hold condition
= d_f - 0.1D
d_f = as given in **1102. Par 2.**
h_f = flooding head as defined in **1102. Par 2** (m).
$perm$ = cargo permeability, defined in **1002. Par 1.** it needs not be taken greater than 0.3 and is to be taken equal to zero for steel mill products.
Z = the lesser of Z_1 and Z_2 given by :

$$Z_1 = \frac{C_h}{A_{DB,h}}$$

$$Z_2 = \frac{C_e}{A_{DB,e}}$$

C_h = shear capacity of the double bottom, as defined in **1103.** considering, for each floor, the lesser of the shear strengths S_{f1} and S_{f2} (See **1103. Par 6**) and for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (See **1103. Par 7**) (kN).
C_e = shear capacity of the double bottom as defined in **1103.** considering, for each floor, the shear strength S_{f1} (See **1103. Par 6**) and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (See **1103. Par 7**) (kN).

$$A_{DB,h} = \sum_{i=1}^{n} S_i B_{DB,i}$$

$$A_{DB,e} = \sum_{i=1}^{n} S_i (B_{DB} - S_l)$$

n = number of floors between stools (or transverse bulkheads, if no stool is fitted)
S_i = spacing of i th-floor (m).
$B_{DB,i}$ = $B_{DB} - S_l$, for floors whose shear strength is given by S_{f1}.

= $B_{DB,h}$, for floors whose shear strength is given by S_{f2}

B_{DB} = breadth of double bottom between hoppers (m) (See **Fig 7.3.14**).

$B_{DB,h}$ = distance between the two considered opening (m) (See **Fig 7.3.14**).

S_l = spacing of double bottom longitudinals adjacent to hoppers (m).

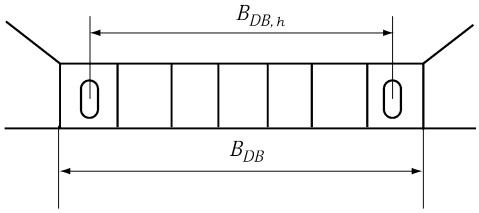

Fig. 7.3.14 Measurement $B_{DB,h}$ and B_{DB}

Section 12 Evaluation of Scantlings of Corrugated Transverse Watertight Bulkheads in Bulk Carriers Considering Hold Flooding

1201. Application and definitions

1. These requirements are to be complied with in respect of the flooding of any cargo hold of bulk carriers of 150 m in length(L_f) and above, with single deck, topside tanks and hopper tanks, and of single side or double side skin construction, intending to carry solid bulk cargoes having a density of 1.0 t/m^3, or above, with vertically corrugated transverse watertight bulkheads, which are contracted for construction on or after 1 July 2006. (Refer to the **Annex 7-7**)

2. The net thickness t_{net} is the thickness obtained by applying the strength criteria given in **1204.**

3. The required thickness is obtained by adding the corrosion addition t_s, given in **1206.** to the net thickness t_{net}.

4. In this requirement homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for each hold, does not exceed 1.2 to be corrected for different cargo densities (See, **Fig 7.3.15**).

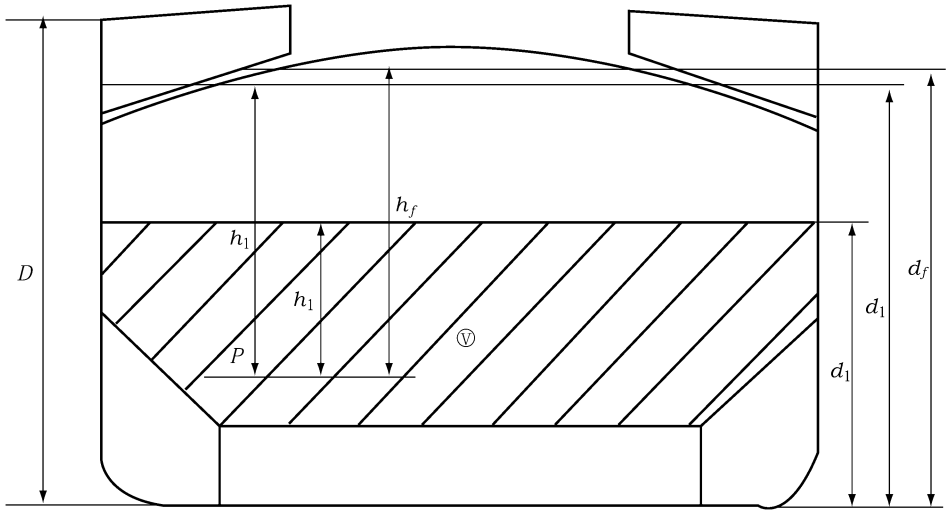

Fig 7.3.15 Measurement of d_1, d_f, h_1 and h_f

1202. Load model

1. General

(1) The loads to be considered as acting on the bulkheads are those given by the combination of the cargo loads with those induced by the flooding of one hold adjacent to the bulkhead under examination. In any case, the pressure due to the flooding water alone is to be considered.

(2) The most severe combinations of cargo induced loads and flooding loads are to be used for the check of the scantlings of each bulkhead, depending on the loading conditions included in the loading manual :

(a) homogeneous loading conditions;

(b) non-homogeneous loading conditions(considering the individual flooding of both loaded and empty holds);

(3) The specified design load limits for the cargo holds are to be represented by loading conditions defined by the Designer in the loading manual.

(4) Non-homogeneous part loading conditions associated with multiport loading and unloading operations for homogeneous loading conditions need not to be considered according to these requirements.

(5) Holds carrying packed cargoes are to be considered as empty holds for this application.

(6) Unless the ship is intended to carry, in non homogeneous conditions, only iron ore or cargo having bulk density equal or greater than 1.78 t/m^3, the maximum mass of cargo which may be carried in the hold shall also be considered to fill that hold volume up to the upper deck level at centreline.

2. Bulkhead corrugation flooding head

The flooding head h_f (See **Fig 7.3.15**) is the distance (m) measured vertically with the ship in the upright position, from the calculation point to a level located at a distance d_f(m) from the baseline equal to :

(1) For ships less than 50,000 tonnes deadweight with Type B freeboard

(a) for the foremost transverse corrugated bulkhead : $d_f = 0.95D$

(b) for the other bulkheads : $d_f = 0.85D$

(2) For ships less than 50,000 tonnes deadweight with Type B freeboard and the ship is to carry cargoes having bulk density less than 1.78 t/m^3 in non-homogeneous loading conditions.

(a) for the foremost transverse corrugated bulkhead : $d_f = 0.9D$

(b) for the other bulkheads : d_f = 0.8D

(3) In general

(a) for the foremost transverse corrugated bulkhead : d_f = D

(b) for the other bulkheads : d_f = 0.9D

(4) In (3), where the ship is to carry cargoes having bulk density less than 1.78 t/m^3 in non-homogeneous loading conditions.

(a) for the foremost transverse corrugated bulkhead : d_f = 0.95D

(b) for the other bulkheads : d_f = 0.85D

3. Pressure in the non-flooded bulk cargo loaded holds

(1) At each point of the bulkhead, the pressure P_c is given by :

$$P_c = \rho_c g h_1 \tan^2\gamma \quad (\mathrm{kN/m^2})$$

ρ_c = bulk cargo density ($\mathrm{t/m^3}$).

g = gravity acceleration (=9,81 $\mathrm{m/s^2}$).

h_1 = vertical distance (m), from the calculation point to horizontal plane corresponding to the level height of the cargo (See **Fig 7.3.15**), located at a distance d_1 (m) from the baseline.

γ = 45° - (ϕ / 2)

ϕ = angle of repose of the cargo, that may generally be taken as 35° for iron ore and 25° for cement.

(2) The force F_c acting on a corrugation is given by :

$$F_c = \rho_c g S_1 \frac{(d_1 - h_{DB} - h_{LS})^2}{2} \tan^2\gamma \quad (\mathrm{kN})$$

ρ_c, d_1, g and γ = as given above (1).

S_1 = spacing of corrugations (m) (See **Fig 7.3.16**).

h_{LS} = mean height of the lower stool from the inner bottom (m).

h_{DB} = height of the double bottom (m).

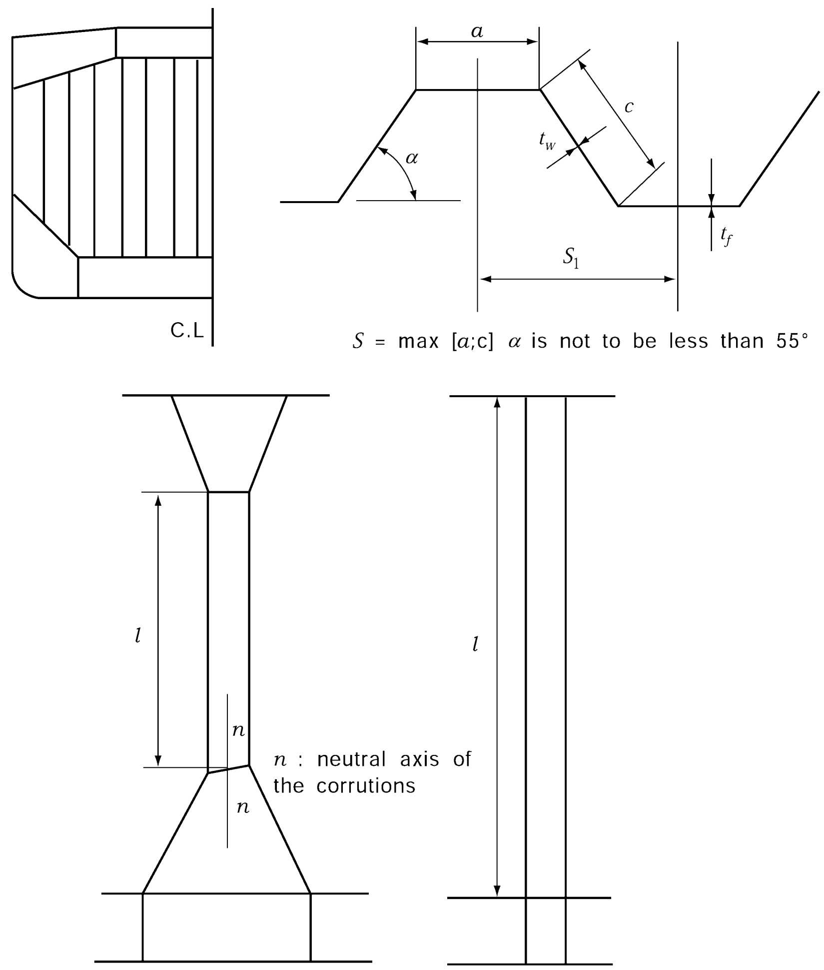

Fig 7.3.16 Measurement of S and l

4. Pressure in the flooded holds

(1) Bulk cargo holds

Two cases are to be considered, depending on the values of d_1 and d_f.

(a) $d_f \geq d_1$

(i) At each point of the bulkhead located at a distance between d_1 and d_f from the baseline, the pressure P_{cf} is given :

$$P_{cf} = \rho g h_f \quad (\mathrm{kN/m^2})$$

ρ = sea water density $(\mathrm{t/m^3})$.
g = as defined in **1202. Par 3.** (1).
h_f = flooding head as defined in **1202. Par 2.**

(ii) At each point of the bulkhead located at a distance lower than d_1 from the baseline, the pressure P_{cf} is given by :

$$P_{cf} = \rho g h_f + [\rho_c - \rho(1 - perm)]\, g h_1 \tan^2\gamma \quad (\mathrm{kN/m^2})$$

ρ and h_f = as defined in above (i).

ρ_c, g, h_1 and γ = as defined in **1202. Par 3.**

$perm$ = permeability of cargo, as defined in **1202. Par 1.**

(iii) The force F_{cf} acting on a corrugation is given by :

$$F_{cf} = S_1 \left[\frac{\rho g (d_f - d_1)^2}{2} + \frac{\rho g (d_f - d_1) + (P_{cf})_{le}}{2} (d_1 - h_{DB} - h_{LS}) \right] \quad (\mathrm{kN})$$

where,

ρ = as defined in (i).

S_1, g, d_1, h_{LS} and h_{DB} = as given in **Par 3.**

d_f = as given in **Par 2.**

$(P_{cf})_{le}$ = pressure at the lower end of the corrugation ($\mathrm{kN/m^2}$).

(b) $d_f < d_1$

(i) At each point of the bulkhead located at a distance between d_1 and d_f from the baseline, the pressure P_{cf} is given by :

$$P_{cf} = \rho_c g h_1 \tan^2 \gamma \quad (\mathrm{kN/m^2})$$

ρ_c, g, h_1 and γ = as given in above **Par 3.**

(ii) At each point of the bulkhead located at a distance lower than d_f from the baseline, the pressure, P_{cf}, is given by :

$$P_{cf} = \rho g h_f + [\rho_c h_1 - \rho (1 - perm) h_f] g \tan^2 \gamma \quad (\mathrm{kN/m^2})$$

where,

ρ, h_f and $perm$ = as given in above (a).

ρ_c, g, h_1 and γ = as given in above **Par 3.**

(iii) The force, F_{cf}, acting on a corrugation is given by :

$$F_{cf} = S_1 \left[\frac{\rho_c g (d_1 - d_f)^2}{2} \tan^2 \gamma + \frac{\rho_c g (d_1 - d_f) \tan^2 \gamma + (P_{cf})_{le}}{2} (d_f - h_{DB} - h_{LS}) \right] \quad (\mathrm{kN})$$

where,

ρ_c, S_1, g, d_1, γ, h_{DB} and h_{LS} = as given by above **Par 3.**

d_f = as given by above **Par 2.**

$(P_{cf})_{le}$ = pressure, at the lower end of the corrugation ($\mathrm{kN/m^2}$)

(2) Pressure in empty holds due to flooding water alone

At each point of the bulkhead, the hydrostatic pressure, P_f, induced by the flooding head, h_f, is to be considered. The force, F_f, acting on a corrugation is given by :

$$F_f = S_1 \rho g \frac{(d_f - h_{DB} - h_{LS})^2}{2} \quad (\mathrm{kN})$$

where,

ρ = as given by (1), (a), (i).

S_1, g, h_{DB} and h_{LS} = as given by **Par 3.**

d_f = as given by **Par 2.**

5. Resultant pressure and force

(1) Homogeneous loading conditions

(a) At each point of the bulkhead structures, the resultant pressure, P, to be considered for the scantlings of the bulkhead is given by ;

$$P = P_{cf} - 0.8P_c \quad (\mathrm{kN/m^2})$$

(b) The resultant force F, acting on a corrugation is given by ;

$$F = F_{cf} - 0.8F_c \quad (\mathrm{kN})$$

(2) Non-homogeneous loading conditions

(a) At each point of the bulkhead structures, the resultant pressure P, to be considered for the scantlings of the bulkhead is given by :

$$P = P_{cf} \quad (\mathrm{kN/m^2})$$

(b) The resultant force F, acting on a corrugation is given by :

$$F = F_{cf} \quad (kN)$$

1203. Bending moment and shear force in the bulkhead corrugations

The bending moment M and the shear force Q in the bulkhead corrugations are given by:

1. Bending moment

$$M = \frac{Fl}{8} \quad (\mathrm{kN\text{-}m})$$

F = resultant force, as given in **1202. Par 5.** (kN).

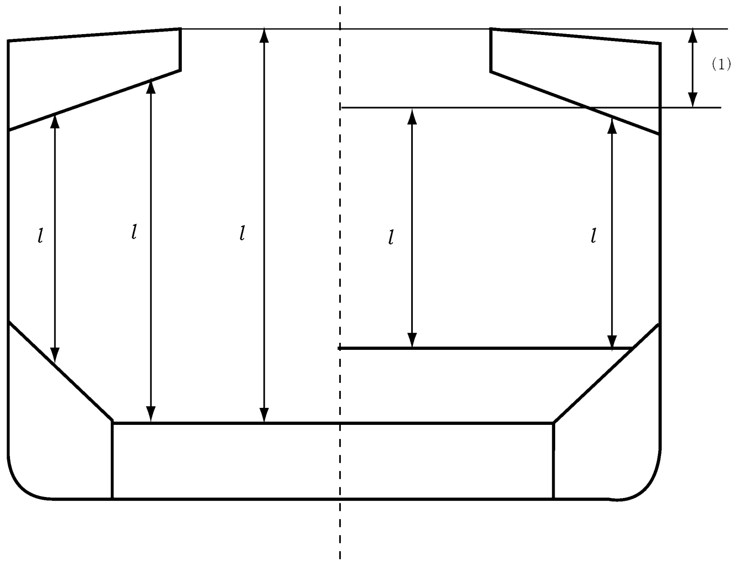
l = span of the corrugation (m) (See, **Fig 7.3.16** and **Fig 7.3.17**).

2. Shear force

The shear force Q, at the lower end of the bulkhead corrugations is given by :

$$Q = 0.8F \quad (\mathrm{kN})$$

F = as given in above **Par 1.**



(Note) (1) For the definition of l, the internal end of the upper stool is not to be taken more than a distance from the deck at the centerline equal to:
(1) For rectangular stool : 2 times the depth of corrugations.
(2) In general : 3 times the depth of corrugations.

Fig 7.3.17 Measurement of span l

1204. Strength criteria

1. General

The following criteria are applicable to transverse bulkheads with vertical corrugations (See **Fig 7.3.16**).

(1) For ships of 190 m of length and above, these bulkheads are to be fitted with a bottom stool, and generally with a top stool below deck. For smaller ships, corrugations may extend from inner bottom to deck.
(2) The corrugation angle(α) shown in **Fig 7.3.16** is not to be less than 55°.
(3) Requirements for local net plate thickness, $t_{\neq t}$ are given in **Par 7.** In addition, the criteria given in **Par 2** and **5** are to be complied with.
(4) The thicknesses of the lower part of corrugations considered in the application of **Par 2** and **3** are to be maintained for a distance from the inner bottom(if no lower stool is fitted) or the top of the lower stool not less than 0.15 l.
(5) The thicknesses of the middle part of corrugations as considered in the application of **Par 2** and **4** are to be maintained to a distance from the deck or the bottom of the upper stool not greater than 0.3 l.
(6) The section modulus of the corrugation in the remaining upper part of the bulkhead is not to be less than 75 % of that required for the middle part, corrected for different yield stresses.
(7) Lower stool
  (A) The height of the lower stool is generally to be not less than 3 times the depth of the corrugations. The thickness and material of the stool top plate is not to be less than those required for the bulkhead plating above.
  (B) The thickness and material of the upper portion of vertical or sloping stool side plating within the depth equal to the corrugation flange width from the stool top is not to be less than the required flange plate thickness and material to meet the bulkhead stiffness requirement at lower end of corrugation.
  (C) The thickness of the stool side plating and the section modulus of the stool side stiffeners is not to be less than the value given by the following formulae.
    (a) The thickness of the stool side plating

(i) $d_f \geq d_1$

$$t = CS\sqrt{h_1' K} + 2.5 \quad (\text{mm})$$

(ii) $d_f < d_1$

$$t = CS\sqrt{h_2' K} + 2.5 \quad (\text{mm})$$

where,

C = coefficient given by the following formula.

$$C = 3.825 C_1$$

C_1 = coefficient given by the following formula according to the value l/S.

$$1 \leq \frac{l}{S} < 3.5 \quad : \left(0.11\frac{l}{S} + 0.615\right)$$

$$3.5 \leq \frac{l}{S} \quad : 1.0$$

S = length of the shorter side of the panel enclosed by stiffeners, etc.
l = length of the longer side of the panel enclosed by stiffeners, etc.
h_1' and h_2' = as given in following formulae.

$$h_1' = h_f + \left\{\frac{\rho_c}{\rho} - (1 - perm)\right\} h_1 (\sin^2\beta \tan^2\gamma + \cos^2\beta)$$

$$h_2' = h_f + \left\{\frac{\rho_c}{\rho} h_1 - (1 - perm) h_f\right\} (\sin^2\beta \tan^2\gamma + \cos^2\beta)$$

β = slope angle of stool side plate (deg).
h_f = as given in **1202. Par 2.**
ρ_c, h_1 and γ = as given in **1202. Par 3.**
ρ = as given in **1202. Par 4.**
$perm$ = permeability of cargo, as defined in **1002. Par 1,** (3).

(b) The section modulus of the stool side vertical stiffeners

(i) $d_f \geq d_1$

$$Z = 7.8 KSh_1' l^2 \quad (\text{cm}^3)$$

(ii) $d_f < d_1$

$$Z = 7.8 KSh_2' l^2 \quad (\text{cm}^3)$$

where,

S = spacing of stiffeners (m).
l = unsupported length of stiffener (m).
h_1' and h_2' = as given in (a).

(D) The distance from the edge of the stool top plate to the surface of the corrugation flange is to be in accordance with **Fig 7.3.18.**

(E) The stool bottom is to be installed in line with double bottom floors and is to have a width not less than 2.5 times the mean depth of the corrugation. The stool is to be fitted with diaphragms in line with the longitudinal double bottom girders for effective support of the corrugated bulkhead. Scallops in the brackets and diaphragms in way of the connections to the stool top plate are to be avoided.

(F) Where corrugations are cut at the bottom stool, corrugated bulkhead plating is to be connected to the stool top plate by full penetration welds. The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or deep penetration welds.(See **Fig 7.3.20**) The supporting floors are to be connected to the inner bottom by either full penetration or deep penetration welds.(See **Fig 7.3.20**)

(G) The plating of the lower stool and supporting floors is generally to be connected to the inner bottom by full penetration welds.

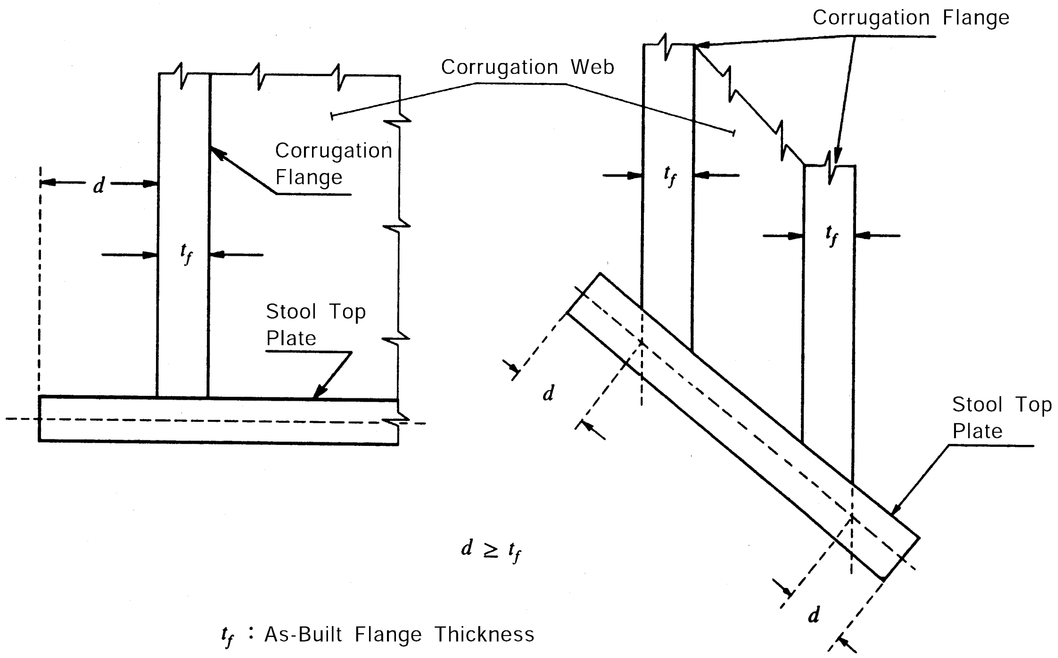


Fig 7.3.18 Permitted distance, d, from edge of stool top plate to surface of corrugation flange

(8) Upper stool

(A) The upper stool, where fitted, is to have a height generally between 2 and 3 times the depth of corrugations. Rectangular stools are to have a height generally equal to 2 times the depth of corrugations, measured from the deck level and at hatch side girder.

(B) The upper stool is to be properly supported by girders or deep brackets between the adjacent hatch-end beams.

(C) The width of the stool bottom plate is generally to be the same as that of the lower stool top plate. The stool top of non rectangular stools is to have a width not less then 2 times the depth of corrugations. The thickness and material of the stool bottom plate are to be the same as those of the bulkhead plating below.

(D) The thickness of the lower portion of stool side plating is not to be less than 80 % of that required for the upper part of the bulkhead plating where the same material is used.

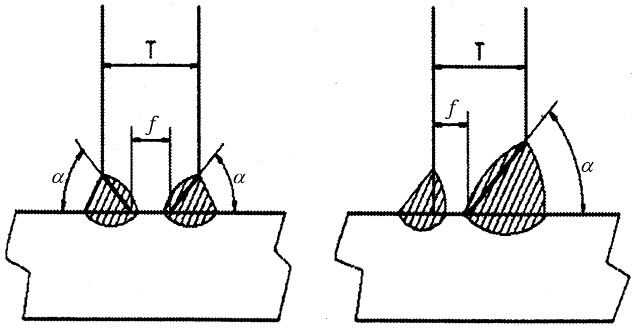
(E) The thickness of the stool side plating and the section modulus of the stool side stiffeners is not to be less than those required by the Society on the basis of the load model in (7), (C). The ends of stool side stiffener are to be attached to brackets at upper and lower end of the stool.

(F) Diaphragms are to be fitted inside the stool in line with and effectively attached to longitudinal deck girders extending to the hatch end coaming girders for effective support of the corrugated bulkhead. Scallops in the brackets and diaphragms in way of the connection to the stool bottom plate are to be avoided.

(9) Alignment

(A) At deck, if no stool is fitted, two transverse reinforced beams are to be fitted in line with the corrugation flanges.

(B) At bottom, if no stool is fitted, the corrugation flanges are to be in line with the supporting floors. Corrugated bulkhead plating is to be connected to the inner bottom plating by full penetration welds. The plating of supporting floors is to be connected to the inner bottom by either full penetration or deep penetration welds. (See **Fig 7.3.20**)



Root face (f) : 3 mm ~ T/3 mm
Groove Angle (α) : 40° ~ 60°

Fig 7.3.20 Welding methods

(C) The thickness and material properties of the supporting floors are to be at least equal to those provided for the corrugation flanges. Moreover, the cut-outs for connections of the inner bottom longitudinal to double bottom floors are to be closed by collar plates.

(D) The supporting floors are to be connected to each other by suitably designed shear plates, as deemed appropriate by the Society.

(E) Stool side plating is to align with the corrugation flanges and stool side vertical stiffeners and their brackets in lower stool are to align with the inner bottom longitudinals to provide appropriate load transmission between these stiffening members. Stool side plating is not to be knuckled anywhere between the inner bottom plating and the stool top.

2. Bending capacity and shear stress

(1) The bending capacity is to be comply with the following relationship :

$$\frac{M}{0.5Z_{le}\sigma_{a,le}+Z_m\sigma_{a,m}}\times 10^3 \leq 0.95$$

M = bending moment, as given in **1203. Par 1** (kN-m).

Z_{le} = section modulus of one half pitch corrugation, at the lower end of corrugations, as given in **Par 3** (cm^3).

Z_m = section modulus of one half pitch corrugation, at the mid-span of corrugations, as given in **Par 4** (cm^3).

$\sigma_{a,le}$ = allowable stress, as given in **Par 5,** for the lower end of corrugations (N/mm^2).

$\sigma_{a,m}$ = allowable stress, as given in **Par 5,** for the mid-span of corrugations (N/mm^2).

(A) In no case Z_m is to be taken greater than the lesser of 1.15 Z_{le} and 1.15 Z'_{le} for calculation of the bending capacity, Z'_{le} being defined below.

(a) In case shedder plates are fitted which :
- are not knuckled;
- are welded to the corrugations and the top of the lower stool by one side penetration weld or equivalent;
- are fitted with a minimum slope of 45° and their lower edge is in line with the stool side plating;

- have thicknesses not less than 75 % of that provided by the corrugation flange ;
- and material properties at least equal to those provided by the flanges.

(b) Or gusset plates are fitted which:
- are in combination with shedder plates having thickness, material properties and welded connections in accordance with the above requirements;
- have a height not less than half of the flange width;
- are fitted in line with the stool side plating;
- are generally welded to the top of the lower stool by full penetration welds, and to the corrugations and shedder plates by one side penetration welds or equivalent.
- have thickness and material properties at least equal to those provided for the flanges.

(B) The section modulus Z_{le}, is to be taken not larger than the value Z'_{le}, given by :

$$Z'_{le} = Z_g + \frac{Qh_g - 0.5\,h_g^2 S_1 P_g}{\sigma_a} \times 10^3 \quad (\text{cm}^3)$$

Z_g = section modulus of one half pitch corrugation calculated, according to **Par 4.** in way of the upper end of shedder or gusset plates, as applicable (cm^3).

Q = shear force, as given in **1203. Par 2.** (kN).

h_g = height of shedder or gusset plates (m), as applicable (See **Fig 7.3.19** (1), (2), (3) and (4)).

S_1 = as given in **1202. Par 3.**

P_g = resultant pressure, as defined in **1202. Par 5.** calculated in way of the middle of the shedder or gusset plates (kN/m^2), as applicable.

σ_a = allowable stress, as given in **Par 5.** (kN/m^2).

(2) Shear stress τ is obtained by dividing the shear force Q by the shear area. The shear area is to be reduced in order to account for possible non-perpendicularity between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by ($\sin\alpha$), α being the angle between the web and the flange.

(3) When calculating the section modulus and the shear area, the $t_{\neq t}$ plate thicknesses are to be used.

(4) The section modulus of corrugations are to be calculated on the basis of the following requirements given in **Par 3** and **4.**

3. Section modulus at the lower end of corrugations

The section modulus is to be calculated with the compression flange having an effective flange width, b_{ef}, not larger than as given in **Par 6.** If the corrugation webs are not supported by local brackets below the stool top (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30 % effective.

(1) Provided that effective shedder plates, as defined in above **Par 2** are fitted (See **Fig 7.3.19** (1) and (2)), when calculating the section modulus of corrugations at the lower end (cross-section ① in **Fig 7.3.19** (1) and (2)), the area of flange plates may be increased by $2.5a\sqrt{t_f t_{sh}}$ (not to be taken greater than $2.5\,at_f$).

a = width of the corrugation flange (m) (See **Fig 7.3.12**).

t_{sh} = net shedder plate thickness (mm).

t_f = net flange thickness (mm).

(2) Provided that effective gusset plates, as defined in above **Par 2** are fitted (See **Fig 7.3.19** (3) and (4)), when calculating the section modulus of corrugations at the lower end (cross-section ① in **Fig 7.3.19** (3) and (4)), the area of flange plates may be increased by $7\,h_g t_f$.

h_g = height of gusset plate (m), see **Fig 7.3.19** (3) and (4), not to be taken greater than

$\frac{10}{7} S_{gu}$

S_{gu} = width of the gusset plates (m).

t_f = net flange thickness based on the as built condition (mm).

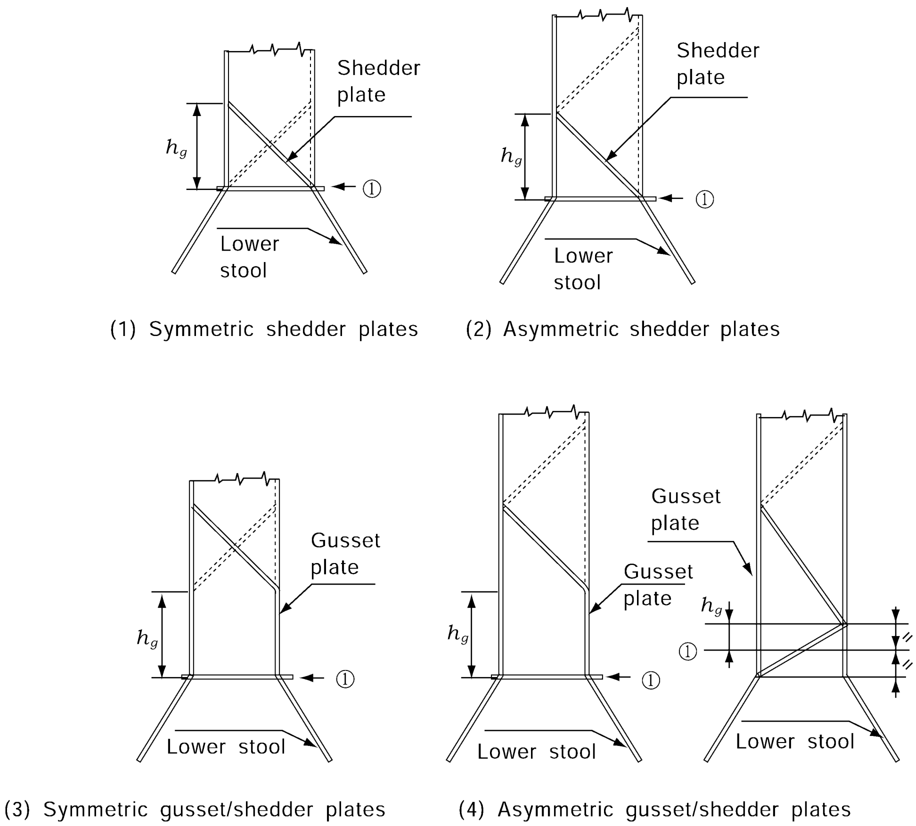


Fig. 7.3.19 Shedder plate and gusset plate

(3) If the corrugation webs are welded to a sloping stool top plate, which have an angle not less than 45° with the horizontal plane, the section modulus of the corrugations may be calculated considering the corrugation webs fully effective. In case effective gusset plates are fitted, when calculating the section modulus of corrugations the area of flange plates may be increased as specified in above (2). No credit can be given to shedder plates only. For angles less than 45°, the effectiveness of the web may be obtained by linear interpolation between 30 % for 0° and 100 % for 45°.

4. Section modulus of corrugations at cross-sections other than the lower end

The section modulus is to be calculated with the corrugation webs considered effective and the compression flange having an effective flange width, b_{ef}, not larger than as given in **Par 6.**

5. Allowable stress check

The normal and shear stresses σ and τ are not to exceed the allowable values σ_a and τ_a given by:

$$\sigma_a = \sigma_y \quad (\text{N/mm}^2)$$

$$\tau_a = 0.5\sigma_y \quad (\text{N/mm}^2)$$

σ_y = the minimum upper yield stress of the material (N/mm^2).

6. Effective compression flange width and shear buckling checks

(1) Effective width of the compression flange of corrugations
The effective width b_{ef} of the corrugation flange is given by :

$$b_{ef} = C_e \alpha \quad (\text{m})$$

$$\beta > 1.25 \ : \ C_e = \frac{2.25}{\beta} - \frac{1.25}{\beta^2}$$

$$\beta \leq 1.25 \ : \ C_e = 1.0$$

$$\beta = \frac{a}{t_f}\sqrt{\frac{\sigma_y}{E}} \times 10^3$$

where,

t_f = net flange thickness (mm).

α = width of the corrugation flange (m) (See **Fig 7.3.16**)

σ_y = the minimum upper yield stress of the material (N/mm^2).

E = modulus of elasticity of the material (N/mm^2) to be assumed equal to 2.06×10^5 for steel.

(2) Shear
The buckling check is to be performed for the web plates at the corrugation ends. The shear stress τ is not to exceed the critical value τ_c , as given by the following formulae.

$$\tau_c = \tau_E \qquad : \quad \tau_E \leq 0.5\tau_y$$

$$\tau_c = \tau_y\left(1 - \frac{\tau_y}{4\tau_E}\right) \qquad : \quad \tau_E > 0.5\tau_y$$

where,

τ_y = shear stress of material, in N/mm^2, t_y is to be determined as $\sigma_y/\sqrt{3}$

τ_E = ideal elastic buckling stress is determined as following :

$$\tau_E = 0.9 k_t E\left(\frac{t}{1000c}\right)^2 \quad (\text{N/mm}^2)$$

$k_t = 6.34$

t = net thickness of corrugation web (mm).

c = width of corrugation web (m). (See, **Fig 7.3.16**)

σ_y and E = as given in above (1).

7. Local net plate thickness

(1) The bulkhead local net plate thickness t_{net} is given by :

$$t_{net} = 14.9 S_w \sqrt{\frac{1.05P}{\sigma_y}} \quad (\text{mm})$$

where,

S_w = plate width, to be taken equal to the width of the corrugation flange or web, whichever is the greater (m) (See **Fig 7.3.16**).

P = resultant pressure as defined in **1202. Par 5,** at the bottom of each strake of plating, in all cases, the net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool, or at the inner bottom, if no lower stool is fitted or at the top of sheddres, if shedders or gusset/shedder plates are fitted (kN/m^2).

σ_y = minimum upper yield stress of the material (kN/m^2).

(2) For built-up corrugation bulkheads, when the thicknesses of the flange and web are different,

(A) The net thickness of the narrower plating is to be not less than t_n, given by :

$$t_n = 14.9 S_n \sqrt{\frac{1.05P}{\sigma_y}} \quad (\text{mm})$$

where,

S_n = the width of the narrow plating (m).

P and σ_y = as given in (1).

(B) The net thickness of the wider plating is not to be taken less than the maximum of the following values :

$$t_{w1} = 14.9 S_w \sqrt{\frac{1.05P}{\sigma_y}} \quad (\text{mm})$$

$$t_{w2} = \sqrt{\frac{440\,S_w^2 \times 1.05\,P}{\sigma_y} - t_{np}^2} \quad (\text{mm})$$

where,

t_{np} = not to be more than the smaller value of the actual net thickness of the narrower plating and t_{w1}.

S_w = the breath of the wider plating (m).

P and σ_y = as given in (1).

1205. Local details

1. As applicable, the design of local details is to be designed such that transferring the corrugated bulkhead forces and moments to the boundary structures, in particular to the double bottom and cross-deck structures, is sufficient.

2. In particular, the thickness and stiffening of effective gusset and shedder plates is to comply with the Society requirement, on the basis of the load model in **1204. Par 2.**

1206. Corrosion addition

The corrosion addition t_s is to be taken equal to 3.5 mm.

Section 13 Requirements for the Fitting of a Forecastle for Bulk Carriers, Ore Carriers and Combination Carriers

1301. Application and definitions

These requirements apply to all bulk carriers, ore carriers and combination carriers which are contracted for construction on or after 1 January 2004. Such ships are to be fitted with an enclosed forecastle on the freeboard deck. The required dimensions of the forecastle are defined in **1302.**
The structural arrangements and scantlings of the forecastle are to be determined at the discretion of the Society.

1302. Dimensions

1. The forecastle is to be located on the freeboard deck with its an bulkhead fitted in way or aft of the forward bulkhead of the foremost hold, as shown in **Fig 7.3.21.**

However, if this requirements hinders hatch cover operation, the aft bulkhead of the forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7% of the ship length abaft the forward perpendicular where the ship length and forward perpendicular are defined in the International Convention of Load Line 1966 and its Protocol 1988.

2. The forecastle height H_F above the main deck is to be not less than:

-the standard height of a superstructure as specified in the International Convention on Load Line 1966 and its Protocol of 1988,
-$H_C + 0.5\,\mathrm{m}$, where is the height of the forward transverse hatch coaming of cargo hold No.1,
whichever is the greater.

3. All points of the aft edge of the forecastle deck are to be located at a distance l_F:
$l_F \leq 5\sqrt{H_F - H_C}$ from the hatch coaming plate in order to apply the reduced loading to the No.1 forward transverse hatch coaming and No.1 hatch cover in applying **Sec. 9. 904. 1.** and **905. 2.**

4. A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centre line is not less than $H_B/\tan 20°$ forward of the aft edge of the forecastle deck, where h_B is the height of the breakwater above the forecastle (see **Fig 7.3.21**).

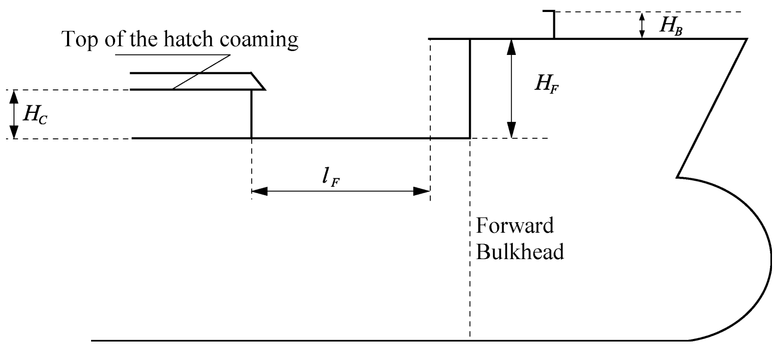

Fig 7.3.21

Section 14 Water Level Detection & Alarms and Drainage & Pumping Systems for Bulk Carriers and Single Hold Cargo Ships

1401. General

Arrangements, testing and etc. for water level detectors, alarms and drainage, pumping systems required by **1403.** and **1404.** are to be followed in accordance with the requirements specified by the Society.

1402. Application

The requirements of this section apply to the ships of 500 tons gross tonnage and above and engaged on international voyage as follows;

1. A ship which is constructed before 1 July 2006 and constructed generally with single deck, top-side tanks and hopper side tanks in cargo spacs, and is intended primarily to carry dry cargo in bulk, and includes such types as ore carriers and combination carriers and a ship which is constructed on or after 1 July 2006 and is intended primarily to carry dry cargo in bulk, and includes such types as ore carriers and combination carriers(hereinafter referred to as 「Bulk carrier」) are to be installed relevant systems in accordance with the requirements in **1403. 1** and **1404.**

2. Cargo ships other than bulk carriers having a single cargo hold below the freeboard deck or cargo holds below the freeboard deck which are not separated by at least one bulkhead made watertight up to the deck(hereinafter referred to as「Single hold cargo ship」) and come fall under following (1) or (2) are to be installed relevant systems in accordance with the requirements of **1403. 3.**

(1) Ships having a length(L) of less than 80 m if constructed on or after 1 July 1998
(2) Ships having a length(L) of less than 100 m if constructed before 1 July 1998

However, the water level detectors required by **1403. 3** need not be fitted in ships fitted with water level detectors complying with the requirements in **1403. 1**, or in ships having suitable width watertight side compartments each side of the cargo hold length extending vertically at least from inner bottom to freeboard deck.

Ships constructed before 1 January 2007 are to be in accordance with the requirements in **Pt 1, Ch.2, 1602.**

1403. Water level detectors, alarms and etc.

1. Water level detectors, audible and visual alarms are to be fitted in each cargo hold, ballast tanks forward of the collision bulkhead, dry space and void space other than a chain cable locker, any part of which extends forward of the foremost cargo hold for bulk carriers.

2. Such alarms specified in **Par. 1** need not be provided in enclosed spaces the volume of which does not exceed 0.1% of the ship‘s maximum displacement volume.

3. Single hold cargo ships having a length(L) of less than 80 m(ships having a length(L) of less than 100 m if constructed before 1 July 1998) are to be fitted with water level detectors, audible and visual alarms in cargo hold. And ships having cargo holds below the freeboard deck which are not separated by at least one bulkhead made watertight up to the deck are to be fitted with water level detectors, audible and visual alarms in each cargo hold.

4. The audible and visual alarms specified in **Par. 1** and **3** shall be located on the navigation bridge.

1404. Draining and pumping system

1. Means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces in any part of which extends forward of the foremost cargo hold are to be provided.

2. Means for draining and pumping specified in **Par. 1** brought into operation from a readily accessible enclosed space, the location of which is accessible from the navigation bridge or propulsion machinery control position without traversing exposed freeboard or superstructure decks.

Section 15 Supplementary Provisions for Carriage of Liquid in Holds

1501. General

1. Bulk carriers whose holds are loaded with cargo oil (hereinafter referred to as "B/O Carriers") are to be in accordance with the requirements in this Section and also those for oil tankers.

2. Other important items required for B/O carriers than those specified in this Section are to be at the discretion of the Society.

3. Where holds are loaded with cargo oil or ballast water, the scantlings of plates, stiffeners and girders composing bilge hopper tanks, topside tanks, transverse bulkheads and their stools as well as side structures are not to be less than those obtained from the relevant formulae, where the value of h specified in **Pt 3, Ch 15, 105.** is applied. The scantlings of structural members of double bottom under holds loaded with ballast are to be at the discretion of the Society.

4. When ships are designed to transport alternatively oil having a flash point below 60°C (closed cup test) or dry cargoes, openings which may be used for cargo operations are not permitted in bulkheads and decks separating oil cargo spaces from other spaces not designed and equipped for the carriage of oil cargoes unless alternative approved means are provided to ensure equivalent integrity.

1502. Holds half-loaded with cargo oils

Where holds are half-loaded with cargo oils, special care is to be taken to avoid synchronization of the natural period of oscillation of liquid in the holds with the natural periods of rolling and pitching of the ship. Where synchronization is not avoidable, plating, stiffeners and girders of transverse bulkheads and topside tanks are to be specially strengthened.

Section 16 Electrical Equipment of Coal Carriers

1601. General

The requirements in this Section apply to the electrical equipment installed in the cargo holds and the compartments adjacent thereto of coal carriers.

1602. Dangerous spaces

The following spaces and zones are dangerous spaces, therefore no electrical equipment except those of explosion protected type is to be installed
(1) Enclosed cargo holds
(2) Ventilation ducts for cargo holds

1603. Electrical equipment

1. Electrical equipment in cargo hold

In principle no electrical equipment is to be installed in the cargo holds. Where it is inevitable to install electrical equipment in the holds, the equipment is to comply with the following requirements:

(1) Switches and socket-outlets are not to be installed except those connected to intrinsically safe circuits.
(2) In case where other electrical equipment than those specified in (1) above is inevitably installed, the equipment and its associated cables are to be installed so as to be kept from mechanical damage. In addition, the feeder circuits for the equipment are to be provided with multipole linked isolating switches situated outside the holds, so deviced as to have the equipment usually locked with the switch in "off" position.
(3) The cables passing through the cargo holds are to be led in gastight heavy gauge steel pipes, and the both ends of the pipes are to be sealed using cable glands and the like in way of the boundaries of the cargo holds.

2. Electrical equipment in the compartments adjacent to cargo holds

The electrical equipment which is installed in the compartments adjacent to the cargo holds and having an opening such as non-gastight door, hatch and like in their bulkheads and decks is to be of explosion protected type accepted by the Society.

3. Cargo lamps

Cargo lamps to be led and used in the cargo holds are to be the types accepted by the Society.

Section 17 Renewal Criteria for Side Shell Frames and Brackets in Single Side Skin Bulk Carriers and Single Side Skin OBO Carriers

1701. Application and definitions

1. These requirements apply to the side shell frames and brackets of cargo holds bounded by the single side shell of bulk carriers constructed with single deck, topside tanks and hopper tanks in cargo spaces intended primarily to carry dry cargo in bulk, which were not built in accordance with **Ch 3, Sec. 7.**

2. In addition, these requirements also apply to the side shell frames and brackets of cargo holds bounded by the single side shell of Oil/Bulk/Ore(OBO) carriers, as defined in **Pt 1, Annex 1-1** of the Guidance relating to the Rules but of single side skin construction.

3. In the case a vessel as defined above does not satisfy above definition in one or more holds, the requirements in this section do not apply to these individual holds.

4. For the purpose of this section, "ships" means both "bulk carriers" and "OBO carriers" as defined above, unless otherwise specified.

5. Bulk carriers subject to these requirements are to be assessed for compliance with the requirements of this rules, the details of these requirements to be followed **Pt 1, Ch 3, 201.** (4) (A).

6. OBO carriers subject to these requirements are to be assessed for compliance with the requirements of this rules, the details of these requirements to be followed **Pt 1, Ch 3, 201.** (4) (B).

7. These requirements define steel renewal criteria or other measures to be taken for the webs and flanges of side shell frames and brackets as per **1702.**

8. Reinforcing measures of side frames are also defined as per **1702. 3.**

9. Finite element or other numerical analysis or direct calculation procedures cannot be used as an alternative to compliance with the requirement of this rule, except in cases off unusual side structure arrangements or framing to which the requirements of this rule cannot be directly applied.

10. Ice strengthened ships

(1) Where ships are reinforced to comply with an ice class notation the intermediate frames are not to be included when considering compliance with this rule
(2) The renewal thicknesses for the additional structure required to meet the ice strengthening notation are to be based on **Pt 3, Ch 20.**
(3) If the ice class notation is requested to be withdrawn, the additional ice strengthening structure, with the exception of tripping brackets (see **1702. 1.** (2) (A) (b) and **1702. 3.**), is not considered to contribute to compliance with this requirement.

1702. Renewal or other measures

1. Criteria for renewal or other measures

(1) Symbols

t_M = thickness as measured, in mm

t_{REN} = thickness at which renewal is required. See **1702. 1.** (2).

$t_{REN,d/t}$ = thickness criteria based on d/t ratio. See **1702. 1.** (2) (A)

$t_{REN,S}$ = thickness criteria based on strength. See **1702. 1.** (2) (B)

t_{COAT} = $0.75 t_{S12}$

t_{S12} = thickness in mm as required by **Ch 3, 106. 3., 4.** for frame webs and by **Ch 3, 702.** for upper and lower brackets webs

t_{AB} = thickness as built, in mm

t_C = See **Table 7.3.12** below

Table 7.3.12 t_C **Values, in** mm

Ship's length L, in m	Hold other than No.1		Hold No.1	
	Span and upper brackets	Lower brackets	Span and upper brackets	Lower brackets
≤100	2.0	2.5	2.0	3.0
150	2.0	3.0	3.0	3.5
≥200	2.0	3.0	3.0	4.0
Note: For intermediate ship lengths, t_C is obtained by linear interpolation between the above values.				

(2) Criteria for webs (Shear and other checks)
The webs of side shell frames and brackets are to be renewed when the measured thickness (t_M) is equal to or less than the thickness (t_{REN}) as defined below:

t_{REN} is the greatest of:

(a) $t_{COAT} - t_C$

(b) $0.75\, t_{AB}$

(c) $t_{REN,d/t}$ (applicable to Zone A and B only)

(d) $t_{REN,S}$ (where required by **1702. 1.** (2) (B))

(A) Thickness criteria based on d/t ratio
Subject to (b) and (c) below, $t_{REN,d/t}$ is given by the following equation:

$$t_{REN,d/t} = (\text{web depth in mm})\ /R$$

where:

R = for frames

$65\, k^{0.5}$ for symmetrically flanged frames

$55\, k^{0.5}$ for asymmetrically flanged frames

for lower brackets (see (a) below):

$87\, k^{0.5}$ for symmetrically flanged frames

$73\, k^{0.5}$ for asymmetrically flanged frames

k = According to **Pt 3, Ch 1, Sec. 4.**

In no instance is $t_{REN,d/t}$ for lower integral brackets to be taken as less than $t_{REN,d/t}$ for the frames they support.

(a) Lower brackets
Lower brackets are to be flanged or face plate is to be fitted.
In calculating the web depth of the lower brackets, the following will apply:

The web depth of lower bracket may be measured from the intersection of the sloped bulkhead of the hopper tank and the side shell plate, perpendicularly to the face plate of the lower bracket (see **Fig 7.3.24**).
Where stiffeners are fitted on the lower bracket plate, the web depth may be taken as the distance between the side shell and the stiffener, between the stiffeners or between the outermost stiffener and the face plate of the brackets, whichever is the greatest.

(b) Tripping bracket alternative

When t_M is less than $t_{REN,d/t}$ at section b) of the side frames, tripping brackets in accordance with **1702. 3**. may be fitted as an alternative to the requirements for the web depth to thickness ratio of side frames, in which case $t_{REN,d/t}$ may be disregarded in the determination of t_{REN} in accordance with **1702. 1.** (2).

(c) Immediately abaft collision bulkhead
For the side frames, including the lower bracket, located immediately abaft the collision bulkheads, whose scantlings are increased in order that their moment of inertia is such to avoid undesirable flexibility of the side shell, when their web as built thickness t_{AB} is greater than $1.65t_{REN,S}$, the thickness $t_{REN,d/t}$ may be taken as the value $t'_{REN,d/t}$ obtained from the following equation:

$$t'_{REN,d/t} = \sqrt[3]{t^2_{REN,d/t} \quad t_{REN,S}}$$

where, $t_{REN,S}$ is obtained from **1703. 3.**

(B) Thickness criteria based on shear strength check
Where t_M in the lower part of side frames, as defined in **Fig 7.3.22**, is equal to or less than t_{COAT}, $t_{REN,S}$ is to be determined in accordance with **1703. 3.**

(C) Thickness of renewed webs of frames and lower brackets
Where steel renewal is required, the renewed webs are to be of a thickness not less than t_{AB}, $1.2t_{COAT}$ or $1.2t_{REN}$, whichever is the greatest.

(D) Criteria for other measures
When $t_{REN} < t_M < t_{COAT}$, measures are to be taken, consisting of all the following:
(a) sand blasting, or equivalent, and coating (see **1702. 2.**),
(b) fitting tripping brackets (see **1702. 3.**), when the above condition occurs for any of the side frame zones A, B, C and D, shown in **Fig 7.3.22**, and
(c) maintaining the coating in "as-new" condition (i.e. without breakdown or rusting) at Special and Intermediate Surveys.

The above measures may be waived if the structural members show no thickness diminution with respect to the as built thicknesses and coating is in "as-new" condition (i.e. without breakdown or rusting).
When the measured frame webs thickness t_M is such that $t_{REN} < t_M < t_{COAT}$ and the coating is in GOOD condition, sand blasting and coating as required in (a) above may be waived even if not found in "as-new"condition, as defined above, provided that tripping brackets are fittted and the coating damaged in way of the tripping bracket welding is repaired.

(3) Criteria for frames and brackets (Bending check)
Where the length or depth of the lower bracket does not meet the requirements in **Ch 3, Sec. 7.**, a bending strength check in accordance with **1703. 4.** is to be carried out and renewals or reinforcements of frames and/or brackets effected as required therein.

2. Thickness measurements, steel renewal, sand blasting and coating

(1) For the purpose of steel renewal, sand blasting and coating, four zones A, B, C and D are defined, as shown in **Fig 7.3.22.**
(2) Representative thickness measurements are to be taken for each zone and are to be assessed against the criteria in **1702. 1.**
(3) In case of integral brackets, when the criteria in **1702. 1.** are not satisfied for zone A or B, steel renewal, sand blasting and coating, as applicable, are to be done for both zones A and B.

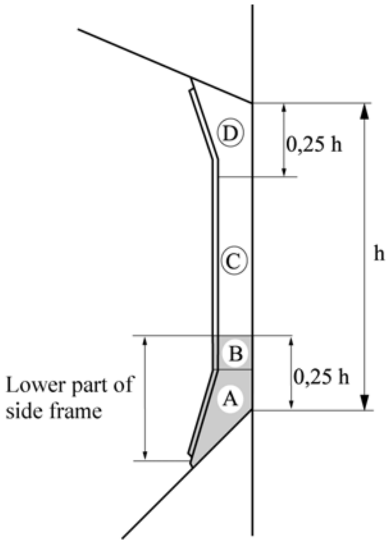

Fig 7.3.22 Lower part and zones of side frames

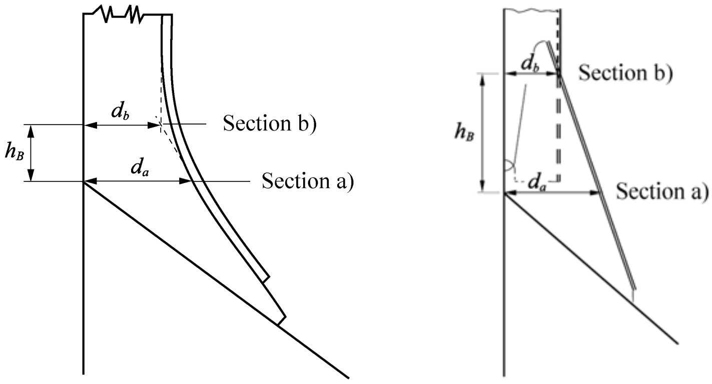

d_a = lower bracket web depth for determining $t_{REN,S}$

d_b = frame web depth

h_B = lower bracket length

Fig 7.3.23 Sections a) and b)

(4) In case of separate brackets, when the criteria in **1702. 1.** are not satisfied for zone A or B, steel renewal, sand blasting and coating is to be done for each one of these zones, as applicable.

(5) When steel renewal is required for zone C according to **1702. 1.**, it is to be done for both zones B and C. When sand blasting and coating is required for zone C according to **1702. 1.**, it is to be done for zones B, C and D.

(6) When steel renewal is required for zone D according to **1702. 1.**, it needs only to be done for this zone. When sand blasting and coating is required for zone D according to **1702. 1.**, it is to be done for both zones C and D.

(7) Special consideration may be given by the Society to zones previously renewed or recoated, if found in "as-new" condition (i.e., without breakdown or rusting).

(8) When adopted, on the basis of the renewal thickness criteria in **1702. 1.**, in general coating is to be applied in compliance with the requirements of **Ch 3, 107.,** as applicable.

(9) Where, according to the requirements in **1702. 1.**, a limited number of side frames and brackets are shown to require coating over part of their length, the following criteria apply.

(A) The part to be coated includes:

- the web and the face plate of the side frames and brackets,

- the hold surface of side shell, hopper tank and topside tank plating, as applicable, over a width not less than 100 mm from the web of the side frame.

(B) Epoxy coating or equivalent is to be applied.

(10) In all cases, all the surfaces to be coated are to be sand blasted prior to coating application.

(11) When flanges of frames or brackets are to be renewed according to this rule, the outstanding breadth to thickness ratio is to comply with the requirements in **Ch 3, 701. 8.**

3. Reinforcing measures

(1) Reinforcing measures are constituted by tripping brackets, located at the lower part and at mid-span of side frames (see **Fig 7.3.25**). Tripping brackets may be located at every two frames, but lower and midspan brackets are to be fitted in line between alternate pairs of frames.

(2) The thickness of the tripping brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.

(3) Double continuous welding is to be adopted for the connections of tripping brackets to the side shell frames and shell plating.

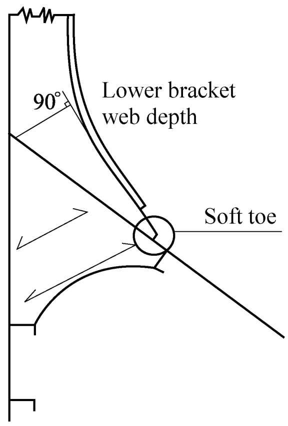

Fig 7.3.24 Definition of the lower bracket web depth for determining $t_{REN,d/t}$

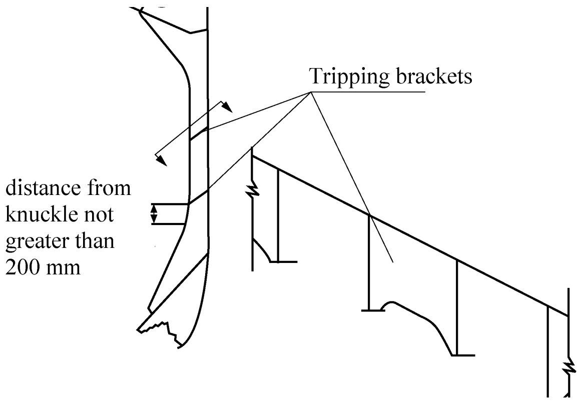

Fig 7.3.25 Tripping brackets

4. Weld throat thickness

In case of steel renewal the welded connections are to comply with **Ch 3, 702. 4.**

5. Pitting and grooving

(1) If pitting intensity is higher than 15% in area (see **Fig 7.3.26**), thickness measurement is to be taken to check pitting corrosion.

(2) The minimum acceptable remaining thickness in pits or grooves is equal to:

- 75% of the as built thickness, for pitting or grooving in the frame and brackets webs and flanges
- 70% of the as built thickness, for pitting or grooving in the side shell, hopper tank and top-side tank plating attached to the side frame, over a width up to 30 mm from each side of it.

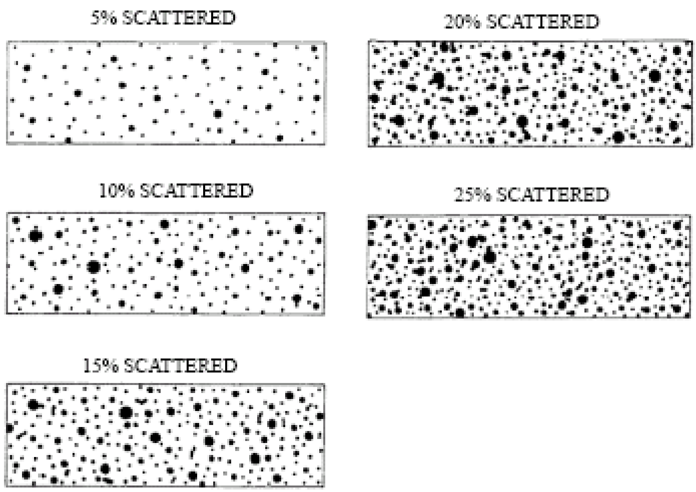

Fig 7.3.26 Pitting intensity diagrams (from 5% to 25% intensity)

6. Renewal of all frames in one or more cargo holds

When all frames in one or more holds are required to be renewed according to this rule, the compliance with the requirements in **Ch 3, Sec. 7.** may be accepted in lieu of the compliance with the requirements in this rule, provided that:

- It is applied at least to all the frames of the hold(s)
- The coating requirements for side frames of "new ships" are complied with
- The section modulus of side frames is calculated according to this Society's rules.

1703 Strength check criteria

In general, loads are to be calculated and strength checks are to be carried out for the aft, middle and forward frames of each hold. The scantlings required for frames in intermediate positions are to be obtained by linear interpolation between the results obtained for the above frames.
When scantlings of side frames vary within a hold, the required scantlings are also to be calculated for the mid frame of each group of frames having the same scantlings. The scantlings required for frames in intermediate positions are to be obtained by linear interpolation between the results obtained for the calculated frames.

1. Load model

(1) Forces

The forces $P_{fr,a}$ and $P_{fr,b}$, in kN, to be considered for the strength checks at sections a) and b) of side frames (specified in **Fig 7.3.23**; in the case of separate lower brackets, section b) is at the top of the lower bracket), are given by:

$$P_{fr,a} = P_S + \max(P_1, P_2)$$

$$P_{fr,b} = P_{fr,a}\frac{h-2h_B}{h}$$

where,

P_S = still water force, in kN

- when the upper end of the side frame span h (see **Fig 7.3.22**) is below the load water line

$$P_S = Sh\left(\frac{p_{S,U}+p_{S,L}}{2}\right)$$

- when the upper end of the side frame span h (see **Fig 7.3.22**) is at or above the load water line

$$P_S = Sh'\left(\frac{p_{S,L}}{2}\right)$$

P_1 = wave force, in kN, in head sea

$$= Sh\left(\frac{p_{1,U}+p_{1,L}}{2}\right)$$

P_2 = wave force, in kN, in beam sea

$$= Sh\left(\frac{p_{2,U}+p_{2,L}}{2}\right)$$

h, h_B = side frame span and lower bracket length, in m, defined in **Fig 7.3.22** and **7.3.23**, respectively

h' = distance, in m, between the lower end of side frame span h (see **Fig 7.3.22**) and the load water line

S = frame spacing, in m

$p_{S,U}$, $p_{S,L}$ = still water pressure, in kN/m^2, at the upper and lower end of the side frame span h (see **Fig 7.3.22**), respectively

$p_{1,U}$, $p_{1,L}$ = wave pressure, in kN/m^2, as defined in **1703. 1.** (2) (A) below for the upper and lower end of the side frame span h, respectively

$p_{2,U}$, $p_{2,L}$ = wave pressure, in kN/m^2, as defined in **1703. 1.** (2) (B) below for the upper and lower end of the side frame span h, respectively

(2) Wave Pressure

(A) Wave pressure p_1

The wave pressure p_1, in kN/m^2, at and below the waterline is given by:

$$p_1 = 1.50\left[p_{11} + 135\frac{B}{2(B+75)} - 1.2(T-z)\right]$$

$$p_{11} = 3k_s C + k_f$$

The wave pressure p_1, in kN/m^2, above the water line is given by:

$$p_1 = p_{1wl} - 7.50(z-T)$$

(B) Wave pressure p_2

The wave pressure p_2, in kN/m^2, at and below the waterline is given by

$$p_2 = 13.0\left[0.5B\frac{50C_r}{2(B+75)} + C_b\frac{0.5B+k_f}{14}(0.7+2\frac{z}{T})\right]$$

The wave pressure p_2, in kN/m^2, above the water line is given by:

$$p_2 = p_{2wl} - 5.0(z-T) \quad (\mathrm{kN/m^2})$$

where,

p_{1wl}= p_1 wave sea pressure at the waterline

p_{2wl}= p_2 wave sea pressure at the waterline

L = Rule length, in m, as defined in **Pt 3, Ch 1**

B = greatest moulded breadth, in m

C_b = block coefficient, as defined in **Pt 3, Ch 1**, but not to be taken less than 0.6

T = maximum design draught, in m

C = coefficient

$$= 10.75 - \left(\frac{300-L}{100}\right)^{1.5} \qquad \text{for } 90 \le L \le 300\ \mathrm{m}$$

= 10.75 for $L > 300$ m

$C_r = \left(1.25 - 0.025 \frac{2k_r}{\sqrt{GM}}\right) k$

k = 1.2 for ships without bilge keel

= 1.0 for ships with bilge keel

k_r = roll radius of gyration.

If the actual value of k_r is not available

= 0.39B for ships with even distribution of mass in transverse section (e.g. alternate heavy cargo loading or homogeneous light cargo loading)

= 0.25B for ships with uneven distribution of mass in transverse section (e.g. homogeneous heavy cargo distribution

GM = 0.12B if the actual value of GM is not available

z = vertical distance, in m, from the baseline to the load point

k_s = $C_b + \frac{0.83}{\sqrt{C_b}}$ at aft end of L

= C_b between 0.2L and 0.6L from aft end of L

= $C_b + \frac{1.33}{\sqrt{C_b}}$ at forward end of L

Between the above specified points, k_s is to be interpolated linearly.

k_f = $0.8C$

2. Allowable stresses

The allowable normal and shear stresses σ_a and τ_a, in N/mm^2, in the side shell frames and brackets are given by:

$$\sigma_a = 0.9\sigma_y$$
$$\tau_a = 0.4\sigma_y$$

where σ_y is the minimum upper yield stress, in N/mm^2, of the material.

3. Shear strength check

(A) Where t_M in the lower part of side frames, as defined in **Fig 7.3.22**, is equal to or less than t_{COAT}, shear strength check is to be carried out in accordance with the following.

(B) The thickness $t_{REN,S}$, in mm, is the greater of the thicknesses $t_{REN,Sa}$ and $t_{REN,Sb}$ obtained from the shear strength check at sections a) and b) (see **Fig 7.3.23** and **1703. 1.**) given by the following, but need not be taken in excess of $0.75t_{S12}$.

- at section a) : $t_{REN,Sa} = \frac{1000\,k_s P_{fr,a}}{d_a \sin\phi\, \tau_a}$ (mm)
- at section b) : $t_{REN,Sa} = \frac{1000\,k_s P_{fr,b}}{d_b \sin\phi\, \tau_a}$ (mm)

where:

k_s : shear force distribution factor, to be taken equal to 0,6

$P_{fr,a}$, $P_{fr,b}$: pressures forces defined in **1703. 1.**

d_a, d_b : bracket and frame web depth, in mm, at sections a) and b), respectively (see **Fig**

7.3.23); in case of separate (non integral) brackets, d_b is to be taken as the minimum web depth deducing possible scallops

ϕ : angle between frame web and shell plate

τ_a : allowable shear stress, in $\mathrm{N/mm^2}$, defined in **1703. 2.**

4. Bending strength check

(1) Where the lower bracket length or depth does not meet the requirements in **Pt 7, Ch 3, Sec. 7**, the actual section modulus, in $\mathrm{cm^3}$, of the brackets and side frames at sections a) and b) is to be not less than:

- at section a) : $Z_a = \dfrac{1000 P_{fr,a} h}{m_a \sigma_a} \quad (\mathrm{cm^3})$
- at section b) : $Z_b = \dfrac{1000 P_{fr,a} h}{m_b \sigma_a} \quad (\mathrm{cm^3})$

where:

$P_{fr,a}$ = pressures force defined in **1703. 1**.

h = side frame span, in m, defined in **Fig 7.3.22**

σ_a = allowable normal stress, in $\mathrm{N/mm^2}$, defined in **1703. 2.**

m_a , m_b = bending moment coefficients defined in **Table 7.3.13**

(2) The actual section modulus of the brackets and side frames is to be calculated about an axis parallel to the attached plate, based on the measured thicknesses. For precalculations, alternative thickness values may be used, provided they are not less than:

- t_{REN} for the web thickness
- the minimum thicknesses allowed by the Society renewal criteria for flange and attached plating.

(3) The attached plate breadth is equal to the frame spacing, measured along the shell at midspan of h.

(4) If the actual section moduli at sections a) and b) are less than the values Z_a and Z_b, the frames and brackets are to be renewed or reinforced in order to obtain actual section moduli not less than $1.2\,Z_a$ and $1.2\,Z_b$, respectively.

(5) In such a case, renewal or reinforcements of the flange are to be extended over the lower part of side frames, as defined in **Fig 7.3.22**.

Table 7.3.13 Bending moment coefficients m_a and m_b

	m_a	m_b		
		$h_B = 0.08h$	$h_B = 0.1h$	$h_B = 0.125h$
Empty holds of ships approved to operate in non homogeneous loading conditions	10	17	19	22
Other cases	12	20	22	26

Note
1. Non homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for each hold, exceeds 1.20 corrected for different cargo densities.
2. For intermediate values of the bracket length h_B, the coefficient m_b is obtained by linear interpolation between the table values.

Section 18 Cargo Hatch Cover Securing Arrangements

1801. Application and implementation

1. These requirements apply to all bulk carriers which were not built in accordance with **Pt 7 Ch 3 Sec 9** and are for steel hatch cover securing devices and stoppers for cargo hold hatchways No.1 and No.2 which are wholly or partially within 0.25*L* of the fore perpendicular, except pontoon type hatch cover.

2. All bulk carriers not built in accordance with **Pt 7, Ch 3, Sec. 9** are to comply with the requirements in accordance with **Pt 1, Ch 3, 201.** (6)

3. All bulk carriers not built in accordance with **Pt 7, Ch 3, Sec. 9** and in order to postpone these requirements are to be followed **Pt 1, Ch 3, 201.** (6).

1802. Securing devices

1. The strength of securing devices is to comply with the following requirements:

2. Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

3. The net sectional area of each securing device is not to be less than:

$$A = 1.4\, a/f \quad (\text{cm}^2)$$

a = spacing between securing devices not to be taken less than 2 meters

$f = (\sigma_y/235)^e$

σ_y = specified minimum upper yield stress in N/mm^2 of the steel used for fabrication, not to be taken greater than 70% of the ultimate tensile strength.

$e = 0.75$ for $\sigma_y > 235$

$= 1.0$ for $\sigma_y \leq 235$

4. Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

5. Between cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weather tightness is to be maintained by the securing devices.

6. For packing line pressures exceeding 5 N/mm, the cross section area is to be increased in direct proportion. The packing line pressure is to be specified.

7. The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, I, of edge elements is not to be less than:

$$I = 6\, p\, a^4 \quad (\text{cm}^4)$$

where,

p : packing line pressure in N/mm, minimum 5 N/mm

a : spacing in m of securing devices.

8. Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

9. Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

10. Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

1803. Stoppers

1. No. 1 and 2 hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m^2.

2. No. 2 hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.

3. No. 1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m^2. This pressure may be reduced to 175 kN/m^2 if a forecastle is fitted.

4. The equivalent stress in stoppers and their supporting structures, and calculated in the throat of the stopper welds is not to exceed the allowable value of $0.8\sigma_y$.

1804. Materials and welding

Where stoppers or securing devices are fitted to comply with the these requirements, they are to be manufactured of materials, including welding electrodes, meeting the relevant requirements. ⚓

CHAPTER 4 CONTAINER SHIPS

Section 1 General

101. Application

1. The construction and equipment of ships intended to be registered and classed as "Container Ship" are to be in accordance with the requirements in this Chapter, where, "Container Ship" means a ship designed exclusively for the carriage of containers in holds and on deck.

2. Except where specially required in this Chapter, the general requirements for the construction and equipment of steel ships are to be applied.

3. The requirements in this Chapter apply to ships which are single deckers having double bottoms in cargo holds and having decks and bottoms framed longitudinally.

4. The container ships with different type from that specified in **Par 3** to which the requirements in this Chapter are not applicable, are to be at the discretion of the Society.

Section 2 Longitudinal Strength

201. Bending strength

The section modulus, minimum section modulus and minimum moment of inertia of the transverse sections of the hull throughout $0.4L$ amidships are to be in accordance with the requirements in **Pt 3, Ch 3, 201.** However, the midship moment of inertia for the ship to which the requirements in this Chapter are not applicable with the abrupt changes in shape of the transverse section is to be increased at the discretion of the Society.

202. Torsional strength

Where the width of hatchway at midship exceeds $0.7B$, special considerations are to be paid to the additional stress and the deformation of hatchway openings due to torsion. Where, however, the ship has two or more rows of hatchways, the distance between the outermost lines of hatchway openings is to be taken as the width of hatchway.

Section 3 Double Bottoms

301. General

1. The construction of double bottoms in holds which are exclusively loaded with containers is to be in accordance with the requirements of this Section.

2. Side girders or solid floors are to be arranged in the double bottoms under corner fittings. Otherwise, double bottoms are to be effectively strengthened so as to support container loads.

3. Where cargo hold is exclusively used for the stowage of containers, the requirements for ceiling and the increment of inner bottom plating under hatchways specified in **Pt 3, Ch 7, 501.** may not be applied.

302. Longitudinals

The section modulus of bottom or inner bottom longitudinals is not to be less than that obtained from the formula given in **Table 7.4.1,** respectively.

Table 7.4.1 Section modulus of longitudinals

Item	Section modulus (cm^3)
Bottom longitudinals	$Z=\frac{CKSl^2}{24-15.0f_BK}(d+0.026L')$
Inner bottom longitudinals	$Z_i \geq 0.75Z_b$

L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.
l = spacing of solid floors (m).
S = spacing of longitudinals (m).
C = coefficient given in the following table.

Case	C
In case where no strut specified in **303.** is provided midway between floors	100
In case where a strut specified in **303.** is provided midway between floors	62.5

NOTE:
Where, however, the width of vertical stiffeners provided on floors and that of struts are large enough, the coefficient may be properly reduced.

303. Vertical struts

1. Vertical struts are to be of rolled sections other than flat bars or bulb plates and to be overlapped with the webs of bottom and inner bottom longitudinals.

2. The sectional area of the vertical struts is not to be less than that obtained from the following formula :

$$A=1.8\,CKSbh \quad (cm^2)$$

where:

S = spacing of longitudinals (m).

b = breadth of the area supported by the strut (m).

h = as obtained from the following formula (m).

$$h=\frac{d+0.026L'}{2}$$

L' = as specified in **Table 7.4.1.**

C = coefficient obtained from the following formula. In no case is the value of coefficient to be less than 1.43.

$$C=\frac{1}{1-0.5\frac{l_s}{k\sqrt{K}}}$$

l_s = length of struts (m).

k = minimum radius of gyration of struts obtained from the following formula (cm).

$$k = \sqrt{\frac{I}{A}}$$

I = the least moment of inertia of the struts (cm^4).

A = sectional area of struts (cm^2).

304. Thickness of inner bottom plating

1. The thickness of inner bottom plating is not to be less than that obtained from the following formulae, whichever is the greater :

$$t_1 = \frac{CKB^2d}{d_0} + 1.5 \quad (\mathrm{mm})$$

$$t_2 = C'S\sqrt{hK} + 1.5 \quad (\mathrm{mm})$$

where :

d_0 = height of centre girder (mm).

S = spacing of inner bottom longitudinals for longitudinal framing or frame spacing for transverse framing (m).

h = as given by the following formula.

$h = 1.13(d - 0.001d_0)$

C = coefficient obtained from **Table 3.7.7**. of **Pt 3.**

C' = coefficient obtained from **Table 3.7.8.** of **Pt 3.**

2. The inner bottom plating with which the lower ends of corner fittings of containers are in contact is to be strengthened by means of doubling or by other appropriate means.

Section 4 Double Side Construction

401. General

1. Side construction in holds is to be double hull construction as far as practicable and is to be thoroughly stiffened by providing side transverse girders and side stringers within double hull.

2. Double side construction is to be in accordance with the requirements in **Pt 3, Ch 14** in addition to the requirements of this Section.

3. Double side shell structures which are used as deep tanks are to be in accordance with the requirements in **Pt 3, Ch 15,** in addition to the requirements of this Section.

4. Side stringers are to be provided in a proper spacing considering the depth of holds. And, side transverse girders are to be provided at the location of solid floors in double bottoms.

5. The scantlings in case where the width of double side shell structures changes in bilge parts, are to be at the discretion of the Society.

6. The scantlings in case where the height from the load line to the strength deck is specially large, are to be at the discretion of the Society.

7. Where structures effectively supporting deck structures and side shell structures are provided in the midway of holds, the requirements in this section may be appropriately modified.

8. At the location where the longitudinal bulkheads and the inner bottom plating are combined, considerations are to be paid with regard to their structural arrangement so as not to cause stress concentration.

9. At the fore and aft ends of double side construction, sufficient considerations are to be paid to the continuity of construction and strength.

402. Side transverse and side stringers

The thickness of side transverse and side stringers is not to be less than that obtained from the following formula. However, where deemed necessary by the Society, the thickness of these members is to be determined in consideration of bending and shear strength.

$$t = 8.5 \frac{S_2}{\sqrt{K}} + 1.5 \quad (\text{mm})$$

where:

S_2 = S_1 or d_1, whichever is the smaller.

S_1 = spacing of the stiffeners provided in the direction of the depth of transverse on the web of transverse for side transverse or spacing of the stiffeners provided in the direction of the depth of stringer on the web of stringer for side stringer (m), respectively.

d_1 = depth of side transverse or side stringers (m). Where, however, the depth of webs is divided by providing stiffeners in the direction of the length of side transverse on the webs or of side stringer on the webs, d_1 may be taken as the divided depth, respectively.

403. Longitudinal bulkheads

The thickness of longitudinal bulkheads and the section modulus of longitudinal stiffeners in case where the double side structure is used as deep tanks, are not to be less than those obtained from the following formulae, respectively.

(1) The thickness of longitudinal bulkheads is not to be less than that obtained from the following formula. However, the thickness of longitudinal bulkheads which are not in contact with sea water in service conditions may be reduced from the following requirements by 0.5 mm.

$$t = 3.6\, C_1 S \sqrt{h} + 2.0 \quad (\text{mm})$$

where:

S = spacing of longitudinal stiffeners (m).

h = vertical distance measured from the lower edge of plate to the midpoint of the distance between the top of tanks and the top of overflow pipes (m). However, with respect to the longitudinal bulkheads composing a large tank, appropriate additional water pressure specified in **Pt 3, Ch 15, 204.** is to be taken into account.

C_1 = coefficient obtained from **Table 7.4.2.**

Table 7.4.2 Coefficients C_1, C_2 and C_3

Framing	C_1
Transverse system	$27.7\sqrt{\dfrac{K}{767-\alpha^2K^2}}$
Longitudinal system	$3.72\sqrt{\dfrac{K}{27.7-\alpha K}}$ but C_1 is not to be less than 1.0

α = as obtained from the following formulae, whichever is the greater: However the value of α_1 or α_2 is not to be less than α_3

$\alpha_1 = 15.0 f_D\left(\dfrac{y-y_B}{Y'}\right)$ $\quad y \geq y_B$

$\alpha_2 = 15.0 f_B\left(\dfrac{y_B-y}{y_B}\right)$ $\quad y < y_B$

$\alpha_3 = \beta\left(\dfrac{B-2b}{B}\right)$

y = distance (m) from the top of keel to the lower edge of plating when the platings under consideration are under y_B and to the upper edge of plating when the platings under consideration are above y_B, respectively.

y_B = vertical distance from the top of keel to the horizontal neutral axis of transverse section (m).

Y' = the greater of the value specified in **Pt 3, Ch 3, 203.,** (5), (a) or (b).

β = coefficient determined according to values of L as specified below :

$\beta = 6/a$ when L is 230 m and under

$\beta = 10.5/a$ when L is 400 m and above

For intermediate values of L, β is to be obtained by linear interpolation.

a = $\sqrt{K}$ when high tensile steels are used for not less than 80 % of side shell plating at the transverse section amidship and 1.0 for other parts.

b = width of double side shell (m).

(2) The section modulus of longitudinal stiffeners on longitudinal bulkheads is not to be less than that obtained from the following formula.

$$Z = 125\, C_1 C_2 C_3 S h l^2 \quad (\text{cm}^3)$$

where:

C_1 : coefficients determined according to the values as specified below :

1.0 where L is 230 m and under,

1.07 where L is 400 m and above.

For intermediate values of L, C_1 is to be obtained by linear interpolation.

C_2 : $K/18$, the value C_2 for h_1, however, is to be as obtained from the following formula.

$$C_2 = \frac{K}{24-\alpha K} \quad (\geq K/18)$$

α : coefficient determined according to **Table 7.4.2.**

C_3 : coefficient given in **Table 7.4.3.**

S : spacing of longitudinal stiffeners (m).

h : the following h_1 or h_2

h_1 : vertical distance measured from the midpoint of the distance between the top of tanks and the top of overflow pipes to the mid-point of distance between the adjacent stiffeners (m).

h_2 : the value obtained from the following formula

$$h_2 = 0.85(h_1 + \Delta h) \quad (\mathrm{m})$$

Δh : the vaule obtained from the following formula

$$\Delta h = \frac{16}{L}(l_t - 10) + 0.25(b_t - 10) \quad (\mathrm{m})$$

l_t : tank length (m) (≥ 10)

b_t : tank breadth (m) (≥ 10)

l : span of girders (m).

Table 7.4.3 Coefficient C_3

One end of stiffener / The other end of stiffener	Connection with hard bracket	Connection with soft bracket	Supported by rule girder or lug connection
Connection with hard bracket	0.70	1.15	0.85
Connection with soft bracket	1.15	0.85	1.30
Supported by rule girder or lug connection	0.85	1.30	1.00
Snip	1.30	1.15	1.50

1. Connection with hard bracket is a connection by bracket to the double bottoms or to the adjacent members, such as longitudinals or stiffeners in line, of the same or larger sections, or a connection by bracket to the equivalent members mentioned above. (See **Fig 3.14.2** (a))
2. Connection with soft brackets is a connection by bracket to the transverse members such as beams or equivalent thereto. (See **Fig 3.14.2** (b))

404. Brackets

Brackets are to be provided on the upper and lower corners inside the double side structure, at every frame in case where transversely stiffened and at an appropriate spacing between side transverse girders in case where longitudinally stiffened.

Section 5 Transverse Bulkheads

501. Construction

1. Transverse bulkheads are to be constructed so as to be sufficiently supported at the location of deck. In case where the width of bulkhead is specially large, the upper parts of transverse bulkheads are to be appropriately strengthened by providing box-shaped structures or by other means.

2. The scantlings of bulkheads and stiffeners are to comply with the requirements in **Pt 3, Ch 14, Sec 3.**

502. Partial bulkheads

Where non-watertight partial bulkheads are provided in cargo holds, the construction and scantlings are to be made to have sufficient strength and rigidity, considering the size of cargo hold, the depth of bulkheads, etc.

Section 6 Deck Construction

601. Construction

1. The thickness of deck plating is to comply with the requirement in **Pt 3, Ch 5, Sec 3.**

2. The scantlings of decks inside the line of deck openings are to be appropriately strengthened in consideration of bending in the plane of deck.

602. Cross ties

1. Where the length of hatchway is large in comparison with the width of hatchway, cross ties are to be provided in the hatchway opening with suitable spacing.

2. Where structures effectively supporting the loads from the side and deck of ship are not provided at the location of cross ties in the holds, special considerations are to be paid to the scantlings of cross ties.

603. Continuity of thickness of deck plating

Consideration is to be paid to the continuity in the thickness of deck plating. Especially, the abrupt change between the thickness inside and outside the line of deck openings is to be avoided.

Section 7 Freight Container Securing Arrangements

701. Cell guide

1. The cell guides supporting containers are to be constructed so as to effectively transmit the loads to double bottom structure, side construction and transverse bulkheads.

2. The strength of cell guide is to be sufficient for the loads from the bottom and side of ship and the loads due to container loads.

702. Freight container securing systems

1. For freight container securing systems plans showing materials, arrangement and scantling, etc. may be submitted for approval of the Society. Where container securing fittings are applied for part container only, this requirements may be suitably applied.

2. Securing devices specified in **Par 1** are to be approved in accordance with the special requirements given by the Society prior to installation on board the ship.

Section 8 Welding

801. Application

1. Fillet welding is to be applied to longitudinals with a web plate thickness over 40 mm and up to 80 mm, which are used for the strength deck or for side shell plating and longitudinal bulkheads that extend upwards from a position 0.25 D below the strength deck.

2. Where longitudinals with a web plate thickness over 80 mm are used, the kind and size of the weldings are to be at the discretion of the Society.

802. Fillet Welding

1. Fillet welding is to be continuous.

2. The size of fillet is to be not less than 8 mm. ⚓

CHAPTER 5
SHIPS CARRYING LIQUEFIED GASES IN BULK

(Separate Publication)

CHAPTER 6
SHIPS CARRYING DANGEROUS CHEMICALS IN BULK

(Separate Publication)

CHAPTER 7 CAR FERRIES AND ROLL-ON/ROLL-OFF SHIPS

Section 1 General

101. Application

1. This Chapter applies to seagoing roll-on/roll-off cargo ships specially designed and constructed for the carriage of vehicles, and cargo in pallet form or in containers, and loaded and unloaded by wheeled vehicles.

2. The hull structures and equipments of ships that are intended for restricted service and carriage of vehicles through the bow door, inner door, side door or ramp formed the hull structures (hereinafter refered to as vehicle doors) is to in accordance with the discretion of the Society.

3. The scantlings and arrangements are to be as required by **Pt 3** except as otherwise specified in this Chapter.

102. Construction and arrangement

1. The requirements provide for a basic structural configuration of a multideck hull which includes a double bottom, and in some cases wing tanks up to the lowest deck. Special consideration is to be given to roll on-roll off cargo ships and ferries intended to be operated only in certain areas or conditions which have been agreed by the Society.

2. Where bulkheads are omitted in accordance with **Pt 3, Ch 9,** a system of partial bulkheads, web frames and deck transverses should be fitted to provide equivalent transverse strength.

3. Longitudinal framing is to be adopted at the strength deck and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.

103. Submission of plans and documentations

In addition to plans and documentations required by **Pt 3, Ch 1, Sec 3,** the following details are to be submitted:

(1) The intended service areas required for ships designed to operate within specified geographical limits.
(2) Bow or stern ramps
(3) Bow, stern and side doors
(4) Movable decks, if fitted, including stowing arrangements for portable components.

Section 2 Longitudinal Strength

201. General

Longitudinal strength calculations are to be made in accordance with the requirements given in **Pt 3, Ch 3.**

Section 3 Deck Structure

301. Application

The arrangements and scantlings of vehicle decks for the carriage of cars, trucks, etc., are be in accordance with the discretion of the Society.

302. Securing arrangements

Details of the connections to the hull of vehicle securing arrangements are to be submitted for approval.

Section 4 Electrical Equipment of Automobile Carriers

401. General

The requirements in this Section apply to the electrical equipment installed in the cargo holds and the compartments adjacent thereto of automobile carriers.

402. Electrical equipment

1. Electrical equipment in cargo hold

(1) In principle no portable electrical appliance are to be located in the cargo holds. Where it is inevitable to locate the appliances in the holds, they are subject to the approval of the Society.

(2) All electrical circuits terminating in the cargo holds are to be provided with multipole linked isolating switches situated outside the cargo holds, and accessible only to authorized personnel. Provision is to be made for isolation and for locking in the "off" position of the means of control of such circuits. However, this requirement does not apply in respect of safety devices such as fire, smoke or gas detector.

(3) In addition to the requirements in this section, the requirements in **Pt 8, Ch 5, 302.** of the Rules are to be complied with.

2. Electrical equipment in the compartment adjacent to cargo holds

For the electrical equipment in the compartments adjacent to the cargo holds and having an opening such as nongastight door, hatch, scuttle and the like in their bulkheads and decks, the requirements in **Par 1** are generally to be applied. ⚓

CHAPTER 8 OFFSHORE SUPPLY SHIPS

Section 1 General

101. Application

1. The construction and equipment of ships intended to be registered and classed as "Offshore Supply Ship" are to be in accordance with the requirements in this Chapter, where "Offshore Supply Ship" means a ship designed and constructed for the carriage of specialized stores and cargoes to mobile offshore units and other offshore installations, and also to "Offshore Tug and Supply Ship" which in addition to the above perform the duties of a tug.

2. The scantlings and arrangements are to be as required by **Pt 3,** except as otherwise specified in this Chapter.

3. Attention is drawn to the need for masters to be able to assess the stability of their ships quickly and accurately in all service conditions.

102. Submission of plans and documentations

In addition to plans and documentations required by **Pt 3, Ch 1, Sec 3,** the followings are to be submitted.

(1) Separate or independent cargo tanks
(2) Cargo tank foundations and securing arrangements
(3) Towing arrangements, including supports and foundations of towing winches
(4) Supports and foundations for anchor handling and laying arrangements for anchors carried as cargo.
(5) Arrangements for the stowage of deck cargoes (cargo containment) and details of any associated racks or other similar structures and their supports and foundations.
(6) Movable decks including the stowing arrangements for portable components
(7) Freeing arrangements

Section 2 Longitudinal Strength

201. General

Longitudinal strength calculations for an offshore supply ship or an offshore tug/supply ship are to comply with the relevant requirements of **Pt 3, Ch 3.**

Section 3 Shell Plating

301. Shell plating

1. The thickness of side shell is to be that required by **Pt 3, Ch 4,** but is in no case to be less than 9 mm.

2. Efficient fenders are to be fitted, with adequate support behind them, in exposed areas.

3. Shell in way of stern rollers immediately adjacent to high duty bollards and in other high load areas is to be suitably reinforced.

Section 4 Deck Plating

401. Weather decks

1. Where cargo is to be carried on weather decks, the scantlings are to be suitable for the specified loadings, but in no case is a head less than 3.5 m to be used. Additional local increases in scantlings may be required where specialized cargoes are likely to induce concentrated loads.

2. The thickness of deck plating is to be not less than that obtained from the following formula.

$$t = 0.025L + 6 \quad \text{(mm)}$$

402. Cargo containment

1. Means are to be provided to enable deck cargoes to be adequately secured and protected. In general, suitable inner bulwarks, rails, bins or storage racks of substantial construction are to be provided and properly secured to adequately strengthened parts of the hull structure .

2. Properly designed locking equipment or efficient means of lashing containers are to be fitted where appropriate.

3. Small hatches (including escape hatches), valve controls, ventilators, air pipes, etc., are to be situated clear of the cargo containment areas.

Section 5 Framing

501. Transverse framing

The section moduli of the main and tween deck frames are to be 25 percent greater than those required by **Pt 3, Ch 8, Sec 4.** Frames are not to be scalloped.

Section 6 Superstructures and Deckhouses

601. Scantlings

The scantlings of deckhouses situated on the forecastle deck and above are to comply with the requirements of **Table 7.8.1.**

Table 7.8.1 Thickness of plating and section modulus of bulkhead stiffeners etc.

Position	Thickness of plating t (mm)	Modulus of stiffeners Z (cm^3)	Depth of stiffeners d (mm)
Fronts	The greater of t = 0.012S or 8.0	$Z = 0.034\,S\,l^2$	$d \geq 100$
Sides	The greater of t = 0.01S or 6.5	$Z = 0.027\,S\,l^2$	$d \geq 75$
Aft ends	The greater of t = 0.008S or 6.5	$Z = 0.021\,S\,l^2$	$d \geq 65$
S = stiffener spacing (mm) l = effective length of stiffeners (m)			
NOTE : The ends of stiffeners are to be connected on all tiers.			

Section 7 Watertight Bulkhead Doors

701. Watertight doors

Watertight doors are to be efficiently constructed and fitted in accordance with **Pt 3, Ch 14, Sec 4.**

Section 8 Engine Exhaust Outlets

801. Location

Engine exhaust outlets are to be located as high as is practicable above the deck and are to be fitted with spark arresters. ⚓

CHAPTER 9 TUGS

Section 1 General

101. Application

1. The construction and equipment of ships intended to be registered as "Tug" are to be in accordance with the requirements in this Chapter. The construction and equipment of ships intended to be registered as "Offshore Tug/Supply Ships" are to be in accordance with the requirements of **Ch 8.**

2. The scantlings and arrangements are to be as required by **Pt 3** except as otherwise specified. The draught d used for the determination of scantlings is to be not less than $0.85D$.

Section 2 Longitudinal Strength

201. General

Longitudinal strength calculations are to be made in accordance with the requirements given in **Pt 3, Ch 3.**

Section 3 Single Bottoms

301. Floors

Single bottom floors are to be in accordance with the requirements of **Pt 3, Ch 6.**

Section 4 Panting and Strengthening of Bottom Forward

401. Panting region reinforcement

The arrangements to resist panting required by **Pt 3, Ch 9,** do not apply to tugs less than 46 m in length. In tugs 46 m or more in length, addition stiffening is also to be fitted in the tween decks throughout the panting region.

402. Strengthening of bottom forward

The requirements for strengthening of bottom forward detailed in **Pt 3, Ch 7, Sec 8,** do not apply to tugs.

Section 5 Machinery Casings

501. Escape hatches

Any emergency exit from the machinery room to the deck is to be capable of being used at extreme angles of heel, and should be positioned as high as possible above the waterline and on or near the ship's centerline. Covers to escape hatches are to have hinges arranged athwartships. Coaming heights are to be at least 600 mm above the upper surface of the deck.

502. Exposed casings

Exposed machinery casings are to be not less in height than 900 mm above the upper surface of the deck. Stiffeners to exposed casings are to be connected to the deck or carried through.

Section 6 Towing Arrangements

601. Towing hooks

1. Towing hooks or equivalent should normally be 5 to 10 percent of the ship's length abaft amidships, but in no circumstances should they be sited forward of the longitudinal center of gravity of the tug in any anticipated condition of loading. In addition, the towing hook should be located as low as practicable in order to minimize heeling moments arising in normal working conditions.

2. Towing hooks are to have reliable release slip arrangement which facilitate towline release regardless of the angle of heel. It is recommended that release units should also be operable from the bridge. The arrangements should be tested to the surveyor s satisfaction. The breaking strength of the hook or its equivalent should generally be 50 percent in excess of that of the towline.

Section 7 Fenders

701. Ship's side fenders

An efficient fender is to be fitted to the ship's side at deck level extending all fore and aft. ⚓

CHAPTER 10 DOUBLE HULL TANKER

Section 1 General

101. Application

1. The requirements in this Chapter apply to double hull oil tankers which were contracted for construction after 1 April 2006, excluding the vessels which should be applied **Pt.12** (IACS Common Structural Rules for Oil Tankers).

2. The constructions and equipments of ships of 90 m and above in length which are framed for tankers with machinery aft having one or more longitudinal bulkheads and single decks with double bottom or with double hull structures, intended to be registered and classed as "tanker" and intended to carry crude oil, petroleum products having a vapour pressure (absolute pressure) less than 0.28 MPa at 37.8 ℃ or other similar liquid cargoes in bulk are to be in accordance with the requirements in this Chapter.

3. In tankers intended to carry liquid cargoes other than crude oil and petroleum products, having the vapour pressure (absolute pressure) less than 0.28 MPa at 37.8 ℃ and having no hazard as poisonous, corrosive, etc. and moreover less inflammablity than that of crude oil and petroleum products, the structural arrangements and scantlings are to be to the satisfaction of the Society, having regarded to the properties of the cargoes to be carried.

4. In case where the construction differs from that specified in **Par 1** and the requirements in this Chapter are considered to be not applicable, matters are to be determined as deemed appropriate by the Society.

5. As regards matters not specifically provided for in this Chapter, the general requirements for the construction and equipment of steel ships given in the relevant **Pts** are to be applied.

6. In addition to the requirements specified in **Par 5,** the relevant requirements in **Ch 1, Secs l0** to **11** and **Pt 8, Ch 2, 104** are to be applied to ships specified in **Par 2.**

102. Location and separation of spaces

1. In cargo oil spaces, the standard arrangement of bulkheads is to be such that the interval between longitudinal bulkheads or transverse bulkheads does not exceed $1.2\sqrt{L}$ (m).

2. Cofferdams are to be provided in accordance with the following (1) to (3) :

(1) Cofferdams of air-tight construction and not to be less than 600 mm in width access are to be provided at fore and aft terminations of cargo oil spaces and the space between cargo space and accommodation space. Where, however, for oil tankers intended to carry cargo oil having a flash point above 60 ℃ this requirements may be suitably modified.
(2) Cofferdams specified in (1) may be used as pump rooms.
(3) Fuel oil or ballast water tanks may be concurrently used as the cofferdams to be provided between cargo oil tanks and fuel oil or ballast tanks, subject to the approval by the Society.

3. Passageways leading to cargo areas are to be provided in accordance with the following (1) to (4):

(1) Access to cofferdams, ballast tanks, cargo oil tanks and any other spaces in the cargo area are to be direct from the open deck and such as to ensure their complete inspection. Access to double bottom spaces may be through a cargo pump room, pump room, deep cofferdam, pipe tunnel or similar compartments, subject to consideration of ventilation aspects.
(2) For access through horizontal openings, hatches or manholes, the dimensions are to be sufficient to allow a person wearing a selfcontained air breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the spaces. The minimum clear opening is not to be less than 600 mm × 600 mm.
(3) For Access through vertical openings, or manholes providing passage through the length and breadth of the space, the minimum clear opening should be not less than 600 mm × 800 mm at a height of not more than 600 mm from the bottom shell plating unless grating or other footholds are provided.

(4) For tankers with a deadweight tonnage of less than 5000 tons, smaller dimension of minimum clear opening specified in (2) and (3) may be approved by the Society in special circumstances, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of the Society.

4. Air-tight bulkheads

All areas, where cargo oil pumps and cargo oil piping are provided, are to be segregated by an air-tight bulkhead from areas where stoves, boilers, propelling machinery, electric installations other than those of explosion-proof type in accordance with the requirements in **Pt 6, Ch 1, Sec 9** where source of ignition is normally present. Where, however, for oil tankers carrying cargo oil having a flash point above 60℃, the requirements may be suitably modified.

5. Ventilations

Ventilation inlets and outlets are to be arranged so as to minimize the possibilities of vapours of cargoes being admitted to an enclosed space containing a source of ignition, or collecting in the vicinity of deck machinery and equipment which may constitute an ignition hazard. Especially, opening of ventilation for machinery spaces are to be situated as far afterwards apart from the cargo spaces as practicable.

6. Ullage openings, sighting ports and tank cleaning opening are not to be arranged in enclosed spaces.

7. Openings in superstructure and deckhouse

The arrangement of openings on the boundaries of superstructures and deckhouse are to be such as to minimize the possibility of accumulation of vapours of cargoes. Due consideration in this regard is to be given for the openings in superstructures and deckhouse when the ship is equipped with cargo piping to load or unload at the stern. The scuttles to the poop front or other similar walls are to be of fixed type.

8. Pipe duct in double bottom

Pipe ducts in the double bottom shall comply with the following requirements :

(1) They should not communicate with the engine room.
(2) Provision shall be made for at least two exits to the open deck arranged at a maximum distance from each other. One of these exits fitted with a watertight closure may lead to the cargo pump room.
(3) In the duct, provision shall be made for adequate mechanical ventilation.
(4) For ships to which the convention applies, refer to **SOLAS 1974(as amended) Regulation II-2/4.5.2.4.**

103. Minimum thickness

1. The thickness of structural members in cargo oil tanks and deep tanks such as bulkhead plating, floors, transverse girders including struts and their end brackets is not to be less than the value determined from **Table 7.10.1** according to the Length of Ship.

2. The thickness of structural members other than **Par 1** in cargo oil tanks and deep tanks is not to be less than 7 mm.

Table 7.10.1 Minimum thickness

L (m)												
	and over		105	120	135	150	165	180	195	225	275	325	375
	and under	105	120	135	150	165	180	195	225	275	325	375	
Thickness(mm)		8.0	8.5	9.0	9.5	10.0	10.5	11.0	11.5	12.0	12.5	13.0	13.5

104. Direct strength calculation

Where approved by the Society, the scantlings of structural members may be determined basing upon direct strength calculation defined in **Pt 3, Ch 1, 206.** Notwithstanding the results of direct strength calculation, where, however, this is not to be applied to the minimum thickness specified in **103.** and the special requirements for corrosion specified in **605.** to **607.**

105. Symbols

The definition of symbols used in this Chapter otherwise specified, are to be in accordance with following :

L' = length of ship (m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.

l = span of stiffeners, longitudinals, frames, transverses or girders (m).

S = spacing of stiffeners, longitudinals, frames, transverses or girders (m).

C_1 = coefficients determined according to values of L as specified below :

C_1 = 1.0 where L is 230 m and under,
1.07 where L is 400 m and above.

For intermediate values of L, C_1 are to be obtained by linear interpolation.

C_1' = coefficients determined according to values of L as specified below :

C_1' = 1.0 where L is 230 m and under,
1.2 where L is 400 m and above.

For intermediate values of L, C_1' are to be obtained by linear interpolation .

f_D and f_B = section modulus ratios are as following formulae, f_B, however, is not to be less than 0.85 or 0.0015L + 0.5, whichever is the lesser.

$$f_D = \frac{Z_{DMreq}}{Z_{Dact}} \qquad f_B = \frac{Z_{BMreq}}{Z_{Bact}}$$

Z_{DMreq} and Z_{BMreq} = section modulus at the deck and bottom of transverse sections of the hull determined to the requirements in **Ch 3, 201.** respectively, when mild steel material symbol A, B, D and E specified in **Pt 2, Ch 1, 301. Par 1** is used (cm^3).

Z_{Dact} and Z_{Bact} = actual section modulus at the deck and bottom of transverse sections of the hull respectively. (cm^3)

α = either α_1 or α_2 according to value of y. However, value of α is not to be less than α_3.

$$\alpha_1 = 15.0 f_D \left(\frac{y - y_B}{Y'} \right) \qquad \text{for} \quad y \geq y_B$$

$$\alpha_2 = 15.0 f_B \left(\frac{y_B - y}{y_B} \right) \qquad \text{for} \quad y < y_B$$

$$\alpha_3 = \beta \left(\frac{B - 2b}{B} \right)$$

y = distance from the top of keel to the lower edge of plating when the platings under consideration are under y_B, to the upper edge of plating when the platings under consideration are above y_B and to the longitudinals stiffener under consideration for longitudinal stiffener, respectively (m).

y_B = distance from the top of keel to the horizontal neutral axis of transverse section amidship (m).

Y' = the greater of the value specified in **Pt 3, Ch 3, 203.,** (5), (a) or (b).

β = coefficient determined according to the values of L as specified below: For intermediate values of L, the value of b is to be determined by linear interpolation:

β = 6.0 when L is 230 m and under,
10.5 when L is 400 m and above.

a = $\sqrt{K}$ when high tensile steels are used for not less than 80 % of side shell platings at the transverse section amidship and 1.0 for other parts.

b = horizontal distance from the side shell plating to the longitudinal bulkhead plating under consideration (m).

Section 2 Bulkhead Plating

201. Bulkhead plating in cargo oil tanks and deep tanks

1. The thickness of bulkhead plating is not to be less than the greatest of the values obtained from the following formula when h is substituted with h_1, h_2 and h_3.

$$t_1 = C_1 C_2 S \sqrt{h} + 2.5 \quad (\mathrm{mm})$$

Table 7.10.2 Water head h_1, h_2, and h_3

<table>
<tr><th></th><th>Cargo oil tanks</th><th>Deep tanks</th></tr>
<tr><td>h_1</td><td>Vertical distance from the lower edge of the bulkhead plating under consideration to the top of hatchway. For side shell plating, a water head corresponding to the minimum draught amidship d_{min} (m) under all operating conditions of the ship may be deducted therefrom. The deductible water head at the top of keel is to be d_{min}, value at point d_{min} above the top of keel, 0, and value at an intermediate point is to be obtained by linear interpolation.</td><td>Vertical distance from the lower edge of the bulkhead plating under consideration to the mid-point between the point on tank top and the upper end of the overflow pipe. For side shell plating, a water head corresponding to the minimum draught amidship d_{min} (m) under all operating conditions of the ship may be deducted therefrom. The deductible water head at the top of keel is to be d_{min}, value at point d_{min} above the top of keel, 0, and value at an intermediate point is to be obtained by linear interpolation</td></tr>
<tr><td>h_2</td><td colspan="2">As obtained from the following formula

$h_2 = 0.85(h_1 + \Delta h)$

where:
Δh = additional water head given by the following formula;
For L-type, U-type etc. of tanks,
Δh is to be determined as deemed appropriate by the Society

$\Delta h = \frac{16}{L}(l_t - 10) + 0.25(b_t - 10)$
l_t = tank length (m), 10, when less than 10 m.
b_t = tank breadth (m), 10, when less than 10 m</td></tr>
<tr><td>h_3</td><td>$h_3 = 0.3\sqrt{L}$ (m)</td><td>Value (m) obtained by multiplying 0.7 by vertical distance from the lower edge of the bulkhead plating under consideration to the point 2.0 m above the top of overflow pipe..</td></tr>
</table>

Table 7.10.3 Coefficient C_2

	longitudinal bulkhead of longitudinal framing	longitudinal bulkhead of transverse framing
For h_1	$C_2 = 13.4\sqrt{\dfrac{K}{27.7-\alpha K}}$	$C_2 = 100\sqrt{\dfrac{K}{767-\alpha^2 K^2}}$
	minimum : $3.6\sqrt{K}$	
For h_2 or h_3 and for transverse bulkhead	$C_2 = 3.6\sqrt{K}$	

where:

h = water head of h_1, h_2 or h_3 is obtained from **Table 7.10.2.**

C_2 = coefficients is obtained from **Table 7.10.3.**

C_1 and S = as specified in **105.**

2. In determining the thickness of longitudinal bulkhead plating, coefficient C_2 for h_1 may be gradually reduced for the parts forward and aftward the midship part, and it may be taken as $3.6\sqrt{K}$ in calculations at $0.1L$ from fore end and aft end.

202. Swash bulkhead

1. Stiffeners and girders of swash bulkhead are to be of sufficient strength considering the size of tanks and opening ratios.

2. The thickness of swash bulkhead plating is not to be less than that obtained from the following formula :

$$t = 0.3S\sqrt{K(L+150)} + 2.5 \quad (\mathrm{mm})$$

where:

S = as specified in **105.**

3. In determining the thickness of swash bulkhead plating, sufficient consideration is to be given for buckling.

203. Trunks

The thickness of trunk top and side plating are to be determined applying the requirements in **201.** in addition to the requirements in **Pt 3, Ch 5.**

Section 3 Longitudinals and Stiffeners

301. Longitudinals

1. The section modulus of bottom longitudinals is not to be less than the value obtained from the formula in **Table 7.10.4.**

2. The section modulus of side longitudinals including bilge longitudinals is not to be less than the value obtained from the formula in **Table 7.10.4.** The section modulus, however, need not exceed that of bottom longitudinals specified in **Table 7.10.4,** but is not to be less than that obtained from the following formula :

$Z = 2.9K\sqrt{L}Sl^2$ (cm^3)

where:

S and l = as specified in **105.**

Table 7.10.4 Section modulus of bottom and side longitudinal

longitudinals	section modulus (cm^3)
Bottom longitudinals	$Z = 100C_1C_2Shl^2$
Side longitudinals including bilge longitudinals	

h = distance from the longitudinals under consideration to the h' (m).
C_2 and h' = as given in following table

	h'	C_2
Bottom longitudinals	$h' = d + 0.026L'$	$C_2 = \frac{K}{24 - 15.0f_BK}$
Side longitudinals including bilge longitudinals	$h' = d + 0.038L'$	$C_2 = \frac{K}{24 - \alpha K}$

C_1, S, l, L', α and f_B = as specified in **105.**

3. For the parts forward and aftward of midship part, the scantlings of longitudinals may be gradually reduced and at $0.1L$ from fore end and aft end they may be reduced by 15 % of the value obtained from the requirements in **Pars 1** and **2.** In no case, however, are the scantlings of longitudinals to be less than those required in **Pars 1** and **2** for the part between a point $0.15L$ from the fore end and the collision bulkhead.

4. For side longitudinals, sufficient consideration is to be given for fatigue strength.

5. In addition to the requirements in **Pars 1** to **4,** the beams or longitudinals on deck or side shell consisting of deep tanks should comply with the requirements in **302.**

302. Bulkhead stiffeners in cargo oil tanks and deep tanks

1. Section modulus of stiffeners is not to be less than that obtained from the following formula :

$Z = 125C_1C_2C_3Shl^2$ (cm^3)

Where:

h = water head h_1, h_2 or h_3 as specified in **Table 7.10.2.** Where, however, "the lower edge of the bulkhead plating under consideration" is to be construed as "the mid-point of the stiffener under consideration" for vertical stiffeners and as "the stiffener under consideration" for horizontal stiffeners. And "side shell plating" is to be construed as "stiffener attached to side shell plating".

C_2 = value obtained from following formula. The value C_2 for h_1, however, is to be as obtained from the formula in **Table 7.10.5.**

$$C_2 = \frac{K}{18}$$

C_3 = as determined from **Table 7.10.6** according to the fixity condition of stiffener ends;
C_1, S and l = as specified in **105.**

Table 7.10.5 Coefficient C_2

Bulkhead and framing systems	C_2
Longitudinal bulkhead of longitudinal framing system	$C_2 = \frac{K}{24 - \alpha K}$ minimum $C_2 = \frac{K}{18}$
Longitudinal bulkhead of transverse framing system, transverse bulkhead	$C_2 = \frac{K}{18}$
α = as specified in **105.**	

Table 7.10.6 Coefficient C_3

One end of stiffener / The other end of stiffener	Connection be hard bracket	Connection be soft bracket	Supported by rule girder or lug connection	Snip
Connection be hard bracket	0.70	1.15	0.85	1.30
Connection be soft bracket	1.15	0.85	1.30	1.15
Supported by rule girder or lug connection	0.85	1.30	1.00	1.50
Snip	1.30	1.15	1.50	1.50

1. Connection by hard bracket is a connection by bracket to the double bottoms or to the adjacent members, such as longitudinals or stiffeners in line, of the same or larger sections, or a connection by bracket to the equivalent members mentioned above. (See **Fig 3.14.2** (a))
2. Connection by soft brackets is a connection by bracket to the transverse members such as beams or equivalent thereto. (See **Fig 3.14.2** (b))

4. For the parts forward and aftward of midship part in determining the section modulus of stiffeners attached to longitudinal bulkhead of longitudinal framing systems, coefficient C_2 for h_1 may be gradually reduced, and at the end parts C_2 may be as $K/18$.

303. Buckling strength

1. Buckling strength of longitudinal frames, beams and stiffeners is to be in accordance with the requirements (1) to (3) below. In case where the Society specially considers necessary according to the materials, scantling, geometries and the point of arrangement of these structural members, detailed assessment may be required.

(1) Longitudinals beams, side longitudinals attached to sheer strakes and longitudinal stiffeners attached to the longitudinal bulkhead within $0.1D$ from the strength deck are to have a slenderness ratio not exceeding 60 at the midship part as far as practicable.

(2) As for flat bars used for longitudinal beams, frames and stiffeners, the ratio of depth to thickness is not to exceed 15.

(3) The full width of face plate of longitudinal beams, frames and stiffeners is not to be less than that obtained from the following formula:

$$b = 2.2\sqrt{d_0 l} \quad (\mathrm{mm})$$

where :

d_0 = depth of web of longitudinal beam, frame or stiffener (mm).

l = as specified in **105.**

2. In case where assembled members, special shape steels or flanged plates are used for frames, beams or stiffeners in cargo oil tanks and deep tanks whose scantlings are specified only in terms of section modulus, the thickness of web is intended to be greater than the required level due to reasons other than strength, it may be suitably modified.

$$t = 0.015 k_0 d_0 + 2.5 \quad (\text{mm})$$

where:

d_0 = depth of web (mm).

k_0 = coefficient according to the location of stiffeners as given **Table 7.10.7.**

Table 7.10.7 Coefficient k_0

Locations	k_0
Bottom longitudinals located not more than $0.25D$ above top of keel	$k_0 = \sqrt{0.25\left(3f_B + \frac{1}{K}\right)}$
Deck longitudinals located not less than $0.25D$ below deck	$k_0 = \sqrt{0.25\left(3f_D + \frac{1}{K}\right)}$
Other structural members	$k_0 = \sqrt{0.25\left(3 + \frac{1}{K}\right)}$

Section 4 Girders

401. General

1. The double bottom and double side hull structures and arrangements and scantlings of girders in cargo oil spaces are to be determined based upon direct strength calculations.

2. Notwithstanding the requirement in **Par 1,** when approved by the Society, the scantlings of these girders may be determined in accordance with the requirements in **403.** to **407.** provided that the arrangements of girders in the double bottom, double side hull and cargo oil tank at cargo oil spaces are determined referring to the structural types shown in following (1) to (5) as the standard:

(1) The height of double bottom at cargo oil spaces is not to be less than $B/20$ (m).
(2) The width of double side hull is not to be less than $D/9$ (m).
(3) In double bottoms at cargo oil spaces, girders are to be provided at a spacing not exceeding $0.9\sqrt{l_t}$ (m) and floors are to be provided at a spacing not exceeding $0.55\sqrt{B}$ (m) or $0.75\sqrt{D}$ (m), whichever is smaller. l_t is the length of a cargo hold (m).
(4) In double side hull, stringer are to be provided at a spacing not exceeding $1.1\sqrt{l_t}$ (m).
(5) Transverse in double side hull and girders in cargo oil tanks and deep tanks are to be provided at positions on floors in double bottoms.

402. Direct strength calculation of girders

The structural models, loads, allowable stress levels, etc. for determining the arrangement of girders and scantling based upon direct strength calculation are to as deemed appropriate by the Society.

403. Scantlings of girders and floors in double bottom

The scantling of girders and floors in double bottom are to be as deemed appropriate by the

Society.

404. Scantlings of stringers and transverse in double side hull

The scantling of stringers and transverse in double side hull are to be as deemed appropriate by the Society.

405. Girders and transverse in cargo oil tanks and deep tanks

1. The section modulus of girders is not to be less than that obtained from the following formula :

$$Z = 7.13\, C_1' k^2 K S h l^2 \quad (\text{cm}^3)$$

Where:

h = waterhead h_1, h_2 or h_3 as specified in **Table 7.10.2.** whichever is the greatest. Where, however, "from the lower edge of the bulkhead plating under consideration" is to be construed as "from the mid-point of S" for horizontal girders, and as "from the mid-point of l " for vertical girders in applying the value of h.

k = correction factor for brackets, and to as obtained from the following formula:

$$k = 1 - \frac{0.65(b_1 + b_2)}{l}$$

b_1 and b_2 = arm length of brackets at respective ends to be girders and transverses (m).

C_1', S and l = as specified in **105.**

2. The moment of inertia of girders is not to be less than that obtained from the following formula. However, in no case is the depth of girders to be less than 2.5 times the depth of slots.

$$I = 30\, h l^4 \quad (\text{cm}^4)$$

Where:

h and l = as specified in **Par 1.**

3. The thickness of girders is not to be less than the greatest of the following t_1, t_2 or t_3 :

$$t_1 = 41.7 \frac{C_1' C_2 K S h l}{d_1} + 2.5 \quad (\text{mm})$$

$$t_2 = 0.174 \sqrt[3]{\frac{C_1' C_2 S h l S_1^2}{d_1}} + 2.5 \quad (\text{mm})$$

$$t_3 = 0.01 S_1 + 2.5 \quad (\text{mm})$$

Where:

h = as specified in **Par 1.**

S_1 = spacing of stiffeners of girders or the depth of girders, whichever is the smaller (mm).

d_1 = depth of the girder under consideration (mm) subtracting the depth of openings.

C_2 = coefficient as obtained from the following formula. In no case is it to be less than 0.5 :

Vertical girder : $C_2 = \left| 1 - \frac{2x}{l} \right|$

Horizontal girder : $C_2 = \left| 1 + \frac{0.2\,l}{h} - \left(2 + \frac{l}{h}\right)\frac{x}{l} + \frac{l}{h}\left(\frac{x}{l}\right)^2 \right|$

Where:

x = distance from the end of l to the sectional area under consideration(m), and from the lower end for vertical girders.

C_1', S and l = as specified in **105.**

4. Where, the stiffeners are provided within the effective width, they may be included in the effective steel plates for calculating actual moment of inertia of girders and section modulus.

5. The thickness of webs at the root of struts for girders and transverse in case where struts are provided, is not to be less than that obtained from following formula. Where slots are provided in bs at the root of struts, they are to be covered effectively with collar plates.

$$t = 16 S_1 \sqrt{\frac{C_1' S b_s h_s}{A}} \quad (\text{mm})$$

Where:

b_s = width supported by struts (m).

h_s = distance from mid-point of b_s to the point of $d + 0.038L'$ above top of keel (m).

S_1 = spacing of stiffeners provided depthwise on the web plates of transverses at the portion where cross ties are connected (m).

C_1' and S = as specified in **105.**

A = as specified in **Pt 7, Ch 1, 403.** (1).

6. The thickness of face plates forming a girder is to be greater than the thickness of web, and the total width is not to be less than that obtained from the following formula :

$$b = 2.7\sqrt{d_0\, l'}$$

where:

d_0 = depth of girder (mm)

l' = distance between supporting points of girders (m). Where, however, if effective tripping brackets are provided, they may be regarded as supporting points.

406. Girders of ships without double side hull

1. In addition to the requirements in **405.**, depth of side transverse d_0 and section modulus of transverse Z are not to be less than those obtained from the following formula :

$$d_0 = 150\, l \quad (\text{mm})$$
$$Z = 8.7 k^2 K S h l^2 \quad (\text{cm}^3)$$

Where:

h = distance from mid-point of l to the point $d + 0.038L'$ above top of keel (m)

k, l and S = as specified in **405.1.**

2. The scantlings of deck transverses are to as given in (1) and (2) below :

(1) Section modulus of deck transverse of a ship without trunks is not to be less than that obtained from the following formula :

$$Z = 3k^2 KS\sqrt{L}\,l^2 \quad (\mathrm{cm}^3)$$

Where:

k, l and S = as specified in **405.1.**

(2) For ships with trunks, the construction of providing continuous deck transverses across the trunk is to be considered as the standard. In this case, the depth of deck transverses that can be regarded as those supported by trunks may be $0.03B$.

3. For transverses provided on the centreline bulkhead, the section modulus Z and depth d_0 of deck transverses are to be less than those obtained from the following formula :

$$d_0 = 120\,l \quad (\mathrm{mm})$$
$$Z = 7.0k^2 KS\,h\,l^2 \quad (\mathrm{cm}^3)$$

Where:

k, l, S and h = as specified in **Par 1.**

407. Stiffeners attached to girders in cargo oil tanks and deep tanks

The thickness of flat bar stiffeners and tripping brackets provided on girders and transverses is not to be less than that obtained from the following formula. However, it needs not exceed the thickness of webs of the girder to which they are provided.

$$t = 0.5\sqrt{L} + 2.5 \quad (\mathrm{mm})$$

408. Cross ties

1. Cross ties in ships having two or more rows of longitudinal bulkheads, where they are effectively connected with longitudinal bulkhead transverses in cargo oil tanks are to be in accordance with this requirements.

2. The sectional area of cross ties interconnecting longitudinal bulkhead transverses in cargo oil tanks is not to be less than that obtained from the following formula :

$$A = C_1' C_2 KS b_s h \quad (\mathrm{cm}^2)$$

Where:

b_s = as specified in **405. 5.**

h = h_s where cross ties are provided in wing cargo oil tanks, vertical distance from mid-point of b_s to top of hatchways of adjacent cargo oil tanks where struts are provided in centre cargo oil tanks (m).

C_2 = coefficient obtained from the following formula, in no case, however, is to be less than 1.1

$$C_2 = \frac{0.77}{1 - 0.5\dfrac{l}{k}}$$

l = length of cross ties between the inner surface of longitudinal bulkhead transverses (m).

k = as given below : $k=\sqrt{\frac{I}{A}}$

I = moment of inertia of cross ties (cm^4).

A = sectional area of cross ties (cm^2)

C_1' and S = as specified in **105.**

Section 5 Structural Details

501. General

1. The principal structural members are to be arranged so that continuity of strength can be secured throughout the cargo area. In forward and afterward parts of the cargo area, the structures are to be effectively strengthened so that continuity of strength is not impaired sharply.

2. For the principal structural members, sufficient consideration is to be given for fixity at ends, supporting and stiffening systems against out-of-plane deflections and the construction is to minimize local stress concentration.

502. Frames and stiffeners

Longitudinal beams, frames and stiffeners are to be of continuous structures, or to be connected securely so that their sectional area at ends can be properly maintained providing sufficient resistance against bending moments.

503. Girders and cross ties

1. Girders provided within the same are to be arranged to avoid sharp changes in strength and rigidity, and brackets in suitable size are to be provided at the ends of girders, and bracket toes are to be sufficiently rounded.

2. In case where the depth of longitudinal girders is large, stiffeners are to be arranged in parallel with face plates.

3. Brackets are to be provided at the ends of cross ties to connect to transverses or girders.

4. Transverses and vertical webs are to be provided with tripping at the junctions with cross ties.

5. Where breadth of face plates forming cross ties exceeds 150 mm on one side of the web, stiffeners are to be provided at proper interval to support the face plates as well.

6. Tripping brackets are to be provided on the web plate transverses at the inner edge of end brackets and at the connecting part of cross ties, etc. and also at the proper interval in order to support transverses effectively. In case where the width of face plates of each girder exceeds 180 mm on one side, the tripping brackets shown above are to support face plates as well.

7. Webs for the upper and lower end brackets of side transverses and longitudinal bulkhead transverses and areas in the vicinity of their inner ends and those in the vicinity of the roots of cross ties are to be stiffened specially with closer spacing.

Section 6 Special Requirements for Corrosion

601. Thickness of shell plating

1. The thickness of shell plating forming casing cargo oil tanks planned to carry ballast water in ships without double side hull is not to be less than a thickness added with 0.5 mm to that obtained from the formula given in **Pt 3, Ch 4.**

2. The thickness of shell plating when applying the requirements of this Chapter may be reduced with 0.5 mm from the thickness obtained from the formula given in **201.**

602. Thickness of deck plating

1. The thickness of freeboard deck plating when applying the requirements of this Chapter may be reduced with 0.5 mm from the thickness obtained from the formula given in **201.**

2. The thickness of the freeboard deck plating in spaces carrying cargo oil when applying the requirements in **Pt 3, Ch 5,** is not to be less than a thickness added with 0.5 mm to that obtained from the formula given in **Pt 3, Ch 5.**

603. Thickness of tank top plating

The thickness of tank top plating in cargo oil tanks and deep tanks is not to be less than the thickness corresponding to that obtained from the formula given in **201.** added by 1.0 mm. Such an addition, however, is not required for the thickness of inner bottom plating.

604. Section moduli of longitudinal beams, frames and stiffeners

1. The section modulus of longitudinal beams provided on deck plating forming casing cargo oil tanks is not to be less than 1.1 times that calculated according to the requirements of **Pt 3, Ch 10.**

2. The section modulus of frames and stiffeners provided on shell plating and bulkheads forming cargo oil tanks planned to carry also ballast water, except the tank to carry ballast water only in heavy weather conditions, is not to be less than 1.1 times that calculated in accordance with the requirements **301.** and **302.**

605. Thickness of plate members in ballast tanks adjacent to cargo oil tanks

1. The thickness of bulkhead plating at the boundaries between ballast tanks and cargo oil tanks is not to be less than the thickness specified in **103.** added by 1.0 mm.

2. In case where the adjacent cargo oil tanks are equipped with heating systems, the thickness of bulkhead plating at the boundaries between ballast tanks and cargo oil tanks is not to be less than the thickness determined from **Par 1** added by 1.0 mm.

606. Thickness of deck plating in cargo oil tanks

The thickness of deck plating in cargo oil tanks is not to be less than the thickness specified in **103.** added by 1.0 mm.

607. Thickness of inner bottom plating in cargo oil tanks

1. The thickness of inner bottom plating of cargo oil tanks is to be sufficient considering the effects of pitting corrosion.

2. The thickness of inner bottom plating in the vicinity of suction bell mouths in cargo oil tanks, and the thickness of suction well, when provide, are not to be less than the thickness obtained by the requirements in **201.** for the appropriate area of application added by 2.0 mm.

Section 7 Special Requirements for Forward Wing Tanks

701. Application

For tankers of not less than 200 m, in length, the structural members in wing tanks which become empty in full loaded condition for spaces from a point $0.15L$ from the fore end to the collision bulkhead are to comply with the requirements in this Section as well as the requirements in each previous Articles concerned.

702. Side longitudinal

1. The section modulus of side longitudinals is not to be less than that obtained from the following formula :

$$Z = 9 C_1 K S h l^2 \quad (\text{cm}^3)$$

Where :

h = distance (m) from the longitudinals under consideration to the point $0.7d + 0.05L$ above top of keel. Where, however, in no case is h to be less than obtained from the following formula (m);

$$h_{\min} = 0.2\sqrt{L} + 0.03L$$

C_1, S and l = as specified in **105.**

2. In case where side longitudinals are connected to transverses by brackets, the section modulus may be determined by multiplying the value obtained from the following formula by the value obtained from the formula specified in **Par 1 :**

$$(1 - C)^2$$

Where:

C = as obtained from the following formulae:

where brackets are provided at both ends $C = \dfrac{b_1 + b_2 - 0.3}{l}$

where a bracket is provided at one end $C = \dfrac{b - 0.15}{l}$

b_1, b_2 and b = length of bracket arms along longitudinals (m). Where, however, in case where the value of C is negative, C = 0 (See **Fig 7.10.1**)

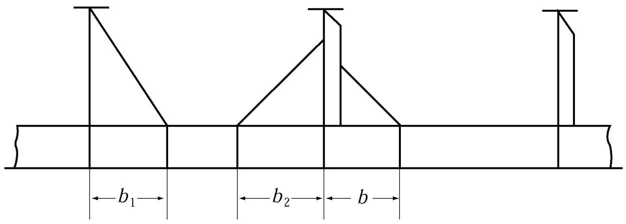

Fig 7.10.1 Measurement of b, b_1 and b_2

703. Reinforcement of bottom forward

The requirements of bottom forward are to comply with the requirements in **Pt 3, Ch 4, 404.** and **Pt 3, Ch 7, Sec 8.**

Section 8 Special Requirements for Tankers with Mid-deck

801. Application

1. The structural members of tankers having mid-deck penetrating longitudinally through the cargo areas are to comply with the requirements in **Sec 1** to **Sec 7.**

2. The scantling of structural members in cargo oil tanks below mid-deck are be as deemed appropriate by the Society.

Section 9 Special Requirements for Hatchways and Permanent Gangway

901. Ships having unusually large freeboard

Relaxation from the requirements specified hereunder will be considered to ships having an unusally large freeboard.

902. Hatchways to cargo oil tanks

1. The thickness of coaming plates is not to be less than 10 mm. Where the length and coaming height of a hatchway exceed 1.25 m and 760 mm respectively, vertical stiffeners are to be provided to the side or end coamings and the upper edge of coamings is to be suitably stiffened.

2. Hatchway covers are to be steel or other approved materials. The construction of steel hatchway covers is to comply with the following requirements. The construction of hatchway covers of materials other than steel is to be in accordance with the discretion of the Society.

(1) The thickness of cover plates is not to be less than 12 mm.

(2) Where the area of a hatchway exceeds 1 m^2 but dose not exceed 2.5 m^2, cover plates are to be stiffened by flat bars of 100 mm in depth spaced not more than 610 mm apart. Where, however, the cover plates are 15 mm or more in thickness, the stiffeners may be dispensed with.

(3) Where the area of a hatchway exceeds 2.5 m^2, cover plates are to be stiffened by flat bars of 125 mm in depth spaced not more than 610 mm apart.

(4) Covers are to be secured oiltight by fastenings spaced not more than 457 mm apart in circular hatchways or 380 mm apart and not more than 230 mm far from the corners in rectangular hatchways.

3. The cover is to be provided with an opening at least 150 m in diameter which is to be so constructed as to be capable of being closed oiltight by means of a screw plug or a cover of peep hole.

4. Hatchway coamings are to be provided with gas cocks or other suitable exhausting devices.

903. Hatchway to spaces other than for cargo oil tanks

In exposed positions on the freeboard and forecastle decks or on the tops of expansion trunks, hatchways serving spaces other than cargo oil tanks are to be provided with steel watertight covers having scantlings complying with the requirements in **Pt 4, Ch 2, Sec 2.**

904. Permanent gangway and passageway

1. A fore and aft permanent gangway complying with the requirements of **Pt 4, Ch 5, 503.** is to be provided at the level of the superstructure deck between the midship bridge or deckhouse and poop or aft deckhouse, or equivalent means of access is to be provided to carry out the purpose of gangway, such as passage below deck. Elsewhere and in ships without midship bridge or deckhouse, arrangements to the satisfaction of the Society are to be provided to safeguard the crew in reaching all parts used in the necessary work of the ship.

2. Safe and satisfactory access from the gangway level is to be available between crew accommodations and machinery space or between separated crew accommodations.

3. Where superstructures are connected by trunks, open rails are to be provided for the whole length of the exposed parts of the freeboard deck.

Section 10 Welding

1001. Application

The welding in tankers is to be accordance with the requirements given in **1002.** in addition to **Pt 3, Ch 1, Sec 5.**

1002. Fillet welding

1. The application of fillet welding to structural members within the cargo area is to as given in **Table 7.10.9.**

2. The leg length of fillet welds in areas given in (1) and (2) below is to be at least 0.7 times the plate thickness as specified in the requirements in this Chapter.

(1) Fillet welding at the connected parts between the outermost girders in the double bottom and floors.

(2) Fillet welding at the connected parts between the lowermost stringers in the double side hull and transverses.

Table 7.10.9 Application of Fillet Welding

Column	Item		Application	kind of weld
1	Girders and Transverses	Web plates	Shell, deck, longitudinal bulkhead or inner bottom plating	F1
2			Web plates	F1
3			Face plates	F2
4		Slots in web plates	Web plates of longitudinal frames, beams and horizontal stiffeners on longitudinal bulkheads	F2
5		Tripping brackets and stiffeners provided on web plates	Web plates	F3
6			Longitudinal frames, beams and horizontal stiffeners on longitudinal bulkheads	F1
7	Longitudinal frames, beams and horizontal stiffeners on longitudinal bulkheads		Shell, deck or longitudinal bulkhead plating	F3
8	Cross ties		Members forming cross ties (web plates to face plates)	F3
9			Face plates of transverses or girders	F1

Note:
Where the radius at the toe of end brackets is small, it is recommended that F1 be used for appropriate length at the toe of bracket.

KOREAN REGISTER

2011

Guidance Relating to the Rules for the Classification of Steel Ships

Part 7

Ships of Special Service

GA-07A-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance relating to the Rules for the Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF PART 7 "SHIPS OF SPECIAL SERVICE"

1. Unless expressly specified otherwise, the requirements in these Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date : 10 January 2011 (based on the application date for classification survey)

Chapter 10 Double hull Tanker

Section 2 Bulkhead Plating

- 201. 3 has been newly added.

Effective Date : 1 July 2011

CHAPTER 7 CAR FERRIES AND ROLL-ON/ROLL-OFF SHIPS

Section 3 Deck Structure

- 301. has been amended.

CONTENTS

CHAPTER 1 OIL TANKERS

Section 1 General

101. Application

1. The prescription in this Guidance principally apply to oil tankers having two longitudinal bulkheads and constructed on the longitudinal framing system, intended for carriage of oils of flash point not exceeding 60°C. Unless otherwise specially noted, the prescriptions in other parts apply for matters common to both cargo ships and tankers.

2. Proposal of novel construction type

In the event that a novel construction type is proposed, scantlings are to be determined by carrying out comparative calculations with the standard structural model conforming to the requirements of the Rules. Submission of data covering the results of model experiments or real ship experiments may be requested by the Society as necessary.

3. Ships carrying liquid cargoes other than crude oil and petroleum products

In application of **101. 4** of the Rules, ships intended to carry liquid cargoes having a vapour pressure (absolute pressure) less than 0.28 MPa at 37.8 ℃ other than crude oil and petroleum products, are to be in accordance with the followings.

(1) The scantlings of structural members of the cargo oil tank part of tankers carrying liquid cargoes of a specific gravity ρ exceeding 1.0 are to be of the values obtained by the following two procedures, whichever is greater:

(A) To calculate for all of the structural members in accordance with the relevant requirements of the Rules

(B) To calculate for respective structural members in accordance with the following prescription:

(a) The scantlings of members attached to shell plating, cross ties and members attached to longitudinal bulkhead which are connected with members attached to shell plating through cross ties are to be determined by the formulae in the Rules, in which h is to be replaced by h_0 shown in **Fig 7.1.1.**

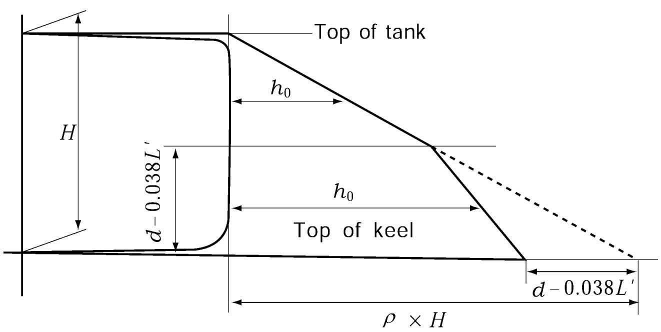

Fig 7.1.1. Measurement of h_0

(b) The scantlings of bulkhead plating, members attached to bulkheads and cross ties are to be determined on the assumption that the tank concerned is filled with liquid cargo of specific gravity ρ up to the top of tank.

(c) The section modulus of deck transverses in centre tanks are to be multiplied by ρ.

(d) The values of ρ are to be selected for respective cases except those contained in **Table 7.1.1.**

Table 7.1.1 Value of ρ

Cargo	ρ
Molasses	1.4
Asphalt	1.1
Concentrated sulphuric acid	1.85

(2) For tankers carrying dangerous chemicals in bulk, the requirements in **Ships Carrying Dangerous Chemicals in Bulk** of the Rules are also to be applied.

102. Arrangement of bulkheads in cargo tanks

1. The length of tanks in cargo oil spaces is less than the greater 10 m or the following value.

(1) Where the longitudinal bulkhead is not installed---------------------------------- $0.1L_f$
(2) Where the longitudinal bulkhead is only installed at centreline ------------- $0.15L_f$
(3) Where two or more longitudinal bulkheads are installed
(A) Wing tank -- $0.2L_f$
(B) Centre tank

(a) for $\frac{b_i}{B_f} \geq \frac{1}{5}$ -- $0.2L_f$

(b) for $\frac{b_i}{B_f} < \frac{1}{5}$

(i) Where the longitudinal bulkhead, which is not on the centreline : $\left(0.5\frac{b_i}{B_f}+0.1\right)L_f$

(ii) Where the longitudinal bulkhead, which is on the centreline : $\left(0.25\frac{b_i}{B_f}+0.15\right)L_f$

b_i = the minimum breadth at location on the load line of the wing tank.(m)

2. In the centre tanks and inner tanks, transverse swash bulkheads are to be provided at an interval not exceeding 15 m or $0.1L$, whichever is greater.

3. In wing tanks, rings and/or girders are to be so constructed as to avoid discontinuity of strength at the positions of longitudinal bulkheads in the centre tanks and inner tanks.

103. Cofferdams

1. Cofferdams and bulkheads bounding cargo oil tanks

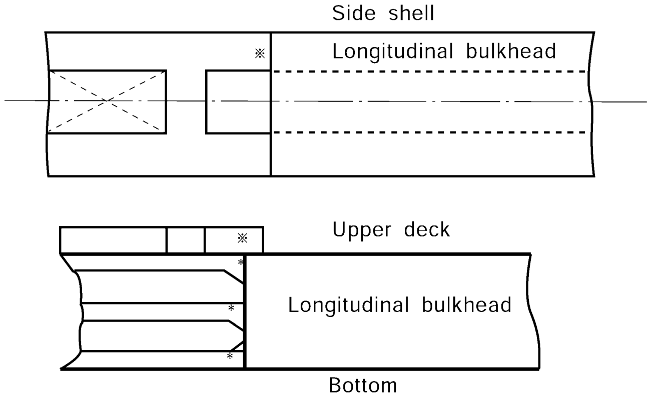
(1) Compartment destined to carriage of fuel oil or water ballast may be utilized as cofferdams needed for isolation from cargo tanks, if such compartments are of all welded construction except deck stringer angles. (See **1003. 2** and **3** of the Rules)
It is recommended that tanks containing such liquid cargoes as will be heavily damaged by contamination of fuel oil-gasoline, molasses, etc. be isolated by cofferdams from fuel oil tanks.
(2) If the fore peak compartment (or tank) is continuous to cargo tanks, the collision bulkhead is not to have any opening except special cases. (See **1003. 2** and **3** of the Rules)
(3) Divisions between compartments defined as cofferdams and other compartments (except cargo oil tanks and fuel oil tanks) are not to have any openings with the exception of bolted watertight manholes provided in chain locker bulkheads, etc. (no watertight door is permitted).

2. Superstructures and deckhouses

The deckhouse protecting the entrance to pump rooms is to be as follows:

(1) The strength of front wall is to be equivalent to that of wall of the bridge.
(2) The strength of side and after walls are to be equivalent to that of front wall of the poop.
(3) The height of doorway coaming is not to be less than 600 mm above the freeboard deck.

3. At the after end of cargo tank region, attention is to be given to keep continuity between the ends of longitudinal bulkheads and the longitudinal members of poop deck, etc. (See **Fig 7.1.2**)



※ : The wall of deckhouse is to be of steel, and be provided on the longitudinal bulkhead.
* : The brackets are to be of big size.

Fig 7.1.2 Continuity of after end of longitudinal bulkhead

4. Tankers having double bottoms under cargo tanks

Access to the double bottoms is not to be provided in cargo tanks. It is to be made from cofferdams at the forward and after ends or through oiltight trunks led from the exposed main deck to the double bottom.

104. Airtight bulkheads

1. Cofferdams which are not utilized as main or auxiliary pump rooms and compartments utilized as cofferdams under the freeboard deck are to meet the requirements for the strength of deep tanks. The bulkhead between the main pump room and engine room is to have structural scantlings of watertight bulkheads in ships of not less than 100 m in length and of airtight bulkheads in ships of less than 100 m in length.

2. The scantlings of airtight bulkheads for which no hydrostatic tests are required are to comply with the following standards. Airtightness tests may be replaced by hose tests.

(1) Thickness : It is not to be less than 6 mm, which may, however, be reduced to 4.5 mm in ships of less than 100 m in length.

(2) Section modulus of stiffeners and girders : It is to be 50 % of the rule requirements for watertight bulkheads. Where connected to shell and decks, however, these stiffening members are to be of such an effectiveness as is equivalent to frames and beams.

109. Direct strength calculation

When determining the scantlings of structural members of cargo hold for a tanker by direct strength calculations, the procedure is to comply with the **Pt 3, Annex 3-2 Guidance for the Direct Strength Assessment** of the Guidance.

Section 2 Hatchways, Gangways and Freeing Arrangement

202. Hatchways to cargo oil tanks

1. In case where hatchway covers of glass-fibre reinforced plastics are provided for cargo oil tanks, they are to comply with the following requirements:

(1) The basic materials is to be of fire-resistant nature.
(2) Model tests are to be carried out according to the standard fire test method specified in SOLAS 1974 (including amendments 1981/ 1983) through exposing the inside face to fire. This standard fire test is to be carried out for a time duration of not less than 20 minutes at a highest temperature of 790℃ to confirm that there is no passage of flame until the end of the first 20 minutes of the test.
(3) Steaming tests are to be carried out to confirm that no deformations causing leakage occur.
(4) Each model of different dimensions is to be subject to hydraulic test with a pressure not less than 0.028 MPa to confirm its strength.
(5) The cover is to be designed to be set either at full-open position or full-close position only. A notice indicating this manner of handling is to be fitted to the upper surface of cover.

2. Materials of tank cleaning hatch covers are to comply with the following requirement.

(1) Covers may be of brass, bronze or steel, but are not to be of aluminium.
(2) Synthetic materials such as glass-fibre reinforced plastics materials may be used only when all the requirements under **Par 1** above can be met.

3. The tightening devices of covers of tank-cleaning hatches are to be capable of keeping an ample tightness under pressure corresponding to water head of 2.45 m above the tank top. If the devices are constructed in any of the types mentioned below or in their equivalent type, the height of hatch coamings required by the provisions of **Pt 4, Ch 2, 102.** (1) of the Rules may be reduced in accordance with the provisions of **Pt 4, Ch 2, 102. 2** and **301.** (4) of the Rules.

(1) In such a type of construction that a liner is placed on the tank top and the cover is tightened by means of bolts, the pitch between these bolts is not to exceed 150 mm, and the number of bolts is not to be less than 10. Any constructions using butterfly-nuts, etc., which can be opened by simple manipulations, is not permitted. The liners are to be of a same material as the upper deck.
(2) The hatch of a type having hinged cover with arm is to have a coaming. The construction is to be such that the hatch cannot be opened simply by hand. (See **Fig 7.1.3**)

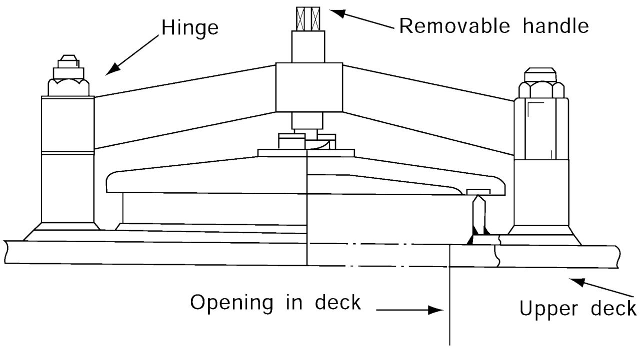


Fig 7.1.3 Cover of tank cleaning hatch

205. Freeing arrangement

Open guardrails for a length not less than half of the length of the exposed parts of the freeboard deck may be replaced by freeing ports, in the lower parts of bulwark, of a total area not less than 33 % of the total area of bulwarks.

Section 3 Longitudinal Frames and Beams in Cargo Oil Spaces

302. Scantlings

1. Slenderness ratio

In 0.4 L amidships, the slenderness ratios of longitudinal beams and longitudinal frames attached to sheer strakes are not to exceed 60 for the large ships and 80 for the small ships. In the calculation of slenderness of ratio, the dimensions of attached plate to be included into calculation are to be (actual spacing of beams or frames) × (actual plate thickness).

2. Side longitudinal

In calculating the side longitudinals as bulkhead stiffeners of deep tanks, h in the formula in Rules is to be that in **510.** of the Rules, if the length or breadth of side tanks exceeds 10 m.

303. Attachment

1. At the intersection of transverse bulkheads, longitudinal frames and beams marked with ○ in **Table 7.1.2** are to be connected by means of through-brackets or they are to penetrate.

Table 7.1.2 Where through-brackets are needed

L (m)	$90 \le L \le 120$	$120 \le L$
Longitudinal beams and side longitudinals attached to sheer strakes	○	○
Side longitudinals and longitudinals on longitudinal bulkhead (except those specified above)	—	○[1)]
Bottom longitudinals and longitudinals on bilge strake	○	○

Note:
(1) The manner of penetration of longitudinals may be as shown in **Fig 7.1.4**, except side longitudinals within 0.2D from top and bottom and longitudinals on longitudinal bulkhead within 0.1D from top and bottom

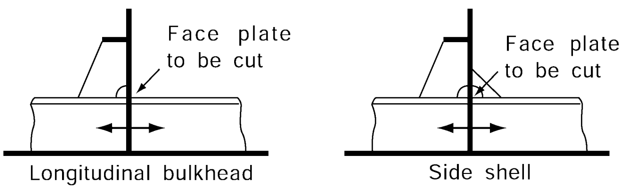

Fig 7.1.4

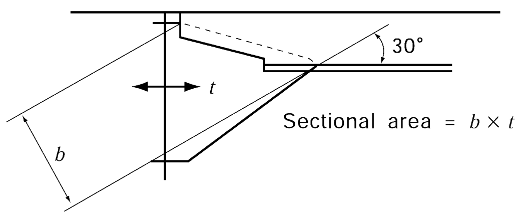

Fig 7.1.5

2. The calculation of sectional area of end bracket is to be as shown in **Fig 7.1.5** so that the area may not be less than the sectional area of the longitudinal beam, frame or stiffener concerned.

3. The connection of end brackets and longitudinal frames or beams is to be as follows.

(1) In ships of 120 m and above in length, the end brackets and longitudinal beams or frames are to overlap each other for an ample length as shown in **Fig 7.1.6.**

(2) In cases other than those under (1) above, the arrangements may be as shown in **Fig 7.1.7.** The bracket is to be brought as close to the plane of web of longitudinal as possible. Where the longitudinals are of flanged plate, the bracket is to be placed on the line of end of curva-

ture and, further, ribs are to be fitted at a point about 10 mm inward of the toe of bracket.

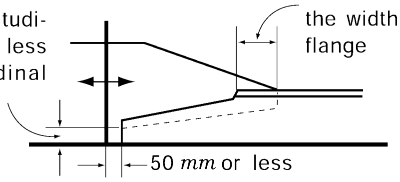

Fig 7.1.6

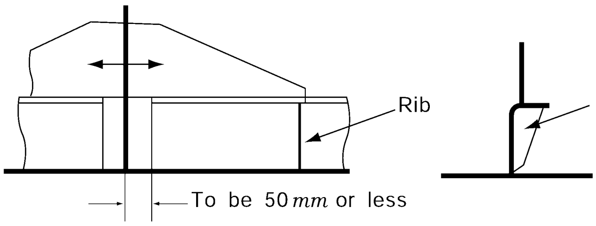

Fig 7.1.7

4. The connection of transverse bulkheads and brackets are to be rounded or levelled, as shown in **Fig 7.1.8.**

(1) The penetrating parts of end brackets are to be rounded or bevelled, as shown in **Fig 7.1.8.**

(2) The connection of end brackets and bulkhead plating is to be reinforced to avoid hard spots, as shown in **Fig 7.1.9.**

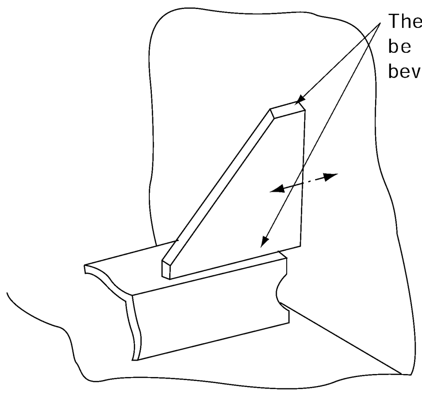

Fig 7.1.8

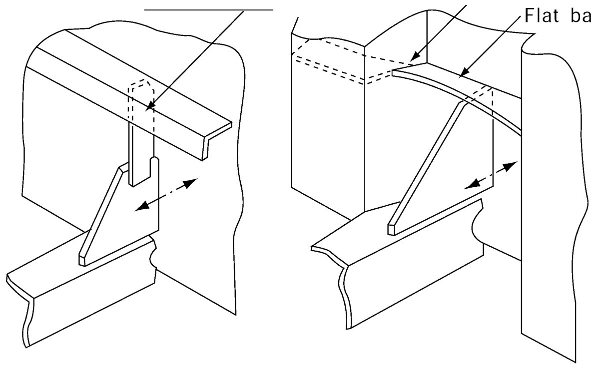

Fig 7.1.9

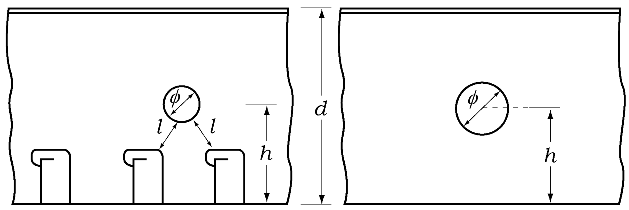
Section 4 Girders, Transverses and Cross Ties in Cargo Oil Spaces

401. General

1. The dimension and locations of lightening holes, if any, are to be as shown in **Fig 7.1.10.**



$\phi \leq \frac{d}{4}$ $\qquad \phi \leq \frac{d}{3}$

$h \leq \frac{d}{2}$ $\qquad h \leq \frac{d}{2}$

$l \geq \phi$

Fig 7.1.10 Locations and dimensions of lightening holes

2. Slots are to be reinforced with collars where flanges of longitudinals are facing each other or where slots are provided at small intervals as is often the case with bilge part.

3. Where the depth of a girder is smaller than the required depth, its section modulus is to be obtained through multiplying the required section modulus by the ratio of required depth to the actual depth.

4. In pump rooms or void spaces, the web thickness may be 1 mm smaller than the required thickness for webs in cargo oil tanks.

5. The scantlings of members in segregated ballast tanks in the midship part are to be same as those of members in cargo oil tanks (**401. 5** of the Rules)

6. Connection of web plates is to be of butt-welding. If lap-welding is adopted, stiffeners are to be provided across the connection lines.

7. In end bracket parts, at connections with cross ties, etc. of transverses where sharing stress and/or compressive stress are expected to be high, additional stiffeners are to be fitted. These parts are not to have lightening holes. If considered necessary, slots for penetration of longitudinals in these parts are to be reinforced with collars.

8. No scallop is to be permitted in the web plate at the connections of face plates or webs. Inevitable scallops for work are to be filled up by welding. For face plates adjacent to the scallop, abrupt change of dimensions is to be avoided carefully. (See **Fig 7.1.11**)

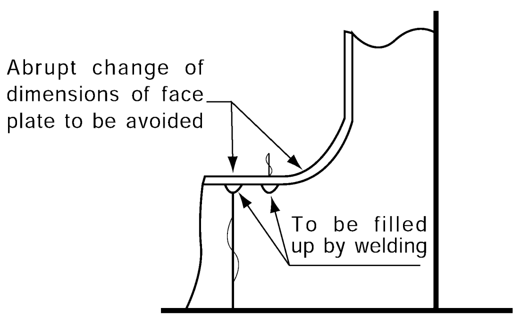


Fig 7.1.11

9. Where angle bars are used instead of flat bars as stiffeners of transverses, etc., their section modulus with effective plates is to be approximately equivalent to the required ones.

10. Where longitudinal frames or stiffeners penetrate bottom transverses, side transverses and vertical webs on longitudinal bulkhead, proper reinforcement is to be made in the extents stipulated in **Table 7.1.3** by fitting brackets on the opposite side of stiffeners on webs of transverse, for connecting longitudinals to transverse, by fitting collars at slots, or by other suitable means. In ships not exceeding 230 m in length, however, the extent of application of such reinforcement may be properly reduced. This reinforcement is to apply to the slots under conditions similar to those in the above-mentioned girders or transverses(for example, slots in transverse swash bulkheads, etc.)

Table 7.1.3 Extents of reinforcement

Member	Extent of reinforcement
Bottom transverse	All connections
Side transverse	All connections below the upper end of curvature of upper cross tie, or the load waterline, whichever is the higher. In ships of 300 m and above in length, it is recommended that similar reinforcement be applied in wider extent upward beyond the limit stipulated above.
Vertical webs on longitudinal bulkhead	All connections below the upper end of curvature of upper cross tie.

402. Transverses and girders provided in centre or inner tanks in ships having two or more rows longitudinal bulkheads

1. Where transverse swash bulkheads complying with rule requirements are provided in tanks, L_0 may be the distance between the transverse bulkhead and the swash bulkhead.

2. As for the treatment of Note 1 to **Table 7.1.3** of the Rules, the value of C_4 is to be equal to 1.2 times the value of C_4 in **Table 7.1.3** of the Rules.

3. As for the treatment of Note 2 to **Table 7.1.3** of the Rules, the value of C_4 in **Table 7.1.3** of the Rules, may be multiplied by $0.25D/d_1$, if the depth of the centreline bottom longitudinal girder d_1 exceeds 25 % of the ship's depth D.

4. The centreline bottom longitudinal girder is to have docking brackets at the middle of span between bottom transverses and between the bottom transverse and transverse bulkhead. If these brackets are of large dimensions, their free edges are to be reinforced against buckling.

5. Where the depth d_2 of centreline vertical web on transverse bulkhead is greater than the spacing S of transverses, the web thickness of bottom girders is to be obtained form the formula in Rules, where d_1 is to be used in place of d_1' and the coefficient η is to be derived form **Table 7.1.4.** (See **Fig 7.1.12**)

Table 7.1.4 Coefficient η

Number of transverse	η
2	0.55
3	0.67
4	0.75
5	0.80

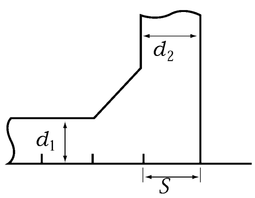

Fig 7.1.12

403. Transverses and girders in wing tanks in ships having two or more rows of longitudinal bulkheads

1. Side transverse

The span l_0 of side transverses is to be measured as shown in **Fig 7.1.13.** The lower end is to be determined in a similar manner.

2. Vertical webs on longitudinal bulkheads

(1) Even when large brackets are provided on the opposite side of longitudinal bulkhead, the span l_0 and radius of transverses are to be measured on the wing tank side in a same manner as (1) above. The size of bracket b may be $(b' + b'')/2$, except when b is to be taken as equal to b' if b'' is smaller than b'.(See **Fig 7.1.14**)

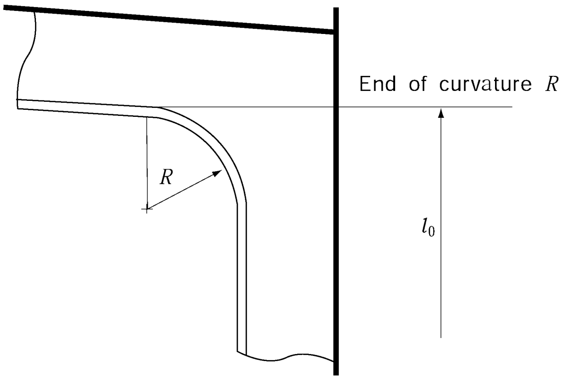

Fig 7.1.13 Measurement of l_0

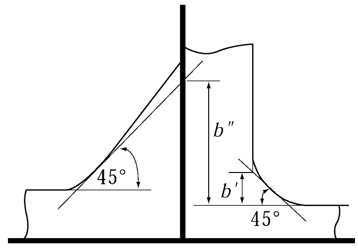

Fig 7.1.14 Measurement of b' and b''

(2) In calculating the web thickness in regard to the shearing force, the brackets on the opposite side of longitudinal bulkhead may be taken into account.
(3) Collars are to be fitted to close slots in the vicinity of the toe of bracket of bottom transverse, which is connected to longitudinal bulkhead, in the centre tank or inner tank.
(4) Girders on corrugated bulkheads are to be balanced girders. Where balanced girders are not adoptable, the neutral axis is to be brought as close to bulkhead plating as possible.

3. Moment of inertia of bottom and deck transverses

The standard values of moment of inertia of bottom and deck transverses are to be obtained from the following formulae :

Bottom transverses : $I = 160 C_0 C_2 Q l_0^2 \dfrac{B_S}{D}$ (cm^4)

Deck transverses : $I = 58 C_0 C_2 Q l_0^2 \dfrac{B_S}{D}$ (cm^4)

where:

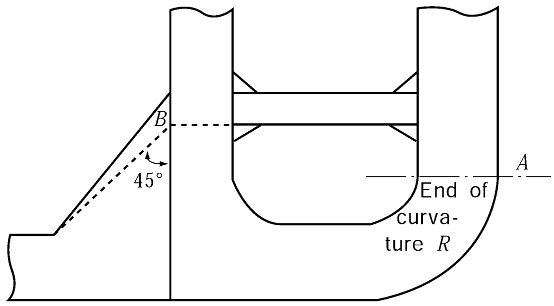
C_0 and C_2 = as specified in **Table 7.1.3** of the Rules

Q and l_0 = as specified in **403. 1** of the Rules

B_S = breadth of wing tank

4. Transverses at bilge part and lower end of longitudinal bulkhead

If the lowest cross tie is located as shown in **Fig 7.1.15** the section modulus of transverse at the bilge part and the lower end of longitudinal bulkhead may be reduced to 90 % of the values obtained from the formula. Further, the web thickness of side transverse at "A" may be 0.5 mm thinner than that obtained from the formula, but is not to be less than the thickness according to **405.** of the Rules.



The lower face of cross tie should be located at least lower than the point "B"

Fig 7.1.15

5. Where side stringers are provided

(1) If a swash bulkhead is provided in the centre tank, l_1 is to be measured as shown in **Fig 7.1.16.**

(2) In addition to the prescriptions in **403. 5** (1) of the Rules, the side stringers and cross ties are to meet the following condition.

$l_1 > l_2 > l_3$ ------------- (See **Fig 7.1.17**)

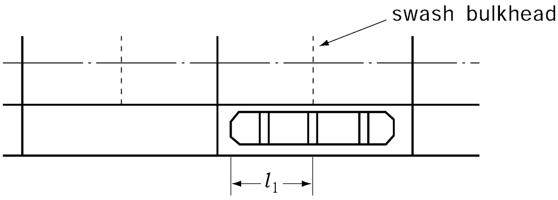


Fig 7.1.16 Measurement of l_1

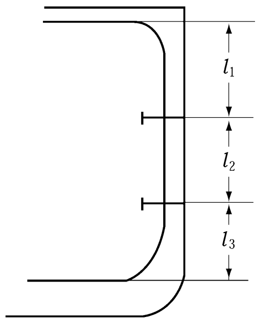

Fig 7.1.17

(3) Where four transverse rings and one horizontal ring are connected by one cross tie, the coefficients C_3 and C_4 for calculation of the scantlings of horizontal ring are to be obtained from **Table 7.1.5. 404. 2** is to apply to the cross tie.

(4) If stringers are arranged asymmetrically or two cross ties are provided, the scantlings of these members are to be decided on the basis of equivalent effectiveness.

Table 7.1.5. C_3 **and** C_4 **of coefficient**

<table>
<tr><th colspan="2">Coefficient</th><th>C_3</th><th>C_4</th></tr>

</table>

6. Side stringers in bow part(longitudinal bulkhead in centreline only)

(1) Where strong stringers support transverse rings(without cross tie) (See **Fig 7.1.8**)

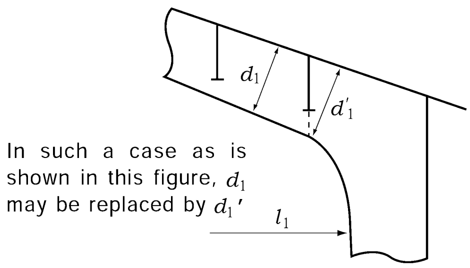

Fig 7.1.18

Transverse ring:

Average depth of girder : $d = C_0 l_0$ (m)

Section modulus of girder :

average over span : $Z = C_2 K^2 Q l_0$ (cm^3)

bilge part : $Z = C_2' Q l_0$ (cm^3)

Longitudinal girder :

Web thickness : $t = C_3 \frac{Q}{d_1} + 2.5$ (mm)

Section modulus of girder : $Z = C_4 K Q l_1$ (cm^3)

C_0, C_2, C_2', C_3 and C_4 are to be obtained from **Table 7.1.6.** These formulae apply to the type of construction comprising three or four transverse rings supported by one or two strong stringers, where K does not exceed 0.5. Symbols are to be as per **403.** of the Rules.

Table 7.1.6 Coefficient C_0, C_2, C_2', C_3 and C_4

No. of longitudinal girders	No. of transverses	Coefficient	$K=\frac{d_0}{d_1}\times\left(\frac{l_1}{l_0}\right)^2$	
			0	0.5
1	3 or 4	C_0 C_2 C_2'	0.080 1.46 2.89	0.125 3.88 5.10
	3	C_3 C_4	54 10.20	36 5.60
	4	C_3 C_4	72 10.60	45 6.40
2	3 or 4	C_0 C_2 C_2'	0.065 0.68 1.36	0.115 3.40 4.76
	3	C_3 C_4	41 7.20	23 3.80
	4	C_3 C_4	50 7.7	32 4.3

Note:
Where only two transverse rings are provided, C_3 and C_4 are to be replaced by $1.2C_3$ and $1.2C_4$, respectively, for the lower longitudinal girder and $0.8C_4$, respectively, for the upper longitudinal girder.

(2) Where the side transverse is connected by cross ties to the vertical webs on the centreline bulkhead (without longitudinal girders), the principal scantlings are to be determined according to **403. 1** (1) to (4), **2** (1) and **3** (3) of the Rules, in which the coefficient in formulae may be those in **Table 7.1.7.** The prescriptions in **404.** of the Rule are to apply to cross ties.

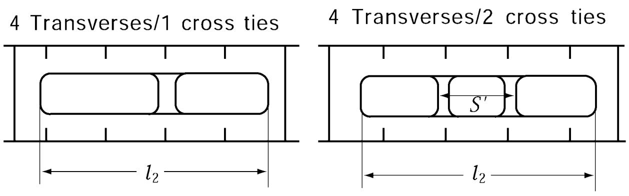
Table 7.1.7 Coefficient C_0, C_2 and C_2'

Coefficient \ No. of cross tie	1	2
C_0	0.10	0.09
C_2	2.52	1.94
C_2'	3.83	2.89

404. Cross ties

1. In the construction of 4 transverses ring/1 cross ties or 4 transverses ring/ 2 cross ties type as per **403. 5** (3), the value of S in the formula is to be obtained from the following formulae.(See **Fig 7.1.19**)

2. In such a construction as shown in **Fig 7.1.20,** brackets asterisked are to be fitted.



$S = \frac{l_2}{2}$ (m) $S = \frac{l_2 + S'}{4}$ (m)

l_2 = span of longitudinal girder/stringer (m).
S' = spacing of cross ties (m).

Fig 7.1.19 Value of S

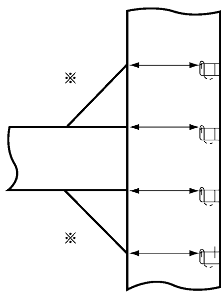


Fig 7.1.20

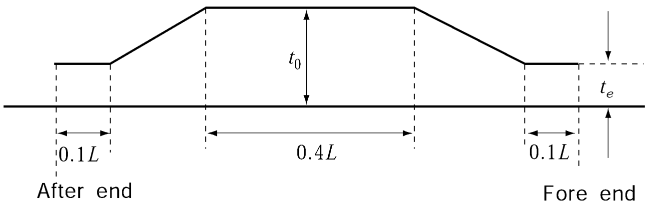
Section 5 Bulkheads in Cargo Oil Spaces

502. Thickness of bulkhead plating

The thickness of the uppermost and the lowest strake of longitudinal bulkheads stipulated in **502. 2** may be tapered down as shown in **Fig 7.1.21,** provided that their thickness is not less than obtained according to **502. 1** and **3** of the Rules.



t_0 = actual thickness in midship part ⌧
t_e = thickness as per Rules, **Table 7.1.1**

Fig 7.1.21 Tapering of thickness of uppermost and lowest strakes of longitudinal bulkhead.

504. Strong vertical webs

1. Centreline vertical webs on transverse bulkhead

d_l and d_u in the prescriptions in **504.** of the Rules are to include the depth of brackets, if there are brackets on the opposite side of the bulkhead.

2. End connection of webs attached to bulkheads

The connection of a member having a large moment of inertia, such as longitudinal girder on bulkhead, and a member having a small moment of inertia, such as longitudinal frames, is to be arranged as shown in **Fig 7.1.22.**

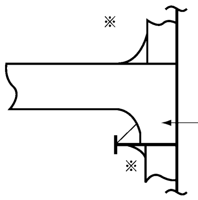


Fig. 7.1.22

506. Horizontal girders supporting vertical webs

Connection of webs and longitudinal frames, etc. is to be as specified in **504. 2.**

511. Swash bulkheads

1. The breadth and thickness of the uppermost and lowest strakes of the centreline swash bulkhead may be 90 % of those required by the Rules for the uppermost and lowest strakes, respectively, of the longitudinal oiltight bulkhead.

2. The "opening ratio" means the ratio of the sum of areas of openings, except slots and scallops, to the area of the bulkhead.

3. The section modulus of stiffeners is to be obtained from the following formula;

$$Z = CSh_s l^2 \quad (\text{cm}^3)$$

where:

S = spacing of stiffeners (m)

l = span of stiffener between supports (m)

C = coefficients stipulated below

both ends effectively bracketed -- 7.1

one end effectively bracketed and the other end supported by girder ---- 8.4

both ends effectively bracketed -- 10.0

h_s = value obtained from the following formula. In no case is it to be less than 2.0

$$h_s = \left(0.176 - \frac{0.025}{100}L\right)(1-a)l_t$$

where :

L = length of ship (m)

a = opening ratio of bulkhead plating

l_t = length of tank (m)

4. Where a vertical web at the middle of two longitudinal bulkheads serves as a strong web supporting horizontal girders, the scantlings of the vertical web are to be obtained from the following formulae:

(1) Depth of web

$$d = 3\left(\frac{l_1}{B_0}\right)^2 d_0 \quad (\text{m})$$

where:

l_1, B_0 and d_0 = as specified in **504.** of the Rules

(2) Sectional area of web at the upper end of lower bracket

$$A = 1.74 \frac{(D - h_1)}{D} S(h - 0.32d)(l - S)C \quad (\text{cm}^2)$$

where:

S, h, l and C = as specified in **501.** of the Rules.

h_1 = vertical distance from the top of keel to the inner toe of lower bracket of the web (m)

But, the sectional area of web is to include the bulkhead plating of the part within the distance form the web to the nearest opening or the distance equal twice the deck longitudinal spaces on each side of the web, whichever is the smaller.

(3) Thickness of web at the upper end of lower bracket

$$t = 12Kb + 2.5 \quad (\text{mm})$$

where:

b = spacing of vertical stiffeners fitted to web (mm)

K = as specified in following formula

$$K = \sqrt{\frac{A}{A_0}}$$

A = sectional area as specified in (2) (cm^2)

A_0 = sectional area of the vertical web (cm^2)

(4) Section modulus of vertical web

$$Z = 4k^2 B_0 h_s l_1^2 \quad (\text{cm}^3)$$

where:

k, B_0 and l_1 = as specified in **504.** (1) of the Rules.

h_s = as specified in **Par 3.** above.

5. The scantlings of waves supporting vertical webs or horizontal girders are not to be less than obtained from the formula in **506.** of the Rules. In applying the formula for W_i, h is to be replaced by h_s prescribed in **Par 3.**

6. The scantlings of webs supporting stiffeners are to be obtained according to **507.** of the Rules in which h is to be replaced by h_s prescribed in **Par 3** and X is to be taken as zero.

7. Where a swash bulkhead consists of bottom transverses, deck transverses, side transverse, vertical webs on longitudinal bulkhead and struts, the scantlings of these webs and struts are to be obtained by applying **402., 403.** and **405.** of the Rules correspondingly. In this case, the section modulus of strut about vertical axis is not to be less than obtained from the following formula.

$$Z = 7.13 d_0 h_s l^2 \quad (\text{cm}^3)$$

where:

d_0 = depth of strut (m)

l = span (m) between supports, to be equal to the breadth of side tank in case of side tanks, or to the distance between longitudinal bulkheads or between centreline vertical web and longitudinal bulkhead. If tripping brackets for the webs and transverses are provided at the ends of the face plates, l may be the distance between the face plates of transverse.

h_s = as specified in **Par 3** above.

Section 6 Relative Deformation of Wing Tanks

601. Relative deformation of wing tanks

1. Special considerations for the case of exceeding limit values

It is required to submit data enough to prove that the proposed construction has an equivalent effectiveness.

2. Mean thickness in formulae

The mean thickness of plating in the formulae in **601.** of the Rules is to be obtained from the following formula.

$$t = \frac{\Sigma l_i t_i}{\Sigma l_i}$$

where :

l_i and t_i are to be taken as follows;

(1) Transverse bulkheads and perforated swash bulkheads : The thickness and breadth of each strake of the bulkhead are to be taken at the middle of the breadth of the tank as shown in **Fig 7.1.23.**

(2) Transverse rings and swash bulkheads of transverse ring type: The thickness and vertical extent of the deck transverse, transverse on longitudinal bulkhead between face bar of deck transverse and upper face bar of the uppermost strut and so on, and parts from the uppermost strut to the bottom transverse are to be taken at the middle of the breadth of the tank (at the bulkhead side if no plating is present at the middle of the breadth of the tank) as shown in **Fig 7.1.24.**

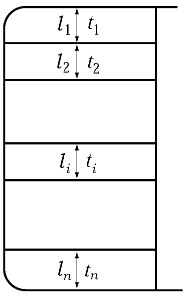

Fig 7.1.23

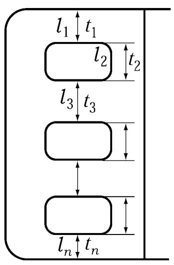

Fig 7.1.24

Section 10 Piping Systems and Venting Systems for Oil Tankers

1001. General

1. In case where double bottom used as other than cargo oil tank is provided below cargo oil tank, the requirements specified in **Sec 10** of the Rules and additionally the requirements specified in the following are to be complied with ;

(1) The air pipes and sounding pipes provided in double bottom may pass through cargo oil tanks. In this case, all pipe joints in the cargo oil tanks are to be of welded joints with a sufficient thickness according to the requirements of **Table 7.1.8.** Further, consideration is to be given to the piping arrangement for expansion and contraction of the pipes.

Table 7.1.8 The sounding pipes and air pipes passing through cargo oil tanks

Nominal diameter(mm)	Thickness of pipe	Reference[(1)]
$A < 100$	8.7	Sch. 160
$100 \le A < 200$	11.1	Sch. 120
$200 \le A < 250$	12.7	Sch. 80
$250 \le A$	15.1	Sch. 80

Note:
(1) Standard specified in *KSD* 3562 and *KSD* 3570

(2) Valve operating rods are not to pass through any part subjected to liquid head at all time, such as the inner bottom plate of the cargo tank.

(3) Pipes conveying liquid and bilge suction pipes for tank or void space at the forward position of the ship are to comply with the following requirements:

(A) Pipes for tank or void space adjacent to the forward end of cargo oil tank may be led to the aft pump room. Fuel oil transfer pipes may be led to the pump provided in the engine room.

(B) Pipes for forepeak tank or void space not adjacent to cargo oil tank may be led to the pump provided in the engine room or the pump to provided in the aft pump room. Where this tank used ballast tank, ballast pipe may be led to the pipes for ballast tank adjacent to the cargo oil tank

(C) Where ballast pipes are arranged without passing through cargo oil tanks, piping for fore peak ballast tanks not located adjacent to cargo oil tanks may be led to the pipe lines for ballast tanks located adjacent to cargo oil.(As for bilge pipes, the requirements of **1003. 1.** (3) of the Rules are to apply) To the contrary, however, ballast pipes for ballast tanks located adjacent to cargo oil tanks are not to be led to the pumps which are installed in the engine room for the use of the ballast tanks not located adjacent to cargo oil tanks.

2. In application of the **1001. 3,** "Requirements concerning use of crude oil or slops as fuel for tanker boilers" are to comply with **Annex 7-1.**

1002. Cargo oil pumps and cargo oil piping systems, pipings in cargo oil tank, etc.

1. In case of maintaining the gastight using by the oil lubricated device specified in **1002. 1** (1) (B) of the Rules, apply to **Ch. 6, 303. 6.**

2. In the provision **1002. 3** of the Rules, the changable device which the Society requires means the following device.

(1) Cargo oil tanks also used as ballast tanks
In case where a tank is used both as a cargo oil tank and a ballast tank alternatively, the cargo oil pipes, ballast pipes and vent pipes are to be arranged changeable so as to serve respective cases by giving reference to the example shown in **Fig 7.1.25.** Further, for other piping systems, the requirements for the piping systems in cargo oil tanks are to be complied with.

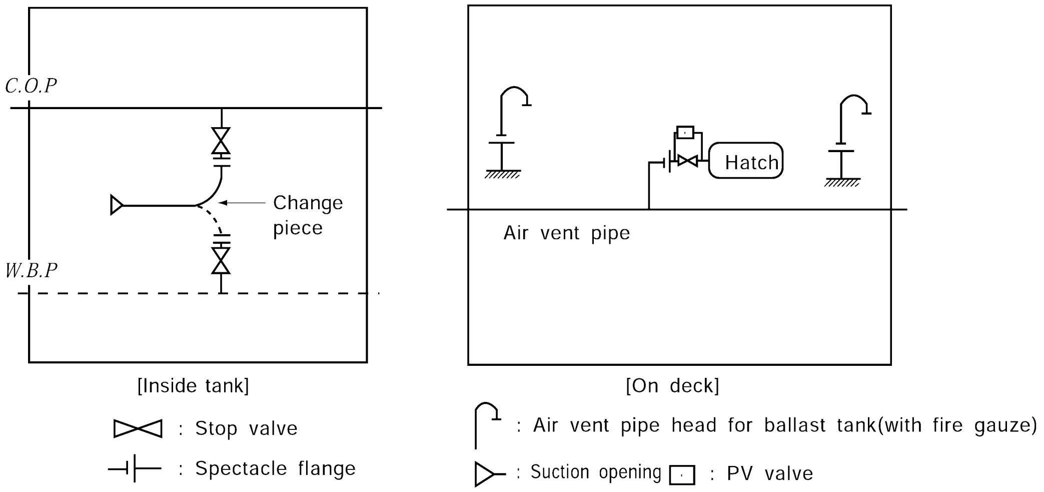

Fig 7.1.25 Example of piping arrangement for a tank used as cargo oil tank and ballast tank in alternative use

(2) Cargo oil tanks also used as fuel oil tanks
In case where a tank is used both as a cargo oil tank and a fuel oil tank alternatively the cargo oil pipes, fuel oil pipes and vent pipes are to be arranged changeable so as to serve respective cases by giving reference to the example shown in **Fig 7.1.26.** Further, for other piping systems, the requirements for the piping systems in cargo oil tanks are to be complied with.

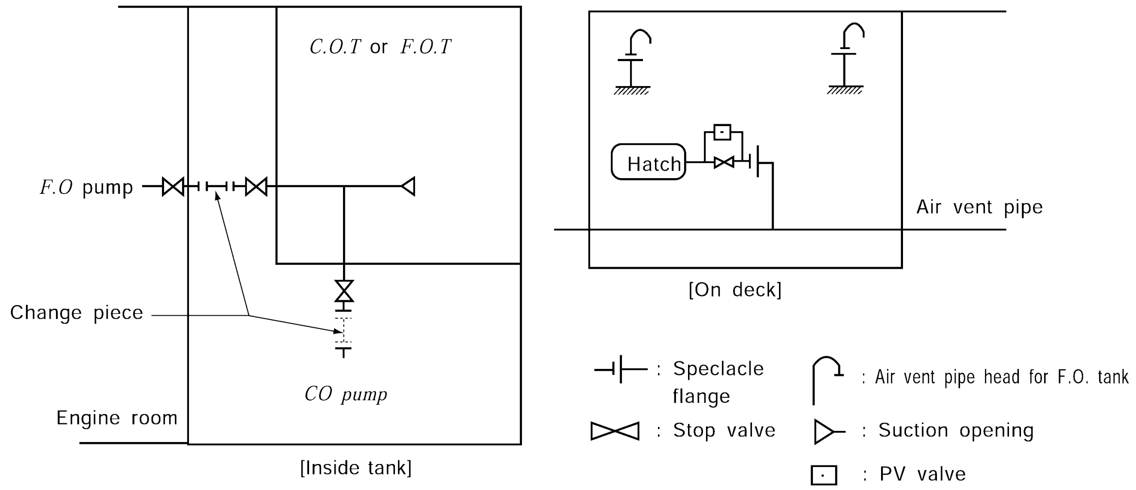

Fig 7.1.26 Example of piping arrangement for a tank used as cargo oil tank and fuel oil tank in alternative use

3. In application to **1002. 4** of the Rules, Piping systems to be connected to cargo oil piping are to be dealt with under the following requirements;

(1) Pumps and pipes in any piping system connected to cargo oil pipes are to be dealt with as those in the cargo oil piping system. However, for piping systems specified in **1002. 2** (4), **9** (6), **1003. 1** (2), **2** (2), Guidance **Pt 8. Appendix 8-5. 7** (7) and item (2) below, this requirement may be dispensed with. The piping systems connected to cargo oil piping mean those connected to cargo oil pipes having openings thereto. Hence, for example, hydraulic oil pipes for the control of cargo oil piping system are not regarded as the piping system connected to the cargo oil piping.

(2) In case where the cargo oil piping system is connected to;

(A) Tank vent pipes : The requirements in Guidance **Pt 8. Appendix 8-5 7** (7) & (8) are to be complied with. Ventilating fans except inert gas blowers, are to be installed within the dangerous spaces.

(B) Pressure gauge pipes for cargo oil piping system (including pumps) :

The pressure gauge to which cargo oil is directly led is to be installed in the pump room or on the weather deck. However, when a stop valve is provided at the joint between the pressure gauge piping system and the cargo oil piping system, and a bulkhead valve is provided at the penetration between the engine room and the pump room, the pressure gauge may be installed in the engine room.

(C) Pipes for measuring oil content :

The sampling pipe for measuring oil content may be led to the spaces other than the dangerous spaces, when the pipe is of nominal diameter of 25 A or less, and two or more stop valves are provided between cargo oil piping and the penetration of the casing of the non-dangerous spaces.

4. In application to **1002. 4.** (5) and (6) of the Rules, where at the request of the owner, cargo piping and the valve control piping are located above the double bottom, the vessel will be assigned with the notation **PCP**(Protected Cargo Piping). This applies also to cargo piping and valve control piping installed in pipe tunnel or duct keel.

5. Bulkhead valves of cargo oil piping systems

In application of **1002. 5** of the Rules, bulkhead valves in cargo oil tanks is to be comply with the following requirements.

(1) The arrangement and type of bulkhead valves are to be as given in **Table 7.1.9.**

Table 7.1.9 Arrangement and type of bulkhead valves

Arrangement A	(Pump room) (Bulkhead) (Cargo oil tank)  ※	In case where stop valve is provided at the end of opening in the cargo oil tank: No specific requirements are imposed on type and material of bulkhead valve.
Arrangement B	(Pump room) (Bulkhead) (Cargo oil tank)  ※	In case where no stop valve is provided at the end of opening in the cargo oil tank: The bulkhead valve is to be of steel castings and be operable from a control position on deck.
Arrangement C	(Pump room) (Bulkhead) (Cargo oil tank)  ※	In case where bulkhead valve is provided in the cargo oil tank: The valve on the tank side is to be operable from a control position on deck.
Arrangement D	(Pump room) (Bulkhead) (Cargo oil tank)  Piping arrangement on the cargo oil tank side is same as shown in A or B.	In cases where bulkhead valve is not provided close to the bulkhead: If those indicated with bold lines in the figure are of cast steel pipes having thickness of 13.5 mm or more or of heavy gauge steel pipes of 16 mm or more, the requirements for bulkhead valves as shown in Arrangement. A or B may be accepted.
Note: ※ This valve is to be installed as close to the bulkhead as practicable		

6. In application of **1002. 7** of the Rules, piping in cargo oil tanks is to be comply with the following requirements.

(1) Pipes for measuring instruments and remote control equipment.

Steel pipes for measuring instruments and remote control equipment provided in cargo oil tanks are to have minimum thickness of Sch. 80., except when they have openings in cargo oil tanks.

(2) Scupper pipes and sanitary pipes

Scuppers draining weather decks may pass through cargo oil tanks. In this case, all of their pipe joints within cargo oil tanks are to be of welded type and wall thickness of the pipes is to be not less than 16 mm. As for the pipes of small diameter, however, consideration may be given reasonably. Scuppers or sanitary pipes from the spaces where ignition source exists such as accommodation space and others, are not to pass through cargo oil tanks. When the pipes of diameter is less than 100A, pipes of Sch. 160 specified in KSD 3570.

(3) Overboard discharge pipes (bilge or ballast pipes)

Overboard discharge pipes passing through cargo oil tanks are to be dealt with under the following requirements;

(A) Overboard discharge pipes are not to pass through the cargo oil tanks other than those having relatively small capacity (e.g., slop tanks, etc.).
(B) Such pipes thickness in cargo oil tanks are to be 16 mm and all pipe joints in cargo oil tanks are to be of welded joints. In case where cast steel pipes are used, the pipe thickness may be 15 mm or more.
(C) Bent pipes are to be provided adequately to absorb the expansion and contraction of the pipe line.
(D) Internal surface of the pipe is to be coated with paints of good corrosion resistance, except where cast steel pipes specified in (b) above or steel pipes of adequate thickness considering corrosion allowance are used.
(E) The pipes are to be supported firmly enough to withstand vibration of ship, and to be so arranged as to enable maintenance and inspection to be carried out satisfactorily after ships are in service. As to the construction and workmanships of the penetration part of shell platings and bulkheads, special care is to be given.
(F) No valves are to be provided in cargo oil tanks.

7. The sounding device of cargo oil tanks is to be of the construction capable of measuring the ullage without opening the tank hatch cover and installed separately from the opening provided in accordance with the requirements of **1002. 8** of the Rules.

(1) Means for ullage measurement of cargo oil tanks are to be such as can make the measurement without opening the tanks.
(2) When sounding pipe is provided, the open end is to be led to the weather deck and to be provided with the pipe heads having a sluice valve or cock fitted with an automatic closing device.
(3) In case where level indicating device is provided, the device is to be of the one approved in accordance with the requirements of the 「**Guidance for the Approval of Manufacturing Process and Type approval. etc**」.
(4) Level indicating device fitting to cargo oil tank of tanker, which is fitted with fixed inert gas system, are to be fixed and closed type.

1003. Piping systems for cargo oil pump rooms, cofferdams and tanks adjacent to cargo oil tanks

1. The open ends of sounding pipes specified in **1003. 1** (4) of the Rules may be provided in pump room. However, that when the open end is lower than the bulkhead deck, the requirements in **Pt 5, Ch 6, 203. 2** (2) of the Rules are to be complied with.

2. In application of the **1003. 2** (2) of the Rules, ballast piping system for ballast tanks adjacent to cargo oil tanks is to be dealt with under the following requirements:

(1) Ballast tanks defined as being safe are to be ballasted and deballasted by pumps which are located in gas safe area. However, they may be deballasted by pumps which are located in dangerous area, provided that a check valve fitted on the line for only deballast.
(2) In case where ballast tanks adjacent to cargo oil tanks are intended to be deballasted by cargo oil pumps in an emergency, a spool piece(or blank flange) and a screw-down non-return valve are to be provided on each ballast pipe at the joint with the cargo oil pipe. Further, a warning notice is to be posted stating that spool pieces are to be removed except for emergencies.

3. In the apply to the **1003. 2** (3) of the Rules, Air vent pipes of ballast tanks adjacent to cargo oil tanks is to be dealt with under the following requirements;

(1) The wording "flame screen" specified in **1003. 2** (3) of the Rules means the screen meeting the following requirements:
(A) To be made of corrosion resisting material.
(B) To comprise two fitted screens of at least 20 × 20 mesh spaced 25.4 ± 12.7 mm apart or single fitted screen of at least 30 × 30 mesh, or to have a performance equivalent thereto
(2) The total sectional area of air vent pipes in case where high level alarm or hatchway specified in **202.** of the Rules is provided in ballast tanks adjacent to cargo oil tanks may be larger than the sectional area under the requirements of **Pt 5, Ch 6, 201. 4** (1) of the Rules or 1,000 cm^2 whichever is the smaller.

4. In application of **1003. 2** (4) of the Rules, the open ends of sounding pipes for ballast tanks adjacent to cargo oil tanks is to be comply with **1003. 1.**

5. In application of **1003. 4** of the Rules, the open ends of sounding pipes for fuel oil tanks adjacent to cargo oil tanks is to be comply with **1003. 1.**

1005. Venting systems of cofferdams adjacent to cargo oil tanks

The wording "flame screen" specified in **1005.** of the Rules means the one specified in **1003. 4** (1).

1006. Positions of openings of machinery spaces, deck house, etc. and electrical equipment, etc.

Where cargo pipe is provided to stern regard as dangerous spaces within 3 m from opening.

1007. Tankers carrying only oils having flash point exceeding 60°C

Ventilation system specified in **1007. 6** of the Rules may be deduct 6 times from ventilation frequency and may not non-sparking construction.

Section 11 Electrical Equipment of Oil Tankers

1101. General

1. The term "semi-enclosed spaces" specified in **1101. 2** of the Rules means the spaces separated by decks and bulkheads where the condition of ventilation is significantly different from that of exposed part of ship.

2. In the case of small ships where part of the forecastle deck corresponds to the dangerous space under the requirements of **1101. 2** (1) (B) (k) & (C) (e) of the Rules and when electrical equipment other than explosion-protected ones are installed under an inevitable reason, the following requirements are to be complied with:

(1) A steel gas barrier is to be provided on the forecastle deck.
(2) The height of the steel gas barrier is to be 2.4 m or more above the upper deck with the full width of the forecastle deck where the steel gas barrier is installed.
(3) The steel gas barrier is not to be provided with any opening.
(4) Electrical equipment is to be at least of the totally enclosed water-proof type.

3. The requirement of **Pt 1101. 3** (2) (D) apply to the following circuit.

(1) Condenser circuit for filter
(2) Earthing circuit for composing intrinsic safety circuit
(3) Neutral circuit of 3000 *V* and above high voltage 3 phase distribute cabling in main machinery, special safety area. etc.

4. Examples of dangerous spaces for **1101. 2** of the Rules are classified as follows.

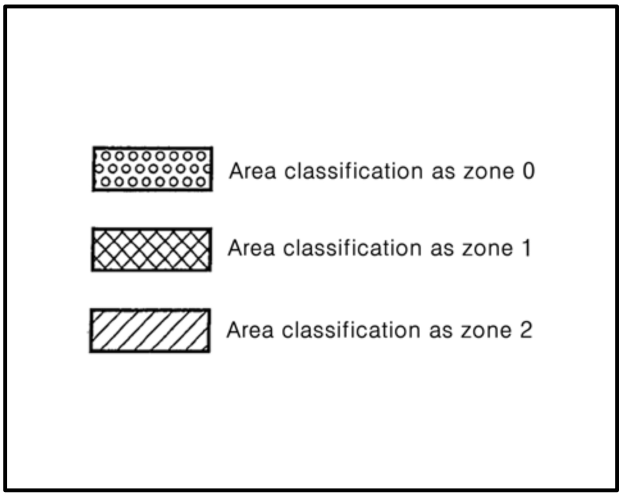

Fig 7.1.27 Classification symbols of dangerous spaces

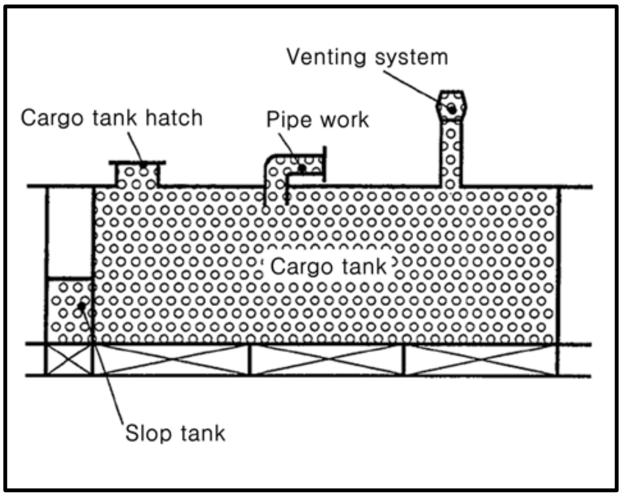

Fig 7.1.28 Example of (1) (A) zone 0

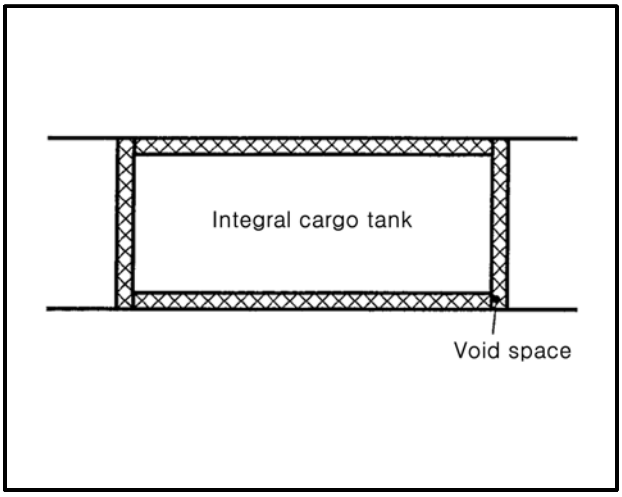

Fig 7.1.29 Example of (1) (B) zone 1 (a)

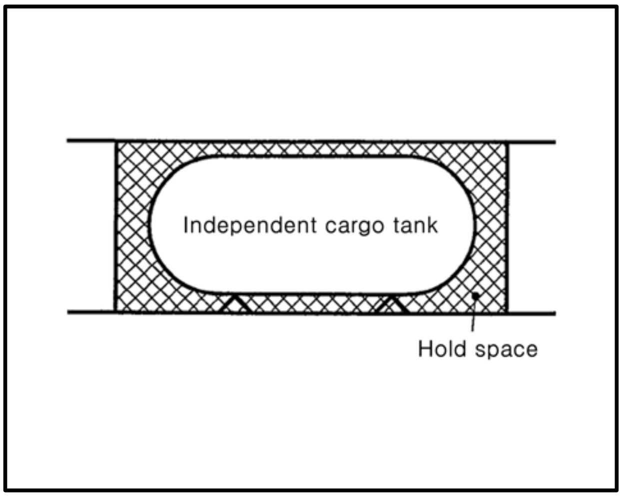

Fig 7.1.30 Example of (1) (B) zone 1 (b)

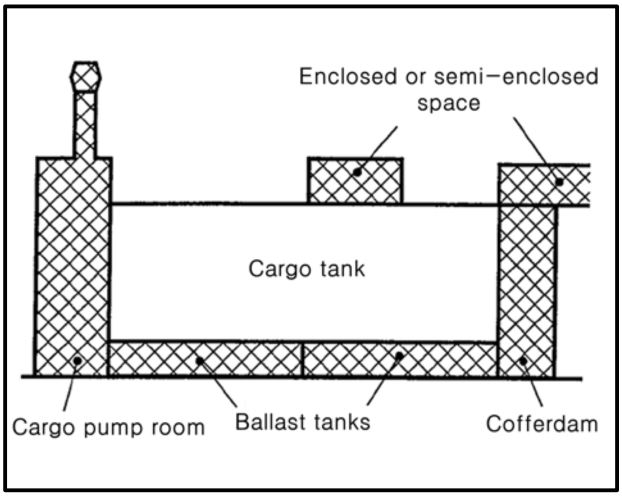

Fig 7.1.31 Example of (1) (B) zone 1 (c) ~ (f)

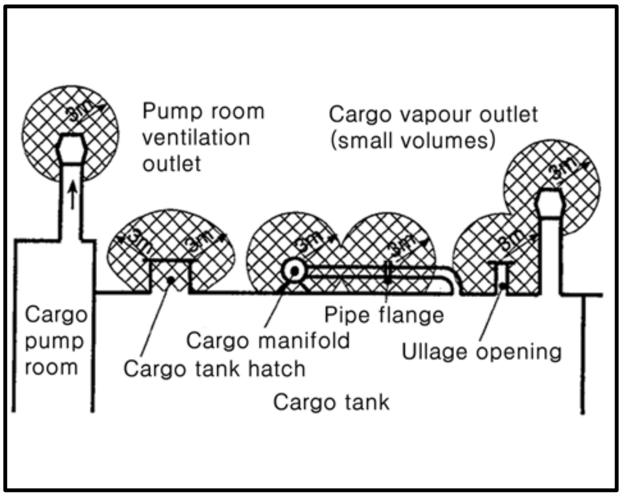

Fig 7.1.32 Example of (1) (B) zone 1 (g)

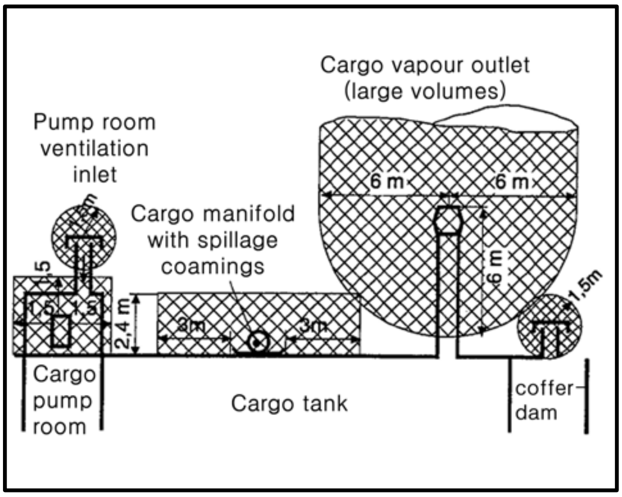

Fig 7.1.33 Example of (1) (B) zone 1 (h) ~ (j)

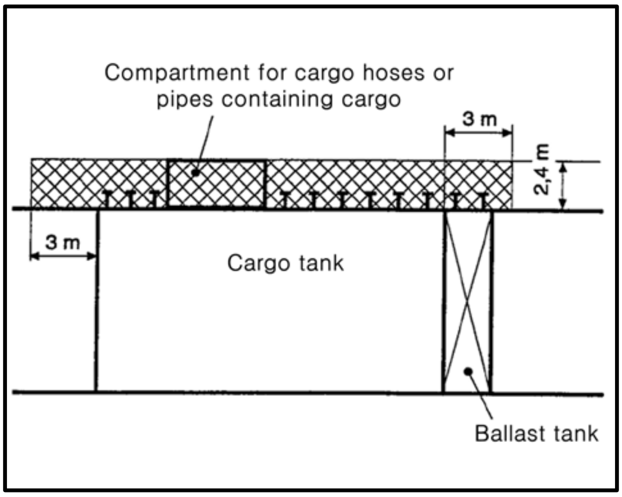

Fig 7.1.34 Example of (1) (B) zone 1 (k) ~ (m)

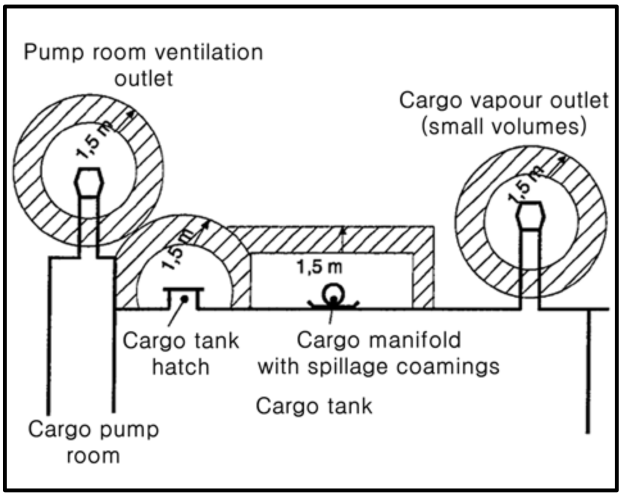

Fig 7.1.35 Example of (1) (C) zone 2 (a)

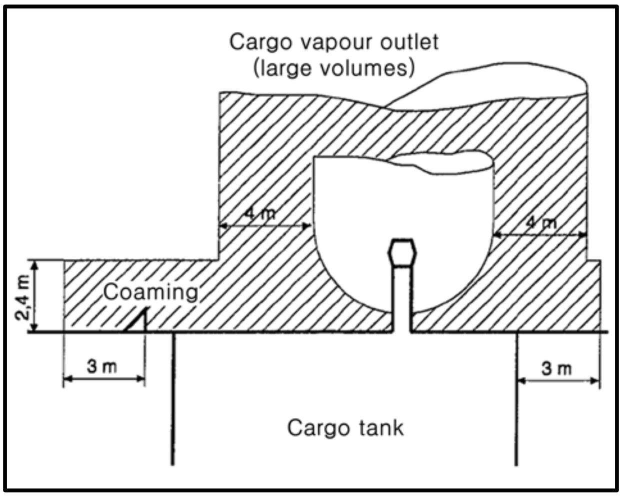

Fig 7.1.36 Example of (1) (C) zone 2 (b),(d),(e)

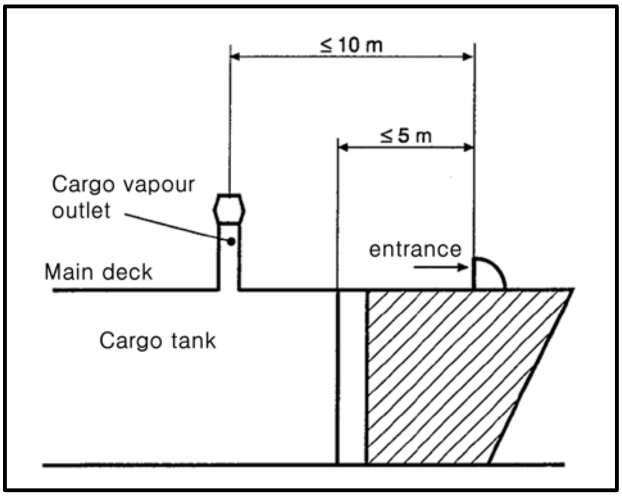

Fig 7.1.37 Example of (1) (C) zone 2 (f)

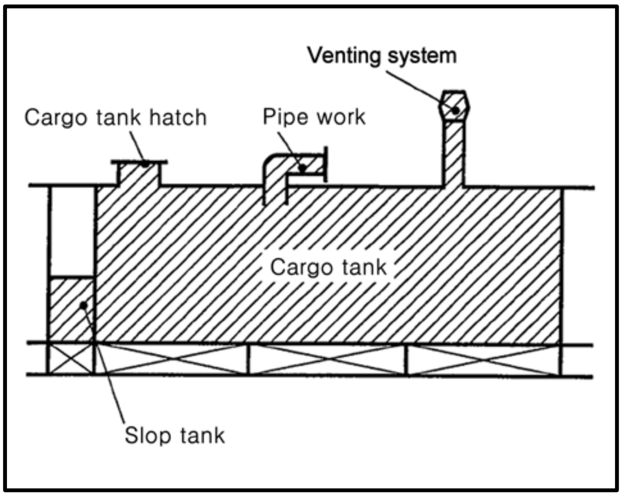

Fig 7.1.38 Example of (2) (B) zone 2 (a) ~ (d)

1103. Electrical equipment in dangerous spaces

1. Explosion-protected electrical equipment in dangerous spaces is to be suitable for use in the explosion gas atmosphere classified into gases and vapours group IIB and temperature class T3 as specified in (KS C) IEC 60079, or equivalent thereto.

2. In addition to the requirements of **1103. 3** of the Rules following requirements are to be satisfied.

(1) In application of (2) and (3), cargo tank includes tanks adjacent to cargo tanks.

(2) The height of the anode is to be measured from the bottom of the tank to the center of the anode, and its weight is to be taken as the weight of the anode as fitted, including the fitting devices and inserts. However, where aluminum anodes are located on horizontal surfaces such as bulkhead girders and stringers not less than 1 m wide fitted with an upstanding flange or face flat projecting not less than 75 mm above the horizontal surface, the height of the anode may be measured from this surface.

1104. Earthing and bonding of cargo tanks, process plant and piping systems for the control of static electricity

1. In application to **1104. 1, 2** of the Rules, where bonding straps are not provided, resistance tests are to be carried out and confirmed that each resistance for the related places is not greater than 1 MΩ. ⚓

CHAPTER 2 ORE CARRIERS

Section 1 General

101. Application

1. The provisions in **Ch 2.** of the Rules assume, as a standard, loading of ore of an apparent specific gravity (quotient of cargo weight divided by hold volume) of 2.0 and an internal friction angle of 35°.

2. The arrangements and scantlings of transverses and cross ties in wing tanks of ships over 230 m in length are to be determined based on direct calculations upon applying the requirements in **102.**. The arrangements and scantlings of structural members other than stated above are to be determined applying the related requirements specified in **Ch 1** and **Ch 2** with a reference of the followings.

(1) When determining H_2 specified in **Ch 1, 403. 1.** of the Rules and h_1 specified in **Ch 1, 403. 3.** of the Rules, L is to be 230 m.

102. Direct strength calculation

When determining the scantlings of structural members of cargo hold for a ore carrier by direct strength calculations, the procedure is to comply with the **Pt 3, Annex 3-2 Guidance for Direct Strength Assessment** of the Guidance and with the following conditions **1**, **2** and **3.**

1. Structural members to be calculated

The direct calculations can be applied for determined the scantlings of the following members forming transverse rings:

Bottom transverse, deck transverse, side transverse, vertical webs on longitudinal bulkhead, cross tie, floors, inner bottoms, bottom shell plating and cross decks.

2. Loads, boundary conditions, and supporting conditions and modelling of structure

Assumed loads, structural models, boundary conditions and supporting condition for the calculation are to be as follows:

(1) Loads
The loads are to be as shown in the column of load in **Table 7.2.1**. Among these, the hydraulic test condition (b), the oil loading condition and the ballasted condition (a) apply to ore/oil carriers only.

(2) The procedure of structural modelling is to be as follows:

(A) Range of analysis
The range of structure to be analyzed is, one side of the adjacent cargo hold(or tank) in the parallel part of the hull, including whole length or half length of each cargo hold(or tank) and transverse bulkhead between these cargo holds(or tanks).
However, this range is to be determined considering the loading patterns of cargo and ballast and longitudinal and transverse symmetries of the bulkheads and girders attached thereto.

(B) Structural modelling
The following standards (a) to (c) apply to divisions in meshing for structural modelling.

(a) In meshing, proper sizes of meshes are to be selected by predicting the stress distribution in the model, and meshes with abnormally large aspect ratios are to be avoided.

(b) Girders and similar members having stress gradients along their depth are to be so meshed as to enable their discrimination.

(c) The length of the short side of each mesh is to be restricted to longitudinal spacing or thereabouts.

(C) Boundary condition and supporting condition of structural modelling
Boundary condition and supporting condition of structural modelling are to be such that the behavior of that can be effectively reproduced in accordance with the range of structural modelling.

3. Permissible stress

The standard values of permissible stress obtained by the direct calculation using the initial scantlings of members including corrosion margins are shown in **Table 7.2.2.**

Table 7.2.1

		Web plate (parallel)		-	-	$175/K$
		Web plate (corner)		-	-	$195/K$
	Floor, Cross deck		-	-	-	$175/K$

Notes:

1. Unit : $\mathrm{N/mm^2}$
2. σ_e : $\sqrt{(\sigma_l^2 - \sigma_l \bullet \sigma_t + \sigma_t^2 + 3\tau^2)}$ (for longitudinal strength member)

   $\sqrt{(\sigma_x^2 - \sigma_x \bullet \sigma_y + \sigma_y^2 + 3\tau^2)}$ (for transverse strength member)

   σ_l : Normal stress in lengthwise direction
   σ_t : Normal stress in breadthwise direction
   τ : Shearing stress on the lengthwise face in the breadthwise-direction for longitudinal strength member
   Shearing stress on the X face in the Y-direction of element coordinate system for transverse strength member
   σ_x : Normal stress in X-direction of element coordinate system
   σ_y : Normal stress in Y-direction of element coordinate system
   σ_a : Normal stress of face plate
3. Openings in floors and girders, if any, are to be taken into consideration in evaluating the stresses.
4. The pont of detecting stress is to be the centre of the element.
5. f' : 0 at the position of the horizontal neutral axis of the cross sectional area of hull, f_B on bottom shell plating. For intermediate values, f' is to be determined by linear interpolation in accordance with vertical distance from the baseline.

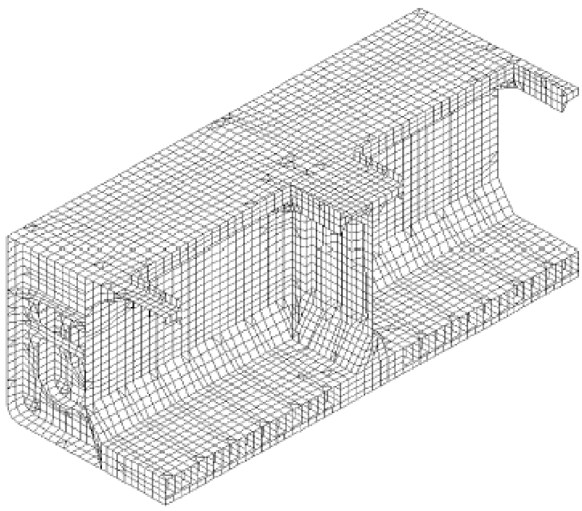

Fig 7.2.1 Example of divisions in meshing structural modelling as a standard

Section 2 Construction and Dimension

202. Double bottoms

1. The transverses between floors in the double bottom under ore holds are to have a section modulus obtained by the following formula:

$$Z = 14.3 S h l^2 \quad (\text{cm}^3)$$

where :

S = distance between the transverse and the floor (m)

h = height from top of inner bottom to the upper deck at the centre line (m)

l = span of transverse (m)

2. The thickness of webs is to be such that the shearing stress due to cargo weight may be lower than 100 N/mm^2 for the members excluding the corrosion margin of 2.5 mm.

203. Construction and scantlings of wing tanks or void spaces

1. Unless otherwise specified, the requirements for tankers specified in the Rules may apply to the construction and scantlings. In tanks and spaces other than water ballast tanks, the thickness of transverses and swash bulkheads may be reduced by 1 mm, except where the provisions of **Ch 10, 103.** of the Rules, are to be applied.

2. The provision in **Fig 7.10.5** of the Guidance is to be referred to for the measurement of span l of transverse in wing tanks and void spaces. The provision **Ch 10, 503.** of the Rules is to be applied to structural details of transverse and cross ties.

3. Longitudinal bulkheads

(1) Where the longitudinal bulkhead is inclined, the scantlings for the pressure of ore are to be determined as prescribed below, depending on the angle of inclination β(degrees) of the bulkhead to the horizontal. (See **Fig 7.2.2**)

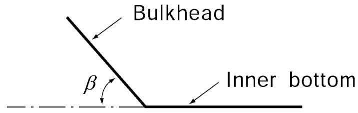

Fig 7.2.2

(A) The thickness of bulkhead plating t is not to be less than that obtained from the following formula:

$$t = CS\sqrt{h} + 2.5 \quad (\text{mm})$$

where :

S = spacing of stiffeners (mm)

h = vertical distance from the lower edge of the strake to the upper deck at the ship's centre line (m)

C = coefficient depending on β (degrees):

β	C
$\beta \leq 40°$	6.51
$40° < \beta < 80°$	$9.80 - 0.0823\beta$
$\beta \geq 80°$	3.22

(B) The section module of longitudinal stiffeners are not to be less than the product of the value determined by application of prescriptions in **204. 1** (2) of the Rules and the following coefficient depending on the inclination of bulkhead β (degrees):

β	C'
$\beta \leq 40°$	3.9
$40° < \beta < 80°$	$6.7 - 0.07\beta$
$\beta \geq 80°$	1.1

(C) It is recommended to increase properly the scantlings of vertical webs on longitudinal bulkhead and cross ties.

204. Transverse bulkheads in ore holds

Where the transverse bulkhead is inclined, the scantlings of the members for pressure of ore are to be determined as prescribed below, depending on the angle of inclination β (degrees) of the bulkhead to the horizontal.

(1) The thickness of bulkhead plating may be 10 % less than obtained according to **203. 3** (1) (A).

(2) In applying the prescriptions in **204. 1** (2) of the Rules for the bulkhead stiffeners, the section modulus are to be multiplied by the following coefficients, if β is less than 80.

$\beta \leq 40°$ ----------------- 3.55

$40° < \beta < 80°$--------------- $6.10 - 0.0638\beta$

(3) The construction in the lower stools of transverse bulkheads is to be as follows:

(A) Stiffening webs are to be provided at a space not exceeding approximately 3.6 m. It is recommended that these stiffening webs be of diaphragm construction.

(B) The depth of stiffening webs is not to be less than 1/5 of l defined under (D) or 2.5 times the depth of slots for penetration of stiffeners, in case of horizontal stiffeners, whichever is greater.

(C) The thickness of stiffening webs is not to be less than the sum of 1/100 of the depth of web plus 4 mm or 8 mm, whichever is greater.

(D) In the case of horizontal stiffening, the section modulus of webs are to be obtained from the following formula.

$$Z = Ck^2 Shl^2 \quad (\text{cm}^3)$$

where :

S = breadth supported by the web, i.e., spacing of webs (m)

h = vertical distance from mid-length of l to the upper deck at the ship's centre line (m)

l = extreme length of web (m)

k = as specified in **Table 7.1.3, Ch 1.** of the Rules

C = coefficient depending on β (degrees)

β	C
$\beta \leq 40°$	18.98
$40° < \beta < 80°$	$31.1 - 0.303\beta$
$\beta \geq 80°$	6.86

(4) Where transverse bulkhead has lower stool, proper consideration should be given to the over-all strength of the bulkheads as a whole.

205. Relative deformation of wing tanks

1. Where the longitudinal bulkheads are inclined, a and b are to be so taken that the hatched areas may be same as shown in **Fig 7.2.3.**

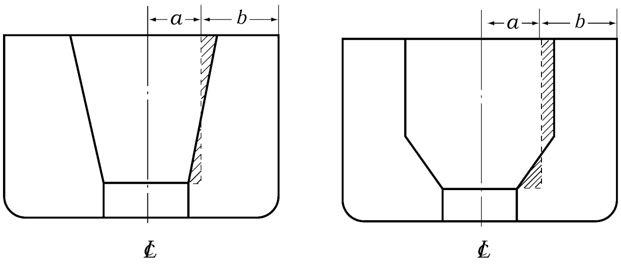

Fig 7.2.3

2. Special considerations for the case of exceeding limit values and how to measure mean thickness of transverse bulkhead plating are to comply with **Ch 1, 601. 2.**

206. Ore/oil carriers

1. General

The construction, arrangement and equipment of ore/oil carriers are to be in accordance with the following, in addition to the provisions in **206. 2** of the Rules.

(1) The piping arrangement is to comply with **Par 3.**
(2) The length of combined ore holds/cargo oil tanks is to comply with **Pt 3, Ch 15, 103. 1.**
(3) Any openings which may be used for cargo operations are not to be fitted to bulkheads and decks separating the cargo oil tanks (including combined ore holds/cargo oil tanks) designed and equipped for the carriage of oil having a flash point below 60°C from other spaces not designed and equipped for the carriage of oil having a flash point below 60°C.
(4) When used as ore carrier, all compartments except slop tanks are to be gas-freed.
(5) As for the equipment, required time, etc. for cleaning and gas-freeing of cargo oil tanks, design documents are to be submitted to the Society for reference.
(6) At the time of approval of plans of ore/oil carriers, manuals containing precautions needed in the process of works for converting from oil tanker into ore carrier and vice versa are to be submitted to the owner and their copies submitted to the Society.

2. Construction of pump rooms

(1) The bottom of pump room of ore/oil carrier is to be constructed with particular care for the continuity of structural members. As example of standard construction of a pump room bottom of single bottom system is shown in **Fig 7.2.4.**

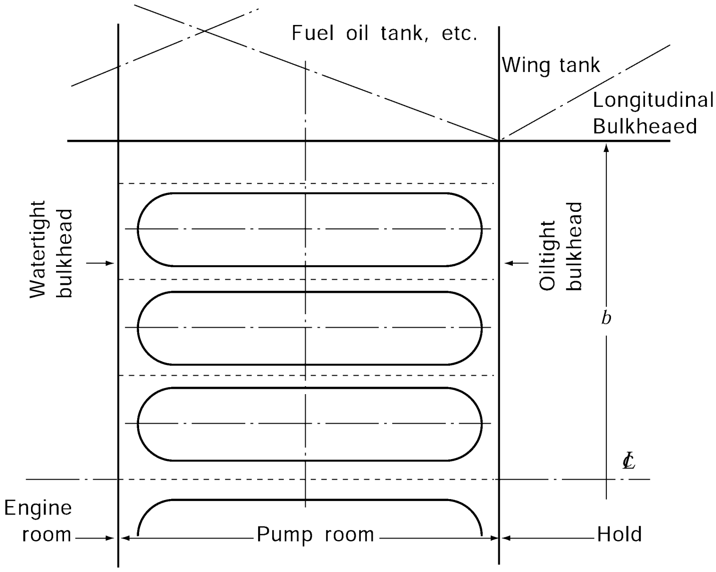

Fig 7.2.4 Example of construction of pump room bottom

(A) The longitudinal bulkheads in the hold space are to be extended aft as far as practicable. Deep horizontal girders are to be provided on the longitudinal bulkheads at the level of the inner bottom in the hold space. The webs of these girders are to be of approximately same thickness as the inner bottom.

(B) Centre girder
Height : same as double bottom in the hold space
Thickness : same as centre girder in the hold space

(C) Side girders
Number : if $b \leq 15$ m------ 2 lines each side,
if $b > 15$ m------ 3 lines each side,
Thickness : same as centre girder
Height : greater than double bottom height in engine room
It is recommended that the side girders be as high as possible.

(D) Sectional area of face plates of girders
The total sectional area of face plates of girders (including total sectional areas of horizontal girders on longitudinal bulkheads, if any) is not to be less than 35 % of the sectional area of inner bottom in the hold space.

(E) Bottom longitudinals
The section modulus of bottom longitudinals Z is to be 10 % times of that obtained from the formula in **Ch 1, 302** of the Rules. However, it is not to be less than that obtained from the following formula:

$$Z = 290\, d\, S \quad (\mathrm{cm}^3)$$

where :
d = draft (m)
S = space of longitudinal (m)

(F) Omission of side girders
One of side girders as per (C) above may be omitted, provided that the thickness of bottom shell plating under the pump room is increased by 2 mm in excess of the required thickness (including tapering).

(G) If high tensile steel is used for deck plating over the pump room, the sectional area of deck in this part is to be suitably increased in excess of the required area.

3. Piping systems

(1) Application

This requirements apply to piping systems and venting systems of ships designed to carry oil or alternatively solid cargoes in bulk.

(2) Terminology

(A) Combination carrier is a ore/oil carrier specified in **Ch 2, 206. 1** of the Rule and a B/O carrier specified in **Ch 3, 801. 1** of the Rules.

(B) Slop tank is a tank which is provided mainly for the carriage of tank washings and cargo oil and which is designed to be capable of loading oil whose flash point does not exceed 60℃ when the ship is in the dry cargo mode.

(C) Solid cargo/oil hold is a compartment which is used as a solid cargo stowing hold when the ship is in the dry cargo mode and which is used as a cargo oil tank when the ship is not in the dry cargo mode.

(D) Ballast/solid cargo hold is a compartment which is used as an exclusive tank for ballast adjacent to a cargo oil tank when the ship is not in the dry cargo mode and which is used as a solid cargo stowing hold when the ship is in the dry cargo mode.

(E) Exclusive solid cargo hold is a compartment which is used as a void space adjacent to a cargo oil tank when the ship is not in the dry cargo mode and which is used as a solid cargo stowing hold when the ship is in the dry cargo mode.

(F) Oil/ballast tank is a tank which is used as a cargo oil tank when the ship is not in the dry cargo mode and which is used as a ballast tank or void space when the ship is in the dry cargo mode.

(G) Exclusive ballast tank is a compartment which is adjacent to a cargo oil tank when the ship is not in the dry cargo mode and which is used as an exclusive tank for ballast even when the ship is in or not in the dry cargo mode.

(H) Cargo hold is a general term for solid cargo/oil hold, ballast/solid cargo hold and exclusive solid cargo hold.

(I) Cargo oil tank is a general term for solid cargo/oil hold, oil/ballast tank and slop tank.

(3) Bilge Piping Systems

(A) Bilge piping systems for the cargo holds are not to be led to the engine room. The cargo oil pump may be used for the purpose of bilge suction on condition that the cargo oil piping systems in the cargo oil pump room used for the bilge suction comply with the requirements in **Pt 5, Ch 6, 404** and **405.** of the Rules.

(B) Bilge suction pipes for the cargo holds

(a) Where two or more cargo oil piping systems (e.g. main and stripping lines) are provided or cargo oil piping systems are provided independently for the oil/ballast tanks and cargo holds and where these cargo oil piping systems are so arranged that liquid in all or selected oil/ballast tanks and cargo holds can be discharged (for the oil/ballast tanks, include the filling of ballasting water) simultaneously when the ship is in the dry cargo mode, these cargo oil pipes may be used as the bilge suction pipes for cargo holds. The diameter of these cargo oil pipes used as bilge suction pipes is not to be less than that specified for the bilge suction pipes.

(b) Where bilge suction pipes are provided for the exclusive use, an exclusive pump for bilge suction is to be provided in the cargo oil pump room or the bilge suctions are to be connected to the cargo oil pump in the cargo oil pump room. Where cargo oil pumps are used as a bilge pump, a stop valve and a screw-down non-return valve are to be provided at the connection between the bilge pipe and cargo oil pump.

(C) Bilge suctions in cargo holds

(a) In general, one bilge suction is to be arranged on each side of the after end of the cargo hold. Where the length of cargo hold in ships having only one cargo hold exceeds 66 m, an additional bilge suction is to be arranged in a suitable position in the forward half-length of the hold.

(b) Bilge wells are to be arranged at suitable positions so as to protect the cover plates from the direct strike of solid cargoes, and to be provided with rose boxes or other suitable means so that the suction may not be choked by ore dust, etc.

(c) Bilge wells in solid cargo/oil holds and ballast/solid cargo holds, except where these bilge wells are also used as cargo oil suction wells, are to be provided with cover plates to blank off these wells or to be provided with blind flanges to blank off the open ends of the bilge suction pipes when the ship is not in the dry cargo mode.

(D) Bilge suction pipes
For exclusive bilge suction pipes, branch bilge suction pipes are to comply with the requirements in **Pt 5, Ch 6, Sec 4** in addition to the requirements in (C). In calculating the inside diameter of the branch bilge suction pipes for draining cargo hold bilge of ore/oil carriers, the mean width of cargo hold may be used in lieu of B. Bilge suction pipes which are also used as a cargo oil pipe or which are connected to eductors are to be as specified in **Table 7.2.3** in addition to comply with the requirements in (b) and (c).

Table 7.2.3 Bilge suction arrangement in cargo hold (common service piping or using eductor)

Type of cargo hold	Bilge suction main	Bilge suction branch	Bilge well	Provisions of valve, blind flange, etc.(3)
Solid cargo/oil hold	common service with cargo oil main	Exclusive	Exclusive	Screw-down non-return valve for branch line; blind flange for open end(1)
		Partial common service(2)	Exclusive(2)	Screw-down non-return valve and blind flange for bilge suction branch line
		common service with cargo oil suction branch line	Common service with cargo oil suction well	Screw-down non-return valve for branch line
	use of eductor	—	Exclusive	Screw-down non-return valve for branch line; blind flange for open end
Ballast/solid cargo hold	common service with cargo oil main	Exclusive	Exclusive	Screw-down non-return valve for branch line; blind flange for open end
	use of eductor	—	—	Screw-down non-return valve for Suction side; blind flange for open end
Segregated solid cargo hold	common service with cargo oil main	Exclusive	Exclusive	Screw-down non-return valve for suction side; blind flange for open end
	use of eductor	—	Exclusive	Screw-down non-return valve for branch line

(Remark)
(1) Wells are to be closed with blind plates or open ends are to be closed with blind flange
(2) As specified in the example of **Fig 7.2.5.**
(3) Valves, in each case, are to be capable of being operated at control position above the bulkhead deck

(4) Cargo Oil Piping Systems
(A) Cargo oil piping systems, except for cargo oil pipes connected to the slop tanks specified in (5), are to be completely gas-freed when the ship is in the dry cargo mode.
(B) Cargo oil suctions in solid cargo/oil hold, except where these suctions are also used as bilge suctions, are to be provided with blank flanges to blank off the open end of the cargo oil suction pipes or to be provided with cover plates to blank off the cargo oil suction wells when the ship is in the dry cargo mode.
(C) Means are to be provided for isolating the piping connecting to the cargo oil pump room with the slop tanks where slop may be carried on dry cargo mode. The means of isolation are to consist of a valve followed by a spectacle flange or a spool piece with appropriate blank flanges. This arrangement is to be located adjacent to the slop tanks, but where this is unreasonable or impracticable it may be located within the pump room directly after the

piping penetrates the bulkhead.(See **Fig 7.2.6**)

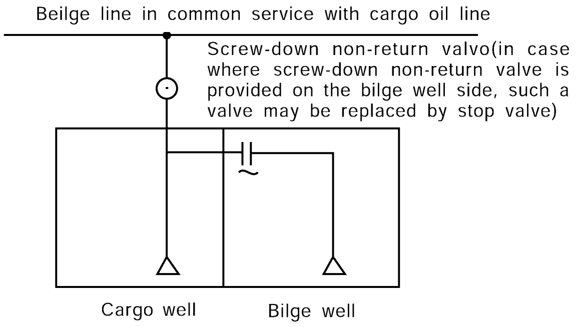

Fig 7.2.5 Examples of bilge suction arrangement in solid cargo/oil hold

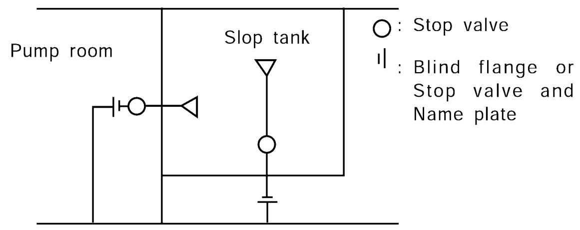

Fig 7.2.6 Examples of piping system of slop tank

(D) A separate pumping and piping arrangement is to be provided for discharging the contents of the slop tanks directly over the open deck when the ship is in the dry cargo mode.

(E) Cargo oil lines below deck are to be installed inside the cargo wing tanks or to be placed in special ducts which are to be capable of being adequately cleaned and ventilated.

(5) Ventilating systems

(A) Combination carriers which are not provided with slop tanks are to comply with the requirements in **Ch 1, 1004.** of the Rules for the ventilating systems for cargo oil tanks of oil tankers.

(B) Vent pipes for slop tanks are to be led to a suitable position in the open air so as to preclude any danger in case where oil having a flash point not exceeding 60°C is carried therein when the ship is in the dry cargo mode. Where vent pipes for slop tanks are connected to the vent pipes for the cargo oil tanks, a change-over device is to be provided to prevent the vapour in the slop tanks from entering into other compartments when the ship is in the dry cargo mode. This change-over device is in general to consist of a valve followed by a blank flange.

(C) All cargo spaces and any enclosed spaces adjacent to cargo spaces are to be capable of mechanically ventilated. The mechanical ventilation may be provided by portable fans. ⚓

CHAPTER 3 BULK CARRIERS

Section 1 General

101. Application

1. The provisions of **Ch 3** of the Rules are to apply correspondingly to ships having structural configuration similar to bulk carriers such as chip carrier, log/timber carrier.

2. All bulk carriers of 150 m in length and above, intending to carry solid bulk cargoes having a density of 1.78 t/m^3, or above, with single deck, topside tanks and hopper tanks, which have the foremost hold stipulated in the following (1) or (2) and have not been constructed in compliance with **Pt 7, Ch 3, Sec 11** and **Sec 12** of the Rules are to be complied with **Annex 7-5.**

(1) the foremost hold is bounded by the side shell only for ships which were contracted for construction prior to 1 July 1998.
(2) the foremost hold is double side skin construction of less than 760 mm breadth measured perpendicular to the side shell in ships, the keels of which were laid, or which were at a similar stage of construction, before 1 July 1999.

103. Direct strength calculation

When determining the scantlings of structural members of cargo hold for a bulk carrier by direct strength calculations, the procedure is to comply with the **Pt 3, Annex 3-2 Guidance for Direct Strength Assessment** of the Guidance.

Section 3 Double Bottoms

301. General

1. Value of k in the case of large slope angle of bilge hoppers or double-hull construction

Where the angle of slope of bilge hoppers to the horizontal exceeds 60° the value of k is to be obtained from the formula in **301. 4** of the Rules, assuming β = 60°. In ships with double-hull construction, the value of k may be 70 % of the value obtained from the same formula.

2. Measurement of hold length l_h

Where the angle of slope of lower stool of transverse bulkhead is smaller than 60° the hold length l_h in the formula in **301. 4** of the Rules, is to be the distance(m) between the intersections of the inner bottom and straight lines having a slope of 60° and passing through the top of the lower stool of the transverse bulkhead.

302. Centre girders and side girders

1. In ships having unusually large freeboards, the height of centre girders may be reduced to the values obtained from the formula in **Table 7.3.2** of the Rules in which D is to be replaced by D', the depth to the assumed freeboard deck. In no case, however, is this height to be less than B/20.

2. Thickness of partial intermediate side girders

The thickness of partial intermediate side girders prescribed in **Table 7.3.2** of the Rules is not to be less than that obtained from the following (1) or (2), whichever is greater.

(1) Minimum thickness as specified in **Par 106.** of the Rules

(2) $t = \frac{C_1'' d_2}{1000} + 2.5 \quad (\mathrm{mm})$

where:

d_2 = as specified in **Table 7.3.2** of the Rules.
C_1'' = as specified in **Table 7.3.1**
S_1 = as specified in **Table 7.3.2** of the Rules.

3. The "specially short holds" in **Table 7.3.2** and **304. 1** of the Rules are holds having a length equal to or less than 30 % of the length of adjacent holds.

4. When calculating the thickness of side girder just under the hopper plate of bilge hopper tank, S in the formula in **Table 7.3.2** of the Rules is to be measured, as a standard, as shown in **Fig 7.3.1.** Further, when calculating the effective sectional area of the above-mentioned side girder, the sectional area obtained from the following formula of the hopper plate in the extent shown in **Fig 7.3.1** may be included into the effective sectional area of the same side girder.

$$A = 10\Sigma h_i t_i\left(1 - \frac{\theta}{90}\right) \quad (\mathrm{cm}^2)$$

where:

h_i = height in the hopper plate (m)

t_i = thickness of subtracted by the thickness 2.5 mm from the hopper plate (mm)

θ = angle between the side girder and the hopper plate (degrees)

Table 7.3.1 Coefficient C_1''

S_1/d_2	C_1''
upto 0.3	3.0
0.4	3.5
0.5	4.3
0.6	5.1
0.7	5.8
0.8	6.5
0.9	7.0
1.0	7.4
1.2	8.0
1.4	8.4
1.6 upward	8.6

Note:
For intermediate value of S_1/d_2, C_1'' is obtained by linear interpolation.

303. Floor plates

1. Thickness of partial intermediate floors

(1) The thickness of partial intermediate floors prescribed in **Table 7.3.3** of the Rules is not to be less than that obtained from the following (1) or (2), whichever is greater:
(A) Minimum thickness as specified in **106.** of the Rules
(B) The thickness of neighbouring floors obtained from the formulae in **Table 7.3.3** of the Rules with the value of S reduced to 60 % of the actual one.

304. Inner bottom plating

For the definition of "specially short holds," **302. 3** is to be referred to **304. 1** of the Rules.

Section 4 Hopper Tanks

401. General

Floor plates are to be provided at the forward and after ends of hopper tanks, and the tank top plating in the engine room is to be keep the continuity of hopper tanks at ends extended into the hopper tanks by about 2 frame spaces.

402. Thickness of hopper plates

1. Where the hopper plate has transverse stiffeners, the thickness of hopper plate is not to be less than that obtained from the following formula:

$$t = 9.6S + 1.5 \quad (\text{mm})$$

where:

S = spacing of stiffeners (m)

The thickness of hopper plates to be included into the calculation of section modulus of hull girder is, but, to be the actual thickness multiplied by a factor of 0.5 when the ratio of the actual thickness to the thickness derived from the above formula is 1.0, or by a factor of 1.0 when the same ratio is 2.0 and above, or by a factor obtained by linear interpolation for an intermediate value of the ratio.

2. The construction at the intersection of inner bottom plating and hopper plate is to be as follows:

(1) The construction at the above-mentioned intersections is to be either of the following two types.

(A) The scallop in the hopper transverse at the above-mentioned intersection is to be filled up or closed by a collar plate. (See **Fig 7.3.2**)

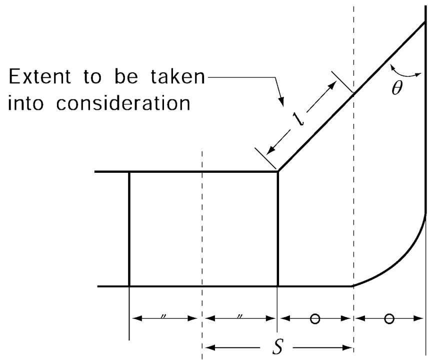

Fig 7.3.1 Measurement of S

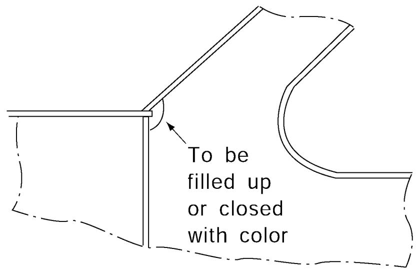

Fig. 7.3.2

(B) Gusset plates are to be fitted onto the hopper transverse in the extension of inner bottom plating. (See **Fig 7.3.3**)

(2) Where the spacing of floor plates in 2 m or more, a bracket is to be provided at the mid-length between floor plates. This bracket is to reach the inner bottom longitudinal and the hopper plate longitudinal next to the side girder located at the intersection. (See **Fig 7.3.4**)

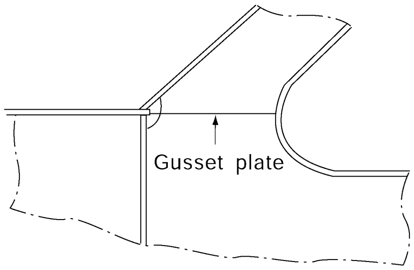

Fig. 7.3.3

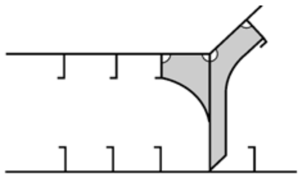

Fig. 7.3.4

Section 5 Topside Tanks

502. Thickness of sloping plates

Where the sloping plate of topside tank has transverse stiffeners, the thickness of sloping plate is not to be less than that obtained from the following formula:

$$t = 12S + 1.5 \quad (\mathrm{mm})$$

where:

S = spacing of transverse stiffeners (m).

The thickness of sloping plates to be included into the calculation of section modulus of hull girder is, however, to be the actual thickness multiplied by a factor of 0.5 when the ratio of the actual thickness to the thickness derived from the above formula is 1.0, or by a factor 1.0 when the same ratio is 2.0 and above, or by a factor obtained by linear interpolation for an intermediate value of the ratio.

507. Large topside tanks

Where the longitudinal diaphragm has transverse stiffeners, the thickness of diaphragm is not to be less than that obtained from the following formula:

$$t = 12.8S + 1.5 \quad (\mathrm{mm})$$

where:

S = spacing of transverse stiffeners (m)

The thickness of diaphragms to be included into the calculation of section modulus of hull girder is, however, to be the actual thickness multiplied by a factor of 0.5 when the ratio of actual thickness to the thickness derived from the above formula is 1.0, or by a factor 1.0 when the same ratio is 2.0 and above, or by a factor obtained by linear interpolation for an intermediate value of the ratio.

Section 6 Transverse Bulkhead and Stools

601. Transverse bulkhead

For transverse bulkhead without lowest stool, the thickness of the lowest strake of bulkhead plating is to be 1 mm greater than those specified in formulae.

Section 7 Hold Frame

702. Top and bottom end connections of frames

Figs. 7.3.5 and **7.3.6** show examples of connection of the upper and lower ends of hold frame to the topside tank and the bilge hopper tank respectively.

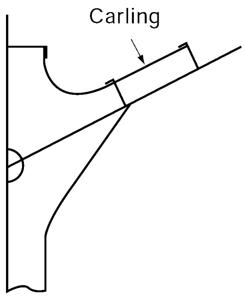

Fig 7.3.5

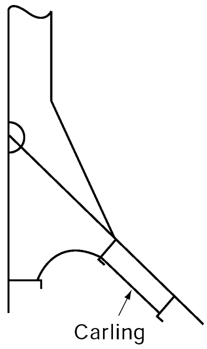

Fig 7.3.6

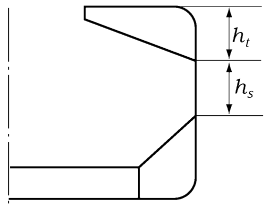

Fig. 7.3.7

Section 8 Decks and Shell Platings

801. Deck plating outside the line of openings

The effective sectional area of deck outside the line of openings at the ends of topside tank is to be determined by tapering from the value obtained from the following formula:

$$A = \left(1 + \frac{A_t}{2A_d}\right) A_d$$

where:

A_t = effective sectional area of sloping plate of topside tank in the midship part

A_d = effective sectional area, required by the Rules, of the strength deck in the midship part

802. Deck plating inside the line of openings

Where the deck inside the line of openings is constructed on the longitudinal framing system, the thickness of deck plating is not to be less than that obtained from the following formula:

$$t = 1.69 \sqrt[3]{\frac{F}{l} S^2} + 1.5 \quad (\mathrm{mm})$$

where:

S = spacing of longitudinal beams (m)

l = length of deck inside the line of openings (m)

$$F = F_1 + F_2 \quad (\mathrm{kN})$$

$$F_1 = 0.49 h_t^2 (\alpha + 1)^2 (l_1 + l_2) \quad (\mathrm{kN})$$

$F_2 = 0.26 LBC_b$ (kN)

$\alpha = \dfrac{h_s}{h_t}$

h_t and h_s = vertical distance from the intersection of sloping plate of topside tank and side shell plating to the upper end of D(m) and vertical distance from the intersection of sloping plate of topside tank and side shell plating to the intersection of hopper plate of bilge hopper tank and side shell plating (m) (See **Fig 7.3.7**)

l_1 and l_2 = lengths (m) of holds forward of and abaft the deck inside the line of openings concerned. But, the lengths of holds are defined as the distances between bulkheads.

Section 9 Hatch Covers and Hatch Coamings of Cargo Holds

905. Closing arrangements

1. Securing devices

(1) When calculating the moment of inertia ($I = 6pa^4$) as specified in **905. 1** (7) of the Rules, the spacing between securing devices, a(m) is maximum of the distance between two consecutive devices, measured along hatch cover periphery(m), and not to be taken as less than 2.5 a_c.

Where,

a_c = max ($a_{1.1}$, $a_{1.2}$) (m) (Refer to **Fig 7.3.8**)

(2) When calculating the actual gross moment of inertia of the edge element, the effective breadth of the attached plating of the hatch cover is to be taken equal to the lesser of the following values.

(A) $0.165a$

(B) Half the distance between the edge element and the adjacent primary member

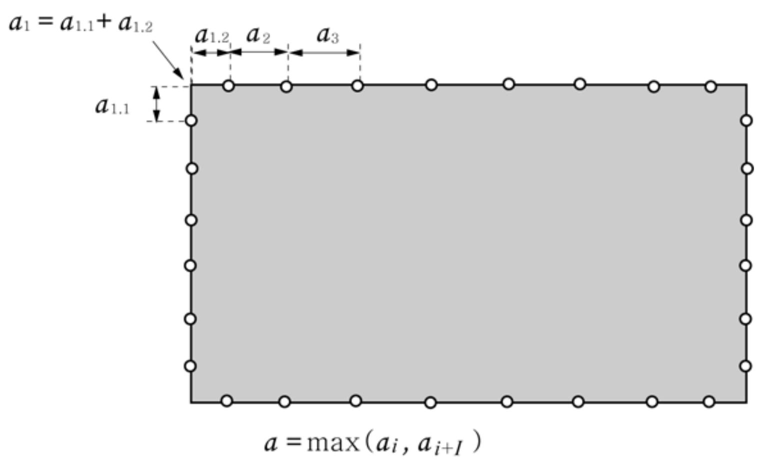

Fig 7.3.8 Spacing of securing devices

Section 14 Water Level Detection & Alarm and Drainage & Pumping Systems for Bulk Carriers and Single Hold Cargo Ships

1401. General

Arrangement and testing etc. for water level detectors, alarms and drainage and pumping systems required by the **1403.** and **1404.** of the Rule are to be in accordance with the requirements of the **Annex 7-6.**

1402. Application

In application to **1402. 2.** of the Rules, "suitable width" means that the distance between the side shell and the inner bulkhead in any part of the watertight compartments is not less than 760 mm measured perpendicular to the side shell.

Section 15 Supplementary Provisions for Carriage of Liquid in Holds

1501. General

1. When cargo holds are utilized as ballast tanks, they are to be kept empty or full throughout the duration of voyage in order to avoid impact due to dynamical load of ballast water.

2. When cargo holds are utilized for ballasting, or under special loading conditions due to loading at two ports, etc., the scantlings of structural members of double bottoms are, in addition to compliance with the provision in **Sec 3.** of the Rules not to be less than that obtained from the formulae concerned which are modified as indicated below.

(1) Designed maximum load draught d is to replace with the draught in the considered loading condition d_b.

(2) The value of coefficient a in the formulae is to be equal to 0.45 + 0.026L'/d or the value obtained from either of the following two formulae depending on whether the hold is loaded or empty, whichever is greater.

For loaded hold : $a = h\gamma/d_b - (1 - 0.026L'/d_b)$

For hold which may be empty during navigation : $a = 1 + 0.026L'/d_b$

where:

γ = as specified in **301. 3** of the Rules

L' = as specified in **Table 7.3.2** of the Rules

(3) The value of coefficient n in the formulae prescribed in **Table 7.3.2** of the Rules is to be obtained from the following formula. But, the value of B/l_h in this formula is to be taken as 1.8 if it is not less than 1.8 and 0.5 if it is less than 0.5

$$n = \frac{1}{3}\left\{\alpha\left(2 - \frac{B}{l_h}\right) + 5 - \frac{B}{l_h}\right\}$$

where:

l_h = as specified in **301. 4** of the Rules

α = ratio of the load difference between the cargo load per unit area on the double bottom of the adjacent hold and the bottom water pressure including added variable wave pressure as prescribed in **Table 7.3.2** of the Rules to the similar load difference of the hold under consideration. The largest value of this ratio within the expected range of bottom water pressure is to be taken. α is to lie in the range from -1.0 to 1.0.

Table 7.3.2 Value of h

	h (m)
Pitching	$h = h_1 + 0.1\, l + 0.77\dfrac{h_1}{h_2}\left(1 - \dfrac{h_1}{h_2}\right)$
Rolling	$h = 0.4B\left\{\dfrac{3\times\dfrac{h_1}{h_2}+0.6}{\sqrt{\left\{1-\left(\dfrac{x}{l_s}\right)^2\right\}^2+\left\{17\left(\dfrac{h_1}{h_2}-0.45\right)^2+0.12\right\}\left(\dfrac{x}{l_s}\right)^2}} - 9.69\left(0.7-\dfrac{h_1}{h_2}\right)\left(0.3-\dfrac{h_1}{h_2}\right)\right\}$
h_1 = height of cargo oil level measured from the top of inner bottom (m) h_2 = height of upper deck, at centreline, above the top of inner bottom(m) l = length of hold (distance between transverse bulkheads) l_s = vertical distance from the intersection of side shell with hopper plate of bilge hopper tank to the intersection of side shell with the sloping plate of topside tank (m) x = vertical distance from the intersection of side shell with hopper plate of bilge hopper tank to the member under consideration (m)	

1502. Holds half-loaded with cargo oils

Where synchronism between pitching and/or rolling and the natural oscillations of cargo oil half-loaded in a hold is unavoidable, the scantlings of plating, stiffeners and girders, near the synchronizing oil level, of the transverse bulkheads in case of pitching or of the sloping plates of topside tanks in case of rolling are not to be less than that obtained from the respective formulae in which h is to be determined by the **Table 7.3.2.**

Section 16 Electrical Equipment in Coal Carriers

1602. Electrical equipment

1. The wording "explosion-protected type as deemed appropriate by the Society" in 1602. 1. (2) of the Rules means those generally meeting the requirements in **Pt 6, Ch 1, Sec 9** of the Rules having the flash point G4, the explosion-protective construction of the explosion grade d1 over (Group Ⅱ A, Temperature Class T4 as specified in (KS C) IEC 60079) or equivalent the explosion-proof construction, intrinsic safety pressurized protected construction which are serviceable safely in coal dust.
2. Cables led to electrical equipment installed within cargo holds are to be generally mineral insulated copper sheathed cables, lead sheathed armour cables or non-metal sheathed armour cables.
3. To the explosion-protected type approved by the Society in electrical equipment in compartments adjoining cargo holds specified in **1602. 1.** (1) of the Rules the requirements in **1602. 1** above apply correspondingly.

Section 17 Renewal Criteria for Side Shell Frames and Brackets in Single Side Skin Bulk Carriers and Single Side Skin OBO Carriers

1701. Application and definitions

Where the finite element or other numerical analysis or direct calculation procedure are allowed according to the Rules, i.e. in case of unusual side structure arrangements or framing, the analysis criteria and the strength check criteria are to be determined at the discretion of the Society.

1702. Renewal or other measures

1. Lower end bracket flanges

The requirements in **1702. 1** (2) (A) of the Rules specify that lower end bracket are required to be fitted and are to be provided with flanges. Bracket flanges are to be fitted on lower end brackets also in the following cases:

(1) When end brackets were not fitted with flanges at design stage and are required to be fitted according to the Rules. In this case, care is to be paid to ensure adequate back-up structure in the hopper and that the bracket is aligned with the back-up structure.

(2) When non-integral lower end brackets were not fitted with flanges at the design stage. In this case, flanges are to be fitted so as to meet the bending strength requirements in **1703. 4** of the Rules. The full width of the bracket flange is to extend up beyond the point at which the frame flange reaches full width.

2. t_M less than $t_{REN,d/t}$ at section b) of the frame

For the comparison with $t_{REN,d/t}$ at section b), the measured value, t_M , is to be based on zone B according to **Table 7.3.23** of the Rules.

3. Tripping brackets

(1) Where there are two existing tripping brackets supporting frames but their location is not in complete compliance with the Rules, i.e. one located less than h/3 above zone A and one less than 2h/3 from intersection of the hopper plate with the side shell, this may be accepted as equivalent to the requirements in **1702.** of the Rules, provided that the tripping bracket thickness is not less than the frame web thickness.

(2) Tripping brackets not connected to flanges are accepted for the purposes of the Rules, provided that have soft toe and the distance between the bracket toe and the frame flange is not greater than about 50 mm. (See **Fig 7.3.9**)

4. Bending check

The bending check needs not be carried out in the case the bracket geometry is modified so as to comply with **Pt 7, Ch 3, Sec 7.**

5. Blast cleaning and coating

When renewal is to be carried out according to the Rules, surface preparation and coating are required for the renewed structures for cargo holds of new buildings.

6. Zone B made of different plate thickness

When zone B is made up of different plate thickness, the lesser thickness is to be used for the application of the requirements in the Rules.

7. Repair of damaged frames already complying with the Rules.

In case of renewal of a damaged frame already complying with the Rules, the following requirements apply:

(1) The conditions accepted in compliance with the Rules are to be restored as a minimum.

(2) For localized damages, the extension of the renewal is to be carried out according to the standard practice of the Society, as the frame already complies with the Rules.

(3) Replacements of rolled profile are preferably to be made of the same rolled section. Built-up profiles are allowed in exceptional cases only. A repair made of an inserted built-up profile in a rolled profile could be acceptable provided some precautions are taken. The flange of the built-up profile is to overlap the repair area with sniped shape to smoothly allow the stresses to pass from the rolled profile to the built-up profile and vice versa.

8. Repair of damaged frames before Ch 3, Sec 17 of the Rules implementation

In case of renewal of a damaged frame before implementation date of the Rules for the considered ship, as built scantlings may be applied. For practical reason, it is up to the Owner whether to renew according to the relevant Rules or not.

9. Tripping brackets for higher strength steel side frames and side shell

Where side frames and side shell are made of higher strength steel (HSS), normal strength steel (NSS) tripping brackets may be accepted, provided the electrodes used for welding are those required for the particular HSS grade, and the thickness of the tripping brackets is equal to the frame web thickness, regardless of the frame web material.

1703. Application of roll radius of gyration(k_r) and bending moment coefficient(m_a)

The following loading conditions are to be considered for the application of the **Ch 3, Sec 17** of the Rules.

(1) Homogeneous heavy cargo (density greater than 1.78 t/m^3), considering k_r=0.25B
(2) Homogeneous light cargo (density less than 1.78 t/m^3), considering k_r=0.39B
(3) Non homogeneous heavy cargo, if allowed, considering k_r=0.39B
(4) Multi port loading/unloading conditions need not be considered.

Therefore, the following combination of roll radius of gyration(k_r) and bending moment coefficient (m_a) table apply for the purpose of the relevant Rules.

(1) Empty holds of ships allowed to operate in non homogeneous loading conditions, k_r=0.38B and m_a=10, m_b=17, 19 or 22
(2) Loaded holds of ships allowed to carry only light cargo(density less than 1.78 t/m^3) k_r=0.38B and m_a=12, m_b=20, 22 or 26
(3) Other cases k_r=0.25B and m_a=12, m_b=20,22 or 26. This represents the loaded hold of a ship in homogeneous heavy cargo loading condition, which is more severe than a loaded hold in non homogeneous cargo condition, where k_r=0.39B. ⚓

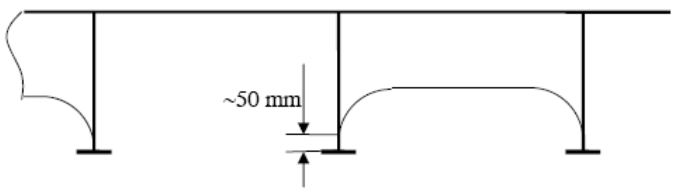

Fig 7.3.9 Tripping bracket

CHAPTER 4 CONTAINER CARRIERS

Section 2 Longitudinal Strength

201. Bending strength

1. The moment of inertia I_0 of the transverse section of hull at the midship of L is to be greater than the following value.

$$I_0 = 3.2 Z_{min} L \quad (\mathrm{cm}^4)$$

where :

Z_{min} = as specified in the requirements in **Pt 3, Ch 3, Table 3.3.1** of the Rules

2. The scantlings of longitudinal members are not to be less than the scantlings of longitudinal members at the midship of L as determined in accordance with the preceding **1.** and in **Pt 3, Ch 3, 201. 2** of the Rules, except for the scantlings of members which differ with the change of the sectional form of the hull.

202. Torsional strength

The torsional strength of hull at each sectional position from the collision bulkhead to the watertight bulkhead at the fore end of the machinery space is to be such that the following relationship is satisfied.

$$\sqrt{(0.75\sigma_V)^2 + \sigma_H^2 + \sigma_W^2} + |\sigma_S| \leq 175/K$$

where:

σ_S = the longitudinal bending stress by the longitudinal bending moment in still water as obtained from the following formula

$$\sigma_S = M_S / Z_V \times 1000 \quad (\mathrm{N/mm^2})$$

σ_V = the longitudinal bending stress by the longitudinal bending moment in wave as obtained from the following formula

$$\sigma_V = M_W / Z_V \times 1000 \quad (\mathrm{N/mm^2})$$

σ_H = the horizontal bending stress by the horizontal bending moment in wave as obtained from the following formula

$$\sigma_H = M_H / Z_H \times 1000 \quad (\mathrm{N/mm^2})$$

M_S, M_W = as specified in **Pt 3, Ch 3, Table 3.3.1** of the Rules

M_H= the horizontal bending moment as obtained from the following formula:

$$M_H = 0.45 C_1 L^2 d (C_b + 0.05) C_H \quad (\mathrm{kN\text{-}m})$$

C_H = coefficient as given in **Table 7.4.1** whose value depends on the ratio of the distance X(m) from the aft end of L to the position of the section under consideration, where intermediate values are to be determined by interpolation.

Table 7.4.1 Coefficient C_H

X/L	0.0	0.4	0.7	1.0
C_H	0.0	1.0	1.0	0.0

Z_V = section modulus of strength deck with respect to longitudinal bending of hull at the position of the section under consideration (cm^3).

Z_H = section modulus of hatch side with respect to horizontal bending of hull at the position of the section under consideration (cm^3).

C_1 = as specified in **Pt 3, Ch 3, Table 3.3.1** of the Rules

σ_W = warping stress due to bending torsion of hull, which is are to be in accordance with the discretion of the Society. But, the value of bending torsion of hull is calculated according to the following formula

$$M_T = \frac{M_0}{2}\left(1 - \cos\frac{2\pi}{L}X\right) \quad (\text{kN-m})$$

$$M_0 = 7.0 K_2 C_W^2 B^3\left(1.75 + 1.5\frac{e}{D_S}\right) \quad (\text{kN-m})$$

C_W= water plane area coefficient.

e = the distance from the top of keel to the shear centre (m). For which is in the below of top of keel, e is taken as positive.

K_2 = as given by the following formula:

$$L < 300\,m \; : \; K_2 = \sqrt{1 - \left(\frac{300 - L}{300}\right)^2}$$

$$L \geq 300\,m \; : \; K_2 = 1.0$$

X = distance from the aft end to considering section (m)

Section 3 Double Bottom Construction

302. Longitudinals

Where the widths of vertical stiffeners on floor plates and vertical struts are specially large, the co-efficient C prescribed in **Table 7.4.1** of the Rules may be modified as prescribed in **Pt 3, Ch 7, 403. 2.**

Section 4 Double Side Construction

401. General

1. Where the breadth of double side construction varies in the bilge part, t_1 in **Table 7.4.2** of the Rules is to be determined as follows:

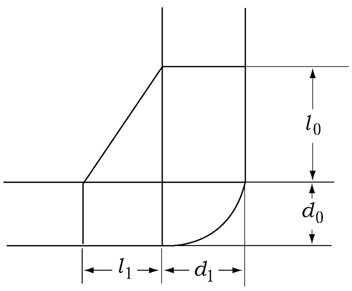
(1) β_T and β_L are to be obtained from the following formulae:

$$\beta_T = 1 + \frac{0.42\left(\frac{B}{D_S}\right)^2 - 0.5}{0.59\frac{D_S - \frac{d_0}{2} - l_{OR}}{B - d_1 - 2l_{1R}}\left(\frac{d_0}{d_1}\right)^2 + 1.0}, \qquad \beta_L = 1 + \frac{0.18\left(\frac{B}{D_S}\right)^2 - 0.5}{0.59\frac{D_S - \frac{d_0}{2} - l_{OR}}{B - d_1 - 2l_{1R}}\left(\frac{d_0}{d_1}\right)^2 + 1.0}$$

l_{OR} and l_{1R} are to be obtained as follows:

(a) Bilge hopper type (See **Fig 7.4.2**)

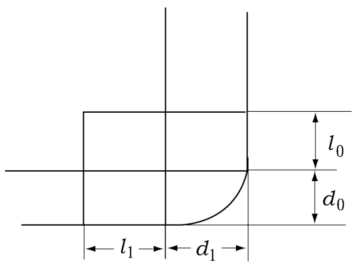
(b) Stepped type (See **Fig 7.4.3**)



$$l_{OR} = \frac{l_0 l_1}{d_1 + l_1}$$

$$l_{1R} = \frac{l_0 l_1}{d_0 + l_0}$$

Fig 7.4.2



$$l_{OR} = l_O$$

$$l_{1R} = l_1$$

Fig 7.4.3

(2) The lower end of h is to be a point at a height of l_{OR} above the inner bottom.

(3) $(d - l_{OR} + 0.038L')$ is to be substituted for $(d + 0.038L')$.

2. Where the height from the designed maximum load line to the strength deck is usually large, t_1 as per **Table 7.4.2** is to be calculated as follows

(1) β_T and β_L are to be obtained from the following formulae:

$$\beta_T = 1 + \frac{0.42\frac{B^2}{D_S D'} - 0.5}{0.59\frac{D_S - \frac{d_0}{2}}{B - d_1}\left(\frac{d_0}{d_1}\right)^2 + 1.0}, \qquad \beta_L = 1 + \frac{0.18\frac{B^2}{D_S D'} - 0.5}{0.59\frac{D_S - \frac{d_0}{2}}{B - d_1}\left(\frac{d_0}{d_1}\right)^2 + 1.0}$$

where :

D' = depth of the ship (m), where the imaginary freeboard deck is provided according to **Pt 3, Ch 1, 203. 2.** (1). D' may be the height from the top of keel to this assumed deck (m).

(2) The value obtained from the following formula is to be substituted for $(d+0.038L')$

$$(d+0.038L')\sqrt{\frac{D'}{D_S}}$$

where :

D' = as specified in (1).

3. If there is a combination of a cross-tie having an ample sectional area and non-watertight partial bulkhead or any similar construction is provided midway in the hold, the l_h in provisions in **Table 7.4.2** may be measured from the bulkhead to such a construction.

4. In case where the breadth of angles or flat bars supporting stiffeners in double hull of side construction is unusually large, scantlings of stiffeners may be determined in accordance with the provision of **Pt 3, Ch 7, 403. 2.**

402. Side transverse and side stringer

The thickness of side transverse girders for shear force and shear buckling strength is not to be less than that obtained from the **Table 7.4.2** in addition to the requirement of Rules, whichever is greatest.

Table 7.4.2 The thickness of side transverse and side stringer

division	thickness (mm)
Side transverse and Side stringer	$t_1 = 0.083\dfrac{CSl_h}{d_1 - a}(d + 0.038L') + 1.5$, $\quad t_2 = 8.6\sqrt[3]{\dfrac{d_1^2(t_1 - 1.5)}{k}} + 1.5$

C : as specified in the following Table.

Side transverse

$$C = (C_1 + \beta_T C_2)C_3$$

$$\beta_T = 1 + \frac{0.42\left(\dfrac{B}{D_S}\right)^2 - 0.5}{0.59\dfrac{\left(D_S - \dfrac{d_0}{2}\right)}{(B - d_1)}\left(\dfrac{d_0}{d_1}\right)^2 + 1.0}$$

C_1, C_2 = as obtained from the following table, in accordance with the value of h/l_h. For intermediate values of h/l_h, the values of C_1 and C_2 are to be determined by linear interpolation.

h/l_h	C_1	C_2
0.5 and under	0.18	0.05
0.75	0.21	0.08
1.00	0.24	0.09
1.25	0.25	0.10
1.50	0.26	0.11
1.75 and above	0.27	0.12

C_3 = as obtained from the following formula, but not to be less than 0.2.

$$C_3 = 1 - 1.8\frac{y}{h}$$

Side stringer

$$C = (C_1 + \beta_L C_2)C_3$$

$$\beta_L = 1 + \frac{0.42\left(\dfrac{B}{D_S}\right)^2 - 0.5}{0.59\dfrac{\left(D_S - \dfrac{d_0}{2}\right)}{(B - d_1)}\left(\dfrac{d_0}{d_1}\right)^2 + 1.0}$$

C_1, C_2 = as obtained from the following table, in accordance with the value of h/l_h. For intermediate values of h/l_h, the values of C_1 and C_2 are to be determined by linear interpolation.

h/l_h	C_1	C_2
0.5 and under	0.20	0.07
0.75	0.24	0.05
1.00	0.26	0.03
1.25		0.01
1.50 and above		0.00

C_3 = as obtained from the following formula

$$C_3 = \left|1 - \frac{2x}{l_h}\right|$$

h = vertical distance from the top of inner bottom to the strength deck at side(m)
l_h = length of hold(m)
d_0 = height of centre girder(m)
L' = length of ship(m). Where, however, L exceeds 230 m, L' is to be taken as 230 m.
d_1 = depth of side transverse or side stringer(m). where, the depth of webs is divided by providing stiffeners in the direction of the length of girder on the webs, d_1 in the formulae for t_2 may be taken as the divided depth.
S = width of the area supported by the side transverse girders(m)
a = depth of the openings at the location under consideration(m)
S_2 = S_1 or d_1, whichever is smaller
y = distance from the lower end of h to the location under consideration(m)
x = distance from the end of l_h to the location under consideration(m)
k = coefficient obtained from table in accordance with the ratio of the spacing S_1 (m) of the stiffeners provided in the direction of the depth of girder on the web of side transverse girder and d_1. For intermediate values of S_1/d_1, the value of k is to be determined by linear interpolation.

S_1/d_1	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.5	2.0 and above
k	60	40	26.8	20	16.4	14.4	13.0	12.3	11.1	10.2

Section 6 Deck Construction

601. Construction

The requirements of decks inside the line of deck openings in connection with bending in the plane of deck are not to be less than that obtained from the **Table 7.4.3.** In the calculations of section modulus and moment of inertia, the deck inside the line of deck openings is to be regarded as a web and the hatch end coaming as a flange.

Table 7.4.3 Decks inside the line of deck opening

Item	Framing	Scantling
Thickness of deck	Boxshaped construction	$t = 0.00417 C_1 \left(\frac{l_V^2 l_C}{\omega_C} \right) + 4.0$ (mm) But, it is to be included the thickness of bottom plating.
	Others	$t = 0.00417 C_1 \left(\frac{l_V^2 l_C}{\omega_C} \right) + 1.5$ (mm)
Section modulus	$Z = 1.43 C_2 l_V^2 l_C^2$ (cm^3)	
Moment of inertial	$I = 0.38 \frac{l_C^4}{S l_V^3} I_V$ (cm^4)	

l_V = distance from the top of inner bottom plating to the bulkhead deck at the centre line of ship (m)
l_C = width of hatchway(m). where two or more rows of hatchway are provided, the width of the widest hatchway is to be taken.
ω_C = width of deck inside the line of deck openings(m)
C_1, C_2 = as obtained form Table in accordance with the value of α. For intermediate values of α, the value of C_1, C_2 are to be determined by linear interpolation.

α	C_1	C_2
0.5 and under	1.00	0.50
1.5 and above	0.37	0.10

α = as obtained form the following formula

$$\alpha = 0.5 l_C \sqrt[4]{\frac{3}{4 S l_V^3} \times \frac{I_V}{I_C}}$$

S = spacing of vertical webs provided on transverse bulkhead (m)
I_V = moment of inertia vertical webs provided on transverse bulkhead (cm^4)
I_C = moment of inertia of decks inside the line of deck openings (cm^4)

Section 7 Freight Container Securing Arrangement

702. Freight container securing systems

1. In case of intending to be approved by the Society for freight container securing arrangement as specified in **702.** of the Rules, it is to be satisfied with the requirement of **Annex 7-2 Guidance for the Container Securing Arrangements.**

2. For approval of manufacturing process and type approval of securing arrangement are to comply with the requirements in **Ch 3, Sec 25.** of 「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」

3. Inspection procedure of Freight container securing arrangement

(1) Inspection procedure of type approved freight container securing arrangement in accordance with the requirements of **Ch 3, Sec 25** of 「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」 is as follows.

(2) The nature and extent of production testing will be considered but the arrangements are to be at least equivalent to one of the following schemes:

(A) (a) For rod lashings, fittings and securing devices
One sample from every fifty pieces, or from each batch if less than fifty piece, is to be proof loaded to 1.5 times the safe working load for which the item is intended.

(b) For chain or wire rope lashings
One sample from every fifty pieces, or from each batch if less than fifty piece, is to be to breaking.

(B) Alternatively, every piece of fittings, securing devices and lashings is to be proof loaded to the safe working load of the item and in addition, one sample from every batch of chain or wire rope lashings is to be tested to breaking.

(3) For fixed securing devices such as items **11.** to **14.** in **Table 3.25.2** of 「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」 consideration will be given to a reduced frequency of mechanical production testing provided the following (A) and (B). Where manufacturer for the fixed securing devices has the certificates of this Class' quality assurance system, inspection procedure is to comply with **Ch 5, 305.** of 「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」

(A) Prototype test results indicate a breaking strength at least 50 % greater than that required by the **Table 3.25.1** of 「**Guidance for Approval of Manufacturing Process and Type Approval, etc.**」

(B) A suitable non-destructive inspection procedure is agreed.

(4) For production tests carried out in accordance with (1)(A) permanent deformation(other than that due to initial embedding of component parts) will not be accepted within the range of loading up to :

(A) where SWL is less than 25 tones : 1.5 × SWL (ton)

(B) where SWL is 25 tones or greater : SWL ×12.5 (ton)
Consideration may be given to acceptance of permanent deformation in the load range between that given in (2) and the proof load provided that satisfactory manual operation can be achieved after completion of tests.

(5) In the event of premature failure or serious plastic deformation occurring in a test sample a further sample should be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

(6) For production tests carried out in accordance with (2)(B) permanent deformation will not be accepted. ⚓

CHAPTER 5 SHIPS CARRYING LIQUEFIED GASES IN BULK

(Separate Publication)

CHAPTER 6 SHIPS CARRYING DANGEROUS CHEMICALS IN BULK

(Separate Publication)

CHAPTER 7 CAR FERRIES AND ROLL-ON/ROLL-OFF SHIPS

Section 1 General

101. Application

The ship specified in **101. 2** of the Rules are to comply with the requirement **Annex 7-3 Guidance for Cargo Ferries and Passenger Ferries.**

Section 3 Deck Structure

301. Application

1. Thickness of vehicle deck

The thickness of vehicle deck is to be less than that obtained from the following (1) and (2). However, the thickness of plating of weather decks is to be 1 mm thicker than obtained from those formulae.

(1) Where the distance between centres of wheel prints in a panel is not less than $2S+a$ (See **Fig 7.7.1**)

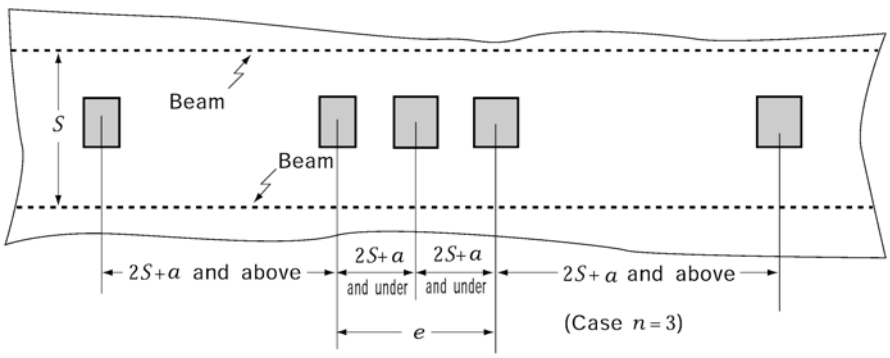


Fig 7.7.1 Measurement of e

$$t = C\sqrt{K}\sqrt{\frac{(2S-b')}{(2S+a)} \times \frac{P}{9.81}} + 0.5 \quad (\mathrm{mm})$$

C = coefficient determined as specified in **Table 7.7.1.**

S = beam spacing (m)

P = maximum design wheel load (kN). if $b > S$, a value equal to the maximum designed wheel load multiplied by the value of S/b

b' = b or S, whichever is the smaller (m)

a and b = length of wheel print measured in parallel and perpendicular to beam (See **Fig 7.7.2**). For vehicles with ordinary pneumatic tires, however, values of a and b in **Table 7.7.2** may be used.

Table 7.7.1 Coefficient C

Frames \ Vehicles		Vehicles used for cargo handling	Other vehicles
Midship part of strength deck	Longitudinal framing	4.6	$\frac{3.64}{\sqrt{1-0.64f_D}}$
	Transverse framing	4.9	$\frac{5.15}{\sqrt{1-0.41{f_D}^2}}$
Elsewhere		4.6	5.2
f_D = as specified in **Pt 3, Ch 1, 124** of the Rules. But, it is to be less than 0.79.			

Table 7.7.2 Wheel print length a and b

wheel \ direction	Wheel print length parallel to axle In **Fig 7.7.2,** a in Case (I), b in Case (II)	Wheel print length right angle to axle In **Fig 7.7.2,** a in Case (I), b in Case (II)
Single tire	Tire width	$\frac{1}{20}\sqrt{P}$
Double tire	2×tire width. Interval between tires, if any, may be added	$\frac{9}{250}\sqrt{P}$
P = as specified in **Par 301. 1 (1)**		

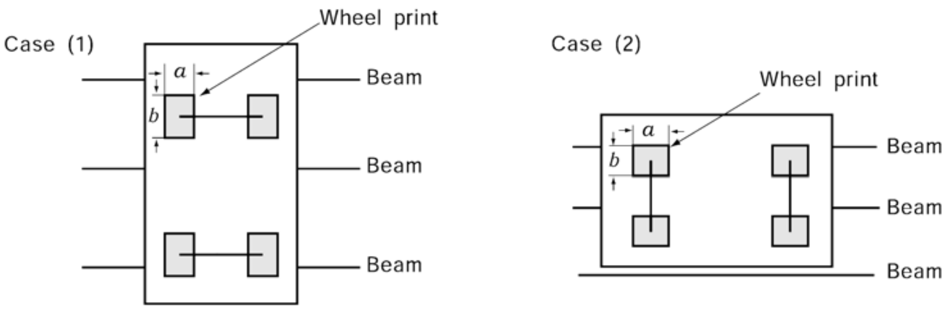

Fig 7.7.2 Measurement of a and b

(2) Where the distance between centres of wheel prints in a panel is less than $2S + a$ (See **Fig 7.7.1**)

$$t = C\sqrt{K}\sqrt{\frac{2S-b')}{(2S+a+e)}\times\frac{nP}{9.81}}+0.5 \quad (\mathrm{mm})$$

e = sum of distances between centres of wheel prints in case where wheels are placed side by side at a spacing less than $2S+a\,(\mathrm{m})$ (See **Fig 7.7.1**)

n = number of wheel loads in the range of e

C, S, a, b' and P = as specified in (1)

2. Section modulus of vehicle deck beams

The section modulus of beams of decks loaded with wheeled vehicles is not to be less than that obtained from the following formula:

$$Z = KC_1C_2M \quad (\mathrm{cm}^3)$$

C_1 = coefficient determined as follows.

for $b/S \leq 0.8$: $C_1 = 1.0$
for $b/S > 0.8$: $C_1 = 1.25 - 0.31b/S$

C_2 = coefficient determined from **Table 7.7.3**

Table 7.7.3 Coefficient C_2

members \ vehicles	Vehicles exclusively used for cargo handling	Other vehicles
Longitudinal beams of strength decks in midship region	$\dfrac{3.6}{1-0.34f_D}$	$\dfrac{4.6}{1-0.64f_D}$
Elsewhere	3.6	4.6
f_D = as specified in **Pt 3, Ch 1, 124** of the Rules. But, it is to be less than 0.79		

b, P and S = as specified in **Par 1.** (1)
M = M_1 or M_2 obtained from the following formulae, whichever is greater.

$$M_1 = \frac{1}{9.81}\left(\sum_{i=1}^{N_I} 4P_{Ii}\alpha_{Ii}\left\{1-\left(\frac{\alpha_{Ii}}{l_I}\right)^2\right\} + \sum_{j=1}^{N_{II}} P_{IIj}\alpha_{IIj}\left(1-\frac{\alpha_{IIj}}{l_{II}}\right)\left(7-5\frac{\alpha_{IIj}}{l_{II}}\right) - \sum_{k=1}^{N_{III}} P_{IIIk}(l_{III}-\alpha_{IIIk})\left\{1-\left(\frac{l_{III}-\alpha_{IIIk}}{l_{III}}\right)^2\right\}\right)$$

$$M_2 = \frac{1}{9.81}\left(-\sum_{i=1}^{N_I} P_{Ii}\alpha_{Ii}\left\{1-\left(\frac{\alpha_{Ii}}{l_I}\right)^2\right\} + \sum_{j=1}^{N_{II}} P_{IIj}\alpha_{IIj}\left(1-\frac{\alpha_{IIj}}{l_{II}}\right)\left(2+5\frac{\alpha_{IIj}}{l_{II}}\right) + \sum_{k=1}^{N_{III}} 4P_{IIIk}(l_{III}-\alpha_{IIIk})\left\{1-\left(\frac{l_{III}-\alpha_{IIIk}}{l_{III}}\right)^2\right\}\right)$$

I_I, I_{II}, I_{III} = span of beam between support points(m)
P_{Ii}, P_{IIj}, P_{IIIk} = maximum design wheel load between support points (kN)
α_{Ii}, α_{IIj}, α_{IIIk} = distance from each support point to the point of action of wheel load (See **Fig 7.7.3**)
N_I, N_{II}, N_{III} = number of wheel loads between each span

3. Scantlings of vehicle deck beams

Scantlings of beams of car decks may be determined by direct strength calculations using the following standards.

(1) The model of structures and the method of calculation are to be those approved by the Society.

(2) Loads are to be assumed as follows;

(a) 1.5×maximum design wheel load for loaded condition with vehicles on car decks.

(b) 1.2×maximum design wheel load for vehicles used for cargo handling only(forklifts or similar vehicles used for handling cargo in ports only).

(3) The allowable stressed for calculation of section moduli are to be as shown in **Table 7.7.4.**

(4) Considering corrosion, etc, the section moduli obtained on the basis of conditions (1) to (3) above are to be multiplied by 1.2 to determine the actual section moduli.

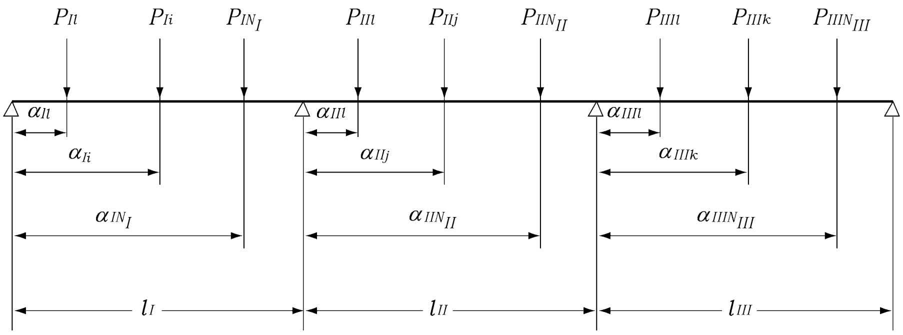

Fig 7.7.3 Measurement of P_{Ii}, α_{Ii}, l_I

Table 7.7.4 Permissible stress (N/mm^2)

Members	Vehicles used for cargo handling only	Other vehicle
Longitudinal beams of strength decks in midship region	$\frac{235-80f_D}{K}$	$\frac{235-150f_D}{K}$
Elsewhere	$\frac{235}{K}$	$\frac{235}{K}$
f_D = as specified in **Pt 3, Ch 1, 124.** of the Rules. But, it is to be less than 0.79		

4. Movable vehicle deck girder

(1) General

Deck girders of movable vehicle decks and similar constructions are to be in accordance with the requirements in this Section in addition to **Pt 3, Ch 11, 103.**

(2) Strength requirement

The scantlings of movable vehicle deck girders are to be determined with the following requirements in (A) through (C).

(A) The effective width of compressive plate flange for each girder is to be determined by the following (a) and (b) corresponding to the stiffening direction of panel.

(a) Effective width for girders parallel to the stiffening direction
The value specified in **Pt 3, Ch 3, 602.**

(b) Effective width for girders crossing at right angles with the stiffening direction

$$b_{eft} = \sum_n \left(\frac{C_{et} \cdot a}{2}\right) \quad \text{(mm)}$$

In case buckling stiffeners for deck plate are fitted properly, these may be taken into account for the determination of effective width. However, it is not to exceed the value specified in **Pt 3, Ch 3, 602.**

C_{et} : Coefficient as given by the following formula. Where, however, C_{et} exceeds 1.0, C_{et} is to be taken as 1.0.

$$C_{et} = \left(\frac{3}{\beta} - \frac{1.75}{\beta^2}\right)\frac{b}{a} + \left(\frac{0.075}{\beta} + \frac{0.75}{\beta^2}\right)\left(1 - \frac{b}{a}\right)$$

n : 1 for girders located on the periphery of vehicle deck, and 2 for the others
a : Spacing of girders crossing at right angles with the stiffening direction (mm)
b : Spacing of stiffeners (mm)
β : Coefficient as given by the following formula

$$\beta = \frac{b}{t}\sqrt{\frac{\sigma_F}{E}}$$

t : Thickness of vehicle deck plating (mm)
σ_F : Minimum upper yield stress or proof stress of the vehicle deck material (N/mm^2)
E : Modulus of elasticity of the material to be assumed equal to 2.06 $\times 10^5$ (N/mm^2) for steel.

(B) Design load and allowable stresses are to be in accordance with the requirements of following (a), (b).
(a) Design load P (kN/mm^2)
- For loaded condition with vehicles on vehicle decks

$$P = 1.5(p + w_{deck})$$

p : Design load on vehicle deck (kN/mm^2)
w_{deck} : Tare of vehicle deck per unit area (kN/mm^2)

- For vehicles used for cargo handling only (fork lifts or similar vehicles used for handling cargo in ports only)

$$P = 1.2(p + w_{deck})$$

(b) Allowable stresses (N/mm^2)
As specified in **Table 3.11.1**. Where, σ_F(N/mm^2) is minimum upper yield stress or proof stress of the material.

Table 3.11.1 Allowable stress

Normal stress	$0.8\sigma_F$
Shear stress	$0.46\sigma_F$

(C) In case the scantlings of girders are determined based upon direct calculations, the method of assessments is to be a grillage model analysis or that can take account of the elastic buckling effects of compression panels of vehicle deck. Otherwise, it may be acceptable that elastic FEM analysis by using shell elements model is carried out and, in addition, buckling strength of compression panels is checked complying with the requirements of **Pt 3, Annex 3-2, III.2.**

(3) Structural details

(A) Fillet weld of the connection of girder webs to the vehicle deck is to be in accordance with **Table 3.11.2.**

(B) The thickness of web plates is not to be less than that obtained by the following formula, except where buckling strength of web plate is examined precisely.

$$\frac{d}{C}+1.0$$

d : Depth of girders (mm)

C : Coefficients are given by the followings.

65 for symmetrically flanged girders

55 for asymmetrically flanged girders

Table 3.11.2 Fillet weld of girder to movable vehicle deck

<table>
<tr><th></th><th>Panel on which vehicular traffic is frequent (1)</th><th>Panels other than the specified in the left column</th></tr>
<tr><td>1) Girders on the deck panel periphery</td><td rowspan="5">F2
(Both sides)</td><td rowspan="4">F2
(Both sides)</td></tr>
<tr><td>2) Within $0.3l$ midspan of girders other than mentioned in (1)(2)</td></tr>
<tr><td>3) Within $0.1l$ end part of girders other than mentioned (1)(2)</td></tr>
<tr><td>4) Intersection for $0.2l'$ of girders other than mentioned in (1)(3)</td></tr>
<tr><td>5) Other than those mentioned above</td><td>F2
(One side, at least)</td></tr>
</table>

(1) Deck panels which are subject to the dynamic load in the vicinity of ramp way and are on the route between a ramp way and another ramp way to reach another deck

(2) l : The total length of each girder

(3) l' : The span of each girder, and $0.1l'$ on either side of the inter section of girders is to be welded

(4) $F2$: As specified in **Pt 3, Ch 1, Table 3.1.6**

5. Supporting structures of movable vehicle deck

(1) The requirements in this section apply to structures supporting movable vehicle decks.

(2) Considering the shape, designed load, etc., of deck panels, supporting structures of movable vehicle decks are to be arranged appropriately.

(3) The connection of supporting members to hull structural members is to be suitably constructed so as to avoid stress concentration. If necessary, suitable reinforcement is to be provided by means of stiffeners, brackets, etc.

(4) In case deck panels are suspended by wire ropes, the ropes are to comply with the require-

ments of **Pt 4** of the Rules or the requirements of the standards as deemed appropriate by the Society, and subjected to suitable corrosion prevention treatment.
The safety factor of the wire ropes is not to be less than the following value, but may not exceed 4.

$$\frac{10^4}{8.85W+1910}$$

Where,
W : Safe working load (ton)

(5) Scantlings of supporting structural members are to be determined to withstand the design loads defined in **4** (B) (a) using the following allowable stresses.

shear stress : $\tau = 0.34\sigma_F$
bending stress : $\sigma = 0.50\sigma_F$
equivalent stress : $\sigma_e = \sqrt{\sigma^2 + 3\tau^2} = 0.64\sigma_F$

Where,
σ_F : Minimum upper yield stress or proof stress of the material (N/mm^2) ⚓

CHAPTER 10 DOUBLE HULL TANKER

Section 1 General

101. Application

1. Application

(1) For ships having the structural features similar to double hull tankers; e.g. ships carrying dangerous chemicals in bulk, the requirements in **Pt 7, Ch 10** of the Rules are to be applied.
(2) Unless otherwise specially noted, the prescriptions in other Parts apply for matters common to both cargo ships and tankers.

2. Proposal of novel construction type

In the event that a novel construction type is proposed, scantlings are to be determined by carrying out comparative calculations with the standard structural model conforming to the requirements of the Rules. Submission of data covering the results of model experiments or real ship experiments may be requested by the Society as necessary.

3. Ships carrying liquid cargoes other than petroleum

(1) The scantlings of structural members of the cargo oil tank part of tankers carrying liquid cargoes of a specific gravity ρ exceeding 1.0 are to be of the values obtained by the following two procedures, whichever is greater:
   (a) To calculate for all of the structural members in accordance with the relevant requirements of the Rules
   (b) To calculate for respective structural members in accordance with the following prescription:
      (i) The scantlings of the bulkhead plates, stiffeners attached bulkhead plating and girders attached bulkhead plating are to be calculated h in the formulae specified in **Sec 2** to **4** of the Rules by multiplying gravity ρ.
      (ii) The scantlings of girders and floors in double bottom and girders and transverses in double side hull are to be calculated h' in the formulae specified in **403.** and **404.** of the Rules by multiplying gravity ρ.
      (iii) The values of ρ are to be selected for respective cases except those contained in **Table 7.10.1.**
(2) For tankers carrying dangerous chemicals in bulk, the requirements in **Ch 6** of the Rules are also to be applied.

Table 7.10.1 Value of ρ

Cargo	ρ
Molasses	1.4
Asphalt	1.1
Concentrated sulphuric acid	1.85

102. Location and separation of spaces

1. The size and arrangement of cargo oil tanks segregated ballast tanks are to comply with the requirements of **MARPOL 1973/78.**

2. Cofferdams and bulkheads bounding cargo oil tanks

(1) In case where a cargo oil tank is adjacent to the fore peak (fore peak tank), the collision bulkhead is to be free from openings.
(2) Divisions between compartments defined as cofferdams and other compartments (except cargo oil tanks and fuel oil tanks) are not to have any openings with the exception of bolted watertight manholes provided in chain locker bulkheads, etc. (no watertight door is permitted).

3. Airtight bulkheads

(1) Cofferdams which are not utilized as main or auxiliary pump rooms and compartments utilized as cofferdams under the freeboard deck are to meet the requirements for the strength of deep tanks. The bulkhead between the main pump room and engine room is to have structural scantlings of watertight bulkheads in ships of not less than 100 m in length and of airtight bulkheads in ships of less than 100 m in length.

(2) The scantlings of airtight bulkheads for which no hydrostatic tests are required are to comply with the following standards. Airtightness tests may be replaced by hose tests.

(A) The plate thickness is not to be less than 6 mm, which may, however, be reduced to 4.5 mm in ships of less than 100 m in length.

(B) The section modulus of stiffeners and girders is to be 50 % of the Rule requirements for watertight bulkheads. Where connected to shell and decks, however, these stiffening members are to be of such an effectiveness as is equivalent to frames and beams.

4. Superstructures and deckhouses

The deckhouse protecting the entrance to pump rooms is to be in accordance with the following requirements:

(1) The strength of front wall is to be equivalent to that of wall of the bridge.

(2) The strength of side walls and after wall are to be equivalent to that of front wall of the poop.

5. Pipe duct in double bottom

"Adequate mechanical ventilation" defined in **102. 8** (3) of the Rules is to be in accordance with the requirements in **Pt 7, Ch 6, 1203.** of the Rules.

Section 2 Bulkhead Plating

201. Bulkhead plating in cargo oil tanks and deep tanks

1. "Bulkhead plating" referred to in this Chapter of the Rules means those plate members used in the boundaries of cargo oil tanks and deep tanks where longitudinal bulkheads, transverse bulkheads, decks plates, side shell and inner bottom plates are included.

2. Distribution of Δh and measurement of b_t for L-Type and U-Type tank of **Table 7.10.2** of the Rules are to be in accordance with **Fig 7.10.1.**

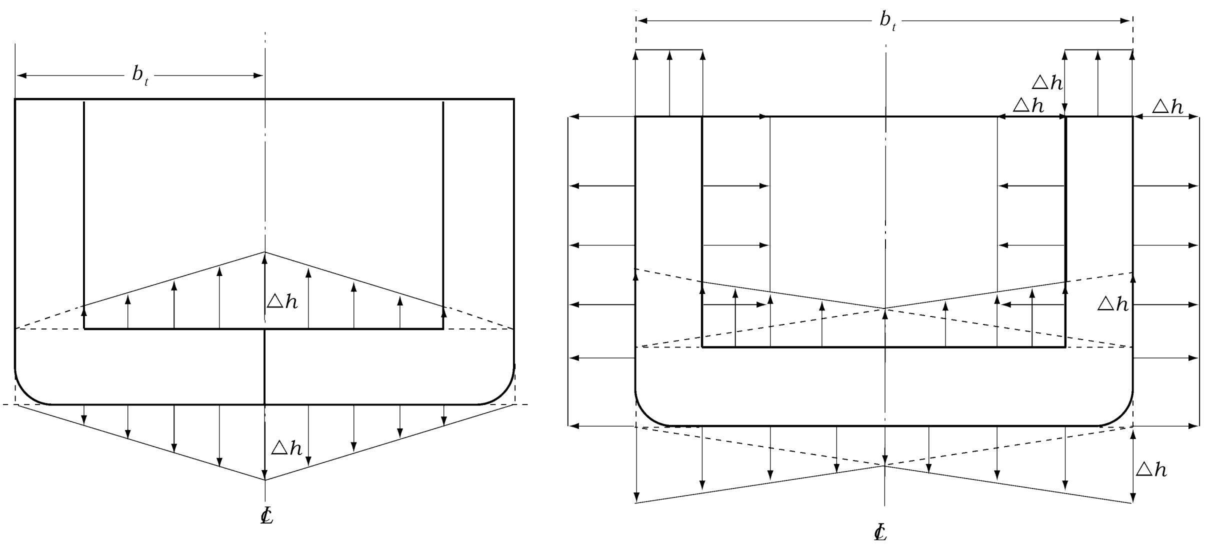

Fig 7.10.1 b_t **and** $\triangle h$ **of L-type and U-type tanks**

3. In the provision of h_3 specified in **Table 7.10.2** of the Rules, for side shell plating, a water head corresponding to the minimum draught amidship d_{min} (m) under all operating conditions of the ship may be deducted therefrom. The deductible water head at the top of keel is to be d_{min}, value at point d_{min} above the top of keel, 0, and value at an intermediate point is to be obtained by linear interpolation.

202. Swash Bulkheads

1. Arrangements of swash bulkheads

In case where the length or breadth of a cargo oil tank exceeds, 15 m or $0.1L$ (m), whichever is greater, swash bulkheads are to be provided in cargo oil tanks. Where, however, this requirement may be dispensed with if special consideration is given to sloshing.

(1) The breadth and thickness of the uppermost and lowest strakes of the centreline swash bulkhead may be 90 % of those required by the Rules for the uppermost and lowest strakes, respectively, of the longitudinal oiltight bulkhead.

(2) The "opening ratio" means the ratio of the sum of areas of openings, except slots and scallops, to the area of the bulkhead.

(3) The section modulus of stiffeners is to be obtained from the following formula.

$$Z = CSh_2 l^2 \quad (\text{cm}^3)$$

where:

C = coefficients given below;

both ends effectively bracketed : C = 7.1

one end effectively bracketed and the other end supported by girder : C = 8.4

both ends supported by girders : C = 10.0

h_s = value obtained from the following formula. In no case is it to be less than 2.0.

$$h_s = (0.176 - 0.00025L)(1-\alpha)l_T$$

α = opening ratio of bulkhead plating.

l_T = length of tank (m).

S and l = spacing of stiffeners and span of stiffener between supports (m).

(4) In applying the requirements of **405. 1** to **3** of the Rules, the scantlings of girders supporting stiffeners are to be obtained in such a way that values of h specified in the requirements under consideration referred to are not less than that obtained by substituting h with h_s specified in (3).

Section 3 Longitudinals and Stiffeners

301. Longitudinals

For the assessment fatigue strength of ship structure according to **301. 4** of the Rules is to comply with **Pt 3, Annex 3-3** of the Guidance.

Section 4 Girders

401. General

1. Notwithstanding the requirement in **401. 2** the scantlings of girders may be determined for tankers with L less than 200 m. in accordance with the requirements in **403.** through **407.** In this case, the arrangement of primary members in the double bottom, double side hull and cargo oil tank at cargo tank area are to be determined referring to the structural types shown in following (1) through (3) as the standard. However, in tankers without partial loading conditions such as half-loading or alternate loading, the spacing of girders and floors in double bottom and stringers and transverses in double side hull may be increased.

(1) Tankers with double bottom structures having longitudinal bulkhead only on the centreline, (hereinafter referred to as "Type A tankers") (See **Fig 3.3.7** of the Rules)

(2) Tankers with double hull structures having no longitudinal bulkhead on the centreline (hereinafter referred to as "Type C tankers") (See **Fig 3.3.7** of the Rules)

(3) Tankers with double hull structures having longitudinal bulkhead only on the centreline (hereinafter referred to as "Type D tankers") (See **Fig 3.3.7** of the Rules)

2. In tankers without partial loading conditions such as half-loading or alternate loading, if the spacing of girders and floors in double bottom and stringers and transverses in double side hull according to type A, C, D tankers of **Par 1** are smaller than the values shown in (1) and (2) , the spacing may be increased to the values given in (1) and (2) :

(1) Girders in double bottom and stringers in double side hull ..... 4.1 (m)

(2) Floors in double bottom and transverses in double side hull ..... 2.8 (m)

402. Direct strength calculations for girders

When determining the scantlings of girders for double hull tankers by direct strength calculations, the procedure is to comply with the **Pt 3, Annex 3-2** of the Guidance.

403. Scantlings of girders and floors in double bottom

1. The thickness of centre girders and side girders in double bottom is not to be less than the greatest of either of the value t_1 specified in the following (1) , t_2 or t_3 specified in the following (2). Where, however, the thickness of centre girders of tankers having the longitudinal bulkhead on the centreline may be determined using only t_3.

(1) The thickness obtained from the following formula according to the each location in the cargo oil tank

$$t_1 = C_1 K \frac{S h_B x}{d_0 - d_1} + 1.5 \quad (\text{mm})$$

where :

S = distance between the centres of two adjacent spaces from side girder under consideration to the adjacent girders or the inner end of tank side brackets (m).

h_B = the values obtained from the following formulae, whichever is the greater :

$$h_{B1} = 0.6d + 0.026L \quad (\text{m})$$
$$h_{B2} = h' - (d - 0.026L) \quad (\text{m})$$

h' = vertical distance from the top of the inner bottom plating to the top of hatches (m).

d_0 = depth of side girder under consideration (m).

d_1 = depth of opening at the point under consideration (m). Where, however, if vertical webs attached the transverse bulkhead are provided in the cargo oil tank, openings in girders provided within the range between the transverse bulkhead and the inner end of bracket of the lower vertical webs under consideration may be omitted except when the Society considers it to be necessary. (See **Fig 7.10.2**)

x = longitudinal distance between the centre of l_T of each cargo oil tank and the point under consideration (m). Where vertical webs attached the transverse bulkhead are provided in the cargo oil tank, x may be calculated as the distance up to the inner end of the bracket attached the lower vertical webs. And where x is under $0.25l_T$, x is to be taken as $0.25l_T$.(see **Fig 7.10.2**)

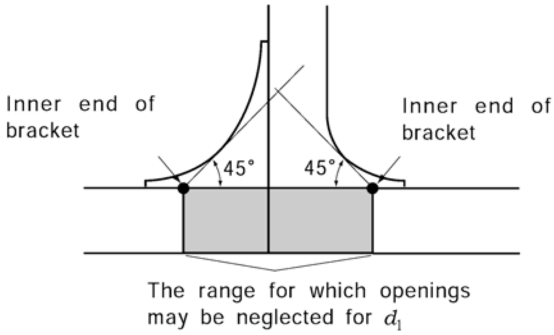

Fig 7.10.2 Based point of d_1, x, y and z

C_1 = coefficient obtained from **Table 7.10.2** and **Table 7.10.3** depending on b/l_T. For intermediate values of C_1 is to be obtained by linear interpolation.

b = distance between the side shell plating and the longitudinal bulkhead on the centreline of the hull at the top of the inner bottom plating at the midship part (m).

l_T= length of the cargo oil tank under consideration (m).

Table 7.10.2 Coefficient of type A and D tanker

b/l_T		0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and under
C_1	Type A	0.045	0.054	0.061	0.068	0.073	0.076	0.079	0.081	0.082
	Type D	0.037	0.044	0.051	0.059	0.065	0.070	0.074	0.076	0.079

Table 7.10.3 Coefficient C_1 of type B tanker

b/l_T	1.0 and under	1.2	1.4	1.6 and over
C_1	0.073	0.079	0.082	0.083

(2) The thickness obtained from the following formula according to the each location in cargo oil tank :

$$t_2 = 8.6\sqrt[3]{\frac{H^2 a^2}{C_3 K}(t_1 - 1.5)} + 1.5 \quad (\text{mm}), \qquad t_3 = \frac{C_4 a}{\sqrt{K}} + 1.5 \quad (\text{mm})$$

where :

a = depth of girders at the point under consideration(m)
Where, however, if horizontal stiffeners are provided at the half way of the depth of girders, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance form the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance between the horizontal stiffeners under consideration (m)

t_1 = thickness of girders calculated under the requirements of (1) according to the type of tankers(mm)

C_3 = coefficient obtained from **Table 7.10.4** according to the ratio of spacing S_1 (m) of stiffeners provided in the direction of the depth of girders and a. For intermediate values of S_1/a, C_3 is to be determined by linear interpolation.

S_1 = spacing of stiffeners provided depthwise on the girder(m)

H = value obtained from the following formulae:

(a) Where the girder is provided with an unreinforced opening.

$$H = 1 + 0.5\phi/a$$

where :
ϕ = major diameter of the openings(m)
α = the greater of a or S_1 (m)

(b) In cases other than(a) : H = 1.0

C_4 = coefficient obtained from **Table 7.10.4** depending on S_1/a. For intermediate values of S_1/a, C_4 is to be obtained by linear interpolation.

Table 7.10.4 Coefficient C_3 and C_4

S_1/a		0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4	1.6 and over
C_3		64	38	25	19	15	12	10	9	8	7	7
C_4	center girder	4.4	5.4	6.3	7.1	7.7	8.2	8.6	8.9	9.3	9.6	9.7
	side girder	3.6	4.4	5.1	5.8	6.3	6.7	7.0	7.3	7.6	7.9	8.0

2. The thickness of floors in double bottom is not to be less than the greatest of either of the value t_1 specified in the following (1), t_2 or t_3 specified in the following (2).

(1) The thickness t_1 obtained from **Table 7.10.5** according to the type of oil tank

Table 7.10.5 Thickness of floor t_1

Type of tankers	Type A tankers	Type C and D tankers
t_1	$t_1 = C_2 K \frac{S b h_B}{d_0 - d_1}\left(1 - \frac{4y}{3b'}\right) + 1.5 \quad (\mathrm{mm})$	$t_1 = C_2 K \frac{S b h_B}{d_0 - d_1} \times \frac{2y}{b'} + 1.5 \quad (\mathrm{mm})$

S = spacing of floors (m)

h_B = the values obtained from the following formula, whichever is the greater. Where, however, for tankers without abnormal loading conditions such as half-loading or alternate loading, specified in **Par 1. (1)** may be used

$h_{B1} = d + 0.026L \quad (\mathrm{m})$

$h_{B2} = h' - (0.6d - 0.026L) \quad (\mathrm{m})$

d_0 = height of floors at the point under consideration (m).

d_1 = depth of opening at the point under consideration (m). Where, however, if transverses attached the longitudinal bulkhead or side transverses attached the side shell plating are provided in the cargo oil tank, openings in floors provided within the range between the longitudinal bulkhead or side shell plating and the inner end of the brackets of the lower transverses under consideration may be omitted except when the Society considers it to be necessary. (See **Fig 7.10.2**)

b' = $b\,(m)$ of **Par 1. (1)** measuring at the floors under consideration.

y is to comply with type of tankers

(A) Type A of tankers : Athwartship distance at the floors under consideration from centreline of the hull to the point under consideration (m). However, if transverses attached the longitudinal bulkhead are provided in the cargo oil tank, for space between the longitudinal bulkhead and the inner end of the bracket of lower transverses under consideration, y may be calculated as the distance up to the inner end of the bracket under consideration. If y exceeds $0.3b'$, y is to be taken as $0.3b'$.

(B) Type C of tankers : Athwartship distance at the floors under consideration from the centreline of the hull to the point under consideration (m). However, if brackets attached the lower transverses of double side hull are provided, y may be calculated as the distance up to the inner end of the bracket under consideration. If y is under $0.25\,b'$, y is to be taken as $0.25\,b'$.

(C) Type D of tankers : Athwartship distance at the floors under consideration from centre of b' to the point under consideration (m). However, if brackets attached the lower transverses of double side hull or the lower transverses of the longitudinal bulkhead on the centreline of the hull in the cargo oil tank are provided, y may be calculated respectively as the distance up to the inner end of the bracket attached the lower transverses of double side hull or up to the inner end of the bracket attached the lower transverses of longitudinal bulkhead on the centreline of the hull. If y is under $0.25b'$, y is to be taken as $0.25b'$.

C_2 = coefficient obtained from **Table 7.10.6** and **Table 7.10.8** depending on b/l_T. For intermediate values of C_2 is to be obtained by linear interpolation.

b, l_T and h' are to be in accordance with the requirements of **Par 1. (1).**

(2) The thickness t_2 or t_3 obtained from the following formula

$$t_2 = 8.6\sqrt[3]{\frac{H^2 a^2}{C_3 K}(t_1 - 1.5)} + 1.5 \quad (\mathrm{mm}), \qquad t_3 = \frac{8.5 S_2}{\sqrt{K}} + 1.5 \quad (\mathrm{mm})$$

where :

a = depth of floors at the point under consideration(m)

Where, however, if horizontal stiffeners are provided at the half way of the depth of floors, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance form the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance between the horizontal stiffeners under consideration(m)

t_1 = thickness of floors calculated under the requirements of (1) according to the type of tankers(mm)

C_3 = coefficient obtained from **Table 7.10.9** according to the ratio of spacing S_1 (m) of stiffeners provided in the direction of the depth of floors and a. For intermediate values of S_1/a, C_3 is to be determined by linear interpolation.

S_1 = spacing of stiffeners provided depthwise on the floor(m)

H = value obtained from the following formulae **Par 1.** (1)

S_2 = S_1 or a, whichever is the smaller(m)

3. When calculating the thickness of side girder just under the hopper plate of bilge hopper tank, S in the formulae in **Par 1.** (1) and **Fig 7.10.3.** is to be measured, as a standard, as shown in **Fig 7.10.3.** For the hopper plate within the range of l in the figure, the sectional area obtained form the following formula may be included into the effective sectional area of the same side girder under consideration. However, if l exceeds the breadth of the hopper plate b_H, l is to be taken as b_H.

$$A_e = 10 \Sigma h_i t_i \left(1 - \frac{\theta}{90}\right) \quad (\text{cm}^2)$$

h_i = breadth of hopper plate within l (mm)

t_i = thickness of hopper plate - 2.5 (mm)

θ = angle between side longitudinal girder plate and hopper plate(degree)

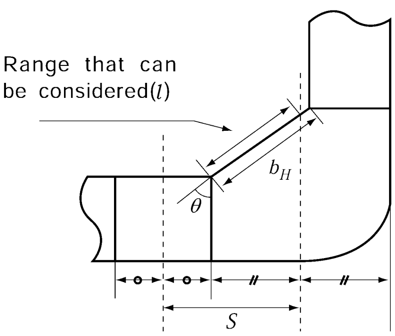

Fig 7.10.3 Measured method of S

404. Scantlings of stringers and transverses in double side hull

1. The thickness of stringers in double side hull is not to be less than the greatest of either of the value t_1 specified in the following (1), t_2 or t_3 specified in the following (2) :

(1) The thickness obtained by the following (1) or (2) according to the type of tankers :

$$t_1 = C_5 K \frac{S h_s x}{d_0 - d_1} + 1.5 \quad (\mathrm{mm})$$

where :

S = breadth of part supported by stringers (m).

h_s = the values obtained from the following formulae, whichever is the greater :

$$h_{s1} = (0.6d - d_3) + 0.038L \quad (\mathrm{m})$$
$$h_{s2} = h' \quad (\mathrm{m})$$

h' = vertical distance from the upper end of bilge hopper, if provided, or top of inner bottom plating to top of hatches (m).

d_3 = height of double bottom at ship's sides (m). Where, however, vertical distance up to the upper end of bilge hopper, if provided.

d_0 = depth of stringers (m).

d_1 = depth of opening at the point under consideration (m). Where, however, if horizontal girders attached the transverse bulkhead are provided in the cargo oil tank, openings in stringers provided within the range between the transverse bulkhead and the inner end of bracket at the end of horizontal girders under consideration may be omitted except when the Society considers it to be necessary. (See **Fig 7.10.2**)

x = longitudinal distance between the centre of l_T of each cargo oil tank and the point under consideration (m). However, if horizontal girders attached the transverse bulkhead are provided in the cargo oil tank, x may be calculated as the distance up to the inner end of bracket attached the end of horizontal girders under consideration. If x is under $0.25l_T$, x is to be taken as $0.25l_T$. (See **Fig 7.10.2**)

C_5 = coefficient obtained from **Table 7.10.10** depending on D'/l_T. For intermediate values of D'/l_T, it is to be obtained by linear interpolation.

D' = value obtained from the following formula :

$$D' = D - d_3 \quad (\mathrm{m})$$

l_T = length of the cargo oil tank under consideration (m).

Table 7.10.10 Coefficient C_5

D'/l_T		0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over
C_5	Type C	0.013	0.019	0.025	0.030	0.034	0.037	0.039	0.042	0.045
	Type D	0.020	0.024	0.028	0.032	0.035	0.038	0.040	0.042	0.045

(2) The thickness t_2 or t_3 obtained from the following formulae according to the location in the cargo oil tank.

$$t_2 = 8.6\sqrt[3]{\frac{H^2a^2}{C_6K}(t_1-1.5)}+1.5 \quad (\mathrm{mm}), \qquad t_3 = \frac{8.5S_2}{\sqrt{K}}+1.5 \quad (\mathrm{mm})$$

where :

a = depth of stringers at the point under consideration (m). Where, however, if horizontal stiffeners are provided at the half way of the depth of stringers in the direction of the length of stringers, a is the distance from the horizontal stiffener under consideration to the side shell plating or the longitudinal bulkhead of double side hull or the distance between the horizontal stiffeners under consideration (m).

t_1 = thickness of stringers calculated under the requirements of (1) (mm).

C_6 = coefficient obtained from **Table 7.10.11** according to the ratio of spacing S_1 of stiffeners provided in the direction of the depth of stringers and a. For intermediate values of S_1/a, C_6' is to be obtained by linear interpolation.

S_1 = spacing of stiffeners provided depthwise on the stringer(m)

H = as specified in **403. 1.** (2)

S_2 = S_1 or a, whichever is the smaller

Table 7.10.11 Coefficient C_6

S_1/a	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C_6	64	38	25	19	15	12	10	9	8	7

2. The thickness of transverses in double side hull is not to be less than the greatest of either of the value t_1 specified in the following (1), t_2 or t_3 specified in the following (2).

(1) The thickness obtained by the following (a) or (b) according to the type of tankers.

$$t_1 = C_7K\frac{SD'h_s}{d_0-d_1}\left(1-1.75\frac{z}{D'}\right)+1.5 \quad (\mathrm{mm})$$

where :

S = breadth of part supported by transverses (m).

h_s = the value obtained from the following formulae, whichever is the greater. Where, however, for tankers without abnormal loading conditions such as half-loading or alternate loading, specified in **Par 1.** (1) may be used.

$$h_{s1} = (d - d_3) + 0.038L \quad (\mathrm{m})$$
$$h_{s2} = h' \quad (\mathrm{m})$$

d_0 = depth of transverses (m).

d_1 = depth of opening at the point under consideration (m). Where, however, if brackets attached the lower transverses of double side hull are provided, the openings in transverses provided within the range between the top of the inner bottom plating and the inner end of the bracket under consideration may be omitted except when the Society considers it to be necessary.(See **Fig 7.10.2**)

z = distance in the direction of ship's depth between the top of the inner bottom plating or the top of the bilge hopper, if provided, and the point under consideration (m). However, if brackets attached the lower transverses of double side hull are provided, for space between the top of the inner bottom plating and the inner end of the bracket under consideration, z may be calculated as the distance at the inner end of the bracket under consideration. If z exceeds $0.4D'$, z is to be taken as $0.4D'$.(See **Fig 7.10.2**)

C_7 = coefficient obtained from **Table 7.10.12** depending on D'/l_T. For intermediate values of D'/l_T, C_7 is to be obtained by linear interpolation.

D', h', l_T and d_3 are to be in accordance with the requirements of **Par 1** (1).

Table 7.10.12 Coefficient C_7 of the Type C and D tankers

D'/l_T		0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over
C_7	Type C	0.052	0.051	0.049	0.046	0.043	0.041	0.038	0.036	0.034
	Type D	0.034	0.034	0.034	0.034	0.033	0.033	0.032	0.031	0.030

(2) The thickness t_2 or t_3 obtained from the following formulae.

$$t_2 = 8.6\sqrt[3]{\frac{H^2a^2}{C_6K}(t_1 - 1.5)} + 1.5 \quad (\mathrm{mm}), \qquad t_3 = \frac{8.5S_2}{\sqrt{K}} + 1.5 \quad (\mathrm{mm})$$

where :

a = depth of transverses at the point under consideration (m). Where, vertical stiffeners are provided at the half way of the depth of transverses in the direction of the length of transverses, distance from the vertical stiffener under consideration to the side shell plating or the longitudinal bulkhead of double side hull or the distance between the vertical stiffeners under consideration (m).

t_1 = thickness of transverse calculated under the requirements of (1) (mm).

C_6 and S_2 = as specified in **1.** (2)

H = as specified in **403. 1.** (2)

3. When calculating the thickness of stringers and transverses in double side hull, S in the formulae in **1,** (1) is to be measured, as a standard, as shown in **Fig 7.10.4.** For the hopper plate within the range of l in the **Fig 7.10.4,** the sectional area obtained from the following formula may be included into the effective sectional area of the stringer under consideration. However, if l exceeds the breadth of the hopper plate b_H, l is to be taken as b_H.

$$A_e = 10\Sigma h_i t_i \left(1 - \frac{\theta}{90}\right) \quad (\text{cm}^2)$$

where :

h_i = breadth of hopper plate within l (mm)

t_i = thickness of hopper plate - 2.5 (mm)

θ = angle between side longitudinal girder plate and hopper plate (degree)

405. Girders and transverses in cargo oil tanks and deep tanks

1. Measurement of span l

Measurement of span of girder l is to be as specified in **Fig 7.10.5.**

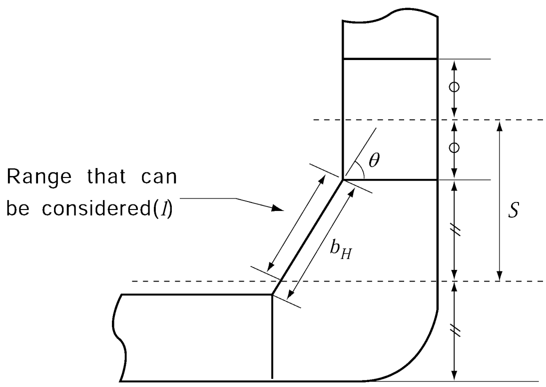

Fig 7.10.4 Measurement of S

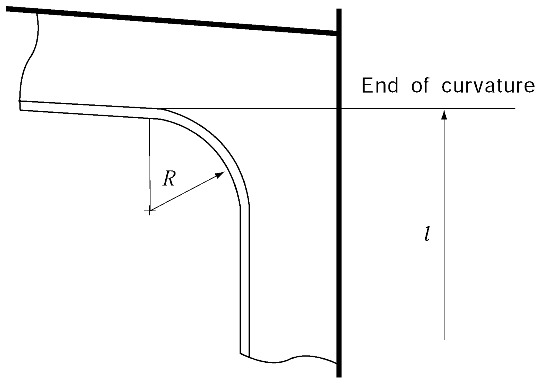

Fig 7.10.5 Measurement of l

2. Transverses on longitudinal bulkhead

(1) Even when large brackets are provided on the opposite side of a longitudinal bulkhead, span l and radius R of transverses are to be measured on the wing tank side in the same manner as in **Par 1.** But, the size of bracket b may be $0.5(b' + b'')$, except when b is to be taken as b' if b'' is smaller than b'. (See **Fig 7.10.6**)

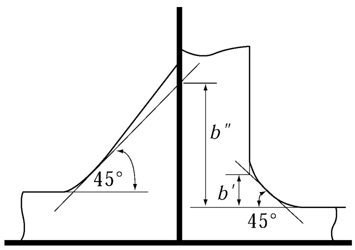

Fig 7.10.6 Measurement of b', b''

(2) In calculating the thickness of web plates in regard to shearing force, the brackets on the opposite side of longitudinal bulkheads may be taken into account.

(3) Girders on corrugated bulkheads are to be of balanced girders. Where balanced girders are not adaptable, the neutral axis is to be brought as close to the bulkhead plating as possible.

Section 5 Structural Details

501. General

Areas represented by mark "○" in **Table 7.10.13** are required to penetrate longitudinal beams and longitudinals.

Table 7.10.13 Required areas of longitudinal beam and longitudinals

Length of Ship (m)	$90 \leq L < 120$	$L \geq 120$
Longitudinal beams and side longitudinals attached to sheer strake	○	○
Side longitudinals and longitudinals on longitudinal bulkhead (except those specified above)	—	○
Bottom longitudinals, inner bottom longitudinals and longitudinals on bilge strake	○	○

503. Girders and cross ties

1. General

(1) The dimensions and locations of lightening holes, where provided, are to be as shown in **Fig 7.10.7.**

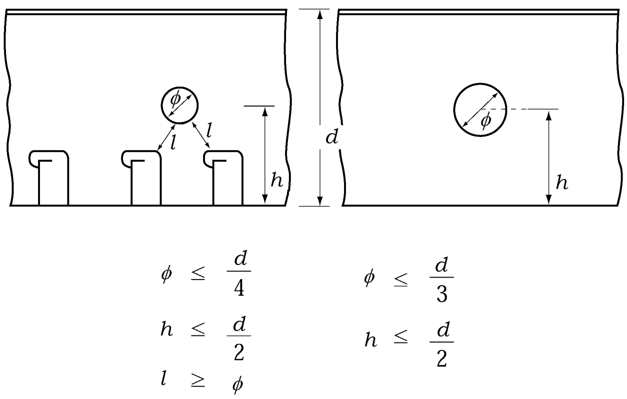

Fig 7.10.7 Locations and dimensions of lightening holes

(2) Slots are to be reinforced with collars where flanges of longitudinals are facing each other or where slots are provided at small intervals as is often the case with bilge part.
(3) In case where the depth of girders is smaller than the required depth, the section modulus of girders is to be obtained by multiplying the Rule-required section modulus by a ratio of the required depth of girder to actual depth.
(4) In pump rooms or void spaces, the thickness of webs may be reduced by 1 mm from the required thickness of webs in cargo oil tanks.
(5) The scantlings of members in segregated ballast tanks in the midship part are to be same as those of members in cargo oil tanks.
(6) In end bracket parts, at connections with cross ties, etc. of transverses where shearing stress and/or compressive stress are expected to be high, additional stiffeners are to be fitted. These

parts are not to have lightening holes. If considered necessary, slots for penetration of longitudinals in these parts are to be reinforced with collars.

(7) The radius of the rounded corner of girder is to be as large as practicable.

(8) Where angle bars are used instead of flat bars as stiffeners of transverses, etc., their section modulus with effective plates is to be approximately equivalent to the required ones.

(9) No scallops are to be permitted in web plates at the connection of face plates on transverses and those of girder plates. Scallops cut out for work convenience are to be filled up by welding. Abrupt change of dimensions is to be avoided carefully. (See **Fig 7.10.8**)

(10)Where longitudinal frames or stiffeners penetrate bottom transverses, side transverses and vertical webs on longitudinal bulkhead, proper reinforcement is to be made in the extents stipulated in **Table 7.10.14,** by fitting brackets on the opposite side of stiffeners on webs of transverse, for connecting longitudinals to transverse, by fitting collars at slots, or by other suitable means. In ships not exceeding 230 m in length, however, the extents of application of such reinforcement may be properly reduced.

Table 7.10.14 Reinforcing range

Member	Reinforcing range
Bottom transverse	All connections
Side transverses	All connections below the upper end of curvature of upper cross tie, or the designed maximum load line, whichever is higher. In ships of 300 m and above in length, it is recommended that similar reinforcement be applied in wider extent upward beyond the limit stipulated above.
Transverses on longitudinal bulkhead	All connections below the upper end R of longitudinal bulkhead curvature of upper cross tie.

(11)Connection of web plates is to be of butt-welding or other type of connection as deemed appropriate by the Society.

2. The intersections of inner bottom plating and bilge hopper

The construction at the intersections of the inner bottom plating and hopper plates is to be as follows:

(1) Where the constructions at the intersection of the inner bottom plating and hopper plates forms a built up construction as specified in **Fig 7.10.9.** It is to comply with following:

(A) Scallops at the above-mentioned intersections in bilge hopper transverses are to be filled up by welding or closed with collar plates. (See **Fig 7.10.9**)

(B) Bilge hopper transverses on the extended line of the inner bottom plating are to be fitted with gusset plates. (See **Fig 7.10.9**)

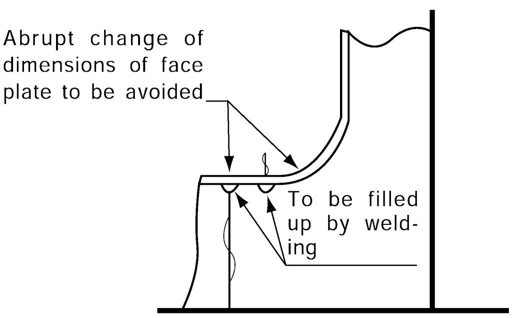

Fig. 7.10.8

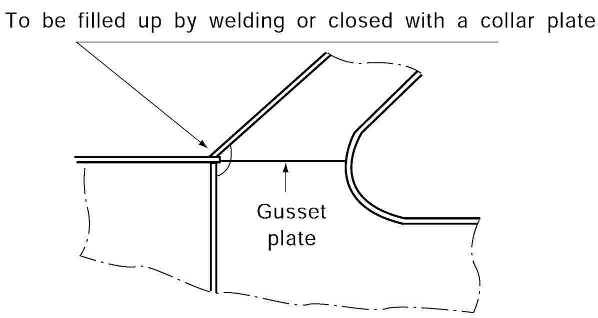

Fig. 7.10.9

(C) Where the spacing of floor plates is 2 m or more, a bracket is to be provided at the mid-length between floor plates. This bracket is to reach the inner bottom longitudinal and the hopper plate longitudinal next to the side girder located at the intersection. (See **Fig 7.10.10**)

(2) Where the constructions at the intersection of the inner bottom plating and hopper plates forms a knuckle construction as specified in **Fig 7.10.11.** The construction at the above mentioned intersection is to be comply with following (A) and/or (B), and (C) in addition to prescribed (1)(C) :

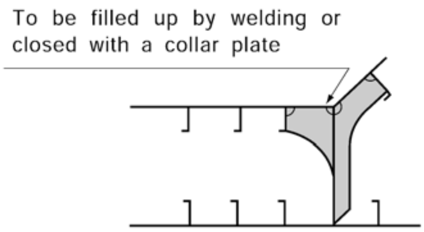

Fig. 7.10.10

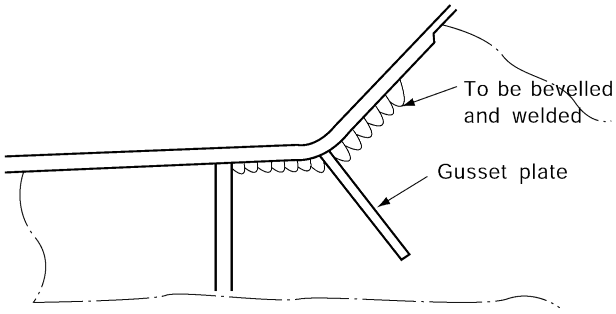

Fig. 7.10.11

(A) Knuckled part is to be bevelled and welded as far as possible.

(B) In areas where brackets are provided, gusset plates are to be attached transverses of bilge hoppers on the extended line of the inner bottom plating. In case where the radius of curvature at the knuckle is large, the number of gusset plates is to be suitably increased.

(C) Stiffeners as shown in **Fig 7.10.10** are to be fitted within 300 mm afore and abaft the bracket.

3. The construction at the intersections of longitudinal bulkheads in double side hull structures and hopper plates is to comply with the requirements prescribed in **Par 2.**

4. Details of end structure of strong brackets

For detailed end structures of end brackets of girders cross tie and transverse is to be standard **Fig 7.10.12.**

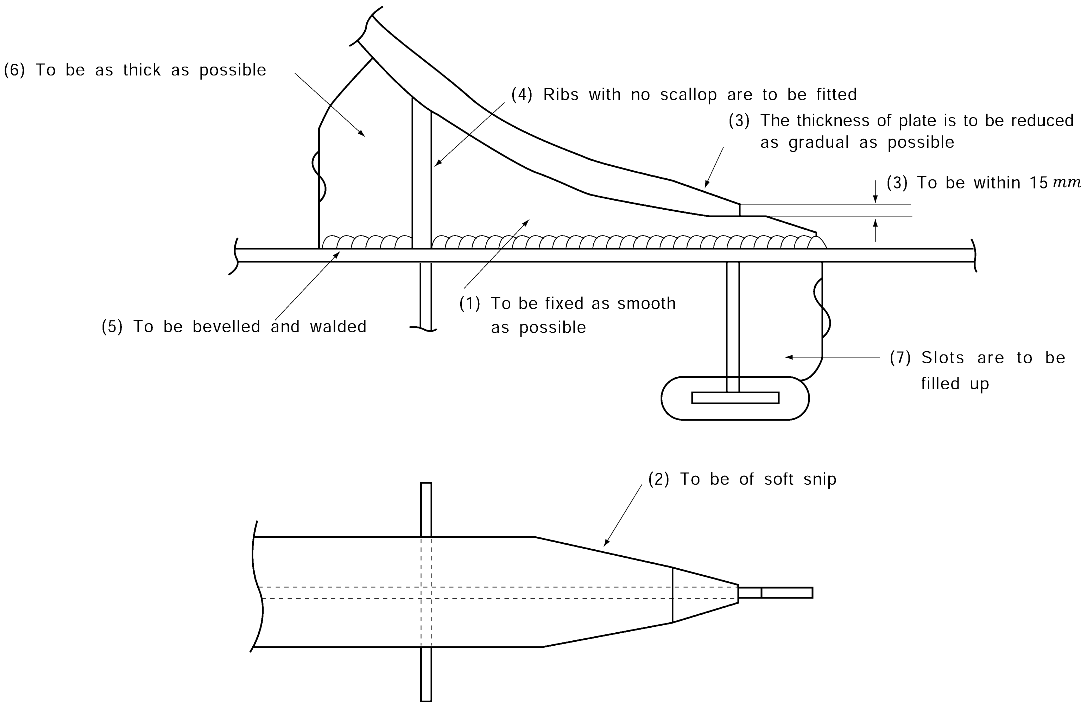

Fig. 7.10.12 Structural details of bracket toe

5. Connection of struts

In the such a construction as shown in **Fig 7.10.13,** brackets, as asterisked, are to be fitted.

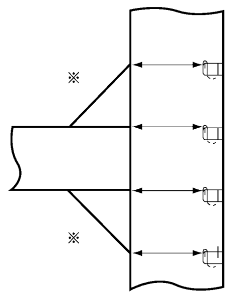

Fig 7.10.13

Section 6 Special Requirements for Corrosion

607. Thickness of inner bottom plating in cargo oil tanks

1. Thickness of inner bottom plating specified in **Par 1.** of the Rules is to comply with following requirement. In the ships engaged in the carriage of crude oil mainly, the thickness t of inner bottom plating is not to be less than obtained from the following formula, except where inner bottom is inclined appropriately;

$$t = 0.026L + 9.0 \quad (\mathrm{mm})$$

2. Thickness increasing range according to **Par 2** of the Rule is to comply with **Fig 7.10.14.** The thickness of range is not to be less than that specified in **607. 2** of the Rule or **Par 1.** adding 2.0 mm, whichever is the greater.

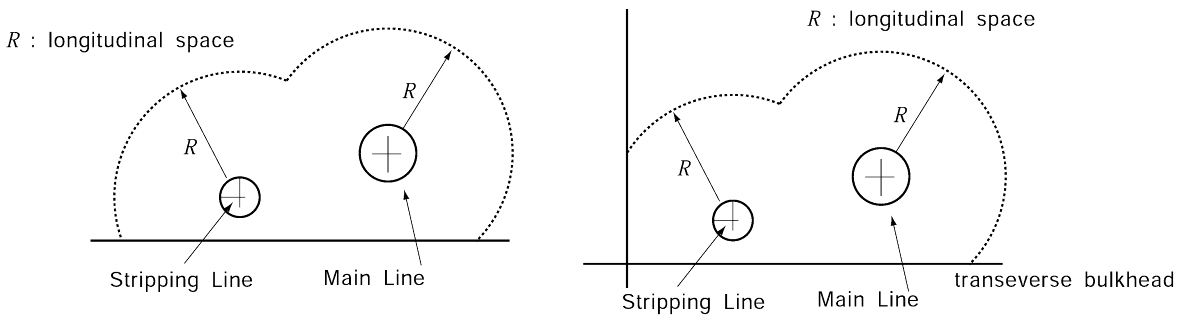

Fig. 7.10.14 Range of strengtened for corrosion of inner bottom

Section 8 Special Requirements for Tankers with Mid-deck

801. Application

1. The structural members of tankers having mid-deck penetrating longitudinally through the cargo areas are to comply with the requirements in **201, 301** and **403.** Values of h_1, h_2 and h_3 are to as specified in **Table 7.10.15.**

Table 7.10.15 Load h_1, h_2 and h_3

Load \ Provision	**201.** of the Rules	**302.** of the Rules	**403.** of the Rules
h_1	Vertical distance form the lower edge of bulkhead plating to the mid-deck(m)	Vertical distance from mid-length of l for vertical stiffeners, and from mid-point between the upper and lower stiffeners for horizontal stiffeners to the mid-deck(m)	Vertical distance from mid-length of S for horizontal girders, and from mid-length of l for vertical girders to the mid-deck (m)
h_2	$0.85(h_1+\Delta h)$ (m), Δh is to be as specified in **Table 7.10.2** of the Rules.	$0.85(h_1+\Delta h)$ (m), Δh is to be as specified in **Table 7.10.2** of the Rules.	$0.85(h_1+\Delta h)$ (m), Δh is to be as specified in **Table 7.10.2** of the Rules.
h_3	0.7 times the vertical distance from the lower edge of bulkhead plating to the top of hatchway multiplied(m)	0.7 times the vertical distance from mid-length of l for vertical stiffeners, and from mid-span of the upper and lower stiffeners for horizontal stiffeners to the top of hatchway(m)	0.7 times the vertical distance from mid-length of S for horizontal girders, and from mid-length of l for vertical girders to the top of hatchway(m)

2. In case where the thickness of a mid-deck plating is counted as the top plating of the lower cargo oil tank, it is not to be less than the thickness obtained form the formula given in **Par 1** using the loads specified in **201.** of the Rules adding 1.0 mm thereto.

Section 9 Special Requirements for Hatchways and Freeing Arrangements

902. Hatchways to cargo oil tanks

1. In case where hatchway covers of glass-fibre reinforced plastics are provided for cargo oil tanks, they are to comply with the **Ch 1, 202. 1.**
2. For the tank cleaning hatch covers, It is to comply with **Ch 1, 202. 2** and **3.**

Section 10 Welding

1002. Fillet welding

In areas where bending, shearing or axial force is particularly significant, the leg length of fillet welds is to be suitably increased or to be bevelled and welded. ⚓

Annex 7-1 Additional Requirements for Oil Tankers Using Crude Oil as a Fuel for Boilers

1. Application

(1) This Annex is apply to the tankers using crude oil or slops as a fuel for main or auxiliary boilers.
(2) Requirements which are not specified in this Annex, may be applied to the related requirements of the Rules for the Classification of Steel Ships.

2. Approval drawings and documents

The approval drawings and documents are to be submitted by the following:

(A) Arrangement
(B) Arrangement of crude oil and slop tank
(C) Piping diagram
(D) Plans and documents specified in **Pt 5, Ch 1, 208** of the Rules
(E) Power and control diagram
(F) Gas instruments and alarm arrangement
(G) Other plans and documents deemed necessary by the Society

3. The crude oil or slops used as a fuel for main or auxiliary boilers.

(1) Crude oil or slops are to be only used as a fuel on the voyage.
(2) Crude oil or slops may be taken directly from cargo tanks or flow slop tanks or from other suitable tanks. These tanks are to be fitted in the cargo tank area and are to be separated from non-gas-dangerous areas by means of cofferdams with gas-tight bulkheads.
(3) When it is necessary to preheat crude oil or slops, their temperature is to be automatically controlled and a high temperature alarm is to be fitted.

4. Boiler

(1) The whole surface of the boilers shall be gas-tight separated from the engine room. The boilers themselves are to be tested for gas-tightness before being used.
(2) Their connections (to be reduced to a minimum) are to be of the heavy flange type. Within the engine room and boiler room these pipes are to be fitted within a metal duct, which is to be gas-tight and tightly connected to the fore bulkhead separating the pump room and to the tray. This duct (and the enclosed piping) is to be fitted at a distance from the ship's side of at least 20% of the vessel's beam amidships and be at an inclination rising towards the boiler so that the oil naturally returns towards the pump room in the case of leakage or failure in delivery pressure. It is to be fitted with inspection openings with gas-tight doors in way of connections of pipes within it, with an automatic closing drain-trap placed on the pump room side, set in such a way as to discharge leakage of crude oil into the pump room. In order to detect leakages, level position indicators with relevant alarms are to be fitted on the drainage tank.
(3) Boilers shall be fitted with a suitable hood placed in such a way as to enclose as much as possible of the burners, valves and oil pipes, without preventing, on the other side, air inlet to burner register.
  (A) The hood, if necessary, is to be fitted with suitable doors placed in such a way as to enable inspection of and access to oil pipes and valves placed behind it.
  (B) It is to be fitted with a duct leading to the open in a safe position, the outlet of which is to be fitted with a suitable flame wire gauze, easily dismountable for cleaning.
  (C) At least two mechanically driven exhaust fans having spark proof impellers are to be fitted so that the pressure inside the hood is less than that in the boiler room.
    (a) The exhaust fans are to be connected with automatic change over in case of stoppage or failure of the one in operation.
    (b) The exhaust fan prime movers shall be placed outside the duct and a gas-tight bulkhead penetration shall be arranged for the shaft.
(4) When using fuel oil for delivery to and return from boilers fuel oil burning units in accordance with **Pt 5, Ch 6, 902** of the Rules shall be fitted in the boiler room. Fuel oil delivery to, and returns from, burners shall be effected by means of a suitable mechanical interlocking device so that running on fuel oil automatically excludes running on crude oil or vice versa.
(5) One pilot burner in addition to the normal burning control is required.

(6) The boiler compartments are to be fitted with a mechanical ventilation plant and shall be designed in such a way as to avoid the formation of gas pockets. Ventilation is to be particularly efficient in way of electrical plants and machinery and other plants which may generate sparks. These plants shall be separated from those for service of other compartments and shall be in accordance with Classification Societies' requirements.
(7) Means are to be provided for the boiler to be automatically purged before firing.

5. Observation tanks

(1) When crude oil is heated by stream or hot water the outlet of the heating coils should be led to a separate observation tank.
(2) The observation tank is to be fitted with a air pipes and the opening end is to be flame screen led to the safe position.

6. Installation of associated components

(1) Pumps, strainers, separators and heaters etc. The whole system of pumps, strainers, separators and heaters, if any, shall be fitted in the cargo pump room or in another room, to be considered as dangerous, and separated from engine and boiler room by gas-tight bulkheads.
(2) Electric, internal combustion and steam (when the steam temperature is higher than 220°C) prime movers of pumps, of separators (if any), etc., shall be fitted in the engine room or in another non-dangerous room. Where drive shafts pass through pump room bulkhead or deck plating, gas-tight glands are to be fitted by **Pt 7, Ch 1, 1002. 1** (1) (B).

7. Pumps

(1) Pumps shall be fitted with a pressure relief by pass from delivery to suction side
(2) It shall be possible to stop them by a remote control placed in a position near the boiler fronts or machinery control room and from outside the engine room.

8. Electrical equipments

Electrical equipments installed in gas dangerous areas is to be applied in **Pt 7, Ch 1, 1103.** of the Rules.

9. Piping systems

(1) The minimum thickness of the piping for crude oil or slops and draining pipes for the tray defined in a (2) are to comply with the **Pt 5, Ch 6, 102. 6** of the Rules.
(2) The piping connections are to be reduced to a minimum. For the piping connections are to be fitted inevitably, it is to comply with the **Pt 5, Ch 6, 104.** of the Rules.
(3) Within the engine room and boiler room these pipes are to be fitted within a metal duct. This duct is to be specified in the following requirement.
  (A) It is to be gas tight and tightly connected to the fore bulkhead separating the pump room and to the tray specified in **4.** (2).
  (B) It is to be at an inclination rising towards the boiler so that the oil naturally returns towards the pump room in the case of leakage or failure in delivery pressure.
  (C) This duct is to be fitted at a distance from the ship's side of at least 20 % of the vessel's beam amidships.
  (D) It is to be fitted with inspection openings with gas tight doors in way of connections of pipes within it, with an automatic closing drain-trap placed on the pump room side, set in such a way as to discharge leakage of crude oil into the pump room.
  (E) A vent pipe is to be fitted at the highest part of the duct and is to be led to the opening a safe position.
  (F) In way of the bulkhead to which the duct is connected, delivery and return oil pipes are to be fitted on the pump room side, with shut-off valves remotely controlled from a position near the boiler fronts or from the machinery control room. The remote control valves should be interlocked with the hood exhaust fans defined in **4.** (5)(C) to ensure that whenever crude oil is circulating the fans are running.
(4) In the piping to supply with oil to boiler manifold, the remote closing means is to be provided.

10. System for monitoring the concentration of hydrocarbon gases

If the concentration of hydrocarbon gases exceeds 30% of the lower flammable limit. An optical warning device is to be installed near the boiler fronts and in the machinery control room. An acoustical alarm, audible in the machinery space and control room, is to be provided. Gas detector is to be fitted at the following position at least.

(A) Duct defined in **9.** (3)
(B) Duct defined in **4.** (3)
(C) Near the boiler
(D) All zones where ventilation may be reduced.

11. Fire protection, inert gas generators and steam supply system

(1) Independent of the fire extinguishing plant as required by **Pt 8, Ch 2** and **Ch 3** of the Rules or Korean Ship Safety Act, an additional fire extinguishing plant is to be fitted in the engine and boiler rooms in such a way that it is possible for an approved fire extinguishing medium to be directed on to the boiler fronts and on to the tray defined in **4.** (2). The emission of extinguishing medium should automatically stop the exhaust fan of the boiler hood specified in **4.** (5)(C).

(2) The duct specified in **9.** (3) is to be permanently connected to an approved inert gas system or steam supply in order to make possible:
(A) In case of fire or leakage
(B) Purging of the duct before carrying out work on the piping in case of leakage.

12. Warning Notice

The following warning notice must be fitted in an easily visible position near the boiler front.

「 **Warning**
When an explosive mixture is signally by the gas detector plant, the watchkeepers are to do as following.
- shut off the remote controlled valves on the crude oil delivery
- return pipes in the pump room,
- inject inert gas into the duct
- turn the boilers to normal running on fuel oil.」 ⚓

Annex 7-2 Guidance for the Container Securing Arrangements

1. Application

(1) This Annex is to be applied to securing system of 20 ft and 40 ft container among standard containers in accordance with the requirements of **ISO 668**. The securing system of other special type or use of containers are to be in accordance with the requirements as deemed appropriate by the Society.
(2) Where the securing system is designed and arranged by other than the requirements of this Annex, it is to be in accordance with the requirements as deemed appropriate by the Society.

2. Type of Securing systems

(1) Containers are to be secured by one, or a combination, of the following systems. Containers secured by the other method are to be in accordance with the requirements as deemed appropriate by the Society.
  (A) Container locking devices
  (B) Rod, wire and chain lashing
  (C) Buttresses, shores or equivalent structural restraint.
  (D) Cell guides
(2) Dunnage is not to be used in associated with approved container securing systems except where forming part of an approved line load stowage specified in **Par 5.** (5)

3. Material and design

(1) Steel used for the construction of the cell guides and for fixed fittings attached to the ship's structure is to comply with the requirements of **Pt 2, Ch 1,** of the Rules or with an equivalent specification acceptable to the Society. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment and the chemical composition of the steel is to be such as to ensure acceptable qualities of weldability. Where deemed necessary by the Society, tests are to be carried out to establish specific welding procedures.
(2) Where cell guides or other securing arrangements are intended to operate in enclosed spaces at low ambient temperatures, special consideration is to be given to the specification of the steel.
(3) Steel used for loose fittings attached to the containers, and for the lashings and securing devices, is to be of a specification acceptable to the Society.

4. Submission of plans and documents

The following plans and documents are to be submitted for the approval of the Society.

(1) General arrangement plan showing the disposition and design weights of the containers
(2) Arrangement and detail plans of container securing arrangements
(3) Calculations on the strength of container securing arrangement including the following ship parameters
  (A) Moulded draught d_c, vertical centre of gravity (VCG), longitudinal centre of flotation (LCF) and transverse metacentric height(GM)
  (B) Design wind speed
(4) Other plans and documents deemed necessary by the Society.

5. Arrangements for stowage on exposed decks without cell guides

(1) General
  (A) Containers stowed on deck or on hatch covers are generally to be aligned in the longitudinal direction. In case of stowing the transverse direction it is to be in accordance with the requirements as deemed appropriate by the Society.
  (B) Containers are to be stowed so that they do not extend beyond the ship's side.
  (C) Where containers are stowed on hatch covers, the covers are to be effectively restrained against sliding by approved type stoppers or equivalent. Details of the locations of stoppers relative to the supporting structure are to be submitted at as early a stage as possible.
  (D) Stool, pillar and similar structure supporting containers and securing devices are to be of adequate strength for the imposed loads and of sufficient stiffness to minimize any deflection which could lead to reduction in the effectiveness of the securing device.
  (E) In the region forward of $0.25L_{pp}$ abaft the fore perpendicular additional securing devices may be required **8.** (1)(E).

(2) Containers in one tier
The containers are to be secured by one of the following (A) to (B);
(A) Containers are to be secured at their lower corners by approved locking devices.
(B) Alternatively, containers may be secured by lashings fitted diagonally or vertically at both ends of each containers, in association with corner fittings at each container corner.
(3) Containers in two tiers
The containers are to be secured by one of the following (A) to (C);
(A) Containers are to be secured at their lower corners at each tier by approved locking devices.
(B) Where the calculations indicate that separation forces will not occur at any point in the stack, double stacking cones may be fitted at all internal corners of the stack and bridge fittings used to connect the tops of the rows in the transverse direction. Locking devices are to be fitted at all external corners.
(C) Alternatively, containers may be secured by lashings in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking device.
(4) Containers in more than three tiers
(A) Where a three tier of containers is fitted, the containers are to be secured by one of the following (a) to (b);
(a) Containers are to be secured at their lower corners at each tier by approved locking devices.
(b) Alternately containers may be secured by lashings. One or two tiers of lashings may be fitted in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.
(B) Where a fourth tier of containers is fitted, it is generally to be secured to the third tier by locking devices at each corner.
(C) Proposals to stow more than five tiers is to be in accordance with the discretion of the Society.
(5) Line load stowage
(A) Where the containers are supported on bearers placed to distribute the stackweight as uniform line loads, the following requirements are to be complied with;
(a) The stack is, in general, to comprise a maximum of two tiers of loaded containers.
(b) The load from the upper tier is to be transferred through the container corners. Line loading is not to be used between tiers.
(c) The load on each vertical corner post of the bottom tier, calculated in accordance with **Par 9**, is not to exceed one half of the rated load of the container.
(d) Where the calculations indicate that lifting forces may occur, locking devices are to be fitted at the container corners.
(e) The clearance below the bottom container corner casting is to be such that the stacking cone or equivalent cannot be dislodged under shear loading.
(B) Where an approved line load stowage system (A) is installed the securing arrangement notation are to comply with **Pt 1, Ch 1, 201.** of the Rules.
(6) Systems incorporating structural restraint
(A) Containers may be secured by the use of a fixed structure providing permanent buttresses in association with portable frameworks.
(B) The framework or other devices securing the containers are to be aligned with the container corner fittings and any clearance gap is to be kept to the minimum to reduce shifting.

6. Arrangements for under-deck stowage without cell guides

(1) Containers are generally to be stowed in holds longitudinally and the stowing of transverse are to be in accordance with the requirements as deemed appropriate by the Society.
(2) Containers may be secured by locking devices only or by a combination of locking devices, buttresses, shore or lashings. Containers are, in general, to be restrained at every corner at the base of the stack and at all intermediate levels.
(3) Where stacks consist of one or two tiers only, consideration will be given to the omission of corner locking devices. Containers must, however, be secured by a minimum of two corner locking devices.
(4) Where the calculations indicate that separation forces could occur at any particular level, twistlocks or equivalent means of securing are to be fitted at that level. Elsewhere, consideration will be given to the use of double stacking cones.
(5) Where the calculations indicate that separation forces will not occur between containers at any

level, consideration will be given to the use of double stacking cones in lieu of locking devices throughout.

(6) Buttresses are generally to be of the tension and compression type and are to be provided with means of adjustment to ensure tightness when fitted in place.

(7) Shores of compression only type may be permanently attached to the ship structure or they may be hinged or portable. When in place they are to abut on the container corner fittings with minimal clearance. Means are to be provided to prevent slackening of the device.

(8) Adjacent stacks of containers are to be linked in line with buttresses or shores in order to transmit lateral loads. The fittings used for these linkages are to be of adequate strength to transmit the loads imposed.

(9) The ships structure supporting shores and buttresses is to be reinforced as necessary.

7. Arrangements for stowage using cell guides

(1) General

(A) The cell guides are not to form an integral part of the ship's structure. The guide system is generally to be so designed as to keep it free of the main hull stresses.

(B) Cell guides are to be designed to resist loads caused by loading and unloading of the containers, to prevent shifting of the containers and to transmit the loads caused by motions of the ship into the main hull structure.

(2) Arrangement and construction

(A) Cell guides are to have sufficient vertical extent and continuity to provide efficient support to containers. Guide bars are to be effectively attached to the supporting structure to prevent tripping or distortion resulting from container loading.

(B) The intersection between cell guide and cross ties is to provide adequate torsional stability.

(C) Intermediate brackets are to be fitted to vertical cell guides at suitable intervals.(See **Fig 1**)

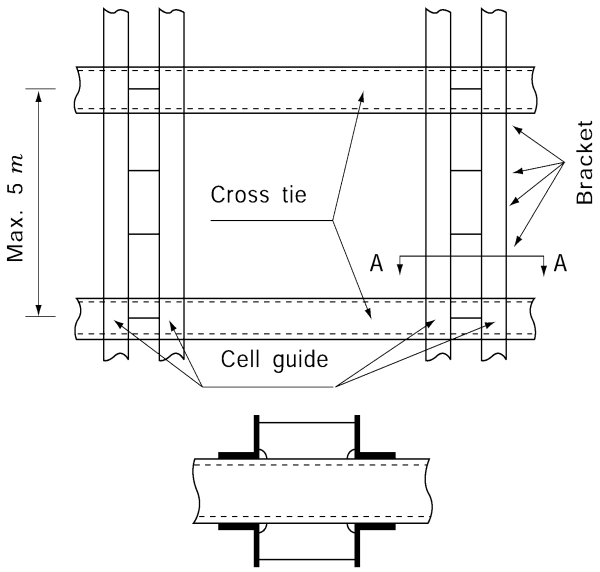

Fig 1 Typical arrangement of cell guides

(D) The cell guides are to give a total clearance between the container and guide bars not exceeding 25 mm in the transverse direction and 40 mm in the longitudinal direction. The deviation of the cell guide bar from its intended line is not generally to exceed 4 mm in the transverse direction and 5 mm in the longitudinal direction.

(3) Cell guide systems in holds

(A) Athwartship cross ties are to be fitted between cell guides at a spacing determined from the loading on the guides but, generally, not more than 5 m part, wherever possible, cross ties are to be arranged in line with the corners of the containers as stowed and are to be supported against fore and aft movement at a minimum of two points across the breadth of the hold. Where, however, the maximum fore and aft deflection in the cross tie can be shown

not to exceed 20 mm, then one support point may be accepted.
(B) Longitudinal tie bars may be required to be fitted where shown necessary by the force calculations for the structure. Where fitted they are to be specified in (A) above.
(C) Where, at the sides or ends of holds, the guide rails are fitted to transverse or longitudinal bulkheads, the bulkhead is to be locally reinforced to resist the additional loads.

(4) Cell guide systems on exposed decks
(A) Analysis methods for the strength of the cell guide structure are to take due account of the interactive effects between guide structure and supporting deck structure and also of the deformation of the hull girder.
(B) At its lower end the guide structure is to be efficiently connected to the deck structure. Cross ties are to be arranged between guides in a transverse direction at a spacing determined by the loading on the guides but in general not more than 3 m apart. Cross bracing members of adequate strength and sufficient number are to be fitted in the transverse and longitudinal directions to prevent excessive deflection of the guide structure.
(C) The height of guide bars above the deck is to be sufficient to ensure adequate restraint to the uppermost container tiers.
(D) Where the cell guide structure is attached to highly stressed hull or deck elements, such as sheer strake, special attention is to be given to the design of the connection and the grade and quality of steel utilized.

(5) Mixed stacks of 20 ft and 40 ft containers
(A) Where the cell guides are arranged for the carriage of 40 ft containers, provision should be made for the installation of temporary intermediate cell guides for 20 ft containers. The permanent structure is to be designed such that it is suitable for either loading pattern.
(B) Alternatively, permanent means for the support of 20 ft containers at the mid-length of a cell arranged for 40 ft containers should be considered. Such means may include the following:
(a) A pillar (inboard) and vertical rest bar (on the longitudinal bulkhead) against which the container stack may rest. The pillar is to be supported laterally by the deck structure over and is to be sufficiently stiff to control lateral deflection of the container stacks.
(b) Guide bars supported transversely by slim structure within the gap between containers and with longitudinal ties as necessary.

Details of proposals will be individually considered, taking into account the loads on the support structure and the resulting deflections.
(C) Where it is desired to stow 20 ft containers in the lower tiers without external support at the mid-bay location, arrangements meeting the following requirements will be considered:
(a) Maximum container weights for 20 ft containers stowed in cell guides with no 40 ft container overstowed, can be derived from **Tables 1** and **3** depending on the transverse acceleration and the number of tiers in the stack.
(b) Maximum container weights for 20 ft containers stowed in cell guides with at least one 40 ft container overstowed, can be derived from **Tables 2** and **4** depending on the transverse acceleration and the number of tiers in the stack.
(c) Where a mixed stack not covered by **Tables 1** to **4** is proposed, two-thirds of the transverse components of forces acting on 20 ft containers are to be assumed to be transmitted to the cell guides and one-third transmitted as a racking force through the unsupported end wall. The container weights are to be such that the racking force on the container end walls does not exceed 15 tonnes at the mid-hold end of the stack of 20 ft containers.
The allowable compressive forces in the container corner posts are not to be exceeded, taking due account of 40 ft containers above as per (5) (C) (e), if applicable. The container weights are to be defined to ensure separation is minimized.
(d) Means are to be provided to prevent transverse sliding of the bottom of the stacks of 20 ft containers at the mid-hold end. This is to be in the form of permanently attached chocks at the inner bottom or equivalent
(e) Stacking cones are to be fitted between each tier of the 20 ft containers to prevent transverse sliding. In addition, where a 40 ft container is required to be stowed above 20 ft containers, stacking cones are to be fitted at the ends of the 40 ft container between the 40 ft container and the 20 ft containers below.
(f) The 20 ft containers are to have steel walls and top (no open frame containers) and are to be of specially strengthened design, where necessary, to correspond to the vertical

compressive load at the cell guide end of the 40 ft containers above.

(g) Where fore and aft tension/pressure approved adapter cones are used to link two 20 ft containers to equate to a 40 ft container, the storage of 40 ft containers above is not required. Special consideration is to be given to the maximum stack weight which is stowed in association with this method of securing. In general, each stack of 20 ft containers is not to exceed 120 tonnes.

Proposals for stowage arrangements other than the above will be individually considered and are to be accompanied by supporting calculations.

NOTE
40 ft overstow containers not included in the number of tiers.

8. Determination and application of forces

(1) Determination of forces

(A) The forces action in the securing system are to be determined for each loading condition and associated set of motions of the ship.

(B) The following forces are to be taken into account:

(a) Static gravity forces
(b) Inertial forces generated by accelerations due to ship motions
(c) Wind forces
(d) Forces imposed by the securing arrangements
(e) Wave impact forces

(C) Where ship response data is not available, the value for roll, pitch and heave as given **Table 5** will be used for the calculation.

Table 5 Ship motions

Motion	Maximum single amplitude	Periods (sec)
Roll	$\phi = \sin^{-1}\theta^\circ$ but need not exceed 30° and is not to be taken less than 22° where $\theta = \sin\phi$ $= (0.45 + 0.1\frac{L}{B})(0.54 - \frac{L}{1270})$	$T_r = \frac{0.7B}{\sqrt{GM}}$
Pitch	$\psi = 12e^{-0.0033L}$, max 8°	$T_p = 0.5\sqrt{L_{pp}}$
Heave	$L_{pp}/80\,\mathrm{m}$	$T_h = 0.5\sqrt{L_{pp}}$
e = base of natural logarithm (2.7183) GM = transverse metacentric height when containers loaded.		

(D) Wind forces are generally to be based on a maximum wind speed of 40 m/s, acting on the outest container stack.

(E) The strength of the securing arrangements in the forward $0.25L_{pp}$ are to be suitable for forces increased by 20 % above the values calculated form these requirements, except where it can be shown that the containers are adequately protected by breakwaters or similar structure.

(F) The force acting on the container is the vectorial summation of the individual directional components of all forces acting at a given instant.

(2) Components of forces

(A) The individual components of forces due to gravity, wind and ship motion acting on a particular condition are to be determined in accordance with **Fig 2** and **Table 6**.

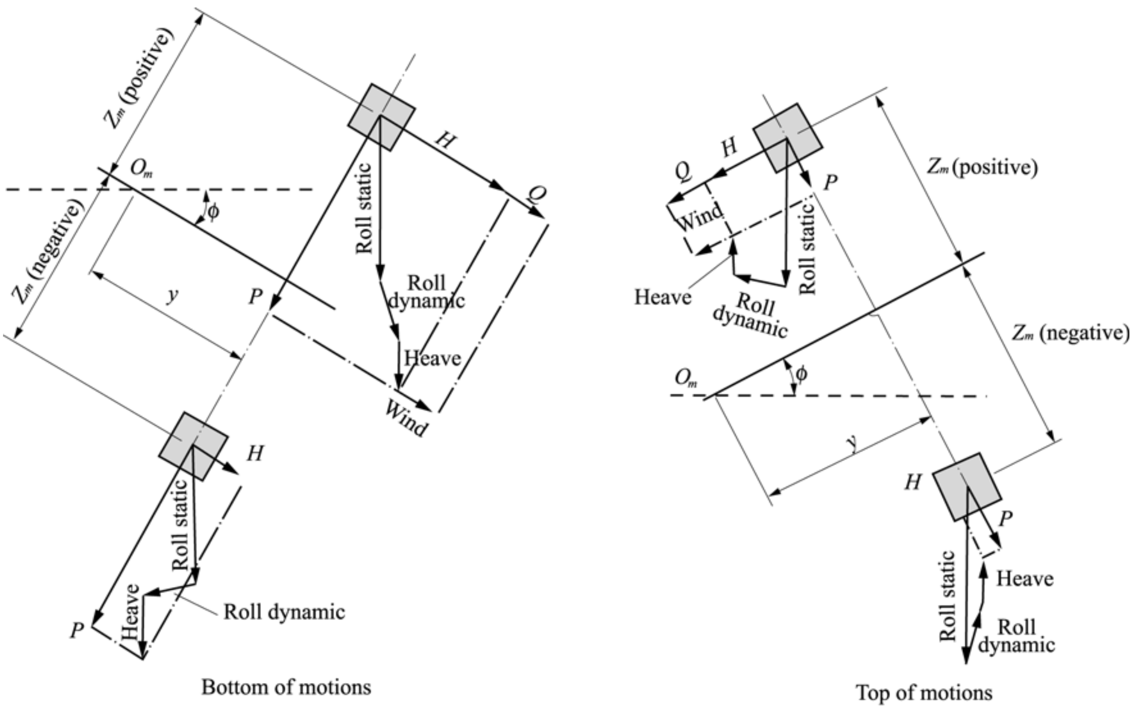

Fig 3 Components of forces on one container (rolling condition)

(B) The summation of the individual components of force for one container above and below the center of motion is shown for the rolling condition in **Fig 3**, and the resultants are obtained from the following expressions ;

(a) Bottom of motions
$$P_{\max} = W\left[\left(1+\frac{0.05L_{pp}}{T_h^2}\right)\cos\phi+\frac{0.07024\phi}{T_r^2}y\right]$$
$$H_{\max} = W\left[\left(1+\frac{0.05L_{pp}}{T_h^2}\right)\sin\phi+\frac{0.07024\phi}{T_r^2}Z_m\right]$$

(b) Top of motions

$$P_{\min} = W\left[\left(1 - \frac{0.05L_{pp}}{T_h^2}\right)\cos\phi - \frac{0.07024\phi}{T_r^2}y\right]$$

$$H_{\min} = W\left[\left(1 - \frac{0.05L_{pp}}{T_h^2}\right)\sin\phi + \frac{0.07024\phi}{T_r^2}Z_m\right]$$

(3) Application of design load

(A) The resultant forces derived for each container in the stack in accordance with (1) are assumed to be divided equally between the walls of the container as follows:

(a) The sliding force in one transverse end is to be 0.5 times of transverse sliding force acting on containers.

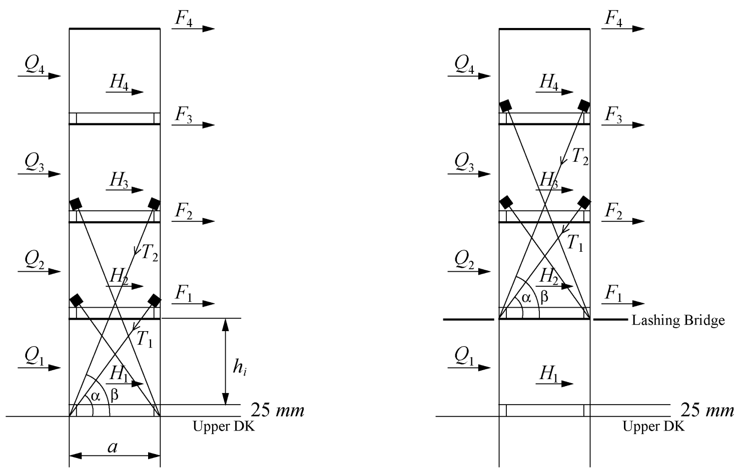
(b) The sliding force in one longitudinal side is to be 0.5 times of longitudinal sliding force acting on containers.

(c) The vertical force in each corner post is to be 0.25 times of sliding force acting on containers.

(d) The wind force in one transverse end is to be 0.5 times of wind force acting on containers.

(B) The sliding forces are taken to act at a mean height one third the height of the container above its base. That is, the force may be distributed as to 1/3 acting at the top of the container and 2/3 acting at the bottom.

(C) Wind force is divided equally between the top and bottom of the container.



Non-lashing bridge type   Lashing bridge type

$$F_4 = \frac{H_4}{3} + \frac{Q_4}{2}$$

$$F_3 = \frac{2H_4}{3} + \frac{H_3}{3} + \frac{Q_4 + Q_3}{2}$$

$$F_2 = \frac{2H_3}{3} + \frac{H_2}{3} + \frac{Q_3 + Q_2}{2}$$

$$F_1 = \frac{2H_2}{3} + \frac{H_1}{3} + \frac{Q_2 + Q_1}{2}$$

$$F_0 = \frac{2H_1}{3} + \frac{Q_1}{2}$$

Fig 4 Forces in four tier stack (rolling condition)

(4) Forces calculation

(A) Non-lashing bridge type

(a) Tension in the lashings

$$T_1 = \frac{1}{\cos\alpha}\left\{\frac{\sum_{i=2}^{n} F_i K_c K_{L2}}{K_{L2}(K_{L1}+K_c)+2K_c K_{L1}+K_c^2} + \frac{F_1 K_c (K_{L2}+K_c)}{K_{L1}K_C + (K_{L1}+K_c)(K_{L2}+K_c)}\right\}$$

$$T_2 = \frac{1}{\cos\beta}\left\{\frac{\sum_{i=2}^{n} F_i (2K_c K_{L1}+K_c^2)}{K_{L2}(K_{L1}+K_c)+2K_c K_{L1}+K_c^2} + \frac{F_1 K_{L1} K_c}{K_{L1}K_C + (K_{L1}+K_c)(K_{L2}+K_c)}\right\}$$

where

K_c = container spring constant from **Table 3**, in mm/ton

$K_{L1} = \dfrac{l_1}{A_1 E_1 \cos^2\alpha}$ (mm/ton) , $K_{L2} = \dfrac{l_2}{A_2 E_2 \cos^2\beta}$ (mm/ton)

l_1, l_2 = effective length of lashing assembly (mm)

A_1, A_2 = cross section area of lashing (mm^2) (When paired lashings are used, a cross-sectional area equal to 150 per cent of the cross-sectional area of one lashing is to be used unless an equalizing system is fitted. If an equalizing system is fitted, the sum of the cross-sectional area is to be used.)

E_1, E_2 = effective modulus of elasticity of lashing ($\mathrm{ton/mm^2}$)
(steel rod : 9.8 $\mathrm{ton/mm^2}$, steel wire : 9.0 $\mathrm{ton/mm^2}$, steel chain : 8.0 $\mathrm{ton/mm^2}$)

(b) Racking force, per end wall : $RF_i = \sum_1^i F_i$

Tier 4 : $RF_4 = F_4$

Tier 3 : $RF_3 = F_4 + F_3$

Tier 2 : $RF_2 = F_4 + F_3 + F_2 - T_2 \cos\beta$

Tier 1 : $RF_1 = F_4 + F_3 + F_2 + F_1 - T_2 \cos\beta - T_1 \cos\alpha$

(c) Shear force, per corner : $SF_i = 0.55 \sum_1^i (H_i + Q_i)$

Tier 4 : $SF_4 = 0.55(H_4 + Q_4)$

Tier 3 : $SF_3 = 0.55(H_4 + H_3 + Q_4 + Q_3)$

Tier 2 : $SF_2 = 0.55(H_4 + H_3 + H_2 + Q_4 + Q_3 + Q_2 - T_2 \cos\beta)$

Tier 1 : $SF_1 = 0.55(H_4 + H_3 + H_2 + H_1 + Q_4 + Q_3 + Q_2 + Q_1 - T_2 \cos\beta - T_1 \cos\alpha)$

(d) Maximum compressive force per bottom corner : $AF_i = P_i + R_i$

Tier 4 : $AF_4 = P_4 + \dfrac{F_4 h_4}{a}$

Tier 3 : $AF_3 = P_4 + P_3 + \dfrac{F_4(h_4 + h_3)}{a} + \dfrac{F_3 h_3}{a} + T_2 \cos(90^\circ - \beta)$

Tier 2 : $AF_2 = P_4 + P_3 + P_2 + \dfrac{F_4(h_4 + h_3 + h_2)}{a} + \dfrac{F_3(h_3 + h_2)}{a} + \dfrac{F_2 h_2}{a}$
$+ T_2 \cos(90^\circ - \beta) + T_1 \cos(90^\circ - \alpha) - \dfrac{T_2 \cos\beta\, h_2}{a}$

Tier 1 : $AF_1 = P_4 + P_3 + P_2 + P_1 + \dfrac{F_4(h_4 + h_3 + h_2 + h_1)}{a} + \dfrac{F_3(h_3 + h_2 + h_1)}{a} + \dfrac{F_2(h_2 + h_1)}{a}$
$+ \dfrac{F_1 h_1}{a} + T_2 \cos(90^\circ - \beta) + T_1 \cos(90^\circ - a) - \dfrac{T_2 \cos\beta (h_2 + h_1)}{a} - \dfrac{T_1 \cos\alpha\, h_1}{a}$

(e) Minimum compressive force per bottom corner : $BF_i = P_i - R_i$

Tier 4 : $BF_4 = P_4 - \dfrac{F_4 h_4}{a}$

Tier 3 : $BF_3 = P_4 + P_3 - \dfrac{F_4(h_4 + h_3)}{a} - \dfrac{F_3 h_3}{a}$

Tier 2 : $BF_2 = P_4 + P_3 + P_2 - \dfrac{F_4(h_4 + h_3 + h_2)}{a} - \dfrac{F_3(h_3 + h_2)}{a} - \dfrac{F_2 h_2}{a} + \dfrac{T_2 \cos\beta\, h_2}{a}$

Tier 1 : $BF_1 = P_4 + P_3 + P_2 + P_1 - \dfrac{F_4(h_4 + h_3 + h_2 + h_1)}{a} - \dfrac{F_3(h_3 + h_2 + h_1)}{a} - \dfrac{F_2(h_2 + h_1)}{a}$
$- \dfrac{F_1 h_1}{a} + \dfrac{T_2 \cos\beta (h_2 + h_1)}{a} + \dfrac{T_1 \cos\alpha\, h_1}{a}$

(B) Lashing bridge type

(a) Tension in the lashings

$$T_1 = \frac{1}{\cos\alpha}\left\{\frac{2K_c\sum_{i=2}^{n}F_i + K_cF_1}{(K_{L1}+2K_c)}\right\} - \frac{2K_c}{(K_{L1}+2K_c)}\left\{\frac{2K_{L1}K_c\sum_{i=1}^{n}F_i + F_1K_{L1}K_c + K_c(K_{L1}+2K_c)\sum_{i=3}^{n}F_i}{K_{L2}(K_{L1}+2K_c)+3K_{L1}K_c+2K_c^2}\right\}$$

$$T_2 = \frac{1}{\cos\beta}\left\{\frac{2K_{L1}K_c\sum_{i=2}^{n}F_i + F_1K_{L1}K_c + K_c(K_{L1}+2K_c)\sum_{i=3}^{n}F_i}{K_{L2}(K_{L1}+2K_c)+3K_{L1}K_c+2K_c^2}\right\}$$

where,

K_c = container spring constant from **Table 7** $(\mathrm{mm/ton})$

$K_{L1} = \dfrac{l_1}{A_1E_1\cos^2\alpha}$ $(\mathrm{mm/ton})$, $K_{L2} = \dfrac{l_2}{A_2E_2\cos^2\beta}$ $(\mathrm{mm/ton})$

l_1, l_2 = effective length of lashing assembly, (mm)

A_1, A_2 = cross section area of lashing $(\mathrm{mm^2})$ (When paired lashings are used, a cross-sectional area equal to 150 per cent of the cross-sectional area of one lashing is to be used unless an equalizing system is fitted. If an equalizing system is fitted, the sum of the cross-sectional area is to be used.)

E_1, E_2 = effective modulus of elasticity of lashing $(\mathrm{ton/mm^2})$
(steel rod:9.8 $\mathrm{ton/mm^2}$, steel wire:9.0 $\mathrm{ton/mm^2}$, steel chain:8.0 $\mathrm{ton/mm^2}$)

(b) Racking force, per end wall : $RF_i = \sum_{1}^{i} F_i$

Tier 4 : $RF_4 = F_4$

Tier 3 : $RF_3 = F_4 + F_3 - T_2\cos\beta$

Tier 2 : $RF_2 = F_4 + F_3 + F_2 - T_2\cos\beta - T_1\cos\alpha$

Tier 1 : $RF_1 = F_4 + F_3 + F_2 + F_1 - T_2\cos\beta - T_1\cos\alpha$

(c) Shear force, per corner : $SF_i = 0.55\sum_{1}^{i}(H_i + Q_i)$

Tier 4 : $SF_4 = 0.55(H_4 + Q_4)$

Tier 3 : $SF_3 = 0.55(H_4 + H_3 + Q_4 + Q_3 - T_2\cos\beta)$

Tier 2 : $SF_2 = 0.55(H_4 + H_3 + H_2 + Q_4 + Q_3 + Q_2 - T_2\cos\beta - T_1\cos\alpha)$

Tier 1 : $SF_1 = 0.55(H_4 + H_3 + H_2 + H_1 + Q_4 + Q_3 + Q_2 + Q_1 - T_2\cos\beta - T_1\cos\alpha)$

(d) Maximum compressive force per bottom corner : $AF_i = P_i + R_i$

Tier 4 : $AF_4 = P_4 + \dfrac{F_4h_4}{a} + T_2(90^\circ - \beta)$

Tier 3 : $AF_3 = P_4 + P_3 + \dfrac{F_4(h_4+h_3)}{a} + \dfrac{F_3h_3}{a} + T_2\cos(90^\circ - \beta) + T_1\cos(90^\circ - \alpha)$

Tier 2 : $AF_2 = P_4 + P_3 + P_2 + \dfrac{F_4(h_4+h_3+h_2)}{a} + \dfrac{F_3(h_3+h_2)}{a} + \dfrac{F_2h_2}{a} + T_2\cos(90^\circ - \beta)$
$+ T_1\cos(90^\circ - \alpha) - \dfrac{T_2\cos\beta(h_3+h_2)}{a} - \dfrac{T_1\cos\alpha\, h_2}{a}$

Tier 1 : $AF_1 = P_4 + P_3 + P_2 + P_1 + \dfrac{F_4(h_4+h_3+h_2+h_1)}{a} + \dfrac{F_3(h_3+h_2+h_1)}{a} + \dfrac{F_2(h_2+h_1)}{a}$
$+ \dfrac{F_1h_1}{a} + T_2\cos(90^\circ - \beta) + T_1\cos(90^\circ - \alpha) - \dfrac{T_2\cos\beta(h_3+h_2+h_1)}{a}$
$- \dfrac{T_1\cos\alpha(h_2+h_1)}{a}$

(e) Minimum compressive force per bottom corner: $BF_i = P_i - R_i$

Tier 4: $BF_4 = P_4 - \frac{F_4 h_4}{a}$

Tier 3: $BF_3 = P_4 + P_3 - \frac{F_4(h_4+h_3)}{a} - \frac{F_3 h_3}{a} + \frac{T_2 \cos\beta h_3}{a}$

Tier 2: $BF_2 = P_4 + P_3 + P_2 - \frac{F_4(h_4+h_3+h_2)}{a} - \frac{F_3(h_3+h_2)}{a} - \frac{F_2 h_2}{a}$

$+ \frac{T_2 \cos\beta (h_3+h_2)}{a} + \frac{T_1 \cos\alpha h_2}{a}$

Tier 1: $BF_1 = P_4 + P_3 + P_2 + P_1 - \frac{F_4(h_4+h_3+h_2+h_1)}{a} - \frac{F_3(h_3+h_2+h_1)}{a}$

$- \frac{F_2(h_2+h_1)}{a} - \frac{F_1 h_1}{a} + \frac{T_2 \cos\beta (h_3+h_3+h_1)}{a} + \frac{T_1 \cos\alpha (h_2+h_1)}{a}$

Table 7 Spring constant for containers

Height of container (m)	Spring constant (mm/ton)		
	Door End	Closed End	Side Wall
2.438	2.70	0.60	1.65
2.591	2.85	0.65	1.75
2.743	3.00	0.70	1.85
2.896	3.15	0.75	1.95

9. Allowable loads and allowable stresses

(1) Allowable forces on the securing system.
Where the container stack is to be secured by stack cone or locking device at the base of the stack and at levels by without lashing system, the load acting on stack cone or locking device specified in **Par 8.** is to be less than the allowable force approved of securing system.

(2) Allowable stress of cell guide
Cell guides systems on deck or in the container cargo hold are to be designed so that the following stress levels are not exceeded in the structure when loaded by forces from the containers calculated in accordance with **Par 8.**

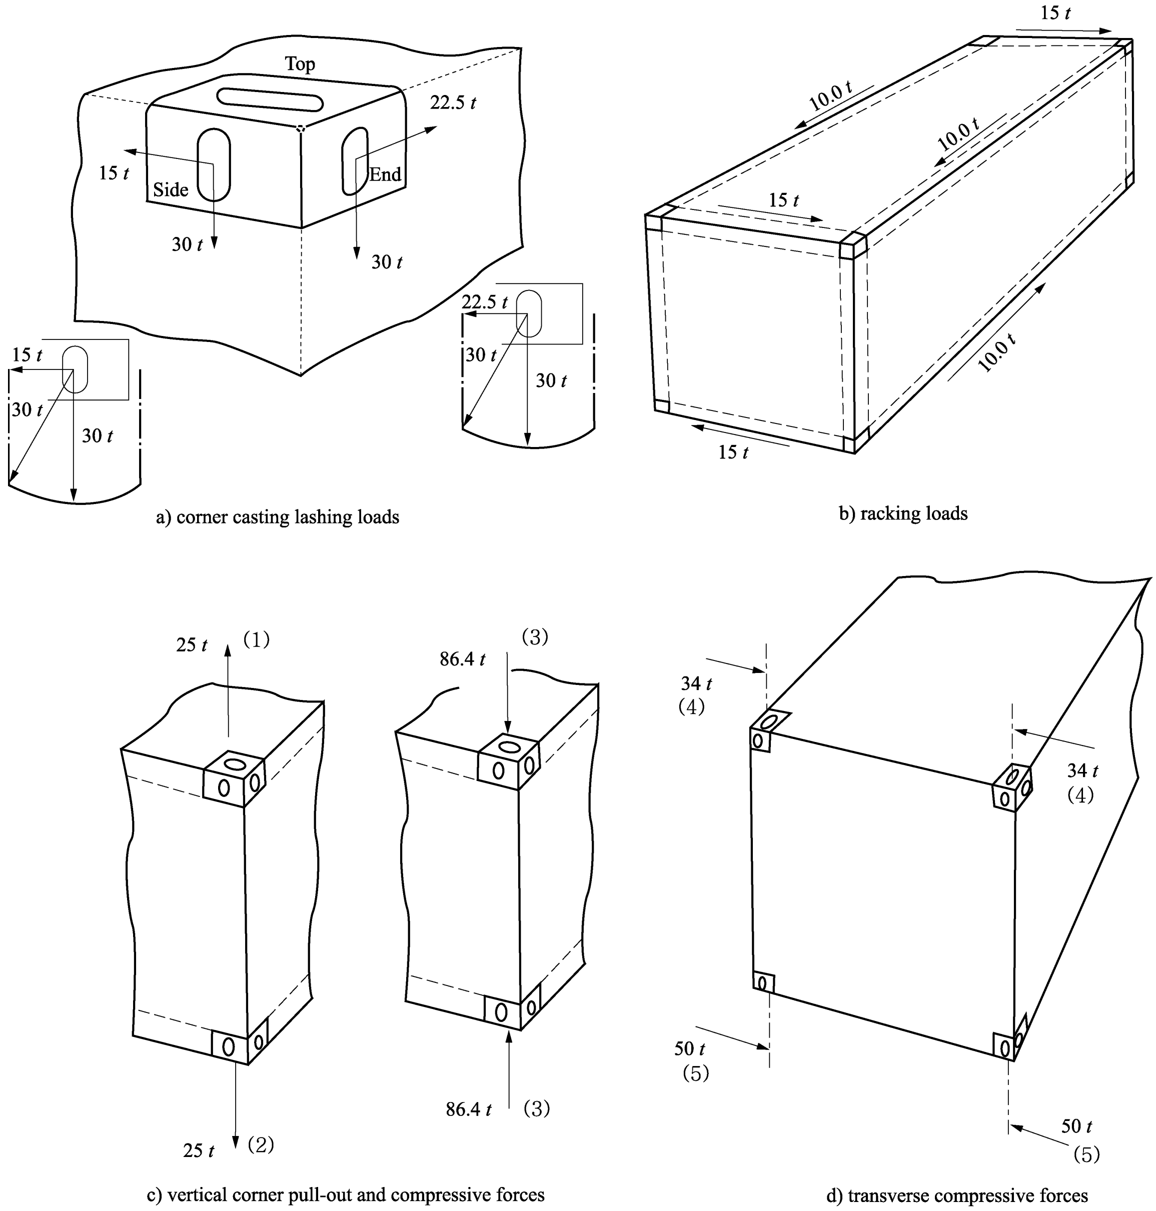
Vertical stress(Bending stress + axial stress) = $0.67\sigma_0$

Shear stress = $0.4\sigma_0$

σ_0 = the yield stress of the material in specified in **Pt 2, Ch 1, Table 2.1.8** of the Rule

(3) Allowable force of lashing
Where the stack is secured by lashing system, the tension acting on lashing system calculated in accordance with **Par 8.** is to be less than safety working load.

(4) Allowable forces on containers
(A) The securing arrangement are to be designed so that force acting on container calculated in accordance with **Par 8.** do not exceed the allowable forces as **Fig 5.**
(B) Where a buttress supports the stack at an intermediate level the total transverse force in the containers at the level is to be the sum of the allowable force of top and bottom.
(C) Where the allowable force of containers used higher strength steels are to be in accordance with the requirements as deemed appropriate by the Society. ⚓



※ These values are to be applied to all kinds of container. But value of ( ) means allowable load of containers suitable for ISO 1496-1:1984

(1) : 15 t
(2) : 20 t
(3) : 20 ft is 45 t, 40 ft is 67.5 t
(4) : 20 ft is 22.5 t
(5) : 20 ft is 35 t

Fig 5 Allowable forces (ISO 1496-1:1990)

Annex 7-3 Guidance for Cargo Ferries and Passenger Ferries

1. Application

(1) This Annex is applied to the cargo ferries and passenger ferries (hereinafter as referred to as "ferries") having a restricted to domestic service. And ferries constructed with material other than steel may be applied. However, ferries constructed in compliance with the related International Convention are regarded as complying with this Annex.
(2) This Annex is not applied to Pure Car Carries and General Cargo Ship which is designed and constructed for the carriage of vehicles in the cargo holds.
(3) For the requirements not mentioned in this Annex, they are to be comply with related requirements on Rules and Guidance.

2. Definition

(1) "Cargo ferry" means that a ship which is operating in regular route and carrying vehicles through the vehicle door (bow door, inner door, side door, ramp formed the hull structures).
(2) "Passenger ferry" means that the cargo ferry of carrying passengers not less than 13 persons in addition to vehicles.
(3) "Vehicle area" means the vehicle loading area providing the vehicle door.
(4) "Vehicle deck" means the deck providing passageway of vehicles or vehicle loading deck providing in vehicle area.
(5) "Open space" means the followings:
(A) The bulkhead is not provided at the end of fore and after, and openings are not provided on the shell plating of vehicle area. In this case, the area of openings on the upper deck of considering area is to be comply with the followings.

$$\frac{a}{A} \geq \frac{1}{2}$$

a = area of opening on the upper deck
A = area of vehicle deck

(B) When the openings are provided on the both side shell plating in vehicle area, the area of opening is comply with the following.

$$\frac{a}{A} + \frac{5}{3}\frac{S_a}{S_A} \geq \frac{1}{2}$$

a, A = as specified in (A)
S_a = area of opening on one side in vehicle area.
S_A = area of shell plating on one side in vehicle area.

(6) "Closed space" means closed space with weathertight other than above mentioned (5)

3. Submission of plans and documentations

For the ferries intended to register to this Society, the following plans and documentations are to be submitted to the Society in addition to plans and documentations described in **Pt 3, Ch 1, 301, 302, Pt 5, Ch 1, Sec 3, Pt 6, Ch 1, 102** and **Pt 8, Ch 1. 102** of the Rules prior to keel laid.
(A) Data which is able to be conformed the foreordinated route of ferry, (for examples; conviction certificate of Owner or provisional Approvals for operation issued by the Authority).
(B) Vehicle arrangement.
(C) Vehicle securing arrangement and details
(D) Vehicle door construction profile, details, opening equipment, closing equipment and description.

4. Arrangement of hull

(1) Forecastle
Forecastle is to be provided to the car ferries engaged in coastal service and it's over (For the

ship having a port of call in middle of operation, a port of call as regarded as departure port and arrival port.) However, when the operating time is not much than one hour, forecastle may not be provided.

(2) Fore peak bulkhead
For the ship which is able to take a both ahead and stern direction with proceeding direction, bulkheads having equivalent ability to fore peak bulkhead described in **Pt 3, Ch 14** are to be provided to both fore and after peak.

5. Vehicle deck

(1) Strength
Strength of vehicle deck is to be in accordance with **Pt. 7, Ch 7, Sec 3.**

(2) Exposed vehicle deck
(A) Bulwarks are to be provided to exposed vehicle deck. At the fore end part, height of bulwarks is to be appropriately increased.
(B) Freeing ports complying with **Pt 4, Ch 4, Sec 2.** of the Rules are to be provided in bulwark and overboard discharges complying with **Pt 5, Ch 6, Sec 3** of the Rules are to be provided on deck.

(3) Closed vehicle deck
Discharging equipments complying with **Pt 5, Ch 6, Sec 3** of the Rules are to be provided and they are not to be directly crossed through the engine room.

6. Vehicle area

(1) Construction
(A) Vehicle area for the car ferries engaged in coastal service and it's over is to be constructed with weather tightness. However, for the car ferries which are navigate to be less than one hour with their maximum speed in coastal area over fresh water area, they may not be constructed with weather tightness or for the car ferries having vehicle deck, which is located in upper deck upward to freeboard deck, is located in backward to fore peak bulkhead and having a vertical height between load line and considered vehicle area of 2 times higher than that of standard superstructure specified in the "Ship's Load Line" of Korean Ship Safety Act, it also may not be constructed with weather tightness.
(B) In closed vehicle area, for the fore castle having a length over than $0.25L_f$, inside door constructed with weather tightness formed as a part of bulkhead at the position of bulkhead is to be provided.

(2) Doors provided in closed vehicle area
(A) All doors passing to vehicle area may be automatically closed type which is made for steel and those may be opened from inside and outside.
(B) The height of doorsill for access door and coaming of opening which may be access through the under of freeboard deck from vehicle area is to be not less than 230 mm and access door and coaming of opening which may be access through machinery room is to be not less than 380 mm.
(C) Above (A) and (B) are not to be applied to the ferries engaging in smooth sea area.

(3) Passenger's room
(A) Passenger's room is not to be provided under the vehicle area.
(B) When the passenger's room is provided on the same deck, they are to be divided with bulkhead.

(4) Evacuation equipment
For the cargo ferries and passenger ferries, evacuation equipment is to comply with **Pt 8, Ch 4, Sec 2** of the Rules.

(5) Ventilation
(A) For the closed vehicle area, sufficient ventilation system is to be provided and it is to be exhausting type except when the prevention of inflow the gases from vehicle area is provided to machinery space, accommodation and service space, it is to be complied with the followings.
(a) It is to be independent from the other ventilation systems.
(b) It is able to ventilate the air of 10 times amount of closed vehicle area capacity (for the cargo ferries, 6 times when deemed appropriate by the Society).
(c) It is to be controlled in external space
(d) In addition to (a) to (c), it is also complied with **Pt 8, Ch 5, 302. 1.** (2) (C), **2.** and **4.**

(B) Sufficient ventilation by the suction type ventilation system(it is able to be sucked with fresh air of outside) is to be accomplished for the machinery, accommodation and service space located under the vehicle deck.

(6) Vehicle load method and load device

(A) Vehicles are to be loaded toward the direction of bow and stern.

(B) Vehicles are not to be loaded forward the fore peak bulkhead.

(C) For the ferries, when the lamp or inside door is not provided in location of fore peak bulkhead the warning mark "Vehicles may not be loaded forward the fore peak bulkhead" is to be provided.

(D) The space between loaded vehicles is not to be less than 600 mm.

(E) In the vehicle area, the protection is to be provided for the access prohibition within 1 m near the access door, stairway and fire extinguishing arrangements.

(F) On the vehicle deck of ferries engaging over coastal area, girders which are not less than 120 mm height between the row of vehicle are to be provided for the prevention of moving of transverse direction with the 2/3 length of deck. However, on the vehicle deck, when the non-slipped paint or other methods approved by this Society, it may be abbreviated. The non-slipped paint or other methods have a friction factor 0.7 and over and are to be assured that they have a sufficient strength of inner pressure and durability.

(G) On the vehicle deck, securing arrangements for the securing of vehicles are to be provided and they are to be ensure the load by the movements of ship which is described in the **Table 1.** For the ferries which is only engaged in smooth sea area and having not more than 30 min of navigating time, if they have a sufficient treatments for non-slip as keys with smooth sea condition, vehicles may not be secured.

Table 1 Ship motion

Classification \ Item	Rolling		Pitching		Safety factor
	degree	cycle	degree	cycle	
Ferries engaging over coastal area	20°	cycle of ship	5°	5 sec	4 over
Ferries that voyaged time is less one hour or smooth water area	10°				

(Note)
1. KG' is the value obtained from the following formula.

$$KG' = 0.5(KG + KB)$$

KG = the vertical position of the centric of the ship
KB = the vertical position of the buoyancy centric of the ship
2. The centric of pitching is to be longitudinal position of the centric of the ship.

(7) Cargo loading other than vehicles

In the vehicle area, unless it is approved by the Society, no cargoes other than vehicles may be loaded. For the cargoes loading other than vehicles, the documents for the closure and loading arrangements by the kinds of cargoes are to be submitted and approved by this Society.

(8) Indication in vehicle area

In the vehicle area, the passageway for the using of access door, stairway, life saving appliances or fire extinguishing appliances is to be provided. This passageway is to be discriminated boundary line with easily visible color.

7. Wagon door

(1) General

(A) Bow and stern door, inner door, side door and ramp of all ferries are to be provided in the upper freeboard deck.

(B) For the ferries engaged in coastal area and over, bow and stern door and side door is to be weather tightness. However, when the inner door or ramp with weather tightness is provided inside of bow door, closure of bow door may be properly considered.

(C) For the ferries having bow door, the structure and arrangement of lamp and inner door is to be in accordance with **Pt 3, Ch 14, 201** and **205** of the Rules.

(D) The strength of bow and stern door, inner door, side door and ramp are to be comply with **Pt 4, Ch 3.** and have a strength larger than that of near members. Near parts of side door is to be properly compensated.

(2) Strength of lamp

The strength of ramp is to be not less than that of deck where ramp is provided and it is to be complied with the followings. When the stern and inner door are used for ramp, the followings are to be satisfied.

(A) The thickness of deck to ramp t is not to be less than the value obtained from the following formula.

$$t = (C_1 + C_2 S)\sqrt{P} + 1.5 \quad (\mathrm{mm})$$

S = the spacing of midpoint of tripping brackets (m)

P = designed maximum vehicle load (ton)

C_1 and C_2 = coefficient as specified in **Table 2**

Table 2 Coefficient C_1 and C_2

Wheel No. \ value	C_1	C_2
Single Wheel	3.35	3.25
Double Wheel	2.06	3.67

(B) The section modulus Z of tripping brackets is not less than the value obtained from the following formula.

$$Z = 4.8\,Wl \quad (\mathrm{cm}^3)$$

W = designed maximum vehicle load (ton)

l = length of tripping bracket (m)

(C) The value is not less than the value calculated under the conditions such that the dimensions of longitudinal and transverse girder of ramp deck is to be regarded as simple supported continuous beam and load is 1.3 times of designed maximum vehicle load (ton), permissible stress 18 $\mathrm{kg/mm^2}$. Deflection is not more than 1/800 of span when the vehicle load is considered.

(D) The strength of ramp which is considered as one of shell for navigating is not less than that of side shell or upper structure.

(3) Remotely controlled opening/closing systems

(A) Where the remotely controlled opening/closing systems devices, the followings are to be complied with.

(a) Control panel is so to be placed that controller may easily observe excepting that the controller may observe opening/closing of the door at the position where the control panel is placed.

(b) The indicating system for opening/closing systems of door is to be provided at the navigation bridge.

(c) Locking device which is able to be stopped at each step is to be provided.

(B) Where the remote control panel is provided at the bow side of exposed deck, the door is to be closed when the lever is pulled to the direction of stern side. The hinged steel cover is to be provided for preventing damage due to the waves and so on.

(4) Closing devices

(A) For the car ferries, opening / closing systems and securing device (hereinafter as referred to closing devices) are to be provided for bow door's perfectly securing. These are able to prevent for easy opening of bow door due to vibration and ship's movement.
(B) In the above (A), closing device is provided with secondary means. If one device is damaged, closing of door is to be maintained by the other one.
(C) At least one of closing devices mentioned in (B) is able to be operated by manual and has a sufficient strength. For the inner door and ramps, wires for the purpose of opening and closing or hoisting is not be regarded as a closing device.
(D) Closing devices of bow door are to be easily confirmed the condition of closing at the bridge or control station. They does not cause any inconvenience for passing of passengers during navigation.
(E) Design load and permissible stress of securing devices are to be in accordance with **Pt 4, Ch 3.**

(5) Notice
Operation method and any attention for vehicle door are to be noticed near to the door or control panel.

8. Air pipe and sounding pipe

(1) Fuel tanks
(A) End of opening of air pipe in all fuel tanks is to be provided on safe area of exposed deck which has not a capability of overflow or gas emitting and it is to be opened in closed vehicle area.
(B) The upper parts of sounding pipe of fuel tanks are to be provided on safe area of exposed deck. However, if it is not available, it may be provided at the space from a distance with electrical equipments and other parts having high temperature. But in this case, cock or sluice valve which is a automatically closed type are to be provided.
(C) For the wire gauze to prevent the passage of flame provided on the end of openings or inside of air pipe, it is to be complied with **Pt 5, Ch 6, 201.** of the Rules.

9. Electric equipment

(1) The electric equipment in closed vehicle area are to be complied with **Pt 7, Ch 7, 402.** of the Rules.
(2) Emergency electric equipment
Requirements and application of emergency power of passenger ferries are in accordance with "Special Regulations for Car Ferries" in Korean Ship Safety Law.

10. Fire protection

(1) Application
(A) For the ferries engaging in lake, river or inside the harbour service area or having an operating time of no more than one hour, this requirement may not be applied.
(B) In spite of the above mentioned (A), All ferries are to be in accordance with the following (3) (F) and (G).
(2) Requirements for cargo ferries
(A) Deck and bulkhead of enclosed vehicle, machinery area and gallery are to be fitted with compartment for preservation of fire protection as specified in "Regulations for Ship's Fire Protection" in Korean Ship Safety Law.
(B) In spite of the above mentioned (A), for the ferries only engaging in smooth sea water area or having an operating time of no more than 2 hours with fully opened vehicle area, A_0 class may be used for deck or bulkhead being a boundary of vehicle, machinery area and gallery.
(C) In "Regulations for Ship's Fire Protection" in Korean Ship Safety Law, when deck and bulkheads are not specified of category, they are to be in accordance with the discretion of this Society.
(D) In case where "A" class divisions are penetrated into the passage of electric cables, pipes, trunks, ducts, etc., or for the provisions of girders, beams or other structural members, arrangements are to be made to ensure that the fire resistance is not impaired.
(E) In case where "B" class divisions are penetrated into the passage of electric cables, pipes, trunks, ducts, etc., or for the fitting of ventilation terminals lighting fixtures and similar devices, arrangements are to be made to ensure that the fire resistance is not impaired.
(F) Pipes penetrating "A" or "B" class divisions are to be of materials approved by the Society

due consideration given to the temperature that such divisions are required to withstand.

(G) In cases of boundaries of car spaces, machinery spaces and galleys, etc. where permeation of oil is possible, the surface of insulation is to be impervious to oil or oil vapours.

(H) Also, they are to be complied with **Pt 8, Ch 2, 201. 1** (1) and **Ch 3, 301. 3** (3) (C), (D) and **303. 2** of the Rules.

(I) Paints, varnishes and other finishes used on interior exposed surfaces are to be those which are considered by the Society that they will not offer undue fire risk and not produce excessive quantity of smoke or poisonous substances.

(3) Special requirements for passenger ferries

(A) Deck and bulkheads of being boundary to enclosed vehicle area are to be preservation of heat protection compartment specified in "Regulations for Ship's Fire Protection" in Korean Ship Safety Law in accordance with characteristic of the closed space.

(B) Deck and bulkheads of being boundary to machinery area and gallery, beside of the mentioned (A) are to be preservation of heat protection compartment specified in "Regulations for Ship's Fire Protection" in Korean Ship Safety Law.

(C) In spite of the above mentioned (A) and (B), for the ferries only engaging in smooth sea water area or having a operating time not much than 2 hours with fully opened vehicle area, A_0 class may be used for deck or bulkhead being a boundary of vehicle, machinery area and gallery.

(D) For deck and bulkhead not specified in "Regulations for Ship's Fire Protection" in Korean Ship Safety Law, they are to be in accordance with the discretion of this Society.

(E) Retardant materials are to be used for the furniture and equipments provided in accommodation and control area. However, where considered unnecessary by the Society, it may be dispensed with.

(F) Materials using for control area, accommodation area and ceiling, lining of bulkhead of stairway have to have a characteristic of putting off the spread of fire.

(G) Paints, varnishes and other finishes used on interior exposed surfaces are to be those which are considered by the Society that they will not offer undue fire risk and not produce excessive quantity of smoke or poisonous substances.

(H) In the compartments of category class A, opening/closing devices (openings of between each other of the cargo area excluding enclosed area of vehicle area, enclosed area, stowage area, baggage area of vehicle area are not included) are to be provided in openings.

(I) Above mentioned opening and closing devices have an equivalent fire resistance. However, if automatic sprinkler system is to be provided or opening and closing devices are to be provided in deck opening having category class A and being a boundary of space providing ceiling with category class B, opening and closing devices may be dispensed with.

(J) In the compartments of category class A, doors (including closing devices) are to be complied with the followings.

(a) Steel or any other similar materials are to be used.

(b) The fire resistance equivalent to that of bulkhead with doors is to be provided. However, arrangement and protection prevent the spread of fire may be dispensed with where water tightness doors are to be provided.

(c) When doors are closed, they are to be constructed for capable of preventing fumes and flames.

(d) From the both sides, they may be opened.

(K) Fire protection doors installed for access of vehicle area are to be provided with automatically closed type and they may be closed when ships inclined with 3.5 *degrees* to the opposite side.

(L) They are to be complied with **10** (2) (D) to (G) and **Pt 8, Ch 3, 301. 3** (3) (C), (D) and **303. 2** of the Rules. Passenger ferries with not less than 1,000 tons gross tonnage are to be also complied with **Pt 8, Ch 2, 202. 1** of the Guidance.

11. Intact stability for passenger ferry

(1) Standard

Intact stability of passenger ferries is to be, for all conditions (including the conditions that all passengers assembled on upper most deck and fully loaded conditions) always complied with the followings.

(A) When the ship has an angle of inclination in the following (2), it has a heeling moment lever more than described in the following (3)

(B) The transverse metacentric height GM is to be positive.

(2) Angle of inclination

(A) Angle of inclination α of (1) is to be satisfied in the following formula.

$$\tan\alpha = 0.8\tan\beta$$

β = the angle of flooding, 20° and angle of deck edge immersion, whichever is smaller

(B) For the ferries engaging in smooth sea area, GZ is to be obtained from the following formula for angle of inclination.

$$GZ = GM\tan\alpha$$

GM = transverse metacentric height

α = as specified in (A)

(3) Heeling moment lever

The heeling moment lever l_3 of (1) is comply with the following formula.

$$l_3 = \frac{2.74AZ + 0.214\Sigma\left(7 - \frac{n}{A_f}\right)A_m n}{100W} \quad (\mathrm{m})$$

n = all the number of passengers in each boarding area

A_f = area for each boarding area (m^2)

A_m = average breadth for using of passengers' movement in each boarding area (m)

A = projected area for the ship side to the above water line (m^2)

Z = distance from the center of A to the center of projected area for the ship side to the below water line (m)

W = displacement (ton)

(4) Passenger ferries engaging in coastal sea area

For the passenger ferries engaging in coastal sea area, the followings are to be complied with considering all the conditions in addition to (1). (See **Fig 1**)

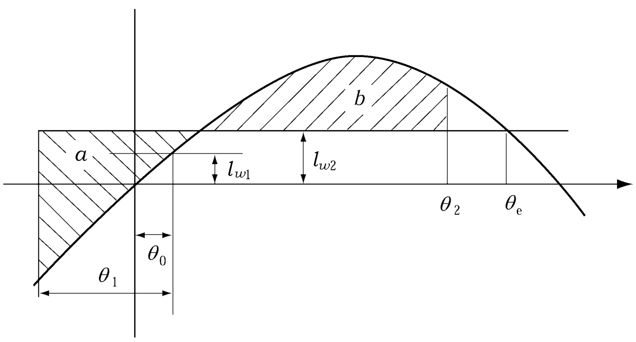


Fig 1 Stability curve

(A) Area "b" is not to be less than area "a".

(B) GZ is not less than $0.0215B$ (m) or 0.275 m, whichever is lesser.

l_{w1} = heeling moment lever caused by steady wind (m) given by the following formula.

$$l_{w1} = \frac{KAZ}{W} \quad (\mathrm{m})$$

K = coefficient specified in **Table 3** due to service area restrictions,

A, Z and W = as specified in (2)

l_{w2} = heeling moment lever caused by gust (m) given by the following formula.

$$l_{w2} = 1.5 l_{w1}$$

a = area encircled by stability curve, l_{w2} and θ_r (m − deg)

b = area encircled by stability curve, l_{w2} and θ_r (m − deg)

θ_r = angle of rolling stop motion (degree). In general, it may be given by the following formula.

$$\theta_r = \theta_0 - \theta_1$$

θ_0 = angle of heel under action of steady wind (degree)

θ_2 = downflooding angle θ_f and θ_c, whichever is smaller.

θ_1 = angle of roll to windward due to wave action (degree) given by the following formula.

$$\theta_1 = \sqrt{\frac{138 rS}{N}}$$

r = values obtained from the following formula.

$$r = 0.73 + 0.6\frac{OG}{d'}$$

OG = distance between the center of gravity and waterline (m), and is taken as positive when the center of gravity is above waterline.

d' = mean draught of the ship (m)

S = coefficient obtained from the following formula, however, when it is not less than 0.1, the value is 0.1 and if it is not more than 0.035, it is to be taken as 0.035.

$$S = P - qT$$

T = rolling period of ship (sec)

P and q = as specified in **Table 3**

N = where the bilge keel is provided, 0.02 may be used. For other cases, it is to be in accordance with the value given by this Society.

Table 3 Coefficient K, P and q

Classification \ Coefficient	K	P	q
Ships engaging over coastal area	0.0514	0.151	0.0072
Ships having estimated voyage time less than $2h$ and engaging over coastal area	0.0274	0.153	0.010

12. Subdivision of passenger ferry and damage stability requirements

(1) Application

(A) For the subdivision of passenger ferry and damage stability requirements are to be in accordance with the relative Articles of "Regulations for the Subdivision of Ship" in Korean Ship Safety Law.

(2) Arrangement

(A) For the passenger ferries, compartments are to be so arranged that limit line is not to be submerged under water, even though one compartment is flooded.

(B) For the passenger ferries having not less than 45 m in length, in addition to (A), compartments are to be so arranged that limit line is not to be submerged under water, even though two compartment, one compartment by the side of the other compartment are flooded.

(C) For the passenger ferries having not less than 79 m in length, in addition to (A), compartments are to be so arranged that limit line is not to be submerged under water, even though any two compartments are flooded.

(3) Damage stability requirements

(A) Damage stability

(a) When the passenger ferries are damaged and any compartments described in (2) are flooded and are treated for equilibrium, the followings are to be complied with.

(i) When compartments are symmetrically flooded, GM is greater than 0.05 m.

(ii) When compartments are unsymmetrically flooded, angle of inclination is not greater than 7°, However, where deemed necessary by this Society, it may be 15°

(iii)Limit line is not be under water.

(b) For all passenger ferries has a necessary stability for the compliance with the above (a) for the all conditions.

(c) For the limit line is submerged under water during the flooding condition (a), ship has to be accomplished proper treatments deemed necessary by this Society.

(d) When the equilibrium is accomplished, maximum angle of inclination is to be approved by this Society.

(B) Damage stability calculation

(a) In damage stability calculation arrangement of flooding compartment, ship's ratio of dimension and property are to be considered in addition to (2) and the following (C), (D).

(b) For the ships having water-tightness deck, longitudinal bulkheads, inside shell, those are to be considered for ship's safety due to heeling when the compartments the parts surrounded by those are flooding.

(C) Flooding ratio of flooding compartment

Flooding ratio is 60 for the area of cargo, ore or stowage loaded, 90 for accommodation area, 85 for machinery space, 0 or 95 for the area where the liquid cargo is loaded whichever is worse. However, when the ships are damaged, more critical calculation is to be conducted for the area where the accommodation equipment or machinery equipment are not provided in due to located in near the water line and cargoes or packages are not stowed.

(D) Damage assumption

(a) The assumed extent of damage should be:

(i) Longitudinal extent : $l = 0.03L + 3.05$ (m) or 10.67 m, whichever is smaller.

(ii) Transverse extent : 0.2B(m) from the ship's side at right angles to the centerline at the level of the summer load line.

(iii) Vertical extent : top of the keel

(b) If any damage of smaller extent than the maximum damage specified in (a) would result in severer condition, such damage should be considered.

(E) Distance between transverse bulkhead

(a) When the distance between two neighbouring compartments, transverse bulkhead is not more than l in the following formula or 10.67 m, (2) is applied by regarding that one of them is not provided.

$$l = 0.03L + 3.05 \quad (\mathrm{m})$$

(b) For the bended area is provided in transverse bulkhead, it is to be in accordance with Article 38 of the "Regulations for the Subdivision of Ships" in Korean Ship Safety Law.

(F) Unsymmetrical flooding

(a) Unsymmetrical flooding is to be avoided as possible.

(b) The equipments for correction of large angle of inclination due to unsymmetrical flooding is to be automatical as possible, and it is approved by the Society.

(c) When the equipments specified in above (b) is cross flooding equipment, they are to be complied with the followings.

(i) When the control devices are provided, they may be controlled upper of bulkhead deck.

(ii) Equilibrium is to be completed in 15 min.

(G) A special example case of application

This Society may properly consider that the ship unusually has a large GZ in intact stability condition. ⚓

Annex 7-4 Guidance for Calculating the Maximum Allowable and Minimum Required Mass of Cargo and Double Bottom Contents with Bulk Carriers

1. The maximum allowable cargo mass W_{MAX} and the minimum allowable cargo mass W_{MIN} for the each cargo hold which are to be described in Loading Manual as specified in **Pt. 3, Annex 3-1, 2.** (4) (A) of the Guidance are to be given by the following as a function of draft in way of the considered cargo hold.

(1) Maximum allowable cargo mass

(A) In the case where the scantlings of structural members of double bottom are determined by the formula prescribed in the requirements of the Rule

(a) The pressure which works on the ships bottom with mass of cargo or ballast water, $9.81\,h_x\gamma\,(\mathrm{kN/m^2})$ is to be not greater than the obtained with the following formula.

$$\max\{a_1n_{f1}, a_2n_{f2}, \cdots, a_nn_{fn}\} + 9.81(d_x - 0.026L'\alpha_R - h_{BST})$$

h_x : Stowage height to the cargo surface from the tank top at the center line (m). In any case, the height of the cargo surface cannot exceed that of the upper deck.

γ : Design specific gravity of cargoes for the cargo hold which is to be taken as $\frac{M_D}{V}$

M_D : Maximum cargo mass of the cargo hold considered (ton)

V : Volume of the cargo hold considered excluding the hatchway ($\mathrm{m^3}$)

a_i : Difference in pressure in loading condition No. i taken from a population with the total of n loading conditions, which works on the center line of the ships bottom with mass of cargo, ballast water and/or double bottom contents and by wave and still water corresponding to the draft ($\mathrm{kN/m^2}$), which is obtained from the following formula. The difference in pressure cannot, however, exceed the design pressure given to the local structural member of double bottom where the member is reinforced to enable ship to carry such heavy cargoes as steel coils.

$$\max\{|p_i - 9.81(d_i + 0.026L')|, |p_i - 9.81(d_i - 0.026L')|\}$$

p_i : Pressure in loading condition No. i, which works on the center line of the ship's bottom by the mass of cargo, ballast water and/or double bottom contents ($\mathrm{kN/m^2}$)

d_i : Draft in loading condition No. i, at mid-hold position of cargo hold length l_H (m)

l_H : Length of cargo hold (m) as defined in **Pt 7, Ch 3, 301. 4** of the Rules.

L' : Length of ship (m). Where exceeds 230 m, is to be taken as 230 m.

α_R : 1.0. However, on the water where there are small effects of ocean waves such as port area, that may be reduced to 0.5.

n_{fi} : 0.9 in loading condition No. i, in the case where the considered hold and either of the adjacent holds are loaded or empty simultaneously. In the other case, it is to be 1.0.

d_x : Draught at mid-hold position of cargo hold length l_H (m)

h_{BST} : Water heads of ballast water charged in the double bottom at the center line (m). In any case, it cannot exceed height of the double bottom.

(b) The maximum allowable cargo mass, W_{MAX} (ton), is to be not greater than the obtained with the following formula.

$$\gamma f(h_x)$$

$f(h_x)$: The function with shows the relationship between the stowage height h_x(m) of cargo at the center line and the volume (m^3) of cargo loaded in the hold. In this case, the cargo may be uniformly supposed to be loaded under level surface.

(B) In the case where the scantlings of structural members of double bottom are determined by direct calculations

(a) The pressure which works on the ships bottom with mass of cargo or ballast water, $9.81 h_x \gamma$ (kN/m^2), is not to be greater than the obtained with the following formula.

$$\max\{a_1, a_2, \cdots, a_n\} + 10.0(d_x - 0.25 H_w \alpha_{DC} - h_{BST})$$

h_x, γ, d_x and h_{BST} : as specified in (A)

a_i : Difference in pressure in loading condition No. i taken from a population with the total of n loading conditions, which works on the center line of the ships bottom by mass of cargo, ballast water and/or double bottom contents and by wave and still water corresponding to the draft (kN/m^2), which is obtained from the following formula. The difference in pressure cannot, however, exceed the design pressure given to the local structural member of double bottom where the member is reinforced to enable ship to carry such heavy cargoes as steel coils.

$$\max\{|p_i - 10.0(d_i + 0.25 H_w)|, |p_i - 10.0(d_i - 0.25 H_w)|\}$$

p_i : The pressure, in loading condition No. i, which works on the center line of the ships bottom by the mass of cargo, ballast water and/or double bottom contents (kN/m^2). In calculating the pressure which arises by the mass of cargo, the density of cargo and the shape of cargo surface which were applied in direct calculations may be, however, taken into consideration.

d_i : Draught in loading condition No. I, at mid-hold position of cargo hold length l_H (m)

H_w : As obtained with the following formula.

$0.61 L^{1/2}$ where $L \leq 150$m

$1.41 L^{1/3}$ where $150\text{m} < L \leq 250$m

$2.23 L^{1/4}$ where $250\text{m} < L \leq 300$m

9.28 where $300\text{m} < L$

α_{DC} : 1.0. On the waters where there are small effects of ocean waves such as the bay , it may be, however, reduced to one-third.

(b) The maximum allowable cargo mass, W_{MAX}(ton) , is to be not greater than the obtained with the following formula.

$\gamma f(h_x)$

$f(h_x)$: as specified in (A)

(2) Minimum allowable cargo mass

(A) In the case where the scantlings of structural members of double bottom are determined by the prescribed formula in the requirements of the Rule

(a) The pressure which works on the ships bottom with mass of cargo or ballast water, $9.81 h_x \gamma\,(\mathrm{kN/m^2})$, is to be not less than the obtained with the following formula.

$$-\max\{a_1 n_{f1}, a_2 n_{f2}, \cdots, a_n n_{fn}\} + 9.81(d_x + 0.026 L' \alpha_R - h_{BST})$$

h_x, γ, a_i, n_{fi}, d_x, L', α_R and h_{BST} : As specified in (1) (A)

(b) Minimum allowable cargo mass $W_{MIN}(\mathrm{ton})$ is to be not less than the obtained with the following formulas.

$\gamma f(h_x)$

$f(h_x)$: As specified in (1) (A)

(B) In the case where the scantlings of structural members of double bottom are determined by direct calculations

(a) The pressure which works on the ships bottom with mass of cargo or ballast water, $9.81 h_x \gamma\,(\mathrm{kN/m^2})$, is to be not less than the obtained with the following formula.

$$\min\{a_1, a_2, \cdots, a_n\} + 10.0(d_x + 0.25 H_w \alpha_{DC} - h_{BST})$$

h_x, γ, d_x, α_{DC}, h_{BST} and H_w : As specified in (1) (B)

a_i : Difference in pressure in loading condition No. i taken from a population with the total of loading conditions, which works on the center line of the ships bottom by mass of cargo, ballast water and/or double bottom contents and by wave and still water corresponding to the draft ($\mathrm{kN/m^2}$), which is obtained from the following formula taking a downward force as a positive value. The difference in pressure cannot, however, exceed the design pressure given to the local structural member of double bottom where the member is reinforced to enable ship to carry such heavy cargoes as steel coils.

$$\min\{(p_i - 10.0(d_i + 0.25 H_w)), (p_i - 10.0(d_i - 0.25 H_w))\}$$

p_i and d_i : As specified in (1) (B)

(b) Minimum allowable cargo mass $W_{MIN}(\mathrm{ton})$ is to be not less than the obtained with the following formula.

$\gamma f(h_x)$

$f(h_x)$: As specified in (1) (B)

2. The maximum allowable cargo mass W_{MAX} and the minimum allowable cargo mass W_{MIN} for the cargo hold and the adjacent cargo hold (hereinafter referred to as "two adjacent holds") which are to be described in Loading Manual as specified in Pt 3, Appendix 3-1, 2.(4)(D) of the Guidance are to be given by the following as a function of draft in way of these holds.

(1) Maximum allowable cargo mass

(A) In the case where in the scantlings of structural members of double bottom are determined by the formula prescribed in the requirements of the Rule

(a) In each hold, the pressure which works on the ships bottom with mass of cargo or ballast water is to be not greater than the obtained with the following formulas.

The pressure, $9.81h_x\gamma\,(\mathrm{kN/m^2})$, which works on the considered hold is;

$$b+9.81(d_x-0.026L'\alpha_R-h_{BST})$$

The pressure, $9.81h'_x\gamma'\,(\mathrm{kN/m^2})$, which works on the adjacent hold is;

$$b'+9.81(d_x-0.026L'\alpha_R-h'_{BST})$$

h_x and h'_x : In each hold, stowage height to the cargo surface from the tank top at the center line (m). In any case, the height of the cargo surface cannot exceed that of the upper deck.

γ and γ' : In each cargo hold, design specific gravity of cargoes for the cargo hold which has the largest value under such loading conditions that two adjacent holds are empty or loaded simultaneously.

b and b' : The case in which a_j and a'_j satisfy the relationship defined by the following formula, b and b' take the absolute value of a_j and a'_j respectively. The absolute value cannot, however, exceed the design pressure given to the local structural member of double bottom where the member is reinforced to enable ship to carry such heavy cargoes as steel coils.

$$a_j a'_j = \max\{a_1 a'_1, a_2 a'_2, \cdots, a_m a'_m\}$$

a_j and a'_j : Differences in pressure of the considered hold and the adjacent hold in loading condition No. j taken from a population with the total of such m loading conditions that two adjacent holds are empty or loaded simultaneously, which work on the center line of the ships bottom by mass of cargo, ballast water and/or double bottom contents and by wave and still water corresponding to the draft ($\mathrm{kN/m^2}$). In loading condition No. j, a_j and a'_j take respectively a_{jk} and a'_{jk} as obtained with the following formula if each difference in pressure of the considered hold and the adjacent hold has the same sign (i.e. plus or minus) in both cases where it added the pressure by wave to the pressure by still water and it subtracted the pressure by wave from the pressure by still water. In any case, it takes a downward force as a positive value.

$$a_{jk} a'_{jk} = \max\{a_{j1} a'_{j1}, a_{j2} a'_{j2}\}$$

a_{jk} and a'_{jk} : Differences in pressure of the considered hold and the adjacent hold in loading condition No. j which are obtained from the following formulas. In case where the pressure by wave is added to the pressure by still water, they are defined as a_{j1} and a'_{j1} respectively. The differences in pressure of the considered hold and the adjacent hold in case where the pressure by wave is subtracted from the pressure by still water are also defined as a_{j2} and a'_{j2}.

$$a_{j1} = p_j - 9.81(d_j + 0.026L')$$
$$a'_{j1} = p'_j - 9.81(d'_j + 0.026L')$$
$$a_{j2} = p_j - 9.81(d_j - 0.026L')$$
$$a'_{j2} = p'_j - 9.81(d'_j - 0.026L')$$

p_j and p'_j : In loading condition No. j, the pressure respectively in the considered hold and in the adjacent hold which arises at the center line of the ships bottom by the mass of cargo, ballast water and/or double bottom contents (kN/m^2).

d_j and d'_j : In loading condition No. j, draught at mid-hold position of cargo hold length l_H (m) of the considered hold and the adjacent hold respectively.

l_H, L' and α_R : As specified in 1. (1) (A)

d_x : The average value of d_j and d'_j (m)

h_{BST} and h'_{BST} : In the considered hold and the adjacent hold respectively, water heads of ballast water charged in the double bottom at the center line (m). In any case, they cannot exceed the height of the double bottom

(b) The maximum allowable cargo mass, W_{MAX}(ton), is to be not greater than the obtained with the following formula.

$$\gamma f_1(h_x) + \gamma' f_2(h'_x)$$

$f_1(h_x)$ and $f_2(h'_x)$: Function, in the considered hold and the adjacent hold respectively, which shows the relationship between the stowage height of the cargo (m) at the center line and the volume (m^3) of the cargo loaded in the hold. In this case, the cargo may be uniformly supposed to be loaded under level surface.

(B) In the case where the scantlings of structural members of double bottom are determined by direct calculations;

(a) In each hold, the pressure which works on the ships bottom with mass of cargo or ballast water is to be not greater than the obtained with the following formulas.

The pressure, $9.81 h_x \gamma$ (kN/m^2), which works on the considered hold is;

$$b + 10.0(d_x - 0.25 H_w \alpha_{DC} - h_{BST})$$

The pressure, $9.81 h'_x \gamma'$ (kN/m^2), which works on the adjacent hold is;

$$b' + 10.0(d_x - 0.25 H_w \alpha_{DC} - h'_{BST})$$

h_x, h'_x, γ, γ', d_x, h_{BST} and h'_{BST} : As specified in (A)

b and b' : As specified in (A), in calculating the values of a_{j1}, a'_{j1}, a_{j2} and a'_{j2} the following formulas are applied respectively.

$$a_{j1} = p_j - 10.0(d_j + 0.25H_w)$$
$$a'_{j1} = p'_j - 10.0(d'_j + 0.25H_w)$$

$a_{j2} = p_j - 10.0(d_j - 0.25H_w)$

$a'_{j2} = p'_j - 10.0(d'_j - 0.25H_w)$

p_j and p'_j : As specified in (A). In calculating the pressure which arises by the mass of cargo, the density of cargo and the shape of cargo surface which were applied in direct calculations may be, however, taken into consideration.

d_j and d'_j : As specified in (A)

H_w and α_{DC} : As specified in **1.**(1) (A)

(b) The maximum allowable cargo mass, W_{MAX}(ton), is to be not greater than that obtained from the following formula.

$\gamma f_1(h_x) + \gamma' f_2(h'_x)$

$f_1(h_x)$ and $f_2(h'_x)$: As specified in (A)

(2) Minimum allowable cargo mass

(A) In the case where the scantlings of structural members of double bottom are determined by the formula prescribed in the requirements of the Rule

(a) In each hold, the pressure which works on the ships bottom by mass of cargo or ballast water is be not less than the obtained with the following formulas.

The pressure, $9.81h_x\gamma\,(\mathrm{kN/m^2})$, which works on the considered hold is;

$-b + 9.81(d_x + 0.026L'\alpha_R - h_{BST})$

The pressure, $9.81h'_x\gamma'\,(\mathrm{kN/m^2})$, which works on the adjacent hold is;

$-b' + 9.81(d_x + 0.026L'\alpha_R - h'_{BST})$

h_x, h'_x, γ, γ', b, b', d_x, L', α_R, h_{BST} and h'_{BST} : As specified in (1) (B)

(b) The minimum allowable cargo mass, W_{MIN}(ton), is to be not less than the obtained with the following formula.

$\gamma f_1(h_x) + \gamma' f_2(h'_x)$

$f_1(h_x)$ and $f_2(h'_x)$: As specified in (1) (A)

(B) In the case where the scantlings of structural members of double bottom are determined by direct calculations

(a) In each hold, the pressure which works on the ships bottom with mass of cargo or ballast water is to be not greater than the obtained with the following formulas.

The pressure, $9.81h_x\gamma\,(\mathrm{kN/m^2})$, which works on the considered hold is;

$b + 10.0(d_x + 0.25H_w\alpha_{DC} - h_{BST})$

The pressure, $9.81h'_x\gamma'\,(\mathrm{kN/m^2})$, which works on the adjacent hold is;

$b' + 10.0(d_x + 0.25H_w\alpha_{DC} - h'_{BST})$

h_x, h'_x, γ, γ', d_x H_w, α_{DC}, h_{BST} and h'_{BST} : As specified in (1) (B)

b and b' : In the case where a_j and a'_j satisfy the relationship defined by the following formula, b and b' take the value of a_j and a'_j respectively. The absolute values of b and b' cannot, however, exceed the design pressure given to the local structural member of double bottom where the member is reinforced to enable ship to carry such heavy cargoes as steel coils.

$$|a_j|\, a'_j = \min\{|a_1|a'_1, |a_2|a'_2, \cdots, |a_m|a'_m\}$$

a_j and a'_j : Differences in pressure of the considered hold and the adjacent hold in loading condition No. j taken from a population with the total of such m loading conditions that two adjacent holds are empty or loaded simultaneously, which works on the center line of the ships bottom by mass of cargo, ballast water and/or double bottom contents and by wave and still water corresponding to the draft ($\mathrm{kN/m^2}$). In loading condition No. j, a_j and a'_j take respectively a_{jk} and a'_{jk} as obtained with the following formulas if each difference in pressure of the considered hold and the adjacent hold has the same sign (i.e. plus or minus) in both cases where it added the pressure by wave to the pressure by still water and it subtracted the pressure by wave from the pressure by still water. In any case, it takes a downward force as a positive value.

$$|a_{jk}|\, a'_{jk} = \min\{|a_{j1}|a'_{j1}, |a_{j2}|a'_{j2}\}$$

a_{jk} and a'_{jk} : Differences in pressure of the considered hold and adjacent hold in loading condition No. j, which are obtained from the following formulas. In case where the pressure by wave is added to the pressure by still water they are defined as a_{j1} and a'_{j1} respectively. The differences in pressure of the considered hold and the adjacent hold in case where the pressure by wave is subtracted from the pressure by still water are also defined as a_{j2} and a'_{j2}.

$$a_{j1} = p_j - 10.0(d_j + 0.25H_w)$$
$$a'_{j1} = p'_j - 10.0(d'_j + 0.25H_w)$$
$$a_{j2} = p_j - 10.0(d_j - 0.25H_w)$$
$$a'_{j2} = p'_j - 10.0(d'_j - 0.25H_w)$$

p_j and p'_j : As specified in (1)(B). In calculating the pressure which arises by the mass of cargo, the density of cargo and the shape of cargo surface which were applied in direct calculations may be, however, taken into consideration.

d_j and d'_j : As specified in (1)(B)

(b) The minimum allowable cargo mass, W_{MIN}(ton), is to be not less than that obtained from the following formula.

$$\gamma f_1(h_x) + \gamma' f_2(h'_x)$$

$f_1(h_x)$ and $f_2(h'_x)$: As specified in (1) (B)

3. Notwithstanding the provisions of **1.** above, for ships of BC-A, BC-B and BC-C specified in **Pt 7, Ch 3, 201. 3** of the Rules, the maximum allowable cargo mass W_{MAX} and the minimum required cargo mass W_{MIN} for the cargo hold may be determined by the following formulae. (See

Fig 1)

$$W_{MAX} = W_{\max}(0) + 1.025\,V\frac{d_x}{h}\,(\mathrm{ton})$$

However, is in no case to be greater than maximum cargo mass $M_D(\mathrm{ton})$

$$W_{MIN} = W_{\min}(0) + 1.025\,V\frac{d_x}{h}\,(ton)$$ However, is in no case to be less than 0.

$$W_{\max}(0) = \max\left\{ W_{\max}(d_i) - 1.025\,V\frac{d_i}{h} \right\}$$

$$W_{\min}(0) = \min\left\{ W_{\min}(d_i) - 1.025\,V\frac{d_i}{h} \right\}$$

$W_{\max}(d_i)$, $W_{\min}(d_i)$: Maximum allowable cargo mass and minimum required cargo mass corresponding to the draught , d_i determined based on the loading condition No. I of loading conditions applied in accordance with the type of ship (ton)

d_i : Draught in the loading condition No. i, at mid-hold position of cargo hold length (m)

V : Volume of the cargo hold excluding volume of the hatchway part (m^3)

h : Vertical distance from the top of inner bottom plating to upper deck plating at the ships centre line(m)

d_x : As specified in **1.** (1) (A)

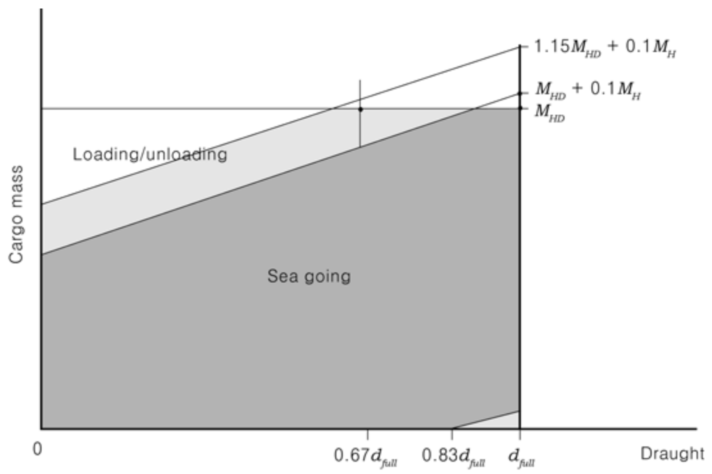

Fig 1 Maximum allowable cargo mass and minimum required cargo mass for a cargo hold(example for a loaded hold in ships of BC-A)

4. Notwithstanding the provisions of **2.** above, for ships of BC-A, BC-B and BC-C specified in **Pt 7, Ch 3, 201. 3** of the Rules, the maximum allowable cargo mass W_{MAX} and the minimum required cargo mass W_{MIN} for the adjacent two holds may be determined by the following formulae. (See **Fig 2**)

$$W_{MAX} = 2M_{Full} + 1.025(V_f + V_d)\frac{d_x - 0.67d}{h}(\mathrm{ton}),$$

However, is in no case to be greater than the maximum cargo mass M_D for each cargo hold.

$W_{MIN} = 1.025(V_f + V_a)\frac{d_x - d_{\min}}{h}(\text{ton})$, However, is in no case to be less than 0.

M_{Full} : the cargo mass in a cargo hold corresponding to cargo with virtual density (homogeneous mass/hold cubic capacity, minimum 1.0 1.0t/m^3) filled to the top of the hatch coaming. M Full is in no case to be less than the actual cargo mass(M_H) in a cargo hold corresponding to a homogeneously loaded condition at maximum draught

V_f and V_a : Volume of the forward and after cargo hold excluding volume of the hatchway part(m^3)

$d_{\min}$: $0.75d$ or draught in ballast conditions with the two adjacent cargo holds empty, whichever is greater(m)

5. In the case specified in **3.** and **4.**, maximum allowable cargo mass and minimum required cargo mass corresponding to draught for loading/unloading conditions in harbour may be increased or decreased by 15 % of the maximum allowable mass for the cargo hold (in case specified in **4.** the maximum allowable mass for the two adjacent cargo hold) at designed maximum load draught in sea-going condition. However, maximum allowable mass is in no case to be greater than the maximum allowable cargo mass at designed maximum load draught for each cargo hold.

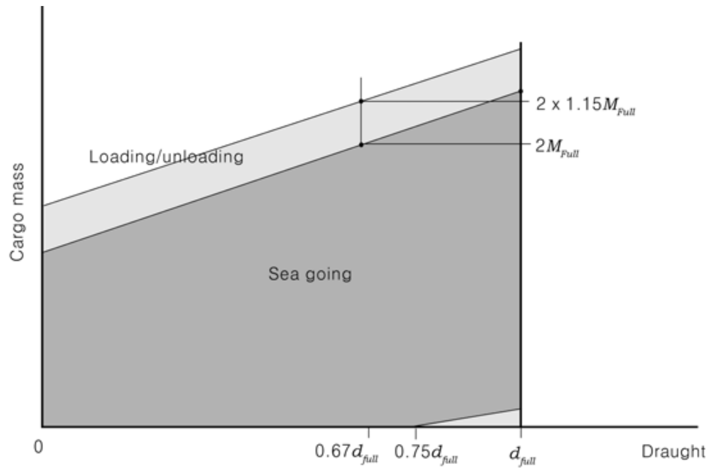

Fig 2 Maximum allowable cargo mass and minimum required cargo mass for two adjacent cargo holds(example)

6. Where, notwithstanding **1.** and **4.** above, the scantling of the double bottom structure is determined for the loading condition other than those given in **1.** or **3.** above, maximum allowable and minimum required mass of cargo may be determined with that condition. Maximum allowable and minimum required mass of cargo being greater or less than the values given in **1.** and **2.**, may be taken when the strength of the double bottom is determined by additional direct calculations and so on.

7. In relation to **1.** to **6.** above, the following notice on referring to maximum allowable and minimum required mass of cargo is to be described in loading manual.

"Where ship engages in a service to carry such hot coils or heavy cargoes that have some adverse effect on the local strength of the double bottom and that the loading is not described as cargo in

Loading Manual, maximum allowable and minimum required mass of cargo are to be considered specially."

8. Typical loading/unloading sequences required in **Pt 3, Appendix 3-1, 3.** (1) (F) of the Guidance, are approved by the Society. Such sequences contain the following loading conditions. However, as for the loading conditions except the following (2), only in case these are specified as ones of the design conditions, these may be included in the loading manual.

(1) Alternate loading condition regulated in **Pt 3, Appendix 3-1**, **3.** (1)(F)(a) of the Guidance
(2) Homogeneous loading condition regulated in **Pt 3, Appendix 3-1, 3.** (1)(F)(b) of the Guidance
(3) Short voyage condition regulated in **Pt 3, Appendix 3-1, 3.** (1)(F)(d) of the Guidance
(4) Multiple port loading/unloading condition regulated in **Pt 3, Appendix 3-1, 3.** (1)(F)(e) of the Guidance
(5) Deck cargo condition regulated in **Pt 3, Appendix 3-1, 3.** (1)(F)(f) of the Guidance
(6) Block loading (partial loading condition; loaded cargo in over two adjacent holds).

9. Each step of a sequence required in **8.** above is specified as follows. A step is defined as each time of changes of the loading equipment position to a new hold.

(1) Each step between commencement of cargo loading in the ballasted condition and the planed loading condition in case of loading cargo.
(2) Each step between commencement of discharging cargo in the planed loading condition and the ballast condition at departure in case of discharging cargo.

10. Each step of sequences specified in **8.** above is acceptable within the allowable limits of longitudinal bending moments and shear forces.

11. In addition to **7.** above, loading manual is to contain the loading/unloading sequence summary forms as specified in **Pt 3, Appendix 3-1, 3.** (1)(F)(g), **Table 4** of Guidance, and to include the following notices.

"Where loading/unloading rather than those included in the design plans or in the loading manual, new loading/unloading sequences are to be developed with the prescribed forms, paying attention to loading rate, the deballasting capability, longitudinal strength, and maximum allowable and minimum required mass of cargo and double bottom contents." ⚓

Annex 7-5 Additional Requirements for Existing Bulk Carriers

1. Scantling of the transverse watertight corrugated bulkhead between cargo holds No.1 and 2, with cargo hold No.1 flooded, for existing bulk carriers

(1) Application and definitions

(A) These requirements apply to all bulk carriers of 150 m in length(L_f) and above, in the foremost hold, intending to carry solid bulk cargoes having a density of 1.78 t/m^3, or above, with single deck, topside tanks and hopper tanks, fitted with vertically corrugated transverse watertight bulkheads between cargo holds No. 1 and 2 where:

(a) the foremost hold is bounded by the side shell only for ships which were contracted for construction prior to 1 July 1998 and have not been constructed in compliance with **Pt 7, Ch 3, Sec 12** of the Rules.

(b) the foremost hold is double side skin construction of less than 760 mm breadth measured perpendicular to the side shell in ships, the keels of which were laid, or which were at a similar stage of construction, before 1 July 1999 and have not been constructed in compliance with **Pt 7, Ch 3, Sec 12** of the Rules.

(B) The net scantlings of the transverse bulkhead between cargo holds Nos. 1 and 2 are to be calculated using the loads given in (2), the bending moment and shear force given in (3) and the strength criteria given in (4).

(C) Steel renewal and/or reinforcements are required as per (6).

(D) In these requirements, homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for the two foremost cargo holds, does not exceed 1.2 to be corrected for different cargo densities.

(2) Load model

(A) General

(a) The loads to be considered as acting on the bulkhead are those given by the combination of the cargo loads with those induced by the flooding of cargo hold No.1.

(b) The most severe combinations of cargo induced loads and flooding loads are to be used for the check of the scantlings of the bulkhead, depending on the loading conditions included in the loading manual:

(i) homogeneous loading conditions;

(ii) non homogeneous loading conditions.

(c) Non homogeneous part loading conditions associated with multiport loading and unloading operations for homogeneous loading conditions need not to be considered according to these requirements.

(B) Bulkhead corrugation flooding head

The flooding head h_f (See **Fig 1**) is the distance, in m, measured vertically with the ship in the upright position, from the calculation point to a level located at a distance d_f (m) from the baseline equal to:

(a) For ships less than 50,000 tonnes deadweight with Type B freeboard : $d_f = 0.95D$

(b) For ships other than shown in (a) :

$d_f = D$

(c) For ships to be operated at an assigned load line draught T_r less than the permissible load line draught T, the flooding head defined in (a) and (b) above may be reduced by $T - T_r$.

(C) Pressure in the flooded hold

(a) Bulk cargo loaded hold

Two cases are to be considered, depending on the values of d_1 and d_f, but, d_1 (See **Fig 1**) being a distance from the baseline given, in m, by:

$$d_1 = \frac{M_c}{\rho_c l_c B} + \frac{V_{LS}}{l_c B} + (h_{HT} - h_{DB})\frac{b_{HT}}{B} + h_{DB} \quad (\text{m})$$

where :

M_c = mass of cargo, in hold No.1(ton)

ρ_c = bulk cargo density (t/m^3)

l_c = length of hold No. 1(m)
B = ship's breadth amidship (m)
V_{LS} = volume of the bottom stool above the inner bottom (m^3)
h_{HT} = height of the hopper tanks amidship from the baseline(m)
h_{DB} = height of the double bottom (m)
b_{HT} = breadth of the hopper tanks amidship (m)

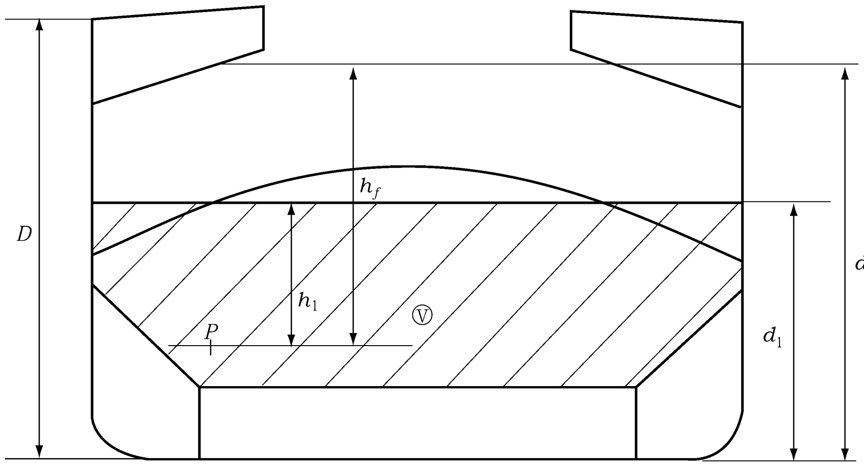

Fig 1 Measurement of d_f, h_1 and h_f

(i) for $d_f \geq d_1$

① At each point of the bulkhead located at a distance between d_1 and d_f from the baseline, the pressure $P_{c,f}$ is given by:

$$P_{c,f} = \rho g h_f \quad (kN/m^2)$$

where :
ρ = 1.025 t/m^3, sea water density (t/m^3)
g = 9.81 m/s^2, gravity acceleration
h_f = flooding head as defined in (B)

② At each point of the bulkhead located at a distance lower than d_1 from the baseline, the pressure $P_{c,f}$ is given by:

$$P_{c,f} = \rho g h_f + [\rho_c - \rho(1 - perm)] g h_1 \tan^2\gamma \quad (kN/m^2)$$

ρ, g, h_f = as given above ①
ρ_c = bulk cargo density (t/m^3)
$perm$ = permeability of cargo, to be taken as 0.3 for ore (corresponding bulk cargo density for iron ore may generally be taken as 3.0 t/m^3),
h_1 = vertical distance, in m, from the calculation point to a level located at a dis-

tance d_1, as defined above, from the base line (See **Fig 1**)

γ = 45° - (ϕ/2)

ϕ = angle of repose of the cargo, in degrees, and may generally be taken as 35° for iron ore and be taken as 25° for cement

③ The force $F_{c,f}$ acting on a corrugation is given by:

$$F_{c,f} = S_1\left[\frac{\rho g(d_f - d_1)^2}{2} + \frac{\rho g(d_f - d_1) + (P_{c,f})_{le}}{2}(d_1 - h_{DB} - h_{LS})\right] \quad \text{(kN)}$$

where :

S_1 = spacing of corrugations(m) (See **Fig 2**)

ρ and g = as specified ② above

d_f = as specified in (B)

$(P_{c,f})_{le}$= pressure at the lower end of the corrugation (kN/mm^2)

d_1 and h_{DB} = as specified in (a)

h_{LS} = height of the lower stool, in m, from the inner bottom.(m)

(ii) for $d_f < d_1$

① At each point of the bulkhead located at a distance between d_f and d_1 from the baseline, the pressure $P_{c,f}$ is given by:

$$P_{c,f} = \rho_c g h_1 \tan^2\gamma \quad \text{(kN/m}^2\text{)}$$

where :

ρ_c, g, h_1 and γ = as specified in (i)

② At each point of the bulkhead located at a distance lower than d_f from the baseline, the pressure $P_{c,f}$ is given by:

$$P_{c,f} = \rho g h_f + [\rho_c h_1 - \rho(1 - perm)h_f] g \tan^2\gamma \quad \text{(kN/m}^2\text{)}$$

where :

ρ, g, h_f, ρ_c, h_1, $perm$ and γ = as specified in (i) above

③ The force $F_{c,f}$ acting on a corrugation is given by:

$$F_{c,f} = S_1\left[\frac{\rho_c g(d_1 - d_f)^2}{2} tan^2\gamma + \frac{\rho_c g(d_1 - d_f)\tan^2\gamma + (P_{c,f})_{le}}{2}(d_1 - h_{DB} - h_{LS})\right] \quad \text{(kN)}$$

where :

S_1, ρ_c, g, γ, $(P_{c,f})_{le}$ and h_{LS} = as specified in (i) above

d_1 and h_{DB} = as specified in (a)

d_f = as specified in (B)

(b) Pressure in the flooded empty hold
At each point of the bulkhead, the hydrostatic pressure P_f induced by the flooding head h_f is to be considered.

$$P_f = \rho g h_f \quad \text{(kN/m}^2\text{)}$$

The force F_f acting on a corrugation is given by the following formulae:

$$F_f = S_1 \rho g \frac{(d_f - d_{DB} - h_{LS})^2}{2} \quad (\text{kN})$$

where :

S_1, g, ρ and h_{LS} = as specified in (i) above

d_1 and h_{DB} = as specified in (a)

d_f = as specified in (B)

(D) Pressure in the non-flooded bulk cargo loaded hold

(a) At each point of the bulkhead, the pressure P_c is given by:

$$P_c = \rho_c g h_1 \tan^2 \gamma \quad (\text{kN/m}^2)$$

where :

ρ_c, g, h_1 and γ = as specified in (C), (a) (i) above

(b) The force F_c acting on a corrugation is given by the following formula:

$$F_c = S_1 \rho_c g \frac{(d_1 - h_{DB} - h_{LS})^2}{2} tan^2 \gamma \quad (\text{kN})$$

where :

ρ_c, g, S_1, h_{LS} and γ = as specified in (C), (a) (i) above

d_1 and h_{DB} = as specified in (C), (a) above

(E) Resultant pressure and load

(a) Homogeneous loading conditions

(i) At each point of the bulkhead structures, the resultant pressure P, to be considered for the scantlings of the bulkhead is given by:

$$P = P_{c,f} - 0.8 P_c \quad (\text{kN/m}^2)$$

(ii) The resultant force F acting on a corrugation is given by:

$$F = F_{c,f} - 0.8 F_c \quad (\text{kN})$$

(b) Non homogeneous loading conditions

(i) At each point of the bulkhead structures, the resultant pressure P to be considered for the scantlings of the bulkhead is given by:

$$P = P_{c,f} \quad (\text{kN/m}^2)$$

(ii) The resultant force F acting on a corrugation is given by:

$$F = F_{c,f} \quad (\text{kN})$$

(iii) In case hold No.1, in non homogeneous loading conditions, is not allowed to be loaded, the resultant pressure P to be considered for the scantlings of the bulkhead and the resultant force F acting on a corrugation is given by:

$$P = P_f \quad (\text{kN/m}^2)$$

$$F = F_f \quad (\text{kN})$$

(3) Bending moment and shear force in the bulkhead corrugations
The bending moment M and the shear force Q in the bulkhead corrugations are obtained using the formulae given in (A) and (B). The M and Q values are to be used for the checks in (4).
(A) Bending moment
The design bending moment M for the bulkhead corrugations is given by:

$$M = \frac{Fl}{8} \quad (\text{kN-m})$$

where :
F = resultant force as specified in (2) (E)
l = span of the corrugation (m) (See **Fig 2** and **3**)
(B) Shear force
The shear force Q at the lower end of the bulkhead corrugations is given by:

$$Q = 0.8F \quad (\text{kN})$$

where :
F and l = as specified in (A) above

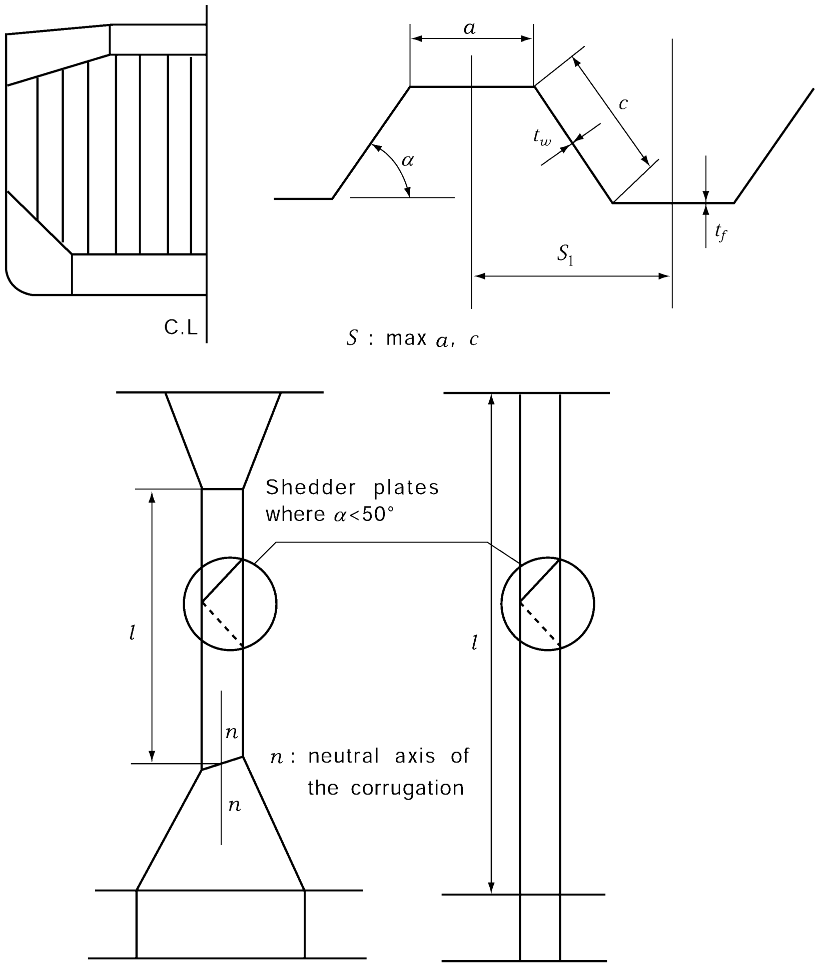

Fig 2 Measurement of S and l

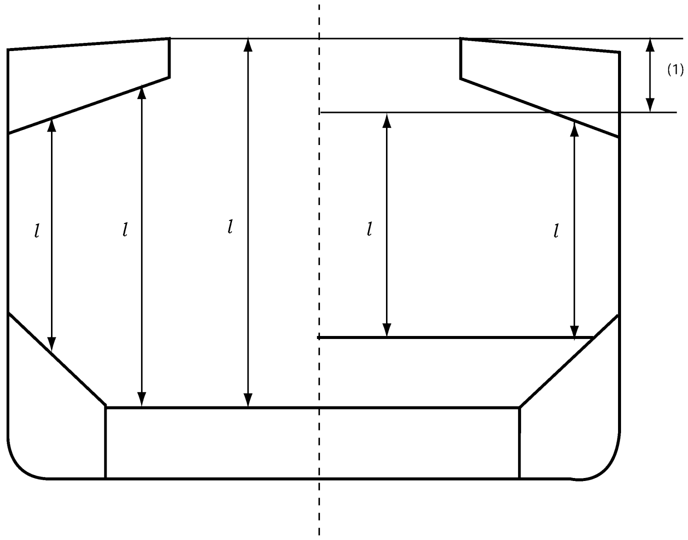

(Note)
(1) For the definition of l, the internal end of the upper stool is not to be taken more than a distance from the deck at the centre line equal to.
(1) For rectangular stool : 2 times the depth of corrugation
(2) For other than shown in (1) : 3 times the depth of corrugation

Fig 3 Measurement of corrugated span l

(4) Strength criteria

(A) General

The following criteria are applicable to transverse bulkheads with vertical corrugations (See **Fig 2**).

(a) Requirements for local net plate thickness are given in (B), (E), (F) and (G).

(b) Where the corrugation angle α shown in **Fig 2** is less than 50°, horizontal row of staggered shedder plates is to be fitted at approximately mid depth of the corrugations to help preserve dimensional stability of the bulkhead under flooding loads. The shedder plates are to be welded to the corrugations by double continuous welding, but they are not to be welded to the side shell.

(c) The thicknesses of the lower part of corrugations considered in the application of (B) and (C) are to be maintained for a distance from the inner bottom (if no lower stool is fitted) or the top of the lower stool not less than $0.15l$.

(d) The thicknesses of the middle part of corrugations considered in the application of (B) and (D) are to be maintained to a distance from the deck (if no upper stool is fitted) or the bottom of the upper stool not greater than $0.3l$.

(B) Bending capacity and shear stress

(a) The bending capacity is to comply with the following relationship:

$$\frac{M}{0.5Z_{le}\sigma_{a,le} + Z_m\sigma_{a,m}} \times 10^3 \leq 1.0$$

where :

M = bending moment(kN-m), as specified in (3)(A) above.

Z_{le} = section modulus of one half pitch corrugation at the lower end of corrugations, as specified in (C) (cm^3)

Z_m = section modulus of one half pitch corrugation at the mid-span of corrugations as specified in (D) (cm^3)

$\sigma_{a,le}$ = allowable stress at the lower end of corrugations as specified in (E)

$\sigma_{a,m}$ = allowable stress at the mid-span of corrugations as specified in (E).

(i) In no case Z_m is to be taken greater than the lesser of $1.15Z_{le}$ and $1.15Z'_{le}$ for calculation of the bending capacity, Z'_{le} being defined below.

① In case effective shedder plates are fitted:

ⓐ Shedder plates are not knuckled;

ⓑ Shedder plates are welded to the corrugations and the top of the lower stool by one side penetration welds or equivalent;

ⓒ Shedder plates are fitted with a minimum slope of 45° and their lower edge is in line with the stool side plating;

② In case effective gusset plates are fitted:

ⓐ Gusset plates are fitted in line with the stool side plating;

ⓑ Gusset plates have material properties at least equal to those provided for the flanges,

(ii) the section modulus Z_{le}, is to be taken not larger than the value Z'_{le} given by :

$$Z'_{le} = Z_g + \frac{Qh_g - 0.5h_g^2 S_1 P_g}{\sigma_a} \times 10^3 \quad (\text{cm}^2)$$

where:

Z_g = section modulus of one half pitch corrugation, according to (D), in way of the upper end of shedder or gusset plates, as applicable

Q = shear force as given in (3)(B)

h_g = height of shedder or gusset plates(m), as applicable (See **Fig 4** (1),(2),(3) and (4))

S_1 = as specified in (2)(C)(a)

P_g = resultant pressure (kN/m^2) as defined in (2)(E), calculated in way of the middle of the shedder or gusset plates, as applicable

σ_a = allowable stress (N/mm^2) as specified in (E).

(b) Stresses τ are obtained by dividing the shear force Q by the shear area. The shear area is to be reduced in order to account for possible non-perpendicularity between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by $\sin\alpha$, where α being the angle between the web and the flange. (See **Fig 2**)

(c) When calculating the section moduli and the shear area, the net plate thicknesses are to be used.

(d) The section moduli of corrugations are to be calculated on the basis of the requirements given in (C) and (D).

(C) Section modulus at the lower end of corrugations

The section modulus is to be calculated with the compression flange having an effective flange width b_{ef}, not larger than as given (F) (a).

If the corrugation webs are not supported by local brackets below the stool top (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30 % effective.

(a) Provided that effective shedder plates, as defined in (B) are fitted (See **Fig 4** (1) and (2)), when calculating the section modulus of corrugations at the lower end (cross-section in **Fig 4** (1) and (2) ①), the area of flange plates (cm^2), may be increased by not to be taken greater than

$$2.5a\sqrt{t_f t_{sh}}\sqrt{\frac{\sigma_{Fsh}}{\sigma_{Ffl}}}$$

but, it is to be less than $2.5at_f$.

a = width, in m, of the corrugation flange (See **Fig 2**)

t_{sh} = net shedder plate thickness (mm)

t_f = net flange thickness (mm)

σ_{Fsh} = minimum upper yield stress (N/mm^2) of the material used for the shedder plates

σ_{Ffl} = minimum upper yield stress (N/mm^2) of the material used for the corrugation flanges.

(b) Provided that effective gusset plates, as defined in (B), are fitted (See **Fig 4** (3) and (4)), when calculating the section modulus of corrugations at the lower end (cross-section in **Fig 4** (3) and (4) ①), the area of flange plates(cm^2), may be increased by 7 $h_g t_{gu}$.

h_g = height of gusset plate in m, (See **Fig 4** (3) and (4)), not to be taken greater than $\frac{10}{7}S_{gu}$

S_{gu} = width of the gusset plates(m)

t_{gu} = net gusset plate thickness(mm), not to be taken greater than t_f

t_f = net flange thickness based on the as built condition.(m)

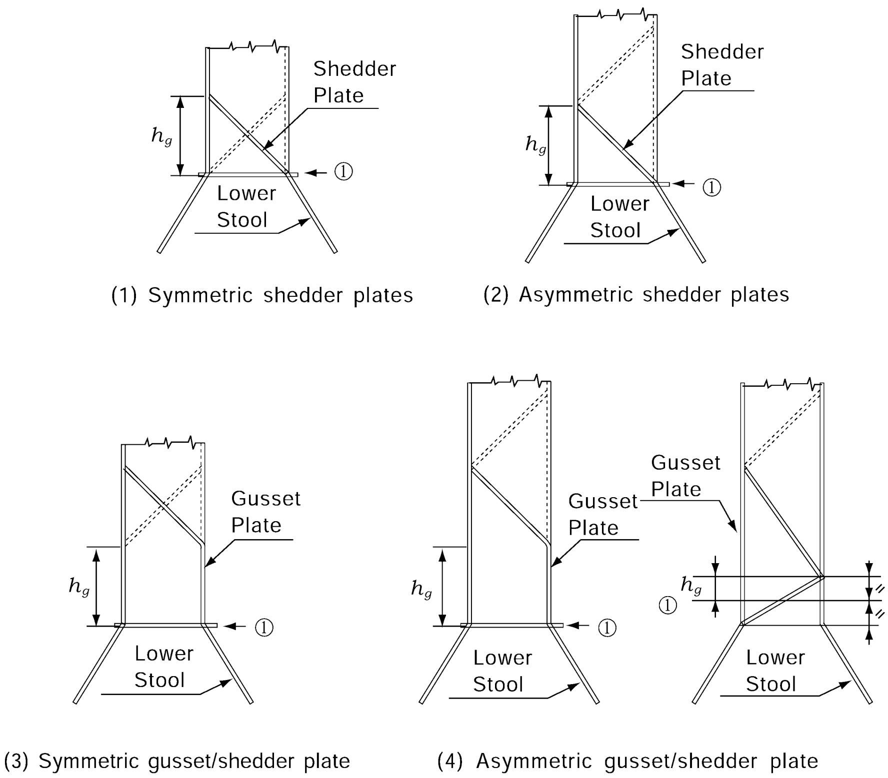

Fig 4 Shedder plates and Gusset plates

(c) If the corrugation webs are welded to a sloping stool top plate, which is at an angle not less than 45° with the horizontal plane, the section modulus of the corrugations may be calculated considering the corrugation webs fully effective. In case effective gusset plates are fitted, when calculating the section modulus of corrugations the area of flange plates may be increased as specified in (b) above. No credit can be given to shedder plates only. For angles less than 45° the effectiveness of the web may be obtained by linear interpolation between 30 % for 0° and 100 % for 45°

(D) Section modulus of corrugations at cross-sections other than the lower end. The section modulus is to be calculated with the corrugation webs considered effective and the compression flange having an effective flange width, b_{ef}, not larger than as given in (F)(a).

(E) Allowable stress check

The normal and shear stresses σ and τ are not to exceed the allowable values σ_a and τ_a, given by:

$$\sigma_a = \sigma_y \quad (\mathrm{N/mm^2})$$

$$\tau_a = 0.50\sigma_y \quad (\mathrm{N/mm^2})$$

where :

σ_y = minimum upper yield stress of the material.($\mathrm{N/mm^2}$)

(F) Effective compression flange width and shear buckling check

(a) Effective width of the compression flange of corrugations

The effective width b_{ef} of the corrugation flange is given by:

$$b_{ef} = C_e a \quad (\mathrm{m})$$

where :

for $\beta > 1.25$: $C_e = \frac{2.25}{\beta} - \frac{1.25}{\beta^2}$

for $\beta \le 1.25$: $C_e = 1.0$

$$\beta = \frac{a}{t_f}\sqrt{\frac{\sigma_y}{E}} \times 10^3$$

t_f = net flange thickness (mm)

a = width of the corrugation flange (m) (See **Fig 2**)

σ_y = minimum upper yield stress of the material ($\mathrm{N/mm^2}$)

E = modulus of elasticity ($\mathrm{N/mm^2}$), to be assumed equal to 2.06 × 10^5 $\mathrm{N/mm^2}$ for steel

(b) Shear

The buckling check is to be performed for the web plates at the corrugation ends. The shear stress τ is not to exceed the critical value τ_c obtained by the following:

$$\tau_c = \tau_E \qquad \text{when : } \tau_E \le 0.5\tau_y$$

$$\tau_c = \tau_y\left(1 - \frac{\tau_y}{4\tau_E}\right) \qquad \text{when : } \tau_E > 0.5\tau_y$$

where :

τ_y = shear stress of the material ($\mathrm{N/mm^2}$)

$$\sigma_y / \sqrt{3}$$

τ_E = elastic buckling stress ($\mathrm{N/mm^2}$)

$$\tau_E = 0.9 k_t E \left(\frac{t}{1000c} \right)^2 \quad (\mathrm{N/mm^2})$$

where :

k_t = 6.34

t = net thickness, in mm, of corrugation web (mm)

c = breadth of corrugation web (See **Fig 2**)

σ_y, E = as specified in (a) above.

(G) Local net plate thickness

(a) The bulkhead local net plate thickness tnet, in mm, is given by:

$$t_{\neq t} = 14.9 S_w \sqrt{\frac{P}{\sigma_y}} \quad (\mathrm{mm})$$

where :

S_w = plate width, in m, to be taken equal to the width of the corrugation flange or web, whichever is the greater (See **Fig 2**)

P = resultant pressure($\mathrm{kN/m^2}$), as defined in (2)(E), at the bottom of each strake of plating; in all cases, the net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool, or at the inner bottom, if no lower stool is fitted or at the top of shedders, if shedder or gusset/shedder plates are fitted.

σ_y = minimum upper yield stress of the material.($\mathrm{N/mm^2}$)

(b) When the thicknesses of the flange and web are different :

(i) The net thickness of the narrower plating is not to be taken less than the following values:

$$t_n = 14.9 S_n \sqrt{\frac{P}{\sigma_y}} \quad (\mathrm{mm})$$

where :

S_n = the width of the narrower plating.(m)

P and σ_y = as specified in (a) above.

(ii) The net thickness of the wider plating is not to be taken less than the maximum of the following values:

$$t_{w1} = 14.9 S_w \sqrt{\frac{P}{\sigma_y}} \quad (\mathrm{mm}), \qquad t_{w2} = \sqrt{\frac{440 S_w^2 P}{\sigma_y} - t_{np}^2} \quad (\mathrm{mm})$$

where :

t_{np} = the lesser value of the between actual net thickness of the narrower plating and t_{w1}.

(5) Local details

(A) As applicable, the design of local details is to comply with the Society's requirements for the purpose of transferring the corrugated bulkhead forces and moments to the boundary structures, in particular to the double bottom and cross-deck structures.

(B) In particular, the thickness and stiffening of gusset and shedder plates, installed for Strengthening purposes, is to comply with the Society's requirements, on the basis of the load model in (2). Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the Society's requirements.

(6) Corrosion addition and steel renewal

(A) Steel renewal is required where the gauged thickness is less than $t_{\neq t}+0.5\,\mathrm{mm}$, $t_{\neq t}$ being the thickness used for the calculation of bending capacity and shear stresses as given in (4)(B) or the local net plate thickness as given in (4)(G). Alternatively, reinforcing doubling strips may be used providing the net thickness is not dictated by shear strength requirements for web plates (See (4)(E) and (4)(F)(b)) or by local pressure requirements for web and flange plates (See (4)(G)).

(B) Where the gauged thickness is within the range $t_{\neq t}+0.5\,\mathrm{mm}$, $t_{\neq t}+1.0\,\mathrm{mm}$, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

(C) Where steel renewal or reinforcement is required, a minimum thickness of $t_{\neq t}+2.5\,\mathrm{mm}$ is to be replenished for the renewed or reinforced parts.

(D) For $0.8(\sigma_{Ffl} t_{fl}) \geq \sigma_{Fs} t_{st}$

σ_{Ffl} = minimum upper yield stress($\mathrm{N/mm^2}$) of the material used for the corrugation flanges

σ_{Fs} = minimum upper yield stress($\mathrm{N/mm^2}$) of the material used for the lower stool side plating or floors (if no stool is fitted)

t_{fl} = flange thickness, in mm, which is found to be acceptable on the basis of the criteria specified in (A) above or, when steel renewal is required, the replenished thickness according to the criteria specified in (C) above. The above flange thickness dictated by local pressure requirements (See (4)(G)) need not be considered for this purpose

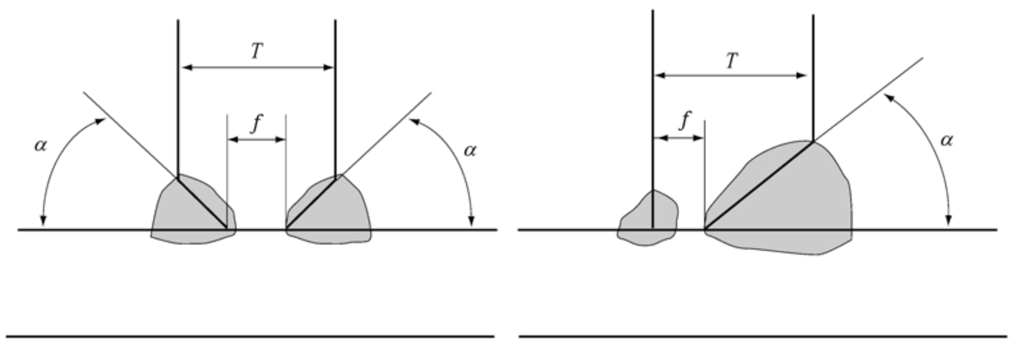
t_{st} = as built thickness of the lower stool side plating or floors (if no stool is fitted) (mm)

(a) Gussets with shedder plates, extending from the lower end of corrugations up to $0.1l$ or reinforcing doubling strips (on bulkhead corrugations and stool side plating) are to be fitted.

(b) If gusset plates are fitted, the material of such gusset plates is to be the same as that of the corrugation flanges. The gusset plates are to be connected to the lower stool shelf plate or inner bottom (if no lower stool is fitted) by deep penetration welds. (See **Fig 5**).

(E) Where steel renewal is required, the bulkhead connections to the lower stool shelf plate or inner bottom (if no stool is fitted) are to be at least made by deep penetration welds.

(F) Where gusset plates are to be fitted or renewed, their connections with the corrugations and the lower stool shelf plate or inner bottom (if no stool is fitted) are to be at least made by deep-penetration welds (See **Fig 5**).



Root Face f : 3mm ~ T/3mm
Groove Angle α : 40° ~ 60°

Fig 5 Deep penetration weld

(G) Guidance on renewal/reinforcement of vertically corrugated transverse watertight bulkhead between cargo holds Nos. 1 and 2

(a) The need for renewal or reinforcement of the vertically corrugated transverse watertight bulkhead between cargo holds Nos. 1 and 2 will be determined by the classification society on a case by case basis using the criteria given in association with the most recent gaugings and findings from survey.

(b) It will take into account the following:

(i) Scantlings of individual vertical corrugations will be assessed for reinforcement / renewal based on thickness measurements obtained in accordance with **Pt 1, Annex 1-5, Table 8** at their lower end, at mid-depth and in way of plate thickness changes in the lower 70 %. These considerations will take into account the provision of gussets and shedder plates and the benefits they offer, provided that they comply with (4)(B) and (A) to (F).

(ii) Permissible levels of diminution will be determined and appropriate measures taken in accordance with (A) and (B).

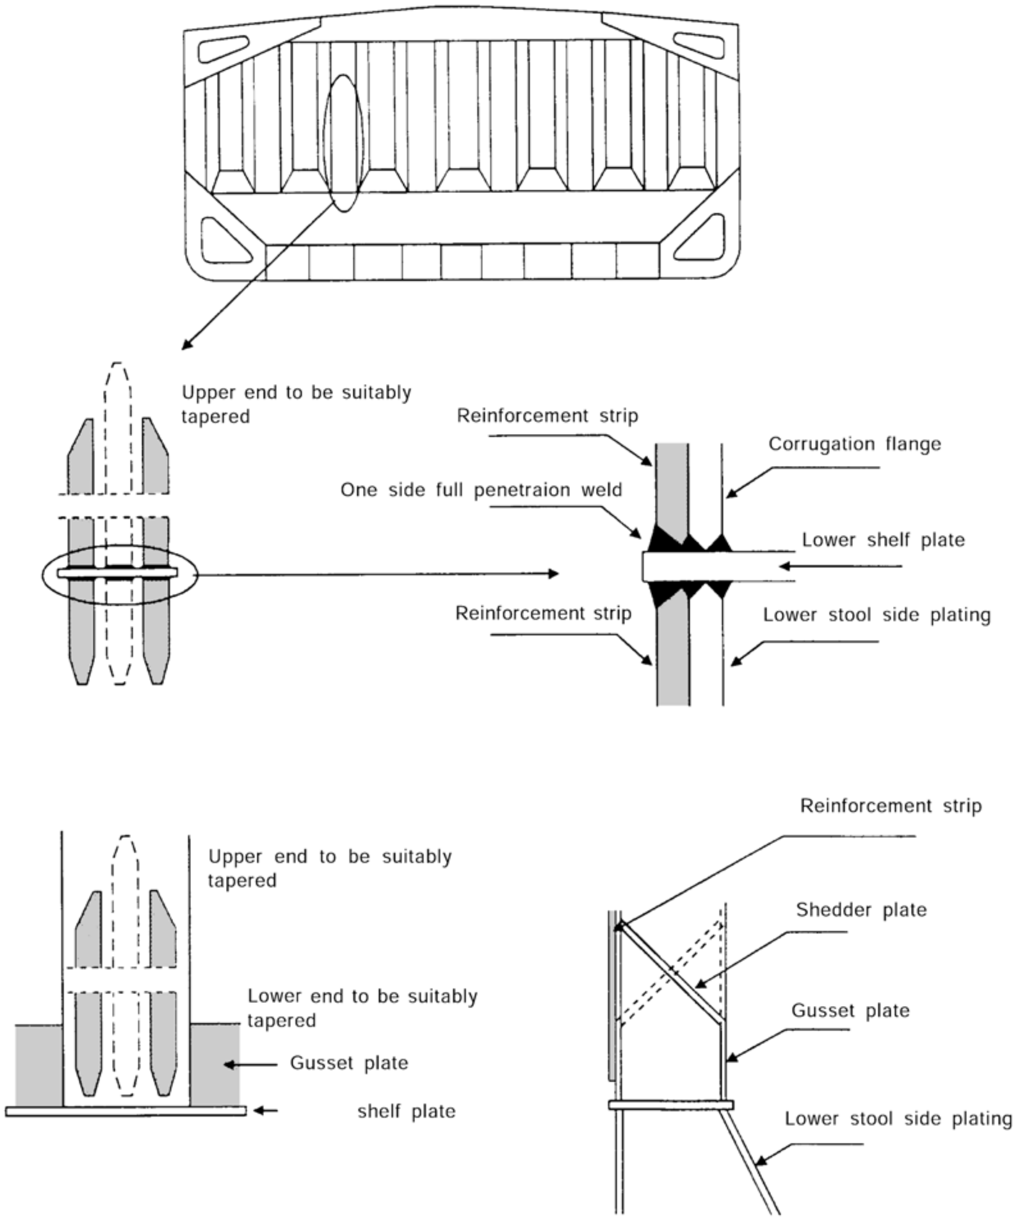
(c) Where renewal is required, the extent of renewal is to be shown clearly in plans. The vertical distance of each renewal zone is to be not less than 15 % of the vertical distance between the upper and lower end of the corrugation measured at the ship's centreline.

(d) Where the reinforcement is accepted by adding strips, the length of the reinforcing strips is to be sufficient to allow it to extend over the whole depth of the diminished plating. In general, the width and thickness of strips should be sufficient to comply with the (A) to (F) requirements. The material of the strips is to be the same as that of the corrugation plating. The strips are to be attached to the existing bulkhead plating by continuous fillet welds. The strips are to be suitably tapered or connected at ends in accordance with Class Society practice. (See **Fig 6**)

(e) Where reinforcing strips are connected to the inner bottom or lower stool shelf plates, one side full penetration welding is to be used. When reinforcing strips are fitted to the corrugation flange and are connected to the lower stool shelf plate, they are normally to be aligned with strips of the same scantlings welded to the stool side plating and having a minimum length equal to the breadth of the corrugation flange.

(f) A general arrangement of structural reinforcement is given by **Fig 6.**

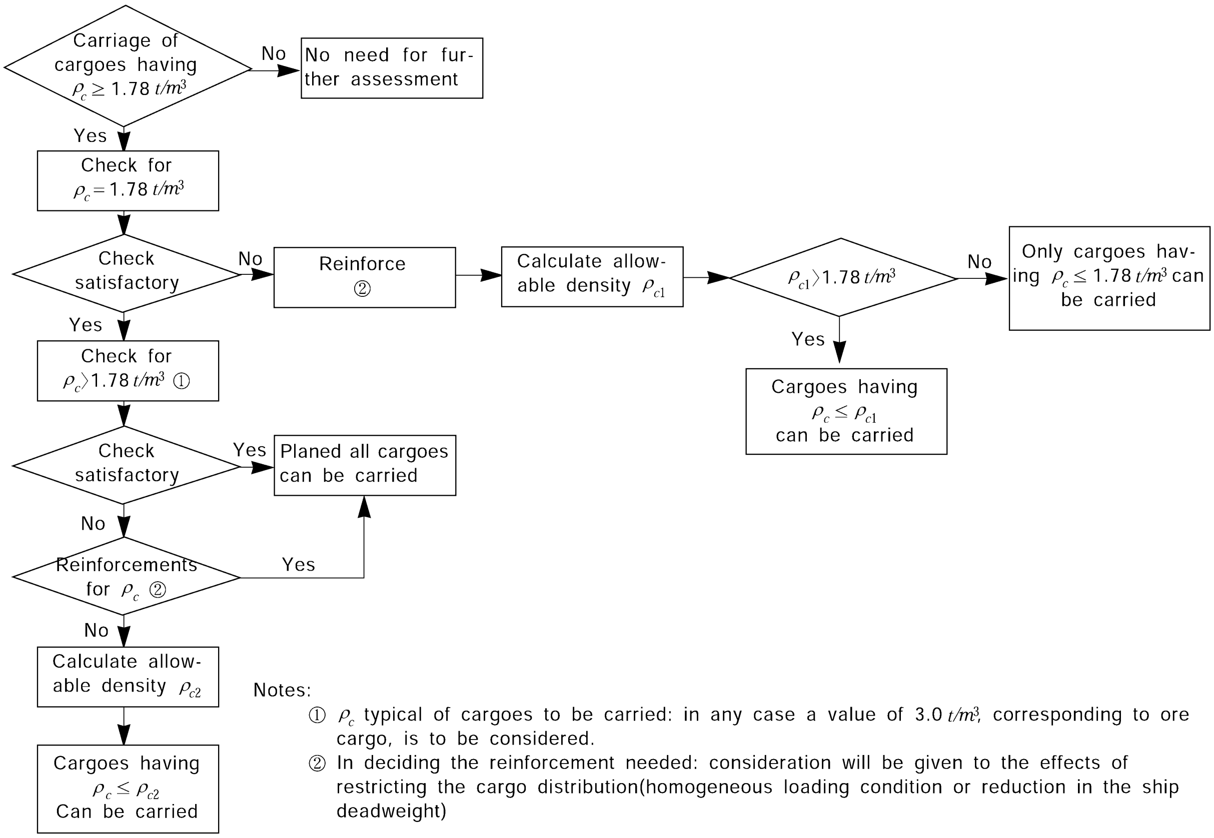
(7) The flow chart to asses capability of carriage of high density cargoes on existing bulk carriers according to the strength of transverse bulkhead between cargo holds Nos. 1 and 2 may refer to the **Fig 7.** However, where the resultant pressure specified in above (2) (E) has the highest value for cargo density(ρ_c) being 1.78 t/m^3, this flow chart may not be applied.



(Note)

1. Square or trapezoidal corrugations are to be reinforced with plate strips fitted to each corrugation flange sufficient to meet the requirements of (A) to (F).
2. The number of strips fitted to each corrugation flange is to be sufficient to meet the requirements (4).
3. The shedder plate may be fitted in one piece or prefabricated with a welded knuckle (gusset plate).
4. Gusset plates, where fitted, are to be welded to the shelf plate in line with the flange of the corrugation, to reduce th stress concentrations at the corrugation corners. Ensure good alignment between gusset plate, corrugation flange and lower stool sloping plate. Use deep penetration welding at all connections. Ensure start and stop of welding is as far away as practically possible from corners of corrugation.
5. Shedder plates are to be attached by on side full penetration welds onto backing bars.
6. Shedder and gusset plates are to have a thickness equal to or greater than the original bulkhead thickness. Gusset plate is to have a minimum height(on the vertical part) equal to half of the width of the corrugation flange. Shedders and gussets are to be same material as flange material.

Fig 6 Example of general arrangement of structural reinforcement



Notes:
① ρ_c typical of cargoes to be carried: in any case a value of $3.0\ t/m^3$, corresponding to ore cargo, is to be considered.
② In deciding the reinforcement needed: consideration will be given to the effects of restricting the cargo distribution(homogeneous loading condition or reduction in the ship deadweight)

Fig 7 Flow chart to assess capability of carriage of high density cargoes on existing bulk carriers according to the strength of transverse bulkhead

2. Evaluation of Allowable Hold Loading of Cargo Hold No. 1 with Cargo Hold No. 1 Flooded, for Existing Bulk Carrier

(1) Application and definitions

(A) These requirements apply to all bulk carriers of 150 m in length and above, in the foremost hold, intending to carry solid bulk cargoes having a density of 1.78 t/m^3, or above, with single deck, topside tanks and hopper tanks, where:

(a) the foremost hold is bounded by the side shell only for ships which were contracted for construction prior to 1 July 1998 and have not been constructed in compliance with **Pt 7, Ch 3, Sec 11** of the Rules.

(b) the foremost hold is double side skin construction of less than 760 mm breadth measured perpendicular to the side shell in ships, the keels of which were laid, or which were at a similar stage of construction, before 1 July 1999 and have not been constructed in compliance with **Pt 7, Ch 3, Sec 11** of the Rules.

(B) Early completion of a special survey coming due after 1 July 1998 to postpone compliance is not allowed.

(C) The loading in cargo hold No. 1 is not to exceed the allowable hold loading in flooded condition, calculated as per (4), using the shear capacity of the double bottom given in (3).

(D) In no case, the allowable hold loading in flooding condition is to be taken greater than the design hold loading in intact condition.

(2) Loading model

(A) General

(a) The loads to be considered as acting on the double bottom are considered by following

(i) the load by the external sea pressures

(ii) the combination of the cargo loads with those induced by the flooding of the hold.

(b) The most severe combinations of cargo induced loads and flooding loads are to be used, depending on the loading conditions included in the loading manual:

(i) homogeneous loading conditions;
(ii) non homogeneous loading conditions;
(iii) packed cargo conditions (such as steel mill products).

(c) For each loading condition, the maximum bulk cargo density to be carried is to be considered in calculating the allowable hold loading limit.

(B) Inner bottom flooding head

The flooding head h_f (See **Fig 8**) is the distance, in m, measured vertically with the ship in the upright position, from the inner bottom to a level located at a distance d_f, in m, from the baseline equal to:

(a) for ships less than 50,000 tonnes deadweight with Type B freeboard : 0.95D
(b) for ships except for (a) above : D

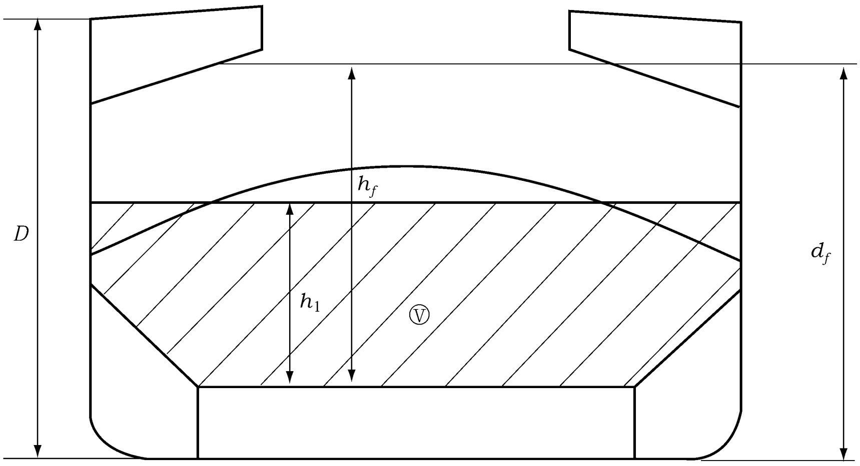


Fig 8 Measurement of d_f, h_1 and h_f

(3) Shear capacity of the double bottom of hold No. 1

(A) The shear capacity C of the double bottom of hold No. 1 is defined as the sum of the shear strength at each end of:

(a) all floors adjacent to both hoppers, less one half of the strength of the two floors adjacent to each stool, or transverse bulkhead if no stool is fitted (See **Fig 9**).
(b) all double bottom girders adjacent to both stools, or transverse bulkheads if no stool is fitted.

(B) The strength of girders or floors which run out and are not directly attached to the boundary stool or hopper girder is to be evaluated for the one end only.

(C) Note that the floors and girders to be considered are those inside the hold boundaries formed by the hoppers and stools (or transverse bulkheads if no stool is fitted). The hopper side girders and the floors directly below the connection of the bulkhead stools (or transverse bulkheads if no stool is fitted) to the inner bottom are not to be included.

(D) When the geometry and/or the structural arrangement of the double bottom are such to make the above (A) to (C) inadequate, to the Society's discretion, the shear capacity C of double bottom is to be calculated according to the Society's criteria.

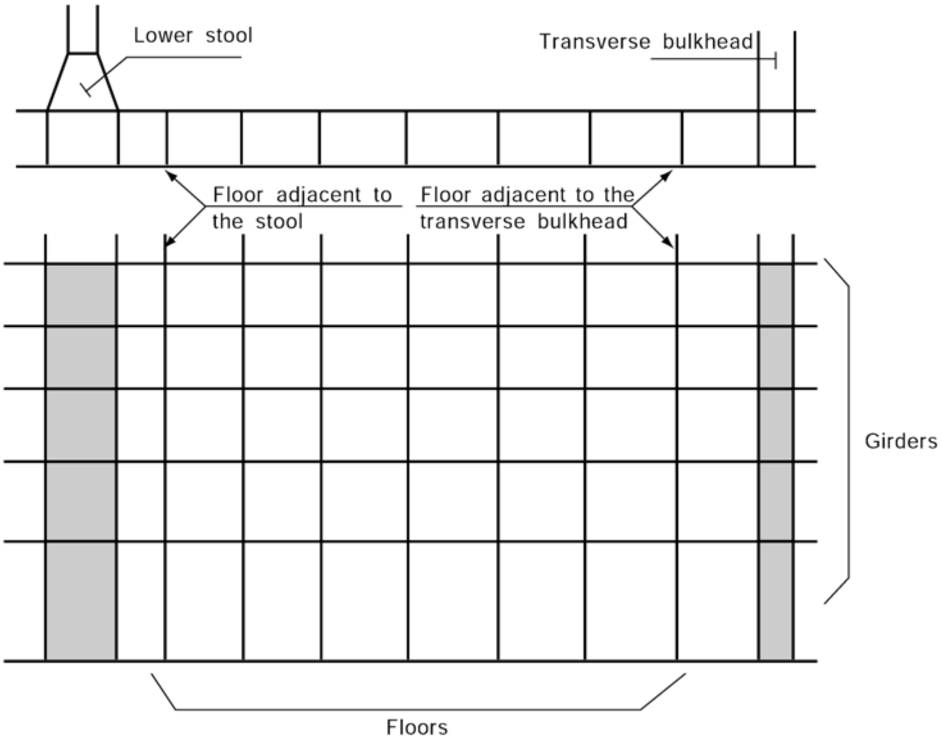

Fig 9 Considering floor and girder

(E) In calculating the shear strength, the net thickness of floors and girders is to be used. The net thickness $t_{\neq t}$, in mm, is given by:

$$t_{\neq t} = t - t_c \quad (\mathrm{mm})$$

where :

t = as built thickness of floors and girders.(mm)

t_c = corrosion diminution, equal to 2 mm, in general ; a lower value of t_c may be adopted, provided that measures are taken, to the Society's satisfaction, to justify the assumption made.

(F) Floor shear strength

The floor shear strength in way of the floor panel adjacent to hoppers S_{f1} and the floor shear strength in way of the openings in the outmost bay (i.e. that bay which is closer to hopper) S_{f2} are given by the following expressions:

$$S_{f1} = A_f \frac{\tau_a}{\eta_1} \times 10^{-3} \quad (\mathrm{kN}), \qquad S_{f2} = A_{f,h} \frac{\tau_a}{\eta_2} \times 10^{-3} \quad (\mathrm{kN})$$

where:

A_f = sectional area of the floor panel adjacent to hoppers (mm^2)

$A_{f,h}$ = net sectional area of the floor panels in way of the openings in the outmost bay(i.e. that bay which is closer to hopper)(mm^2)

τ_a = allowable shear stress ($\mathrm{N/mm}^2$), to be taken equal to $\sigma_y / \sqrt{3}$

σ_y = minimum upper yield stress of the material ($\mathrm{N/mm}^2$)

η_1 = 1.1

η_2 = 1.2, η_2 may be reduced, as the Society's discretion, down to 1.10 where appropriate reinforcements are fitted to the Society's satisfaction

(G) Girder shear strength

The girder shear strength in way of the girder panel adjacent to stools (or transverse bulkheads, if no stool is fitted) S_{g1} and the girder shear strength in way of the largest opening in the outmost bay (i.e. that bay which is closer to stool, or transverse bulkhead, if no stool is fitted) S_{g2} are given by the following expressions:

$$S_{g1} = A_g \frac{\tau_a}{\eta_1} \times 10^{-3} \quad (\mathrm{kN}), \qquad S_{g2} = A_{g,h} \frac{\tau_a}{\eta_2} \times 10^{-3} \quad (\mathrm{kN})$$

where :

A_g = minimum sectional area of the girder panel adjacent to stools(or transverse bulkheads, if no stool is fitted) (mm^2)

$A_{g,h}$ = net sectional area of the girder panels in way of the largest opening in the outmost bay (i.e. that bay which is closest to stool, or transverse bulkhead, if no stool is fitted)(mm^2)

τ_a = allowable shear stress($\mathrm{N/mm}^2$), as given in (F) above.

η_1 = 1.10

η_2 = 1.15, η_2 may be reduced, at the Society's discretion, down to 1.10 where appropriate reinforcements are fitted to the Society's satisfaction

(4) Allowable hold loading

The allowable hold loading W is given by:

$$W = \rho_c V \frac{1}{F} \quad (\mathrm{ton})$$

where :

F = 1.05, however, 1.0 for steel mill products

ρ_c = cargo density for bulk cargoes , for steel products, ρ_c is to be taken as the density of steel ($\mathrm{t/m}^3$)

V = volume occupied by cargo at a level h_1 (m^3)

$$h_1 = \frac{X}{\rho_c g}$$

X is as follows.

(A) for bulk cargoes the lesser of X_1 and X_2 given by:

$$X_1 = \frac{Z + \rho g (E - h_f)}{1 + \frac{\rho}{\rho_c}(perm - 1)}, \qquad X_2 = Z + \rho g (E - h_f perm)$$

ρ = sea water density ($\mathrm{t/m}^3$)

g = 9.81 $\mathrm{m/s}^2$, gravity acceleration

E = ship immersion for flooded hold condition, $d_f - 0.1D$

d_f = as specified in (2)(B)

h_f = flooding head as defined in (2)(B)
$perm$ = cargo permeability, to be taken as 0.3 for ore
Z = the lesser of Z_1 and Z_2 given by

$$Z_1 = \frac{C_h}{A_{DB,h}}, \quad Z_2 = \frac{C_e}{A_{DB,e}}$$

C_h = shear capacity of the double bottom as defined in (3), considering, for each floor, the lesser of the shear strengths S_{f1} and S_{f2} (See (3)(F)) and, for each girder, the lesser of the shear strengths S_{f1} and S_{f2} (See (3)(G))
C_e = shear capacity of the double bottom as defined in (3), considering, for each floor, the shear strength S_{f1} (See (3)(F)) and, for each girder, the lesser of the shear strengths S_{f1} and S_{f2} (See (3)(G))

$$A_{DB,h} = \sum_{i=1}^{i=n} S_i B_{DB,i}$$
$$A_{DB,e} = \sum_{i=1}^{i=n} S_i (B_{DB} - S)$$

n = number of floors between stools (or transverse bulkheads, if no stool is fitted)
S_i = space of ith-floor(m)
$B_{DB,i}$ = $B_{DB} - S$ for floors whose shear strength is given by S_{f1} (See (3)(F)) $B_{DB,h}$ for floors whose shear strength is given by S_{f2} (See (3)(F))
B_{DB} = breadth of double bottom between hoppers (m) (See **Fig 10**)
$B_{DB,h}$ = distance between the two considered opening (m) (See **Fig 10**)
S = spacing of double bottom longitudinals adjacent to hoppers (m)

(B) for steel products, X may be taken as X_1, using $perm$ = 0

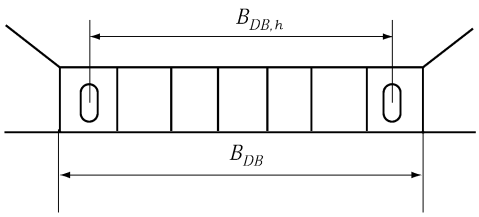

Fig 10 Measurement of $B_{DB,h}$ and B_{DB}

3. Damage Stability

(1) Bulk carriers which are subject to compliance with **Pars 1** and **2** shall, when loaded to the summer loadline, be able to withstand flooding of the foremost cargo hold in all loading conditions and remain afloat in a satisfactory condition of equilibrium, as specified in **SOLAS regulation XII 4.2** to **4.6.**
(2) A ship having been built with an insufficient number of transverse watertight bulkheads to satisfy this requirement may be exempted form the application of **Pars 1** and **2** and this requirement provided the ship fulfills the requirement in **SOLAS XII Reg. 9.** ⚓

Annex 7-6 Water Level Detection & Alarms and Drainage & Pumping Systems for Bulk Carriers and Single Hold Cargo Ships

I. Water level detection & alarms

1. General

(1) The plans containing details on installation, welding and electrical equipment of the water ingress alarm system specified in this Annex to be submitted to the Society for approval.
After installation on board, this system is to be tested and inspected by the attending Surveyor.

(2) Any water level detection & alarm is to be approved by the Society in accordance with the requirements of the relevant regulations.

2. Definitions

(1) **Water level detector** means a system comprising sensors and indication devices that detect and warn of water ingress in cargo holds and other spaces as required in **Pt 7 Ch 3 1403. 1** and **3** of the Rule.

(2) **Sensor** means a unit fitted at the location being monitored that activates a signal to identify the presence of water at the location in **Pt 7 Ch 3 1403. 1** and **3** of the Rule

(3) **Pre-alarm level** means the lower level(0.5 m, single hold cargo ships : not less than 0.3 m) at which the sensor(s) in the cargo hold space will operate.

(4) **Main alarm level** means the higher level($0.15D$ and above, however not exceed the maximum 2 m, single hold cargo ships : not more than $0.15D$) at which the sensor(s) in the cargo hold space will operate or the sole level in spaces other than cargo holds

(5) **Overriding device** means a device to make keeping the current function of an equipment, though a set alarm signal in it would be taken place.

(6) **Depth of ship** means the distance from bottom of cargo hold to hatch coaming. (See **Fig 1**)

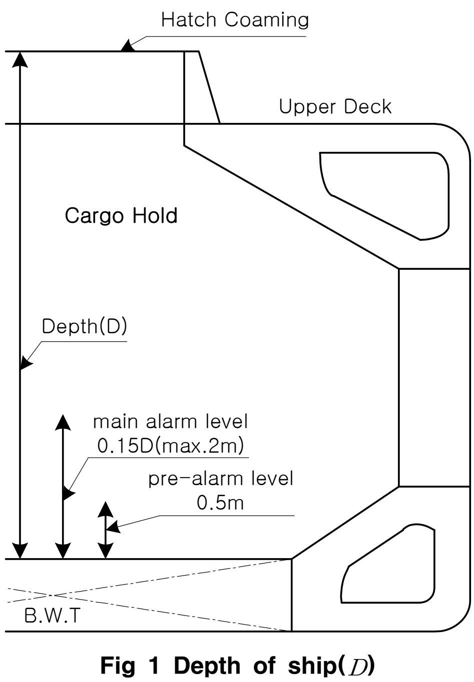

Fig 1 Depth of ship(D)

3. Installation requirements

(1) Bulk Carriers

(A) For cargo holds

(a) In each cargo hold, giving audible and visual alarms, one when the water level above the inner bottom in any hold reaches a height of 0.5 m and another at a height not less than 15% of the depth of the cargo hold but not more than 2 m. On bulk carriers to which **SOLAS Reg.XII/9.2** applies, detectors with only the latter alarm need be installed.

(b) The water level detectors are to be fitted in the aft end of the cargo hold. For cargo holds which are used for water ballast, an alarm overriding device may be installed. The visual alarms are to clearly discriminate between the two different water levels detected in each hold. The illustrations for application and location of installation are showing in Fig **2** to Fig **5.**

(c) The sensors may be installed inside of stools, where the ship has stools in cargo hold. In this case, the character of each sensor is to be considered in conjunction with installation.

(d) In case where the direct contact type detectors will be used, the inspection holes or the equivalent means are to be provided to remove the cargo/water mixture. The mesh size of filter element on inspection holes is to be decided by considering of the diameter of cargo particles and provided a spare filter element for each detector. Any filter element fitted to detectors is to be capable of being cleaned before new loading.

(B) In any ballast tank forward of the collision bulkhead required, giving an audible and visual alarm when the liquid in the tank reaches a level not exceeding 10% of the tank capacity. An alarm overriding device may be installed to be activated when the tank is in use.

(C) In any dry or void space other than a chain cable locker, any part of which extends forward of the foremost cargo hold, giving an audible and visual alarm at a water level of 0.1 m above the deck. Such alarms need not be provided in enclosed spaces the volume of which does not exceed 0.1% of the ship's maximum displacement volume.

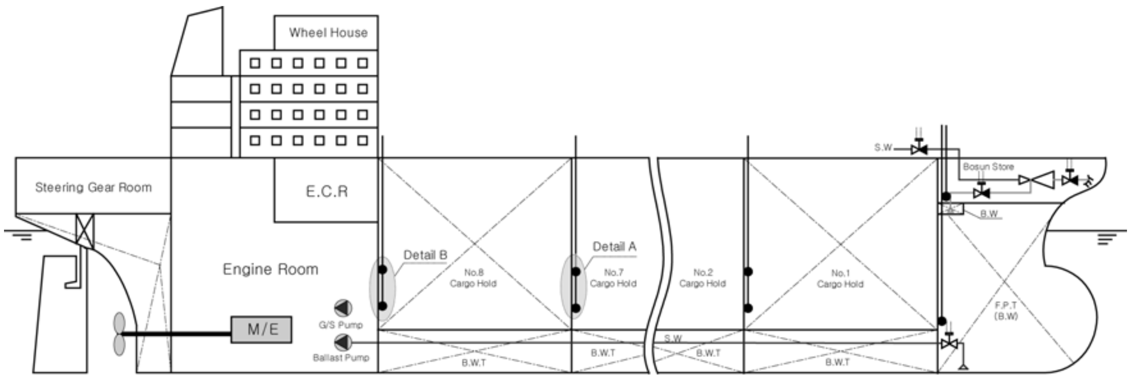

Fig 2 Installation position of water level detector

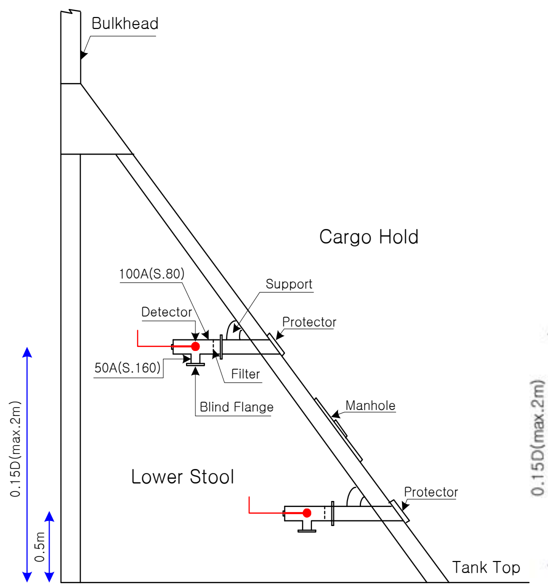

Fig 3 (Detail A)

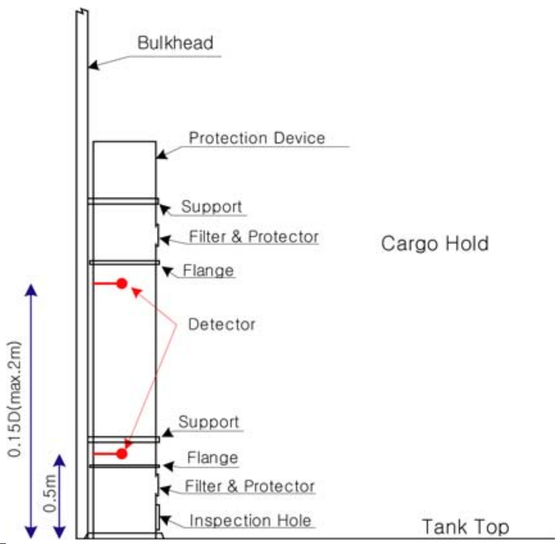

Fig 4 (Detail A)

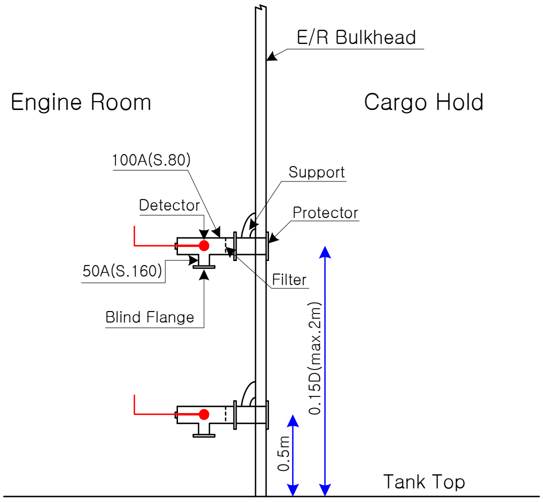

Fig 5 (Detail B)

(2) Single Hold Cargo Ships

(A) Those are to be fitted in such space with water level detectors which give an audible and visual alarm at the navigation bridge when the water level above the inner bottom in the cargo hold reaches a height of not less than 0.3 m, and another when such level reaches not more than 15 % of the mean depth of the cargo hold.

(B) Those are to be fitted at the aft end of the hold(above its lowest part where the inner bottom is not parallel to the designed waterline). Where webs or partial watertight bulkheads are fitted above the inner bottom, additional detectors are to be fitted.

4. Detector system requirements

(1) General

(A) This detecting system is to provide a reliable indication of water reaching a preset level. The audible and visual alarms are to be suitable for location on the navigation bridge.

(B) Protection of the enclosures of electrical components installed in cargo holds, ballast tanks and dry spaces are to be satisfied the requirements of **IP68** in accordance with **(KS C) IEC 60529.**

(C) Protection of the enclosures of electrical components installed above ballast and cargo spaces are to be satisfied the requirements of **IP56** in accordance with **(KS C) IEC 60529.**

(D) The water level detector system is to be capable of being supplied with electrical power from two independent electrical supplies. Failure of one electrical power supply of them is to activate an alarm, both visual and audible.

(2) For cargo holds

An alarm, both visual and audible, is to be activated each when the level of water reaches the pre-alarm level or main alarm level in the cargo hold being monitored. The visual alarm is to identify the cargo hold and the audible main alarm is not to be the same as that for the pre-alarm level.

(3) For compartments other than cargo holds

An alarm, both visual and audible, is to be activated when the level of water in the space being monitored is detected on sensor. The characteristics of the visual and audible alarm is to be the same as those for the main alarm level in a cargo hold.

5. Functional requirements

(1) Means of detecting water level

The method of detecting water level may be by direct or indirect means. A direct means determines the presence of water by physical contact of the water with detection device and indirect means of detection include devices such as the air purge or ultrasonic type sensor.

(2) Functional requirements

(A) The system of detecting water level is to be capable of continuous operation while the ship is at sea.

(B) Detection equipment is to be suitably corrosion resistant for all intended cargoes.

(C) The detector indicating the water level is to be capable of activating to an accuracy of

±100 mm.

(D) The part of the system which has circuitry in the cargo area, is to be intrinsically safe type and at least a **IIB T3** in accordance with **(KS C) IEC** publication **60079.**

(E) Detectors serving a cargo hold is to be capable of being functionally tested in situation when the hold is empty using either direct or indirect methods.

(3) Installation of sensors

(A) The sensors are to be located in a protected position that is communication with the aft part of the cargo hold such that position of the sensor detects the level that is representative of the levels in the actual hold space. These sensors are to be located either as close to the centerline as practicable, or at both the port and starboard sides of the cargo hold.

(B) The detector installation should not inhibit the use of any sounding pipe or other water level gauging device for cargo holds or other spaces and detectors and equipment are to be installed where they are accessible for survey, maintenance and repair.

(C) Electrical cables and any associated equipment installed in cargo holds are to be protected from damage by cargoes or mechanical handling equipment associated with bulk carrier operations, such as in tubes of robust construction or in similar protected locations.

6. Alarm system requirements

(1) The visual and audible alarms are to be suitable for location on the navigation bridge. These alarms are to be complied with the requirements of the **SOLAS Chap.V/Reg.17&18** and also the **Code on Alarms and Indicators.**

(2) Visual indication using a light of a distinct colour, or digital display that is clearly visible in all expected light levels, which does not seriously interfere with other activities necessary for the safe operation of the ship. The visual indication is to be capable of remaining visible until the condition activating it has returned below the level of the relevant sensor. The visual indication is not to be capable of being extinguished by the operator. In case of the system with a flickering function, that flicker is to be capable of being muted by the operator, but, at that time, the visual indication is not to be extinguished.

(3) In conjunction with the visual indication for the same sensor, the system is to be capable of providing audible indication and alarms in the space in which the indicator is situated. The audible indication is to be capable of being muted by the operator.

(4) Time delays may be incorporated into the alarm system to prevent spurious alarms due to sloshing effects associated with ship motions.

(5) The system may be provided with a capability of overriding indication and alarms for the detection systems installed only in tanks and holds that have been designed for carriage of water ballast. An override visual indication capability should be provided throughout deactivation of the water level detector for the holds or tanks. However, where such an override capability is provided, cancellation of the override condition and reactivation of the alarm should automatically occur after the hold or tank has been de-ballasted to a level below the lowest alarm indicator level.

(6) Alarms are to continuously monitor the system and activate a visual and audible alarm on detecting a fault. The audible alarm is to be capable of being muted by manual operation but the visual indication should remain active until the malfunction is cleared. The alarm for malfunction is distinguishable from the alarm for water level detecting, but it may be substituted the system fail alarm.

(7) Alarm systems are to be complied with the requirements of **(KS C) IEC 60092-504**. A test switch for visual indication and audible alarm is to be fitted on alarm panel and the switch is to be returned to the off position automatically after any use.

7. System test requirements

(1) Alarm system

(A) The visual indication is not to be extinguished by the operator.

(B) It is to be set at a level that alerts operators and tested, but does not interfere with the safe operation of the ship.

(C) That they are distinguishable from other alarms.

(2) Water level detectors

(A) After installation on board, a functionality test for detectors is to be carried out. The test is to be represented the presence of water at the detectors for every level monitored, but simulation methods may be used where the direct use of eater is impracticable.

(B) Each detector alarm should be tested to verify that the pre-alarm(0.5 m, single hold cargo ships : not less than 0.3 m) and main alarm levels[0.15 D (max. 2 m), single hold cargo ships : not more than 0.15 D] operate for every space where they are installed and indicate correctly. Also, the fault monitoring arrangements should be tested as far as practicable.

(C) Records of testing of alarm systems should be retained on board.

8. Manuals

Documented operating and maintenance procedures for water level detection containing the following informations are to be kept on board and readily accessible and the procedures are to be written in working language of the master and officers:

- A description of the equipment for detection and alarm arrangements
- Evidence that the equipment has been type tested
- Line diagrams of the detection and alarm system showing the positions of equipment.
- Installation instructions for setting, securing, protecting and testing.
- List of cargoes for which the detector is suitable for operating in a 50% seawater slurry mixture
- Procedures to be followed in the event of equipment not functioning correctly.
- Maintenance requirements for equipment and system.

II. Drainage and pumping system

1. General

The plans containing piping diagram of drainage and pumping systems specified in this Annex are to be submitted for approval by the Society and after installation on board, a functionality test for the pumping system is to be carried out.

2. Position for installation

(1) Ballast tanks forward of the collision bulkhead

(2) Dry spaces other than chain lockers, any part of which extends forward of the foremost cargo hold and the volume of which exceeds 0.1% of the ship's maximum displacement volume.

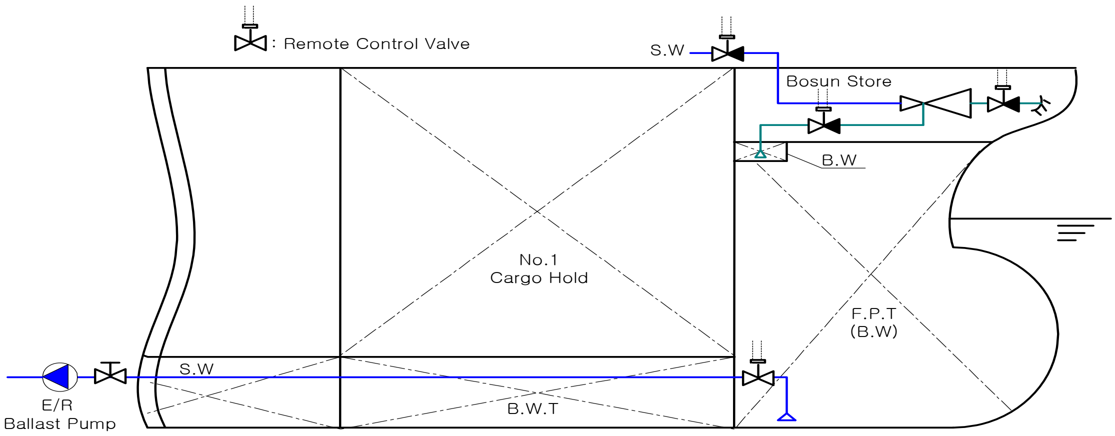

Fig 6 Application example

3. Requirements for installation

(1) The means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold shall be capable of being brought into operation from a readily accessible enclosed space, the location of which accessible from the navigation bridge or propulsion machinery control position without traversing exposed freeboard or superstructure decks.

(2) Where the piping arrangements for dewatering closed dry spaces are connected to the piping arrangements for the drainage of water ballast tanks, two non-return valves are to be provided to

prevent the ingress of water into dry spaces from those intended for the carriage of water ballast. One of these non-return valves is to be fitted with shut-off isolation arrangement. The non-return valves are to be located in readily accessible positions. The shut-off isolation arrangement are to be capable of being controlled from the navigation bridge, the propulsion machinery control position or enclosed space which is readily accessible from the navigation bridge or the propulsion machinery control position without travelling exposed freeboard or superstructure decks. In this context, a position which is accessible via an under deck passage, a pipe trunk or other similar means of access is not to be taken as being in the "readily accessible enclosed space".

(3) Where pipes serving such tanks or bilges pierce the collision bulkhead, valve operation by means of remotely operated actuators may be accepted provided that the location of such valve controls complies with this regulation **3** (1).

(4) The remote control valve is not to move from the demanded position in the case of failure of the control system power or actuator power.

(5) Positive indication is to be provided at the remote control station to show that the valve is fully open or closed.

(6) The dewatering arrangements are to be such that when they are in operation, other systems essential for the safety of the ship including fire-fighting and bilge systems remain available and ready for immediate use. The systems for normal operation of electric power supplies, propulsion and steering are not to be affected by the operation of the dewatering systems.

(7) Bilge wells in dry space are to be provided with gratings or strainers that will prevent blockage of the dewatering system with debris.

(8) The enclosures of electrical equipment for the dewatering system installed in any of the forward dry spaces are to provide protection to IPX8 standard as defined in **Pt 6, Ch 1, 103. 2** (1) (B) of the Guidance, **Table 6.1.3** and (KS C) (KS C) IEC Publication 60529 for a water head equal to the height of the space in which the electrical equipment is installed for a time duration of at least 24 hours.

(9) The dewatering system for ballast tanks located forward of the collision bulkhead and for bilges of dry spaces any part of which extends forward of the foremost cargo hold is to be such that any accumulated water can be drained directly by a pump or eductor and to be designed to remove water from the forward spaces at a rate of not less than the following formula.

$$Q = 320 \times A$$

where :

Q : Capacity of the dewatering system (m^3/h)

A : Cross-sectional area of the largest air pipe or ventilator pipe connected from the exposed deck to a closed forward space that is required to be dewatered by these arrangements (m^2) ⚓

Annex 7-7 Unified Interpretation of Convention

(Unless expressly specified otherwise, the requirements in these Annex apply in accordance with keeling date based on SOLAS Convention)

1. UI SC 207 (Structural Strength of Bulk Carriers in case of Accidental Hold Flooding)

(1) This is to clarify the implementation date between SOLAS XII/5.2 and IACS UR S17, S18 and S20, these structural requirements are to be complied with in respect of the flooding of any cargo hold of bulk carriers of 150 m in length and above, intending to carry solid bulk cargoes 1.0 t/m^3 density or above.

(2) Unified Interpretation
Regardless of the date of contract for construction, or the cargo hold cross section configuration, of ships which shall comply with SOLAS XII/5.2, such ships are to comply with IACS Unified Requirements(UR) S17(rev.7), S18(rev.7) for corrugated transverse bulkheads, where fitted, and S20(rev.4), if they do not comply with the IACS CSR for bulk carriers.

3) This is uniformly implemented from 1 July 2006.

2. UI SC 208 (Protection of Cargo Holds Loading/Unloading Equipment)

(1) This is to clarify the implementation date between SOLAS XII/6.4.1 (SLS. 14 / Circ. 250) and IACS CSR, in terms of protection of cargo holds from loading/discharge equipment of bulk carriers of 150 m in length and above, intending to carry solid bulk cargoes 1.0 t/m^3 density or above.

(2) Unified Interpretation
Bulk carriers which shall comply with SOLAS regulation XII/6.4.1 and which do not comply with the IACS CSR for Bulk Carriers, are to comply with the following:
(A) The grab requirements of **Pt 3,** of the Rules.
(B) Wire rope grooving in way of cargo holds openings is to be prevented by fitting suitable protection such as half-round bar on the hatch side girders(i.e. upper portion of top side tank plates)/hatch end beams in cargo hold and upper portion of hatch coamings.

(3) The requirements of (A) and (B) are satisfied, "Grab" notation of our Society is to be imposed.

(4) This is uniformly implemented from 1 July 2006.

3. UI SC 209 (Failure of Cargo Hold Structural Members and Panels)

(1) This is to bridge the gap
- The 1 April 2006 contract for construction date associated with CSR for bulk carriers and the 1 July 2006 keel laying date associated with the entry into force of the amended SOLAS XII/6.5.3.
- The definition of bulk carriers according to UR and the new definition of the amended SOLAS XII/6.5.3.

and to give an equivalent criteria regarding lateral buckling of ordinary stiffeners for ships which shall comply with SOLAS XII/6.5.3, but are not designed according to CSR for bulk carriers.

(2) Unified Interpretation
Ships which shall comply with SOLAS XII/6.5.3 are to satisfy either (A) or (B) as given below.
(A) CSR for bulk carriers, **Ch 3, Sec 1** "Material" and **Ch 6, Sec 3** "Buckling & ultimate strength of ordinary stiffeners and stiffened panels.
(B) For ships not designed according to CSR for Bulk Carriers (**Ch 3, Sec 1** and **Ch 6, Sec 3**):
(a) For ships with single side structures the material grade shall not be less than grade D/DH for :
- lower bracket of side frame
- side shell plate between two points located to 0.125 l above and 0.125 l below the intersection of side shell and bilge hopper sloping plate or inner bottom plate. The

span of the side frame, l, is defined as the distance between the supporting structures.

In case of side frames built with multiple spans, the above requirements apply to the lower part only. (See **Fig 1**)

(b) The safety factor with respect to lateral buckling of longitudinal and transverse ordinary stiffeners is to be increased by a factor at least 1.15(allowable utilization factor to be reduced by at least 1/1.15=0.87) for the following areas.

- hatchway coaming
- inner bottom
- sloped stiffened panel of topside tanks and hopper tanks (if any)
- inner side (if any)
- top stool and bottom stool of transverse bulkhead (if any)
- stiffened transverse bulkhead (if any)
- side shell (if directly bounding the cargo hold)

The lateral buckling requirements of ordinary stiffeners shall be in accordance with the Rules of the Society.

(3) This is uniformly implemented from 1 July 2006 at the time of the assessment of concerned parts. ⚓

KOREAN REGISTER OF SHIPPING

APPLICATION OF PART 7 "SHIPS OF SPECIAL SERVICE(CH 5, 6)"

1. Unless expressly specified otherwise, the requirements in the Rules apply to ships for which contracts for construction are signed on or after 1 July 2011.

2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date 1 July 2011

CHAPTER 5 SHIPS CARRYING LIQUEFIED GASES IN BULK

Section 5 Process Pressure Vessels and Liquid, Vapour, and Pressure Piping Systems

- 503. has been amended.

CHAPTER 6 SHIPS CARRYING DANGEROUS CHEMICALS IN BULK

Section 11 Fire Protection and Fire Extinction

- 1101. has been amended.

CONTENTS

CHAPTER 5 SHIPS CARRYING LIQUEFIED GASES IN BULK

Section 1 General

101. Application (IGC Code 1.1)

1. The requirements in this Chapter apply to ships constructed on or after 1 July 1998. Ships constructed before 1 July 1998 are subject to the requirements of IMO Res. MSC. 5(48) adopted on 17 June 1983 and its additional amendments. Ships constructed before 1 July 1986 are subject to the requirements of IMO Res. A. 328(IX) and its additional amendments and ships constructed before 1 November 1976 are to comply with the requirements of IMO Res. A. 329(IX). **802. 18** and **Sec 15** apply to all ships carrying liquefied gases in bulk regardless of the date of construction. Ships constructed before 1 July 1986 and not having the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk, are to comply with the special requirements given by the Society.

2. The requirements in this Chapter apply to ships carrying liquefied gases in bulk (hereinafter referred to as a "ship" in this Chapter) intended to be registered and classed with the Society. The term "liquefied gases" means liquefied gases having an absolute vapour pressure exceeding 0.28 MPa at a temperature of 37.8°C, and other similar flammable products as shown in **Sec 19.**

3. The construction and equipment of ships for carriage of such liquefied gases which are not designated in **Sec 19** are to be to the satisfaction of the Society.

4. For ships to be classed for restricted service and ships not provided with propulsive machinery, the requirements may be modified as appropriate.

5. The ship's hull, machinery and equipment not specified in this Chapter are generally to comply with the requirements in the relevant Chapters of these Rules.

6. When it is intended to carry products covered by this Chapter and products covered by **Ch 6,** the ship should comply with the requirements of both Chapters appropriate to the products carried. However, when a ship is designed and constructed for the carriage of the products listed exclusively in **Sec 19,** the requirements of this Chapter should take precedence.

7. The Society may be subject to IMO decisions which would be different from the requirements of this Chapter.

102. Approval for plans

For classification survey during construction, the following plans and documents as may be required depending upon the products intended to be loaded, condition of cargo storage, construction of cargo containment system and other design conditions are to be submitted in triplicate before the work is commenced.

1. Plans and data for approval

(1) Manufacturing specifications for cargo tanks, insulations and secondary barriers (including welding procedures, inspection and testing procedures for weld and cargo tanks, properties of insulation materials and secondary barriers and their processing manual and working standards)
(2) Details of cargo tank construction
(3) Arrangement of cargo tank accessories including details of fittings inside the tanks
(4) Details of cargo tank supports, deck portions through which cargo tanks penetrate, and their sealing devices
(5) Details of secondary barriers
(6) Specifications and standards of materials (including insulations) used for cargo piping system in connection with design pressure and/or temperature
(7) Specifications and standards of materials of cargo tanks, insulations, secondary barriers and cargo tank supports
(8) Layout and details of attachment for insulations
(9) Constructions of cargo pumps, cargo compressors and their prime movers
(10) Constructions of main parts of refrigeration systems

(11) Piping diagrams of cargo and instrument
(12) Piping diagrams of refrigerant for refrigeration systems
(13) Bilge arrangements and ventilation systems in hold spaces or interbarrier spaces, cargo pump room, cargo compressor room and cargo control room
(14) Arrangement of sensors for gas detectors, temperature indicators, and pressure gauges
(15) Diagrams of inert gas lines and details of pressure adjusting devices, where hold spaces or interbarrier spaces are filled by inert gases
(16) Details of pressure relief devices and drainage systems for leakage of liquefied cargo in hold spaces or interbarrier spaces
(17) Sectional assembly, details of nozzles, fitting arrangement and details of fittings for various pressure vessels
(18) Details of valves for special purpose, cargo hoses, expansion joints, filters, etc., for cargo piping system
(19) Piping diagram, constructions and particulars of utilization units, where cargo is used as fuel
(20) Electric wiring plans and a table of electrical equipment in dangerous spaces
(21) Arrangement of earth connections for cargo tanks, pipe lines, machinery, equipment, etc.
(22) Plans showing dangerous spaces
(23) Fire extinguishing system stipulated in **Sec 11.**

2. Plans and data for reference

(1) Principal basic design and technical reports of cargo containment systems
(2) Data of test method and its result, where model test is carried out in compliance with the requirements of **Sec 4.**
(3) Data for notch toughness, corrosiveness, physical and mechanical properties of materials and welded parts at the minimum design temperature and room temperature, where new materials or welding methods are adopted for constructing the cargo tanks, secondary barriers, insulations and others
(4) Data of design loads stipulated in **403.**
(5) Calculation sheets of cargo tanks and supports stipulated in **404.** to **406.**
(6) Data of the test method and the results, where model tests were carried out to demonstrate the strength and performance of cargo tanks, insulations, secondary barriers, cargo tank supports
(7) Calculation sheets of heat transfer on the main parts of cargo tank under various condition of loading, where considered necessary by the Society.
(8) Calculation sheets of the thermal stress on the main parts of cargo tank at the condition of the temperature distribution stipulated in (7), where considered necessary by the Society
(9) Calculation sheets of temperature distribution on hull structure, where considered necessary by the Society
(10) Specifications of cargo handling systems
(11) Composition and physical properties of cargoes (including a saturated vapour pressure diagram within the necessary temperature range)
(12) Calculation sheets of relieving capacity for pressure relief valves of cargo tank (including calculation of the back pressure in cargo vent system)
(13) Calculation sheets for capacity of refrigeration systems
(14) Cargo piping arrangement
(15) Calculation sheets of filling limits for cargo tanks
(16) Arrangement of access manholes stipulated in **305.** in cargo tank area and the guide for access through these manholes.
(17) Operation manual stipulated in **Sec 18.**
(18) Calculation for ship survival capability stipulated in **Sec 2.**
(19) Equipment for personnel protection stipulated in **Sec 14.**

103. Equivalents

The construction and equipment, etc. which do not fall under the provisions of this Chapter but are considered to be equivalent to those required in this Chapter will be accepted by the Society.

104. National regulations

For the construction and equipment of the ship, attention is to be paid to the requirements of the national regulations of the country in which the ship is registered and/or of the port which the ship intendes to visit.

105. Hazards (IGC Code 1.2)

Hazards of gases covered by this Chapter include fire, toxicity, corrosivity, reactivity, low temperature and pressure.

106. Definitions (IGC Code 1.3)

The definitions of terms are to be as specified in the following and **Sec 4,** unless otherwise specified elsewhere.

1. "**Accommodation spaces**" are those spaces used for public spaces, corridors, lavatories, cabins, offices, hospitals, cinemas, games and hobbies rooms, barber shops, pantries containing no cooking appliances and similar spaces. Public spaces are those portions of the accommodation which are used for halls, dining rooms, lounges and similar permanently enclosed spaces.

2. "**A class divisions**" are those divisions formed by bulkheads and decks which comply with the following criteria:

(1) they are constructed of steel or other equivalent material;
(2) they are suitably stiffened;
(3) they are insulated with approved non-combustible materials such that the average temperature of the unexposed side will not rise more than 140 ℃ above the original temperature, nor will the temperature, at any one point, including any joint, rise more than 180 ℃ above the original temperature, within the time listed below:

class "A-60" 60 min
class "A-30" 30 min
class "A-15" 15 min
class "A-0" 0 min

(4) they are constructed as to be capable of preventing the passage of smoke and flame to the end of the one-hour standard fire test; and
(5) the Society has required a test of a prototype bulkhead or deck in accordance with the Fire Test Procedures Code to ensure that it meets the requirements above for integrity and temperature rise.

3. (1) "**Administration**" means the Government of the State whose flag the ship is entitled to fly.

(2) "**Port Administration**" means the appropriate authority of the country in the Port of which the ship is loading or unloading.

4. "**Boiling point**" is the temperature at which a product exhibits a vapour pressure equal to the atmospheric pressure.

5. "**Breadth (B)**" means the maximum breadth of the ship, measured amidships to the moulded line of the frame in a ship with a metal shell and to the outer surface of the hull in a ship with a shell of any other material. The breadth (B) should be measured in metres.

6. "**Cargo area**" is that part of the ship which contains the cargo containment system and cargo pump and compressor rooms and includes deck areas over the full length and breadth of the part of the ship over the above-mentioned spaces. Where fitted, the cofferdams, ballast or void spaces at the after end of the aftermost hold space or at the forward end of the forwardmost hold space are excluded from the cargo area.

7. "**Cargo containment system**" is the arrangement for containment of cargo including, where fitted, a primary and secondary barrier, associated insulation and any intervening spaces, and adjacent structure if necessary for the support of these elements. If the secondary barrier is part of the hull structure it may be a boundary of the hold space.

8. "**Cargo control room**" is a space used in the control of cargo handling operations and complying with the requirements of **304.**

9. "**Cargoes**" are products listed in **Sec 19** carried in bulk by ships subject to this Chapter.

10. "**Cargo service spaces**" are spaces within the cargo area used for workshops, lockers and store-rooms of more than 2 m^2 in area, used for cargo handling equipment.

11. "**Cargo tank**" is the liquid-tight shell designed to be the primary container of the cargo and includes all such containers whether or not associated with insulation or secondary barriers or both.

12. "**Cofferdam**" is the isolating space between two adjacent steel bulkheads or decks. This space may be a void space or a ballast space.

13. "**Control stations**" are those spaces in which ships" radio or main navigating equipment or the emergency source of power is located or where the fire-recording or fire-control equipment is centralized. This does not include special fire-control equipment which can be most practically located in the cargo area.

14. "**Flammable products**" are those identified by an "F" in column "f" in the table of **Sec 19.**

15. "**Flammability limits**" are the conditions defining the state of fuel-oxidant mixture at which application of an adequately strong external ignition source is only just capable of producing flammability in a given test apparatus.

16. "**Gas carrier**" is a cargo ship constructed or adapted and used for the carriage in bulk of any liquefied gas or other products listed in the table of **Sec 19.**

17. "**Gas-dangerous space or zone**" is:

(1) a space in the cargo area which is not arranged or equipped in an approved manner to ensure that its atmosphere is at all times maintained in a gas-safe condition;
(2) an enclosed space outside the cargo area through which any piping containing liquid or gaseous products passes, or within which such piping terminates, unless approved arrangements are installed to prevent any escape of product vapour into the atmosphere of that space;
(3) a cargo containment system and cargo piping;
(4) (a) a hold space where cargo is carried in a cargo containment system requiring a secondary barrier;
(b) a hold space where cargo is carried in a cargo containment system not requiring a secondary barrier;
(5) a space separated from a hold space described in (4) (a) by a single gastight steel boundary;
(6) a cargo pump room and cargo compressor room;
(7) a zone on the open deck, or semi-enclosed space on the open deck, within 3 m of any cargo tank outlet, gas or vapour outlet, cargo pipe flange or cargo valve or of entrances and ventilation openings to cargo pump rooms and cargo compressor rooms;
(8) the open deck over the cargo area and 3 m forward and aft of the cargo area on the open deck up to a height of 2.4 m above the weather deck;
(9) a zone within 2.4 m of the outer surface of a cargo containment system where such surface is exposed to the weather;
(10) an enclosed or semi-enclosed space in which pipes containing products are located. A space which contains gas detection equipment complying with **1306. 5** and a space utilizing boil-off gas as fuel and complying with **Sec 16** are not considered gas-dangerous spaces in this context;
(11) a compartment for cargo hoses; or
(12) an enclosed or semi-enclosed space having a direct opening into any gas-dangerous space or zone.

18. "**Gas-safe space**" is a space other than a gas-dangerous space.

19. "**Hold space**" is the space enclosed by the ship's structure in which a cargo containment system is situated.

20. "**Independent**" means that a piping or venting system, for example, is in no way connected to another system and there are no provisions available for the potential connection to other systems.

21. "**Insulation space**" is the space, which may or may not be an interbarrier space, occupied wholly or in part by insulation.

22. "**Interbarrier space**" is the space between a primary and a secondary barrier, whether or not completely or partially occupied by insulation or other material.

23. "**Length (L)**" means 96 % of the total length on a waterline at 85 % of the least moulded depth measured from the top of the keel, or the length from the foreside of the stem to the axis of the rudder stock on that waterline, if that be greater. In ships designed with a rake of keel, the waterline on which this length is measured should be parallel to the designed waterline. The length (L)

should be measured in metres.

24. ″**Machinery spaces of category A**″ are those spaces and trunks to such spaces which contain:

(1) internal combustion machinery used for main propulsion; or
(2) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or
(3) any oil-fired boiler or oil fuel unit.

25. ″**Machinery spaces**″ are all machinery spaces of category A and all other spaces containing propelling machinery, boilers, oil fuel units, steam and internal combustion engines, generators and major electrical machinery, oil filling stations, refrigerating, stabilizing, ventilation and air-conditioning machinery, and similar spaces; and trunks to such spaces.

26. ″**MARVS**″ is the maximum allowable relief valve setting of a cargo tank.

27. ″**Oil fuel unit**″ is the equipment used for the preparation of oil fuel for delivery to an oil-fired boiler, or equipment used for the preparation for delivery of heated oil to an internal combustion engine, and includes any oil pressure pumps, filters and heaters dealing with oil at a pressure of more than 0.18 MPa gauge.

28. ″**Organization**″ is the International Maritime Organization (IMO).

29. ″**Permeability**″ of a space means the ratio of the volume within that space which is assumed to be occupied by water to the total volume of that space.

30. (1) ″**Primary barrier**″ is the inner element designed to contain the cargo when the cargo containment system includes two boundaries.

(2) ″**Secondary barrier**″ is the liquid-resisting outer element of a cargo containment system designed to afford temporary containment of any envisaged leakage of liquid cargo through the primary barrier and to prevent the lowering of the temperature of the ship's structure to an unsafe level. Types of secondary barrier are more fully defined in **Sec 4.**

31. ″**Relative density**″ is the ratio of the mass of a volume of a product to the mass of an equal volume of fresh water.

32. ″**Separate**″ means that a cargo piping system or cargo vent system, for example, is not connected to another cargo piping or cargo vent system. This separation may be achieved by the use of design or operational methods. Operational methods should not be used within a cargo tank and should consist of one of the following types:

(1) removing spool pieces or valves and blanking the pipe ends;
(2) arrangement of two spectacle flanges in series with provisions for detecting leak age into the pipe between the two spectacle flanges.

33. ″**Service spaces**″ are those spaces used for galleys, pantries containing cooking appliances, lockers, mail and specie rooms, store-rooms, workshops other than those forming part of the machinery spaces and similar spaces and trunks to such spaces.

34. ″**SOLAS**″ means the International Convention for the Safety of Life at Sea,1974, as amended.

35. ″**1983 SOLAS amendments**″ means amendments to the 1974 SOLAS Convention adopted by the Maritime Safety Committee of the Organization at its forty-eighth session on 17 June 1983 by resolution MSC. 6(48).

36. ″**Tank cover**″ is the protective structure intended to protect the cargo containment system against damage where it protrudes through the weather deck or to ensure the continuity and integrity of the deck structure.

37. ″**Tank dome**″ is the upward extension of a portion of a cargo tank. In the case of below-deck cargo containment systems the tank dome protrudes through the weather deck or through a tank cover.

38. ″**Toxic products**″ are those identified by a "T" in column "f" in the table of **Sec 19.**

39. ″**Vapour pressure**″ is the equilibrium pressure of the saturated vapour above the liquid expressed in bar absolute at a specified temperature.

40. ″**Void space**″ is an enclosed space in the cargo area external to a cargo containment system, other than a hold space, ballast space, fuel oil tank, cargo pump or compressor room, or any space in normal use by personnel.

41. "**Recognized standards**" are applicable international or national standards acceptable to the Society or standards laid down and maintained by the Society which complies with the standards adopted by the organization.

Section 2 Ship Survival Capability and Location of Cargo Tanks

201. General (IGC Code 2.1)

1. Ships subject to this Chapter should survive the normal effects of flooding following assumed hull damage caused by some external force. In addition, to safeguard the ship and the environment, the cargo tanks should be protected from penetration in the case of minor damage to the ship resulting, for example, from contact with a jetty or tug, and given a measure of protection from damage in the case of collision or stranding, by locating them at specified minimum distances inboard from the ship's shell plating. Both the damage to be assumed and the proximity of the tanks to the ship's shell should be dependent upon the degree of hazard presented by the product to be carried.

2. Ships subject to this Chapter should be designed to one of the following standards:

(1) A type 1 G ship is a gas carrier intended to transport products indicated in **Sec 19** which require maximum preventive measures to preclude the escape of such cargo.
(2) A type 2 G ship is a gas carrier intended to transport products indicated in **Sec 19** which require significant preventive measures to preclude the escape of such cargo.
(3) A type 2 PG ship is a gas carrier of 150 m in length or less intended to transport products indicated in Sec 19 which require significant preventive measures to preclude escape of such cargo, and where the products are carried in independent type C tanks designed (see **402. 4** (4)) for a MARVS of at least 0.7 MPa gauge and a cargo containment system design temperature of -55°C or above. Note that a ship of this description but over 150 m in length is to be considered a type 2 G ship.
(4) A type 3 G ship is a gas carrier intended to carry products indicated in **Sec 19** which require moderate preventive measures to preclude the escape of such cargo.

Thus a type 1 G ship is a gas carrier intended for the transportation of products considered to present the greatest overall hazard and types 2 G/2 PG and type 3 G for products of progressively lesser hazards. Accordingly, a type 1 G ship should survive the most severe standard of damage and its cargo tanks should be located at the maximum prescribed distance inboard from the shell plating.

3. The ship type required for individual products is indicated in column "c" in the table of **Sec 19.**

4. If a ship is intended to carry more than one product listed in **Sec 19,** the standard of damage should correspond to that product having the most stringent ship type requirement. The requirements for the location of individual cargo tanks, however, are those for ship types related to the respective products intended to be carried.

202. Freeboard and intact stability (IGC Code 2.2)

1. Ships subject to this Chapter may be assigned the minimum freeboard permitted by the International Convention on Load Lines in force. However, the draught associated with the assignment should not be greater than the maximum draught otherwise permitted by this Chapter.

2. The stability of the ship in all seagoing conditions and during loading and unloading cargo should be to a standard which is acceptable to the Society.

3. When calculating the effect of free surfaces of consumable liquids for loading conditions it should be assumed that, for each type of liquid, at least one transverse pair or a single centre tank has a free surface and the tank or combination of tanks to be taken into account should be those where the effect of free surfaces is the greatest. The free surface effect in undamaged compartments should be calculated by a method acceptable to the Society.

4. Solid ballast should not normally be used in double bottom spaces in the cargo area. Where, however, because of stability considerations, the fitting of solid ballast in such spaces becomes unavoidable, then its disposition should be governed by the need to ensure that the impact loads resulting from bottom damage are not directly transmitted to the cargo tank structure.

5. The master of the ship should be supplied with a Loading and Stability Information booklet. This booklet should contain details of typical service conditions, loading, unloading and ballasting operations, provisions for evaluating other conditions of loading and a summary of the ship's survival capabilities. In addition, the booklet should contain sufficient information to enable the master to load and operate the ship in a safe and seaworthy manner.

203. Shipside discharges below the freeboard deck (IGC Code 2.3)

1. The provision and control of valves fitted to discharges led through the shell from spaces below the freeboard deck or from within the superstructures and deckhouses on the freeboard deck fitted with weathertight doors should comply with the requirements of the relevant regulation of the International Convention on Load Lines in force, except that the choice of valves should be limited to:

(1) one automatic non-return valve with a positive means of closing from above the freeboard deck; or

(2) where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds 0.01 L, two automatic non-return valves without positive means of closing, provided that the inboard valve is always accessible for examination under service conditions.

2. For the purpose of this Section "**summer load waterline**" and "**freeboard deck**", have the meanings defined in the International Convention on Load Lines in force.

3. The automatic non-return valves referred to in **Par 1** (1) and (2) should comply with recognized standards and should fully effective in preventing admission of water into the ship, taking into account the sinkage, trim and heel in survival requirements in **209.**

204. Conditions of loading (IGC Code 2.4)

Damage survival capability should be investigated on the basis of loading information submitted to the Society for all anticipated conditions of loading and variations in draught and trim. The survival requirements need not be applied to the ship when in the ballast condition, provided that any cargo retained on board is solely used for cooling, circulation or fuelling purposes.

205. Damage assumptions (IGC Code 2.5)

1. The assumed maximum extent of damage should be:

(1) Side damage:

(a) Longitudinal extent: 1/3 $L^{2/3}$ or 14.5 m, whichever is less

(b) Transverse extent: B/5 or 11.5 m, whichever is less
measured inboard from the ship's side at right angles to the centreline at the level of the summer load line

(c) Vertical extent: upwards without limit
from the moulded line of the bottom shell plating at centreline.

(2) Bottom damage:

	For 0.3 L from the forward perpendicular of the ship	Any other part of the ship
(a) Longitudinal extent:	1/3 $L^{2/3}$ or 14.5 m, whichever is less	1/3$L^{2/3}$ or 5 m, whichever is less
(b) Transverse extent:	B/6 or 10 m, whichever is less	B/6 or 5 m, whichever is less
(c) Vertical extent:	B/15 or 2 m, whichever is less measured from the moulded line of the bottom shell plating at centreline. (see **206. 3**)	B/15 or 2 m, whichever is less measured from the moulded line of the bottom shell plating at centreline. (see **206. 3**)

2. Other damage:

(1) If any damage of a lesser extent than the maximum damage specified in **Par 1** would result in a more severe condition, such damage should be assumed.

(2) Local side damage anywhere in the cargo area extending inboard 760 mm measured normal to the hull shell should be considered and transverse bulkheads should be assumed damaged when also required by the applicable subparagraphs of **208.1.**

206. Location of cargo tanks (IGC Code 2.6)

1. Cargo tanks should be located at the following distances inboard:

(1) Type 1 G ships: from the side shell plating not less than the transverse extent of damage specified in **205.1** (1) (b) and from the moulded line of the bottom shell plating at centreline not less than the vertical extent of damage specified in **205.1** (2) (c) and nowhere less than 760 mm from the shell plating.

(2) Types 2 G/2 PG and 3 G ships: from the moulded line of the bottom shell plating at centre-line not less than the vertical extent of damage specified in **205. 1** (2) (c) and nowhere less than 760 mm from the shell plating.

2. For the purpose of tank location, the vertical extent of bottom damage should be measured to the inner bottom when membrane or semi-membrane tanks are used, otherwise to the bottom of the cargo tanks. The transverse extent of side damage should be measured to the longitudinal bulkhead when membrane or semi-membrane tanks are used, otherwise to the side of the cargo tanks (see **Fig 7.5.1**). For internal insulation tanks the extent of damage should be measured to the supporting tank plating.

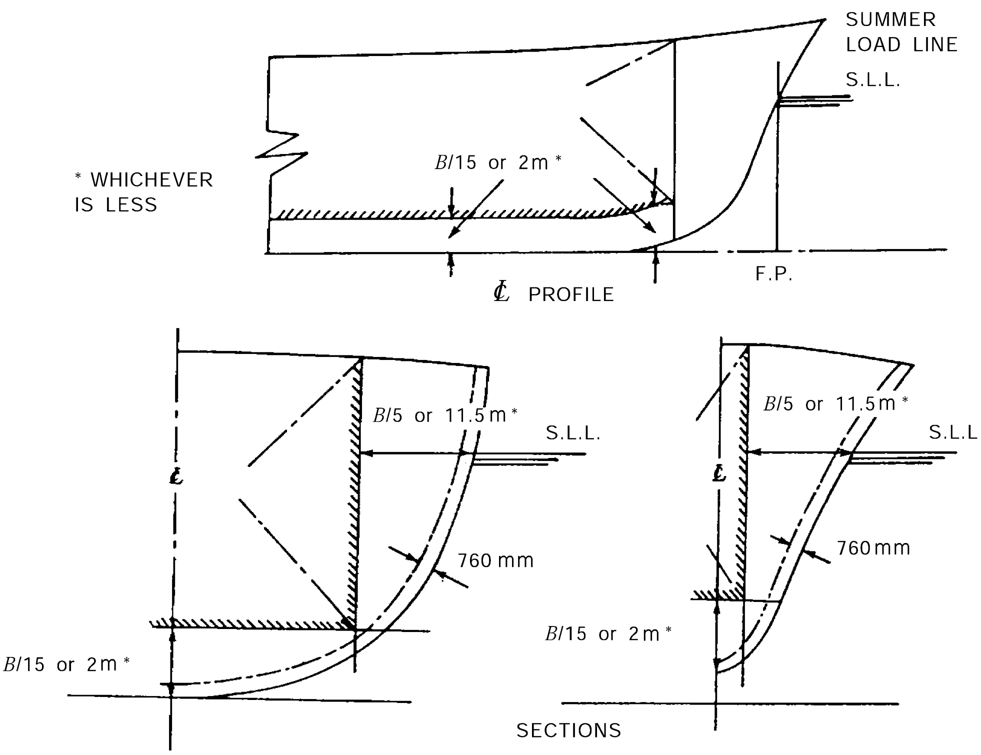

Fig 7.5.1 Tank location requirements as set out in 206.

3. Except for type 1 G ships, suction wells installed in cargo tanks may protrude into the vertical extent of bottom damage specified in **205. 1** (2) (c) provided that such wells are as small as practicable and the protrusion below the inner bottom plating does not exceed 25 % of the depth of the double bottom or 350 mm, whichever is less. Where there is no double bottom, the protrusion below the upper limit of bottom damage should not exceed 350 mm. Suction wells installed in accordance with this paragraph may be ignored in determining the compartments affected by damage.

207. Flooding assumptions (IGC Code 2.7)

1. The requirements of **209.** should be confirmed by calculations which take into consideration the design characteristics of the ship; the arrangements, configuration and contents of the damaged compartments; the distribution, relative densities and the free surface effects of liquids; and the draught and trim for all conditions of loading.

2. The permeabilities of spaces assumed to be damaged should be as follows:

Spaces	Permeabilities
Appropriated to stores	0.60
Occupied by accommodation	0.95
Occupied by machinery	0.85
Voids	0.95
Intended for consumable liquids	0 to 0.95
Intended for other liquids	0 to 0.95

3. Wherever damage penetrates a tank containing liquids, it should be assumed that the contents are completely lost from that compartment and replaced by salt water up to the level of the final plane of equilibrium.

4. Where the damage between transverse watertight bulkheads is envisaged as specified in **208. 1** (4), (5) and (6), transverse bulkheads should be spaced at least at a distance equal to the longitudinal extent of damage specified in **205. 1** (1) (a) in order to be considered effective. Where transverse bulkheads are spaced at a lesser distance, one or more of these bulkheads within such extent of damage should be assumed as non-existent for the purpose of determining flooded compartments. Further, any portion of a transverse bulkhead bounding side compartments or double bottom compartments should be assumed damaged if the watertight bulkhead boundaries are within the extent of vertical or horizontal penetration required by **205.** Also, any transverse bulkhead should be assumed damaged if it contains a step or recess of more than 3 m in length located within the extent of penetration of assumed damage. The step formed by the after peak bulkhead and after peak tank top should not be regarded as a step for the purpose of this paragraph.

5. The ship should be so designed as to keep unsymmetrical flooding to the minimum consistent with efficient arrangements.

6. Equalization arrangements requiring mechanical aids such as valves or cross-levelling pipes, if fitted, should not be considered for the purpose of reducing an angle of heel or attaining the minimum range of residual stability to meet the requirements of **209. 1** and sufficient residual stability should be maintained during all stages where equalization is used. Spaces which are linked by ducts of large cross-sectional area may be considered to be common.

7. If pipes, ducts, trunks or tunnels are situated within the assumed extent of damage penetration, as defined in **205.,** arrangements should be such that progressive flooding cannot thereby extend to compartments other than those assumed to be flooded for each case of damage.

8. The buoyancy of any superstructure directly above the side damage should be disregarded. The unflooded parts of superstructures beyond the extent of damage, however, may be taken into consideration provided that:

(1) they are separated from the damaged space by watertight divisions and the requirements of **209. 1** (1) in respect of these intact spaces are complied with; and

(2) openings in such divisions are capable of being closed by remotely operated sliding watertight doors and unprotected openings are not immersed within the minimum range of residual stability required in **209. 2** (1); however the immersion of any other openings capable of being closed weathertight may be permitted.

208. Standard of damage (IGC Code 2.8)

1. Ships should be capable of surviving the damage indicated in **205.** with the flooding assumptions in **207.** to the extent determined by the ship's type according to the following standards:

(1) A type 1 G ship should be assumed to sustain damage anywhere in its length;

(2) A type 2 G ship of more than 150 m in length should be assumed to sustain damage anywhere in its length;

(3) A type 2 G ship of 150 m in length or less should be assumed to sustain damage anywhere in

its length except involving either of the bulkheads bounding a machinery space located aft;

(4) A type 2 PG ship should be assumed to sustain damage anywhere in its length except involving transverse bulkheads spaced further apart than the longitudinal extent of damage as specified in **205. 1** (1) (a);

(5) A type 3 G ship of 125 m in length or more should be assumed to sustain damage anywhere in its length except involving transverse bulkheads spaced further apart than the longitudinal extent of damage specified in **205. 1** (1) (a);

(6) A type 3 G ship less than 125 m in length should be assumed to sustain damage anywhere in its length except involving transverse bulkheads spaced further apart than the longitudinal extent of damage specified in **205.1** (1) (a) and except damage involving the machinery space when located aft. However, the ability to survive the flooding of the machinery space should be considered by the Society.

2. In the case of small type 2 G/2 PG and 3G ships which do not comply in all respects with the appropriate requirements of **Par 1** (3), (4) and (6), special dispensations may only be considered by the Society provided that alternative measures can be taken which maintain the same degree of safety. The nature of the alternative measures should be approved and clearly stated and be available to the Port Administration. Any such dispensation should be duly noted on the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk.

209. Survival requirements (IGC Code 2.9)

Ships subject to this Chapter should be capable of surviving the assumed damage specified in **205.** to the standard provided in **208.** in a condition of stable equilibrium and should satisfy the following criteria.

1. In any stage of flooding:

(1) the waterline, taking into account sinkage, heel and trim, should be below the lower edge of any opening through which progressive flooding or downflooding may take place. Such openings should include air pipes and openings which are closed by means of weathertight doors or hatch covers and may exclude those openings closed by menas of watertight manhole covers and watertight flush scuttles, small watertight cargo tank hatch covers which maintain the high integrity of the deck, remotely operated watertight sliding doors, and sidescuttles of the non-opening type;

(2) the maximum angle of heel due to unsymmetrical flooding should not exceed 30°; and

(3) the residual stability during intermediate stages of flooding should be to the satisfaction of the Society. However, it should never be significantly less than that required by **Par 2** (1).

2. At final equilibrium after flooding:

(1) the righting lever curve should have a minimum range of 20° beyond the position of equilibrium in association with a maximum residual righting lever of at least 0.1 m within the 20° range; the area under the curve within this range should not be less than 0.0175 m·rad. Unprotected openings should not be immersed within this range unless the space concerned is assumed to be flooded. Within this range, the immersion of any of the openings listed in **Par 1** (1) and other openings capable of being closed weathertight may be permitted; and

(2) the emergency source of power should be capable of operating.

Section 3 Ship Arrangements

301. Segregation of the cargo area (IGC Code 3.1)

1. Hold spaces should be segregated from machinery and boiler spaces, accommodation spaces, service spaces and control stations, chain lockers, drinking and domestic water tanks and from stores. Hold spaces should be located forward of machinery spaces of category A, other than those deemed necessary by the Society for the safety or navigation of the ship.

2. Where cargo is carried in a cargo containment system not requiring a secondary barrier, segregation of hold spaces from spaces referred to in **Par 1** or spaces either below or outboard of the hold spaces may be effected by cofferdams, fuel oil tanks or a single gastight bulkhead of all-welded construction forming an A-60 class division. A gastight A-0 class division is satisfactory if there is no source of ignition or fire hazard in the adjoining spaces.

3. Where cargo is carried in a cargo containment system requiring a secondary barrier, segregation of hold spaces from spaces referred to in **Par 1** or spaces either below or outboard of the hold spaces which contain a source of ignition or fire hazard should be effected by cofferdams or fuel oil tanks. If there is no source of ignition or fire hazard in the adjoining space, segregation may be by a single A-0 class division which is gastight.

4. When cargo is carried in a cargo containment system requiring a secondary barrier:

(1) at temperatures below -10°C, hold spaces should be segregated from the sea by a double bottom; and

(2) at temperatures below -55°C, the ship should also have a longitudinal bulkhead forming side tanks.

5. Any piping system which may contain cargo or cargo vapour should:

(1) be segregated from other piping systems, except where inter-connections are required for cargo-related operations such as purging, gas-freeing or inerting. In such cases, precautions should be taken to ensure that cargo or cargo vapour cannot enter such other piping systems through the inter-connections;

(2) except as provided in **Sec 16,** not pass through any accommodation space, service space or control station or through a machinery space other than a cargo pump room or cargo compressor space;

(3) be connected into the cargo containment system directly from the open deck except that pipes installed in a vertical trunk-way or equivalent may be used to traverse void spaces above a cargo containment system and except that pipes for drainage, venting or purging may traverse cofferdams;

(4) except for bow or stern loading and unloading arrangements in accordance with **308.** and emergency cargo jettisoning piping systems in accordance with **Par 6,** and except in accordance with **Sec 16,** be located in the cargo area above the open deck; and

(5) except for thwartship shore connection piping not subject to internal pressure at sea or emergency cargo jettisoning piping systems, be located inboard of the transverse tank location requirements of **206.1.**

6. Any emergency cargo jettisoning piping system should comply with **Par 5** as appropriate and may be led aft externally to accommodation spaces, service spaces or control stations or machinery spaces, but should not pass through them. If an emergency cargo jettisoning piping system is permanently installed a suitable means of isolation from the cargo piping should be provided within the cargo area.

7. Arrangements should be made for sealing the weather decks in way of openings for cargo containment systems.

302. Accommodation, service and machinery spaces and control stations (IGC Code 3.2)

1. No accommodation space, service space or control station should be located within the cargo area. The bulkhead of accommodation spaces, service spaces or control stations which face the cargo area should be so located as to avoid the entry of gas from the hold space to such spaces through a single failure of a deck or bulkhead on a ship having a containment system requiring a secondary barrier.

2. In order to guard against the danger of hazardous vapours, due consideration should be given to the location of air intakes and openings into accommodation, service and machinery spaces and control stations in relation to cargo piping, cargo vent systems and machinery space exhausts from gas burning arrangements.

3. Access through doors, gastight or otherwise, should not be permitted from a gas-safe space to a gas-dangerous space, except for access to service spaces forward of the cargo area through air-locks as permitted by **306. 1** when accommodation spaces are aft.

4. Entrances, air inlets and openings to accommodation spaces, service spaces, machinery spaces and control stations should not face the cargo area. They should be located on the end bulkhead not facing the cargo area or on the outboard side of the superstructure or deckhouse or on both at a distance of at least 4 % of the length (L) of the ship but not less than 3 m from the end of the superstructure or deckhouse facing the cargo area. This distance, however, need not exceed 5 m. Windows and sidescuttles facing the cargo area and on the sides of the superstructure or deckhouse within the distance mentioned above should be of the fixed (non-opening) type. Wheelhouse windows may be non-fixed and wheelhouse doors may be located within the above limits so long as they are so designed that a rapid and efficient gas and vapour tightening of the wheelhouse can be ensured. For ships dedicated to the carriage of cargoes which have neither flammable nor toxic hazards, the Society may approve relaxations from the above requirements.

5. Sidescuttles in the shell below the uppermost continuous deck and in the first tier of the superstructure or deckhouse should be of the fixed (non-opening) type.

6. All air intakes and openings into the accommodation spaces, service spaces and control stations should be fitted with closing devices. For toxic gases they should be operated from inside the space.

303. Cargo pump rooms and cargo compressor rooms (IGC Code 3.3)

1. (1) Cargo pump rooms and cargo compressor rooms should be situated above the weather deck and located within the cargo area unless specially approved by the Society. Cargo compressor rooms should be treated as cargo pump rooms for the purpose of fire protection according to SOLAS chapter II-2/9.2.4.

(2) When cargo pump rooms and cargo compressor rooms are permitted to be fitted above or below the weather deck at the after end of the aftermost hold space or at the forward end of the forwardmost hold space, the limits of the cargo area as defined in **106. 6** should be extended to include the cargo pump rooms and cargo compressor rooms for the full breadth and depth of the ship and deck areas above those spaces.

(3) Where the limits of the cargo area are extended by (2), the bulkhead which separates the cargo pump rooms and cargo compressor rooms from accommodation and service spaces, control stations and machinery spaces of category A should be so located as to avoid the entry of gas to these spaces through a single failure of a deck or bulkhead.

2. Where pumps and compressors are driven by shafting passing through a bulkhead or deck, gastight seals with efficient lubrication or other means of ensuring the permanence of the gas seal should be fitted in way of the bulkhead or deck.

3. Arrangements of cargo pump rooms and cargo compressor rooms should be such as to ensure safe unrestricted access for personnel wearing protective clothing and breathing apparatus, and in the event of injury to allow unconscious personnel to be removed. All valves necessary for cargo handling should be readily accessible to personnel wearing protective clothing. Suitable arrangements should be made to deal with drainage of pump and compressor rooms.

304. Cargo control rooms (IGC Code 3.4)

1. Any cargo control room should be above the weather deck and may be located in the cargo area. The cargo control room may be located within the accommodation spaces, service spaces or control stations provided the following conditions are complied with:

(1) the cargo control room is a gas-safe space; and

(2) (a) if the entrance complies with **302. 4,** the control room may have access to the spaces de-

scribed above;

(b) if the entrance does into comply with **302. 4,** the control room should have no access to the spaces described above and the boundaries to such spaces should be insulated to A-60 class integrity

2. If the cargo control room is designed to be a gas-safe space, instrumentation should, as far as possible, be by indirect reading systems and should in any case be designed to prevent any escape of gas into the atmosphere of that space. Location of the gas detector within the cargo control room will not violate the gas-safe space if installed in accordance with **1306. 5.**

3. If the cargo control room for ships carrying flammable cargoes is a gas-dangerous space, sources of ignition should be excluded. Consideration should be paid to the safety characteristics of any electrical installations.

305. Access to spaces in the cargo area (IGC Code 3.5)

1. Visual inspection should be possible of at least one side of the inner hull structure without the removal of any fixed structure or fitting. If such a visual inspection, whether combined with those inspections required in **Par 2, 407. 7** or **410. 16** or not, is only possible at the outer face of the inner hull, the inner hull should not be a fuel-oil tank boundary wall.

2. Inspection of one side of any insulation in hold spaces should be possible. If the integrity of the insulation system can be verified by inspection of the outside of the hold space boundary when tanks are at service temperature, inspection of one side of the insulation in the hold space need not be required.

3. Arrangements for hold spaces, void spaces and other spaces that could be considered gas-dangerous and cargo tanks should be such as to allow entry and inspection of any such space by personnel wearing protective clothing and breathing apparatus and in the event of injury to allow unconscious personnel to be removed from the space and should comply with the following:

(1) Access should be provided:

(A) to cargo tanks direct from the open deck;

(B) through horizontal openings, hatches or manholes, the dimensions of which should be sufficient to allow a person wearing a breathing apparatus to ascend or descend any ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space; the minimum clear opening should be not less than 600 mm by 600 mm; and

(C) through vertical openings, or manholes providing passage through the length and breadth of the space, the minimum clear opening of which should be not less than 600 mm by 800 mm at a height of not more than 600 mm from the bottom plating unless gratings or other footholds are provided.

(2) the dimensions referred to in (1) (B) and (C) may be decreased if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of the Society.

(3) The requirements of (1) (B) and (C) do not apply to spaces described in **106. 17** (5). Such spaces should be provided only with direct or indirect access from the open weather deck, not including an enclosed gas-safe space.

4. Access from the open weather deck to gas-safe spaces should be located in a gas-safe zone at least 2.4 m above the weather deck unless the access is by means of an air-lock in accordance with **306.**

306. Air locks (IGC Code 3.6)

1. An air-lock should only be permitted between a gas-dangerous zone on the open weather deck and a gas-safe space and should consist of two steel doors substantially gastight spaced at least 1.5 m but not more than 2.5 m apart.

2. The doors should be self-closing and without any holding back arrangements.

3. An audible and visual alarm system to give a warning on both sides of the air lock should be provided to indicate if more than one door is moved from the closed position.

4. In ships carrying flammable products, electrical equipment which is not of the certified safe type in spaces protected by air locks should be de-energized upon loss of overpressure in the space (see also **1001.** 4). Electrical equipment which is not of the certified safe type for manoeuvring, anchoring and mooring equipment as well as the emergency fire pumps should not be located in spaces to be protected by air locks.

5. The air lock space should be mechanically ventilated from a gas-safe space and maintained at an overpressure to the gas-dangerous zone on the open weather deck.

6. The air-lock space should be monitored for cargo vapour.

7. Subject to the requirements of the International Convention on Load Lines in force, the door still should not be less than 300 mm in height.

307. Bilge, ballast and fuel oil arrangements (IGC Code 3.7)

1. (1) Where cargo is carried in a cargo containment system not requiring a secondary barrier, hold spaces should be provided with suitable drainage arrangements not connected with the machinery space. Means of detecting any leakage should be provided.

(2) Where there is a secondary barrier, suitable drainage arrangements for dealing with any leakage into the hold or insulation spaces through adjacent ship structure should be provided. The suction should not be led to pumps inside the machinery space. Means of detecting such leakage should be provided.

2. (1) The hold or interbarrier spaces of Type A independent tank ships should be provided with a drainage system suitable for handling liquid cargo in the event of cargo tank leakage or rupture. Such arrangements should provide for the return of any cargo leakage to the liquid cargo piping.

(2) Arrangements referred to in (1) should provided with a removable spool piece. This paragraph applies to ships constructed on or after 1 July 2002.

3. In case of internal insulation tanks, means of detecting leakage and drainage arrangements are not required for interbarrier spaces and spaces between the secondary barrier and the inner hull or independent tank structure which are completely filled by insulation material complying with **409. 7** (2).

4. Ballast spaces, including wet duct keels used as ballast piping, fuel-oil tanks and gas-safe spaces may be connected to pumps in the machinery spaces. Dry duct keels with ballast piping passing through, may be connected to pumps in the machinery spaces, provided the connections are led directly to the pumps and the discharge from the pumps lead directly overboard with no valves or manifolds in either line which could connect the line from the duct keel to lines serving gas-safe spaces. Pump vents should not be open to machinery spaces.

308. Bow or stern loading and unloading arrangements (IGC Code 3.8)

1. Subject to the requirements in **308.,** cargo piping may be arranged to permit bow or stern loading and unloading.

Bow or stern loading and unloading lines which are led past accommodation spaces, service spaces or control stations should not be used for the transfer of products requiring a type 1G ship. Bow or stern loading and unloading lines should not be used for the transfer of toxic products as specified in **106. 38** unless specifically approved by the Society.

2. Portable arrangements should not be permitted.

3. In addition to the requirements of **Sec 5** the following provisions apply to cargo piping and related piping equipment:

(1) Cargo piping and related piping equipment outside the cargo area should have only welded connections. The piping outside the cargo area should run on the open deck and should be at least 760 mm inboard except for thwartships shore connection piping. Such piping should be clearly identified and fitted with a shutoff valve at its connection to the cargo piping system within the cargo area. At this location, it should also be capable of being separated by means of a removable spool piece and blank flanges when not in use.

(2) The piping is to be full penetration butt welded, and fully radiographed regardless of pipe diameter and design temperature. Flange connections in the piping are only permitted within the cargo area and at the shore connection.

(3) Arrangements should be made to allow such piping to be purged and gas-freed after use When not in use, the spool pieces should be removed and the pipe ends be blank-flanged. The vent pipes connected with the purge should be located in the cargo area.

4. Entrances, air inlets and openings to accommodation spaces, service spaces, machinery spaces and control stations should not face the cargo shore connection location of bow or stern loading and unloading arrangements. They should be located on the outboard side of the superstructure or deckhouse at a distance of at least 4 % of the length of the ship but not less than 3 m from the end of the superstructure or deck house facing the cargo shore connection location of the bow or stern loading and unloading arrangements. This distance, however, need not exceed 5 m. Sidescuttles facing the shore connection location and on the sides of the superstructure or deckhouse within the distance mentioned above should be of the fixed (non-opening) type. In addition. during the use of the bow or stern loading and unloading arrangements, all doors, ports and other openings on the corresponding superstructure or deckhouse side should be kept closed. Where, in the case of small ships, compliance with **302. 4** and this paragraph is not possible, the Society may approve relaxations from the above requirements.

5. Deck openings and air inlets to spaces within distances of 10 m from the cargo shore connection location should be kept closed during the use of bow or stern loading or unloading arrangements.

6. Electrical equipment within a zone of 3 m from the cargo shore connection location should be in accordance with **Sec 10.**

7. Fire-fighting arrangements for the bow or stern loading and unloading areas should be in accordance with **1103. 1** (3) and **1104. 7.**

8. Means of communication between the cargo control station and the shore connection location should be provided and if necessary certified safe.

Section 4 Cargo Containment

401. General (IGC Code 4.1)

1. The Society should take appropriate steps to ensure uniformity in the implementation and application of the provisions of this Section.

2. In addition to the definitions in **106.,** the definitions given in this Section apply throughout this Chapter.

402. Definitions (IGC Code 4.2)

1. Integral tanks

(1) Integral tanks form a structural part of the ship's hull and are influenced in the same manner and by the same loads which stress the adjacent hull structure.
(2) The design vapour pressure P_0 as defined in **Par 6** should not normally exceed 0.025 MPa. If, however, the hull scantlings are increased accordingly, P_0 may be increased to a higher value but less than 0.007 MPa.
(3) Integral tanks may be used for products provided the boiling point of the cargo is not below -10°C. A lower temperature may be accepted by the Society subject to special consideration.

2. Membrane tanks

(1) Membrane tanks are non-self-supporting tanks which consist of a thin layer (membrane) supported through insulation by the adjacent hull structure. The membrane is designed in such a way that thermal and other expansion or contraction is compensated for without undue stressing of the membrane.
(2) The design vapour pressure P_0 should not normally exceed 0.025 MPa. If, however, the hull scantlings are increased accordingly and consideration is given, where appropriate, to the strength of the supporting insulation, P_0 may be increased to a higher value but less than 0.07 MPa.
(3) The definition of membrane tanks does not exclude designs such as those in which nonmetallic membranes are used or in which membranes are included or incorporated in insulation. Such designs require, however, special consideration by the Society. In any case the thickness of the membranes should normally not exceed 10 mm.

3. Semi-membrane tanks

(1) Semi-membrane tanks are non-self-supporting tanks in the loaded condition and consist of a layer, parts of which are supported through insulation by the adjacent hull structure, whereas the rounded parts of this layer connecting the above-mentioned supported parts are designed also to accommodate the thermal and other expansion or contraction.
(2) The design vapour pressure P_0 should not normally exceed 0.025 MPa. If, however, the hull scantlings are increased accordingly, and consideration is given, where appropriate, to the strength of the supporting insulation, P_0 may be increased to a higher value but less than 0.07 MPa.

4. Independent tanks

(1) Independent tanks are self-supporting; they do not form part of the ship's hull and are not essential to the hull strength. There are three categories of independent tanks referred to in (2) to (4).
(2) Type A independent tanks are tanks which are designed primarily using recognized standards of classical ship-structural analysis procedures. Where such tank are primarily constructed of plane surfaces (gravity tanks), the design vapour pressure P_0 should be less than 0.07 MPa.
(3) Type B independent tanks are tanks which are designed using model tests, refined analytical tools and analysis methods to determine stress levels, fatigue life and crack propagation characteristics. Where such tanks are primarily constructed of plane surfaces (gravity tanks) the design vapour pressure P_0 should be less than 0.07 MPa.
(4) Type C independent tanks (also referred to as pressure vessels) are tanks meeting pressure vessel criteria and having a design vapour pressure not less than:

$P_0 = 0.2 + A\,C(\rho_r)^{\frac{3}{2}}$ (MPa)

where : $A = 0.00185\left(\dfrac{\sigma_m}{\triangle\sigma_A}\right)^2$

with

σ_m = design primary membrane stress

$\triangle\sigma_A$ = allowable dynamic membrane stress (double amplitude at probability level $Q = 10^{-8}$)

55 N/mm^2 for ferritic-perlitic, martensitic and austenitic steels

25 N/mm^2 for aluminium alloy (5083-0)

C = a characteristic tank dimension to be taken as the greatest of the following:

h, $0.75b$ or $0.45l$

with

h = height of tank (dimension in ship's vertical direction) (m)

b = width of tank (dimension in ship's transverse direction) (m)

l = length of tank (dimension in ship's longitudinal direction) (m)

ρ_r = the relative density of the cargo (ρ_r = 1 for fresh water) at the design temperature.

However, the Society may allocate a tank complying with the criterion of this subparagraph to type A or type B, dependent on the configuration of the tank and the arrangement of its supports and attachments.

5. Internal insulation tanks

(1) Internal insulation tanks are non-self-supporting and consist of thermal insulation materials which contribute to the cargo containment and are supported by the structure of the adjacent inner hull or of an independent tank. The inner surface of the insulation is exposed to the cargo.

(2) The two categories of internal insulation tanks are:

(a) Type 1 tanks which are tanks in which the insulation or a combination of the insulation and one or more liners functions only as the primary barrier. The inner hull or an independent tank structure should function as the secondary barrier when required.

(b) Type 2 tanks which are tanks in which the insulation or a combination of the insulation and one or more liners functions as both the primary and the secondary barrier and where these barriers are clearly distinguishable.

The terms "liner" means a thin, non-self-supporting, metallic, nonmetallic or composite material which forms part of an internal insulation tank in order to enhance its fracture resistance or other mechanical properties. A liner differs from a membrane in that it is not intended to function alone as a liquid barrier.

(3) Internal insulation tanks should be of suitable materials enabling the cargo containment system to be designed using model tests and refined analytical methods as required in **404. 7.**

(4) The design vapour pressure P_0 should not normally exceed 0.025 MPa. If, however, the cargo containment system is designed for a higher vapour pressure, P_0 may be increased to such higher value, but not exceeding 0.07 MPa if the internal insulation tanks are supported by the inner hull structure. However, a design vapour pressure of more than 0.07 MPa may be accepted by the Society provided the internal insulation tanks are supported by suitable independent tank structures.

6. Design vapour pressure

(1) The design vapour pressure P_0 is the maximum gauge pressure at the top of the tank which has been used in the design of the tank.

(2) For cargo tanks where there is no temperature control and where the pressure of the cargo is dictated only by the ambient temperature, P_0 should not be less than the gauge vapour pressure of the cargo at a temperature of 45°C. However, lesser values of this temperature may be accepted by the Society for ships operating in restricted areas or on voyages of restricted duration and account may be taken in such cases of any insulation of the tanks. Conversely, higher values of this temperature may be required for ships permanently operating in areas of high am-

bient temperature.

(3) In all cases, including (2), P_0 should not be less than MARVS.

(4) Subject to special consideration by the Society and to the limitations given in **Pars 1** to **5** for the various tank types, a vapour pressure higher than P_0 may be accepted in harbour conditions, where dynamic loads are reduced.

7. Design temperature

The design temperature for selection of materials is the minimum temperature at which cargo may be loaded or transported in the cargo tanks. Provision to the satisfaction of the Society should be made to ensure that the tank or cargo temperature cannot be lowered below the design temperature.

403. Design loads (IGC Code 4.3)

1. General

(1) Tanks together with their supports and other fixtures should be designed taking into account proper combinations of the following loads:
- internal pressure
- external pressure
- dynamic loads due to the motions of the ship
- thermal loads sloshing loads
- loads corresponding to ship deflection
- tank and cargo weight with the corresponding reactions in way of supports
- insulation weight
- loads in way of towers and other attachment

The extent to which these loads should be considered depends on the type of tank, and is more fully detailed in the following paragraphs.

(2) Account should be taken of the loads corresponding to the pressure test referred to in **410.**

(3) Account should be taken of an increase of vapour pressure in harbour conditions referred to in **402. 6** (4).

(4) The tanks should be designed for the most unfavourable static heel angle within the range 0° to 30° without exceeding allowable stresses given in **405. 1.**

2. Internal pressure

(1) The internal pressure P_{eq} in bars gauge resulting from the design vapour pressure P_0 and the internal liquid pressure P_{gd} defined in (2), but not including effects of liquid sloshing, should be calculated as follows:

$$P_{eq} = P_0 + (P_{gd})\,\mathrm{max} \quad (\mathrm{MPa})$$

Equivalent calculation procedures may be applied.

(2) The internal liquid pressures are those created by the resulting acceleration of the centre of gravity of the cargo due to the motions of the ship referred to in **Par 4** (1). The value of internal liquid pressure P_{gd} resulting from combined effects of gravity and dynamic accelerations should be calculated as follows:

$$P_{gd} = a_\beta Z_\beta \frac{\rho}{1.02 \times 10^5} \quad (\mathrm{MPa})$$

where:

a_β = dimensionless acceleration (i.e. relative to the acceleration of gravity), resulting from gravitational and dynamic loads, in an arbitrary direction β (see **Fig 7.5.2**).

Z_β = largest liquid height (m) above the point where the pressure is to be determined measured from the tank shell in the β direction (see **Fig 7.5.3**). Tank domes considered to be part of the accepted total tank volume should be taken into account when determining Z_β unless the total volume of tank domes V_d does not exceed the following value:

$$V_d = V_t\left(\frac{100 - FL}{FL}\right)$$

where:

V_t = tank volume without any domes.

FL = filling limit (%) according to **Sec 15**

ρ = maximum cargo density (kg/m^3) at the design temperature.

The direction which gives the maximum value $(P_{gd})\max$ of P_{gd} should be considered. Where acceleration components in three directions need to be considered, an ellipsoid should be used instead of the ellipse in **Fig. 7.5.2.** The above formula applies only to full tanks.

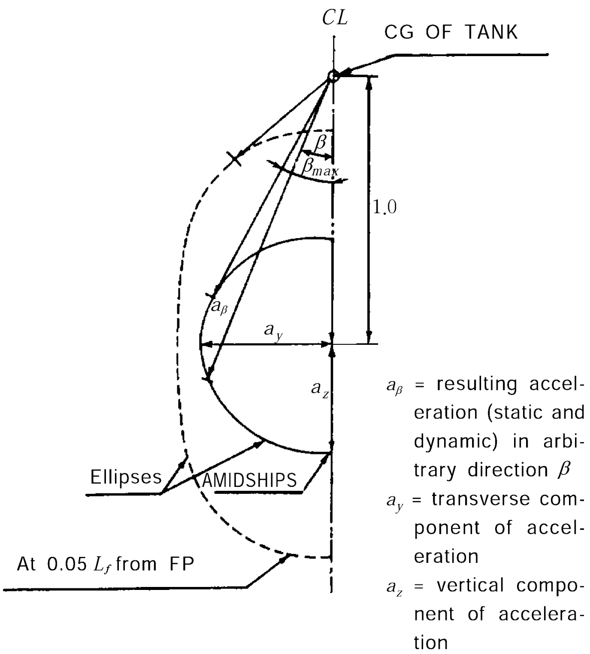

Fig. 7.5.2 Acceleration Ellipse

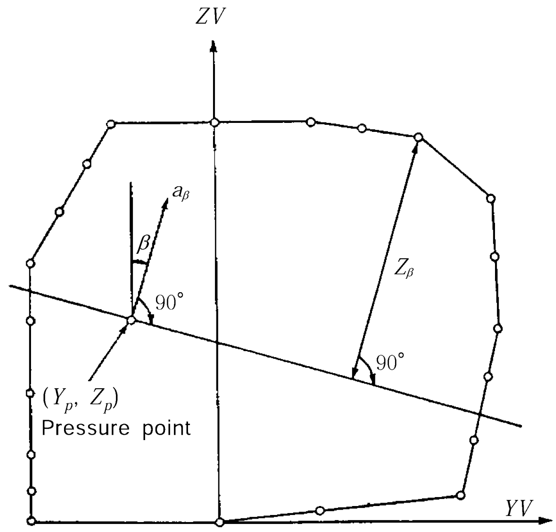

Fig. 7.5.3 Determination of Internal Pressure Heads

3. External pressure

External design pressure loads should be based on the difference between the minimum internal pressure (maximum vacuum) and the maximum external pressure to which any portion of the tank may be subjected simultaneously.

4. Dynamic loads due to ship motions

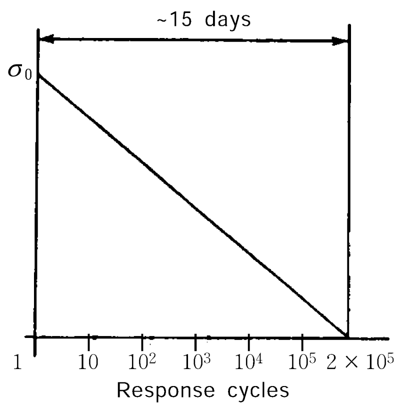
(1) The determination of dynamic loads should take account of the long-term distribution of ship motions, including the effects of surge, sway, heave, roll, pitch and yaw on irregular seas which the ship will experience during its operating life (normally taken to correspond to 10^8 wave encounters). Account may be taken of reduction in dynamic loads due to necessary speed reduction and variation of heading when this consideration has also formed part of the hull strength assessment.

(2) For design against plastic deformation and buckl ing the dynamic loads should be taken as the most probable largest loads the ship will encounte during its operating life (normally taken to correspond to a probability level of 10^{-8}). Guidance formulae for acceleration components are

given in **412.**

(3) When design against fatigue is to be considered the dynamic spectrum should be determined by long-term distribution calculation based on the operating life of the ship (normally taken to correspond to 10^8 wave encounters). If simplified dynamic loading spectra are used for the estimation of the fatigue life, those should be specially considered by the Society.

(4) For practical application of crack propagation estimates, simplified load distribution over a period of 15 days may be used. Such distributions may be obtained as indicated in **Fig 7.5.4.**



σ_0 = most probable maximum stress over the life of the ship

Response cycle scale is logarithmic; the value of 2×10^5 is given as an example of estimate.

Fig 7.5.4 Simplified Load Ditribution

(5) Ships for restricted service may be given special consideration.

(6) The accelerations acting on tanks are estimated at their centre of gravity and include the following components :

vertical acceleration : motion accelerations of heave, pitch and, possibly, roll (normal to the ship base);

transverse acceleration : motion accelerations of sway, yaw and roll; and gravity component of roll;

longitudinal acceleration : motion accelerations of surge and pitch; and gravity component of pitch.

5. Sloshing loads

(1) When partial filling is contemplated, the risk of significant loads due to sloshing induced by any of the ship motions referred to in **Par 4** (6) should be considered.

(2) When risk of significant sloshing-induced loads in found to be present, special tests and calculations should be required.

6. Thermal loads

(1) Transient thermal loads during cooling down periods should be considered for tanks intended for cargo temperatures below -55°C.

(2) Stationary thermal loads should be considered for tanks where design supporting arrangement and operating temperature may given rise to significant thermal stresses.

7. Loads on supports

The loads on supports are covered by **406.**

404. Structural analyses (IGC Code 4.4)

1. Integral tanks

The structural analysis of integral tanks should be in accordance with the requirements of **Pt 3, Ch 15** of the Rules. The tank boundary scantlings should meet at least the requirements for deep tanks taking into account the internal pressure as indicated in **403. 2,** but the resulting scantlings should not be less than normally required by such standards.

2. Membrane tanks

(1) For membrane tanks, the effects of all static and dynamic loads should be considered to determine the suitability of the membrane and of the associated insulation with respect to plastic deformation and fatigue.

(2) Before approval is given, a model of both the primary and secondary barriers, including corners and joints, should normally be tested to verify that they will withstand the expected combined strains due to static, dynamic and thermal loads. Test conditions should represent the most extreme service conditions the cargo containment system will see in its life. Material tests should ensure that ageing is not liable to prevent the materials from carrying out their intended function.

(3) For the purpose of the test referred to in (2), a complete analysis of the particular motions, accelerations and response of ships and cargo containment systems should be performed, unless these data are available from similar ships.

(4) Special attention should be paid to the possible collapse of the membrane due to an overpressure in the interbarrier space, to a possible vacuum in the cargo tank, to the sloshing effects and to hull vibration effects.

(5) A structural analysis of the hull should be to the satisfaction of the Society, taking into account the internal pressure as indicated in **403. 2.** Special attention, however, should be paid to deflections of the hull and their compatibility with the membrane and associated insulation. Inner hull plating thickness should meet at least the requirements of **Pt 3, Ch 15** of the Rules for deep tanks taking into account the internal pressure as indicated in **403. 2.** The allowable stress for the membrane, membrane-supporting material and insulation should be determined in each particular case.

3. Semi-membrane tanks

A structural analysis should be performed in accordance with the requirements for membrane tanks or independent tanks as appropriate, taking into account the internal pressure as indicated in **403. 2.**

4. Type A independent tanks

(1) A structural analysis should be performed to the satisfaction of the Society taking into account the internal pressure as indicated in **403. 2.** The cargo tank plating thickness should meet at least the requirements of **Pt 3, Ch 15** of the Rules for deep tanks taking into account the internal pressure as indicated in **403. 2** and any corrosion allowance required by **405. 2.**

(2) For parts such as structure in way of supports not otherwise covered by the requirements of **Pt 3, Ch 15** of the Rules, stresses should be determined by direct calculations, taking into account the loads referred to in **403.** as far as applicable, and the ship deflection in way of supports.

5. Type B independent tanks

For tanks of this type the following applies :

(1) The effects of all dynamic and static loads should be used to determine the suitability of the structure with respect to:
- plastic deformation
- buckling
- fatigue failure
- crack propagation

Statistical wave load analysis in accordance with **403. 4,** finite element analysis or similar methods and fracture mechanics analysis or an equivalent approach, should be carried out.

(2) A three-dimensional analysis should be carried out to evaluate the stress levels contributed by the ship's hull. The model for this analysis should include the cargo tank with its supporting and keying system as well as a reasonable part of the hull.

(3) A complete analysis of the particular ship accelerations and motions in irregular waves and of the response of the ship and its cargo tanks to these forces and motions should be performed unless these data are available from similar ships.
(4) A buckling analysis should consider the maximum construction tolerances.
(5) Where deemed necessary by the Society, model tests may be required to determine stress concentration factors and fatigue life of structural elements.
(6) The cumulative effect of the fatigue load should comply with:

$$\Sigma\frac{n_i}{N_i}+\frac{10^3}{N_j}\le C_w$$

where:

n_i = number of stress cycles at each stress level during the life of the ship

N_i = number of cycles to fracture for the respective stress level according to the Wöhler ($S-N$) curve

N_j = number of cycles to fracture for the fatigue loads due to loading and unloading

C_w should be less than or equal to 0.5, except that the Society may give special consideration to the use of a value greater than 0.5 but not greater than 1.0, dependent on the test procedure and data used to establish the Wöhler ($S-N$) curve.

6. Type C independent tanks

(1) Scantlings based on internal pressure should be calculated as follows :
(a) The thickness and form of pressure-containing parts of pressure vessels under internal pressure, including flanges should be determined according to the requirements of **Pt 5, Ch 5** of the Rules. These calculations in all cases should be based on generally accepted pressure vessel design theory, Openings in pressure-containing parts of pressure vessels should be reinforced in accordance with the requirements of **Pt 5, Ch 5** of the Rules.
(b) The design liquid pressure defined in **403. 2** should be taken into account in the above calculations.
(c) The welded joint efficiency factor to be used in the calculation according to (a) should be 0.95 when the inspection and the non-destructive testing referred to in **410. 9** are carried out. This figure may be increased up to 1.0 when account is taken of other considerations, such as the material used, type of joints, welding procedure and type of loading. For process pressure vessels the Society may accept partial nondestructive examinations, but not less than those of **410. 9** (2) (b) depending on such factors as the material used, the design temperature, the nil ductility transition temperature of the material as fabricated, the type of joint and welding procedure, but in this case an efficiency factor of not more than 0.85 should be adopted. For special materials, the above-metioned factors should be reduced depending on the specified mechanical properties of the welded joint.
(2) Buckling criteria should be as follows:
(a) The thickness and form of pressure vessels subject to external pressure and other loads causing compressive stresses should be to a standard acceptable to the Society. These calculations in all cases should be based on generally accepted pressure vessel buckling theory and should adequately account for the difference in theoretical and actual buckling stress as a result of plate edge misalignment, ovality and deviation from true circular form over a specified arc or chord length.
(b) The design external pressure P_e used for verifying the buckling of the pressure vessels should not be less than that given by:

$$P_e=P_1+P_2+P_3+P_4\,(\mathrm{MPa})$$

where:

P_1 = setting value of vacuum relief valves. For vessels not fitted with vacuum relief valves P_1 should be specially considered, but should not in general be taken as less than 0.025 MPa.

P_2 = the set pressure of the pressure relief valves for completely closed spaces containing pressure vessels or parts of pressure vessels; elsewhere P_2 = 0.

P_3 = compressive actions in the shell due to the weight and contraction of insulation, weight of shell, including corrosion allowance, and other miscellaneous external pressure loads to which the pressure vessel may be subjected. These include, but are not limited to, weight of domes, weight of towers and piping, effect of product in the partially filled condition, accelerations and hull deflection. In addition the local effect of external or internal pressure or both should be taken into account.

P_4 = external pressure due to head of water for pressure vessels or part of pressure vessels on exposed decks;
elsewhere P_4 = 0.

(3) Stress analysis in respect of static and dynamic loads should be performed as follows:
(a) Pressure vessel scantlings should be determined in accordance with (1) and (2).
(b) Calculations of the loads and stresses in way of the supports and the shell attachment of the support should be made. Loads referred to in **403.** should be used, as applicable. Stresses in way of the supports should be to a standard acceptable to the Society. In special cases a fatigue analysis may be required by the Society.
(c) If required by the Society, secondary stresses and thermal stresses should be specially considered.

(4) For pressure vessels, the thickness calculated according to (1) or the thickness required by (2) plus the corrosion allowance, if any, should be considered as a minimum without any negative tolerance.

(5) For pressure vessels, the minimum thickness of shell and heads including corrosion allowance, after forming, should not be less than 5 mm for carbon-manganese steels and nickel steels, 3 mm for austenitic steels or 7 mm for aluminium alloys.

7. Internal insulation tanks

(1) The effects of all static and dynamic loads should be considered to determine the suitability of the tank with respect to:
- fatigue failure
- crack propagation from both free and supported surfaces
- adhesive and cohesive strength
- compressive, tensile and shear strength.

Statistical wave load analysis in accordance with **403. 4,** finite element analysis or similar methods and fracture mechanics analysis or an equivalent approach should be carried out.

(2) (a) Special attention should be given to crack resistance and to deflections of the inner hull or independent tank structure and their compatibility with the insulation materials. A three-dimensional structural analysis should be carried out to the satisfaction of the Society. This analysis is to evaluate the stress levels and deformations contributed either by the inner hull or by the independent tank structure or both and should also take into account the internal pressure as indicated in **403. 2.** Where water ballast spaces are adjacent to the inner hull forming the supporting structure of the internal insulation tank, the analysis should take account of the dynamic loads caused by water ballast under the influence of ship motions.
(b) The allowable stresses and associated deflections for the internal insulation tank and the inner hull structure or independent tank structure should be determined in each particular case.
(c) Thicknesses of plating of the inner hull or of an independent tank should at least comply with the requirements of Recognized Standards, taking into account the internal pressure as indicated in **403. 2.** Tanks constructed of plane surfaces should at least comply with the requirements of **Pt 3, Ch 15** of the Rules for deep tanks.

(3) A complete analysis of the response of ship, cargo and any ballast to accelerations and motions in irregular waves of the particular ship should be performed to the satisfaction of the Society unless such analysis is available for a similar ship.

(4) (a) In order to confirm the design principles, prototype testing of composite models including

structural elements should be carried out under combined effects of static, dynamic and thermal loads.

(b) Test conditions should represent the most extreme service conditions the cargo containment system will be exposed to during the lifetime of the ship, including thermal cycles. For this purpose, 400 thermal cycles are considered to be a minimum, based upon 19 round voyages per year; where more than 19 round voyages per year are expected, a higher number of thermal cycles will be required. These 400 thermal cycles may be divided into 20 full cycles (cargo temperature to 45°C) and 380 partial cycles (cargo temperature to that temperature expected to be reached in the ballast voyage).

(c) Models should be representative of the actual construction including corners, joints, pump mounts, piping penetrations and other critical areas, and should take into account variations in any material properties, workmanship and quality control.

(d) Combined tension and fatigue tests should be carried out to evaluate crack behaviour of the insulation material in the case where a through crack develops in the inner hull or independent tank structure. In these tests, where applicable the crack area should be subjected to the maximum hydrostatic pressure of the ballast water.

(5) The effects of fatigue loading should be determined in accordance with **Par 5** (6) or by an equivalent method.

(6) For internal insulation tanks, repair procedures should be developed during the prototype testing programme for both the insulation material and the inner hull or the independent tank structure.

405. Allowable stresses and corrosion allowances (IGC Code 4.5)

1. Allowable stresses

(1) For integral tanks, allowable stresses should normally be those given for hull structure in the requirements of **Pt 3, Ch 1, 206.** of the Rules.

(2) For membrane tanks, reference is made to the requirements of **404. 2.** (5).

(3) For type A independent tanks primarily constructed of plane surfaces, the stresses for primary and secondary members (stiffeners, webframes, stringers, girders) when calculated by classical analysis procedures should not exceed the lower of $R_m/2.66$ or $R_e/1.33$ for carbon-manganese steels and aluminium alloys, where R_m and R_e are defined in (7). However, if detailed calculations are carried out for the primary members, the equivalent stress σ_c as defined in (8) may be increased over that indicated above to a stress acceptable to the Society; calculations should take into account the effects of bending, shear, axial and torsional deformation as well as the hull/cargo tank interaction forces due to the deflection of the double bottom and cargo tank bottoms.

(4) For type B independent tanks, primarily constructed of bodies of revolution, the allowable stresses should not exceed:

$$\sigma_m \leq f$$

$$\sigma_L \leq 1.5f$$

$$\sigma_b \leq 1.5F$$

$$\sigma_L + \sigma_b \leq 1.5F$$

$$\sigma_m + \sigma_b \leq 1.5F$$

where:

σ_m = equivalent primary general membrane stress

σ_L = equivalent primary local membrane stress

σ_b = equivalent primary bending stress

f = the lesser of R_m/A or R_e/B

F = the lesser of R_m/C or R_e/D

with R_m and R_e as defined in (7). With regard to the stresses σ_m, σ_L and σ_b see also the definition of stress categories in **413.** The values of A, B, C and D should be shown on the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk and should have at least the minimum values of **Table 7.5.1.**

(5) For type B independent tanks, primarily constructed of plane surfaces, the Society may require compliance with additional or other stress criteria.

(6) For type C independent tanks the maximum allowable membrane stress to be used in calculation according to **404. 6** (1) (a) should be the lower of:

R_m/A or R_e/B

where:

R_m and R_e are as defined in (7).

The values of A and B should be shown on the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk, and should have at least the minimum values indicated in the **Table 7.5.1.**

Table 7.5.1 Values of A, B, C and D

	Nickel steels and carbon-manganese steels	Austenitic steels	Aluminium alloys
A	3	3.5	4
B	2	1.6	1.5
C	3	3	3
D	1.5	1.5	1.5

(7) For the purpose of (3), (4) and (6) the following apply:

(a) R_e = specified minimum yield stress at room temperature (N/mm^2). If the stress strain curve does not show a defined yield stress, the 0.2 % proof stress applies.

R_m = specified minimum tensile strength at room temperature (N/mm^2).

For welded connections in aluminium alloys the respective values of R_e or R_m in annealed conditions should be used.

(b) The above properties should correspond to the minimum specified mechanical properties of the material, including the weld metal in the as-fabricated condition. Subject to special consideration by the Society, account may be taken of enhanced yield stress and tensile strength at low temperature. The temperature on which the material properties are based should be shown on the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk.

(8) The equivalent stress σ_c (von Mises, Huber) should be determined by:

$$\sigma_c = \sqrt{\sigma_x^2 + \sigma_y^2 - \sigma_x \sigma_y + 3\tau_{xy}^2}$$

where:

σ_x = total normal stress in x-direction

σ_y = total normal stress in y-direction

τ_{xy} = total shear stress in x-y plane.

(9) When the static and dynamic stresses are calculated separately and unless other methods of calculation are justified, the total stresses should be calculated according to:

$$\sigma_x = \sigma_{x \cdot st} \pm \sqrt{\Sigma(\sigma_{x \cdot dyn})^2}$$

$$\sigma_y = \sigma_{y \cdot st} \pm \sqrt{\Sigma(\sigma_{y \cdot dyn})^2}$$

$$\tau_{xy} = \tau_{xy \cdot st} \pm \sqrt{\Sigma(\tau_{xy \cdot dyn})^2}$$

where:

$\sigma_{x \cdot st}$, $\sigma_{y \cdot st}$ and $\tau_{xy \cdot st}$ = static stresses

$\sigma_{x \cdot dyn}$, $\sigma_{y \cdot dyn}$ and $\tau_{xy \cdot dyn}$ = dynamic stresses

all determined separately from acceleration components and hull strain components due to deflection and torsion.

(10) For internal insulation tanks, reference is made to the requirements of **404. 7** (2).

(11) Allowable stresses for materials other than those covered by **Sec 6** should be subject to approval by the Society in each case.

(12) Stresses may be further limited by fatigue analysis, crack propagation analysis and buckling criteria.

2. Corrosion allowances

(1) No corrosion allowance should generally be required in addition to the thickness resulting from the structural analysis. However, where there is no environmental control around the cargo tank, such as inerting, or where the cargo is of a corrosive nature, the Society may require a suitable corrosion allowance.

(2) For pressure vessels no corrosion allowance is generally required if the contents of the pressure vessel are non-corrosive and the external surface is protected by inert atmosphere or by an appropriate insulation with an approved vapour barrier. Paint or other thin coatings should not be credited as protection. Where special alloys are used with acceptable corrosion resistance, no corrosion allowance should be required. If the above conditions are not satisfied, the scantiings calculated according to **404. 6** should be increased as appropriate.

406. Supports (IGC Code 4.6)

1. Cargo tanks should be supported by the hull in a manner which will prevent bodily movement of the tank under static and dynamic loads while allowing contraction and expansion of the tank under temperature variation sand hull deflections without undue stressing of the tank and of the hull.

2. The tanks with supports should also be designed for a static angle of heel of 30° without exceeding allowable stresses given in **405. 1.**

3. The supports should be calculated for the most probable largest resulting acceleration, taking into account rotational as well as translational effects. This acceleration in a given direction may be determined as shown in **Fig 7.5.2.** The half axes of the "**acceleration ellipse**" should be determined according to **403. 4** (2).

4. Suitable supports should be provided to withstand a collision force acting on the tank corresponding to one half the weight of the tank and cargo in the forward direction and one quarter the weight of the tank and cargo in the aft direction without deformation likely to endanger the tank structure.

5. The loads mentioned in **Pars 2** and **4** need not be combined with each other or with wave-induced loads.

6. For independent tanks and, where appropriate, for membrane and semi-membrane tanks, provision should be made to key the tanks against the rotational effects referred to in **Par 3.**

7. Antiflotation arrangements should be provided for independent tanks. The antiflotation arrangements should be suitable to withstand an upward force caused by an empty tank in a hold space flooded to the summer load draught of the ship, without plastic deformation likely to endanger the hull structure.

407. Secondary barrier (IGC Code 4.7)

1. Where the cargo temperature at atmospheric pressure is below -10°C, a secondary barrier should be provided when required by **Par 3** to act as a temporary containment for any envisaged leakage of liquid cargo through the primary barrier.

2. Where the cargo temperature at atmospheric pressure is not below -55°C, the hull structure may act as a secondary barrier. In such a case:

(1) the hull material should be suitable for the cargo temperature at atmospheric pressure as required by **409. 2;** and

(2) the design should be such that this temperature will not result in unacceptable hull stresses.

3. Secondary barriers in relation to tank types should normally be provided in accordance with **Table 7.5.2.** For tanks which differ from the basic tank types as defined in **402.** the secondary barrier requirements should be decided by the Society in each case.

Table 7.5.2 Secondary Barriers in Relation to Tank Types

Cargo temperature at atmospheric pressure	-10°C and above	Below -10°C down to -55°C	Below -55°C
Basic tank type	No secondary barrier required	Hull may act as secondary barrier	Separate secondary barrier where required
Integral		Tank type not normally allowed(1)	
Membrane		Complete secondary barrier	
Semi-membrane		Complete secondary barrier(2)	
Independent			
Type A		Complete secondary barrier	
Type B		Partial secondary barrier	
Type C		No secondary barrier required	
Internal insulation			
Type 1		Complete secondary barrier	
Type 2		Complete secondary barrier is incorporated	

Notes:

(1) A complete secondary barrier should normally be required if cargoes with a temperature at atmospheric pressure below -10° are permitted in accordance with **402.1**(3).

(2) In the case of semi-membrane tanks which comply in all respects with the requirements applicable to type independent tanks, except for the manner of support the Society may, after special consideration, accept a partial secondary barrier.

4. The secondary barrier should be so designed that:

(1) it is capable of containing any envisaged leakage of liquid cargo for a period of 15 days, unless different requirements apply for particular voyages, taking into account the load spectrum referred to in **403. 4** (4);

(2) it will prevent lowering of the temperature of the ship structure to an unsafe level in the case of leakage of the primary barrier as indicated in **408. 2;** and

(3) the mechanism of failure for the primary barrier does not also cause the failure of the secondary barrier and vice versa.

5. The secondary barrier should fulfil its functions at a static angle of heel of 30°.

6. (1) Where a partial secondary barrier is required, its extent should be determined on the basis of cargo leakage corresponding to the extent of failure resulting from the load spectrum referred to in **403. 4** (4) after the initial detection of a primary leak. Due account may be taken of liquid evaporation, rate of leakage, pumping capacity and other relevant factors. In all cases, however, the inner bottom adjacent to cargo tanks should be protected against liquid cargo.

(2) Clear of the partial secondary barrier, provision such as a spray shield should be made to deflect any liquid cargo down into the space between the primary and secondary barriers and to keep the temperature of the hull structure to a safe level.

7. The secondary barrier should be capable of being periodically checked for its effectiveness, by means of a pressure/vacuum test, a visual inspection or another suitable method acceptable to the Society. The method should be submitted to the Society for approval.

408. Insulation (IGC Code 4.8)

1. Where a product is carried at a temperature below -10°C suitable insulation should be provided to ensure that the temperature of the hull structure does not fall below the minimum allowable design temperature given in **Sec 6** for the grade of steel concerned, as detailed in **409.,** when the cargo tanks are at their design temperature and the ambient temperatures are 5°C for air and 0°C for seawater. These conditions may generally be used for world-wide service. However, higher values of the ambient temperatures may be accepted by the Society for ships operated in restricted areas. Conversely, lesser values of the ambient temperatures may be fixed by the Society for ships trading occasionally or regularly to areas in latitudes where such lower temperatures are expected during the winter months. The ambient temperatures used in the design should be shown on the International Certificate of Fitness for the Carriage of Liquefied Gases on Bulk.

2. Where a complete or partial secondary barrier is required, calculations should be made with the assumptions in **Par 1** to check that the temperature of the hull structure does not fall below the minimum allowable design temperature given in **Sec 6** for the grade of steel concerned, as detailed in **409.** The complete or partial secondary barrier should be assumed to be at the cargo temperature at atmospheric pressure.

3. Calculations required by **Pars 1** and **2** should be made assuming still air and still water, and except as permitted by **Par 4,** no credit should be given for means of heating. In the case referred to in **Par 2,** the cooling effect of the rising boil-off vapour from the leaked cargo should be considered in the heat transmission studies. For structural members connecting inner and outer hulls, the mean temperature may be taken for determining the steel grade.

4. In all cases referred to in **Pars 1** and **2** and for ambient temperature conditions of 5°C for air and 0°C for seawater, approved means of heating transverse hull structural material may be used to ensure that the temperatures of this material do not fall below the minimum allowable values. If lower ambient temperatures are specified, approved means of heating may also be used for longitudinal hull structural material, provided this material remains suitable for the temperature conditions of 5°C for air and 0°C for seawater without heating. Such means of heating should comply with the following requirements:

(1) sufficient heat should be available to maintain the hull structure above the minimum allowable temperature in the conditions referred to in **Pars 1** and **2;**
(2) the heating system should be so arranged that, in the event of a failure in any part of the system, stand-by heating could be maintained equal to not less than 100 % of the theoretical heat load;
(3) the heating system should be considered as an essential auxiliary; and
(4) the design and construction of the heating system should be to the satisfaction of the Society.

5. In determining the insulation thickness, due regard should be paid to the amount of acceptable boil-off in association with the reliquefaction plant on board, main propulsion machinery or other temperature control system.

409. Materials (IGC Code 4.9)

1. The shell and deck plating of the ship and all stiffeners attached thereto should be in accordance with the requirements of **Pt 3** of the Rules, unless the calculated temperature of the material in the design condition is below -5°C due to the effect of the low temperature cargo, in which case the material should be in accordance with **Table 7.5.7** assuming the ambient sea and air temperature of 0°C and 5°C respectively. In the design condition, the complete or partial secondary barrier should be assumed to be at the cargo temperature at atmospheric pressure and for tanks without secondary barriers, the primary barrier should be assumed to be at the cargo temperature.

2. Hull material forming the secondary barrier should be in accordance with **Table 7.5.4.** Metallic materials used in secondary barriers not forming part of the hull structure should be in accordance with **Table 7.5.4** or **7.5.5** as applicable. Insulation materials forming a secondary barrier should comply with the requirements of **Par 7.** Where the secondary barrier is formed by the deck or side shell plating, the material grade required by **Table 7.5.4** should be carried into the adjacent deck or side shell plating, where applicable, to a suitable extent.

3. Materials used in the construction of cargo tanks should be in accordance with **Table 7.5.3, 7.5.4** or **7.5.5.**

4. Materials other than those referred to in **Pars 1, 2** and **3** used in the construction of the ship which are subject to reduced temperature due to the cargo and which do not form part of the secondary barrier should be in accordance with **Table 7.5.7** for temperatures as determined by **408.** This includes inner bottom plating, longitudinal bulkhead plating, transverse bulkhead plating, floors, webs, stringers and all attached stiffening members.

5. The insulation materials should be suitable for loads which may be imposed on them by the adjacent structure.

Table 7.5.3

CHEMICAL COMPOSITION AND HEAT TREATMENT		
CARBON-MANGANESE STEEL	Fully killed	
Fine grain steel where thickness exceeds 20 mm		
Small additions of alloying elements by agreement with the Society Composition limits to be approved by the Society		
Normalized, or quenched and tempered(2)		
TENSILE AND TOUGHNESS (IMPACT) TEST REQUIREMENTS		
Plates	Each "piece" to be tested	
Sections and forgings	Batch test	
Tensile properties	Specified minimum yield stress not to exceed 410 N/mm^2 (3)	
CHARPY V-NOTCH TEST		
Plates	Transverse test pieces. Minimum average energy value (E) 27 J	
Sections and forgings	Longitudinal test pieces. Minimum average energy value (E) 41 J	
Test temperature	Thickness t (mm)	Test temperature (°C)
	$t \leq 20$	0
	$20 < t \leq 40$	-20

Notes:
(1) For seamless pipes and fittings normal practice applies. The use of longitudinally and spirally welded pipes should be specially approved by the Society.
(2) A controlled rolling procedure may be used as an alternative to normalizing or quenching and tempering, subject to special approval by the Society.
(3) Materials with specified minimum yield stress exceeding 410 N/mm^2 may be specially approved by the Society. For these materials, particular attention should be given to the hardness of the weld and heat affected zone.

Table 7.5.4

PLATES, SECTIONS AND FORGINGS(1) FOR CARGO TANKS, SECONDARY BARRIERS AND PROCESS PRESSURE VESSELS FOR DESIGN TEMPERATURES BELOW 0°C AND DOWN TO -55°C
Maximum thickness 25 mm(2)

CHEMICAL COMPOSITION AND HEAT TREATMENT
CARBON-MANGANESE STEEL Fully killed Aluminium treated fine grain steel

Chemical composition (ladle analysis)

C	Mn	Si	S	P
0.16 % max.(3)	0.70 -1.60 %	0.10-0.50 %	0.035 % max.	0.035 % max.

Optional additions: Alloys and grain refining elements may be generally in accordance with the following:

Ni	Cr	Mo	Cu	Nb	V
0.80 % max.	0.25 % max.	0.08 % max.	0.35 % max	0.05 % max.	0.10 % max.

Normalized or quenched and tempered(4)

TENSILE AND TOUGHNESS (IMPACT) TEST REQUIREMENTS

Plates	Each "piece" to be tested
Sections and forgings	Batch test
CHARPY V-NOTCH TEST	Test temperature 5°C below the design temperature or -20°C whichever is lower
Plates	Transverse test pieces. Minimum average energy value (E) 27 J
Sections and forgings(1)	Longitudinal test pieces. Minimum average energy value (E) 41 J

Notes:
(1) The Charpy V-notch and chemistry requirements for forgings may be specially considered by the Society.
(2) For material thickness of more than 25 mm, Charpy V-notch tests should be conducted as follows:

Material thickness(mm)	Test temperature
$25 < t \leq 30$	10°C below design temperature or -20°C whichever is lower
$30 < t \leq 35$	15°C below design temperature or -20°C whichever is lower
$35 < t \leq 40$	20°C below design temperature

The impact energy value should be in accordance with the table for the applicable type of test specimen. For material thickness of more than 40 mm, the Charpy V-notch values should be specially considered.
Materials for tanks and parts of tanks which are completely thermally stress relieved after welding may be tested at a temperature 5°C below design temperature or-20°C whichever is lower.
For thermally stress relieved reinforcements and other fittings, the test temperature should be the same as that required for the adjacent tank-shell thickness.
(3) By special agreement with the Society, the carbon content may be increased to 0.18 % maximum provided the design temperature is not lower than -40°C.
(4) A controlled rolling procedure may be used as an alternative to normalizing or quenching and tempering, subject to special approval by the Society.
Guidance: For materials exceeding 25 mm in thickness for which the test temperature is -60°C or lower, the application of specially treated steels or steels in accordance with **Table 7.5.5** may be necessary.

Table 7.5.5

PLATES, SECTIONS AND FORGINGS[1] FOR CARGO TANKS, SECONDARY BARRIERS AND PROCESS PRESSURE VESSELS FOR DESIGN TEMPERATURES BELOW -55°C AND DOWN TO -165°C[2]
Maximum thickness 25 mm[3]

Minimum design temp. (°C)	Chemical composition[4] and heat treatment	Impact test temp.(°C)
-60	1.5 % nickel steel-normalized	-65
-65	2.25 % nickel steel-normalized or normalized and tempered[5]	-70
-90	3.5 % nickel steel-normalized or normalized and tempered[5]	-95
-105	5 % nickel steel-normalized or normalized and tempered[5][6]	-110
-165	9 % nickel steel-double normalized and tempered or quenched and tempered	-196
-165	Austenitic steels, such as types 304, 304 L, 316, 316 L, 321 and 347 solution treated[7]	-196
-165	Aluminium alloys; such as type 5083 annealed	Not required
-165	Austenitic Fe-Ni alloy (36 % nickel).Heat treatment as agreed	Not required

TENSILE AND TOUGHNESS (IMPACT) TEST REQUIREMENTS

Plates	Each "piece" to be tested
Sections and forgings	Batch test

CHARPY V-NOTCH TEST

Plates	Transverse test pieces. Minimum average energy value (E) 27 J
Sections and forgings	Longitudinal test pieces. Minimum average energy value (E) 41 J

Notes:
(1) The impact test required for forgings used in critical applications should be subject to special consideration by the Society.
(2) The requirements for design temperatures below -165°C should be specially agreed with the Society.
(3) For materials 1.5 % Ni, 2.25 % Ni, 3.5 % Ni and 5 % Ni, with thicknesses greater than 25 mm, the impact tests should be conducted as follows:

Material thickness (mm)	Test temperature
$25 < t \leq 30$	10°C below design temperature
$30 < t \leq 35$	15°C below design temperature
$35 < t \leq 40$	20°C below design temperature

In no case should the test temperature be above that indicated in this table. The energy value should be in accordance with this table for the applicable type of test specimen. For material thickness of more than 40 mm, the Charpy V-notch values should be specially considered. For 9 % Ni, austenitic stainless steels and aluminium alloys, thicknesses greater than 25 mm may be used at the discretion of the Society.
(4) The chemical composition limits should be approved by the Society.
(5) A lower minimum design temperature for quenched and tempered steels may be specially agreed with the Society.
(6) A specially heat treated 5 % nickel steel, for example triple heat treated 5 % nickel steel, may be used down to -165°C upon special agreement with the Society, provided that the impact tests are carried out at -196°C.
(7) The impact test may be omitted subject to agreement with the Society.

Teble 7.5.6

PIPES (SEAMLESS AND WELDED)(1), FORGINGS(2) AND CASTINGS(2) FOR CARGO AND PROCESS PIPING FOR DESIGN TEMPERATURES BELOW 0°C AND DOWN TO -165°C(3)
Maximum thickness 25 mm

Minimum design temp. (°C)	Chemical composition(5) and heat treatment	Impact test	
		Test temp.(°C)	Minimum average energy (E)(J)
-55	Carbon-manganese steel. Fully killed fine grain. Normalized or as agreed(6)	(4)	27
-65	2.25 % nickel steel. Normalized or normalized and tempered(6)	-70	34
-90	3.5 % nickel steel. Normalized or normalized and tempered(6)	-95	34
-165	9 % nickel steel(7) Double normalized and tempered or quenched and tempered	-196	41
	Austenitic steels, such as types 304, 304 L, 316, 316 L, 321 and 347. Solution treated(8)	-196	41
	Aluminium alloys, such as type 5083 annealed	-	Not required

TENSILE AND TOUGHNESS (IMPACT) TEST REQUIREMENTS
Each batch to be tested
IMPACT TEST Longitudinal test pieces

Notes:
(1) The use of longitudinally or spirally welded pipes should be specially approved by the Society.
(2) The requirements for forgings and castings may be subject to special consideration by the Society.
(3) The requirements for design temperatures below-165°C should be specially agreed with the Society.
(4) The test temperature should be 5°C below the design temperature or -20°C whichever is lower.
(5) The composition limits should be approved by the Society.
(6) A lower design temperature may be specially agreed with the Society for quenched and tempered materials.
(7) This chemical composition is not suitable for castings.
(8) Impact tests may be omitted subject to agreement with the Society.

Table 7.5.7

PLATES AND SECTIONS FOR HULL STRUCTURES REQUIRED BY **409. 1** AND **409. 4**

Minimum design temperature of hull structure (°C)	Maximum thickness (mm) for steel grades in accordance with **601. 9**						
	A	B	D	E	AH	DH	EH
0 and above(1) -5 and above(2)	Normal practice						
down to -5	15	25	30	50	25	45	50
down to -10	×	20	25	50	20	40	50
down to -20	×	×	20	50	×	30	50
down to -30	×	×	×	40	×	20	40
Below -30	In accordance with **Table 7.5.4** except that the thickness limitation given in **Table 7.5.4** and in footnote (2) of that table does not apply.						

Notes: "x" means steel grade not to be used.
(1) For the purpose of **409. 4**
(2) For the purpose of **409. 1**

6. Where applicable, due to location or environmental conditions, insulation materials should have suitable properties of resistance to fire and flame spread and should be adequately protected against penetration of water vapour and mechanical damage.

7. (1) Materials used for thermal insulation should be tested for the following properties as applicable, to ensure that they are adequate for the intended service:

(a) compatibility with the cargo
(b) solubility in the cargo
(c) absorption of the cargo
(d) shrinkage
(e) ageing
(f) closed cell content
(g) density
(h) mechanical properties
(i) thermal expansion
(j) abrasion
(k) cohesion
(I) thermal conductivity
(m) resistance to vibrations
(n) resistance to fire and flame spread

(2) In addition to meeting the above requirements, insulation materials which form part of the cargo containment as defined in **402. 5** should be tested for the following properties after simulation of ageing and thermal cycling to ensure that they are adequate for the intended service:

(a) bonding (adhesive and cohesive strength)
(b) resistance to cargo pressure
(c) fatigue and crack propagation properties
(d) compatibility with cargo constituents and any other agent expected to be in contact with the insulation in normal service.
(e) where applicable the influence of presence of water and water pressure on the insulation properties should be taken into account.
(f) gas de-absorbing.

(3) The above properties, where applicable, should be tested for the range between the expected maximum temperature in service and 5°C below the minimum design temperature, but not lower than -196°C.

8. The procedure for fabrication, storage, handling, erection, quality control and control against harmful exposure to sunlight of insulation materials should be to the satisfaction of the Society.

9. Where powder or granulated insulation is used, the arrangements should be such as to prevent compacting of the material due to vibrations. The design should incorporate means to ensure that the material remains sufficiently buoyant to maintain the required thermal conductivity and also prevent any undue increase of pressure on the cargo containment system.

410. Construction and testing (IGC Code 4.10)

1. (1) All welded joints of the shells of independent tanks should be of the butt weld, full penetration type. For dome-to-shell connections, the Society may approve tee welds of the full penetration type. Except for small penetrations on domes, nozzle welds are also generally to be designed with full penetration.

(2) Welding joint details for type C independent tanks should be as follows:

(a) All longitudinal and circumferential joints of pressure vessels should be of butt welded, full penetration, double vee or single vee type. Full penetration butt welds should be obtained by double welding or by the use of backing rings. If used, backing rings should be removed, unless specifically approved by the Society for very small process pressure vessels. Other edge preparations may be allowed by the Society depending on the results of the tests carried out at the approval of the welding procedure.
(b) The bevel preparation of the joints between the pressure vessel body and domes and between domes and relevant fittings should be designed according to a standard for pressure vessels acceptable to the Society. All welds connecting nozzles, domes or other penetrations of the vessel and all welds connecting flanges to the vessel or nozzles should be full pene-

tration welds extending through the entire thickness of the vessel wall or nozzle wall, unless specially approved by the Society for small nozzle diameters.

2. Workmanship should be to the satisfaction of the Society. Inspection and non-destructive testing of welds for tanks other than type C independent tanks should be in accordance with the requirements of **603. 7.**

3. For membrane tanks, quality assurance measures, weld procedure qualification, design details, materials, construction, inspection and production testing of components, should be to standards developed during the prototype testing programme.

4. For semi-membrane tanks the relevant requirements in this Article for independent tanks or for membrane tanks should be applied as appropriate.

5. (1) For internal insulation tanks, in order to ensure uniform quality of the material, quality control procedures including environmental control, application procedure qualification, corners, penetrations and other design details, materials specification, installation and production testing of components should be to standards developed during the prototype test programme.

(2) A quality control specification including maximum permissible size of constructional defects, tests and inspections during the fabrication, installation and also sampling tests at each of these stages should be to the satisfaction of the Society.

6. Integral tanks should be hydrostatically or hydropneumatically tested to the satisfaction of the Society. The test in general should be so performed that the stresses approximate, as fas as practicable, to the design stresses and that the pressure at the top of the tank corresponds at least to the MARVS.

7. In ships fitted with membrane or semi-membrane tanks, cofferdams and all spaces which may normally contain liquid and are adjacent to the hull structure supporting the membrane should be hydrostatically or hydropneumatically tested in accordance with Recognized Standards. In addition, any other hold structure supporting the membrane should be tested for tightness. Pipe tunnels and other compartments which do not normally contain liquid need not be hydrostatically tested.

8. (1) In ships fitted with internal insulation tanks where the inner hull is the supporting structure, all inner hull structure should be hydrostatically or hydropheumatically tested in accordance with Recognized Standards, taking into account the MARVS.

(2) In ships fitted with internal insulation tanks where independent tanks are the supporting structure, the independent tanks should be tested in accordance with **Par 10** (1).

(3) For internal insulation tanks where the inner hull structure or an independent tank structure acts as a secondary barrier, a tightness test of those structures should be carried out using techniques to the satisfaction of the Society.

(4) These tests should be performed before the application of the materials which will form the internal insulation tank.

9. For type C independent tanks, inspection and nondestructive testing should be as follows:

(1) Manufacture and workmanship - The tolerances relating to manufacture and workmanship such as out-of-roundness, local deviations from the true form, welded joints alignment and tapering of plates having different thicknesses, should comply with standards acceptable to the Society. The tolerances should also be related to the buckling analysis referred to in **404. 6** (2).

(2) Non-destructive testing - As far as completion and extension of non-destructive testing of welded joints are concerned, the extent of non-destructive testing should be total or partial according to standards acceptable to the Society, but the controls to be carried out should not be less than the following:

(a) Total non-destructive testing referred to in **404. 6** (1) (c):
Radiography : butt welds 100 % and
Surface crack detection : all welds 10 %;
reinforcement rings around holes, nozzles, etc. 100 %.
As an alternative, ultrasonic testing may be accepted as a partial substitute for the radiographic testing, if specially allowed by the Society. In addition, the Society may require total ultrasonic testing on welding of reinforcement rings around holes, nozzles, etc.

(b) Partial non-destructive testing referred to in **404. 6** (1) (c):
Radiography : butt welds: all welded crossing joints and at least 10 % of the full length at selected positions uniformly distributed and

Surface crack detection : reinforcement rings around holes, nozzles, etc. 100 %
Ultrasonic testing : as may be required by the Society in each instance.

10. Each independent tank should be subjected to hydrostatic or hydropneumatic test as follows:

(1) For type A independent tanks, this test should be so performed that the stresses approximate, as far as practicable, to the design stresses and that the pressure at the top of the tank corresponds at least to the MARVS. When a hydropneumatic test is performed, the conditions should simulate, as far as practicable, the actual loading of the tank and of its supports.

(2) For type B independent tanks, the test should be performed as required in (1) for type A independent tanks. In addition, the maximum primary membrane stress or maximum bending stress in primary members under test conditions should not exceed 90 % of the yield strength of the material (as fabricated) at the test temperature. To ensure that this condition is satisfied, when calculations indicate that this stress exceeds 75 % of the yield strength, the prototype test should be monitored by the use of strain gauges or other suitable equipment.

(3) Type C independent tanks should be tested as follows:

(a) Each pressure vessel, when completely manufactured, should be subjected to a hydrostatic test at a pressure measured at the top of the tanks, of not less than 1.5 P_0, but in no case during the pressure test should the calculated primary membrane stress at any point exceed 90 % of the yield stress of the material. The definition of P_0 is given in **402. 6**. To ensure that this condition is satisfied where calculations indicate that this stress will exceed 0.75 times the yield strength, the prototype test should be monitored by the use of strain gauges or other suitable equipment in pressure vessels other than simple cylindrical and spherical pressure vessels.

(b) The temperature of the water used for the test should be at least 30°C above the nil ductility transition temperature of the material as fabricated.

(c) The pressure should be held for 2 h per 25 mm of thickness but in no case less than 2 h.

(d) Where necessary for cargo pressure vessels, and with the specific approval of the Society, a hydropneumatic test may be carried out under the conditions prescribed in (a), (b) and (c).

(e) Special consideration may be given by the Society to the testing of tanks in which higher allowable stresses are used, depending on service temperature. However, the requirements of (a) should be fully complied with.

(f) After completion and assembly, each pressure vessel and its related fittings should be subjected to an adequate tightness test.

(g) Pneumatic testing of pressure vessels other than cargo tanks should be considered on an individual case basis by the Society. Such testing should be permitted only for those vessels which are so designed or supported that they cannot be safely filled with water, or for those vessels which cannot be dried and are to be used in a service where traces of the testing medium cannot be tolerated.

11. All tanks should be subjected to a tightness test which may be performed in combination with the pressure test referred to in **Par 10** or separately.

12. Requirements with respect to inspection of secondary barriers should be decided by the Society in each case.

13. In ships fitted with type B independent tanks, at least one tank and its support should be instrumented to confirm stress levels unless the design and arrangement for the size of ship involved are supported by full-scale experience. Similar instrumentation may be required by the Society for type C independent tanks dependent on their configuration and on the arrangement of their supports and attachments.

14. The overall performance of the cargo containment system should be verified for compliance with the design parameters during the initial cool-down, loading and discharging of the cargo. Records of the performance of the components and equipment essential to verify the design parameters should be maintained and be available to the Society.

15. Heating arrangements, if fitted in accordance with **408. 4,** should be tested for required heat output and heat distribution.

16. The hull should be inspected for cold spots following the first loaded voyage.

17. The insulation materials of internal insulation tanks should be subjected to additional inspection in order to verify their surface conditions after the third loaded voyage of the ship, but not later than the first 6 months of the ship's service after building or a major repair work is undertaken on the internal insulation tanks.

18. For type C independent tanks, the required marking of the pressure vessel should be achieved by a method which does not cause unacceptable local stress raisers.

411. Stress relieving for type C independent tanks (IGC Code 4.11)

1. For type C independent tanks of carbon and carbon-manganese steel, post-weld heat treatment should be performed after welding if the design temperature is below -10°C. Post-weld heat treatment in all other cases and for materials other than those mentioned above should be to the satisfaction of the Society. The soaking temperature and holding time should be to the satisfaction of the Society.

2. In the case of large cargo pressure vessels of carbon or carbon-manganese steel for which it is difficult to perform the heat treatment, mechanical stress relieving by pressurizing may be carried out as an alternative to the heat treatment subject to the following conditions:

(1) Complicated welded pressure vessel parts, such as sumps or domes with nozzles, with adjacent shell plates should be heat treated before they are welded to larger parts of the pressure vessel.

(2) The mechanical stress relieving process should preferably be carried out during the hydrostatic pressure test required by the requirement in **410. 10** (3), by applying a higher pressure than the test pressure required by **410. 10** (3) (a). The pressurizing medium should be water.

(3) For the water temperature, the requirement in **410.10** (3) (b) applies.

(4) Stress relieving should be performed while the tank is supported by its regular saddles or supporting structure or, when stress relieving cannot be carried out on board, in a manner which will give the same stresses and stress distribution as when supported by its regular saddles or supporting structure.

(5) The maximum stress relieving pressure should be held for two hours per 25 mm of thickness but in no case less than two hours.

(6) The upper limits placed on the calculated stress levels during stress relieving should be the following:

- equivalent general primary membrane stress: 0.9 R_e
- equivalent stress composed of primary bending stress plus membrane stress: 1.35 R_e

  where Re is the specific lower minimum yield stress or 0.2 % proof stress at test temperature of the steel used for the tank.

(7) Strain measurements will normally be required to prove these limits for at least the first tank of a series of identical tanks built consecutively. The location of strain gauges should be included in the mechanical stress relieving procedure to be submitted in accordance with **411. 2** (14).

(8) The test procedure should demonstrate that a linear relationship between pressure and strain is achieved at the end of the stress relieving process when the pressure is raised again up to the design pressure.

(9) High stress areas in way of geometrical discontinuities such as nozzles and other openings should be checked for cracks by dye penetrant or magnetic particle inspection after mechanical stress relieving. Particular attention in this respect should be given to plates exceeding 30 mm in thickness.

(10) Steels which have a ratio of yield stress to ultimate tensile strength greater than 0.8 should generally not be mechanically stress relieved. If however the yield stress is raised by a method giving high ductility of the steel, slightly higher rates may be accepted upon consideration in each case.

(11) Mechanical stress relieving cannot be substituted for heat treatment of cold formed parts of tanks if the degree of cold forming exceeds the limit above which heat treatment is required.

(12) The thickness of the shell and heads of the tank should not exceed 40 mm. Higher thicknesses may be accepted for parts which are thermally stress relieved.

(13) Local buckling should be guarded against particularly when tori-spherical heads are used for tanks and domes.

(14) The procedure for mechanical stress relieving should be submitted beforehand to the Society for approval.

412. Guidance formulae for acceleration components (IGC Code 4.12)

The following formulae are given as guidance for the components of acceleration due to ship's motions corresponding to a probability level of 10^{-8} in the North Atlantic and apply to ships with a length exceeding 50 m.

Vertical acceleration as defined in **403. 4** (6) : $a_z = \pm a_0 \sqrt{1 + \left(5.3 - \frac{45}{L_0}\right)^2 \left(\frac{x}{L_0} + 0.05\right)^2 \left(\frac{0.6}{C_b}\right)^{1.5}}$

Transverse acceleration as defined in **403. 4** (6) : $a_y = \pm a_0 \sqrt{0.6 + 2.5\left(\frac{x}{L_0} + 0.05\right)^2 + K\left(1 + 0.6K\frac{z}{B}\right)^2}$

Longitudinal acceleration as defined in **403. 4** (6) : $a_x = \pm a_0 \sqrt{0.06 + A^2 - 0.25A}$

with:

$$A = \left(0.7 - \frac{L_0}{1200} + 5\frac{z}{L_0}\right)\left(\frac{0.6}{C_b}\right)$$

where:

L_0 = length of the ship for determination of scantlings as defined in Recognized Standards (m)

C_b = block coefficient

B = greatest moulded breadth of the ship (m)

x = longitudinal distance (m) from amidships to the centre of gravity of the tank with contents; x is positive forward of amidships, negative aft of amidships

z = vertical distance (m) from the ship's actual water-line to the centre of gravity of tank with contents; z is positive above and negative below the waterline.

$$a_0 = 0.2\frac{V}{\sqrt{L_0}} + \frac{34 - \frac{600}{L_0}}{L_0}$$

where: V = service speed (knots)

K = 1 in general. For particular loading conditions and hull forms, determination of K according to the formula below may be necessary.

K = 13 GM/B, where $K \geq$ 1.0 and GM = metacentric height (m)

a_x, a_y and a_z = maximum dimensionless accelerations (i.e. relative to the acceleration of gravity) in the respective directions and they are considered as acting separately for calculation purposes. a_z does not include the component due to the static weight, a_y includes the component due to the static weight in the transverse direction due to rolling and a_x includes the component due to the static weight in the longitudinal direction due to pitching.

413. Stress categories (IGC Code 4.13)

For the purpose of stress evaluation referred to in **405. 1** (4), stress categories are defined in this Article.

1. Normall stress is the component of stress normal to the plane of reference.

2. Membrane stress is the component of normal stress which is uniformly distributed and equal to the average value of the stress across the thickness of the section under consideration.

3. Bending stress is the variable stress across the thickness of the section under consideration, after the subtraction of the membrane stress.

4. Shear stress is the component of the stress acting in the plane of reference.

5. Primary stress is a stress produced by the imposed loading and which is necessary to balance the external forces and moments. The basic characteristic of a primary stress is that it is not self-limiting. Primary stresses which considerably exceed the yield strength will result in failure or at least in gross deformations.

6. Primary general membrane stress is a primary membrane stress which is so distributed in the structure that no redistribution of load occurs as a result of yielding.

7. Primary local membrane stress arises where a membrane stress produced by pressure or other mechanical loading and associated with a primary or a discontinuity effect produces excessive distortion in the transfer of loads for other portions of the structure. Such a stress is classified as a primary local membrane stress although it has some characteristics of a secondary stress. A stress region may be considered as local if :

$$S_1 \leq 0.5\sqrt{Rt}$$
$$S_2 \geq 2.5\sqrt{Rt}$$

where:

S_1 = distance in the meridional direction over which the equivalent stress exceeds 1.1 f

S_2 = distance in the meridional direction to another region where the limits for primary general membrane stress are exceeded

R = mean radius of the vessel

t = wall thickness of the vessel at the location where the primary general membrane stress limit is exceeded

f = allowable primary general membrane stress.

8. Secondary stress is a normal stress or shear stress developed by constraints of adjacent parts or by self constraint of a structure. The basic characteristic of a secondary stress is that it is self-limiting. Local yielding and minor distortions can satisfy the conditions which cause the stress to occur.

Section 5 Process Pressure Vessels and Liquid, Vapour, and Pressure Piping Systems

501. General (IGC Code 5.1)

1. The Society should take appropriate steps to ensure uniformity in the implementation and application of the provisions of this Section.

2. The requirements for type C independent tanks in **Sec 4** may also apply to process pressure vessels if required by the Society. If so required the term "pressure vessels" as used in **Sec 4** covers both type C independent tanks and process pressure vessels.

502. Cargo and process piping (IGC Code 5.2)

1. General

(1) The requirements of **502.** to **505.** apply to product and process piping including vapour piping and vent lines of safety valves or similar piping. Instrument piping not containing cargo is exempt from these requirements.
(2) Provision should be made by the use of offsets, loops, bends, mechanical expansion joints such as bellows, slip joints and ball joints or similar suitable means to protect the piping, piping system components and cargo tanks from excessive stresses due to thermal movement and from movements of the tank and hull structure. Where mechanical expansion joints are used in piping they should be held to a minimum and, where located outside cargo tanks, should be of the bellows type.
(3) Low-temperature piping should be thermally isolated from the adjacent hull structure, where necessary, to prevent the temperature of the hull from falling below the design temperature of the hull material. Where liquid piping is dismantled regularly, or where liquid leakage may be anticipated, such as at shore connections and at pump seals, protection for the hull beneath should be provided.
(4) Where tanks or piping are separated from the ship's structure by thermal isolation, provision should be made for electrically bonding both the piping and the tanks. All gasketed pipe joints and hose connections should be electrically bonded.
(5) Suitable means should be provided to relieve the pressure and remove liquid contents from cargo loading and discharging crossover headers and cargo hoses to the cargo tanks or other suitable location, prior to disconnecting the cargo hoses.
(6) All pipelines or components which may be isolated in a liquid full condition should be provided with relief valves.
(7) Relief valves discharging liquid cargo from the cargo piping system should discharge into the cargo tanks; alternatively they may discharge to the cargo vent mast if means are provided to detect and dispose of any liquid cargo which may flow into the vent system. Relief valves on cargo pumps should discharge to the pump suction.

2. Scantlings based on internal pressure

(1) Subject to the conditions stated in **Par 4,** the wall thickness of pipes should not be less than:

$$t = \frac{t_0 + b + c}{1 - \frac{a}{100}}$$

where:

t_0 = theoretical thickness (mm)

$$t_0 = \frac{PD}{2Ke + P}$$

with:

P = design pressure (MPa) referred to in **Par 3**

D = outside diameter (mm)

K = allowable stress (N/mm^2) referred to in **Par 4**

e = efficiency factor equal to 1.0 for seamless pipes and for longitudinally or spirally welded pipes, delivered by approved manufacturers of welded pipes, which are considered equivalent to seamless pipes when non-destructive testing on welds is carried out in accordance with Recognized Standards. In other cases an efficiency factor of less than 1.0, in accordance with recognized standards, may be required depending on the manufacturing process.

b = allowance for bending (mm). The value of b should be chosen so that the calculated stress in the bend, due to internal pressure only, does not exceed the allowable stress. Where such justification is not given, b should be:

$$b = \frac{Dt_0}{2.5r}$$

with :

r = mean radius of the bend (mm)

c = corrosion allowance (mm). If corrosion or erosion is expected, the wall thickness of the piping should be increased over that required by other design requirements. This allowance should be consistent with the expected life of the piping.

a = negative manufacturing tolerance of thickness (%).

3. Design pressure

(1) The design pressure P in the formula for t_0 in **Par 2** (1) is the maximum gauge pressure to which the system may be subjected in service.

(2) The greater of the following design conditions should be used for piping, piping systems and components as appropriate:

(a) for vapour piping systems or components which may be separated from their relief valves and which may contain some liquid: the saturated vapour pressure at 45°C, or higher or lower if agreed upon by the Society (see **402. 6** (2));

(b) for systems or components which may be separated from their relief valves and which contain only vapour at all times: the superheated vapour pressure at 45°C or higher or lower if agreed upon by the Society (see **402. 6** (2)), assuming an initial condition of saturated vapour in the system at the system operating pressure and temperature; or

(c) the MARVS of the cargo tanks and cargo processing systems; or

(d) the pressure setting of the associated pump or compressor discharge relief valve; or

(e) the maximum total discharge or loading head of the cargo piping system; or

(f) the relief valve setting on a pipeline system.

(3) The design pressure should not be less than 1.0 MPa gauge except for open ended lines where it should be not less than 0.5 MPa gauge.

4. Permissible stresses

(1) For pipes, the permissible stress to be considered in the formula for t in **Par 2** (1) is the lower of the following values:

$$R_m/A \quad \text{or} \quad R_e/B$$

where:

R_m = specified minimum tensile strength at room temperature (N/mm^2)

R_e = specified minimum yield stress at room temperature (N/mm^2)

If the stress-strain curve does not show a defined yield stress, the 0.2 % proof stress applies. The values of A and B should be shown on the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk and have values of at least A = 2.7 and B = 1.8.

(2) The minimum wall thickness should be in accordance with Recognized Standards.

(3) Where necessary for mechanical strength to prevent damage, collapse, excessive sag or buckling of pipes due to superimposed loads from supports, ship deflection or other causes, the wall thickness should be increased over that required by **Par 2,** or, if this is impracticable or would cause excessive local stresses, these loads should be reduced, protected against or eliminated by other design methods.

(4) Flanges, valves and other fittings should comply with recognized standards, taking into account the design pressure defined in **Par 3.** For bellows expansion joints used in vapour service, a lower minimum design pressure may be accepted by the Society.

(5) For flanges not complying with a standard, the dimensions of flanges and related bolts should be to the satisfaction of the Society.

5. Stress analysis

When the design temperature is -110°C or lower, a complete stress analysis, taking into account all the stresses due to weight of pipes, including acceleration loads if significant, internal pressure, thermal contraction and loads induced by hog and sag of the ship for each branch of the piping system should be submitted to the Society. For temperatures of above -110°C, a stress analysis may be required by the Society in relation to such matters as the design or stiffness of the piping system and the choice of materials. In any case, consideration should be given to thermal stresses, even though calculations are not submitted. The analysis may be carried out according to a code of practice acceptable to the Society.

6. Materials

(1) The choice and testing of materials used in piping systems should comply with the requirements of **Sec 6** taking into account the minimum design temperature. However, some relaxation may be permitted in the quality of material of open ended vent piping, provided the temperature of the cargo at the pressure relief valve setting is -55°C or greater and provided no liquid discharge to the vent piping can occur. Similar relaxations may be permitted under the same temperature conditions to open ended piping inside cargo tanks, excluding discharge piping and all piping inside membrane and semi-membrane tanks.

(2) Materials having a melting point below 925°C should not be used for piping outside the cargo tanks except for short lengths of pipes attached to the cargo tanks, in which case fire-resisting insulation should be provided.

503. Tests of piping components and pumps prior to installation on board (IGC Code 5.3)

1. Each type of piping component and pump should be subject to the following tests.

(1) Valves

(A) Type tests

Each size and type of valve intended to be used at a working temperature below -55°C is to be type approved. Type tests to the minimum design temperature or lower and to a pressure not lower than the maximum design pressure foreseen for the valves is to be witnessed in the presence of the Surveyor. Type tests are to include hydrostatic test of the valve body at a pressure equal to 1.5 times the design pressure, seat and stem leakage test at a pressure equal to 1.1 times the design pressure, and cryogenic testing consisting of valve operation and leakage verification at the design temperature.

For valves intended to be used at a working temperature above -55°C, type approval is not required.

(B) Production tests

All valves are to be tested at the plant of manufacturer in the presence of the Surveyor. Testing is to include hydrostatic test of the valve body at a pressure equal to 1.5 times the design pressure, seat and stem leakage test at a pressure equal to 1.1 times the design pressure.

In addition, cryogenic testing consisting of valve operation and leakage verification at the design temperature for a minimum of 10% of each type and size of valve for valves intended to be used at a working temperature below -55°C.

As an alternative to the above, the manufacturer may request the Society to certify a valve subject to the following:

(a) The valve has been type approved as required by **Ch 5, 503. 1** (1) (A) for valves intended to be used at a working temperature below -55°C, and
(b) The manufacturer has a recognized quality system that has been assessed and certified by the Society subject to periodic audits, and
(c) The quality control plan contains a provision to subject each valve to a hydrostatic test of the valve body at a pressure equal to 1.5 times the design pressure and seat and stem leakage test at a pressure equal to 1.1 times the design pressure. The manufacturer is to maintain records of such tests, and
(d) Cryogenic testing consisting of valve operation and leakage verification at the design temperature for a minimum of 10 % of each type and size of valve for valves intended to be used at a working temperature below -55 °C in the presence of the Society' representative.

(2) Expansion Bellows

Each type of expansion bellows intended for use on cargo piping outside the cargo tank and, where required, on those expansion bellows installed within the cargo tanks is to be type approved by the following tests:

(A) A type element of the bellows, not precompressed, should be pressure tested at not less than 5 times the design pressure without bursting. The duration of the test should not be less than 5 min.
(B) A pressure test should be performed on a type expansion joint complete with all the accessories such as flanges, stays and articulations, at twice the design pressure at the extreme displacement conditions recommended by the manufacturer without permanent deformation. Depending on the materials used, the Society may require the test to be at the minimum design temperature.
(C) A cyclic test (thermal movements) should be performed on a complete expansion joint, which is to successfully withstand at least as many cycles, under the conditions of pressure, temperature, axial movement, rotational movement and transverse movement, as it will encounter in actual service. Testing at ambient temperature is permitted, when this testing is at least as severe as testing at the service temperature.
(D) A cyclic fatigue test (ship deformation) should be performed on a complete expansion joint, without internal pressure, by simulating the bellows movement corresponding to a compensated pipe length, for at least 2,000,000 cycles at a frequency not higher than 5 cycles/s. This test is only required when, due to the piping arrangement, ship deformation loads are actually experienced.
(E) The Society may waive performance of the tests referred to in this paragraph provided that complete documentation is supplied to establish the suitability of the expansion joints to withstand the expected working conditions. When the maximum internal pressure exceeds 0.1 MPa gauge this documentation is to include sufficient test data to justify the design method used, with particular reference to correlation between calculation and test results.

(3) Cargo Pumps

(A) Each size and type of pumps is subject to design approval and the tests of following (a) to (c) in the presence of the Surveyor. However, for the pump designed the same as an existing pump approved by the Society and having satisfactory in-service experience, consideration may be given to waiving the tests.
  (a) hydrostatic test of the pump body equal to 1.5 times the design pressure
  (b) the following capacity tests
    (i) For submerged pumps, the capacity test is to be carried out with the design medium or with a medium below the design temperature.
    (ii) For deep well pumps, the capacity test may be carried out with water. In addition, for deep well pumps, a spin test to demonstrate satisfactory operation of bearing clearances, wear rings and sealing arrangements is to be carried out at the design temperature.
  (c) After completion of tests, the pump is to be opened out for examination.
(B) All pumps of the same size and type which have been granted design approval are subject to the tests of following (a) and (b) at the plant of manufacturer in the presence of the

Surveyor.
(a) hydrostatic test of the pump body equal to 1.5 times the design pressure
(b) the capacity tests in compliance with the special requirements given by the Society.
The manufacturer may request the Society to waive the above tests subject to the following:
(c) The pump has been tested as required by **Ch 5, 503. 1** (3) (A) and
(d) The manufacturer has a recognised quality system that has been assessed and certified by the Society subject to periodic audits, and
(e) The quality control plan contains a provision to subject each pump to a hydrostatic test of the pump body equal to 1.5 times the design pressure and a capacity test. The manufacturer is to maintain records of such tests.

504. Piping fabrication and joining details (IGC Code 5.4)

1. The requirements of this Article apply to piping inside and outside the cargo tanks. Relaxations from these requirements may be accepted, in accordance with recognized standards, for piping inside cargo tanks and open-ended piping.

2. The following direct connection of pipe lengths, without flanges, may be considered:
(1) Butt-welded joints with complete penetration at the root may be used in all applications. For design temperatures below -10°C, butt welds should be either double welded or equivalent to a double welded butt joint. This may be accomplished by use of a backing ring, consumable insert or inert gas back-up on the first pass. For design pressures in excess of 1.0 MPa and design temperatures of -10°C or lower, backing rings should be removed.
(2) Slip-on welded joints with sleeves and related welding, having dimensions in accordance with recognized standards, should only be used for open-ended lines with external diameter of 50 mm or less and design temperatures not lower than -55°C.
(3) Screwed couplings complying with recognized standards only be used for accessory lines and instrumentation lines with external diameters of 25 mm or less.

3. (1) Flanges in flange connections should be of the welded neck, slip-on or socket welded type.
(2) Flanges should comply with recognized standards as to their type, manufacture and test. In particular, for all piping except open ended, the following restrictions apply:
(a) For design temperatures lower than -55°C, only welded neck flanges should be used.
(b) For design temperatures lower than -10°C, slip-on flanges should not be used in nominal sizes above 100 mm and socket welded flanges should not be used in nominal sizes above 50 mm.

4. Piping connections, other than those mentioned in **Pars 2** and **3,** may be accepted by the Society in each case.

5. Bellows and expansion joints should be provided to allow for expansion of piping.
(1) If necessary, bellows should be protected against icing.
(2) Slip joints should not be used except within the cargo tanks.

6. Welding, post-weld heat treatment and non-destructive testing.
(1) Welding should be carried out in accordance with **603.**
(2) Post-weld heat treatment should be required for all butt welds of pipes made with carbon, carbon-manganese and low alloy steels. The Society may waive the requirement for thermal stress relieving of pipes having wall thickness less than 10 mm in relation to the design temperature and pressure of the piping system concerned.
(3) In addition to normal controls before and during the welding and to the visual inspection of the finished welds, as necessary for proving that the welding has been carried out correctly and according to the requirements of this paragraph, the following tests should be required:
(a) 100 % radiographic inspection of butt welded joints for piping systems with design temperatures lower than -10°C and with inside diameters of more than 75 mm or wall thicknesses greater than 10 mm. When such butt welded joints of piping sections are made by automatic welding procedures in the pipe fabrication shop, upon special approval by the Society, the extent of radiographic inspection may be progressively reduced but in no case to less than 10 % of each joint, If defects are revealed, the extent of examination should be increased to 100 % and should include inspection of previously accepted welds. This special

approval can only be granted if well-documented quality assurance procedures and records are available to enable the Society to assess the ability of the manufacturer to produce satisfactory welds consistently.

(b) For other butt-welded joints of pipes not covered by (a), spot radiographic tests or other non-destructive tests should be carried out at the discretion of the Society depending upon service, position and materials. In general, at least 10 % of butt-welded joints of pipes should be radiographed.

505. Testing of piping on board (IGC Code 5.5)

1. The requirements of this Article apply to piping inside and outside the cargo tanks. However, the Society may accept relaxations from these requirements for piping inside cargo tanks and open-ended piping.

2. After assembly, all cargo and process piping should be subjected to a hydrostatic test to at least 1.5 times the design pressure. When piping systems or parts of systems are completely manufactured and equipped with all fittings, the hydrostatic test may be conducted prior to installation aboard ship. Joints welded on board should be hydrostatically tested to at least 1.5 times the design pressure. Where water cannot be tolerated and the piping cannot be dried prior to putting the system into service, proposals for alternative testing fluids or testing means should be submitted to the Society for approval.

3. After assembly on board, each cargo and process piping system should be subjected to a leak test using air, halides, or other suitable medium to a pressure depending on the leak detection method applied.

4. All piping systems including valves, fittings and associated equipment for handling cargo or vapours should be tested under normal operating conditions not later than at the first loading operation.

506. Cargo system valving requirements (IGC Code 5.6)

1. Every cargo piping system and cargo tank should be provided with the following valves, as applicable:

(1) For cargo tanks with a MARVS not exceeding 0.07 MPa gauge, all liquid and vapour connections, except safety relief valves and liquid level gauging devices, should have shutoff valves located as close to the tank as practicable. These valves may be remotely controlled but should be capable of local manual operation and provide full closure. One or more remotely controlled emergency shutdown valves should be provided on the ship for shutting down liquid and vapour cargo transfer between ship and shore. Such valves may be arranged to suit the ship's design and may be the same valve as required in **Par 3** and should comply with the requirements of **Par 4.**

(2) For cargo tanks with a MARVS exceeding 0.07 MPa gauge, all liquid and vapour connections, except safety relief valves and liquid level gauging devices, should be equipped with a manually operated stop valve and a remotely controlled emergency shutdown valve. These valves should be located as close to the tank as practicable. Where the pipe size does not exceed 50 mm in diameter, excess flow valves may be used in lieu of the emergency shutdown valve. A single valve may be substituted for the two separate valves provided the valve complies with the requirements of **Par 4,** is capable of local manual operation and provides full closure of the line.

(3) Cargo pumps and compressors should be arranged to shutdown automatically if the emergency shutdown valves required by **Par 1** (1) and (2) are closed by the emergency shutdown system required by **Par 4.**

2. Cargo tank connections for gauging or measuring devices need not be equipped with excess flow or emergency shutdown valves provided that the devices are so constructed that the outward flow of tank contents cannot exceed that passed by a 1.5 mm diameter circular hole.

3. One remotely operated emergency shutdown valve should be provided at each cargo hose connection in use. Connections not used in transfer operations may be blinded with blank flanges in lieu of valves.

4. The control system for all required emergency shutdown valves should be so arranged that all such valves may be operated by single controls situated in at least two remote locations on the ship.

One of these locations should be the control position required by **1301. 3** or cargo control room. The control system should also be provided with fusible elements designed to melt at temperatures between 98°C and 104°C which will cause the emergency shutdown valves to close in the event of fire. Locations for such fusible elements should include the tank domes and loading stations. Emergency shutdown valves should be of the fail-closed (closed on loss of power) type and be capable of local manual closing operation. Emergency shutdown valves in liquid piping should fully close under all serivce conditions within 30 s of actuation. Information about the closing time of the valves and their operating characteristics should be available on board and the closing time should be verifiable and reproducible. Such valves should close smoothly.

5. The closure time of 30 s for the emergency shutdown valve referred to in **506. 4** should be measured from the time of manual or automatic initiation to final closure. This is called the total shutdown time and is made up of a signal response time and a valve closure time. The valve closure time should be such as to avoid surge pressure in pipelines. Such valves should close in such a manner as to cut off the flows smoothly. This paragraph applies to ships constructed on or after 1 July 2002.

6. Excess flow valves should close automatically at the rated closing flow of vapour or liquid as specified by the manufacturer. The piping including fittings, valves, and appurtenances protected by an excess flow valve, should have a greater capacity than the rated closing flow of the excess flow valve. Excess flow valves may be designed with a bypass not exceeding an area of 1.0 mm diameter circular opening to allow equalization of pressure, after an operating shutdown.

507. Ship's cargo hoses (IGC Code 5.7)

1. Liquid and vapour hoses used for cargo transfer should be compatible with the cargo and suitable for the cargo temperature.

2. Hoses subject to tank pressure, or the discharge pressure of pumps or vapour compressors, should be designed for a bursting pressure not less than 5 times the maximum pressure the hose will be subjected to during cargo transfer.

3. For cargo hoses installed on board ships on or after 1 July 2002, each new type of cargo hose, complete with end-fittings, should be prototype-tested at a normal ambient temperature with 200 pressure cycles from zero to at least twice the specified maximum working pressure. After this cycle pressure test has been carried out, the prototype test should demonstrate a bursting pressure of at least 5 times its specified maximum working pressure at the extreme service temperature. Hoses used for prototype testing should not be used for cargo service. Thereafter, before being placed in service, each new length of cargo hose produced should be hydrostatically tested at ambient temperature to a pressure not less than 1.5 times its specified maximum working pressure but not more than two-fifths of its bursting pressure. The hose should be stencilled or otherwise marked with the date of testing, its specified maximum working pressure and, if used in services other than the ambient temperature services, its maximum and minimum service temperature, as applicable. The specified maximum working pressure should not be less than 1.0 MPa gauge.

508. Cargo transfer methods (IGC Code 5.8)

1. Where cargo transfer is by means of cargo pumps not accessible for repair with the tanks in service, at least two separate means should be provided to transfer cargo from each cargo tank and the design should be such that failure of one cargo pump, or means of transfer, will not prevent the cargo transfer by another pump or pumps, or other cargo transfer means.

2. The procedure for transfer of cargo by gas pressurization should preclude lifting of the relief valves during such transfer. Gas pressurization may be accepted as a means of transfer of cargo for those tanks so designed that the design factor of safety is not reduced under the conditions prevailing during the cargo transfer operation.

509. Vapour return connections (IGC Code 5.9)

Connections for vapour return lines to the shore installations should be provided.

Section 6 Materials of Construction

601. General (IGC Code 6.1)

1. The Society should take appropriate steps to ensure uniformity in the implementation and application of the provisions of this Section.

2. This Section gives the requirements for plates, sections, pipes, forgings, castings and weldments used in the construction of cargo tanks, cargo process pressure vessels, cargo and process piping, secondary barriers and contiguous hull structures associated with the transportation of the products. The requirements for rolled materials, forgings and castings are given in **602.** and **Tables 7.5.3** to **7.5.7.** The requirements for weldments are given in **603.**

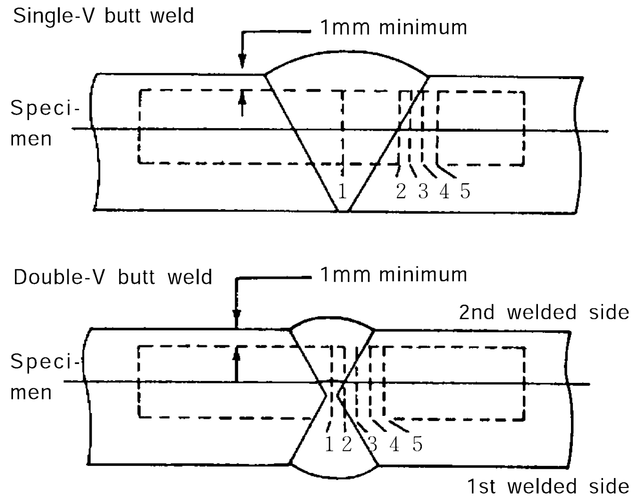
3. The manufacture, testing, inspection and documentation should be in accordance with the requirements of **Pt 2** of the Rules and the specified requirements given in this Chapter.

4. (1) Acceptance tests should include Charpy V-notch toughness tests unless otherwise specified by the Society. The specified Charpy V-notch requirements are minimum average energy values for three full size (10 mm × 10 mm) specimens and minimum single energy values for individual specimens. Dimensions and tolerances of Charpy V-notch specimens should be in accordance with Recognized Standards. The testing and requirements for specimens smaller than 5.0 mm size should be in accordance with the requirements of **Pt 2** of the Rules. Minimum average values for subsized specimens should be:

Charpy V-notch specimen size	Minimum energy average of three specimens
10 x 10 mm	E
10 x 7.5 mm	5/6 E
10 x 5.0 mm	2/3 E
where: E = the energy values (J) specified in **Tables 7.5.3** to **7.5.6**	

Only one individual value may be below the specified average value provided it is not less than 70 % of that value.

(2) In all cases, the largest size Charpy specimens possible for the material thickness should be machined with the specimens located as near as practicable to a point midway between the surface and the centre of the thickness and the length of the notch perpendicular to the suface (see **Fig. 7.5.5**). If the average value of the three initial Charpy V-notch specimens fails to meet the stated requirements, or the value for more than one specimen is below the required average value, or when the value for one specimen is below the minimum value permitted for a single specimen,three additional specimens from the same material may be tested and the results combined with those previously obtained to form a new average. If this new average complies with the requirements and if no more than two individual results are lower than the required average and no more than one result is lower than the required value for a single specimen, the piece or batch may be accepted. At the discretion of the Society other types of toughness tests, such as a drop weight test, may be used. This may be in addition to or in lieu of the Charpy V-notch test.



Notch location:
1. Centre of weld
2. On fusion line
3. In HAZ, 1mm from fusion line
4. In HAZ, 3mm from fusion line
5. In HAZ, 5mm from fusion line
HAZ = heat-affected zone

The largest size Charpy specimens possible for the material thickness should be machined with the centre of the specimens located as near as practicable to a point midway between the surface and the centre of the thickness. In all cases, the distance from the surface of the material to the edge of the specimen should be approximately 1mm or greater In addition for double-V butt welds, specimens should be machined closer to the surface of the second welded side.

Fig 7.5.5 Orientation of Weld Test Specimen

5. Tensile strength, yield stress and elongation should be to the satisfaction of the Society. For carbon-manganese steel and other materials with definitive yield points, consideration should be given to the limitation of the yield to tensile ratio.

6. The bend test may be omitted as a material acceptance test, but is required for weld tests.

7. Materials with alternative chemical composition or mechanical properties may be accepted by the Society.

8. Where post-weld heat treatment is specified or required, the properties of the base material should be determined in the heat treated condition in accordance with the applicable table of this Section and the weld properties should be determined in the heat treated condition in accordance with **603.** In cases where a post-weld heat treatment is applied, the test requirements may be modified at the discretion of the Society.

9. Where reference is made in this Section to *A, B, D, E, AH, DH* and *EH* hull structural steels, these steel grades are the grades of steel according to **Pt 2** of the Rules.

602. Material requirements (IGC Code 6.2)

The requirements for materials of construction are shown in the tables as follows **(Refer to Table 409.)**:

Table 7.5.3: Plates, pipes (seamless and welded), sections and forgings for cargo tanks and process pressure vessels for design temperatures not lower than 0°C.

Table 7.5.4: Plates, sections and forgings for cargo tanks, secondary barriers and process pressure vessels for design temperatures below 0°C and down to -55°C.

Table 7.5.5: Plates, sections and forgings for cargo tanks, secondary barriers and process pressure vessels for design temperatures below -55°C and down to -165°C.

Table 7.5.6: Pipes (seamless and welded), forgings and castings for cargo and process piping for design temperatures below 0°C and down to -165°C.

Table 7.5.7: Plates and sections for hull structures required by **409. 1** and **409. 4.**

603. Welding and non-destructive testing (IGC Code 6.3)

1. General

The requirements of this Article are those generally employed for carbon, carbon-managanese, nickel alloy and stainless steels, and may form the basis for acceptance testing of other material. At the discretion of the Society, impact testing of stainless steel and aluminium alloy weldments may be omitted and other tests may be specially required for any material.

2. Welding consumables

Welding consumables intended for welding of cargo tanks should be in accordance with Recognized Standards unless otherwise agreed with the Society. Deposited weld metal tests and butt weld tests should be required for all welding consumables, unless otherwise specially agreed with the Society. The results obtained from tensile and Charpy V-notch impact tests should be in accordance with Recognized Standards. The chemical composition of the deposited weld metal should be recorded for information and approval.

3. Welding procedure tests for cargo tanks and process pressure vessels

(1) Welding procedure tests for cargo tanks and process pressure vessels are required for all butt welds and the test assemblies should be representative of:
- each base material
- each type of consumable and welding process
- each welding position.

For butt welds in plates, the test assemblies should be so prepared that the rolling direction is parallel to the direction of welding. The range of thickness qualified by each welding procedure test should be in accordance with Recognized Standards. Radiographic or ultrasonic testing may be performed at the option of the fabricator or the Society. Procedure tests for consumables intended for fillet welding procedure tests should be in accordance with Recognized Standards. In such cases consumables should be selected which exhibit satisfactory impact properties.

(2) The following welding procedure tests for cargo tanks and process pressure vessels should be made from each test assembly:

(a) Cross-weld tensile tests.

(b) Transverse bend tests which may be face, root or side bends at the discretion of the Society. However, longitudinal bend test may be required in lieu of transverse bend tests in cases where the base material and weld metal have different strength levels.

(c) One set of three Charpy V-notch impacts, generally at each of the following locations, as shown in **Fig. 7.5.5**:
- Centreline of the welds
- Fusion line (F.L.)
- 1 mm from the F.L.
- 3 mm from the F.L.
- 5 mm from the F.L

(d) Macrosection, microsection and hardness survey may also be required by the Society.

4. Test requirements

(1) Tensile tests: Generally, tensile strength should not be less than the specified minimum tensile strength for the appropriate parent materials. The Society may also require that the transverse weld tensile strength should not be less than the specified minimum tensile strength for the weld metal, where the weld metal has a lower tensile strength than that of the parent metal. In every case, the position of fracture is to be reported for information.

(2) Bend tests: No fracture is acceptable after a 180° bend over a former of a diameter 4 times the thickness of the test pieces, unless otherwise specially required by or agreed with the Society.

(3) Charpy V-notch impact tests: Charpy tests should be conducted at the temperature prescribed for the base material being joined. The results of weld metal impact tests, minimum average energy (E), should be no less than 27 J. The weld metal requirements for subsize specimens and single energy values should be in accordance with **601. 4.** The results of fusion line and heat affected zone impact tests should show a minimum average energy (E) in accordance with the transverse or longitudinal requirements of the base material, whichever is applicable, and for subsize specimens, the minimum average energy (E) should be in accordance with **601. 4.** If the material thickness does not permit machining either full-size or standard subsize specimens, the testing procedure and acceptance standards should be in accordance with Recognized Standards.

5. Welding procedure tests for piping

Welding procedure tests for piping should be carried out and should be similar to those detailed for cargo tanks in **Par 3.** Unless otherwise specially agreed with the Society, the test requirements should be in accordance with **Par 4.**

6. Production weld tests

(1) For all cargo tanks and process pressure vessels except integral and membrane tanks, production weld tests should generally be performed for approximately each 50 m of butt weld joints and should be representative of each welding position. For secondary barriers, the same type production tests as required for primary tanks should be performed except that the number of tests may be reduced subject to agreement with the Society. Tests, other than those specified in (2), (3) and (4), may be required for cargo tanks or secondary barriers at the discretion of the Society.

(2) The production tests for types A and B independent tanks and semi-membrane tanks should include the following tests:

(a) Bend tests, and where required for procedure tests one set of three Charpy V-notch tests should be made for each 50 m of weld. The Charpy V-notch tests should be made with specimens having the notch alternately located in the centre of the weld and in the heat affected zone (most critical location based on procedure qualification results). For austenitic stainless steel, all notches should be in the centre of the weld.

(b) The test requirements are the same as the applicable test requirements listed in **Par 4,** except that impact tests that do not meet the prescribed energy requirements may still be accepted, upon special consideration by the Society, by passing a drop weight test. In such cases, two drop weight specimens should be tested for each set of Charpy specimens that failed and both must show "no break" performance at the temperature at which the Charpy tests were conducted.

(3) In addition to those tests listed in (2) (a) for type C independent tanks and process pressure vessels transverse weld tensile tests are required. The test requirements are listed in **Par 4** except that impact tests that do not meet the prescribed energy requirements may still be accepted upon special consideration by the Society, by passing a drop weight test. In such cases, two drop weight specimens should be tested for each set of Charpy specimens that failed, and both must show "no break" performance at the temperature at which the Charpy tests were conducted.

(4) Production tests for integral and membrane tanks should be in accordance with Recognized Standards.

7. Non-destructive testing

(1) For type A independent tanks and semi-membrane tanks where the design temperature is -20°C or less, and for type B independent tanks regardless of temperature, all full penetration butt welds of the shell plating of cargo tanks should be subjected to 100 % radiographic inspection.

(a) Where the design temperature is higher than -20°C, all full penetration butt welds in way of intersections and at least 10 % of the remaining full penetration welds of tank structures should be subjected to radiographic inspection.

(b) In each case the remaining tank structure including the welding of stiffeners and other fittings and attachments should be examined by magnetic particle or dye penetrant methods as considered necessary by the Society.

(c) All test procedures and acceptance standards should be in accordance with Recognized Standards. The Society may accept an approved ultrasonic test procedure in lieu of radiographic inspection, but may in addition require supplementary inspection by radiography at selected locations. Further, the Society may require ultrasonic testing in addition to normal radiographic inspection.

(2) Inspection of type C independent tanks and process pressure vessels should be carried out in accordance with **410. 9.**

(3) For integral and membrane tanks, special weld inspection procedures and acceptance criteria should be in accordance with Recognized Standards.

(4) The inspection and non-destructive testing of the inner hull or the independent tank structures supporting internal insulation tanks should take into account the design criteria given in **404. 7.** The schedule for inspection and non-destructive testing should be to the satisfaction of the Society.

(5) Inspection of piping should be carried out in accordance with the requirements of **Sec 5.**

(6) The secondary barrier should be radiographed as considered necessary by the Society. Where the outer shell of the hull is part of the secondary barrier, all sheer strake butts and the intersections of all butts and seams in the side shell should be tested by radiography.

Section 7 Cargo Pressure/Temperature Control

701. General (IGC Code 7.1)

1. Unless the entire cargo system is designed to withstand the full gauge vapour pressure of the cargo under conditions of the upper ambient design temperatures, maintenance of the cargo tank pressure below the MARVS should be provided by one or more of the following means, except as otherwise provided in this Article:

(1) a system which regulates the pressure in the cargo tanks by the use of mechanical refrigeration;
(2) a system whereby the boil-off vapours are utilized as fuel for shipboard use or waste heat system subject to the provisions of **Sec 16.** This system may be used at all times, including while in port and while manoeuvring, provided that a means of disposing of excess energy is provided, such as a steam dump system, that is satisfactory to the Society;
(3) a system allowing the product to warm up and increase in pressure. The insulation or cargo tank design pressure or both should be adequate to provide for a suitable margin for the operating time and temperatures involved. The system should be acceptable to the Society in each case;
(4) other systems acceptable to the Society;
(5) in addition to the above means, the Society may permit certain cargoes to be controlled by venting cargo vapours to the atmosphere at sea. This may also be permitted in port with the permission of the port Administration;

2. The systems required by **Par 1** should be constructed, fitted and tested to the satisfaction of the Society. Materials used in their construction should be suitable for use with the cargoes to be carried. For normal service, the upper ambient design temperature should be:

- sea : 32°C
- air : 45°C

For service in especially hot or cold zones these design temperatures should be increased or reduced, as appropriate, by the Society.

3. For certain highly dangerous cargoes specified in **Sec 17,** the cargo containment system should be capable of withstanding the full vapour pressure of the cargo under condition of the upper ambient design temperature irrespective of any system provided for dealing with boil-off gas.

702. Refrigeration systems(IGC Code 7.2)

1. A refrigeration system should consist of one or more units capable of maintaining the required cargo pressure/temperature under conditions of the upper ambient design temperatures. Unless an alternative means of controlling the cargo pressure/temperature is provided to the satisfaction of the Society, a stand-by unit (or units) affording spare capacity at least equal to the largest required single unit should be provided. A stand-by unit should consist of a compressor with its driving motor, control system and any necessary fittings to permit operation independently of the normal service units. A stand-by heat exchanger should be provided unless the normal heat exchanger for the unit has an excess capacity of at least 25 % of the largest required capacity. Separate piping systems are not required.

2. (1) Where two or more refrigerated cargoes which may react chemically in a dangerous manner are carried simultaneously, special consideration should be given to the refrigeration systems to avoid the possibility of mixing cargoes. For the carriage of such cargoes, separate refrigeration systems, each complete with a stand-by unit as specified in **Par 1,** should be provided for each cargo. However, where cooling is provided by an indirect or combined system and leakage in the heat exchangers cannot cause mixing of the cargoes under any envisaged condition, separate refrigeration units need not be fitted.

(2) Where two or more refrigerated cargoes are not mutually soluble under the conditions of carriage, so that their vapour pressures would be additive on mixing, special consideration should be given to the refrigeration systems to avoid the possibility of mixing cargoes.

3. Where cooling water is required in refrigeration systems, an adequate supply should be provided by a pump or pumps used exclusively for this purpose. This pump or these pumps should have at least two sea suction lines, where practicable leading from sea-chests, one port and one starboard.

A spare pump of adequate capacity should be provided, which may be a pump used for other services so long as its use for cooling would not interfere with any other essential service.

4. The refrigeration system may be arranged in one of the following ways:

(1) a direct system where evaporated cargo is compressed, condensed and returned to cargo tanks. For certain cargoes specified in **Sec 17** this system should not be used;
(2) an indirect system where cargo or evaporated cargo is cooled or condensed by refrigerant without being compressed;
(3) a combined system where evaporated cargo is compressed and condensed in a cargo/refrigerant heat exchanger and returned to the cargo tanks. For certain cargoes specified in **Sec 17** this system should not be used.

5. All primary and secondary refrigerants must be compatible with each other and with the cargo with which they come into contact. The heat exchange may take place either remotely from the cargo tank or by cooling coils fitted inside or outside the cargo tank.

Section 8 Cargo Tank Vent Systems

801. General (IGC Code 8.1)

All cargo tanks should be provided with a pressure relief system appropriate to the design of the cargo containment system and the cargo being carried. Hold spaces, interbarrier spaces and cargo piping which may be subject to pressures beyond their design capabilities should also be provided with a suitable pressure relief system. The pressure relief system should be connected to a vent piping system so designed as to minimize the possibility of cargo vapour accumulating on the decks, or entering accommodation spaces, service spaces, control stations and machinery spaces, or other spaces where it may create a dangerous condition. Pressure control systems specified by **Sec 7** should be independent of the pressure relief valves.

802. Pressure relief systems (IGC Code 8.2)

1. Each cargo tank with a volume exceeding 20 m^3 should be fitted with at least two pressure relief valves of approximately equal capacity, suitably designed and constructed for the prescribed service. For cargo tanks with a volume not exceeding 20 m^3, a single relief valve may be fitted.

2. Interbarrier spaces should be provided with pressure relief devices complying with recognized standards.

3. In general, the setting of the pressure relief valves should not be higher than the vapour pressure which has been used in the design of the tank. However, where two or more pressure relief valves are fitted, valves comprising not more than 50 % of the total relieving capacity may be set at a pressure up to 5 % above MARVS.

4. Pressure relief valves should be connected to the highest part of the cargo tank above deck level. Pressure relief valves on cargo tanks with a design temperature below 0°C should be arranged to prevent their becoming inoperative due to ice formation when they are closed. Due consideration should be given to the construction and arrangement of pressure relief valves on cargo tanks subject to low ambient temperatures. Valves should be constructed of materials with a melting point above 925°C. Consideration should be given to lower melting point materials for internal parts and seals if their use will yield a significant improvement in the general operation of the valve.

5. Pressure relief valves should be prototype tested to ensure that the valves have the capacity required. Each valve should be tested to ensure that it opens at the prescribed pressure setting with an allowance not exceeding ±10 % for 0 to 0.15 MPa, ± 6 % for 0.15 to 0.3 MPa, ± 3 % for 0.3 MPa and above. Pressure relief valves should be set and sealed by a competent authority acceptable to the Society and a record of this action, including the values of set pressure, should be retained aboard the ship.

6. In the case of cargo tanks permitted to have more than one relief valve setting this may be accomplished by:

(1) installing two or more properly set and sealed valves and providing means as necessary for isolating the valves not in use from the cargo tank; or

(2) installing relief valves whose settings may be changed by the insertion of previously approved spacer pieces or alternative springs or by other similar means not requiring pressure testing to verify the new set pressure. All other valve adjustment should be sealed.

7. The changing of the set pressure under the provisions of **802. 6**, and the corresponding resetting of the alarms referred to in **1304. 1**, should be carried out under the supervision of the master in accordance with procedures approved by the Society and specified in the ship's operating manual. Changes in set pressures should be recorded in the ship's log and a sign posted in the cargo control room, if provided, and at each relief valve, stating the set pressure.

8. Stop valves or other means of blanking off pipes between tanks and pressure relief valves to facilitate maintenance should not be fitted unless all the following arrangements are provided:

(1) suitable arrangements to prevent more than one pressure relief valve being out of service at the same time;

(2) a device which automatically and in a clearly visible way indicates which one of the pressure relief valves is out of service; and

(3) pressure relief valve capacities such that if one valve is out of service the remaining valves have the combined relieving capacity required by **805.** However, this capacity may be provided by the combined capacity of all valves, if a suitably maintained spare valve is carried on board.

9. Each pressure relief valve installed on a cargo tank should be connected to a venting system, which should be so constructed that the discharge of gas will be unimpeded and directed vertically upwards at the exit and so arranged as to minimize the possibility of water or snow entering the vent system. The height of vent exits should not be less than $B/3$ or 6 m, whichever is the greater, above the weather deck and 6 *m* above the working area, the fore and aft gangway, deck storage tanks and cargo liquid lines.

10. Cargo tank pressure relief valve vent exits should be arranged at a distance at least equal to B or 25 m, whichever is less, from the nearest air intake or opening to accommodation spaces, service spaces and control stations, or other gas-safe spaces. For ships less than 90 m in length, smaller distances may be permitted by the Society. All other vent exits connected to the cargo containment system should be arranged at a distance of at least 10 m from the nearest air intake or opening to accommodation spaces, service spaces and control stations, or other gas-safe spaces.

11. All other cargo vent exits not dealt with in other sections should be arranged in accordance with **Pars 9** and **10.**

12. If cargoes which react in a hazardous manner with each other are carried simultaneously, a separate pressure relief system should be fitted for each cargo carried.

13. In the vent piping system, means for draining liquid from places where it may accumulate should be provided. The pressure relief valves and piping should be so arranged that liquid can under no circumstances accumulate in or near the pressure relief valves.

14. Suitable protection screens should be fitted on vent outlets to prevent the ingress of foreign objects.

15. All vent piping should be so designed and arranged that it will not be damaged by temperature variations to which it may be exposed, or by the ship's motions.

16. The back pressure in the vent lines from the pressure relief valves should be taken into account in determining the flow capacity required by **805.** The pressure drop in the vent line from the tank to the pressure relief valve inlet should not exceed 3 % of the valve set pressure. For unbalanced pressure relief valves the back pressure in the discharge line should not exceed 10 % of the gauge pressure at the relief valve inlet with the vent lines under fire exposure as referred to in **805. 2.**

17. Pressure relief valves should be positioned on the cargo tank so that they will remain in the vapour phase under conditions of 15° list and 0.015 L trim, where L is as defined in **106. 23** at the maximum allowable filling limit(FL).

18. The adequacy of the vent system fitted on tanks loaded in accordance with **1501. 5** is to be demonstrated using the special guidelines. A relevant certificate should be permanently kept on board the ship. For the purposes of this paragraph, vent system means :

(1) the tank outlet and the piping to the pressure relief valve;
(2) the pressure relief valve;
(3) the piping from the pressure relief valve to the location of discharge to the atmosphere and including any interconnections and piping which joins other tanks.

This paragraph may apply to all ships regardless of the date of construction.

803. Additional pressure relieving system for liquid level control (IGC Code 8.3)

1. Where required by **1501. 4** (2), an additional pressure relieving system to prevent the tank from becoming liquid full at any time during relief under the fire exposure conditions referred to in **805.** should be fitted to each tank. This pressure relieving system should consist of:

(1) one or more relief valves set at a pressure corresponding to the gauge vapour pressure of the cargo at the reference temperature defined in **1501. 4** (2); and
(2) an override arrangement, whenever necessary, to prevent its normal operation. This arrangement should include fusible elements designed to melt at temperatures between 98°C and 104°C and to cause relief valves specified in (1) to become operable. The fusible elements should be lo-

cated, in particular, in the vicinity of relief valves. The system should become operable upon loss of system power if provided. The override arrangement should not be dependent on any source of ship's power.

2. The total relieving capacity of the additional pressure relieving system at the pressure mentioned in **Par 1** (1) should not be less than:

$$Q' = FG'A^{0.82}\ (\mathrm{m^3/s})$$

where:

Q' = minimum required rate of discharge of air at standard conditions of 273K and 0.1013MPa.

$$G' = \frac{12.4}{(L+\rho_r m)D}\sqrt{\frac{ZT}{M}}$$

with:

ρ_r : relative density of liquid phase of product at relieving conditions (ρ_r = 1.0 for fresh water)

m = $-di/d\rho_r$: gradient of decrease of liquid phase enthalpy against increase of liquid phase density (KJ/kg) at relieving conditions. For set pressures not higher than 0.2 MPa the value in **Table 7.5.8** may be used. For products not listed in the table and for higher set pressures, the value of m should be calculated on the basis of the thermodynamic data of the product itself

Table 7.5.8 Factor m

Product	$m = -di/d\rho_r$ (KJ/kg)
Ammonia, anhydrous	3,400
Butadiene	1,800
Butane	2,000
Butylenes	1,900
Ethane	2,100
Ethylene	1,500
Methane	2,300
Methyl chloride	816
Nitrogen	400
Propane	2,000
Propylene	1,600
Propylene oxide	1,550
Vinyl chloride	900
The values in this table may be used for set pressures not higher than 0.2 MPa.	

i : enthalpy of liquid (KJ/kg)

T' : temperature in kelvins (K) at relieving conditions, i.e. at the pressure at which the additional pressure relieving system is set

F, A, L, D, Z and M are defined in **805. 2.**

3. Compliance with **Par 1** (1) requires changing of the setting of the relief valves provided for in this Article. This should be accomplished in accordance with the provisions of **802. 6** and **7.**

4. Relief valves mentioned under **Par 1** (1) above may be the same as the pressure relief valves mentioned in **802.,** provided the setting pressure and the relieving capacity are in compliance with the requirements of this Article.

5. The exhaust of such pressure relief valves may be led to the venting system referred to in **802. 9.** If separate venting arrangements are fitted these should be in accordance with the requirements of **802. 9** to **15.**

804. Vacuum protection systems (IGC Code 8.4)

1. Cargo tanks designed to withstand a maximum external pressure differential exceeding 0.025 MPa and capable of withstanding the maximum external pressure differential which can be attained at maximum discharge rates with no vapour return into the cargo tanks, or by operation of a cargo refrigeration system, need no vacuum protection systems.

2. Cargo tanks designed to withstand a maximum external pressure differential not exceeding 0.025 MPa, or tanks which cannot withstand the maximum external pressure differential that can be attained at maximum discharge rates with no vapour return into the cargo tanks, or by operation of a cargo refrigeration system, or by sending boil-off vapour to the machinery spaces, should be fitted with:

(1) two independent pressure switches to sequentially alarm and subsequently stop all suction of cargo liquid or vapour from the cargo tank, and refrigeration equipment if fitted, by suitable means at a pressure sufficiently below the maximum external designed pressure differential of the cargo tank; or
(2) vacuum relief valves with a gas flow capacity at least equal to the maximum cargo discharge rate per cargo tank, set to open at a pressure sufficiently below the external design differential pressure of the cargo tank; or
(3) other vacuum relief systems acceptable to the Society.

3. Subject to the requirements of **Sec 17,** the vacuum relief valves should admit an inert gas, cargo vapour or air to the cargo tank and should be arranged to minimize the possibility of the entrance of water or snow. If cargo vapour is admitted, it should be from a source other than the cargo vapour lines.

4. The vacuum protection system should be capable of being tested to ensure that it operates at the prescribed pressure.

805. Size of valves (IGC Code 8.5)

Pressure relief valves should have a combined relieving capacity for each cargo tank to discharge the greater of the following with not more than a 20 % rise in cargo tank pressure above the MARVS:

1. the maximum capacity of the cargo tank inerting system if the maximum attainable working pressure of the cargo tank inerting system exceeds the MARVS of the cargo tanks; or

2. vapours generated under fire exposure computed using the following formula:

$$Q = FGA^{0.82} \quad (\mathrm{m^3/s})$$

where:

Q = minimum required rate of discharge of air at standard conditions of 273 K and 0.1013 MPa.

F = fire exposure factor for different cargo tank types:

F = 1.0 for tanks without insulation located on deck;

F = 0.5 for tanks above the deck when insulation is approved by the Society (Approval will be based on the use of an approved fireproofing material, the thermal conductance of insulation, and its stability under fire exposure);

F = 0.5 for uninsulated independent tanks installed in holds;

F = 0.2 for insulated independent tanks in holds (or uninsulated independent tanks in insulated holds);

F = 0.1 for insulated independent tanks in inerted holds (or uninsulated independent tanks in inerted, insulated holds);

F = 0.1 for membrane and semi-membrane tanks.

For independent tanks partly protruding through the open deck, the fire exposure factor should be determined on the basis of the surface areas above and below deck.

G = gas factor

$$G = \frac{12.4}{LD}\sqrt{\frac{ZT}{M}}$$

with:

T = temperature in kelvins (K) at relieving conditions, i.e. 120 % of the pressure at which the pressure relief valve is set.

L = latent heat of the material being vaporized at relieving conditions, in KJ/kg.

D = constant based on relation of specific heats k, shown in **Table 7.5.9;** if k is not known, D = 0.606 should be used. The constant D may also be calculated by the following formula:

Table 7.5.9 Constant D

k	D	k	D
1.00	0.606	1.52	0.704
1.02	0.611	1.54	0.707
1.04	0.615	1.56	0.710
1.06	0.620	1.58	0.713
1.08	0.624	1.60	0.716
1.10	0.628	1.62	0.719
1.12	0.633	1.64	0.722
1.14	0.637	1.66	0.725
1.16	0.641	1.68	0.728
1.18	0.645	1.70	0.731
1.20	0.649	1.72	0.734
1.22	0.652	1.74	0.736
1.24	0.656	1.76	0.739
1.26	0.660	1.78	0.742
1.28	0.664	1.80	0.745
1.30	0.667	1.82	0.747
1.32	0.671	1.84	0.750
1.34	0.674	1.86	0.752
1.36	0.677	1.88	0.755
1.38	0.681	1.90	0.758
1.40	0.685	1.92	0.760
1.42	0.688	1.94	0.763
1.44	0.691	1.96	0.765
1.46	0.695	1.98	0.767
1.48	0.698	2.00	0.770
1.50	0.701	2.02	0.772
		2.20	0.792

$$D=\sqrt{k\left(\frac{2}{k+1}\right)^{\frac{k+1}{k-1}}}$$

Z = compressibility factor of the gas at relieving conditions; if not known, Z = 1.0 should be used.

M = molecular mass of the product

A = external surface area of the tank (m^2) for different tank types :

for body-of-revolution type tanks : A = external surface area;

for other than body-of-revolution type tanks : A = external surface area less the projected bottom surface area ;

for tanks consisting of an array of pressure vessel tanks:

insulation on the ship's structure:

A = external surface area of the hold less its projected bottom area;

insulation on the tank structure:

A = external surface area of the array of pressure vessels excluding insulation, less the projected bottom area as shown in **Fig 7.5.6.**

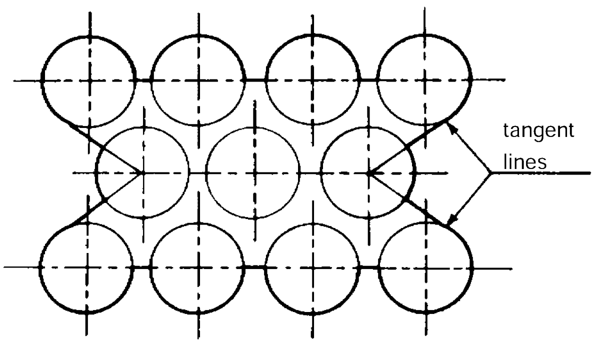


Fig. 7.5.6 Determination of the Projected Bottom Area for Tanks Consisting of an Array

Section 9 Environmental Control

901. Environmental control within cargo tanks and cargo piping systems (IGC Code 9.1)

1. A piping system should be provided to enable each cargo tank to be safely gas-freed, and to be safely purged with cargo gas from a gas-free condition. The system should be arranged to minimize the possibility of pockets of gas or air remaining after gas-freeing or purging.

2. A sufficient number of gas sampling points should be provided for each cargo tank in order to adequately monitor the progress of purging and gas-freeing. Gas sampling connections should be valved and capped above the main deck.

3. For flammable gases, the system should be arranged to minimize the possibility of a flammable mixture existing in the cargo tank during any part of the gas-freeing operation by utilizing an inerting medium as an intermediate step. In addition, the system should enable the cargo tank to be purged with an inerting medium prior to filling with cargo vapour or liquid, without permitting a flammable mixture to exist at any time within the cargo tank.

4. Piping systems which may contain cargo should be capable of being gas-freed and purged as provided in **Pars 1** and **3.**

5. Inert gas utilized in these procedures may be provided from the shore or from the ship.

902. Environmental control within the hold spaces (cargo containment systems other than type C independent tanks) (IGC Code 9.2)

1. Interbarrier and hold spaces associated with cargo containment systems for flammable gases requiring full secondary barriers should be inerted with a suitable dry inert gas and kept inerted with make-up gas provided by a shipboard inert gas generation system, or by shipboard storage which should be sufficient for normal consumption for at least 30 days.

2. (1) Interbarrier and hold spaces associated with cargo containment systems for flammable gases requiring partial secondary barriers should be inerted with suitable dry inert gas and kept inerted with makeup gas provided by a shipboard inert gas generation system or by shipboard storage which should be sufficient for normal consumption for at least 30 days.

(2) Alternatively, subject to the restrictions specified in **Sec 17,** the Society may allow the spaces referred to in (1) to be filled with dry air provided that the ship maintains a stored charge of inert gas or is fitted with an inert gas generation system sufficient to inert the largest of these spaces; and provided that the configuration of the spaces and the relevant vapour detection systems, together with the capability of the inerting arrangements, ensure that any leakage from the cargo tanks will be rapidly detected and inerting effected before a dangerous condition can develop. Equipment for the provision of sufficient dry air of suitable quality to satisfy the expected demand should be provided.

3. For non-flammable gases, the spaces referred to in **Par 1** and **Par 2** (1) may be maintained with a suitable dry air or inert atmosphere.

4. In case of internal insulation tanks, environmental control arrangements are not required for interbarrier spaces and spaces between the secondary barrier and the inner hull or independent tank structures completely filled with insulation materials complying with **409. 7** (2).

903. Environmental control of spaces surrounding type C independent tanks (IGC Code 9.3)

Spaces surrounding refrigerated cargo tanks not having secondary barriers should be filled with suitable dry inert gas or dry air and be maintained in this condition with make-up inert gas provided by a ship-board inert gas generation system, shipboard storage of inert gas, or dry air provided by suitable air drying equipment.

904. Inerting (IGC Code 9.4)

1. Inerting refers to the process of providing a noncombustible environment by the addition of compatible gases, which may be carried in storage vessels or produced on board the ship or supplied from the shore. The inert gases should be compatible chemically and operationally, at all temperatures likely to occur within the spaces to be inerted, with the materials of construction of the spaces and the cargo. The dew points of the gases should be taken into consideration.

2. Where inert gas is also stored for fire-fighting purposes, it should be carried in separate containers and should not be used for cargo services.

3. Where inert gas is stored at temperature below 0°C, either as a liquid or as a vapour, the storage and supply system should be so designed that the temperature of the ship's structure is not reduced below the limiting values imposed on it.

4. Arrangements suitable for the cargo carried should be provided to prevent the backflow of cargo vapour into the inert gas system.

5. The arrangements should be such that each space being inerted can be isolated and the necessary controls and relief valves etc. should be provided for controlling pressure in these spaces.

905. Inert gas production on board (IGC Code 9.5)

1. The equipment should be capable of producing inert gas with an oxygen content at no time greater than 5 % by volume subject to the special requirements of **Sec 17.** A continuous-reading oxygen content meter should be fitted to the inert gas supply from the equipment and should be fitted with an alarm set at a maximum of 5 % oxygen content by volume subject to the requirements of **Sec 17.** Additionally, where inert gas is made by an on-board process of fractional distillation of air which involves the storage of the cryogenic liquefied nitrogen for subsequent release, the liquefied gas entering the storage vessel should be monitored for traces of oxygen to avoid possible initial high oxygen enrichment of the gas when released for inerting purposes.

2. An inert gas system should have pressure controls and monitoring arrangements appropriate to the cargo containment system. A means acceptable to the Society, located in the cargo area, of preventing the backflow of cargo gas should be provided.

3. Spaces containing inert gas generating plants should have no direct access to accommodation spaces, service spaces or control stations, but may be located in machinery spaces. If such plants are located in machinery spaces or other spaces outside the cargo area, two non-return valves, or equivalent devices should be fitted in the inert gas main in the cargo area as required in **Par 2.** Inert gas piping should not pass through accommodation spaces, service spaces or control stations. When not in use, the inert gas system should be made separate from the cargo system in the cargo area except for connections to the hold spaces or interbarrier spaces.

4. Flame burning equipment for generating inert gas should not be located within the cargo area. Special consideration may be given to the location of inert gas generating equipment using the catalytic combustion process.

Section 10 Electrical Installations

1001. General (IGC Code 10.1)

1. The provisions of the Section are applicable to ships carrying flammable products and should be applied in conjunction with part D of chapter II-1 of the 1983 SOLAS amendments.

2. Electrical installations should be such as to minimize the risk of fire and explosion from flammable products. Electrical installations complying with this Section need not be considered as a source of ignition for the purposes of **Sec 3.**

3. The Society should take appropriate steps to ensure uniformity in the implementation and application of the provisions of this Section in respect of electrical installations.

4. Electrical equipment, cables and wiring shall not be installed in hazardous locations unless it conforms with the standards not inferior to those acceptable to the Organization. Refer to the standards published by the International Electrotechnical Commission, IEC 60092-502:1999" Electrical installation in ships - tankers. However, for locations not covered by such standards, electrical equipments, cables and wiring which do not conform to the standards may be installed in hazardous locations based on a risk assessment to the satisfaction of the Society to ensure that an equivalent level of safety is assured.

5. Where electrical equipment is installed in gas dangerous spaces or zones as provided in **Par 4,** it should be to the satisfaction of the Society and approved by the relevant authorities recognized by the Society for operation in the flammable atmosphere concerned.

Section 11 Fire Protection and Fire Extinction

1101. Fire safety requirements (IGC Code 11.1)

1. The requirements for tankers in SOLAS chapter II-2 should apply to ships covered by this Chapter, irrespective of tonnage including ships of less than 500 tons gross tonnage, except that:

(1) regulations 4.5.1.6 and 4.5.10 do not apply ;
(2) regulation 10.2 as applicable to cargo ships and regulations 10.4 and 10.5 should apply as they would apply to tankers of 2,000 gross tonnage and over ;.
(3) regulation 10.5.6 should apply to ships of 2,000 gross tonnage and over ;
(4) the following regulations of SOLAS chapter II-2 related to tankers do not apply and are replaced by Sections and articles of this Chapter as detailed below :

SOLAS Regulation	Replaced by
10.10	**1106.**
4.5.1.1 and 4.5.1.2	**Sec 3**
4.5.5 and 10.8	**1103.** and **1104.**
10.9	**1105.**

(5) regulation 13.3.4 and 13.4.3 should apply to ships of 500 gross tonnage and over ;

2. All sources of ignition should be excluded from spaces where flammable vapour may be present except as otherwise provided in **Secs 10** and **16.**

3. The provisions of this article apply in conjunction with **Sec 3.**

4. For the purposes of fire fighting, any open deck areas above cofferdams, ballast or void spaces at the after end of the aftermost hold space or at the forward end of the forward most hold space should be included in the cargo area.

1102. Fire water main equipment (IGC Code 11.2)

1. All ships, irrespective of size, carrying products which are subject to this Chapter should comply with the requirements of SOLAS regulations II-2/10.2, 10.4 and 10.5, except that the required fire pump capacity and fire main and water service pipe diameter should not be limited by the provisions of regulations II-2/10.2.2.4.1 and II-2/10.2.1.3 when the fire pump and fire main are used as part of the water spray system as permitted by **1103. 3.** In addition, the requirements of regulation II-2/10.2.1.6 should be met at a pressure of at least 0.5 MPa gauge.

2. The arrangements should be such that at least two jets of water can reach any part of the deck in the cargo area and those portions of the cargo containment system and tank covers above the deck. The necessary number of fire hydrants should be located to satisfy the above arrangements and to comply with the requirements of SOLAS regulations II-2/10.2.1.5.1 and II-2/10.2.3.3, with hose lengths as specified in regulation II-2/10.2.3.1.1.

3. Stop valves should be fitted in any crossover provided and in the fire main or mains at the poop front and at intervals of not more than 40 m between hydrants on the deck in the cargo area for the purpose of isolating damaged sections of the main.

4. All water nozzles provided for fire-fighting use should be of an approved dual-purpose type capable of producing either a spray or a jet. All pipes, valves, nozzles and other fittings in the fire-fighting systems should be resistant to the effects of fire and to corrosion by water.

5. Where the ship's engine-room is unattended, arrangements should be made to start and connect to the fire main at least one fire pump by remote control from the navigating bridge or other control station outside the cargo area.

1103. Water spray system (IGC Code 11.3)

1. On ships carrying flammable or toxic products or both, a water spray system for cooling, fire prevention and crew protection should be installed to cover:

(1) exposed cargo tank domes and any exposed parts of cargo tanks;
(2) exposed on-deck storage vessels for flammable or toxic products;
(3) cargo liquid and vapour discharge and loading manifolds and the area of their control valves and any other areas where essential control valves are situated and which should be at least equal to the area of the drip trays provided; and
(4) boundaries of superstructures and deckhouses normally manned, cargo compressors rooms, cargo pump rooms, store-rooms containing high fire risk items and cargo control rooms, all facing the cargo area. Boundaries of unmanned forecastle structures not containing high fire risk items or equipment do not require water spray protection.

2. The system should be capable of covering all areas mentioned in **Par 1** with a uniformly distributed water spray of at least 10 l/m^2 per minute for horizontal projected surfaces and 4 l/m^2 per minute for vertical surfaces. For structures having no clearly defined horizontal or vertical surfaces, the capacity of the water spray system should be the greater of the following:

(1) projected horizontal surface multiplied by 10 l/m^2 per minute; or
(2) actual surface multiplied by 4 l/m^2 per minute.
On vertical surfaces, spacing of nozzles protecting lower areas may take account of anticipated rundown from higher areas. Stop valves should be fitted at intervals in the spray main for the purpose of isolating damaged sections. Alternatively, the system may be divided into two or more sections which may be operated independently provided the necessary controls are located together, aft of the cargo area. A section protecting any area included in **Par 1** (1) and (2) should cover the whole of the athwartship tank grouping which includes that area.

3. The capacity of the water spray pumps should be sufficient to deliver the required amount of water to all areas simultaneously or where the system is divided into sections, the arrangements and capacity should be such as to supply water simultaneously to anyone section and to the surfaces specified in **Par 1** (3) and (4). Alternatively, the main fire pumps may be used for this service provided that their total capacity is increased by the amount needed for the spray system. In either case, a connection, through a stop valve, should be made between the fire main and water spray main outside the cargo area.

4. Subject to the approval of the Society, water pumps normally used for other services may be arranged to supply the water spray main.

5. All pipes, valves, nozzles and other fittings in the water spray systems should be resistant to corrosion by seawater, for which purpose galvanized pipe, for example, may be used, and to the effect of fire.

6. Remote starting of pumps supplying the water spray system and remote operation of any normally closed valves in the system should be arranged in suitable locations outside the cargo area, adjacent to the accommodation spaces and readily accessible and operable in the event of fire in the areas protected.

1104. Dry chemical powder fire-extinguishing systems (IGC Code 11.4)

1. Ships in which the carriage of flammable products is intended should be fitted with fixed dry chemical powder type extinguishing systems for the purpose of fighting fire on the deck in the cargo area and bow or stern cargo handling areas if applicable. The system and the dry chemical powder should be adequate fo this purpose and satisfactory to the Society.

2. The system should be capable of delivering powder from at least two hand hose lines or combination monitor/hand hose lines to any part of the above-deck exposed cargo area including above-deck product piping. The system should be activated by an inert gas such as nitrogen, used exclusively for this purpose and stored in pressure vessels adjacent to the powder containers.

3. The system for use in the cargo area should consist of at least two independent self-contained dry chemical powder units with associated controls, pressurizing medium fixed piping, monitors or hand hose lines. For ships with a cargo capacity of less than 1,000 m^3 only one such unit need be fitted, subject to approval by the Society. A monitor should be provided and so arranged as to protect the cargo loading and discharge manifold areas and be capable of actuation and discharge locally and remotely. The monitor is not required to be remotely aimed if it can deliver the necessary powder to all required areas of coverage from a single position. All hand hose lines and monitors should be capable of actuation at the hose storage reel or monitor. At least one hand hose line or monitor should be situated at the after end of the cargo area.

4. A fire-extinguishing unit having two or more monitors, hand hose lines, or combinations thereof, should have independent pipes with a manifold at the powder container, unless a suitable alternative means is provided to ensure proper performance as approved by the Society. Where two or more pipes are attached to a unit the arrangement should be such that any or all of the monitors and hand hose lines should be capable of simultaneous or sequential operation at their rated capacities.

5. The capacity of a monitor should be not less than 10 kg/sec. Hand hose lines should be non-kinkable and be fitted with a nozzle capable of on/off operation and discharge at a rate not less than 3.5 kg/sec. The maximum discharge rate should be such as to allow operation by one man. The length of a hand hose line should not exceed 33 m. Where fixed piping is provided between the powder container and a hand hose line or monitor, the length of piping should not exceed that length which is capable of maintaining the powder in a fluidized state during sustained or intermittent use, and which can be purged of powder when the system is shut down. Hand hose lines and nozzles should be of weather-resistant construction or stored in water-resistant housing or covers and be readily accessible.

6. A sufficient quantity of dry chemical powder should be stored in each container to provide a minimum 45 seconds discharge time for all monitors and hand hose lines attached to each powder unit. Coverage from fixed monitors should be in accordance with **Table 7.5.10.**

Table 7.5.10 Coverage from Fixed Monitors

Capacity of fixed monitors(kg/sec) each	10	25	45
Maximum distance of coverage(m)	10	30	40

Hand hose lines should be considered to have a maximum effective distance of coverage equal to the length of hose. Special consideration should be given where areas to be protected are substantially higher than the monitor or hand hose reel locations.

7. Ships fitted with bow or stern loading and discharge arrangements should be provided with an additional dry chemical powder unit complete with at least one monitor and one hand hose line complying with the requirements of **Pars 1** to **6.** This additional unit should be located to protect the bow or stern loading and discharge arrangements. The area of the cargo line forward or aft of the cargo area should be protected by hand hose lines.

1105. Cargo compressor and pump rooms (IGC Code 11.5)

1. The cargo compressor and pump rooms of any ship should be provided with a carbon dioxide system as specified in SOLAS regulation II-2/10.9.1.1. A notice should be exhibited at the controls stating that the system is only to be used for fire-extinguishing and not for inerting purposes, due to the electrostatic ignition hazard. The alarms referred to in SOLAS regulation II-2/10.9.1.1.1 should be safe for use in a flammable cargo vapour-air mixture. For the purpose of this requirement, an extinguishing system should be provided which would be suitable for machinery spaces. However, the amount of carbon dioxide gas carried should be sufficient to provide a quantity of free gas equal to 45 % of the gross volume of the cargo compressor and pump rooms in all cases.

2. Cargo compressor and pump rooms of ships which are dedicated to the carriage of a restricted number of cargoes should be protected by an appropriate fire-extinguishing system approved by the Society.

1106. Fire-fighter's outfits (IGC Code 11.6)

1. Every ship carrying flammable products should carry fire-fighter's outfits complying with the requirements of SOLAS regulation II-2/10.10 as follows:

Total cargo capacity	Number of outfits
5,000 m^3 and below	4
above 5,000 m^3	5

2. Additional requirements for safety equipment are given in **Sec 14.**

3. Any breathing apparatus required as part of a fire-fighter's outfit should be a self-contained air-breathing apparatus having a capacity of at least 1,200 l of free air.

Section 12 Mechanical Ventilation in the Cargo Area

The requirements of this Section should be substituted for SOLAS regulations II-2/4.5.2.6 and II-2/4.5.4.

1201. Spaces required to be entered during normal cargo handling operations (IGC Code 12.1)

1. Electric motor rooms, cargo compressor and pump rooms, other enclosed spaces which contain cargo handling equipment and similar spaces in which cargo handling operations are performed should be fitted with mechanical ventilation systems capable of being controlled from outside such spaces. Provision should be made to ventilate such spaces prior to entering the compartment and operating the equipment and a warning notice requiring the use of such ventilation should be placed outside the compartment.

2. Mechanical ventilation inlets and outlets should be arranged to ensure sufficient air movement through the space to avoid the accumulation of flammable or toxic vapours and to ensure a safe working environment, but in no case should the ventilation system have a capacity of less than 30 changes of air per hour based upon the total volume of the space. As an exception, gas-safe cargo control rooms may have eight changes of air per hour.

3. Ventilation systems should be fixed and, if of the negative pressure type, permit extraction from either the upper or the lower parts of the spaces, or from both the upper and the lower parts, depending on the density of the vapours of the products carried.

4. In rooms housing electric motors driving cargo compressors or pumps, spaces except machinery spaces containing inert gas generators, cargo control rooms if considered as gas-safe spaces and other gas-safe spaces within the cargo area, the ventilation should be of the positive pressure type.

5. In cargo compressor and pump rooms and in cargo control rooms if considered gas-dangerous, the ventilation should be of the negative pressure type.

6. Ventilation exhaust ducts from gas-dangerous spaces should discharge upwards in locations at least 10 m in the horizontal direction from ventilation intakes and openings to accommodation spaces, service spaces and control stations and other gas-safe spaces.

7. Ventilation intakes should be so arranged as to minimize the possibility of re-cycling hazardous vapours from any ventilation discharge opening.

8. Ventilation ducts from gas-dangerous spaces should not be led through accommodation, service and machinery spaces or control stations, except as allowed in **Sec 16.**

9. Electric motors driving fans should be placed outside the ventilation ducts if the carriage of flammable products is intended. Ventilation fans should not produce a source of vapour ignition in either the ventilated space or the ventilation system associated with the space. Ventilation fans and fan ducts, in way of fans only, for gas-dangerous spaces should be of non sparking construction defined as:

(1) impellers or housing of nonmetallic construction, due regard being paid to the elimination of static electricity;
(2) impellers and housing of nonferrous materials;
(3) impellers and housing of austenitic stainless steel; and
(4) ferrous impellers and housing with not less than 13 mm design tip clearance.
Any combination or an aluminium or magnesium alloy fixed or rotating component and a ferrous fixed or rotating component, regardless of tip clearance, is considered a sparking hazard and should not be used in these places.

10. Spare parts should be carried for each type of fan on board referred to in this Section.

11. Protection screens of not more than 13 mm square mesh should be fitted in outside openings of ventilation ducts.

1202. Spaces not normally entered (IGC Code 12.2)

Hold spaces, interbarrier spaces, void spaces, cofferdams, spaces containing cargo piping and other spaces where cargo vapour may accumulate, should be capable of being ventilated to ensure a safe environment when entry into the spaces is necessary. Where a permanent ventilation system is not provided for such spaces, approved means of portable mechanical ventilation should be provided. Where necessary owing to the arrangement of spaces, such as hold spaces and interbarrier spaces, essential ducting for such ventilation should be permanently installed. Fans or blowers should be clear of personnel access openings, and should comply with **1201. 9.**

Section 13 Instrumentation (Gauging, Gas Detection)

1301. General (IGC Code 13.1)

1. Each cargo tank should be provided with means for indicating level, pressure and temperature of the cargo. Pressure gauges and temperature indicating devices should be installed in the liquid and vapour piping systems, in cargo refrigerating installations and in the inert gas systems as detailed in this Section.

2. Where a secondary barrier is required, permanently installed instrumentation should be provided to detect when the primary barrier fails to be liquid tight at any location or when liquid cargo is in contact with the secondary barrier at any location. This instrumentation should consist of appropriate gas detecting devices according to **1306.** However, the instrumentation need not be capable of locating the area where liquid cargo leaks through the primary barrier or where liquid cargo is in contact with the secondary barrier.

3. If the loading and unloading of the ship is performed by means of remotely controlled valves and pumps, all controls and indicators associated with a given cargo tank should be concentrated in one control position.

4. Instruments should be tested to ensure reliability in the working conditions and recalibrated at regular intervals. Test procedures for instruments and the intervals between recalibration should be approved by the Society.

1302. Level indicators for cargo tanks (IGC Code 13.2)

1. Each cargo tank should be fitted with at least one liquid level gauging device, designed to operate at pressures not less than the MARVS of the cargo tank and at temperatures within the cargo operating temperature range. Where only one liquid level gauge is fitted it should be so arranged that any necessary maintenance can be carried out while the cargo tank is in service.

2. Cargo tank liquid level gauges may be of the following types subject to any special requirement for particular cargoes shown in column "g" in the table of **Sec 19:**

(1) indirect devices, which determine the amount of cargo by means such as weighing or pipe flow meters;

(2) closed devices, which do not penetrate the cargo tank, such as devices using radioisotopes or ultrasonic devices;

(3) closed devices, which penetrate the cargo tank, but which form part of a closed system and keep the cargo from being released, such as float type systems, electronic probes, magnetic probes and bubble tube indicators. If a closed gauging device is not mounted directly on the tank it should be provided with a shutoff valve located as close as possible to the tank; and

(4) restricted devices, which penetrate the tank and when in use permit a small quantity of cargo vapour or liquid to escape to the atmosphere, such as fixed tube and slip tube gauges. When not in use, the devices should be kept completely closed. The design and installation should ensure that no dangerous escape of cargo can take place when opening the device. Such gauging devices should be so designed that the maximum opening does not exceed 1.5 mm diameter or equivalent area unless the device is provided with an excess flow valve.

3. Sighting ports with a suitable protective cover and situated above the liquid level with an internal scale may be allowed by the Society as a secondary means of gauging for cargo tanks having a design vapour pressure not higher than 0.07 MPa.

4. Tubular gauge glasses should not be fitted. Gauge glasses of the robust type as fitted on high-pressure boilers and fitted with excess flow valves may be allowed by the Society for deck tanks, subject to any provisions of **Sec 17.**

1303. Overflow control (IGC Code 13.3)

1. Except as provided in **Par 2,** each cargo tank should be fitted with a high liquid level alarm operating independently of other liquid level indicators and giving an audible and visual warning when activated. Another sensor operating independently of the high liquid level alarm should automatically actuate a shutoff valve in a manner which will both avoid excessive liquid pressure in the loading line and prevent the tank from becoming liquid full. The emergency shutdown valve referred to in **506. 1** and **506. 3** may be used for this purpose. If another valve is used for this purpose, the same information as referred to in **506. 4** should be available on board.

2. A high liquid level alarm and automatic shutoff of cargo tank filling need not be required when the cargo tank:

(1) is a pressure tank with a volume not more than 200 m^3; or
(2) is designed to withstand the maximum possible pressure during the loading operation and such pressure is below that of the start-to-discharge pressure of the cargo tank relief valve.

3. Electrical circuits, if any, of level alarms should be capable of being tested prior to loading.

1304. Pressure gauges (IGC Code 13.4)

1. The vapour space of each cargo tank should be provided with a pressure gauge which should incorporate an indicator in the control position required by **1301. 3.** In addition, a high-pressure alarm and, if vacuum protection is required, a low-pressure alarm should be provided on the navigating bridge. Maximum and minimum allowable pressures should be marked on the indicators. The alarms should be activated before the set pressures are reached. For cargo tanks fitted with pressure relief valves, which can be set at more than one set pressure in accordance with **802. 6,** high-pressure alarms should be provided for each set pressure.

2. Each cargo pump discharge line and each liquid and vapour cargo manifold should be provided with at least one pressure gauge.

3. Local-reading manifold pressure gauges should be provided to indicate the pressure between stop valves and hose connections to the shore.

4. Hold spaces and interbarrier spaces without open connection to the atmosphere should be provided with pressure gauges.

1305. Temperature indicating devices (IGC Code 13.5)

1. Each cargo tank should be provided with at least two devices for indicating cargo temperatures, one placed at the bottom of the cargo tank and the second near the top of the tank, below the highest allowable liquid level. The temperature indicating devices should be marked to show the lowest temperature for which the cargo tank has been approved by the Society.

2. When a cargo is carried in a cargo containment system with a secondary barrier at a temperature lower than -55°C, temperature indicating devices should be provided within the insulation or on the hull structure adjacent to cargo containment systems. The devices should give readings at regular intervals and, where applicable, audible warning of temperatures approaching the lowest for which the hull steel is suitable.

3. If cargo is to be carried at temperatures lower than -55°C, the cargo tank boundaries, if appropriate for the design of the cargo containment system, should be fitted with temperature indicating devices as follows:

(1) A sufficient number of devices to establish that an unsatisfactory temperature gradient does not occur.
(2) On one tank a number of devices in excess of those required in (1) in order to verify that the initial cool down procedure is satisfactory. These devices may be either temporary or permanent. When a series of similar ships is built, the second and successive ships need not comply with the requirements of this subparagraph.

4. The number and position of temperature indicating devices should be to the satisfaction of the Society.

1306. Gas detection requirements (IGC Code 13.6)

1. Gas detection equipment acceptable to the Society and suitable for the gases to be carried should be provided in accordance with column "f" in the table of **Sec 19.**

2. In every installation, the positions of fixed sampling heads should be determined with due regard to the density of the vapours of the products intended to be carried and the dilution from compartment purging or ventilation.

3. Pipe runs from sampling heads should not be led through gas-safe spaces except as permitted by **Par 5.**

4. Audible and visual alarms from the gas detection equipment, if required by this Article, should be located on the navigating bridge, in the control position required by **1301. 3,** and at the gas detector readout location.

5. Gas detection equipment may be located in the control position required by **1301. 3,** on the navigating bridge or at other suitable locations. When such equipment is located in a gas-safe space the following conditions should be met:

(1) gas-sampling lines should have shutoff valves or an equivalent arrangement to prevent cross-communication with gas-dangerous spaces; and
(2) exhaust gas from the detector should be discharged to the atmosphere in a safe location.

6. Gas detection equipment should be so designed that it may readily be tested. Testing and calibration should be carried out at regular intervals. Suitable equipment and span gas for this purpose should be carried on board. Where practicable, permanent connections for such equipment should be fitted.

7. A permanently installed system of gas detection and audible and visual alarms should be provided for:

(1) cargo pump rooms;
(2) cargo compressor rooms;
(3) motor rooms for cargo handling machinery;
(4) cargo control rooms unless designated as gas-safe;
(5) other enclosed spaces in the cargo area where vapour may accumulate including hold spaces and interbarrier spaces for independent tanks other than type C;
(6) ventilation hoods and gas ducts where required by **Sec 16;** and
(7) air locks.

8. The gas detection equipment should be capable of sampling and analysing from each sampling head location sequentially at intervals not exceeding 30 min, except that in the case of gas detection for the ventilation hoods and gas ducts referred to in **1306. 7** (6) sampling should be continuous. Common sampling lines to the detection equipment should not be fitted.

9. In the case of products which are toxic or both toxic and flammable, the Society except when column "i" in the table of **Sec 19** refers to **1709.,** may authorize the use of portable equipment for detection of toxic products as an alternative to a permanently installed system, if such equipment is used before personnel enter the spaces listed in **Par 7** and at 30 min intervals while they remain therein.

10. For the spaces listed in **Par 7,** alarms should be activated for flammable products when the vapour concentration reaches 30 % of the lower flammable limit.

11. In the case of flammable products, where cargo containment systems other than independent tanks are used, hold spaces and interbarrier spaces should be provided with a permanently installed gas detection system capable of measuring gas concentrations of 0 % to 100 % by volume. The detection equipment, equipped with audible and visual alarms, should be capable of monitoring from each sampling head location sequentially at intervals not exceeding 30 min. Alarms should be activated when the vapour concentration reaches the equivalent of 30 % of the lower flammable limit in air or such other limit as may be approved by the Society in the light of particular cargo containment arrangements. Common sampling lines to the detection equipment should not be fitted.

12. In the case of toxic gases, hold spaces and interbarrier spaces should be provided with a permanently installed piping system for obtaining gas samples from the spaces. Gas from these spaces should be sampled and analysed from each sampling head location by means of fixed or portable equipment at intervals not exceeding 4 h and in any event before personnel enter the space and at 30 min intervals while they remain therein.

13. Every ship should be provided with at least two sets of portable gas detection equipment acceptable to the Society and suitable for the products to be carried.

14. A suitable instrument for the measurement of oxygen levels in inert atmospheres should be provided.

Section 14 Personnel Protection

1401. Protective equipment (IGC Code 14.1)

Suitable protective equipment including eye protection should be provided for protection of crew members engaged in loading and discharging operations, taking into account the character of the products.

1402. Safety equipment (IGC Code 14.2)

1. Sufficient, but not less than two complete sets of safety equipment in addition to the firmen's outfits required by **1106. 1** each permitting personnel to enter and work in a gas-filled space, should be provided.

2. One complete set of safety equipment should consist of:

(1) one self-contained air-breathing apparatus not using stored oxygen, having a capacity of at least 1,200 l of free air;
(2) protective clothing, boots, gloves and tight fitting goggles;
(3) steel-cored rescue line with belt; and
(4) explosion-proof lamp.

3. An adequate supply of compressed air should be provided and should consist either of:

(1) one set of fully charged spare air bottles for each breathing apparatus required by **Par 1;** a special air compressor suitable for the supply of high-pressure air of the required purity; and a charging manifold capable of dealing with sufficient spare breathing apparatus air bottles for the breathing apparatus required by **Par 1;** or
(2) fully charged spare air bottles with a total free air capacity of at least 6,000 l for each breathing apparatus required by **Par 1.**

4. Alternatively, the Society may accept a low-pressure air line system with hose connection suitable for use with the breathing apparatus required by **Par 1.** This system should provide sufficient high-pressure air capacity to supply, through pressure reduction devices, enough low-pressure air to enable two men to work in a gas-dangerous space for at least 1 h without using the air bottles of the breathing apparatus. Means should be provided for recharging the fixed air bottles and the breathing apparatus air bottles from a special air compressor suitable for the supply of high-pressure air of the required purity.

5. Protective equipment required in **1401.** and safety equipment required in **Par 1** should be kept in suitable, clearly marked lockers located in readily accessible places.

6. The compressed air equipment should be inspected at least once a month by a responsible officer and the inspection recorded in the ship's log-book, and inspected and tested by an expert at least once a year.

1403. First-aid equipment (IGC Code 14.3)

1. A stretcher which is suitable for hoisting an injured person from spaces below deck should be kept in a readily accessible location.

2. The ship should have on board medical first-aid equipment, including oxygen resuscitation equipment and antidotes for cargoes to be carried. Medical First Aid Guide for Use in Accidents Involving Dangerous Goods(MFAG) numbers related to products covered by the code are given in the table of minimum requirements(**Sec 19**)

1404. Personnel protection requirements for individual products (IGC Code 14.4)

1. Provisions of **1404.** are applicable to ships carrying products for which those paragraphs are listed in column "i" in the table of **Sec 19.**

2. Respiratory and eye protection suitable for emergency escape purposes should be provided for every person on board subject to the following:

(1) (a) filter type respiratory protection is unacceptable;

(b) self-contained breathing apparatus should normally have a duration of service of at least 15 min;

(2) emergency escape respiratory protection should not be used for fire-fighting or cargo handling purposes and should be marked to that effect;

(3) two additional sets of the above respiratory and eye protection should be permanently located in the navigating bridge.

3. Suitably marked decontamination showers and an eyewash should be available on deck in convenient locations. The showers and eyewash should be operable in all ambient conditions.

4. In ships of a cargo capacity of 2,000 m^3 and over, two complete sets of safety equipment should be provided in addition to the equipment required by **1106. 1** and **1402. 1.** At least three spare charged air bottles should be provided for each self-contained air breathing apparatus required in this paragraph.

5. Personnel should be protected against the effects of a major cargo release by the provision of a space within the accommodation area designed and equipped to the satisfaction of the Society.

6. For certain highly dangerous products, cargo control rooms should be of the gas-safe type only.

Section 15 Filling Limits for Cargo Tanks

1501. General (IGC Code 15.1)

1. No cargo tanks should have a higher filling limit(FL) than 98 % at the reference temperature, except as permitted by **Par 3.**

2. The maximum loading limit(LL) to which a cargo tank may be loaded should be determined by the following formula:

$$LL = FL\frac{\rho_R}{\rho_L}$$

where:

LL = loading limit expressed as a percentage, being the maximum allowable liquid volume relative to the tank volume to which the tank may be loaded(%)

FL = filling limit as specified in **Par 1** or **3**

ρ_R = relative density of cargo at the reference temperature

ρ_L = relative density of cargo at the loading temperature and pressure.

3. The Society may allow a higher filling limit(FL) than the limit of 98 % specified in **Par 1** at the reference temperature, taking into account the shape of the tank, arrangements of pressure relief valves, accuracy of level and temperature gauging and the difference between the loading temperature and the temperature corresponding to the vapour pressure of the cargo at the set pressure of the pressure relief valves, provided the conditions in **802. 17** are maintained.

4. For the purposes of this Section only, "reference temperature" means:

(1) the temperature corresponding to the vapour pressure of the cargo at the set pressure of the pressure relief valves when no cargo vapour pressure/temperature control as referred to in **Sec 7** is provided.

(2) the temperature of the cargo upon termination of loading, during transport, or at unloading, whichever is the greatest, when a cargo vapour pressure/temperature control as referred to in **Sec 7** is provided. If this reference temperature would result in the cargo tank becoming liquid full before the cargo reaches a temperature corresponding to the vapour pressure of the cargo at the set pressure of the relief valves required in **802.**, an additional pressure relieving system complying with **803.** should be fitted.

5. The Society may allow type C tanks to be loaded according to the following formula, provided that the tank vent system has been approved in accordance with **802. 18:**

$$LL = FL\frac{\rho_R}{\rho_L}$$

where:

LL = loading limit as specified in **Par 2;**

FL = filling limit as specified in **Par 1** or **3;**

ρ_R = relative density of cargo at the highest temperature which the cargo may reach upon termination or loading, during transport, or at unloading, under the ambient design temperature conditions described in **701. 2;** and

ρ_L = as specified in **Par 2.**

This paragraph does not apply to products requiring a type 1 G ship.

6. This Section applies to all ships regardless of the date of construction.

1502. Information to be provided to the master (IGC Code 15.2)

The maximum allowable loading limits for each cargo tank should be indicated for each product which may be carried, for each loading temperature which may be applied and for the applicable maximum reference temperature, on a list to be approved by the Society. Pressures at which the pressure relief valves, including those valves required by **803.**, have been set should also be stated on the list. A copy of the list should be permanently kept on board by the master.

Section 16 Use of Cargo as Fuel

1601. General (IGC Code 16.1)

1. Methane (LNG) is the only cargo whose vapour or boil-off gas may be utilized in machinery spaces of category A and in such spaces may be utilized only in boilers, inert gas generators, and combustion engines and gas turbines.

2. These provisions do not preclude the use of gas fuel for auxiliary services in other locations, provided that such other services and locations should be subject to special consideration by the Society.

1602. Arrangement of machinery spaces of category A (IGC Code 16.2)

1. Spaces in which gas fuel is utilized should be fitted with a mechanical ventilation system and should be arranged in such a way as to prevent the formation of dead spaces. Such ventilation should be particularly effective in the vicinity of electrical equipment and machinery or of other equipment and machinery which may generate sparks. Such a ventilation system should be separated from those intended for other spaces.

2. Gas detectors should be fitted in these spaces, particularly in the zones where air circulation is reduced. The gas detection system should comply with the requirements of **Sec 13.**

3. Electrical equipment located in the double wall pipe or duct specified in **1603. 1** should be of the intrinsically safe type.

1603. Gas fuel supply (IGC Code 16.3)

1. Gas fuel piping should not pass through accommodation spaces, service spaces or control stations. Gas fuel piping may pass through or extend into other spaces provided they fulfil one of the following:

(1) the gas fuel piping should be a double wall piping system with the gas fuel contained in the inner pipe. The space between the concentric pipes should be pressurized with inert gas at a pressure greater than the gas fuel pressure. Suitable alarms should be provided to indicate a loss of inert gas pressure between the pipes; or

(2) the gas fuel piping should be installed within a ventilated pipe or duct. The air space between the gas fuel piping and the inner wall of this pipe or duct should be equipped with mechanical exhaust ventilation having a capacity of at least 30 air changes per hour. The ventilation system should be arranged to maintain a pressure less than the atmospheric pressure. The fan motors should be placed outside the ventilated pipe or duct. The ventilation outlet should be placed in a position where no flammable gas-air mixture may be ignited. The ventilation should always be in operation when there is gas fuel in the piping. Continuous gas detection should be provided to indicate leaks and to shut down the gas fuel supply to the machinery space in accordance with **Par 10**. The master gas fuel valve required by **Par 7** should close automatically, if the required air flow is not established and maintained by the exhaust ventilation system.

2. If a gas leak occurs, the gas fuel supply should not be restored until the leak has been found and repaired. Instructions to this effect should be placed in a prominent position in the machinery spaces.

3. The double wall piping system or the ventilated pipe or duct provided for the gas fuel piping should terminate at the ventilation hood or casing required by **Par 4.**

4. A ventilation hood or casing should be provided for the areas occupied by flanges, valves, etc., and for the gas fuel piping, at gas fuel utilization units, such as boilers, diesel engines and gas turbines. If this ventilation hood or casing is not served by the exhaust ventilation fan serving the ventilated pipe or duct as specified in **Par 1** (2), then it should be equipped with an exhaust ventilation system and continuous gas detection should be provided to indicate leaks and to shut down the gas fuel supply to the machinery space in accordance with **Par 10.** The master gas fuel valve required by **Par 7** should close automatically if the required air flow is not established and maintained by the exhaust ventilation system. The ventilation hood or casing should be installed or mounted to permit the ventilating air to sweep across the gas utilization unit and be exhausted at the top of the ventilation hood or casing.

5. The ventilation inlet and discharge for the required ventilation systems should be respectively from and to a safe location.

6. Each gas utilization unit should be provided with a set of three automatic valves. Two of these valves should be in series in the gas fuel pipe to the consuming equipment. The third valve should be in a pipe that vents, to a safe location in the open air, that portion of the gas fuel piping that is between the two valves in series. These valves should be so arranged that failure of the necessary forced draft, loss of flame on boiler burners, abnormal pressure in the gas fuel supply line, or failure of the valve control actuating medium will cause the two gas fuel valves which are in series to close automatically and cause the vent valve to open automatically. Alternatively, the function of one of the valves in series and of the valve in the vent line can be incorporated into one valve body so arranged that, when one of the above conditions occurs, flow to the gas utilization unit will be blocked and the vent opened. The three shut-off valves should be arranged for manual reset.

7. A master gas fuel valve that can be closed from within the machinery space should be provided within the cargo area. The valve should be arranged so as to close automatically if leakage of gas is detected, or loss of ventilation for the duct or casing or loss of pressurization of the double wall gas fuel piping occurs.

8. Gas fuel piping in machinery spaces should comply with **502.** to **505.** as far as found applicable. The piping should, as far as practicable, have welded joints. Those parts of the gas fuel piping, which are not enclosed in a ventilated pipe or duct according to **Par 1** and are on the open deck outside the cargo area should have full penetration butt-welded joints and should be fully radiographed.

9. Provision should be made for inerting and gas-freeing that portion of the gas fuel piping system located in the machinery space.

10. Gas detection systems provided in accordance with the requirements of **Pars 1** and **4** should comply with **1306. 2** and **1306. 4** through **1306. 8** as applicable; they should activate the alarm at 30 % of the lower flammable limit and shut down the master gas fuel valve referred to in **Par 7** before the gas concentration reaches 60 % of the lower flammable limit.

1604. Gas make-up plant and related storage tanks (IGC Code 16.4)

1. All equipment (heaters, compressors, filters, etc.) for making up the gas for its use as fuel, and the related storage tanks should be located in the cargo area in accordance with the requirement of **301. 5** (4). If the equipment is in an enclosed space, the space should be ventilated according to **1201.** and be equipped with a fixed fire-extinguishing system according to **1105.** and with a gas detection system according to **1306.,** as applicable.

2. The compressors should be capable of being remotely stopped from a position which is always and easily accessible, and also from the engine-room. In addition, the compressors should be capable of automatically stopping when the suction pressure reaches a certain value depending on the set pressure of the vacuum relief valves of the cargo tanks. The automatic shut-down device of the compressors should have a manual resetting. Volumetric compressors should be fitted with pressure relief valves discharging into the suction line of the compressor. The size of the pressure relief valves should be determined in such a way that, with the delivery valve kept closed, the maximum pressure does not exceed by more than 10 % the maximum working pressure, The requirements of **506. 1** (3) apply to these compressors.

3. If the heating medium for the gas fuel evaporator or heater is returned to spaces outside the cargo area it should first go through a degassing tank. The degassing tank should be located in the cargo area. Provisions should be made to detect and alarm the presence of gas in the tank. The vent outlet should be in a safe position and fitted with a flame screen.

4. Piping and pressure vessels in the gas fuel conditioning system should comply with **Sec 5.**

1605. Special requirements for main boilers (IGC Code 16.5)

1. Each boiler should have a separate uptake.

2. A system suitable to ensure the forced draught in the boilers should be provided. The particulars of such a system should be to the satisfaction of the Society.

3. Combustion chambers of boilers should be of suitable form such as not to present pockets where gas may accumulate.

4. The burner systems should be of dual type, suitable to burn either oil fuel or gas fuel alone or oil and gas fuel simultaneously. Only oil fuel should be used during manoeuvring and port operations unless automatic transfer from gas to oil burning is provided in which case the burning of a combination of oil and gas or gas alone may be permitted provided the system is demonstrated to the satisfaction of the Society. It should be possible to change over easily and quickly from gas fuel operation to oil fuel operation. Gas nozzles should be fitted in such a way that gas fuel is ignited by the flame of the oil fuel burner. A flame scanner should be installed and arranged to assure that gas flow to the burner is cut off unless satisfactory ignition has been established and maintained. On the pipe of each gas burner a manually operated shut-off valve should be fitted. An installation should be provided for purging the gas supply piping to the burners by means of inert gas or steam, after the extinguishing of these burners.

5. Alarm devices should be fitted in order to monitor a possible decrease in liquid fuel oil pressure or a possible failure of the related pumps.

6. Arrangements should be made that, in case of flame failure of all operating burners for gas or oil or for a combination thereof, the combustion chambers of the boilers are automatically purged before relighting. Arrangements should also be made to enable the boilers to be manually purged.

1606. Special requirements for gas-fired internal combustion engines and gas-fired turbines (IGC Code 16.6)

Special provisions for gas-fuelled internal combustion engines and for gas turbines will be considered by the Society in each case.

Section 17 Special Requirements

1701. General (IGC Code 17.1)

The provisions of this Section are applicable where reference is made in column "i" in the table of **Sec 19.** These are requirements additional to the general requirements of this Chapter.

1702. Materials of construction (IGC Code 17.2)

Materials which may be exposed to cargo during normal operations should be resistant to the corrosive action of the gases. In addition, the following materials of construction for cargo tanks, and associated pipelines, valves, fittings and other items of equipment should not be used for certain products as specified in column "i" in the table of **Sec 19**:
(1) mercury, copper and copper-bearing alloys, and zinc;
(2) copper, silver, mercury, magnesium and other acetylide-forming metals;
(3) aluminium and aluminium-bearing alloys;
(4) copper, copper alloys, zinc and galvanized steel;
(5) aluminium, copper and alloys of either;
(6) copper and copper-bearing alloys with greater than 1% copper.

1703. Independent tanks (IGC Code 17.3)

1. Products should be carried in independent tanks only.

2. Products should be carried in type C independent tanks and the provisions of **701. 3** apply. The design pressure of the cargo tank should take into account any padding pressure or vapour discharge unloading pressure.

1704. Refrigeration systems (IGC Code 17.4)

1. Only the indirect system described in **702. 4** (2) should be used.

2. For a ship engaged in the carriage of products which readily form dangerous peroxides, recondensed cargo should not be allowed to form stagnant pockets of uninhibited liquid. This may be achieved either by:
(1) using the indirect system described in **702. 4** (2) with the condenser inside the cargo tank; or
(2) using the direct system or combined system described in **702. 4** (1) and (3) respectively, or the indirect system described in **702. 4** (2) with the condenser outside the cargo tank, and designing the condensate system to avoid any places in which liquid could collect and be retained. Where this is impossible inhibited liquid should be added upstream of such a place.

3. If the ship is to carry consecutively products as specified in **Par 2** with a ballast passage between, all uninhibited liquid should be removed prior to the ballast voyage. If a second cargo is to be carried between such consecutive cargoes, the reliquefaction system should be thoroughly drained and purged before loading the second cargo. Purging should be carried out using either inert gas or vapour from the second cargo, if compatible. Practical steps should be taken to ensure that polymers or peroxides do not accumulate in the cargo system.

1705. Deck cargo piping (IGC Code 17.5)

One hundred per cent radiography of all butt-welded joints in cargo piping exceeding 75 mm in diameter is required.

1706. Exclusion of air from vapour spaces (IGC Code 17.6)

Air should be removed from the cargo tanks and associated piping before loading and then subsequently excluded by:
(1) introducing inert gas to maintain a positive pressure. Storage or production capacity of the inert gas should be sufficient to meet normal operating requirements and relief valve leakage. The oxygen content of inert gas should at no time be greater than 0.2 % by volume; or

(2) control of cargo temperatures such that a positive pressure is maintained at all times.

1707. Moisture control (IGC Code 17.7)

For gases which are non-flammable and may become corrosive or react dangerously with water, moisture control should be provided to ensure that cargo tanks are dry before loading and that during discharge, dry air or cargo vapour is introduced to prevent negative pressures. For the purposes of this paragraph, dry air is air which has a dew point of -45°C or below at atmospheric pressure.

1708. Inhibition (IGC Code 17.8)

Care should be taken to ensure that the cargo is sufficiently inhibited to prevent polymerization at all times during the voyage. Ships should be provided with a certificate from the manufacturer stating:

(1) Name and amount of inhibitor added;
(2) date inhibitor was added and the normally expected duration of its effectiveness;
(3) any temperature limitations affecting the inhibitor;
(4) the action to be taken should be length of the voyage exceed the effective lifetime of the inhibitors.

1709. Permanently installed toxic gas detectors (IGC Code 17.9)

1. Gas sampling lines should not be led into or through gas-safe spaces. Alarms referred to in **1306. 7** should be activated when the vapour concentration reaches the threshold limiting value.

2. The alternative of using portable equipment in accordance with **1306. 9** should not be permitted.

1710. Flame screens on vent outlets (IGC Code 17.10)

Cargo tank vent outlets should be provided with readily renewable and effective flame screens or safety heads of an approved type when carrying a cargo referenced to this Article. Due attention should be paid in the design of flame screens and vent heads to the possibility of the blockage of these devices by the freezing of cargo vapour or by icing up in adverse weather conditions. Ordinary protection screens should be fitted after removal of the flame screens.

1711. Maximum allowable quantity of cargo per tank (IGC Code 17.11)

When carrying a cargo referenced to this Article the quantity of the cargo should not exceed 3,000 m^3 in any one tank.

1712. Submerged electric cargo pumps (IGC Code 17.12)

The vapour space of cargo tanks equipped with submerged electric motor pumps should be inerted to a positive pressure prior to loading, during carriage and during unloading of flammable liquids.

1713. Ammonia (IGC Code 17.13)

1. Anhydrous ammonia may cause stress corrosion cracking in containment and process systems made of carbon-manganese steel or nickel steel. To minimize the risk of this occurring, measures detailed in **Pars 2** to **8** should be taken as appropriate.

2. Where carbon-manganese steel is used, cargo tanks, process pressure vessels and cargo piping should be made of fine-grained steel with a specified minimum yield strength not exceeding 355 N/mm^2 and with an actual yield strength not exceeding 440 N/mm^2. One of the following constructional or operational measures should also be taken:

(1) lower strength material with a specified minimum tensile strength not exceeding 410 N/mm^2 should be used; or
(2) cargo tanks, etc., should be post-weld stress relief heat treated; or
(3) carriage temperature should be maintained preferably at a temperature close to the product's boiling point of -33°C but in no case at a temperature above -20°C; or

(4) the ammonia should contain not less than 0.1 % w/w water.

3. If carbon-manganese steels with higher yield properties are used other than those specified in **Par 2,** the completed cargo tanks, piping, etc., should be given a post-weld stress relief heat treatment.

4. Process pressure vessels and piping of the condensate part of the refrigeration system should be given a post-weld stress relief heat treatment when made of materials mentioned in **Par 1.**

5. The tensile and yield properties of the welding consumables should exceed those of the tank or piping material by the smallest practical amount.

6. Nickel steel containing more than 5 % nickel and carbon-manganese steel not complying with the requirements of **Pars 2** and **3** are particularly susceptible to ammonia stress corrosion cracking and should not be used for containment and piping systems for the carriage of this product.

7. Nickel steel containing not more than 5 % nickel may be used provided the carriage temperature complies with the requirements specified in **2** (3).

8. In order to minimize the risk of ammonia stress corrosion cracking, it is advisable to keep the dissolved oxygen content below 2.5 ppm w/w. This can best be achieved by reducing the average oxygen content in the tanks prior to the introduction of liquid ammonia to less than the values given as a function of the carriage temperature T in the table below:

T (°C)	O_2 (%, v/v)
-30 and below	0.90
-20	0.50
-10	0.28
0	0.16
10	0.10
20	0.05
30	0.03

Oxygen percentages for intermediate temperatures may be obtained by direct interpolation.

1714. Chlorine (IGC Code 17.14)

1. Cargo containment system

(1) The capacity of each tank should not exceed 600 m^3 and the total capacity of all cargo tanks should not exceed 1,200 m^3.
(2) The tank design vapour pressure should not be less than 1.35 MPa (see also **701. 3** and **1703. 2**).
(3) Parts of tanks protruding above the upper deck should be provided with protection against thermal radiation taking into account total engulfment by fire.
(4) Each tank should be provided with two pressure relief valves. A bursting disc of appropriate material should be installed between the tank and the pressure relief valves. The rupture pressure of the bursting disc should be 0.1 MPa lower than the opening pressure of the pressure relief valve, which should be set at the design vapour pressure of the tank but not less than 1.35 MPa gauge. The space between the bursting disc and the relief valve should be connected through an excess flow valve to a pressure gauge and a gas detection system. Provision should be made to keep this space at or near the atmospheric pressure during normal operation.
(5) Outlets from pressure relief valves should be arranged in such a way as to minimize the hazards on board the ship as well as to the environment. Leakage from the relief valves should be led through the absorption plant to reduce the gas concentration as far as possible. The relief valve exhaust line should be arranged at the forward end of the ship to discharge outboard at deck level with an arrangement to select either port or starboard side, with a mechanical interlock to ensure that one line is always open.
(6) The Society and the port Administration may require that chlorine is carried in refrigerated state at a specified maximum pressure.

2. Cargo piping systems

(1) Cargo discharge should be performed by means of compressed chlorine vapour from shore, dry air or another acceptable gas or fully submerged pumps. The pressure in the vapour space of the tank during discharging should not exceed 1.05 MPa gauge. Cargo discharge compressors on board ships should not be accepted by the Society.
(2) The design pressure of the cargo piping system should be not less than 2.1 MPa gauge. The internal diameter of the cargo pipes should not exceed 100 mm. Only pipe bends should be accepted for compensation of pipeline thermal movement. The use of flanged joints should be restricted to a minimum, and when used the flanges should be of the welding neck type with tongue and groove.
(3) Relief valves of the cargo piping system should discharge to the absorption plant (see also **802. 16**).

3. Materials

(1) The cargo tanks and cargo piping systems should be made of steel suitable for the cargo and for a temperature of -40°C, even if a higher transport temperature is intended to be used.
(2) The tanks should be thermally stress-relieved. Mechanical stress relief should not be accepted as an equivalent.

4. Instrumentation-safety devices

(1) The ship should be provided with a chlorine absorbing plant with connections to the cargo piping system and the cargo tanks. The absorbing plant should be capable of neutralizing at least 2 % of the total cargo capacity at a reasonable absorption rate.
(2) During the gas-freeing of cargo tanks, vapours should not be discharged to the atmosphere.
(3) A gas detecting system should be provided capable of monitoring chlorine concentrations of at least 1 ppm by volume. Suction points should be located:
(a) near the bottom of the hold spaces;
(b) in the pipes from the safety relief valves;
(c) at the outlet from the gas absorbing plant;
(d) at the inlet to the ventilation systems for the accommodation, service and machinery spaces and control stations;
(e) on deck at the forward end, in the middle and at the after end of the cargo area. (Only required to be used during cargo handling and gas-freeing operations).
The gas detection system should be provided with an audible and visual alarm with a set point of 5 ppm.
(4) Each cargo tank should be fitted with a high pressure alarm giving an audible alarm at a pressure equal to 1.05 MPa gauge.

5. Personnel protection

In addition to the requirements given in **Sec 14** the following requirements should be met:

(1) The enclosed space required by **1404. 5** should be easily and quickly accessible from the open deck and from accommodation spaces and should be capable of being rapidly closed gastight. Access to this space from the deck and from the accommodation spaces should be by means of an air lock. The space should be so designed as to accommodate the entire crew of the ship and be provided with a source of uncontaminated air for a period of not less than 4 h. One of the decontamination showers required by **1404. 3** should be located near the air lock to the space.
(2) A compressor and the necessary equipment for filling the air bottles should be provided.
(3) One set of oxygen therapy equipment should be carried in the space referred to in (1).

6. Filling limits for cargo tanks

(1) The requirements of **1501. 4** (2) do not apply when it is intended to carry chlorine.
(2) The chlorine content of the gas in the vapour space of the cargo tank after loading should be greater than 80 % by volume.

1715. Diethyl ether and vinyl ethyl ether (IGC Code 17.15)

1. The cargo should be discharge only by deepwell pumps or by hydraulically operated submerged pumps. These pumps should be of a type designed to avoid liquid pressure against the shaft gland.

2. Inert gas displacement may be used for discharging cargo from type C independent tanks provided the cargo system is designed for the expected pressure.

1716. Ethylene oxide (IGC Code 17.16)

1. For the carriage of ethylene oxide the requirements of **1720.** apply, with the additions and modifications as given in this Article.

2. Deck tanks should not be used for the carriage of ethylene oxide.

3. Stainless steels types 416 and 442 as well as cast iron should not be used in ethylene oxide cargo containment and piping systems.

4. Before loading, tanks should be thoroughly and effectively cleaned to remove all traces of previous cargoes from tanks and associated pipework, except where the immediate prior cargo has been ethylene oxide, propylene oxide or mixtures of these products. Particular care should be taken in the case of ammonia in tanks made of steel other than stainless steel.

5. Ethylene oxide should be discharged only by deepwell pumps or inert gas displacement. The arrangement of pumps should comply with **1720. 5** (3).

6. Ethylene oxide should be carried refrigerated only and maintained at temperatures of less than 30°C.

7. Pressure relief valves should be set at a pressure of not less than 0.55 MPa gauge. The maximum set pressure should be specially approved by the Society.

8. The protective padding of nitrogen gas as required by **1720. 15** should be such that the nitrogen concentration in the vapour space of the cargo tank will at no time be less than 45 % by volume.

9. Before loading and at all times when the cargo tank contains ethylene oxide liquid or vapour, the cargo tank should be inerted with nitrogen.

10. The water spray system required by **1720. 17** and that required by **1103.** should operate automatically in a fire involving the cargo containment system.

11. A jettisoning arrangement should be provided to allow the emergency discharge of ethylene oxide in the event of uncontrollable self-reaction.

1717. Isopropylamine and monoethylamine (IGC Code 17.17)

Separate piping systems should be provided as defined in **106. 32.**

1718. Methyl acetylene-propadiene mixtures (IGC Code 17.18)

1. Methyl acetylene-propadiene mixtures should be suitable stabilized for transport. Additionally, upper limits of temperature and pressure during the refrigeration should be specified for the mixtures.

2. Examples of acceptable, stabilized compositions are:

(1) Composition 1
- (a) maximum methyl acetylene to propadiene molar ratio of **3** to **1**;
- (b) maximum combined concentration of methyl acetylene and propadiene of 65 mol per cent,
- (c) minimum combined concentration of propane, butane, and isobutane of 24 mol per cent, of which at least one third (on a molar basis) must be butanes and one third propane; and
- (d) maximum combined concentration of propylene and butadiene of 10 mol per cent.

(2) Composition 2
- (a) maximum methyl acetylene and propadiene combined concentration of 30 mol per cent;
- (b) maximum methyl acetylene concentration of 20 mol per cent;
- (c) maximum propadiene concentration of 20 mol per cent;
- (d) maximum propylene concentration of 45 mol per cent;
- (e) maximum butadiene and butylenes combined concentration of **2** mol per cent;
- (f) minimum saturated C_4 hydrocarbon concentration of **4** mol per cent; and
- (g) minimum propane concentration of 25 mol per cent.

3. Other compositions may be accepted provided the stability of the mixture is demonstrated to the satisfaction of the Society.

4. A ship carrying methyl acetylene-propadiene mixtures should preferably have an indirect refrigeration system as specified in **702. 4** (2). Alternatively, a ship not provided with indirect refrigeration may utilize direct vapour compression refrigeration subject to pressure and temperature limitations depending on the composition. For the example compositions given in **Par 2,** the following features should be provided:

(1) A vapour compressor that does not raise the temperature and pressure of the vapour above 60°C and 1.75 MPa gauge during its operation, and that does not allow vapour to stagnate in the compressor while it continues to run.
(2) Discharge piping from each compressor stage or each cylinder in the same stage of a reciprocating compressor should have:
(a) two temperature-actuated shutdown switches set to operate at 60°C or less;
(b) a pressure-actuated shutdown switch set to operate at 1.75 MPa gauge or less; and
(c) a safety relief valve set to relieve at 1.8 MPa gauge or less.
(3) The relief valve required by **Par 4** (2) (c) should vent to a mast meeting the requirements of **802. 9, 10, 13** and **14** and should not relieve into the compressor suction line.
(4) An alarm that sounds in the cargo control position and in the navigating bridge when a high pressure switch, or a high-temperature switch operates.

5. The piping system, including the cargo refrigeration system, for tanks to be loaded with methyl acetylene-propadiene mixtures should be either independent (as defined in **106. 20**) or separate (as defined in **106. 32**) from piping and refrigeration systems for other tanks. This segregation applies to all liquid and vapour vent lines and any other possible connections, such as common inert gas supply lines.

1719. Nitrogen (IGC Code 17.19)

Materials of construction and ancillary equipment such as insulation should be resistant to the effects of high oxygen concentrations caused by condensation and enrichment at the low temperatures attained in parts of the cargo system. Due consideration should be given to ventilation in such areas where condensation might occur to avoid the stratification of oxygen-enriched atmosphere.

1720. Propylene oxide and mixtures of ethylene oxide-propylene oxide with ethylene oxide content of not more than 30% by weight (IGC Code 17.20)

1. Products transported under the provisions of this Article should be acetylene-free.

2. (1) Unless cargo tanks are properly cleaned, these products should not be carried in tanks which have contained as one of the three previous cargoes any product known to catalyse polymerization, such as:
(a) anhydrous ammonia and ammonia solutions;
(b) amines and amine solutions;
(c) oxidizing substances (e.g. chlorine).
(2) Before loading, tanks should be thoroughly and effectively cleaned to remove all traces of previous cargoes from tanks and associated pipework, except where the immediate prior cargo has been propylene oxide or ethylene oxide-propylene oxide mixtures. Particular care should be taken in the case of ammonia in tanks made of steel other than stainless steel.
(3) In all cases, the effectiveness of cleaning procedures for tanks and associated pipework should be checked by suitable testing or inspection to ascertain that no traces of acidic or alkaline materials remain that might create a hazardous situation in the presence of these products.
(4) Tanks should be entered and inspected prior to each initial loading of these products to ensure freedom from contamination, heavy rust deposits and any visible structural defects. When cargo tanks are in continuous service for these products, such inspections should be performed at intervals of not more than 2 years.
(5) Tanks for the carriage of these products should be of steel or strainless steel construction.
(6) Tanks which have contained these products may be used for other cargoes after thorough cleaning of tanks and associated pipework systems by washing or purging.

3. (1) All valves, flanges, fittings and accessory equipment should be of a type suitable for use with these products and should be constructed of steel or stainless steel in accordance with recognized standards. Discs or disc faces, seats and other wearing parts of valves should be made of stainless steel containing not less than 11 % chromium.

(2) Gaskets should be constructed of materials which do not react with, dissolve in, or lower the autoignition temperature of these products and which are fire-resistant and possess adequate mechanical behaviour. The surface presented to the cargo should be polytetrafluorethylene (PTFE) or materials giving a similar degree of safety by their inertness. Spirally-wound stainless steel with a filler of PTFE or similar fluorinated polymer may be accepted by the Society.

(3) Insulation and packing if used should be of a material which does not react with, dissolve in, or lower the autoignition temperature of these products.

(4) The following materials are generally found unsatisfactory for gaskets, packing and similar uses in containment systems for these products and would require testing before being approved by the Society.

(a) Neoprene or natural rubber if it comes into contact with the products;

(b) Asbestos or binders used with asbestos;

(c) Materials containing oxides of magnesium, such as mineral wools.

4. Filling and discharge piping should extend to within 100 mm of the bottom of the tank or any sump.

5. (1) The products should be loaded and discharge in such a manner that venting of the tanks to atmosphere does not occur. If vapour return to shore is used during tank loading, the vapour return system connected to a containment system for the product should be independent of all other containment systems.

(2) During discharging operations, the pressure in the cargo tank should be maintained above 0.07 MPa gauge.

(3) The cargo should be discharged only by deepwell pumps, hydraulically operated submerged pumps, or inert gas displacement. Each cargo pump should be arranged to ensure that the product does not heat significantly if the discharge line from the pump is shut off or otherwise blocked.

6. Tanks carrying these products should be vented independently of tanks carrying other products. Facilities should be provided for sampling the tank contents without opening the tank to atmosphere.

7. Cargo hoses used for transfer of these products should be marked "FOR ALKYLENE OXIDE TRANSFER ONLY".

8. Hold spaces should be monitored for these products. Hold spaces surrounding type A and B independent tanks should also be inerted and monitored for oxygen. The oxygen content of these spaces should be maintained below 2 %. Portable sampling equipment is satisfactory.

9. Prior to disconnecting shore-lines, the pressure in liquid and vapour lines should be relieved through suitable valves installed at the loading header. Liquid and vapour from these lines should not be discharged to atmosphere.

10. Tanks should be designed for the maximum pressure expected to be encountered during loading, carriage or unloading of cargo.

11. Tanks for the carriage of propylene oxide with a design vapour pressure of less than 0.06 MPa and tanks for the carriage of ethylene oxide-propylene oxide mixtures with a design vapour pressure of less than 0.12 MPa should have a cooling system to maintain the cargo below the reference temperature. For reference temperature see **1501. 4** (1).

12. Pressure relief valve settings should not be less than 0.02 MPa gauge and for type C independent cargo tanks not greater than 0.7 MPa gauge for the carriage of propylene oxide and not greater than 0.53 MPa gauge for the carriage of ethylene oxide-propylene oxide mixtures.

13. (1) The piping system for tanks to be loaded with these products should be completely separate from piping systems for all other tanks, including empty tanks, and from all cargo compressors. If the piping system for the tanks to be loaded with these products is not independent as defined in **106. 20** the required piping separation should be accomplished by the removal of spool pieces, valves, or other pipe sections and the installation of blank flanges at these locations. The required separation applies to all liquid and vapour piping, liquid and vapour vent lines and any other possible connections such as common inert gas supply lines.

(2) The products should be transported only in accordance with cargo handling plans that have been approved by the Society. Each intended loading arrangement should be shown on a separate cargo handling plan. Cargo handling plans should show the entire cargo piping system and the locations for installation of blank flanges needed to meet the above piping separation requirements. A copy of each approved cargo handling plan should be kept on board the ship. The International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk should be endorsed to include reference to the approved cargo handling plans.

(3) Before each initial loading of these products and before every subsequent return to such services, certification verifying that the required piping separation has been achieved should be obtained from a responsible person acceptable to the port Administration and carried on board the ship. Each connection between a blank flange and pipeline flange should be fitted with a wire and seal by the responsible person to ensure that inadvertent removal of the blank flange is impossible.

14. The maximum allowable tank loading limits for each cargo tank should be indicated for each loading temperature which may be applied and for the applicable maximum reference temperature, on a list to be approved by the Society. A copy of the list should be permanently kept on board by the master.

15. The cargo should be carried under a suitable protective padding of nitrogen gas. An automatic nitrogen make-up system should be installed to prevent the tank pressure falling below 0.007 MPa gauge in the event of product temperature fall due to ambient conditions or malfunctioning of refrigeration system. Sufficient nitrogen should be available on board to satisfy the demand of the automatic pressure control. Nitrogen of commercially pure quality (99.9 % by valume) should be used for padding. A battery of nitrogen bottles connected to the cargo tanks through a pressure reduction valve satisfies the intention of the expression "automatic" in this context.

16. The cargo tank vapour space should be tested prior to and after loading to ensure that the oxygen content is 2 % by volume or less.

17. A water spray system of sufficient capacity should be provided to blanket effectively the area surrounding the loading manifold, the exposed deck piping associated with product handling and the tank domes. The arrangement of piping and nozzles should be such as to give a uniform distribution rate of 10 l/m^2 per minute. The water spray system should be capable of both local and remote manual operation and the arrangement should ensure that any spilled cargo is washed away. Remote manual operation should be arranged such that remote starting of pumps supplying water spray system and remote operation of any normally closed valves in the system can be carried out from a suitable location outside the cargo area, adjacent to the accommodation spaces and readily accessible and operable in the event of fire in the areas protected. Additionally, a water hose with pressure to the nozzle, when ambient temperatures permit, should be connected ready for immediate use during loading and unloading operation.

1721. Vinyl chloride (IGC Code 17.21)

In cases where polymerization of vinyl chloride is prevented by addition of an inhibitor, **1708.** is applicable. In cases where no or insufficient inhibitor has been added, any inert gas used for the purposes of **1706.** should contain not more oxygen than 0.1 %. Before loading is started, inert gas samples from the tanks and piping should be analysed. When vinyl chloride is carried, a positive pressure should always be maintained in the tanks, also during ballast voyages between successive carriages.

Section 18 Operating Requirements

1801. Cargo information (IGC Code 18.1)

1. Information should be on board and available to all concerned, giving the necessary data for the safe carriage of cargo. Such information should include for each product carried:

(1) a full description of the physical and chemical properties necessary for the safe containment of the cargo;
(2) action to be taken in the event of spills or leaks;
(3) counter-measures against accidental personal contact;
(4) fire-fighting procedures and fire-fighting media;
(5) procedures for cargo transfer, gas-freeing, ballasting, tank cleaning and changing cargoes;
(6) special equipment needed for the safe handling of the particular cargo;
(7) minimum allowable inner hull steel temperatures; and
(8) emergency procedures.

2. Products required to be inhibited should be refused if the certificate required by **1708.** is not supplied.

3. A copy of this Chapter or national regulations incorporating the provisions of this Chapter should be on board every ship covered by this Chapter.

1802. Compatibility (IGC Code 18.2)

1. The master should ascertain that the quantity and characteristics of each product to be loaded are within the limits indicated in the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk and in the Loading and Stability Information booklet provided for in **202. 5** and that products are listed in the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk as required under **Sec 3** of the Certificate.

2. Care should be taken to avoid dangerous chemical reactions if cargoes are mixed. This is of particular significance in respect of:

(1) tank cleaning procedures required between successive cargoes in the same tank; and
(2) simultaneous carriage of cargoes which react when mixed. This should be permitted only if the complete cargo systems including, but not limited to, cargo pipework, tanks, vent systems and refrigeration systems are separated as defined in **106. 32.**

1803. Personnel training (IGC Code 18.3)

1. Personnel involved in cargo operations should be adequately trained in handling procedures.

2. All personnel should be adequately trained in the use of protective equipment provided on board and have basic training in the procedures, appropriate to their duties, necessary under emergency conditions.

3. Officers should be trained in emergency procedures to deal with conditions of leakage, spillage or fire involving the cargo, and a sufficient number of them should be instructed and trained in essential first aid for cargoes carried.

1804. Entry into spaces (IGC Code 18.4)

1. Personnel should not enter cargo tanks, hold spaces, void spaces, cargo handling spaces or other enclosed spaces where gas may accumulate, unless:

(1) the gas content of the atmosphere in such space is determined by means of fixed or portable equipment to ensure oxygen sufficiency and the absence of toxic atmosphere; or
(2) personnel wear breathing apparatus and other necessary protective equipment and the entire operation is under the close supervision of a responsible officer.

2. Personnel entering any space designated as gas dangerous on a ship carrying flammable products should not introduce any potential source of ignition into the space unless it has been certified gas-free and is maintained in that condition.

3. (1) For internal insulation tanks, special fire precautions should be taken in the event of hot work carried out in the vicinity of the tanks. For this purpose, gas absorbing and deabsorbing characteristics of the insulation material should be taken into account.

(2) For internal insulation tanks, repairs should be carried out in accordance with the procedures provided for in **404. 7** (6).

1805. Carriage of cargo at low temperature (IGC Code 18.5)

1. When carrying cargoes at low temperatures:

(1) if provided, the heating arrangements associated with cargo containment systems should be operated in such a manner as to ensure that the temperature does not fall below that for which the materials of the hull structure is designed;
(2) loading should be carried out in such a manner as to ensure that unsatisfactory temperature gradients do not occur in any cargo tank, piping, or other ancillary equipment; and
(3) when cooling down tanks from temperatures at or near ambient, the cool-down procedure laid down for that particular tank, piping and ancillary equipment should be followed closely.

1806. Protective equipment (IGC Code 18.6)

Personnel should be made aware of the hazards associated with the cargo being handled and should be instructed to act with care and use the appropriate protective equipment as mentioned in **1401.** during cargo handling.

1807. Systems and controls (IGC Code 18.7)

Cargo emergency shutdown and alarm systems involved in cargo transfer should be tested and checked before cargo handling operations begin. Essential cargo handling controls should also be tested and checked prior to transfer operations.

1808. Cargo transfer operations (IGC Code 18.8)

1. Transfer operations including emergency procedures should be discussed between ship personnel and the persons responsible at the shore facility prior to commencement and communications maintained throughout the transfer operations.

2. The closing time of the valve referred to in **1303.1** (i.e. time from shutdown signal initiation to complete valve closure) should not be greater than:

$$\frac{3{,}600\,U}{LR} \quad \text{(sec)}$$

where:

U = ullage volume at operating signal level (m^3)

LR = maximum loading rate agreed between ship and shore facility (m^3/h).

The loading rate should be adjusted to limit surge pressure on valve closure to an acceptable level taking into account the loading hose or arm, the ship and the shore piping systems where relevent.

1809. Additional operating requirements (IGC Code 18.9)

Additional operating requirements will be found in the following paragraphs of this Chapter: **308. 4, 308.5, 701.1** (5), **802. 5, 802. 7, 904. 2, 1201.1, 1201.10, 1301.4, 1402. 5, 1402.6, 1403.1, 1501., 1502., 1602. 2, 1704. 2, 1706., 1707., 1712., 1713., 1714., 1715., 1716., 1717., 1718., 1720.**

Section 19 Summary of Minimum Requirements

EXPLANATORY NOTES

UN Number (column b)

The UN numbers as listed in the table of **Sec 19** are intended for information only.

Vapour detection required (column f)

F - Flammable vapour detection
T - Toxic vapour detection
O - Oxygen analyser
F+T- Flammable and toxic vapour detection

Gauging-types permitted (column g)

I - Indirect, or closed, as described in **1302. 2** (1) and (2)
C - Indirect, or closed, as described in **1302. 2** (1), (2) and (3)
R - Indirect, closed or restricted, as described in **1302. 2** (1), (2), (3) and (4).

Refrigerant gases

Non-toxic and non-flammable gases such as:
dichlorodifIuoromethane (1028)
dichloromonofluoromethane (1029)
dichlorotetrafIuoroethane (1958)
monochlorodifIuoromethane (1018)
monochlorotetrafluoroethane (1021)
monochlorotrifluoromethane (1022)

Unless otherwise specified, gas mixtures containing less than 5 % total acetylenes may be transported with no further requirements than those provided for the major components.

MFAG table No. (column h)

MFAG numbers are provided for information on the emergency procedures to be applied in the event of an incident with the products covered by the IGC Code. Where any of the products listed are carried at low temperature from which frostbite may occur MFAG No. 620 is also applicable.

* This cargo is covered also by the IBC Code.

CHAPTER 6 SHIPS CARRYING DANGEROUS CHEMICALS IN BULK

Section 1 General

101. Application (IBC Code 1.1)

1. The requirements in this Chapter apply to ships constructed on or after 1 July 1986, unless expressly provided otherwise. The requirements are also to comply with the requirements of IMO Res. MSC. 4 (48), MSC. 176 (79) and its additional amendments. Ships constructed before 1 July 1986 are to comply with the requirements of IMO Res. A.212 (VII), MEPC. 144 (54) and its additional amendments.

2. The requirements in this Chapter apply to ships, including those of less than 500 gross tonnage, engaged in the carriage of bulk cargoes of dangerous chemicals or noxious liquid substances, other than petroleum or similar flammable products as follows:

(1) Products having significant fire hazards in excess of those of petroleum products and similar flammable products.
(2) Products having significant hazards in addition to or other than flammability.

3. Products that have been reviewed and determined not to present safety and pollution hazards to such an extent as to warrant the application of the Rules are found in **Sec 18.**

4. Liquids covered of this Chapter are those having a vapour pressure not exceeding 0.28 MPa absolute at a temperature of 37.8 ℃.

5. For the purpose of MARPOL 73/78, the requirements applies only to NLS tanker defined thereof, which are engaged in the carriage of Noxious Liquid Substances identified as such by an entry of X, Y or Z in column c of Sec 17.

6. For a product for carriage in bulk, but not listed in **Secs 17** or **18,** the Administration shall prescribe the preliminary suitable conditions for the carriage, having regard to the criteria for hazard evaluation of bulk chemicals. For the evaluation of the pollution hazard of such a product and assignment of its pollution category, the procedure specified in regulation 6.3 of Annex II of MARPOL 73/78 is to be followed.

7. The ship's hull, machinery and equipment not specified in this Chapter are generally to comply with the requirements in the relevant Chapters of these Rules.

8. The ships carrying flammable dangerous chemicals in bulk are also to be in compliance with the requirements in **Pt 7, Ch 1** and **Pt 8** unless otherwise required in this Chapter.

9. For ships to be classed for restricted service and ships not provided with propulsive machinery, the requirements may be modified as appropriate.

10. When it is intended to carry products covered by this Chapter and products covered by **Ch 5,** the ship shall comply with the requirements of both Chapters appropriate to the products carried, However, when a ship is designed and constructed for the carriage of the products listed exclusively in **Sec 17**, the requirements of this Chapter should take precedence.

102. Approval for plans

For classification survey during construction, the following plans and informations as may be necessary depending upon the products intended to be loaded, condition of cargo storage, construction of cargo containment system and other design conditions are to be submitted in triplicate before the work is commenced.

1. Plans and data for approval

(1) Manufacturing specifications for independent cargo tanks (including materials to be used, welding procedures and inspection and testing procedures for weld and cargo tanks).
(2) Details of cargo tank construction.
(3) Arrangements of cargo tank accessories (including details of fittings inside the tanks).
(4) Details of independent cargo tank supports, deck portions through which cargo tanks penetrate

and their sealing devices when provided.
(5) Plans showing arrangement and the methods of attachment of the insulation together with the working procedure concerned.
(6) When the cargoes are required to be cooled, the plans and informations in accordance with **Ch 5, 102. 1** (1), (6), (7), (8) and (16) are to be submitted depending upon the cargo storage plan and the type of cargo tank construction.
(7) Cargo pump construction plan including list of materials to be used and their specifications.
(8) Piping arrangement in cargo tank area.
(9) Cargo tank ventilation arrangement.
(10) Ventilation plan of cargo pump rooms, cofferdams, double bottoms and others.
(11) Diagram of monitoring and measurement system for cargo level, cargo temperature and others and the detail construction of their equipment.
(12) Control system for cargo temperature.
(13) Details of environmental control system such as inerting, padding, drying or ventilation including the piping diagram and the construction of their equipment.
(14) Instruments for cargo vapour detection.
(15) Electrical wiring plans and a table of electrical equipment used in dangerous spaces.
(16) Arrangement of earth connections for cargo tanks, pipe lines, machinery and equipment, only when flammable cargoes are intended to be loaded.
(17) Plans showing dangerous spaces.
(18) Fire extinguishing system.

2. Plans and data for reference

(1) Lists showing chemical and physical properties and other special properties of the all cargoes intended to be loaded. Loading plans of the dangerous chemicals coming within the scope of this Chapter and other chemicals to be loaded simultaneously with these dangerous chemicals.
(2) Guide of reactivity hazard defined by reactivity with other chemicals, water or the chemical itself including polymerization and, where deemed necessary, with the heating or cooling media. The chemicals not intended to be loaded simultaneously with the dangerous chemicals coming within the scope of this Chapter may be excluded from these guides.
(3) Data of reactivity hazard between intended cargoes and coating or lining in cargo tanks and of piping and equipment that may come into contact with cargo liquid or vapour.
(4) Data of suitability of corrosion-resistance materials for the cargoes having corrosive properties.
(5) Strength calculation of each cargo tanks and, where deemed necessary, thermal stress calculation.
(6) Capacity calculation of heating system as required cargoes to be heated.
(7) Plans and documents in accordance with **Ch 5, 102. 2** (1), (6), (8) and (10) depending upon the cargo storage plan and the type of cargo tank construction when the cargoes require to be cooled.
(8) Arrangements of access manholes stipulated in 304. in cargo tank area and the guide for access through these manholes.
(9) Operation manual stipulated in **Sec 16.**
(10) Calculation for ship survival capability stipulated in **Sec 2.**
(11) Equipment for personnel protection.

103. Equivalents

The construction, equipment, etc., which do not fall under the provisions of this Chapter but is considered to be equivalent to those required in this Chapter will be accepted by the Society.

104. National regulations

For the construction and equipment of the ship, attention is to be paid to the requirements of national regulations of the country in which the ship is registered and/or of the port which the ship intends to visit.

105. Hazards (IBC Code 1.2)

Hazards of products covered by this Chapter include as follows :

1. Fire hazard, defined by flashpoint, explosive/flammability limits/range and autoignition temperature of the chemical.

2. Health hazard, defined by:

(1) corrosive effects on the skin in the liquid state ; or
(2) acute toxic effect, taking into account values of :
LD_{50} (oral): a dose which is lethal to 50 % of the test subjects when administered orally;
LD_{50} (skin): a dose which is lethal to 50 % of the test subjects when administered to the skin;
LC_{50} (inhalation): the concentration which is lethal by inhalation to 50 % of the test subjects; or
(3) Other health effects such as carcinogenicity and sensitization.

3. Reactivity hazard, defined by reactivity:

(1) with water ;
(2) with air;
(3) with other products; or
(4) of the product itself (e.g. polymerization)

4. Marine pollution hazard, as defined :

(1) bioaccumulation ;
(2) lack of ready biodegradibility ;
(3) acute toxicity to aquatic organisms ;
(4) chronic toxity to acquatic organisms ;
(5) long term human health effect; and
(6) physical properties resulting in the product floating or sinking and so adversely affecting marine life.

106. Definitions (IBC Code 1.3)

The definitions of terms are to be as specified in the following and **Sec 4,** unless otherwise specified elsewhere.

1. "**Accommodation spaces**" are those spaces used for public spaces, corridors, lavatories, cabins, offices, hospitals, cinemas, games and hobbies rooms, barber shops, pantries containing no cooking appliances and similar spaces. "**Public spaces**" are those portions of the accommodation spaces which are used for halls, dining rooms, lounges and similar permanently enclosed spaces.

2. "**Administration**" means the Government of the State whose flag the ship is entitled to fly.

3. "**Anniversary date**" means the day and the month of each year, which will correspond to the date of expiry of the International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk.

4. "**Boiling point**" is the temperature at which a product exhibits a vapour pressure equal to the atmospheric pressure.

5. "**Breadth (B)**" means the maximum breadth of the ship, measured amidships to the moulded line of the frame in a ship with a metal shell and to the outer surface of the hull in a ship with a shell of any other material. The breadth (B) should be measured in metres.

6. "**Cargo area**" is that part of the ship that contains cargo tanks, slop tanks, cargo pump rooms including pump rooms, cofferdams, ballast or void spaces adjacent to cargo tanks or slop tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above-mentioned spaces. Where independent tanks are installed in hold spaces, cofferdams, ballast or void spaces at the after end of the aftermost hold space or at the forward end of the forward hold space are excluded from the cargo area.

7. "**Cargo pump room**" is a space containing pumps and their accessories for the handling of products covered by this Chapter.

8. "**Cargo service spaces**" are spaces within the cargo area used for workshops, lockers and store-rooms of more than 2 m^2 in area, used for cargo handling equipment.

9. "**Cargo tank**" is the envelope designed to contain the cargo.

10. "**Chemical tanker**" is a cargo ship constructed or adapted and used for the carriage in bulk of any liquid product listed in **Sec 17.**

11. "**Cofferdam**" is the isolating space between two adjacent steel bulkheads or decks. This space may be a void space or a ballast space.

12. "**Control stations**" are those spaces in which ship's radio or main navigating equipment or the emergency source of power is located or where the fire-recording or fire-control equipment is centralized. This does not include special fire control equipment which can be most practically located in the cargo area.

13. "**Dangerous chemicals**" means any liquid chemicals designated as presenting a safety hazard, based on the safety criteria for assigning products to chapter 17.

14. "**Density**" is the ratio of the mass to the volume of a product, expressed in terms of kilograms per cubic meter. This applies to liquid, gases and vapours.

15 "**Explosive/flammability limits/range**" are the conditions defining the state of fuel-oxidant mixture at which application of an adequately strong external ignition source is only just capable of producing flammability in a given test apparatus.

16. "**Flash point**" is the temperature in degrees Celsius at which a product will give off enough flammable vapour to be ignited. Values given in this Chapter are "closed cup test" determined by an approved flash point apparatus.

17. "**Hold space**" is the space enclosed by the ship's structure in which an independent cargo tank is situated.

18. "**Independent**" means that a piping or venting system, for example, is in no way connected to another system and that there are no provisions available for the potential connection to other systems.

19. "**Length (L)**" means 96 % of the total length on a waterline at 85% of the least moulded depth measured from the top of the keel, or the length from the forside of the stem to the axis of the rudder stock on that waterline, if that be greater. In ships designed with a rake of keel, the waterline on which this length is measured should be parallel to the designed waterline. The length (L) should be measured in metres.

20. "**Machinery spaces of category A**" are those spaces and trunks to such spaces which contain:

(1) internal combustion machinery used for main propulsion; or
(2) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or
(3) any oil-fired boiler or oil fuel unit, or any oil-fired equipment other than boilers, such as inert gas generators, incinerators, etc.

21. "**Machinery spaces**" are all machinery spaces of category A and all other spaces containing propelling machinery, boilers, oil fuel units, steam and internal combustion engines, generators and major electrical machinery, oil filling stations, refrigerating, stabilizing, ventilation and air-conditioning machinery, and similar spaces, and trunks to such spaces.

22. "**MARPOL 73/78**" means the International Convention for the Prevention of Pollution from Ships, 1973, as modified by the Protocol of 1978 relating thereto, as amended.

23. "**Noxious liquid substance**" means any substance indicated in the pollution Category column of chapter 17 or 18 of the International Chemical Code, or the current MEPC.2/Circular or provisionally assessed under the provisions of regulation 6.3 of MARPOL Annex II as falling into category X, Y or Z.

24. "**Oil fuel unit**" is the equipment used for the preparation of oil fuel for delivery to an oil-fired boiler, or equipment used for the preparation for delivery of heated oil to an internal combustion engine, and includes any oil pressure pumps, filters and heaters dealing with oil al a pressure of more than 0.18 MPa gauge.

25. "**Organization**" is the International Maritime Organization (IMO).

26. "**Permeability**" of a space means the ratio of the volume within the space which is assumed to be occupied by water to the total volume of that space.

27 "**Port Administration**" means the appropriate authority of the country in the port of which the ship is loading or unloading.

28. "**Products**" is the collective term used to cover both Noxious Liquid Substances and Dangerous Chemicals

29. "**Pump room**" is a space, located in the cargo area, containing pumps and their accessories for the handling of ballast and oil fuel.

30. "**Recognized standards**" are applicable international or national standards acceptable to the Society or standards laid down and maintained by the Society which complies with the standards adopted by the organization.

31. "**Recognized temperature**" is the temperature at which the vapour pressure of the cargo corresponds to the set pressure of the pressure-relief valve.

32. "**Separate**" means that a cargo piping system or cargo vent system, for example, is not connected to another cargo piping or cargo vent system.

33. "**Service spaces**" are those spaces used for galleys, pantries containing cooking appliances, lockers, mail and specie rooms, store-rooms, workshops other than those forming part of the machinery spaces and similar spaces and trunks to such spaces.

34. " **SOLAS** " means the International Convention for the Safety of Life at Sea, 1974.

35. "**Vapour pressure**" is the equilibrium pressure of the saturate vapour above the liquid expressed in bars absolute at a specified temperature.

36. "**Void space**" is an enclosed space in the cargo area external to a cargo tank, other than a hold space, ballast space, oil fuel tank, cargo pump room, pump room, or any space in normal use by personnel.

Section 2 Ship Survival Capability and Location of Cargo Tanks

201. General (IBC Code 2.1)

1. Ships subject to this Chapter should survive the normal effects of flooding following assumed hull damage caused by some external force. In addition, to safeguard the ship and the environment, the cargo tanks of certain types of ships should be protected from penetration in the case of minor damage to the ship resulting, for example, from contact with a jetty or tug, and given a measure of protection from damage in the case of collision or stranding, by locating them at specified minimum distances inboard from the ship's shell plating. Both the damage to be assumed and the proximity of the cargo tanks to the ship's shell should be dependent upon the degree of hazard presented by the products to be carried.

2. Ships subject to this Chapter should be designed to one of the following standards:

(1) A "**type 1 ship**" is a chemical tanker intended to transport **Sec 17** products with very severe environmental and safety hazards which require maximum preventive measures to preclude an escape of such cargo.

(2) A "**type 2 ship**" is a chemical tanker intended to transport **Sec 17** products with appreciably severe environmental and safety hazards which require significant preventive measures to preclude an escape of such cargo.

(3) A "**type 3 ship**" is a chemical tanker intended to transport **Sec 17** products with sufficiently severe environmental and safety hazards which require a moderate degree of containment to increase survival capability in a damaged condition.

Thus a type 1 ship is a chemical tanker intended for the transportation of products considered to present the greatest overall hazard and type 2 and type 3 ships for products of progressively lesser hazards. Accordingly, a type 1 ship should survive the most severe standard of damage and its cargo tanks should be located at the maximum prescribed distance inboard from the shell plating.

3. The ship type required for individual products is indicated in column "e" in the table of **Sec 17.**

4. If a ship is intended to carry more than one product listed in **Sec 17,** the standard of damage should correspond to that product having the most stringent ship type requirement. The requirements for the location of individual cargo tanks, however, are those for ship types related to the respective products intended to be carried.

202. Freeboard and intact stability (IBC Code 2.2)

1. Ships subject to this Chapter may be assigned the minimum freeboard permitted by the International Convention on Load Lines in force. However, the draught associated with the assignment should not be greater than the maximum draught otherwise permitted by this Chapter.

2. The stability of the ship in all seagoing conditions should be to a standard which is acceptable to the Society.

3. When calculating the effect of free surfaces of consumable liquids for loading conditions it should be assumed that, for each type of liquid, at least one transverse pair or a single centre tank has a free surface and the tank or combination of tanks to be taken into account should be those where the effect of free surfaces is the greatest. The free surface effect in undamaged compartments should be calculated by a method acceptable to the Society.

4. Solid ballast should not normally be used in double bottom spaces in the cargo area. Where, however, because of stability considerations, the fitting of solid ballast in such spaces becomes unavoidable, then its disposition should be governed by the need to ensure that the impact loads resulting from bottom damage are not directly transmitted to the cargo tank structure.

5. The master of the ship should be supplied with a Loading and Stability Information booklet. This booklet should contain details of typical service and ballast conditions, provisions for evaluating other conditions of loading and a summary of the ship's survival capabilities. In addition, the booklet should contain sufficient information to enable the master to load and operate the ship in a safe and seaworthy manner.

203. Shipside discharges below the freeboard deck (IBC Code 2.3)

1. The provision and control of valves fitted to discharges led through the shell from spaces below the freeboard deck or from with in the superstructures and deckhouses on the freeboard deck fitted with weathertight doors should comply with the requirements of the relevant regulation of the International Convention on Load Lines in force, except that the choice of valves should be limited to:

(1) one automatic non-return valve with a positive means of closing from above the freeboard deck; or

(2) where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds 0.01 L, two automatic non-return valves without positive means of closing, provided that the inboard valve is always accessible for examination under service conditions.

2. For the purpose of this Section "**summer load waterline**" and "**freeboard deck**", have the meanings as defined in the International Convention on Load Lines in force.

3. The automatic non-return valves referred to in **Par 1** (1) and (2) should be of a type acceptable to the Society and should be fully effective in preventing admission of water into the ship, taking into account the sinkage, trim and heel in survival requirements in **209.** and should comply with recognized standards.

204. Conditions of loading (IBC Code 2.4)

Damage survival capability should be investigated on the basis of loading information submitted to the Society for all anticipated conditions of loading and variations in draught and trim. Ballast conditions where the chemical tanker is not carrying products covered by this Chapter, or is carrying only residues for such products, need not be considered.

205. Damage assumptions (IBC Code 2.5)

1. The assumed maximum extent of damage should be:

(1) Side damage:

(a) Longitudinal extent: 1/3 $L^{2/3}$ or 14.5 m, whichever is less

(b) Transverse extent: B/5 or 11.5 m, whichever is less, measured inboard from the ship's side at right angles to the centreline at the level of the summer load line

(c) Vertical extent: upwards without limit, from the moulded line of the bottom shell plating at centreline.

(2) Bottom damage:

	For 0.3 L from the forward perpendicular of the ship	Any other part of the ship
(a) Longitudinal extent:	1/3 $L^{2/3}$ or 14.5 m, whichever is less	1/3 $L^{2/3}$ or 5 m, whichever is less
(b) Transverse extent:	B/6 or 10 m, whichever is less	B/6 or 5 m, whichever is less
(c) Vertical extent:	B/15 or 2 m, whichever is less, measured from the moulded line of the bottom shell plating at centreline. (see **206. 2**)	B/15 or 2 m, whichever is less, measured from the moulded line of the bottom shell plating at centreline. (see **206. 2**)

2. Other damage:

If any damage of a lesser extent than the maximum damage specified in **Par 1** would result in a more severe condition, such damage should be considered.

206. Location of cargo tanks (IBC Code 2.6)

1. Cargo tanks should be located at the following distances inboard.

(1) Type 1 ships: from the side shell plating not less than the transverse extent of damage specified in **205. 1** (1) (b) and from the moulded line of the bottom shell plating at centreline not less than the vertical extent of damage specified in **205. 1** (2) (c) and nowhere less than 760 mm from the shell plating. This requirement does not apply to the tanks for diluted slops arising from tank washing.
(2) Type 2 ships: from the moulded line of the bottom shell plating at centreline not less than the vertical extent of damage specified in **205. 1** (2) (c) and nowhere less than 760 mm from the shell plating. This requirement does not apply to the tanks for diluted slops arising from tank washing.
(3) Type 3 ships: no requirement.

2. Except for type 1 ships, suction wells installed in cargo tanks may protrude into the vertical extent of bottom damage specified in **205. 1** (2) (c) provided that such wells are as small as practicable and the protrusion below the inner bottom plating does not exceed 25 % of the depth of the double bottom or 350 mm, whichever is less. Where there is no double bottom, the protrusion of the suction well of independent tanks below the upper limit of bottom damage should not exceed 350 mm. Suction wells installed in accordance with this paragraph may be ignored in determining the compartments affected by damage.

207. Flooding assumptions (IBC Code 2.7)

1. The requirements of **209.** should be confirmed by calculations which take into consideration the design characteristics of the ship; the arrangements, configuration and contents of the damaged compartments; the distribution, relative densities and the free surface effects of liquids; and the draught and trim for all conditions of loading.

2. The permeabilities of spaces assumed to be damaged should be as follows:

Spaces	Permeabilities
Appropriated to stores	0.60
Occupied by accommodation	0.95
Occupied by machinery	0.85
Voids	0.95
Intended for consumable liquids	0 to 0.95
Intended for other liquids	0 to 0.95

3. Wherever damage penetrates a tank containing liquids it should be assumed that the contents are completely lost from that compartment and replaced by salt water up to the level of the final plane of equilibrium.

4. Every watertight division within the maximum extent of damage defined in **205. 1** and considered to have sustained damage in positions given in **208. 1** should be assumed to be penetrated. Where damage less than the maximum is being considered in accordance with **205. 2,** only watertight divisions or combinations of watertight divisions within the envelope of such lesser damage should be assumed to be penetrated.

5. The ship should be so designed as to keep unsymmetrical flooding to the minimum consistent with efficient arrangements.

6. Equalization arrangements requiring mechanical aids such as valves or cross-levelling pipes, if fitted, should not be considered for the purpose of reducing an angle of heel or attaining the minimum range of residual stability to meet the requirements of **209.** and sufficient residual stability should be maintained during all stages where equalization is used. Spaces which are linked by ducts of large cross-sectional area may be considered to be common.

7. If pipes, ducts, trunks or tunnels are situated within the assumed extent of damage penetration, as defined in **205.,** arrangements should be such that progressive flooding cannot thereby extend to compartments other than those assumed to be flooded for each case of damage.

8. The buoyancy of any superstructure directly above the side damage should be disregarded. The unflooded parts of superstructures beyond the extent of damage, however, may be taken into consideration provided that:

(1) they are separated from the damaged space by watertight divisions and the requirements of **209. 3** in respect of these intact spaces are complied with; and
(2) openings in such divisions are capable of being closed by remotely operated sliding watertight doors and unprotected openings are not immersed within the minimum range of residual stability required in **209.;** however the immersion of any other openings capable of being closed weathertight may be permitted.

208. Standard of damage (IBC Code 2.8)

1. Ships should be capable of surviving the damage indicated in **205.** with the flooding assumptions in **207.** to the extent determined by the ship's type according to the following standards:

(1) A type 1 ship should be assumed to sustain damage anywhere in its length;
(2) A type 2 ship of more than 150 m in length should be assumed to sustain damage anywhere in its length;
(3) A type 2 ship of 150 m in length or less should be assumed to sustain damage anywhere in its length except involving either of the bulkheads bounding a machinery space located aft;
(4) A type 3 ship of more than 225 m in length should be assumed to sustain damage anywhere in its length;
(5) A type 3 ship of 125 m in length or more but not exceeding 225 m in length should be assumed to sustain damage anywhere in its length except involving either of the bulkheads bounding a machinery space located aft;
(6) A type 3 ship below 125 m in length should be assumed to sustain damage anywhere in its length except involving damage to the machinery space when located aft. However, the ability to survive the flooding of the machinery space should be considered by the Society.

2. In the case of small type 2 and type 3 ships which do not comply in all respects with the appropriate requirements of **Par 1** (3) and (6), special dispensation may only be considered by the Society provided that alternative measures can be taken which maintain the same degree of safety.

209. Survival requirements (IBC Code 2.9)

1. Ships subject to this Chapter should be capable of surviving the assumed damage specified in **205.** to the standard provided in **208.** in a condition of stable equilibrium and should satisfy the following criteria.

2. In any stage of flooding:

(1) the waterline, taking into account sinkage, heel and trim, should be below the lower edge of any opening through which progressive flooding or downflooding may take place. Such openings should include air pipes and openings which are closed by means of weathertight doors or hatch covers and may exclude those openings closed by means of watertight manhole covers and watertight flush scuttles, small watertight cargo tank hatch covers which maintain the high integrity of the deck, remotely operated watertight sliding doors, and sidescuttles of the non-opening type;
(2) the maximum angle of heel due to unsymmetrical flooding should not exceed 25° except that this angle may be increased up to 30° if no deck immersion occurs;
(3) the residual stability during intermediate stages of flooding should be to the satisfaction of the Society. However, it should never be significantly less than that required by **Par 3.**

3. At final equilibrium after flooding:

(1) the righting lever curve should have a minimum range of 20° beyond the position of equilibrium in association with a maximum residual righting lever of at least 0.1 m within the 20° range; the area under the curve within this range should not be less than 0.0175 m · rad. Unprotected openings should not be immersed within this range unless the space concerned is assumed to be flooded. Within this range, the immersion of any of the openings listed in **Par 2** (1) and other openings capable of being closed weathertight may be permitted; and
(2) the emergency source of power should be capable of operating.

Section 3 Ship Arrangements

301. Cargo segregation (IBC Code 3.1)

1. Unless expressly provided otherwise, tanks containing cargo or residues of cargo subject to this Chapter should be segregated from accommodation, service and machinery spaces and from drinking water and stores for human consumption by means of a cofferdam, void space, cargo pump room, pump room, empty tank, oil fuel tank or other similar space.

2. Cargoes, residues of cargoes or mixtures containing cargoes which react in a hazardous manner with other cargoes, residues or mixtures, should:

(1) be segregated from such other cargoes by means of a cofferdam, void space, cargo pump room, pump room, empty tank, or tank containing a mutually compatible cargo;
(2) have separate pumping and piping systems which should not pass through other cargo tanks containing such cargoes, unless encased in a tunnel; and
(3) have separate tank venting systems.

3. Cargo piping should not pass through any accommodation, service or machinery space other than cargo pump rooms or pump rooms.

4. Cargoes subject to this Chapter should not be carried in either the fore or aft peak tank.

5. If cargo piping systems or cargo ventilation systems are to be separated. This separation may be achieved by the use of design or operational methods. Operational methods shall not be used within a cargo tank and shall consist of one of the following type:

(1) removing spool-pieces or valves and blanking the pipe ends.
(2) arrangement of two spectacle flanges in series, with provisions for detecting leakage into the pipe between the two spectacle flanges.

302. Accommodation, service and machinery spaces and control stations (IBC Code 3.2)

1. No accommodation or service spaces or control stations should be located within the cargo area except over a cargo pump room recess or pump room recess that complies with SOLAS regulations II-2/4.5.1 to 4.5.2.4 and no cargo or slop tank should be aft of the forward end of any accommodation.

2. In order to guard against the danger of hazardous vapours, due consideration should be given to the location of air intakes and openings into accommodation, service and machinery spaces and control stations in relation to cargo piping and cargo vent systems.

3. Entrances, air inlets and openings to accommodation, service and machinery spaces and control stations should not face the cargo area. They should be located on the end bulkhead not facing the cargo area and/or on the outboard side of the superstructure or deck house at a distance of at least 4 % of the length (L) of the ship but not less than 3 m from the end of the superstructure or deckhouse facing the cargo area. This distance, however, need not exceed 5 m. No doors should be permitted within the limits mentioned above, except that doors to those spaces not having access to accommodation and service spaces and control stations, such as cargo control stations and store-rooms may be fitted. Where such doors are fitted, the boundaries of the space should be insulated to "A-60" standard. Bolted plates for removal of machinery may be fitted within the limits specified above. Wheelhouse doors and wheel house windows may be located within the limits specified above so long as they are so designed that a rapid and efficient gas- and vapour-tightening of the wheelhouse can be ensured. Windows and sidescuttles facing the cargo area and on the sides of the super structures and deckhouses within the limits specified above should be of the fixed (non-opening) type. Such sidescuttles in the first tier on the main deck should be fitted with inside covers of steel or equivalent material.

303. Cargo pump rooms (IBC Code 3.3)

1. Cargo pump rooms should be so arranged as to ensure:

(1) unrestricted passage at all times from any ladder platform and from the floor; and
(2) unrestricted access to all valves necessary for cargo handling for a person wearing the required

personnel protective equipment.

2. Permanent arrangements should be made for hoisting an injured person with a rescue line while avoiding any projecting obstacles.

3. Guard railings should be installed on all ladders and platforms.

4. Normal access ladders should not be fitted vertical and should incorporate platforms at suitable intervals.

5. Means should be provided to deal with drainage and any possible leakage from cargo pumps and valves in cargo pump rooms. The bilge system serving the cargo pump room should be operable from outside the cargo pump room. One or more slop tanks for storage of contaminated bilge water or tank washings should be provided. A shore connection with a standard coupling or other facilities should be provided for transferring contaminated liquids to onshore reception facilities.

6. Pump discharge pressure gauges should be provided outside the cargo pump room.

7. Where machinery is driven by shafting passing through a bulkhead or deck, gastight seals with efficient lubrication or other means of ensuring the permanence of the gas seal should be fitted in way of the bulkhead or deck.

304. Access to spaces in the cargo area (IBC Code 3.4)

1. Access to cofferdams, ballast tanks, cargo tanks and other spaces in the cargo area should be direct from the open deck and such as to ensure their complete inspection. Access to double bottom spaces may be through a cargo pump room, pump room, deep cofferdam, pipe tunnel or similar compartments, subject to consideration of ventilation aspects.

2. For access through horizontal openings, hatches or manholes, the dimensions should be sufficient to allow a person wearing a self-contained air breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening should be not less than 600 mm by 600 mm.

3. For access through vertical openings, or manholes providing passage through the length and breadth of the space, the minimum clear opening should be not less than 600 mm by 800 mm at a height of not more than 600 mm from the bottom shell plating unless gratings or other footholds are provided.

4. Smaller dimensions may be approved by the Society in special circumstances, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of the Society.

305. Bilge and ballast arrangements (IBC Code 3.5)

1. Pumps, ballast lines, vent lines and other similar equipment serving permanent ballast tanks should be independent of similar equipment serving cargo tanks and of cargo tanks themselves. Discharge arrangements for permanent ballast tanks sited immediately adjacent to cargo tanks should be outside machinery spaces and accommodation spaces. Filling arrangements may be in the machinery spaces provided that such arrangements ensure filling from tank deck level and non return valves are fitted.

2. Filling of ballast in cargo tanks may be arranged from deck level by pumps serving permanent ballast tanks, provided that the filling line has no permanent connection to cargo tanks or piping and that non-return valves are fitted.

3. Bilge pumping arrangements for cargo pump rooms, pump rooms, void spaces, slop tanks, double bottom tanks and similar spaces should be situated entirely within the cargo area except for void spaces, double bottom tanks and ballast tanks were such spaces are separated from tanks containing cargo or residues of cargo by a double bulkhead.

306. Pump and pipeline identification (IBC Code 3.6)

Provisions should be made for the distinctive marking of pumps, valves and pipelines to identify the service and tanks which they serve.

307. Bow or stern loading and unloading arrangements (IBC Code 3.7)

1. Cargo piping may be fitted to permit bow or stern loading and unloading. Portable arrangements should not be permitted.

2. Bow or stern loading and unloading lines should not be used for the transfer of products required to be carried in type 1 ships. Bow and stern loading and unloading lines should not be used for the transfer of cargoes emitting toxic vapours required to comply with **1512. 1,** unless specifically approved by the Society.

3. In addition to **501.,** the following provisions apply:

(1) The piping outside the cargo area should be fitted at least 760 mm inboard on the open deck. Such piping should be clearly identified and fitted with a shutoff valve at its connection to the cargo piping system within the cargo area. At this location, it should also be capable of being separated by means of a removable spool piece and blank flanges when not in use.
(2) The shore connection should be fitted with a shutoff valve and a blank flange.
(3) The piping should be full penetration butt-welded, and fully radiographed. Flange connections in the piping should only be permitted within the cargo area and at the shore connection.
(4) Spray shields should be provided at the connections specified in (1) as well as collecting trays of sufficient capacity with means for the disposal of drainage.
(5) The piping should be self-draining to the cargo area and preferably into a cargo tank. Alternative arrangements for draining the piping may be accepted by the Society.
(6) Arrangements should be made to allow such piping to be purged after use and maintained gas-safe when not in use. The vent pipes connected with the purge should be located in the cargo area. The relevant connections to the piping should be provided with a shutoff valve and blank flange.

4. Entrances, air inlets and openings to accommodation, service and machinery spaces and control stations should not face the cargo shore connection location of bow or stern loading and unloading arrangements. They should be located on the outboard side of the superstructure or deckhouse at a distance of at least 4 % of the length of the ship but not less than 3 m from the end of the house facing the cargo shore connection location of the bow or stern loading and unloading arrangements. This distance, however, need not exceed 5 m. Sidescuttles facing the shore-connection location and on the sides of the superstructure or deckhouse within the distance mentioned above should be of the fixed (non-opening) type. In addition, during the use of the bow or stern loading and unloading arrangements, all doors, ports and other openings on the corresponding superstructure or deckhouse side should be kept closed. Where, in the case of small ships, compliance with **302. 3** and this paragraph is not possible, the Society may approve relaxations from the above requirements.

5. Air pipes and other openings to enclosed spaces not listed in **307. 4** should be shielded from any spray which may come from a burst hose or connection.

6. Escape routes should not terminate within the coamings required by **307. 7** or within a distance of 3 m beyond the coamings.

7. Continuous coamings of suitable height should be fitted to keep any spills on deck and away from the accommodation and service areas.

8. Electrical equipment within the coamings required by **307. 7** or within a distance of 3 m beyond the coamings should be in accordance with the requirements of **Sec 10.**

9. Fire-fighting arrangements for the bow or stern loading and unloading areas should be in accordance with **1103. 16.**

10. Means of communication between the cargo control station and the cargo shore connection location should be provided and certified safe, if necessary. Provision should be made for the remote shutdown of cargo pumps from the cargo shoreconnection location.

Section 4 Cargo Containment

401. Definitions (IBC Code 4.1)

1. "**Independent tank**" means a cargo containment envelope which is not contiguous with, or part of, the hull structure. An independent tank is built and installed so as to eliminate whenever possible (or in any event to minimize) its stressing as a result of stressing or motion of the adjacent hull structure. An independent tank is not essential to the structural completeness of the ship's hull.

2. "**Integral tank**" means a cargo containment envelope which forms part of the ship's hull and which may be stressed in the same manner and by the same loads which stress the contiguous hull structure and which is normally essential to the structural completeness of the ship's hull.

3. "**Gravity tank**" means a tank having a design pressure not greater than 0.07 MPa gauge at the top of the tank. A gravity tank may be independent or integral. A gravity tank should be constructed and tested according to recognized standards taking account of the temperature of carriage and relative density of the cargo.

4. "**Pressure tank**" means a tank having a design pressure greater than 0.07 MPa gauge. A pressure tank should be an independent tank and should be of a configuration permitting the application of pressure vessel design criteria according to recognized standards.

402. Tank type requirements for individual products (IBC Code 4.2)

Requirements for both installation and design of tank types for individual products are shown in column "f" in the table of **Sec 17.**

Section 5 Cargo Transfer

501. Piping scantlings (IBC Code 5.1)

1. Subject to the conditions stated in **Par 4** the wall thickness (t) of pipes should not be less than:

$$t = \frac{t_0 + b + c}{1 - \frac{a}{100}} \quad (\mathrm{mm})$$

where:

t_0 = theoretical thickness

$$t_0 = \frac{P \cdot D}{2K \cdot e + P} \quad (\mathrm{mm})$$

with

P = design pressure (MPa) referred to in **Par 2**

D = outside diameter (mm)

K = allowable stress($\mathrm{N/mm^2}$) referred to in **Par 5**

e = efficiency factor; equal to 1.0 for seamless pipes and for longitudinally or spirally welded pipes, delivered by manufacturers approved for making welded pipes, which are considered equivalent to seamless pipes wnen non-destructive testing on welds is carried out in accordance with recognized standards. In other cases, an efficiency factor of less than 1.0, in accordance with recognized standards, may be required depending on the manufacturing process.

b = allowance for bending (mm). The value of b should be chosen so that the calculated stress in the bend, due to internal pressure only, does not exceed the allowable stress. Where such justification is not given, b should be not less than:

$$b = \frac{D \cdot t_0}{2.5r} \quad (\mathrm{mm})$$

with

r = mean radius of the bend (mm).

c = corrosion allowance (mm). If corrosion or erosion is expected, the wall thickness of piping should be increased over that required by the other design requirements.

a = negative manufacturing tolerance for thickness (%).

2. The design pressure P in the formula for t_0 in **Par 1** is the maximum gauge pressure to which the system may be subjected in service, taking into account the highest set pressure on any relief valve on the system.

3. Piping and piping system components which are not protected by a relief valve, or which may be isolated from their relief valve, should be designed for at least the greatest of:

(1) for piping systems or components which may contain some liquid, the saturated vapour pressure at 45°C;

(2) the pressure setting of the associated pump discharge relief valve;

(3) the maximum possible total pressure head at the outlet of the associated pumps when a pump

discharge relief valve is not installed.

4. The design pressure should not be less than 1.0 MPa gauge except for open-ended lines where it should be not less than 0.5 MPa gauge.

5. For pipes, the allowable stress to be considered in the formula for to in **Par 1** is the lower of the following values:

R_m/A or R_e/B

where:

R_m = specified minimum tensile strength at ambient temperature (N/mm^2)

R_e = specified minimum yield stress at ambient temperature (N/mm^2). If the stress-strain curve does not show a defined yield stress, the 0.2 % proof stress applies.

A and B should have values of at least A = 2.7 and B = 1.8

6. (1) The minimum wall thickness should be in accordance with recognized standards.

(2) Where necessary for mechanical strength to prevent damage, collapse, excessive sag or buckling of pipes due to weight of pipes and content and to superimposed loads from supports, ship deflection or other causes, the wall thickness should be increased over that required by **Par 1** or, if this is impracticable or would cause excessive local stresses, these loads should be reduced, protected against or eliminated by other design methods.

(3) Flanges, valves and other fittings should be in accordance with recognized standards, taking into account the design pressure defined under **Par 2.**

(4) For flanges not complying with a standard the dimensions of flanges and associated bolts should be to the satisfaction of the Society.

502. Piping fabrication and joining details (IBC Code 5.2)

1. The requirements of this Article apply to piping inside and outside the cargo tanks. However, relaxations from these requirements may be accepted in accordance with recognized standards for open-ended piping and for piping inside cargo tanks except for cargo piping serving other cargo tanks.

2. Cargo piping should be joined by welding except:

(1) for approved connections to shutoff valves and expansion joints; and

(2) for other exceptional cases specifically approved by the Society.

3. The following direct connections of pipe lengths, without flanges may be considered:

(1) Butt-welded joints with complete penetration at the root may be used in all applications.

(2) Slip-on welded joints with sleeves and related welding having dimensions in accordance with recognized standards should only be used for pipes with an external diameter of 50 mm or less. This type of joint should not be used when crevice corrosion is expected to occur.

(3) Screwed connections in accordance with recognized standards should only be used for accessory lines and instrumentation lines with external diameters of 25 mm or less.

4. Expansion of piping should normally be allowed for by the provision of expansion loops or bends in the piping system.

(1) Bellows in accordance with recognized standards may be specially considered.

(2) Slip joints should not be used.

5. Welding, post-weld heat treatment and non-destructive testing should be performed in accordance with Recognized Standards.

503. Flange connections (IBC Code 5.3)

1. Flanges should be of the welded neck, slip-on or socket-welded type. However, socket-welded type flanges should not be used in nominal size above 50 mm.

2. Flanges should comply with recognized standards as to their type, manufacture and test.

504. Test requirements for piping (IBC Code 5.4)

1. The test requirements of this Article apply to piping inside and outside cargo tanks. However, relaxations from these requirements may be accepted in accordance with recognized standards for piping inside tanks and open-ended piping.

2. After assembly, each cargo piping system should be subject to a hydrostatic test to at least 1.5 times the design pressure. When piping systems or parts of systems are completely manufactured and equipped with all fittings, the hydrostatic test may be conducted prior to installation aboard the ship. Joints welded on board should be hydrostatically tested to at least 1.5 times the design pressure.

3. After assembly on board, each cargo piping system should be tested for leaks to a pressure depending on the method applied.

505. Piping arrangements (IBC Code 5.5)

1. Cargo piping should not be installed under deck between the outboard side of the cargo containment spaces and the skin of the ship unless clearances required for damage protection (see **206.**) are maintained; but such distances may be reduced where damage to the pipe would not cause release of cargo provided that the clearance required for inspection purposes is maintained.

2. Cargo piping, located below the main deck, may run from the tank it serves and penetrate tank bulkheads or boundaries common to longitudinally or transversally adjacent cargo tanks, ballast tanks, empty tanks, pump rooms or cargo pump rooms provided that inside the tank it serves it is fitted with a stop valve operable from the weather deck and provided cargo compatibility is assured in the event of piping failure. As an exception, where a cargo tank is adjacent to a cargo pump room, the stop valve operable from the weather deck may be situated on the tank bulkhead on the cargo pump room side, provided an additional valve is fitted between the bulkhead valve and the cargo pump. A totally enclosed hydraulically-operated valve located outside the cargo tank may, however, be accepted, provided that the valve is:

(1) designed to preclude the risk of leakage;
(2) fitted on the bulkhead of the cargo tank which it serves;
(3) suitably protected against mechanical damage;
(4) fitted at a distance from the shell, as required for damage protection; and
(5) operable from the weather deck.

3. In any cargo pump room where a pump serves more than one tank, a stop valve should be fitted in the line to each tank.

4. Cargo piping installed in pipe tunnels should also comply with the requirements of **Pars 1** and **2.** Pipe tunnels should satisfy all tank requirements for construction, location and ventilation and electrical hazard requirements. Cargo compatibility should be assured in the event of a piping failure. The tunnel should not have any other openings except to the weather deck and cargo pump room or pump room.

5. Cargo piping passing through bulkheads should be so arranged as to preclude excessive stresses at the bulkhead and should not utilize flanges bolted through the bulkhead.

506. Cargo transfer control systems (IBC Code 5.6)

1. For the purpose of adequately controlling the cargo, cargo transfer systems should be provided with:

(1) one stop valve capable of being manually operated on each tank filling and discharge line, located near the tank penetration; if an individual deepwell pump is used to discharge the contents of a cargo tank, a stop valve is not required on the discharge line of that tank;
(2) one stop valve at each cargo hose connection;
(3) remote shutdown devices for all cargo pumps and similar equipment.

2. The controls necessary during transfer or transport of cargoes covered by this Chapter other than in cargo pump rooms which have been dealt with elsewhere in this Chapter should not be located below the weather deck.

3. For certain products, additional cargo transfer control requirements are shown in column "o" in the table of **Sec 17.**

507. Ship's cargo hoses (IBC Code 5.7)

1. Liquid and vapour hoses used for cargo transfer should be compatible with the cargo and suitable for the cargo temperature.

2. Hoses subject to tank pressure or the discharge pressure of pumps should be designed for a bursting pressure not less than 5 times the maximum pressure the hose will be subjected to during cargo transfer.

3. For cargo hoses installed on board ships on or after 1 July 2002, each new type of cargo hose, complete with end-fittings, should be prototype-tested at a normal ambient temperature with 200 pressure cycles from zero to at least twice the specified maximum working pressure. After this cycle pressure test has been carried out, the prototype test should demonstrate a bursting pressure of at least 5 times its specified maximum working pressure at the extreme service temperature. Hoses used for prototype testing should not be used for cargo service. Thereafter, before being placed in service, each new length of cargo hose produced should be hydrostatically tested at ambient temperature to a pressure not less than 1.5 times its specified maximum working pressure but not more than two fifths of its bursting pressure. The hose should be stencilled or otherwise marked with its specified maximum working pressure and, if used in other than ambient temperature services, its maximum and minimum service temperature as applicable. The specified maximum working pressure should not be less than 1.0 MPa gauge.

Section 6 Materials of Construction

601. General (IBC Code 6.1)

1. Structural materials used for tank construction, together with associated piping, pumps, valves, vents and their jointing materials, should be suitable at the temperature and pressure for the cargo to be carried in accordance with recognized standards. Steel is assumed to be the normal material of construction.

2. The shipyard is responsible for providing compatibility information to the ship operator and/or master. This must be done in a timely manner before delivery of the ship or on completion of a relevant modification of the material of construction.

3. Where applicable the following should be taken into account in selecting the material of construction:

(1) notch ductility at the operating temperature;
(2) corrosive effect of the cargo;
(3) possibility of hazardous reactions between the cargo and the material of construction; and
(4) suitability of linings.

4. The shipper of the cargo is responsible for providing compatibility information to the ship operator and/or master. This must be done in a timely manner before transportation of the product. The cargo shall be compatible with all materials of construction such that :

(1) no damages to the integrity of the materials of construction is incurred ; and/or
(2) no hazardous, or potentially hazardous reaction is created.

5. When a product is submitted to IMO for evaluation, and where compatibility of the product with materials referred to in paragraph 1 renders special requirements, the BLG Product Data Reporting form shall provide information on the required materials of construction. These requirements shall be reflected in Sec.15 and consequentially be referred to in column o of Sec 17. The reporting form shall also indicate if no special requirements are necessary. The products of the product is responsible for providing the correct information.

Section 7 Cargo Temperature Control

701. General (IBC Code 7.1)

1. When provided, any cargo heating or cooling systems should be constructed, fitted and tested to the satisfaction of the Society. Materials used in the construction of temperature control systems should be suitable for use with the product intended to be carried.

2. Heating or cooling media should be of a type approved for use with the specific cargo. Consideration should be given to the surface temperature of heating coils or ducts to avoid dangerous reactions from localized overheating or overcooling of cargo. (see also **1513. 6**)

3. Heating or cooling systems should be provided with valves to isolate the system for each tank and to allow manual regulation of flow.

4. In any heating or cooling system, means should be provided to ensure that, when in any condition other than empty, a higher pressure can be maintained within the system than the maximum pressure head that could be exerted by the cargo tank contents on the system.

5. Means should be provided for measuring the cargo temperature.

(1) The means for measuring the cargo temperature should be of restricted or closed type, respectively, when a restricted or closed gauging device is required for individual substances as shown in column "j" in the table of **Sec 17.**

(2) A restricted temperature-measuring device is subject to the definition for a restricted gauging device in **1301. 1** (2), e.g. a portable thermometer lowered inside a gauge tube of the restricted type.

(3) A closed temperature measuring device is subject to the definition for closed gauging device in **1301. 1** (3), e.g. a remote-reading thermometer of which the sensor is installed in the tank.

(4) When overheating or overcooling could result in a dangerous condition, an alarm system which monitors the cargo temperature should be provided. (See also operational requirements in **1606**.)

6. When products for which **1512., 1512. 1** or **3** are listed in column "o" in the table of **Sec 17** are being heated or cooled, the heating or cooling medium should operate in a circuit:

(1) which is independent of other ship's services, except for another cargo heating or cooling system, and which does not enter the machinery space; or

(2) which is external to the tank carrying toxic products; or

(3) Where the medium is sampled to check for the presence of cargo before it is recirculated to other services of the ship or into the machinery space. The sampling equipment should be located within the cargo area and be capable of detecting the presence of any toxic cargo being heated or cooled. Where this method is used, the coil return should be tested not only at the commencement of heating or cooling of a toxic product, but also on the first occasion the coil is used subsequent to having carried an unheated or uncooled toxic cargo.

702. Additional requirements (IBC Code 7.2)

For certain products, additional requirements contained in **Sec 15** are shown in column "o" in the table of **Sec 17.**

Section 8 Cargo Tank Venting and Gas-freeing Arrangements

801. Application (IBC Code 8.1)

1. Unless expressly provided otherwise, this section applies to ships constructed on or after 1 January 1994.

2. Ship constructed before 1 January 1994 shall comply with the requirements of Section 8 of the Rules which were in force prior to the said date.

3. Ships constructed on or after 1 July 1986 but before 1 January 1994 which fully comply with the requirements of the Rules at that time may be regarded as complying with the requirements of SOLAS regulation Il-2/4.5.3, 4.5.6, to 4.5.8, 4.5.10 and 11.6.

4. For ships to which this Chapter applies, the requirements of this Section shall apply in lieu of regulation II-2/59.1 and 59.2 of the 1974 SOLAS Convention, as amended.

5. Ships constructed on or after 1 July 1986, but before 1 July 2002 shall comply with the paragraph **803. 3**. However, the Society may approve relaxation of the requirements for ships of less than 500 gross tonnage which were constructed on or after 1 July 1986, but before 1 July 2002.

802. Cargo tank venting (IBC Code 8.2)

1. All cargo tanks should be provided with a venting system appropriate to the cargo being carried and these systems should be independent of the air pipes and venting systems of all other compartments of the ship. Tank venting systems should be designed so as to minimize the possibility of cargo vapour accumulating about the decks, entering accommodation, service and machinery spaces and control stations and in the case of flammable vapours entering or collecting in spaces or areas containing sources of ignition. Tank venting systems should be arranged to prevent entrance of water into the cargo tanks and at the same time, vent outlets should direct the vapour discharge upwards in the form of unimpeded jets.

2. The venting systems should be connected to the top of each cargo tank and as far as practicable the cargo vent lines should be self-draining back to the cargo tanks under all normal operational conditions of list and trim. Where it is necessary to drain venting systems above the level of any pressure/vacuum valve, capped or plugged drain cocks should be provided.

3. Provision should be made to ensure that the liquid head in any tank does not exceed the design head of the tank. Suitable high-level alarms, overflow control systems or spill valves, together with gauging and tank filling procedures may be accepted for this purpose. Where the means of limiting cargo tank overpressure includes an automatic closing valve, the valve should comply with the appropriate provisions of **1519.**

4. Tank venting systems should be designed and operated so as to ensure that neither pressure nor vacuum created in the cargo tanks during loading or unloading exceeds tank design parameters. The main factors to be considered in the sizing of a tank venting system are as follows:

(1) design loading and unloading rate;
(2) gas evolution during loading: this should be taken account of by multiplying the maximum loading rate by a factor of at least 1.25;
(3) density of the cargo vapour mixture;
(4) pressure loss in vent piping and across valves and fittings;
(5) pressure/vacuum settings of relief devices.

5. Tank vent piping connected to cargo tanks of corrosion-resistant material, or to tanks which are lined or coated to handle special cargoes as required by this Chapter, should be similarly lined or coated or constructed of corrosion-resistant material.

6. The master should be provided with the maximum permissible loading and unloading rates for each tank or group of tanks consistent with design of the venting systems.

803. Types of tank venting systems (IBC Code 8.3)

1. An open tank venting system is a system which offers no restriction except for friction losses to the free flow of cargo vapours to and from the cargo tanks during normal operations, An open venting system may consist of individual vents from each tank, or such individual vents may be combined into a common header or headers, with due regard to cargo segregation. In no case should shutoff valves be fitted either to the individual vents or to the header.

2. A controlled tank venting system is a system in which pressure and vacuum relief valves or pressure/vacuum valves are fitted to each tank to limit the pressure or vacuum in the tank. A controlled venting system may consist of individual vents from each tank or such individual vents on the pressure side only as may be combined into a common header or headers with due regard to cargo segregation. In no case should shutoff valves be fitted either above or below pressure or vacuum relief valves or pressure/vacuum valves. Provision may be made for bypassing a pressure or vacuum valve or pressure/vacuum valve under certain operating conditions provided that the requirement of **Par 6** is maintained and that there is suitable indication to show whether or not the valve is bypassed.

3. On ships constructed on or after 1 July 2002, controlled tank venting systems should consist of a primary and a secondary means of allowing full flow relief of vapour to prevent over-pressure or under-pressure in the event of failure of one means. Alternatively, the secondary means may consist of pressure sensors fitted in each tank with a monitoring system in the ship's cargo control room or position from which cargo operations are normally carried out. Such monitoring equipment should also provide an alarm facility which is activated by detection of over-pressure or under-pressure conditions within a tank.

4. The position of vent outlets of a controlled tank venting system should be arranged:

(1) at a height of not less than 6 m above the weather deck or above a raised walkway if fitted within 4 m of the raised walkway;

(2) at a distance of at least 10 m measured horizontally from the nearest air intake or opening to accommodation, service and machinery spaces and ignition sources.

5. The vent outlet height referred to in **4** (1) may be reduced to 3 m above the deck or a raised walkway, as applicable, provided that high velocity venting valves of a type approved by the Society, directing the vapour/air mixture upwards in an unimpeded jet with an exit velocity of at least 30 m/s, are fitted.

6. Controlled tank venting systems fitted to tanks to be used for cargoes having a flashpoint not exceeding 60°C (closed cup test) should be provided with devices to prevent the passage of flame into the cargo tanks. The design, testing and locating of the devices should comply with the requirements of the Society, which should contain at least the standards adopted by the Organization.

7. In designing venting systems and in the selection of devices to prevent the passage of flame for incorporation into the tank venting system, due attention should be paid to the possibility of the blockage of these systems and fittings by, for example, the freezing of cargo vapour, polymer build up, atmospheric dust or icing up in adverse weather conditions. In this context it should be noted that flame arresters and flame screens are more susceptible to blockage. Provisions should be made such that the system and fittings may be inspected, operationally checked, cleaned or renewed as applicable.

8. Reference in **Pars 1** and **2** to the use of shutoff valves in the venting lines should be interpreted to extend to all other means of stoppage, including spectacle blanks and blank flanges.

804. Venting requirements for individual products (IBC Code 8.4)

Venting requirements for individual products are shown in column "g", and additional requirements in column "o" in the table of **Sec 17.**

805. Cargo tank gas-freeing (IBC Code 8.5)

1. The arrangements for gas-freeing cargo tanks used for cargoes other than those for which open venting is permitted should be such as to minimize the hazards due to the dispersal of flammable or toxic vapours in the atmosphere and to flammable or toxic vapour mixtures in a cargo tank.

Accordingly, gas-freeing operations should be carried out such that vapour is initially discharged:

(1) through the vent outlets specified in **803. 3** and **803. 4;** or
(2) through outlets at least 2 m above the cargo tank deck level with a vertical efflux velocity of at least 30 m/s maintained during the gas- freeing operation; or
(3) through outlets at least 2 m above the cargo tank deck level with a vertical efflux velocity of at least 20 m/s which are protected by suitable devices to prevent the passage of flame.
When the flammable vapour concentration at the outlets has been reduced to 30 % of the lower flammable limit and, in the case of a toxic product, the vapour concentration does not present a significant health hazard, gas-freeing may thereafter be continued at cargo tank deck level.

2. The outlets referred to in **1** (2) and **1** (3) may be fixed or portable pipes.

3. In designing a gas-freeing system in conformity with **Par 1,** particularly in order to achieve the required exit velocities of **1** (2) and **1** (3), due consideration should be given to the following:

(1) materials of construction of system;
(2) time to gas-free;
(3) flow characteristics of fans to be used;
(4) the pressure losses created by ducting, piping, cargo tank inlets and outlets;
(5) the pressure achievable in the fan driving medium (e.g. water or compressed air);
(6) the densities of the cargo vapour/air mixtures for the range of cargoes to be carried.

Section 9 Environmental Control

901. General (IBC Code 9.1)

1. Vapour spaces within cargo tanks and, in some cases, spaces surrounding cargo tanks may require to have specially controlled atmospheres.

2. There are four different types of control for cargo tanks, as follows:

(1) Inerting - by filling the cargo tank and associated piping systems and, where specified in **Sec 15,** the spaces surrounding the cargo tanks, with a gas or vapour which will not support combustion and which will not react with the cargo, and maintaining that condition.
(2) Padding- by filling the cargo tank and associated piping systems with a liquid, gas or vapour which separates the cargo from the air, and maintaining that condition.
(3) Drying - by filling the cargo tank and associated piping systems with moisture-free gas or vapour with a dewpoint of -40°C or below at atmospheric pressure, and maintaining that condition.
(4) Ventilation - forced or natural.

3. Where inerting or padding of cargo tanks is required:

(1) An adequate supply of inert gas for use in filling and discharging the cargo tanks should be carried or should be manufactured on board unless a shore supply is available. In addition, sufficient inert gas should be available on the ship to compensate for normal losses during transportation.
(2) The inert gas system on board the ship should be able to maintain a pressure of at least 0.007 MPa gauge within the containment system at all times. In addition, the inert gas system should not raise the cargo tank pressure to more than the tank's relief valve setting.
(3) Where padding is used, similar arrangements for supply of the padding medium should be made as required for inert gas in (1) and (2).
(4) Means should be provided for monitoring ullage spaces containing a gas blanket to ensure that the correct atmosphere is being maintained.
(5) Inerting or padding arrangements or both, where used with flammable cargoes, should be such as to minimize the creation of static electricity during the admission of the inerting medium.

4. Where drying is used and dry nitrogen is used as the medium, similar arrangements for supply of the drying agent should be made to those required in **Par 3.** Where agents are used as the drying medium on all air inlets to the tank, sufficient medium should be carried for the duration of the voyage, taking into consideration the diurnal temperature range and the expected humidity.

902. Environmental control requirements for individual products (IBC Code 9.2)

The required types of environmental control for certain products are shown in column "h" in the table of **Sec 17.**

Section 10 Electrical Installations

1001. General (IBC Code 10.1)

1. The provisions of this Section are applicable to ships carrying cargoes which are inherently, or due to their reaction with other substances, flammable or corrosive to the electrical equipment, and should be applied in conjunction with applicable electrical requirements of part D, chapter II-1 of the 1983 SOLAS amendments.

2. (1) Electrical installations shall be such as to minimize the risk of fire and explosion from flam mable products. Reference is made to the recommendation published the International Electrotechnical Commission, in particular to publication IEC 60079-1-1 : 2002

(2) Where the specific cargo is liable to damage the materials normally used in electrical apparatus, due consideration should be given to the particular characteristics of the materials chosen for conductors, insulation, metal parts, etc. As far as necessary, these components should be protected to prevent contact with gases or vapours liable to be encountered.

3. The Society should take appropriate steps to ensure uniformity in the implementation and the application of the provisions of this Section in respect of electrical installations.

4. Electrical equipment, cables and wiring shall not be installed in the hazardous locations unless it conforms with the standards not inferior to those acceptable to the recommendation published the International Electrotechnical Commission, in particular to publication IEC 60079-1-1 : 2002. However, for locations not covered by such standards, electrical equipment, cables and wiring which do not conform to the standards may be installed in hazardous locations based on a risk assessment to the satisfaction of the Society, to ensure that an equivalent level of safety is assured.

5. Where electrical equipment is installed in hazardous locations, as permitted in this Section, it should be to the satisfaction of the Society and certified by the relevent authorities recognized by the Society for operation in the flammable atmosphere concerned, as indicated in column "i" in the table of **Sec 17.**

6. For guidance, indication is given if the flashpoint of a substance is in excess of 60°C. In the case of heated cargo, carriage conditions might need to be established and the requirements for cargoes having a flashpoint not exceeding 60°C applied.

1002. Bonding (IBC Code 10.2)

Independent cargo tanks should be electrically bonded to the hull. All gasketed cargo pipe joints and hose connections should be electrically bonded.

1003. Electrical requirements for individual products (IBC Code 10.3)

Electrical requirements for individual products are shown in column "i" in the table of **Sec 17.**

Section 11 Fire Protection and Fire Extinction

1101. Application (IBC Code 11.1)

1. The requirements for tankers in chapter II-2 of the 1983 SOLAS amendments shall apply to ships covered by this Chapter, irrespective of tonnage, including ships of less than 500 tons gross tonnages, except that:

(1) regulations 4.5.5, 10.8 and 10.9 shall not apply;
(2) regulation 4.5.1.2 (i.e. the requirements for location of the main cargo control station) need not apply;
(3) regulation 10.2, 10.4 and 10.5 shall apply as they would apply to cargo ships of 2,000 tons gross tonnage and over;
(4) regulation of 10.5.6 shall apply to ships of 2,000 gross tonnage and over;
(5) the provisions of **1103.** shall apply in lieu of regulation 10.8; and
(6) the provisions of **1102.** shall apply in lieu of regulation 10.9.
(7) regulation 4.5.10 shall apply to ships of 500 gross tonnage and over, replacing "hydrocarbon gases" by "flammable vapours" in the regulation; and.
(8) regulations 13.3.4 and 13.4.3 shall apply to ships of 500 gross tonnage and over.

2. Notwithstanding the provisions of **Par 1,** ships engaged solely in the carriage of products which are non-flammable (entry NF in column "i" of the table of minimum requirements) need not comply with the requirements for tanker specified in SOLAS chapter II-2, provided that they comply with the requirements for cargo ships of that chapter, except that regulation 10.7 need not apply to such ships and **1102.** and **1103.** hereunder need not apply.

3. For ships engaged solely in the carriage of products with flashpoint above 60°C (entry "yes" in column "i" of the table of minimum requirements) the requirements of SOLAS chapter II-2 may apply as specified in regulation II-2/1.6.4 in lieu of the provisions of this Section.

4. Monitoring of the concentration of flammable vapour

In lieu of the provisions of SOLAS regulation II-2/1.6.7, the requirements of regulations II-2/4.5.10.1.1 and II-2/4.5.10.1.4 shall apply and a system for continuous monitoring of the concentration of flammable vapours shall be fitted on ships of 500 gross tonnage and over which were constructed before 1 January 2009 by the date of the first scheduled dry-docking after 1 January 2009, but not later than 1 January 2012. Sampling points or detector heads should be located in suitable positions in order that potentially dangerous leakages are readily detected. When the flammable vapour concentration reaches a pre-set level which shall not be higher than 10 % of the lower flammable limit, a continuous audible and visual alarm signal shall be automatically effected in the pump-room and cargo control room to alert personnel to the potential hazard. However, existing monitoring systems already fitted having a pre-set level not greater than 30 % of the lower flammable limit may be accepted. Notwithstanding the above provisions, the Administration may exempt ships not engaged on international voyages from those requirements.

1102. Cargo pump rooms (IBC Code 11.2)

1. The cargo pump room of any ship should be provided with a fixed carbon dioxide fire-extinguishing system as specified in regulation II-2/5.1 and .2 of the 1983 SOLAS amendments. A notice should be exhibited at the controls stating that the system is only to be used for fire-extinguishing and not for inerting purposes, due to the electrostatic ignition hazard. The alarms referred to in regulation II-2/5.1.6 of the 1983 SOLAS amendments should be safe for use in a flammable cargo vapour-air mixture. For the purpose of this requirements, an extinguishing system should be provided which would be suitable for machinery spaces. However, the amount of gas carried should be sufficient to provide a quantity of free gas equal to 45% of the gross volume of the cargo pump room in all cases; or

2. Cargo pump rooms of ships which are dedicated to the carriage of a restricted number of cargoes should be protected by an appropriate fire-extinguishing system approved by the Society.

3. A fire-extinguishing system consisting of either a fixed pressure water-spray system or a high-expansion foam system could be provided for a cargo pump room if cargoes will be carried which are not suited to extinguishment by carbon dioxide or equivalent media. The International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk should reflect this conditional requirement.

1103. Cargo area (IBC Code 11.3)

1. Every ship should be provided with a fixed deck foam system in accordance with the requirements of **Pars 2** to **12.**

2. Only one type of foam concentrate should be supplied, and it should be effective for the maximum possible number of cargoes intended to be carried. For other cargoes for which foam is not effective or is incompatible, additional arrangements to the satisfaction of the Society should be provided. Regular protein foam should not be used.

3. The arrangements for providing foam should be capable of delivering foam to the entire cargo tanks deck area as well as into any cargo tank, the deck of which is assumed to be ruptured.

4. The deck foam system should be capable of simple and rapid operation. The main control station for the system should be suitably located outside of the cargo area, adjacent to the accommodation spaces and readily accessible and operable in the event of fires in the areas protected.

5. The rate of supply of foam solution should be not less than the greatest of the following:

(1) 2 l/min per square metre of the cargo tanks deck area, where cargo tanks deck area means the maximum breadth of the ship times the total longitudinal extent of the cargo tank spaces;
(2) 20 l/min per square metre of the horizontal sectional area of the single tank having the largest such area;
(3) 10 l/min per square metre of the area protected by the largest monitor, such area being entirely forward of the monitor, but not less than 1,250 l/min. For ships of less than 4,000 tonnes deadweight, the minimum capacity of the monitor should be to the satisfaction of the Society.

6. Sufficient foam concentrate should be supplied to ensure at least 30 min of foam generation when using the highest of the solution rates stipulated in **5** (1) to (3).

7. Foam from the fixed foam system should be supplied by means of monitors and foam applicators. At least 50 % of the foam rate required in **Par 5.** (1) or (2) should be delivered from each monitor. The capacity of any monitor should be at least 10 l/min of foam solution per square metre of deck area protected by that monitor, such area being entirely forward of the monitor. Such capacity should be not less than 1,250 l/min. For ships of less than 4,000 tonnes deadweight, the minimum capacity of the monitor should be to the satisfaction of the Society.

8. The distance from the monitor to the farthest extremity of the protected area forward of that monitor should be not more than 75 % of the monitor throw in still air conditions.

9. A monitor and hose connection for a foam applicator should be situated both port and starboard at the poop front or accommodation spaces facing the cargo area.

10. Applicators should be provided for flexibility of action during fire-fighting operations and to cover areas screened from the monitors. The capacity of any applicator should be not less than 400 l/min and the applicator throw in still air conditions should be not less than 15 m. The number of foam applicators provided should be not less than four. The number and disposition of foam main outlets should be such that foam from at least two applicators can be directed to any part of the cargo tanks deck area.

11. Valves should be provided in the foam main, and in the fire main where this is an integral part of the deck foam system, immediately forward of any monitor position to isolate damaged sections of those mains.

12. Operation of a deck foam system at its required output should permit the simultaneous use of the minimum required number of jets of water at the required pressure from the fire main.

13. Ships which are dedicated to the carriage of a restricted number of cargoes should be protected by alternative provisions to the satisfaction of the Society when they are just as effective for the products concerned as the deck foam system required for the generality of flammable cargoes.

14. Suitable portable fire-extinguishing equipment for the products to be carried should be provided and kept in good operating order.

15. Where flammable cargoes are to be carried all sources of ignition should be excluded from hazardous locations referred to in **1001. 4.**

16. Ships fitted with bow or stern loading and unloading arrangements should be provided with one additional foam monitor meeting the requirements of **Par 7** and one additional applicator meeting the requirements of **Par 10.** The additional monitor should be located to protect the bow or stern loading and unloading arrangements. The area of the cargo line forward or aft of the cargo area should be protected by the above-mentioned applicator.

1104. Special requirements (IBC Code 11.4)

Fire-extinguishing media determined to be effective for certain products are listed in column "l" in the table of **Sec 17.**

Section 12 Mechanical Ventilation in the Cargo Area

For ships to which this Chapter applies, the requirements of this Section replace the requirements of SOLAS regulation II-2/ 4.5.2.6 and 4.5.4. However, for products addressed under **1101. 2** and **1101. 3,** except acids and products for which **1517.** applies, SOLAS regulation II-2/4.5.2.6 and 4.5.4 may apply in lieu of the provisions of this Section.

1201. Spaces normally entered during cargo handling operations (IBC Code 12.1)

1. Cargo pump rooms and other enclosed spaces which contain cargo handling equipment and similar spaces in which work is performed on the cargo should be fitted with mechanical ventilation systems, capable of being controlled from outside such spaces.

2. Provision should be made to ventilate such spaces prior to entering the compartment and operating the equipment and a warning notice requiring the use of such ventilation should be placed outside the compartment.

3. Mechanical ventilation inlets and outlets should be arranged to ensure sufficient air movement through the space to avoid the accumulation of toxic or flammable vapours or both (taking into account their vapour densities) and to ensure sufficient oxygen to provide a safe working environment, but in no case should the ventilation system have a capacity of less than 30 changes of air per hour based upon the total volume of the space. For certain products, increased ventilation rates for cargo pump rooms are prescribed in **1517.**

4. Ventilation systems should be permanent and should normally be of the extraction type. Extraction from above and below the floor plates should be possible. In rooms housing motors driving cargo pumps, the ventilation should be of the positive pressure type.

5. Ventilation exhaust ducts from spaces within the cargo area should discharge upwards in locations at least 10 m in the horizontal direction from ventilation intakes and openings to accommodation, service and machinery spaces and control stations and other spaces outside the cargo area.

6. Ventilation intakes should be so arranged as to minimize the possibility of recycling hazardous vapours from any ventilation discharge opening.

7. Ventilation ducts should not be led through accommodation, service and machinery spaces or other similar spaces.

8. Electric motors driving fans should be placed outside the ventilation ducts if the carriage of flammable products is intended. Ventilation fans and fan ducts, in way of fans only, for hazardous locations referred to in **Sec 10** should be of non sparking construction defined as:

(1) impellers or housing of nonmetallic construction, due regard being paid to the elimination of static electricity;
(2) impellers and housing of nonferrous materials;
(3) impellers and housing of austenitic stainless steel; and
(4) ferrous impellers and housing with not less than 13 mm design tip clearance.
Any combination of an aluminium or magnesium alloy fixed or rotating component and a ferrous fixed or rotating component, regardless of tip clearance, is considered a sparking hazard and should not be used in these places.

9. Sufficient spare parts should be carried for each type of fan on board, required by this Section.

10. Protection screens of not more than 13 mm square mesh should be fitted in outside openings of ventilation ducts.

1202. Pump rooms and other enclosed spaces normally entered (IBC Code 12.2)

Pump rooms and other enclosed spaces normally entered, which are not covered by **1201. 1,** should be fitted with mechanical ventilation systems, capable of being controlled from outside such spaces and complying with the requirements of **1201. 3,** except that the capacity should not be less than 20 changes of air per hour, based upon the total volume of the space. Provision should be made to ventilate such spaces prior to entering.

1203. Spaces not normally entered (IBC Code 12.3)

Double bottoms, cofferdams, duct keels, pipe tunnels, hold spaces and other spaces where cargo may accumulate, should be capable of being ventilated to ensure a safe environment when entry into the spaces is necessary. Where a permanent ventilation system is not provided for such spaces, approved means of portable mechanical ventilation should be provided. Where necessary owing to the arrangement of spaces, for instance hold spaces, essential ducting for such ventilation should be permanently installed. For permanent installations, the capacity of 8 air changes per hour should be provided and for portable systems the capacity of 16 air changes per hour. Fans or blowers should be clear of personnel access openings, and should comply with **1201. 8.**

Section 13 Instrumentation

1301. Gauging (IBC Code 13.1)

1. Cargo tanks should be fitted with one of the following types of gauging devices:

(1) Open device"which makes use of an opening in the tanks and may expose the gauger to the cargo or its vapour. An example of this is the ullage opening.

(2) Restricted device"which penetrates the tank and which, when in use, permits a small quantity of cargo vapour or liquid to be exposed to the atmosphere. When not in use, the device is completely closed. The design should ensure that no dangerous escape of tank contents (liquid or spray) can take place in opening the device.

(3) Closed device"which penetrates the tank, but which is part of a closed system and keeps tank contents from being released. Examples are the float-type systems, electronic probe, magnetic probe and protected sight glass. Alternatively an indirect device which does not penetrate the tank shell and which is independent of the tank may be used. Examples are weighing of cargo, pipe flow meter.

2. Gauging devices should be independent of the equipment required under **1519.**

3. Open gauging and restricted gauging should be allowed only where:

(1) open venting is allowed by this Chapter; or

(2) means are provided for relieving tank pressure before the gauge is operated.

4. Types of gauging for individual products are shown in column "j" in the table of **Sec 17.**

1302. Vapour detection (IBC Code 13.2)

1. Ships carrying toxic or flammable products or both should be equipped with at least two instruments designed and calibrated for testing for the specific vapours in question. If such instruments are not capable of testing for both toxic concentrations and flammable concentrations, then two separate sets of instruments should be provided.

2. Vapour detection instruments may be portable or fixed. If a fixed system is installed, at least one portable instrument should be provided.

3. When toxic vapour detection equipment is not available for some products which require such detection, as indicated in column "k" in the table of **Sec 17,** the Society may exempt the ship from the requirement, provided an appropriate entry is made on the International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk. When granting such an exemption, the Society should recognize the necessity for additional breathing air supply and an entry should be made on the International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk drawing attention to the provisions of **1402. 4** and **1604. 2** (2).

4. Vapour detection requirements for individual products are shown in column "k" in the table of **Sec 17.**

Section 14 Personnel Protection

1401. Protective equipment (IBC Code 14.1)

1. For the protection of crew members who are engaged in loading and discharging operations, the ship should have on board suitable protective equipment consisting of large aprons, special gloves with long sleeves, suitable footwear, coveralls of chemical-resistant material, and tight-fitting goggles or face shields or both. The protective clothing and equipment should cover all skin so that no part of the body is unprotected.

2. Work clothes and protective equipment should be kept in easily accessible places and in special lockers. Such equipment should not be kept within accommodation spaces, with the exception of new, unused equipment and equipment which has not been used since undergoing a thorough cleaning process. The Society may, however, approve storage rooms for such equipment within accommodation spaces if adequately segregated from living spaces such as cabins, passageways dining rooms, bathrooms, etc.

3. Protective equipment should be used in any operation which may entail danger to personnel.

1402. Safety equipment (IBC Code 14.2)

1. Ships carrying cargoes for which **1512., 1512. 1** or **3** is listed in column "o" in the table of **Sec 17** shall have on board sufficient but not less than three complete sets of safety equipment each permitting personnel to enter a gas-filled compartment and perform work there for at least 20 min. Such equipment shall be in addition to that required by SOLAS regulation II-2/10.10.

2. One complete set of safety equipment should consist of:

(1) one self-contained air-breathing apparatus (not using stored oxygen);
(2) protective clothing, boots, gloves and tightfitting goggles;
(3) fireproof lifeline with belt resistant to the cargoes carried; and
(4) explosion-proof lamp.

3. For the safety equipment required in **Par 1,** all ships should carry the following, either:

(1) one set of fully charged spare air bottles for each breathing apparatus;
(2) a special air compressor suitable for the supply of high-pressure air of the required purity.
(3) a charging manifold capable of dealing with sufficient spare breathing apparatus air bottles for the breathing apparatus; or
(4) fully charged spare air bottles with a total free air capacity of at least 6,000 l for each breathing apparatus on board in excess of the requirements of SOLAS regulation II-2/10.10.

4. A cargo pump room of ships carrying cargoes which are subject to the requirements of **1518.** or cargoes for which in column "k" in the table of **Sec 17** toxic vapour detection equipment is required but is not available should have either:

(1) a low-pressure line system with hose connections suitable for use with the breathing apparatus required by **Par 1.** This system should provide sufficient high-pressure air capacity to supply, through pressure reduction devices, enough low-pressure air to enable two men to work in a gas-dangerous space for at least 1 h without using the air bottles of the breathing apparatus. Means should be provided for recharging the fixed air bottles and breathing apparatus air bottles from a special air compressor suitable for the supply of high-pressure air of the required purity; or
(2) an equivalent quantity of spare bottled air in lieu of the low-pressure air line.

5. At least one set of safety equipment as required by **Par 2** should be kept in a suitable clearly marked locker in a readily accessible place near the cargo pump room. The other sets of safety equipment should also be kept in suitable, clearly marked, easily accessible, places.

6. The breathing apparatus should be inspected at least once a month by a responsible officer, and the inspection recorded in the ship's log-book. The equipment should be inspected and tested by an expert at least once a year.

1403. Emergency equipment (IBC Code 14.3)

1. Ships carrying cargoes for which "Yes" is indicated in column "n" of the Sec 17, shall be provided with suitable respiratory and eye protection sufficient for every person on board for emergency escape purposes, subject to the following:

(1) filter type respiratory protection is unacceptable;
(2) self-contained breathing apparatus shall have normally at least a duration of service of 15 min;
(3) emergency escape respiratory protection shall not be used for fire-fighting or cargo handling purposes and shall be marked to that effect.

2. The ships shall have on board medical first-aid equipment including oxygen resuscitation equipment and antidotes for cargoes carried, based on the guidelines developed by IMO.

3. A stretcher which is suitable for hoisting an injured person up from spaces such as the cargo pump room shall be placed in a readily accessible location.

4. Suitably marked decontamination showers and an eyewash shall be available on deck in convenient locations. The showers and eyewash shall be operable in all ambient conditions.

Section 15 Special Requirements

1501. General

The provisions of this Section are applicable where specific reference is made in column "o" in the table of **Sec 17**. These requirements are additional to the general requirements of this Chapter.

1502. Ammonium nitrate solution, 93 % or less (IBC Code 15.2)

1. The ammonium nitrate solution should contain at least 7 % by weight of water. The acidity (pH) of the cargo when diluted with ten parts of water to one part of cargo by weight should be between 5.0 and 7.0. The solution should not contain more than 10 ppm chloride ions, 10 ppm ferric ions, and should be free of other contaminants.

2. Tanks and equipment for ammonium nitrate solution should be independent of tanks and equipment containing other cargoes or combustible products. Equipment which may in service, or when defective, release combustible products into the cargo, e.g. lubricants, should not be used. Tanks should not be used for seawater ballast.

3. Except where expressly approved by the Society, ammonium nitrate solutions should not be transported in tanks which have previously contained other cargoes unless tanks and associated equipment have been cleaned to the satisfaction of the Society.

4. The temperature of the heat exchanging medium in the tank heating system should not exceed 160°C. The heating system should be provided with a control system to keep the cargo at a bulk mean temperature of 140°C. High-temperature alarms at 145°C and 150°C and a low-temperature alarm at 125°C should be provided. Where the temperature of the heat exchanging medium exceeds 160°C an alarm should also be given. Temperature alarms and controls should be located on the navigating bridge.

5. If the bulk mean cargo temperature reaches 145°C, a cargo sample should be diluted with ten parts of distilled or demineralized water to one part of cargo by weight and the acidity (pH) should be determined by means of a narrow range indicator paper or stick. Acidity (pH) measurements should then be taken every 24 h. If the acidity (pH) is found to be below 4.2, ammonia gas should be injected into the cargo until the acidity (pH) of 5.0 is reached.

6. A fixed installation should be provided to inject ammonia gas into the cargo. Controls for this system should be located on the navigating bridge. For this purpose, 300 kg of ammonia per 1,000 tonnes of ammonium nitrate solution should be available on board.

7. Cargo pumps should be of the centrifugal deepwell type or of the centrifugal type with water-flushed seals.

8. Vent piping should be fitted with approved weatherhoods to prevent clogging. Such weatherhoods should be accessible for inspection and cleaning.

9. Hot work on tanks, piping and equipment which have been in contact with ammonium nitrate solution should only be done after all traces of ammonium nitrate have been removed, inside as well as outside.

1503. Carbon disulphide (IBC Code 15.3)

Carbon disulphide may be carried either under water pad or under suitable inert gas pad as specified in the following paragraphs.

Carriage under water pad

1. Provision should be made to maintain a water pad in the cargo tank during loading, unloading and transit. In addition, an inert gas pad should be maintained in the ullage space during transit.

2. All openings should be in the top of the tank, above the deck.

3. Loading lines should terminate near the bottom of the tank.

4. A standard ullage opening should be provided for emergency sounding.

5. Cargo piping and vent lines should be independent of piping and vent lines used for other cargo.

6. Pumps may be used for discharging cargo, provided they are of the deepwell or hydraulically driven submersible types. The means of driving a deepwell pump should not present a source of ignition for carbon disulphide and should not employ equipment that may exceed a temperature of 80°C.

7. If a cargo discharge pump is used, it should be inserted through a cylindrical well extending from the tank top to a point near the tank bottom. A water pad should be formed in this well before attempting pump removal unless the tank has been certified as gas-free.

8. Water or inert gas displacement may be used for discharging cargo, provided the cargo system is designed for the expected pressure and temperature.

9. Safety relief valves should be of stainless steel construction.

10. Because of its low ignition temperature and close clearances required to arrest its flame propagation, only intrinsically safe system and circuits are permitted in the hazardous location described in **1002. 3.**

Carriage under suitable inert gas pad

11. Carbon disulphide should be carried in independent tanks with a design pressure of not less than 0.06 MPa gauge.

12. All openings should be located on the top of the tank, above the deck.

13. Gaskets used in the containment system should be of a material which does not react with, or dissolve in, carbon disulphide.

14. Threaded joints should not be permitted in the cargo containment system, including the vapour lines.

15. Prior to loading, the tank(s) should be inerted with suitable inert gas until the oxygen level is 2 % by volume or lower. Means should be provided to automatically maintain a positive pressure in the tank using suitable inert gas during loading, transport and discharge. The system should be able to maintain this positive pressure between 0.01 and 0.02 MPa gauge, and should be remotely monitored and fitted with over/underpressure alarms.

16. Hold spaces surrounding an independent tank carrying carbon disulphide should be inerted by a suitable inert gas until the oxygen level is 2 % or less. Means should be provided to monitor and maintain this condition throughout the voyage. Means should also be provided to sample these spaces for carbon disulphide vapour.

17. Carbon disulphide should be loaded, transported and discharged in such a manner that venting to the atmosphere does not occur. If carbon disulphide vapour is returned to shore during loading or to the ship during discharge, the vapour return system should be independent of all other containment systems.

18. Carbon disulphide should be discharged only by submerged deepwell pumps or by a suitable inert gas displacement. The submerged deepwell pumps should be operated in a way that prevents heat build-up in the pump. The pump should also be equipped with a temperature sensor in the pump housing with remote readout and alarm in the cargo control room. The alarm should be set at 80°C. The pump should also be fitted with an automatic shut-down device, if the tank pressure falls below atmospheric pressure during the discharge.

19. Air should not be allowed to enter the cargo tank, cargo pump or lines while carbon disulphide is contained in the system.

20. No other cargo handling, tank cleaning or deballasting should take place concurrent with loading or discharge of carbon disulphide.

21. A water spray system of sufficient capacity should be provided to blanket effectively the area surrounding the loading manifold, the exposed deck piping associated with product handling and the tank domes. The arrangement of piping and nozzles should be such as to give an uniform distribution rate of 10 $l/m^2/min$. Remote manual operation should be arranged such that remote starting of pumps supplying the water-spray system and remote operation of any normally closed valves in the system can be carried out from a suitable location outside the cargo area adjacent to the accommodation spaces and readily accessible and operable in the event of fire in the areas protected.

The water-spray system should be capable of both local and remote manual operation, and the arrangement should ensure that any spilled cargo is washed away. Additionally, a water hose with pressure to the nozzle when atmospheric temperature permits, should be connected ready for immediate use during loading and unloading operations.

22. No cargo tanks should be more than 98 % liquid-full at the reference temperature (R).

23. The maximum volume (V_L) of cargo to be loaded in a tank should be:

$$V_L = 0.98\, V\rho_R / \rho_L$$

where:

V_L : volume of the tank

ρ_R : relative density of cargo at the reference temperature (R)

ρ_L : relative density of cargo at the loading temperature

R : reference temperature, i.e. the temperature at which the vapour pressure of the cargo corresponds to the set pressure of the pressure relief valve.

24. The maximum allowable tank filling limits for each cargo tank should be indicated for each loading temperature which may be applied, and for the applicable maximum reference temperature, on a list approved by the Administration. A copy of the list should be permanently kept on board by the master.

25. Zones on open deck, or semi-enclosed spaces on open deck within three metres of a tank outlet, gas or vapour outlet, cargo pipe flange or cargo valve of a tank certified to carry carbon disulphide, should comply with the electrical equipment requirements specified for carbon disulphide in column "i" in the table of **Sec 17.** Also, within the specified zone, no other heat sources, like steam piping with surface temperatures in excess of 80°C should be allowed.

26. Means should be provided to ullage and sample the cargo without opening the tank or disturbing the positive suitable inert gas blanket.

27. The product should be transported only in accordance with a cargo handling plan that has been approved by the Administration. Cargo handling plans should show the entire cargo piping system. A copy of the approved cargo handling plan should be available on board. The International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk should be endorsed to include reference to the approved cargo handling plan.

1504. Diethyl ether (IBC Code 15.4)

1. Unless inerted, natural ventilation should be provided for the voids around the cargo tanks while the vessel is under way. If a mechanical ventilation system is installed, all blowers should be of non-sparking construction. Mechanical ventilation equipment should not be located in the void spaces surrounding the cargo tanks.

2. Pressure relief valve settings should not be less than 0.02 MPa gauge for gravity tanks.

3. Inert gas displacement may be used for discharging cargo from pressure tanks provided the cargo system is designed for the expected pressure.

4. In view of the fire hazard, provision should be made to avoid any ignition source or heat generation or both in the cargo area.

5. Pumps may be used for discharging cargo, provided that they are of a type designed to avoid liquid pressure against the shaft gland or are of a hydraulically operated submerged type and are suitable for use with the cargo.

6. Provision should be made to maintain the inert gas pad in the cargo tank during loading, unloading and transit.

1505. Hydrogen peroxide solutions (IBC Code 15.5)

1. Hydrogen peroxide solutions over 60 % but not over 70 %

(1) Hydrogen peroxide solutions over 60 % but not over 70 % should be carried in dedicated ships only and no other cargoes should be carried.
(2) Cargo tanks and associated equipment should be either pure aluminium (99.5 %) or solid stainless steel (304 *L*, 316, 316 *L* or 316 *Ti*), and passivated in accordance with approved procedures. Aluminium should not be used for piping on deck. All nonmetallic materials of construction for the containment system should neither be attacked by hydrogen peroxide nor contribute to its decomposition.
(3) Pump rooms should not be used for cargo transfer operations.
(4) Cargo tanks should be separated by cofferdams from oil fuel tanks or any other space containing flammable or combustible materials.
(5) Tanks intended for the carriage of hydrogen peroxide should not be used for seawater ballast.
(6) Temperature sensors should be installed at the top and bottom of the tank. Remote temperature readouts and continuous monitoring should be located on the navigating bridge. If the temperature in the tanks rises above 35°C, visible and audible alarms should be activated on the navigating bridge.
(7) Fixed oxygen monitors (or gas sampling lines) should be provided in void spaces adjacent to tanks to detect leakage of the cargo into these spaces. Remote readouts, continuous monitoring (if gas-sampling lines are used, intermittent sampling is satisfactory) and visible and audible alarms similar to those for the temperature sensors should also be located on the navigating bridge. The visible and audible alarms should be activated if the oxygen concentration in these void spaces exceeds 30 % by volume. Two portable oxygen monitors should also be available as back-up systems.
(8) As a safeguard against uncontrolled decomposition, a cargo jettisoning system should be installed to discharge the cargo overboard. The cargo should be jettisoned if the temperature rise of the cargo exceeds a rate of 2°C per hour over a 5 h period or when the temperature in the tank exceeds 40°C.
(9) Cargo tank venting systems should have pressure/vacuum relief valves for normal controlled venting, and rupture discs or a similar device for emergency venting, should tank pressure rise rapidly as a result of uncontrolled decomposition. Rupture discs should be sized on the basis of tank design pressure, tank size and anticipated decomposition rate.
(10) A fixed water-spray system should be provided for diluting and washing away any concentrated hydrogen peroxide solution spilled on deck. The areas covered by the water-spray should include the manifold/hose connections and the tank tops of those tanks designated for carrying hydrogen peroxide solutions. The minimum application rate should satisfy the following criteria:
  (a) The product should be diluted from the original concentration to 35 % by weight within 5 min of the spill.
  (b) The rate and estimated size of the spill should be based upon maximum anticipated loading and discharge rates, the time required to stop flow of cargo in the vent of tank overfill or a piping/hose failure, and the time necessary to begin application of dilution water with actuation at the cargo control location or on the navigating bridge.
(11) Only those hydrogen peroxide solutions which have a maximum decomposition rate of 1 % per year at 25°C should be carried. Certification from the shipper that the product meets this standard should be presented to the master and kept on board. A technical representative of the manufacturer should be on board to monitor the transfer operations and have the capability tc test the stability of the peroxide. He should certify to the master that the cargo has been loaded in a stable condition.
(12) Protective clothing that is resistant to hydrogen peroxide solutions should be provided for each crew member involved in cargo transfer operations. Protective clothing should include nonflammable coveralls, suitable gloves, boots and eye protection.

2. Hydrogen peroxide solutions over 8 % but not over 60 % by weight

(1) The ship's shell plating should not form any boundaries of tanks containing this product.
(2) Hydrogen peroxide should be carried in tanks thoroughly and effectively cleaned of all traces of previous cargoes and their vapours or ballast. Procedures for inspection, cleaning, passivation and loading of tanks should be in accordance with MSC/Circ. 394. A certificate should be on

board the vessel indicating that the procedures in the circular have been followed. The passivation requirement may be waived by the Society for domestic shipments of short duration. Particular care in this respect is essential to ensure the safe carriage of hydrogen peroxide.
(a) When hydrogen peroxide is carried no other cargoes should be carried simultaneously.
(b) Tanks which have contained hydrogen peroxide may be used for other cargoes after cleaning in accordance with the procedures outlined in MSC/Circ. 394.
(c) Consideration in design should provide minimum internal tank structure, free draining, no entrapment and ease of visual inspection.

(3) Cargo tanks and associated equipment should be either pure aluminium (99.5 %) or solid stainless steel of types suitable for use with hydrogen peroxide (e.g. 304, 304 L, 316, 316 L, 316 Ti). Aluminium should not be used for piping on deck. All nonmetallic materials of construction for the containment system should neither be attacked by hydrogen peroxide nor contribute to its decomposition.

(4) Cargo tanks should be separated by a cofferdam from fuel oil tanks or any other space containing materials incompatible with hydrogen peroxide.

(5) Temperature sensors should be installed at the top and bottom of the tank. Remote temperature readouts and continuous monitoring should be located on the navigating bridge. If the temperature in the tank rises above 35°C, visible and audible alarms should activate on the navigating bridge.

(6) Fixed oxygen monitors (or gas-sampling lines) should be provided in void spaces adjacent to tanks to detect leakage of the cargo into these spaces. The enhancement of flammability by oxygen enrichments should be recognized. Remote readouts, continuous monitoring (if gas-sampling lines are used, intermittent sampling is satisfactory) and visible and audible alarms similar to those for the temperature sensors should also be located on the navigating bridge. The visible and audible alarms should activate if the oxygen concentration in these void spaces exceeds 30 % by volume. Two portable oxygen monitors should also be available as back-up systems.

(7) As a safeguard against uncontrolled decomposition, a cargo jettisoning system should be installed to discharge the cargo overboard. The cargo should be jettisoned if the temperature rise of the cargo exceeds a rate of 2°C per hour over a five-hour period or when the temperature in the tank exceeds 40°C.

(8) Cargo tank venting systems with filtration should have pressure/vacuum relief valves for normal controlled venting, and a device for emergency venting, should have for tank pressure rise rapidly as a result of an uncontrolled decomposition rate, as stipulated in (7). These venting systems should be designed in such a manner that there is no introduction of seawater into the cargo tank even under heavy sea conditions. Emergency venting should be sized on the basis of tank design pressure and tank size.

(9) A fixed water-spray system should be provided for diluting and washing away any concentrated solution spilled on deck. The areas covered by the water-spray should include the manifold/hose connections and the tank tops of those tanks designated for the carriage of hydrogen peroxide solutions. The minimum application rate should satisfy the following criteria:
(a) The product should be diluted from the original concentration to 35 % by weight within 5 minutes of the spill.
(b) The rate and estimated size of the spill should be based upon maximum anticipated loading and discharge rates, the time required to stop flow of the cargo in the event of tank overfill or a piping/hose failure, and the time necessary to begin application of dilution water with actuation at the cargo control location or on the navigating bridge.

(10) Only those hydrogen peroxide solutions which have a maximum decomposition rate of 1 % per year at 25°C should be carried. Certification from the shipper that the product meets this standard should be presented to the master and kept on board. A technical representative of the manufacturer should be on board to monitor the transfer operations and have the capability to test the stability of the hydrogen peroxide. He should certify to the master that the cargo has been loaded in a stable condition.

(11) Protective clothing that is resistant to hydrogen peroxide should be provided for each crew member involved in cargo transfer operations. Protective clothing should include coveralls that are nonflammable, suitable gloves, boots and eye protection.

(12) During transfer of hydrogen peroxide the related piping system should be separated from all other systems. Cargo hoses used for transfer of hydrogen peroxide should be marked "FOR HYDROGEN PEROXIDE TRANSFER ONLY".

3. Procedures for inspection, cleaning, passivation and loading of tanks for the carriage of hydrogen peroxide solutions 8-60%, which have contained other cargoes, or for the carriage of other cargoes after carriage of hydrogen peroxide.

(1) Tanks having contained cargoes other than hydrogen peroxide shall be inspected, cleaned and passivated before re-use for the transport of hydrogen peroxide solutions. The procedures for inspection and cleaning, as given in paragraphs (2) to (8) below, apply to both stainless steel and pure aluminium tanks (see paragraph 2.(2)). Procedures for passivation are given in paragraph (9) for stainless steel and (10) for aluminium. Unless otherwise specified, all steps apply to the tanks and to all associated equipment having been in contact with the other cargo.

(2) After unloading the previous cargo the tank shall be rendered safe and inspected for any residues, scale and rust.

(3) Tanks and associated equipment shall be washed with clean filtered water. The water to be used shall at least have the quality of potable water with a low chlorine content.

(4) Trace residues and vapours of the previous cargo shall be removed by steaming of tank and equipment.

(5) Tank and equipment are washed again with clean water (quality as above) and dried, using filtered, oil-free air.

(6) The atmosphere in the tank shall be sampled and investigated for the presence of organic vapours and oxygen concentration.

(7) The tank shall be checked again by visual inspection for residues of the previous cargo, scale and rust as well as for any smell of the previous cargo.

(8) If inspection or measurements indicate the presence of residues of the previous cargo or its vapours, actions described in paragraphs (3) to (5) shall be repeated.

(9) Tank and equipment made from stainless steel which have contained other cargoes than hydrogen peroxide or which have been under repair shall be cleaned and passivated, regardless of any previous passivation, according to the following procedure:

(a) New welds and other repaired parts shall be cleaned and finished using stainless steel wire brush, chisel, sandpaper or buff. Rough surfaces shall be given a smooth finish. A final polishing is necessary.

(b) Fatty and oily residues shall be removed by the use of appropriate organic solvents or detergent solutions in water. The use of chlorine-containing compounds shall be avoided as they can seriously interfere with passivation.

(c) The residues of the degreasing agent shall be removed, followed by a washing with water.

(d) In the next step, scale and rust shall be removed by the application of acid (e.g. a mixture of nitric and hydrofluoric acids), followed again by a washing with clean water.

(e) All the metal surfaces which can come into contact with hydrogen peroxide shall be passivated by the application of nitric acid of a concentration between 10 and 35% by mass. The nitric acid must be free from heavy metals, other oxidizing agents or hydrogen fluoride. The passivation process shall continue for 8 to 24 h, depending upon the concentration of acid, the ambient temperature and other factors. During this time a continuous contact between the surfaces to be passivated and the nitric acid shall be ensured. In the case of large surfaces this may be achieved by recirculating the acid. Hydrogen gas may be evolved in the passivation process, leading to the presence of an explosive atmosphere in the tanks. Therefore, appropriate measures must be taken to avoid the build-up or the ignition of such an atmosphere.

(f) After passivation the surfaces shall be thoroughly washed with clean filtered water. The washing process shall be repeated until the effluent water has the same pH value as the incoming water.

(g) Surfaces treated according to the above steps may cause some decomposition when coming into contact with hydrogen peroxide for the first time. This decomposition will cease after a short time (usually within two or three days). Therefore an additional flushing with hydrogen peroxide for a period of at least two days is recommended.

(h) Only degreasing agents and acid cleaning agents which have been recommended for this purpose by the manufacturer of the hydrogen peroxide shall be used in the process.

(10) Tanks and equipment made from aluminium and which have contained cargoes other than hydrogen peroxide, or which have been under repair, shall be cleaned and passivated. The following is an example of a recommended procedure:

(a) The tank shall be washed with a solution of a sulphonated detergent in hot water, followed by a washing with water.

(b) The surface shall then be treated for 15 to 20 min with a solution of sodium hydroxide of a concentration of 7% by mass or treated for a longer period with a less concentrated solution (e.g. for 12 h with 0.4 to 0.5% sodium hydroxide). To prevent excessive corrosion at the bottom of the tank when treating with more concentrated solutions of sodium hydroxide, water shall be added continuously to dilute the sodium hydroxide solution which collects there.

(c) The tank shall be thoroughly washed with clean, filtered water. As soon as possible after washing, the surface shall be passivated by the application of nitric acid of a concentration between 30 and 35% by mass. The passivation process shall continue for 16 to 24 h. During this time a continuous contact between the surfaces to be passivated and the nitric acid shall be ensured.

(d) After passivation the surfaces shall be thoroughly washed with clean, filtered water. The washing process shall be repeated until the effluent water has the same pH value as the incoming water.

(e) A visual inspection shall be made to ensure that all surfaces have been treated. It is recommended that an additional flushing is carried out for a minimum of 24 h with dilute hydrogen peroxide solution of a concentration approximately 3% by mass.

(11) The concentration and stability of the hydrogen peroxide solution to be loaded shall be determined.

(12) The hydrogen peroxide is loaded under intermittent visual supervision of the interior of the tank from an appropriate opening.

(13) If substantial bubbling is observed which does not disappear within 15 min after the completion of loading, the contents of the tank shall be unloaded and disposed of in an environmentally safe manner. The tank and equipment shall then be repassivated as described above.

(14) The concentration and stability of the hydrogen peroxide solution shall be determined again. If the same values are obtained within the limits of error as in paragraph (10), the tank is considered to be properly passivated and the cargo ready for shipment.

(15) Actions described in paragraphs (2) to (8) shall be carried out under the supervision of the master or shipper. Actions described in paragraphs (9) to (15) shall be carried out under the on-site supervision and responsibility of a representative of the hydrogen peroxide manufacturer or under supervision and responsibility of another person familiar with the safety-relevant properties of hydrogen peroxide.

(16) The following procedure shall be applied when tanks having contained hydrogen peroxide solution are to be used for other products (unless otherwise specified, all steps apply to the tanks and to all associated equipment having been in contact with hydrogen peroxide):

(a) Hydrogen peroxide cargo residue shall be drained as completely as possible from tanks and equipment.

(b) Tanks and equipment shall be rinsed with clean water, and subsequently thoroughly washed with clean water.

(c) The interior of the tank shall be dried and inspected for any residues. Steps (a) to (c) in (16), shall be carried out under the supervision of the master or the shipper. Step (c) in paragraph (16) shall be carried out by a person familiar with the safety-relevant properties of the chemical to be transported and of hydrogen peroxide.

SPECIAL CAUTIONS :

(1) Hydrogen peroxide decomposition may enrich the atmosphere with oxygen and appropriate precautions shall be observed.

(2) Hydrogen gas may be evolved in the passivation processes described in paragraphs (9)(e), (10)(b) and (10)(d), leading to the presence of an explosive atmosphere in the tank. Therefore, appropriate measures must be taken to avoid the build-up or the ignition of such an atmosphere.

1506. Motor fuel anti-knock compounds (containing lead alkyls) (IBC Code 15.6)

1. Tanks used for these cargoes should not be used for the transportation of any other cargo except those commodities to be used in the manufacturer of motor fuel anti-knock compounds containing lead alkyls.

2. If a cargo pump room is located on deck level according to **1518.,** the ventilation arrangements should be in compliance with **1517.**

3. Entry into cargo tanks used for the transportation of these cargoes is not permitted unless approved by the Society.

4. Air analysis should be made for lead content to determine if the atmosphere is satisfactory prior to allowing personnel to enter the cargo pump room or void spaces surrounding the cargo tank.

1507. Phosphorus, yellow or white (IBC Code 15.7)

1. Phosphorus should, at all times, be loaded, carried and discharged under a water pad of 760 mm minimum depth. During discharge operations, arrangements should be made to ensure that water occupies the volume of phosphorus discharged. Any water discharged from a phosphorus tank should be returned only to a shore installation.

2. Tanks should be designed and tested to a minimum equivalent water head of 2.4 m above the top of the tank, under designed loading conditions, taking into account the depth, relative density and method of loading and discharge of the phosphorus.

3. Tanks should be so designed as to minimize the interfacial area between the liquid phosphorus and its water pad.

4. A minimum ullage space of 1 % should be maintained above the water pad. The ullage space should be filled with inert gas or naturally ventilated by two cowled standpipes terminating at different heights but at least 6 m above the deck and at least 2 m above the pump house top.

5. All openings should be at the top of cargo tanks, and fittings and joints attached thereto should be of materials resistant to phosphorus pentoxide.

6. Phosphorus should be loaded at a temperature not exceeding 60°C.

7. Tank heating arrangements should be external to tank and have a suitable method of temperature control to ensure that the temperature of the phosphorus does not exceed 60°C. A high-temperature alarm should be fitted.

8. A water drench system acceptable to the Society should be installed in all void spaces surrounding the tanks. The system should operate automaticatly in the event of an escape of phosphorus.

9. Void spaces referred to in **Par 8** should be provided with effective means of mechanical ventilation which should be capable of being sealed off quickly in an emergency.

10. Loading and discharge of phosphorus should be governed by a central system on the ship which, in addition to incorporating high-level alarms, should ensure that no overflow of tanks is possible and that such operations can be stopped quickly in an emergency from either ship or shore.

11. During cargo transfer, a water hose on deck should be connected to a water supply and kept flowing throughout the operation so that any spillage of phosphorus may be washed down with water immediately.

12. Ship-to-shore loading and discharge connections should be of a type approved by the Society.

1508. Propylene oxide and mixtures of ethylene oxide/propylene oxide with an ethylene oxide content of not more than 30 % by weight (IBC Code 15.8)

1. Products transported under the provisions of this Article should be acetylene-free.

2. Unless cargo tanks are properly cleaned, these products should not be carried in tanks which have contained as one of the three previous cargoes any products known to catalyse polymerization, such as:

(1) mineral acids (e.g. sulphuric, hydrochloric, nitric);
(2) carboxylic acids and anhydrides (e.g. formic, acetic);
(3) halogenated carboxylic acids (e.g. chloracetic);
(4) sulphonic acids (e.g. benzene sulphonic);
(5) caustic alkalis (e.g. sodium hydroxide, potassium hydroxide);
(6) ammonia and ammonia solutions;
(7) amines and amine solutions;

(8) oxidizing substances.

3. Before loading, tanks should be thoroughly and effectively cleaned, to remove all traces of previous cargoes from tanks and associated pipework, except where the immediately prior cargo has been propylene oxide or ethylene oxide/propylene oxide mixtures. Particular care should be taken in the case of ammonia in tanks made of steel other than stainless steel.

4. In all cases, the effectiveness of cleaning procedures for tanks and associated pipework should be checked by suitable testing or inspection to ascertain that no traces of acidic or alkaline materials remain that might create a hazardous situation in the presence of these products.

5. Tanks should be entered and inspected prior to each initial loading of these products to ensure freedom from contamination, heavy rust deposits and visible structural defects. When cargo tanks are in continuous service for these products, such inspections should be performed at intervals of not more than 2 years.

6. Tanks for the carriage of these products should be of steel or stainless steel construction.

7. Tanks for the carriage of these products may be used for other cargoes after thorough cleaning of tanks and associated pipework systems by washing or purging.

8. All valves, flanges, fittings and accessory equipment should be of a type suitable for use with the products and should be constructed of steel or stainless steel in accordance with recognized standards. Discs or disc faces, seats and other wearing parts of valves should be made of stainless steel containing not less than 11 % chromium.

9. Gaskets should be constructed of materials which do not react with, dissolve in, or lower the autoignition temperature of these products and which are fire-resistant and possess adequate mechanical behaviour. The surface presented to the cargo should be polytetrafluoroethylene (PTFE), or materials giving a similar degree of safety by their inertness. Spirally wound stainless steel with a filler of PTFE or similar fluorinated polymer may be accepted.

10. Insulation and packing, if used, should be of a material which does not react with, dissolve in, or lower the autoignition temperature of these products.

11. The following materials and generally found unsatisfactory for gaskets, packing and similar uses in containment systems for these products and would require testing before being approved by the Society:

(1) Neoprene or nature rubber, if it comes into contact with the products.
(2) Asbestos, or binders used with asbestos.
(3) Materials containing oxides of magnesium, such as mineral wools.

12. Threaded joints should not be permitted in the cargo liquid and vapour lines.

13. Filling and discharge piping should extend to within 100 mm of the bottom of the tank or any sump pit.

14. The containment system for a tank containing these products should have a valved vapour return connection.

15. The products should be loaded and discharged in such a manner that venting of the tanks to atmosphere does not occur. If vapour return to shore is used during tank loading, the vapour return system connected to a containment system for the product should be independent of all other containment systems.

16. During discharge operations, the pressure in the cargo tank should be maintained above 0.007 MPa gauge.

17. Tanks carrying these products should be vented independently of tanks carrying other products. Facilities should be provided for sampling the tank contents without opening the tank to atmosphere.

18. The cargo should be discharged only by deepwell pumps, hydraulically operated submerged pumps, or inert gas displacement. Each cargo pump should be arranged to ensure that the product does not heat significantly if the discharge line from the pump is shut off or otherwise blocked.

19. Cargo hoses used for transfer of these products should be marked **"FOR ALKYLENE OXIDE TRANSFER ONLY"**.

20. Cargo tanks, void spaces and other enclosed spaces, adjacent to an integral gravity cargo tank carrying propylene oxide, should either contain a compatible cargo (those cargoes specified in **Par 2** are examples of substances considered incompatible) or be inerted by injection of a suitable inert gas. Any hold space in which an independent cargo tank is located should be inerted. Such inerted spaces and tanks should be monitored for these products and oxygen. Portable sampling equipment is satisfactory. The oxygen content of these spaces should be maintained below 2 %.

21. In no case should air be allowed to enter the cargo pump or piping system while these products are contained within the system.

22. Prior to disconnecting shore-lines, the pressure in liquid and vapour lines should be relieved through suitable valves installed at the loading header. Liquid and vapour from these lines should not be discharged to atmosphere.

23. Propylene oxide may be carried in pressure tanks or in independent or integral gravity tanks. Ethylene oxide/propylene oxide mixtures should be carried in independent gravity tanks or pressure tanks. Tanks should be designed for the maximum pressure expected to be encountered during loading, conveying and discharging cargo.

24. Tanks for the carriage of propylene oxide with a design pressure less than 0.06 MPa gauge and tanks for the carriage of ethylene oxide/propylene oxide mixtures with a design pressure less than 0.12 MPa gauge should have a cooling system to maintain the cargo below the reference temperature.

25. The refrigeration requirement for tanks with a design pressure less than 0.06 MPa gauge may be waived by the Society for ships operating in restricted areas or on voyages of restricted duration, and account may be taken in such cases of any insulation of the tanks. The area and times of year for which such carriage would be permitted should be included in the conditions of carriage on the International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk.

26. Any cooling system should maintain the liquid temperature below the boiling temperature at the containment pressure. At least two complete cooling plants automatically regulated by variations within the tanks should be provided. Each cooling plant should be complete with the necessary auxiliaries for proper operation. The control system should also be capable of being manually operated. An alarm should be provided to indicate malfunctioning of the temperature controls. The capacity of each cooling system should be sufficient to maintain the temperature of the liquid cargo below the reference temperature of the system.

27. An alternative arrangement may consist of three cooling plants, any two of which should be sufficient to maintain the liquid temperatures below the reference temperature.

28. Cooling media which are separated from the products by a single wall only should be nonreactive with the products.

29. Cooling systems requiring compression of the products should not be used.

30. Pressure relief valve settings should not be less than 0.02 MPa gauge and for pressure tanks not greater than 0.7 MPa gauge for the carriage of propylene oxide and not greater than 0.53 MPa gauge for the carriage of propylene oxide/ethylene oxide mixtures.

31. The piping system for tanks to be loaded with these products should be separated from piping systems for all other tanks, including empty tanks. If the piping system for the tanks to be loaded is not independent, the required piping separation should be accomplished by the removal of spool pieces, valves, or other pipe sections, and the installation of blank flanges at these locations. The required separation applies to all liquid and vapour piping, liquid and vapour vent lines and any other possible connections, such as common inert gas supply lines.

32. These products may be transported only in accordance with cargo handling plans that have been approved by the Society. Each intended loading arrangement should be shown on a separate cargo handling plan. Cargo handling plans should show the entire cargo piping system and the locations for installation of blank flanges needed to meet the above piping separation requirements. A copy of each approved cargo handling plan should be maintained on board the ship. The International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk should be endorsed to include reference to the approved cargo handling plans.

33. Before each initial loading of these products and before every subsequent return to such service, certification verifying that the required piping separation has been achieved should be obtained from a responsible person acceptable to the port Administration and carried on board the ship. Each connection between a blank flange and a pipeline flange should be fitted with a wire and seal by the responsible person to ensure that inadvertent removal of the blank flange is impossible.

34. (1) No cargo tanks should be more than 98 % liquid-full at the reference temperature.

(2) The maximum volume (V_L) of cargo to be loaded in a tank should be:

$$V_L = 0.98\,V\frac{\rho_R}{\rho_L}$$

where

V = volume of the tank

ρ_R = relative density of cargo at the reference temperature.

ρ_L = relative density of cargo at the loading temperature and pressure.

(3) The maximum allowable tank filling limits for each cargo tank should be indicated for each loading temperature which may be applied, and for the applicable maximum reference temperature, on a list to be approved by the Society. A copy of the list should be permanently kept on board by the master.

35. The cargo should be carried under a suitable protective padding of nitrogen gas. An automatic nitrogen make-up system should be installed to prevent the tank pressure falling below 0.07 MPa gauge in the event of product temperature fall due to ambient conditions or maloperation of refrigeration systems. Sufficient nitrogen should be available on board to satisfy the demand of the automatic pressure control. Nitrogen of commercially pure quality (99.9 % by volume) should be used for padding. A battery of nitrogen bottles connected to the cargo tanks through a pressure reduction valve satisfies the intention of the expression "automatic" in this context.

36. The cargo tank vapour space should be tested prior to and after loading to ensure that the oxygen content is 2 % by volume or less.

37. A water-spray system of sufficient capacity should be provided to blanket effectively the area surrounding the loading manifold, the exposed deck piping associated with product handling and the tank domes. The arrangement of piping and nozzles should be such as to give a uniform distribution rate of 10 l/min per square metre. Remote manual operation should be arranged such that remote starting of pumps supplying the water- spray system and remote operation of any normally closed valves in the system can be carried out from a suitable location outside the cargo area, adjacent to the accommodation spaces and readily accessible and operable in the event of fire in the areas protected. The water-spray system should be capable of both local and remote manual operation and the arrangement should ensure that any spilled cargo is washed away. Additionally, a water hose with pressure to the nozzle, when atmospheric temperatures permit, should be connected ready for immediate use during loading and unloading operations.

38. A remotely operated, controlled closing-rate, shutoff valve should be provided at each cargo hose connection used during cargo transfer.

1509. Sodium chlorate solution, 50 % or less (IBC Code 15.9)

1. Tanks and associated equipment which have contained this product may be used for other cargoes after thorough cleaning by washing or purging.

2. In the event of spillage of this product, all spilled liquid should be thoroughly washed away without delay. To minimize fire risk, spillage should not be allowed to dry out.

1510. Sulphur, Molten (IBC Code 15.10)

1. Cargo tank ventilation should be provided to maintain the concentration of hydrogen sulphide below one half of its lower explosive limit throughout the cargo tank vapour space for all conditions of carriage, i.e. below 1.85 % by volume.

2. Where mechanical ventilation systems are used for maintaining low gas concentrations in cargo tanks, an alarm system should be provided to give warning if the system fails.

3. Ventilation systems should be so designed and arranged as to preclude depositing of sulphur within the system.

4. Openings to void spaces adjacent to cargo tanks should be so designed and fitted as to prevent the entry of water, sulphur or cargo vapour.

5. Connections should be provided to permit sampling and analysing of vapour in void spaces.

6. Cargo temperature controls should be provided to ensure that the temperature of the sulphur does not exceed 155°C.

7. Sulphur (molten) has a flashpoint above 60°C : however, electrical equipment shall be certificated safe for gases evolved.

1511. Acids (IBC Code 15.11)

1. The ship's shell plating should not form any boundaries of tanks containing mineral acids.

2. Proposals for lining steel tanks and related piping systems with corrosion-resistant materials may be considered by the Society. The elasticity of the lining should not be less than that of the supporting boundary plating.

3. Unless constructed wholly of corrosion-resistant materials or fitted with an approved lining, the plating thickness should take into account the corrosivity of the cargo.

4. Flanges of the loading and discharge manifold connections should be provided with shields, which may be portable, to guard against the danger of the cargo being sprayed; and in addition, drip trays should also be provided to guard against leakage on to the deck.

5. Because of the danger of evolution of hydrogen when these substances are being carried, the electrical arrangements should comply with **1001.4.** The certified safe type equipment should be suitable for use in hydrogen-air mixtures. Other sources of ignition should not be permitted in such spaces.

6. Substances subjected to the requirements of this Article should be segregated from oil fuel tanks, in addition to the segregation requirements in **301. 1.**

7. Provision should be made for suitable apparatus to detect leakage of cargo into adjacent spaces.

8. The cargo pump room bilge pumping and drainage arrangements should be of corrosion-resistant materials.

1512. Toxic products (IBC Code 15.12)

1. Exhaust openings of tank vent systems should be located:

(1) at a height of $B/3$ or 6 m, whichever is greater, above the weather deck or, in the case of a deck tank, the access gangway;
(2) not less than 6 m above the fore-and-aft gangway, if fitted within 6 m of the gangway; and
(3) 15 m from any opening or air intake to any accommodation and service spaces;
(4) the vent height may be reduced to 3 m above the deck or fore-and-aft gangway, as applicable, provided high-velocity vent valves of a type approved by the Society, directing the vapour-air mixture upwards in an unimpeded jet with an exit velocity of at least 30 m/s, are fitted.

2. Tank venting systems should be provided with a connection for a vapour return line to the shore installation.

3. Products should:

(1) not be stowed adjacent to oil fuel tanks;
(2) have separate piping systems; and
(3) have tank vent systems separate from tanks containing nontoxic products. (see also **307. 2**)

4. Cargo tank relief valve settings should be a minimum of 0.02 MPa gauge.

1513. Cargoes protected by additives (IBC Code 15.13)

1. Certain cargoes with a reference in column "o" in the table of **Sec 17** by the nature of their chemical make-up, tend, under certain conditions of temperature, exposure to air or contact with a catalyst, to undergo polymerization, decomposition, oxidation or other chemical changes. Mitigation of this tendency is carried out by introducing small amounts of chemical additives into the liquid cargo or by controlling the cargo tank environment.

2. Ships carrying these cargoes should be so designed as to eliminate from the cargo tanks and cargo handling system any material of construction or contaminants which could act as a catalyst or destroy the inhibitor.

3. Care should be taken to ensure that these cargoes are sufficiently protected to prevent deleterious chemical change at all times during the voyage. Ships carrying such cargoes should be provided with a certificate of protection from the manufacturer and kept during the voyage specifying:

(1) the name and amount of additive present;
(2) whether the additive is oxygen dependent;
(3) date additive was put in the product and duration of effectiveness;
(4) any temperature limitations qualifying the additives" effective lifetime; and
(5) the action to be taken should the length of voyage exceed the effective lifetime of the additives.

4. Ships using the exclusion of air as the method of preventing oxidation of the cargo should comply with **901. 3.**

5. A product containing an oxygen dependent additive should be carried without inertion (in tanks of a size not greater than 3,000 m^3). Such cargoes should not be carried in a tank requiring inertion under the requirements of **SOLAS** chapter II-2.

6. Venting systems should be of a design that eliminates blockage from polymer build-up. Venting equipment should be of a type that can be checked periodically for adequacy of operation.

7. Crystallization or solidification of cargoes normally carried in the molten state can lead to depletion of inhibitor in parts of the tank contents. Subsequent remelting can thus yield pockets of uninhibited, liquid with the accompanying risk of dangerous polymerization. To prevent this, care should be taken to ensure that at no time are such cargoes allowed to crystallize or solidify, either wholly or partially, in any part of the tank. Any required heating arrangements should be such as to ensure that in no part of the tank does cargo become overheated to such an extent that any dangerous polymerization can be initiated. If the temperature from steam coils would induce overheating, an indirect low-temperature heating system should be used.

1514. Cargoes with a vapour pressure greater than 0.1013 MPa absolute at 37.8°C (IBC Code 15.14)

1. For a cargo referenced in column "o" in the table of **Sec 17** to this Article, a mechanical refrigeration system should be provided unless the cargo system is designed to withstand the vapour pressure of the cargo at 45°C. Where the cargo system is designed to withstand the vapour pressure of the cargo at 45°C, and no refrigeration system is provided, a notation should be made in the conditions of carriage on the International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk to indicate the required relief valve setting for the tanks.

2. A mechanical refrigeration system should maintain the liquid temperature below the boiling temperature at the cargo tank design pressure.

3. When ships operate in restricted areas and at restricted times of the year, or on voyages of limited duration, the Society involved may agree to waive requirements for a refrigeration system. A notation of any such agreement, listing geographic area restrictions and times of the year, or voyage duration limitations, should be included in the conditions of carriage on the International Certificate for the Carriage of Dangerous Chemicals in Bulk.

4. Connections should be provided for returning expelled gases to shore during loading.

5. Each tank should be provided with a pressure gauge which indicates the pressure in the vapour space above the cargo.

6. Where the cargo needs to be cooled, thermometers should be provided at the top and bottom of each tank.

7. (1) No cargo tanks should be more than 98 % liquid-full at the reference temperature (R).

(2) The maximum volume (V_L) of cargo to be loaded in a tank should be:

$$V_L = 0.98\,V\frac{\rho_R}{\rho_L}$$

where

V = volume of the tank

ρ_R = relative density of cargo at the reference temperature (R)

ρ_L = relative density of cargo at the loading temperature

R = reference temperature corresponding to the vapour pressure of the cargo at the set pressure of the pressure relief valve.

(3) The maximum allowable tank filling limits for each cargo tank should be indicated for each loading temperature which may be applied, and for the applicable maximum reference temperature, on a list approved by the Society. A copy of the list should be permanently kept on board by the master.

1515. Cargoes with low ignition temperature and wide flammability range (IBC Code 15.15)

Deleted.

1516. Cargo contamination (IBC Code 15.16)

1. Where column "o" in the table of **Sec 17** refers to this Article, water should not be allowed to contaminate this cargo. In addition, the following provisions apply:

(1) Air inlets to pressure/vacuum relief valves of tanks containing the cargo should be situated at least 2 m above the weather deck.

(2) Water or steam should not be used as the heat transfer media in a cargo temperature control system required by **Sec 7.**

(3) The cargo should not be carried in cargo tanks adjacent to permanent ballast or water tanks unless the tanks are empty and dry.

(4) The cargo should not be carried in tanks adjacent to slop tanks or cargo tanks containing ballast or slops or other cargoes containing water which may react in a dangerous manner. Pumps, pipes or vent lines serving such tanks should beseparate from similar equipment serving tanks containing the cargo. Pipelines from slop tanks or ballast lines should not pass through tanks containing the cargo unless encased in a tunnel.

1517. Increased ventilation requirements (IBC Code 15.17)

For certain products, the ventilation system as described in **1201.3** should have a minimum capacity of at least 45 changes of air per hour based upon the total volume of space. The ventilation system exhaust ducts should discharge at least 10 m away from openings into accommodation spaces, work areas or other similar spaces, and intakes to ventilation systems, and at least 4 *m* above the tank deck.

1518. Special cargo pump room requirements (IBC Code 15.18)

For certain products, the cargo pump room should be located on the deck level or cargo pumps should be located in the cargo tank. The Society may give special consideration to cargo pump rooms below deck.

1519. Overflow control (IBC Code 15.19)

1. The provisions of this Article are applicable where specific reference is made in column "o" in the table of **Sec 17,** and are in addition to the requirements for gauging devices.

2. In the event of a power failure on any system essential for safe loading, an alarm should be given to the operators concerned.

3. Loading operations should be terminated at once in the event of any system essential for safe loading becoming inoperative.

4. Level alarms should be capable of being tested prior to loading.

5. The high-level alarm system required under **Par 6** should be independent of the overflow control system required by **Par 7** and should be independent of the equipment required by **1301.**

6. Cargo tanks should be fitted with a visual and audible high-level alarm which complies with **Pars 1** to **5** and which indicates when the liquid level in the cargo tank approaches the normal full condition.

7. A tank overflow control system required by this Article should:

(1) come into operation when the normal tank loading procedures fail to stop the tank liquid level exceeding the normal full condition;
(2) give a visual and audible tank overflow alarm to the ship's operator; and
(3) provide an agreed signal for sequential shutdown of onshore pumps or valves or both and of the ship's valves. The signal, as well as the pump and valve shutdown, may be dependent on operator's intervention. The use of shipboard automatic closing valves should be permitted only when specific approval has been obtained from the Society and the port Administrations concerned.

8. The loading rate (LR) of the tank should not exceed:

$$LR = \frac{3{,}600\,U}{t} \quad (\mathrm{m^3/h})$$

where

U = ullage volume ($\mathrm{m^3}$) at operating signal level;

t = time (s) needed from the initiating signal to fully stopping the cargo flow into the tank, being the sum of times needed for each step in sequential operations such as operator's responses to signals, stopping pumps and closing valves; and should also take into account the pipeline system design pressure.

1520. Alkyl(C_7–C_9) nitrates, all isomers (IBC Code 15.20)

1. The carriage temperature of the cargo should be maintained below 100°C to prevent the occurrence of a self-sustaining, exothermic decomposition reaction.

2. The cargo may not be carried in independent pressure vessels permanently affixed to the vessel's deck unless:

(1) the tanks are sufficiently insulated from fire; and

(2) the vessel has a water deluge system for the tanks such that the cargo temperature is maintained below 100°C and the temperature rise in the tanks does not exceed 1.5°C/hour for a fire of 650°C (1200°F).

1521. Temperature sensors (IBC Code 15.21)

Temperature sensors should be used to monitor the cargo pump temperature to detect overheating due to pump failures.

Section 16 Operational Requirements

1601. Maximum allowable quantity of cargo per tank (IBC Code 16.1)

1. The quantity of a cargo required to be carried in a type 1 ship should not exceed 1,250 m^3 in any one tank.

2. The quantity of a cargo required to be carried in a type 2 ship should not exceed 3,000 m^3 in any one tank.

3. Tanks carrying liquids at ambient temperatures should be so loaded as to avoid the tank becoming liquid-full during the voyage, having due regard to the highest temperature which the cargo may reach.

1602. Cargo information (IBC Code 16.2)

1. A copy of this Chapter, or national regulations incorporating the provisions of this Chapter, should be on board every ship covered by this Chapter.

2. Any cargo offered for bulk shipment shall be indicated in the shipping documents by the product name, under which it is listed in Sec 17 or 18 or the latest edition of MEPC.2/Circ. or under which it has been provisionally assessed. Where the cargo is a mixture, an analysis indicating the dangerous components contributing significantly to the total hazard of the product shall be provided, or a complete analysis if this is available. Such an analysis shall be certified by the manufacturer or by an independent expert acceptable to the Society.

3. Information should be on board, and available to all concerned, giving the necessary data for the safe carriage of the cargo. Such information should include a cargo stowage plan to be kept in an accessible place, indicating all cargo on board, including each dangerous chemical carried:

(1) a full description of the physical and chemical properties, including reactivity necessary for the safe containment of the cargo;
(2) action to be taken in the event of spills or leaks;
(3) countermeasures against accidental personal contact;
(4) fire-fighting procedures and fire-fighting media;
(5) procedures for cargo transfer, tank cleaning, gas-freeing and ballasting;
(6) for those cargoes required to be stabilized or inhibited in accordance with **1501., 1505. 1** (11) or **1513. 3,** the cargo should be refused if the certificate required by these paragraphs is not supplied.

4. If sufficient information necessary for the safe transportation of the cargo is not available, the cargo should be refused.

5. Cargoes which evolve highly toxic imperceptible vapours should not be transported unless perceptible additives are introduced into the cargo.

6. Where column "o" in the table of **Sec 17** refers to this paragraph, the cargo's viscosity at 20°C shall be specified on a shipping document and if the cargo's viscosity exceeds 50mPa·s at 20°C, the temperature at which the cargo has a viscosity of 50mPa·s shall be specified in the shipping document.

7. Where column "o" in the table of **Sec 17** refers to this paragraph, the cargo's melting point shall be indicated in the shipping document.

1603. Personnel training (IBC Code 16.3)

1. All personnel should be adequately trained in the use of protective equipment and have basic training in the procedures appropriate to their duties, necessary under emergency conditions.

2. Personnel involved in cargo operations should be adequately trained in handling procedures.

3. Officers shall be trained in emergency procedures to deal with conditions of leakage, spillage or fire involving the cargo, based on the guidelines developed by IMO, and a sufficient number of them shall be instructed and trained in essential first aid for cargoes carried, based on the guidelines developed by the IMO. Refer to the Medical First Aid Guide for use in Accident involving Dangerous Goods (MFAG), which provides advice on the treatment of casualties in accordance with the symptoms exhibited as well as equipment and antidotes that may be appropriate for treating the casulity and to the relevant provisions of the STCW Code, part A and B.

1604. Opening of and entry into cargo tanks (IBC Code 16.4)

1. During handling and carriage of cargoes producing flammable or toxic vapours, or both, or when ballasting after the discharge of such cargo, or when loading or unloading cargo, cargo tank lids should always be kept closed. With any hazardous cargo, cargo tank lids, ullage and sighting ports and tank washing access covers should be open only when necessary.

2. Personnel should not enter cargo tanks, void spaces around such tanks, cargo handling spaces or other enclosed spaces unless:

(1) the compartment is free of toxic vapours and not deficient in oxygen; or
(2) personnel wear breathing apparatus and other necessary protective equipment, and the entire operation is under the close supervision of a responsible officer.

3. Personnel should not enter such spaces when the only hazard is of a purely flammable nature, except under the close supervision of a responsible officer.

1605. Stowage of cargo samples (IBC Code 16.5)

1. Samples which have to be kept on board should be stowed in a designated space situated in the cargo area or, exceptionally, elsewhere, subject to the approval of the Society.

2. The stowage space should be:

(1) cell-divided in order to avoid shifting of the bottles at sea;
(2) made of material fully resistant to the different liquids intended to be stowed; and
(3) equipped with adequate ventilation arrangements.

3. Samples which react with each other dangerously should not be stowed close to each other.

4. Samples should not be retained on board longer than necessary.

1606. Cargoes not to be exposed to excessive heat (IBC Code 16.6)

1. Where the possibility exists of a dangerous reaction of a cargo such as polymerization, decomposition, thermal instability or evolution of gas, resulting from local overheating of the cargo in either the tank or associated pipelines, such cargo should be loaded and carried adequately segregated from other products whose temperature is sufficiently high to initiate a reaction of such cargo (see **701. 5**(4)).

2. Heating coils in tanks carrying this product should be blanked off or secured by equivalent means.

3. Heat-sensitive products should not be carried in deck tanks which are not insulated.

4. In order to avoid elevated temperatures, this cargo should not be carried in deck tanks.

Section 17 Summary of Minimum Requirements

1. The list of the products applied to this Section shall refer to the summary of minimum requirements in chapter 17 of the IBC Code, as amended, which shall be in accordance with the guidances specified separatedly.
2. Mixtures of noxious liquid substances presenting pollution hazards only and which are provisionally assessed under regulation 6.3 of MARPOL Annex II, may be carried under the requirements of this Chapter applicable to the appropriate position of the entry in this Section for noxious liquids, not otherwise specified (n.o.s).

Section 18 List of Chemicals to which this Chapter does not apply

1. This Section applies to products, which have been reviewed for their safety and pollution hazards and determined not to present hazards to such an extent as to warrant application of the Code.

2. Although the products listed in this Section fall outside the scope of this Chapter, the attention of the Society is drawn to the fact that some safety precautions may be needed for their safe transportation. Accordingly, the Society should prescribe appropriate safety requirements.

3. Some liquid substances are identified as falling into pollution category Z and, therefore, subject to certain operational requirements of Annex II of MARPOL 73/78.

4. Liquid mixtures which are assessed or provisionally under regulation 6.3 of MARPOL Annex II as falling into pollution category Z or OS, and which do not present safety hazards, may be carried under the appropriate entry in this Section for "Noxious or Non-Noxious liquid Substances, not otherwise specified (n.o.s)".

5. The list of the products applied to this Section shall refer to the products in chapter 18 of the IBC Code as amended. The explanatory notes of the products are of the following.

(1) Product name : The product names shall be used in the shipping document for any cargo offered for bulk shipments. Any additional name may be included in brackets after the product name. In some cases, the product name are not identical with the names given in previous issues of the Code.

(2) Pollution category : The letter Z means the pollution category assigned to each product under Annex II of MARPOL 73/78. OS means the product was evaluated and found to fall outside the categories X, Y, or Z.

6. The list of products shall be in accordance with the guidances specified separatedly.

Section 19 Index of Products Carried in Bulk

The index of products shall be in accordance with the guidances specified separately.

Section 20 Transport of Liquid Chemical Wastes

2001. General (IBC Code 20.1)

1. Maritime transport of liquid chemical wastes could present a threat to human health and to the environment.

2. Liquid chemical wastes should, therefore, be transported in accordance with relevant international conventions and recommendations and, in particular, where it concerns maritime transport in bulk, with the requirements of this Chapter.

2002. Definitions (IBC Code 20.2)

For the purpose of this Section:

(1) "**Liquid chemical wastes**" are substances, solutions or mixtures, offered for shipment, containing or contaminated with one or more constituents which are subject to the requirements of this Chapter and for which no direct use is envisaged but which are carried for dumping, incineration or other methods of disposal other than at sea.

(2) "**Transboundary movement**" means maritime transport of wastes from an area under the national jurisdiction of one country to or through an area under the national jurisdiction of another country, or to or through an area not under the national jurisdiction of any country, provided at least two countries are concerned by the movement.

2003. Applicability (IBC Code 20.3)

1. The requirements of this Section are applicable to the transboundary movement of liquid chemical wastes in bulk by seagoing ships and should be considered in conjunction with all other requirements of this Chapter.

2. The requirements of this Section do not apply to:

(1) wastes derived from shipboard operations which are covered by the requirements of MARPOL 73/78;

(2) substances, solutions or mixtures containing or contaminated with radioactive materials which are subject to the applicable requirements for radioactive materials.

2004. Permitted shipments (IBC Code 20.4)

Transboundary movement of wastes is permitted to commence only when:

(1) notification has been sent by the competent authority of the country of origin, or by the generator or exporter through the channel of the competent authority of the country of origin, to the country of final destination; and

(2) the competent authority of the country of origin, having received the written consent of the country of final destination stating that the wastes will be safely incinerated or treated by other methods of disposal, has given authorization to the movement.

2005. Documentation (IBC Code 20.5)

In addition to the documentation specified in **1602.**, ships engaged in transboundary movement of liquid chemical wastes transported in bulk should carry on board a waste movement document issued by the competent authority of the country of origin.

2006. Classification of liquid chemical wastes (IBC Code 20.6)

For the purpose of the protection of the marine environment all liquid chemical wastes transported in bulk should be treated as Category A noxious liquid substances, irrespective of the actual evaluated category.

2007. Carriage and handling of liquid chemical wastes (IBC Code 20.7)

Liquid chemical wastes are to be carried in ships and cargo tanks in accordance with the minimum requirements for liquid chemical wastes specified in **Sec 17**, unless there are clear grounds indicating that the hazards of the wastes would warrant:

(1) carriage in accordance with the ship type 1 requirements; or

(2) any additional requirements of this Chapter applicable to the substance or, in case of a mixture, its constituent presenting the predominant hazard.

Section 21 Criteria for assigning carriage requirements for products subject to the IBC Code

This Criteria is to be in accordance with the guidances specified separately.⫝

KOREAN REGISTER

2011

Guidance Relating to the Rules for the Classification of Steel Ships

---

Part 7
Ships of Special Service

GA-07B-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance relating to the Rules for Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF PART 7 "SHIPS OF SPECIAL SERVICE(CH 5, 6)"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date 1 July 2011

CHAPTER 5 SHIPS CARRYING LIQUEFIED GASES IN BULK

Section 15 Filling Limits for Cargo Tanks

- 1501. 1 has been amended.

CHAPTER 6 SHIPS CARRYING DANGEROUS CHEMICALS IN BULK

Section 11 Fire Protection and Fire Extinction

- 1101. has been deleted.

Section 14 Personnel Protection

- 1402. 2 (5) has been newly added.

CONTENTS

CHAPTER 5 SHIPS CARRYING LIQUEFIED GASES IN BULK

Section 1 General

101. Application

In application to 101. of the Rules, requirements for ships not having the international certificate of fitness for the carriage of liquefied gases in bulk shall be complied with Annex 7A-1 of this guidance.

106. Definitions

1. Cargo area

Cargo area extended by the requirements in **303. 1** (2) of the Rules is, for example, as shown in **Fig 7.5.1** of the Guidance.

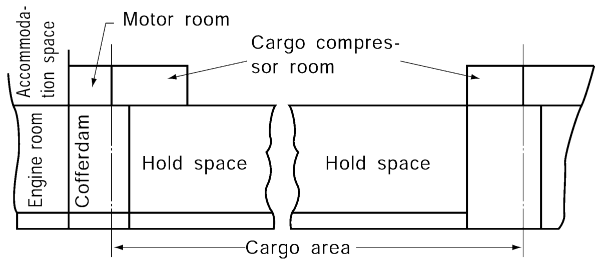

Fig. 7.5.1

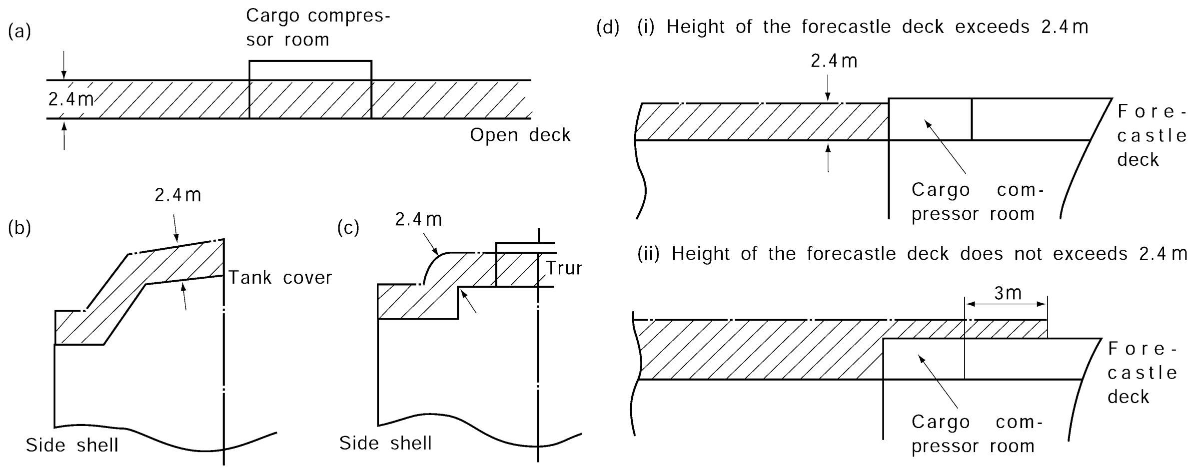
2. Gas-dangerous space

(1) The "approved manner to ensure that its atmosphere is at all times maintained in a gas-safe condition" referred to in **106. 17** (1) of the Rules means to ensure that there are no openings which are directly led to the compartments specified in **106. 17** (2) through (12) of the Rules, or to protect by air locks specified in **306.** of the Rules.

(2) The "3 m of any cargo tank outlet, gas or vapour outlet, cargo pipe flange or cargo valve or of entrances and ventilation openings to cargo pump rooms and cargo compressor rooms" referred to in **106. 17** (7) of the Rules is to be measured as a sphere above outlets and openings, and as a cylinder below.

(3) The "area on the open deck up to a height of 2.4 m above the weather deck" referred to in **106. 17** (8) of the Rules is, for example, as shown in (a) through (d) of **Fig 7.5.2** of the Guidance.

(4) The "direct opening into" referred to in **106. 17** (12) of the Rules includes those openings such as hatches normally used for access which are closed by doors, covers, etc. Bolted plates for removal of machinery need not be regarded as direct openings where another means for access are provided.



Note:
A space in the cargo compressor room is to consider the gas-dangerous space in accordance with the requirements in **106. 17**(6) of the Rules.

Fig 7.5.2

3. Hold space

"Hold spaces" in the requirements in **106. 19** of the Rules includes the peripheral compartments of cargo tanks in the case of integral tanks. (See **Fig 7.5.3** of the Guidance)

4. Independent

The "provisions available for the potential connection to other systems" referred to in **106. 20** of the Rules include the blank flanges.

5. Interbarrier space

"Inter-barrier space" referred to in **106. 22** of the Rules means the peripheral compartments of the cargo tanks in the case of integral tanks. (See **Fig 7.5.3** of the Guidance)

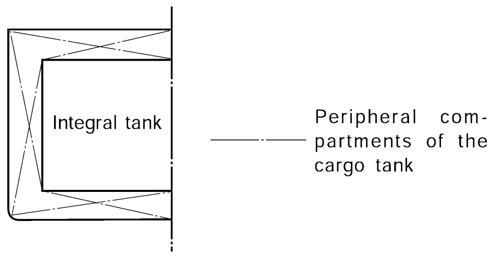


Fig 7.5.3

Section 2 Ship Survival Capability and Location of Cargo Tanks

202. Freeboard and intact stability

1. Solid ballast

In applying the requirements in **202. 4** of the Rules, the solid ballast is to comply with the following requirements.

(1) In case where solid ballast is arranged under unavoidable reasons to ensure stability of the ship, the distance between such solid ballast and the cargo tank is to be not less than 760 mm at any point.

(2) The solid ballast is to be of concrete blocks and similar materials which can be fitted securely to the hull structure of the ship. No solid ballast consisting of scrap iron in bulk, etc. is accepted.

2. Stability information

The items relating to the survival capability of the ship to be entered in the stability information specified in **202. 5** of the Rules are to include, at least, the following (1) through (5) :

(1) Data relating to loading and distribution of cargo and ballast necessary to ensure compliance with damage survival requirements.

(2) Data relating to the ship's survival capabilities.

(3) Plan showing the damage control procedures (describing the locations of fittings necessary for the damage control such as closing appliances and valves, and list of instructions for their controls)

(4) Data relating to the effects of free surface or liquid heeling moments of cargo tanks at all stages of filling.

(5) Example calculations and standard blank forms to facilitate calculations (which are useful for verifying compliance with the survival requirements in an intact condition of the ship).

203. Shipside discharges below the freeboard deck

1. In applying the requirements in **203. 1** of the Rules, the following requirements (1) to (3) are to be complied with :

(1) The scupper pipes within the superstructure are to be in accordance with the requirements in **Pt 5, Ch 6, 302. 1** of the Guidance.

(2) The inboard side open ends of scupper pipes are to be in accordance with the requirements in **Pt 5, Ch 6, 302. 2** (1) (A) of the Guidance.

(3) The direct overboard discharge pipes of top side tanks are to be in accordance with the requirements in **Pt 5, Ch 6, 302. 2** (1) (B) of the Guidance.

2. The requirements of **203. 1** of the Rules don't apply to the overboard discharge pipes from the superstructure and deckhouse located on or above the second deck on freeboard deck.

204. Conditions of loading

To ensure the compliance with the survival requirements in **209.** of the Rules for "all anticipated conditions of loading and variations in draught and trim" specified in **204.** of the Rules at least one or combination of the following (1) to (3) are to be taken for the draught up to the summer water load line :

(1) Carry out damage stability calculations for all anticipated conditions of loading.

(2) Provide manual or calculating machine capable of carrying out the required damage stability calculations. When calculating machine is provided, suitable means of redundancy is to be provided for possible failure of the machine.

(3) Provide diagrams permitting to verify compliance with the survival requirements on the basis of the data in intact condition of the ship(e.g. KG values).

205. Damage assumptions

1. Other damages

For the purpose of the requirements in **205. 2** (2) of the Rules, the transverse bulkheads assumed to remain intact in the requirements in **208. 1** (4) to (6) of the Rules may also be assumed that they remain free from local damages.

206. Location of cargo tanks

1. For the purpose of the requirements in **206. 1** of the Rules, cargo tanks are to be arranged where distances to the primary barrier are to be satisfied with the Rule requirements in case the distances between cargo tanks are fixed.

2. For the purpose of the requirements in **206. 3** of the Rules, the suction wells are not to be installed less than 760 mm from the shell plating.

207. Flooding assumptions

1. General

(1) Conditions that are anticipated to cause more severe results are to be selected of all anticipated conditions of loading, and consideration is to be given to the following (A) through (H) in making calculation according to **207. 1** of the Rules.
   (A) Tanks in way of the assumed damage filled with liquid at increments of about 25 % between empty and the maximum weight of liquid, or liquids, intended to be carried in the particular tanks under consideration.
   (B) The distribution of liquids in the adjacent tanks concerned which will give the most severe result, taking trim into account.
   (C) A number of draughts over the operating range, up to and including the tropical freeboard mark. The fresh water free boards need not be considered.
   (D) The effect of damage involving the machinery space and adjacent tanks containing liquids over a number of draughts as in (C) above.
   (E) The ship in either the departure or the arrival condition, whichever will give the most severe result.
   (F) The ship without trim and a sufficient number of trims covering the operating range, in order to permit interpolation.
   (G) Where the assumed damage causes the ship to trim by the stern, condition having the largest allowable trim by the stern, consistent with operational requirements.
   (H) Where the assumed damage causes the ship to trim by the bow, condition having the largest allowable trim by the bow, consistent with operational requirements.

(2) The free surface effects of intact cargo tanks in the damage stability calculation are to be computed for the actual angle of heel caused by assumed damage and for each angle of heel within the stability limit.

(3) In calculating the effect of free surface of consumable liquids, it is to be assumed that, for each type of liquid, at least one transverse pair or a single centre line tank has maximum free surface, and the tank or combination of tanks to be taken into account are to be those where the effect of free surfaces is the greatest ; in each tank the centre of gravity of the contents is to be taken at the centre of volume of the tank. The remaining tanks are to be assumed either completely empty or completely filled, and the distribution of consumable liquids among these tanks is to be such as to obtain the greatest possible height above the keel for the centre of gravity.

(4) In calculating free surface effects given in the preceding (3), the requirements are to be complied with preceding (2).

2. Permeability

For the purpose of the requirements in **207. 2** of the Rules, the Society may approve a lesser permeability in consideration of volume of the insulations etc. provided within the compartment.

3. Damage of transverse bulkhead

In applying the requirements for damage of transverse bulkhead specified in **207. 4** of the Rules, the extent of damage when the transverse bulkhead is stepped or recessed, are for example, as shown in **Fig 7.5.4** of the Guidance.

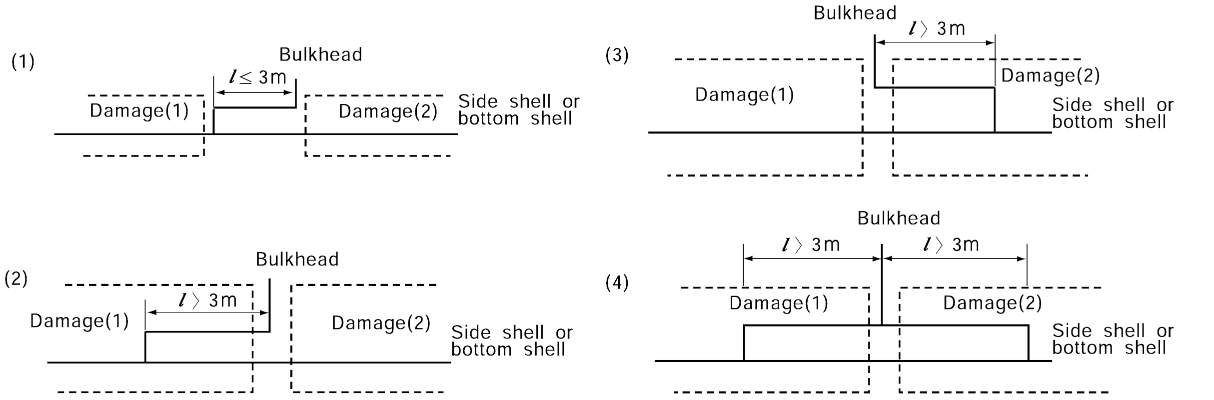

Fig 7.5.4

4. Equalization arrangements

(1) The equalization arrangements specified in **207. 6** of the Rules are to be made operable from a readily accessible place in the damaged condition before using the equalization arrangement.

(2) The righting arm curve of the ship without using the equalization arrangement referred to in the preceding (1) is to be determined in accordance with the requirements in **207. 3** of the Rules, but calculation in this case is to be made assuming that the cross-levelling pipe is closed or this equalization arrangement is not effectively functioning.

(3) The cross sectional area of the cross-levelling pipe used for the equalization arrangement referred to in the preceding (1) is to satisfy the value obtained from the following equation :

$$A \geq 7.5 \frac{V}{\sqrt{H}} \quad (\mathrm{cm}^2)$$

where:

A : cross sectional area of cross-levelling pipe (cm^2)

V : estimated flooding volume in flooded compartment (cm^3)

H : height from the draught line before flooding to the centre line of pipe (m)

(4) "ducts of large cross-sectional area" referred to in **207. 6** of the Rules are to satisfy both of the following equations :

$$A \geq 150 \frac{V}{\sqrt{H}} \quad (\mathrm{cm}^2), \qquad A \geq 2Sh \quad (\mathrm{cm}^2)$$

where:

V : value obtained by the preceding (3)

H : height obtained by the preceding (3) to the centre of duct

S : frame distance (cm). However, in case of longitudinal framing system, S may be obtained from the following equation but not to be less than 61 cm :

$$S = 45 + 0.2 L_f \quad (\mathrm{cm})$$

h : B/15 (cm)

5. Progressive flooding

The "arrangements should be such that progressive flooding cannot thereby extend" referred to in the requirements in **207. 7** of the Rules may be such as a stop valve operable from the exposed deck and accommodation space, etc. provided outside the extent of damage. In this case, any part of operating systems is to effectively function for assumed damage.

6. Buoyancy of superstructure

(1) For the purpose of **207. 8** of the Rules, the longitudinal extent of damage to superstructures above a machinery space located aft is to be the same as the longitudinal extent of the side damage to the machinery space specified **208. 1** of the Rules. (See **Fig 7.5.5** of the Guidance)

(2) The sliding watertight doors specified in **207. 8** (2) of the Rules are to be remotely operable from a readily accessible place in case of damage. Further, the openings of weathertight accepted within the minimum range of residual stability are to be capable of being securely closed at final equilibrium.

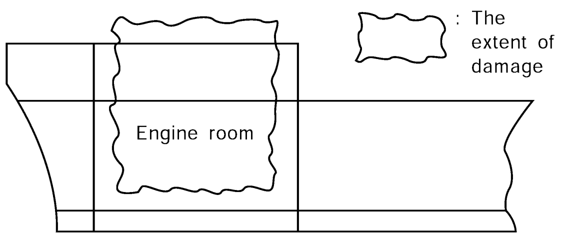

Fig. 7.5.5

208. Standard of damage

1. General

(1) For the purpose of the standard of damage specified in **208. 1** of the Rules, damage assumed to have sustained within 0.3 L_f or there about from the stern are to be in accordance with the following requirements (A) and (B) :

(A) For bottom damage for 0.3 L_f from the forward perpendicular and above (according to **205. 1** (2) of the Rules), such damage may not be considered beyond the point of 0.3 L_f from the forward perpendicular.

(B) For cases of bottom damage which is applied to damage sustained in areas after the point of 0.3 L_f from the forward perpendicular (according to **205. 1** (2) of the Rules), such damage is to be considered up to the point corresponding to 0.3 L_f - 5.0 m from the forward perpendicular.

(2) For a type 3G ship less than 125 m in length(L_f) specified in **208. 1** (6) of the Rules, the ability to survive the flooding of machinery space is to be in accordance with the following (A) and (B):

(A) The ability to survive the flooding of machinery space is to be in accordance with the requirements **209. 1** (1) and (2) of the Rules.

(B) Where L_f is 70 m or more and less than 125 m, the areas under the curve at least within 20° range beyond the position of equilibrium are to be 0.0175 m · rad or more at final equilibrium after flooding.

(C) Where L_f is less than 70 m, the areas under curve are to be 0.0088 m · rad or more.

(3) In case the bulkhead in machinery space is watertight structure at the flooding of machinery space referred to in the preceding (2), around machinery space areas of superstructures located aft may be considered the spare buoyancy. In this case the doors located at bulkhead of machinery space are to be sliding watertight doors remotely operated from superstructure deck.

2. Standard of damage for small ships

Small ships specified in **208. 2** of the Rules are ships less than 70 m of L_f. Special dispensations except type 1G ships may be in accordance with the following (1) through (4) :

(1) The extent of damage and the standard of damage are to be complied with the requirements **205.** and **208. 1** of the Rules respectively.

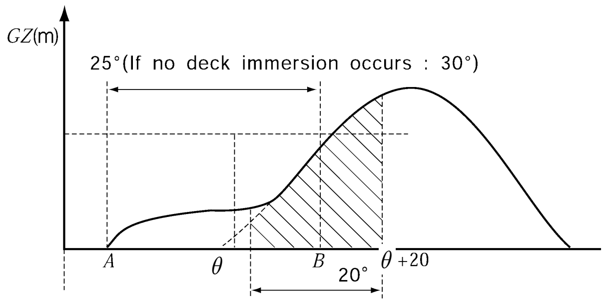
(2) It is to be in accordance with the requirements **209. 1** (1) and (2) of the Rules.
(3) The areas under the righting lever curve within 20° range beyond the position of equilibrium are to be 0.0175 m · rad or more at final equilibrium after flooding.
(4) The maximum values of residual righting lever is not limited.

209. Survival requirements

1. Survival requirements

(1) For the purpose of the requirements of **209. 1** (1) of the Rules, openings specified in the following (A) and (B) may be regarded as watertight flash deck openings.
 (A) Openings protected by tank covers with strength equivalent to deck plating.
 (B) Openings for cargo containment systems on the weather decks sealed with effectively packing of non-combustible material complied with the requirements in **Pt 8, Ch 1, 103.** (1) of the Rules or equivalent and of sufficient strength.
 (C) Sounding pipe with closing head
(2) For the purpose of **209. 2** (1) of the Rules, openings capable of being closed weathertight whose immersion are accepted within the required range of residual stability are to be closed securely at final equilibrium after flooding. However, the requirement may not apply to float type air pipes with automatic closing systems in water.

2. For the purpose of **209. 2** (1) of the Rules, the righting lever curve may be considered to satisfy the requirements within the range of residual stability between the position of equilibrium and the angle of 25° (or 30° if no deck immersion occurs) further through 20° from any arbitrary angle of heel within the residual stability range. (See **Fig 7.5.6** of the Guidance)



θ : any angle commencing between the position of equilibrium and the angle of 25° (or 30° if no deck immersion occurs).

Fig 7.5.6

Section 3 Ship Arrangements

301. Segregation of the cargo area

1. Segregation of the hold space

(1) "Forward of machinery spaces of category A" referred to in **301. 1** of the Rules means to be located forward of the forward bulkhead (including the stepped or recessed portions) in machinery spaces of category A. (See **Fig 7.5.7** of the Guidance)

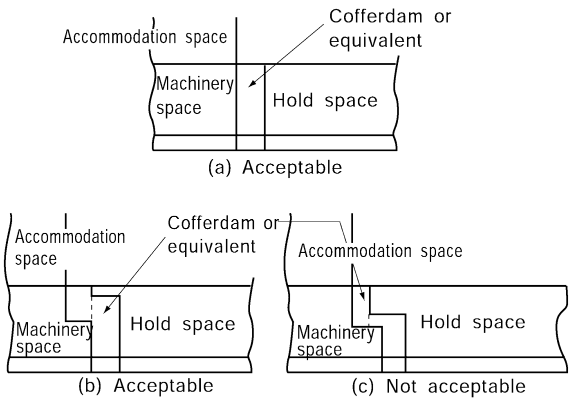


Fig. 7.5.7

(2) Where machinery spaces of category A are located forward of hold spaces, which "deemed necessary by the Society for the safety or navigation of the ship" specified in the requirements in **301.1** of the Rules, the following requirements (A) and (B) are to be complied with. Further, the Society may give additional requirements when deemed necessary. :

(A) The requirements for fire protection and fire extinguishing for the machinery spaces of category A specified in **Pt 8** of the Rules are to be complied with.

(B) The requirements for periodically unmanned machinery spaces specified in **Pt 6, Ch 2** of the Rules and **Pt 8, Ch 2** of the Guidance are to be complied with.

(3) Hold spaces are neither to be located forward of the collision bulkhead nor aftward of the aft peak bulkhead.

2. Segregation of the hold space in case of a cargo containment system not requiring secondary barrier

(1) "If there is no source of ignition or fire hazard" referred to in the requirements in **301. 2** of the Rules means those compartments such as ballast tanks, fresh water tanks, cofferdams, fuel oil tanks, cargo service spaces where there is no source of ignition and is not normally entered by persons, cargo pump rooms and cargo compressor rooms, etc.

(2) The packing used for bolted watertight manholes fitted on the boundaries of ballast tanks, cofferdams, fuel oil tanks from among the compartments referred to the preceding (1) may not be of non-combustible material.

3. Segregation of the hold space in case of a cargo containment system requiring secondary barrier

"If there is no source of ignition or fire hazard" referred to in the requirements in **301. 3** of the Rules means the compartments specified in **301. 2** (1) above.

4. Segregation of cargo piping

(1) For the purpose of the requirements in **301. 5** (1) of the Rules, combinations of a screw-down check valve and a check valve or of a spectacle flange and a stop valve are to be provided at the inter-connections of cargo or cargo vapour lines and inert gas lines necessary for the operation. (See **Fig 7.5.8** of the Guidance)

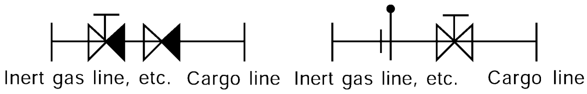

Fig. 7.5.8

(2) The screw-down check valve specified in the preceding (1) may be replaced with a combination of check valve and stop valve. Further, the spectacle flange may be replaced with a spool piece.

(3) "Vertical trunk-way" referred to in the requirements in **301. 5** (3) of the Rules is to comply with the following requirements (A) through (G) :

(A) The access opening in the vertical trunk-way is to comply with the requirements in **305. 3** of the Rules.

(B) The bilge discharge system in the vertical trunk-way is to comply with the requirements in **307. 1** (2) and **2** of the Rules.

(C) Pressure relief system complying with the requirements in **802. 2** of the Rules is to be provided.

(D) Inerting system complying with the requirements in **902. 2** of the Rules is to be provided.

(E) The electrical installations within the vertical trunk-way are to comply with the requirements in **1002. 3** (1) of the Rules.

(F) Ventilation system complying with the requirements in **1202.** of the Rules is to be provided.

(G) Gas detecting system complying with the requirements in **1306. 7** of the Rules is to be provided.

5. Emergency cargo jettisoning piping system

For the purpose of the requirements in **301. 6** of the Rules, the emergency cargo jettisoning piping system is to comply with the requirements in **308. 3** and **7** of the Rules. The Society may give additional requirements according to details of arrangement.

6. Openings for cargo containment system

"Arrangements for sealing the weather decks in way of openings for cargo containments systems" referred to in **301. 7** of the Rules means the arrangements complying with the requirements in **Pt 4, Ch 2, 102.** and 103. of the Rules.

302. Accommodation, service and machinery spaces and control stations

1. Segregation of hold spaces requiring a secondary barrier

"To be so located as to avoid the entry of gas from the hold space to such spaces through a single failure of a deck or bulkhead" referred to in **302. 1** of the Rules means that boundaries of the compartment are so arranged as not to make linear contact or point contact with hold spaces. (See **Fig 7.5.9** of the Guidance)

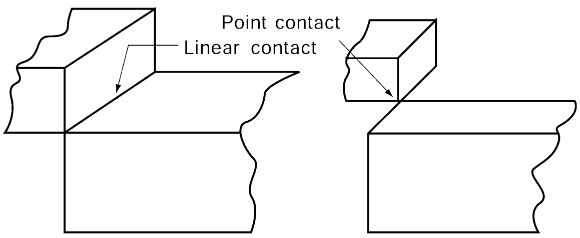

Fig. 7.5.9

2. Location of air intakes and openings in to accommodation spaces, etc.

Compliance with the requirements in **302. 4, 308. 4, 802. 10** and **1201. 6** of the Rules would also ensure compliance with the requirement in **302. 2** of the Rules. Air outlets are subject to the same requirements as air inlets and air intakes.

3. Arrangements of entrances, air inlets and openings

(1) Windows and side-scuttles "so designed that a rapid and efficient gas and vapour tightening of the wheelhouse can be ensured" referred to in **302. 4** of the Rules means those fitted with packing and clamping devices. These window and side scuttles are subject to hose tests or other suitable tests acceptable to the Society to verify their gas-tightness.
(2) In case where clear view screens are provided in wheelhouse within the restricted area specified in **302. 4** of the Rules, additional clamping devices are to be provided to the clear view screen or alternative arrangement of closing the window to make it gastight when the screen is not in rotating motion is to be made.
(3) The requirements in **302. 4** of the Rules may not apply to ships dedicated to the carriage of cargo which require neither F nor T in column f of **Table in Ch 5, Sec 19** of the Rules.

4. Closing devices of air intakes and openings

(1) For the purpose of the requirements in **302. 6** of the Rules, closing devices for air intakes and openings are to have suitable gas-tightness where steel made fire protection flaps without gaskets are not accepted.
(2) For the purpose of the requirements in **302. 6** of the Rules, the closing devices in ships intended to carry toxic products which require T in column f of the Table in **Ch 5, Sec 19** of the Rules, the following requirements (A) through (D) are to be complied with :
(A) The requirements in the preceding (1) are to be complied with.
(B) The compartments required to have closing means operable from inside are to be as follows :
(a) radio rooms and navigating rooms
(b) mess rooms and galleys
(c) cabins, lavatories, hospitals, etc.
(C) Internal closing required in (B) above is not required for such compartments not normally manned as listed below.
(a) deck store rooms
(b) forecastle store rooms
(c) engine room casings and steering gear compartments
(d) workshops
(e) cargo control rooms located within the cargo area
(D) When internal closing is required, this is to include both ventilation intakes and outlets.

303. Cargo pump rooms and cargo compressor rooms

1. Location

(1) For the purpose of the requirements in **303. 1** of the Rules, where cargo pump rooms and compressor rooms are permitted to be fitted at the after end of the after-most hold space or at the forward, the arrangements are, for example, as shown in **Fig 7.5.10** of the Guidance.

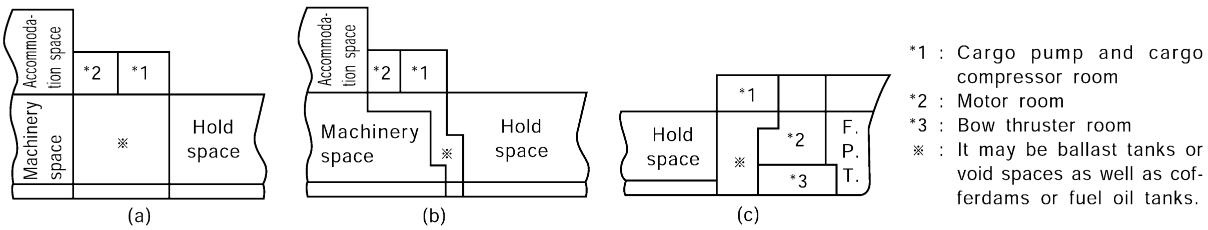

Fig. 7.5.10

(2) For the purpose of the requirements in **303. 1** (1) of the Rules, the arrangement that cargo pump rooms and cargo compressor rooms are located below the exposed deck is not accepted.
(3) The compartments within the cargo area extended according to the requirements in **303. 1** (2) of the Rules may not be regarded as gas-dangerous space as far as the following requirements (A) and (B) are complied with (See **Fig 7.5.11** of the Guidance). However, consideration is to be given to the requirements in **303. 1** (3) of the Rules.

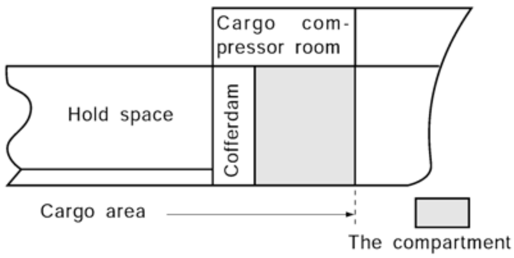

Fig. 7.5.11

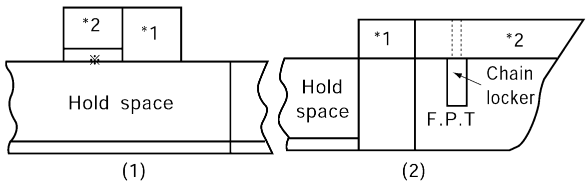
(A) The access holes and air vents to the compartment are to have no openings to gas-dangerous space.
(B) The compartment is not to fall under any compartments specified in **106. 17** (1) and (2) of the Rules.

(4) The requirements in **303. 1** (3) of the Rules are also to apply to cases where cargo area is not extended according to the requirements in **303. 1** (2) of the Rules.

2. Gastight seal of shaft

(1) Shaft seals such as those manually feeding grease periodically are not considered as the "other means of ensuring the permanence of the gas seal" referred to in **303. 2** of the Rules.
(2) The shaft seals required in **303. 2** of the Rules are to be provided outside cargo pump rooms and cargo compressor rooms.
(3) The arrangement of motor rooms housing electric motors driving cargo pumps and cargo compressors referred to in **303. 2** of the Rules is to be as, for example, shown in **Fig 7.5.12** (1) of the Guidance. If the arrangement can not be complied with the above requirement in case of such as a small ship, it may be as, for example, shown in **Fig 7.5.12** (2) of the Guidance, where the openings of compartments such as chain lockers considered as the source of ignition are provided in the motor rooms, however, the openings are to be closed by steel watertight covers fitted with warning signs stating that "The openings are to be always kept closed. If opened, the motor room is to be sufficiently ventilated."
(4) The motor rooms referred to in the preceding (3) are to be arranged in gas-safe spaces.



*1 : Cargo pump and cargo compressor room
*2 : Motor room
※ : Cofferdam it is to be needed for the hold space having secondary barrier.

Fig. 7.5.12

3. Access and discharge of drainage

Drain plugs provided on the casing walls of the compartment for draining onto the exposed deck may be accepted, as the "Suitable arrangements...... to deal with drainage" referred to in **303. 3** of the Rules.

304. Cargo control rooms

1. Location

The boundaries where "A-60" class insulation is required according to the requirements in **304. 1** (2) of the Rules are to be as, for example, shown in **Fig 7.5.13** of the Guidance. The ceilings and floors of the cargo control room, asterisked in the drawing, are also to be applied with "A-60" class insulation.

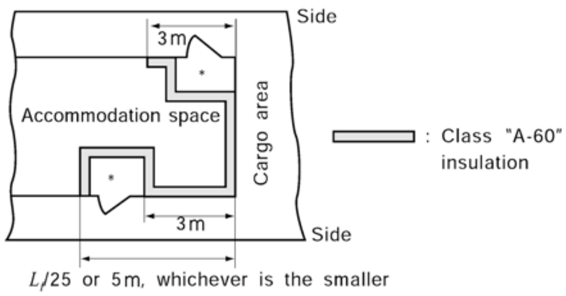


Fig 7.5.13

2. Source of ignition

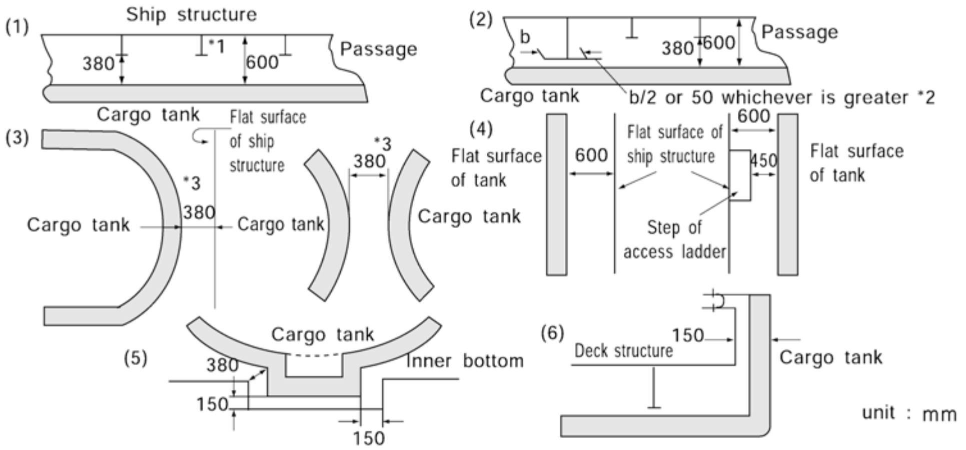
For the purpose of the requirements in **304. 3** of the Rules, the electrical installations in the cargo control room are to comply with the requirements in **1002.** of the Rules depending on the location of the room. The cargo control room is to be provided with mechanical ventilation complying with the requirements in **1201.** of the Rules.

305. Access to spaces in the cargo area

1. The minimum clearance for inspection required in the requirement of **305. 1** and **2** of the Rules are to be as shown in **Fig 7.5.14** of the Guidance.

2. Access for inspection of insulation

According to the requirements in **305. 2** of the Rules, neither visual inspection may be required on one side of the insulation in hold spaces of membrane tanks and semi-membrane tanks nor apply the requirements in **305. 3** of the Rules.



(Note)
1. *1 : This distance between the surface to be inspected and the surface to which structural elements are fitted may b at least 450*mm* in case of a curved tank surface (e.g. in case of type C independent tank).
2. *2 : Where the Surveyor does not require to pass between the surface to be inspected and any part of the structure.
3. *3 : Where the Surveyor does not require to pass between that curved surface and another surface, a smaller distanc than 380*mm* may be accepted taking into account the curved surface.
4. If necessary for inspection, fixed or portable staging is to be installed. This staging is not to impair the distances required in (1) to (4) of the picture.
5. If fixed or portable ventilation ducting has to be fitted in compliance with **1202.** of the Rules, such ducting is not to impair the distances required above (1) to (4) of the picture.

Fig 7.5.14 Cargo Tank Clearances for Inspection

3. The details of minimum opening size required in **305. 3** (1) (B) and (C) of the Rules are to be as shown in **Fig 7.5.15** of the Guidance.

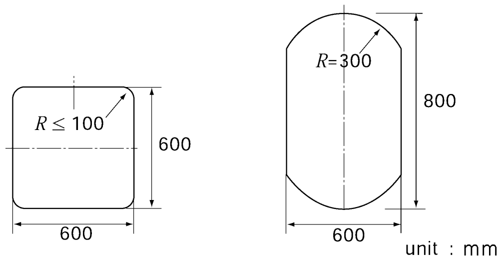


Fig 7.5.15 Minimum Opening Size

4. Access to spaces in the hold spaces, etc.

(1) In applying the requirements in **305. 3** (1) (B) of the Rules, type C independent tanks may have the access holes from exposed spaces with a diameter not less than 600 mm.

(2) In case where those tanks can not be provided with the access holes specified in the preceding (1) due to strength reasons in ships with L_f not more than 70 m, they may be replaced with circular holes with a diameter not less than 500 mm or oval holes with equivalent open area. However, they are to be sufficient to allow entry by a personnel wearing protective clothing and to allow unconscious personnel to be removed from the space.

(3) In case where direct or indirect access from open weather deck without access to gas-safe space, the requirements of **305. 3** (1) (B) and (C) of the Rules may not apply to spaces separated from hold spaces described in **106. 17** (4) (B) of the Rules.

(4) Access hole from weather deck specified in the preceding (3) may be opened at gas-dangerous space. In this case, it is to be applied the requirements for gas-dangerous space except the requirements of **305. 3** (1) (B) and (C) of the Rules.

(5) In applying the requirements in **305. 3** (3) of the Rules, access hole from the weather deck is to comply with the requirements in the preceding (4).

5. Access to gas-safe spaces

"Open weather deck" referred to in the requirements of **305. 4** of the Rules means the exposed part of the uppermost continuous deck within the cargo area.

306. Air-locks

1. Location of gastight doors

For the purpose of the requirements in **306. 1** of the Rules, the steel doors for air-lock are to be verified for their gas-tightness by hose tests or other means considered appropriate by the Society, as necessary.

2. Maintenance of overpressure in the protected space

For the purpose of the requirements in **306. 4** of the Rules, maintenance of overpressure in spaces protected by air-locks is to be by the differential pressure sensing devices provided within the compartment, but alternatively, either of the following method (1) or (2) may be employed :

(1) The following means are considered acceptable alternatives to differential pressure sensing devices in spaces having a ventilation rate not less than 30 air changes per hour :
(A) monitoring of current or power in the electrical supply to the ventilation motors ; or
(B) air low sensors in the ventilation ducts.

(2) In spaces where the ventilation rate is less than 30 air changes per hour and where one of the means specified in the preceding (1) is fitted, in addition, the arrangements are to be made to de-energize electrical equipment which is not of the certified safe type, if more than one air-lock door is moved from the closed position.

3. Ventilation

(1) For the purpose of the requirements in **306. 5** of the Rules, the ventilating fans for air-lock space and their air intakes are to be provided in the gas-safe space. However, in this case, the ventilating fans may not comply with the requirements in **1201.** of the Rules. Protection screens of not more than 13 mm×13 mm square mesh are to be fitted in outside openings of ventilation ducts.

(2) For the purpose of the requirements in **306. 5** of the Rules, verification of maintenance of pressure in spaces protected by air-locks is to be by, for example, monitoring of current in electrical supply to the ventilation motors, air flow sensors in the ventilation ducts or differential pressure sensing devices. The standard ventilation rate in the air-lock space is 8 air changes per hour.

307. Bilge, ballast and fuel oil arrangements

1. Drainage arrangements of hold spaces

(1) For the purpose of the requirements in **307. 1** (1) of the Rules, the drainage arrangements of hold spaces are to be of bilge pumps and bilge pipings provided with in the cargo area complying with the requirements in **Pt 5, Ch 6, Sec 4** of the Rules, or to be of bilge suction system by eductors. In the case of bilge eductors, those capacity and arrangement are to comply with the requirements in **Pt 5, Ch 6** of the Guidance and the total capacity of the eductor is not to be less than 40 m^3/hr.
(2) Where eductors are provided in accordance with the preceding (1), root valves are to be provided in driving water lines at the aft end of the cargo area, and the branch lines of the driving water line are to be fitted with screw-down check valves.
(3) For the purpose of the requirements in **307. 1** (1) of the Rules, the means to detect gas leakage in hold spaces, when the hold spaces are not inerted, may be commonly used for sounding pipes specified in **Pt 5, Ch 6, 203.** of the Rules. In case where the sounding pipes are provided together with gas leakage detecter, an automatic closing head is to be fitted at the each of upper end of the sounding pipes. When hold spaces are inerted, the requirements in (4) are to be complied with.
(4) For the purpose of the requirements in **307. 1** (2) of the Rules, the drainage arrangements of hold spaces are to comply with the requirements in the preceding (1) and (2). The means of detecting gas leakage in hold spaces is to be of the level alarm system of closed type complying with the requirements in **1302. 2** (3) of the Rules.
(5) Cofferdam and void spaces are also to comply with this Article.

2. Drainage system of interbarrier spaces

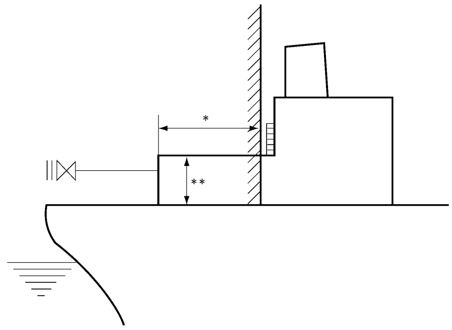
For the purpose of the requirements in **307. 2** of the Rules, the drainage arrangements for dealing with any leakage into the hold or insulation spaces are to comply with the following requirements (1) through (4) :

(1) Even in the case of a partial secondary barrier which is designed on condition that the total volume of leaked cargo would evaporate, the drainage arrangements are to be provided.
(2) In case where a complete secondary barrier is provided and estimation of leakage of liquid cargo is not carried out, the capacity of the drainage arrangements is to comply with the requirements in **Pt 5, Ch 6, Sec 4** of the Rules.
(3) The drainage arrangements to deal with the leaked cargo may commonly serve as those required in **307. 1** (2) of the Rules.
(4) The piping system of the drainage arrangements of leaked cargo is to comply with the requirements in **Sec 5** of the Rules. The water-driven eductor is not accepted as such arrangement.

308. Bow or stern loading and unloading arrangements

1. Arrangements of air inlets and openings

For the purpose of the requirements in **308. 4** of the Rules, the arrangements of air intakes and openings to accommodation spaces are, for example, not to be provided within the shadowed range in **Fig 7.5.16** of the Guidance.



* : $0.04L_f$ or 3m, whichever is the greater, but need not exceed 5m.

** : To be of the standard height of superstructure prescribed in the 1966 International Load Line Convention or more.

Fig 7.5.16

Section 4 Cargo Containment

402. Definitions

1. Integral tanks

In case where the design vapour pressure is made higher than 0.025 MPa in accordance with the requirements in **402. 1** (2) of the Rules, special consideration is to be given to stress concentration for the welding and detailed construction of cargo tanks.

2. Membrane tanks

In case where the design vapour pressure is made higher than 0.025 MPa in accordance with the provision to the requirements in **402. 2** (2) of the Rules, this vapour pressure is to be taken into account when model test specified in **404. 2** (2) of the Rules is conducted. In this case, special consideration is to be given to stress concentration for the welding and construction details of the adjacent hull structure.

3. "Recognized standards" of the requirements in **402. 4** (2) of the Rules means normally the requirements in **Pt 3, Ch 15** of the Rules.

4. In applying the requirements of **402. 4** (4) of the Rules, if the carriage of products (it is only applicable to products having a relative density exceeding 1.0) not covered by the requirements in **Pt 7, Ch 5** of the Rules is intended, the following requirements (1) and (2) are to be complied with :

(1) The double amplitude of the primary membrane stress $\triangle\sigma_m$ created by the maximum dynamic pressure differential $\triangle P$ is not to exceed the allowable double amplitude of the dynamic membrane stress $\triangle\sigma_A$ as specified in **402. 4** (4) of the Rules, ie: $\triangle\sigma_m \leq \triangle\sigma_A$.

(2) The dynamic pressure differential $\triangle P$ is to be calculated as follows:

$$\triangle P = P(a_{\beta 1}Z_{\beta 1} - a_{\beta 2}Z_{\beta 2})/1.02 \times 10^5 \quad \text{(MPa)}$$

where P, a_β, Z_β are as defined in **403. 2** (2) of the Rules, see also **Fig 7.5.17** of the Guidance. $a_{\beta 1}$ and $Z_{\beta 1}$ are the a_β- and Z_β- values giving the maximum liquid pressure hgdmax as defined in **403. 2** of the Rules. $a_{\beta 2}$ and $Z_{\beta 2}$ are the ab and Z_β values giving the minimum liquid pressure hgdmin.

In order to evaluate the maximum pressure differential $\triangle P$, pressure differentials is to be evaluated over the full range of the acceleration ellipse as shown in **Fig 7.5.17** of the Guidance.

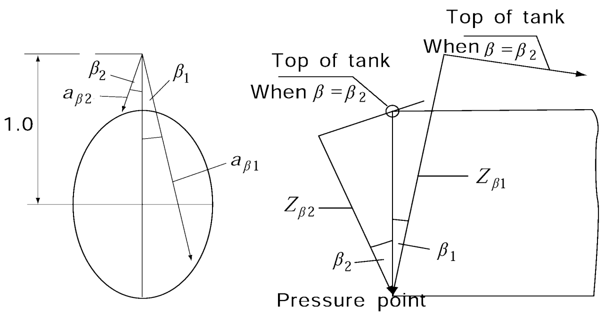


Fig 7.5.17 Acceleration Ellipse and Evaluation of Pressure Differentials

5. Design vapour pressure

For the purpose of the requirements in **402. 6** (2) of the Rules, when a design vapour pressure either higher or lower than 45°C is employed, the ambient temperature is to be of the highest atmospheric temperature of the sea area which is the permanent trade area of the ship obtained from the weather data covering a long period.

6. Design temperature

"Provision to the satisfaction of the Society" referred to in the requirements in **402. 7** of the Rules means the cargo temperature/pressure control systems and temperature indication system complying with the requirements in **Sec 7** and **Sec 13** of the Rules.

403. Design loads

1. General

(1) For the purpose of the requirements in **403. 1** (2) of the Rules, in the case of type B and C independent tanks, their stress levels under the pressure tests are to be confirmed that they are within the stress range specified in the **410. 10** (2) and (3) of the Rules.
(2) The cargo tanks other than those indicated in the preceding (1) are to be verified in strength undergoing the enough analysis required for each tank type in considering the internal pressure distribution at the time of the pressure test. However, when the detailed analysis is carried out, the preceding (1) may apply.
(3) For the purpose of the requirements in **403. 1** (4) of the Rules, the added mass due to hull damage or flooding may not be considered.

2. Internal pressure

(1) As the "Equivalent calculation procedures" referred to in the requirements in **403. 2** (1) of the Rules, the following (A) to (B) may be based upon :
(A) In the case of square tanks, the water head at arbitrary point j on the tank plate is to be obtained from the following equations :

$$h_j = h_{j \cdot st} + h_{j \cdot dyn} \quad \text{(MPa)}$$

$$h_{j \cdot st} = \frac{P_0 + \rho \cdot z_j}{1.02 \times 10^5} \quad \text{(MPa)}$$

$$h_{j \cdot dyn} = \frac{\rho \sqrt{(x_j \cdot a_x)^2 + (y_j \cdot a_y)^2 + (z_j \cdot a_z)^2}}{1.02 \times 10^5} \quad \text{(MPa)}$$

P_0 and ρ : as specified in **403. 2** of the Rules.
a_x, a_y and a_z : as specified in **Fig 7.5.18** of the Guidance and in **403. 2** of the Rules.
x_j, y_j and z_j (m) : as specified in **Fig 7.5.18** of the Guidance.

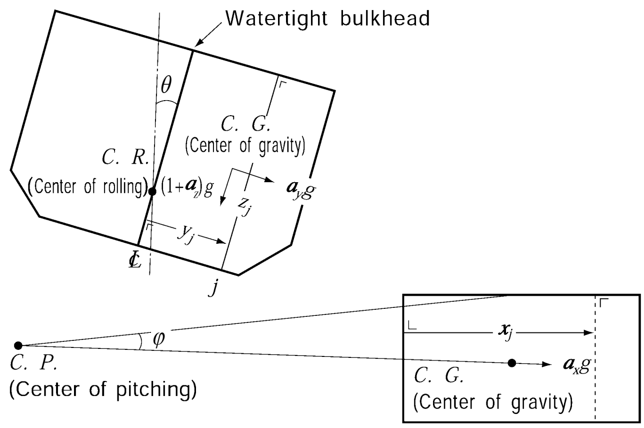

Fig. 7.5.18

(B) In the case of spherical tanks, pressure $P(\phi, \theta)$, at arbitrary point on the tank plate is to be obtained from the following equations :
(a) $P(\phi,\theta) = P(\phi,\theta)_{st} + P(\phi,\theta)_{dyn}$ ·· (MPa)

$$P(\phi,\theta)_{st} = P_0 + \rho \cdot R \cdot (1-\cos\theta)/(1.02\times10^5) \quad \text{(MPa)}$$

$$P(\phi,\theta)_{dyn} = \sqrt{P_1^2+P_2^2+P_3^2} \quad \text{(MPa)}$$

$$P_1 = \rho \cdot R(\sqrt{1+a_x^2} - a_x \cdot \sin\phi \cdot \cos\theta - 1)/(1.02\times10^5) \quad \text{(MPa)}$$

$$P_2 = \rho \cdot R(\sqrt{1+a_y^2} - a_y \cdot \sin\phi \cdot \cos\theta - 1)/(1.02\times10^5) \quad \text{(MPa)}$$

$$P_3 = \rho \cdot R \cdot a_z(1-\cos\theta)/(1.02\times10^5) \quad \text{(MPa)}$$

where ;

P_0, ρ, a_x, a_y and a_z : as specified in the preceding (A)

R : inner radius of sphere (m)

ϕ, θ : as specified in **Fig 7.5.19** of the Guidance.

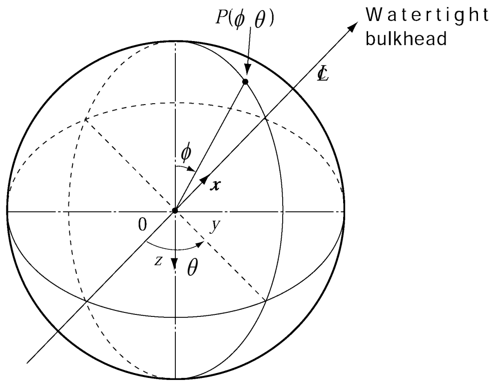

Fig. 7.5.19

(b) Notwithstanding the value specified in the preceding (a), the value of P is not to be less than the following value :

$$P(\phi,\theta)_{\min} = P_0 + \rho \cdot R(1+a_z) \cdot (1-\cos\phi)/(1.02\times10^5) \quad \text{(MPa)}$$

where;

P_0, ρ, R and a_z : as specified in the preceding (A).

(C) In the case of cylindrical tank arranged horizontally along the longitudinal direction of the ship, pressure $P(x_j, \phi)$ at an arbitrary point on the tank plate is to be obtained from the following equation :

(a) $P(x_j,\phi)_{st} = P_0 + \rho R(1-\cos\phi)/(1.02\times10^5)\ (1.02\times10^5)$ .... (MPa)

$$P(x_j,\phi)_{dyn} = \sqrt{P_1^2+P_2^2+P_3^2} \quad \text{(MPa)}$$

$$P_1 = \rho \cdot x_j \cdot a_x/(1.02\times10^7) \quad \text{(MPa)}$$

$$P_2 = \rho \cdot R(\sqrt{1+a_y^2} - a_y\sin\phi - 1)/(1.02\times10^5) \quad \text{(MPa)}$$

$$P_3 = \rho \cdot R \cdot a_z(1-\cos\phi)/(1.02\times10^5) \quad \text{(MPa)}$$

$$P(x_j,\phi)_{\min} = P_0 + \rho \cdot R(1+a_z)(1-\cos\phi)/(1.02\times10^5) \quad \text{(MPa)}$$

where;

P_0, ρ, a_x, a_y and a_z : as specified in the preceding (B)

R : inner radius of cylinder (m)

ϕ, x_j : as specified in **Fig 7.5.20** of the Guidance.

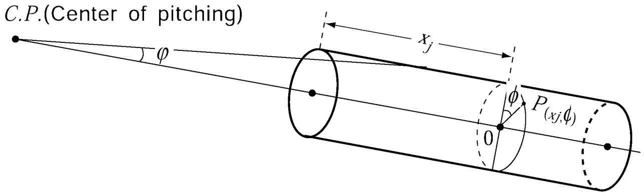

Fig. 7.5.20

(b) Notwithstanding the value specified in the preceding (a), the value of P is not to be less than the following value :

$$P(x_j, \phi)_{\min} = P_0 + \rho \cdot R(1+a_z)(1-\cos\phi)/(1.02\times 10^5) \cdots \text{ (MPa)}$$

(2) For the purpose of the requirements in **403. 4** (3) of the Rules, the stress due to fatigue load may be generally determined by using the cumulative probability curve as shown in **Fig 7.5.21.**

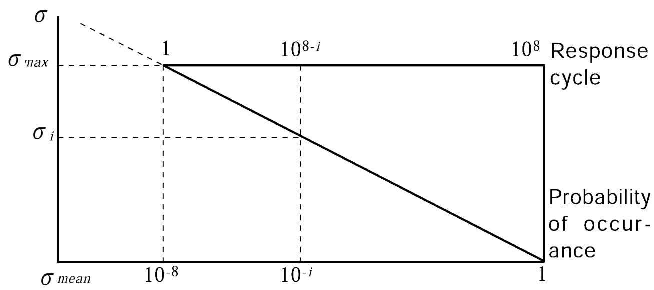

Fig. 7.5.21

(3) When the fatigue strength analysis specified in the requirements in **404. 5** of the Rules is carried out using the frequency distribution of cyclic stress shown in the preceding (2), the number of representative stress(σ_i) is to be eight, and σ_i and its number of repetition n_i may be obtained from the following equation :

$$\sigma_i = \frac{17-2 \cdot i}{16}\sigma_{\max}$$
$$n_i = 0.9\times 10^i$$

where :

i = 1, 2, ..., 8

σ_{max} : stress induced by the predicted maximum dynamic load (half amplitude)

(4) For the purpose of **403. 4** (4) of the Rules, the fatigue load used in the calculation of propagation speed of fatigue cracks is, as a rule, to be the predicted maximum load value that can occur at the most severe period in the trade area specified. In case where analysis is made by using the load frequency distribution given in **Fig 7.5.4** of the Rules, the number of representative stress(σ_i) is to be set at five and si and its number of repetition n_i may be obtained from the following equations :

$$\sigma_i = \frac{5.5-i}{5.3}\sigma_{max}$$
$$n_i = 1.8\times 10^i$$

where :

i = 1, 2, . . ., 5

σ_{max} : stress created by the predicted maximum load

(5) The "ships for restricted service" referred to in **403. 4** (5) of the Rules means those ships with notations "Coasting Service" or "Smooth Water Service" affixed. In this case, the dynamic load may be determined by the results of calculation of ship motions carried out on the basis of the data on sea and weather conditions at the navigating area which are considered appropriately by the Society.

3. Sloshing loads

(1) For the purpose of the requirements in **403. 5** of the Rules, sloshing loads are to be determined in such a way that assessments are made by model experiment for each type of cargo tanks. For cargo tanks where partial filling is intended, data concerning the resonant period of the hull and natural period of the liquids are to be available on board the ship for avoiding the danger of resonance.

(2) Notwithstanding the requirements in the preceding (1), in the type C independent tank in ships with L_f not exceeding 90 m, consideration for structural strength of cargo tanks due to sloshing loads may not be necessary. For tanks partial filling is intended, however, sufficient consideration is to be taken for the installation of equipment in cargo tanks such as cargo piping and cargo pump, against impact loads due to sloshing.

4. Thermal loads

(1) For the purpose of the requirements in **403. 6** (1) of the Rules, arrangements for cooling down are to be provided so as not to cause excessive stress on the tank structures. Further, where cargo with temperature lower than 0°C but not lower than -55°C is carried, such installations for cooling down are also to be provided.

(2) The arrangements shown in the preceding (1) are to be such that safety in cooling down using the arrangements has been proved by records of cargo tanks of similar design or cooling down operation is performed at a rate not exceeding the safe temperature reduction curve which has been proved by thermal stress analysis.

(3) The installations shown in the preceding (1) are to be also capable of performing cooling down at time when excessive thermal loads may be anticipated due to splashing of the residual cargo liquid in ballast passage of the ship under heavy weather as well as at time of cargo loading.

(4) For the purpose of the requirements in **403. 6** (2) of the Rules, no thermal stress analysis may be required for cargo tanks with design temperature of -10°C or upward, in general. In cargo tanks with design temperature at -55°C or below, the structural strength is to be verified through thermal stress analysis by taking into account the vertical temperature distribution at time of cooling down and partial cargo loading, and when necessary, the temperature distribution in the direction of the plate thickness of plating of full loaded tanks.

(5) For tanks other than those specified in the preceding (4), the Society may request thermal stress analysis of the cargo tank by taking into account the constraining condition of the cargo tank by tank supporting structure in case where the tank supporting system is special, and thermal analysis in consideration of the effect of materials with different coefficients of thermal expansion in case where such materials are used.

(6) In the cases referred to in the preceding (4) and (5) where the type of tank supporting system is special, the Society may request thermal analysis on the tank supporting structure itself.

404. Structural analysis

1. Membrane tanks

(1) For the purpose of the requirements in **404. 2** (1) of the Rules, in the assessments of plastic deformations and fatigue of the membrane and thermal insulation materials, all static and dynamic stresses and thermal stress specified in **403.** of the Rules are to be taken into account.

(2) In the assessments referred to in the preceding (1), verification is to be made through fatigue tests on a model combining the elements of the tank, secondary barrier, insulation structure and tank supporting structure considering the dimensional effects on real tank and the effects of dispersions in materials and fabrication accuracy as an integral part of the test specified in **404. 2** (2) of the Rules.

(3) Tests specified in the requirements in **404. 2** (2) of the Rules, are to be conducted on a model in combination of the primary barrier, insulation structure and secondary barrier. Test object and testing procedure are to be determined for each type of tank in each case.

(4) The assessments of collapse of the membrane referred to in the requirements of **404. 2** (4) of the Rules are to be made in accordance with the following requirements (A) to (C) :

(A) For overpressure and negative pressure in the interbarrier space, collapse test is to be conducted on a prototype model of the membrane to verify its ultimate strength.

(B) For sloshing loads, impact load experiment is to be carried out on a prototype model of the membrane to verify its strength when the Society considers necessary.

(C) For vibrations, the natural frequency of the membrane is to be determined whereby it is to be verified that the membrane does not undergo resonance with the vibrations excited by propeller and main engine.

(5) For the purpose of the requirements in **404. 2** (5) of the Rules, the hull structure adjacent to membrane tanks is to comply with the requirements in **Pt 3, Ch 15** of the Rules and, in addition, the stress in the hull structure is to be restricted in consideration of the structural strength of membrane tanks, if necessary. The allowable stresses of the membrane, membrane supporting structures and insulation materials are to be determined in each case according to the mechanical properties of materials, records of construction, product specifications and levels of product quality control practice.

2. Semi-membrane tanks

(1) For the purpose of the requirements in **404. 3** of the Rules, stress analysis is to be carried out on the structural members of cargo tanks in consideration of the loads specified in the requirements in **403.** of the Rules. In this case, the requirements in **405. 1** (4) of the Rules apply correspondingly to the allowable stress.

(2) For stress analysis referred to in the preceding (1), the Society may request model test to verify the accuracy in such stress analysis or stress measurements at time of pressure test of cargo tanks when the Society deems necessary.

3. Type A independent tanks

(1) For the purpose of the requirements in **404. 4** (1) of the Rules, the corrosion allowance may be reduced or may not be required in accordance with the requirements in **405. 2** of the Rules. In structures where the membrane or axial force due to internal pressure can not be neglected, the calculation equation specified in **Pt 3, Ch 15** of the Rules may be used after suitable modification.

(2) In case where no corrosion allowance specified in **405. 2** of the Rules is required in accordance with the preceding (1), stiffeners may have section modulus more than 1/1.2 of one required in **Pt 3, Ch 15, Sec 2** of the Rules.

(3) For the purpose of the requirements in **404. 4** (2) of the Rules, the following (A) to (C) are to be considered for loads and ship deflections.

(A) Ship deflections due to longitudinal bending moment in waves and longitudinal still water bending moment.

(B) Ship deflections due to horizontal bending moment in waves and twisting moment, when necessary due to type of supporting structures.

(C) Internal pressure specified in **403. 2** of the Rules.

4. Type B independent tanks

In applying the requirements in **404. 5** of the Rules, the following requirements (1) through (10) are to be complied with :

(1) The cargo tank structure is to be analyzed by three dimensional frame structural analysis method or finite element method. The model for the analysis is to include concerned hull structures and support construction considering ship deflections and local deflections of hull due to vertical, horizontal and twisting moments.

(2) The strength members of cargo tanks are to be computed in details by the finite element method. In case where compatible results can be obtained, however, the frame structural analysis method may be used in replacement therewith.

(3) In the preceding (1) and (2), dynamic loads necessary for the calculation of interactions between the hull and cargo tanks specified in **404. 5** (2) of the Rules are, as a rule, to be determined by long-term distribution in accordance with the requirements in **403. 4** and **404. 5** (3) of the

Rules where the most probable largest load in terms of the probability of occurrence as deemed appropriate by the Society is to be used. The dynamic stress(σ_{dyn}) due to such loads are to be evaluated for their phase difference according to the requirements in **405. 1** (9) of the Rules, and the total stress including dynamic stress is to be the sum of such dynamic stress and static stress(σ_{st}). However, the load within cargo tanks may be considered as the internal pressure specified in the requirements in **403. 2** (2) of the Rules by using the value of long-term distribution of acceleration computed by direct calculation according to the requirements in **403. 4** and **404. 5** (3) of the Rules.

(4) The scantlings of cargo tank plates and stiffeners fitted to tank plates are to the satisfaction of the Society in consideration of the stress distribution and the mode of stress.

(5) In case where bulkheads are provided in cargo tanks, the scantlings of bulkhead plates and stiffeners fitted to the bulkhead plates are to the satisfaction of the Society.

(6) The strength members in cargo tanks are to be subjected to fatigue strength analysis for both the base metal and welded joints of high stress regions and stress concentration regions. S-N curves are to be plotted by experiment by the taking into account the following (A) through (F) :

(A) Shape and size of test specimen
(B) Stress concentration and notch sensitivity
(C) Mode of stress
(D) Mean stress
(E) Welding conditions
(F) Ambient temperature

In the experiment, the number of test specimen is to be determined statistically and S-N curves are to be plotted against non-destruction probability P = 50 %.

(7) Relative to the design standards for the secondary barrier, the crack propagation analysis specified in the requirements in **404. 5** (1) of the Rules is to be carried out to verify that the assumed initial cracks would not reach the critical crack length in a period. The rate of cargo leakage is to be computed on the basis of the crack length obtained by this analysis.

(8) It is to be verified that the cargo tank plates and associated structural members have sufficient strength against compressive buckling, tripping buckling of stiffeners, shearing buckling, and bending buckling of tripping brackets.

(9) The cargo tank plates and stiffeners are to have such scantlings as not to be caused harmful effects by resonance with the vibrations of exciting sources. The natural frequencies of the cargo tanks and stiffeners used in the above assessment are to be the minimum values in a state in contact with cargo liquid.

(10) The accuracy in stress analysis is to be verified by model tank test or pressure measurements taken at time of pressure tests on a real ship in accordance with the requirements in **410. 13** of the Rules.

5. Type C independent tanks

(1) For the purpose of the requirements in **404. 6** of the Rules, for the scantlings, shapes and reinforcements of openings of cargo tanks against internal pressure in cargo tanks, the requirements for Class 1 pressure vessels in **Pt 5, Ch 5** of the Rules apply.

(2) The "standard acceptable to the Society" referred to in the requirements in **404. 6** (2) of the Rules means such standards as KS, ASME, etc. P_4 among design external pressure P_0 is to be the value computed by applying the requirements in **Pt 3, Ch 10, Sec 2, Ch 16, Sec 2** and **Ch 17, Sec 2** of the Rules corresponding to the location of the tanks.

405. Allowable stresses and corrosion allowances

1. Allowable stresses

(1) The "classical analysis procedures" referred to in the requirements in **405. 1** (3) of the Rules means the beam theory where the type of stress to be assessed is the combined stress of bending stress and axial stress.

(2) For the purpose of the requirements in **405. 1** (3) of the Rules, the allowable stress for the equivalent stress σc when detailed stress calculations are made on primary members is to be as given in **Table 7.5.1** of the Guidance.

Table 7.5.1 Allowable Stresses for the Primary Equivalent Stress

Ferrite steels	Austenitic steels	Aluminium alloys
0.79 R_e	0.84 R_e	0.79 R_e
0.53 R_m	0.42 R_m	0.42 R_m
(Note) For each member, the smaller of the above values is to be used with R_e and R_m as specified in **405. 1** (7) of the Rules		

(3) For the purpose of the requirements in **405. 1** (5) of the Rules, the allowable stress for the primary stress of the prismatic Type B independent tanks is to be in accordance with the requirements in **405. 1** (4) of the Rules.

(4) For the purpose of the requirements in **405. 1** (7) of the Rules, the values of R_e and R_m when the strength of welds is less than that of the parent metal as in the case of 9 % nickel steel are to be of the required values of mechanical properties of the weld metal. For welded joints of aluminium alloys R5083-O and R5083/5183 and 9 % nickel steel, the values of R_e and R_m may be modified in consideration of the increase in the yield stress and tensile stress at low temperature after taking into account the welding procedure employed.

(5) Permissible stresses in way of supports of type C independent tanks made of carbon manganese steel.

(A) For the purpose of the requirements in **405. 1** of the Rules, the following criterion for the allowable stresses in way of supports of type C independent tanks made of carbon manganese steel may be used:

$$\sigma_e = \sqrt{(\sigma_n + \sigma_b)^2 + 3\tau^2} \leq \sigma_a$$

where:

σ_e : equivalent stress($\mathrm{N/mm^2}$)

σ_n : nominal stress in the circumferential direction of the stiffening ring ($\mathrm{N/mm^2}$)

σ_b : bending stress in the circumferential direction of the stiffening ring ($\mathrm{N/mm^2}$)

τ : shear stress in the stiffening ring ($\mathrm{N/mm^2}$)

σ_a : allowable stress ($\mathrm{N/mm^2}$), to be taken as the smaller of the values:

0.57 R_m or 0.85 R_e

R_m and R_e as defined in **405. 1** (7) of the Rules

Equivalent stress values Re is to be calculated over the full extent of the stiffening ring by a procedure acceptable to this Society, for a sufficient number of load cases as defined in **406. 2** and **3** of the Rules.

(B) The following assumptions are to be made for the stiffening rings:

(a) The stiffening ring is to be considered as a circumferential beam formed by web, face plate, if any, and associated shell plating.
The effective width of the associated plating should be taken as:

(i) For cylindrical shells:
an effective width (mm) not greater than 0.78 $\sqrt{rt}$ on each side of the web.
A double plate, if any, may be included within that distance.
where:
r = mean radius of the cylindrical shell (mm)
t = shell thickness (mm)

(ii) For longitudinal bulkheads (in the case of lobe tanks):
the effective width (mm) is to be determined according to established standards.
A value of 20 tb on each side of the web may be taken as a guidance value.
where:
t_b = bulkhead thickness (mm)

(b) The stiffening ring is to be loaded with circumferential forces, on each side of the ring, due to the shear stress, determined by the bi-dimensional shear flow theory from the shear force of the tank.

(C) The following factors are to be taken into account:

(a) Elasticity of support material (intermediate layer of wood or similar material)

(b) Change in contact surface between tank and support, and of the relevant reactions, due to:

- thermal shrinkage of tank
- elastic deformations of tank and support material

The final distribution of the reaction forces at the supports is not to show any tensile forces.

(D) The buckling strength of the stiffening rings is to be examined.

2. Corrosion allowances

(1) The corrosion allowance "where there is no environmental control around the cargo tank, such as inerting" referred to in the requirements in **405. 2** (1) of the Rules, in the case of steel, is to be 1 mm. Except for tanks carrying cargoes containing considerable amounts of impurities or corrosive substances such as chlorine and sulfur dioxide, no corrosion allowance may be required for aluminum alloys and stainless steel.

(2) For the purpose of the requirements in **405. 2** (2) of the Rules, no corrosion allowance may be required for the internal surface of pressure vessels including the Type C independent tank except for the case where corrosive substances are to be loaded. For the exterior surface where there is no environmental control around the cargo tank such as inerting or where there is no protection by suitable insulation materials having the approved vapour barrier, the corrosion allowance for steel is to be the smaller of 1 mm or 1/6 of the required thickness excluding the corrosion allowance.

(3) In case where no corrosion allowance is considered for cargo tanks protected by insulation according to the requirements in **405. 2** (2) of the Rules, the gastightness of the vapour barrier of insulation structure is to have been verified. This gastightness is to be verified in the test of insulation specified in the requirements in **409. 7** of the Rules.

406. Supports

1. General

In spaces between the refrigerated tanks and supports, suitable insulation materials are to be provided so that hull structure might not be cooled excessively through the supporting structures according to the requirement of **408. 1** of the Rules.

2. Provision against the rotational effect

(1) The analysis of supporting structures against the load conditions specified in **406. 2** and **3** of the Rules is to be done while giving considerations to the following conditions (A) and (B) :

(A) A condition where static load by the weight of cargo tank containing the cargo at a static heel angle of 30° and the static sea water pressure without dynamic pressure due to waves is imposed.

(B) A condition where load by the weight of cargo tank containing the cargo with the acceleration caused by ship motions specified in the requirements in **406. 3** of the Rules and the dynamic seawater pressure due to waves are imposed. Such dynamic sea water pressure due to waves may be determined by the requirements in **Pt 7, Ch 3, 103.** of the Rules.

(2) The results of analysis for the conditions indicated in the preceding (1) are not to exceed the allowable stress determined in consideration of the requirements in **405. 1** of the Rules depending on type of cargo tanks. Further, sufficient safety factor against the critical buckling stress is to be considered.

407. Secondary barrier

1. Hull structure acting as a secondary barrier

(1) For the purpose of requirements in **407. 2** (2) of the Rules, thermal stress analysis is to be carried out for the calculation condition in case of cargo leakage specified in the requirements in **409. 1** of the Rules.
(2) The combined stress of the maximum membrane stress or the maximum bending stress obtained in the analysis of the preceding (1) and the static stress created by the static load specified in the requirements in **403.** of the Rules is not to exceed 90 % of the yield stress of the material.
(3) In the ship designed under the same design temperature and loading conditions of similar ships where it is verified that the thermal stress is sufficiently small, the Society may accept omission of the analysis referred to in the preceding (1).

2. Tank type and secondary barrier

The conditions for approving partial secondary barrier for the semi-membrane tanks specified in Note 2 of **Table 7.5.2** of the Rules are to be in accordance with the following (1) through (6) :

(1) Detailed stress analysis is to be carried out. Wave loads as the design load are to be assumed in details according to the requirements in **403. 4** of the Rules. The results of stress analysis are to be verified for the accuracy by measuring the stresses at time of pressure tests on a real ship or model test.
(2) The results of stress analysis under the requirements in the preceding (1) are not to exceed the allowable stress specified in the requirements in **405. 1** (4) of the Rules.
(3) The requirements in **404. 4** (6), (7) and (9) of the Guidance are to be complied with.
(4) Cargo tanks are to be subjected to buckling analysis depending on their structural type whereby it is to be verified that they have sufficient strength against buckling.
(5) Repair procedures for cargo tanks are to be established. On the fatigue strength and crack propagation analysis in case such repair procedures have been applied, assessments are to be carried out by applying the requirements in **404. 4** (6) and (7) of the Guidance correspondingly.
(6) The hull structure adjacent to cargo tanks is to be subjected to strength analysis compatible with the case of cargo tanks. In addition to carrying out detailed stress analysis by the method of which accuracy has been verified by stress measurements, etc., it is to be verified that the strength is sufficient through the fatigue strength analysis and crack propagation analysis done by applying the requirements in **404. 5** of the Rules correspondingly.

3. Standards of secondary barrier

(1) For the purpose of the requirements in **407. 4** of the Rule, the secondary barriers of nonmetal material are to conform to the following requirements (A) to (C) :
  (A) Compatibility with the cargo is to have been verified, and to have necessary mechanical properties at the cargo temperature under the atmospheric pressure.
  (B) A model test may be required to prove that the secondary barrier has effective performance when the Society deems it necessary.
  (C) For welded joints, welding procedure tests and production test are to be conducted. The test plans for the above are to have been approved by the Society beforehand.
(2) For the purpose of the requirements in **407. 4** (1) of the Rules, no special analysis of the complete secondary barrier for verifying that "it is capable of containing any envisaged leakage of liquid cargo for a period of 15 days" may be carried out except for cases where the Society deems it specially necessary.

4. Extent of secondary barrier

(1) For the purpose of the requirements in **407. 5** of the Rules, the extent of the secondary barrier is, at least, to cover the surface of leaked liquid cargo corresponding to a static heel angle of 30°.
(2) The "surface of leaked liquid cargo" referred to in the preceding (1) means a surface of fully leakage of fully loaded cargo for the complete secondary barrier, and of liquid cargo determined in accordance with the requirements in **407. 6** of the Rules for the partial secondary barriers.
(3) For spaces outside the extent of the secondary barriers specified in the preceding (1), the hull structures are to be protected against splashes of leaked cargo by the spray shields specified in the requirements in **407. 6** (2) of the Rules, or the extent of the secondary barrier is to be suitably extended.

5. Partial secondary barrier

(1) For the purpose of the requirements in **407. 6** of the Rules, the protection of the inner bottom plating at the lower part of cargo tanks is to conform to the following requirements (A) and (B) :

(A) According to the requirements in **407. 2** of the Rules, the inner bottom plating is to act as the secondary barrier.

(B) In case where a drip tray is provided as a secondary barrier for example as shown in **Fig 7.5.22** of the Guidance with consideration so as not to allow the leaked liquid cargo to overflow from the secondary barrier, no protection may be required. However, where no such consideration is taken, the inner bottom plating is to be protected by insulation materials.

(2) The spray shield specified in the requirements in **407. 6** (2) of the Rules is to have been verified by test that it has satisfactory performance to act as the shield.

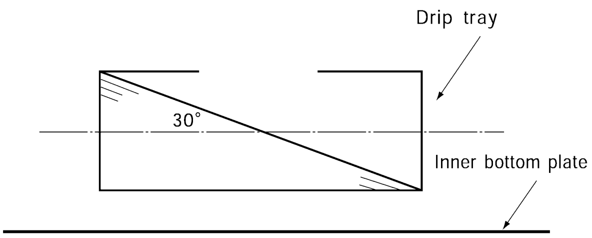

Fig. 7.5.22 Drip Tray to Protect the Inner Bottom Plate

6. Periodical survey of secondary barrier

(1) For the purpose of the requirements in **407. 7** of the Rules, the test procedure where visual inspection of the secondary barrier is not possible is to be in accordance with the following requirements (A) to (C) :

(A) The inspection method of the secondary barrier and its criteria relating to the performance to act as the secondary barrier are to be verified for their effectiveness through model test.

(B) The secondary barrier is to be verified by model test for the required performance. This model test is to be capable of verifying that the secondary barrier can maintain the necessary performance throughout the life of the ship.

(C) When sufficient data to prove the effectiveness and reliability relative to the preceding (A) and (B) are submitted to the satisfaction of the Society, this model test may be omitted.

408. Insulation

1. Protection of hull structure for low temperature products

For the purpose of the requirements in **408. 1, 2** and **3** of the Rules, the calculation conditions in computing the temperature of hull structures are to be in accordance with the following (A) through (D) :

(A) The loading condition of the ship for the calculation is to be full loaded condition.

(B) At the upright cargo leakage is to be considered for the calculation in accordance with the following (a) through (d). However, no leakage may be considered for integral tanks and type C independent tanks.

(a) It is to be assumed that the failure of all cargo tanks located between transverse watertight bulkheads are caused. However, in case where the cross section of the ship is divided into more than one compartments by longitudinal bulkheads of the ship, it is to be assumed that the failure of all cargo tanks within each such compartment is caused.

(b) It is to be assumed that the locations of the failure of the cargo tank cover all conceivable ones.

(c) It is to be assumed that only the liquid cargo leaks out where the cargo tank, supports and hull remain intact without involving any deflections or fracture.

(d) For cargo tanks where the complete secondary barrier is required according to the requirements in **407. 3** of the Rules, it is to be assumed that the leakage of liquid cargo occurs instantaneously and the levels of residual liquid cargo in damaged cargo tank and the leaked liquid level in the hold space reach the same level instantaneously.

(C) The boundary conditions of the calculation mode1 are to be in accordance with the following requirements (a) through (k) :

(a) The temperature of the compartment adjacent to hold spaces is to be determined by heat transmission calculation. The atmosphere of the compartment which is adjacent to the compartment contiguous to hold space may be taken as a still air at 0°C. In the case of machinery space, it may be assumed as a still air at 5°C.

(b) It is to be assumed that there is no radiation of sun beam.

(c) The atmospheric air and sea water are to be assumed as still atmospheric air at 5°C and still sea water at 0°C respectively.

(d) The structures in hold space such as insulation materials and supports are to be assumed that they do not absorb liquid cargo.

(e) In compartments where gases exist other than in hold spaces, it is to be assumed that they are in natural convection.

(f) It is to be assumed that the gas and liquid within the same compartment are at the same temperature.

(g) At time of damage to the cargo tank, the gaseous phase in the cargo tank and that in hold spaces are to be assumed to have a pressure equals to the atmospheric pressure.

(h) It is to be assumed that there is no transfer of gases within the insulation materials.

(i) It is to be assumed that there is no influence of moisture.

(j) The temperature of the secondary barrier in a state of leakage is to be assumed to be the same as the cargo temperature at the atmospheric pressure, whereas the temperature of the intact cargo tank is the design temperature. The ship is to be assumed to stay upright.

(k) It is to be assumed that there is no influence of paints.

(D) The calculation conditions in heat transmission calculation are to be in accordance with the following requirements (a) through (i) :

(a) Temperature distribution and heat transmission are to be dealt with as the phenomena in a steady state. No transient condition may be considered.

(b) Sea water is to be assumed to have a density of 1,025 kg/m^3 and a coagulation point of 2.5°C with physical properties compatible with those of fresh water for other items.

(c) The liquid cargo is to be assumed to have uniform temperature distribution.

(d) The heat transfer coefficients at various boundaries can be computed by using the numeral values given in **Table 7.5.2** of the Guidance, but calculation may be carried out by using empirical equations given in the heat transfer engineering data which has been made public. In this case, heat transfer due to radiation is also to be taken into account.

Table 7.5.2 The Heat Transfer Coefficient at Various Boundaries

Boundaries	Heat transfer coefficients (W/m^2·°C)
Still gas ← → Hull or liquid	5.8
Still sea water ← → Hull	116.3
Cargo vapour ← → Hull contacted to air	11.6

(e) The substance for which temperature distribution is investigated is to be assumed to be of homogeneous one without directivity.

(f) Frames may be dealt with as fins.

(g) In case where hold spaces located forward and afterward the hold space under study are in the same conditions, they may be treated as a two dimensional problem.

(h) The cooling effect by the latent heat of evaporation of the liquid cargo may not be taken into account.

(i) The temperature of structural members is to be represented by the temperature at their half thickness, and for individual members, the following requirements (i) through (iv) are to be complied with :

(i) The temperature of those frames fitted to plates is to be assumed to be the same as the temperature of the plates, but when the temperature distribution of the frame in the direction of depth is known, the area mean of the temperature distribution may be taken.

(ii) The temperature of web frames supporting frames or plates is to be the temperature at their half depth for webs, and the temperature of face plates for these.
(iii) The temperature of members connecting the inner shell and outer shell, e.g., brackets and girders is to be of the mean of the temperature of the inner shell and that of the outer shell.
(iv) The temperature of brackets is to be the temperature at their centroid.

409. Materials

1. Hull material not forming secondary barrier

(1) For the purpose of the requirements in **409. 4** of the Rules, brackets, panel breakers on such as girders, tripping brackets and docking brackets provided to prevent buckling of structural members may be excluded from the application of the requirements.
(2) Notwithstanding the requirements in the preceding (1), for longitudinal strength members and stiffeners in deep tanks and watertight bulkheads among those shown above the requirements apply.

2. Insulation materials

(1) For the purpose of the requirements in **409. 5** of the Rules, insulation materials of independent tanks and integral tanks are to be free from generating harmful defects that degrade the insulation performance even under such conditions of service that can actually take place in insulation structure including forced deflection and thermal expansion and contraction.
(2) The performance referred to in the preceding (1) is to be verified in the insulation procedure test specified in 5 below as necessary.

3. Protection of insulation

For the purpose of the requirements in **409. 6** of the Rules, insulation materials are to be protected in accordance with the following requirements (1) to (3) :

(1) For insulation materials installed in hold spaces and tank covers, no fire protections and protections for mechanical damage may be provided except for cases where such are specially necessary. However, these insulation materials are to be applied with coating or subjected to surface treatment with aluminium foil, etc.
(2) Insulation materials provided at exposed areas are to be protected by galvanized iron sheets or to be of the non-combustible insulation materials specified in the requirements in **Pt 8, Ch 1, 104.** (1) of the Rules applied with moisture-resistant coating. In case where the Society deems necessary, provision of steel covering may be requested as a protection against mechanical damage.
(3) The coating materials to be applied on the surface of insulation materials are to comply with the requirements in **Pt 8, Ch 1, 308. 2** of the Rules or equivalent.

4. Properties of insulation materials

(1) For the purpose of the requirements in **409. 7** of the Rules, the properties of insulation materials are, in general, to be verified by the tests given in **Table 7.5.3** of the Guidance.
(2) In addition to complying with the requirements in the preceding (1), property verification test may be requested by the Society depending on the insulation system.
(3) If the material, which has been approved according to the Guidance given by the Society, satisfies the performance requirements and such performance is considered to serve the purpose, the tests referred to in the preceding (1) may be omitted.
(4) For insulation materials to which the requirements in the preceding (1) to (3) do not apply, the following requirements (A) and (B) are to be complied with :
 (A) For insulation materials used for supports of independent tanks, the requirements given in the column of membrane tank and semi-membrane tank in **Table 7.5.3** of the Guidance apply.
 (B) For insulation materials provided in cargo tanks to which no provision of insulation is required according to the requirements in **408.** of the Rules, data on the necessary properties of those specified in **409. 7** (1) of the Rules depending on the insulation system is to be submitted to the Society.
(5) The test method for the properties specified in **409. 7** (1) of the Rules is to be **Table 7.5.4** of the Guidance or to the satisfaction of the Society.

5. Quality control of insulation materials

"The satisfaction of the Society" referred to in the requirements in **409. 8** of the Rules means as shown in the following (1) and (2):

(1) The insulation materials are to be approved in accordance with the Guidance. In the above, tests and inspection are to be conducted according to the procedures on the manufacture, storage, handling and product quality control established by the manufacturer.

(2) The inspection for insulation work is to include the following items of tests and inspections (A) to (C):

(A) Insulation procedure test
For insulation system and insulation procedure without previous records, tests are to be conducted in accordance with the test plan approved by the Society. The test may be conducted at the manufacturer of insulation materials or shipyard as necessary.

(B) Insulation production test
In accordance with the test plan approved by the Society in advance, tests are to be conducted to verify the work control, working environment control and product quality control during insulation procedure.

(C) Completion inspection
After the insulation work is completed, inspection is to be conducted for dimensions, shape, appearance, etc. in accordance with the procedures already approved by the Society, and in addition, the insulation performance is also to be verified in the test specified in **410. 14** of the Rules.

Table 7.5.3 Properties of Insulation Material for Cargo Tank Types

No.	Ensuring items		Integral tank	Membrane/ semi-membrane tank[3)]	Type A/B independent tank	Type C independent tank	Internal insulation tank[4)]	Note

Remarks
○ : Items to be verified through verification test for properties.
△ : Items to be verified through verification test where deemed necessary depending on the insulation material.
□ : Items for which preparation of data on the properties is desirable.

Notes :
1) Necessary when the insulation material acts as spray shield specified in the requirements in **407. 6** (2) of the Rules. In other cases, data on the properties is to be prepared.
2) Not generally required for cargo tanks where the design temperature exceeds -10°C.
3) It is necessary to verify the fatigue strength characteristics in accordance with the requirements in **402. 2** and **404. 3** of the Rules.
4) It is necessary to verify the fatigue strength characteristics in accordance with the requirements in **404. 7** and **409. 7** (2) of the Rule.

Table 7.5.4 Test Items for Insulation Materials

Test items	Test methods
1. Compatibility with the cargo	Tensile, compress., shearing, bending test after dipping in the cargo
2. Solubility in the cargo	Changes in thesize and weight of test specimen before and after dipping in the cargo
3. Absorption of the cargo	Comparison of weight of test specimen or test of water absorbing properties before and after dipping in the cargo
4. Shrinkage	ASTM D2126
5. Aging	ASTM D756 (Comparison of thermal conductivity before and after aging)
6. Closed cell content	ASTM D2856

410. Construction and testing

1. Independent tanks

(1) For the purpose of the requirements in **410. 1** (1) of the Rules, the fillet weld of the full penetration type approved for joints between cargo tank plates and dome are, at least, to conform to the following requirements (A) or (B) depending on cargo tank type :

(A) In the case of Type A independent tank, non-destructive testing procedure is to be established.

(B) In the case of Type B and Type C independent tank, records of production are to be kept and fatigue strength is to be ensured by fatigue strength analysis and non- destructive testing procedures established for the proposed construction.

(2) The "dome-to-shell connections" referred to in the requirements in **410. 1** (1) of the Rules are applicable to tanks with MARVS is 0.07 MPa or below, and the connections mean ordinary cargo pipes or other penetrations of equivalent size sufficiently small when compared with the size of dome.

(3) In welding of the penetrations referred to in the preceding (2) full penetration type welding may not be required, but are to have proper grooves. In this case, all the weld lines for penetrations of pipes with outside diameter exceeding 100 mm, and the partial weld lines for those with outside diameter of 100mm or below, are to be subjected to non-destructive test as appropriate.

(4) The "specifically approved by the Society" referred to in the requirements in **410. 1** (2) (A) of the Rules means the case of tanks where MARVS is 1.0 MPa or below and the design temperature is higher than -10°C satisfying both of the following requirements (A) and (B). However, this is to be limited to areas where non-destructive test is possible.

(A) Pressure vessels where removal of backing strip is operationally difficult and which are not used in an atmosphere liable to generating stress corrosion cracks.

(B) There is no excessive stress concentration.

(5) As a case "specially approved by the Society" referred to in the requirements in **410. 1** (2) (b)

of the Rules, full penetration welding may not be required for small nozzle diameters for use in measurement, inspection or similar other application being fitted to the cargo tank with MARVS of not more than 1.0 MPa and the design temperature is not less than -10°C. In this case, welding is to comply with the requirements in KS B 6231.

2. Membrane tanks

(1) For the purpose of the requirements in **410. 3** of the Rules, quality assurance procedure, welding control, design details, quality control of materials, construction method, inspection and standards of production testing of components for membrane tanks are to be developed during the prototype test specified in **404. 2** of the Rules or another prototype test separately conducted for development of production procedure, and their effectiveness is to be verified. The relevant data is to be noted in the construction procedure manual for cargo tanks including the insulation construction of membrane tanks.
(2) The construction procedure manual referred to in the preceding (1) is to be approved by the Society after being verified through prototype test.

3. Integral tanks

For the purpose of the requirements in **410. 6** of the Rules, the hydraulic test of integral tanks is to conform to the requirements in **Pt 3, Ch 1, 209.** of the Rules. However, for tanks whose design MARVS exceeds 0.025 *MPa* or specific gravity of the cargo exceeds 0.6, the test may be such as to conform to the requirements specified in **410. 10** (1) of the Rules correspondingly.

4. Hull structure adjacent to membrane or semi-membrane tanks

(1) The "hydrostatically or hydropneumatically tested in accordance with recognized standards" referred to in the requirements in **410. 7** of the Rules means the hydraulic test according to the requirements in **Pt 3, Ch 1, 209.** of the Rules. In this case, hydraulic pressure may be applied from hull structures such as ballast tanks and cofferdams.
(2) The leakage test for the "other hold structure supporting the membrane" referred to in the requirements in **410. 7** of the Rules is to be in accordance with the testing procedure applicable to general hull structures as specified in **Pt 3, Ch 1, 209.** of the Rules.

5. Type C independent tanks

(1) For the purpose of the requirements in **410. 9** (1) of the Rules, the allowable dimensional deviations for the manufacture and fabrication are to conform to the requirements in **Pt 5, Ch 5, 402. 5** of the Rules, and in addition to the requirements in KS B 6231.
(2) For the purpose of the requirements in **410. 9** (2) (B) of the Rules, the ultrasonic testing is to be conducted in the following cases (A) and (B) :
  (A) In case where defect detection by radiographic testing fails and ultrasonic testing is considered additionally necessary.
  (B) In case where ultrasonic testing is considered necessary for the quality control of essential structural members.
(3) For the purpose of the requirements in **410. 9** (2) of the Rules, testing procedure and acceptance criteria for the non-destructive tests are to be in accordance with the requirements in **603. 6** (1) of the Guidance.

6. Hydrostatic or hydropneumatic test for independent tank

(1) For the purpose of the requirements in **410. 10** (1) and (2) of the Rules, the hydrostatic or hydropneumatic test of cargo tanks is to be conducted by simulating the actual load conditions (static load + dynamic load) in accordance with the following requirements (A) and (B) :
  (A) Test of cargo tanks
  Hydrostatic-hydropneumatic test is to simulate the static pressure of cargo, acceleration by ship motions and internal pressure including the vapour pressure by water head and pneumatic pressure. (See **Fig 7.5.23, 7.5.24** and **7.5.25** of the Guidance)
  (B) Load test of supporting structures
  Hydraulic test is to simulate the cargo weight and the load created by the acceleration due to ship motions solely by the weight of water. (See **Fig 7.5.26** of the Guidance)
(2) All tests specified in the preceding (1) (A) and (B) may be conducted individually.

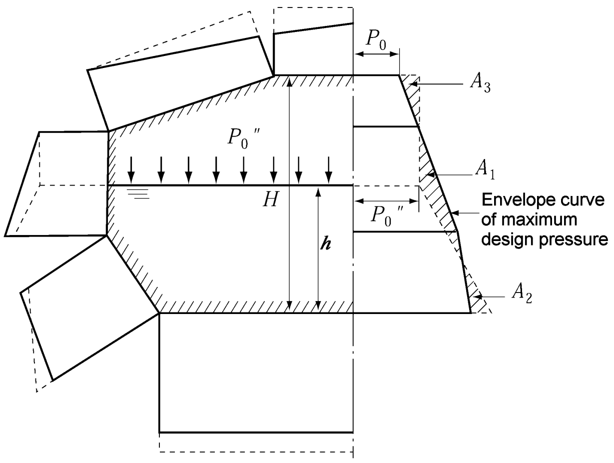

Fig 7.5.23 Simulating the Internal Pressure Distribution of Rectangular Tank

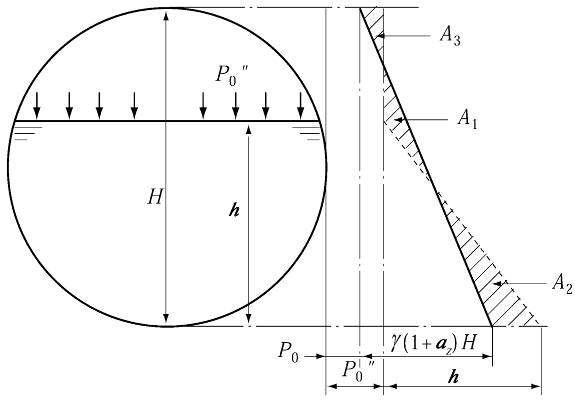

Fig 7.5.24 Simulating the Internal Pressure Distribution of Spherical Tank

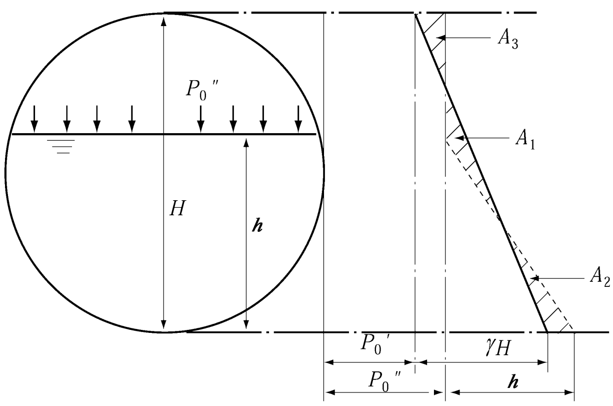

Fig 7.5.25 Simulating the Internal Pressure Distribution at Pressure Discharge

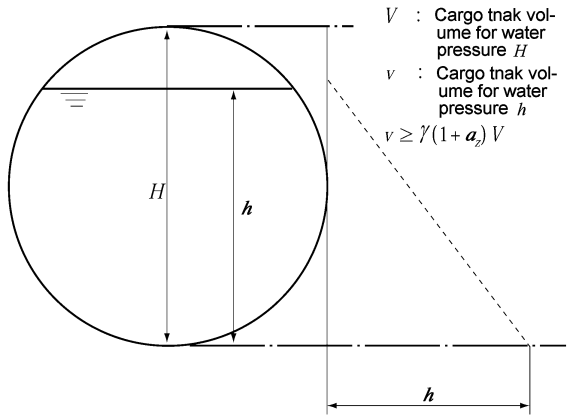

Fig 7.5.26 Simulating the Loading Condition of Support Structure

* Explanatory notes on symbols in **Fig 7.5.23** to **7.5.26** of the Guidance

------	: maximum loading condition which is predicted to actually encounter
···	: pressure testing condition simulating as far as practicable (P_0'' and h are to be chosen so that $P_0'' > P_0$ or $P_0'' > P_0'$ and $A_2 + A_3 > A_1$ as far as practicable)
H	: depth of tank
h	: water head
γ	: specific gravity of cargo
a_z	: maximum vertical acceleration (non-dimensional)
P_0	: design vapour pressure at ordinary passage
P_0'	: design vapour pressure during pressurized unloading in port
P_0''	: air pressure

(3) In the case of the cargo tank of supports which can be regarded as those of the same type manufactured at the same manufacturing plant, implementation of the second and subsequent tests of cargo tanks and supports specified in the preceding (1) (B) may be omitted when deemed acceptable by the Society.

(4) The "pressure vessels other than simple cylindrical and spherical pressure vessels" referred to in the requirements in **410. 10** (3) (A) of the Rules means those cylindrical or spherical pressure vessels with supporting structures of well proved records. In tanks of special shape having supporting structures likely to cause excessive bending stress or bicylindrical shape tanks, the stress

levels are to be verified by strain measurement through prototype test.

(5) "Where necessary" referred to in the requirements in **410. 10** (3) (D) of the Rules means a case in which the shipbuilding berth or hull structure can not withstand the hydrostatic load when cargo tanks are filled with water to the tank top level and another case in which a large load exceeding the design load is imposed on the structural members of the tank or adjacent structures by conducting the hydrostatic test.

(6) For the purpose of the requirements in **410. 10** (3) (F) of the Rules, the leakage test is to be of the airtightness test conducted at a pressure of MARVS or more of the pressure vessel.

7. Tightness test for cargo tanks

For the purpose of the requirements in **410. 11** of the Rules, in case where leakage of cargo tanks can not be inspected in the hydraulic test or hydrostatic-hydropneumatic test according to the requirements in **410. 10** of the Rules, the tightness test of cargo tanks is to be conducted separately. This test is to be of the airtightness test conducted at a pressure of MARVS or more of the cargo tank.

8. Stress measurements instrumentation of type B independent tanks

For the purpose of the requirements in **410. 13** of the Rules, in case where stress measurements of the cargo tank previously built which can be regarded as the tank of the same design manufactured at the same shipyard had resulted in good agreement with design stress levels, provision of instrumentation of independent tanks stress levels for tanks subsequently built may be omitted.

9. Gas-trial and cargo full loading test (related to 505. 4 of the Rules)

(1) In accordance with the requirements in **410. 14** and **505. 4** of the Rules the following tests (A) and (B) are to be conducted in the attendance of the Surveyor to verify the performance of the cargo containment installations and cargo handling equipment :

(A) Gas-trial

On items given in **Table 7.5.5** of the Guidance, tests are to be conducted to verify the performance of the cargo containment system cargo handling equipment and instrumentation using a suitable quantity of the cargo after the completion of all the construction work. However, for cargo tanks with a design temperature of 0°C or more, omission of this test may be accepted if substitution is made by the operating test with the substituting medium to verify the requirements given in **Table 7.5.5** of the Guidance except for the case where the tank is of the first cargo tank manufactured by the manufacturer of cargo tanks.

(B) Cargo full loading test

On items given in **Table 7.5.6** of the Guidance, tests are to be conducted after completion of all the construction work to verify that the cargo containment installations, cargo handling equipment and instrumentation satisfy the design conditions under the fully loaded condition of cargo. However, for this test, the attendance of the Surveyor may be omitted for ships whose cargo containment and cargo transfer installations can be regarded as of the same specification of those which have previously been built and tested at the same shipyard.

(2) The kinds of real liquid cargo and gas used in the gas-trial and cargo full loading test specified in the preceding (1) are to be such that reproduction of the most severe conditions of those design conditions of the cargo containment system, the transfer installations, the reliquefaction system, etc. and consideration is to be given to the following requirements (A) and (B) :

(A) The verification relative to design temperatures is to be made by reproducing the condition that the cargo on the basis of which design temperature has been determined is cooled down as close to the design temperature as practicable.

(B) For design conditions basing on the corrosivity or extreme toxicity, omission of verification through the use of these cargoes in gas-trial may be accepted in case where experimental data and information to prove the compliance of the construction and equipment including structural materials have been submitted to the Society.

(3) The quantities of the real cargo and vapour used in the gas-trial and cargo full loading test referred to in the preceding (1) are to be sufficient to conducting the tests specified in (1) above.

(4) The cargo full loading test to capacity specified in the preceding (1)(B) may be conducted simultaneously with the gas-trial indicated in the preceding (1)(A).

(5) The survey items "at loading operation" specified in **Table 7.5.6** of the Guidance in the preceding (1)(B) may be substituted by the test items which were carried out during on board test and gas trial, and the survey items on "Condition of cargo tanks and other cargo containment

systems after full loading" may be confirmed when the inspection for "discharging operation" is carried out.

Table 7.5.5 Test Items at the Gas Trial

Test item	◎ : Attendance of the Surveyor ○ : Submittion of the record	Inspection equipme	Survey item
1. Drying test	○	· Inert gas generator	· Dew point · Change of dryness in cargo tanks and hold spaces
2. Inerting test	○	· Inert gas generator	· Operation of the inert gas generator · Measuring of atmosphere in cargo tanks
3. Inert gas purge test using cargo vapour	○	· Cargo vapourizer · Compressor	· Change of O_2/temperature of cargo vapour in cargo tanks · Quantity of cargo vapour (or liquid) supply · Capacity of the vapourizer · Capacity of the compressor
4. Cool-down test	◎/○	· Spray pump · Compressor · Cargo piping · Temperature indicators forcargo tank · Spray piping	· Temperature curve of cargo tanks[1)] · Inspection of hold spaces/condition of insulation of tanks (after cool-down) · Cooling condition of spray piping·Cooling condition of cargo piping · Capacity of spray pump · Cargo consumption · Capacity of compressor (property of return gas) · Temperature/pressure in cargo tank · Shrinkage of cargo tank[2)]
5. Loading test of cargo liquid	◎/○	· Compressor · Cargo piping related for loading · level gauge/temperature indicator	· Temperature/pressure level in cargo tanks · Temperature/pressure in hold spaces · Temperature/pressure of cargo liquid/gas at manifolds · Service condition of cargo piping
6. Operation test of cargo pump	◎/○	· All cargo pumps	· Discharge pressure/current of cargo pumps · Liquid level/pressure in cargo tanks · Stripping
7. Operation test of pressure/temperature control system	◎/○	· Depend on the type of controls	· Depend on the type of controls

Notes :
1) The Society may approve omission in consideration of the quality control status and manufacturing records of insulation materials.
2) To be verified only in case of independent tanks.

Table 7.5.6 Survey Items of Full Load Test

	Survey items
1. At loading operation	· Continuous loading rate · Actual operation of level, temperature, pressure indicator, etc. · Actual operation of alarm system[1)] · Actual operation of overflow control system[1)]
2. Condition of cargo tanks and other cargo containment systems after full loading	· Cargo tanks and supports · Hull adjacent to cargo tanks (cold spot) · Insulation capacity of cargo tanks and supports · Atmosphere in hold spaces
3. During voyage	· Insulation capacity of cargo tanks and supports · Cold spot on the construction adjacent to cargo tanks · Capacity of pressure/temperature indicator
4. At discharging operation	· Discharging rate · Other operation of discharging · Submitting/survey of related records without attendance for **3** above.
Note : 1) In case where implementation is difficult, the verification of operation may be made by suitable other method.	

10. Cold spot inspection

(1) The cold spot inspection of cargo tanks specified in **410. 16** of the Rules is to be carried out during the cargo full loading test to capacity specified in **410. 9** (1) for the membrane tank, semi-membrane tank, internal insulation tank, and when necessary, independent tank.

(2) The cold spot inspection of cargo tanks specified in the preceding (1) may be confirmed when the inspection for discharging operation is carried out.

11 Examination before and after the first loaded voyage (Only if the LNG Vessels)

In accordance with the requirements in 410. 14 & 16 of the Rules, it is preferred that Gas Trial and Cargo Loading Tests are finished at the shipyard, but either or both of these may be postponed until after entering into a voyage and the survey requirements are as follows

(1) First Loading (Considered to be full loading) :

(A) Priority to be given to latter stages of loading (approximately last 6 hours).

(B) Review cargo logs and alarm reports.

(C) Witness satisfactory operation of the following:

- Gas detection system.
- Cargo control and monitoring systems such as level gauging equipment, temperature sensors, pressure gauges, cargo pumps and compressors, proper control of cargo heat exchangers, if operating, etc.
- Nitrogen generating plant or inert gas generator, if operating.
- Nitrogen pressure control system for insulation, interbarrier, and annular spaces, as applicable.
- Cofferdam heating system, if in operation.
- Reliquefaction plant, if fitted.
- Equipment fitted for the burning of cargo vapors such as boilers, engines, gas combustion units, etc., if operating.

(D) Examination of on-deck cargo piping systems including expansion and supporting arrangements.

(E) Witness topping off process for cargo tanks including high level alarms activated during normal loading.

(F) Advise master to carry out cold spot examination of the hull and external insulation during transit voyage to unloading port.

(2) First Unloading :

(A) Priority to be given to the commencement of unloading (approximately first 4 - 6 hours).

(B) Witness emergency shutdown system testing prior to commencement of unloading.
(C) Review cargo logs and alarm reports.
(D) Witness satisfactory operation of the following:
- Gas detection system.
- Cargo control and monitoring systems such as level gauging equipment, temperature sensors, pressure gauges, cargo pumps and compressors, proper control of cargo heat exchangers, if operating, etc.
- Nitrogen generating plant or inert gas generator, if operating.
- Nitrogen pressure control system for insulation, interbarrier, and annular spaces, as applicable.
- On membrane vessels, verify that the readings of the cofferdam and inner hull temperature sensors are not below the allowable temperature for the selected grade of steel. Review previous readings.
- Cofferdam heating system, if in operation.
- Reliquefaction plant and review of records from previous voyage.
- Equipment fitted for the burning of cargo vapors such as boilers, engines, gas combustion units, etc., if operating.

(E) Examination of on-deck cargo piping systems including expansion and supporting arrangements.
(F) Obtain written statement from the Master that the cold spot examination was carried out during the transit voyage found satisfactory. Where possible, the surveyor should examine selected spaces.

12. Inspection of Secondary Barrier

With respect to the requirement of **410. 12**, it is to be verified that secondary barriers keep a specific level of tightness required in the system design in accordance with an appropriated procedures. For cargo containment system with glued secondary barriers, a tightness test are to be carried out in accordance with approved system designers' procedure before and after initial cool down and related values obtained in the test are to be recorded for the use as reference for periodical surveys. If significant differences in the results before and after cool down for each tank or between tanks or if other anomalies are observed, an investigation is to be carried out and additional testing such as differential pressure, thermographic or acoustic emissions testing is to be carried out as necessary. For containment systems with welded metallic secondary barriers, a tightness test after initial cool down is not required.

411. Stress relieving for type C independent tanks

1. Stress relieving by post-weld heat treatment

For the purpose of the requirements in **411. 1** of the Rules, the stress relieving is to be in accordance with the following requirements (1) to (3) :

(1) The post-weld heat treatment is to comply with the requirements in **Pt 5, Ch 5, 403.** of the Rules.
(2) For 9 % nickel steel, 5 % nickel steel and aluminium alloy 5083-O, post-weld heat treatment may, in general, be omitted.
(3) For cargo tanks made of carbon steel and carbon manganese steel with the design temperature of -10°C or more, the requirements in **Pt 5, Ch 5, 403.** of the Rules may be based upon except for cargo tanks anticipated to carry chlorine, ammonia and toxic cargoes.

Section 5 Process Pressure Vessels and Liquid, Vapour and Pressure Piping Systems

501. General

1. Process pressure vessels

(1) For the purpose of the requirements in **501. 2** of the Rules, "process pressure vessels" means the pressure vessels used for cargo operation, cooling, processing of boil-off gases and temporarily containing the cargo inside where heat exchangers are included. They, however, do not include those pressure vessels for refrigerant without containing cargo and parts of cargo pumps, compressors and valves subjected to internal pressure.

(2) Of those process pressure vessels referred to in the preceding (1), for the process pressure vessels that are not used for cargo storage, only the requirements in **404. 6** (1) and (2), **405. 1** (6) and **2, 409. 3, 410. 1, 2, 9, 10** (3), **11** and **18** and **411. 1** of the Rules apply.

502. Cargo and process piping

1. General

(1) For the purpose of the requirements in **502. 1** (1) of the Rules, "product and process piping" means the piping used for cargo operation, cooling, heating, processing and disposing of boil-off gases having a possibility of coming to contact with the cargo. The refrigerant piping which does not directly come to contact with the cargo is not included.

(2) For product and process piping referred to in the preceding (1), in addition to the requirements in **502.** to **505.** of the Rules and, the requirements **Pt 5, Ch 6** of the Rules apply where considered as necessary by the Society.

(3) For the purpose of the requirements in **502. 1** (3) of the Rules, for piping with design temperature lower than 5°C, the following requirements (A) to (C) are to be complied with to protect the hull structure.

(A) The branches of the piping are to be insulated for thermally separating them from the hull structure. However, in case where the materials of hull structures comply with the requirements given in **Table 7.5.7** of the Rules against the temperature obtained by heat transmission calculation in consideration of the design temperature of the piping, these requirements may be dispensed with.

(B) As a means of protection for hull structures against cargo leakage from the piping, drain pans or equivalent manufactured from the materials specified in **Table 7.5.5** and **Table 7.5.6** of the Guidance having sufficient capacity are to be arranged according to the design temperature of the piping at all locations where liquid leakage is likely.

(C) Drain pans or equivalent indicated in the preceding (B) are to be provided below all flange joints of liquid piping with design temperature not exceeding 55°C located outside the cargo tanks. However, in case where the arrangement is made in such a way that the hull structures do not reach dangerous temperature even in case of leakage from flanges, these requirements may be dispensed with.

(4) The materials of drain pans referred to in the preceding (3) (B) and (C) may be made such that they comply with the requirements of Korean Industrial Standards or recognized standards and are suitable for the design temperature of the piping system.

(5) For the purpose of the requirements in **502. 1** (4) of the Rules, the electrical bonding is to conform to the requirements of **Pt 6, Ch 1, 104.** of the Rules. In case where the gasketed flange joint are used, the flange bolts only are not considered as an earthing, and the connections and earthing are to be provided with earthing conductors. Also, in case where electrical bondings are necessary for cargo tanks and secondary barriers, such bondings are to be provided at readily accessible places.

(6) The "suitable means" referred to in the requirements in **502. 1** (5) of the Rules means the residual liquid discharging piping led to cargo tank, liquid cargo line or other drain tank.

(7) "All pipelines or components which may be isolated in a liquid full condition" referred to in the requirements in **502. 1** (6) of the Rules means, for example, those pipelines given in the following (A) and (B) :

(A) Pipeline between two adjacent stop valves.

(B) Pipeline between stop valve and compressor or pump likely to be liquid full. However, where the relief valve mounted on the compressor or pump is in effective condition, this requirement may be dispensed with.

(8) For the pipeline indicated in the preceding (7), a relief valve is to be provided irrespective of its design pressure. This relief valve is to be of approved one in accordance with the special requirements given by the Society.

(9) The "means to detect and dispose of any liquid cargo which may flow into the vent system" referred to in the requirements in **502. 1** (7) of the Rules means the fol1owing (A) and (B) (See **Fig 7.5.27** of the Guidance) :

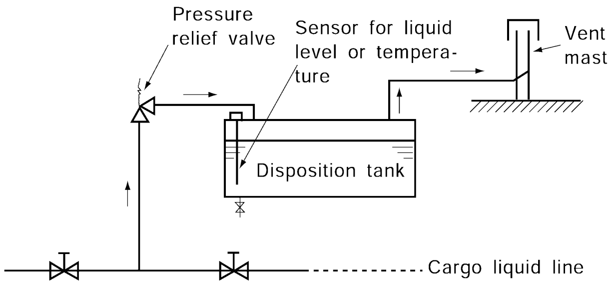

Fig 7.5.27 Example Means to Detect and Dispose of Any Liquid Cargo Which may Flow into the Vent System

(A) As a means to dispose of the liquid cargo, a tank with a capacity larger than those determined in the following (a) to (c) is to be provided. The material of the disposition tank is to be of equivalent to the liquid cargo piping or higher grade, and in the case of pressurized cargo tanks, consideration is to be given to the temperature drop due to expansion and evaporation.

(a) By assuming possible state of liquid full condition that may actually take place, the quantity of liquid cargo to be covered is to be determined.

(b) Due to heat input from the fire, the quantity of expansion for the quantity of liquid indicated in (a) above to rise from the initial temperature (normally, the minimum design temperature of the pipeline) to the temperature of vapour saturation at the set pressure of the relief valve is to be obtained and on the basis of which the quantity of the liquid to the disposition tank is to be determined.

(c) By giving consideration to the back pressure of the vent pipeline, the liquid phase quantity in the disposition tank of the inflow quantity obtained in the preceding (b) is to be computed to obtain the capacity.

(B) As a means for detecting liquid cargo, a high level alarm sensor or low temperature alarm sensor in case of low temperature cargo tanks, and a high level alarm sensor in case of pressure cargo tanks, are to be provided in the disposition tank and to issue alarm when the sensor functions.

2. Scantlings based on internal pressure

For the purpose of the requirements in **502. 2** of the Rules, the following requirements are to be complied with :

(1) The joint efficiency of electric-resistance welded pipes where non-destructive testing for full length of weld lines is not conducted is to be 0.85.

(2) For methane, propane, butane, butadiene and propylene cargoes, the corrosion allowance is to be 0.3 mm for carbon-manganese steel and 0 mm for stainless steel and aluminium alloys. Where effective corrosion control are taken for the interior of carbon-manganese steel pipes, the corrosion allowance may be 0.15 mm.

(3) In addition to the preceding (2), for carbon-manganese steel pipes arranged on open deck without any effective external corrosion control means, 1.2 mm is to be added to the required corrosion allowance.

(4) The negative manufacturing dimensional deviation in pipe thickness is, except for expressly provided otherwise, to be in accordance with the requirements in **Pt 2, Ch 1, 401. 7, 402. 7** and **404. 7** of the Rules.

3. Design pressure

(1) For the purpose of the requirements in **502. 3** (2) of the Rules, where design vapour temperature higher or lower than 45°C is employed, the requirements in **402. 6** (1) of the Rules apply.

(2) The "relief valve on a pipeline system" referred to in the requirements in **502. 3** (2) (F) of the Rules means the one which is approved in accordance with the special requirements given by the Society.

4. Permissible stress

(1) The "minimum wall thickness to be in accordance with recognized standards" referred to in the requirements in **502. 4** (2) of the Rules means the value corresponding to Schedule 40 of KS SPPS for carbon-manganese steel, and the value corresponding to Schedule 10 *S* for stainless steel. However, for steel pipes provided with effective corrosion control or those not arranged under corrosive environment, the value may be reduced to the extent acceptable to the Society with a limitation of 1 mm. Further, the value for pipes in cargo tanks and pipes having open ends may also be reduced to the extent acceptable to the Society.

(2) The cases where increase in pipe size is required according to the requirements in **502. 4** (3) of the Rules are the cases in which such becomes necessary on the basis of the results of stress analysis specified in the requirements in **502. 5** of the Rules, and in which suitable supports and means to absorb structural expansion and contraction can not be arranged due to convenience of on-deck piping, etc.

(3) As a presumption for the condition indicated in the preceding (2), the supports for piping are to be so arranged as to prevent exertion of the own weight of the pipe on valves or other fittings and to prevent generation of excessive vibration.

(4) For the purpose of the requirements in **502. 4** (4) of the Rules, fittings are to comply with the following requirements (A) and (B) :

(A) Valves, flanges and other fittings are to comply with the requirements of KS, ANSI or equivalent for their type and size, and the requirements in **Pt 5, Ch 6, 104.** of the Rules for flanges.

(B) The design pressure of bellows type expansion joints to be used in vapour piping may be taken 0.2 MPa for those provided on pipelines with open ends, and 0.5 MPa for those provided on other pipelines.

5. Stress analysis

(1) For the purpose of the requirements in **502. 5** of the Rules, the calculation conditions and allowable stress in the stress analysis are to be in accordance with the following requirements (A) through (E) as standard :

(A) As temperature condition, a state uniformly cooled down to the design temperature is to be considered. As the reference temperature (thermal stress = 0), 15°C is to be regarded as standard.

(B) Loading conditions are to be in accordance with the following requirements (a) through (d) :

(a) As internal pressure, the design pressure specified in the requirements in **502. 3** of the Rules is to be considered.

(b) The own weight of pipelines, when can not be neglected, is to be considered including its acceleration.

(c) As forced displacement, the forced strains corresponding to allowable sagging moment and hogging moment for the hull are to be considered.

(d) As thermal load, one which can be determined according to the condition indicated in the preceding (A) is to be considered.

(C) Support conditions are to be as deemed appropriate by the Society depending on the construction, arrangement and materials of the pipe supports.

(D) Allowable stresses are to be as deemed appropriate by the Society depending on the calculation method and materials of pipelines.

(E) Insulation materials are to be considered to give no contribution at all to the strength of the pipeline.

(2) According to the requirements in **502. 5** of the Rules, stress analysis may be required for pipings with the design temperature higher than -110°C where the following (A) to (C) are relevant :

(A) Where suitable supports or means to absorb structural expansion and contraction can not be arranged due to convenience of on-deck piping arrangement.
(B) Where new supporting method or new means to absorb expansion and contraction are used.
(C) Other cases where the Society deems necessary.

6. Materials

(1) For the purpose of the requirements in **502. 6** (1) of the Rules, the materials of pipings, valves and fittings are to comply with the relevant requirements in **Sec 6** of the Rules, and at the same time, to conform to the relevant requirements in **Pt 2, Ch 1** of the Rules. However, for materials used in pipings as specified in the following (A) through (D), those conforming to KS or other standards as deemed appropriate by the Society may be used where they comply with the requirements in Sec 6 of the Rules considering the temperature.
(A) Pipes, valves and pipe fittings used for cargo piping and process piping with the design pressure not exceeding 1.0 MPa and design temperature of 0°C or more.
(B) Valves and pipe fittings used for cargo piping and process piping with the design pressure not exceeding 3.0 MPa and design temperature of 0°C or more and nominal diameter less than 100 A.
(C) Pipes, valves and pipe fittings used for accessory piping or instrumentation piping with diameter not exceeding 25 mm irrespective of the design pressure and design temperature.
(2) Notwithstanding the requirements in the preceding (1), the piping having open ends not coming to contact with the liquid cargo led from the pressure relieving valves of cargo tanks and cargo piping or process piping with the design temperature of -55°C or higher may not be made of the steel for low temperature services specified in **Table 7.5.6** of the Rules. Further, its material may be such as to comply with KS or other standards as deemed appropriate by the Society.
(3) For the purpose of the requirements in **502. 6** (2) of the Rules, the insulation applied on the short pipes with a melting point lower than 925°C fitted to the cargo tank, except for the minimum range of area necessary for inspection and maintenance of pipe flanges, is to be protected according to the requirements specified in **409. 3** (2) of the Guidance. Further, the insulation materials for cargo piping and other piping are to conform to the requirements in **409. 4** (4) (B) of the Guidance.

503. Tests of piping components and pumps prior to installation on board

1. Requirements of type tests

(1) For the purpose of the requirements in **503. 1** (1) of the Rules, those valves which are relevant to the following (A) or (B) are to be approved in accordance with the requirements in the Guidance.
(A) All valves used for the cargo and process piping with the design temperature lower than -55°C.
(B) Those valves used for accessory piping or instrumentation piping of the design temperature lower than -55°C with an outside diameter exceeding 25 mm and normally come to contact with the cargo.
(2) For the purpose of the requirements in **503. 1** (2) of the Rules, all bellows type expansion joints provided on all cargo piping including the cargo liquid/vapour piping provided both inside and outside the tanks, and vent piping with open ends are to be of the approved ones in accordance with the special requirements given by the Society.

504. Piping fabrication and joining details

1. Application

According to the requirements in **504. 1** of the Rules, the requirements specified in **504. 2** to 6 of the Rules may be modified in accordance with the following (1) and (3) :
(1) For pipes provided inside the cargo tanks with open end excluding pump discharging pipings, the following requirements (A) to (C) apply :
(A) Butt welded joints with backing strips, sleeve joints and screw joints may be used in all cases.
(B) Slip-on and socket welded joints may be used in all cases.
(C) Non-destructive testing for butt welded joints may be omitted.

(2) For pipes with open ends provided outside the cargo tanks are to conform to the requirements specified in the preceding (1) (A) and (B), and in addition, the non-destructive testing for butt welded joints may be reduced to 10% sampling.

2. Connection of pipes without flanges

The "screwed couplings" referred to in the requirements in **504. 2** (3) of the Rules are to conform to the requirements of KS B 0222 or equivalent.

3. Flange connection

For the purpose of the requirements in **504. 3** (2) of the Rules, type and size of flange connections are to comply with the **Pt 5, Ch 6, Fig 5.6.1** of the Rules for the welded neck, slip-on and socket welded type as following requirements (1) to (3) :

The others except welding connection are to comply with the requirements of KS, ANSI or other standards as deemed appropriate by the Society for their type and size.

(1) Welded neck type : Type A in **Pt 5, Ch 6, Fig 5.6.1** of the Rules
(2) Slip-on welded type : Type B1 in **Pt 5, Ch 6, Fig 5.6.1** of the Rules
(3) Socket welded type : Type B2, B3 in **Pt 5, Ch 6, Fig 5.6.1** of the Rules

4. Welding, post-weld heat treatment and non-destructive testing

(1) For the purpose of the requirements in **504. 6** (2) of the Rules, the post-weld heat treatment of pipes with thickness less than 10 mm may be omitted except for those required in the requirements in **Pt 5, Ch 6, 105. 5** of the Rules.
(2) For the purpose of the requirements in **504. 6** (3) of the Rules, the radiographic testing method and the judgement for acceptance are to conform to the requirements in **Pt 5, Ch 6, 1204.** of the Rules.
(3) The "other non-destructive tests" referred to in **504. 6** (3) (B) of the Rules means the ultrasonic testing, and depending on use of pipes, magnetic particle testing or liquid penetrant testing, and the testing procedures are to conform to the requirements in KS D 0250, KS D 0213, KS B 0816.

505. Testing of piping on board

1. Application

For the purpose of the requirements in **505. 1** of the Rules, for pipes within the cargo tank and pipes with open ends, the hydraulic test and leak test specified in the requirements in **505. 2** and **3** of the Rules may be omitted. However, the hydraulic test specified in the requirements in **505. 2** of the Rules is to be conducted for pipes without open ends and discharging pipes provided inside the cargo tanks.

2. Leak test

For the purpose of the requirements in **505. 3** of the Rules, the leak test of pipelines is to be conducted at a pressure of 90 % of the design pressure of the pipings, The test pressure may be modified, when test is conducted with a liquid of high leak detecting ability.

3. Test under operating condition

For the purpose of the requirements in **505. 4** of the Rules, the test is to be conducted according to the requirements in **410. 9** of the Guidance.

506. Cargo system valve requirements

1. Stop valves fitted to the cargo tank

(1) For the purpose of the requirements in **506. 1** (1) and (2) of the Rules, no expansion joints are to be provided between the cargo tank and stop valves fitted to the cargo tank. "To be capable of local manual operation and provide full closure" referred to in the requirements means that the stop valve is fitted with manual operated closing means.
(2) For the purpose of the requirements in **506. 1** (2) of the Rules, the duplicated provisions of manual stop valve and emergency shutdown valve may be made in such a way as shown in

Fig 7.5.28 of the Guidance.

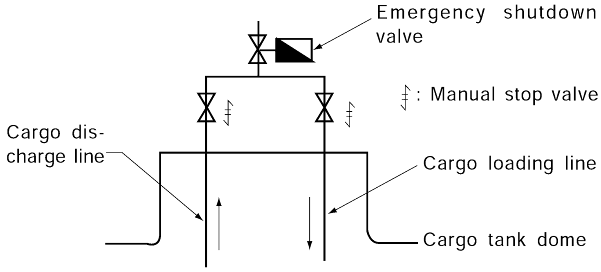

Fig. 7.5.28 Duplicate Provisions of Stop Valve and Emergency Shutdown Valve

2. Cargo hose connection

(1) The "connections not used in transfer operations" referred to in the requirements in **506. 3** of the Rules means those not used for cargo operation, for example, hose connection used for gas free operation. In this case, stop valve and blind flange are to be provided at the connection.
(2) For the purpose of the requirements in **506. 3** of the Rules, the connection between the cargo hose connection and shore line is to be electrically bonded.

3. Emergency shutdown valves

The emergency shutdown valves specified in **506. 4** of the Rules are to be in accordance with the following requirements (1) to (5) :

(1) In case where there is no cargo control room and no remote control of cargo operation is carried out, one of the remote control locations of the emergency shutdown valves is to be in the wheelhouse.
(2) The "fail-closed type" referred to in the requirement of the Rules is, for example, one of given in the following (A) and (B) :
  (A) The type in which the hydraulic or pneumatic pressure is solely used in valve opening motion, and the valve closing motion including the case of fail-closure is effected by spring or weight.
  (B) Where valve diameter is so large that both opening and closing motions of the valve are hydraulically or pneumatically effected, the operating oil or air in the fail-closure operation is to be supplied from a specially provided accumulator and the system setup is to comply with the following requirements (a) to (c) :
    (a) The valve operating cylinder may be used for both ordinary motion and fail-closure motion, but the hydraulic or pneumatic line from the special accumulator for fail-closure operation to the valve operating cylinder is not to serve commonly with those for ordinary valve operation. Further, no stop valve is to be provided on the hydraulic or pneumatic line for fail-closure.
    (b) The capacity of a special accumulator for fail-closure operation is to be sufficient to operate, at least, twice all the emergency shutdown valves. However, when a special accumulator is connected to the emergency shutdown valves of the same type provided on both sides of the ship, it may be made in such a way that the emergency shutdown valves on one side is operated twice.
    (c) Alarm is to be given in the event of loss of hydraulic or pneumatic pressure for ordinary valve motion and activation of fail-closure operation.
(3) To "be capable of local manual closing operation" referred to in the requirements of the Rules means the one which can be directly manually closed, and in addition those shutdown by manual release of hydraulic pressure or pneumatic pressure or shutdown by manual pump.
(4) To "fully close under all service conditions within 30 s of actuation" referred to in the requirements of the Rules means that the emergency shutdown valve assumes the completely closed within 30 s from the issuance of closing signals of the valve. This provision may not apply to the manual emergency shutdown valves given in the preceding (3).
(5) No stop valve is to be provided on the hydraulic or pneumatic line for closing the emergency shutdown valve.

507. Ship's cargo hoses

1. General

For the purpose of the requirements in **507.** of the Rules, the cargo hoses carried by the ship are to be one of given in the following (1) to (3) :

(1) Accepted ones by either preliminary survey in accordance with Ship Safety Act or inspection in accordance with the requirements of type approval
(2) Accepted ones by an inspection organization recognized by the Society
(3) Approved ones in accordance with the requirements of the Guidance

508. Cargo transfer methods

1. Cargo transfer installations

(1) For the purpose of the requirements in **508. 1** of the Rules, when the cargo transfer methods are of the submerged pumps or by deep well pumps, standby cargo pump or the cargo transfer installations according to the requirements in **508. 2** of the Rules are to be provided.
(2) The standby cargo pump referred to in the preceding (1) may be such as to conform to the following requirements :
  (A) Where two sets or more cargo pumps are provided in one cargo tank, the provision of standby cargo pump may be omitted even when both of them are normally subjected to simultaneous operation. Where cargo tank of such a construction that it is separated by a bulkhead and connecting holes or bulkhead valve with remote control are not provided, each such tank separated by the bulkhead is to be regarded as one cargo tank.
  (B) The stripping pump may be regarded as a standby cargo pump.
  (C) The eductor may be regarded as a standby cargo pump. In this case, however, care is to be taken so that even when cargoes of different kinds are carried simultaneously, the driving fluid is available at all times.
(3) The cargo pumps specified in the requirements in **508. 1** of the Rules are to be approved in accordance with the requirements of the Guidance.

2. Cargo transfer by gas pressurization

(1) The "gas pressurization" referred to in the requirements in **508. 2** of the Rules means, for example, to pressurize the cargo tank with cargo vapour pressurized by cargo compressor or cargo heater.
(2) The compressor referred to in the preceding (1) is to be approved in accordance with the Guidance.

Section 6 Materials of Construction

601. General

1. Mechanical properties

For the purpose of the requirements in **601. 5** of the Rules, the required values of tensile strength, yield stress and elongation of a material are to be in accordance with the requirements in **Pt 2, Ch 1** of the Rules applicable to the material.

2. Alternative materials

When the design temperature of a material falls under the higher temperature range than the specified one for the material in **Table 7.5.5** and **Table 7.5.6** of the Rules, the impact test temperature given in **Table 7.5.3** to **Table 7.5.6** of the Rules correspondingly to the design temperature may be used instead of the impact test temperature depending on the material. For example, in the case of 2.25 % nickel steel pipes used at the design temperature of -45°C, the impact test temperature may be -50°C, while in the case of 3.5 % nickel steel plates used at the design temperature of -61°C, the impact test temperature may be -70°C.

3. Properties after post-weld heat treatment

For the purpose of the requirements in **601. 8** of the Rules, when post-weld heat treatment is carried out, the properties of the base material are to be in accordance with the requirements given in **Table 7.5.3** to **Table 7.5.6** of the Rules in the heat treated condition or equivalent condition whether such post-weld heat treatment is regarded in **411.** or **504. 6** (2) of the Rules or not. The welds properties at welding procedure qualification tests and production weld tests specified in the requirements in **603.** of the Rules are to satisfy the requirements in **603. 4** and **6** of the Rules in the heat treated condition.

602. Material requirements

(1) For the purpose of the requirements in **Table 7.5.3** of the Rules, the following requirements are to be complied with :
   (A) The use of the longitudinally or spirally welded pipes given in the Note (1) of the Table is to be in accordance with the relevant requirements in **Pt 2, Ch 1, Sec 4** of the Rules.
   (B) Fittings of type C independent tanks and process pressure vessels with the design pressure not exceeding 3.0MPa and design temperature of 0°C or more and nominal diameter less than 100A given in Note (1) may comply with the requirements of KS or other standards as deemed appropriate by the Society.
   (C) The controlled rolling as a substitution for normalizing given in Note (2) may be of the temperature controlled rolling or Thermo-Mechanical Controlled Processing (TMCP). Also, the controlled rolling as a substitution for tempering and quenching may be of TMCP.
(2) The controlled rolling as a substitution for normalizing or tempering and quenching given in Note (4) of **Table 7.5.4** of the Rules may be of TMCP.
(3) For the purpose of the requirements in **Table 7.5.5** of the Rules, the following requirements are to be complied with :
   (A) For the purpose of the requirements in Note (2) of the Table, aluminium alloy of 5083, austenitic stainless steel, 36 % nickel steel and 9 % nickel steel may be used at the design temperature up to 196°C.
   (B) For the purpose of the requirements in Note (4) of the Table, the chemical composition limit of a material, if the material specified in **Pt 2** of the Rules, is to be in accordance with the relevant requirements in **Pt 2, Ch 1** of the Rules.
   (C) For the purpose of the requirements in Note (7) of the Table, the omission of the impact test given in Note (7) of the Table may generally be accepted for the austenitic steel of the type referred to in the Table.
(4) For the purpose of the requirements in **Table 7.5.6** of the Rules, the following requirements are to be complied with :
   (A) The use of vertically or spirally welded pipes given in Note (1) of the Table is to be in accordance with the requirements in the preceding (1) (A).
   (B) The requirements for forgings and castings given in Note (2) of the Table are to be in ac-

cordance with the relevant requirements in **Pt 2, Ch 1** of the Rules if specified.
(C) For the design temperature given in Note (3) of the Table lower than -165°C, the provision in the preceding (3) (A) are to apply.
(D) The chemical composition limit given in Note (5) of the Table is to be in accordance with the requirements in the preceding (3) (B).
(E) The omission of the impact test given in Note (8) of this Table are to be in accordance with the requirements in the preceding (3) (C).

603. Welding and non-destructive testing

1. General

(1) The requirements in **603.** of the Rules apply to independent tanks, semi-membrane tanks, process pressure vessels, integral tanks and piping. The requirements on membrane tanks, are to the satisfaction of the Society depending on the structural type of the tank.
(2) For the purpose of the requirements in **603. 6** of the Rules, the following requirements (A) and (B) are to be complied with.
(A) The impact test may generally be omitted for austenitic stainless steels of types given in **Table 7.5.5** and **Table 7.5.6** of the Rules.
(B) The impact test may generally be omitted for aluminum alloys of 5083 and welding material of 5183.

2. Welding procedure qualification tests of cargo tanks and process pressure vessels

For the purpose of the requirements in **603. 3** (2) of the Rules the following requirements are to be complied with :

(1) Longitudinal bend tests which are required in lieu of transverse bend tests in the case where the base material and weld metal have different strength level specified in **603. 3** (2) (B) of the Rules, such as 9 % nickel steel, are to be in accordance with the requirements in **Pt 2, Ch 2, 402.** of the Rules.
(2) For the purpose of the requirements in **603. 3** (2) (D) of the Rules, for type C independent tanks and process pressure vessels, macroscopic and microscopic examinations and hardness tests are to be carried out according to the requirements of the Rules. For other independent tanks, integral tank and semi-membrane tanks, macroscopic examinations are to be carried out according to the requirements in **Pt 2, Ch 2, Sec 4** of the Rules.

3. Test requirements

(1) For the purpose of the requirements in **603. 4** of the Rules, the welding procedure qualification test are also to comply with the relevant requirements in **Pt 2, Ch 2, Sec 4.** and **Pt 5, Ch 5, Sec 4** of the Rules.
(2) For the purpose of the requirements in **603. 4** (1) of the Rules, the transverse tensile strength of weld metal which has lower tensile strength than that of the parent metal, e.g. in the case of 9 % nickel steel, is to comply with the requirements in **Pt 2, Ch 2, 402. 5** of the Rules.
(3) For the purpose of the requirements in **603. 4** (2) of the Rules, bend tests are also to comply with the requirements in **Pt 2, Ch 2, 402. 6** of the Rules. In case where the base metal is of RLP9 specified in **Pt 2, Ch 1** of the Rules, bend tests may be omitted.
(4) For the purpose of the requirements in **603. 4** (3) of the Rules, the test temperature of impact tests may be determined in accordance with the requirements in **601. 2** of the Guidance.

4. Welding procedure qualification tests for piping

For the purpose of the requirements in **603. 5** of the Rules, welding procedure qualification tests for pipes are also to be in accordance with the relevant requirements in **Pt 2, Ch 1** and **Pt 2, Ch 2, Sec 4** of the Rules.

5. Production weld tests

(1) For the purpose of the requirements in **603. 6** of the Rules, production weld tests are also to be in accordance with the relevant requirements in **Pt 2, Ch 2, Sec 3** of the Rules and **Pt 5, Ch 5, 405.** of the Rules.
(2) For the purpose of the requirements in **603. 6** (1) of the Rules, the number of test specimens for production weld tests of secondary barriers may be reduced to the extent as deemed appropriate by the Society considering the experience of same welding procedures in past, workman-

ship and quality control. In general, intervals of production weld tests for secondary barriers may be approximately 200 mm of butt weld joints and the tests are to be representative of each welding position.

(3) For the purpose of the requirements in **603. 6** (4) of the Rules, number of test specimens for the production weld tests for integral tanks may be reduced to the same level as in the case of secondary barrier given in the preceding (2). Production weld tests for membrane tanks are left to the discretion of the Society depending on the construction system of the tank.

6. Non-destructive testing

(1) For the purpose of the requirements in **603. 7** (1) of the Rules, the following requirements are to be complied with.

(A) For the non-destructive tests specified in the requirements in **603. 7** (1) (B) of the Rules for the remaining welds of tank plates of type A and B independent tanks and semi-membrane tanks other than butt welds, fillet welds of highly stressed parts of main structural members of cargo tanks are to be examined magnetic particle or dye penetrant tests given in the following (B). Butt welds of highly stressed parts of main structural members such as face plates of girders are to be subjected to radiographic test given in the following (B).

(B) The following requirements (a) through (d) are to apply as the testing procedures and acceptance criteria for the non-destructive tests referred to in the requirements in **603. 7** (1) (C) of the Rules :

(a) For radiographic tests, the test may be in accordance with the requirements in KS B 0845, ISO 2437, ISO 2504 and ISO/R1027 where the acceptance criteria are to be KS Grade 2 or higher. In the case of KS Grade 3, acceptance is left to the discretion of the Society in consideration of the importancy of the structural members and nature of defects, etc.

(b) For ultrasonic tests, the requirements in KS D 0250 apply correspondingly.

(c) For magnetic particle test, the requirements in KS D 0213 apply correspondingly.

(d) For dye penetrant tests, the requirements in KS B 0816 apply correspondingly.

(C) Where ultrasonic tests are performed as a substitution for radio-graphic tests according to the requirements in **603. 7** (1) (C) of the Rules, at least 10 % of the whole testing objects are to be subjected to radiographic tests.

(2) For the purpose of the requirements in **603. 7** (3) of the Rules, the welding inspection procedures and acceptance criteria for integral tanks are to comply with the requirements in **603. 7** (1) (A) of the Rules correspondingly. The procedures and criteria for membrane tanks are to be to the satisfaction of the Society, depending on the structural type of the tanks.

(3) For the purpose of the requirements in **603. 7** (6) of the Rules, the radio-graphic tests of secondary barriers where the hull structure acts as the secondary barrier are to be performed for the double bottom tank top platings and bulkhead platings in accordance with the requirements for shell platings of ordinary ships specified in **Pt 2, Ch 2, 309.** of the Rules.

Section 7 Cargo Pressure/Temperature Control

701. General

1. Means of control

The "system allowing the product to warm up and increase in pressure" referred to in the requirements in **701. 1** (3) of the Rules means the pressurized cargo tanks which are, in general, accepted for ships with limited area of service. The ambient design temperature and period of voyage as the design conditions of the system are to be to the satisfaction of the Society in consideration of the sea and weather conditions of the service area, and where necessary, possible extension of voyage for sheltering from heavy weather.

2. Design requirement of the systems

(1) For the purpose of the requirements in **701. 2** of the Rules, the cooling system is to comply with the following requirements (A) to (C) :
- (A) For the refrigerating plant, the following requirements (a) and (b) are to be complied with :
  - (a) In the case of indirect system, the relevant requirements in **Pt 9, Ch 1** of the Rules are to be complied with.
  - (b) In the case of the direct system, the following requirements (i) through (vii) are to be complied with :
    - (i) The construction of compressors is to be such that causes only a small amount of gas leakage and without sparks.
    - (ii) A relief valve or overpressure preventing device is to be provided on the discharge from the compressor. However, when overpressure is unlikely, this requirement may be dispensed with. The vent pipe of the relief valve of the compressor is to be led to the vent system specified in the requirements in **802. 9** of the Rules.
    - (iii) A pressure gauge is to be provided on the discharge side of the compressor.
    - (iv) Means to avoid the entry of cargo liquid into the compressor are to be provided.
    - (v) The requirements in **Pt 9, Ch 1, 401.** and **404. 1** of the Rules apply correspondingly.
    - (vi) The temperature of the cooling sea water used in the calculation of capacity of the refrigeration plant is to be the ambient sea water temperature specified in **701. 2** of the Rules.
    - (vii) The compressors and heat exchangers are to be approved in accordance with the requirements of the Guidance.
- (B) For pressure vessels and pipings, the requirements in **501. 2** and **502.** of the Rules and **501. 1** and **502. 1** (1) of the Guidance are to be complied with.
- (C) For pressure relief valves, level gauges and other fittings, the relevant requirements in **Secs 5, 8** and **13** of the Rules apply correspondingly as necessary.

(2) The increments/decrements of design ambient temperature specified in the requirements in **701. 2** of the Rules are to be in accordance with **402. 3** of the Guidance.

(3) The maximum temperature of steam and heating media within the cargo area is to be adjusted to take into account the temperature class of the cargoes.

3. Design requirement for dangerous cargoes

The "certain highly dangerous cargoes specified in **Sec 17**" referred to in **701. 3** of the Rules means the cargoes to which **1703. 2** of the Rules applies as required in column h in Table of **Sec 19** of the Rules.

702. Refrigeration systems

1. Stand-by unit and heat exchanger

For the purpose of the requirements in **702. 1** of the Rules, the stand-by unit of the refrigeration system and stand-by heat exchangers are to comply with the following requirements :

(1) The stand-by refrigeration system referred to in the requirements of the Rules does not include heat exchanger.

(2) Where the whole necessary capacity is shared by multiple sets of units, the capacity of the stand-by unit may be made in such a way that it compensates the capacity of one unit having

the largest capacity among others.

(3) Where the refrigeration plants are all driven by electric motors, electrical supply to the motors is to be fed from two or more generators.

(4) The piping of the stand-by heat exchangers may, for example, be made as given in **Fig 7.5.29** of the Guidance. In this case, the total capacity of the heat exchangers including stand-by unit is to be 125 % or more of the maximum requirement.

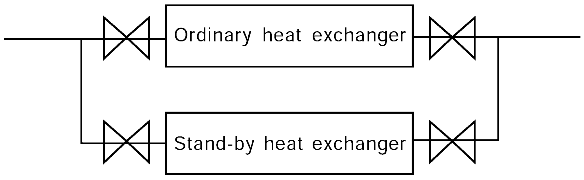

Fig. 7.5.29 The Example Piping of the Stand-by Heat Exchanger

2. Requirement for carrying simultaneously cargoes or chemical reaction

The "cargoes which may react chemically in a dangerous manner" referred to in **702. 2** (1) of the Rules means those cargoes in combination as given in **Table 7.5.7** of the Guidance. For other cargoes not given in this Table, except for those given in the notes of the Table, decision is to be taken in each case upon investigating the physical properties.

Table 7.5.7 Cargoes Which may React Chemically in a Dangerous Manner

Group No.	Groups	Product name								
6	Ammonia	Ammonia, anhydrous	6							
7	Aliphatic amines	Dimenthylamine Monoethylamine		7						
16	Alkylene oxides	Propylene oxide	*H*	*H*	16					
19	Aldehydes	Acetaldehyde	*H*	*H*		19				
30	Olefines	Butadiene Ethylene Propylene Butylene Methyl acetylene -propadiene alxtures					30			
31	Paraffins	Butane Ethane Methane (LNG) Propane						31		
35	Vinyl halides	Vinyl chloride							35	
36	Halogenated hydrocarbons	Ethyl chloride Methyl bromide Methyl chloride								36

Notes:
1. [H] in Table denotes possibility of dangerous reaction whereas blank column signifies no possibility of such reaction.
2. In general, chlorine and ethylene oxide are to be individually refrigerated or not carried together with other cargo.
3. Nitrogen has no danger of reacting with other cargo.

3. Cooling water

(1) "Any other essential service" referred to in the requirements in **702. 3** of the Rules means water supply to equipment necessary for propulsion, discharge of bilges, ballasting/deballasting and fire services specified in **Pt 5, Ch 1, 102. 1** of the Guidance. The service for the water spray system specified in the requirements in **1103.** of the Rules is to be included therein.

(2) In case where the stand-by cooling pump is used for service common to that given in the preceding (1), the capacity of this pump is not to be less than the total capacity of the maximum cooling requirement and the necessary capacity for the particular service.

4. Type of refrigeration system

The "certain cargoes specified in **Sec 17**" referred to in the requirements in **702. 4** (1) and (3) of the Rules means those cargoes to which the application of the provisions of **1704. 1** of the Rules is required in column h in Table of **Sec 19** of the Rules.

5. Heat Exchange

For the purpose of the requirements in **702. 5** of the Rules, the compressors for the refrigerant and other equipment that directly handle the refrigerant are, as a rule, to be installed within the cargo area. However, in case where proper means of detecting the leakage of the cargo into the refrigerant and shutting-off the inflow of the leaked cargo to the spaces outside the cargo area after the detection of leakage is established depending on the possibility of cargo leakage into the refrigerant pipes within the heat exchangers, this requirement may be dispensed with.

Section 8 Cargo Tank Vent System

801. General

For the purpose of the requirements in **801.** of the Rules, the pressure relief system of hold spaces is to be in accordance with the following requirements :

(1) In hold spaces not regarded as the interbarrier space and in case where environmental control within the space is required in accordance with the provisions in **902.** and **903.** of the Rules, one or more pressure relief systems of sufficient capacity are to be provided. The set pressure of those pressure relief systems is to be so set as not to exceed the design pressure of the cargo containment system and hull construction under the condition of dry air sealing, inerting or voyaging. The location of the vent discharge outlet to which the exhaust from the pressure relief systems is to be in accordance with the requirements in **Pt 5, Ch 6, 201. 5** of the Rules, and in addition, consideration is to be given so as not to cause the inert gas to accumulate on deck.

(2) The pressure relief system of hold spaces regarded as the interbarrier space or part thereof is to conform to the requirements in **802. 2** of the Guidance.

(3) The evaluation of the adequacy of type C independent tank vent system is to be in accordance with requirements in IMO Res. A. 829(19).

802. Pressure relief systems

1. Pressure relief system for interbarrier spaces

(1) The "pressure relief devices to the satisfaction of the Society" referred to in the requirements in **802. 2** of the Rules means pressure relief valves, rupture discs or equivalent. Two or more of them in combination are to be provided in each space to be covered.

(2) When only pressure relief valves are provided as the pressure relief devices given in the preceding (1), the following requirements (A) and (B) are to be complied with :

(A) In case where the cargo tank is of the type A independent tank, semi-membrane tank provided with complete secondary barrier, membrane tank or integral tank, the following requirements (a) and (b) are to be complied with :

(a) The capacity of the pressure relief system is to be sufficient to relieve the greater of the maximum supply capacity of the inerting system and dry air supply system or the estimated volume of cargo evaporation in an event of failure of the cargo tank.

(b) Pressure relief valves are to be in accordance with the requirements in **802. 3** of the Guidance.

(B) In case where the cargo tank is of the type B independent tank or semi-membrane tank provided with partial secondary barrier, the following requirements (a) and (b) are to be complied with :

(a) The capacity of pressure relief device is to be in accordance with the preceding (A) (a).

(b) Pressure relief valves may not be such as being approved in accordance with the requirements in **802. 3** of the Guidance. However, they are to be equivalent to those complying with the requirements for PV valves in **Pt 7, Ch 1, 1004. 1** of the Guidance.

(3) When, as a pressure relief device referred to in the preceding (1), pressure relief valve and rupture disc are provided in combination, they are to conform to the following requirements (A) to (C) for the cargo tank types indicated in the preceding (2) (A) :

(A) The capacity of the pressure relief valve is to be sufficient to relieve the maximum supply capacity of the inerting system.

(B) Pressure relief valves are to be in accordance with the requirements in the preceding (2) (B) (b).

(C) The capacity of rupture disc is to be sufficient to relieve the volume of cargo evaporation in an event of failure of the cargo tank, and the construction is to be as deemed appropriate by the Society.

(4) The relieving capacity of pressure relief devices for interbarrier spaces is to be determined as followings :

(A) The combined relieving capacity of the pressure relief devices for interbarrier spaces surrounding type A independent cargo tanks where the insulation is fitted to the cargo tanks may be determined by the following formula :

$$Q_{sa} = 3.4 A_c \frac{\rho}{\rho_v} \sqrt{h} \quad (\mathrm{m^3/s})$$

where:

Q_{sa} : minimum required discharge rate of air at standard conditions of 273K and 0.1013 MPa

A_c : design crack opening area ($\mathrm{m^2}$), $\pi\delta\, l/4$

δ : maximum crack opening width (m), 0.2 t

t : thickness of tank bottom plating (m)

l : design crack length equal to the diagonal of the largest plate panel of the tank bottom (m), see **Fig 7.5.30** of the Guidance

h : maximum liquid height above tank bottom plus 10·MARVS (m)

ρ : density of product liquid phase at the set pressure of the interbarrier space relief device ($\mathrm{kg/m^3}$)

ρ_v : density of product vapour phase at the set pressure of the interbarrier space relief device and a temperature of 273 K ($\mathrm{kg/m^3}$)

(B) The relieving capacity of pressure relief devices of interbarrier spaces surrounding type B independent cargo tanks may be determined on the basis of the preceding (A). However, the leakage rate is to be determined in accordance with **407. 6** (1) of the Rules.

(C) The relieving capacity of pressure relief devices of interbarrier spaces of membrane and semi-membrane tanks is to be evaluated on the basis of specific membrane or semi-membrane tank design.

(D) The relieving capacity of pressure relief devices of interbarrier spaces adjacent to integral type cargo tanks may, if applicable, be determined as for type A independent cargo tanks.

(E) Interbarrier space pressure relief devices in the scope of this paragraph are emergency devices for protecting the hull structure from being unduly overstressed in case of a pressure rise in the interbarrier space due to primary barrier failure. Therefore, such devices need not comply with the requirements in **802. 9** and **802. 10** of the Rules.

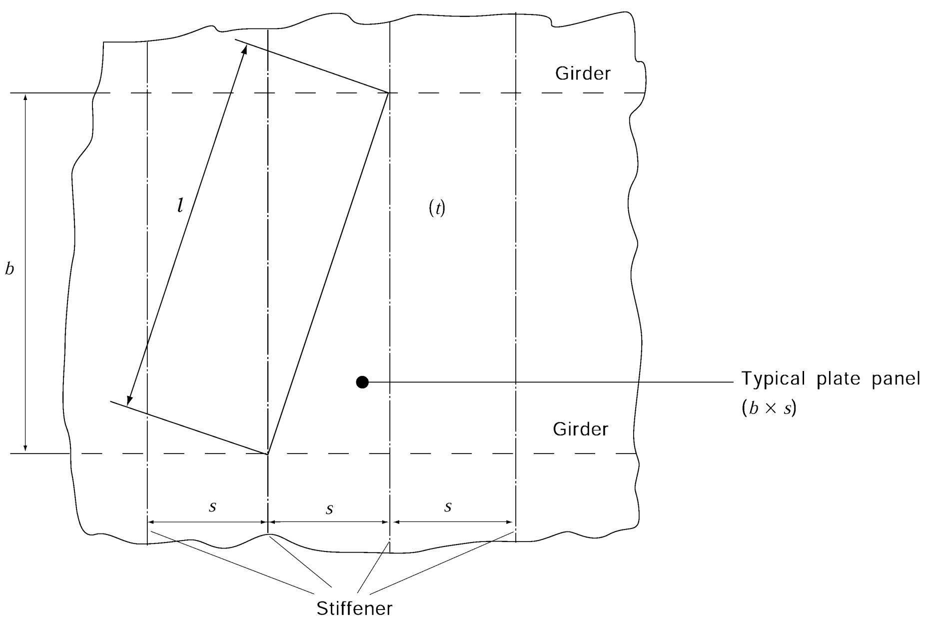

Fig. 7.5.30 The Example Size of Tank Bottom Plate

2. Arrangement of pressure relief valves

For the purpose of the requirements in **802. 4** of the Rules, for the cargo tank with the design temperature lower than 0°C, it is to be verified through temperature distribution calculation, etc. that the valve would not freeze or it is provided with anti-freezing construction. In ships where the requirements in **Pt 3, Ch 20** of the Rules apply or ships regularly navigate through the sea of cold zone, the pressure relief valves are to have satisfactory proved function under freezing condition or to be provided with heating system to prevent functional inability due to freezing.

3. Capacity of pressure relief valves

For the purpose of the requirements in **802. 5** of the Rules, pressure relief valves to be provided in cargo tanks, cargo piping and interbarrier spaces, as necessary, are to be approved in accordance with the Guidance for Approval of Manufacturing Process and Type Approval, etc.

4. Changing of set pressure of relief valves

The means as "necessary for isolating the valves not in use from the cargo tank" referred to in **802. 6** of the Rules means, for example, the arrangement as shown in **Fig 7.5.31** of the Guidance.

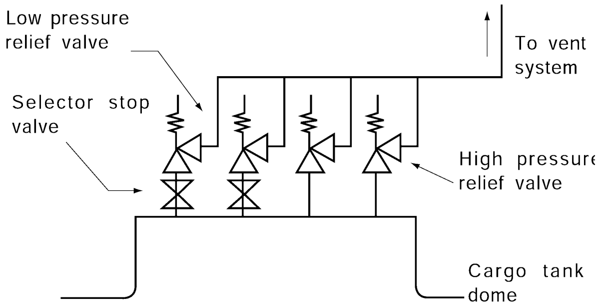

Fig. 7.5.31

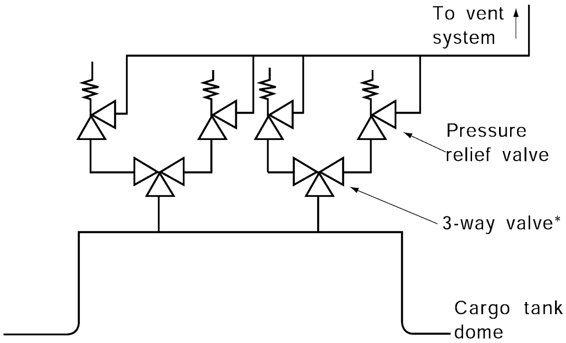
5. Stop valves between tanks and pressure relief valves

(1) For the purpose of the requirements in **802. 8** of the Rules, no stop valve is to be provided in the vent piping on the downstream of the pressure relief valve.

(2) The "suitable arrangements" referred to in the requirements in **802. 8** (1) of the Rules means, for example, the arrangement as shown in **Fig 7.5.31** of the Guidance, the arrangement through transfer of the 3-way valve as shown in **Fig 7.5.32** of the Guidance or by stop valve of inter-locking type.

(3) The "suitably maintained spare valve" referred to in the requirements in **802. 8** (3) of the Rules means, for example, valves of the same type and capacity of valve ① and valve ② in the arrangement as shown in **Fig 7.5.33** of the Guidance. In this case, if valve ① and valve ② are of the completely same type and capacity, only one set of such spare may be accepted.



* : 3-way valve in which the direction of opening is indicated where means are provided to prevent any intermediate valve position

Fig. 7.5.32

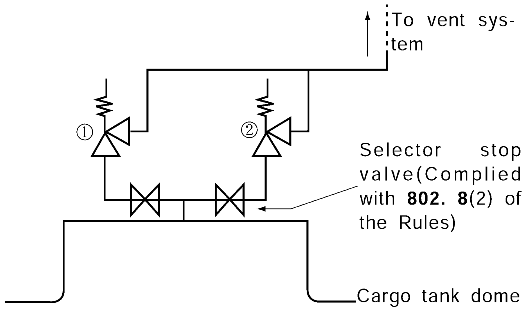


Fig. 7.5.33

6. Venting system

(1) To "be so constructed that the discharge of gas will be directed upwards and so arranged as to minimize the possibility of water or snow entering the vent system" referred to in the requirements in **802. 9** of the Rules means for example, as shown in **Fig 7.5.34** of the Guidance.
(2) For the purpose of the requirements in **802. 9** of the Rules, the height of the vent discharge outlet is to be measured from the exposed deck at the place where the vent mast is provided.

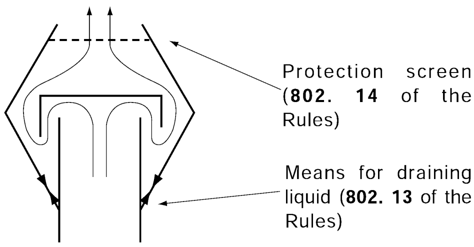

Fig. 7.5.34 Example of Construction of Vent Discharge Outlet

7. Arrangement of vent exits

For the purpose of the requirements in **802. 10** of the Rules, the distance to the vent discharge outlet is to be measured horizontally.

8. Arrangement of all other cargo vent exits

For the purpose of the requirements in **802. 11** of the Rules, the arrangements of other vent discharge outlet are to be in accordance with following requirements (1) to (3) :

(1) Vent discharge outlets from the gas fuel piping specified in **1603. 6** of the Rules are to be in accordance with the requirements in **802. 9** and **10** of the Rules.
(2) Vent discharge outlets shown in the following (A) and (B) are to be arranged at a horizontal distance not less than 10 m from the nearest air intakes, discharge outlets or opening to accommodation spaces, service spaces and control stations, or other gas-safe spaces.
   (A) Vent discharge outlet of the discharge gas from gas detecting system specified in the requirements in **1306. 5** (2) of the Rules.
   (B) Discharge outlet specified in the requirements in **1603. 5** of the Rules
(3) Vent discharge outlets from pressure relief valves or rupture discs of interbarrier spaces are to be installed in gas dangerous zones.

9. Pressure relief system for carrying incompatible cargoes simultaneously

The "separate pressure relief system" referred to in the requirements in **802. 12** of the Rules means the independent vent system including an independently provided pressure relief valve. In this case, no specific requirement is provided on the distance between vent discharge outlets.

10. Means for draining of vent piping system

For the purpose of the requirements in **802. 13** of the Rules, drain plugs or drain cocks are to be provided at places, such as vent post bottoms and bend parts of vent pipes, where drains are likely to accumulate.

11. Protection screens on vent outlets

The "protection screens" referred to in the requirements in **802. 14** of the Rules means wire gauze of 13 mm × 13 mm mesh or below with suitable strength against falling objects.

12. The "special guidelines" referred to in **802. 18** of the Rules means **Annex 7A-2.**

803. Additional pressure relieving system for liquid level control

1. Requirement of additional pressure relieving systems

The words "to prevent the tank from becoming liquid full" contained in **803. 1** of the Rules have the meaning that at no time during the loading, transport or unloading of the cargo including fire conditions will the tank be more than 98 % liquid full, except as permitted by the requirements in **1501. 3** of the Rules.

804. Vacuum protection systems

1. Fitting of vacuum protection systems

(1) For the purpose of the requirements in **804. 2** (1) of the Rules, the means to stop all suction of the cargo liquid or cargo vapour may be by shutting off valves or stopping the equipment provided that they are automatically operated.
(2) For the purpose of the requirements in **804. 2** (2) of the Rules, the vacuum relief valve is to conform to the requirements in **802. 5** of the Rules and to be approved in accordance with the Guidance. However, means as specified in the requirements in **804. 2** (1) or (3) of the Rules are to be provided, and where vacuum relief valve adjusted to function at a pressure lower than such means is provided as an additional device, the requirements may be dispensed with for this vacuum relief valve as an additional means.

2. Requirement of vacuum protection systems

For the purpose of the requirements in **804. 3** of the Rules, vacuum relief valves are to be in accordance with the following requirements (1) and (2) :

(1) Only for cases where vacuum relief valves adjusted to a set pressure lower than the operating pressure of the device specified in the requirements in **804. 2** (1) or (3) of the Rules, are provided for additional means of the devices, it may be accepted to admit the air to be introduced into the tank even in case of flammable cargoes except for the cases specified in the relevant requirements in **Sec 17** of the Rules.
(2) The air suction opening for the vacuum relief valve as an additional device indicated in the preceding (1) may be made in such a way that the requirements in **802. 9** and **10** of the Rules do not apply. However, the requirements in **Pt 5, Ch 6, 201. 5** of the Rules are to be complied with, and the construction of the suction opening is, for example, to be as shown in **Fig 7.5.34** of the Guidance.

805. Size of valves

1. Size of valves

For the purpose of the requirements in **805. 2** of the Rules, the fire exposure factor is to be in accordance with the following requirements (1) through (4) :

(1) The insulation materials used at exposed spaces when F = 0.5 are to conform to the requirements in **409. 3** (2) of the Guidance.
(2) In the case of integral tanks, F = 0.1.
(3) The fire exposure factor of the tank which partially protrudes beyond the tank cover having the

fire integrity equivalent to the deck and deck structure is to be of such a value as obtained by proportional distribution of cargo tank surface areas above and below the deck or tank cover.

(4) In case where hold spaces filled with dry air is accepted for semi-membrane tanks provided with partial secondary barriers in accordance with the requirements in **902. 2** (2) of the Rules, F = 0.2.

Section 9 Environmental Control

901. Environmental control within cargo tanks and cargo piping systems

1. Gas-free and purge systems of cargo tanks

For the purpose of the requirements in **901. 1** of the Rules, the design and arrangement of gas-freeing and purging piping systems of cargo tanks are to be in accordance with the following requirements (1) and (2) :

(1) For installation of piping and fixing of pipe fittings in cargo tanks, sufficient consideration is to be taken for possible transient temperature differential.
(2) The effectiveness of replacement of cargo tank atmosphere is to be verified at time of gas trial given in **410. 9** of the Guidance.

2. Monitoring of purging and gas-freeing

For the purpose of the requirements in **901. 2** of the Rules, the arrangement of gas sampling points in cargo tanks is to be determined according to the cargo properties, cargo tank construction and capacity and the abilities of gas-freeing and purging systems, and where appropriate, the adequacy of the arrangement of gas sampling points is to be verified by the performance test. The locations of gas sampling points are, as standard, to be at the upper, middle and lower space of the cargo tank.

3. Inerting of cargo tanks

For the purpose of the requirements in **901. 3** of the Rules, for cargo tanks carrying petroleum products, etc. the requirements in this Chapter apply, and in addition, the requirements specified in **Pt 8, Ch 1, 401. 2** of the Rules are to be complied with.

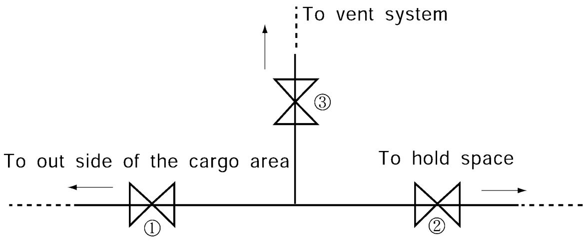
902. Environmental control within the hold spaces (cargo containment systems other than type C independent tanks)

1. Environmental control, requiring full secondary barriers

(1) For the purpose of the requirements in **902. 1** of the Rules, even in cases where full secondary barrier is not required according to the requirements in **407. 3** of the Rules, if flammable gases are carried in type A independent tank, integral tank, membrane tank and semi-membrane tank, the requirements in **902. 1** of the Rules apply correspondingly.
(2) The "suitable dry inert gas" referred to in the requirements in **902. 1** of the Rules means the inert gas of which dew point is controlled in accordance with **904. 1** (4) of the Guidance. Further, the "normal consumption for at least 30 days" referred to in the requirements in **902. 1** of the Rules is to be given consideration for the effects of atmospheric pressure and temperature variations during the passage and additional consumption by gas detection, etc.

2. Environmental control, requiring partial secondary barriers

(1) For the purpose of the requirements in **902. 2** of the Rules, even in cases where the provision of partial secondary barriers is not required according to the requirements in **407. 3** of the Rules, when flammable gases are carried by type B independent tank, the requirements in **902. 2** of the Rules apply.
(2) The "suitable dry inert gas" and the "normal consumption for at least 30 days" referred to in the requirements in **902. 2** (1) of the Rules are to be as specified in 1 (2) above.
(3) In cases where dry air is introduced into the interbarrier spaces and hold spaces, at least the following requirements (A) to (C) are to be complied with :
    (A) Dew point of dry air is to be controlled according to **904. 1** (4) of the Guidance.
    (B) On the supply piping of dry air, one stop valve is to be provided at the inlet into the space which is filled with dry air, and two non-return valves are to be provided within the cargo area side near the forward or aft end of the cargo area. However, one of the two non-return valves may be substituted by 3-in one set as **Fig 7.5.35** of the Guidance.



1) When dry air is being supplied, stop valves ① and ② are to be opened, and stop valves ③ is to be closed.
2) When dry air supply is stopped, stop valve ③ is to be opened, and stop valves ① and ② are to be closed.

Fig. 7.5.35

(C) Instrumentation is to be provided in accordance with the following requirements (a) to (c) :
  (a) At the outlet of the dry air supply system, pressure gauge and thermometer are to be provided.
  (b) One or more dew point meters as deemed appropriate by the Society are to be provided. However, in case where only one dew point meter is provided, a spare cell unit is to be provided.
  (c) At the outlet of the dry air supply system, interbarrier spaces and hold spaces, connections for dew point meter are to be provided.

3. Environmental control for non-flammable gases

(1) The "suitable dry air or inert atmosphere" referred to in the requirements in **902. 3** of the Rules means a state in which spaces are filled with the air with controlled dew point or inert gas according to the requirements in **904. 1** (4) of the Guidance. This inert gas system may not conform to the requirements in 904. and 905. of the Rules, but is to be provided with a storage system or generating system capable of making up a consumption for at least 30 days.
(2) In case where dry air is introduced according to the preceding (1), the requirements in **902. 2** (3) of the Guidance are to be complied with.

4. Environmental control for doble hull and double bottom spaces

Ventilation, inerting and gas measurements for double hull and double bottom spaces are to comply with the requirements in **Ch 1, 1009.** to **1011.** of the Rules.

903. Environmental control of spaces surrounding type C independent tanks

1. Environmental control of spaces surrounding type C independent tanks

For the purpose of the requirements in **903.** of the Rules, the environmental control of the compartment is to be in accordance with **902. 3** (1) and (2) of the Guidance.

904. Inerting

1. Properties of inert-gas and its supply

For the purpose of the requirements in **904. 1** of the Rules, the following requirements (1) through (4) are to be complied with :

(1) For the inert gas supply piping, evaporator and heater, if necessary, are to be provided so that the compartment supplied with inert gas can be maintained at proper temperature and pressure and further, thermometer and pressure gauges are to be provided for monitoring.
(2) Where the inert gas is stored in inert gas bottles, the following requirements (A) through (D) are to be complied with :
  (A) The inert gas bottles and piping are to be dealt with according to the following requirements (a) to (c) :
    (a) The material of the piping may be according to the requirements of the standard as deemed appropriate by the Society.
    (b) The gas bottle may be according to the requirements of the National Standards notwith-

standing the requirements in **Pt 5, Ch 5, Sec 3** of the Rules.
(c) The hydraulic tests for pipes, valves and pipe fittings may be omitted.
(B) The location of installation of the bottles is to be as given in the following (a) and (b) :
(a) The inert gas bottles are, as a rule, to be located in the storage room within the cargo area.
(b) The storage room of inert gas bottles is to be well ventilated so as not to allow leaked gas accumulate the room and be capable of being accessed from the exposed deck.
(C) The inert gas bottles are to be so arranged to be safe against ship motions and vibrations, and are to be stored upright as far as practicable.
(D) The piping system, after assembly of board, is to be subjected to airtightness test at a pressure 1.25 times the maximum working pressure or more, and free flow test at a suitable pressure.

(3) Where the permanent storage tank installed on deck is used as the inert gas storage container, the requirements for the design, tests and inspection of the tank and the piping are to be in accordance with the relevant requirements specified for process pressure vessels and piping systems in **Sec 4** and **Sec 5** of the Rules. However, consideration may be given as appropriate depending on their service conditions.
(4) The dew point of dry inert gas is, in general, not exceed the minimum design temperature of the exposed surface of the insulation material of the cargo tank into the hold space and hul1 structural members of the space being inerted in normal condition.

2. Storage of inert gas at low temperature

For the purpose of the requirements in **904. 3** of the Rules, the thermal isolation between the hull structure and the storage tank, and where necessary, the inert gas supply piping is to be in accordance with **502. 1** (3) of the Guidance.

3. Prevention of the back flow of cargo vapour

For the purpose of the requirements in **904. 4** of the Rules, the arrangement to prevent the back flow of cargo vapour from entering the inert gas system is to be in accordance with **301. 4** (1) of the Guidance. (See **Fig 7.5.36** of the Guidance)

4. Isolation of spaces being inerted

(1) For the purpose of the requirements in **904. 5** of the Rules, the isolation of the spaces being inerted such as cargo tanks, cargo piping system, process pressure vessels and their piping system from the inert gas system are to be in accordance with the preceding **Par 3.**
(2) The isolation of the spaces being isolated other than those indicated in the preceding (1) is to be in accordance with the following requirements (A) and (B) :
(A) The isolation of the interbarrier spaces, hold spaces where the cargo vapour does not exist in normal condition and the outer side of double wall gas fuel piping specified in the requirements in **1603. 1** (1) of the Rules may be by a stop valve.
(B) The isolation of the compartments where cargo vapours are likely to exist in normal condition is to be by the combination of screw-down check valve, stop valve, automatic or control valve, and non-return valve. (See **Fig 7.5.36** of the Guidance)

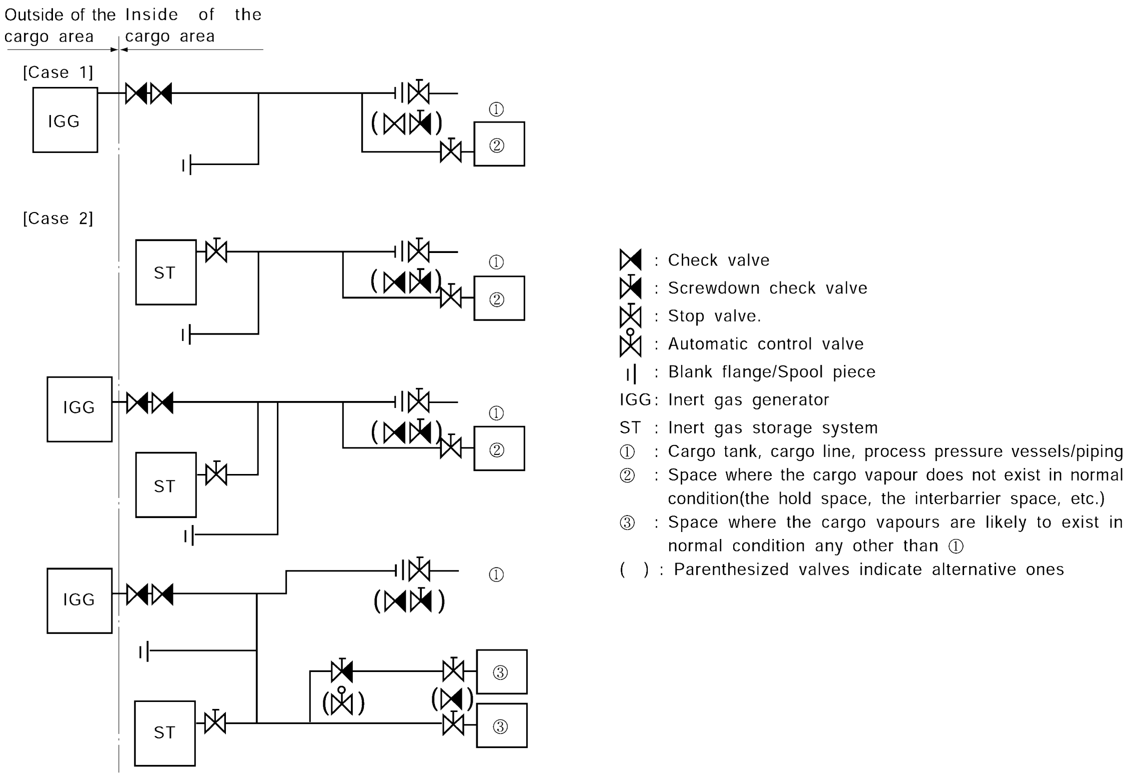


Fig. 7.5.36

905. Inert gas production on board

1. Inert gas production equipment

(1) For the purpose of the requirements in **905. 1** of the Rules, the combustion type inerting systems are to be in accordance with the relevant requirements of **Pt 8, Annex 8-5** of the Guidance and the following requirements (A) to (C).

(A) Inerting gas production equipment is to be provided with sufficient amount of suitable fuel oil.

(B) Where two sets or more inerting gas production equipments are provided, the stop valve is to be installed on the supply outlets of each equipment.

(C) Where the volumetric blower is provided in inerting gas production equipment, the pressure relief valves are to be installed on discharge outlets of blowers to prevent generating the over pressure.

(2) In addition to the preceding (1), nitrogen generating system is to be complied with the relevant requirements in **Pt 8, Annex 8-5** of the Guidance.

(3) The components of inerting gas production equipment given in the preceding (1) and (2) are to be approved by the Society.

Section 10 Electrical Installations

1001. General

1. Certified safe type equipment

(1) The words "satisfaction of the Society" referred to in **1001. 5** of the Rules mean the explosion protected electrical equipment required by **Pt 6, Ch 1, Sec 9** of the Rules and having the performance classified by Gases and Vapours Group and Temperature Class according to **Table 7.5.8** of the Guidance by the type of vapour or equivalent.

(2) The words "approved one as the certified safe type" mean that type tested as the explosion-protected electrical equipment in accordance with the requirements in **Pt 6, Ch 1, 109. 3** and **4** of the Rules and/or equipment recognized that there is no fear of serving as a source of ignition structurally.

Table 7.5.8 Gases and Vapours Groups and Temperature Class

Product name	UN number	Gases and vapours groups	Temperature class
Acetic aldehyde	1089	II A	T4
Ammonia, anhydrous	1005	II A	T1
Butadiene	1010	II B	T2
Butane	1011	II A	T2
Butane－propane mixtures	1011/1978	II A	T2
Butylenes	1012	※	※
Chlorine	1017	－	－
Diethyl ether	1155	II B	T4
Dimethylamine	1032	II A	T2
Ethane	1961	II A	T1
Ethyl chloride	1037	II A	T1
Ethylene	1038	II B	T2
Ethylene oxide	1040	II B	T2
Ethylene oxide－propylene oxide mixtures with ethylene oxide content of not more than 30 % by weight	2983	※	※
Isoprene	1218	II B	T3
Isopropylamine	1221	II A	T2
Methane (LNG)	1972	II A	T1

Vinylidene chloride	1303	II A	T2

Notes:
1. Temperature classes and gases and vapours groups are as defined in IEC 60079.
2. 「―」 indicates that the product is non-flammable, and * is to be to satisfaction of the Societ

Section 11 Fire Protection and Fire Extinction

1101. Fire safety requirements

1. Exclusion of ignition source

For the purpose of the requirements in **1101. 2** of the Rules, in the gas-dangerous zones or areas specified in the requirements in **106. 17** of the Rules, for ships carrying flammable substances, electrical equipment, windlasses, openings of chain lockers which are regarded as sources of ignition are not to be provided except for those approved under the relevant requirements in **Sec 10** of the Rules.

1102. Fire water main equipment

1. Fire pump and fire main

For the purpose of the requirements in **1102. 1** of the Rules, the minimum pressure at fire hydrant of the fire main is to be not less than 0.5 MPa gauge irrespective whether the fire pump and water main as used as part of water spray system or not.

2. Nozzles

For the purpose of the requirements in **1102. 4** of the Rules, all nozzles provided for fire-fighting are to be in accordance with the relevant requirements of **Pt 8, Ch 3** of the Rules.

3. Remote control

In case of applying the requirements in **1102. 5** of the Rules, at least one of fire pumps is to be capable of starting by remote control, and all valves provided between the fire pump and fire main are to be capable of being opened by remote control from the navigation bridge or other control stations outside the cargo area.

1103. Water spray system

1. Area to be covered

(1) For the purpose of the requirements in **1103. 1** (1) of the Rules, the area to be covered at the exposed tank dome is to include the areas where stop valves for cargo tanks and emergency shutdown valves specified in the requirements in **506. 1** of the Rules are fitted.
(2) For the purpose of the requirements **1103. 1** (3) of the Rules, the area of the manifold is to include the areas where emergency shutdown valves specified in the requirements in **506. 3** of the Rules are fitted. Further, the "control valve" referred to in the requirements in **1103. 1** (3) of the Rules is to include stop valves for the transfer of cargo line to and from vapour line.
(3) The "high fire risk items" referred to in the requirements in **1103. 1** (4) of the Rules are not to include the hydraulic machinery and electric motors. Further, the "boundaries .... all facing the cargo area" referred to in the requirements in **1103. 1** (4) of the Rules are not to include the ceiling of the compartment to be covered.

2. Arrangement and capacity

For the purpose of the requirements in **1103. 2** of the Rules, the following requirements (1) to (2) are to be complied with :

(1) The nozzles for protecting vertical surfaces are to be arranged per every two tiers for the end walls of the accommodation spaces, as standard.
(2) The intermediate valves fitted with the fire main are to be provided at the connections between the branch line and spray main for example, as shown in **Fig 7.5.37** of the Guidance.

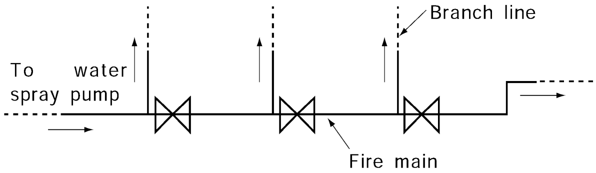

Fig. 7.5.37

3. Use for other services

For the purpose of the requirements in **1103. 4** of the Rules, the ballast pump and bilge pump may be used commonly for the water spray system.

1104. Dry chemical powder fire-extinguishing systems

1. General

The "satisfactory to the Society" referred to in the requirements in **1104. 1** of the Rules means that the requirements in **507. 1** of the Guidance are complied with.

2. Component of the systems

For the purpose of the requirements in **1104. 2** of the Rules, dry chemical powder fire-extinguishing systems are to conform to the requirements in **1104. 2** to **6** of the Rules, and in addition they are to be approved in accordance with the Guidance.

3. Monitors and hand hose lines

For the purpose of the requirements in **1104. 3** of the Rules, the manifold areas may be protected by only one monitor provided that it can be so fixed to protect the manifold area used for cargo operation even if there are manifolds on both sides of the ship.

4. Capacity of dry chemical powder

For the purpose of the requirements in **1104. 6** of the Rules, when the areas to be covered are located higher than the installed positions of monitors and manual hose reels, the Society may request increase in the capacity of these monitors and manual hose reels depending on their arrangement.

1105. Cargo compressor and pump rooms

1. Fixed fire-extinguishing installation for cargo compressor and pump rooms

For the purpose of the requirements in **1105. 1** of the Rules, the fixed gas fire-extinguishing systems for cargo compressor and pump rooms are to be in accordance with the requirements following (1) through (6). Independent inert gas system is to be provided, if the fire-extinguishing medium is not compatible with inerting.

(1) The fixed gas fire-extinguishing system is to conform to the relevant requirements in **Pt 8, Ch 3** of the Rules correspondingly.
(2) In the case of carbon dioxide or halogenated hydro-carbon fire-extinguishing systems, the requirements in **Ch 6, 1102. 1** of the Rules are to be complied with.
(3) In the case of the nitrogen gas fire-extinguishing system, the volume of nitrogen gas is to be not less than that multiply following values by total volume of the relevant spaces and also to be in accordance with national requirements.

$$\frac{21 - O_2}{21} \times 1.2$$

where :

O_2 : limit volume of carbon (Vol%)

(4) The storage containers and pipings for nitrogen gas fire-extinguishing system are to be such that nitrogen gas equal to 85 % of the volume of preceding (3) can be discharged into the space within 2 minutes.

(5) The boundaries of cargo compressor and pump rooms in relation to the requirements in **1105.** of the Rules is to remain in a state corresponding to "A-0" class fire integrity including doors, etc. of the boundaries. Packing provided for doors is, as a rule, to be of non-combustible material defined in the relevant requirements in **Pt 8, Ch 1** of the Rules. However, in case where special consideration is taken for structural details in way of openings, materials and quantity of the packing, the packing need not be of non-combustible one.

(6) Notwithstanding the requirements in the preceding (5), when steel blind covers are provided for the windows fitted on the boundary of the compartment and the exposed area, these windows may not be "A-0" class. Further, at the boundary to electric motor room, no windows are to be provided unless they correspond to "A-0" class.

Section 12 Mechanical Ventilation in the Cargo Area

1201. Spaces required to be entered during normal cargo handling operations

1. Ventilation exhaust ducts from gas-dangerous spaces

For the purpose of the requirements in **1201. 6** of the Rules, the construction of ventilation exhaust ducts is, for example, to be as shown in **Fig 7.5.38** of the Guidance.

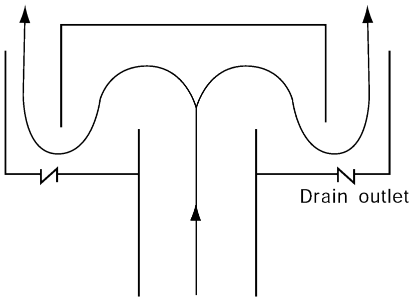

Fig. 7.5.38

2. Arrangement of ventilation intakes

For the purpose of the requirements in **1201. 7** of the Rules, ventilation intakes are, at least, to be located in the gas-safe areas.

3. Construction of ventilation fans

For the purpose of the requirements in **1201. 9** of the Rules, the following requirements (1) and (2) are to be complied with :

(1) Ventilation fans are to be approved in accordance with the Guidance.
(2) The ventilation fans for motor rooms where electric motors to drive cargo compressors and cargo pumps are installed are to conform to the requirements in **1201. 9** of the Rules, and in addition, to the following requirements (A) and (B) :
   (A) To have a ventilation capacity of not less then 30 air changes of the total volume of the motor room per hour.
   (B) Electric motors driving ventilation fans are to conform to the relevant requirements in **Ch 5, Sec 10** of the Rules depending on the location of motors, and in addition, to the requirements for exterior-mounted type specified in **Pt 8, Ch 1, 312. 2** of the Guidance when motors are installed in exposed spaces.

4. Spare parts

"Spare parts" means one spare impeller for each type of fan.

5. Protection screens of ventilation duct openings

The Protection screens are to be in accordance with **802. 11** of the Guidance.

1202. Spaces not normally entered

1. Ventilation of hold spaces

(1) Natural ventilation alone is not acceptable.

Section 13 Instrumentation (Gauging, Gas Detection)

1301. General

1. Centralization of controls equipments and indicators

For the purpose of the requirements in **1301. 3** of the Rules, in case where control equipment and indicators are unable to be centralized in the cargo control room or other suitable places, they are to be provided in the wheelhouse.

2. Calibration and test of measuring instruments

For the purpose of the requirements in **1301. 4** of the Rules, tests and inspections of measuring instruments are to be in accordance with the following requirements (1) to (3) :

(1) Tests and inspections of measuring instruments during manufacture of each are to conform to the following requirements (A) to (C) :
  (A) Gas detection equipment are to be in accordance with the requirements in the Guidance.
  (B) Level gauges are to be in accordance with the requirements in the Guidance for Approval of Manufacturing Process and Type Approval, Etc.
  (C) Pressure gauges and temperature indicating devices are to be in accordance with the requirements of the standards recognized by the Society or are to be manufactured under effective quality control system and to be ensured for their reliability.

(2) After installation on board the ship, the instrument is to be subjected to operation test to verify that it has the specified performance. This test is not necessarily conducted with the actual cargo, but for gas detection equipment, suitable test gases are to be used in the test.

(3) For retests and testing procedures of instrumentation after installation on board the ship, at least the following items are to be noted in the Operation Manual specified in the requirements in **1801. 1** of the Rules :
  (A) Check method and testing procedure before use
  (B) Check method and testing procedure during use
  (C) Periodical check method and intervals specified by the manufacturer
  (D) Service life of equipment (excluding those permanent system components)
  (E) Periodical inspection procedure specified in the requirements in **Pt 1, Ch 2, 204.** (4) of the Rules
  (F) Other precautions

1302. Level indicators for cargo tanks

1. General

For the purpose of the requirements **1302. 1** of the Rules, the following requirements (1) and (2) are to be complied with :

(1) The performance and construction of level gauges are to be approved according to the Guidance for Approval of Manufacturing Process and Type Approval, Etc.

(2) The effectiveness and number of units of level gauges are to be in accordance with the following requirements (A) and (B) :
  (A) Where only one level gauge is fitted, it is to be arranged so that any necessary maintenance can be carried out while the cargo tank is in service.
  (B) For example, in case where gauging of levels is limited at high level and low level, such level is considered effective on condition that cargo is loaded within such range.

2. Type of level indicators

For the purpose of the requirements in **1302. 2** of the Rules, in case where the prospective cargoes are plural and the type of level gauges required in column g in Table of **Sec 19** of the Rules is also plural where two or more level gauges are provided for each requirement (in the case shown in **1** (2) (A) above, may be one), they may be multiplicate. However, for the type of level gauge for less severe requirements, warning sign stating that the level gauge is not to be used for other cargoes than the specified cargoes is to be posted.

3. Sighting ports

For the purpose of the requirements in **1302. 3** of the Rules, the construction and liquid-tight and gas-tight performance of the sighting ports are to be equivalent to the tank top plating and suitable protection steel covers are to be provided. For the purpose of the requirements in **1302. 1** of the Rules, the sighting ports are not to be regarded as level gauges required.

4. Tubular glass gauge

Tubular glass gauges are to conform to the requirements in **1302. 4** of the Rules, and in addition, to the requirements in **Pt 5, Ch 5, 129.** of the Rules.

1303. Overflow control

1. General

For the purpose of the requirements in **1303. 1** of the Rules, the following requirements are to be complied with :

(1) High level alarm systems are to be in accordance with **Pt 7, Ch 1, 1004. 5** of the Guidance.
(2) The sensor for automatic closing of the loading valve for overflow control may be combined with those of level gauges required in **1302. 1** of the Rules.

2. Omission of automatic shutoff

The "maximum possible pressure during the loading operation" referred to in the requirements in **1303. 2** (2) of the Rules is to be considered as the maximum pressure generated by the discharge pressure of shore-based transfer pump and cargo vapour pressure.

3. Level alarms with electrical circuits

To "be capable of being tested prior to loading" referred to in the requirements in **1303. 3** of the Rules means to be capable of verifying by test (for example, by buzzer test) that all alarm circuits are in normal working condition when verification through actual operation is impossible. However, a special attention is to be paid to those that can not be always monitored the breaking down of the circuit.

1304. Pressure gauges

1. Pressure gauges and alarms of cargo tanks

(1) The low pressure alarm provided on the navigation bridge under the requirements in **1304. 1** of the Rules, when the provision of vacuum relief valve is required by the provision in **804. 2** of the Rules, is to be capable of issuing alarm at a suitable differential pressure between inside and outside of cargo tank, which is lower than the maximum design external pressure of the cargo tank.
(2) The alarm system specified in the requirements in **1304. 1** of the Rules is to issue visible and audible alarms.

1305. Temperature indicating devices

1. General

The "lowest temperature for which the cargo tank has been approved by the Society" referred to in the requirements in **1305. 1** of the Rules means the lowest design temperature indicated together with the classification characters in the Register Book.

2. Temperature indicating devices of hull structure when a cargo is carried at a temperature lower than −55°C

The word, "where applicable" referred to in the requirements in **1305. 2** of the Rules means the case where provision is made for heating the structural hull members as specified in the requirements in **408. 4** of the Rules. At four points, at least, on double bottom tank top platings, the temperature sensors are to be provided.

3. Temperature indicating devices of cargo tanks when a cargo is carried at a temperature lower than −55°C

For the purpose of the requirements in **1305. 3** of the Rules, the temperature indicating devices for cases of carrying the cargo at a temperature lower than -55°C are to be in accordance with the following requirements :

(1) In order to verify the cooling down or loading procedures according to the requirements in **403. 4** (1) of the Guidance, temperature indicating devices required in the provisions in **1305. 3** (1) of the Rules are to be provided.

(2) The temperature sensors provided for verifying the cooling down procedure specified in the requirements in **1305. 3** (2) of the Rules are to be arranged under considering the arrangement of spray nozzles and construction of cargo containment system. For the other cargo tanks which can be regarded as having the same construction and arrangements as the cargo tanks provided with above sensors, the temperature indicating devices specified in the requirements in preceding (1) and **1305. 1** of the Rules may only be provided.

1306. Gas detection requirements

1. General

The "equipment acceptable to the Society" referred to in the requirements in **1306. 1** of the Rules may be followed as given in **507. 1** (1) to (3) of the Guidance.

2. Positions of fixed sampling heads

For the purpose of the requirements in **1306. 2** of the Rules, the positions of fixed sampling heads are to be arranged where cargo vapours are liable to accumulate by taking into account the geometrical configurations of the compartment to be covered, construction and arrangement of the space within the compartment. In this case, the sampling heads are, as a rule, to be provided at least at two locations for each such compartment.

3. Location of gas detection equipment

The "safe location" referred to in the requirements in **1306. 5** (2) of the Rules means the location specified in **802. 8** (2) of the Guidance when the sampled gas is of the dangerous ones. In case where the sampled gas is not dangerous, it may be returned to the place of sampling.

4. Gas detection equipment for toxic products

For the purpose of the requirements in **1306. 9** of the Rules, the use of portable gas detecting equipment is to be in accordance with the following requirements :

(1) At least two sets of portable gas detecting equipments are to be provided on board.

(2) In the case of the cargo expressed in "$F+T$" in column f in Table of **Sec 19** of the Rules, the fixed type flammable gas detecting device specified in the requirements in **1306. 11** of the Rules is to be provided additionally.

(3) In case where the equipments are composed of consumables such as detecting tubes, suitable spare parts such as detecting tubes are to be provided on board in addition to the equipments specified in the preceding (1) by taking into account the shipboard work and the frequency of carriage of the cargo. In the case of the detecting tube type, detecting tubes are to be provided for each kind of loadings cargos as above requirement, but two suction pumps for each type of the portable detection equipments may be enough.

5. Gas detection for cargo containment systems other than independent tanks

For the purpose of the requirements in **1306. 11** of the Rules, the gas detection equipment for hold spaces and interbarrier spaces of cargo tanks other than independent tanks are to be in accordance with the following requirements :

(1) In the case of integral tanks, the requirements in **1306. 11** of the Rules do not apply. However, the requirements in **1306. 7** (5) of the Rules apply to the hold space of this cargo containment system.

(2) The available measuring range of gas detector is to be ordinarily made under the graduation where the lower explosive limit is taken as 100% but the range may be changeable to measure gas concentration between 0 % and 100 % in volumetric percent if necessary.

6. Gas detection for toxic gases

For the purpose of the requirements in **1306. 12** of the Rules, the gas sampling pipes of hold spaces and inter-barrier spaces dealing with toxic gas in case of portable gas detection equipment are to have openings at the upper part or lower part of the compartment in consideration of the cargo vapour density and automatic closing pipe heads are to be fitted at their top ends. In case where the sounding pipes specified in the requirements in **Pt 5, Ch 6, 203.** of the Rules can be used for the purpose in consideration of the cargo vapour density and the set pressure of the relief valve of the compartment, they may be used commonly therewith.

7. Instruments for measurement of oxygen levels

The "suitable instrument for the measurement of oxygen levels" referred to in the requirements in **1306. 14** of the Rules means the one as given in **507. 1** of the Guidance in a corresponding manner.

Section 15 Filling Limits for Cargo Tanks

1501. General

1. Filling limit higher than 98 %

For the purpose of the requirements in **1501. 3** of the Rules, the loading limits are to be in accordance with the following requirements :

(1) The "filling limit (FL)" means the maximum liquid volume in a cargo tank relative to the accepted tank volume when the liquid cargo has reached the reference temperature specified in the requirements in **1501. 4** of the Rules. In this case, the total volume of the cargo tank may include the volume of tank dome provided that either of the following conditions is satisfied :

(A) In applying the requirements in **403. 2** (2) of the Rules, consideration is given to the tank dome for determining Z_β.

(B) Tank dome is to be in accordance with **403. 2** (2) of the Guidance.

(2) In case where the following conditions (A) and (B) are satisfied, the filling limit may be a value exceeding 98% within the limit not exceeding 99.5 % :

(A) The maximum allowable filling limit results from the following formula :

$$\frac{V_{FL}}{V} \times 100 \ (\%)$$

where

V_{FL} : cargo tank volume to liquid level corresponding to the filling limit (m^3)

V : accepted total tank volume (m^3)

(B) Under conditions specified in **802. 17** of the Rules, the suction funnels of the pressure relief valves are to remain well above the sloped liquid level for the expanded volume determined by following formula :

$$V_{FL} \times \frac{100 + \alpha_t}{100} \ (\mathrm{m}^3)$$

where:

α_t : the value as given by the following formula :

$$\alpha_t = \sqrt{\alpha_1^2 + \alpha_2^2 + \alpha_3^2} \ (\%)$$

α_1 : relative increase in liquid volume due to the tolerance of level gauges as given by the following formula : $\alpha_1 = \frac{dV}{dh}\left(\frac{h \times \Delta Z}{V}\right) \ (\%)$

where:

dV/dh : variation of tank volume per metre filling height at the filling height h $(\mathrm{m}^3/\mathrm{m})$

h : filling height (m) at the filling limit FL to be investigated (FL > 98 %)

$\triangle Z$: maximum total tolerance of level gauges (%)

V : as specified in the preceding (A)

α_2 : relative increase in liquid volume due to the tolerance of temperature gauges as given by the following formula :

$$\alpha_2 = 100 \times \left\{ 1 - \left(\frac{T_C - T_L - \Delta T}{T_C - T_L} \right)^{0.26} \right\} (\%)$$

where:

T_C : critical temperature of the product (K)

T_L : highest loading temperature of the product (K)

$\triangle T$: maximum tolerance of temperature gauges (K)

α_3 : relative increase in liquid volume due to the difference between loading temperature and the temperature corresponding to the vapour pressure of the cargo at the set pressure of the pressure relief valves taking into account the accuracy of the cargo tank calibration as given by the following formula :

$$\alpha_3 = \left(\frac{\rho_L}{\rho_R} - 1 \right) \times \Delta a \quad (\%)$$

where:

ρ_L and ρ_R : cargo densities as defined in **1501. 2** of the Rules

$\triangle a$: accuracy of cargo tank calibration (%)

2. Reference temperature

The "cargo tank becoming liquid full" referred to in the requirements in **1501. 4** (2) of the Rules is to be construed as given in **803. 1** of the Guidance in a corresponding manner.

Section 16 Use of Cargo as Fuel

1605. Special requirements for main boilers

1. The "on the pipe of each gas burner a manually operated shut-off valve should be fitted" referred to the requirements in **1605. 4** of the Rules is to be in accordance with **Fig 7.5.39** of the Guidance.

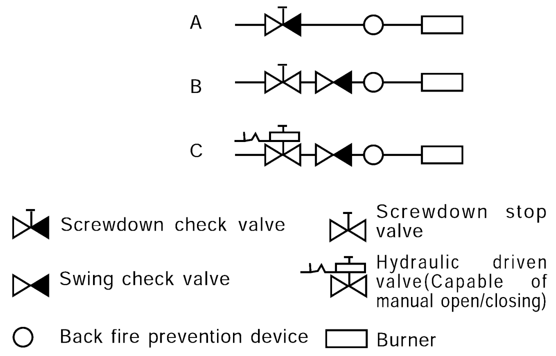

Fig. 7.5.39 Example for Arrangement of Manually Operated Shutoff Valve

Section 17 Special Requirements

1720. Propylene oxide and mixtures of ethylene oxide-propylene oxide with ethylene oxide (content of not more than 30 % by weight)

1. Valves, flanges and fittings

For the purpose of the requirements in **1720. 3** (3) of the Rules, the materials for insulation and packing with neoprene, natural rubber, asbestos and binders used with asbestos are not to be used. The materials containing oxides of magnesium, also are not to be used.

2. Padding of nitrogen gas

For the purpose of the requirements in **1720. 15** of the Rules, the nitrogen gas generator of membrane type capable of ensuring a purity not less than 99% in volume may be used.

Section 18 Operating Requirements

1801. Cargo information

1. General

In the cargo information specified in the requirements in **1801. 1** of the Rules, at least, the following items (1) through (11) are to be included, and the detailed contents are to be guided by the requirements in **Ch 18** of the IGC Codes with the contents as specified in **Sec 18** of the Rules. These detailed contents may be covered under separate booklets, but in such a case, it is to be expressly shown in the specific operation manual that reference is to be made to separate booklet.

(1) Cargo information
  (A) A full description of the physical and chemical properties necessary for the safe containment of the cargo
  (B) Action to be taken in the event of spills or leaks
  (C) Counter-measures against accidental personal contact
  (D) Fire-fighting procedures and fire-fighting media
  (E) Procedures for cargo transfer, gas-freeing, ballasting, deballasting, environmental control within the hold spaces and interbarrier spaces, tank cleaning and changing cargoes
  (F) Special equipment needed for the safe handling of the particular cargo
  (G) Minimum allowable inner hull steel temperatures
  (H) Emergency procedures
  (I) Action to be taken for inhibition
(2) Cargo stowage information
  (A) Hull strength and strength of cargo containment system
  (B) Stability (intact and damage)
(3) Personal training
  (A) Emergency measures
  (B) Assignment of work duty (cargo handling, fire-fighting, etc.)
  (C) Use of protective clothings and first-aiding
(4) Access to gas-dangerous spaces
  (A) Entering after gas-free or entering wearing protective clothings under the supervision of the duty officer
  (B) Exclusion of source of ignition
  (C) Special measures in the case of internal insulation tanks
(5) Carriage of low temperature cargoes
  (A) Use of heating arrangement
  (B) Procedures of cooling down
(6) Handling of protective equipment and their storage areas
(7) Cargo transfer system and control
  (A) Tests and inspection of control
  (B) Tests and inspection of alarms and emergency shutdown system
(8) Cargo transfer operation
  (A) Discussion between ship personnel and the persons responsible at the shore facility at time of cargo discharge
  (B) Emergency procedures
  (C) Cargo stowage plan
(9) Cargo handling operation
(10) Information on national rules and regulations
(11) The provisions in each Chapter of the IGC Code prescribing the working restrictions which are also specified in the following requirements of **Ch 5** of the Rules :
  106. 32, 308. 1 (1), **308. 3** (3), **308. 4, 308. 5, 410. 14, 701. 1** (5), **802. 5, 802. 7, 901. 3, 902., 904. 2, 1201. 10, 1202., 1301. 4, 1303. 1, 1306. 6, 1306. 9, 1402. 4, 1402. 5, 1402. 6, 1501., 1502., 1603., 1704. 2, 1704. 3, 1706., 1707., 1708., 1710., 1711., 1712., 1713., 1714., 1715., 1716., 1717., 1718. and 1720.**

Section 19 Summary of Minimum Requirements

The requirements for the construction and equipment of the ship when the cargo recognized to have equivalent danger of the liquefied gas or other cargo indicated in **Sec 19** of the Rules is carried are to be determined according to the physical properties (vapour pressure, liquid density, latent heat of evaporation, etc.) of the cargo as far as the basic design of the construction and equipment are concerned unless otherwise required by the Administration. Further, each item of the minimum requirements and special requirements of **Sec 19** of the Rules are to be determined individually. ⚓

CHAPTER 6 SHIPS CARRYING DANGEROUS CHEMICALS IN BULK

Section 1 General

101. General

1. Application

(1) Where the products specified in Table of **Sec 17** of the Rules are added to the cargo carried in bulk to maintain the properties of the cargo, the requirements in **Ch 6** of the Rules may not apply to such additive cargoes. However, in consideration of the properties and quantity of such additive cargoes, additional requirements for tank vent system, electrical installations, instrumentation, safety equipment, etc. may be applied.

(2) Where the mixed products not reacting with each other such as polymer, etc. are carried, all requirements for the product separated each other are to apply.

106. Definitions

1. Definitions

(1) For the purpose of **Ch 6** of the Rules and the Guidance, the term "adjacent" means all cases of facial contact, linear contact and point contact unless otherwise specified.

(2) The term "cargo area" referred to in **106. 5** of the Rules excludes the fuel oil tanks adjacent to the cargo tanks or slop tanks of the arrangement as given in **Fig 7.6.1** of the Guidance. However, the requirements specified in **Ch 6, 304.** of the Rules apply.

(3) The piping system "separated" from each other as referred to in **106. 24** of the Rules mean either of the following :

(A) Piping system completely independent from each other.

(B) The piping system that come through with the tank carrying other cargo, but can be separated by the means as exemplified in [Acceptable] in **Fig 7.6.2** of the Guidance when cargoes likely to cause dangerous reaction with each other are carried may be regarded as those completely independent from each other. In case where separation can be achieved by this method, operational precautions are to be noted in the Operation Manual.

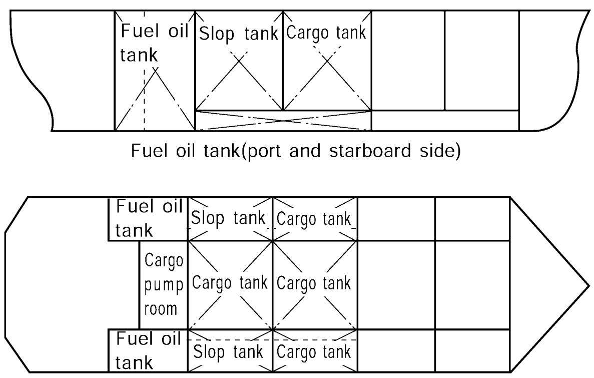

Fig. 7.6.1

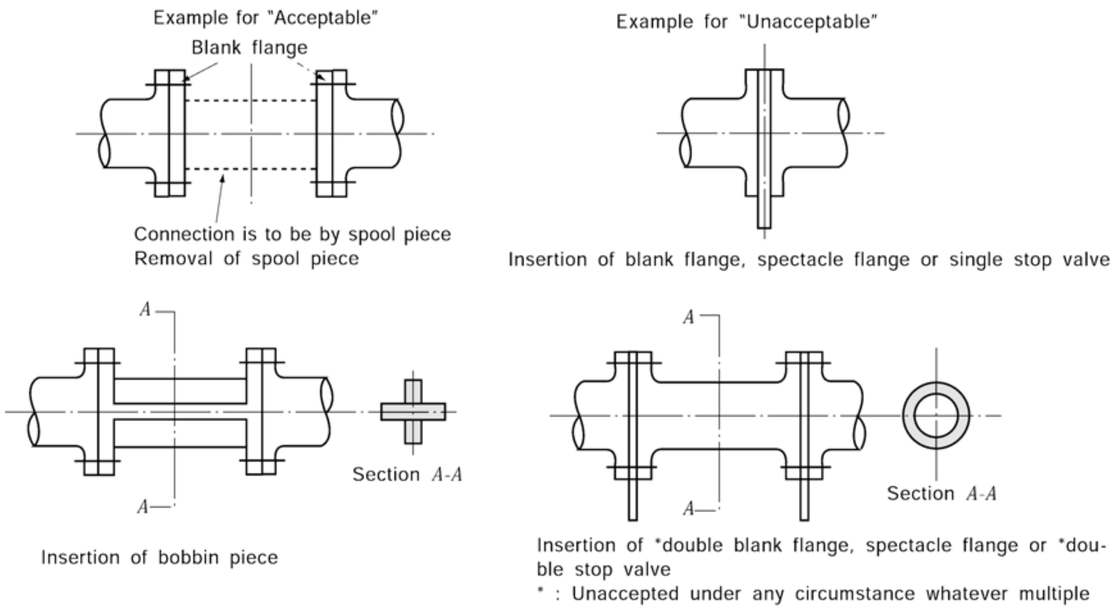


Example for "Acceptable"
Blank flange
Connection is to be by spool piece
Removal of spool piece
Example for "Unacceptable"
Insertion of blank flange, spectacle flange or single stop valve
A
A
Section A-A
Insertion of bobbin piece
A
A
Section A-A
Insertion of *double blank flange, spectacle flange or *double stop valve
* : Unaccepted under any circumstance whatever multiple

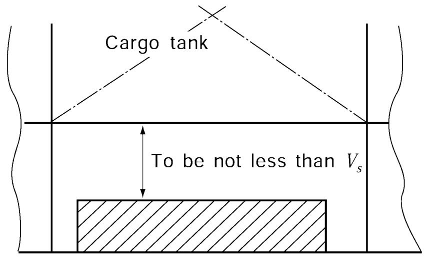
Fig. 7.6.2

Section 2 Ship Survival Capability and Location of Cargo Tanks

202. Freeboard and intact stability

1. Solid ballast

Where the requirements for the initial stability are not satisfied, use of solid ballast may be approved. When solid ballast is provided directly below the tank, the distance between the top of solid ballast and cargo tank bottom is to be not less than the vertical extent of damage(V_s) as given **Fig 7.6.3** of the Guidance.



Shaded section : Solid ballast
V_s: Vertical extent of damage given in **205.** of the Rules

Fig. 7.6.3

203. Shipside discharges below the freeboard deck

1. For the purpose of the requirements in **203. 1** of the Rules, the following requirements (1) and (2) are to be complied with.

(1) The scupper pipes within the superstructure are to be in accordance with the requirements in **Pt 5, Ch 6, 302. 1** of the Guidance.

(2) The inboard open ends of scupper pipes are to be in accordance with the requirements in **Pt 5, Ch 6, 302. 2** (1) (A) of the Guidance.

2. The requirements of **203. 1** of the Rules do not apply to the overboard discharges led through the shell from the superstructure and deckhouse located on or above the second deck on freeboard deck.

3. The scupper pipe in hazardous area is not to pass through the safety area or engine room.

205. Damage assumption

1. Assumed maximum extent of damage

For the purpose of the standard of damage specified in **205. 1** (2) of the Rules, damage assumed to have sustained within 0.3 L_f from the forward perpendicular of the ship are to be in accordance with the following requirements (1) and (2) :

(1) For bottom damage for 0.3 L_f from the forward perpendicular and forward (according to **205. 1** (2) of the Rules), such damage may not be considered beyond the point of 0.3 L_f from the forward perpendicular.

(2) For cases of bottom damage which is applied to damage sustained in areas after the point of 0.3 L_f from the forward perpendicular (according to **205. 1** (2) of the Rules), such damage is to be considered up to the point corresponding to 0.3 L_f - 5.0 m from the forward perpendicular.

206. Location of cargo tanks

1. Location of cargo tanks

Notwithstanding the requirements for the location of cargo tanks in **206.** of the Rules, cargo pump room bilges or tank washings may be thrown into any cargo tanks.

2. Suction well installed in cargo tanks

It is desirable that the area of suction well is not larger than the area necessary for the installation of cargo pumps, suction pipes, valves, heating coils, etc. added with the area necessary for sufficient suction, cleaning and maintenance.

207. Flooding assumptions

1. Equalization arrangements

The "cross-levelling pipes" specified in **207. 6** of the Rules are to comply with the following requirements :

(1) Use of this equalization arrangement is to be accepted only for obtaining the GZ area of 0.0175 m.rad for the righting lever of 0.1 m and the range between the state of equilibrium and 20°. Without the use of this equalization arrangement, the requirements for heel angle and positive stability range are to be satisfied. (See **Fig 7.6.4** of the Guidance)

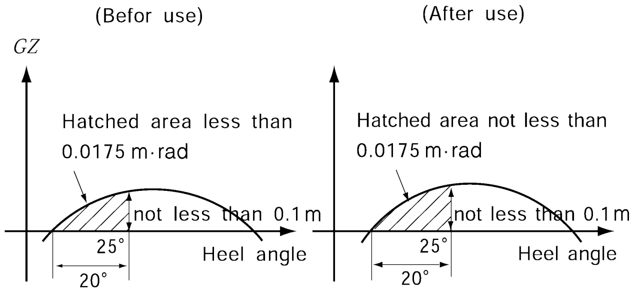


Fig 7.6.4

(2) When righting lever curves before use of this equalization arrangements are determined, the following assumptions are to be made :
   (A) The cargo or consumable liquid in the damaged space has completely spilled out.
   (B) The damaged space is filled with sea water to the water level outside the ship.
   (C) The cross-levelling pipes are closed.

(3) The time required for horizontal adjustment is to be not more than 15 minutes.

(4) The cross sectional area A of piping used for horizontal adjustment is to be as follows :

$$A \geq 7.5\,V/\sqrt{H} \quad (\mathrm{cm}^2)$$

where:

V : Quantity of water expected to enter the flooded space (m^3)

H : Height from the draught line before flooding to the centre line of the pipe (m)

(5) It is not desirable to connect spaces on both sides of the ship with a large diameter duct to ensure the same rate of flooding as this aggravates the heeling moment of the ship in turning motion.

2. Buoyancy of superstructure

(1) In the case of the side damage where the machinery space is regarded as one-space flooding in **207. 8** of the Rules, damage extent applicable to spaces other than the machinery space is applied to poop. With this reason, therefore, the space within poop surrounding the machinery space and enveloped by watertight bulkheads can not be treated as a reserve buoyancy unless watertight bulkheads are arranged as given in **Fig 7.6.5** of the Guidance. However, in case where such treatment is accepted under the special requirements for small ships in accordance with **208. 2** of the Rules as a special relaxation by the Society, the above requirements may not be applied. Where the engine room bulkhead is knuckled, the space between the foremost end and the aftermost end is to be taken as the damaged space of the superstructure as given in **Fig 7.6.6** of the Guidance.

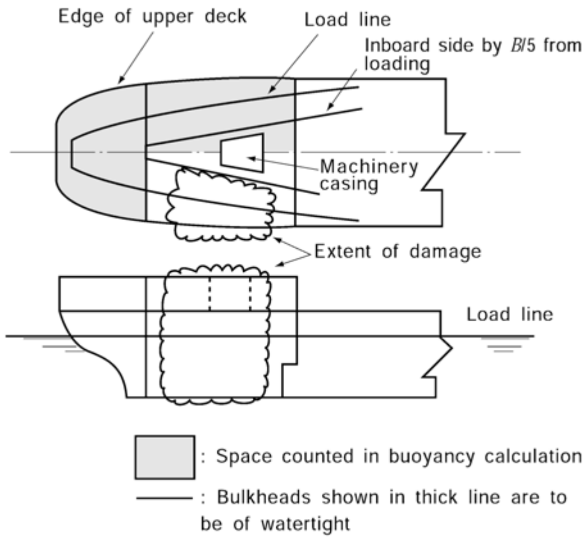

Fig 7.6.5

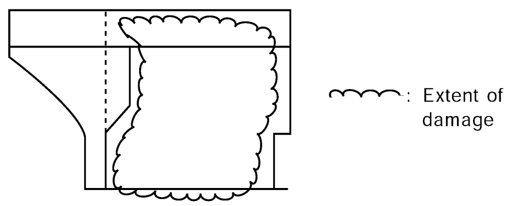

Fig 7.6.6

(2) In **207. 8** (2) of the Rules, the remotely operated sliding watertight doors are to be capable of being controlled from a safe and readily accessible place. Weathertight openings submerge in water under the minimum range of residual stability are to be capable of closing securely in a state of equilibrium.

208. Standard of damage

1. Assumed extent of damage

(1) In **208. 1** (3) and (5) of the Rules, the treatment of the stairway cases located forward or aft end bulkheads of the machinery space is to be in accordance with **Fig 7.6.7** of the Guidance.

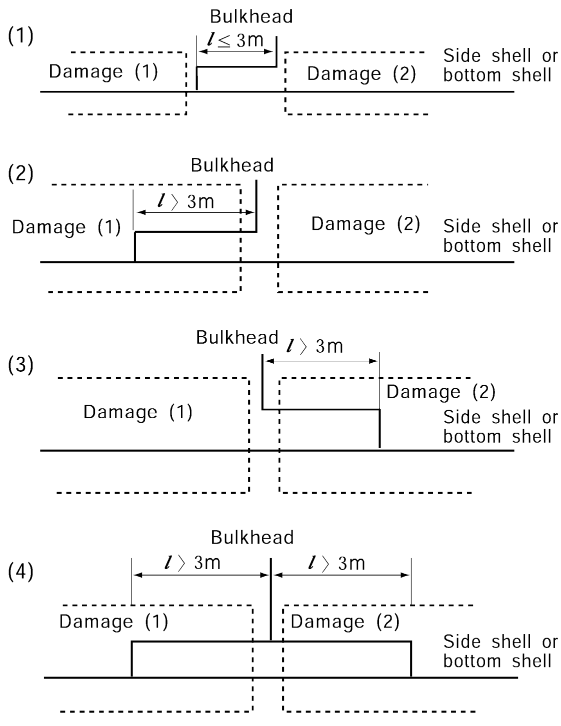

Fig 7.6.7

(2) In **208. 1** (6) of the Rules, the expression "should be considered by the Society" means that the survival requirements specified in 209. of the Rules under a condition of flooding only in the machinery space are satisfied, or the following requirements are satisfied (See **Fig 7.6.8** of the Guidance) :

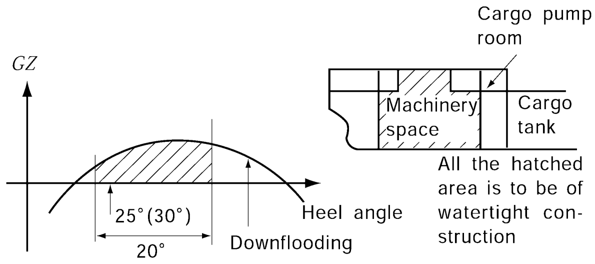

Fig. 7.6.8

(A) The area with positive sign of the righting lever curve within the range from an arbitrary point between the final state of equilibrium after flooding and 25° (or 30° when the deck side line is not submerged) to 20° is to be :
(a) $70\,m \leq L_f < 125\,\mathrm{m}$: 0.0175 m·rad or more.
(b) $L_f < 70\,\mathrm{m}$: 0.0088 m · rad or more
(B) The position of down flooding is to be in accordance with **209. 3** (1) of the Rules.
(C) The angle of heel is to be in accordance with **209. 2** (2) of the Rules. Where the machinery casing is of the watertight construction, the space in poop surrounding the machinery space may be treated as a reserve buoyancy. When a door is provided, it is to be of the watertight sliding door remotely operated from the poop deck.

2. Alternative measures

The "special dispensations" in **208. 2** of the Rules are to be in accordance with the following. (See **Fig 7.6.9** of the Guidance)

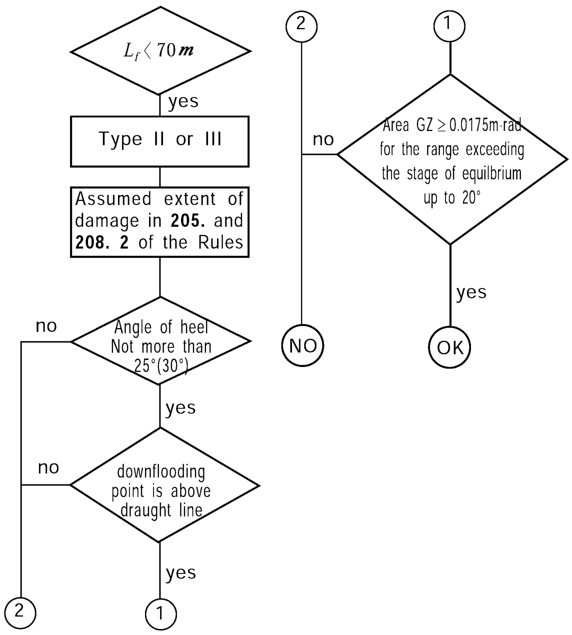

Fig. 7.6.9

(1) No dispensations are to be accepted for Type I ships.
(2) Small ships mean as those whose $L_f < 70\,\mathrm{m}$.
(3) Except for the case of flooding of machinery space of Type III ships(**208. 1** (6) of the Rules), it is to be in accordance with the following :
(A) Assumed extent of damage is to be in accordance with **205., 208. 1** (3) and (6) of the

Rules.

(B) Down flooding point and angle of heel are to be in accordance with **209. 2** and **3** of the Rules.

(C) The area with positive sign of the righting lever curve within the range from an arbitrary point between the final stage of equilibrium after flooding and 25° (or 30° when the deck side line is not submerged) to 20° is to be 0.0175 m.rad or more.

(D) The maximum value of GZ is not specified.

209. Survival requirements

1. Stability criteria at any stage of flooding

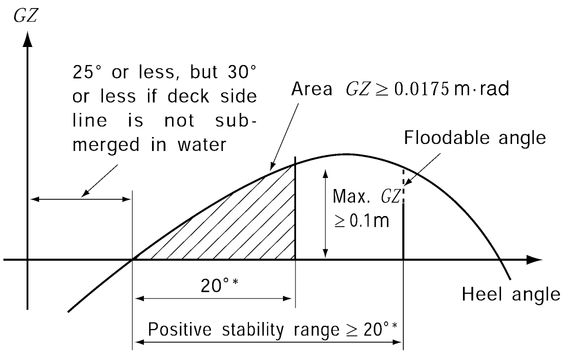
The words "to the satisfaction of the Society" in **209. 2** (3) of the Rules mean as follows :

In ordinary cases, the final stage of flooding is considered most severe, but the most severe condition may be encountered during intermediate stages of flooding involving replacement of sea water in the damaged space. In this connection, stability during such intermediate stages of flooding are to be considered when specifically requested by the Society.

2. Stability criteria at final equilibrium after flooding

(1) In **209. 3** of the Rules, floodable weathertight openings within the minimum stability range (20°) are to be capable of being securely closed at the final stage of equilibrium after flooding. Where safe access thereto is impracticable due to submersion of deck or large angle of heel, such weathertight openings may not be accepted. However, air pipes of float type, etc. having self-closing mechanism in case of submersion in water may be accepted.

(2) The survival requirements at the final stage of equilibrium after flooding are to be in accordance with **Fig 7.6.10** of the Guidance.



Note * : The initial point of calculation of the stability range at an angle of heel of 20° may be taken arbitrarily at any intermediate point between the angle of heel at the final stage of equilibrium and the maximum angle of heel.

Fig 7.6.10

Section 3 Ship Arrangements

301. Cargo segregation

1. Segregation of tank containing cargo or residues of cargo

For cargo tanks and slop tanks, neither linear contacts nor point contacts with accommodation spaces, service spaces, machinery space, etc. are to be accepted. Further, no segregation of spaces in contact by means of slanting plates is to be accepted.

2. Segregation of cargoes which react with other cargoes

Where cargoes which react with other cargoes in a hazardous manner are loaded simultaneously, the ship arrangement as given in **Fig 7.6.11** of the Guidance is not to be accepted. Only in the requirements for segregation of cargoes which react with each other, the linear contacts and point contacts as given in **Fig 7.6.12** of the Guidance may be accepted. Where the cargo pipes are of common pipes, they are not to pass through cargo tanks carrying cargoes which react with each other in a hazardous manner except for the cases where pipe arrangement is provided a tunnel or made as given in **Fig 7.6.13** of the Guidance.

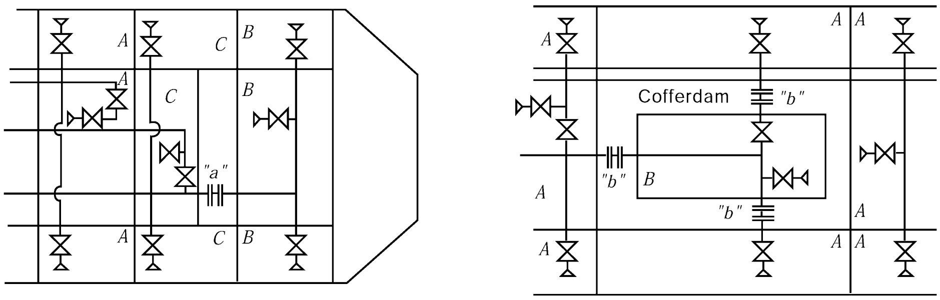


Fig. 7.6.13

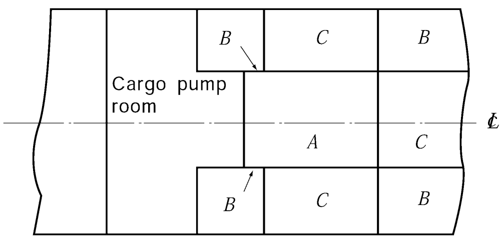
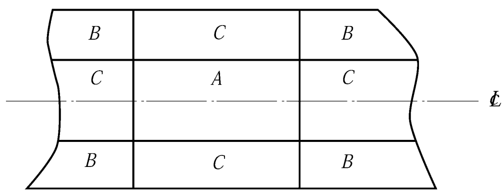


A and *B* react with each other in a hazardous manner. (Arrowhead of *B* indicates facial contacts.)
A and *C*, and *B* and *C* do not react with each other in a hazardous manner.

Fig. 7.6.11



A and *B* react with each other in a hazardous manner.
A and *C*, and *B* and *C* do not react with each other in a hazardous manner.

Fig. 7.6.12

Notes :
1. "a" and "b" are to be separated within cofferdam or void spaces in the method specified in 301.5 of the Rules. No separation in thanks is to be accepted.
2. A and B are cargoes which react with each other in a hazardous manner.
3. A and C, and B and C are safe cargoes which do not react with each other in a hazardous manner. In this case, however, cargo operation of cargo B by connecting the spool pieces of "a" and "b: after discharging cargo A is unacceptable, and therefore provisions of independent cargo pumps may be required for cargo operation on tanks segregated under the method given above.

3. Cargo piping

Cargo piping is not to pass through the spaces specified in **301. 3** of the Rules and, in addition, spaces such as fuel oil tanks, fresh water tanks and control stations.

302. Accommodation, service and machinery spaces and control stations

1. Arrangements

When segregated by a gastight deck and well ventilated, such a space is not electrically hazardous space, and in this case, arrangement of accommodation spaces, service spaces or control stations above fuel oil tanks adjacent to cargo tanks in the poop as given in Fig **7.6.14** of the Guidance may be accepted. Paint lockers, regardless of their use, should not be located above the cargo area.

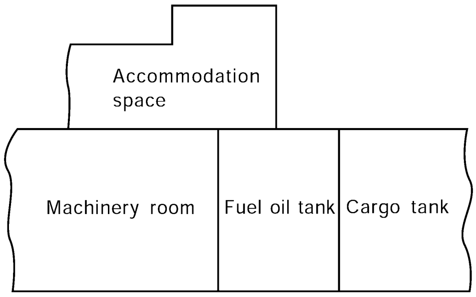


Fig 7.6.14

2. Location of air intakes and openings

The locations of air intakes and openings are to comply with the requirements in **302. 3, 307. 4, 803. 2, 1201. 5** and **1512.** of the Rules.

3. Entrances, air inlets and openings to accommodation, service and machinery spaces and control stations

(1) For exhaust air outlets of the mechanical ventilation system of accommodation, service and machinery spaces and exhaust air outlets specified in **302. 2, 307. 4, 803. 3** and **1512. 1** of the Rules the requirements in this Chapter also apply.

(2) Spaces where doors can be provided are to be restricted to lockers containing cargo gears and safety equipment, cargo control room and decontamination shower room. As given in **Fig 7.6.15** of the Guidance, these spaces are not provided with passageways led to accommodation spaces and service spaces and control station, and the casings, floors and ceilings adjacent to the accommodation spaces are to be insulated to "A-60" standard.

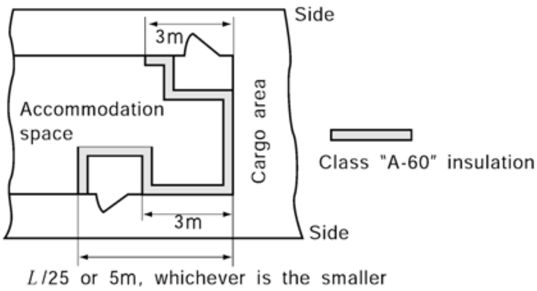

Fig 7.6.15

(3) The gastight wheelhouse doors and windows are to be fitted with packing and dog bolts. These windows, doors and clear view screens are to be hose-tested at a pressure of 0.2MPa. To ensure gastightness of the clear view screen, an additional window fitted with dog bolts or other means of gastight capable of tightening the window pane when the screen is not rotating are to be provided.

(4) For ships carrying dangerous chemicals in bulk, irrespective of the kind of cargo, coaming is to be provided at the forward end of the deckhouse to prevent the ingress of the cargo overflown on the deck into the deckhouse including the accommodation and service spaces and control stations as given in **Fig 7.6.16** of the Guidance. The height of coaming is to be 300 mm from the deck, 50 mm above the upper edge of the sheer strake or 50 mm above the upper face of the deck longitudinals, whichever is the greatest.

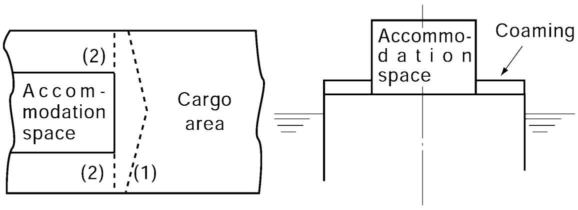

Fig. 7.6.16

303. Cargo pump rooms

1. Arrangement of cargo pump rooms

Where cargo pump rooms are normally manned, or in case where cargo pump rooms are specially large, an additional escape trunk is to be provided. In this case, it is desirable that two escape routes led to the weather deck are available.

2. Permanent arrangement for hoisting an injured person

The permanent arrangement for hoisting an injured person from cargo pump room is to be in accordance with the following requirements :

(1) To be capable of being one-man-operated from the weather deck.
(2) To be capable of lifting an injured person up to the place on the weather deck.
(3) To be capable of lifting a weight of not less than 255 kg.

3. Access ladders

The angle of normal access ladders provided in cargo pump room to a horizontal plane is to be not more than 60°.

4. Means for discharging cargoes and bilges

(1) For pumps and valves dealing with cargoes likely to cause corrosions of structural members or contamination with other bilges within the cargo pump room due to leakage of corrosive cargoes, interactive cargoes or water prohibitive cargoes, proper bilge processing systems are to be provided according to degree of hazard. For instance, as the bilge processing systems for pumps dealing with interactive cargoes, provisions of independent bilge processing systems may be considered. In case where interactive cargoes are handled in the same cargo pump room, simultaneous cargo operations are to be avoided whereby the next cargo operation is to be carried out after complete bilge processing for the first cargo.
(2) Slop tanks specified in **303. 5** of the Rules are to comply with the following requirements (A) through (D) :
(A) In case of using the tank both as cargo tank and slop tank, the same requirements applicable to cargo tanks apply.
(B) Where no cargo is carried and only bilges or tank washings are contained, no requirements for ship type (only concerning the cargo tank arrangement) apply, notwithstanding kind of cargoes contained in bilges or tank washings. However, for the minimum requirements other than ship type, the following (a), (b) and (c) are to be complied with :
(a) For ventilation system, electrical installation and instrumentation, the severest of the requirements applicable to the cargoes contained in the slops is to apply.
(b) For tank environmental control and its special requirements, all the requirements for all cargoes contained in the slops are to be satisfied.
(c) For tank type, the requirements for the cargo contained in the slops are to be satisfied.
(C) For tank washings of tanks that carried the dangerous cargoes subjected to **1512.** of the Rules, slop tanks containing bilges of the cargo pump room used for the cargo operation of these cargoes and pipes serving them, the requirements of **1512.** of the Rules apply without exceptions.
(D) In case where two or more cargoes which react in a hazardous manner are carried, the tank washings and bilges containing these cargoes are not to be contained in the same slop tank. Therefore, slop tanks equal in number to that of cargoes which react in a hazardous

manner carried at the same time are to be provided. In this case, when cargo tanks are used as slop tanks, these cargo tanks are to be provided with the pumps and pipelines to serve as the slop tanks.

(E) For ships carried the oil subjected to MARPOL 73/78 Annex 1, the capacity of slop tanks is to be complied with MARPOL 73/78 Annex 1.

5. Cargo pump discharge pressure gauges

"Cargo pumps" specified in **303. 6** of the Rules are the cargo pumps, tank cleaning pumps, bilge pumps, etc. used for handling cargoes and liquids containing cargoes in general.

6. Gas tightness of shafting passing through bulkhead or deck

The shaft seals of a type for periodical feeding of grease are not acceptable. Only continuous gas-tight sealing type is acceptable. These shaft seals are to be provided outside the cargo pump room. (See **Fig 7.6.17** of the Guidance)

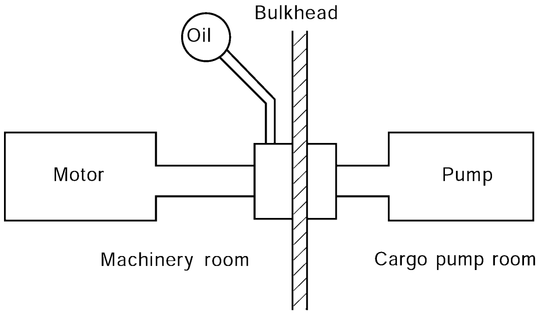

Fig. 7.6.17

304. Access to spaces in the cargo are

1. General

(1) Spaces having direct openings to hold spaces containing independent tanks are to be to the requirements in **304.** of the Rules irrespective of the definition of the cargo area. Fuel oil tanks which have face contacts, linear contacts or point contacts with cargo tanks and those arranged directly below cargo pump room are not included in the cargo area, but subject to the following requirements.

(A) Fuel oil tank adjacent to cargo tank or in linear or point contact therewith. (See **Fig 7.6.18** of the Guidance) Access holes are to be to the requirements in this Paragraph, and access is to be from the cargo area.

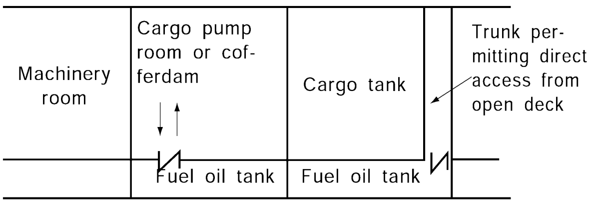

Fig. 7.6.18

(B) Fuel oil tank directly below cargo pump room. (See **Fig 7.6.19** of the Guidance) Access holes are to be to the requirements in this Paragraph, and in consideration of possible cargo leakage, access is to be from the cargo area.

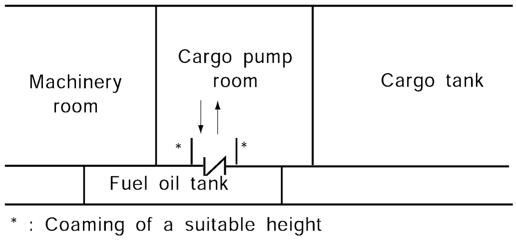

Fig. 7.6.19

(C) For fuel oil tanks given in **Fig 7.6.20,** the requirements in this Paragraph do not apply. Access from the cargo area is desirable.

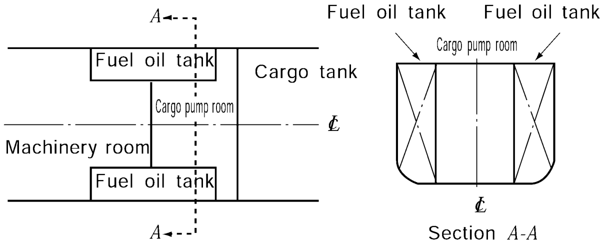

Fig. 7.6.20

(2) For access openings of double bottom, etc., the following requirements are to be complied with : Two access routes are, as a rule, necessary for double bottom or similar other spaces as given in (1) to (3) of **Fig 7.6.21** of the Guidance. The arrangement as given in (4) of **Fig 7.6.21** of the Guidance is not to be accepted. On condition that easy access is provided and an unconscious injured person can be rescued, only one access route may be accepted for a relatively small space. On duct keel, access openings are to be provided at both ends, and an opening led to weather deck is to be provided at intervals not exceeding 60 m.

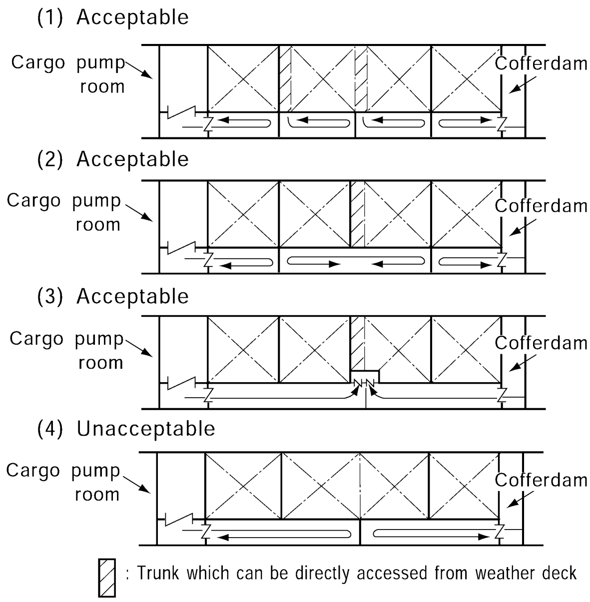

Fig. 7.6.21

(3) Access openings to independent cargo tanks are to be in accordance with the following requirements :
Independent cargo tanks are to be provided with trunks or domes protruding beyond the weather

deck as given in **Fig 7.6.22** of the Guidance and cargo tank hatches are to be provided on the top of these trunks or domes. No opening of any construction is to be provided on the cargo tank wall below the weather deck.

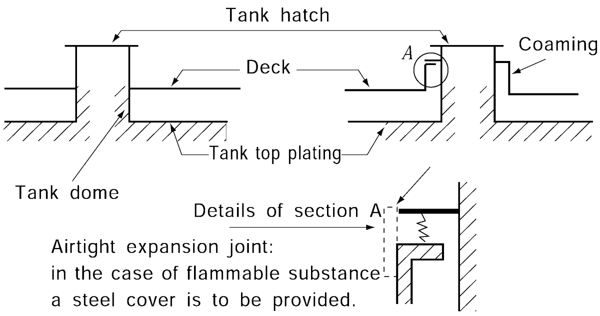

Fig. 7.6.22

2. Minimum clear opening for access through horizontal openings

The minimum opening dimensions are to be 600 mm × 600 mm with rounded corners.

3. Minimum clear opening for access through vertical openings and arrangements of vertical openings

Access openings are to comply with the following requirements:

(1) Opening of 600 mm × 800 mm is to be so oriented that the major axis is taken in the vertical direction. However, where the major axis is difficult to be taken in the vertical direction under the structural reason, horizontal direction may be taken.

(2) At access openings and in the vicinity, no pipes or equipment that interfere with the assurance of access route are to be arranged.

4. Relaxation of opening dimension

Opening dimensions may be as given in **Table 7.6.1** of the Guidance provided that person wearing safety equipment has access to openings and an injured person is easily rescued from the bottom of spaces.

Table 7.6.1 Relaxation of Opening Dimension

Spaces	Minimum dimension (mm)
Cargo Tanks	600×600
Void Spaces, W.B.T	H : 500×500, V : 500×650
F.O.T	H : 450×450, V : 400×500

305. Bilge and ballast arrangements

1. General

(1) The discharge arrangements of permanent ballast tanks adjacent to cargo tanks may be such that ballast pumps in the machinery space are used as given as **Fig 7.6.23** of the Guidance and ballast or bilges are discharged overboard through the eductor in the cargo pump room. In this case, check valve is to be provided between the ballast pump and eductor and spool piece is to be provided on the weather deck within the cargo area.

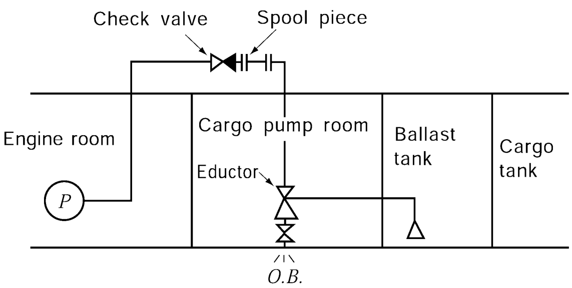

Fig. 7.6.23

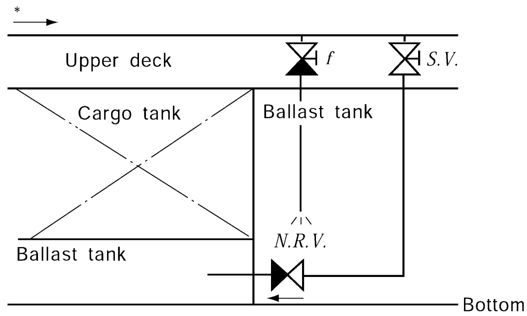
(2) The words "ensure filling from tank deck level and check valves are fitted" referred to in **305. 1** of the Rules mean that exclusively used for filling from the weather deck but can not be used for discharging fitted with stop valves on the weather deck or stop valves operable from the weather deck and additionally check valves are provided as given in **Fig 7.6.24** of the Guidance. Further, sufficient consideration is to be taken so as not to cause non-compliance with the damage stability requirements due to damage to pipelines or spillage of dangerous ballast or cargo into other compartments.



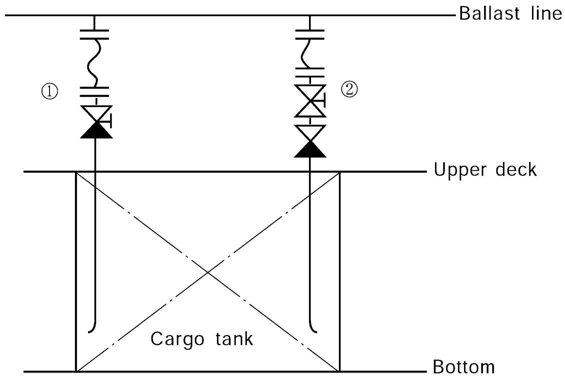
* : A line to ensure filling only from the pump in machinery room
N.R.V. : Non-return valve (Check valve)
S.V. : Stop valve
f : Stop valve + check valve or screw-down check valve

Fig. 7.6.24

(3) Pipelines of ballast tanks adjacent to cargo tanks and not adjacent to cargo tanks are to be basically independent.

2. Filling of ballast in cargo tanks

(1) The case referred to in **305. 2** of the Rules as "the filling line has no permanent connection to cargo tanks or piping and that check valves are fitted" is to be as given in **Fig 7.6.25** of the Guidance. In this case, filling is to be limited to that from the open deck, where spool pieces or hoses and stop valves or check valves are required.
(2) When filling is made from the open deck according to the preceding (1), the piping arrangement in cargo tanks is to be such that the filling pipe is extended as close to the bottom as practicable to minimize generation of static electricity.



① Hose (spool piece) + screw-down check valve
② Hose (spool piece) + stop valve + check valve

Fig 7.6.25

3. Bilge pumping arrangements for the cargo area

Pipes dealing with cargo or cargo residues passing through void spaces, double bottom and ballast tank spaces are to be treated within the bilge cargo spaces of the compartments even when they are segregated from tanks containing cargo or cargo residues by double bulkheads.

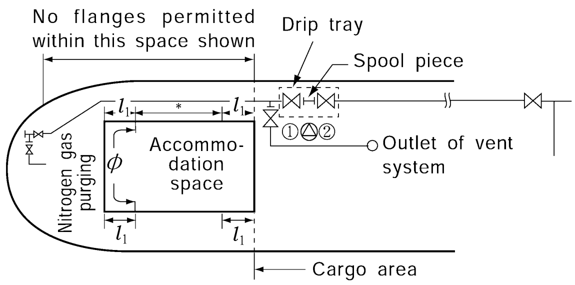
306. Pump and pipeline identification

"Marking" referred to in **306.** of the Rules is to be made by peel-resisting tapes or paint coat to clearly identify respective pipes.

307. Bow or stern loading and unloading arrangements

1. General

The bow or stern loading and unloading arrangements are to be given in **Fig 7.6.26** of the Guidance, as a standard.



l_1 : $L/25$ or 3m, whichever is the greater, but need not exceed 5m.
* : Where inlets, air intakes, openings, etc. are permitted to be provided.
ϕ : Where inlets, air intakes, openings, etc. are not permitted to be provided.
Valve ① : The stop valve required in **307. 3** (1) of the Rules.
Valve ② : The stop valve necessary for fitting/removal of the spool piece.
⚠ : Spray shield is to provided for valves and spool piece. (portable one may be accepted.)

Fig 7.6.26

2. Entrances, air inlets and openings to accommodation, service and machinery spaces and control stations

All openings such as entrances, to accommodation, service and machinery spaces and control stations, air inlets, rope hatches, openings to machinery casing, openings in escape routes, etc. are to be arranged in areas outside the shaded sections given in **Fig 7.6.27** of the Guidance. The standard height of superstructure is to be as given in **Table 7.6.2** of the Guidance.

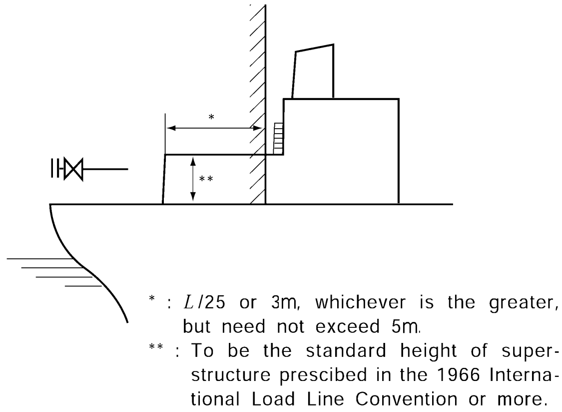


Fig 7.6.27

Table 7.6.2 The Standard Height (m)

L (m)	Low Poop	Other poop
Not more than 30	0.90	1.80
75	1.20	1.80
Not less than 125	1.80	2.30

3. Escape route

The "escape route" referred to in **307. 6** of the Rules means the escape route from machinery space.

4. Continuous coamings

The "continuous coamings of suitable height" referred to in **307. 7** of the Rules are the coamings provided on the cargo handling machinery and gear with a height above deck of 150 mm or 50 mm above the upper edge of the sheer strake as given **Fig 7.6.28** of the Guidance, whichever is the greater, and are to be arranged in direction of breadth of ships continuously.

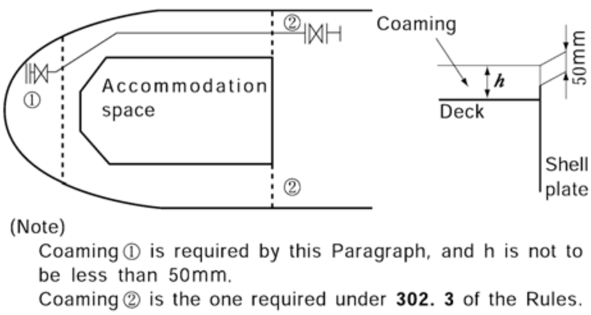

Fig 7.6.28

5. Fire-extinguishing arrangements

One each monitor for foam fire-extinguishing system and portable foam applicator unit required in the cargo area are to be provided. The hydrant connected with the portable foam applicator unit is to be arranged within the range effective for discharging the fire-extinguishing medium and the portable foam applicator unit is to be stowed in a space ready for immediate use.

Section 5 Cargo Transfer

501. Piping scantlings

1. Design standard for piping

(1) In **501. 6** (1) of the Rules, the minimum thickness of stainless steel pipes is, in general, to be in accordance with the following requirements :
· Cargo pipes passing through ballast tanks : Schedule 40 S
However, the minimum thickness is to satisfy the requirements for thickness of pipes subjected to internal pressure specified in **501. 1** of the Rules.

(2) The protection for cases "Where necessary for mechanical strength" referred to in **501. 6** (2) of the Rules is to be provided as follows :
(A) No protection is required for steel pipes used for ordinary applications.
(B) Where aluminium pipes, stainless steel pipes of which thickness is reduced according to their tensile strength, etc. considered vulnerable to impact loads are used, suitable protection is to be provided.
(C) It is desirable that manifolds are to be made of steel.
(D) Pipes passing through bulkheads or decks, those arranged an elevated space above upper deck, those subjected to load of the loading arms at the manifold may be required to have increased thickness.

(3) In "Flanges, valves and other fittings" referred to in **501. 6** (3) of the Rules, the use of stop valves and expansion joints is to be in accordance with the following requirements :
(A) To comply with the requirements in **Pt 5, Ch 6** of the Rules (for both Class I and Class II pipes).
(B) Since use of expansion joints is not allowed for the cargo pipes within tanks containing the cargo for which special means for the maintenance of product quality are required, expansion of the pipes is to be absorbed by U-bends, etc.
(C) The materials of valves, seals, etc. are not to be of the ones of which use is prohibited.

502. Piping fabrication and joining details

1. Joint of cargo piping

Cargo pipes are to be joined by welded joints except for the flange joints for shut-off valves and expansion joints, spool pieces and equivalent fittings approved in **502. 2** of the Rules and flange joints necessary for painting, lining, assembly, inspection or maintenance. Further, movable anti-acid shields to guard against spray are to be provided at flange welding of cargo pipes above the deck referred to in **1511.** of the Rules.

2. Direct connection of pipes without flanges

Where Class I pipes or Class II pipes are required under **504.** of the Rules for butt-welded joints in **502. 3** (1) of the Rules, the requirements in **Pt 5, Ch 6** of the Rules are to be complied with. The butt welding procedure for cargo pipes (including liquid cargo and vapour cargo) where use of Class III pipes are permitted is to be the same as in Class II pipes. However, nondestructive testing may not be carried out.

3. Expansion joints

The "bellows" referred to in **502. 4** (1) of the Rules are not to be used for cargoes having corrosive or polymerizing nature unless consideration is taken for the cargo drains trapped in the corrugated parts of the joints.

503. Flange connections

1. Standards for flanges

The "standard approved by the Society" referred to in **503. 2** of the Rules means the requirements in **Pt 5, Ch 6, 104.** of the Rules.

504. Tests requirements for piping

1. Application

The classification standard and test requirements for cargo piping are to be in accordance with **Tables 7.6.3** and **7.6.4** of the Guidance.

Table 7.6.3

Ship type	Classification of applicable cargo (See **Table 7.6.4** of the Guidance)	Remark
Type 1	Class I pipes	Irrespective of the design pressure and temperature, the requirements in the left-hand column apply, as a standard. For compatibility between cargo and cargo piping materials, separate investigation is to be made.
Type 2	Class II pipes	
Type 3	Class III pipes	

Notes :
(1) Cargo piping means the piping to transfer liquid cargo and vapour cargo.
(2) Cargo piping for slop tanks arranged in accordance with the requirements of ship type 3 is to be classified into Class III irrespective of the ship type requirements for cargo contained in slop tanks.
(3) Cargo piping passing through the tanks cargo with higher ship type requirements is to comply with the requirements of the piping specified for such cargo.

Table 7.6.4. Test Requirements for Piping

<table>
<tr><th rowspan="2"></th><th rowspan="2">Materials of pipe</th><th rowspan="2">Materials of valves, cocks and pipe fittings</th><th colspan="3">Shop tests for pipe fabrication</th><th rowspan="2">Shop tests for valves and pipe fittings</th><th rowspan="2">Shipboard tests for piping</th></tr>

</table>

505. Piping arrangement

1. Cargo piping under deck

(1) "the stop valve operable from the weather deck" referred to in **505. 2** of the Rules is to be located in the vicinity of each open end within each tank.

(2) "As an exception ..." specified in **505. 2** of the Rules following is applicable only to the cargo piping arranged in one cargo tank or slop tank adjacent to the cargo pump room as given in the shaded section of **Fig 7.6.29** of the Guidance. In this case, an additional stop valve is to be provided between the bulkhead valve and cargo pump.

(3) The word "leakage" referred to in **505. 2** (1) of the Rules includes the leakage through packing.

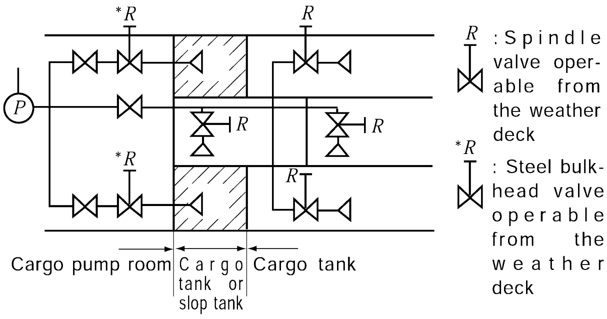

Fig. 7.6.29

506. Cargo transfer control systems

1. General

(1) The "one stop valve capable of being manually operated on each tank filling and discharge line, located near the tank penetration" referred to in **506. 1** (1) of the Rules, for cargo pipes provided in cargo tanks as given in **Fig 7.6.30** of the Guidance may be omitted if there are stop valve specified in **505. 2** of the Rules (stop valve located near the open end and operable from the weather deck) and bulkhead valve provided in the cargo pump room specified in **505. 3** of the Rules.

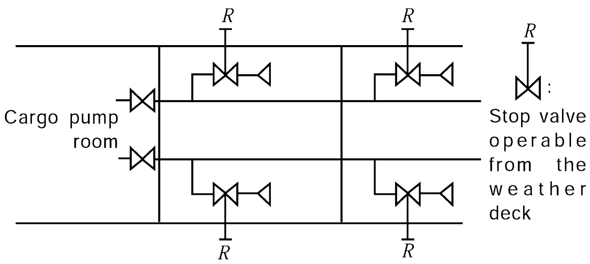

Fig. 7.6.30

(2) Stop valve is not required at the deck penetration of the discharge piping of deep well pump or submerged pump provided independently in each tank, but a stop valve is to be provided near at each penetration of weather deck as given in **Fig 7.6.31** of the Guidance for the direct cargo filling line(piping capable of filling cargo without being led through the cargo pump).

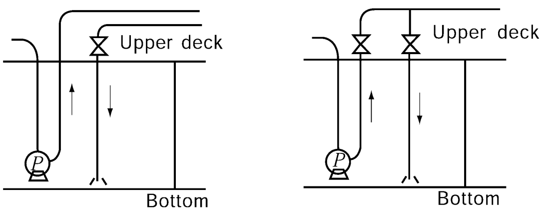

Fig. 7.6.31

(3) When the "direct cargo filling line" specified in the preceding (2) is provided, the open end of such direct cargo filling line for highly flammable and/or toxic chemicals is to be extended to not more than 10 cm above the tank top or sump surface or the filling pipe radius, whichever is the greater.
(4) The "one stop valve" referred to in **506. 1** (2) of the Rules is also required for the hose connection used for the transfer of cargo vapour.
(5) In addition to the preceding (4), a stop valve is required for the hose connection to the shore vapour circulation. When the stop valve is of the portable type for fitting as necessary, stop valves equal to or greater, in number, than the maximum number of tanks scheduled for simultaneous loading of the cargo requiring shore circulation are to be provided at shore for the ship. The restriction to the number of loaded cargo tanks according to the number of these stop valves is to be noted in the Operation Manual of the ship carrying dangerous chemicals in bulk.
(6) It is desirable that the "remote shut-down devices" referred to in **506. 1** (3) of the Rules can be centrally controlled from a place manned at all times during the cargo operation (e.g. cargo control station).

507. Ship's cargo hoses

1. General

(1) The "hoses" referred to in **507. 1** of the Rules are to comply with the following requirements :
  (A) When come in contact with the cargo, hoses are not to be mechanically damaged or caused extreme degrading in their function.
  (B) The materials of cargo hoses are not to give hazardous effects on the cargo.
(2) In the preceding (1), if cargo hoses are integral with the emergency cargo pump or they are submerged in the tank connected to the pump, the requirements in the preceding (1) are to be considered for both the inside and outside surfaces of hoses.

Section 7 Cargo Temperature Control

701. General

1. General

The "cargo heating or cooling system" referred to in **701. 1** of the Rules is to comply with the following requirements :

(1) For possible failure of any component or the whole system serving as a source of heating in ships carrying the cargo requiring heating and to which the requirements in this Chapter apply, means are to be provided so as not to disable cargo heating, cargo operation or not to endanger the safety of the ship.

(2) For the refrigerating installations and insulation materials of ships carrying the cargo requiring cooling to which the requirements in this Chapter apply, the requirements in **Ch 5, Sec 4** to **Sec 7** of the Rules and those specified in **Pt 9, Ch 1** of the Rules for Refrigerating Installations apply correspondingly. Particular attention is to be paid to the cargo since propylene oxide for the refrigerating installation of which detailed requirements are specified.

(3) Cargo requiring heating means the dangerous chemicals with a melting point not less than 15°, as a standard, but if deemed necessary by the Society, heating means for cargo may be required according to the service area and operation condition of the ship. In this case, the temperature measuring equipment specified in **701. 5** of the Rules is to be of the fixed type.

(4) The maximum temperature of steam and heating media within the cargo area is to be adjusted to take into account the temperature class of the cargoes.

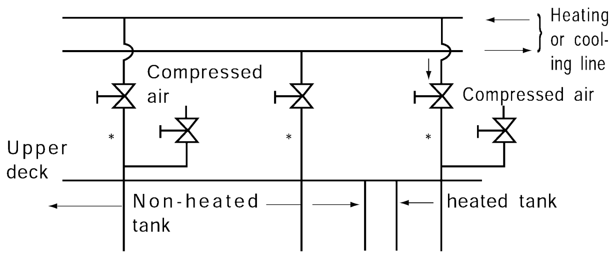
2. Control valves of cargo temperature control system

The "valves to isolate the system for each tank and to allow manual regulation of flow" referred to in **701. 3** of the Rules means the valves provided between the main vapour line and each tank and are capable of regulating flow rate. This also applies to the case of the refrigerating installations. In **Table 7.6.1** of the Rules where carriage of the water prohibiting cargoes to which the requirements of **1516. 2** of the Rules apply is intended, spool pieces are to be provided in addition to these valves.

3. Maintenance of pressure in cargo temperature control system lines

As the provision for the maintenance of the pressure specified in **701. 4** of the Rules, compressed air may be supplied from the deck general service air line fed from the air reservoirs and air compressors in the machinery space to the heating (cooling) piping.

When it is solely planned to carry the heated (cooled) cargo in all tanks, compressed air may be fed from the compressed air main, but if it is intended to carry the heated (cooled) cargo in part of tanks with the rest of tanks used for the carriage of non-heated (non-cooled) cargo, compressed air is to be supplied from the connection on the tank side of the stop valve of the compressed air branch line as given in **Fig 7.6.32** of the Guidance. In case where carriage of the cargo not requiring heating (or cooling) but requiring to inert the tanks and cofferdams adjacent thereto, no air is to be sealed in the line but inert gas is to be filled in. Consideration is to be given so as not to cause dangerous mutual reaction between the sealing medium and the cargo. Where other means are employed for the maintenance of line pressure, the same requirements apply.



* For the heating (cooling) lines led to tanks where water prohibiting cargoes are carried, spool pieces are to be provided on the tank side of the stop valve.
Where the cargo causing harmful reaction with the thermal medium is carried, the heating (cooling) lines are to be emptied, dried and gases are to be filled before cargo loading.

Fig. 7.6.32

4. Means for measuring the cargo temperature

"When overheating or overcooling could result in a dangerous condition" referred to in **701. 5** (4) of the Rules means such a case where the adjacent cargo tanks or fuel oil tanks are heated or cooled to the extent that they suffer from thermal effects. In this case, the temperature sensing ends are to be provided at least at two locations on the liquid surface and bottom of the tank.

5. Circuit operated with heating or cooling medium

(1) The cargoes falling under the requirements in **701. 6** of the Rules are to be those to which application of the requirements of either **1512., 1512. 1** or **1512. 3** specified in **Table 7.6.1** of the Rules is required, but they also apply to the cargo with a notation of "*T*" in vapour detection of the Table.

(2) "where the medium is sampled to check for the presence of cargo" referred to in **701. 6** (3) of the Rules is to be of the detection tank fitted with a detection cock as given in **Fig 7.6.33** of the Guidance, as a standard. Although provision of a oil observation tank in the machinery space is required for ordinary tankers according to the requirements in **Pt 7, Ch 1, 1002. 9** of the Rules, in the case of carriers carrying dangerous chemicals in bulk, provision in the machinery space is not permitted and such means is to be provided on the weather deck within the cargo area without exception. Means of detection is to be by an effective toxic gas-detecting tube or suitable testing agent. The suitable testing agent is to have been procured from the manufacturer.

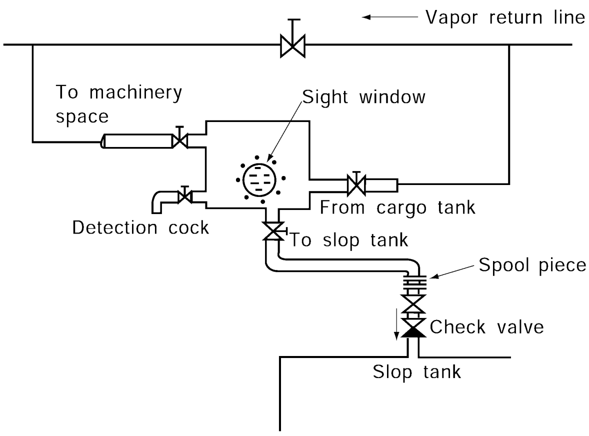


Fig. 7.6.33

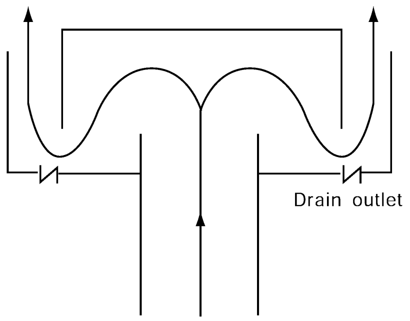
Section 8 Cargo Tank Venting and Gas-freeing Arrangements

802. Cargo tank venting

1. Venting systems

(1) "Tank venting systems are to be arranged to prevent entrance of water into the cargo tanks and at the same time, vent outlet are to direct the vapour discharge upwards in the form of unimpeded jets" referred to in **802. 1** of the Rules mean the outlet as given in **Fig 7.6.34** of the Guidance.



Drain outlet is to be sized so small that no bulk of vapour leaks out.

Fig. 7.6.34

2. Provision for drainage of vent lines

The "cargo vent lines are to be self-draining back to the cargo tanks" referred to in **802. 2** of the Rules is to be so arranged that drains of the vent lines will flow into cargo tanks by natural gravitation by heels and trims of the ship. In case where such piping arrangement is impracticable, drain cocks are to be fitted at the location of PV valves and other places where drains tend to accumulate. For drain cocks which are capable of returning drains to the slop tanks when large volume of drains are accumulated, hose connections are to be provided.

3. Provision to protect liquefied head exceeding design head

(1) When the "provision made to ensure that the liquid head in any tank does not exceed the design head of the tank" referred to in **802. 3** of the Rules is designed, the following items are to be considered :
(A) loading and unloading rate
(B) filling of ballast and discharge rate
(C) gas evolution
(D) pressure loss considered resistance coefficient
(E) pressure loss in ventilation system
(F) operating pressure(suction/discharge setting pressure) where high velocity venting valves or relief valves are used
(G) density of equilibrium of the vapour/air mixture
(H) air supply rate by fixed type ventilation system

(2) Except for the case specified in **1519.** of the Rules, no independency is required among liquid level gauges, high liquid level alarm system and overflow control system. The high level alarm system or overflow control system required in **1519.** of the Rules may be used for the prevention of cargo tank overpressure. When the cargo having a larger specific gravity than the design specific gravity is carried in partial loading, the cargo tank is to be provided with the measuring systems required in 1301. of the Rules, and additionally, high liquid level alarm system capable of being set at arbitrary levels is to be provided for the protection of the cargo tank.

(3) The system fitted with valves and flanges for connecting cargo hoses at hatches on the top of cargo tank for preventing cargo tank overpressure as given in **Fig 7.6.35** of the Guidance may be accepted only when either of the following (A) or (B) is relevant :

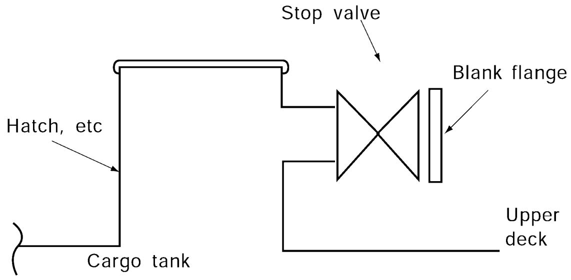


Fig. 7.6.35

(A) Cargo loading is carried out only at ports fully equipped with circulating systems
(B) Where method of cargo transfer to other cargo tanks has been established. In this case, however, cargo loading may be restricted under the requirements for mutual reaction with each other.
In either case of (A) or (B), much difficulty is involved in observing the operational restrictions and hence it is desirable to install the high level alarm or overflow control system specified in **1519.** of the Rules. For tanks carrying the cargo with a flash point of not more than 60°C, provision of the high level alarm system or overflow control system conforming to **Pt 7, Ch 1, 1004. 7** of the Rules is required where spill valves are not to be used. (Spill valves are not deemed equivalent.)

4. Design parameter of venting systems

(1) The size of vent system specified in **802. 4** of the Rules is to be given consideration so that the back pressure produced during the cargo operation at the maximum design loading rate does not exceed either of the following allowable pressures :
(A) Where no special consideration is taken for the strength of tank, the tank design pressure 2.45 m (head)
(B) Where cargo tank is suitably strengthened and the tank has been tested in the presence of the Surveyor of the Society, such tank test head.
(2) The parameters specified in **802. 4** of the Rules are to be considered in sizing of a tank venting system. In a cargo with a boiling point not more than 45°C having a high vapour pressure, the factor exceeding 1.25 may be required in connection to the gas evolution during loading specified in **802. 4** of the Rules.
(3) During the cargo loading/unloading, venting may be carried out through a by-pass line provided for the PV valve or high-speed discharge system. In this case, the height of atmospheric discharge opening of the by-pass line is to comply with the requirements for the height of the discharge outlet of the venting system specified in **803. 3** (1)and **1512. 1** (1) and (2) of the Rules. However, any venting arrangement to discharge the vapour directly by opening the high-speed discharge system is not accepted.

5. High level alarms and overflow control systems specified in the **Ch 6 802. 3** of the Rules are to be type approved by this Society.

803. Types of tank venting systems

1. Open tank venting system

The term "with due regard to cargo segregation" referred to in **803. 1** of the Rules means the design that restricts the ingress of the cargo of a cargo tank into other cargo tanks through vent lines even at times of heavy weather as given in **Fig 7.6.36** of the Guidance. In consideration of possible degrading of product quality due to coming to contact with different dangerous chemicals or their vapours, however, it is desirable that even the open type vent system be of independent design as far as practicable.

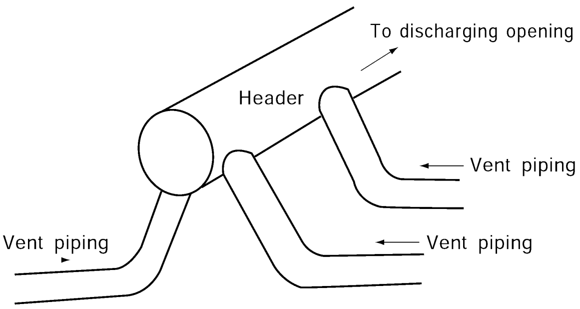

Fig. 7.6.36

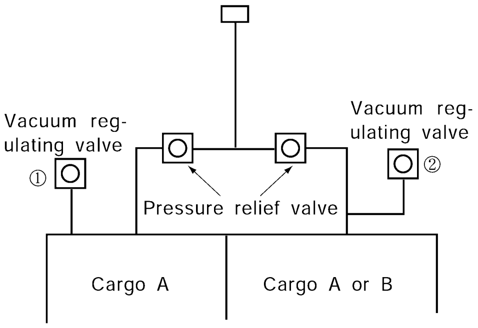
2. Controlled tank venting system

(1) The words "such individual vents on the pressure side only may be combined into a common header or headers, with due regard to cargo segregation" referred to in **803. 2** of the Rules mean as follows :

(A) In case where the controlled venting systems of the cargo tanks carrying the cargoes different from each other or the same cargoes are led to a common pipe header, the pressure relief valves and vacuum regulating valves are to be separate from each other, and any other arrangement than that given in **Fig 7.6.37** of the Guidance is unacceptable. This requirement does not apply to tanks where cargoes which react in a dangerous manner are carried.



(Vacuum regulating valve is to be of the arrangement either ① or ②)

Fig. 7.6.37

(B) When PV valves whose pressure side and vacuum side are led to the common pipe for the vent system of the cargo tank intended to carry cargoes different from each other or the same cargos are used, any arrangement other than the venting system independent for each tank is unacceptable. Accordingly, both the arrangements given as (a) and (b) of **Fig 7.6.38** of the Guidance are unacceptable.

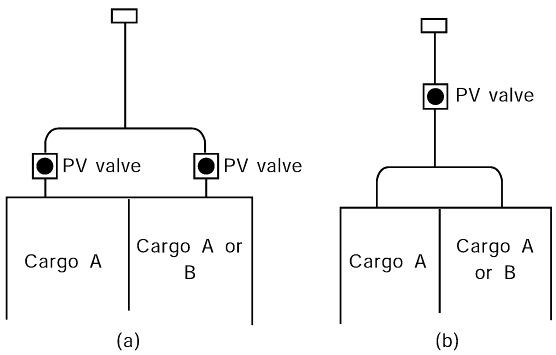


Fig. 7.6.38

(2) The measurement of the height of vent outlet "not less than 6 m above the weather deck" referred to in **803. 4** (1) of the Rules is to be taken as given in **Fig 7.6.39** of the Guidance. As for the height of the opening of the vacuum regulating valve, it is to be not less than 760 mm above the freeboard deck for the cargo to which application of **1516. 1** of the Rules is not required.

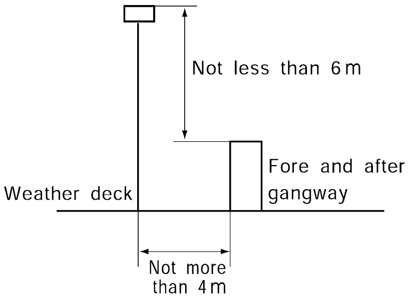

Fig 7.6.39

(3) As the countermeasures against the "freezing of cargo vapour or by icing up in adverse weather conditions" referred to in **803. 7** (3) of the Rules, ships operated in cold zone are to be provided with heating systems, etc. for the prevention thereof. In ships not provided with special heating systems, proper maintenance and inspection work procedures are to have been established.

(4) PV valves referred to **803. 2** of the Rules are to be type approved by the Society. The pressure setting, installation, tests and marking of the PV valves are to comply with the requirements of **Pt 8, Ch 3, 505. 1** of the Guidance.

(5) Devices to prevent the passage of flame(including high velocity valves) referred to **803. 5** and **6** are be type approved by the Society. The design, arrangement, inspection and etc., are to comply with the requirements of **Pt 8, Ch 2, 104. 11** of the Guidance.

805. Cargo tank gas-freeing

1. The method and instruction of cargo tank gas-freeing are to be described on the Cargo Operation Manual in detail.

2. Openings for gas-freeing are to be arranged at places as far as at least the distance specified in **803.** or **1512.** of the Rules from all openings or air intakes of accommodation or service spaces.

Section 9 Environmental Control

901. General

1. Inerting or padding of cargo tanks

(1) The inert gas supply system for ensuring "sufficient inert gas available on the ship to compensate for normal losses during transportation" referred to in **901. 3** (1) of the Rules is to be as follows :

(A) The nitrogen gas generating system that separates nitrogen from the air may be used in combination of the inert gas contained in a pressure vessel as a make-up system at sea.

(B) The required quantity of inert gas to be carried onboard the ship is to be determined for each ship in consideration of the construction and equipment of the ship, but it, as a rule, is to be not less than 5 % of the total volume of cargo spaces to be inerted or expected loss during 30 day voyage, whichever is greater.

(2) Where inerting gas is generated on board by oil-fired inert gas generators according to **901. 3** (1) of the Rules, followings are to comply with. In the case of systems using inert gas from other source, special consideration is to be required.

(A) Inert gas systems are to comply with IMO Res. A.567(14) "Regulation for inert gas systems on chemical tankers". In this resolution, Administration means this Society.

(B) A water seal of inert gas piping device on deck may be replaced by venting valve between two sets of shut-off valve, and following conditions are to be complied with :

(a) Valve is to be operated automatically. Open and close signal is to be obtained directly from the inflow of inert gas or the differential pressure.

(b) The alarm device for valve malfunction is to be installed. For example, the operating situation for blower stop and open of supply valve is to be condition of alarm operation.

(C) In addition to IMO Res A.567(14), following requirements are to be complied with.

(a) Drawings and data to be submitted are to comply with **Pt 8, Ch 1** of the Guidance.

(b) Automatic combustion control capable of producing suitable inert gas under all service conditions is to be fitted to the inert gas generators.

(c) Where two sets of inert gas blowers are provided, total capacity is to be provided equally at two sets, and each blower's capacity is to be 1/3 of total capacity and over.

(d) Materials used in inert gas systems are to be suitable for their intended purpose. In particular those parts or scrubbers, blowers, non-return devices, scrubber effluent and other drain pipes which may be subjected to corrosive action of the gases and/or liquids are to be either constructed of corrosion resistant material or lined with rubber, glass fiber epoxy resin or other equivalent coating material.

(e) The compartment provided with oil burning type inert gas generators is to be fire protection structure such as machinery space of category A.

(f) All devices installed on board are to be satisfied by the Surveyor on the test according to the working condition.

(3) The "means to be provided for monitoring" referred to in **901. 3** (4) of the Rules are to be as follows :

(A) Continuous monitoring system

(a) Continuous monitoring by fixed oxygen content meter, or

(b) Combined use of continuous pressure measurement of tank atmosphere and portable oxygen content meter.

(B) In the case of the cargo where the "closed type" is required for measurement instruments and inerted method is applied, the measurements by a portable oxygen content meter are to be taken at such measuring line from which no cargo is leaked onto the deck during and after the measurements, and means are provided to lead the exhaust gas to the cargo vent lines. In the case of the cargo where the "restricted type" is required, means are to be provided so that the opening for measurement are automatically closed.

2. Environmental control for double hull spaces, etc.

Ventilation, inerting and gas measurement for double hull and double bottom spaces are to comply with **Ch 1, 1009.** to **1011.** of the Rules.

Section 10 Electrical Installations

1001. General

1. Electrical equipment installed in the flammable atmosphere

(1) The words "to the satisfaction of the Society" referred to in **1001. 5** of the Rules are to be in accordance with the following (A) or (B) :

(A) Those complying with the requirements in **Pt 6, Ch 1, Sec 9** of the Rules, and having apparatus groups and temperature classes given in column i in table of **Sec 17** of the Rules according to the type of gas.

(B) Explosion-protected electrical equipment in **Pt 6, Ch 1, Sec 9** of the Rules and having type approval by the Society.

(C) Those approved as having no structural hazard to serve as a source of ignition.

1002. Bonding

1. Bonding

In application to 1002. of the Rules, the electrical bonding is to conform to the requirements of **Pt 6, Ch 1, 104.** of the Rules. In case where the gasketed flange joint are used, the flange bolts only are not considered as an earthing, and the connections and earthing are to be provided with earthing conductors.

Section 11 Fire Protection and Fire Extinction

1102. Cargo pump rooms

1. Fire-extinguishing system for the ships dedicated to the service of a restricted number of cargoes

The term "an appropriate fire-extinguishing system approved by the Society" referred to in **1102. 2** of the Rules means fixed carbon dioxide fire extinguishing system. The fire extinguishing system for ships carrying only the restricted number of cargoes as defined "No-nil requirements" in column j in table of **Sec 17** of the Rules is left to the discretion of the Society.

1103. Cargo area

1. Type of foam concentrate

(1) The "regular protein foam" referred to in **1103. 2** of the Rules means the foam without either any agents or anti-frozen agents added to be leveled the liquid point not higher than 0°C.
(2) Where plural fire extinguishing agents including foam are defined effective in column l in table of **Sec 17** of the Rules, foam fire extinguishing system is to be provided.

2. Arrangements for providing foam

For the purpose of the requirements in **1103. 3** of the Rules, the arrangements for providing foam are to be as follows :

(1) For the deck area of cargo tanks, reference is to be made to **Fig 7.6.40** of the Guidance.
(2) In supplying foams to inside the cargo tanks, access hatches, etc. may be used.

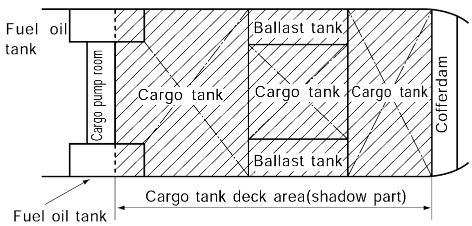

Fig. 7.6.40

3. Rate of supply of foam solution

For the purpose of the requirements in **1103. 5** (3) of the Rules, the minimum capacity of the monitor for ships less than 4,000tons deadweight is to be 1,000 l per minute and the rate of spray may be set at 10 $l/m^2/min$.

4. Specification of monitor and foam applicator

For the purpose of the requirements in **1103. 7** of the Rules, for the monitor and foam applicator for ships less than 4,000 tons deadweight, the requirements in preceding 3 are to apply correspondingly.

5. Requirements of fire main

For the purpose of the requirements in **1103. 12** of the Rules, the fire main is to be capable of discharging at least two lines of water jet on deck, accommodation space, control rooms and machinery space during the fire-fighting operation by foam.

6. Alternative provisions installed in ships dedicated to the carriage of a restricted number of cargoes

The fire extinguishing systems for ships carrying the cargoes defined "No-nil requirements" in column l in table of **Sec 17** of the Rules are left to the discretion of the Society.

7. Portable fire-extinguishing equipment

As portable fire-extinguishing equipment, two fire extinguishers with a capacity of 9 l to 13.5 l using the fire-extinguishing agents suitable for the type of cargo carried are to be provided at each manifold. These fire extinguishers are to be stored at suitable places except for the time of cargo operation.

8. Exclusion of sources of ignition

For the purpose of the requirements in **1103. 15** of the Rules, the windlasses and chain lockers are to be regarded as sources of ignition and are not to be provided in the dangerous compartments given in **1002.** of the Rules. The relevant requirements in **Pt 8, Ch 2** of the Rules are also to be complied with.

1104. Special requirements

1. Special requirements

(1) For ships dedicated to exclusive carriage of one type of cargo relating to the fire-extinguishing installation given in column l in table of **Sec 17** of the Rules, either one of the alternative fire-extinguishing equipment specified therein may be selected and provided notwithstanding the requirements in column l. Further, the fire-extinguishing arrangements in ships carrying only the cargo defined "NF" in column i and "No-nil requirements"in column l in table of **Sec 17** of the Rules are to be such that any places on deck within the cargo area can be covered by water spray from at least two lines of fire nozzles discharged from separate fire hydrants.

(2) The capacity of fire-extinguishing agent of dry chemical fire extinguishers is to be the greater or more of the following capacities :

(A) The capacity required in **Ch 5, 1104. 6** of the Rules.

(B) 1.5 kg/m^2 of the total deck area of the cargo tanks which are expected to carry simultaneously the cargo for which the fire-extinguishing equipment is required. For other requirements for installations, the requirements in **Ch 5, 1104.** of the Rules apply correspondingly.

(3) The "C-water spray" required in column l in table of **Sec 17** of the Rules as the fire-extinguishing equipment of "ammonium solution of 28 % or less" may be replaced with the water spray from the fixed deck foam system.

Section 12 Mechanical Ventilation in the Cargo Area

1201. Spaces normally entered during cargo handling operations

1. Ventilation prior to entering the compartment

For the purpose of the requirements in **1201. 2** of the Rules, the ventilating period before the entrance of person in the compartments is to be 15 minutes as standard.

2. Type of ventilation systems

For the purpose of the requirements in **1201. 4** of the Rules, the ventilation ducts in cargo pump room are to be provided at the upper part of cargo pump room, and in addition, to be arranged in compliance with the requirements in **Pt 7, Ch 1, 105.** of the Rules. Further, the suction openings are to be arranged as far apart as practicable from each other, for instance on a diagonal line of cargo pump room, in consideration of the vapour density of the cargo and air intaking efficiency.

3. Arrangement of ventilation intakes

For the purpose of the requirements in **1201. 6** of the Rules, the ventilation intakes are to be so arranged as to minimize the possibility of recycling hazardous vapours.

4. Arrangement of ventilation ducts

For the purpose of the requirements in **1201. 7** of the Rules, in view of the difficulties involved in the maintenance when protection against the approved type of cargo to be carried is required, the location of ventilation ducts on the bulkhead bounding the cargo pump room and machinery room as given in **Fig 7.6.41** of the Guidance is not allowed.

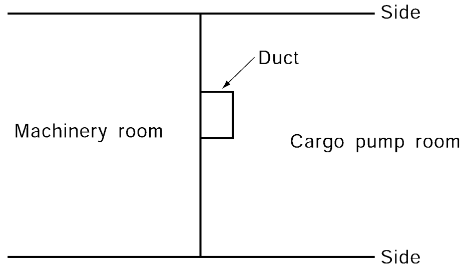

Fig. 7.6.41

5. Requirements of electric motors driving fans

In application of **1201. 8** of the Rules, the ventilation fan "of non-sparking construction" is to be comply with the requirements specified in **Ch 1, 1006. 2** of the Guidance.

6. Spare parts for fan

For the purpose of the requirements in **1201. 9** of the Rules, one spare impeller is to be provided for each type of fan.

7. Protection screens fitted in the opening of ventilation ducts

For the purpose of the requirements in **1201. 10** of the Rules, the protection screens may be of wire gauze of 13 mm × 13 mm mesh. However, the wire gauze is to have suitable strength against the falling impact of foreign objects.

1202. Pump rooms and other enclosed spaces normally entered

1. In application to 1202 of the Rules, the following requirements are to be complied with :

(1) The requirements in **1202.** of the Rules apply irrespective whether the control system of the pumps and valves in the pump room is provided outside the pump room or not.

(2) The pump room and other enclosed spaces normally entered are to have 20 air changes per hour and, in addition, the requirements in **1201.** of the Rules are to be complied with. In enclosed spaces normally entered, the special lockers and storage rooms specified in **1401. 2** of

the Rules and suitable clearly marked locker specified in **1402. 5** of the Rules which are readily accessible for persons are to be included. However, for the enclosed small spaces where the maximum travel distance to the door is 5 m or less, it is difficult to install the fixed ventilation system, portable ventilation system may be permitted.

(3) The ballast pump room where no cargo piping whatever penetrates therethrough or where cargo pipings without having flange joints and valves penetrate therethrough is to be dealt with in accordance with the following requirements :

(A) The exhaust outlet of the mechanical ventilation fans of the ballast pump room may not undergo the restriction to its location specified in **1201. 5** of the Rules.

(B) The exhaust inlet and outlet of the mechanical ventilation fans serving the ballast pump room is to be provided with a protective wire gauge of 13 mm × 13 mm mesh.

(C) For the exhaust ventilation fans of the ballast pump room, spare parts as required for the ventilation fans of cargo pump room are to be provided for each type.

(D) The fire hydrants are to be provided as the fire-extinguishing arrangement of the ballast pump room, but no fixed gas fire-extinguishing system is required.

1203. Spaces not normally entered

1. Spaces not normally entered

The ventilation system provided in spaces not normally entered is not allowed to be the natural ventilation alone. Where a fan is provided in the permanent duct, eight air changes per hour, and where no permanent duct is provided, sixteen air changes per hour are to be provided.

Section 13 Instrumentation

1301. General

1. Types of gauging devices

(1) The openings for the restricted device and closed device of the types of gauging devices referred to in **1301. 1** of the Rules are to comply with the following requirements:

(A) Restricted device :

The inside diameter of the opening is to be not more than 200 mm for both sounding pipe and ullage hatch and to be provided with self-closing type pipe head fitting. For cargo tank sounding/ullage measuring, the device is to be of the gas seal valve capable of being fitted with a measuring device of the construction restricting a massive leakage of cargo vapour. Glazed peeping window is to be provided separately as necessary.

(B) Closed device :

The closed construction is to be of all welded construction, as a rule, but flange construction for periodic inspection which is normally not open may be accepted as the closed device.

(2) In types referred to in **1301. 1** (1), (2) and (3) of the Rules, the closed type may serve commonly with open type and restricted type, and the restricted type, with open type respectively. Namely, the degree of safety is the highest in the closed type followed by the restricted type and then open type, thus it descends in the order of description. In the cargo tank where loading of the cargo required to be provided with the closed devices is expected, restricted devices may be provided in addition to closed devices. In more specific terms, in case where carriage is made of the cargo for which the use of closed devices is required, only the closed devices are to be used, but when carriage is made of the cargo in this tank for which the use of restricted devices is required, either of the closed devices and/or restricted devices may be used. However, for tanks where use of either the closed devised or restricted devices is required, open devices are not to be provided from the safety point of view.

(3) Where peeping windows are provided as a means of gauging device, their construction, liquid and gas sealing performance are to be equivalent to that of tank top, and are to be fitted with protective covers of sufficient strength.

(4) The fitting of a gauging device on the bulkhead of tank with a flange is not allowed under any circumstances. Namely, the gauging device is to be housed in a recessed pipe as shown in **Fig 7.6.42** of the Guidance.

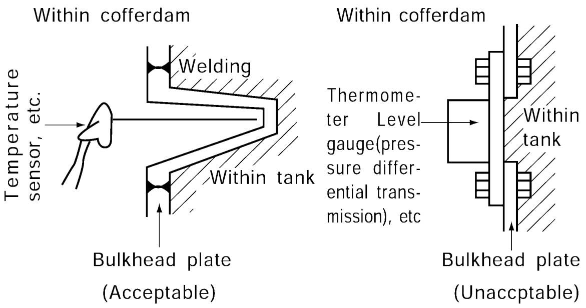

Fig. 7.6.42

(5) The performance and construction of liquid level indicator are to have been approved in accordance with the Guidance for the Approval of Manufacturing Process and Type Approval, Etc.

(6) The tests (pressure, temperature, etc.) and inspection for other gauging devices are to be comply with the following requirements (A) and (B). However, the performance test does not necessarily require a test using the real cargo if as the effect of the device can be verified.

(A) Testing procedure at time of manufacture

Performance tests are to be conducted using the real cargo according to the test plan prepared by the manufacturer. However, in the case of devices which are of the same type previously approved, the performance test using the real cargo may be omitted on approval by the Society. In the case of fixed type device, tests and inspection are to be arranged in accordance with the shipboard test plan approved by the Society.

(B) Reinspection and retesting procedures onboard.

For the gauging devices and equipment fitted onboard the ship, the data specifying the following items (the data are to have been approved by the Society) are to be placed onboard the ship.

(a) Check procedure before use (including the testing procedure)
(b) Check procedure during use (including the testing procedure)
(c) The periodical check procedure established by the manufacturer and service frequency
(d) Service life
(e) Tests and inspection procedures at periodical inspection
(f) Other precautions

1302. Vapour detection

1. Requirements for some products which are not available with toxic vapour detection

In case where a suitable vapour detection instrument for a specific cargo is not available, approval from the Society is to be obtained. However, it is desirable that fixed type vapour detection instruments are installed as far as such are available. At least against carbon disulfide and chlorsulfonic acid, fixed type vapour detection instruments are to be provided.

Section 14 Personnel Protection

1401. Protective equipment

1. Requirements for work clothes and protective equipment

Work clothes and protective equipment specified in the requirements in **1401. 1** of the Rules are to be capable of protecting the entire body of the wearer against cargo splashes in all directions, and the number of sets necessary for those working on deck and in cargo pump room are to be provided. Where one type of work clothes or protective equipment is not sufficient for all prospective types of cargo of the ship, necessary number of sets for respective types of cargo is to be provided.

2. Lockers for work clothes and protective equipment

The protective equipment used for once or more to handle the cargo to which the requirements in **Ch 6** of the Rules apply are, as a rule, to be stored in the lockers provided within the cargo area. One set of these is to be stored in the locker near the cargo pump room at all times. The construction of the special locker for the storage of protective equipment provided in the cargo area is to comply with the requirement in **Pt 3, Ch 17** of the Rules. When this can not be complied with under unavoidable reasons, protective equipment may be stored in the store room or locker having no openings to accommodation space and service space and located outside the cargo area as shown in **Fig 7.6.43** of the Guidance. This requirement does not apply to brand new protective equipment, unused equipment, or equipment which has not been used since undergoing a thorough cleaning process.

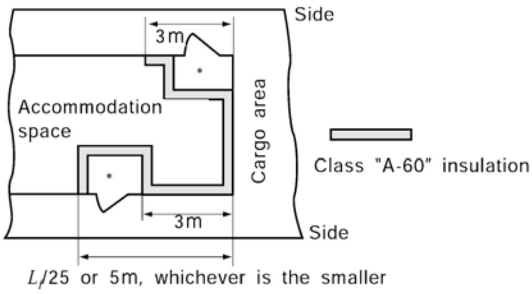

Fig 7.6.43

* : When the storage place of protective equipment is provided within the accommodation space or service space, such is only allowed at areas with openings as specified in **302. 3** of the Rules. In this case, it is desirable to provide showers, etc. within the room. the location of the store room of cargo specimens referred to in **1605. 4** of the Rules is to be dealt with in the same manner as above.

1402. Safety equipment

1. The number of safety equipment is to be determined after carefully studying the arrangement and scheme of shipboard working persons.

2. The safety equipment specified in **1402. 2** of the Rules is to comply with the following requirements :

(1) The term "perform work for at least 20 min." means a capacity in terms of the free air volume at atmospheric pressure is 800 litres or more.
(2) Work clothes and protective equipment of excellent acid-resisting, alkali-resisting and anti-toxic features against the types of prospective cargo are to be used. No duplicated use of work clothes and protective equipment with those required under **1401. 1** of the Rules, in number, is permitted.
(3) The length of the fire-resisting life line is to be 30 m or more so that it can be used also for signalling between the person who enters the enclosed compartment and the other person outside the compartment.
(4) The explosion-proof light is to be capable of lighting for a period not less than 3 hours.

(5) The suits for toxic cargoes are to be fitted with integral gloves and boots.

3. The air compressor referred to in **1402. 3** (2) of the Rules is to be capable of charging the air bottles placed onboard to their maximum working pressure.

4. The additional requirements for the cargo pump room of ships carrying cargo for which no effective vapour detection instruments are provided are to be as given in the following (1) and (2) :

(1) The additional air bottles for the work in the cargo pump room of ships carrying toxic cargo without being provided with effective vapour toxicity detection instruments are to be provided in addition to the number of spare air bottles specified in **1402. 3** of the Rules.

(2) The capacity of the equivalent air bottle in replacement with the low pressure air piping as an additional air breathing apparatus is to be not less than 4,800 litres under the atmospheric pressure.

1403. Emergency equipment

In application to **1403. 2** of the Rules, reference is made to the Medical First Aid Guide for use in Accidents Involving Dangerous Goods (MFAG), which provides advice on the treatment of casualities in accordance with the symptoms exhibited as well as equipment and antidotes that may be appropriate for treating the casualty.

Section 15 Special Requirements

1502. Ammonium nitrate solution, 93 % or less

1. Temperature of the heat exchanging medium in the tank heating system

For the requirements in **1502. 4** of the Rules, the temperature alarm is to be of visible and audible alarm. The detecting temperature is to be the mean temperature within the tank, but the heating system is to be so arranged to avoid uneven heating.

2. Fixed installation for ammonia gas injection system

For the requirements in **1502. 6** of the Rules, where ammonia gas is injected into cargo, the cargo is to be circulated during the injection being made.

3. Type of cargo pump

The sealing system of centrifugal pump is to be of the stuffing box provided with lantern rings as shown in **Fig 7.6.44** of the Guidance and the pressurized fresh water is to be injected into the stuffing box from lantern rings.

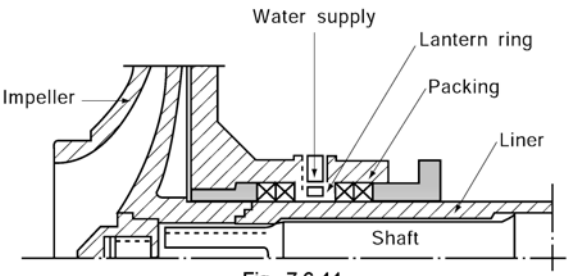

Fig. 7.6.44

1503. Carbon disulphide

1. Opening for emergency sounding

The opening for emergency sounding is to be provided with sluice valve and cock fitted with automatic closing devices. Further, warning signs banning their use other than in emergency cases are to be fitted.

1505. Hydrogen peroxide solutions

1. Fixed water spray system

When the rate and estimated size of the spill referred to in **1505. 1** (10) (B) of the Rules are calculated, the piping and hoses are to be considered to have undergone total loss.

1508. Propylene oxide and mixtures of ethylene oxide/propylene oxide with an ethylene oxide content of not more than 30 % by weight

1. Conditions of carriage

The nitrogen gas produced by the membrane type nitrogen gas generator capable of ensuring a purity of 99 % or more by volume may be used as the nitrogen gas to be sealed.

1510. Sulphur, molten

1. Cargo temperature control system

For the requirements in **1510. 6** of the Rules, the cargo temperature control system may employ manual temperature control trip, etc. provided that the cargo tanks are equipped with cargo temperature indicators and high/low temperature alarms. In this case, tank temperatures are to be so monitored and controlled as not to allow them to exceed 155°C at any points of measurement. In case where the heating medium does not exceed 155°C, the requirements here may be reduced to the temperature indicator only.

2. The double pipes or effective devices are to be provided so that cargo pipe or ventilation pipe is not to be solidified.

1511. Acids

1. Anti-corrosive treatment

For the purpose of the requirements in **1511. 2** of the Rules, the use of lining or corrosion-resistant materials is to be applied also to the boundary walls of cargo pump room (the bottom and boundaries to a height of 1 m from the bottom). Where the effectiveness of lining or corrosion-resistant materials is not verified, the boundary walls are to be used corrosion-resistant materials.

2. Means of guard against the danger of cargo being sprayed and leakage

For the purpose of the requirements in **1511. 4** of the Rules, the shields to guard against the danger of cargo being sprayed and leakage are to be of acid-resistant materials.

3. Segregation of cargo from oil fuel tanks

For the purpose of the requirements in **1511. 6** of the Rules, in segregating cargo tanks carrying cargoes or cargo residues from oil fuel tanks, none of facial contacts, linear contacts and point contacts are accepted.

4. Apparatus for detection of leakage of cargo

For the purpose of the requirements in **1511. 7** of the Rules, the apparatus for detection of leakage of cargo is to be of the pH meter and hydrogen detector. These apparatuses may be of portable ones. Further, alternative means such as litmus papers may also be used.

5. Material of bilge pumping and drainage arrangements in cargo pump room

For the purpose of the requirements in **1511. 8** of the Rules, underneath the cargo pumps and associated flange joints, drain pans are to be provided and the collected drains are to be led to bilge wells through the drain lines. These drain lines are to be formed by corrosion-resistant materials or to be applied with effective coatings. Where the bottom of the cargo pump room and its casing walls to a height of 1m from the bottom are made corrosion-resistant, the requirements may be dispensed with.

1512. Toxic products

1. The tank venting systems referred to in **1512. 2** of the Rules are to be provided with the stop valve on return line to shore installation.

1513. Cargoes protected by additives

In application to **1513. 5** of the Rules, For equivalency arrangements for the carriage of styrene monomer, see MSC/Circ.879 and MSC/Circ.879/Corr.1.

1514. Cargoes with a vapour pressure greater than 0.1013 MPa absolute at 37.8°C

1. For the purpose of the requirements in **1514. 4** of the Rules, the tank venting systems are to be provided with the stop valve on return line to shore installation.

1516. Cargo contamination

1. No contamination of cargo with alkali or acidic materials

In segregating the cargo tanks carrying cargo to which the requirements in **1516.** of the Rules apply and the cargo tanks carrying cargo of either alkalinity or acidity, none of facial contacts, linear contacts and point contacts are accepted. Further, segregation of cargo pipes and tank venting systems is required.

2. No contamination with water

(1) The "permanent ballast or water tanks unless the tanks are empty or dry" referred to in **1516. 2** (3) of the Rules means that the tank casings, frames, etc. are free from attachments of water droplets or from moistened condition. In the cargo tanks adjacent to permanent ballast or water tanks not maintained in dry condition, no cargo to which the requirements in **1516. 2** of the Rules apply is to be carried. In this case, none of linear contacts and point contacts are accepted. However, the cross welding such as **Fig 7.6.45** may be accepted.

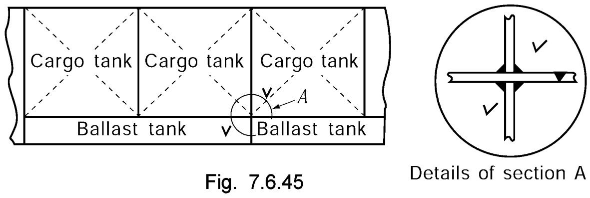

Fig. 7.6.45

(2) Where cargo that reacts dangerously with water is carried in the cargo tank adjacent to ballast tanks, the ballast tank is to be fitted with detachable spool pieces (at outside the tank, e.g. pump room, etc.), the said detachable spool pieces are to be removed after discharging the ballast, and then the open ends are to be blanked off. In this case, the ballast tanks are to be made in dry condition and, at the same time, it is to be ensured that there is no possibility of introducing ballast water thereto by erroneous operation. With permanent ballast tanks not in dry condition or cargo tanks adjacent to water tanks, the carriage of cargo to which the requirements in **1516. 2** of the Rules apply is not allowed. In this case, both linear contacts and point contacts may be not accepted. However, the cross welding such as **Fig 7.6.48** may be accepted. However, the linear contacts and point contacts divided into the cross welding such as **Fig 7.6.48** may be accepted

(3) Where cargo that reacts dangerously with water is heated, the thermal oil installations or the other indirect heating installations are to be provided.

1517. Increased ventilation requirements

1. Increased ventilation requirements

The "work areas or other similar spaces" referred to in **1517.** of the Rules are the service spaces, cargo control rooms and other similar spaces but not include cargo manifolds where cargo operation is carried out.

1518. Special cargo pump room requirements

Under any circumstances, no cargo pump room is arranged directly below open deck. Namely, for tanks carrying the cargo to which the requirements in **1518.** of the Rules apply, either submerged type cargo pump is to be provided therein or cargo pump room is to be provided on open deck.

1519. Overflow control

1. Test of level alarm

In the test of alarms carried out prior to loading, their functions are to be capable of being tested by actual operation of level gauges. When verification by actual operation is impracticable, suitable means to verify that the alarm circuits in normal condition as shown in **Fig 7.6.46** of the Guidance is to be provided.

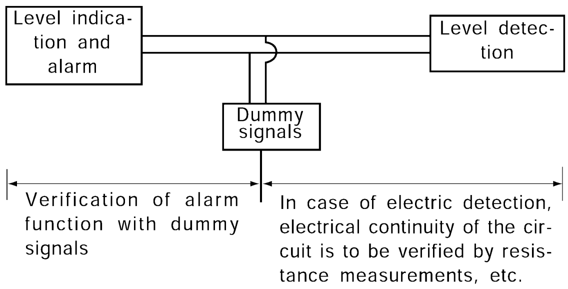

Fig. 7.6.46

2. Independence of high level alarm

For cargoes required to have high level alarm system and overflow control system in the requirements, the provisions of closed type instruments are required in many cases. For such tanks, the following detecting ends are required :

(A) Level gauging devices (**1301.** of the Rules)
(B) High level alarm (**1519. 6** of the Rules)
(C) Overflow controls (**1519. 7** of the Rules)

The above detecting ends (A), (B) and (C) are to be separate from each other. However, only for pipes to which the detecting ends of (B) and (C) (limit switch, float, electric device, etc.) are fitted, they may serve commonly. The electric, pneumatic or hydraulic circuits required for the detecting ends of (A), (B) and (C) are to be independent so that defect in one circuit may not cause functional disability in other circuits. In case where process units are provided on bridge, etc. for the purpose of visual display, the electric circuits concerned are to be independent at least up to the point of display. Power is to be supplied from distribution box.

3. Installation of high level alarm

When modular units are provided in the control room or on bridge as high level alarms specified in **1519. 6** of the Rules, level indicators and visible alarms independent from those (A), (B) and (C) given in the preceding 2 are to be provided. Visible and audible alarms are to be provided also in the cargo areas. Visible alarms are to be provided at such locations readily recognizable also from shore side. In case where no control room is provided, audible and visible alarms are to be provided in the cargo control room. Except for entering the cargo tanks which have thoroughly been washed clean, the testing device for detecting ends is to be provided outside the tank. Simulation test of electric circuit or self-monitoring circuit may be accepted.

Section 16 Operational Requirements

1601. Maximum allowable quantity of cargo per tank

The maximum allowable quantity of cargo specified in **1601.** of the Rules is to be determined in consideration of the thermal expansion of the cargo at temperature of 45°C Care is to be taken so as to ensure that the open ends of the venting system in the tank may not submerge in the cargo but in the gaseous phase under any trim condition of the ship at sea. Further, the maximum allowable quantity of cargo in cases where the tank temperature will possibly exceed 45°C being affected by tank heating is to be determined on the basis of such a temperature.

1604. Opening of and entry into cargo tanks

Covers of the cargo tank specified in **1604.** of the Rules, ullage hole covers and peeping hole covers or tank cleaning hatch covers are not to be opened except for cases where air is intaken in gas free operation, tank washing operation, gauging is taken of the tanks requiring the open devices and restricted devices and during gas detection and when samples are being taken.

1605. Stowage of cargo samples

When the stowage of cargo samples is made within the cargo area, such stowage compartment is to be only accessible directly from the exposed areas of the ship provided with exhaust type independent mechanical ventilating fan capable of ensuring twenty air changes or more per hour. Where it is difficult to install the permanent ventilation system due to the confined stowage compartment, portable ventilation system may be permitted. However, for the stowage small compartment where the maximum travel distance to the door is 5 m or less, it is difficult to install the fixed ventilation system, portable ventilation system may be permitted.

1606. Cargoes not to be exposed to excessive heat

In case where the tank carrying the cargo which is not to be exposed to excessive heat is subjected to tank heating or where the tank is adjacent to other tanks (cargo tanks, oil fuel tanks, etc.) which are heated, fixed type thermometers and temperature alarms are to be provided.

Section 17 Summary of Minimum Requirements

In application to **1** of the Rules, "The Guidance specified separatedly" means the Annex 7B-1 of this Guidance.

Section 18 List of products to which the Code does not apply

In application to **6** of the Rules, "The Guidance specified separatedly" means the Annex 7B-2 of this Guidance.

Section 19 Index of Products Carried in Bulk

"The Guidance specified separately" means the Annex 7B-3 of this Guidance.

Section 21
Criteria for assigning carriage requirements for products subject to the IBC Code

"The Guidance specified separatedly" means the Annex 7B-4 of the Guidance.

Annex 7A-1 Requirements for Ships not having the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk

Section 1 General

101. Application

1. The construction, equipment and survey of ships intended to be classified as liquefied gas carriers not having the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk are to be in compliance with the requirements in this Annex. "Liquefied gas carrier" in this Annex means a ship designed to contain and carry liquid dangerous cargoes in bulk having a vapour pressure (the pressure is expressed in gauge, and the same is to apply hereinafter) of 2 kg/cm^2 or above at a temperature of 38°C. However, the tests prescribed in **104. 2** (10) of Annex may be omitted by carrying out at the time of initial cargo handling of the ship.

2. General items not specified in this Annex, are to conform to the requirements specified in the relevant Parts of the Rules.

3. As for construction and equipment as well as surveys of liquefied gas carriers intended to carry cargoes having different properties from the liquefied petroleum gas, special consideration is to be paid according to the properties of the cargoes.

4. Loading facilities of liquefied gas carriers which are different from those specified in this Annex may be accepted by the Society, provided that those facilities are deemed equivalent to those required in this Annex.

5. The requirements of **Sec 2** in this Annex apply to pressurized liquefied petroleum gas carrier and the requirements of **Sec 3** apply to low temperature liquefied petroleum gas carriers. Ships, however, which are intended to transport liquefied petroleum gas at temperature below -50°C, are to be at the discretion of the Society.

102. Definitions

The definition of each nomenclature in this Annex is as follows :

1. The "pressurized liquefied petroleum gas carriers" mean the ships intended to contain and transport of the liquefied petroleum gas with the vapour pressure of 0.2 MPa or above at 38°C in storage tanks permanently attached to hull structure at atmospheric temperature and under pressurized condition.

2. The "low temperature liquefied petroleum gas carriers" mean the ships intended to contain and transport liquefied petroleum gas with vapour pressure of 0.2 MPa or above at 38°C, in fixed, independent from hulls and self-supporting type tanks thermally insulated from outside, at or near the atmospheric pressure under refrigerated condition.

3. For the pressurized liquefied petroleum gas carriers, tanks include storage tanks and auxiliary tanks. Storage tank is a storage tank specified in preceding **1** and auxiliary tank is a tank to provide forced pressure head to cargo pumps.

For the low temperature liquefied petroleum gas carriers, tanks are the tanks specified in preceding **2** in which liquefied petroleum gas is loaded.

4. Tank hold is a compartment in which storage tanks of preceding **1** and tanks of preceding **2** are installed.

5. Liquid is liquid phase of liquefied petroleum gas.

6. Gas is gaseous phase of liquefied petroleum gas.

7. Dangerous space is the space where inflammable or explosive substances are placed and where those are stored or are liable to escape into. For ships prescribed in this Annex, at least, following compartments and areas are to be considered as dangerous spaces:

(1) Tank.
(2) Compartment adjoining the tank.
(3) Compartment containing cargo handling machinery and equipment, such as cargo pump room, compressor room, etc.
(4) Zone or semi-enclosed space on open deck, within at least 3 m from any tank outlet, gas/vapour outlet, liquid outlet or cargo pipe flange.
   (A) Openings, as specified above, are the following openings ;
      Tank outlet : Manhole, tank fittings
      Gas outlet : Entrances and ventilation openings of spaces specified in (3), (7) and (8) safety valves, shore connection
      Liquid outlet : Shore connection, overboard discharge pipe
   (B) Flange of cargo pipe is as follows ;
      Cargo pipe means liquid and gas pipe except overboard discharge pipe
      Slip-on and screw type are considered as flanged type.
(5) Zone enclosed by the following width, height and length, on the weather deck:
   (A) Full breadth of the ship ;
   (B) 2.4 m in height above the weather deck ;
   (C) Total length obtained by extending 3 m each in both fore and after directions, with length from leading edge of the foremost storage tank to the trailing edge of the rearmost storage tank.
   (D) In the case of small ships where part of the forecastle deck corresponds to the dangerous space under the requirements of preceding (C) and when electrical equipment other than explosion-protected ones are installed between the leading edge of the foremost storage tank and extension of 3 m in fore direction under an inevitable reason, the following requirements are to be complied with:
      (a) A steel gas barrier is to be provided on the forecastle deck.
      (b) The height of the steel gas barrier is to be 2.4 m or more above the upper deck with the full width of the forecastle deck where the steel gas barrier is installed.
      (c) The steel gas barrier is not to be provided with any opening.
      (d) Electrical equipment is to be at least of the totally enclosed water-proof type.
(6) Exposed area within 2.4 m from the outer surface of storage tank.(in case where the tank is covered by insulator or protective enclosure, the distance is to be measured from its external surface.)
(7) Enclosed or semi-enclosed space where cargo piping is installed.
(8) Compartment where cargo hoses are stored.
(9) Enclosed or semi-enclosed space directly above the dangerous spaces prescribed in (2) or (3) above, except space which is partitioned by gastight bulkheads and is suitably ventilated. "suitably ventilated" means the mechanical ventilation separated from those for compartments specified in preceding (2), (3), (7) and (8), and the air charge rate are not limited.
(10) Any enclosed or semi-enclosed space which has a direct opening to any one of dangerous spaces prescribed in (1) to (9) above.
   The following items are not regarded as the direct openings.
   (A) For windows, manholes, etc.,
      (a) Fixed type gastight portholes
      (b) Bolted, gastight or watertight openings which are not necessary to be opened while the ship is at sea.
   (B) For doors,
      (a) In access opening doors of the living quarters on the upper deck where double, metal self-closing doors are provided in addition to weather-tight doors. Provided, however, that sufficient face-to-face contact is obtained for the self-closing type doors by applying packing to the contact face or by other adequate means.
      (b) In case where double, metal self-closing doors are provided in addition to weather-tight doors for deck storeroom, etc., and the space between the double doors is provided with effective mechanical supply ventilation system.
         In case where double, metal self-closing doors are provided in addition to weather-tight doors, and the space between the double doors is provided with effective mechanic\l supply ventilating system which is interlocked with the non-explosion-protected electrical equipment within the compartment.
         The above (b) may a\so apply to the access opening doors specified in (a) above. The

term "semi-enclosed spaces" specified in (4), (7), (9) and (10) above means the spaces separated by decks and bulkheads where the condition of ventilation is significantly different from that of exposed part of ship.

8. Void space in tank holds is an empty space around tanks in tank holds.

9. Secondary barrier is a structure to hold leaked cargo for more than a fixed period so as not to lower the temperature of main hull structures below that specified in the design.

103. Plans and documents to be approved

Where the loading facilities of liquefied petroleum gas are installed on board, at least, following plans and documents are to be approved by this Society.

Pressurized liquefied petroleum gas carriers

1. Plans and documents to be submitted for approval are as follows:

(1) Specifications for manufacture of tanks including details of welding material and welding procedures.
(2) Overall assembly diagrams and details of tanks and pressure vessels including details of seats for attachment of accessories, nozzles, and also of inner fittings.
(3) Accessory layout on tanks and pressure vessels, detailed drawings of accessories including liquid level gauges, quick closing valves, excess flow valves, etc.
(4) Layout and installation diagrams of storage tanks and auxiliary tanks, details of an deck penetrations and its closing appliances, and details of working benches.
(5) Piping diagrams of liquefied petroleum gas and instrument.
(6) Bilge arrangement and ventilation systems in compartments provided with the loading facilities of liquefied petroleum gas.
(7) Arrangement of safety devices.
(8) Arrangement of sensors for gas detectors.
(9) Details of valves for special purpose, cargo handling hoses, expansion joints, filters, etc. for liquefied petroleum gas.
(10) Constructions of cargo pumps, gas compressors and their prime movers.
(11) Drawings showing dangerous spaces.
(12) Arrangement of earth connections for tanks, piping, equipment, etc.
(13) Electric wiring plans and a table of electrical equipment in dangerous spaces. In this case, the table of electrical equipment is to comply with **Pt 6, Ch 1, 102.** of the Guidance.
(14) Other plans and documents which deemed necessary by the Society.

2. Documents to be submitted for reference are as follows:

(1) Specifications for cargo spaces.
(2) Compositions and physical properties of cargoes including a diagram of saturated vapour pressure within the temperature range from -10°C to 45°C.
(3) Strength calculation sheets of tanks and tank supports and calculation sheets of relieving capacity of safety valves including back pressure calculation of vent pipes.
(4) Piping arrangement of liquefied petroleum gas.
(5) Calculation sheets of filling limits for cargo.
(6) Operation manual prescribed in **106.** of this Annex.

Low temperature liquefied petroleum gas carriers

1. Plans and documents to be submitted for approval are as follows:

(1) Plans given in (5), (6), (9) to (14) of those required for pressurized liquefied petroleum gas carriers.
(2) Manufacturing specifications of tanks (including details of welding procedures, test and inspection plan of welds and tanks, properties of insulation materials and their processing manual).

(3) Construction and details of tanks.
(4) Accessory arrangement on tanks including details of fittings inside the tanks, and details of fittings including level gauges and valves for special purpose.
(5) Details of tank foundations, tank securing devices, deck portions through which tanks penetrate, and closing devices.
(6) Layout and attachment details of heat insulating materials.
(7) Details of secondary barriers, where they are provided.
(8) Details of emergency pressure relief devices from void spaces in tank holds, and details of discharging devices for leaked liquid.
(9) Details of pressure adjusting devices, where void spaces in tank holds are filled by inert gases.
(10) Sectional assembly, details of nozzles, fitting arrangement and details of fittings for various pressure vessels.
(11) Kinds and specifications of materials used for liquefied petroleum gas piping system in connection with the design pressures and/or temperatures.
(12) Piping diagram of refrigerant for re-liquefying devices of vapourized gas.
(13) Arrangements of sensors for gas detectors, temperature indicators, pressure gauges, etc.
(14) Construction of principal parts of re-liquefying devices of vapourized gas in accordance with the requirements for refrigerating devices.

2. Documents to be submitted for reference are as follows :

(1) Documents given in (1), (3) to (6) those required for pressurized liquefied petroleum gas carriers.
(2) Composition and physical properties of cargo including a saturated vapour pressure diagram within the necessary temperature range.
(3) Calculation sheets of capacity of liquefying devices of vapourized gas.

104. Tests and Inspections

Various tests and inspections are to be in accordance with the following requirements as well as the requirements in the relevant Chapters.

1. Pressurized liquefied petroleum gas carriers

(1) Hydrostatic tests
Tanks and pressure vessels, pipes, valves and their fittings for cargo, as well as cargo handling hoses are to be hydrostatically tested at the pressures specified below and are to be satisfactory before installation in the ships.
(A) Tanks and pressure vessels : 1.5 times the design pressure.
(B) Pipes, valves and fittings as well as cargo handling hoses : 2 times the design pressure (or the maximum working pressure).
(C) Cargo compressors and pumps : 1.5 times its maximum working pressure for the pressure parts.
(D) Cargo pipings : In case the welding is carried out at site, tests are to be performed after finishing of welding.

(2) Airtight tests
(A) Tanks and pressure vessels, pipings, valves and their fittings for cargo, as well as cargo handling hoses are to be tested for airtightness at the design pressure (or the maximum working pressure) and are to be satisfactory before installation in the ships.
(B) Piping systems for cargo, after installation in ships, are to be tested for airtightness at a pressure of 90 % or more of the set pressures of relief valves for the piping system and are to be satisfactory.
(C) Cargo compressors and pumps are to be tested for airtightness at the maximum working pressure for their pressure parts.
(D) Cargo pipings are to be tested after finishing of welding, where the welding is carried out at site.

(3) Radiographic tests
Welded joints of piping system for cargo are to be radiographically tested in accordance with the instruction of the Surveyor and are to be satisfactory. For weld joints on the cargo piping, 10 % or more of the joints are to be radiographically tested and the joints tested are to be considered for materials, joint figure, welding position, welding control, experience, etc.

(4) Confirmation tests
Safety valves, relief valves, pressure gauges, thermometers, safety devices, gas detectors, remote control devices, etc. are to be examined of their performance before or after being fitted up.

2. Low temperature liquefied petroleum gas carriers

(1) Tests and surveys of secondary barriers
Where secondary barriers are provided, their effectiveness is to be confirmed by suitable methods at the time of construction. It is also desirable to design them so that effectiveness may be checked at periodical surveys after having been placed in service. In case where the effectiveness of the secondary barriers cannot be checked after having been placed in service, their reliability is to be confirmed by suitable methods at the time of construction.

(2) Welding procedure qualification tests
The welding procedures for use in tank welding are to be those which have been accepted by tests for the welding procedure qualification tests in accordance with the requirements in **Pt 2, Ch 2, Sec 4** of the Rules.

(3) Non-destructive inspections of weld joints
(A) All butt-welded joints of tank plates are to be radiographically examined. Where, however, approved by the Society in consideration of liquid temperature, defect detecting ability, etc., a part of the radiographic examination may be substituted by other types of non-destructive inspections. Even in this case, the radiographic examination is to be carried out for over 20 % of the total butt-welded length and near the intersections of weld lines.
(B) Welded joints for cargo piping are to be radiographically examined satisfactorily in accordance with the instruction of the Surveyor.

(4) Hydraulic tests of tanks
(A) At least one tank or more are to subject to the following tests after their fabrication and before applying heat insulations. Water is to be filled up to the top plate of the tank (excluding the dome, which will be excluded hereinafter) and tanks are to subject to pressure by either pneumatic or hydrostatic pressure corresponding to a water head of either 2.45 m above the tank top plate or up to 0.6 m above the top of hatch opening from the tank top plate, whichever is the greater. Confirmation is to be made that there is no leakage and/or no harmful deformation under such pressure. The remaining tanks may be tested by filling water up to 60 % of the tank depth then applying the pneumatic pressure specified above. However, as for at least one tank, the test pressure or equivalent test water head is to be raised to a pressure 1.2 times the set pressure of the safety valve for overpressure.
(B) Where the structure does not permit inspection of the outer surface of tank plate at the hydrostatic pressure test, any other suitable means to compensate the above is to be proposed for the approval by the Society.

(5) Tests of various pressure vessels
Each pressure vessels and its fittings are to be hydrostatically tested and airtight tested by applying the provisions in preceding 1 (1) and (2) and are to be satisfactory.

(6) Heat insulating materials
Where heat insulations are applied on the tanks, model tests are to be carried out in respect of the method of its application, and confirmation is to be made that the insulations will not come off or break under working condition.

(7) Tank fittings
(A) Safety valves for overpressure, vacuum relief valves and tank fittings not connected to piping are, prior to their installation, to be hydrostatically tested at a pressure of 0.2 MPa and airtight tested at a pressure not less than 0.1 MPa, and are to be satisfactory.
(B) Fittings other than those specified in (A) are, prior to their installation, to be hydrostatically and airtight tested satisfactorily in accordance with (8) (A) and (B) below.

(8) Pipes, valves, pipe fittings, etc. for cargo
(A) Pipes, valves and pipe fittings for cargo and cargo hoses are, prior to their installation in the ship, to be hydrostatically tested satisfactorily at a pressure 2 times the maximum working pressure of the piping system or at a pressure of 1.0 MPa, whichever is the greater.
(B) Pipes, valves, pipe fittings for cargo and cargo hoses are, prior to their installation in the ship, to be airtight tested satisfactorily at the maximum working pressures.
(C) Piping system for cargo is, after installed in the ship, to be airtight tested satisfactorily at a pressure 90 % or more of the set pressure of the relief valve for the piping system.

(9) Confirmation tests
The requirements in preceding **1** (4) are also to apply low temperature liquefied petroleum gas carriers.

(10) Operation tests
The low temperature liquefied petroleum gas carriers are to be confirmed that each of tanks and each of the facilities fulfill the respective conditions initially planned, upon completion of the entire building work and under the fully loaded design condition. In addition, cargo handling facilities are to be inspected under operation with actual cargo.

105. Marking

1. In case of pressurized liquefied petroleum gas carriers, the following particulars are to be marked on each storage tank in a place where easily visible after being installed:

Design pressure, maximum working temperature, capacity, hydrostatic test pressure, date of manufacture, manufacturer's name and manufacturing number.

In case of low temperature liquefied petroleum gas carriers, the following particulars are to be marked in the vicinity of tank dome at a place easily visible:

Tank number, capacity, set pressure of safety valve for overpressure, maximum density of cargo, minimum working temperature, date of manufacture, and manufacturer's name.

2. The maximum working pressure is to be marked on cargo hoses.

3. All pipes connected to tanks are to be marked distinctly either for liquid or gas vapour.

106. Operation manual

Shipbuilders are to supply operation manual to the ship owners outlining operations and maintenance of various facilities for cargo handling as well as safety measures.

Section 2 Pressurized Liquefied Petroleum Gas carriers

201. Arrangement and installation of tanks and compartments containing tanks

1. Arrangement of tanks

Tanks are not to be installed forward of the collision bulkhead nor afterward of the after peak bulkhead.

2. Tank spaces on weather decks

When tanks are either on weather decks or partly projecting out of weather decks, the tanks or protruded parts are to satisfy the following requirements:

(1) Not to interfere with the crew's traffic and working.
(2) To be kept sufficiently from living quarters, boats, embarkation places, fire hydrants and machinery or instruments liable to cause explosion of gas.

3. Distance between tanks and hull structure

(1) The distance between tanks and hull structure such as inner edge of side frames (excepting frames specially provided), inner edge of bulkhead members (excepting girders) and top of inner plating of double bottoms is not to be less than 380 mm for maintenance and inspection, unless otherwise approved by the Society.
(2) For ships of 60 m or more in length, the distance between tanks and side plating is not to be less than 610 mm. And, for ships of single bottom construction, the distance between tanks and bottom plating is not to be less than 610 mm.
(3) Where two or more tanks are installed, the distance between tanks is not to be less than 380 mm, unless specially approved by the Society.

4. Location of manholes

Manhole and accessories of tanks are to be provided above weather decks.

5. Tank supports

Tanks are to be supported securely on steel foundations arranged to avoid excessive concentration of load near the support.

6. Compartments for tank installation

Compartments for tank installation are to be watertight and not to contain any possible source for igniting liquefied petroleum gas (i.e. heat or spark sources, electric equipment, etc.). The spaces are not to have any air communication with other compartments containing such ignition sources.

7. Watertightness of weather deck

In case where tanks penetrate through weather decks, their watertightness is to be in compliance with the requirements specified in **Pt 4, Ch 2 of** the Rules.

8. Earthing

Each tank is to be electrically earthed effectively.

202. Tanks and pressure vessels

1. Application

Tanks and pressure vessels for cargo (hereinafter referred to as "pressure vessel") are to be of welded construction and are to be in compliance with the requirements for welded pressure vessels Class 1 specified in **Pt 5, Ch 5** of the Rules, except those specified in this Section.

2. Materials

The materials for tanks and pressure vessels are to have good weldability and notch toughness at low temperatures to which they may be exposed. The materials used are subject to the Society's approval in respect of design and fabrication procedure.

3. Minimum thickness of shell and end plates

The thickness of shell and end plates of tanks and pressure vessels is not to be less than 8 mm. However, in cases where tanks and pressure vessels are not used for storing liquid continuously nor exceed 900 mm in diameter, the thickness may be reduced to 6 mm.

4. Manholes

The tank is to be provided with a manhole of not less than 275 mm × 375 mm or of diameter not less than 375 mm on or close to tank top. Where access trunk is fitted up to any tank, the inside diameter of trunk is not to be less than 750 mm.

203. Pipes, valves, pipe fittings, pressure vessel fittings and tank accessories for cargo

1. Materials and workmanship

(1) Valves, flanges, pipe fittings, pressure vessel fittings and tank accessories are to be of construction suitable for liquefied petroleum gas transported, and are to be made of steel or other materials approved by the Society.
(2) Valve seats, packings, gaskets, etc. are to be of material which has suitable properties against the corrosion by the liquid. The materials for gaskets of manholes or flanges are to withstand temperature of 530°C without failure.
(3) Pipes subjected to liquid or gas pressure are to be seamless or electric-resistance welded steel pipes.
(4) The workmanship of piping specified in preceding (3) is to comply with the requirements for Class 1 piping specified in **Pt 5, Ch 6** of the Rules.

2. Maximum working pressure of cargo piping system

(1) The maximum working pressure of piping system is defined as that during ordinary service.

Where additional pressure is applied on the system by pump, compressor, etc., this maximum pressure is to be properly adjusted taking account of such additional pressure.

(2) Where the maximum working pressure of piping system is less than 1.0 MPa, the pipes and pipe fittings are to be so designed as to withstand a pressure not less than 1.0 MPa, except for those of vent lines specified in **Par. 12** below.

3. Pipe joints

(1) Pipe joints are to be butt weld or flanged coupling, and flanges are to be joined to pipes by welding.
(2) Pipe flanges are to be of 2.0MPa or above in nominal pressure stipulated by KS (Korean Industrial Standard) or equivalent thereto, except for those of vent lines specified in 12 below.
(3) Screw joints of KS B 0222, only with the dimensions of PT25 or under, may be used in places where they can be shut off from tanks, liquid pressure vessels and main pipes for cargo transfer, and furthermore where inspection can be made easily.

4. Expansion joints

Where expansion joints are used in piping subject to pressure of tank or pressure vessel, or delivery pressure of pumps or compressors, they are to be bent pipes made of seamless or electric- resistance welded steel pipes, or to be approved corrugated expansion joints or the equivalent.

5. Relief valves in pipe lines

Relief valves are to be fitted up on pipe lines which are filled with liquid and closed, and consequently where an excessive pressure may occur. Escaping gas from relief valves is to be led to a main discharge line of safety valves on storage tanks.

6. Pipe supports

Piping is to be provided with adequate supports to prevent its own weight being exerted on valves and their fittings as well as to prevent its excessive vibration.

7. Bonding and earthing

Each pipe line is to be electrically connected and to be earthed effectively.

8. Tank accessories and valves

(1) Each storage tank is to be provided with shut-off valves for filling and discharging liquid or gas, safety valves, level gauges, thermometer wells and a pressure gauge, all of which are to be installed above the weather deck, and suitable access means are also to be provided for facilitating the operation. Where tanks are installed under the weather deck, these access means are to be placed on a trunk or a dome positioned on the weather deck. All connections to tanks are to be protected against mechanical damage.
(2) Manually operated stop valves for all the connections other than for safety valves and level gauging devices are to be provided as close to tanks as practicable.
(3) For tanks whose content is discharged outward with the level gauge opening exceeding 1.4 mm in diameter, excess flow valves are to be provided.
(4) Thermometer wells are to be terminated in liquid spaces and connections to the tank wall is to be welded or flanged and gastight lids are to be provided.
(5) A pressure gauge is to be fitted up at the highest location of each tank or its vicinity.
(6) Where the inside diameter of the pressure gauge exceeds 1.4 mm, the connecting pipe is to be provided with an excess flow valve.
(7) The excess flow valve is to close automatically at the flow rate of gas or liquid specified by the maker. Piping including fittings and accessories protected by an excess flow valve, is to have a capacity greater than the rated flow of the excess valve. Excess flow valves may be provided with a bypass not exceeding 1 mm in diameter to equalize pressures.

9. Valves and accessories attached to pressure vessels

The requirements in preceding 8 are to be applied, as far as possible, to valves and accessories attached to pressure vessels.

10. Filling and discharge pipes of tanks

(1) Either of the following valves is to be provided for each filling pipe:
(A) One check valve and one excess flow valve.

(B) One duplicate check valve.
(C) Two check valves.

(2) Except pipes to which filling connections, safety valves and liquid level gauges are provided, all liquid or gas connections to tanks are to be provided with automatic excess flow valves or internal-type quick shut-off valves being always closed except during filling or discharging operation. Such valves are to be provided with emergency shut-off devices by remote control with fusible plugs to melt at temperatures below 104°C thereby closing the shut-off valves automatically in case of fire, in addition to general shut-off devices.

(3) Where filling and discharging are to be performed through single connection and a screw-type stop valve and a quick shut-off valve specified in preceding (2) are provided, non-return valves or excess flow valves may be dispensed with.

(4) Excess flow valves, internal-type quick shut-off valves or non-return valves are to be fitted on the interior or exterior walls of tanks. Where, however, these valves are fitted up on the exterior walls of tanks, care is to be taken so that any undue strain may not cause breakage between the tanks and the valves.

11. Safety valves

(1) Two or more safety valves are to be fitted on each tank, and are to be set to blow-off steam automatically at a pressure not exceeding the design pressure of each tank.
Safety valves are to be among the following and other types of safety valves are to be approved by the Society whenever they are used.

(A) High lift type
The valve lift is to be 1/15 and above, below 1/7 the inside diameter of valve seat. The required areas of steam passages at the chest inlet and outlet are not to be less than the same and 2 times the required valve seat area respectively.

(B) Full bore type
The valve seat is not to be less than 1.15 times the area at the throat.
The area of steam passage at the valve seat is not to be less than 1.05 times the area at the throat, when the valve is open. And the minimum steam passage area at the outlet is not to be less than 2 times the area at the valve seat when the valve is open.

(2) The total capacity of safety valves on each tank is to be sufficient to relieve the volume obtained from the following formula at a pressure not exceeding 1.2 times the approved working pressure. However, for tanks lagged with insulating material, the required quantity of discharge of safety valves may be reduced within the range down to $W_r/2$ depending on the degree of heat insulation effectiveness, where approved by the Society.

$$W_r = 1.56 \times \frac{A^{0.82}}{L_h} 10^5$$

where :

W_r : Required discharge quantity(kg/h)

A : The following value depending on the shape and dimensions of each tank:

$D_t \times (U + 0.3\,D_t)$-------for tanks of cylindrical form having dished or semi-elliptical heads.

$D_t \times U$ --------------- for tanks of cylindrical form having hemispherical heads.

D_t^2 ------------------ for spherical tanks.

D_t : Outside diameter of tanks(m)

U : Overall external length of tanks(m)

L_h : Latent heat for vaporization of cargo at 1.2 times the approved working pressure of tanks(kcal/kg)

The discharge quantity of safety valves is following formula.

$$W = KCA(10P+1)\sqrt{\frac{M}{ZT}}$$

where :

W : Discharge quantity(kg/h)

A : πDL (cm^2) for high lift type

$\frac{\pi}{4}D_t^2$ (cm^2) for full bore type

D : Diameter of disc seat hole (cm)

L : Valve lift (cm)

D_t : Diameter of discharge part (cm).

P : Pressure 1.2 times the limit pressure of tanks(MPa)

M : Atomic weight of fluid

T : Absolute temperature of fluid at P (K)

Z : Compression coefficient of fluid gas at P and T (in case of uncertainty : 1)

K : 0.65

$$C = 387\sqrt{k\left(\frac{2}{k+1}\right)^{\frac{k+1}{k-1}}}$$

k : Specific heat ratio of fluid at P and T (It may be value at normal condition)

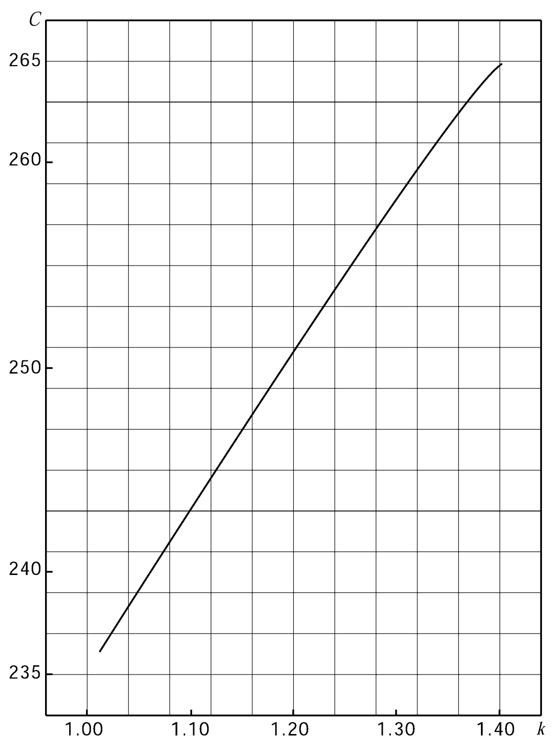

Fig. 1 Relationship between C and k

(3) Safety valves are to be attached to tanks near the highest part of vapour space so as to be able to discharge vapour gas during operation. No shut-off valve is to be fitted between the tanks and the safety valves, except where a set of interlocking type shut-off valves is so arranged that

when one of them is closed the others are automatically opened. In this case, total capacity of two or more safety valves opened are at all times to satisfy the requirements in preceding (2).

(4) One or more safety valves are to be fitted on each pressure vessel for liquid. The capacity and attachment of safety valves are generally to be in accordance with the requirements of preceding (1), (2) and (3) respectively.

12. Vent pipes for safety valves and relief valves

(1) Discharge from safety valves and relief valves is to be led to vent pipes.
(2) Stop valves are not to be fitted to vent pipes.
(3) Vent pipes are to be so designed as to prevent mechanical injury, intrusion of rain or snow and accumulation of drain.
(4) Vent pipes of safety valves on storage tanks are to be capable of discharging a quantity given in **Table 1** of this Annex according to the number of tanks connected to the vent pipe without interfering effective discharge from safety valves by excessive back pressure.

Table 1. Total Valve Discharge

Number of tanks	1 and 2	3	4	5	6 and more
Total valve discharge (%)	100	90	80	70	60

(5) Openings of vent pipes are to be located at a position of 4.5 m or more above the top of tank. Where a deckhouse is situated within horizontal distance of 15 m from the opening, openings are also to be located at a place 3 m higher above the top of deckhouse. At opening of each vent pipe, an effective frame arrester is to be provided.

13. Level gauges

(1) Level gauges of storage tanks are to be in compliance with the following requirements:
  (A) Level gauges are to be capable of indicating the highest level of liquid which will be loaded in the range from -7°C to 45°C.
  (B) Level gauges may be of any of the following types:
  Rotary tube type, slip tube type, fixed tube type, magnet type, automatic float type or similar types having equivalent effectiveness.
  (C) Level gauges of float type or magnet type are to be used in conjunction with tube type level gauges.
  (D) Where a level gauge is connected to a lead pipe fitted on the exterior of a tank, an automatic shut-off valve in case of failure of the lead pipe is to be fitted as close to the tank as practicable. Where, however, the lead pipe is of sufficiently robust construction, the automatic shut-off valve may be omitted.
  (E) A flat type sight glass may be equipped on an automatic float tape reading level gauge. In this case, the glass is to satisfy the requirements specified in (4) below and to be protected effectively by a metallic cover.
(2) Level gauges of intermediate tanks are to be in compliance with the requirements in preceding (1) (B) to (E). But, in case where a self-closing valve or an excess flow valve is equipped in conjunction with the manual stop valve at the connected part of the tank, flat glass type level gauges may be used.
(3) Flat glass type level gauges of pressure vessels are to be in compliance with the requirements in (2) above.
(4) The flat type sight glasses used in level gauges are to be made of heat treated high strength materials and the thickness is not to be less than 12.7 mm.
(5) Round type glass level gauges are not to be used in any case.

204. Cargo handling facilities

1. Application

The requirements in **204.** apply to cargo handling facilities with compressors and liquid pumps or compressors only. Where any other type of facilities than those mentioned above is intended to be provided, full particulars of the installation are to be submitted to be the Society for approval.

2. Location of cargo handling facilities

Cargo handling facilities are not to be located on the weather deck except in compartments in which piping and/or compressors are installed.

3. Cargo hoses

Cargo hoses are to be of suitable material to resist against chemical action of liquid and to be designed for a bursting pressure not less than 5 times the maximum working pressure to which they may be subjected.

4. Connection to shore pipe

(1) In the vicinity of connections between the shore pipes for cargo handling (for both liquid and gas) and the loading headers of ships, shut-off valves are to be provided, each of which can shut off each connection from shore pipes. Adequate shut-off valves are to be fitted on the connections so as to be able to release pressures in the pipes connected to the shore.
(2) The connections with shore pipes are to be arranged so that they may be electrically connected to each other.

5. Pumps and compressors

(1) Pumps and compressors are to be capable of transporting liquefied petroleum gas effectively and are to be so constructed as to minimize gas leakage as far as practicable and free from sparking.
(2) Pumps and compressors are not to be used for purposes other than cargo handling of liquefied petroleum gas.
(3) Where pumps or compressors are driven by engines located in an adjacent compartment, gastight glands are to be provided at portions where driving shafts pass through the bulkhead and alignment of shaft center is to be easily adjusted.
(4) Relief valves or other overpressure protection devices are to be provided on the delivery side of pumps or compressors, except where overpressure is not anticipated. Discharged liquid from the relief valve provided on a pump is to be led to the suction of the pump and the discharge from that provided on a compressor is to be led to the discharge pipe of safety valves on storage tanks, respectively.
(5) Pressure gauges are to be fitted on the delivery side of the pumps and compressors.
(6) Compressors are to be arranged so that no liquid may be sucked in. For this purpose, where an auxiliary tank is provided, suitable means are to be provided to stop the compressors automatically when the liquid level in the intermediate tank reaches the predetermined level.

6. Installation of pumps and compressors

Pumps and compressors are to be installed on the weather deck or in the compartments isolated from adjacent compartments by gastight bulkheads.

205. Ventilation, drainage, etc.

1. Ventilation system

(1) An independent mechanical ventilation system of exhaust type capable of changing the air at a rate of 20 times or more the compartment volume per hour is to be installed in each compartment in which pumps and/or compressors are installed and isolated from adjacent compartment by gastight bulkheads.
(2) An independent mechanical ventilation of supply type having the capacity specified in preceding (1) is to be provided in each compartment in which electric motors or electrical equipment are installed and petroleum gas is liable to intrude.
(3) An effective ventilation system is to be provided for tank holds.
(4) Outlet ends of exhaust pipes of compartments to the atmosphere which come under the provisions in preceding (1) and (2) are to be situated at a distance of 3 m or more from the entrances of companions, deckhouses or superstructures, except where compartments communicated to these entrances are safe spaces from danger of gas explosion.

2. Ventilation system of engine rooms and other compartments containing ignition sources

(1) The ventilation system of engine rooms and other compartments with possible ignition sources

in them is to be of air supply type. Openings of air inlet and outlet are to be placed as high as possible from tank top and possibly apart from ventilation openings of tanks, tank holds and compartments in which pumps and/or compressors are installed, and/or outlet ends of vent pipes from the safety valves.

(2) The ventilation openings of compartments, where the internal combustion engines, boilers or non-explosion-proof type electric equipment are installed, are to be so arranged as to prevent accidental introduction of gas through ventilation openings into the compartments, particularly in the event of failure of cargo handling equipment.

3. Bilge system

(1) The bilge system for the tank holds, pump rooms and compressor rooms for liquefied petroleum gas is to be independent from those of the other compartments.

(2) Not less than 2 sets of power pumps are to be provided in the compartments or on the deck for the purpose of drainage of the tank holds and the pump and/or compressor rooms. The capacity of each pump (Q) is not to be less than following formula. For ships less than 50 m in length, however, 2 sets of manual pumps may be substituted for one power pump.

$$Q = 0.575\, d^2 \ (\mathrm{m^3/h})$$

d : Inside diameter of the main bilge suction specified in preceding (4) (cm).

(3) Where ejectors or eductors are used instead of power pumps, their details are to be submitted to the Society for approval.

(4) The inside diameter of the main bilge suction pipe is to be as specified in **Pt 5, Ch 6, 404. 1** of the Rules.

(5) One of the power pumps specified in preceding (2) may be substituted by a suitable independent power pump in the engine room connected to an emergency suction pipe, which is provided in the tank and the inside diameter of which is not to be less than that of the main bilge suction pipe specified in preceding (4). In this case, the suction pipe is to be of independent bilge suction and a shut-off valve and a blank flange are to be provided in the engine room at the place where the pipe passes through the watertight bulkhead with a notice "For emergency use only" posted near the valve.

4. Cooling devices

Suitable cooling devices are to be provided on storage tanks to keep the liquid temperature in the tanks always below 45°C due to the rise of ambient temperature.

5. Prevention of discharging fire particle through exhaust pipe

Provisions are to be made to prevent discharging fire particles through exhaust pipes of boilers, internal combustion engines or cooking appliances.

6. Installation of equipment containing ignition sources

Any equipment containing ignition sources is not to be installed in the dangerous spaces specified in **102.** (7) of this Annex.

7. Gas detectors

An appropriate number of gas detector probes are to be arranged in tank holds, and a device which automatically detects gas concentration in the tank holds is to be installed.

206. Electrical installations

1. Application

Electrical installations are to be in compliance with the requirements in **206.** as well as the requirements in **Pt 6, Ch 1** of the Rules.

2. Power distribution system

The system of power distribution is to be one of the following types;

(1) Direct current with two insulated wires

(2) Single-phase two insulated wires
(3) Three-phase three insulated wires.
Earth indicating lamps or their alternative means and capacitors used for radio noise suppression may be earthed.

3. Switchboard, section board and power distribution board

Every outgoing circuit from switchboards, section boards or distribution boards is to be provided with a multi-pole circuit breaker or a multi-pole linked switch arranged to interrupt the circuit on each pole simultaneously.

4. Wiring in dangerous spaces

No cable is to be installed in the dangerous spaces specified in **102.** (7) of this Annex. Where it is inevitable to install cables in such spaces, the cables are to comply with the following requirements:

(1) Cables are of the type listed below.
Where corrosion may be anticipated, impervious sheath or equivalent protection is to be applied over steel armour for corrosion protection;
(A) Lead sheath armoured
(B) Impervious sheath armoured
(C) Mineral insulated metallic sheathed
(2) Cables installed is spaces which are always exposed to liquid or vapour of cargo are to be of a type which is not liable to be corroded by liquid or gas, nor to be damaged at the temperature and pressure encountered in any working condition.
(3) Cables are to be installed in the vicinity of the center line of the hull as far as practicable.
(4) Cables are to be installed sufficiently separated from decks, bulkheads, tanks and various pipes.
(5) Where cables pass through bulkheads which constitute the partitions between the dangerous space and the safety spaces or through decks, the sections are to be gastight.
(6) Cables installed in regular corridors or decks are to be properly protected from mechanical damages. Cables and their supports are to be attached so as to withstand expansion, contraction and other actions of the hull structure.
(7) Wiring between the electrical equipment in dangerous spaces and the switches or control devices thereof in safety zones are to have sealing boxes installed on the side of switches or control devices so as to maintain gastightness.
(8) Wiring and cables of intrinsically safe type circuit are to be of exclusive use, and they are to be installed separately from cables for general circuits.

5. Electrical installations in dangerous spaces

(1) No electrical installation is to be provided in the dangerous spaces specified in **102.** (7) of this Annex. Where it is inevitable to provide electrical installations in such spaces, they are to comply with the following requirements:
(A) In all dangerous spaces
Intrinsically safe type electrical equipment may be installed.
(B) In the dangerous spaces specified in **102.** (7) (A) of this Annex
Submerged type electric motors installed in tanks are to be of an explosion-proof type approved by the Society.
(C) In the dangerous spaces specified in **102.** (7) (B), (C) or (H) of this Annex
(a) Electrical sounding devices with enclosed covering may be installed. However, their cables are to be run in galvanized steel pipes of heavy gauge, and pipe joints are to be gastight.
(b) When cables for cathodic anti-corrosion devices from external power sources are installed through these compartments, for protection of the hull, they are to comply with the requirements in preceding (a).
(c) Explosion-proof lighting fittings considered suitable by the Society may be installed. However, the lighting fittings are to be arranged on at least two independent circuits, and are to be controlled by double-pole switches which are connected to locking devices of lighting fittings installed in safety zones outside the compartment. In addition, the lighting fittings and their corresponding double-pole switches are to be clearly labelled for identification.
(d) Where power supply cables to electrical equipment other than mentioned in preceding

(a), (b) and (c) are led through these spaces, their cables are to be kept to essential minimum, and the cables are to be run in galvanized steel pipes of heavy gauge which are maintained gastight. Cable expansion bends are not to be provided.

(D) In dangerous spaces specified in **102.** (7) (D), (G) or (I) of this Annex.
  (a) Explosion-proof electrical equipment considered suitable by the Society may be installed.
  (b) Cables may be installed through these spaces, however, as a rule, cable expansion bends are not to be provided.

(E) In dangerous spaces specified in **102.** (7) (E), (F) or (J) of this Annex.
The requirements in (D) may be applied. In addition, the cables may be provided with expansion and contraction portions.

(2) Where cargo pumps or compressors are driven by electric motors, the electric motors are to be installed in separate compartments which are partitioned by gastight bulkheads or decks from the compartments where pumps or compressors are installed. In case where it is difficult to comply with the above requirements, the documents are to be submitted in advance to the Society for approval.

(3) Where the separate compartments specified in preceding (2) conform to each of the requirements below, electrical equipment in those compartments may be of types other than explosion-proof type:
  (A) The construction, where the shafts pass through bulkheads or decks, is to comply with the requirements in **204. 5** (3) of this Annex.
  (B) Direct openings are not to be provided to the dangerous spaces specified in **102.** (7) of this Annex.
  (C) Air supply type mechanical ventilation devices, with adequate safety measures, are to be installed.

(4) Where the dangerous spaces are illuminated by lamps installed in safety zones through bulkheads or decks, one of the following requirements is to be satisfied :
  (A) To be illuminated from the safety zones through gastight glass windows fitted on bulkheads or decks. However, the gastight glass windows are not to reduce strength or watertightness of the bulkheads or decks to which the windows are fitted.
  (B) Explosion-proof bulkhead lighting fittings considered suitable by the Society are to be used. However, their fittings to bulkheads or decks are to be gastight, and the electric lamps are to be replaced from the safe side.

(5) It is recommended that the electrical equipment used for measuring, monitoring, controlling or communication are of intrinsically safe type.

6. Portable lighting appliances

Portable lighting appliances for use in dangerous spaces are to be of self-contained battery lamps of explosion-proof type or of explosion-proof type considered suitable by the Society.

Section 3 Low Temperature Liquefied Petroleum Gas carriers

301. Structural arrangements

1. Size of tanks

The inner length of tanks is to be 0.2 L or less. For ships less than 100m in L, the length of tanks is to be followings and over.

$$0.1L + 10 \ (\text{m})$$

2. Doble bottom

Unless specially approved by the Society, double bottoms are to be provided.

3. Cofferdams

Cofferdams are to be provided between the tank holds and the main engine rooms as well as the boiler rooms. The cofferdams may be concurrently used as tanks for storage of oil having a flashing point exceeding 60°C, ballast tanks, cargo pump rooms, etc. Further, in case where non-combustible insulations are applied on bulkheads between the tank holds and the main engine rooms as well as the boiler rooms, the above cofferdams may be omitted in accordance with the following requirements.

(1) This insulation in bulkheads is to be provided at the side of main engine rooms and of boiler rooms.

(2) For insulation materials, the fire test are to be carried out in accordance with the followings:

(A) Test specimen

The test specimen which is insulated on steel plate by the actual workmanship is to be complied with IMO Res. 754(18).

(B) Fire test

The specimen is to be exposed in a test furnace to the temperatures corresponding approximately to the Standard Time-Temperature Curve.

At the end of the first 5 minutes	576°C
At the end of the first 10 minutes	679°C
At the end of the first 15 minutes	738°C
At the end of the first 30 minutes	841°C
At the end of the first 60 minutes	945°C

(C) Criteria

The average surface temperature rise of steel plates is not to be more than 140°C, and the temperature rise recorded by any of the individual surface is not to be more than 180°C above its initial temperature at any of the individual surface during 1 hour test duration.

4. Arrangement of tanks

(1) Tanks are not to be provided forward of the collision bulkhead nor aftward of the after peak bulkhead.

(2) Hull structural members, tanks, insulations, etc. are to be arranged so that at least one surface of hull structure and each tank may be seen, and the distance between the hull structure and the tank, except where the Society specially approved as to be adequate for maintenance and inspection, is not to be less than 380 mm from the inner edge of side frames excluding special frames, the inner edge of bulkhead members excluding girders and the lower edge of deck members excluding girders, and is not to be less than 610 mm from the top of inner bottom plating. Further, the distance between the tank and the side plating is not to be less than 900 mm. The arrangement of tanks is to comply with **201** of this Annex.

5. Emergency facilities

(1) Emergency pressure relief devices are to be provided in the void spaces in tank holds. For leaked cargo, suitable discharging devices are to be provided.

(2) As a safeguard for the hull structure against major damage or failure of the tanks, devices are to be provided to throw away the cargo within a tank or tanks which have been damaged.

6. Gas detection, temperature detection, etc.

(1) Pressure relief valves are to be provided in the void spaces in tank holds so that pressures in void spaces may not rise above the predetermined pressure.

(2) To detect any leakage of cargo, a suitable number of probes for gas detectors are to be located in the void spaces in tank holds, and devices to automatically detect gas concentration are to be provided. They are to automatically indicate position and concentration of leaked gas at the location where they are placed for surveillance, either in voyage or during cargo handling. They are also to be set so that a warning signal may be issued when gas concentration exceeds at least 1/5 of the lower explosion limit value.

(3) The hull structures, which are liable to be cooled by leakage, etc. of cargo, are to be provided with temperature probes at suitable positions. They are to automatically indicate position and temperature of leaked gas at the locations where they are placed for surveillance, either in voyage or during cargo handling. They are also to be set so that a warning signal may be issued when temperature around probe becomes excessively low.

7. Watertightness of weather deck

The watertightness of weather decks around the domes of tanks is to comply with the requirements in **Pt 4, Ch 2** of the Rules.

8. Earthing

Each tank is to be electrically earthed effectively.

302. Hull Structures

1. Grades of steel in accordance with usage

(1) Where secondary barriers are provided:
Where secondary barriers are provided and layout are arranged so that hull structures may not be cooled excessively even in case of cargo leakage from tanks, the grades of steel used for hull structures are to be as specified in **Pt 3, Ch 1, 405.** and **406.** of the Rules.

(2) Where secondary barriers are not provided:

(A) At both atmospheric and sea water temperatures of 5°C and under normal conditions, the temperatures of the steel used for main hull structure are not to be equal to or lower than those listed below, depending on each grade.

RA steel	0°C
RB or RD steel	-10°C
RE steel	-20°C

(B) In case of leakage of cargo liquid from tanks, the temperatures of the steel used for main hull structure, at atmospheric and sea water temperatures of 5°C, are not to be equal to or lower than those listed below, depending on each grade.

RA steel	-10°C
RB or RD steel	-30°C
RE steel	-50°C

However, for steel plates more than 15 mm in thickness, and where their temperatures become below -35°C, steel for low temperature service specified in **Pt 2, Ch 1, 304.** of the Rules is to be used. When the temperatures of hull structure, the following condition is to be considered.

A. Ship condition
- A-1 Voyage with design load draft and design seagoing speed
- A-2 The hull is to be kept full load draft after damage outbreak, and trim and heeling are considered O condition.

B. Tank damage condition
- B-1 The damaged tank is to be one. However, in case watertight bulkheads are to be comparted in tank, one compartment may be considered.
- B-2 The damaged part is to be on the bottom. the plates of vertical, tops and etc. may not be considered.
- B-3 When the tank is damaged, it is considered that tank, support, equipment, hull, etc, are not deformed and not destruct regarding cargo as leakage and flowing out.
- B-4 It is happened in a twinkle that cargos leak and flow out, and the remained liquid level in the damaged tank and the liquid level in the empty spaces is to be equal immediately.

C. Boundary condition
- C-1 Damage is perceptible immediately.
- C-2 It is to be stationary vapour of +5°C in the compartments adjacent to vicinity empty spaces.
- C-3 The radiation of sunlight is to be ignored.
- C-4 Insulation material, supporting equipment and materials in the vicinity empty spaces are not to suck the cargo liquid except the materials for the discretion of the Society
- C-6 The phase of vapour in the vicinity empty spaces of damaged tank is that the evaporating gas is to rise at a uniform speed.
- C-7 The compartments filled with vapour other than the vicinity empty spaces of damaged tank are to be circulated naturally.

C-8 Vapour and liquid in the same compartment may be at the same temperature.
C-9 Vapour in the tank and phase of vapour in the vicinity empty spaces may be at the same pressure.
C-10 The gas movement in the insulating material may be ignored.
C-11 The humidity may be ignored.
C-12 The effect of paint may be ignored.

D. Calculation condition
D-1 The humidity distribution and the heat transfer are to be in normal condition. However, it is to be in abnormal condition instantaneously after damage break out.
D-2 Sea water is to be 1025 kg/m^3 of density, -2.5°C of freezing point, and others are marked with the property of fresh water.
D-3 The temperature of cargo is to be equal.
D-4 Heat transfer rate may be calculated by using the following values.

			Heat transfer rate ($kcal/m^2h℃$)
Atmosphere	↔	Hull	10
Outside sea water	↔	Hull	2000
Stationary vapour	↔	Hull or liquid	5
Stationary sea water	↔	Hull	100
Cargo liquid	↔	Hull adjacent to sea water	3000
Cargo liquid	↔	Hull adjacent to air	200

D-5 It may be considered that the temperature distribution on object without direction is not to equal generally.
D-6 Bone may be analyzed with fin.
D-7 It may be treated two dimensional problem.
D-8 The temperature of members is to be center temperature of the plate thickness, and the temperature of girder webs is to be average temperature of direction of web depth.

2. Hull structural members

Main structural members for hull referred to preceding **1.** (2) mean the members of **Table 2** of this Annex.

Table 2. Main Structural Members for Hull

Upper deck	Single hull	Deck, longitudinal beams, transverse beams, longitudinal & transverse girders
	Double hull (Topside tanks)	Inner shell plate, stiffeners, girders
Side	Single hull	Shell plates, transverse frame, side longitudinals, special frames
	Double hull	Longitudinal bulkhead plates, longitudinal bulkhead stiffeners and girders
Bilge hopper		Slopping plates, stiffeners, girders
Double bottom		Inner bottom plates, longitudinals, reverse frames of open floors
Transverse bulkhead		Bulkhead plates, stiffeners and girders
Others		Brackets (except tripping brackets)
(Note) Above girders are included girder plates and face. However, stiffeners on girder plates are not included.		

3. Material classes

In case the calculation for hull temperature is omitted, material classes for main structural members for hull are to be those specified in **Table 3.** of this Annex.

Table 3. Material Classes

Member			Steel grades
Upper deck	Single hull	Deck, longitudinal beams, transverse beams, longitudinal girders and brackets	*RB* or *RD*
	Double hull (Topside tanks)	Inner shell plates	*RB* or *RD*
Side	Single hull	All main structural member	*RE*
	Double hull	Longitudinal bulkhead plates Main structure member (except above)	*RE*, *RT*-35 in case of $t \geq 15$ *RB* or *RD*
Bilge hopper		Slopping plates Main structure member (except above)	*RE*, *RT*-35 in case of $t \geq 15$ *RB* or *RD*
Double bottom		Inner bottom plates Main structure member (except above)	*RE*, *RT*-35 in case of $t \geq 15$ *RB* or *RD*
Transverse bulkhead		Bulkhead plates Main structural member (except above)	*RE*, *RT*-35 in case of $t \geq 15$ *RB* or *RD*
Tank support material		Materials for integrated tank support Materials for unintegrated tank support	Equivalent of tank material *RB* or *RD*

(Note)
1. Main structural members mean members specified in **Table 2.**
2. The steel grades except main structural members specified in **Table 2** are to comply with **Pt 3, Ch 1, 405.** of the Rules.
3. t is thicknes

303. Tanks

1. Materials

The steel materials used in important parts of tanks are to be those specified in **Table 4** of this Annex or their equivalents.

Table 4 Kinds and Grades of Steel for Use in Tanks

Range of temperatures in service T (°C)	Thickness t (mm)		
	$t \leq 15$	$15 < t \leq 20$	$20 < t$
$-10 < T \leq 0$	*RB*	*RD*	*RE*
$-25 \leq T \leq -10$	*RE*, *RL* 24*A*		
$-35 \leq T < -25$	*RL* 24*A* or *RE* (for $t \leq 9$)		*RL* 24*B*, *RL* 33 or *RL* 37
$-50 \leq T < -35$	*RL* 24*B*, *RL* 33, *RL* 37		Material considered suitable by the Society.

2. Workmanship

(1) Tanks are to be shaped so that excessive stress concentration may be avoided, and any corners are to be smoothly rounded.
(2) The joining of tank plates are to be butt joints welded from both sides, except where specially approved by the Society.

3. Manholes

A manhole of each tank is to be provided above the weather deck, and its size is not to be less than 275 mm × 375 mm nor of diameter less than 375 mm.

4. Layout and scantlings of tank material

(1) The materials of which tanks are built are to be of sufficient strength in consideration of internal pressure of cargo, increased load due to inclination of tanks as well as dynamic loads due to ship motion, etc. However, the scantlings are to be in accordance with the following:

(A) The thickness of tank plates is not to be less than obtained from the following formula or 7 mm, whichever is the greater:

$$3.42S\sqrt{h}\times\sqrt{\frac{41}{\alpha}}+2.2\ \ (\mathrm{mm})$$

where

S : Spacing of stiffeners (m)

α : Specified minimum tensile strength of material used ($\mathrm{kg/mm^2}$)

h : Distance from the lower edge of tank plate to the top of hatch opening (m)

(B) The section modulus of stiffeners on tank plates is not to be less than obtained from the following formula:

$$CShl^2\frac{41}{\alpha}\ \ (\mathrm{cm^3})$$

where:

C and l : As specified in **Pt 3, Ch 15, 203.** of the Rules.

α and S : As specified in preceding (A)

h : Distance from the mid-point of l for vertical stiffeners, or from the mid-point of distance between the adjacent stiffeners for horizontal stiffeners, to the top of hatch opening (m)

(C) The depth, thickness of webs and face area of girders to support stiffeners on tank plates are not to be less than obtained from the following formulae respectively.

Depth of girder: 143 l (mm) or 2.5 a (mm), whichever is the greater.

Thickness of web : $0.01d_0 + 2.0$ (mm). However, in any case, the thickness of web is not to be less than obtained from the following formula:

$$0.0417C\frac{Shl}{d_1}\times\frac{41}{\alpha}+1.5\ \ (\mathrm{mm})$$

Face area : $71.3\frac{Shl}{d_0}\times\frac{41}{\alpha}-\frac{d_0t}{600}\ \ (\mathrm{cm^2})$

where

C, S, l and d_1 : As specified in **Pt 3, Ch 15, 204.** of the Rules.

d_0 : Depth of girders (mm)

a : Depth of slots for stiffeners (mm)

t : Thickness of webs of girders

α : As specified in preceding (A)

h : Distance from the mid-point of l for vertical girders, or from the mid-point of S for horizontal girders, to the top of hatch opening (m)

(2) Plates, stiffeners and girders of wash bulkheads provided in tanks are to be of sufficient strength in consideration of the size of tanks as well as of their opening ratio.

The scantlings of wash bulkheads are not to be less than obtained in accordance with **Pt 3, Ch 15** of the Rules by taking h_s obtained from the following formula instead of h. However, h_s is to be not less than 2.0.

$$h_s = \rho\left(0.176 - \frac{0.025}{100}L\right)(1-a)l_t$$

where

ρ : Specific gravity of cargo

L : Length of ship (m)

a : Opening rate of plates

l_t : Length of tanks (m)

304. Tank supports and fixings

1. Tank supports

Tank supports are to be made of suitable materials and are to be so constructed as to avoid any excessive load concentration on the hull structure as well as the tanks. They are also to be capable of coping with expansion or contraction due to change in tank temperature and are also to be of sufficient strength in consideration of the tank weight as well as the forces due to ship motion by rolling, pitching, etc.

2. Stopper of movement

Means of preventing movement of the tanks is to be provided so that the tanks may not move due to ship motion. This means of preventing the movement is to be capable of coping with expansion or contraction due to change in tank temperature and are also to be of sufficient strength in consideration of the forces due to ship motion by rolling, pitching, etc.

3. Prevention means of tank floating

Tanks are to be provided with devices to prevent floating of tanks, when void spaces in tank holds are flooded due to maritime disaster or other causes, thereby causing considerable damage to the hull structure by the floating of empty tanks.

305. Heat insulation

1. Heat insulation of tanks

Periphery of tanks is to be effectively heat insulated so as not to cool the hull excessively.

2. Heat insulating materials

The insulating materials are to be such that they withstand external forces applied during service and that their properties will not change remarkably when in contact with cargo.

306. Tank fittings

1. General

(1) Tanks are to be provided with necessary fittings for cargo handling as well as for safety.
(2) The openings provided on tanks are to be provided on domes extending above the weather deck, except where specially approved by the Society.
(3) No flexible coupling other than of bending tube type, is to be provided between the tank and the valve fitted to the tank.

2. Materials

Materials for tank fittings are to be such that they are not easily affected by cargo and they reserve sufficient mechanical properties at the lowest cargo temperature.

3. Stop valves

(1) A manual stop valve is to be provided on each piping connected to the tank, as close to the tank dome as possible, except the safety valves, vacuum relief valves and level gauges. Where the valve is remote-controlled, it is to be capable of being opened or closed manually.
(2) No stop valve is to be provided between the tank and the safety valves as well as the vacuum relief valves.

4. Pressure gauges and alarm devices for low pressure

A pressure gauging device which suitably indicates gas pressure in the tank is to be provided on each tank. It is to be of such type that the tank pressure can be checked near the dome and further the pressure is to be read at place from which surveillance is carried out in voyage and during cargo handling. Further, an alarm device is to be provided which operates at a pressure higher than the set pressure of the vacuum relief valve, when tank pressure decreases.

5. Thermometers

Means are to be provided for determining the temperature of the tank walls. Measuring points are to be arranged so that the temperature difference of the tank walls may be indicated.

6. Liquid level gauges and alarm devices

A liquid level gauging device is to be provided in each tank to determine the level of the liquid without opening the tank. Independent high level alarms are to be provided, which are to issue alarm signal at places where cargo handling is being watched or controlled.

7. Overpressure safety valves

(1) Two or more safety valves against overpressure are to be provided on each tank at the uppermost point of gas part. In case of pilot-type safety valves, a separate pressure detecting terminal is to be provided respectively.
(2) The total capacity of safety valves against overpressure is to be such that it is capable of discharging the amount specified in (A) or (B), whichever is the greater, at a pressure not exceeding 1.2 times the set pressure:
  (A) The total amount of gas at ambient temperature of 45°C by adding the amount of gas generated due to heat input into the tank to the gas quantity discharged during loading at a full capacity.
  (B) The quantity of gas to be generated by heat input into the tank in case of fire, represented by the amount of gas generated from the heat quantity obtained from the following formula. Where, however, specially approved by the Society in consideration of the hull structure and tank structure, the coefficient of 12,200 in the following formula may be reduced in the range down to 6,100. Further, where the shape construction, and layout of the tanks differ from those set forth in **102**. (2) of the Annex or where application of the following formula is not considered practical, the calculation method will be decided in each case.

$$Q_h = 12{,}200\,A^{0.82}$$

where

Q_h : Heat input (kcal/h)

A : Total surface area of the tank, excluding the surface area below the minimum draught in ballast condition (m^2)

8. Protection devices of tank against vacuum

The following protection devices are at least to be provided so as not to cause dangerous vacuum condition in each tank:

(1) Automatic stopping devices at low pressure for machinery, such as cargo pumps and refrigerating facilities which may cause vacuum condition in the tank. The pressure detecting arrangement of the automatic stopping device is to be separate from that of low pressure alarm specified in preceding **Par. 4.** However, the automatic stopping device may be considered as the alarm device, where the Society considers it to be equivalent to the alarm device in respect of its design.

(2) Vacuum relief valve which copes with the maximum unloading rate of the tank.

9. Precooling of tanks

Precooling arrangements are to be made on the tanks so as not to generate dangerous thermal stress at the time of loading.

307. Cargo piping systems

1. Application

The piping systems are to comply with the requirements in **307.** as well as with those for Class 1 piping specified **Pt 5, Ch 6** of the Rules.

2. Arrangement

All of the cargo pipings other than those installed in tanks, pump rooms and gas compressor rooms, are to be installed on the weather decks, except where approved by the Society.

3. Maximum working pressure, materials and others for cargo piping system

(1) The maximum working pressure of piping system is defined as the maximum value of the pressure of the system in ordinary service. Where additional pressure is applied by pumps, compressors, etc., the maximum value is to be decided taking account of such an additional pressure.
(2) Even where the maximum working pressure of the piping system is less than 0.5 MPa, the pipe and pipe fittings are to be so designed as to withstand the standard pressure of 0.5 MPa, except that of vent lines in **12.** below.
(3) The materials for the piping facilities are such that they are not easily affected by cargo and that they have sufficient mechanical properties even at the lowest cargo temperature.

4. Pipe joints

(1) Pipe joints, other than those for piping within tanks and those for vent piping, are to be butt-welded or flanged couplings, and the pipes and flanges are to be welded.
(2) Pipe flanges other than those for vent piping are generally to be of raised-face type.
(3) Screw joints of KS B 0222 with dimensions of PT 25 or less may be used at visible locations where they can be shut off by valves from tanks and pressure vessels for liquid and from the main pipes for cargo handling.

5. Expansion joints

Expansion joints are to be provided at suitable locations within the piping system to prevent generation of excessive stress due to expansion or contraction. The expansion joints are to be bent pipes or to be of other approved construction.

6. Prevention of mis-handling

(1) The piping devices for a number of tanks, some of which are for exclusive use for a certain cargo, are to be so arranged that an exclusive piping is to be provided individually for each different cargo, except where the common use of piping or mixing of cargoes will not cause any trouble.
(2) Where exclusive pipings are connected each other, means to avoid mis-operation is to be provided.

7. Shore connections

(1) At the connections between shore pipes for cargo handling (for both liquid and gas) and load headers of ship, shut-off valves are to be provided, each of which can be remotely shut off in case of emergency. The valves are to be such that they can shut off from other easily accessible locations than the regular place as well.
(2) Connections between shore pipes and ship's piping are to be so arranged as to be electrically connected each other.

8. Relief valves in pipe lines

A relief valve is to be provided on each pipe line in which the pressure may possibly rise above the maximum working pressure and on each pipe line in which the liquid may possibly be locked.

9. Pipe supports and fixings

All pipe lines are to be provided with adequate supports to prevent the weight of pipe lines from acting on valves and fittings and also to prevent excessive vibration. Pipe lines for use at low temperature are to be fixed so that adjoining hull structures may not be cooled excessively.

10. Earthing

Each pipe line is to be electrically connected and earthed effectively.

11. Cargo hoses

Cargo hoses equipped in ships are to be of materials not easily affected by cargoes and to be of suitable mechanical properties even at the working temperature, and are to be designed for a bursting pressure not less than 5 times the maximum working pressure (at least 2.5 MPa) to which they may be subjected.

12. Vent pipes

(1) Discharge from safety valves and relief valves is to be led to vent pipes. However, discharge from relief valves in pipe lines may be led into tanks, where effectiveness of relief valves is not lowered.
(2) The provisions in **203. 12** (2), (3) and (4) of this Annex are to apply.
(3) Each outlet end of vent pipes is to be located at a position 1/3 of the ship's breadth above the weather deck and where it is not liable to impair safety of the ship as far as practicable. At each outlet of the vent pipes, a suitable flame arrester is to be provided, and it is to be arranged so that the discharge may not blow out downward from the horizontal.

308. Cargo refrigerating facilities

1. Refrigerating facilities

At least two sets of refrigerating facilities are to be provided, and each of them is to be arranged for immediate use by switching.

2. Capacity

The capacity of refrigerating facilities is to be sufficient to maintain the cargo at the specified temperature, even in case where one set is out of service for 24 hours a day and only the remaining set or sets are in operation.

3. Re-liquefying facilities

(1) Where refrigerating facilities are of a type in which refrigerant is used, **Pt 9, Ch 1, 401. 1 to 4, 403. 3, 4, 404.** and **405.** of the Rules are to be applied to these refrigerating facilities.
(2) Where refrigerating facilities are of a type in which gas is directly liquefied under pressure, **204. 5** (1), (3) to (6) and 6 of this Annex as well as **Pt 9, Ch 1, 401. 1** to **4, 403. 4** (2), **404. 4** and **405.** of the Rules are to be applied.
(3) As for pressure vessels subjected to pressure of liquid and gas, the approved working pressure is to be at least 0.5 MPa and the requirements in **202. 1** to **4** of this Annex as well as **Pt 5, Ch 5** of the Rules are to be applied. As for safety valves, level gauges and other fittings, the requirements in **203. 9, 11, 13** (3) to (5) of this Annex are to be applied.

4. Automatic stopping devices against low pressure

The automatic stopping devices of refrigerating facilities specified in **306. 8** (1) of this Annex are to be so adjusted as to stop at a higher pressure than the set pressure of the vacuum relief valve on the tank. In addition, this automatic stopping device is not to lose its effectiveness even when the refrigerating facility is manually operated.

5. Earthing

All machinery and equipment for liquid and gas are to be earthed effectively.

309. Cargo handling facilities

1. Cargo handling facilities

In addition to the regular cargo pump facilities, any ship is to be provided with stand-by units and the units may be as follows:

(1) In case of a tank provided with two or more pumps, the stand-by units may be omitted in spite of being used.
(2) The stripper pump may be permitted with stand-by units.
(3) The eductor may be permitted with stand-by units.

2. Materials

The materials for cargo handling facilities are to be suitable for kind of cargo and temperature to be encountered in service.

3. Cargo pumps

The requirements in **204. 5** (1) to (5) of this Annex are also to apply.

4. Automatic stopping and remote stopping devices of cargo pumps

(1) Any pump is to be provided with an automatic stopping device or its equivalent to operate when liquid level in the tank reaches the predetermined low level, so as to protect the pump as well as its driving machinery.
(2) The automatic stopping device to operate at low pressure set forth in **306. 8** (1) of this Annex is to be so adjusted as to automatically stop at a higher pressure than the set pressure of the vacuum relief valve on the tank.
(3) The pumps are to be stopped from a remote location where cargo handling is watched or controlled.

5. Gas compressors and accessories

Where compressors are installed for delivery and loading of gas, the requirements in **308. 3** (2), (3) and **308. 4** of this Annex are to apply.

6. Earthing

All machinery and equipment for liquid and gas are to be electrically earthed effectively.

310. Ventilation system, etc.

1. Ventilation system, etc.

(1) The requirements in **205. 1** (1), (2), (4), 2 and **5** of this Annex are to apply.
(2) Tank holds are to be provided with bilge discharging facilities. The bilge suction pipe, however, is not to be led to non-dangerous spaces in the ship.

2. Installation of equipment causing ignition sources

Equipment which may cause ignition sources is not to be installed in the dangerous spaces specified in **102**. (7) of this Annex.

311. Electrical installations

1. Application

The electrical installations are to comply with these requirements as well as the requirements in **206.** of this Annex.

2. Power supply to cargo refrigerating facilities

Where all the machinery of the cargo refrigerating facilities specified in 308. of this Annex are electrically driven, the power supply is to be arranged from two or more generators, and the power supply to electric motors are to be made from circuits divided into at least two or more groups, through a main switch board or equivalent distribution board. ⚓

Annex 7A-2 Guidelines for the Evaluation of the Adequacy of Type C Tank Vent Systems

101. General

1. The tank outlet to the pressure relief valves is to remain in the vapour phase at the 98% liquid level, 15° of heel angle and 0.015 L of pitch angle.

2. Pressure relief valves which have been sized in accordance with **Pt 7, Ch 5, Sec 8** of the Rules, are to have adequate capacity.

3. To assure adequate relieving capacity condition, followings are to be complied with :

(1) The pressure drop in the vent pipe from the cargo tank to the pressure relief valve inlet ($\triangle p_{inlet}$) is not to exceed 3% of MARVS, at the pressure relief valve capacity required in Rules from equation **103.** (1) below, at 1.2 times maximum allowable relief valve setting (gauge pressure, hereafter MARVS) on all vapour flow.

(2) The blowdown ($\triangle p_{dose}$) is not to be less than $\triangle p_{inlet}$ + 0.02 × MARVS at the installed rated vapour capacity where required to assure stable operation of the pressure relief valve. This calculation is to be carried out at MARVS on all vapour flow. Pilot-operated valves can tolerate higher inlet-pipe pressure losses when the pilot senses at a point that is not affected by the inlet-pipe pressure drop.

4. The built-up back pressure in the vent piping from the pressure relief valve outlet to the location of discharge to the atmosphere, and including any vent pipe interconnections which joint other tanks, is not to exceed the following values :

(1) For unbalanced pressure relief valves : 3 % MARVS.
Special consideration may be given in cases where the back pressure exceeds 10 % of MARVS at a tank pressure of 1.2 × MARVS; and

(2) For balanced pressure relief valves and pilot-operated pressure relief valves as advised by manufacturer : normally 30 % of MARVS for balanced pressure relief valves and 50 % of MARVS for pilot-operated pressure relief valves,
when assuming isenthalpic expansion of saturated liquid, at 1.2 × MARVS, through the pressure relief valve with the vent piping under fire exposure.

5. The built-up back pressure in the vent piping may be estimated by the procedures outlined in **102.**

6. A more accurate procedure for evaluating tank vent systems on flashing two-phase flow is to be consulted if these simplified procedures of **102.** do not demonstrate compliance with the preceding **3** and **4.**

102. Procedures

The following procedures are to be complied with to demonstrate the adequacy of a tank vent system to limit the pressure rise in a cargo tank to not greater than 1.2 × MARVS during all conditions, including fire conditions implicit in **Pt 7, Ch 5, 805. 2** of the Rules.

(1) Prepare a simplified flow sheet of the cargo tank vent system, identifying the fittings and the actual diameters and lengths of pipe.
Divide the system into sections between nodes at changes in pipe diameter and at inter-connections with flows from other relief valves.
List the fittings and their dynamic loss coefficients. Calculate the external surface area of the piping sections between the nodes.

(2) Calculate the pressure relief valve capacity (Q_{GCC}) of each tank pressure relief valve, in $\mathrm{m^3/s}$ of air at standard conditions in accordance with **Pt 7, Ch 5, 805. 2** of the Rules and note the installed rated capacity (Q_{IR}) of each pressure relief valve in $\mathrm{m^3/s}$ air at standard conditions at 1.2 × MARVS. The calculation is to be done for the highest gas factor of the products included in the cargo list. N-Butane has often the highest value for gas factor "G" in the Rules and usual1y determines the Rule minimum capacity.
Determine the mass flows for cargo conditions at 1.2 × MARVS through each pressure relief valve for the pressure relief valve capacity and for the installed rated capacity for both all vapour flow and for two phase cargo flow. Also calculate the mass flow at MARVS for the installed rated capacity on all vapour flow.

Equation in **103.** (1) may be used for all vapour mass flow and equations in **103.** (2), (3) and (4) may be used for two phase mass flow. Equation in **103.** (2) may be applied to multi-component mixtures whose boiling point range does not exceed 100 K.

(3) Estimate all the vapour flow pressure drop in the pipe from the cargo tank connection inlet flange, working from the known tank pressure towards the pressure relief valve. This pressure drop is calculated by using the difference in stagnation pressures. Therefore, the second term of equation in **103.** (5) (A) may be used for pipe sections of constant diameter. For contractions, equation in **103.** (5) (B) may be used.

(4) Check that the pressure drop at each pressure relief valve inlet complies with **101. 3** (1), at the pressure relief valve capacity for all vapour flow to assure adequate relief capacity. For the calculation, the vapour mass flow of product (W_g) from equation in **103.** (1) is to be used.
For control purposes, **101. 3** (1) is to be repeated using the pressure relief valve two-phase flow (W', equation in **103.** (4)) at 1.2 × MARVS and **101. 3** (2) by using the installed rated two-phase flow at MARVS. Both calculations are to give a smaller inlet pressure loss than the corresponding all vapour pressure loss.
Check that the blowdown ($\triangle p_{dose}$) complies with **101. 3** (2) to assure stable operation.

(5) Estimate the two-phase flow pressure in the discharge pipe at the location of discharge to the atmosphere. Equation in **103.** (6) may be used, with the pressure relief valve two-phase mass flow (W') to assure adequate relief capacity, to check if the exit pressure is greater than 0.1 MPa.

(6) Estimate the vapour fraction and two-phase density in the vent pipe at the exit to the atmosphere, assuming transfer of the fire heat flux of 108 $\mathrm{kW/m^2}$ through the uninsulated vent piping. Equations in **103.** (7) and (8) may be used.

(7) Estimate the built-up back pressure at the pressure relief valve outlet flange, commencing from the known vent pipe exit pressure, calculating the pressure drop between pipe nodes and working, section by section, back up the pipe to the pressure relief valve.
Equations in **103.** (7), (8) and (5) (A) may be used with iteration until the upstream node absolute pressure, vapour fraction and specific volume are justified and assuming that vapour is saturated.
At pipe diameter expansion fittings where fluid velocity is reduced, a pressure recovery generally occurs. This recovery is overestimated in case of two-phase flow when dynamic loss coefficients for single-phase flow are used. For the purpose of these guidelines, the static exit pressure of a conical expansion fitting is assumed to be equal to the static inlet pressure.

(8) Estimate the choking pressure(p_{ec}) at the exit of every section with the mass flux (G_p) in that section for the pipeline between the pressure relief valve and the vent exit. Equation in **103.** (6) may be used.
Compare the pressure distribution along the vent line as derived from preceding (5) to (7), with the different choking pressures for each section as derived from equation in **103.** (6).
If choking pressure at any location exceeds the corresponding calculated pressure derived from preceding (5) to (7), the calculation as described in preceding (5) to (7) is to be repeated commencing from choking point location and corresponding choking pressure, working back up the pipe to the pressure relief valve.
If choking pressure at more than one location exceeds the corresponding calculated pressure derived from preceding (5) to (7), the commencing point of the recalculation is to be taken as the choking location point giving the highest built-up back pressure.

(9) Check that the built-up back pressure at each pressure relief valve outlet complies with **101. 4.** at the pressure relief valve capacity for two-phase mass flow (W'), to assure stable operation of the valves, thus assuring adequate relief capacity.

(10) For conventional unbalanced valves only :
(A) If back pressure as derived from preceding (5) to (8) is within the range of 10 % to 20 % of MARVS, an additional evaluation is to be performed in order to decide whether the system is acceptable.
(B) The system is to perform with the following requirement: with one valve closed and all others discharging at the installed rated pressure relief valve capacity, and the back pressure is to be less than 10 % of MARVS.

103. Equations

The following equations may be used to demonstrate the adequacy of the vent system.

(1) For all vapour mass flow rate from tank through pressure relief valves

$$W_g = \frac{71 \cdot 10^3 \cdot F \cdot A^{0.82}}{h_{fg}} \quad (\mathrm{kg/s})$$

where

F : Fire exposure factor according to **Pt 7, Ch 5, 805.** of the Rules

A : External surface area of type C tank (m^2)

h_{fg} : Latent heat of vaporization of cargo at 1.2 × MARVS (J/kg)

(2) For isenthalpic flashing mass flux of liquid through pressure relief valve orifice
This equation is valid for multi-component mixtures whose boiling point range does not exceed 100 K.

$$G_v \approx h_{fg} \cdot \rho_g \left(\frac{1}{T_0 \cdot c} \right)^{\frac{1}{2}} \quad (\mathrm{kg/m^2 s})$$

where

h_{fg} : Latent heat of vaporization of cargo at 1.2 × MARVS (J/kg)

p_g : Vapour density 1.2 × MARVS and corresponding boiling temperature ($\mathrm{kg/m^3}$)

T_0 : Temperature of cargo at 1.2 × MARVS (K)

c : Liquid specific heat at 1.2 × MARVS (J/kgK)

(3) For two-phase mass flow rate through pressure relief valve is installed

$$W = G_v \cdot K_w \cdot A_v \quad (\mathrm{kg/s})$$

where

G_v : being taken from preceding (2) ($\mathrm{kg/m^2 s}$)

K_w : Pressure relief valve discharge coefficient on water(approx. 0.8 × measured K_d on air)

A_v : Actual orifice area of pressure relief valve (m^2)

(4) For pressure relief valve capacity for two-phase mass flow

$$W' = G_v \cdot K_w \cdot A_v \frac{Q_{GCC}}{Q_{IR}} \quad (\mathrm{kg/s})$$

where

Q_{GCC} : Pressure relief valve capacity of air at standard conditions in accordance with **Pt 7, Ch 5, 805. 2** of the Rules ($\mathrm{m^3/s}$)

Q_{IR}: Installed rated pressure relief valve capacity of air at T=273K and p=0.1013 MPa ($\mathrm{m^3/s}$)

(5) For the calculation of the static pressure difference in a pipe section of constant diameter in which the mass flux (G_p) is constant

(A) $$\Delta p = G_p^2 (v_e - v_i) + \frac{1}{2} \cdot G_p^2 \left(\frac{v_e + v_i}{2} \right) \left(4f \frac{L}{D} + \Sigma N \right) \quad (\mathrm{Pa})$$

where

G_p : Mass flux through the pipe section

$$G_P = \frac{W}{\pi D^2/4} \text{ or } \frac{W'}{\pi \cdot D^2/4} \quad (\mathrm{kg/m^2/s})$$

v_e : Two-phase specific volume at pipe section exit ($\mathrm{m^3/kg}$)
v_i : Two-phase specific volume at pipe section inlet ($\mathrm{m^3/kg}$)
f : Fanning friction factor f = 0.005 for two-phase fully turbulent flow
L : Length of pipe section (m)
D : Diameter of pipe section (m)
ΣN : Sum of dynamic loss coefficients for fittings in the pipe section, $N = 4f \cdot L/D$ equivalent (typical values of N are given in **Table 5**)

Table 5 Typical Values for Dynamic Loss Coefficient for Vent System Fittings

Fitting	$N(=4f \cdot L/D)$
Inlet pipe from tank to Pressure relief valve	
- Square-edged inlet	0.5
- Protruding conical inlet	0.15
- Conical reduction	0.10
Discharge piping from Pressure relief valve to mast vent exit	
- 45° bend	0.2
- 45° single-mitre elbow	0.45
- 90° long redius bend	0.3
- 90°short radius bend	0.5
- 90° double-mitre elbow	0.6
- Soft-tee	0.3
- Hard-tee	1.1
- Cowl mast vent exit	2.25
- Top-hat mast vent exit	4.5
- Flame screen(**Pt 7, Ch 5, 1710.** of the Rules)	1.4
(Note) N may vary with pipe diameter	

(B) For contractions, the difference in stagnation pressure is defined by :

$$\Delta p = \frac{1}{2} \cdot G_{p,e}^2 \cdot v_i N \quad (\mathrm{Pa})$$

where

N : Dynamic loss coefficients of the contraction
$G_{p,e}$: Mass flux at the exit of the contraction ($\mathrm{kg/m^2s}$)
v_i : Specific volume at the inlet of the contraction ($\mathrm{m^3/kg}$)

(6) For two-phase critical chocking pressure at vent mast exit or exit from any vent pipe section

$$p_{ec} = G_p \left(\frac{p_0 \omega}{\rho_0} \right)^{\frac{1}{2}} \quad (\mathrm{Pa})$$

where

G_p : as defined in preceding (5) (A)

p_0 : Cargo vapour pressure in tank at inlet to pressure relief valve (P_a)

ρ_0 : Cargo liquid density in tank at inlet to pressure relief valve at p_0 and T_0 (kg/m^3)

ω : Compressible flow parameter in tank at inlet to pressure relief valve

$$= \alpha_0 + (1 - \alpha_0) \frac{\rho_0 \cdot c \cdot T_0 \cdot p_0 \cdot (v_{go} - v_{fo})^2}{(h_{go} - h_{fo})^2}$$

where

α_0 : Inlet void fraction or vapour volume fraction at inlet to pressure relief valve
0, when assuming isenthalpic expansion of saturated liquid, at 1.2 × MARVS, through the pressure relief valve

c : See preceding (2)

T_0 : See preceding (2)

$(v_{go} - v_{fo})$: Difference in gaseous and liquid specific volume at temperature T_0 at inlet to pressure relief valve (m^3/kg)

$(h_{go} - h_{fo})$: Difference in gaseous and liquid enthalpy at temperature T_o at inlet to pressure relief valve (J/kg)

(7) For exit quality, or vapour mass fraction at pipe section exit

$$x_e = \frac{h_{fo} - h_{fe} + 1000 \cdot q \cdot \Sigma \frac{a}{W}}{h_{fg}}$$

(e.g. x_e = 0.3 ≡ 30 % quality ≡ 30 % vapour + 70 % liquid by mass)

where

h_{fo} : Liquid enthalpy in tank at inlet to pressure relief valve (J/kg)

h_{fe} : Liquid enthalpy at back pressure at pipe section exit (J/kg)

h_{fg} : Latent heat of vaporization at pipe section exit (J/kg)

q : Heat flux from fire exposure into vent pipe equal to 108 kW/m^2

a : Heated external surface area of vent pipe section (m^2)

W : Mass flow rate in vent pipe section (kg/s)

(8) For two-phase density(ρ) and specific volume (v)

$$\rho = \frac{\rho_g}{x} \quad (kg/m^3)$$

where

ρ_g : Saturated vapour density at pipe section inlet or exit (kg/m^3)

x : Vapour fraction at pipe section inlet or exit

$$v = \frac{1}{\rho} \quad (m^3/kg)$$

Annex 7B-1 Table of Summary of Minimum Requirements

Product name (column a)	The product name shall be used in the shipping document for any cargo offered for bulk shipments. Any additional name may be included in brackets after the product name. In some cases, the product names are not identical with the names given in previous issues of the Code
UN number (column b)	Deleted
Pollution category (column c)	The letter X, Y, Z means the pollution category assigned to each product under MARPOL Annex II
Hazards (column d)	*S* means that the product is included in the Rules because of its safety hazards; *P* means that the product is included in the Rules because of its pollution hazards; and *S*/*P* means that the product is included in the Rules because of both its safety and pollution hazards.
Ship type (column e)	1 : ship type 1 2 : ship type 2 3 : ship type 3
Tank type (column f)	1 : independent tank 2 : integral tank G : gravity tank P : pressure tank
Tank vents (column g)	Cont. : controlled venting Open : open venting
Tank environmental control (column h)	Inert : inerting Pad : liquid or gas padding Dry : drying Vent : natural or forced ventilation No : no special requirements under this code
Electrical equipment (column i)	Temperature classes (i') ; T1 to T6, - : indicates no requirements, blank : no information Apparatus groups(i") ; IIA, IIB or IIC, - : indicates no requirements, blank : no information Flash point (i"') ; Yes : flashpoint exceeding 60°C No : flashpoint not exceeding 60°C NF : nonflammable product
Gauging (column j)	O : open gauging R : restricted gauging C : closed gauging
Vapour detection (column k)	F : flammable vapours T : toxic vapours No : indicates no special requirements under this Code
Fire protection (column l)	A : alcohol-resistant foam or multi-purpose foam B : regular foam, encompasses all foams that are not of an alcohol-resistant type, including fluoroprotein and aqueous-film-forming foam (AFFF) C : water-spray D : dry chemical No : no special requirements under this chapter
Materials of construction (column m)	Deleted
Emergency equipment (column n)	Yes : see 1403. 1 No : no special requirements under this Chapter
Specific and operational requirements (column o)	When specific reference is made to chapter 15 and /or 16, these requirements shall be additional to the requirements in any other column.

Notes ;

Subindex (a)	If the product to be carried contains flammable solvents such that the flashpoint does not exceed 60℃, then special electrical systems and a flammable-vapour detector shall be provided.
Subindex (b)	Although water is suitable for extinguishing open-air fires involving chemicals to which this footnote applies, water shall not be allowed to contaminate closed tanks containing these chemicals because of the risk of hazardous gas generation.
Subindex (c)	Phosphorus, yellow or white is carried above its autoignition temperature and therefore flashpoint is not appropriate. Electrical equipment requirements may be similar to those for substances with a flashpoint above 60℃.
Subindex (d)	Requirements are based on those isomers having a flashpoint of 60℃, or less; some isomers have a flashpoint greater than 60℃, and therefore the requirements based on flammability would not apply to such isomers.
Subindex (e)	Applies to n-decyl alcohol only.
Subindex (f)	Dry chemical shall not be used as fire extinguishing media
Subindex (g)	Confined spaces shall be tested for both formic acid vapours and carbon monoxide gas, a decomposition product.
Subindex (h)	Applies to p-xylene only.
Subindex (i)	For mixtures containing no other components with safety hazards and where the pollution category is Y or less
Subindex (j)	Only certain alcohol-resistant foams are effective
Subindex (k)	Requirements for Ship Type identified in column e might be subject to regulation 4.1.3 of Annex II of MARPOL 73/78
Subindex (l)	Applicable when the melting point is equal to or greater than 0°C.
Subindex (m)	From vegetable oils specified in the IBC Code.
Subindex (*)	The number in a parenthesis in the column "o" is the number of IBC Code equivalent to the number of this regulation.

Annex 7B-2 List of products to which the Code does not apply

Product name	Pollution Category
Acetone	Z
Alcoholic beverages, n.o.s.	Z
Apple juice	OS
n-Butyl alcohol	Z
sec-Butyl alcohol	Z
Calcium nitrate solutions (50% or less)	Z
Clay slurry	OS
Coal slurry	OS
Diethylene glycol	Z
Ethyl alcohol	Z
Ethylene carbonate	Z
Glucose solution	OS
Glycerine	Z
Hexamethylenetetramine solutions	Z
Hexylene glycol	Z
Hydrogenated starch hydrolysate	OS
Isopropyl alcohol	Z
Kaolin slurry	OS
Lecithin	OS
Magnesium hydroxide slurry	Z
Maltitol solution	OS
N-Methylglucamine solution (70% or less)	Z
Methyl propyl ketone	Z
Molasses	OS
Noxious liquid, (11) n.o.s. (trade name ...., contains ....) Cat. Z	Z
Non-noxious liquid, (12) n.o.s. (trade name ...., contains ....) Cat. OS	OS
Polyaluminium chloride solution	Z
Polyglycerin, sodium salt solution (containing less than 3% sodium hydroxide)	Z
Potassium formate solutions	Z
Propylene carbonate	Z
Propylene glycol	Z
Sodium acetate solutions	Z
Sodium sulphate solutions	Z
Sorbitol solution	OS
Sulphonated polyacrylate solution	Z
Tetraethyl silicate monomer/oligomer (20% in ethanol)	Z
Triethylene glycol	Z
Vegetable protein solution (hydrolysed)	OS
Water	OS

Annex 7B-3 Index of Products Carried in Bulk

1. For the Chapter 19 of IBC Code, the first column of the Index of Products Carried in Bulk (hereafter referred to as .the Index.) provides the so called Index Name. Where the Index Name is in capital and in bold, the Index Name is identical to the Product Name in either chapter 17 or chapter 18. The second column listing the relevant Product Name is therefore empty. Where the Index Name is in non-bold lower case it reflects a synonym for which the Product Name in either chapter 17 or chapter 18 is given in the second column. The relevant chapter of the IBC Code is reflected in the third column. The fourth column gives the UN Numbers of products, which were available up to February 2001.

2. The Index has been developed for information purposes only. None of the Index Names indicated in non-bold lower case in the first column shall be used as Product Name on the shipping document.

3. Prefixes forming an integral part of the name are shown in ordinary (roman) type and are taken into account in determining the alphabetical order of entries. These include such prefixes as:

Mono Di Tri Tetra Penta Iso Bis Neo Ortho Cyclo

4. Prefixes that are disregarded for purposes of alphabetical order are in italics and include the following:

n- (normal-)

sec- (secondary-)

tert- (tertiary-)

o- (ortho-)

m- (meta-)

p- (para-)

N-

O-

sym- (symmetrical)

uns- (unsymmetrical)

dl-

cis-

trans-

(E)-

(Z)-

alpha- (α-)

beta- (β-)

gamma- (γ-)

epsilon- (ε-)

Annex 7B-4 Criteria for assigning carriage requirements for products subject to the IBC Code

101. Introduction

1. The following criteria are guidelines for the determination of pollution classification and assignment of appropriate carriage requirements for bulk liquid cargoes being considered as candidates for entry into the IBC Code or annexes 1, 3 or 4 of MEPC.2/Circs.

2. In developing such criteria, every effort has been made to follow the criteria and cut off points developed under the Global Harmonized System (GHS).

3. Although the criteria are intended to be closely defined in order to establish a uniform approach, it must be emphasized that these are guidelines only and, where human experience or other factors indicates the need for alternative arrangements, these shall always be taken into account. Where deviations from the criteria have been recognized, they shall be properly recorded with justifications.

102. Contents

This chapter contains the following:
(1) minimum safety and pollution criteria for products subject to chapter 17 of the IBC Code;
(2) criteria used to assign the minimum carriage requirements for products, which meet the safety or pollution criteria to make them subject to chapter 17 of the IBC Code;
(3) criteria used for special requirements in chapter 15 of the IBC Code to be included in column o of chapter 17 of the IBC Code;
(4) criteria used for special requirements in chapter 16 of the IBC Code to be included in column o of chapter 17 of the IBC Code; and
(5) definitions of properties used within this chapter.

103. Minimum safety and pollution criteria for products subject to chapter 17 of the IBC Code

Products are deemed to be hazardous and subject to chapter 17 of the IBC Code if they meet one or more of the following criteria:
(1) inhalation LC_{50} < 20 mg/l/4h (see definitions in paragraph 107.1(1));
(2) dermal LD_{50} < 2000 mg/kg (see definitions in paragraph 107.1(2));
(3) oral LD_{50} < 2000 mg/kg (see definitions in paragraph 107.1(3));
(4) toxic to mammals by prolonged exposure (see definitions in paragraph 2107.2);
(5) cause skin sensitization (see definitions in paragraph 107.3);
(6) cause respiratory sensitization (see definitions in paragraph 2107.4);
(7) corrosive to skin (see definitions in paragraph 107.5);
(8) have a Water Reactive Index (WRI) of > 1 (see definitions in paragraph 107.6);
(9) require inertion, inhibition, stabilization, temperature control or tank environmental control in order to prevent a hazardous reaction (see definitions in paragraph 107.10);
(10) flash point < 23℃; and have an explosive/flammability range (expressed as a percentage by volume in air) of > 20%;
(11) autoignition temperature of < 200℃; and
(12) classified as pollution category X or Y or meeting the criteria for rules 11 to 13 under paragraph 104.5(1).

104. Criteria used to assign the minimum carriage requirements for products, which meet the minimum safety or pollution criteria to make them subject to chapter 17 of the IBC Code

1. Column a - Product Name

The International Union of Pure and Applied Chemistry (IUPAC) name shall be used as far as possible but, where this is unnecessarily complex, then a technically correct and unambiguous alternative chemical name may be used.

2. Column b . Deleted

3. Column c - Pollution Category

Column c identifies the pollution category assigned to each product under Annex II of MARPOL 73/78.

4. Column d - Hazards

An .S. is assigned to column d if any of the safety criteria described in paragraphs 103.1.(1) to 103.1.(11) are met.

A .P. is assigned to column d if the product meets the criteria for assigning Ship Type 1 to 3 as defined by rules 1 to 14 in paragraph 104.5.

5. Column e - Ship Type

(1) The basic criteria for assigning Ship Types based on the GESAMP Hazard Profile are shown in the table below. An explanation of the details in the columns is provided in appendix 1 of MARPOL Annex II. Selected rules, identified in this table, are specified in section (2) for assigning specific Ship Types.

Number	A1	A2	B1	B2	D3	E2	Ship Type
1			≥5				1
2	≥4	NR	4		CMRTNI		
3	≥4	NR			CMRTNI		2
4			4				
5	≥4		3				
6		NR	3				
7				≥1			
8						Fp	
9					CMRTNI	F	
10			≥2			S	
11	≥4						3
12		NR					
13			≥1				
14	All other category Y Substances						
15	All other category Z Substances, All "Other Substances" (OS)						NA

(2) The Ship Type is assigned according to the following criteria:

(A) Ship Type 1:
Inhalation LC_{50} < 0.5 mg/l/4h; and/or
Dermal LD_{50} < 50 mg/kg; and/or
Oral LD_{50} < 5 mg/kg; and/or
Autoignition temperature < 65℃; and/or
Explosive range > 50% v/v in air and the flash point < 23℃; and/or
Rules 1 or 2 of the table shown in (1)

(B) Ship Type 2:
Inhalation LC_{50} > 0.5 mg/l/4h - < 2 mg/l/4h; and/or
Dermal LD_{50} > 50 mg/kg - < 1000 mg/kg; and/or
OralLD50 > 5 mg/kg - < 300 mg/kg; and/or
WRI=2;
Autoignition temperature < 200℃; and/or
Explosive range > 40% v/v in air and the flash point < 23℃; and/or

Any of the rules 3 to 10 of the table shown in (1)

(C) Ship Type 3:
Any of the minimum safety or pollution criteria for bulk liquid cargoes subject to chapter 17 of the IBC Code not meeting the requirements for ship types 1 or 2 and not meeting rule 15 of the table shown in (1)

6. Column f - Tank type

(1) The tank type is assigned according to the following criteria:

(A) Tank type 1G:
Inhalation LC_{50} < 0.5 ㎎/l/4h; and/or
Dermal LD_{50} < 200 ㎎/㎏); and/or
Autoignition temperature < 65℃; and/or
Explosive range > 40% v/v in air and the flash point < 23℃; and/or
WRI=2

(B) Tank type 2G:
Any of the minimum safety or pollution criteria for bulk liquid cargoes subject to chapter 17 or the IBC Code not meeting the requirements for tank type 1G.

7. Column g - Tank vents

(1) The tank venting arrangements are assigned according to the following criteria:

(A) Controlled:
Inhalation LC_{50} < 10 ㎎/l/4h; and/or
Toxic to mammals by prolonged exposure; and/or
Respiratory sensitizer; and/or
Special carriage control needed; and/or
Flash point < 60℃
Corrosive to skin (< 4 h exposure)

(B) Open:
Any of the minimum safety or pollution criteria for bulk liquid cargoes subject to chapter 17 or the IBC Code not meeting the requirements for controlled tank vents.

8. Column h - Tank environmental control

(1) The Tank environmental control conditions are assigned according to the following criteria:

(A) Inert:
Autoignition temperature < 200℃; and/or
Reacts with air to cause a hazard; and/or
Explosive range > 40% and the flash point < 23℃.
Dry: WRI > 1

(B) Pad : Only applies to specific products identified on a case by case basis.

(C) Vent: Only applies to specific products identified on a case by case basis.

(D) No: Where the above criteria do not apply, (inerting requirements may be required under SOLAS)

9. Column i - Electrical equipment

(1) If the flash point of the product is < 60℃ or the product is heated to within 15℃ of its flash point then the electrical equipment required are assigned according to the following criteria, else .-. is assigned in column i. and i...

(A) Column i. - Temperature class:
T1 Autoignition temperature > 450℃
T2 Autoignition temperature > 300℃ but < 450℃
T3 Autoignition temperature > 200℃ but < 300℃
T4 Autoignition temperature > 135℃ but < 200℃
T5 Autoignition temperature > 100℃ but < 135℃
T6 Autoignition temperature > 85℃ but < 100℃

(B) Column i.. - Apparatus group:

Apparatus group	MESG at 20 ℃ (mm)	MIC ratio product/methane
IIA	≥ 0.9	> 0.8
IIB	0.5 < but < 0.9	0.45 ≤ but ≤ 0.8
IIC	≤ 0.5	< 0.45

(a) The tests shall be carried out in accordance with the procedures described in IEC 60079-1-1:2002 and IEC 79-3.

(b) For gases and vapours it is sufficient to make only one determination of either the Maximum Experimental Safe Gap (MESG) or the Minimum Igniting Current (MIC) provided that:

(i) for Group IIA: the MESG > 0.9 mm or the MIC ratio > 0.9.

(ii) for Group IIB: the MESG is > 0.55 mm and < 0.9 mm; or the MIC ratio is > 0.5 and <0.8.

(iii) for Group IIC: the MESG is < 0.5 mm or the MIC ratio is <0.45.

(c) It is necessary to determine both the MESG and the MIC ratio when:

(i) The MIC ratio determination only has been made, and the ratio is between 0.8 and 0.9, when an MESG determination will be required;

(ii) The MIC ratio determination only has been made, and the ratio is between 0.45 and 0.5, when an MESG determination will be required; or

(iii) The MESG only has been found, and is between 0.5 mm and 0.55 mm, when an MIC ratio determination will be required.

(C) Column i... Flash point: > 60℃ : Yes
< 60℃ : No
Non-flammable : NF

10. Column j - Gauging

(1) The type of gauging equipment permitted is assigned according to the following criteria:

(A) Closed:
Inhalation LC_{50} < 2 mg/l/4h; and/or
Dermal LD_{50} < 1000 mg/kg; and/or
Toxic to mammals by prolonged exposure; and/or
Respiratory sensitizer; and/or
Corrosive to skin (< 3 min exposure).

(B) Restricted:
Inhalation LC50 > 2 - < 10 mg/l/4h; and/or
Special carriage control indicates Inerting required; and/or
Corrosive to skin (>3 min - < 1 h exposure); and/or
Flash point < 60℃.

(C) Open:
Any of the minimum safety or pollution criteria for bulk liquid cargoes subject to chapter 17 or the IBC Code not meeting the requirements for closed or restricted gauging.

11. Column k - Vapour detection

(1) The type of vapour detection equipment required is determined by the following criteria:

(A) Toxic (T) :
Inhalation LC_{50} < 10 mg/l/4h, and/or
Respiratory sensitizer; and/or
Toxic by prolonged exposure.

(B) Flammable (F) : Flash point < 60℃

(C) No : Where the above criteria do not apply.

12. Column l - Fire protection equipment

(1) The appropriate fire-fighting media are defined as being appropriate according to the following criteria related to the properties of the product:

(A) Solubility > 10% (>100000 mg/l) : A Alcohol-resistant foam.

(B) Solubility < 10% (<100000 mg/l/4h) : A Alcohol-resistant foam; and/or : B Regular foam.

(C) WRI = 0 : C Water spray (generally used as a coolant and can be used with A and/or B providing that the WRI=0).

(D) WRI >1 : D Dry chemical.
(E) No : No requirements under this Code.
(2) Note: all appropriate media shall be listed.

13. Column m . Deleted.

14. Column n - Emergency Equipment

(1) The requirement to have personnel emergency equipment on board is identified by .Yes. in column n according to the following criteria:
Inhalation LC_{50} < 2 mg/l/4h; and/or
Respiratory sensitizer; and/or
Corrosive to skin (< 3 min exposure); and/or
WRI=2
(2) No: indicates that the above criteria do not apply.

105. Criteria for special requirements in chapter 15 to be included in column o

1. The assignment of special requirements in column o shall normally follow clear criteria based on the data supplied in the reporting form. Where it is considered appropriate to deviate from such criteria, this shall be clearly documented in such a way that it can easily be retrieved on demand.

2. The criteria for making reference to the special requirements identified in chapters 15 and 16 are defined below with comments where relevant.

3. Paragraphs 15.2 to 15.10 and 15.20

Paragraphs 15.2 to 15.10 and 15.20 identify specific products by name with special carriage requirements that cannot be easily accommodated in any other way.

4. Paragraph 15.11 - Acids

Paragraph 15.11 applies to all acids unless they:
(1) are organic acids - when only paragraphs 15.11.2 to 15.11.4 and paragraphs 15.11.6 to 15.11.8 apply; or
(2) do not evolve hydrogen - when paragraph 15.11.5 need not apply.

5. Paragraph 15.12 - Toxic products

(1) All of paragraph 15.12 is added to column o according to the following criteria:
Inhalation LC_{50} < 2 mg/l/4h; and/or
the product is a respiratory sensitizer; and/or
the product is toxic to mammals by prolonged exposure.
(2) Paragraph 15.12.3 is added to column o according to the following criteria:
Inhalation LC_{50} > 2 - < 10 mg/l/4h; and/or
Dermal LD_{50} < 1000 mg/kg; and/or
Oral LD_{50} < 300 mg/kg.
(3) Paragraph 15.12.4 is added to column o according to the following criterion:
Inhalation LC_{50} > 2 - < 10 mg/l/4h.

6. Paragraph 15.13 - Cargoes protected by additives

The requirement to assign paragraph 15.13 to column o is based on the information related to the products tendency to polymerise, decompose, oxidise or undergo other chemical changes which may cause a hazard under normal carriage conditions and which would be prevented by the addition of appropriate additives.

7. Paragraph 15.14 - Cargoes with a vapour pressure greater than atmospheric at 37.8℃ The requirement to assign paragraph 15.14 to column o is based on the following criterion : Boiling point < 37.8℃

8. Paragraph 15.16 - Cargo contamination

Paragraph 15.16.1 is deleted.
Paragraph 15.16.2 is added to column o according to the following criterion:
WRI > 1

9. Paragraph 15.17 - Increased ventilation requirements

Paragraph 15.17 shall be added to column o according to the following criteria:
Inhalation LC_{50} > 0.5 - < 2 mg/l/4h; and/or
Respiratory sensitizer; and/or
Toxic to mammals by prolonged exposure; and/or
Corrosive to skin (< 1 h exposure time).

10. Paragraph 15.18 - Special cargo pump-room requirements

Paragraph 15.18 shall be added to column o according to the following criterion:
Inhalation LC_{50} < 0.5 mg/l/4h

11. Paragraph 15.19 - Overflow control

(1) Paragraph 15.19 shall be added to column o according to the following criteria:
Inhalation LC_{50} < 2 mg/l/4h; and/or
Dermal LD_{50} < 1000 mg/kg; and/or
Oral LD_{50} < 300 mg/kg; and/or
Respiratory sensitizer; and/or
Corrosive to skin (< 3 min exposure); and/or
Autoignition temperature < 200℃; and/or
Explosive range > 40% v/v in air and flash point < 23℃; and/or
Classified as ship type 1 on pollution grounds.

(2) Only paragraph 15.19.6 shall apply if the product has any of the following properties:
Inhalation LC_{50} > 2 mg/l/4h - < 10 mg/l/4h; and/or
Dermal LD_{50} > 1000 mg/kg - < 2000 mg/kg; and/or
Oral LD_{50} > 300 mg/kg - < 2000 mg/kg; and/or
Skin sensitizer; and/or
Corrosive to skin (> 3 min - < 1 h exposure); and/or
Flash point <60℃; and/or
Classified as ship type 2 on pollution grounds; and/or
Pollution category X or Y.

12. Paragraph 15.21 . Temperature sensors

Paragraph 15.21 is added to column o according to the heat sensitivity of the product. This requirement is related to pumps in cargo pump rooms only.

106. Criteria for special requirements in chapter 16 to be included in column o

1. Paragraphs 16.1 to 16.2.5 and 16.3 to 16.5

These apply to all cargoes and so are not referenced specifically in column o.

2. Paragraph 16.2.6

Paragraph 16.2.6 is added to column o for products, which meet the following criteria:
Pollution Category X or Y and viscosity > 50 mPa.s at 20℃

3. Paragraph 16.2.7

Paragraph 16.2.7 is added to column o for products, which meet the following criterion:
Melting point > 0℃.

4. Paragraph 16.6 . Cargo not to be exposed to excessive heat

Paragraphs 16.6.2 to 1606.4 are added to column o for products, which are identified as requiring temperature control during carriage.

107. Definitions

1. Acute mammalian toxicity

(1) Acutely toxic by inhalation*

Inhalation toxicity (LC_{50})	
Hazard level	mg/l/4h
High	≤ 0.5
Moderately high	0.5 < but ≤ 2
Moderate	2 < but ≤ 10
Slight	10 < but ≤ 20
Negligible	20 <

(2) Acutely toxic in contact with skin

Dermal toxicity (LD_{50})	
Hazard Level	mg/kg
High	≤ 50
Moderately high	50 < but ≤ 200
Moderate	200 < but ≤ 1000
Slight	1000 < but ≤ 2000
Negligible	2000 <

(3) Acutely toxic if swallowed

Oral toxicity (LD_{50})	
Hazard Level	mg/kg
High	≤ 5
Moderately high	5 < but ≤ 50
Moderate	50 < but ≤ 300
Slight	300 < but ≤ 2000
Negligible	2000 <

* All inhalation toxicity data are assumed to be associated with vapours and not mists or sprays, unless indicated otherwise.

2. Toxic to mammals by prolonged exposure

(1) A product is classified as toxic by prolonged exposure if it meets any of the following criteria: it is known to be, or suspected of being a carcinogen, mutagen, reprotoxic, neurotoxic, immunotoxic or exposure below the lethal dose is known to cause specific organ oriented systemic toxicity (TOST) or other related effects.

(2) Such effects may be identified from the GESAMP Hazard Profile of the product or other recognized sources of such information.

3. Skin sensitization

(1) A product is classified as a skin sensitizer:
if there is evidence in humans that the substance can induce sensitization by skin contact in a substantial number of persons; or
where there are positive results from an appropriate animal test.

(2) When an adjuvant type test method for skin sensitization is used, a response of at least 30% of the animals is considered as positive. For a non-adjuvant test method a response of at least 15% of the animals is considered positive.

(3) When a positive result is obtained from the Mouse Ear Swelling Test (MEST) or the Local Lymph Node Assay (LLNA), this may be sufficient to classify the product as a skin sensitizer.

4. Respiratory sensitization

A product is classified as a respiratory sensitizer:

(1) if there is evidence in humans that the substance can induce specific respiratory hypersensitivity; and/or
(2) where there are positive results from an appropriate animal test; and/or
(3) where the product is identified as a skin sensitizer and there is no evidence to show that it is not a respiratory sensitizer.

5. Corrosive to skin*

Hazard Level	Exposure time to cause full thickness necrosis of skin	Observation time
Severely corrosive to skin	≤ 3 min	≤ 1 h
Highly corrosive to skin	3 min < but ≤ 1 h	≤ 14 days
Moderately corrosive to skin	1 h < but ≤ 4 h	≤ 14 days

* Products that are corrosive to skin are, for the purpose of assigning relevant carriage requirements, deemed to be corrosive by inhalation.

6. Water reactive substances

These are classified into three groups as follows:

Water reactive index (WRI)	Definition
2	Any chemical which, in contact with water, may produce a toxic, flammable or corrosive gas or aerosol.
1	Any chemical which, in contact with water, may generate heat or produce a non-toxic, non-flammable or non corrosive gas.
0	Any chemical which, in contact with water, would not undergo a reaction to justify a valve of 1 or 2.

7. Air reactive substances

Air reactive substances are products which react with air to cause a potentially hazardous situation, e.g. the formation of peroxides which may cause an explosive reaction.

8. Electrical apparatus - Temperature Class (for products which either have a flashpoint of < 60℃ or are heated to within 15℃ of their flashpoint)

(1) The Temperature Class is defined by the International Electrotechnical Commission (IEC) as: The highest temperature attained under practical conditions of operation within the rating of the apparatus (and recognized overloads, if any, associated therewith) by any part of any surface, the exposure of which to an explosive atmosphere may involve a risk.
(2) The Temperature Class of the electrical apparatus is assigned by selecting the Maximum Surface Temperature which is closest to, but less than, the product's autoignition temperature (see 21.4.9.(1)(A)).

9. Electrical apparatus - Apparatus group (for products with a flashpoint of < 60℃)

(1) This refers to intrinsically safe and associated electrical apparatus for explosive gas atmospheres which the IEC divide into the following groups:
  (A) Group I: for mines susceptible to firedamp (not used by IMO); and
  (B) Group II: for applications in other industries - further sub-divided according to its Maximum Experimental Safe Gap (MESG) and/or the Minimum Igniting Current (MIC) of the gas/vapour into groups IIA, IIB and IIC.
(2) This property cannot be determined from other data associated with the product; it has to be either measured or assigned by assimilation with related products in an homologous series.

10. Special carriage control conditions

(1) Special carriage control conditions refer to specific measures that need to be taken in order to either prevent a hazardous reaction. They include:

(A) Inhibition: the addition of a compound (usually organic) that retards or stops an undesired chemical reaction such as corrosion, oxidation or polymerization;

(B) Stabilization: the addition of a substance (stabilizer) that tends to keep a compound, mixture or solution from changing its form or chemical nature. Such stabilizers may retard a reaction rate, preserve a chemical equilibrium, act as antioxidants, keep pigments and other components in emulsion form or prevent the particles in colloidal suspension from precipitating;

(C) Inertion: the addition of a gas (usually nitrogen) in the ullage space of a tank that prevents the formation of a flammable cargo/air mixture;

(D) Temperature control: the maintenance of a specific temperature range for the cargo in order to prevent a hazardous reaction or to keep the viscosity low enough to allow the product to be pumped; and

(E) Padding and venting: only applies to specific products identified on a case by case basis.

11. Flammable cargoes

(1) A cargo is defined as flammable according to the following criteria:

IBC Code descriptor	Flash point (degree Centigrade)
Highly flammable	< 23
Flammable	$23 \leq$ but ≤ 60

(2) It should be noted that flash points of mixtures and aqueous solutions need to be measured unless all of the components are non-flammable.

(3) It should be noted that the carriage of bulk liquid cargoes which have a flash point of <60℃ is subject to other SOLAS regulations. ⚓

Fire Protection and Fire Extinction

RA-08-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF
PART 8 "FIRE PROTECTION AND FIRE EXTINCTION"

1. Unless expressly specified otherwise, the requirements in this Rules apply to ships for which contracts for construction are signed on or after 1 July 2011.

2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date 1 January 2011 (regardless of the contract date for construction)

CHAPTER 5 SPECIAL REQUIREMENTS

Section 2 Carriage of dangerous goods

- 201. 1 has been amended.
- 201. 6 (1) has been amended.
- Table 8.5.1, Table 8.5.2 and Table 8.5.3 of 202. have been amended.

Effective Date 1 July 2011

CHAPTER 2 PREVENTION OF FIRE AND EXPLOSION

Section 1 Prevention of ignition probability

- 101. 2 (5) (B) has been amended.

Section 2 Prevention of fire growth potential

- 202. 2 (1) has been amended.

CHAPTER 3. SUPPRESSION OF FIRE

Section 3 Containment of fire

- 303. 1 (1) and (2) have been amended.
- 303. 2 (1) has been amended.

CHAPTER 5. SPECIAL REQUIREMENTS

Section 2 Carriage of dangerous goods

- 203. has been deleted.

CONTENTS

CHAPTER 1 FIRE PROTECTION, FIRE DETECTION AND FIRE EXTINCTION

SECTION 1 General

101. Application

1. Unless expressly specified otherwise, where ships not less than 500 tons gross tonnage and Passengers ships are engaged in international voyage, those construction of fire protection, fire detection and fire extinction shall be complied with the requirements of this Part. However, for cargo ships less than 500 tons gross tonnage or cargo ships not engaged international voyage or fishing vessels they may apply to the requirements in accordance with **the Guidance** as provided separatedly.

2. In addition to para 1 they shall also be complied with the International Conventions of SOLAS and the National Regulations of the country in which the ships is registered.

3. Despite of para 1 and 2 for the ships not applied to the SOLAS but applied to the Ships Safety Law or Fishing vessel Law of Korea those fire-fighting system shall be in accordance with the relevant requirements specified by these Laws.

102. Plans and documents

1. The following plans and documents are to be submitted to the Society for approval before the work is commenced.

(1) Plans of construction for fire protection (details of construction for fire protection and arrangements of closing appliances of openings, etc.)
(2) Plans for details of escape route and width of escape route, etc. (Calculation method of stairway width for Passenger ships)
(3) Plans of fire control plan showing clearly for each deck the control station, the various fire section enclosed by "A" class divisions, the sections enclosed by "B" class divisions together with particulars of the fire detection and fire alarm systems, the sprinkler installations, the fire-extinguishing appliances, means of access to different compartments, decks, etc., and the ventilating system including particulars of the fan control positions, the position of dampers and identification numbers of the ventilating fan serving each section. (Refer to the Guidance)
(4) Other plans and documents deemed necessary by the Society. (Refer to the Guidance)

103. Definitions

1. Accommodation spaces are those spaces used for public spaces, corridors, lavatories, cabins, offices, hospitals, cinemas, game and hobby rooms, barber shops, pantries containing no cooking appliances and similar spaces;(Refer to the Guidance)

2. ″A″ class divisions are those divisions formed by bulkheads and decks which comply with the following criteria:

(1) they are constructed of steel or other equivalent material;
(2) they are suitably stiffened;
(3) they are insulated with approved non-combustible materials such that the average temperature of the unexposed side will not rise more than 140 ℃ above the original temperature, nor will the temperature, at any one point, including any joint, rise more than 180 ℃ above the original temperature, within the time listed below:
class "A-60" 60 min
class "A-30" 30 min
class "A-15" 15 min
class "A-0" 0 min
(4) they are constructed as to be capable of preventing the passage of smoke and flame to the end of the one-hour standard fire test; and
(5) the Society has required a test of a prototype bulkhead or deck in accordance with the Fire

Test Procedures Code to ensure that it meets the requirements above for integrity and temperature rise.

3. Atriums are public spaces within a single main vertical zone spanning three or more open decks.

4. "B" class divisions are those divisions formed by bulkheads, decks, ceilings or linings which comply with the following criteria:

(1) they are constructed of approved non-combustible materials and all materials used in the construction and erection of "B" class divisions are non-combustible, with the exception that combustible veneers may be permitted provided they meet other appropriate requirements of this chapter;

(2) they have an insulation value such that the average temperature of the unexposed side will not rise more than 140 ℃ above the original temperature, nor will the temperature at any one point, including any joint, rise more than 225 ℃ above the original temperature, within the time listed below:

class "B-15" 15 min

class "B-0" 0 min

(3) they are constructed as to be capable of preventing the passage of flame to the end of the first half hour of the standard fire test; and

(4) the Society has required a test of a prototype division in accordance with the Fire Test Procedures Code to ensure that it meets the above requirements for integrity and temperature rise.

5. Bulkhead deck is the uppermost deck up to which the transverse watertight bulkheads are carried.

6. Cargo area is that part of the ship that contains cargo holds, cargo tanks, slop tanks and cargo pump-rooms including pump-rooms, cofferdams, ballast and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above-mentioned spaces.

7. Cargo ship is any ship which is not a passenger ship.

8. Cargo spaces are spaces used for cargo, cargo oil tanks, tanks for other liquid cargo and trunks to such spaces.

9. Central control station is a control station in which the following control and indicator functions are centralized:

(1) fixed fire detection and fire alarm systems;

(2) automatic sprinkler, fire detection and fire alarm systems;

(3) fire door indicator panels;

(4) fire door closure;

(5) watertight door indicator panels;

(6) watertight door closures;

(7) ventilation fans;

(8) general/fire alarms;

(9) communication systems including telephones; and

(10) microphones to public address systems.

10. "C" class divisions are divisions constructed of approved non-combustible materials. They need meet neither requirements relative to the passage of smoke and flame nor limitations relative to the temperature rise. Combustible veneers are permitted provided they meet the requirements of this Part.

11. Chemical tanker is a ship specified in **Pt 7, Ch 6** of the Rules of Steel Ship.

12. Closed ro-ro spaces are ro-ro spaces which are neither open ro-ro spaces nor weather decks.

13. Closed vehicle spaces are vehicle spaces which are neither open vehicle spaces nor weather decks.

14. Combination carrier is a cargo ship designed to carry both oil and solid cargoes in bulk.

15. Combustible material is any material other than a non-combustible material.

16. Continuous "B" class ceilings or linings are those "B" class ceilings or linings which terminate at an "A" or "B" class division.

17. Continuously manned central control station is a central control station which is continuously manned by a responsible member of the crew.

18. Control stations are those spaces in which the ship's radio or main navigating equipment or the emergency source of power is located or where the fire recording or fire control equipment is centralized. Spaces where the fire recording or fire control equipment is centralized are also considered to be a fire control station. (Refer to the Guidance)

19. Crude oil is any oil occurring naturally in the earth whether or not treated to render it suitable for transportation and includes crude oil where certain distillate fractions may have been removed from or added to.

20. Dangerous goods are those goods referred to in the IMDG Code of IMO.

21. Deadweight is the difference in tonnes between the displacement of a ship in water of a specific gravity of 1.025 at the load waterline corresponding to the assigned summer freeboard and the lightweight of the ship.

22. Fire Safety Systems Code means the International Code for Fire Safety Systems as adopted by the International Maritime Organization.

23. Fire Test Procedures Code means the International Code for Application of Fire Test Procedures as adopted by the International Maritime Organization.

24. Flashpoint is the temperature in degrees Celsius (closed cup test) at which a product will give off enough flammable vapour to be ignited, as determined by an approved flashpoint apparatus.

25. Gas carrier is a ship specified in **Pt 7, Ch 5** of the Rules of Steel Ships.

26. Helideck is a purpose-built helicopter landing area located on a ship including all structure, fire-fighting appliances and other equipment necessary for the safe operation of helicopters.

27. Helicopter facility is a helideck including any refuelling and hangar facilities.

28. Lightweight is the displacement of a ship in tonnes without cargo, fuel, lubricating oil, ballast water, fresh water and feedwater in tanks, consumable stores, and passengers and crew and their effects.

29. Low flame spread means that the surface thus described will adequately restrict the spread of flame, this being determined in accordance with the Fire Test Procedures Code.

30. Machinery spaces are machinery spaces of category A and other spaces containing propulsion machinery, boilers, oil fuel units, steam and internal combustion engines, generators and major electrical machinery, oil filling stations, refrigerating, stabilizing, ventilation and air conditioning machinery, and similar spaces, and trunks to such spaces.

31. Machinery spaces of category A are those spaces and trunks to such spaces which contain either:
(1) internal combustion machinery used for main propulsion;
(2) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or
(3) any oil-fired boiler or oil fuel unit, or any oil-fired equipment other than boilers, such as inert gas generators, incinerators, etc.

32. Main vertical zones are those sections into which the hull, superstructure and deckhouses are divided by "A" class divisions, the mean length and width of which on any deck does not in general exceed 40 m.

33. Non-combustible material is a material which neither burns nor gives off flammable vapours in sufficient quantity for self-ignition when heated to approximately 750 ℃, this being determined in accordance with the Fire Test Procedures Code.

34. Oil fuel unit is the equipment used for the preparation of oil fuel for delivery to an oil-fired boiler, or equipment used for the preparation for delivery of heated oil to an internal combustion engine, and includes any oil pressure pumps, filters and heaters dealing with oil at a pressure of more than 0.18 MPa. (Refer to the Guidance)

35. Open ro-ro spaces are those ro-ro spaces that are either open at both ends or have an opening at one end, and are provided with adequate natural ventilation effective over their entire length through permanent openings distributed in the side plating or deckhead or from above, having a total area of at least 10 % of the total area of the space sides.

36. Open vehicle spaces are those vehicle spaces either open at both ends, or have an opening at one end and are provided with adequate natural ventilation effective over their entire length through permanent openings distributed in the side plating or deckhead or from above, having a total area of at least 10 % of the total area of the space sides.

37. Passenger ship is a ship which carries more than twelve passengers.

38. Prescriptive requirements means the construction characteristics, limiting dimensions, or fire safety systems

39. Public spaces are those portions of the accommodation which are used for halls, dining rooms, lounges and similar permanently enclosed spaces.

40. Rooms containing furniture and furnishings of restricted fire risk are those rooms containing furniture and furnishings of restricted fire risk (whether cabins, public spaces, offices or other types of accommodation) in which:

(1) case furniture such as desks, wardrobes, dressing tables, bureaux, dressers, are constructed entirely of approved non-combustible materials, except that a combustible veneer not exceeding 2 mm may be used on the working surface of such articles;
(2) free-standing furniture such as chairs, sofas, tables, are constructed with frames of non-combustible materials;
(3) draperies, curtains and other suspended textile materials have qualities of resistance to the propagation of flame not inferior to those of wool having a mass of mass 0.8 kg/m^2, this being determined in accordance with the Fire Test Procedures Code;
(4) floor coverings have low flame spread characteristics;
(5) exposed surfaces of bulkheads, linings and ceilings have low flame-spread characteristics;
(6) upholstered furniture has qualities of resistance to the ignition and propagation of flame, this being determined in accordance with the Fire Test Procedures Code; and
(7) bedding components have qualities of resistance to the ignition and propagation of flame, this being determined in accordance with the Fire Test Procedures Code.

41. Ro-ro spaces are spaces not normally subdivided in any way and normally extending to either a substantial length or the entire length of the ship in which motor vehicles with fuel in their tanks for their own propulsion or goods (packaged or in bulk, in or on rail or road cars, vehicles (including road or rail tankers), trailers, containers, pallets, demountable tanks or in or on similar stowage units or other receptacles) can be loaded and unloaded normally in a horizontal direction. (Refer to the Guidance)

42. Ro-ro passenger ship means a passenger ship with ro-ro spaces or special category spaces.

43. Steel or other equivalent material means any non-combustible material which, by itself or due to insulation provided, has structural and integrity properties equivalent to steel at the end of the applicable exposure to the standard fire test (e.g. aluminium alloy with appropriate insulation).

44. Sauna is a hot room with temperatures normally varying between 80 ℃ ~ 120 ℃ where the heat is provided by a hot surface (e.g. by an electrically-heated oven). The hot room may also include the space where the oven is located and adjacent bathrooms.

45. Service spaces are those spaces used for galleys, pantries containing cooking appliances, lockers, mail and specie rooms, storerooms, workshops other than those forming part of the machinery spaces, and similar spaces and trunks to such spaces. (Refer to the Guidance)

46. Special category spaces are those enclosed vehicle spaces above and below the bulkhead deck, into and from which vehicles can be driven and to which passengers have access. Special category spaces may be accommodated on more than one deck provided that the total overall clear height for vehicles does not exceed 10 m.

47. A standard fire test is a test in which specimens of the relevant bulkheads or decks are exposed in a test furnace to temperatures corresponding approximately to the standard time-temperature curve in accordance with the test method specified in the Fire Test Procedures Code.

48. Tanker is a cargo ship constructed or adapted for the carriage in bulk of liquid cargoes of an inflammable nature. (Refer to the Guidance)

49. Vehicle spaces are cargo spaces intended for carriage of motor vehicles with fuel in their tanks for their own propulsion. (Refer to the Guidance)

50. Weather deck is a deck which is completely exposed to the weather from above and from at least two sides.

51. Periodically unattended machinery space is a machinery space of UMA ship specified in **Pt 9, Ch 3** of the Rules.

52. Cabin balcony is an open deck space which is provided for the exclusive use of the occupants of a single cabin and has direct access from such a cabin.

53. Safety centre is a control station dedicated to the management of emergency situations. Safety systems' operation, control and/or monitoring are an integral part of the safety centre.

104. Other Operation Requirements.

For fire protection, fire detection and fire extinction, those operation requirements which contain operational readiness and maintenance, onboard training and drills and cargo handling operation shall be in accordance with the Guidance as provided separately. ⚓

CHAPTER 2 PREVENTION OF FIRE AND EXPLOSION

SECTION 1 Prevention of ignition probability

101. Arrangements for oil fuel, lubrication oil and other flammable oils

1. The following limitations shall apply to the use of oil as fuel

(1) Except as otherwise permitted by this paragraph, no oil fuel with a flashpoint of less than 60 ℃ shall be used;

(2) In emergency generators oil fuel with a flashpoint of not less than 43 ℃ may be used;

(3) The use of oil fuel having a flashpoint of less than 60 ℃ but not less than 43 ℃ may be permitted (e.g., for feeding the emergency fire pump's engines and the auxiliary machines which are not located in the machinery spaces of category A) subject to the following:

(A) fuel oil tanks except those arranged in double bottom compartments shall be located outside of machinery spaces of category A;

(B) provisions for the measurement of oil temperature are provided on the suction pipe of the oil fuel pump;

(C) stop valves and/or cocks are provided on the inlet side and outlet side of the oil fuel strainers; and

(D) pipe joints of welded construction or of circular cone type or spherical type union joint are applied as much as possible,

(4) In cargo ships the use of fuel having a lower flashpoint than otherwise specified paragraph above for example crude oil, may be permitted provided that such fuel is not stored in any machinery space and subject to the approval of the complete installation.

2. In a ship in which oil fuel is used, the arrangements for the storage, distribution and utilization of the oil fuel shall be such as to ensure the safety of the ship and persons on board and shall at least comply with the following provisions.

(1) As far as practicable, parts of the oil fuel system containing heated oil under pressure exceeding 0.18 MPa shall be placed in a concealed position such that defects and leakage can readily be observed. The machinery spaces in way of such parts of the oil fuel system shall be adequately illuminated.

(2) The ventilation of machinery spaces shall be sufficient under normal conditions to prevent accumulation of oil vapour.

(3) Oil fuel tanks are to comply with the following requirements. (Refer to the Guidance)

(A) Fuel oil, lubrication oil and other flammable oils shall not be carried in forepeak tanks. (Refer to the Guidance)

(B) As far as practicable, oil fuel tanks shall be part of the ships structure and shall be located outside machinery spaces of category A. Where oil fuel tanks, other than double bottom tanks, are necessarily located adjacent to or within machinery spaces of category A, at least one of their vertical sides shall be contiguous to the machinery space boundaries, and shall preferably have a common boundary with the double bottom tanks, and the area of the tank boundary common with the machinery spaces shall be kept to a minimum. Where such tanks are situated within the boundaries of machinery spaces of category A they shall not contain oil fuel having a flashpoint of less than 60 ℃. In general, the use of free-standing oil fuel tanks shall be avoided. When such tanks are employed their use shall be prohibited in category A machinery spaces on passenger ships. Where permitted, they shall be placed in an oil-tight spill tray of ample size having a suitable drain pipe leading to a suitably sized spill oil tank. (Refer to the Guidance)

(C) No oil fuel tank shall be situated where spillage or leakage therefrom can constitute a fire or explosion hazard by falling on heated surfaces.

(D) Oil fuel pipes, which, if damaged, would allow oil to escape from a storage, settling or daily service tank having a capacity of 500 liters and above situated above the double bottom, shall be fitted with a cock or valve directly on the tank capable of being closed from a safe position outside the space concerned in the event of a fire occurring in the space in which such tanks are situated. In the special case of deep tanks situated in any shaft or pipe tunnel or similar space, valves on the tank shall be fitted, but control in the event of fire may be effected by means of an additional valve on the pipe or pipes outside the tunnel or similar space. If such an additional valve is fitted in the machinery space it shall be operated from a position outside this space. The controls for remote operation of the valve for the emergency generator fuel tank shall be in a separate location from the controls for remote operation of other valves for tanks located in machinery spaces.

(E) Safe and efficient means of ascertaining the amount of oil fuel contained in any oil fuel tank shall be provided. (Refer to the Guidance)

(a) Where sounding pipes are used, they shall not terminate in any space where the risk of ignition of spillage from the sounding pipe might arise. In particular, they shall not terminate in passenger or crew spaces. As a general rule, they shall not terminate in machinery spaces. However, where considers that these latter requirements are impracticable, it may permit termination of sounding pipes in machinery spaces on condition that all of the following requirements are met:

(i) an oil-level gauge is provided meeting the requirements of paragraph (b);

(ii) the sounding pipes terminate in locations remote from ignition hazards unless precautions are taken, such as the fitting of effective screens, to prevent the oil fuel in the case of spillage through the terminations of the sounding pipes from coming into contact with a source of ignition; and

(iii) the termination of sounding pipes are fitted with self-closing blanking devices and with a small-diameter self-closing control cock located below the blanking device for the purpose of ascertaining before the blanking device is opened that oil fuel is not present. Provisions shall be made so as to ensure that any spillage of oil fuel through the control cock involves no ignition hazard.

(b) Other oil-level gauges may be used in place of sounding pipes subject to the following conditions:

(i) in passenger ships, such gauges shall not require penetration below the top of the tank and their failure or overfilling of the tanks shall not permit release of fuel; and

(ii) in cargo ships, the failure of such gauges or overfilling of the tank shall not permit release of fuel into the space. The use of cylindrical gauge glasses is prohibited. It may be permitted to use oil-level gauges with flat glasses and self-closing valves between the gauges and fuel tanks.

(c) The means prescribed in paragraph (b) which are acceptable shall be maintained in the proper condition to ensure their continued accurate functioning in service.

(4) Provisions shall be made to prevent overpressure in any oil tank or in any part of the oil fuel system, including the filling pipes served by pumps on board. Air and overflow pipes and relief valves shall discharge to a position where there is no risk of fire or explosion from the emergence of oils and vapour and shall not lead into crew spaces, passenger spaces nor into special category spaces, closed ro-ro cargo spaces, machinery spaces or similar spaces.

(5) Oil fuel piping is to comply with the following requirements.

(A) Oil fuel pipes and their valves and fittings shall be of steel or other approved material, except that restricted use of flexible pipes shall be permissible in positions where they are necessary. Such flexible pipes and end attachments shall be of approved fire-resisting materials of adequate strength and shall be constructed to the satisfaction of the Society. For valves, fitted to oil fuel tanks and which are under static pressure, steel or spheroidal-graphite cast iron may be accepted. However, ordinary cast iron valves may be used in piping systems where the design pressure is lower than 7 bar and the design temperature is below 60 ℃. (Refer to the Guidance)

(B) External high-pressure fuel delivery lines between the high-pressure fuel pumps and fuel injectors shall be protected with a jacketed piping system capable of containing fuel from a high-pressure line failure. A jacketed pipe incorporates an outer pipe into which the high-pressure fuel pipe is placed, forming a permanent assembly. The jacketed piping system shall include a means for collection of leakages and arrangements and shall be provided with an alarm in case of a fuel line failure. If non-metallic materials are used for shielding purpose, they are to be of approved types. (Refer to the Guidance)

(C) Oil fuel lines shall not be located immediately above or near units of high temperature including boilers, steam pipelines, exhaust manifolds, silencers or other equipment required to be insulated by paragraph (6). As far as practicable, oil fuel lines shall be arranged far apart from hot surfaces, electrical installations or other sources of ignition and shall be screened or otherwise suitably protected to avoid oil spray or oil leakage onto the sources of ignition. The number of joints in such piping systems shall be kept to a minimum.

(D) Components of a diesel engine fuel system shall be designed considering the maximum peak pressure which will be experienced in service, including any high pressure pulses which are generated and transmitted back into the fuel supply and spill lines by the action of fuel injection pumps. Connections within the fuel supply and spill lines shall be constructed having regard to their ability to prevent pressurized oil fuel leaks while in service and after maintenance.
(E) In multi-engine installations which are supplied from the same fuel source, means of isolating the fuel supply and spill piping to individual engines, shall be provided. The means of isolation shall not affect the operation of the other engines and shall be operable from a position not rendered inaccessible by a fire on any of the engines.
(F) Where it may be permitted to convey oil and combustible liquids through accommodation and service spaces, the pipes conveying oil or combustible liquids shall be of a material approved by the Society having regard to the fire risk.
(6) Protection of high temperature surfaces is to be taken as follows.
(A) Surfaces with temperatures above 220 ℃ which may be impinged as a result of a fuel system failure shall be properly insulated.
(B) Precautions shall be taken to prevent any oil that may escape under pressure from any pump, filter or heater from coming into contact with heated surfaces.

3. Arrangements for lubricating oil is to comply with the following requirements.

(1) The arrangements for the storage, distribution and utilization of oil used in pressure lubrication systems shall be such as to ensure the safety of the ship and persons on board. The arrangements made in machinery spaces of category A, and whenever practicable in other machinery spaces, shall at least comply with the provisions of **Par 2** (1), **2** (3) (C), **2** (3) (D), **2** (3) (E), **2** (4), **2** (5) (A), **2** (5) (C) and **2** (6) except that:
(A) this does not preclude the use of sight-flow glasses in lubricating systems provided that they are shown by testing to have a suitable degree of fire resistance; and
(B) sounding pipes may be authorized in machinery spaces; however, the requirements of **Par 2** (3) (E) (a) (i) and **2** (3) (E) (a) (iii) need not be applied on condition that the sounding pipes are fitted with appropriate means of closure;

(2) The provisions of **Par 2** (3) (D) shall also apply to lubricating oil tanks except those having a capacity less than 500 liters, storage tanks on which valves are closed during the normal operation mode of the ship, or where it is determined that an unintended operation of a quick closing valve on the oil lubricating tank would endanger the safe operation of the main propulsion and essential auxiliary machinery. (Refer to the Guidance)

4. Arrangements for other flammable oils is to comply with the following requirements.The arrangements for the storage, distribution and utilization of other flammable oils employed under pressure in power transmission systems, control and activating systems and heating systems shall be such as to ensure the safety of the ship and persons on board. Suitable oil collecting arrangements for leaks shall be fitted below hydraulic valves and cylinders.

In locations where means of ignition are present, such arrangements shall at least comply with the provisions of **Par 2** (3) (C), **2** (3) (E), **2** (5) (C) and **2** (6) and with the provisions of **Par 2** (4) and **2** (5) (A) in respect of strength and construction.

5. In addition to the requirements of **Par 1** to **4,** the oil fuel and lubricating oil systems in a periodically unattended machinery space shall comply with the following:

(1) where daily service oil fuel tanks are filled automatically, or by remote control, means shall be provided to prevent overflow spillages. Other equipment which treats flammable liquids automatically (e.g. oil fuel purifiers) which, whenever practicable, shall be installed in a special space reserved for purifiers and their heaters, shall have arrangements to prevent overflow spillages; and
(2) where daily service oil fuel tanks or settling tanks are fitted with heating arrangements, a high temperature alarm shall be provided if the flashpoint of the oil fuel can be exceeded.

102. Arrangements for gasous fuel for domestic purpose

Gaseous fuel systems used for domestic purposes shall be approved by the Society. Storage of gas bottles shall be located on the open deck or in a well ventilated space which opens only to the open deck.

103. Miscellaneous items of ignition sources and ignitability

1. Electric radiators, if used, shall be fixed in position and so constructed as to reduce fire risks to a minimum. No such radiators shall be fitted with an element so exposed that clothing, curtains, or other similar materials can be scorched or set on fire by heat from the element.

2. Waste receptacles shall be constructed of non-combustible materials with no openings in the sides or bottom. (Refer to the Guidance)

3. In spaces where penetration of oil products is possible, the surface of insulation shall be impervious to oil or oil vapours. (Refer to the Guidance)

4. Primary deck coverings, if applied within accommodation and service spaces and control stations, or if applied on cabin balconies of passenger ships shall be of approved material which will not readily ignite, this being determined in accordance with the Fire Test Procedures Code.

104. Cargo areas of tankers

1. Separation of cargo oil tanks is to taken as follows.

(1) Cargo pump-rooms, cargo tanks, slop tanks and cofferdams shall be positioned forward of machinery spaces. However, oil fuel bunker tanks need not be forward of machinery spaces. Cargo tanks and slop tanks shall be isolated from machinery spaces by cofferdams, cargo pump-rooms, oil bunker tanks or ballast tanks. Pump-rooms containing pumps and their accessories for ballasting those spaces situated adjacent to cargo tanks and slop tanks and pumps for oil fuel transfer, shall be considered as equivalent to a cargo pump-room within the context of this regulation provided that such pump-rooms have the same safety standard as that required for cargo pump-rooms. Pump-rooms intended solely for ballast or oil fuel transfer, however, need not comply with the requirements of **Ch 3, 408.** The lower portion of the pump-room may be recessed into machinery spaces of category A to accommodate pumps, provided that the deck head of the recess is in general not more than one third of the moulded depth above the keel, except that in the case of ships of not more than 25,000 tonnes deadweight, where it can be demonstrated that for reasons of access and satisfactory piping arrangements this is impracticable, the Society may permit a recess in excess of such height, but not exceeding one half of the moulded depth above the keel. (Refer to the Guidance)

(2) Main cargo control stations, control stations, accommodation and service spaces (excluding isolated cargo handling gear lockers) shall be positioned aft of cargo tanks, slop tanks, and spaces which isolate cargo or slop tanks from machinery spaces, but not necessarily aft of the oil fuel bunker tanks and ballast tanks, and shall be arranged in such a way that a single failure of a deck or bulkhead shall not permit the entry of gas or fumes from the cargo tanks into an accommodation space, main cargo control stations, control station, or service spaces. A recess provided in accordance with paragraph (1) above need not be taken into account when the position of these spaces is being determined. (Refer to the Guidance)

(3) However, where deemed necessary, the Society may permit main cargo control stations, control stations, accommodation and service spaces forward of the cargo tanks, slop tanks and spaces which isolate cargo and slop tanks from machinery spaces, but not necessarily forward of oil fuel bunker tanks or ballast tanks. Machinery spaces, other than those of category A, may be permitted forward of the cargo tanks and slop tanks provided they are isolated from the cargo tanks and slop tanks by cofferdams, cargo pump-rooms, oil fuel bunker tanks or ballast tanks, and have at least one portable fire extinguisher. In cases where they contain internal combustion machinery, one approved foam-type extinguisher of at least 45 liters capacity or equivalent shall be arranged in addition to portable fire extinguishers. If operation of a semi-portable fire extinguisher is impracticable, this fire extinguisher may be replaced by two additional portable fire extinguishers. Accommodation spaces, main cargo control spaces, control stations and service spaces shall be arranged in such a way that a single failure of a deck or bulkhead shall not permit the entry of gas or fumes from the cargo tanks into such spaces. In addition, where deemed necessary for the safety or navigation of the ship, the Society may permit machinery spaces containing internal combustion machinery not being main propulsion machinery having an

output greater than 375 kW to be located forward of the cargo area provided the arrangements are in accordance with the provisions of this paragraph. (Refer to the Guidance)

(4) Combination carriers only are to comply with the following requirements.

(A) The slop tanks shall be surrounded by cofferdams except where the boundaries of the slop tanks, where slop may be carried on dry cargo voyages, are part of the hull, main cargo deck, cargo pump-room bulkhead or oil fuel bunker tank. These cofferdams shall not be open to a double bottom, pipe tunnel, pump-room or other enclosed space, nor shall they be used for cargo or ballast and shall not be connected to piping systems serving oil cargo or ballast. Means shall be provided for filling the cofferdams with water and for draining them. Where the boundary of a slop tank is part of the cargo pump-room bulkhead, the pump-room shall not be open to the double bottom, pipe tunnel or other enclosed space; however, openings provided with gastight bolted covers may be permitted; (Refer to the Guidance)

(B) Means shall be provided for isolating the piping connecting the pump-room with the slop tanks referred to in paragraph (A). The means of isolation shall consist of a valve followed by a spectacle flange or a spool piece with appropriate blank flanges. This arrangement shall be located adjacent to the slop tanks, but where this is unreasonable or impracticable, it may be located within the pump-room directly after the piping penetrates the bulkhead. A separate permanently installed pumping and piping arrangement incorporating a manifold, provided with a shut-off valve and a blank flange, shall be provided for discharging the contents of the slop tanks directly to the open deck for disposal to shore reception facilities when the ship is in the dry cargo mode. When the transfer system is used for slop transfer in the dry cargo mode, it shall have no connection to other systems. Separation from other systems by means of removal of spool pieces may be accepted;

(C) Hatches and tank cleaning openings to slop tanks shall only be permitted on the open deck and shall be fitted with closing arrangements. Except where they consist of bolted plates with bolts at watertight spacing, these closing arrangements shall be provided with locking arrangements under the control of the responsible ship's officer; and

(D) Where cargo wing tanks are provided, cargo oil lines below deck shall be installed inside these tanks. However, the Society may permit cargo oil lines to be placed in special ducts provided there are capable of being adequately cleaned and ventilated to the satisfaction of the Society. Where cargo wing tanks are not provided, cargo oil lines below deck shall be placed in special ducts.

(5) Where the fitting of a navigation position above the cargo area is shown to be necessary, it shall be for navigation purposes only and it shall be separated from the cargo tank deck by means of an open space with a height of at least 2 m. The fire protection requirements for such a navigation position shall be that required for control stations, as specified in regulation **Ch 3, 301. 4** (2) and other provisions for tankers, as applicable.

(6) Means shall be provided to keep deck spills away from the accommodation and service areas. This may be accomplished by provision of a permanent continuous coaming of a height of at least 300 mm, extending from side to side. Special consideration shall be given to the arrangements associated with stern loading. (Refer to the Guidance)

2. Restriction on boundary openings is to comply with the following requirements

(1) Except as permitted in paragraph (2) access doors, air inlets and openings to accommodation spaces, service spaces, control stations and machinery spaces shall not face the cargo area. They shall be located on the transverse bulkhead not facing the cargo area or on the outboard side of the superstructure or deckhouse at a distance of at least 4 % of the length of the ship but not less than 3 m from the end of the superstructure or deckhouse facing the cargo area. This distance need not exceed 5 m. (Refer to the Guidance)

(2) The Society may permit access doors in boundary bulkheads facing the cargo area or within the 5m limits specified in paragraph (1), to main cargo control stations and to such service spaces used as provision rooms, store-rooms and lockers, provided they do not give access directly or indirectly to any other space containing or providing for accommodation, control stations or service spaces such as galleys, pantries or workshops, or similar spaces containing sources of vapour ignition. The boundary of such a space shall be insulated to "A-60" standard, with the exception of the boundary facing the cargo area. Bolted plates for the removal of machinery may be fitted within the limits specified in paragraph (1). Wheelhouse doors and windows may be located within the limits specified in paragraph (1) so long as they are designed to ensure

that the wheelhouse can be made rapidly and efficiently gas and vapour tight. (Refer to the Guidance)

(3) Windows and sidescuttles facing the cargo area and on the sides of the superstructures and deckhouses within the limits specified in paragraph (1) shall be of the fixed (non-opening) type. Such windows and sidescuttles, except wheelhouse windows, shall be constructed to "A-60" class standard except that "A-0" class standard is acceptable for windows and side scuttles outside the limit specified in **Ch 3, 301. 4** (2) (E).

(4) Where there is permanent access from a pipe tunnel to the main pump-room, a watertight door shall be fitted complying with the relevant requirements and, in addition, with the following: (Refer to the Guidance)

(A) in addition to the bridge operation, the watertight door shall be capable of being manually closed from outside the main pump-room entrance; and

(B) the watertight door shall be kept closed during normal operations of the ship except when access to the pipe tunnel is required.

(5) Permanent approved gastight lighting enclosures for illuminating cargo pump-rooms may be permitted in bulkheads and decks separating cargo pump-rooms and other spaces provided they are of adequate strength and the integrity and gastightness of the bulkhead or deck is maintained.

(6) The arrangement of ventilation inlets and outlets and other deckhouse and superstructure boundary space openings shall be such as to complement the provisions of **Par 3** and **Ch 3, 505.** Such vents, especially for machinery spaces, shall be situated as far aft as practicable. Due consideration in this regard shall be given when the ship is equipped to load or discharge at the stern. Sources of ignition such as electrical equipment shall be so arranged as to avoid an explosion hazard.

3. Cargo tank venting is to comply with the following requirements.

(1) The venting systems of cargo tanks are to be entirely distinct from the air pipes of the other compartments of the ship. The arrangements and position of openings in the cargo tank deck from which emission of flammable vapours can occur shall be such as to minimize the possibility of flammable vapours being admitted to enclosed spaces containing a source of ignition, or collecting in the vicinity of deck machinery and equipment which may constitute an ignition hazard. In accordance with this general principle, the criteria in paragraphs (2) to (5) and **Ch 3, 505.** will apply.

(2) Venting arrangements are to comply with the following requirements

(A) The venting arrangements in each cargo tank may be independent or combined with other cargo tanks and may be incorporated into the inert gas piping.

(B) Where the arrangements are combined with other cargo tanks, either stop valves or other acceptable means shall be provided to isolate each cargo tank. Where stop valves are fitted, they shall be provided with locking arrangements which shall be under the control of the responsible ship's officer. There shall be a clear visual indication of the operational status of the valves or other acceptable means. Where tanks have been isolated, it shall be ensured that relevant isolating valves are opened before cargo loading or ballasting or discharging of those tanks is commenced. Any isolation must continue to permit the flow caused by thermal variations in a cargo tank in accordance with **Ch 3, 505. 1** (1). (Refer to the Guidance)

(C) If cargo loading and ballasting or discharging of a cargo tank or cargo tank group is intended, which is isolated from a common venting system, that cargo tank or cargo tank group shall be fitted with a means for over-pressure or under-pressure protection as required in **Ch 3, 505. 3** (2).

(D) The venting arrangements shall be connected to the top of each cargo tank and shall be self-draining to the cargo tanks under all normal conditions of trim and list of the ship. Where it may not be possible to provide self-draining lines, permanent arrangements shall be provided to drain the vent lines to a cargo tank.

(3) The venting system shall be provided with devices to prevent the passage of flame into the cargo tanks. The design, testing and locating of these devices shall comply with the requirements established on the basis of **the guidelines** developed by the IMO Organization. Ullage openings shall not be used for pressure equalization. They shall be provided with self-closing and tightly sealing covers. Flame arresters and screens are not permitted in these openings. (Refer to the Guidance)

(4) Vent outlets for cargo handling and ballasting are to comply with the following requirements.

(A) Vent outlets for cargo loading, discharging and ballasting required by **Ch 3, 505. 1** (2) shall: (Refer to the Guidance)

(a) permit the free flow of vapour mixtures; or permit the throttling of the discharge of the vapour mixtures to achieve a velocity of not less than 30 m/s ;

(b) be so arranged that the vapour mixture is discharged vertically upwards;

(c) where the method is by free flow of vapour mixtures, be such that the outlet shall be not less than 6 m above the cargo tank deck or fore and aft catwalk if situated within 4 m of the catwalk and located not less than 10 m measured horizontally from the nearest air intakes and openings to enclosed spaces containing a source of ignition and from deck machinery, which may include anchor windlass and chain locker openings, and equipment which may constitute an ignition hazard; and

(d) where the method is by high-velocity discharge, be located at a height not less than 2 m above the cargo tank deck and not less than 10 m measured horizontally from the nearest air intakes and openings to enclosed spaces containing a source of ignition and from deck machinery, which may include anchor windlass and chain locker openings, and equipment which may constitute an ignition hazard. These outlets shall be provided with high velocity devices of an approved type.

(B) The arrangements for the venting of vapours displaced from the cargo tanks during loading and ballasting shall comply with **Par 3** and **Ch 3, 505.** and shall consist of either one or more mast risers, or a number of high-velocity vents. The inert gas supply main may be used for such venting.

(5) In combination carriers, the arrangements for isolating slop tanks containing oil or oil residues from other cargo tanks shall consist of blank flanges which will remain in position at all times when cargoes other than liquid cargoes are carried.

4. Ventilation is to comply with the following requirements.

(1) Cargo pump-rooms shall be mechanically ventilated and discharges from the exhaust fans shall be led to a safe place on the open deck. The ventilation of these rooms shall have sufficient capacity to minimize the possibility of accumulation of flammable vapours. The number of air changes shall be at least 20 per hour, based upon the gross volume of the space. The air ducts shall be arranged so that all of the space is effectively ventilated. The ventilation shall be of the suction type using fans of the non-sparking type. (Refer to the Guidance)

(2) In combination carriers, cargo spaces and any enclosed spaces adjacent to cargo spaces shall be capable of being mechanically ventilated. The mechanical ventilation may be provided by portable fans. An approved fixed gas warning system capable of monitoring flammable vapours shall be provided in cargo pump-rooms, pipe ducts and cofferdams, as referred to in **Par 1** (4) adjacent to slop tanks. Suitable arrangements shall be made to facilitate measurement of flammable vapours in all other spaces within the cargo area. Such measurements shall be made possible from the open deck or easily accessible positions.

5. Inert gas systems is to comply with the following requirements. (Refer to the Guidance)

(1) For tankers of 20,000 tons deadweight and upwards, the protection of the cargo tanks shall be achieved by a fixed inert gas system in accordance with the requirements of the Fire Safety Systems Code, except that, in lieu of the above, the Society, after having given consideration to the ship's arrangement and equipment, may accept other fixed installations if they afford protection equivalent to the above. The requirements for alternative fixed installations shall comply with the requirements in paragraph (6).

(2) Tankers operating with a cargo tank cleaning procedure using crude oil washing, irrespective of its age, shall be fitted with an inert gas system complying with the requirements of the Fire Safety Systems Code and with fixed tank washing machines.

(3) Tankers required to be fitted with inert gas systems shall comply with the following provisions: (Refer to the Guidance)

(A) double hull spaces shall be fitted with suitable connections for the supply of inert gas;

(B) where hull spaces are connected to a permanently fitted inert gas distribution system, means shall be provided to prevent hydrocarbon gases from the cargo tanks entering the double hull spaces through the system; and

(C) where such spaces are not permanently connected to an inert gas distribution system, appropriate means shall be provided to allow connection to the inert gas main.

(4) The requirements for inert gas systems contained in the Fire Safety Systems Code need not be applied to:

(A) chemical tankers and gas carriers that comply with the requirements for inert gas systems on chemical tankers established on the basis of the guidelines developed by the IMO Organization; or

(B) chemical tankers and gas carriers when carrying flammable cargoes other than crude oil or petroleum products such as cargoes listed in the International Bulk Chemical Code, provided that the capacity of tanks used for their carriage does not exceed 3,000 m^3 and the individual nozzle capacities of tank washing machines do not exceed 17.5 m^3/h and the total combined throughput from the number of machines in use in a cargo tank at any one time does not exceed 110 m^3/h.

(5) General requirements for inert gas systems are to comply with the following requirements.

(A) The inert gas system shall be capable of inerting, purging and gas freeing empty tanks and maintaining the atmosphere in cargo tanks with the required oxygen content.

(B) The inert gas system referred to in paragraph (A) shall be designed, constructed and tested in accordance with the Fire Safety Systems Code.

(C) Tankers fitted with a fixed inert gas system shall be provided with a closed ullage system.

(6) Where an installation equivalent to a fixed inert gas system is installed, it shall:

(A) be capable of preventing dangerous accumulations of explosive mixtures in intact cargo tanks during normal service throughout the ballast voyage and necessary in-tank operations; and

(B) be so designed as to minimize the risk of ignition from the generation of static electricity by the system itself.

6. Inerting, purging and gas freeing are to comply with the following requirements.

(1) Arrangements for purging and/or gas freeing shall be such as to minimize the hazards due to dispersal of flammable vapours in the atmosphere and to flammable mixtures in a cargo tank.

(2) The procedure for cargo tank purging and/or gas freeing shall be carried out in accordance with the requirements specified in the Guidance.

(3) The arrangements for inerting, purging or gas-freeing of empty tanks as required in paragraph **5** (5) (A) shall be to the satisfaction of the Society and shall be such that the accumulation of hydrocarbon vapours in pockets formed by the internal structural members in a tank is minimized and that : (Refer to the Guidance)

(A) on individual cargo tanks, the gas outlet pipe, if fitted, shall be positioned as far as practicable from the inert gas/air inlet and in accordance with paragraph **3** and **Ch 3, 505.** The inlet of such outlet pipes may be located either at deck level or at not more than 1 m above the bottom of the tank;

(B) the cross-sectional area of such gas outlet pipe referred to in paragraph (A) shall be such that an exit velocity of at least 20 m/s can be maintained when any three tanks are being simultaneously supplied with inert gas. Their outlets shall extend not less than 2 m above deck level; and

(C) each gas outlet referred to in paragraph (B) shall be fitted with suitable blanking arrangements.

7. Gas measurement is to comply with the following requirements. (Refer to the Guidance)

(1) Tankers shall be equipped with at least one portable instrument for measuring flammable vapour concentrations, together with a sufficient set of spares. Suitable means shall be provided for the calibration of such instruments. (Refer to the Guidance)

(2) Arrangements for gas measurement in double hull and double bottom spaces are to comply with the following requirements.

(A) Suitable portable instruments for measuring oxygen and flammable vapour concentrations shall be provided. In selecting these instruments, due attention shall be given to their use in combination with the fixed gas-sampling-line systems referred to in paragraph (B).

(B) Where the atmosphere in double hull spaces cannot be reliably measured using flexible gas sampling hoses, such spaces shall be fitted with permanent gas sampling lines. The configuration of gas sampling lines shall be adapted to the design of such spaces.

(C) The materials of construction and the dimensions of gas sampling lines shall be such as to prevent restriction. Where plastic materials are used, they shall be electrically conductive.

8. Double hull and double bottom spaces shall be fitted with suitable connections for the supply of air.

9. Drip pans for collecting cargo residues in cargo lines and hoses shall be provided in the area of pipe and hose connections under the manifold area. Cargo hoses and tank washing hoses shall have electrical continuity over their entire lengths including couplings and flanges (except shore connections) and should be earthed for removal of electrostatic charges.

10. Protection of cargo pump-rooms is to complied with the following requirements.

(1) cargo pumps, ballast pumps and stripping pumps, installed in cargo pump-rooms and driven by shafts passing through pump-room bulkheads shall be fitted with temperature sensing devices for bulkhead shaft glands, bearings and pump casings. A continuous audible and visual alarm signal shall be automatically effected in the cargo control room or the pump control station;

(2) lighting in cargo pump-rooms, except emergency lighting, shall be interlocked with ventilation such that the ventilation shall be in operation when switching on the lighting. Failure of the ventilation system shall not cause the lighting to go out;

(3) a system for continuous monitoring of the concentration of hydrocarbon gases shall be fitted. Sampling points or detector heads shall be located in suitable positions in order that potentially dangerous leakages are readily detected. When the hydrocarbon gas concentration reaches a pre-set level which shall not be higher than 10 % of the lower flammable limit, a continuous audible and visual alarm signal shall be automatically effected in the pump-room, engine control room, cargo control room and navigation bridge to alert personnel to the potential hazard ; and (Refer to the Guidance)

(4) all pump-rooms shall be provided with bilge level monitoring devices together with appropriately located alarms.

SECTION 2 Prevention of fire growth potential

201. Control of air supply and flammable liquid to the spaces

1. Closing appliances and stopping devices of ventilation are to comply with the following requirements.

(1) The main inlets and outlets of all ventilation systems shall be capable of being closed from outside the spaces being ventilated. The means of closing shall be easily accessible as well as prominently and permanently marked and shall indicate whether the shutoff is open or closed. (Refer to the Guidance)

(2) Power ventilation of accommodation spaces, service spaces, cargo spaces, control stations and machinery spaces shall be capable of being stopped from an easily accessible position outside the space being served. This position shall not be readily cut off in the event of a fire in the spaces served. (Refer to the Guidance)

(3) **In passenger ships carrying more than 36 passengers**, power ventilation, except machinery space and cargo space ventilation and any alternative system which may be required under **Ch 3, 202.** shall be fitted with controls so grouped that all fans may be stopped from either of two separate positions which shall be situated as far apart as practicable. Fans serving power ventilation systems to cargo spaces shall be capable of being stopped from a safe position outside such spaces.

2. Means of control in machinery spaces are to comply with the following requirements.

(1) Means of control shall be provided for opening and closure of skylights, closure of openings in funnels which normally allow exhaust ventilation and closure of ventilator dampers.

(2) Means of control shall be provided for stopping ventilating fans. Controls provided for the power ventilation serving machinery spaces shall be grouped so as to be operable from two positions, one of which shall be outside such spaces. The means provided for stopping the power ventilation of the machinery spaces shall be entirely separate from the means provided for stopping ventilation of other spaces.

(3) Means of control shall be provided for stopping forced and induced draught fans, oil fuel transfer pumps, oil fuel unit pumps, lubricating oil service pumps, thermal oil circulating pumps and oil separators (purifiers). However, paragraphs (4) and (5) need not apply to oily water

separators.

(4) The controls required in paragraphs (1) to (3) and in **101. 2** (3) (D) shall be located outside the space concerned so they will not be cut off in the event of fire in the space they serve.

(5) In passenger ships, the controls required in paragraphs (1) to (4) and in **Ch 3, 202. 3** and **Ch 3, 304. 2** (3) and the controls for any required fire-extinguishing system shall be situated at one control position or grouped in as few positions as possible to the satisfaction of the Society. Such positions shall have a safe access from the open deck.

3. Means of control in periodically unattended machinery spaces is to comply with the additional following requirements. (Refer to the Guidance)

(1) For periodically unattended machinery spaces, the Society shall give special consideration to maintaining the fire integrity of the machinery spaces, the location and centralization of the fire-extinguishing system controls, the required shutdown arrangements (e.g. ventilation, fuel pumps, etc.) and that additional fire-extinguishing appliances and other fire-fighting equipment and breathing apparatus may be required.

(2) In passenger ships, these requirements shall be at least equivalent to those of machinery spaces normally attended.

202. Fire protection materials (Refer to the Guidance)

1. Non-combustible materials are to be used as follows.

(1) Insulating materials shall be non-combustible, except in cargo spaces, mail rooms, baggage rooms and refrigerated compartments of service spaces. Vapour barriers and adhesives used in conjunction with insulation, as well as the insulation of pipe fittings for cold service systems, need not be of non-combustible materials, but they shall be kept to the minimum quantity practicable and their exposed surfaces shall have low flame spread characteristics. (Refer to the Guidance)

(2) In passenger ships, except in cargo spaces, partial bulkheads or decks used to screen or to separate adjacent cabin balconies, all linings, grounds, draught stops and ceilings shall be of non-combustible material except in mail rooms, baggage rooms, saunas or refrigerated compartments of service spaces. Partial bulkheads or decks used to subdivide a space for utility or artistic treatment shall also be of non-combustible materials.

(3) In cargo ships, all linings, ceilings, draught stops and their associated grounds shall be of non-combustible materials in the following spaces:

(A) in accommodation and service spaces and control stations for ships where Method IC is specified as referred to in **Ch 3, 301. 3** (1); and

(B) in corridors and stairway enclosures serving accommodation and service spaces and control stations for ships where Method IIC and IIIC are specified as referred to in **Ch 3, 301. 3** (1).

2. Use of combustible materials is to be permitted as follows. (Refer to the Guidance)

(1) In passenger ships, "A", "B" or "C" class divisions in accommodation, services spaces and cabin balconies which are faced with combustible materials, facings, mouldings, decorations and veneers shall comply with the provisions of paragraphs (3) to (5) and **Sec 3.** However, traditional wooden benches and wooden linings on bulkheads and ceilings are permitted in saunas and such materials need not be subject to the calculations prescribed in paragraphs (3) and (4). However, the provisions of paragraph 3.2.3 need not be applied to cabin balconies.

(2) In cargo ships, non-combustible bulkheads, ceilings and linings fitted in accommodation and service spaces may be faced with combustible materials, facings, mouldings, decorations and veneers provided such spaces are bounded by non-combustible bulkheads, ceilings and linings in accordance with the provisions of paragraphs (3) to (5) and **Sec 3.**

(3) Combustible materials used on the surfaces and linings specified in paragraph (1), (2) shall have a calorific value not exceeding 45 MJ/m^2 of the area for the thickness used. The requirements of this paragraph are not applicable to the surfaces of furniture fixed to linings or bulkheads.

(4) Combustible materials used in accordance with paragraph (1), (2) shall comply with the following requirements:

(A) The total volume of combustible facings, mouldings, decorations and veneers in accommodation and service spaces shall not exceed a volume equivalent to 2.5 mm veneer on the combined area of the walls and ceiling linings. Furniture fixed to linings, bulkheads or decks need not be included in the calculation of the total volume of combustible materials; and

(B) In the case of ships fitted with an automatic sprinkler system complying with the provisions of the Fire Safety Systems Code, the above volume may include some combustible material used for erection of "C" class divisions.

(5) The following surfaces shall have low flame-spread characteristics in accordance with the Fire Test Procedures Code: (Refer to the Guidance)

(A) In passenger ships:

(a) exposed surfaces in corridors and stairway enclosures and of bulkhead and ceiling linings in accommodation and service spaces (except saunas) and control stations; and

(b) surfaces and grounds in concealed or inaccessible spaces in accommodation and service spaces and control stations.

(c) exposed surfaces of cabin balconies, except for natural hard wood decking systems.

(B) In cargo ships:

(a) exposed surfaces in corridors and stairway enclosures and of ceilings in accommodation and service spaces (except saunas) and control stations; and

(b) surfaces and grounds in concealed or inaccessible spaces in accommodation and service spaces and control stations.

3. Furniture in stairway enclosures of passenger ships shall be limited to seating. It shall be fixed, limited to six seats on each deck in each stairway enclosure, be of restricted fire risk determined in accordance with the Fire Test Procedure Code, and shall not restrict the passenger escape route. The Society may permit additional seating in the main reception area within a stairway enclosure if it is fixed, non-combustible and does not restrict the passenger escape route. Furniture shall not be permitted in passenger and crew corridors forming escape routes in cabin areas. In addition to the above, lockers of non-combustible material, providing storage for non-hazardous safety equipment required by these regulations, may be permitted. Drinking water dispensers and ice cube machines may be permitted in corridors provided they are fixed and do not restrict the width of the escape routes. This applies as well to decorative flower or plant arrangements, statues or other objects of art such as paintings and tapestries in corridors and stairways.

4. On passenger ships, furniture and furnishings on cabin balconies shall comply with regulations **Ch 1, 103. 40** (1),(2),(3),(6) and (7) unless such balconies are protected by a fixed pressure water-spraying and fixed fire detection and fire alarm systems complying with regulations **Ch 3, 108.** and **Ch 3, 405. 1** (3).

SECTION 3 Prevention of smoke generation potential and toxicity

301. Paints, vanishes and other finishes

1. Paints, varnishes and other finishes used on exposed interior surfaces shall not be capable of producing excessive quantities of smoke and toxic products, this being determined in accordance with the Fire Test Procedures Code. (Refer to the Guidance)

2. Paints, varnishes and other finishes used on exposed surfaces of passenger ship cabin balconies, excluding natural hard wood decking systems, shall not be capable of producing excessive quantities of smoke and toxic products, this being determined in accordance with the Fire Test Procedures Code.

302. Primary deck coverings

1. Primary deck coverings, if applied within accommodation and service spaces and control stations, shall be of approved material which will not give rise to smoke or toxic or explosive hazards at elevated temperatures, this being determined in accordance with the Fire Test Procedures Code. (Refer to the Guidance)

2. Primary deck coverings on passenger ship cabin balconies shall not give rise to smoke, toxic or explosive hazards at elevated temperatures, this being determined in accordance with the Fire Test Procedures Code. ⚓

CHAPTER 3 SUPPRESSION OF FIRE

SECTION 1 Detection and Alarm

101. General requirements

1. A fixed fire detection and fire alarm system shall be provided in accordance with the Fire Safety Systems Code. (Refer to the Guidance)

2. A fixed fire detection and fire alarm system and a sample extraction smoke detection system required in this regulation and other regulations in this part shall be of an approved type and comply with the Fire Safety Systems Code. (Refer to the Guidance)

3. Where a fixed fire detection and fire alarm system is required for the protection of spaces other than those specified in **103. 1** at least one detector complying with the Fire Safety Systems Code shall be installed in each such space.

4. Initial and periodical tests are also to be complied with ;

(1) The function of fixed fire detection and fire alarm systems required by the relevant regulations of this chapter shall be tested under varying conditions of ventilation after installation.

(2) The function of fixed fire detection and fire alarm systems shall be periodically tested to the satisfaction of the Society by means of equipment producing hot air at the appropriate temperature, or smoke or aerosol particles having the appropriate range of density or particle size, or other phenomena associated with incipient fires to which the detector is designed to respond.

5. A fixed fire detection and fire alarm system for passenger ships shall be capable of remotely and individually identifying each detector and manually operated call point.

102. Protection of machinery spaces

1. A fixed fire detection and fire alarm system shall be installed in: (Refer to the Guidance)

(1) periodically unattended machinery spaces;

(2) machinery spaces where the installation of automatic and remote control systems and equipment has been approved in lieu of continuous manning of the space; and

(3) machinery spaces where the main propulsion and associated machinery including sources of main source of electrical power are provided with various degrees of automatic or remote control and are under continuous manned supervision from a control room.

2. The fixed fire detection and fire alarm system required in **Par 1** (1) shall be so designed and the detectors so positioned as to detect rapidly the onset of fire in any part of those spaces and under any normal conditions of operation of the machinery and variations of ventilation as required by the possible range of ambient temperatures. Except in spaces of restricted height and where their use is specially appropriate, detection systems using only thermal detectors shall not be permitted. The detection system shall initiate audible and visual alarms distinct in both respects from the alarms of any other system not indicating fire, in sufficient places to ensure that the alarms are heard and observed on the navigating bridge and by a responsible engineer officer. When the navigating bridge is unmanned the alarm shall sound in a place where a responsible member of the crew is on duty. (Refer to the Guidance)

103. Protection of accommodation and service spaces and control stations

1. Smoke detectors shall be installed in all stairways, corridors and escape routes within accommodation spaces as provided in **Par 2, 3** and **4.** Consideration shall be given to the installation of special purpose smoke detectors within ventilation ducting.

2. For passenger ships carrying more than 36 passengers, a fixed fire detection and fire alarm system shall be installed and arranged as to provide smoke detection in service spaces, control stations and accommodation spaces, including corridors, stairways and escape routes within accommodation spaces. Smoke detectors need not be fitted in private bathrooms and galleys. Spaces having little or no fire risk such as voids, public toilets, carbon dioxide rooms and similar spaces need not be fitted with a fixed fire detection and alarm system. Detectors fitted in cabins, when activated, shall also be capable of emitting, or cause to be emitted, an audible alarm within the space where they are located.

3. For passenger ships carrying not more than 36 passengers, there shall be installed throughout each separate zone, whether vertical or horizontal, in all accommodation and service spaces and, where it is considered necessary, in control stations, except spaces which afford no substantial fire risk such as void spaces, sanitary spaces, etc., either:

(1) a fixed fire detection and fire alarm system so installed and arranged as to detect the presence of fire in such spaces and providing smoke detection in corridors, stairways and escape routes within accommodation spaces. Detectors fitted in cabins, when activated, shall also be capable of emitting, or cause to be emitted, an audible alarm within the space where they are located.; or

(2) an automatic sprinkler, fire detection and fire alarm system of an approved type complying with the relevant requirements of the Fire Safety Systems Code and so installed and arranged as to protect such spaces and, in addition, a fixed fire detection and fire alarm system and so installed and arranged as to provide smoke detection in corridors, stairways and escape routes within accommodation spaces.

4. In passenger ships, the entire main vertical zone containing the atrium shall be protected throughout with a smoke detection system.

5. For Cargo ships, accommodation and service spaces and control stations of cargo ships shall be protected by a fixed fire detection and fire alarm system and/or an automatic sprinkler, fire detection and fire alarm system as follows depending on a protection method adopted in accordance with **301. 3** (1). (Refer to the Guidance)

(1) Method IC
A fixed fire detection and fire alarm system shall be so installed and arranged as to provide smoke detection in all corridors, stairways and escape routes within accommodation spaces.

(2) Method IIC
An automatic sprinkler, fire detection and fire alarm system of an approved type complying with the relevant requirements of the Fire Safety Systems Code shall be so installed and arranged as to protect accommodation spaces, galleys and other service spaces, except spaces which afford no substantial fire risk such as void spaces, sanitary spaces, etc. In addition, a fixed fire detection and fire alarm system shall be so installed and arranged as to provide smoke detection in all corridors, stairways and escape routes within accommodation spaces.

(3) Method IIIC
A fixed fire detection and fire alarm system shall be so installed and arranged as to detect the presence of fire in all accommodation spaces and service spaces providing smoke detection in corridors, stairways and escape routes within accommodation spaces, except spaces which afford no substantial fire risk such as void spaces, sanitary spaces, etc. In addition, a fixed fire detection and fire alarm system shall be so installed and arranged as to provide smoke detection in all corridors, stairways and escape routes within accommodation spaces.

104. Protection of cargo spaces in passenger ships

A fixed fire detection and fire alarm system or a sample extraction smoke detection system shall be provided in any cargo space which, in the opinion of the Society, is not accessible, except where it is shown to the satisfaction that the ship is engaged on voyages of such short duration that it would be unreasonable to apply this requirement.

105. Manually operated call points

Manually operated call points complying with the Fire Safety Systems Code shall be installed throughout the accommodation spaces, service spaces and control stations. One manually operated call point shall be located at each exit into the outside. Manually operated call points shall be readily accessible in the corridors of each deck such that no part of the corridor is more than 20 m from a manually operated call point.

106. Fire patrols in passenger ships

1. For ships carrying more than 36 passengers an efficient patrol system shall be maintained so that an outbreak of fire may be promptly detected. Each member of the fire patrol shall be trained to be familiar with the arrangements of the ship as well as the location and operation of any equipment he may be called upon to use.

2. The construction of ceiling and bulkheads shall be such that it will be possible, without impairing the efficiency of the fire protection, for the fire patrols to detect any smoke originating in concealed and inaccessible places, except where in the opinion of the Society there is no risk of fire originating in such places.

3. Each member of the fire patrol shall be provided with a two-way portable radiotelephone apparatus.

107. Fire alarm signalling systems in passenger ships

1. Passenger ships shall at all times when at sea, or in port (except when out of service), be so manned or equipped as to ensure that any initial fire alarm is immediately received by a responsible member of the crew.

2. The control panel of fixed fire detection and fire alarm systems shall be designed on the fail-safe principle (e.g. an open detector circuit shall cause an alarm condition).

3. Passenger ships carrying more than 36 passengers shall have the fire detection alarms for the systems required by **103. 2** centralized in a continuously manned central control station. In addition, controls for remote closing of the fire doors and shutting down the ventilation fans shall be centralized in the same location. The ventilation fans shall be capable of reactivation by the crew at the continuously manned control station. The control panels in the central control station shall be capable of indicating open or closed positions of fire doors and closed or off status of the detectors, alarms and fans. The control panel shall be continuously powered and shall have an automatic change-over to standby power supply in case of loss of normal power supply. The control panel shall be powered from the main source of electrical power and the emergency source of electrical power unless other arrangements are permitted by the regulations, as applicable.

4. A special alarm, operated from the navigation bridge or fire control station, shall be fitted to summon the crew. This alarm may be part of the ship's general alarm system and shall be capable of being sounded independently of the alarm to the passenger spaces.

108. Protection of cabin balconies on passenger ships

A fixed fire detection and fire alarm system complying with the provisions of the Fire Safety Systems Code shall be insulated on cabin balconies of ships to which regulation **Sec. 2, 202. 4** applies, when furniture and furnishings on such balconies are not as defined in regulations **Sec. 1, 103. 40** (1),(2),(3),(6) and (7).

SECTION 2 Control of smoke speed

201. Protection of control stations outside machinery space

Practicable measures shall be taken for control stations outside machinery spaces in order to ensure that ventilation, visibility and freedom from smoke are maintained so that, in the event of fire, the machinery and equipment contained therein may be supervised and continue to function effectively. Alternative and separate means of air supply shall be provided and air inlets of the two sources of supply shall be so disposed that the risk of both inlets drawing in smoke simultaneously is minimized. At the discretion of the Society, such requirements need not apply to control stations situated on, and opening on to, an open deck or where local closing arrangements would be equally effective. The ventilation system serving safety centres may be derived from the ventilation system serving the navigation bridge, unless located in an adjacent main vertical zone. (Refer to the Guidance)

202. Release of smoke from machinery spaces

1. The provisions of this paragraph shall apply to machinery spaces of category A and, where the Society considers desirable, to other machinery spaces.

2. Suitable arrangements shall be made to permit the release of smoke, in the event of fire, from the space to be protected, subject to the provisions of **304. 2** (1). The normal ventilation systems may be acceptable for this purpose.

3. Means of control shall be provided for permitting the release of smoke and such controls shall be located outside the space concerned so that, in the event of fire, they will not be cut off from the space they serve.

4. In passenger ships, the controls required by **Par 3** shall be situated at one control position or grouped in as few positions as possible to the satisfaction of the Society. Such positions shall have a safe access from the open deck.

203. Draft stops

Air spaces enclosed behind ceilings, panelling or linings shall be divided by close-fitting draught stops spaced not more than 14 m apart. In the vertical direction, such enclosed air spaces, including those behind linings of stairways, trunks, etc., shall be closed at each deck. (Refer to the Guidance)

204. Smoke extraction systems in atriums of passenger ships

Atriums shall be equipped with a smoke extraction system. The smoke extraction system shall be activated by the required smoke detection system and be capable of manual control. The fans shall be sized such that the entire volume within space can be exhausted in 10 min or less.

SECTION 3 Containment of fire

301. Thermal and structural boundaries

1. Ships of all types shall be subdivided into spaces by thermal and structural divisions having regard to the fire risks of the space. (Refer to the Guidance)

2. For passenger ships the following requirements are to be complied with :

(1) Main vertical zones and horizontal zones are to be complied with the following requirements.

(A) In ships carrying **more than 36 passengers,** the hull, superstructure and deckhouses shall be subdivided into main vertical zones by "A-60" class divisions. Steps and recesses shall be kept to a minimum, but where they are necessary they shall also be "A-60" class divisions. Where a category ⑤,⑨,⑩ defined in paragraph (3) (B) (b) is on one side or where fuel oil tanks are on both sides of the division the standard may be reduced to "A-0".

(B) In ships carrying **not more than 36 passengers,** the hull, superstructure and deckhouses in way of accommodation and service spaces shall be subdivided into main vertical zones by "A" class divisions. These divisions shall have insulation values in accordance with tables in paragraph (4).

(C) As far as practicable, the bulkheads forming the boundaries of the main vertical zones above the bulkhead deck shall be in line with watertight subdivision bulkheads situated immediately below the bulkhead deck. The length and width of main vertical zones may be extended to a maximum of 48 m in order to bring the ends of main vertical zones to coincide with watertight subdivision bulkheads or in order to accommodate a large public space extending for the whole length of the main vertical zone provided that the total area of the main vertical zone is not greater than 1,600 m^2 on any deck. The length or width of a main vertical zone is the maximum distance between the furthermost points of the bulkheads bounding it. (Refer to the Guidance)

(D) Such bulkheads shall extend from deck to deck and to the shell or other boundaries.

(E) Where a main vertical zone is subdivided by horizontal "A" class divisions into horizontal zones for the purpose of providing an appropriate barrier between a zone with sprinklers and a zone without sprinklers, the divisions shall extend between adjacent main vertical zone bulkheads and to the shell or exterior boundaries of the ship and shall be insulated in accordance with the fire insulation and integrity values given in **Table 8.3.4.**

(F) On ships designed for special purposes, such as automobile or railroad car ferries, where the provision of main vertical zone bulkheads would defeat the purpose for which the ship is intended, equivalent means for controlling and limiting a fire shall be substituted and specifically approved by the Society. Service spaces and ship stores shall not be located on ro-ro decks unless protected in accordance with the applicable regulations.

(G) However, in a ship with special category spaces, such spaces shall comply with the applicable provisions of **Ch 5, Sec 3** and where such compliance would be inconsistent with other requirements for passenger ships specified in this chapter, the requirements of **Ch 6, Sec 3** shall prevail.

(2) Bulkheads within a main vertical zone are to be complied with the following requirements.

(A) For ships carrying **more than 36 passengers,** bulkheads which are not required to be "A" class divisions shall be at least "B" class or "C" class divisions as prescribed in the tables in paragraph (3).

(B) For ships carrying **not more than 36 passengers,** bulkheads within accommodation and service spaces which are not required to be "A" class divisions shall be at least "B" class or "C" class divisions as prescribed in the tables in paragraph (4). In addition, corridor bulkheads, where not required to be "A" class, shall be "B" class divisions which shall extend from deck to deck except:

(a) when continuous "B" class ceilings or linings are fitted on both sides of the bulkhead, the portion of the bulkhead behind the continuous ceiling or lining shall be of material which, in thickness and composition, is acceptable in the construction of "B" class divisions, but which shall be required to meet "B" class integrity standards only in so far as is reasonable and practicable in the opinion of the Society; and

(b) in the case of a ship protected by an automatic sprinkler system complying with the provisions of the Fire Safety Systems Code, the corridor bulkheads may terminate at a ceiling in the corridor provided such bulkheads and ceilings are of "B" class standard in compliance with paragraph (4). All doors and frames in such bulkheads shall be of non-combustible materials and shall have the same fire integrity as the bulkhead in which they are fitted.

(C) Bulkheads required to be "B" class divisions, except corridor bulkheads as prescribed in paragraph (B), shall extend from deck to deck and to the shell or other boundaries. However, where a continuous "B" class ceiling or lining is fitted on both sides of a bulkhead which is at least of the same fire resistance as the adjoining bulkhead, the bulkhead may terminate at the continuous ceiling or lining. (Refer to the Guidance)

(3) Fire integrity of bulkheads and decks in ships carrying **more than 36 passengers** are to be complied with the following requirements.

(A) In addition to complying with the specific provisions for fire integrity of bulkheads and decks of passenger ships, the minimum fire integrity of all bulkheads and decks shall be as prescribed in **Tables 8.3.1** and **8.3.2.** Where, due to any particular structural arrangements in the ship, difficulty is experienced in determining from the tables the minimum fire integrity value of any divisions, such values shall be determined to the satisfaction of the Society. (Refer to the Guidance)

(B) The following requirements shall govern application of the tables:

(a) **Table 8.3.1** shall apply to bulkheads not bounding either main vertical zones or horizontal zones. **Table 8.3.2** shall apply to decks not forming steps in main vertical zones nor bounding horizontal zones.

(b) For determining the appropriate fire integrity standards to be applied to boundaries between adjacent spaces, such spaces are classified according to their fire risk as shown in categories ① to ⑭ below. Where the contents and use of a space are such that there is a doubt as to its classification for the purpose of this regulation, or where it is possible to assign two or more classifications to a space, it shall be treated as a space within the relevant category having the most stringent boundary requirements. Smaller, enclosed rooms within a space that have less than 30 % communicating openings to that space are considered separate spaces. The fire integrity of the boundary bulkheads and decks of such smaller rooms shall be as prescribed in **Tables 8.3.1** and **8.3.2.** The title of each category is intended to be typical rather than restrictive. The number in parentheses preceding each category refers to the applicable column or row in the tables.

① Control stations
Spaces containing emergency sources of power and lighting.
Wheelhouse and chartroom.
Spaces containing the ship's radio equipment.
Fire control stations
Control room for propulsion machinery when located outside the propulsion machinery space.
Spaces containing centralized fire alarm equipment.
Spaces containing centralized emergency public address system stations and equipment.

② Stairways
Interior stairways, lifts, totally enclosed emergency escape trunks, and escalators (other than those wholly contained within the machinery spaces) for passengers and crew and enclosures thereto.
In this connection a stairway which is enclosed at only one level shall be regarded as part of the space from which it is not separated by a fire door.

③ Corridors
Passenger and crew corridors and lobbies.

④ Evacuation stations and external escape routes
Survival craft stowage area.
Open deck spaces and enclosed promenades forming lifeboat and liferaft embarkation and lowering stations.
Assembly stations, internal and external.
External stairs and open decks used for escape routes.
The ship's side to the waterline in the lightest seagoing condition, superstructure and deckhouse sides situated below and adjacent to the liferaft and evacuation slide embarkation areas.

⑤ Open deck spaces
Open deck spaces and enclosed promenades clear of lifeboat and liferaft embarkation and lowering stations. To be considered in this category, enclosed promenades shall have no significant fire risk, meaning that furnishings shall be restricted to deck furniture. In addition, such spaces shall be naturally ventilated by permanent openings. Air spaces (the space outside superstructures and deckhouses).

⑥ Accommodation spaces of minor fire risk
Cabins containing furniture and furnishings of restricted fire risk.
Offices and dispensaries containing furniture and furnishings of restricted fire risk.
Public spaces containing furniture and furnishings of restricted fire risk and having a deck area of less than 50 m^2.

⑦ Accommodation spaces of moderate fire risk
Spaces as in category ⑥ above but containing furniture and furnishings of other than restricted fire risk.
Public spaces containing furniture and furnishings of restricted fire risk and having a deck area of 50 m^2 or more.
Isolated lockers and small store-rooms in accommodation spaces having areas less than 4 m^2 (in which flammable liquids are not stowed).
Motion picture projection and film stowage rooms. Diet kitchens (containing no open flame).
Cleaning gear lockers (in which flammable liquids are not stowed).
Laboratories (in which flammable liquids are not stowed).
Pharmacies.
Small drying rooms (having a deck area of 4 m^2 or less).
Specie rooms.
Operating rooms.

⑧ Accommodation spaces of greater fire risk
Public spaces containing furniture and furnishings of other than restricted fire risk

and having a deck area of 50 m^2 or more.
Barber shops and beauty parlours. Saunas.
Sale shops.

⑨ Sanitary and similar spaces
Communal sanitary facilities, showers, baths, water closets, etc.
Small laundry rooms.
Indoor swimming pool area.
Isolated pantries containing no cooking appliances in accommodation spaces.
Private sanitary facilities shall be considered a portion of the space in which they are located.

⑩ Tanks, voids and auxiliary machinery spaces having little or no fire risk
Water tanks forming part of the ship's structure.
Voids and cofferdams.
Auxiliary machinery spaces which do not contain machinery having a pressure lubrication system and where storage of combustibles is prohibited, such as:
ventilation and air-conditioning rooms;
windlass room; steering gear room;
stabilizer equipment room;
electrical propulsion motor room;
rooms containing section switchboards and purely electrical equipment other than oil-filled electrical transformers (above 10 kVA) ;
shaft alleys and pipe tunnels;
spaces for pumps and refrigeration machinery (not handling or using flammable liquids).
Closed trunks serving the spaces listed above.
Other closed trunks such as pipe and cable trunks.

⑪ Auxiliary machinery spaces, cargo spaces, cargo and other oil tanks and other similar spaces of moderate fire risk
Cargo oil tanks.
Cargo holds, trunkways and hatchways.
Refrigerated chambers.
Oil fuel tanks (where installed in a separate space with no machinery).
Shaft alleys and pipe tunnels allowing storage of combustibles.
Auxiliary machinery spaces as in category ⑩ which contain machinery having a pressure lubrication system or where storage of combustibles is permitted.
Oil fuel filling stations.
Spaces containing oil-filled electrical transformers (above 10 kVA).
Spaces containing turbine and reciprocating steam engine driven auxiliary generators and small internal combustion engines of power output up to 110 kW driving generators, sprinkler, drencher or fire pumps, bilge pumps, etc.
Closed trunks serving the spaces listed above.

⑫ Machinery spaces and main galleys
Main propulsion machinery rooms (other than electric propulsion motor rooms) and boiler rooms.
Auxiliary machinery spaces other than those in categories ⑩ and ⑪ which contain internal combustion machinery or other oil-burning, heating or pumping units.
Main galleys and annexes.
Trunks and casings to the spaces listed above.

⑬ Store-rooms, workshops, pantries, etc.
Main pantries not annexed to galleys.
Main laundry.
Large drying rooms (having a deck area of more than 4 m^2)
Miscellaneous stores.
Mail and baggage rooms.
Garbage rooms.
Workshops (not part of machinery spaces, galleys, etc.).
Lockers and store-rooms having areas greater than 4 m^2, other than those spaces that have provisions for the storage of flammable liquids.

⑭ Other spaces in which flammable liquids are stowed

Paint lockers.
Store-rooms containing flammable liquids (including dyes, medicines, etc.).
Laboratories (in which flammable liquids are stowed)

Note: To be applied to **Tables 8.3.1** and **8.3.2**

a Where adjacent spaces are in the same numerical category and superscript "a" appears, a bulkhead or deck between such spaces need not be fitted if deemed unnecessary by the Society. For example, in category ⑫ a bulkhead need not be required between a galley and its annexed pantries provided the pantry bulkhead and decks maintain the integrity of the galley boundaries. A bulkhead is, however, required between a galley and machinery space even though both spaces are in category ⑫.

b The ship's side, to the waterline in the lightest seagoing condition, superstructure and deckhouse sides situated below and adjacent to liferafts and evacuation slides may be reduced to "A-30".

c Where public toilets are installed completely within the stairway enclosure, the public toilet bulkhead within the stairway enclosure can be of "B" class integrity.

d Where spaces of categories ⑥,⑦,⑧ and ⑨ are located completely within the outer perimeter of the assembly station, the bulkheads of these spaces are allowed to be of "B-0" class integrity. Control positions for audio, video and light installations may be considered as part of the assembly station.

(c) Where a single value is shown for the fire integrity of a boundary between two spaces, that value shall apply in all cases;

(d) Notwithstanding the provisions of paragraph (2) there are no special requirements for material or integrity of boundaries where only a dash appears in the tables; and

(C) Continuous "B" class ceilings or linings, in association with the relevant decks or bulkheads, may be accepted as contributing wholly or in part, to the required insulation and integrity of a division.

(D) Construction and arrangement of saunas are to comply with the following requirements.

(a) The perimeter of the sauna shall be of "A" class boundaries and may include changing rooms, showers and toilets. The sauna shall be insulated to A-60 standard against other spaces except those inside of the perimeter and spaces of categories ⑤,⑨ and ⑩.

(b) Bathrooms with direct access to saunas may be considered as part of them. In such cases, the door between sauna and the bathroom need not comply with fire safety requirements.

(c) The traditional wooden lining on the bulkheads and ceiling are permitted in the sauna. The ceiling above the oven shall be lined with a non-combustible plate with an air gap of at least 30 mm. The distance from the hot surfaces to combustible materials shall be at least 500 mm or the combustible materials shall be protected (e.g. non-combustible plate with an air gap of at least 30 mm).

(d) The traditional wooden benches are permitted to be used in the sauna.

(e) The sauna door shall open outwards by pushing.

(f) Electrically heated ovens shall be provided with a timer.

(4) Fire integrity of bulkheads and decks in ships carrying **not more than 36 passengers**

(A) In addition to complying with the specific provisions for fire integrity of bulkheads and decks of passenger ships, the minimum fire integrity of bulkheads and decks shall be as prescribed in **Tables 8.3.3** and **8.3.4.**

(B) The following requirements govern application of the tables:

(a) **Tables 8.3.3** and **8.3.4** shall apply respectively to the bulkheads and decks separating adjacent spaces.

(b) For determining the appropriate fire integrity standards to be applied to divisions between adjacent spaces, such spaces are classified according to their fire risk as shown in categories ① to ⑪ below. Where the contents and use of a space are such that there is a doubt as to its classification for the purpose of this regulation, or where it is possible to assign two or more classifications to a space, it shall be treated as a space within the relevant category having the most stringent boundary requirements. Smaller, enclosed rooms within a space that have less than 30 % communicating openings to that space are considered separate spaces. The fire integrity of the boundary bulkheads and decks of such smaller rooms shall be as prescribed in **Tables 8.3.3** and **8.3.4** The title of each category is intended to be typical rather than restrictive. The number in parentheses preceding each category refers to the applicable column or row in the tables.

① Control stations
Spaces containing emergency sources of power and lighting.
Wheelhouse and chartroom.
Spaces containing the ship's radio equipment.
Fire control stations.
Control room for propulsion machinery when located outside the machinery space.
Spaces containing centralized fire alarm equipment.
② Corridors
Passenger and crew corridors and lobbies.
③ Accommodation spaces
Spaces as defined in **Ch 1, 103. 1** excluding corridors.
④ Stairways
Interior stairways, lifts, totally enclosed emergency escape trunks, and escalators (other than those wholly contained within the machinery spaces) and enclosures thereto.
In this connection, a stairway which is enclosed only at one level shall be regarded as part of the space from which it is not separated by a fire door.
⑤ Service spaces (low risk)
Lockers and store-rooms not having provisions for the storage of flammable liquids and having areas less than 4 m^2 and drying rooms and laundries.
⑥ Machinery spaces of category A
Spaces as defined in **Ch 1, 103. 31.**
⑦ Other machinery spaces
Electrical equipment rooms (auto-telephone exchange, air-conditioning duct spaces).
Spaces as defined in **Ch 1, 103. 30** excluding machinery spaces of category A.
⑧ Cargo spaces
All spaces used for cargo (including cargo oil tanks) and trunkways and hatchways to such spaces, other than special category spaces.
⑨ Service spaces (high risk)
Galleys, pantries containing cooking appliances, paint and lamp rooms, lockers and store-rooms having areas of 4 m^2 or more, spaces for the storage of flammable liquids, saunas and workshops other than those forming part of the machinery spaces.
⑩ Open decks
Open deck spaces and enclosed promenades having little or no fire risk. Enclosed promenades should have no significant fire risk, meaning that furnishing should be restricted to deck furniture. In addition, such spaces should be naturally ventilated by permanent openings. Air spaces (the space outside superstructures and deck-houses).
⑪ Special category spaces and ro-ro spaces
Spaces as defined in **Ch 1, 103. 41** and **46**.

(c) In determining the applicable fire integrity standard of a boundary between two spaces within a main vertical zone or horizontal zone which is not protected by an automatic sprinkler system complying with the provisions of the Fire Safety Systems Code or between such zones neither of which is so protected, the higher of the two values given in the tables shall apply;
(d) In determining the applicable fire integrity standard of a boundary between two spaces within a main vertical zone or horizontal zone which is protected by an automatic sprinkler system complying with the provisions of the Fire Safety Systems Code or between such zones both of which are so protected, the lesser of the two values given in the tables shall apply. Where a zone with sprinklers and a zone without sprinklers meet within accommodation and service spaces, the higher of the two values given in the tables shall apply to the division between the zones;

(C) Continuous "B" class ceilings or linings, in association with the relevant decks or bulkheads, may be accepted as contributing, wholly or in part, to the required insulation and integrity of a division.
(D) External boundaries which are required in **501.** to be of steel or other equivalent material may be pierced for the fitting of windows and sidescuttles provided that there is no requirement for such boundaries of passenger ships to have "A" class integrity. Similarly, in such

boundaries which are not required to have "A" class integrity, doors may be constructed of materials which are to the satisfaction of the Society.

(E) Saunas shall comply with paragraph (3) (D).

Table 8.3.3 Fire integrity of bulkheads separating adjacent spaces (not more than 36 passengers)

Spaces		①	②	③	④	⑤	⑥	⑦	⑧	⑨	⑩	⑪

Notes : To be applied to both **Tables 8.3.3** and **8.3.4** as appropriate.

a. For clarification as to which applies, see paragraphs (2) and (5).

b. Where spaces are of the same numerical category and superscript b appears, a bulkhead or deck of the rating shown in the tables is only required when the adjacent spaces are for a different purpose, (e.g. in category ⑨). A galley next to a galley does not require a bulkhead but a galley next to a paint room requires an "A-0" bulkhead.

c. Bulkhead separating the wheelhouse and chartroom from each other may have a "B-0" rating. No fire rating is required for those partitions separating the navigation bridge and the safety centre when the latter is within the navigation bridge.

d. See paragraphs (B) (c) and (B) (d).

e. For the application of paragraph (1) (B) "B-0" and "C", where appearing in **Table 8.3.3,** shall be read as "A-0".

f. Fire insulation need not be fitted if the machinery space in category ⑦, in the opinion of the Society, has little or no fire risk.

* Where an asterisk appears in the tables, the division is required to be of steel or other equivalent material, but is not required to be of "A" class standard. However, where a deck, except in a category ⑩ space, is penetrated for the passage of elec-

tric cables, pipes and vent ducts, such penetrations should be made tight to prevent the passage of flame and smoke. Divisions between control stations (emergency generators) and open decks may have air intake openings without means for closure, unless a fixed gas fire-fighting system is fitted. For the application of paragraph (1) (B), an asterisk, where appearing in **Table 8.3.4,** except for categories ⑧ and ⑩, shall be read as “A-0".

(5) Protection of stairways and lifts in accommodation area are to comply with following requirements.

(A) Stairways shall be within enclosures formed of "A" class divisions, with positive means of closure at all openings, except that:

(a) a stairway connecting only two decks need not be enclosed, provided the integrity of the deck is maintained by proper bulkheads or self-closing doors in one 'tween-deck space. When a stairway is closed in one 'tween-deck space, the stairway enclosure shall be protected in accordance with the tables for decks in paragraphs (3) or (4); and

(b) stairways may be fitted in the open in a public space, provided they lie wholly within the public space.

(B) Lift trunks shall be so fitted as to prevent the passage of smoke and flame from one 'tween-deck to another and shall be provided with means of closing so as to permit the control of draught and smoke. Machinery for lifts located within stairway enclosures shall be arranged in a separate room, surrounded by steel boundaries, except that small passages for lift cables are permitted. Lifts which open into spaces other than corridors, public spaces, special category spaces, stairways and external areas shall not open into stairways included in the means of escape.

(6) Arrangement of cabin balconies is to comply with the following requirements.
Non-load bearing partial bulkheads which separate adjacent cabin balconies shall be capable of being opened by the crew from each side for the purpose of fighting fires.

(7) Protection of atriums is to comply with the following requirements

(A) Atriums shall be within enclosures of "A"class divisions having a fire rating determined in accordance with **Tables 8.3.2** and **8.3.4**, as applicable

(B) Decks separating spaces within atriums shall have a fire rating determined in acccordance with **Tables 8.3.2** and **8.3.4**, as applicable

3. Cargo Ships except tankers are to comply with the following requirements.

(1) Methods of protection in accommodation area are to comply with the following requirements.

(A) One of the following methods of protection shall be adopted in accommodation and service spaces and control stations:

(a) Method IC
The construction of internal divisional bulkheads of non-combustible "B" or "C" class divisions generally without the installation of an automatic sprinkler, fire detection and fire alarm system in the accommodation and service spaces, except as required by **103. 5** (1);

(b) Method IIC
The fitting of an automatic sprinkler, fire detection and fire alarm system as required by **103. 5** (2) for the detection and extinction of fire in all spaces in which fire might be expected to originate, generally with no restriction on the type of internal divisional bulkheads; or

(c) Method IIIC
The fitting of a fixed fire detection and fire alarm system as required by **103. 5** (2), in spaces in which a fire might be expected to originate, generally with no restriction on the type of internal divisional bulkheads, except that in no case must the area of any accommodation space or spaces bounded by an "A" or "B" class division exceed 50 m^2 Consideration may be given by the Society to increasing this area for public spaces. (Refer to the Guidance)

(B) The requirements for the use of non-combustible materials in the construction and insulation of boundary bulkheads of machinery spaces, control stations, service spaces, etc., and the protection of the above stairway enclosures and corridors will be common to all three methods outlined in paragraph (1) (A).

(2) Bulkheads within accommodation area are to comply with the following requirements.

(A) Bulkheads required to be "B" class divisions shall extend from deck to deck and to the shell or other boundaries. However, where a continuous "B" class ceiling or lining is fitted on both sides of the bulkhead, the bulkhead may terminate at the continuous ceiling or lining.

(B) Method IC
Bulkheads not required by this or other regulations for cargo ships to be "A" or "B" class divisions, shall be of at least "C" class construction.

(C) Method IIC
There shall be no restriction on the construction of bulkheads not required by this or other regulations for cargo ships to be "A" or "B" class divisions except in individual cases where "C" class bulkheads are required in accordance with **Table 8.3.5.**

(D) Method IIIC
There shall be no restriction on the construction of bulkheads not required for cargo ships to be "A" or "B" class divisions except that the area of any accommodation space or spaces bounded by a continuous "A" or "B" class division must in no case exceed 50 m^2, except in individual cases where "C" class bulkheads are required in accordance with **Table 8.3.5.** Consideration may be given by the Society to increasing this area for public spaces.

(3) Fire integrity of bulkheads and decks are to comply with the following requirements.

(A) In addition to complying with the specific provisions for fire integrity of bulkheads and decks of cargo ships, the minimum fire integrity of bulkheads and decks shall be as prescribed in **Tables 8.3.5** and **8.3.6.**

(B) The following requirements shall govern application of the tables:

(a) **Tables 8.3.5** and **8.3.6** shall apply respectively to the bulkheads and decks separating adjacent spaces.

(b) For determining the appropriate fire integrity standards to be applied to divisions between adjacent spaces, such spaces are classified according to their fire risk as shown in categories ① to ⑪ below. Where the contents and use of a space are such that there is a doubt as to its classification for the purpose of this regulation, or where it is possible to assign two or more classifications to a space, it shall be treated as a space within the relevant category having the most stringent boundary requirements. Smaller, enclosed rooms within a space that have less than 30 % communicating openings to that space are considered separate spaces. The fire integrity of the boundary bulkheads and decks of such smaller rooms shall be as prescribed in **Tables 8.3.5** and **8.3.6** The title of each category is intended to be typical rather than restrictive. The number in parentheses preceding each category refers to the applicable column or row in the tables.

① Control stations
Spaces containing emergency sources of power and lighting.
Wheelhouse and chartroom.
Spaces containing the ship's radio equipment.
Fire control stations.
Control room for propulsion machinery when located outside the machinery space.
Spaces containing centralized fire alarm equipment.

② Corridors
corridors and lobbies.

③ Accommodation spaces
Spaces as defined in **Ch 1, 103. 1** excluding corridors.

④ Stairways Interior stairway, lifts, totally enclosed emergency escape trunks, and escalators (other than those wholly contained within the machinery spaces) and enclosures thereto. In this connection, a stairway which is enclosed only at one level shall be regarded as part of the space from which it is not separated by a fire door.

⑤ Service spaces (low risk)
Lockers and store-rooms not having provisions for the storage of flammable liquids and having areas less than 4 m^2 and drying rooms and laundries.

⑥ Machinery spaces of category A
Spaces as defined in **Ch 1, 103. 31.**

⑦ Other machinery spaces
Electrical equipment rooms (auto-telephone exchange, air-conditioning duct spaces).
Spaces as defined in **Ch 1, 103. 30** excluding machinery spaces of category A.

⑧ Cargo spaces
All spaces used for cargo (including cargo oil tanks) and trunkways and hatchways to such spaces.

⑨ Service spaces (high risk)
Galleys, pantries containing cooking appliances, saunas, paint lockers and store-rooms having areas of 4 m^2 or more, spaces for the storage of flammable liquids, and work shops other than those forming part of the machinery spaces.

⑩ Open decks
Open deck spaces and enclosed promenades having little or no fire risk. To be considered in this category, enclosed promenades shall have no significant fire risk, meaning that furnishings shall be restricted to deck furniture. In addition, such spaces shall be naturally ventilated by permanent openings.
Air spaces (the space outside superstructures and deckhouses).

⑪ Ro-ro and vehicle spaces
Ro-ro spaces and Vehicle spaces as defined in **Ch 1, 103. 41** and **49.**

Ro-ro spaces and vehicle spaces	⑪	A-60	A-30	A-30	A-30	A-0	A-60	A-0	A-0	A-30	*	* h

Note: To be applied to **Tables 8.3.5** and **8.3.6** as appropriate.

a. No special requirements are imposed upon bulkheads in methods IIC and IIIC fire protection.
b. In case of method IIIC "B" class bulkheads of "B-0" rating shall be provided between spaces or groups of spaces of 50 m^2 and over in area.
c. For clarification as to which applies, see paragraphs (2) and (4).
d. Where spaces are of the same numerical category and superscript d appear, a bulkhead or deck of the rating shown in the tables is only required when the adjacent

spaces are for a different purpose (e.g. in category ⑨). A galley next to a galley does not require a bulkhead but a galley next to a paint room requires an "A-0" bulkhead.

e. Bulkheads separating the wheelhouse, chartroom and radio room from each other may have a "B-0" rating.
f. An "A-0" rating may be used if no dangerous goods are intended to be carried or if such goods are stowed not less than 3 m horizontally from such a bulkhead.
g. For cargo spaces in which dangerous goods are intended to be carried, **Ch 5, 202. 8** applies.
h. Bulkheads and decks separating ro-ro spaces shall be capable of being closed reasonably gastight and such divisions shall have "A" class integrity in so far as reasonable and practicable, if in the opinion of the Society it has little or no fire risk.
i. Fire insulation need not be fitted if the machinery in category ⑦ if, in the opinion of the Society, it has little or no fire risk.
* Where an asterisk appears in the tables, the division is required to be of steel or other equivalent material but is not required to be of "A" class standard. However, where a deck, except an open deck, is penetrated for the passage of electric cables, pipes and vent ducts, such penetrations should be made tight to prevent the passage of flame and smoke. Divisions between control stations (emergency generators) and open decks may have air intake openings without means for closure, unless a fixed gas fire-fighting system is fitted.

(C) Continuous "B" class ceilings or linings, in association with the relevant decks or bulkheads, may be accepted as contributing, wholly or in part, to the required insulation and integrity of a division.
(D) External boundaries which are required in **501.** to be of steel or other equivalent material may be pierced for the fitting of windows and sidescuttles provided that there is no requirement for such boundaries of cargo ships to have "A" class integrity. Similarly, in such boundaries which are not required to have "A" class integrity, doors may be constructed of materials which are to the satisfaction of the Society.
(E) Saunas shall comply with **Par 2** (3) (D).

(4) Protection of stairways and lift trunks in accommodation spaces, service spaces and control stations are to comply with the following requirements.
(A) Stairways which penetrate only a single deck shall be protected, at a minimum, at one level by at least "B-0" class divisions and self-closing doors. Lifts which penetrate only a single deck shall be surrounded by "A-0" class divisions with steel doors at both levels. Stairways and lift trunks which penetrate more than a single deck shall be surrounded by at least "A-0" class divisions and be protected by self-closing doors at all levels. (Refer to the Guidance)
(B) On ships having accommodation for 12 persons or less, where stairways penetrate more than a single deck and where there are at least two escape routes direct to the open deck at every accommodation level, the "A-0" requirements of paragraph (A) may be reduced to "B-0".

4. Tankers are to comply with the following requirements.

(1) For tankers, only method IC as defined in **Par 3** (1) (A) shall be used.

(2) Fire integrity of bulkheads and decks are to comply with the following requirements.
(A) the minimum fire integrity of bulkheads and decks shall be as prescribed in **Tables 8.3.7** and **8.3.8.**
(B) The following requirements shall govern application of the tables:
(a) **Tables 8.3.7** and **8.3.8** shall apply respectively to the bulkhead and decks separating adjacent spaces;
(b) For determining the appropriate fire integrity standards to be applied to divisions between adjacent spaces, such spaces are classified according to their fire risk as shown in categories ① to ⑩ below. Where the contents and use of a space are such that there is a doubt as to its classification for the purpose of this regulation, or where it is possible to assign two or more classifications to a space, it shall be treated as a space within the relevant category having the most stringent boundary requirements. Smaller,

enclosed areas within a space that have less than 30 % communicating openings to that space are considered separate areas. The fire integrity of the boundary bulkheads and decks of such smaller spaces shall be as prescribed in **Tables 8.3.7** and **8.3.8** The number in parentheses preceding each category refers to the applicable column or row in the tables ;

① Control stations
Spaces containing emergency sources of power and lighting.
Wheelhouse and chartroom.
Spaces containing the ship's radio equipment.
Fire control stations.
Control room for propulsion machinery when located outside the machinery space.
Spaces containing centralized fire alarm equipment.

② Corridors
Corridors and lobbies.

③ Accommodation spaces
Spaces as defined in **Ch 1, 103. 1** excluding corridors.

④ Stairways
Interior stairways, lifts, totally enclosed emergency escape trunks, and escalators (other than those wholly contained within the machinery spaces) and enclosures thereto. In this connection, a stairway which is enclosed only at one level shall be regarded as part of the space from which it is not separated by a fire door.

⑤ Service spaces (low risk)
Lockers and store-rooms not having provisions for the storage of flammable liquids and having areas less than 4 m^2 and drying rooms and laundries.

⑥ Machinery spaces of category A
Spaces as defined in **Ch 1, 103. 31.**

⑦ Other machinery spaces
Electrical equipment rooms (auto-telephone exchange and air-conditioning duct spaces).
Spaces as defined in **Ch 1, 103. 30** excluding machinery spaces of category A.

⑧ Cargo pump-rooms
Spaces containing cargo pumps and entrances and trunks to such spaces.

⑨ Service spaces (high risk)
Galleys, pantries containing cooking appliances, saunas, paint lockers and store-rooms having areas of 4 m^2 or more, spaces for the storage of flammable liquids and work shops other than those forming part of the machinery spaces.

⑩ Open decks
Open deck spaces and enclosed promenades having little or no fire risk. To be considered in this category, enclosed promenades shall have no significant fire risk, meaning that furnishings shall be restricted to deck furniture. In addition, such spaces shall be naturally ventilated by permanent openings.
Air spaces (the space outside superstructures and deckhouses).

(C) Continuous "B" class ceilings or linings, in association with the relevant decks or bulkheads, may be accepted as contributing, wholly or in part, to the required insulation and integrity of a division.

(D) External boundaries which are required in **501.** to be of steel or other equivalent material may be pierced for the fitting of windows and sidescuttles provided that there is no requirement for such boundaries of tankers to have "A" class integrity. Similarly, in such boundaries which are not required to have "A" class integrity, doors may be constructed of materials which are to the satisfaction of the Society.

(E) Exterior boundaries of superstructures and deckhouses enclosing accommodation and including any overhanging decks which support such accommodation, shall be constructed of steel and insulated to "A-60" standard for the whole of the portions which face the cargo area and on the outward sides for a distance of 3 m from the end boundary facing the cargo area. The distance of 3 m shall be measured horizontally and parallel to the middle line of the ship from the boundary which faces the cargo area at each deck level. In the case of the sides of those superstructures and deckhouses, such insulation shall be carried up to the underside of the deck of the navigation bridge. (Refer to the Guidance)

(F) Skylights to cargo pump-rooms shall be of steel, shall not contain any glass and shall be capable of being closed from outside the pump-room.

(G) Construction and arrangement of saunas shall comply with **Ch 3, 301. 2** (3) (D).

Notes: To be applied to **Tables 8.3.7** and **8.3.8** as appropriate.

a. For clarification as to which applies, see **Par 3** (2) and (4).

b. Where spaces are of the same numerical category and superscript b appears, a bulkhead or deck of the rating shown in the tables is only required when the adjacent spaces are for a different purpose (e.g. in category ⑨). A galley next to a galley does not require a bulkhead but a galley next to a paint room requires an "A-0" bulkhead.

c. Bulkheads separating the wheelhouse, chartroom and radio room from each other may have a "B-0" rating.

d. Bulkheads and decks between cargo pump-rooms and machinery spaces of category A may be penetrated by cargo pump shaft glands and similar gland penetrations, provided that gas tight seals with efficient lubrication or other means of ensuring the permanence of the gas seal are fitted in way of the bulkheads or deck. (Refer to the Guidance)

e. Fire insulation need not be fitted if the machinery space in category ⑦ if, in the opinion of the Society, it has little or no fire risk.

* Where an asterisk appears in the table, the division is required to be of steel or other equivalent material, but is not required to be of "A" class standard. However, where a deck, except an open deck, is penetrated for the passage of electric cables, pipes and vent ducts, such penetrations should be made tight to prevent the passage of flame and smoke. Divisions between control stations (emergency generators) and open decks may have air intake openings without means for closure, unless a fixed gas fire-fighting system is fitted.

302. Penetration in fire-resisting divisions and prevention of heat transmission

(Refer to the Guidance)

1. Where "A" class divisions are penetrated, such penetrations shall be tested in accordance with the Fire Test Procedures Code, subject to the provisions of **303. 1** (1) (E). In the case of ventilation ducts, **306. 1** (2) and **306. 3** (1) apply. However, where a pipe penetration is made of steel or equivalent material having a thickness of 3 mm or greater and a length of not less than 900 mm (preferably 450 mm on each side of the division), and no openings, testing is not required. Such penetrations shall be suitably insulated by extension of the insulation at the same level of the division.

2. Where "B" class divisions are penetrated for the passage of electric cables, pipes, trunks, ducts, etc., or for the fitting of ventilation terminals, lighting fixtures and similar devices, arrangements shall be made to ensure that the fire resistance is not impaired, subject to the provisions of **306. 3** (2). Pipes other than steel or copper that penetrate "B" class divisions shall be protected by either:

(1) a fire tested penetration device, suitable for the fire resistance of the division pierced and the type of pipe used; or

(2) a steel sleeve, having a thickness of not less than 1.8 mm and a length of not less than 900 mm for pipe diameters of 150 mm or more and not less than 600 mm for pipe diameters of less than 150 mm (preferably equally divided to each side of the division). The pipe shall be connected to the ends of the sleeve by flanges or couplings; or the clearance between the sleeve and the pipe shall not exceed 2.5 mm; or any clearance between pipe and sleeve shall be made tight by means of non-combustible or other suitable material.

3. Uninsulated metallic pipes penetrating "A" or "B" class divisions shall be of materials having a melting temperature which exceeds 950 ℃ for "A-0" and 850 ℃ for "B-0" class divisions.

4. In approving structural fire protection details, the Society shall have regard to the risk of heat transmission at intersections and terminal points of required thermal barriers. The insulation of a deck or bulkhead shall be carried past the penetration, intersection or terminal point for a distance of at least 450 mm in the case of steel and aluminium structures. If a space is divided with a deck or a bulkhead of "A" class standard having insulation of different values, the insulation with the higher value shall continue on the deck or bulkhead with the insulation of the lesser value for a distance of at least 450 mm. (Refer to the Guidance)

303. Protection of openings in fire resisting divisions

1. Openings in bulkheads and decks in **passenger ships** are to comply with the following requirements. (Refer to the Guidance)

(1) Openings in "A" class divisions shall satisfy the following requirements.

(A) Except for hatches between cargo, special category, store, and baggage spaces, and between such spaces and the weather decks, openings shall be provided with permanently attached means of closing which shall be at least as effective for resisting fires as the divisions in which they are fitted.

(B) The construction of doors and door frames in "A" class divisions, with the means of securing them when closed, shall provide resistance to fire as well as to the passage of smoke and flame equivalent to that of the bulkheads in which the doors are situated, this being determined in accordance with the Fire Test Procedures Code. Such doors and door frames shall be constructed of steel or other equivalent material. Doors approved without the sill being part of the frame shall be installed such that the gap under the door does not exceed 12 mm. A non-combustible sill shall be installed under the door such that floor coverings do not extend beneath the closed door.

(C) Watertight doors need not be insulated.

(D) It shall be possible for each door to be opened and closed from each side of the bulkhead by one person only.

(E) Fire doors in main vertical zone bulkheads, galley boundaries and stairway enclosures other than power-operated watertight doors and those which are normally locked, shall satisfy the following requirements:

(a) the doors shall be self-closing and be capable of closing with an angle of inclination of up to 3.5° opposing closure;

(b) the approximate time of closure for hinged fire doors shall be no more than 40s and no less than 10s from the beginning of their movement with the ship in upright position. The approximate uniform rate of closure for sliding doors shall be of no more than 0.2 m/s and no less than 0.1 m/s with the ship in upright position;

(c) the doors, except those for emergency escape trunks, shall be capable of remote release from the continuously manned central control station, either simultaneously or in groups and shall be capable of release also individually from a position at both sides of the door. Release switches shall have an on-off function to prevent automatic resetting of the system;

(d) hold-back hooks not subject to central control station release are prohibited;

(e) a door closed remotely from the central control station shall be capable of being re-opened from both sides of the door by local control. After such local opening, the door shall automatically close again;

(f) indication must be provided at the fire door indicator panel in the continuously manned central control station whether each door is closed;

(g) the release mechanism shall be so designed that the door will automatically close in the event of disruption of the control system or central power supply;

(h) local power accumulators for power-operated doors shall be provided in the immediate vicinity of the doors to enable the doors to be operated after disruption of the control system or central power supply at least ten times (fully opened and closed) using the local controls;

(i) disruption of the control system or central power supply at one door shall not impair the safe functioning of the other doors;

(j) remote-released sliding or power-operated doors shall be equipped with an alarm that sounds at least 5s but no more than 10s after the door being released from the central control station and before the door begins to move and continues sounding until the door is completely closed;

(k) a door designed to re-open upon contacting an object in its path shall re-open not more than 1 m from the point of contact;

(l) double-leaf doors equipped with a latch necessary for their fire integrity shall have a latch that is automatically activated by the operation of the doors when released by the system;

(m) doors giving direct access to special category spaces which are power-operated and automatically closed need not be equipped with the alarms and remote-release mechanisms required in paragraphs (a) and (j);

(n) the components of the local control system shall be accessible for maintenance and adjusting;

(o) power-operated doors shall be provided with a control system of an approved type which shall be able to operate in case of fire and be in accordance with the Fire Test Procedures Code. This system shall satisfy the following requirements:

(i) the control system shall be able to operate the door at the temperature of at least 200 ℃ for at least 60 min, served by the power supply;

(ii) the power supply for all other doors not subject to fire shall not be impaired; and

(iii) at temperatures exceeding 200 ℃ the control system shall be automatically isolated from the power supply and shall be capable of keeping the door closed up to at least 945 ℃.

(F) In ships carrying **not more than 36 passengers**, where a space is protected by an automatic sprinkler fire detection and alarm system complying with the provisions the Fire Safety Systems Code or fitted with a continuous "B" class ceiling, openings in decks not forming steps in main vertical zones nor bounding horizontal zones shall be closed reasonably tight and such decks shall meet the "A" class integrity requirements in so far as is reasonable and practicable in the opinion of the Society.

(G) The requirements for "A" class integrity of the outer boundaries of a ship shall not apply to glass partitions, windows and sidescuttles, provided that there is no requirement for such boundaries to have "A" class integrity in paragraph (3) (C). The requirements for "A" class integrity of the outer boundaries of the ship shall not apply to exterior doors, except for those in superstructures and deckhouses facing lifesaving appliances, embarkation and external assembly station areas, external stairs and open decks used for escape routes. Stairway enclosure doors need not meet this requirement.

(H) Except for watertight doors, weathertight doors (semi-watertight doors), doors leading to the open deck and doors which need to be reasonably gastight, all "A" class doors located in stairways, public spaces and main vertical zone bulkheads in escape routes shall be equipped with a self-closing hose port of material, construction and fire resistance which is equivalent to the door into which it is fitted, and shall be a 150 mm square clear opening with the door closed and shall be inset into the lower edge of the door, opposite the door hinges or, in the case of sliding doors, nearest the opening.

(I) Where it is necessary that a ventilation duct passes through a main vertical zone division, a fail-safe automatic closing fire damper shall be fitted adjacent to the division. The damper shall also be capable of being manually closed from each side of the division. The operating position shall be readily accessible and be marked in red light-reflecting colour. The duct between the division and the damper shall be of steel or other equivalent material and, if necessary, insulated to comply with the requirements of **302. 1.** The damper shall be fitted on at least one side of the division with a visible indicator showing whether the damper is in the open position.

(2) Openings in "B" class divisions shall satisfy the following requirements.

(A) Doors and door frames in "B" class divisions and means of securing them shall provide a method of closure which shall have resistance to fire equivalent to that of the divisions, this being determined in accordance with the Fire Test Procedure Code except that ventilation openings may be permitted in the lower portion of such doors. Where such opening is in or under a door the total net area of any such opening or openings shall not exceed 0.05 m^2. Alternatively, a non-combustible air balance duct routed between the cabin and the corridor, and located below the sanitary unit is permitted where the cross-sectional area of the duct does not exceed 0.05 m^2. All ventilation openings shall be fitted with a grill made of non-combustible material. Doors shall be non-combustible. Doors approved without the sill being part of the frame shall be installed such that the gap under the door does not exceed 25 mm. (Refer to the Guidance)

(B) Cabin doors in "B" class divisions shall be of a self-closing type. Hold-back hooks are not permitted. (Refer to the Guidance)

(C) The requirements for "B" class integrity of the outer boundaries of a ship shall not apply to glass partitions, windows and sidescuttles. Similarly, the requirements for "B" class integrity shall not apply to exterior doors in superstructures and deckhouses. For ships carrying **not more than 36 passengers**, the Society may permit the use of combustible materials in doors separating cabins from the individual interior sanitary spaces such as showers.

(D) In ships carrying **not more than 36 passengers**, where an automatic sprinkler system complying with the provisions of the Fire Safety Systems Code is fitted:

(a) openings in decks not forming steps in main vertical zones nor bounding horizontal zones shall be closed reasonably tight and such decks shall meet the "B" class integrity requirements in so far as is reasonable and practicable in the opinion of the Society; and

(b) openings in corridor bulkheads of "B" class materials shall be protected in accordance with the provisions of **301. 2** (2).

(3) Windows and side scuttles shall satisfy the following requirements.

(A) Windows and side scuttles in bulkheads within accommodation and service spaces and control stations other than those to which the provisions of paragraph (1) (F) and of paragraph (2) (C) apply, shall be so constructed as to preserve the integrity requirements of the type of bulkheads in which they are fitted, this being determined in accordance with the FTP Code.

(B) Notwithstanding the requirements of **Tables 8.3.1** to **8.3.4,** windows and sidescuttles in bulkheads separating accommodation and service spaces and control stations from weather shall be constructed with frames of steel or other suitable material. The glass shall be retained by a metal glazing bead or angle.

(C) Windows facing life-saving appliances, embarkation and assembly stations, external stairs and open decks used for escape routes, and windows situated below liferaft and escape slide embarkation areas shall have fire integrity as required in **Table 8.3.1.** Where automatic dedicated sprinkler heads are provided for windows, "A-0" windows may be accepted as equivalent. To be considered under this paragraph, the sprinkler heads must either be :

(a) dedicated heads located above the windows, and installed in addition to the conventional ceiling sprinklers; or

(b) conventional ceiling sprinkler heads arranged such that the window is protected by an average application rate of at least 5 litres/(min • m^2) and the additional window area is included in the calculation of the area of coverage; or

(c) water-mist nozzles that have been tested and approved in accordance with the quidelines approved by the IMO.

Windows located in the ship's side below the lifeboat embarkation area shall have fire integrity at least equal to "A-0" class. :

2. Doors in fire-resisting divisions in **cargo ships** are to comply with the following requirements.

(1) The fire resistance of doors shall be equivalent to that of the division in which they are fitted, this being determined in accordance with the Fire Test Procedures Code. Doors approved as "A" class without the sill being part of the frame shall be installed such that the gap under the door does not exceed 12 mm and a non-combustible sill shall be installed under the door such that floor coverings do not extend beneath the closed door. Doors approved as "B" class without the sill being part of the frame shall be installed such that the gap under the door does not exceed 25 mm. Doors and door frames in "A" class divisions shall be constructed of steel. Doors in "B" class divisions shall be non-combustible. Doors fitted in boundary bulkheads of machinery spaces of category A shall be reasonably gastight and self-closing. In ships constructed according to method IC, the Society may permit the use of combustible materials in doors separating cabins from individual interior sanitary accommodation such as showers. (Refer to the Guidance)

(2) Doors required to be self-closing shall not be fitted with hold-back hooks. However, hold-back arrangements fitted with remote release devices of the fail-safe type may be utilized.

(3) In corridor bulkheads ventilation openings may be permitted in and under the doors of cabins and public spaces. Ventilation openings are also permitted in "B" class doors leading to lavatories, offices, pantries, lockers and store rooms. Except as permitted below, the openings shall be provided only in the lower half of a door. Where such an opening is in or under a door the total net area of any such opening or openings shall not exceed 0.05 m^2. Alternatively, a non-combustible air balance duct routed between the cabin and the corridor, and located below the sanitary unit is permitted where the cross-sectional area of the duct does not exceed 0.05 m^2. Ventilation openings, except those under the door, shall be fitted with a grille made of non-combustible material. (Refer to the Guidance)

(4) Watertight doors need not be insulated.

304. Protection of openings in machinery space boundaries

1. The provision of this paragraph shall apply to machinery spaces of category A and, where the Society considers it desirable, to other machinery spaces.

2. Protection of openings in machinery space boundaries shall satisfy the following requirements.

(1) The number of skylights, doors, ventilators, openings in funnels to permit exhaust ventilation and other openings to machinery spaces shall be reduced to a minimum consistent with the needs of ventilation and the proper and safe working of the ship.

(2) Skylights shall be of steel and shall not contain glass panels.

(3) Means of control shall be provided for closing power-operated doors or actuating release mechanisms on doors other than power-operated watertight doors. The control shall be located outside the space concerned, where they will not be cut off in the event of fire in the space it serves.

(4) In passenger ships, the means of control required in paragraph (3) shall be situated at one control position or grouped in as few positions as possible to the satisfaction of the Society. Such positions shall have safe access from the open deck.

(5) In passenger ships, doors, other than power-operated watertight doors shall be so arranged that positive closure is assured in case of fire in the space by power-operated closing arrangements or by the provision of self-closing doors capable of closing against an inclination of 3.5° opposing closure, and having a fail-safe hold-back arrangement, provided with a remotely operated release device. Doors for emergency escape trunks need not be fitted with a fail-safe hold-back facility and a remotely operated release device.

(6) Windows shall not be fitted in machinery space boundaries. However, this does not preclude the use of glass in control rooms within the machinery spaces.

305. Protection of cargo space boundaries

1. In passenger ships carrying **more than 36 passengers**, the boundary bulkheads and decks of special category and ro-ro spaces shall be insulated to "A-60" class standard. However, where a category ⑤,⑨,⑩ space, as defined in **301. 2** (3), is on one side of the division the standard may be reduced to "A-0". Where fuel oil tanks are below a special category space, the integrity of the deck between such spaces may be reduced to "A-0" standard.

2. In passenger ships carrying **not more than 36 passengers**, the boundary bulkheads of special category spaces shall be insulated as required for category ⑪ spaces in **Table 8.3.3** and the horizontal boundaries as required for category ⑧ spaces in **Table 8.3.4.**

3. In passenger ships carrying **not more than 36 passengers** the boundary bulkheads and decks of closed and open ro-ro spaces shall have a fire integrity as required for category ⑧ spaces in **Table 8.3.3** and the horizontal boundaries as required for category ⑧ spaces in **Table 8.3.4.**

4. In passenger ships, indicators shall be provided on the navigating bridge which shall indicate when any fire door leading to or from the special category spaces is closed.

5. In tankers, for the protection of cargo tanks carrying crude oil and petroleum products having a flashpoint not exceeding 60 ℃, materials readily rendered ineffective by heat shall not be used for valves, fittings, tank opening covers, cargo vent piping, and cargo piping so as to prevent the spread of fire to the cargo. (Refer to the Guidance)

306. Ventilation systems (Refer to the Guidance)

1. Duct and dampers are to comply with the following requirements.

(1) Ventilation ducts shall be of steel or equivalent material. However, short ducts, not generally exceeding 2 m in length and with a free cross-sectional area not exceeding 0.02 m^2, need not be steel or equivalent subject to the following conditions : (Refer to the Guidance)

(A) subject to (B), the ducts are made of a material which has low flame spread characteristics;

(B) the ducts shall be made of heat resisting non-combustible material, which may be faced internally and externally with membranes having low flame-spread characteristics and, in each case, a calorific value not exceeding 45 MJ/m^2 of their surface area for the thickness used;

(C) the ducts are only used at the end of the ventilation device; and

(D) the ducts are not situated less than 600 mm, measured along the duct, from an opening in an "A" or "B" class division including continuous "B" class ceiling.

(2) The following arrangements shall be tested in accordance with the Fire Test Procedures Code:

(A) fire dampers, including their relevant means of operation; and

(B) duct penetrations through "A" class divisions. However, the test is not required where steel sleeves are directly joined to ventilation ducts by means of riveted or screwed flanges or by welding.

2. Arrangement of ducts are to comply with the following requirements. (Refer to the Guidance)

(1) The ventilation systems for machinery spaces of category A, vehicle spaces, ro-ro spaces, galleys, special category spaces and cargo spaces shall, in general, be separated from each other and from the ventilation systems serving other spaces. Except that the galley ventilation systems on cargo ships of less than 4,000 gross tonnage and in passenger ships carrying not more than 36 passengers, need not be completely separated, but may be served by separate ducts from a ventilation unit serving other spaces. In any case, an automatic fire damper shall be fitted in the galley ventilation duct near the ventilation unit. Ducts provided for the ventilation of machinery spaces of category A, galleys, vehicle spaces, ro-ro spaces or special category spaces shall not pass through accommodation spaces, service spaces or control stations unless they comply with the conditions specified in paragraphs (A) to (D) or (E) and (F) below:

(A) the ducts are constructed of steel having a thickness of at least 3 mm and 5 mm for ducts the widths or diameters of which are up to and including 300 mm and 760 mm and over respectively and, in the case of such ducts, the widths or diameters of which are between 300 mm and 760 mm having a thickness obtained by interpolation;

(B) the ducts are suitably supported and stiffened;

(C) the ducts are fitted with automatic fire dampers close to the boundaries penetrated; and

(D) the ducts are insulated to "A-60" class standard from the machinery spaces, galleys, vehicle spaces, ro-ro spaces or special category spaces to a point at least 5 m beyond each fire damper; or
(E) the ducts are constructed of steel in accordance with paragraphs (A) and (B); and
(F) the ducts are insulated to "A-60" class standard throughout the accommodation spaces, service spaces or control stations; except that penetrations of main zone divisions shall also comply with the requirements of **303. 1** (1) (H).

(2) Ducts provided for ventilation to accommodation spaces, service spaces or control stations shall not pass through machinery spaces of category A, galleys, vehicle spaces, ro-ro spaces or special category spaces unless they comply with the conditions specified in paragraphs (1) (A) to (1) (C) or (1) (E) and (1) (F):
(A) the ducts where they pass through a machinery space of category A, galley, vehicle space, ro-ro space or special category space are constructed of steel in accordance with paragraphs (1) (A) and (1) (B);
(B) automatic fire dampers are fitted close to the boundaries penetrated; and
(C) the integrity of the machinery space, galley, vehicle space, ro-ro space or special category space boundaries is maintained at the penetrations; or
(D) the ducts where they pass through a machinery space of category A, galley, vehicle space, ro-ro space or special category space are constructed of steel in accordance with paragraphs (1) (A) and (1) (B); and
(E) the ducts are insulated to "A-60" standard within the machinery space, galley, vehicle space, ro-ro space or special category space; except that penetrations of main zone divisions shall also comply with the requirements of **303. 1** (1) (H).

3. Details of duct penetrations are to comply with the following requirements.

(1) Where a thin plated duct with a free cross-sectional area equal to, or less than, 0.02 m^2 passes through "A" class bulkheads or decks, the opening shall be lined with a steel sheet sleeve having a thickness of at least 3 mm and a length of at least 200 mm, divided preferably into 100 mm on each side of the bulkhead or, in the case of the deck, wholly laid on the lower side of the decks pierced. Where ventilation ducts with a free cross-sectional area exceeding 0.02 m^2 pass through "A" class bulkheads or decks, the opening shall be lined with a steel sheet sleeve. However, where such ducts are of steel construction and pass through a deck or bulkhead, the ducts and sleeves shall comply with the following:
(A) The sleeves shall have a thickness of at least 3 mm and a length of at least 900 mm. When passing through bulkheads, this length shall be divided preferably into 450 mm on each side of the bulkhead. These ducts, or sleeves lining such ducts, shall be provided with fire insulation. The insulation shall have at least the same fire integrity as the bulkhead or deck through which the duct passes; and
(B) Ducts with a free cross-sectional area exceeding 0.075 m^2 shall be fitted with fire dampers in addition to the requirements of paragraph (A). The fire damper shall operate automatically, but shall also be capable of being closed manually from both sides of the bulkhead or deck. The damper shall be provided with an indicator which shows whether the damper is open or closed. Fire dampers are not required, however, where ducts pass through spaces surrounded by "A" class divisions, without serving those spaces, provided those ducts have the same fire integrity as the divisions which they pierce. Fire dampers shall be easily accessible. Where they are placed behind ceilings or linings, these ceilings or linings shall be provided with an inspection door on which a plate reporting the identification number of the fire damper is provided. The fire damper identification number shall also be placed on any remote controls required. (Refer to the Guidance)

(2) Ventilation ducts with a free cross-sectional area exceeding 0.02 m^2 passing through "B" class bulkheads shall be lined with steel sheet sleeves of 900 mm in length divided preferably into 450 mm on each side of the bulkheads unless the duct is of steel for this length.

4. Ventilation systems for passenger ships carrying more than 36 passengers shall be in compliance with the following additional requirements.

(1) In general, the ventilation fans shall be so disposed that the ducts reaching the various spaces remain within the main vertical zone.

(2) Where ventilation systems penetrate decks, precautions shall be taken, in addition to those

relating to the fire integrity of the deck required by **302. 1** and **303. 1** (1) (E), to reduce the likelihood of smoke and hot gases passing from one 'tween-deck space to another through the system. In addition to insulation requirements contained in **Par 4**, vertical ducts shall, if necessary, be insulated as required by the appropriate **Tables 8.3.1** and **8.3.2.**

(3) Except in cargo spaces, ventilation ducts shall be constructed of the following materials:

(A) ducts not less than 0.075 m^2 in free cross-sectional area and all vertical ducts serving more than a single 'tween-deck space shall be constructed of steel or other equivalent material;

(B) ducts less than 0.075 m^2 in free cross-sectional area other than the vertical ducts referred to in paragraph (A), shall be constructed of steel or equivalent materials. Where such ducts penetrate "A" or "B" class division due regard shall be given to ensuring the fire integrity of the division; and

(C) short length of duct, not in general exceeding 0.02 m^2 in free cross-sectional area nor 2 m in length, need not be steel or equivalent provided that all of the following conditions are met:

(a) subject to (b), the duct is constructed of a material which has low flame spread characteristics;

(b) the ducts shall be made of heat resisting non-combustible material, which may be faced internally and externally with membranes having low flame-spread characteristics and, in each case, a calorific value not exceeding 45 MJ/m^2 of their surface area for the thickness used;

(c) the duct is used only at the terminal end of the ventilation system; and

(d) the duct is not located closer than 600 mm measured along its length to a penetration of an "A" or "B" class division, including continuous "B" class ceilings.

(4) Stairway enclosures shall be ventilated and served by an independent fan and duct system which shall not serve any other spaces in the ventilation systems.

(5) Exhaust ducts shall be provided with hatches for inspection and cleaning. The hatches shall be located near the fire dampers.

5. Exhaust ducts from galley ranges are to comply with the following requirements. (Refer to the Guidance)

(1) For passenger ships carrying **more than 36 passengers** are to comply with the following requirements. exhaust ducts from galley ranges shall meet the requirements of **306. 2** (1) (E) and **306. 2** (1) (F) and shall be fitted with: (Refer to the Guidance)

(A) a grease trap readily removable for cleaning unless an alternative approved grease removal system is fitted;

(B) a fire damper located in the lower end of the duct which is automatically and remotely operated, and in addition a remotely operated fire damper located in the upper end of the duct;

(C) a fixed means for extinguishing a fire within the duct;

(D) remote-control arrangements for shutting off the exhaust fans and supply fans, for operating the fire dampers mentioned in paragraph (B) and for operating the fire-extinguishing system, which shall be placed in a position close to the entrance to the galley. Where a multi-branch system is installed, a remote means located with the above controls shall be provided to close all branches exhausting through the same main duct before an extinguishing medium is released into the system; and

(E) suitably located hatches for inspection and cleaning.

(2) Exhaust ducts from ranges for cooking equipment installed on open decks shall conform to (1), as applicable, when passing through accommodation spaces or spaces containing combustible materials.

(3) For cargo ships and passenger ships carrying not more than 36 passenger ships, where they pass through accommodation spaces or spaces containing combustible materials, the exhaust ducts from galley ranges shall be constructed of "A" class divisions. Each exhaust duct shall be fitted with: (Refer to the Guidance)

(A) a grease trap readily removable for cleaning;

(B) a fire damper located in the lower end of the duct and, in addition, a fire damper in the upper end of the duct;

(C) arrangements, operable from within the galley, for shutting off the exhaust fans; and

(D) fixed means for extinguishing a fire within the duct.

(4) Exhaust ducts from main laundries in ships carrying more than 36 passengers shall be fitted with:
(A) filters readily removable for cleaning purposes;
(B) a fire damper located in the lower end of the duct which is automatically and remotely operated;
(C) remote-control arrangements for shutting off the exhaust fans and supply fans from within the spaces and for operating the fire damper mentioned in (B); and
(D) suitably located hatches for inspection and cleaning

SECTION 4 Fire fighting

401. Water supply systems

1. Fire mains and hydrants are to comply with the following requirements.

(1) Materials readily rendered ineffective by heat shall not be used for fire mains and hydrants unless adequately protected. The pipes and hydrants shall be so placed that the fire hoses may be easily coupled to them. The arrangement of pipes and hydrants shall be such as to avoid the possibility of freezing. Suitable drainage provisions shall be provided for fire main piping. Isolation valves shall be installed for all open deck fire main branches used for purposes other than fire fighting. In ships where deck cargo may be carried, the positions of the hydrants shall be such that they are always readily accessible and the pipes shall be arranged as far as practicable to avoid risk of damage by such cargo.

(2) The arrangements for the ready availability of water supply shall be provided as follows.
(A) Passenger ships shall satisfy the following requirements.
(a) in case of 1,000 gross tonnage and upwards such that at least one effective jet of water is immediately available from any hydrant in an interior location and so as to ensure the continuation of the output of water by the automatic starting of one required fire pump;
(b) in case of less than 1,000 gross tonnage by automatic start of at least one fire pump or by remote starting from the navigation bridge of at least one fire pump. If the pump starts automatically or if the bottom valve cannot be opened from where the pump is remotely started, the bottom valve shall always be kept open; and
(c) if fitted with periodically unattended machinery spaces, the Society shall determine provisions for fixed water fire-extinguishing arrangement for such spaces equivalent to those required for normally attended machinery spaces;
(B) Cargo ships shall satisfy the following requirements.
With a periodically unattended machinery space or when only one person is required on watch, there shall be immediate water delivery from the fire main system at a suitable pressure, either by remote starting of one of the main fire pumps with remote starting from the navigating bridge and fire control station, if any, or permanent pressurization of the fire main system by one of the main fire pumps, except that the Society may waive this requirement for cargo ships of less than 1,600 gross tonnage if the fire pump starting arrangement in the machinery space is in an easily accessible position.

(3) The diameter of the fire main and water service pipes shall be sufficient for the effective distribution of the maximum required discharge from two fire pumps operating simultaneously, except that in the case of cargo ships the diameter need only be sufficient for the discharge of 140 m^3/h.

(4) Isolating valves and relief valves are to comply with the following requirements.
(A) Isolating valves to separate the section of the fire main within the machinery space containing the main fire pump or pumps from the rest of the fire main shall be fitted in an easily accessible and tenable position outside the machinery spaces. The fire main shall be so arranged that when the isolating valves are shut all the hydrants on the ship, except those in the machinery space referred to above, can be supplied with water by another fire pump or an emergency fire pump. The emergency fire pump, its seawater inlet, and suction and delivery pipes and isolating valves shall be located outside the machinery space. If this arrangement cannot be made, the sea-chest may be fitted in the machinery space if the valve is remotely controlled from a position in the same compartment as the emergency

pump and the suction pipe is as short as practicable. Short lengths of suction or discharge piping may penetrate the machinery space, provided they are enclosed in a substantial steel casing, or are insulated to A-60 class standards. The pipes shall have substantial wall thickness, but in no case less than 11 mm, and shall be welded except for the flanged connection to the sea inlet valve. (Refer to the Guidance)

(B) A valve shall be fitted to serve each fire hydrant so that any fire hose may be removed while the fire pumps are in operation.

(C) Relief valves shall be provided in conjunction with fire pumps if the pumps are capable of developing a pressure exceeding the design pressure of the water service pipes, hydrants and hoses. These valves shall be so placed and adjusted as to prevent excessive pressure in any part of the fire main system.

(D) In tankers, isolation valves shall be fitted in the fire main at poop front in a protected position and on the tank deck at intervals of not more than 40 m to preserve the integrity of the fire main system in case of fire or explosion.

(5) Number and position of hydrants are to comply with the following requirements.

(A) The number and position of hydrants shall be such that at least two jets of water not emanating from the same hydrant, one of which shall be from a single length of hose, may reach any part of the ship normally accessible to the passengers or crew while the ship is being navigated and any part of any cargo space when empty, any ro-ro space or any vehicle space in which latter case the two jets shall reach any part of the space, each from a single length of hose. Furthermore, such hydrants shall be positioned near the accesses to the protected spaces.

(B) In addition to the requirements in the paragraph (A), passenger ships shall comply with the following:

(a) in the accommodation, service and machinery spaces the number and position of hydrants shall be such that the requirements of paragraph (A) may be complied with when all watertight doors and all doors in main vertical zone bulkheads are closed; and

(b) where access is provided to a machinery space of category A at a low level from an adjacent shaft tunnel, two hydrants shall be provided external to, but near the entrance to that machinery space. Where such access is provided from other spaces, in one of those spaces two hydrants shall be provided near the entrance to the machinery space of category A. Such provision need not be made where the tunnel or adjacent spaces are not part of the escape route.

(6) With the two pumps simultaneously delivering water through the nozzles specified in **Par 3** (3), with the quantity of water as specified in **Par 1** (3), through any adjacent hydrants, the following minimum pressures shall be maintained at all hydrants: (Refer to the Guidance)

(A) for passenger ships:

4,000 gross tonnage and upwards	0.40 MPa
less than 4000 gross tonnage	0.30 MPa

(B) for cargo ships,

6,000 gross tonnage and upwards	0.27 MPa
less than 6,000 gross tonnage;	0.25 MPa

(C) the maximum pressure at any hydrant shall not exceed that at which the effective control of a fire hose can be demonstrated.

(7) International shore connection is to comply with the following requirements. (Refer to the Guidance)

(A) Ships of 500 gross tonnage and upwards shall be provided with at least one international shore connection complying with the Fire Safety Systems Code.

(B) Facilities shall be available enabling such a connection to be used on either side of the ship.

2. Fire pumps are to be comply with the following requirements. (Refer to the Guidance)

(1) Sanitary, ballast, bilge or general service pumps may be accepted as fire pumps, provided that they are not normally used for pumping oil and that if they are subject to occasional duty for the transfer or pumping of oil fuel, suitable change-over arrangements are fitted.

(2) Ships shall be provided with independently driven fire pumps as follows:

(A) in passenger ships of:

- 4,000 gross tonnage and upwards at least three
- less than 4,000 gross tonnage at least two

(B) in cargo ships of:
- 1,000 gross tonnage and upwards at least two
- less than 1,000 gross tonnage at least two power driven pumps, one of which shall be independently driven.

(3) Arrangement of fire pumps and fire main shall satisfy the following requirements.(Refer to the Guidance)

(A) The arrangement of sea connections, fire pumps and their sources of power shall be as to ensure that:

(a) in passenger ships of l,000 gross tonnage and upwards, in the event of a fire in any one compartment all the fire pumps will not be put out of action; and

(b) in passenger ships of less than 1,000 gross tonnage and in cargo ships, if a fire in any one compartment could put all the pumps out of action, there shall be an alternative means consisting of an emergency fire pump complying with the provisions of the Fire Safety Systems Code with its source of power and sea connection located outside the space where the main fire pumps or their sources of power are located. (Refer to the Guidance)

(B) The space containing the emergency fire pump (Refer to the Guidance) is to satisfy the following requirements.

(a) The space containing the fire pump shall not be contiguous to the boundaries of machinery spaces of category A or those spaces containing main fire pumps. Where this is not practicable, the common bulkhead between the two spaces shall be insulated to a standard of structural fire protection equivalent to that required for a control station in regulation **301. 3** (3). (Refer to the Guidance)

(b) No direct access shall be permitted between the machinery space and the space containing the emergency fire pump and its source of power. When this is impracticable, the Society may accept an arrangement where the access is by means of an airlock with the door of the machinery space being of A-60 class standard, and the other door being at least steel, both reasonably gastight, self-closing and without any hold back arrangements. Alternatively, the access may be through a watertight door capable of being operated from a space remote from the machinery space and the space containing the emergency fire pump and unlikely to be cut off in the event of fire in those spaces. In such cases, a second means of access to the space containing the emergency fire pump and its source of power shall be provided. (Refer to the Guidance)

(c) Ventilation arrangements to the space containing the independent source of power for the emergency fire pump shall be such as to preclude, as far as practicable, the possibility of smoke from a machinery space fire entering or being drawn into that space.

(C) In addition, in cargo ships where other pumps, such as general service, bilge and ballast, etc., are fitted in a machinery space, arrangements shall be made to ensure that at least one of these pumps, having the capacity and pressure required by **Par 1** (6) (B) and **2** (4) (B) is capable of providing water to the fire main. (Refer to the Guidance)

(4) Capacity of fire pumps are to comply with the following requirements.

(A) The required fire pumps shall be capable of delivering for fire-fighting purposes a quantity of water, at the pressure specified in **Par 1** (6), as follows:

(a) pumps in passenger ships, the quantity of water is not less than two thirds of the quantity required to be dealt with by the bilge pumps when employed for bilge pumping; and

(b) pumps in cargo ships, other than any emergency pump, the quantity of water is not less than four thirds of the required quantity to be dealt with by each of the independent bilge pumps in a passenger ship of the same dimension when employed in bilge pumping, provided that in no cargo ship need the total required capacity of the fire pumps exceed 180 m^3/h.

(B) Each of the required fire pumps (other than any emergency pump required in **Par 2** (3) (A) (b) for cargo ships) shall have a capacity not less than 80 % of the total required capacity divided by the minimum number of required fire pumps but in any case not less than 25 m^3/h and each such pump shall in any event be capable of delivering at least the two required jets of water. These fire pumps shall be capable of supplying the fire main system under the required conditions. Where more pumps than the minimum of required pumps are installed such additional pumps shall have a capacity of at least 25 m^3/h and shall be capable of delivering at least the two jets of water required in **Par 1** (5) (A).

3. Fire hoses and nozzles are to comply with the following requirements. (Refer to the Guidance)

(1) Fire hoses shall be of non-perishable material approved and shall be sufficient in length to project a jet of water to any of the spaces in which they may be required to be used. Each hose shall be provided with a nozzle and the necessary couplings. Hoses specified in this chapter as "fire hoses" shall, together with any necessary fittings and tools, be kept ready for use in conspicuous positions near the water service hydrants or connections. Additionally, in interior locations in passenger ships carrying more than 36 passengers fire hoses shall be connected to the hydrants at all times. Fire hoses shall have a length of at least 10 m, but not more than:

(A) 15 m in machinery spaces;
(B) 20 m in other spaces and open decks; and
(C) 25 m for open decks on ships with a maximum breadth in excess of 30 m.

Unless one hose and nozzle is provided for each hydrant in the ship, there shall be complete interchangeability of hose couplings and nozzles.

(2) Number and diameter of fire hoses are to comply with the following requirements.

(A) Ships shall be provided with fire hoses the number and diameter of which shall be to the satisfaction of the Society.
(B) In passenger ships, there shall be at least one fire hose for each of the hydrants required by **Par 1** (5) and these hoses shall be used only for the purposes of extinguishing fires or testing the fire-extinguishing apparatus at fire drills and surveys.
(C) In cargo ships of 1,000 gross tonnage and upwards, the number of fire hoses to be provided shall be one for each 30 m length of the ship and one spare but in no case less than five in all. This number does not include any hoses required in any engine or boiler room. The Society may increase the number of hoses required so as to ensure that hoses in sufficient number are available and accessible at all times, having regard to the type of ship and the nature of trade in which the ship is employed. Ships carrying dangerous goods in accordance with the Rules for Classification of Steel Ships, **Ch. 5, Sec 2** shall be provided with 3 hoses and nozzles, in addition to those required above; and in cargo ships of less than 1,000 gross tonnage, the number of fire hoses to be provided shall be calculated in accordance with this paragraph. However, the number of hoses shall in no case be less than three.

(3) Size and types of nozzles are to comply with the following requirements.

(A) For the purposes of this chapter, standard nozzle sizes shall be 12 mm, 16 mm and 19 mm or as near thereto as possible. Larger diameter nozzles may be permitted at the discretion of the Society.
(B) For accommodation and service spaces, a nozzle size greater than 12 mm need not be used.
(C) For machinery spaces and exterior locations, the nozzle size shall be such as to obtain the maximum discharge possible from two jets at the pressure mentioned in **Par 1** (6) from the smallest pump, provided that a nozzle size greater than 19 mm need not be used.
(D) Nozzles shall be of an approved dual-purpose type (i.e., spray/jet type) incorporating a shutoff.

402. Portable fire extinguisher

1. Portable fire extinguishers shall comply with the requirements of the Fire Safety Systems Code. (Refer to the Guidance)

2. Arrangement of fire extinguishers shall satisfy the following requirements. (Refer to the Guidance)

(1) Accommodation spaces, service spaces and control stations shall be provided with portable fire extinguishers of appropriate types and in sufficient number to the satisfaction of the Society. Ships of 1,000 gross tonnage and upwards shall carry at least five portable fire extinguishers.
(2) One of the portable fire extinguishers intended for use in any space shall be stowed near the entrance to that space.
(3) Carbon dioxide fire extinguishers shall not be placed in accommodation spaces. In control stations and other spaces containing electrical or electronic equipment or appliances necessary for the safety of the ship, fire extinguishers should be provided whose extinguishing media are neither electrically conductive nor harmful to the equipment and appliances.

(4) Fire extinguishers shall be situated ready for use at easily visible places, which can be reached quickly and easily at any time in the event of a fire, and in such a way that their serviceability is not impaired by the weather, vibration or other external factors. Portable fire extinguishers shall be provided with devices which indicate whether they have been used.

3. Spare charges shall satisfy the following requirements.

(1) Spare charges shall be provided for 100 % of the first 10 extinguishers and 50 % of the remaining fire extinguishers capable of being recharged on board. Not more than 60 total spare charges are required. Instructions for recharging shall be carried on board.

(2) For fire extinguishers which cannot be recharged onboard, additional portable fire extinguishers of the same quantity, type, capacity and number as determined in paragraph (1) above shall be provided in lieu of spare charges.

403. Fixed fire - extinguishing systems

1. Types of fixed fire extinguishing systems shall satisfy the following requirements.

(1) A fixed fire extinguishing system required by **404.** below may be any of the following systems:

(A) a fixed gas fire-extinguishing system complying with the provisions of the Fire Safety Systems Code; (Refer to the Guidance)

(B) a fixed high-expansion foam fire-extinguishing system complying with the provisions of the Fire Safety Systems Code; and (Refer to the Guidance)

(C) a fixed pressure water-spraying fire-extinguishing system complying with the provisions of the Fire Safety Systems Code. (Refer to the Guidance)

(2) Where a fixed fire-extinguishing system not required by this chapter is installed, it shall meet the requirements of the relevant regulations of this chapter and the Fire Safety Systems Code.

(3) Fire-extinguishing systems using Halon 1211, 1301, and 2402 and perfluorocarbons shall be prohibited.

(4) In general, the Society shall not permit the use of steam as a fire-extinguishing medium in fixed fire-extinguishing systems. Where the use of steam is permitted, it shall be used only in restricted areas as an addition to the required fire-extinguishing system and shall comply with the requirements of the Fire Safety System Code.

2. Where a fixed gas fire-extinguishing system is used, openings which may admit air to, or allow gas to escape from, a protected space shall be capable of being closed from outside the protected space.

3. When the fire extinguishing medium is stored outside a protected space, it shall be stored in a room which is located behind the forward collision bulkhead, and is used for no other purposes. Any entrance to such a storage room shall preferably be from the open deck and shall be independent of the protected space. If the storage space is located below deck, it shall be located no more than one deck below the open deck and shall be directly accessible by a stairway or ladder from the open deck. Spaces which are located below deck or spaces where access from the open deck is not provided, shall be fitted with a mechanical ventilation system designed to take exhaust air from the bottom of the space and shall be sized to provide at least 6 air changes per hour. Access doors shall open outwards, and bulkheads and decks including doors and other means of closing any opening therein, which form the boundaries between such rooms and adjacent enclosed spaces shall be gastight. For the purpose of the application of **Tables 8.3.1** to **8.3.8,** such storage rooms shall be treated as fire control stations.

4. Pumps, other than those serving the fire main, required for the provision of water for fire-extinguishing systems required by this chapter, their sources of power and their controls shall be installed outside the space or spaces protected by such systems and shall be so arranged that a fire in the space or spaces protected will not put any such system.

404. Fire extinguishing arrangements in machinery spaces

1. Machinery spaces containing oil-fired boilers or oil fuel units shall satisfy the following requirements. (Refer to the Guidance)

(1) Machinery spaces of category A containing oil-fired boilers or oil fuel units shall be provided with any one of the fixed fire-extinguishing systems in **403. 1** In each case, if the engine and boiler rooms are not entirely separate, or if fuel oil can drain from the boiler room into the engine-room, the combined engine and boiler rooms shall be considered as one compartment.

(2) Additional fire-extinguishing arrangements

(A) There shall be in each boiler room or at an entrance outside of the boiler room at least one portable foam applicator unit complying with the provisions of the Fire Safety Systems Code.

(B) There shall be at least two portable foam extinguishers or equivalent in each firing space in each boiler room and in each space in which a part of the oil fuel installation is situated. There shall be not less than one approved foam-type extinguisher of at least 135 liters capacity or equivalent in each boiler room. These extinguishers shall be provided with hoses on reels suitable for reaching any part of the boiler room. In the case of domestic boilers of less than 175 kW an approved foam-type extinguisher of at least 135 liters capacity is not required.

(C) In each firing space there shall be a receptacle containing at least 0.1 m^3 sand, sawdust impregnated with soda, or other approved dry material, along with a suitable shovel for spreading the material. An approved portable extinguisher may be substituted as an alternative.

2. Machinery spaces containing internal combustion machinery shall satisfy the following requirements. (Refer to the Guidance)

(1) Machinery spaces of category A containing internal combustion machinery shall be provided with one of the fixed fire-extinguishing systems in **403. 1.**

(2) Additional fire-extinguishing arrangements are to comply with the following requirements.

(A) There shall be at least one portable foam applicator unit complying with the provisions of the Fire Safety Systems Code.

(B) There shall be in each such space approved foam-type fire extinguishers, each of at least 45 liters capacity or equivalent, sufficient in number to enable foam or its equivalent to be directed on to any part of the fuel and lubricating oil pressure systems, gearing and other fire hazards. In addition, there shall be provided a sufficient number of portable foam extinguishers or equivalent which shall be so located that no point in the space is more than 10 m walking distance from an extinguisher and that there are at least two such extinguishers in each such space. For smaller spaces of cargo ships the Society may consider relaxing this requirement.

3. Machinery spaces containing steam turbines or enclosed steam engines shall satisfy the following requirements.

(1) In spaces containing steam turbines or enclosed steam engines used for main propulsion or other purposes having in the aggregate a total output of not less than 375 kW, one of the fire-extinguishing systems specified in **403. 1** shall be provided if such spaces are periodically unattended.

(2) Additional fire-extinguishing arrangements are to comply with the following requirements.

(A) There shall be approved foam fire extinguishers each of at least 45 liters capacity or equivalent sufficient in number to enable foam or its equivalent to be directed on to any part of the pressure lubrication system, on to any part of the casings enclosing pressure lubricated parts of the turbines, engines or associated gearing, and any other fire hazards. However, such extinguishers shall not be required if protection, at least equivalent to that required by this subparagraph, is provided in such spaces by a fixed fire-extinguishing system fitted in compliance with **403. 1.**

(B) There shall be a sufficient number of portable foam extinguishers or equivalent which shall be so located that no point in the space is more than 10 m walking distance from an extinguisher and that there are at least two such extinguishers in each such space, except that such extinguishers shall not be required in addition to any provided in compliance with **404. 1** (2) (B).

4. Where, in the opinion of the Society, a fire hazard exists in any machinery space for which no specific provisions for fire-extinguishing appliances are prescribed in **Par 1, 2** and **3,** there shall be provided in, or adjacent to, that space such a number of approved portable fire extinguishers or other means of fire extinction as the Society may deem sufficient.

5. In passenger ships carrying more than 36 passengers, each machinery space of category A shall be provided with at least two suitable water fog applicators. (Refer to the Guidance)

6. Fixed local application fire-fighting systems shall comply with the following requirements. (Refer to the Guidance)

(1) It shall apply to passenger ships of 500 gross tonnage and above and cargo ships of 2000 gross tonnage and above.
(2) Machinery spaces of category A above 500 m^3 in volume shall, in addition to the fixed fire-extinguishing system required in **404. 1** (1), be protected by an approved type of fixed water-based or equivalent local application fire-fighting system, based on the guidelines developed by the IMO Organization. In the case of periodically unattended machinery spaces, the fire fighting system shall have both automatic and manual release capabilities. In the case of continuously manned machinery spaces, the fire-fighting system is only required to have a manual release capability.
(3) Fixed local application fire-fighting systems are to protect areas such as the following without the necessity of engine shutdown, personnel evacuation, or sealing of the spaces:
(A) the fire hazard portions of internal combustion machinery used for the ship's main propulsion and power generation; (Refer to the Guidance)
(B) boiler fronts;
(C) the fire hazard portions of incinerators; and
(D) purifiers for heated fuel oil.
(4) Activation of any local application system shall give a visual and distinct audible alarm in the protected space and at continuously manned stations. The alarm shall indicate the specific system activated. The system alarm requirements described within this paragraph are in addition to, and not a substitute for, the detection and fire alarm system required elsewhere in this chapter.

405. Fire-extinguishing arrangements in control stations, accommodation and service spaces

1. Sprinkler and water spray systems in passenger ships shall satisfy the following requirements.

(1) Passenger ships carrying more than 36 passengers shall be equipped with an automatic sprinkler, fire detection and fire alarm system of an approved type complying with the requirements of the Fire Safety Systems Code in all control stations, accommodation and service spaces, including corridors and stairways. Alternatively, control stations, where water may cause damage to essential equipment, may be fitted with an approved fixed fire-extinguishing system of another type. Spaces having little or no fire risk such as voids, public toilets, carbon dioxide rooms and similar spaces need not be fitted with an automatic sprinkler system. (Refer to the Guidance)
(2) In passenger ships carrying not more than 36 passengers, when a fixed smoke detection and fire alarm system complying with the provisions of the Fire Safety Systems Code is provided only in corridors, stairways and escape routes within accommodation spaces, an automatic sprinkler system shall be installed in accordance with regulation **103. 3** (2).
(3) A fixed pressure water-spraying fire-extinguishing system complying with the provisions of the Fire Safety Systems Code shall be installed on cabin balconies of ships to which regulation **Sec. 2, 202. 4** applies, where furniture and furnishings on such balconies are not as defined in regulations **Sec. 1, 103. 40** (1),(2),(3),(6) and (7).

2. In cargo ships in which method IIC specified in regulation **301. 3** (1) (A) (b) is adopted, an automatic sprinkler, fire detection and fire alarm system shall be fitted in accordance with the requirements in regulation **103. 5** (2).

3. Spaces containing flammable liquid shall satisfy the following requirements.

(1) Paint lockers shall be protected by:
(A) a carbon dioxide system, designed to give a minimum volume of free gas equal to 40 % of the gross volume of the protected space.
(B) a dry powder system, designed for at least 0.5 kg/m^3 ;
(C) a water spraying or sprinkler system, designed for 5 litres/m^2 min. Water spraying systems may be connected to the fire main of the ship; or

(D) a system providing equivalent protection, as determined by the Society. In any case, the system shall be operable from outside the protected space.

(2) Flammable liquid lockers shall be protected by an appropriate fire-extinguishing arrangement approved by the Society. (Refer to the Guidance)

(3) For lockers of a deck area of less than 4 m^2, which do not give access to accommodation spaces, a carbon dioxide portable fire extinguisher sized to provide a minimum volume of free gas equal to 40 % of the gross volume of the space may be accepted in lieu of a fixed system. A discharge port shall be arranged in the locker to allow the discharge of the extinguisher without having to enter into the protected space. The required portable fire extinguisher shall be stowed adjacent to the port. Alternatively, a port or hose connection may be provided to facilitate the use of fire main water. (Refer to the Guidance)

4. Deep-fat cooking equipment

Deep-fat cooking equipment installed in enclosed spaces or on open decks shall be fitted with the following:

(1) an automatic or manual extinguishing system tested to an international standard acceptable to the IMO;*

(2) a primary and backup thermostat with an alarm to alert the operator in the event of failure of either thermostat;

(3) arrangements for automatically shutting off the electrical power upon activation of the extinguishing system;

(4) an alarm for indicating operation of the extinguishing system in the galley where the equipment is installed; and

(5) controls for manual operation of the extinguishing system which are clearly labelled for ready use by the crew.

406. Fire-extinguishing arrangements in cargo spaces

1. Fixed gas fire-extinguishing systems for general cargo shall satisfy the following requirements. (Refer to the Guidance)

(1) Except as provided for in **Par 2,** the cargo spaces of passenger ships of 1,000 gross tonnage and upwards shall be protected by a fixed carbon dioxide or inert gas fire-extinguishing system complying with the provisions of the Fire Safety Systems Code or by a fixed high expansion foam fire-extinguishing system which gives equivalent protection.

(2) Where it is shown to the satisfaction of the Society that a passenger ship is engaged on voyages of such short duration that it would be unreasonable to apply the requirements of paragraph (1) and also in ships of less than 1,000 gross tonnage, the arrangements in cargo spaces shall be to the satisfaction of the Society, provided that the ship is fitted with steel hatch covers and effective means of closing all ventilators and other openings leading to the cargo spaces.

(3) Except for ro-ro and vehicle spaces, cargo spaces on cargo ships of 2,000 gross tonnage and upwards shall be protected by a fixed carbon dioxide or inert gas fire-extinguishing system complying with the provisions of the Fire Safety Systems Code, or by a fire-extinguishing system which gives equivalent protection. (Refer to the Guidance)

(4) The Society may exempt from the requirements of **Par 1** (3) and 2, cargo spaces of any cargo ship if constructed, and solely intended for, the carriage of ore, coal, grain, unseasoned timber, non-combustible cargoes or cargoes which, in the opinion of the Society, constitute a low fire risk*. Such exemptions may be granted only if the ship is fitted with steel hatch covers and effective means of closing ventilators and other openings leading to the cargo spaces. The Society shall issue an exemption certificate concerned and shall ensure that the list of cargoes the ship is permitted to carry is attached to the exemption certificate. (Refer to the Guidance)

2. A ship engaged in the carriage of dangerous goods in any cargo spaces shall be provided with a fixed carbon dioxide or inert gas fire-extinguishing system complying with the provisions of the Fire Safety Systems Code or with a fire-extinguishing system which, in the opinion of the Society, gives equivalent protection for the cargoes carried. (Refer to the Guidance)

407. Cargo tank protection

1. Fixed deck foam systems shall satisfy the following requirements. (Refer to the Guidance)
(1) For tankers of 20,000 tonnes deadweight and upwards, a fixed deck foam system shall be provided in accordance with the requirements of the Fire Safety Systems Code, except that, in lieu of the above, the Society, after having given consideration to the ship's arrangement and equipment, may accept other fixed installations if they afford protection equivalent to the above. The requirements for alternative fixed installations shall comply with the requirements in paragraph (2).
(2) In accordance with paragraph (1), where the Society accepts an equivalent fixed installation in lieu of the fixed deck foam system, the installation shall:
(A) be capable of extinguishing spill fires and also preclude ignition of spilled oil not yet ignited; and
(B) be capable of combating fires in ruptured tanks.
(3) Tankers of less than 20,000 tonnes deadweight shall be provided with a deck foam system complying with the requirements of the Fire Safety Systems Code.

408. Protection of cargo pump room

1. Each cargo pump-room shall be provided with one of the following fixed fire-extinguishing systems operated from a readily accessible position outside the pump-room. Cargo pump-rooms shall be provided with a system suitable for machinery spaces of category A. (Refer to the Guidance)
(1) A carbon dioxide system complying with the provisions the Fire Safety Systems Code and with the following requirements : (Refer to the Guidance)
(A) the alarms giving audible warning of the release of fire-extinguishing medium shall be safe for use in a flammable cargo vapour/air mixture; and
(B) a notice shall be exhibited at the controls stating that due to the electrostatic ignition hazard, the system is to be used only for fire extinguishing and not for inerting purposes.
(2) A high-expansion foam system complying with the provisions of the Fire Safety Systems Code, provided that the foam concentrate supply is suitable for extinguishing fires involving the cargoes carried.
(3) A fixed pressure water-spraying system complying with the provisions of the Fire Safety Systems Code.

2. Where the extinguishing medium used in the cargo pump-room system is also used in systems serving other spaces, the quantity of medium provided or its delivery rate need not be more than the maximum required for the largest compartment.

409. Fire-fighter's outfit

1. Fire-fighter's outfits shall comply with the Fire Safety Systems Code. (Refer to the Guidance)

2. Number of fire-fighter's outfits shall satisfy the following requirements.
(1) Ships shall carry at least two fire-fighter's outfits.
(2) In addition, in passenger ships there shall be provided:
(A) for every 80 m, or part thereof, of the aggregate of the lengths of all passenger spaces and service spaces on the deck which carries such spaces or, if there is more than one such deck, on the deck which has the largest aggregate of such lengths, two fire-fighter's outfits and, in addition, two sets of personal equipment, each set comprising the items stipulated in the Fire Safety Systems Code. In passenger ships carrying more than 36 passengers, two additional fire-fighter's outfits shall be provided for each main vertical zone. However, for stairway enclosures which constitute individual main vertical zones and for the main vertical zones in the fore or aft end of a ship which do not contain spaces of categories ⑥,⑦,⑧, ⑫ defined in regulation **301. 2** (3), no additional fire-fighter's outfits are required; and
(B) ships carrying more than 36 passengers, for each pair of breathing apparatus there shall be provided one water fog applicator which shall be stored adjacent to such apparatus.
(3) In addition, in tankers, two fire-fighter's outfits shall be provided.
(4) The Society may require additional sets of personal equipment and breathing apparatus, having

due regard to the size and type of the ship.

(5) Two spare charges shall be provided for each required breathing apparatus. Passenger ships carrying not more than 36 passengers and cargo ships that are equipped with suitably located means for fully recharging the air cylinders free from contamination, need carry only one spare charge for each required apparatus. In passenger ships carrying more than 36 passengers, at least two spare charges for each breathing apparatus shall be provided.

(6) Passenger ships carrying more than 36 passengers shall be fitted with a suitably located means for fully recharging breathing air cylinders, free from contamination. The means for recharging shall be either :

(A) breathing air compressors supplied from the main and emergency switchboard, or independently driven, with a minimum capacity of 60 ℓ/min per required breathing apparatus, not to exceed 420 ℓ/min ; or

(B) self-contained high-pressure storage systems of suitable pressure to recharge the breathing apparatus used on board, with a capacity of at least 1,200 ℓ per required breathing apparatus, not to exceed 50,000 ℓ of free air.

3. Storage of fire-fighter's outfits shall satisfy the following requirements.

(1) The fire-fighter's outfits or sets of personal equipment shall be kept ready for use in an easily accessible location that is permanently and clearly marked and, where more than one fire-fighter's outfit or more than one set of personal equipment is carried, they shall be stored in widely separated positions.

(2) In passenger ships, at least two fire-fighter's outfits and, in addition, one set of personal equipment shall be available at any one position. At least two fire-fighter's outfits shall be stored in each main vertical zone.

SECTION 5 Structural integrity

501. Material of hull, superstructures, structural bulkheads, decks and deckhouses

The hull, superstructures, structural bulkheads, decks and deckhouses shall be constructed of steel or other equivalent material. For the purpose of applying the definition of steel or other equivalent material as given in **Ch 1, 103. 43** the "applicable fire exposure" shall be according to the integrity and insulation standards given in **Tables 8.3.1** to **8.3.4.** For example, where divisions such as decks or sides and ends of deckhouses are permitted to have "B-0" fire integrity, the "applicable fire exposure shall be half an hour. (Refer to the Guidance)

502. Structure of aluminium alloy

1. Unless otherwise specified in **501.,** in cases where any part of the structure is of aluminium alloy, the following shall apply:

(1) the insulation of aluminium alloy components of "A" or "B" class divisions, except structure which, in the opinion of the Society, is non-load-bearing, shall be such that the temperature of the structural core does not rise more than 200 ℃ above the ambient temperature at any time during the applicable fire exposure to the standard fire test; and (Refer to the Guidance)

(2) special attention shall be given to the insulation of aluminium alloy components of columns, stanchions and other structural members required to support lifeboat and liferaft stowage, launching and embarkation areas, and "A" and "B" class divisions to ensure:

(A) that for such members supporting lifeboat and liferaft areas and "A" class divisions, the temperature rise limitation specified in paragraph (1) shall apply at the end of one hour; and

(B) that for such members required to support "B" class divisions, the temperature rise limitation specified in paragraph (1) shall apply at the end of half an hour.

503. Machinery spaces of category A

1. Crowns and casings of machinery spaces of category A shall be of steel construction and shall be insulated as required by **Tables 8.3.5** and **8.3.7,** as appropriate. (Refer to the Guidance)

2. The floor plating of normal passageways in machinery spaces of category A shall be made of steel.

504. Materials of overboard fittings

Materials readily rendered ineffective by heat shall not be used for overboard scuppers, sanitary discharges, and other outlets which are close to the waterline and where the failure of the material in the event of fire would give rise to danger of flooding. (Refer to the Guidance)

505. Protection of cargo tank structure against pressure or vacuum in tankers

1. The venting arrangements shall be so designed and operated as to ensure that neither pressure nor vacuum in cargo tanks shall exceed design parameters and be such as to provide for

(1) the flow of the small volumes of vapour, air or inert gas mixtures caused by thermal variations in a cargo tank in all cases through pressure/vacuum valves; and (Refer to the Guidance)

(2) the passage of large volumes of vapour, air or inert gas mixtures during cargo loading and ballasting, or during discharging.

2. Openings for pressure release required by paragraph (1) shall have as great a height as is practicable above the cargo tank deck to obtain maximum dispersal of flammable vapours, but in no case less than 2 m above the cargo tank deck; and be arranged at the furthest distance practicable but not less than 5 m from the nearest air intakes and openings to enclosed spaces containing a source of ignition and from deck machinery and equipment which may constitute an ignition hazard. Anchor windlass and chain locker openings constitute an ignition hazard. (Refer to the Guidance)

3. Safety measures in cargo tanks shall satisfy the following requirements.

(1) Provisions shall be made to guard against liquid rising in the venting system to a height which would exceed the design head of cargo tanks. This shall be accomplished by high-level alarms or overflow control systems or other equivalent means, together with independent gauging devices and cargo tank filling procedures. For the purposes of this regulation, spill valves are not considered equivalent to an overflow system.

(2) A secondary means of allowing full flow relief of vapour, air or inert gas mixtures to prevent over-pressure or under-pressure in the event of failure of the arrangements in **Par 1. (2)** Alternatively, pressure sensors may be fitted in each tank protected by the arrangement required in **Par 1. (2),** with a monitoring system in the ship's cargo control room or the position from which cargo operations are normally carried out. Such monitoring equipment shall also provide an alarm facility which is activated by detection of over-pressure or under-pressure conditions within a tank. (Refer to the Guidance)

(3) Pressure/vacuum valves required by **Par 1. (1)** may be provided with a bypass arrangement when they are located in a vent main or masthead riser. Where such an arrangement is provided there shall be suitable indicators to show whether the bypass is open or closed.

(4) One or more pressure/vacuum-breaking devices shall be provided to prevent the cargo tanks from being subject to:

(A) a positive pressure, in excess of the test pressure of the cargo tank, if the cargo were to be loaded at the maximum rated capacity and all other outlets are left shut; and

(B) a negative pressure in excess of 700 mm water gauge if cargo were to be discharged at the maximum rated capacity of the cargo pumps and the inert gas blowers were to fail.

Such devices shall be installed on the inert gas main unless they are installed in the venting system required by regulation **Ch 2, 104. 3** (1) or on individual cargo tanks. The location and design of the devices shall be in accordance with regulation **Ch 2, 104. 3** and **505.**

4. Vent outlets for cargo loading, discharging and ballasting required by **Par 1.** shall be designed on the basis of the maximum designed loading rate multiplied by a factor of at least 1.25 to take account of gas evolution, in order to prevent the pressure in any cargo tank from exceeding the design pressure. The master shall be provided with information regarding the maximum permissible loading rate for each cargo tank and in the case of combined venting systems, for each group of cargo tanks. (Refer to the Guidance) ⚓

CHAPTER 4 ESCAPE

SECTION 1 Notification of crew and passengers

101. General emergency alarm system

A general emergency alarm system required by SOLAS shall be used for notifying crew and passengers of a fire.

102. Public address systems in passenger ships

A public address system or other effective means of communication complying with the requirements of SOLAS shall be available throughout the accommodation and service spaces and control stations and open decks.

SECTION 2 Means of escape

201. General requirements

1. Unless expressly provided otherwise in this regulation, at least two widely separated and ready means of escape shall be provided from all spaces or group of spaces.

2. Lifts shall not be considered as forming one of the means of escape as required by this regulation.

202. Means of escape from control stations, accommodation and service spaces

1. The following requirements shall comply with.

(1) Stairways and ladders shall be so arranged as to provide ready means of escape to the lifeboat and liferaft embarkation deck from passenger and crew accommodation spaces and from spaces in which the crew is normally employed, other than machinery spaces.

(2) Unless expressly provided otherwise in this regulation, a corridor, lobby, or part of a corridor from which there is only one route of escape shall be prohibited. Dead-end corridors used in service areas which are necessary for the practical utility of the ship, such as fuel oil stations and athwartship supply corridors, shall be permitted, provided such dead-end corridors are separated from crew accommodation areas and are inaccessible from passenger accommodation areas. Also, a part of a corridor that has a depth not exceeding its width is considered a recess or local extension and is permitted.

(3) All stairways in accommodation and service spaces and control stations shall be of steel frame construction except where the Society sanctions the use of other equivalent material.

(4) If a radiotelegraph station has no direct access to the open deck, two means of escape from or access to, the station shall be provided, one of which may be a porthole or window of sufficient size or other means to the satisfaction of the Society. (Refer to the Guidance)

(5) Doors in escape routes shall, in general, open in-way of the direction of escape, except that:

(A) individual cabin doors may open into the cabins in order to avoid injury to persons in the corridor when the door is opened; and

(B) doors in vertical emergency escape trunks may open out of the trunk in order to permit the trunk to be used both for escape and for access.

2. Means of escape in **passenger** ships shall comply with the following requirements.

(1) Escape from spaces below the bulkhead deck shall satisfy the following requirements.

(A) Below the bulkhead deck two means of escape, at least one of which shall be independent of watertight doors, shall be provided from each watertight compartment or similarly restricted space or group of spaces. Exceptionally, the Society may dispense with one of the means of escape for crew spaces that are entered only occasionally, if the required escape route is independent of watertight doors.

(B) Where the Society has granted dispensation under the provisions of paragraph (A), this sole means of escape shall provide safe escape. However, stairways shall not be less than 800 mm in clear width with handrails on both sides.

(2) Above the bulkhead deck there shall be at least two means of escape from each main vertical zone or similarly restricted space or group of spaces at least one of which shall give access to a stairway forming a vertical escape.

(3) Stairway enclosures in accommodation and service spaces shall have direct access from the corridors and be of a sufficient area to prevent congestion, having in view the number of persons likely to use them in an emergency. Within the perimeter of such stairway enclosures, only public toilets, lockers of non-combustible material providing storage for non-hazardous safety equipment and open information counters are permitted. Only corridors, lifts, public toilets, special category spaces and open ro-ro spaces to which any passengers carried can have access, other escape stairways required by paragraph (4) (A) and external areas are permitted to have direct access to these stairway enclosures. Public spaces may also have direct access to stairway enclosures except for the backstage of a theatre. Small corridors or "lobbies" used to separate an enclosed stairway from galleys or main laundries may have direct access to the stairway provided they have a minimum deck area of 4.5 m^2, a width of no less than 900 mm and contain a fire hose station.

(4) Details of means of escape shall satisfy the following requirements.

(A) At least one of the means of escape required by paragraphs (1) (A) and (2) shall consist of a readily accessible enclosed stairway, which shall provide continuous fire shelter from the level of its origin to the appropriate lifeboat and liferaft embarkation decks, or to the uppermost weather deck if the embarkation deck does not extend to the main vertical zone being considered. In the latter case, direct access to the embarkation deck by way of external open stairways and passageways shall be provided and shall have emergency lighting in accordance with regulation of SOLAS and slip-free surfaces underfoot. Boundaries facing external open stairways and passageways forming part of an escape route and boundaries in such a position that their failure during a fire would impede escape to the embarkation deck shall have fire integrity, including insulation values, in accordance with **Tables 8.3.1** to **8.3.4,** as appropriate.

(B) Protection of access from the stairway enclosures to the lifeboat and liferaft embarkation areas shall be provided either directly or through protected internal routes which have fire integrity and insulation values for stairway enclosures as determined by **Tables 8.3.1** to **8.3.4,** as appropriate.

(C) Stairways serving only a space and a balcony in that space shall not be considered as forming one of the required means of escape.

(D) Each level within an atrium shall have two means of escape, one of which shall give direct access to an enclosed vertical means of escape meeting the requirements of paragraph (A).

(E) The widths, number and continuity of escapes shall be in accordance with the requirements in the Fire Safety Systems Code. (Refer to the Guidance)

(5) Marking of escape routes shall satisfy the following requirements.

(A) In addition to the emergency lighting required by regulations of SOLAS, the means of escape, including stairways and exits, shall be marked by lighting or photoluminescent strip indicators placed not more than 300 mm above the deck at all points of the escape route including angles and intersections. The marking must enable passengers to identify the routes of escape and readily identify the escape exits. If electric illumination is used, it shall be supplied by the emergency source of power and it shall be so arranged that the failure of any single light or cut in a lighting strip will not result in the marking being ineffective. Additionally, escape route signs and fire equipment location markings shall be of photoluminescent material or marked by lighting. The Society shall ensure that such lighting or photoluminescent equipment has been evaluated, tested and applied in accordance with the Fire Safety Systems Code. (Refer to the Guidance)

(B) In passenger ships carrying more than 36 passengers, the requirements of the paragraph (A) shall also apply to the crew accommodation areas.

(C) In lieu of the escape route lighting system required by (A), alternative evacuation guidance systems may be accepted if approved by the Society based on the guidelines developed by the IMO.

(6) Normally locked doors that form part of an escape route shall satisfy the following requirements.

(A) Cabin and stateroom doors shall not require keys to unlock them from inside the room. Neither shall there be any doors along any designated escape route which require keys to unlock them when moving in the direction of escape.
(B) Escape doors from public spaces that are normally latched shall be fitted with a means of quick release. Such means shall consist of a door-latching mechanism incorporating a device that releases the latch upon the application of a force in the direction of escape flow. Quick release mechanisms shall be designed and installed to the satisfaction of the Society and, in particular:
(a) consist of bars or panels, the actuating portion of which extends across at least one half of the width of the door leaf, at least 760 mm and not more than 1120 mm above the deck;
(b) cause the latch to release when a force not exceeding 67 N is applied; and
(c) not be equipped with any locking device, set screw or other arrangement that prevents the release of the latch when pressure is applied to the releasing device.

3. Means of escape in cargo ships shall comply with the following requirements. (Refer to the Guidance)

(1) At all levels of accommodation there shall be provided at least two widely separated means of escape from each restricted space or group of spaces.
(2) Below the lowest open deck the main means of escape shall be a stairway and the second escape may be a trunk or a stairway. (Refer to the Guidance)
(3) Above the lowest open deck the means of escape shall be stairways or doors to an open deck or a combination thereof. (Refer to the Guidance)
(4) No dead-end corridors having a length of more than 7 m shall be accepted. (Refer to the Guidance)
(5) The width, number and continuity of escape routes shall be in accordance with the requirements in the Fire Safety Systems Code.
(6) Exceptionally the Society may dispense with one of the means of escape, for crew spaces that are entered only occasionally, if the required escape route is independent of watertight doors.

4. Emergency escape breathing devices shall comply with the following requirements.

(1) Emergency escape breathing devices shall comply with the Fire Safety Systems Code. Spare emergency escape breathing devices shall be kept onboard. (Refer to the Guidance)
(2) All ships shall carry at least two emergency escape breathing devices within accommodation spaces.
(3) In passenger ships, at least two emergency escape breathing devices shall be carried in each main vertical zone.
(4) In passenger ships carrying more than 36 passengers, two emergency escape breathing devices, in addition to those required in paragraph (3) above, shall be carried in each main vertical zone.
(5) However, paragraphs (3) and (4) do not apply to stairway enclosures which constitute individual main vertical zones and for the main vertical zones in the fore or aft end of a ship which do not contain spaces of categories ⑥,⑦,⑧,⑫ defined in **Ch 3, 301. 2** (3).

203. Means of escape from machinery spaces

1. Means of escape from each machinery space in passenger ships shall comply with the following provisions. (Refer to the Guidance)

(1) Where the space is below the bulkhead deck the two means of escape shall consist of either:
(A) two sets of steel ladders as widely separated as possible, leading to doors in the upper part of the space similarly separated and from which access is provided to the appropriate life boat and liferaft embarkation decks. One of these ladders shall be located within a protected enclosure that satisfies **Ch 3, 301. 2** (3), category ②, or **Ch 3, 301. 2** (4), category ④, as appropriate, from the lower part of the space it serves to a safe position outside the space. Self-closing fire doors of the same fire integrity standards shall be fitted in the enclosure. The ladder shall be fixed in such a way that heat is not transferred into the enclosure through non-insulated fixing points. The protected enclosure shall have minimum internal dimensions of at least 800 mm × 800 mm, and shall have emergency lighting provisions; or
(B) one steel ladder leading to a door in the upper part of the space from which access is

provided to the embarkation deck and additionally, in the lower part of the space and in a position well separated from the ladder referred to, a steel door capable of being operated from each side and which provides access to a safe escape route from the lower part of the space to the embarkation deck.

(2) Where the space is above the bulkhead deck, the two means of escape shall be as widely separated as possible and the doors leading from such means of escape shall be in a position from which access is provided to the appropriate lifeboat and liferaft embarkation decks. Where such means of escape require the use of ladders, these shall be of steel.

(3) In a ship of less than 1,000 gross tonnage, the Society may dispense with one of the means of escape, due regard being paid to the width and disposition of the upper part of the space. In a ship of 1,000 gross tonnage and above, the Society may dispense with one means of escape from any such space, including a normally unattended auxiliary machinery space, so long as either a door or a steel ladder provides a safe escape route to the embarkation deck, due regard being paid to the nature and location of the space and whether persons are normally employed in that space. In the steering gear space, a second means of escape shall be provided when the emergency steering position is located in that space unless there is direct access to the open deck.

(4) Two means of escape shall be provided from a machinery control room located within a machinery space, at least one of which will provide continuous fire shelter to a safe position outside.

2. Means of escape from each machinery space in cargo ships shall comply with the following provisions. (Refer to the Guidance)

(1) Except as provided in paragraph (2), two means of escape shall be provided from each machinery space of category A. In particular, one of the following provisions shall be complied with:

(A) two sets of steel ladders as widely separated as possible leading to doors in the upper part of the space similarly separated and from which access is provided to the open deck. One of these ladders shall be located within a protected enclosure that satisfies **Ch 3, 301. 2** (3), category ④, from the lower part of the space it serves to a safe position outside the space. Self-closing fire doors of the same fire integrity standards shall be fitted in the enclosure. The ladder shall be fixed in such a way that heat is not transferred into the enclosure through non-insulated fixing points. The enclosure shall have minimum internal dimensions of at least 800 mm × 800 mm, and shall have emergency lighting provisions; or

(B) one steel ladder leading to a door in the upper part of the space from which access is provided to the open deck and, additionally, in the lower part of the space and in a position well separated from the ladder referred to, a steel door capable of being operated from each side and which provides access to a safe escape route from the lower part of the space to the open deck.

(2) In a ship of less than 1,000 gross tonnage, the Society may dispense with one of the means of escape required under paragraph (1), due regard being paid to the dimension and disposition of the upper part of the space. In addition, the means of escape from machinery spaces of category A need not comply with the requirement for an enclosed fire shelter listed in paragraph (1) (A). In the steering gear space, a second means of escape shall be provided when the emergency steering position is located in that space unless there is direct access to the open deck.

(3) From machinery spaces other than those of category A, two escape routes shall be provided except that a single escape route may be accepted for spaces that are entered only occasionally, and for spaces where the maximum travel distance to the door is 5 m or less. (Refer to the Guidance)

3. Emergency escape breathing devices shall satisfy the following requirements.(Refer to the Guidance)

(1) On all ships, within the machinery spaces, emergency escape breathing devices shall be situated ready for use at easily visible places, which can be reached quickly and easily at any time in the event of fire. The location of emergency escape breathing devices shall take into account the layout of the machinery space and the number of persons normally working in the spaces.*

(2) The number and location of these devices shall be indicated in the fire control plan required in regulation of SOLAS.

(3) Emergency escape breathing devices shall comply with the Fire Safety Systems Code. (Refer to the Guidance)

204. Means of escape on passenger ships from special category and open ro-ro spaces to which any passengers carried can have access

1. In special category and open ro-ro spaces to which any passengers carried can have access, the number and locations of the means of escape both below and above the bulkhead deck shall be to the satisfaction of the Society and, in general, the safety of access to the embarkation deck shall be at least equivalent to that provided for under **202. 2** (1) (A), **202. 2** (2), **202. 2** (4) (A), **202. 2** (4) (B). Such spaces shall be provided with designated walkways to the means of escape with a breadth of at least 600 mm. The parking arrangements for the vehicles shall maintain the walkways clear at all times.

2. One of the escape routes from the machinery spaces where the crew is normally employed shall avoid direct access to any special category space.

205. Means of escape from ro-ro spaces

At least two means of escape shall be provided in ro-ro spaces where the crew are normally employed. The escape routes shall provide a safe escape to the lifeboat and liferaft embarkation decks and shall be located at the fore and aft ends of the space. (Refer to the Guidance)

206. Additional requirements from ro-ro passenger ships

1. The following requirements shall comply with..

(1) Escape routes shall be provided from every normally occupied space on the ship to an assembly station. These escape routes shall be arranged so as to provide the most direct route possible to the assembly station, and shall be marked with symbols based on the guidelines developed by the IMO.

(2) The escape route from cabins to stairway enclosures shall be as direct as possible, with a minimum number of changes in direction. It shall not be necessary to cross from one side of the ship to the other to reach an escape route. It shall not be necessary to climb more than two decks up or down in order to reach an assembly station or open deck from any passenger space.

(3) External routes shall be provided from open decks, as referred to in paragraph (2), to the survival craft embarkation stations.

(4) Where enclosed spaces adjoin an open deck, openings from the enclosed space to the open deck shall, where practicable, be capable of being used as an emergency exit.

(5) Escape routes shall not be obstructed by furniture and other obstructions. With the exception of tables and chairs which may be cleared to provide open space, cabinets and other heavy furnishings in public spaces and along escape routes shall be secured in place to prevent shifting if the ship rolls or lists. Floor coverings shall also be secured in place. When the ship is underway, escape routes shall be kept clear of obstructions such as cleaning carts, bedding, luggage and boxes of goods.

2. Instruction for safe escape shall be in accordance with the following requirements.

(1) Decks shall be sequentially numbered, starting with "1" at the tank top or lowest deck. The numbers shall be prominently displayed at stair landings and lift lobbies. Decks may also be named, but the deck number shall always be displayed with the name.

(2) Simple "mimic" plans showing the "you are here" position and escape routes marked by arrows, shall be prominently displayed on the inside of each cabin door and in public spaces. The plan shall show the directions of escape and shall be properly oriented in relation to its position on the ship.

3. Strength of handrails and corridors shall comply with the following requirements.

(1) Handrails or other handholds shall be provided in corridors along the entire escape route so that a firm handhold is available at every step of the way, where possible, to the assembly stations and embarkation stations. Such handrails shall be provided on both sides of longitudinal corridors more than 1.8 m in width and transverse corridors more than 1 m in width. Particular attention shall be paid to the need to be able to cross lobbies, atriums and other large open spaces along escape routes. Handrails and other handholds shall be of such strength as to withstand a distributed horizontal load of 750 N/m applied in the direction of the centre of the

corridor or space, and a distributed vertical load of 750 N/m applied in the downward direction. The two loads need not be applied simultaneously.

(2) The lowest 0.5 m of bulkheads and other partitions forming vertical divisions along escape routes shall be able to sustain a load of 750 N/m to allow them to be used as walking surfaces from the side of the escape route with the ship at large angles of heel.

4. Escape routes shall be evaluated by an evacuation analysis early in the design process. The analysis shall be used to identify and eliminate, as far as practicable, congestion which may develop during an abandonment, due to normal movement of passengers and crew along escape routes, including the possibility that crew may need to move along these routes in a direction opposite the movement of passengers. In addition, the analysis shall be used to demonstrate that escape arrangements are sufficiently flexible to provide for the possibility that certain escape routes, assembly stations, embarkation stations or survival craft may not be available as a result of a casualty. ⚓

CHAPTER 5 SPECIAL REQUIREMENTS

SECTION 1 Helicopter facilities

101. Application

1. In addition ships equipped with helidecks shall comply with the requirements of this regulation.

2. Where helicopters land or conduct winching operations on an occasional or emergency basis on ships without helidecks, fire-fighting equipment fitted in accordance with the requirements in **Ch 3** may be used. This equipment shall be made readily available in close proximity to the landing or winching areas during helicopter operations.

3. Notwithstanding the requirements of **Par 2** above, ro-ro passenger ships without helidecks shall comply with the relevant regulation of the Convention. (Refer to the Guidance)

102. Structure

1. In general, the construction of the helidecks shall be of steel or other equivalent materials. If the helideck forms the deckhead of a deckhouse or superstructure, it shall be insulated to "A-60" class standard.

2. If the Society permits aluminium or other low melting point metal construction that is not made equivalent to steel, the following provisions shall be satisfied:

(1) if the platform is cantilevered over the side of the ship, after each fire on the ship or on the platform, the platform shall undergo a structural analysis to determine its suitability for further use; and

(2) if the platform is located above the ship's deckhouse or similar structure, the following conditions shall be satisfied:

(A) the deckhouse top and bulkheads under the platform shall have no openings;

(B) windows under the platform shall be provided with steel shutters; and

(C) after each fire on the platform or in close proximity, the platform shall undergo a structural analysis to determine its suitability for further use.

103. Means of escape

A helideck shall be provided with both a main and an emergency means of escape and access for fire fighting and rescue personnel. These shall be located as far apart from each other as is practicable and preferably on opposite sides of the helideck.

104. Fire-fighting appliances

1. In close proximity to the helideck, the following fire-fighting appliances shall be provided and stored near the means of access to that helideck:

(1) at least two dry powder extinguishers having a total capacity of not less than 45 kg;

(2) carbon dioxide extinguishers of a total capacity of not less than 18 kg or equivalent;

(3) a suitable foam application system consisting of monitors or foam making branch pipes capable of delivering foam to all parts of the helideck in all weather conditions in which helicopters can operate. The system shall be capable of delivering a discharge rate as required in table for at least five minutes;

Category	Helicopter overall length	Discharge rate foam solution(L/min)
H1	up to but not including 15 m	250
H2	from 15 m up to but not including 24 m	500
H3	from 24 m up to but not including 35 m	800

(4) the principal agent shall be suitable for use with salt water and conform to performance standards not inferior to those acceptable to the IMO Organization;

(5) at least two nozzles of an approved dual-purpose type (jet/spray) and hoses sufficient to reach any part of the helideck;
(6) in addition to the requirements of regulation **Ch 3, 409.,** two sets of fire-fighter's outfits; and
(7) at least the following equipment shall be stored in a manner that provides for immediate use and protection from the elements:
- adjustable wrench;
- blanket, fire resistant;
- cutters, bolt 60 cm;
- hook, grab or salving;
- hacksaw, heavy duty complete with 6 spare blades;
- ladder;
- lift line 5 mm diameter x 15 m in length;
- pliers, side cutting;
- set of assorted screwdrivers; and
- harness knife complete with sheath.

105. Drainage facilities

Drainage facilities in way of helidecks shall be constructed of steel and shall lead directly overboard independent of any other system and shall be designed so that drainage does not fall onto any part of the ship.

106. Helicopter refueling and hanger facilities

1. Where the ship has helicopter refuelling and hangar facilities, the following requirements shall be complied with:
(1) a designated area shall be provided for the storage of fuel tanks which shall be:
(A) as remote as is practicable from accommodation spaces, escape routes and embarkation stations; and
(B) isolated from areas containing a source of vapour ignition;
(2) the fuel storage area shall be provided with arrangements whereby fuel spillage may be collected and drained to a safe location;
(3) tanks and associated equipment shall be protected against physical damage and from a fire in an adjacent space or area;
(4) where portable fuel storage tanks are used, special attention shall be given to:
(A) design of the tank for its intended purpose;
(B) mounting and securing arrangements;
(C) electric bonding; and
(D) inspection procedures;
(5) storage tank fuel pumps shall be provided with means which permit shutdown from a safe remote location in the event of a fire. Where a gravity fuelling system is installed, equivalent closing arrangements shall be provided to isolate the fuel source;
(6) the fuel pumping unit shall be connected to one tank at a time. The piping between the tank and the pumping unit shall be of steel or equivalent material, as short as possible, and protected against damage;
(7) electrical fuel pumping units and associated control equipment shall be of a type suitable for the location and potential hazards;
(8) fuel pumping units shall incorporate a device which will prevent over-pressurization of the delivery or filling hose;
(9) equipment used in refuelling operations shall be electrically bonded;
(10)"NO SMOKING" signs shall be displayed at appropriate locations;
(11)hanger, refuelling and maintenance facilities shall be treated as category 'A' machinery spaces with regard to structural fire protection, fixed fire-extinguishing and detection system requirements;
(12)enclosed hanger facilities or enclosed spaces containing refuelling installations shall be provided with mechanical ventilation, as required by regulation **302.** for closed ro-ro spaces of cargo ships. Ventilation fans shall be of non-sparking type; and
(13)electric equipment and wiring in enclosed hanger or enclosed spaces containing refuelling installations shall comply with regulations **302. 2, 302. 3, 302. 4.**

107. Operations manual and fire- fighting service

1. Each helicopter facility shall have an operations manual, including a description and a checklist of safety precautions, procedures and equipment requirements. This manual may be part of the ship's emergency response procedures.

2. The procedures and precautions to be followed during refuelling operations shall be in accordance with recognized safe practices and contained in the operations manual.

3. Fire-fighting personnel consisting of at least two persons trained for rescue and fire-fighting duties and fire-fighting equipment shall be immediately available at all times when helicopter operations are expected.

4. Fire-fighting personnel shall be present during refuelling operations. However, the fire-fighting personnel shall not be involved with refuelling activities.

5. On-board refresher training shall be carried out and additional supplies of fire-fighting media shall be provided for training and testing of the equipment.

SECTION 2 Carriage of dangerous goods

201. General requirements

1. In addition, ship types and cargo spaces, referred to in **Par 2**, intended for the carriage of dangerous goods shall comply with the requirements of this regulation, as appropriate, except when carrying dangerous goods in limited quantities and excepted quantities unless such requirements have already been met by compliance with the requirements elsewhere in this chapter. The types of ships and modes of carriage of dangerous goods are referred to in **Par 2.** and in **Table 8.5.1.** Cargo ships of less than 500 gross tonnage shall comply with this regulation, but Society may reduce the requirements and such reduced requirements shall be recorded in the document of compliance referred to in **203.**

2. The following ship types and cargo spaces shall govern the application of **Tables 8.5.1** and **8.5.2**:

(1) ships and cargo spaces not specifically designed for the carriage of freight containers, but intended for the carriage of dangerous goods in packaged form including goods in freight containers and portable tanks;
(2) purpose-built container ships and cargo spaces intended for the carriage of dangerous goods in freight containers and portable tanks. (Refer to the Guidance)
(3) ro-ro ships and ro-ro spaces intended for the carriage of dangerous goods. (Refer to the Guidance)
(4) ships and cargo spaces intended for the carriage of solid dangerous goods in bulk; and
(5) ships and cargo spaces intended for carriage of dangerous goods other than liquids and gases in bulk in shipborne barges.

202. Special requirements

Unless otherwise specified, the following requirements shall govern the application of **Tables 8.5.1, 8.5.2** and **8.5.3** to both "on-deck" and "under-deck" stowage of dangerous goods where the numbers of the following paragraphs are indicated in the first column of the tables.

1. Water supplies shall satisfy the following requirements. (Refer to the Guidance)

(1) Arrangements shall be made to ensure immediate availability of a supply of water from the fire main at the required pressure either by permanent pressurization or by suitably placed remote arrangements for the fire pumps.
(2) The quantity of water delivered shall be capable of supplying four nozzles of a size and at pressures as specified in **Ch. 3, 401.** capable of being trained on any part of the cargo space when empty. This amount of water may be applied by equivalent means to the satisfaction of the Society. (Refer to the Guidance)
(3) Means shall be provided for effectively cooling the designated underdeck cargo space by at least 5 litres/min per square meter of the horizontal area of cargo spaces, either by a fixed arrange-

ment of spraying nozzles or flooding the cargo space with water. Hoses may be used for this purpose in small cargo spaces and in small areas of larger cargo spaces at the discretion of the Society. However, the drainage and pumping arrangements shall be such as to prevent the build-up of free surfaces. The drainage system shall be sized to remove no less than 125 % of the combined capacity of both the water spraying system pumps and the required number of fire hose nozzles. The drainage system valves shall be operable from outside the protected space at a position in the vicinity of the extinguishing system controls. Bilge wells shall be of sufficient holding capacity and shall be arranged at the side shell of the ship at a distance from each other of not more than 40 m in each watertight compartment. If this is not possible, the adverse effect upon stability of the added weight and free surface of water shall be taken into account to the extent deemed necessary by the Society in its approval of the stability information.

(4) Provision to flood a designated under-deck cargo space with suitable specified media may be substituted for the requirements in paragraph (3). (Refer to the Guidance)

(5) The total required capacity of the water supply shall satisfy paragraphs (2) and (3), if applicable, simultaneously calculated for the largest designated cargo space. The capacity requirements of paragraph (2) shall be met by the total capacity of the main fire pump(s) not including the capacity of the emergency fire pump, if fitted. If a drencher system is used to satisfy paragraph (3), the drencher pump shall also be taken into account in this total capacity calculation.

2. Electrical equipment and wiring shall not be fitted in enclosed cargo spaces or vehicle spaces unless it is essential for operational purposes in the opinion of the Society. However, if electrical equipment is fitted in such spaces, it shall be of a certified safe type* for use in the dangerous environments to which it may be exposed unless it is possible to completely isolate the electrical system (e.g. by removal of links in the system, other than fuses). Cable penetrations of the decks and bulkheads shall be sealed against the passage of gas or vapour. Through runs of cables and cables within the cargo spaces shall be protected against damage from impact. Any other equipment which may constitute a source of ignition of flammable vapour shall not be permitted. (Refer to the Guidance)

3. Ro-ro spaces shall be fitted with a fixed fire detection and fire alarm system complying with the requirements of the Fire Safety Systems Code. All other types of cargo spaces shall be fitted with either a fixed fire detection and fire alarm system or a sample extraction smoke detection system complying with the requirements of the Fire Safety Systems Code. If a sample extraction smoke detection system is fitted, particular attention shall be made to the Fire Safety Systems Code in order to prevent the leakage of toxic fumes into occupied areas.

4. Ventilation arrangement shall satisfy the following requirements. (Refer to the Guidance)

(1) Adequate power ventilation shall be provided in enclosed cargo spaces. The arrangement shall be such as to provide for at least six air changes per hour in the cargo space based on an empty cargo space and for removal of vapours from the upper or lower parts of the cargo space, as appropriate. (Refer to the Guidance)

(2) The fans shall be such as to avoid the possibility of ignition of flammable gas air mixtures. Suitable wire mesh guards shall be fitted over inlet and outlet ventilation openings. (Refer to the Guidance)

(3) Natural ventilation shall be provided in enclosed cargo spaces intended for the carriage of solid dangerous goods in bulk, where there is no provision for mechanical ventilation.

5. Bilge pumping shall satisfy the following requirements. (Refer to the Guidance)

(1) Where it is intended to carry flammable (liquids with flash point less than 23 ℃) or toxic liquids in enclosed cargo spaces, the bilge pumping system shall be designed to protect against inadvertent pumping of such liquids through machinery space piping or pumps. Where large quantities of such liquids are carried, consideration shall be given to the provision of additional means of draining those cargo spaces.

(2) If the bilge drainage system is additional to the system served by pumps in the machinery space, the capacity of the system shall be not less than 10 m^3/h per cargo space served. If the additional system is common, the capacity need not exceed 25 m^3/h. The additional bilge system need not be arranged with redundancy. (Refer to the Guidance)

(3) Whenever flammable or toxic liquids are carried, the bilge line into the machinery space shall be isolated either by fitting a blank flange or by a closed lockable valve. (Refer to the Guidance)

(4) Enclosed spaces outside machinery spaces containing bilge pumps serving cargo spaces intended for carriage of flammable or toxic liquids should be fitted with separate mechanical ventilation giving at least 6 air changes per hour. If the space has access from another enclosed space, the door shall be self-closing.

(5) If bilge drainage of cargo spaces is arranged by gravity drainage, the drainage shall be either led directly overboard or to a closed drain tank located outside the machinery spaces. The tank shall be provided with a vent pipe to a safe location on the open deck. Drainage from a cargo space into bilge wells in a lower space is only permitted if that space satisfies the same requirements as the cargo space above.

6. Personnel protection shall satisfy the following requirements

(1) Four sets of full protective clothing resistant to chemical attack shall be provided in addition to the fire-fighter's outfits required by **Ch 3, 409.** and shall be selected taking into account the hazards associated with the chemicals being transported and the recognized standards developed according to the class and physical state. The protective clothing shall cover all skin, so that no part of the body is unprotected. (Refer to the Guidance)

(2) At least two self-contained breathing apparatuses additional to those required by **Ch 3, 409.** shall be provided. Two spare charges suitable for use with the breathing apparatus shall be provided for each required apparatus. Passenger ships carrying not more than 36 passengers and cargo ships that are equipped with suitably located means for fully recharging the air cylinders free from contamination, need carry only one spare charge for each required apparatus. (Refer to the Guidance)

7. Portable fire extinguishers with a total capacity of at least 12 kg of dry powder or equivalent shall be provided for the cargo spaces. These extinguishers shall be in addition to any portable fire extinguishers required elsewhere in this chapter.

8. Bulkheads forming boundaries between cargo spaces and machinery spaces of category A shall be insulated to "A-60" class standard, unless the dangerous goods are stowed at least 3 m horizontally away from such bulkheads. Other boundaries between such spaces shall be insulated to "A-60" class standard. (Refer to the Guidance)

9. Each open ro-ro space having a deck above it and each space deemed to be a closed ro-ro space not capable of being sealed, shall be fitted with an approved fixed pressure water-spraying system for manual operation which shall protect all parts of any deck and vehicle platform in the space, except that the Society may permit the use of any other fixed fire-extinguishing system that has been shown by full-scale test to be no less effective. However, the drainage and pumping arrangements shall be such as to prevent the build-up of free surfaces. The drainage system shall be sized to remove no less than 125 % of the combined capacity of both the water spraying system pumps and the required number of fire hose nozzles. The drainage system valves shall be operable from outside the protected space at a position in the vicinity of the extinguishing system controls. Bilge wells shall be of sufficient holding capacity and shall be arranged at the side shell of the ship at a distance from each other of not more than 40 m in each watertight compartment. If this is not possible the adverse effect upon stability of the added weight and free surface of water shall be taken into account to the extent deemed necessary by the Society in its approval of the stability information.*

10. Separation of ro-ro spaces shall satisfy the following requirements.

(1) In ships having ro-ro spaces, a separation shall be provided between a closed ro-ro space and an adjacent open ro-ro space. The separation shall be such as to minimize the passage of dangerous vapours and liquids between such spaces. Alternatively, such separation need not be provided if the ro-ro space is considered to be a closed cargo space over its entire length and shall fully comply with the relevant special requirements of this regulation.

(2) In ships having ro-ro spaces, a separation shall be provided between a closed ro-ro space and the adjacent weather deck. The separation shall be such as to minimize the passage of dangerous vapours and liquids between such spaces. Alternatively, a separation need not be provided if the arrangements of the closed ro-ro spaces are in accordance with those required for the dangerous goods carried on adjacent weather deck.

Table 8.5.1 Application of the requirements to different modes of carriage of dangerous goods in ships and cargo spaces.

Regulation 201.2 / Section 2	Weather decks .1 to .5 inclusive	.1 Not specifically designed	.2 Container cargo spaces	.3 Closed ro-ro cargo spaces5	.3 Open ro-ro cargo spaces	.4 Solid dangerous goods in bulk	.5 Shipborne barges
202.1.(1)	x	x	x	x	x	For application of requirements of regulation **Sec. 202** to different classes of dangerous goods. see **table 8.5.2**	x
202.1.(2)	x	x	x	x	x		-
202.1.(3)	-	x	x	x	x		x
202.1.(4)	-	x	x	x	x		x
202.2	-	x	x	x	x		x[4]
202.3	-	x	x	x	-		x[4]
202.4.(1)	-	x	x[1]	x	-		x[4]
202.4.(2)	-	x	x[1]	x	-		x[4]
202.5	-	x	x	x	-		-

202.10.(1)	-	-	-	x	-		-
202.10.(2)	-	-	-	x	-		-

Where "x" appears in **Table 8.5.1** it means this requirement is applicable to all classes of dangerous goods as given in the appropriate line of **Table 8.5.3**, except as indicated by the notes.

Notes :

1. For classes 4 and 5.1 solids not applicable to closed freight containers. For classes 2, 3, 6.1 and 8 when carried in closed freight containers, the ventilation rate may be reduced to not less than two air changes per hour. For classes 4 and 5.1 liquids when carried in closed freight containers, the ventilation rate may be reduced to not less than two air changes per hour. For the purpose of this requirement, a portable tank is a closed freight container.
2. Applicable to decks only.
3. Applies only to closed ro-ro spaces, not capable of being sealed.
4. In the special case where the barges are capable of containing flammable vapours or alternatively if they are capable of discharging flammable vapours to a safe space outside the barge carrier compartment by means of ventilation ducts connected to the barges, these requirements may be reduced or waived to the satisfaction of the Society.
5. Special category spaces shall be treated as closed ro-ro spaces when dangerous goods are carried.

Notes:

6. The hazards of substances in this class which may be carried in bulk are such that special consideration must be given by the Society to the construction and equipment of

the ship involved in addition to meeting the requirements enumerated in this table.
7. Only applicable to Seedcake containing solvent extractions, to Ammonium nitrate and to Ammonium nitrate fertilizers.
8. Only applicable to Ammonium nitrate and to Ammonium nitrate fertilizers. However, a degree of protection in accordance with standards contained in the International Electrotechnical Commission publication 60079, Electrical Apparatus for Explosive Gas Atmospheres, is sufficient.
9. Only suitable wire mesh guards are required.
10. The requirements of the International Maritime Solid Bulk Cargoes (IMSBC) Code, as amended, are sufficient.

Notes

11. When "mechanically-ventilated spaces" are required by the International Maritime Dangerous Goods Code, as amended.
12. Stow 3 m horizontally away from the machinery space boundaries in all cases.
13. Refer to the International Maritime Dangerous Goods Code, as amended.
14. As appropriate to the goods to be carried.
15. FP means flashpoint.
16. Under the provisions of the IMDG Code, stowage of class 5.2 dangerous goods under deck or in enclosed ro-ro spaces is prohibited.
17. Only applicable to dangerous goods evolving flammable vapour listed in the IMDG Code.
18. Only applicable to dangerous goods having a flashpoint less than 23ºC listed in the IMDG Code.
19. Only applicable to dangerous goods having a subsidiary risk class 6.1.
20. Under the provisions of the IMDG Code, stowage of class 2.3 having subsidiary risk class 2.1 under deck or in enclosed ro-ro spaces is prohibited.
21. Under the provisions of the IMDG Code, stowage of class 4.3 liquids having a flashpoint less than 23ºC under deck or in enclosed ro-ro spaces is prohibited.

SECTION 3 Protection of vehicle, special category and ro-ro spaces

301. General requirements

1. In addition, as appropriate, vehicle, special category and ro-ro spaces shall comply with the requirements of this regulation.

2. Basic principles for passenger ships shall be satisfied as follows.

(1) The basic principle underlying the provisions of this regulation is that the main vertical zoning required by **Ch 3, 301.** may not be practicable in vehicle spaces of passenger ships and, therefore, equivalent protection must be obtained in such spaces on the basis of a horizontal zone concept and by the provision of an efficient fixed fire-extinguishing system. Based on this concept, a horizontal zone for the purpose of this regulation may include special category spaces on more than one deck provided that the total overall clear height for vehicles does not exceed 10 m. (Refer to the Guidance)

(2) The basic principle underlying the provisions of paragraph (1) are also applicable to ro-ro spaces.

(3) The requirements of ventilation systems, openings in "A" class divisions and penetrations in "A" class divisions for maintaining the integrity of vertical zones in this chapter shall be applied equally to decks and bulkheads forming the boundaries separating horizontal zones from each other and from the remainder of the ship.

302. Precaution against ignition of flammable vapours in closed vehicle spaces closed ro-ro spaces and special category spaces

1. Ventilation systems shall be satisfied as follows.

(1) There shall be provided an effective power ventilation system sufficient to give at least the following air changes. The Society may require an increased number of air changes when vehicles are being loaded and unloaded.

(A) In case passenger ships
Special category spaces ; 10 air changes per hour
Closed ro-ro and vehicle spaces other than special category spaces for ships carrying more than 36 passengers ; 10 air changes per hour
Closed ro-ro and vehicle spaces other than special category spaces for ships carrying not more than 36 passengers ; 6 air changes per hour

(B) In case cargo ships ; 6 air changes per hour

(2) Performance of ventilation systems shall be satisfied as follows.

(A) In passenger ships, the power ventilation system required in para. (1) shall be separated from other ventilation systems and shall be in operation at all times when vehicles are in such spaces. Ventilation ducts serving such cargo spaces capable of being effectively sealed shall be separated for such space. The system shall be capable of being controlled from a position outside such spaces.

(B) In cargo ships, ventilation fans shall normally be run continuously whenever vehicles are on board. Where this is impracticable, they shall be operated for a limited period daily as weather permits and in any case for a reasonable period prior to discharge, after which period the ro-ro or vehicle space shall be proved gas-free. One or more portable combustible gas detecting instruments shall be carried for this purpose. The system shall be entirely separate from other ventilating systems. Ventilation ducts serving ro-ro or vehicle spaces shall be capable of being effectively sealed for each cargo space. The system shall be capable of being controlled from a position outside such spaces.

(C) The ventilation system shall be such as to prevent air stratification and the formation of air pockets.

(3) Means shall be provided on the navigation bridge to indicate any loss of the required ventilating capacity. (Refer to the Guidance)

(4) Closing appliances and ducts shall be satisfied as follows.

(A) Arrangements shall be provided to permit a rapid shutdown and effective closure of the ventilation system from outside of the space in case of fire, taking into account the weather and sea conditions. (Refer to the Guidance)

(B) Ventilation ducts, including dampers, within a common horizontal zone shall be made of steel. In passenger ships, ventilation ducts that pass through other horizontal zones or machinery spaces shall be "A-60" class steel ducts constructed in accordance with **Ch 3, 306. 2.**

(5) Permanent openings in the side plating, the ends or deckhead of the space shall be so situated that a fire in the cargo space does not endanger stowage areas and embarkation stations for survival craft and accommodation spaces, service spaces and control stations in superstructures and deckhouses above the cargo spaces. (Refer to the Guidance)

2. Electrical equipment and wiring shall be satisfied as follows.

(1) Except as provided in paragraph (2), electrical equipment and wiring shall be of a type suitable for use in an explosive petrol and air mixture. (Refer to the Guidance)

(2) In case of other than special category spaces below the bulkhead deck, notwithstanding the provisions in paragraph (1), above a height of 450 mm from the deck and from each platform for vehicles, if fitted, except platforms with openings of sufficient size permitting penetration of petrol gases downwards, electrical equipment of a type so enclosed and protected as to prevent the escape of sparks shall be permitted as an alternative on condition that the ventilation system is so designed and operated as to provide continuous ventilation of the cargo spaces at the rate of at least ten air changes per hour whenever vehicles are on board. (Refer to the Guidance)

3. Electrical equipment and wiring, if installed in an exhaust ventilation duct, shall be of a type approved for use in explosive petrol and air mixtures and the outlet from any exhaust duct shall be sited in a safe position, having regard to other possible sources of ignition. (Refer to the Guidance)

4. Other equipment which may constitute a source of ignition of flammable vapours shall not be permitted.

5. Scuppers shall not be led to machinery or other spaces where sources of ignition may be present.

303. Detection and alarm

(Refer to the Guidance)

1. Except as provided in **Par 3** (1), there shall be provided a fixed fire detection and fire alarm system complying with the requirements of the Fire Safety Systems Code. The fixed fire detection system shall be capable of rapidly detecting the onset of fire. The type of detectors and their spacing and location shall be to the satisfaction of the Society taking into account the effects of ventilation and other relevant factors. After being installed the system shall be tested under normal ventilation conditions and shall give an overall response time to the satisfaction of the Society.

2. Except open ro-ro spaces, open vehicle spaces and special category spaces, a sample extraction smoke detection system complying with the requirements of the Fire Safety Systems Code may be used as an alternative of the fixed fire detection and fire alarm system required in **Par 1.**

3. Special category spaces shall be satisfied as follows.

(1) An efficient fire patrol system shall be maintained in special category spaces. However, if an efficient fire patrol system is maintained by a continuous fire watch at all times during the voyage, a fixed fire detection and fire alarm systems is not required.

(2) Manually operated call points shall be spaced so that no part of the space is more than 20 m from a manually operated call point, and one shall be placed close to each exit from such spaces.

304. Structure protection

Notwithstanding the provisions of **Ch 3, 301. 2,** in passenger ships carrying more than 36 passengers, the boundary bulkheads and decks of special category spaces and ro-ro spaces shall be insulated to "A-60" class standard. However, where a category ⑤,⑨,⑩ space, as defined in regulation **Ch 3, 301. 2** (3), is on one side of the division the standard may be reduced to "A-0". Where fuel oil tanks are below a special category space or a ro-ro space, the integrity of the deck between such spaces, may be reduced to "A-0" standard.

305. Fire-extinction

(Refer to the Guidance)

1. Fixed fire-extinguishing systems shall satisfy the following requirements.

(1) Vehicle spaces and ro-ro spaces which are not special category spaces and are capable of being sealed from a location outside of the cargo spaces shall be fitted with a fixed gas fire-extinguishing system which shall comply with the provisions of the Fire Safety Systems Code, except that:

(A) if a carbon dioxide system is fitted, the quantity of gas available shall be at least sufficient to give a minimum volume of free gas equal to 45 % of the gross volume of the largest such cargo space which is capable of being sealed, and the arrangements shall be such as to ensure that at least two thirds of the gas required for the relevant space shall be introduced within 10 min; (Refer to the Guidance)

(B) any other fixed inert gas fire-extinguishing system or fixed high expansion foam fire-extinguishing system may be fitted provided the Society is satisfied that an equivalent protection is achieved; and

(C) as an alternative, a system meeting the requirements of paragraph (2) may be fitted.

(2) Ro-ro and vehicle spaces not capable of being sealed and special category spaces shall be fitted with an approved fixed pressure water spraying system for manual operation which shall protect all parts of any deck and vehicle platform in such spaces. Such water spray systems shall have:

(A) a pressure gauge on the valve manifold;

(B) clear marking on each manifold valve indicating the spaces served;

(C) instructions for maintenance and operation located in the valve room; and

(D) a sufficient number of drainage valves.

(3) The Society may permit the use of any other fixed fire-extinguishing system* that has been shown that it is not less effective by a full-scale test in conditions simulating a flowing petrol fire in a vehicle space or a ro-ro space in controlling fires likely to occur in such a space.

(4) When fixed pressure water-spraying systems are provided, in view of the serious loss of stability which could arise due to large quantities of water accumulating on the deck or decks during the operation of the fixed pressure water-spraying system; the following arrangements shall be provided:

(A) in passenger ships: (Refer to the Guidance)

(a) in the spaces above the bulkhead deck, scuppers shall be fitted so as to ensure that such water is rapidly discharged directly overboard, taking into account the guidelines of MSC.1/Circ.1320;

(b) in ro-ro passenger ships discharge valves for scuppers, fitted with positive means of closing operable from a position above the bulkhead deck in accordance with the requirements of the International Convention on Load Lines in force, shall be kept open while the ships are at sea;

(c) any operation of valves referred to in paragraph (a) shall be recorded in the log-book;

(d) in the spaces below the bulkhead deck, the Society may require pumping and drainage facilities to be provided additional to the requirements of regulation of SOLAS. In such case, the drainage system shall be sized to remove no less than 125 % of the combined capacity of both the water spraying system pumps and the required number of fire hose nozzles, taking into account the guidelines of MSC.1/Circ.1320. The drainage system valves shall be operable from outside the protected space at a position in the vicinity of the extinguishing system controls. Bilge wells shall be of sufficient holding capacity and shall be arranged at the side shell of the ship at a distance from each other of not more than 40 m in each watertight compartment;

(B) in cargo ships,

the drainage and pumping arrangements shall be such as to prevent the build-up of free surfaces. In such case, the drainage system shall be sized to remove no less than 125 % of the combined capacity of both the water spraying system pumps and the required number of fire hose nozzles, taking into account the guidelines of MSC.1/Circ.1320. The drainage system valves shall be operable from outside the protected space at a position in the vicinity of the extinguishing system controls. Bilge wells shall be of sufficient holding capacity and shall be arranged at the side shell of the ship at a distance from each other of not more than 40 m in each watertight compartment. If this is not possible the adverse effect upon stability of the added weight and free surface of water shall be taken into account to the extent deemed necessary by the Society in its approval of the stability information.* Such information shall be included in the stability information supplied to the master as required by regulation of SOLAS.

(5) On all ships, for closed vehicles and ro-ro spaces and special category spaces, where fixed pressure water-spraying systems are fitted, means shall be provided to prevent the blockage of drainage arrangements, taking into account the guidelines of MSC.1/Circ.1320. Ships constructed before 1 January 2010 shall comply with the requirements of this paragraph by the first survey after 1 January 2010.

2. Portable fire extinguishers shall satisfy the following requirements.

(1) Portable extinguishers shall be provided at each deck level in each hold or compartment where vehicles are carried, spaced not more than 20 m apart on both sides of the space. At least one portable fire-extinguisher shall be located at each access to such a cargo space.

(2) In addition to the provision of paragraph (1), the following fire extinguishing appliances shall be provided in vehicle, ro-ro and special category spaces intended for the carriage of motor vehicles with fuel in their tanks for their own propulsion:

(A) at least three water-fog applicators; and

(B) one portable foam applicator unit complying with the provisions of the Fire Safety Systems Code, provided that at least two such units are available in the ship for use in such ro-ro spaces.

SECTION 4 Qualitative failure analysis for propulsion and steering on passenger ships

401. Application

Qualitative failure analysis for propulsion and steering on passenger ships shall apply to the requirements in accordance with the Guidance as provided separately. (Refer to the Guidance) ⚓

Guidance Relating to the Rules for the Classification of Steel Ships

Part 8

Fire Protection and Fire Extinction

GA-08-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance relating to the Rules for Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF
PART 8 "FIRE PROTECTION AND FIRE EXTINCTION"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.

2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date 1 July 2010

CHAPTER 3. SUPPRESSION OF FIRE

Section 4 Fire fighting
- 403. 1 (2) (B) (a) has been amended.

Effective Date 1 July 2011

CHAPTER 2. PREVENTION OF FIRE AND EXPLOSION

Section 1 Prevention of ignition probability
- 101. 3 has been amended.
- Fig 8.2.1 of 101. has been amended.

Section 2 Prevention of fire growth potential
- 201. 2 has been newly added.

CHAPTER 3. SUPPRESSION OF FIRE

Section 3 Containment of fire
- 301. 1 has been amended.

Section 4 Fire fighting
- 401. 1 and 4 have been amended.
- < Minimum numbers and distribution of portable fire extinguishers in the various types of spaces on board ships > Notes (7) of 402. has been newly added.

CHAPTER 5. SPECIAL REQUIREMENTS

Section 2 Carriage of dangerous goods
- 202. 4 (7) and 11 have been amended.

Annex 8-2. Penetrations through Divisions
- 2 has been amended.

Annex 8-3. Special Requirements for Ships which are not engaged in international voyage or Ships of less than 500 gross tonnage

(Fire-fighting system of ships which are subject to the Ships Safety Law of the Korean Government, but not SOLAS, shall follow the relevant requirements)

- 16 (3) has been amended.
- 16 (5) has been newly added.

CONTENTS

CHAPTER 1 FIRE PROTECTION, FIRE DETECTION AND FIRE EXTINCTION

SECTION 1 General

101. Application

1. In applying **101. 1** of the Rules, "the guidance specified separatedly" means that the following requirements should be complied with ;

(1) Ships of less than 500 tons gross tonnage should be in accordance with **Annex 8-3** special requirements of the Guidance.

(2) Ships which are not engaged in international voyage, and Ships for restricted service (Classification Equipment Notation "C" or "S") should be in accordance with **Annex 8-3** special requirements of the Guidance.

(3) Fishing vessels should be in accordance with **Annex 8-4** alleviation requirements of the Guidance.

2. In applying **101.** of the Rules, where the Government the flag of which a ship is to be entitled to fly does not authorize this Society to carry out the statutory inspection on behalf of it, the requirements of fire-fighting systems may not be applied.

102. Plans and documents

1. In applying **102. 1** (3) of the Rules, where the Fixed local application fire-fighting systems is intended for inspection by this Society, the following plans and documents shall be submitted for approval.

(1) Diagrams of piping and instrument.
(2) Diagrams of control system.
(3) Piping arrangements and hydraulic calculation sheets.
(4) Plans for pump including performance curve.
(5) Specifications of location and dimension on the protected area.
(6) Others considered necessary by this Society.

2. In applying **102. 1** (4) of the Rules, where inert gas system is intended for inspection by this Society, the following plans and documents shall be submitted for approval. Where, however, the system is the one already approved by the Society, they may be omitted from submission.

(1) Plans
(a) General arrangements of inert gas systems including the control systems and monitoring systems.
(b) Details of each component consisting of inert gas systems.
(c) Piping diagram system for the distribution of inert gas.
(d) Other plans and documents considered necessary by the Society.
(2) Documents
(a) Instructions and operation manual of the inert gas system (including the notice related to the safety of the operators).
(b) Other drawings and data considered necessary by the Society.
(3) The instructions and operation manual specified in (2) (a) are to be carried on board the ship.

103. Definitions

1. In applying **103. 1** of the Rules, pantries containing no cooking appliances may contain the following devices. However, a dining room containing such appliances is not to be regarded as a pantry.

(1) Coffee automats, toasters, dish washers, microwave ovens, water boilers and similar appliances each of them with a maximum power of 5 kW.

(2) Electrically heated cooking plates and hot plates for keeping food warm each of them with a maximum power of 2 kW and a surface temperature not above 150 °C.

2. In applying **103. 18** of the Rules, the following are to be included.

(1) Spaces containing the following battery sources regardless of battery capacity are to be included in control spaces, where the emergency source of power is located.
(A) Emergency batteries in separate battery room for power supply from black-out until start of emergency generator,
(B) Emergency batteries in separate battery room as reserve source of energy to radio telegraph installation,
(C) Batteries for start of emergency generator, and
(D) In principle, all emergency batteries required in pursuance of the related provisions of **Pt 6, Ch 1** to the Rules.
(2) Main navigational equipment includes, in particular, the steering stand and the compass, radar and direction-finding equipment. However, steering gear rooms containing an emergency steering position are not considered to be control stations.
(3) Where in the fixed fire-extinguishing systems there are no specific requirements for the centralization within a control station of major components of a system, such major components may be placed in spaces which are not considered to be a control station.

3. In applying **103. 34** of the Rules, “Oil fuel unit" includes any equipment used for the preparation and delivery of oil fuel for inert gas generators or turbines. Oil fuel transfer pumps are not considered as oil fuel units.

4. In applying **103. 41** of the Rules, "Spaces not normally subdivided in any way" means those spaces which are not subdivided in longitudinal direction by watertight bulkheads or gastight bulkheads.

5. In applying **103. 45** of the Rules, pantries containing cooking appliances may contain the following devices. However, any electrically heated cooking plate or hot plate for keeping food warm with a power of more than 5 kW are to be regarded as galleys.
(1) Coffee automats, toasters, dish washers, microwave ovens, water boilers and similar appliances each of them with a power of more than 5 kW.
(2) Electrically heated cooking plates and hot plates for keeping food warm each of them with a maximum power of 5 kW.

6. In applying **103. 48** of the Rules, the following requirements for tankers are to be applied.
(1) Requirements for tankers in this chapter shall apply to tankers carrying crude oil or petroleum products having a flashpoint not exceeding 60 ℃ (closed cup test), as determined by an approved flashpoint apparatus, and a Reid vapour pressure which is below the atmospheric pressure or other liquid products having a similar fire hazard.
(2) Where liquid cargoes other than those referred to in (1) above or liquefied gases which introduce additional fire hazards are intended to be carried, additional safety measures shall be required, having due regard to the provisions of the International Bulk Chemical Code, the Bulk Chemical Code, the International Gas Carrier Code, and the Gas Carrier Code, as appropriate. A liquid cargo with a flashpoint of less than 60 degrees C for which a regular foam fire-fighting system complying with the Fire Safety Systems Code is not effective, is considered to be a cargo introducing additional fire hazards in this context. The following additional measures are required:
(A) the foam shall be of alcohol resistant type;
(B) the type of foam concentrates for use in chemical tankers shall be to the satisfaction of the Society taking into account the guidelines developed by the IMO; and
Refer to the Guidelines for performance and testing criteria and surveys of expansion foam concentrates for fire-extinguishing systems for chemical tankers (MSC/Circ.799).
(C) the capacity and application rates of the foam extinguishing system shall comply with chapter 11 of the International Bulk Chemical Code, except that lower application rates may be accepted based on performance tests. For tankers fitted with inert gas systems, a quantity of foam concentrate sufficient for 20 min of foam generation may be accepted;
Refer to the Information on flashpoint and recommended fire-fighting media for chemicals to which neither the IBC nor BCH Codes apply (MSC/Circ.553).
(3) For the purpose of this regulation, a liquid cargo with a vapour pressure greater than 1.013 bar absolute at 37.8 degrees C is considered to be a cargo introducing additional fire hazards. Ships carrying such substances shall comply with the requirements of the IBC Code. When ships operate in restricted areas and at restricted times, the Society concerned may agree to waive the requirements for refrigeration systems in accordance with requirements of the International Bulk Chemical Code.

(4) Liquid cargoes with a flashpoint exceeding 60 degrees C other than oil products or liquid cargoes subject to the requirements of the International Bulk Chemical Code are considered to constitute a low fire risk, not requiring the protection of a fixed foam extinguishing system.

(5) Tankers carrying petroleum products with a flashpoint exceeding 60 degrees C (closed cup test), as determined by an approved flashpoint apparatus, shall comply with the following requirements.

(A) The requirements for cargo ships other than tankers

(B) Isolation valves shall be fitted in the fire main at poop front in a protected position and on the tank deck at intervals of not more than 40 m to preserve the integrity of the fire main system in case of fire or explosion.

(C) In addition, in tankers, two fire-fighter's outfits shall be provided.

(D) In lieu of the fixed fire extinguishing system required in cargo spaces, they shall be fitted with a fixed deck foam system which shall comply with the provisions of the Fire Safety Systems Code.

(6) Combination carriers shall not carry cargoes other than oil unless all cargo spaces are empty of oil and gas-freed or unless the arrangements provided in each case have been be approved by the Society taking into account the guidelines developed by the IMO.
Refer to the Guidelines for inert gas systems (MSC/Circ.353), as amended by MSC/Circ.387 comply with the provisions of the Fire Safety Systems Code.

(7) Chemical tankers and gas carriers shall comply with the requirements for tankers, except where alternative and supplementary arrangements are provided to the satisfaction of the Society, having due regard to the provisions of the International Bulk Chemical Code and the International Gas Carrier Code, as appropriate.

7. In applying **103. 49** of the Rules, "vehicle spaces" means those cargo spaces other than ro/ro spaces.

104. Other Operation Requirements.

1. In applying **104.** of the Rules, "the Guidance as provided separatedly" means the **Annex 8-6** of the Guidance. And alternative design and arrangements for fire safety shall be in accordance with the relevant requirements of SOLAS. ⚓

CHAPTER 2 PREVENTION OF FIRE AND EXPLOSION

SECTION 1 Prevention of ignition probability

101. Arrangements for oil fuel, lubrication oil and other flammable oils

1. In applying **101. 2** (3) of the Rules, Oil fuel in storage tanks should not to be heated to temperatures within 10 °C below the flash point of the fuel oil, except that where oil fuel in service tanks, settling tanks and any other tanks in supply system is heated the following arrangements should be provided:
(1) the length of the vent pipes from such tanks and/or a cooling device is sufficient for cooling the vapours to below 60 °C, or the outlet of the vent pipes is located 3 m away from a source of ignition;
(2) the vent pipes are fitted with flame screens;
(3) there are no openings from the vapour space of the fuel tanks into machinery spaces (bolted manholes are acceptable) ;
(4) enclosed spaces are not located directly over such fuel tanks, except for vented cofferdams ;
(5) electrical equipment is not fitted in the vapour space of the tanks, unless it is certified to be intrinsically safe.

2. In applying **101. 2** (3) (A) of the Rules, when the ship of 400 tons gross tonnage and above is applied to the MARPOL convention, oil shall not be carried in a forepeak tank or a tank forward of the collision bulkhead.

3. In applying **101. 2** (3) (B) of the Rules, the one shown in **Fig 8.2.1** of the Guidance is to be referred to as the standard arrangement of fuel oil tanks in machinery spaces of category A. And "free standing oil tanks" are to be kept to a minimum.

4. In applying **101. 2** (3) (D) and 3 (2) of the Rules, when a filling pipes for fuel oil tank or lubricating oil tank are fitted at the place of the tank top nearby or above the overflow pipes, it is considered that there is no worry about the leakage arising from the damages.

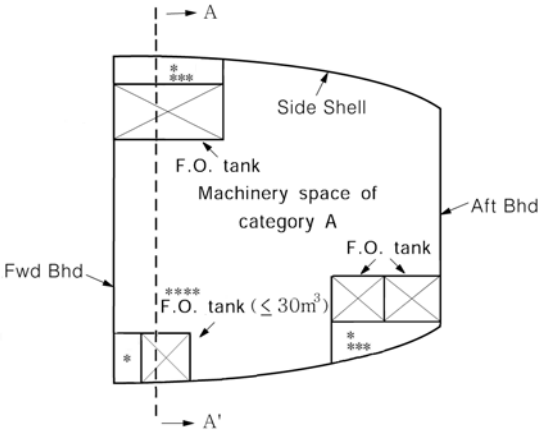
5. In applying **101. 2** (3) (E) of the Rules, short sounding pipes may be used for tanks other than double bottom tanks without the additional closed level gauge provided an overflow system is fitted. And level switches may be used below the tank top provided they are contained in a steel enclosure or other enclosure not capable of being destroyed by fire.

6. In applying **101. 2** (5) (A) of the Rules, hose clamps and similar types of attachments for flexible pipes should not be permitted.

7. In applying **101. 2** (5) (B) of the Rules, engines having single cylinder, multi-cylinder engines having separate fuel pumps and those having multiple fuel injection pump units are included, however, this regulation do not apply to gas turbine and lifeboat engines. A suitable enclosure on engine having an 375 kW or less may be used as an alternative to the jacketed piping system as following requirements.
(1) The enclosure is to have a similar function to jacketed pipes i.e., prevent spray from a damaged injector pipe impinging on a hot surface.
(2) The enclosure is to completely surround the injection pipes except that existing "cold" engine surfaces may be considered as part of the enclosure.
(3) All engine parts within the enclosure are to have a surface temperature not exceeding 220 °C when the engine is running at its maximum rating.
(4) The enclosure is to have sufficient strength and cover area to resist the effects of high pressure spray from a failed fuel pipe in service, prevent hot parts from being sprayed and restrict the area that can be reached by leaked fuel. Where the enclosure is not of metallic construction, it is to be made of non-combustible, non oil-absorbing material.
(5) Screening by the use of reinforced tapes is not acceptable as a suitable enclosure.
(6) Where leaked oil can reach hot surfaces, suitable drainage arrangements are to be fitted to enable rapid passage of leaked oil to a safe location which may be a drain tank. Leaked fuel flow onto "cold" engine surfaces can be accepted, provided that it is prevented from leaking onto hot surfaces by means of screens or other arrangements.
(7) Where the enclosure has penetrations to accommodate high pressure fittings, the penetrations are

to be a close fit to prevent leakage.

Plan



* Cofferdam

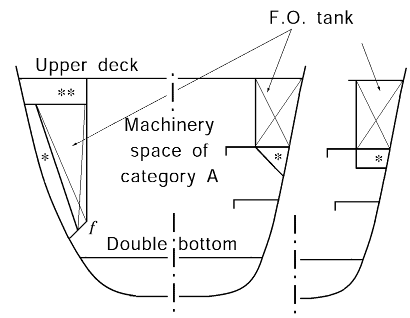
Requirements for cofferdam:

1. To be gas-tigth.
2. To be provided with sounding devices, air pipes and fittings for drainage(drain plug. etc.).

*** Where the requirements of MARPOL I/12A are met(aggregate oil fuel capacity of 600 m^3 and above)

**** "Small oil fuel tank" is an oil fuel tank with a maximum individual capacity no greater than 30 m^3

Section A-A'



f : Tank bottom may be knuckled only due to reasons of workmanship.

** : In case where the tip plates of fuel oil tanks are not common with upper deck and machinery is installed above fuel oil tanks, rooms for auxiliary machinery which are considered to have little fire risks, such as pipe passages for those other than flammable liquids, fan rooms, air conditioning machinery room, refrigerating machinery room, rooms for hydraulic system may be provided.

Fig 8.2.1

102. Arrangements for gaseous fuel for domestic purpose

In applying **102.** of the Rules, a portion of open deck, recessed into a deck structure, machinery casing, deck house, etc., utilized for the exclusive storage of gas bottles is considered acceptable, provided that such a recess has an unobstructed opening, except for small appurtenant structures, such as opening corner radii, small sills, pillars, etc.(The opening may be provided with grating walls and door) and the depth of such a recess is not greater than 1 m. A portion of open deck meeting the above should be considered as open deck in applying **Ch 3, 301. tables 8.3.1** to **8.3.8** of the Rules.

103. Miscellaneous items of ignition sources and ignitability

1. In applying **103. 2** of the Rules, this regulation is not intended to preclude the use of containers constructed of combustible materials in galleys, pantries, bars, garbage handling or storage spaces and incinerator rooms provided they are intended purely for the carriage of wet waste, glass bottles and metal cans and are suitably marked.

2. In applying **103. 3** of the Rules, "spaces where penetration of oil products is possible" means the spaces located in the vicinity of all types of equipment (purifiers, pumps and tanks) and pipe fittings (valves, flanges, strainers, flowmeters, etc.) handling oils (fuel oil, lubricating oil, hydraulic oil and thermal oil) with possible involvement of oils or oil vapours leaked or splashed during operation or in maintenance work to reach out thermal insulation. However, these do not apply to thermal insulation of pipes in machinery spaces. The fire insulation in such spaces can be covered by metal sheets (not perforated) or by vapour-proof glass cloth accurately sealed at the joint.

104. Cargo areas of tankers

1. In applying **104. 1** (1) of the Rules, “cofferdam” mean, for the purpose of this regulation, an isolating space between two adjacent steel bulkheads or decks. The minimum distance between the two bulkheads or decks should be sufficient for safe access and inspection. In order to meet the single failure principle, in the particular case when a corner-to-corner situation occurs, this principle may be met by welding a diagonal plate across the corner. And ballast pump rooms are also to comply with **Pt 7, Ch 1, 1004.** of the Rules and then the lower part of the ballast pump rooms may be recessed into machinery space of category A to the same extent as provided for cargo pump rooms. And pump-rooms intended solely for ballast transfer or fuel oil transfer need not comply with the requirements of **104. 10** of the Rules.
Void spaces or ballast water tank protecting fuel oil tank as shown in **Fig 8.2.2**, need not be considered as "cargo area" defined in **Ch 1, 103. 6** of the Rules even though they have a cruciform contact with the cargo oil tank or slop tank.

The void space protecting fuel oil tank is not considered as a cofferdam specified in this paragraph. There is no objection to the locations of the void space shown in **Fig 8.2.2**, even though they have a cruciform contact with the slop tank.

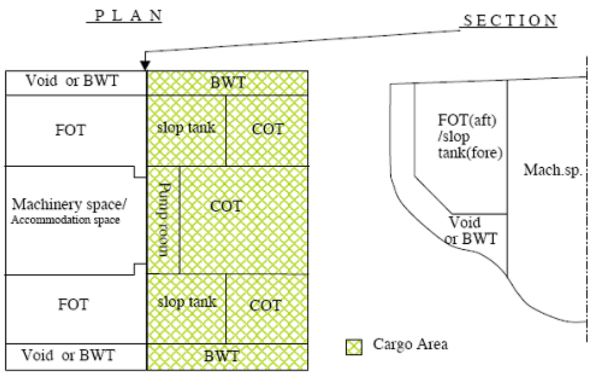


Fig 8.2.2

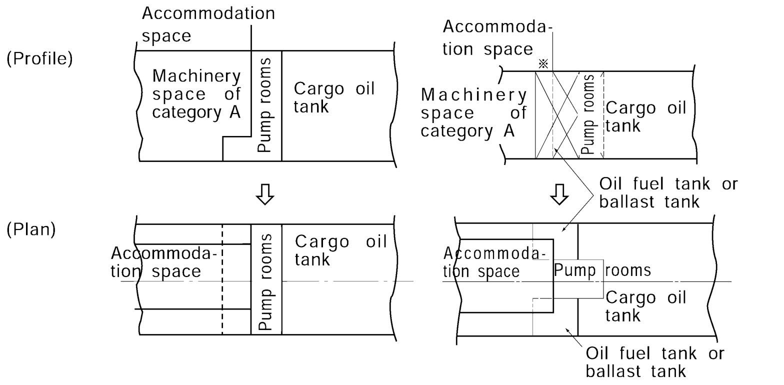
2. In applying **104. 1** (2) of the Rules, arrangement of main cargo control stations, control stations, accommodation spaces and service spaces is to comply with the following requirements:

(A) Main cargo control stations, control stations, accommodation spaces and service spaces (including chain lockers) are not to make point contact or linear contact with cargo oil tanks or s1op tanks. However, they may make point contact or linear contact with cargo pump rooms and cofferdams.

(B) Main cargo control stations, control stations, accommodation spaces and service spaces need not be arranged aft of the recess of the lower parts of cargo pump rooms and ballast pump rooms into machinery spaces of category A accepted under the requirements of **Ch 2, 104. 1** (1) of the Rules and aft of the oil fuel tanks or ballast tanks (see **Fig 8.2.3**).

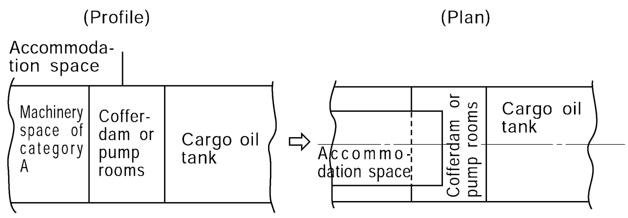
Fig 8.2.3 Arramgements of accommodation spaces, cargo oil tanks and machinery spaces of category A

Acceptable



※ Consideration is to be given to the requirements or **Pt 3, Ch 15, 304.** of the Rules.

Not acceptable



3. In applying **104. 1** (3) of the Rules, lamp rooms, store rooms, paint rooms, lockers, etc. independently provided at the bow section which are seldom accessed by persons may be provided in cargo areas other than cargo tanks and slop tanks such as the upper part of the ballast tanks, cofferdams, etc. or ship side adjoining thereto. (see **Fig 8.2.4**).

4. In applying **104. 1** (2) & (3) of the Rules, Paint lockers, regardless of their use, cannot be located above the tanks and spaces defined in the para. (2) for oil tankers and the cargo area for chemical tankers.

5. In applying **104. 1** (4) of the Rules, the arrangements and separation of spaces in combination carriers are to comply with the requirements for ore/oil carriers specified in **Pt 7, Ch 2, 206.** and **207.** of the Rules, and the requirements of **Pt 7, Ch 3, Sec 15** of the Rules for bulk/oil carriers.

6. In applying **104. 1** (6) of the Rules, "a permanent continuous coaming" means a suitable place between the aft extreme end of cargo oil tanks and the front bulkheads of deckhouses and it is not to be made lower than 50 mm above the upper edge of shear strakes (see **Fig 8.2.5**). And special consideration for stern loading means that foam extinguishers or equivalent are to be provided in addition to the requirements of **Pt 7, Ch 1, 1002. 4** (4) and **1006.** of the Rules, and further, oil drip pans in sufficient size or spillage coaming are to be provided.

7. In applying **104. 2.** (1) of the Rules, lamp rooms, store rooms, paint rooms and lockers, etc., which are arranged in forecastle independently from the group of accommodation spaces and are not normally accessed by persons are not regarded as service spaces. And access to forecastle spaces containing sources of ignition may be permitted through doors facing cargo area provided the doors are located outside hazardous areas as defined in **(KR C) IEC Publication 60092-502.**

<table>
<tr><td>Acceptable</td><td>
※ The minimum distance between the two bulkheads or decks of cofferdam is to be sufficient for safe access and inspection. No cargo, wastes or other goods are not to be contained in cofferdams.
※1 In order to meet the single failure principle, in the particular case when a corner-to-corner situation occurs, this principle may be met by welding a diagonal plate across the corner.</td></tr>
<tr><td>Not acceptable</td><td></td></tr>
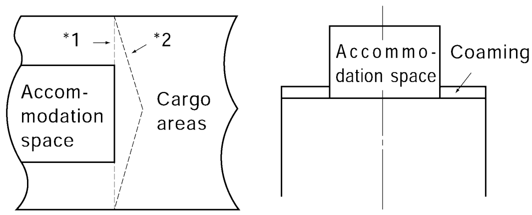
</table>

Fig 8.2.4



Coaming : *1 or * 2 , whichever is possible

Fig. 8.2.5 Coaming preventing spill into accommodation spaces and service spaces

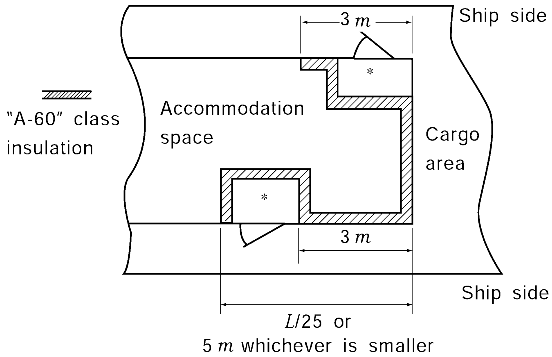
8 In applying **104. 2** (2) of the Rules, the boundaries of spaces, where application of "A-60" class insulation is required, are to be insulated as exemplified in **Fig 8.2.6**. The ceilings and floors of spaces with asterisk are also to be applied with "A-60" class insulation. Incidentally, remote-controlled type foam tanks may be provided in these spaces.

And wheelhouse doors and wheelhouse windows which can be made rapidly and efficiently gas and vapour tight are to be such doors and windows that are provided with packing and clamping fittings, and are to be tested for gas tightness. Where hose tests are adopted instead of gas tightness, the following hose tests are to be carried out.

(1) Nozzle diameter is to be minimum 12 mm.

(2) Water pressure just before the nozzle is to be not less than 2 bar.

(3) Distance between the nozzle and the doors or windows is to be maximum 1.5 m.



* The ceilings and floors of spaces with asterisk are also to be applied with "A−60" class insulation.

Fig. 8.2.6 A−60 class insulation to be required.

9. In applying **104. 2** (4) of the Rules, the Pipe ducts in double bottom under cargo oil tanks shall comply with the following requirements.

(1) They should not communicate with the engine room.

(2) Provision shall be made for at least two exits to the open deck arranged at a maximum distance from each other. One of these exits fitted with a watertight closure may lead to the cargo pump room.

(3) In the duct, provision shall be made for adequate mechanical ventilation.

10. In applying **104. 3** (2) (B) of the Rules, where the arrangements are in common combined with other cargo oil tanks, the arrangement and method in order to isolate each cargo oil tank are to be as follows.

(1) Where the arrangements are in common combined with other cargo oil tanks. (See **Fig 8.2.7**)

(A) It is to be install the stop valve etc. to isolate each cargo oil tank in order to prevent fire and explosion in specific cargo oil tank from spreading other cargo oil tank pass through vent system.

(B) Stop valve is to be closed except loading and unloading and fitted in a locks in order not to mistaken operation and managed by responsible person.

(C) Even though stop valves are closed, PV valves are to installed with bypassing type for the stop valve in cargo tanks for the capable of controlling of a change of pressure occurring by a change of temperature at sea. In this case, where the cargo tank has a negative pressure, PV valves are to be constructed with the independent suction valves which are able to inhale the air form the outside.

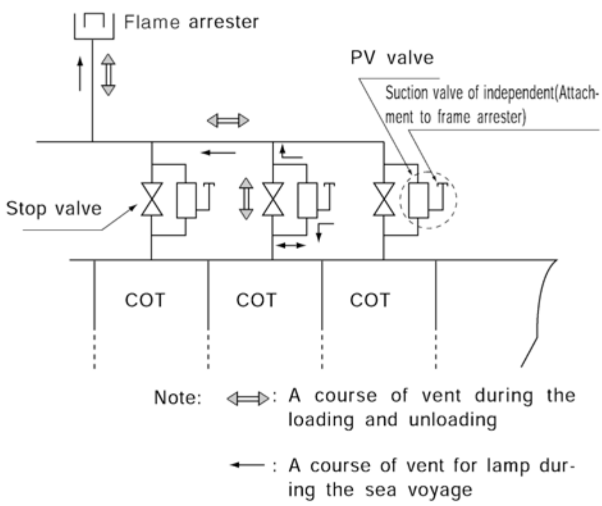


Fig. 8.2.7 **Examples of isolation of cargo oil tank**

11. In applying **104. 3** (3) of the Rules, refer to MSC/Circ.677 on revised standards for the design, testing and locating of devices to prevent the passage of flame into cargo tanks in tankers and to

MSC/Circ.450/Rev.1 on revised factors to be taken into consideration when designing cargo tank venting and gas-freeing arrangements. And ullage openings do not include cargo tank openings that are fitted with standpipe arrangements with its own manually operated shutoff valve. Examples include the common 1" to 2" diameter standpipe arrangements that are used for sampling, monitoring or measuring of ullage/temperature/interface, oxygen, liquid and hand dipping in the cargo tank. And ullage plugs, sighting ports and tank cleaning openings are not to be arranged in enclosed spaces.

And then the designs, arrangements, tests of devices to prevent the passage of flame are to be in accordance with followings. The devices are to be type approved by this Society.

(1) The venting system is to be provided with devices to prevent the passage of flame into the cargo oil tanks.
 (A) Flame screens, flame arresters or detonation flame arrester are to be fitted at the following openings.
  (a) Air suction inlets, through which vapours cannot be vented to atmosphere, of the venting system for preventing the vacuum in the tanks specified **Ch 3, 505. 1** (1) of the Rules.
  (b) Air suction inlets, through which vapours cannot be vented to atmosphere, of the venting systems for preventing the vacuum in the tank specified in **Ch 3, 505. 1** (2) of the Rules.
 (B) Flame arrester, detonation flame arresters or high velocity vents are to be fitted for the following openings.
  (a) Openings for pressure release specified in **Ch 3, 505. 2**, of the Rules.
  (b) Vent outlets specified in **Ch 2, 104. 3** (4) (A) (c) of the Rules.
  (c) Discharge outlets specified in **Ch 2, 104. 6** (3) (B) of the Rules.
 (C) For the vent outlets specified in **Ch 2, 104, 3** (4) (A) (d) of the Rules, the high velocity device is to be fitted.
(2) For determining the size of the devices to avoid pressure exceeding allowable one of vacuum in cargo tanks during loading of discharging calculations of pressure losses are to be carried out. The following parameters are to be taken into account.
 (A) Loading/discharging rates
 (B) Gas release
 (C) Pressure loss across the devices, taking into account the resistance coefficient
 (D) Pressure loss in the venting system
 (E) Pressure at which the vent opens if a high velocity device is used
 (F) Density of the mixture of the saturated vapour and air
(3) Tests and inspection
 (A) The tests and inspection for the individual product are to be carried out in accordance with followings.
  (a) Construction inspection
  (b) Hydraulic test(only for high velocity valves)
  (c) Confirmation of the pressure at which the valve opens and closes
 (B) On board test
 It is to be ascertained by a suitable method that the high velocity valves can be operable smoothly after installed on board.
(4) Test report
 A test report for each finished device is to be prepared. This is to include
 (A) detailed drawings of the device
 (B) types of tests conducted. Where in-line devices are tested, this information is to include the maximum pressures and velocities observed in the test
 (C) specific advice on approved attachments
 (D) types of cargo for which the device is approved drawings of the test rig
 (E) in the case of high velocity vent, the pressures at which the device opens and closes in the efflux velocity
 (F) all the information marked on the device in following (6)
(5) Manufacturer's instruction manual
 The manufacturer is to supply a copy of the instruction manual, which is to be kept on board the tanker and which is to include followings.
 (A) installation instructions

(B) operating instructions
(C) maintenance requirements, including cleaning
(D) copy of the laboratory report referred to in (8)
(E) flow test data, including flow rates under both positive and negative pressures, operating sensitivity, flow resistance and velocity, are to be provided.

(6) Marking of device
Each device is to be permanently marked, or have a permanently fixed tag made of stainless steel or other corrosion-resistant material, to indicate
(A) manufacturer's name or trade mark
(B) style, type, model or other manufacturer's designation for the device
(C) size of the outlet for which the device is approved
(D) approved location for installation, including maximum or minimum length of pipe, if any, between the device and the atmosphere
(E) direction of flow through the device
(F) indication of the test laboratory and report number
(G) compliance with the requirements of MSC/Circ.677

12. In applying **104. 3** (4) (A) of the Rules, electrical equipment fitted in compliance with (KS C) IEC 60092-502 is not considered to be a source of ignition or ignition hazard.

13. In applying **104. 4** (1) of the Rules, ventilation fan of non-sparking type is to be comply with the following requirements.

(1) Design criteria
(A) Air gap
The air gap between the impeller and the casing is not to be less than 0,1 of the shaft diameter in way of the impeller bearing but not less than 2 mm. It need not be more than 13 mm.
(B) Protection screen
Protection screens of not more than 13 mm square mesh are to be fitted in the opening of ventilation ducts on the open deck to prevent the entrance of objects into the fan housing.

(2) Materials
(A) Impeller and housing
The impeller and the housing in way of the impeller are to be made of alloys which are recognised as being spark proof by appropriate test.
(B) Electrostatic charges
Electrostatic charges both in the rotating body and the casing are to be prevented by the use of antistatic materials. Furthermore, the installation on board of the ventilation units is to be such as to ensure the safe bonding to the hull of the units themselves.
(C) Acceptable Combination of Materials
Tests may not be required for fans having the following combinations:
(a) Impellers and/or housings of nonmetallic material, due regard being paid to the elimination of static electricity,
(b) Impellers and casings of non-ferrous materials,
(c) Impellers of aluminium alloys or magnesium alloys and a ferrous (including austenitic stainless steel) housing on which a ring of suitable thickness on non-ferrous materials is fitted in way of the impeller,
(d) Any combination of ferrous (including austenitic stainless steel) impellers and casings with not less than 13 mm design tip clearance.
(D) Unacceptable Combination of Materials
The following impellers and housings are considered as sparking and are not permitted:
(a) Impellers of an aluminium alloy or magnesium alloy and a ferrous housing, regardless of tip clearance,
(b) Housing made of an aluminium alloy or a magnesium alloy and a ferrous impeller, regardless of tip clearance,
(c) Any combination of ferrous impeller and casings with less than 13 mm design tip clearance.

(3) Notwithstanding the requirements specified above, fans for which non-sparking property test is carried out in the presence of the Surveyor with satisfactory results may be considered as a non-sparking type. This test may be omitted for fans having test results considered as appropriate by the Society.

(4) In case where non-metal materials are used, the antistatic property is to be verified by a method as considered adequate by the Society. Those with an electric resistance not exceeding $1\times10^4 \sim 10^8\ \Omega$ (British Standard BS 2050)or those with an electrical conductivity of 1×10^{-10} S/m or less may be considered to have antistatic property.

14. In applying **104. 5** of the Rules, refer to **Annex 8-5** and the Regulation for inert gas systems on chemical tankers adapted by the IMO by resolution A.567(14) and Corr.1. And in case where liquid-filled type devices are provided as the pressure/vacuum breaking devices, a heating system is to be provided if such liquid is likely to freeze.

15. In applying **104. 5** (3) of the Rules, "a permanently fitted inert gas distribution system" means that the branch lines for the supply of inert gas into the double hull spaces are to be connected to the position between the inert gas regulating valve and the water seal or equivalent measures. And in case not permanently connected to an inert gas distribution system "appropriate means" means the arrangement consist of portable pipes or flexible hoses and blanking flange.

16. In applying **104. 6** (2) of the Rules, "the Guidance as provided separated" means **Annex 8-6 21** special requirements of the Guidance.

17. In applying **104. 6** (3) of the Rules, the outlets mentioned in (A) (B) (C) are to be located in compliance with **104. 3** (4) (A) (c) of the Rules as far as the horizontal distance is concerned.

18. In applying **104. 7** of the Rules, oil tankers carrying oil and solid cargo in bulk alternately, are to be complied with the following items.

(1) Pump rooms, ducts for cargo oil piping and cofferdams (only those adjacent to slop tanks) are to be provided with fixed gas detectors which are to satisfaction of the Society.
(2) Appropriate measurements are to be taken so as to detect flammable gases in cargo oil tanks and spaces adjacent to cargo oil tanks (except para (1) above) at a place in open decks or easily accessible place.
(3) With regard to (2) above, in case of oil tanks including gas carriers or chemical tankers, gas analysing units of the sampling type with non-explosion-proof measuring equipment outside gas dangerous zones may be installed in areas outside cargo areas (e.g. in cargo control room, navigation bridge or engine room) when mounted on the forward bulkhead provided that the following requirements are satisfactory.
(A) Sampling lines are not to run through gas dangerous spaces, except where permitted under (E) below.
(B) The gas sampling pipes are to be equipped with flame arresters. Sample gas is to be led to the atmosphere with outlets arranged in a safe location.
(C) Bulkhead penetrations of sample pipes between safe and dangerous areas are to be of approved type and have same fire integrity as the division penetrated. A manual isolating valve is to be fitted in each of the sampling lines at the bulkhead on the gas safe side.
(D) The gas detection equipment including sample piping, sample pumps, solenoids, analysing units, etc. is to be located in a reasonably gastight (e.g. a fully enclosed steel cabinet with a gasketed door) which is to be monitored by its own sampling point. At gas concentrations above 30 % LFL inside the steel cabinet the entire gas analysing unit is to be automatically shut down.
(E) Where the cabinet cannot be arranged directly on the bulkhead, sample pipes are to be of steel or other equivalent material and without detachable connections, except for the connection points for isolating valves at the bulkhead and analysing units, and are to be routed on their shortest ways.

19. In applying **104. 7** (1) of the Rules, a sufficient set of spares should be considered as being satisfied when a minimum of two such instruments are provided onboard. And all tankers subject to a flashpoint 60 °C below are to be equipped with two(2) portable flammable gas detectors (for oil tankers fitted with inert gas systems, to be capable of measuring concentrations of flammable vapours in inerted atmosphere) and two(2) portable O_2 analysers. Ships having closed ro/ro spaces or ships having oil recovery equipment or developing oil fences are to be provided with one(1) flammable gas detector which is satisfied by the Society. The flammable gas detector is to comply with the following items:

(1) It is to be convenient for carrying and easy to handle.
(2) Metallic parts are to be of anti-corrosive material or to be treated equivalent thereto.
(3) It is to be capable of sufficiently detecting gas of the density of one twenty of explosive limit

of flammable gas.

(4) It is to sufficiently operate at the temperature of -10 °C to 40 °C.

(5) There is not to be abnormality when it is dropped at 10 m high.

(6) It is to be of safe structure for the flammable gas to be detected.

(7) Suitable means is to be provided for the calibration of such instruments.

20. In applying **104. 10** (3) of the Rules, Sampling points or detector heads located in suitable position is to be at the exhaust ventilation duct and lower parts of the pump room above floor plates and the sampling time is reasonably short.

SECTION 2 Prevention of fire growth potential

201. Control of air supply and flammable liquid to the spaces

1. In applying **201. 1** (1) of the Rules, it need not comply with the requirement of details of duct penetrations specified **Ch 3, 306. 3** of the Rules.

2. In applying **201. 1** (1) of the Rules, Battery room ventilators are to be fitted with a means of closing for conditions of following (1) to (3). And where a battery room ventilator is fitted with a closing device, then a warning notice stating, for example "This closing device is to be kept open and only closed in the event of fire or other emergency − Explosive gas", is to be provided at the closing device to mitigate the possibility of inadvertent closing.

(1) The battery room does not open directly onto an exposed deck.
(2) The ventilation opening for the battery room is required to be fitted with a closing device according to the Load Line Convention (i.e. the height of the opening does not extend to more than 4.5 m above the deck for position 1 or to more than 2.3 m above the deck in position 2
(3) The battery room is fitted with a fixed gas fire extinguishing system.

3. In applying **201. 1** (2) of the Rules, the fan in cabin temperature unit is not to be applied, if it is not capable of supplying outside air to the cabin when the power ventilation is shut down.

4. In applying **201. 3** of the Rules, these requirement applies to machinery spaces of category A.

202. Fire protection materials

1. In applying **202.** of the Rules, in accommodation spaces, service spaces and control stations, details of fire protection materials for restricted use of combustible materials are to be in accordance with **Annex 8-1** of the Guidance regardless of the type of material used.

2. In applying **202. 1** (1) of the Rules, grounds, gratings, linings, ceilings, and internal divisions with associated doors used in refrigerated compartments may not be of the non-combustible materials. "cold service systems" means refrigeration systems and chilled water piping for air- conditioning systems, i.e systems with temperatures below ambient air and sea water..

3. In applying **202. 2** of the Rules, a division consisting of a non-combustible core and combustible veneers may be accepted as a B or C class division, provided that the non-combustible core is tested in accordance with the FTP code part 1, that the B class division is tested in accordance with the FTP code, part 3, and that the veneers are tested in accordance with the FTP code part 5 and part 2 , if applicable.

4. In applying **202. 2** (5) **o**f the Rules, "concealed spaces or inaccessible spaces" is, for instance, the spaces in the rear side of ceilings, spaces between lining and shell plating, spaces in double-plated bulkheads and other similar spaces. And "having low flame-spread characteristics" means those combustible materials which passed the following tests in accordance with the requirements specified in the Guidance for Approval of Manufacturing Process and Type Approval, Etc.

(1) Flame propagation test (2) Smoking test (3) Toxic gas test

SECTION 3 Prevention of Smoke generation potential and toxicity

301. Paints, vanishes and other finishes

In applying **301.** of the Rules, this regulation only applies to accommodation spaces, service spaces, control stations as well as stairway enclosures. "Other finishes" mean combustible flooring of deck covering and combustible veneers applied on surfaces of bulkheads, linings and ceilings. However, those surface materials used for handrails and non-skid strips of stairs or other surface materials used only for equally small areas of application may not be required to satisfy these requirements. And It does not apply to furniture. Vibration damping rubber may be used unless it forms a part of the structural integrity.

302. Primary deck coverings

In applying **302.** of the Rules, "Primary deck coverings" means the first combustible layer of a floor construction which is applied directly on the top of deck plating and is inclusive of any primary coat, anti-corrosive compound or adhesive which is necessary to provide protection or adhesion to the deck plating. In this case, "the first layer" means the materials forming deck covering excluding "A" class deck (including insulation materials), non-combustible materials and fire retardant surface floorings. Finishes such as plastic tile and latex used as primary deck covering are also to comply with Resolution A.687(17). ⚓

CHAPTER 3 SUPPRESSION OF FIRE

SECTION 1 Detection and Alarm

101. General requirements

1. In applying **101. 1** of the Rules, fixed fire detection and fire alarm system are also to be complied with the following requirements, and herein "Section means group of fire detection and manually operated call points as reported in the indicating units, and then "Loop" means electrical circuit linking detectors of various sections and connected to the control panel.

(1) Any required fixed fire detection and fire alarm system with manually operated call points shall be capable of immediate operation at all times.

(2) The fixed fire detection and fire alarm system shall not be used for any other purpose, except that closing of fire doors and similar functions may be permitted at the control panel. And then watertight doors which also serve as fire doors are not to be closed automatically in case of fire detection.

(3) The system and equipment shall be suitably designed to withstand supply voltage variation and transients, ambient temperature changes, vibration, humidity, shock, impact and corrosion normally encountered in ships.

(4) Fixed fire detection and fire alarm systems with a zone address identification capability shall be so arranged that:

(A) means are provided to ensure that any fault (e.g. power break, short circuit, earth) occurring in the loop will not render the whole loop ineffective;

(B) all arrangements are made to enable the initial configuration of the system to be restored in the event of failure (electrical, electronic, informatics);

(C) the first initiated fire alarm will not prevent any other detector from initiating further fire alarms; and

(D) no loop will pass through a space twice. When this is not practical (e.g. for large public spaces), the part of the loop which by necessity passes through the space for a second time shall be installed at the maximum possible distance from the other parts of the loop. However, the requirement that a system be so arranged to ensure that any fault occurring in the loop will not render the whole loop ineffective, is considered satisfied when a fault occurring in the loop only rendered ineffective a part of the loop not being larger than a section of a system without means of remotely identifying each detector.

(5) There shall be not less than two sources of power supply for the electrical equipment used in the operation of the fixed fire detection and fire alarm system, one of which shall be an emergency source. The supply shall be provided by separate feeders reserved solely for that purpose. Such feeders shall run to an automatic change-over switch situated in or adjacent to the control panel for the fire detection system and should be complied with the following requirements.

(A) Continuity of power supply

(a) Operation of the automatic changeover switch or a failure of one of the power supplies shall not result in permanent or temporary degradation of the fixed fire detection and fire alarm system.

(b) Where the fixed fire detection and fire alarm system would be degraded by the momentary loss of power, a source of stored energy having adequate capacity shall be provided to ensure the continuous operation during changeover between power supplies.

(c) Connection of electrical power supplies to an automatic changeover switch shall be arranged such that a failure will not result in the loss of all supplies to the automatic changeover switch.

(B) Emergency supply

(a) The fixed fire detection and fire alarm system emergency power may be supplied by an accumulator battery or from the emergency switchboard. Where the system is supplied from an accumulator battery, the arrangements are to comply with the following requirements.

(i) The accumulator battery shall have the capacity to operate the fire detection system under normal and alarm conditions during the period required by SOLAS

Chapter Ⅱ-1, Regulation 42 or 43(as applicable) for the emergency source of power supply

(ii) The rating of the charge unit, on restoration of the input power, shall be sufficient to recharge the batteries while maintaining the output supply to the fire detection system.

(iii) The accumulator batteries are to be suitably located for use in an emergency

(b) Where the emergency feeder for the electrical equipment used in the operation of the fixed fire detection and fire alarm system is supplied from the emergency switchboard, it shall run from this switchboard to the automatic changeover switch without passing through any other switchboard

(6) Detectors are to be complied with the requirement as follows,

(A) Detectors shall be operated by heat, smoke or other products of combustion, flame, or any combination of these factors. Detectors operated by other factors indicative of incipient fires may be considered by the Society provided that they are no less sensitive than such detectors. Flame detectors shall only be used in addition to smoke or heat detectors.

(B) Smoke detectors required in all stairways, corridors and escape routes within accommodation spaces shall be certified to operate before the smoke density exceeds 12.5 % obscuration per meter, but not until the smoke density exceeds 2 % obscuration per meter. Smoke detectors to be installed in other spaces shall operate within sensitivity limits to the satisfaction of the Society having regard to the avoidance of detector insensitivity or oversensitivity.

(C) Heat detectors shall be certified to operate before the temperature exceeds 78 ℃ but not until the temperature exceeds 54 ℃, when the temperature is raised to those limits at a rate less than 1 ℃ per minute. At higher rates of temperature rise, the heat detector shall operate within temperature limits to the satisfaction of the Society having regard to the avoidance of detector insensitivity or oversensitivity.

(D) The operation temperature of heat detectors in drying rooms and similar spaces of a normal high ambient temperature may be up to 130 ℃, and up to 140 ℃ in saunas.

(E) All detectors shall be of a type such that they can be tested for correct operation and restored to normal surveillance.

(7) Installation is to be complied with the requirements as follows,

(A) Detectors and manually operated call points shall be grouped into sections.

(B) A section of fire detectors which covers a control station, a service space or an accommodation space shall not include a machinery space of category A. For fixed fire detection and fire alarm systems with remotely and individually identifiable fire detectors, a loop covering sections of fire detectors in accommodation, service spaces and control station shall not include sections of fire detectors in machinery spaces of category A.

(C) Where the fixed fire detection and fire alarm system does not include means of remotely identifying each detector individually, no section covering more than one deck within accommodation spaces, service spaces and control stations shall normally be permitted except a section which covers an enclosed stairway. In order to avoid delay in identifying the source of fire, the number of enclosed spaces included in each section shall be limited as determined by the Society. In no case shall more than 50 enclosed spaces be permitted in any section. If the system is fitted with remotely and individually identifiable fire detectors, the sections may cover several decks and serve any number of enclosed spaces.

(D) In passenger ships, if there is no fixed fire detection and fire alarm system capable of remotely and individually identifying each detector, a section of detectors shall not serve spaces on both sides of the ship nor on more than one deck and neither shall it be situated in more than one main vertical zone except that the same section of detectors may serve spaces on more than one deck if those spaces are located in the fore or aft end of the ship or if they protect common spaces on different decks (e.g. fan rooms, galleys, public spaces, etc.). In ships of less than 20 m in breadth, the same section of detectors may serve spaces on both sides of the ship. In passenger ships fitted with individually identifiable fire detectors, a section may serve spaces on both sides of the ship and on several decks but shall not be situated in more than one main vertical zone.

(E) Positioning of detectors is to be complied with as follows,

(a) Detectors shall be located for optimum performance. Positions near beams and ventilation ducts or other positions where patterns of air flow could adversely affect performance and positions where impact or physical damage is likely shall be avoided. Detectors which are located on the overhead shall be a minimum distance of 0.5 m away from bulkheads, except in corridors, lockers and stairways.

(b) The maximum spacing of detectors shall be complied with as follows,

Type of detector	Maximum floor area per detector	Maximum distance apart between centers	Maximum distance away from bulkheads
Heat	37 m^2	9 m	4.5 m
Smoke	74 m^2	11 m	5.5 m

The Society may require or permit different spacing to that specified in the above table if based upon test data which demonstrate the characteristics of the detectors.

(F) Arrangement of electric wiring is to be complied with as follows,

(a) Electrical wiring which forms part of the system shall be so arranged as to avoid galleys, machinery spaces of category A, and other enclosed spaces of high fire risk except where it is necessary to provide for fire detection or fire alarm in such spaces or to connect to the appropriate power supply.

(b) A loop of fire detection systems with a zone address identification capability shall not be damaged at more than one point by a fire.

(8) For system control requirements, visual and audible fire signals is to be complied with as follows,

(A) The activation of any detector or manually operated call point shall initiate a visual and audible fire signal at the control panel and indicating units. If the signals have not received attention within 2 minutes an audible alarm shall be automatically sounded throughout the crew accommodation and service spaces, control stations and machinery spaces of category A. This alarm sounder system need not be an integral part of the detection system. Refer to the Code on Alarms and Indicators as adopted by the IMO by resolution A.830(19).

(B) The control panel shall be located on the navigating bridge or in the continuously manned central control station.

(C) Indicating units shall, as a minimum, denote the section in which a detector has been activated or manually operated call point has been operated. At least one unit shall be so located that it is easily accessible to responsible members of the crew at all times. One indicating unit shall be located on the navigating bridge if the control panel is located in the main fire control station.

(D) Clear information shall be displayed on or adjacent to each indicating unit about the spaces covered and the location of the sections.

(E) Power supplies and electric circuits necessary for the operation of the system shall be monitored for loss of power or fault conditions as appropriate. Occurrence of a fault condition shall initiate a visual and audible fault signal at the control panel which shall be distinct from a fire signal.

(9) Suitable instructions and component spares for testing and maintenance shall be provided.

2. In applying **101. 2** of the Rules, Sample extraction smoke detection systems is also to be complied with as follows,

(1) Any required system shall be capable of continuous operation at all times except that systems operating on a sequential scanning principle may be accepted, provided that the interval between scanning the same position twice gives an overall response time to the satisfaction of the Society.

(2) The system shall be designed, constructed and installed so as to prevent the leakage of any toxic or flammable substances or fire-extinguishing media into any accommodation and service space, control station or machinery space.

(3) The system and equipment shall be suitably designed to withstand supply voltage variations and transients, ambient temperature changes, vibration, humidity, shock, impact and corrosion normally encountered in ships and to avoid the possibility of ignition of a flammable gas air mixture.

(4) The system shall be of a type that can be tested for correct operation and restored to normal surveillance without the renewal of any component.

(5) An alternative power supply for the electrical equipment used in the operation of the system shall be provided.

(6) Components are to be complied with the following requirements.
(A) The sensing unit shall be certified to operate before the smoke density within the sensing chamber exceeds 6.65 % obscuration per meter.
(B) Duplicate sample extraction fans shall be provided. The fans shall be of sufficient capacity to operate under normal ventilation conditions in the protected area and shall give an overall response time to the satisfaction of the Society.
(C) The control panel shall permit observation of smoke in the individual sampling pipe.
(D) Means shall be provided to monitor the airflow through the sampling pipes so designed as to ensure that as far as practicable equal quantities are extracted from each interconnected accumulator.
(E) Sampling pipes shall be a minimum of 12 mm internal diameter except when used in conjunction with fixed gas fire-extinguishing systems when the minimum size of pipe shall be sufficient to permit the fire-extinguishing gas to be discharged within the appropriate time.
(F) Sampling pipes shall be provided with an arrangement for periodically purging with compressed air.
(7) Smoke accumulators are to be complied with the following requirements.
(A) At least one smoke accumulator shall be located in every enclosed space for which smoke detection is required. However, where a space is designed to carry oil or refrigerated cargo alternatively with cargoes for which a smoke sampling system is required, means may be provided to isolate the smoke accumulators in such compartments for the system. Such means shall be to the satisfaction of the Society.
(B) Smoke accumulators shall be located for optimum performance and shall be spaced so that no part of the overhead deck area is more than 12 m measured horizontally from an accumulator. Where systems are used in spaces which may be mechanically ventilated, the position of the smoke accumulators shall be considered having regard to the effects of ventilation.
(C) Smoke accumulators shall be positioned where impact or physical damage is unlikely to occur.
(D) Not more than four accumulators shall be connected to each sampling point.
(E) Smoke accumulators from more than one enclosed space shall not be connected to the same sampling point.
(8) Sampling pipes are to be complied with the following requirements.
(A) The sampling pipe arrangements shall be such that the location of the fire can be readily identified.
(B) Sampling pipes shall be self-draining and suitably protected from impact or damage from cargo working.
(9) For system control requirements, visual and audible fire signals are to be complied with the following requirements.
(A) The control panel shall be located on the navigating bridge or in the continuously manned central control station.
(B) Clear information shall be displayed on or adjacent to the control panel designating the spaces covered.
(C) The detection of smoke or other products of combustion shall initiate a visual and audible signal at the control panel and the navigating bridge or continuously manned central control station.
(D) Power supplies necessary for the operation of the system shall be monitored for loss of power. Any loss of power shall initiate a visual and audible signal at the control panel and the navigating bridge which shall be distinct from a signal indicating smoke detection.
(10) Suitable instructions and component spares shall be provided for the testing and maintenance of the system.

102. Protection of machinery spaces

1. In applying **102. 1** of the Rules, these requirement applies to machinery spaces of category A.

2. In applying **102. 2** of the Rules, the fire detecting system for unattended machinery spaces shall be complied with the following requirements.

(1) An automatic fire detection system is to be fitted in the machinery spaces.

(2) The system is to be designed with self-monitoring properties. Power or system failures are to initiate an audible alarm distinguishable from the fire alarm.
(3) The fire detection indicating panel is to be located on the navigating bridge, fire control station, or other accessible place where a fire in the machinery space will not render it inoperative.
(4) The fire detection indicating panel is to indicate the place of the detected fire in accordance with the arranged fire zones by means of a visual signal. Audible signals clearly distinguishable in character from any other audible signals shall be audible throughout the navigating bridge and the accommodation area of the personnel responsible for the operation of the machinery space.
