(5) Fire detectors are to be of types, and so located, that they will rapidly detect the onset of fire in conditions normally present in the machinery space. Consideration is to be given to avoiding false alarms. The type and location of detectors are to be approved by the Classification Society and a combination of detector types is recommended in order to enable the system to react to more than one type of fire symptom.
(6) Fire detector zones are to be arranged in a manner that will enable the operating staff to locate the seat of the fire. The arrangement and the number of loops and the location of detector heads is to be approved in each case. Air currents created by the machinery are not to render the detection system ineffective.
(7) When fire detectors are provided with the means to adjust their sensitivity, necessary arrangements are to be ensured to fix and identify the set point.
(8) When it is intended that a particular loop or detector is to be temporarily switched off, this state is to be clearly indicated. Reactivation of the loop or detector is to be performed automatically after a present time.
(9) The fire detection indicating panel is to be provided with facilities for functional testing.
(10) The fire detecting system shall be fed automatically from the emergency source of power by a separate feeder if the main source of power fails.
(11) Facilities are to be provided in the fire detecting system to release manually the fire alarm from the places of passageways having entrances to engine and boiler rooms, navigating bridge, and control station in engine room.

103. Protection of accommodation and service spaces and control stations

In applying **103. 5** of the Rules, as for the methods of divisions and protections for accommodation spaces and service spaces, **Fig 8.3.1** is to be referred to as the standard arrangements. And in case of ships built in accordance with Method IIIC, the detection system is only relevant to the accommodation block and then service spaces built away from the accommodation block need not be fitted with a fixed fire detection system.

</table>

Fig 8.3.1 Method of division and protection for accommodation spaces and service spaces

108. Protection of cabin balconies on passenger ships

In applying **108.** of the Rules, fixed fire detection and fire alarm systems for cabin balconies shall be approved by the Society based on the Guidelines (MSC.1/Circ. 1242) developed by the IMO.

SECTION 2 Control of smoke speed

201. Protection of control stations outside machinery space

In applying **201.** of the Rules, the "practicable equipment" means that mechanical ventilation system is preferable, but natural ventilation system may also be accepted. And "where the local closing arrangements are equally effective" means that fire dampers or smoke dampers which are easily closed within the control stations are provided in the ventilation system so that smoke will not be drawn into such a control station in case of fire, and further, any openings, where provided, can be easily and securely closed.

203. Draft stops

In applying **203.** of the Rules,the draft stops, in general, are to coincide with the bulkheads where continuous ceilings are used. And any of the following methods of construction may be used to construct draft stops.

(1) The extension of the "B" class bulkhead, ceiling or lining
(2) The extension of the "C" class bulkhead, ceiling or lining
(3) 1 mm thick minimum steel sheet, stiffened where necessary, intermittently welded to the ship's structure and the top profile of the bulkhead, or fastened mechanically to the ceilings or linings
(4) Non-combustible board type material fasten mechanically to the ship's structure, bulkheads, ceilings or linings
(5) "A" class mineral wool insulation, not less than 20 mm in thickness, faced on each side with expanded metal mesh, the mesh on one side being attached to the ship's structure or expanded metal mesh may be fitted on one side and non-combustible cloth (glass-cloth) on the other side of mineral wool insulation.

SECTION 3 Containment of fire

301. Thermal and structural boundaries

1. In applying **301. 1** of the Rules, spaces of categories for the application of the standards of fire integrity are also to be complied with following ,

Control stations	Motor-generator rooms or inverter rooms for navigational or radio apparatus, storage rooms for fixed gas fire extinguishing system (where the system is stored outside the space to be protected)
Service spaces (low risk)	Shore connection box rooms, accommodation ladder winch machinery rooms, spaces where distribution panels and starters are located, ballast control rooms, main cargo control rooms
Other machinery spaces	Storage rooms for hydraulic units for deck machinery and cargo gears, steering gear room (see Note (1) below) foam tank rooms (those not capable of being remotely-controlled are regarded as the control stations), inert gas fan rooms
Service spaces (high risk)	Oxygen or acetylene bottle storage rooms (see Note (2) below), provision store rooms (see Note (3) below), jumper lockers (see Note (4) below)
Others	1. Passages under decks of container ships are to be regarded as void spaces. However, in case where they serve as escape route, they are to be regarded as corridors. 2. In this case, locker rooms, store rooms, lavatories for control stations, etc., in which someone may occupy temporarily, having no entrance to corridors but only entrance therefrom may be regarded as an integral part of such spaces. If a space is divided into two (or more) smaller spaces so that these new spaces form enclosed spaces (e.g. a cabinet built in a mess-room, a store room built in a mess-room), these new enclosed spaces are to be surrounded by fire-resistant bulkheads and decks in accordance with Rules. 3. Weather decks used to cargo stowage are to be considered as cargo spaces except for cargoes which constitute a low fire risk. 4. Ventilating fan rooms within refrigerated cargo spaces and cargo handling gear locker which can be accessible only from ro/ro spaces or vehicle spaces may be regarded as a part of Cargo spaces, ro-ro and vehicle spaces respectively. 5. Cable trunks are to apply to the requirements of the Rules **301. 3** (4) for lift trunks
Notes: (1) In case where an emergency fire pump is installed in the steering gear room or spaces which are only accessible directly therefrom, the fire integrity of boundaries between the space where the main fire pump is installed and the steering gear room is to be in accordance with **Fig 8.3.6** (2) In case where one side or more of the walls are open to exposed deck, such storage rooms may be regarded as those on open deck. (3) Refrigerated provision chambers are to be service spaces (high risk) if thermally insulated with combustible materials, or service spaces (low risk) if thermally insulated with non-combustible material. Provision chambers having areas of less than 4 m^2 may be considered as a service space with low risk of fire. (4) In case where jumper lockers are used as Oil skin lockers, they are regarded as high risk service spaces, except for Oil skin lockers, they are regarded as low risk service spaces	

2. In applying **301. 2** (1) (C) of the Rules, if a stairway serves two main vertical zones, the maximum length of any one main vertical zone need not be measured from the far side of the stairway enclosure. In this case all boundaries of the stairway enclosure are to be insulated as main vertical zone bulkhead and access doors leading into the stairway are to be provided from the two outside zones. The number of main vertical zone of 48 m is not limited as long as they comply with all the requirements.

3. In applying **301. 2** (2) (C) of the Rules, if an air gap between cabins results in an opening in the continuous class B-15 ceiling, the bulkheads on both sides of the air gap are to be of class B-15.

4. In applying **301. 2** (3) (A) of the Rules, distribution board may be located behind panels/linings within accommodation spaces including stairway enclosures, without the need to categorize the space, provided no provision is made for storage.

5. In applying **301. 3** (1) (A) (c) of the Rules, increasing area for public spaces is, in principle, to be limited to 75 m^2.

6. In applying **301. 3** (4) (A) of the Rules, stairway penetrating more than a single deck are to be protected in accordance with the following requirements:

(1) In case where stairways and passages are provided in stairway enclosures and access to other decks is possible through such stairway enclosures, self-closing "A" class fire doors are to be provided at each deck level (see **Fig 8.3.2** (a)).

(2) In case where only stairways are provided in stairway enclosures and access to other decks is made through outside the enclosures at each deck level, the following requirements are to be complied with:

(A) In case of stairways with open steps, they are to be protected by self-closing "A" class fire doors at each deck level and at each end of a stair (see **Fig 8.3.2** (b)).

(B) In case of stairways with closed steps, self-closing "B" class fire doors are to be provided at least at one end of each stair (see **Fig 8.3.2** (c)).

Structural configuration	Structural details
(a) Stairways accessible to other decks not going out of the stairway enclosures	(b) Only stairways with open steps are surrounded by an enclosure and access to other decks is made through outside the enclosure at each deck level and each end a stair.	(c) Only stairways with closed steps are surrounded by an enclousre and access to other decks is made through outside the enclosure at each deck level and one end of each stair.	
f : Self-closing "A" class fire door
F : Self-closing "B" class fire door

Fig 8.3.2 Protection of the stairway enclosures penetrating more than a single deck

7. In applying **301. 4** (2) (E) of the Rules, insulation of superstructures and deckhouses facing the cargo area are to be in accordance with the following requirements:

(1) "The outward sides for a distance of 3 m from the end boundary" refer to the **Fig 8.3.3** (a) of the Guidance.

(2) In the case of the arrangement as shown in **Fig 8.3.3** (b) of the Guidance, "A-60" class insulation is to be applied to the aft end bulkhead of deckhouse and side walls of accommodation spaces and service spaces of 3 m from the fore end thereof where they form the external boundaries of accommodation spaces and service spaces.

(3) "A-60" class Insulation requirements for the side walls for 3 m aft of the front bulkhead are to apply to all areas in the vertical direction up to the underside of the deck of the navigation bridge for superstructures and deckhouses.

(4) The side walls of a wheelhouse having the structural arrangement unlikely to be exposed to flames in case of fire in way of cargo area (e.g. structural arrangement of a wheelhouse provided on the sponson deck) may not be provided with the insulation.

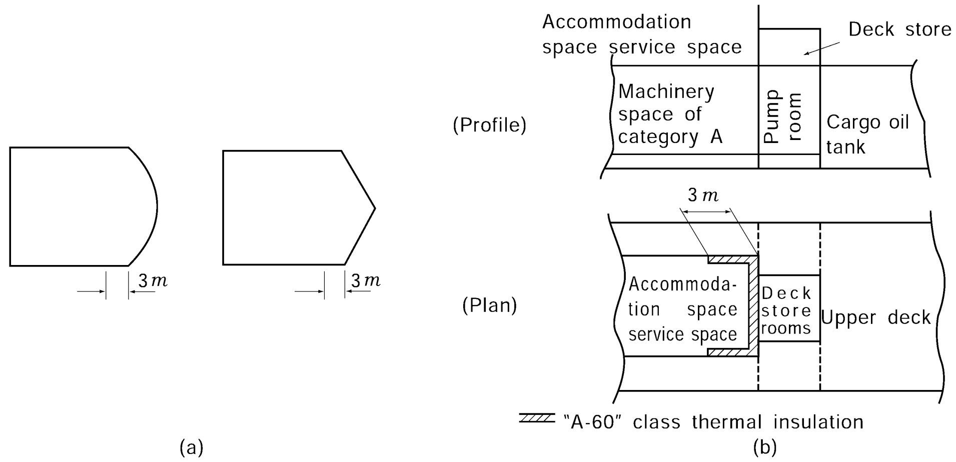

Fig 8.3.3 Insulation of superstructures and deckhouses facing the cargo area

8. In applying **301. 4** (2) Table Notes d. of the Rules, permanent approved gastight lighting enclosures for illumination with sufficient strength and maintaining the fire integrity and gas tightness of the bulkhead or deck are to have integrity and gas tightness equivalent to Grade A bronze side scuttles (fixed type) specified in **Pt 4, Ch 8, Sec 8** of the Rules and to be fitted with fire-resisting glass where illumination is made through a glazed window. The skylight, the bulkheads and decks bounding the cargo pump rooms required to have "A-60" class fire protection under the requirements of the Rules are not to be fitted with these glazed windows.

302. Penetration in fire-resisting divisions and prevention of heat transmission

1. In applying **302.** of the Rules, the structural arrangements penetrated through "A"or "B" class divisions are to be in accordance with **Annex 8-2** of the Guidance, and in addition electric cable penetrations are also to be complied with the requirement of **Pt 6, Ch1, 408.** of the Rules.

2. In applying **302. 4** of the Rules, treatment of terminal points and intersections of insulated bulkheads and decks" is to be in accordance with **Fig 8.3.4**.

Treatment of terminal points and intersections	Structural details
(1) Insulation of stiffeners, girders, etc., in case where their depth is 450 mm or less, is to be applied to the whole structure including the flanges or face plates. Where the depth exceeds 450 mm, such insulation is to be applied to at least 450 mm in depth from bulkheads or decks. However, in case where the fire integrity has been verified by a standard fire test, this requirement may be dispensed with	Where $d \leq 450$ mm Where $d > 450$ mm (2) The structural extension of insulation at intersections between uninsulated bulkheads, decks or brackets is to be 450 mm or more	(3) In case where the lower part of insulation has to be cut for drainage, the construction is to be inaccordance with the structural details.	t : Thickness of thermal insulation d : Depth of stiffener or girder	

Fig 8.3.4 Treatment of terminal points and intersections of insulated bulkheads and decks

303. Protection of openings in fire resisting divisions

1. In applying **303. 1** of the Rules, balancing openings or ducts between two enclosed spaces are prohibited except for openings as permitted by **303. 1** (2) & **2** of the Rules.
2. In applying **303. 1** of the Rules, guidelines developed by the IMO referred in **303. 1** (3) (C) (c) of the Rules should be in accordance with the IMO Res. A.800(19).
3. In applying **303. 2** (1) of the Rules, where required divisions are replaced by divisions of a higher standard, the door need only conform to the required division.
4. In applying **303. 2** (2) of the Rules, "Remote release devices of fail-safe type" means the system which releases hooks or other equivalent devices by remote operation, and that the door is automatically closed even in case of failure of the system.

5. In applying **303. 2** (3) of the Rules, in case where ventilation openings are provided on corridor bulkheads, the following requirements are to be complied with

(1) For corridor bulkheads except stairway enclosures required to have "B" class fire integrity, "B" class fire door with louvres of approved type leading to lavatories, offices, pantries, lockers and store rooms may be provided. In this case, the louvres are to be capable of being closed from the corridor side.

(2) For duct trunks adjoining to corridor bulkheads, ventilation openings with manual closing appliances may be provided. In this case, grids made of non-combustible materials are to be fitted to the ventilation openings. Furthermore, in case where the sectional area of such a ventilation opening exceeds 0.075 m^2, self-closing type fire damper is to be provided in addition to the manual closing appliances.

305. Protection of cargo space boundaries

In applying **305. 5** of the Rules, when ships are designed to transport alternatively oil or dry cargoes, openings which may be used for cargo operations are not permitted in bulkheads and decks separating oil cargo spaces from other spaces not designed and equipped for the carriage of oil cargoes unless alternative approved means are provided to ensure equivalent integrity.

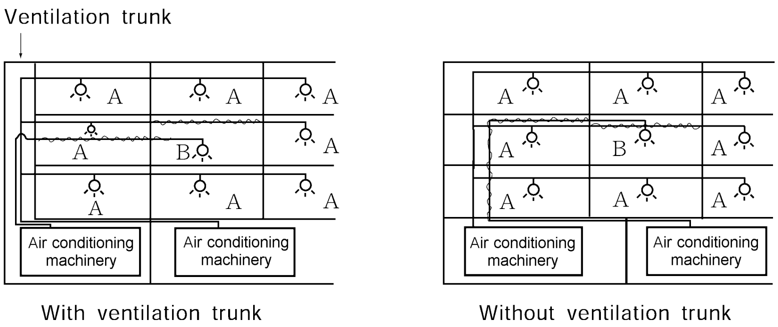
306. Ventilation systems

1. In applying **306.** of the Rules, exhaust ventilations of accommodation spaces, service spaces and control stations to be effected through the exhaust ventilation ducts except where ventilation openings are accepted under **303. 4**.

2. In applying **306. 1** (1) of the Rules, Combustible gaskets in flanged ventilation duct connections are not permitted within 600 mm of an opening in an A class or B class division and in ducts required to be of A class construction. However, flexible bellows of combustible material may be used for the connecting fans to ducting in air conditioning rooms. And a free cross-sectional area means the area calculated on the basis of the inner diameter of the duct.

3. In applying **306. 1** (B) of the Rules and **306. 4** (3) (C) of the Rules, calorific value refers to ISO, in particular publication ISO 1716, Determination of calorific potential.

4. In applying **306. 2** of the Rules, "A-60" class insulation" is, as a standard, to be an insulation with rock-wool approved as non-combustible material, or insulation approved as "A-60" class standard and arrangement of ducts are to be in accordance with **Fig 8.3.5**.



A: Accommodation spaces, service spaces excluding galleys or control stations
B: Machinery spaces of category A, galleys, car deck spaces or ro-ro cargo spaces

Fig 8.3.5 Examples for arrangements of Ventilation system

5. In applying **306. 2** (1) of the Rules, the expression"in any case" means, in this context, "for any duct section" and this section actually applies to arrangements where a ventilation unit serves some spaces and a galley by a separate duct as permitted, as permitted for cargo ships of less than 4,000 gross tonnage and for passenger ships carrying not more than 36 passengers.

6. In applying **306. 3** (1) (B) of the Rules, "Fire dampers automatically" is to be the fuse type dampers or those considered to be equivalent by the Society. "Being closed manually" means closing by mechanical means of release or by remote operation of the fire damper by means of a fail-safe electrical switch or pneumatic release (spring-loaded, etc.) on both sides of the division. However, ducts or pipes with free sectional area of 0.075 m^3 or less need not be fitted with fire damper at their passage through Class"A" division.

7. In applying the requirements of **306. 5** of the Rules, the exhaust ducts from galley ranges are to be in accordance with the following requirements:

(1) The exhaust ducts from galley ranges are, in principle, to be independent from other ducts. In case where this is impracticable, self-closing type fire dampers which can be remotely operated are to be fitted to the other branch ducts in order to be capable of closing these dampers together with those for galley ranges simultaneously.
(2) Unless otherwise permitted by the Society, the term of "spaces containing combustible materials" will normally apply to all spaces in accommodation.
(3) "A" class divisions herein means that ducts are to be of steel with a thickness of 4.5 mm or more.
(4) The fire dampers located at the lower end of the ducts are to be such that they can be readily and safely closed in the galley in case of fire in way of range.
(5) In case where the carbon dioxide gas fire extinguishing system specified in **403.** of the Rules is provided as fixed means for extinguishing a fire within the exhaust duct, the quantity of fire extinguishing medium is to be 100 % or more of the volume of the duct spaces to be protected.
(6) The fire extinguishing system specified in **306. 5** (3) (D) of the Rules shall be operated automatically due to a fire within the duct.

8. In applying **306. 5** (1) of the Rules, the requirements to exhaust ducts from galley ranges in which grease or fat is likely to accumulate will apply to all exhaust ducts from galley ranges.

9. In applying **306. 5** (3) of the Rules, fire dampers do not need to pass the fire test in Res. A754(18), but should be of steel and capable of stopping the draught. The requirements to “A” class applies only to the part of the duct outside of the galley. And the term"spaces containing combustible materials will normally apply to all spaces in accommodation.

10. In applying **301. 2** (1), (2) & **301. 5** (2), (3) of the Rules for determining fire insulation for trunks and ducts which pass through an enclosed space, the term "pass through" means the part of the trunk/duct contiguous to the enclosed space. (see **Fig 8.3.6**)

11. In applying the requirements of **306. 3** (1) (B) of the Rules, fire-protection requirements of fan rooms serving engine-rooms are to be complied as follows.

(1) A fan room solely serving the engine-room or multiple spaces containing an engine-room, may be treated as machinery space having little or no fire risk.
In this case:
(A) Boundaries between the fan room and engine-room casing should be of “A-0” fire integrity;
(B) Duct penetrations should comply with **306. 3** (1) (B) of the Rules;
(C) Ducts serving the engine-room should be routed directly to the relevant fan(s) and from the fan to the louvers; and
(D) Closing of the ventilation duct to/from the engine-room should be possible from outside the engine-room. In this case, the controls for the closing of the engine-room ventilation duct (i.e., a fire damper installed in accordance with **306. 3** (1) (B) of the Rules) can be located inside the fan room.
(2) A fan room solely serving the engine-room may be considered as part of the engine-room. In this case:
(A) Requirements for fire integrity of the horizontal boundary between fan room and engine-room need not apply; and
(B) Closing the ventilation duct to/from engine-room should be possible from outside the engine-room. In this case, the controls for closing of the ventilation trunk (i.e., a fire damper installed as per **306. 3** (1) (B) of the Rules) should be located outside the fan room.
(3) For both of the cases described above:

(A) For any space(s) adjacent to the fan room superstructure, the fire integrity of the separating bulkhead(s) should meet the applicable fire integrity requirements contained in the table set out in **301. Table 8.3** of the Rules ;and

(B) Load Line Convention requirements relevant to the means of closing for downflooding protection should be applied, if necessary.

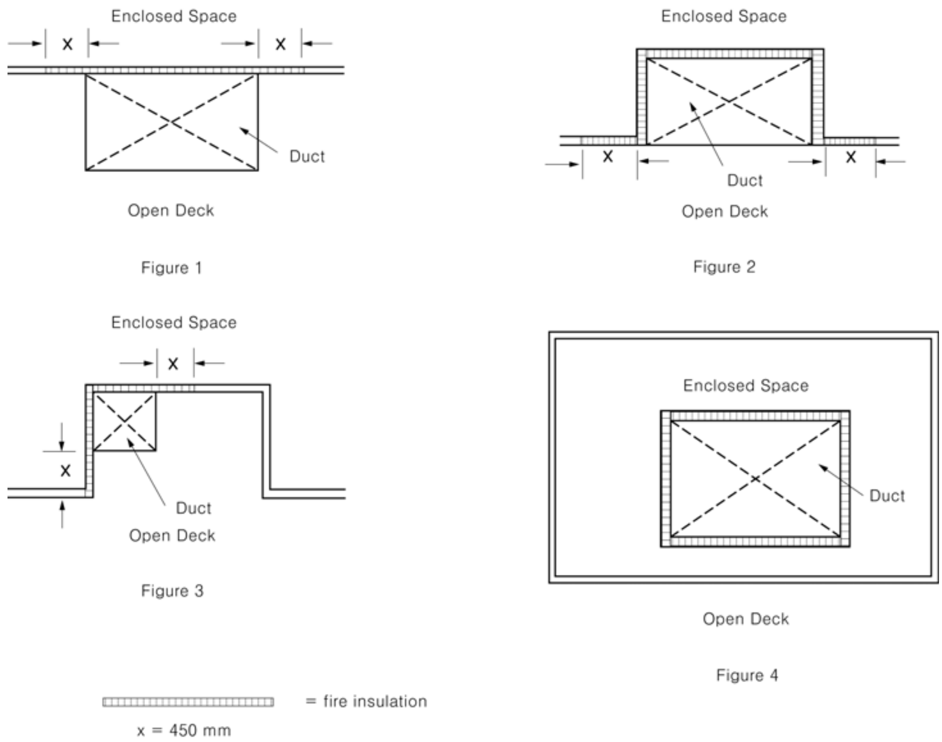


Fig 8.3.6 Examples of ducts contiguous to enclosed space

SECTION 4 Fire fighting

401. Water supply systems

1. In applying **401. 1** (4) (A) of the Rules, isolating valves are not applicable to the piping from fire pumps located in other spaces other than category A machinery spaces.

2. In applying **401. 1** (6) of the Rules, the minimum pressure is to be sufficient to produce a 12 m jet throw, through any adjacent hydrants, to any part of the ships referred to **401. 1** (5) of the Rules, on passenger and cargo ships under 1,000 tonnes gross tonnage.

3. In applying **401. 1** (7) of the Rules, Standard dimensions of flanges for the international shore connection shall be in accordance with the following table. And International shore connections shall be of steel or other equivalent material and shall be designed for 1.0 MPa services. The flange shall have a flat face on one side and, on the other side, it shall be permanently attached to a coupling that will fit the ship's hydrant and hose. The connection shall be kept aboard the ship together with a gasket of any material suitable for 1.0 MPa services.

Description	Dimension	
Outside diameter	178 mm	Inside diameter	64 mm	
Bolt circle diameter	132 mm	
Slots in flange	4 holes 19 mm in diameter spaced equidistantly on a bolt circle of the above diameter, slotted to the flange periphery	
Flange thickness	14.5 mm minimum	
Bolts and nuts	4 ea, each of 16 mm diameter, 50 mm in length including eight(8) washers	

4. In applying **401. 2** (3) of the Rules, on ships for navigation in ice, on ships for navigation in polar water and on ships for navigation in polar and ice breaking service, sea inlet system is to be in accordance with the requirements in **Pt 3, Ch 20, 702.** of the Rules, the requirements in **Pt 3, Ch 21, 308.** of the Guidance and the requirements in **Pt 3, Ch 22, 903.** of the Guidance respectively.

5. In applying **401. 2** (3) (A) (b) of the Rules, the electrical cables to the emergency fire pump are not to pass through the machinery spaces containing the main fire pumps and their sources of power and prime movers. They are to be of a fire resistant type approve by the Society, where they pass through other high fire risk areas. And unless the two main fire pumps, their sea suctions and the fuel supply or source of power for each pump are situated within compartments separated at least by A-0 divisions, so that a fire in any one compartment will not render both fire pumps inoperable, an emergency fire pump should be fitted. An arrangement in which one main fire pump is located in a compartment having more than one bulkhead adjacent to the compartment containing the other main fire pump should also require an emergency fire pump.

6. In applying **401. 2** (3) (B) of the Rules, emergency fire pumps is not applicable to passenger ships of l,000 gross tonnage and upwards and is also, in principle, to be complied with as follows,

(1) The emergency fire pump shall be of a fixed independently driven power-operated pump.

(2) Capacity of emergency fire pump

(A) The capacity of the pump shall not be less than 40 % of the total capacity of the fire pumps specified in **401. 2** (4) of the Rules and in any case not less than

(a) for passenger ships less than 1000 gross tonnage and for cargo ships of 2000 gross tonnage and upwards ; 25 cubic meters/h

(b) for cargo ships less than 2000 gross tonnage ; 15 cubic meters/h.

(B) In applying **403. 1** (1) of the Rules, where a fixed water-based fire extinguishing system installed for the protection of the machinery space of cargo ships is supplied by the emergency fire pump, the emergency fire pump capacity shall be adequate to supply the fixed fire extinguishing system at the required pressure plus two jets of water. The capacity of the two jets shall in any case be calculated by that emanating from the biggest nozzle size available onboard from the following table(When selecting the biggest nozzle size available onboard, the nozzles located in the space where the main fire pumps are located can be excluded), but shall not be less than 25 m^3/h

< Capacity of single jet >

Pressure at Hydrant \ Nozzle size	16 mm	19 mm
0.27 N/mm^2	16 m^3/h	23.5 m^3/h

(3) When the pump is delivering the quantity of water required by paragraph (2) the pressure at any hydrants shall be not less than the minimum pressure specified in the Rules.
(4) The total suction head and the net positive suction head of the pump shall be determined having due regard to the requirements on the pump capacity and on the hydrant pressure under all conditions of list, trim, roll and pitch likely to be encountered in service. The ballast condition of a ship on entering or leaving a dry dock need not be considered a service condition. Upon completion of the emergency fire pump installation, a performance test confirming the capacity required in the Rules should be carried out. As far as practicable, the test should be carried out at lightest seagoing draught at the suction position.
(5) Any diesel driven power source for the pump shall be capable of being readily started in its cold condition down to the temperature of 0 ℃ by hand (manual) cranking. If this is impracticable, or if lower temperature are likely to be encountered, consideration is to be given to the provision and maintenance of heating arrangement, acceptable to the Society so that ready starting will be assured. If hand (manual) starting is impracticable, the Society may permit other means of starting. These means shall be such as to enable the diesel driven power source to be started at least six times within a period of 30 min and at least twice within the first 10 min.
(6) Any service fuel tank shall contain sufficient fuel to enable the pump to run on full load for at least three hours and sufficient reserves of fuel shall be available outside the machinery space of category A to enable the pump to be run on full load for an additional 15 h.
(7) The room where the pump and prime mover are installed is to have adequate space for maintenance work and inspections .
(8) Where necessary to ensure priming, the emergency fire pump should be of the self priming type.
(9) Where a power-operated emergency fire pump is fitted, its fuel or power supply is to be so arranged that it will not readily be affected by a fire in the compartment containing the main fire pumps. The room where the emergency fire pump prime mover is located is to be illuminated and well ventilated from the emergency source of supply.

7. In applying **401. 2** (3) (B) (a) of the Rule, when a single access to the emergency fire pump room is through another spaces adjoining a machinery space of category A or the spaces containing the main fire pumps, class A-60 boundary is required between the other space and the machinery space of category A or the spaces containing the main fire pumps.

8. In applying **401. 2** (3) (B) (b) of the Rule, if a direct access between machinery spaces provided with the main fire pumps are installed and spaces provided with an emergency fire pump or the second means of access to the space provided with an emergency fire pump is inevitably provided, **Fig 8.3.7** is to be referred to as the standard arrangements.

<table>
<tr><th colspan="3">Construction</th><th>Structural details</th></tr>

</table>

Fig 8.3.7 Corridors in machinery spaces and spaces provided with emergency fire pumps

9. In applying **401. 2** (3) (C) of the Rules, this paragraph does not force designers to choose pumps with capacity and pressure characteristics other than that being optimal for the service intended, just to make their connection to the fire main possible, provided the required number and capacity of fire pumps are already fitted.

10. In applying **401. 3** of the Rules, Aluminium alloys may be used for fire hose couplings and nozzles, except in open deck areas of oil tankers and chemical tankers. And fire hose nozzles made of plastic type material, e.g. polycarbonate, are considered acceptable provided capacity and serviceability are documented and the nozzles are found suitable for the marine environment.

402. Portable fire extinguisher

1. In applying **402. 1** of the Rules, portable fire extinguisher is also to be complied with as follows.

(1) All fire extinguishers shall be of approved types and designs based on the guidelines **Res.A.602(15)** developed by the IMO.

(2) Each powder or carbon dioxide extinguisher shall have a capacity of at least 5 kg, and each foam extinguisher shall have a capacity of at least 9 L. The mass of all portable fire extinguishers shall not exceed 23 kg, and they shall have a fire-extinguishing capability at least equivalent to that of a 9 L fluid extinguisher.

(3) the Society shall determine the equivalent of fire extinguishers.

(4) Only refills approved for the fire extinguisher in question shall be used for recharging

(5) In applying **404. 1** (2) (A) & **404. 2** (2) (A) of the Rules, a portable foam applicator unit shall consist of a foam nozzle/branch pipe, either of a self-inducing type or in combination with a separate inductor, capable of being connected to the fire main by a fire hose, together with a portable tank containing at least 20 ℓ of foam concentrate and at least one spare tank of foam concentrate of the same capacity, and the System performance is as follows.

(A) The nozzle/branch pipe and inductor shall be capable of producing effective foam suitable for extinguishing an oil fire, at a foam solution flow rate of at least 200 ℓ/min at the nominal pressure in the fire main.

(B) The foam concentrate shall be approved by the Flag Administration in which the ship is registered or to be registered based on the guideline developed by the IMO.* However, in case where there is no expressly provided national regulations, the foam concentrate shall be approved by the Contracting Government of the SOLAS or the Society.

* Refer to the Guidelines for the performance and testing criteria and surveys of low-expansion foam concentrates for fixed fire-extinguishing systems (MSC/Circ.582/Corr.1).

(C) The values of the foam expansion and drainage time of the foam produced by the portable foam applicator unit shall not differ more than ± 10 % of that determined in (B).

(D) The portable foam applicator unit shall be designed to withstand clogging, ambient temperature changes, vibration, humidity, shock, impact and corrosion normally encountered on ships.

2. In applying **402. 2** of the Rules, number and arrangement of portable fire extinguishers are to be complied with as follows.

(1) If a space is locked when unmanned, portable fire extinguishers required for that space may be kept inside or outside the space.

(2) The selection of portable fire extinguishers should be appropriate to the fire hazard(s) in the space in accordance with the Guidelines for marine portable fire extinguishers, as adopted by Res.A.951(23). The classes of portable fire extinguishers in the table are only for reference.

(3) Unless expressly provided by the Unified Interpretations of SOLAS Ch II-2, the FSS Code, the FTP Code and related fire test procedures (MSC/Circ. 1120) or **404.** of the Rules, the number and arrangement of portable fire extinguishers in machinery spaces of category A are specified in the following table.

< Minimum numbers and distribution of portable fire extinguishers in the various types of spaces on board ships >

Type of spaces		Minimum number of extinguishers	Class(es) of extinguisher(s)(6)
Accommo. spaces	Public spaces	1 per 250 m² of deck area or fraction thereof	A
	Corridors	Travel distance to extinguishers should not exceed 25 m within each deck and main vertical zone	A
	Stairway	0	
	Lavatories, cabins, offices, pantries containing no cooking appliances	0	
	Hospital	1	A
Service spaces	Laundry drying rooms, pantries containing cooking appliances	1(2)	A or B
	Lockers and store rooms (having a deck area of 4 m² or more), mail and baggage rooms, specie rooms, workshops (not part of machinery spaces, galleys)	1(2)	B
	Galleys	1 class B and 1 additional class F or K for galleys with deep fat fryers	B, F or K
	Lockers and store rooms (deck area is less than 4 m²)	0	
	Other spaces in which flammable liquids are stowed	In accordance with **405. 3** of the Rules	
Control stations	Control stations (other than wheelhouse)	1	A or C
	Wheelhouse	2, if the wheelhouse is less than 50 m² only 1 extinguisher is required(3)	A or C
Machinery spaces of category A	Central control station for propulsion machinery	1, and 1 additional extinguisher suitable for electrical fires when main switchboards are arranged in central control station	A and/or C
	Vicinity of the main switchboards	2	C
	Workshops	1	A or B
	Enclosed space with oil-fired inert gas generators, incinerators and waste disposal units	2	B
	Separately enclosed room with fuel oil purifiers(7)	0	
	Periodically unattended Machinery spaces of category A	1 at each entrance(1)	B
Other spaces	Workshops forming part of machinery spaces and other machinery spaces (auxiliary spaces, electrical equipment spaces, auto - telephone exchange rooms, air conditioning spaces and other similar spaces)	1	B or C
	Weather deck	0(4)	B
	Ro-ro spaces and vehicle spaces	No point if space is more than 20 m walking distance from an extinguisher at each deck level(4),(5)	
	Cargo spaces	0(4)	B
	Cargo pump-room	2	B
	Helidecks	In accordance with **Ch 5, 104.** of the Rules	B

NOTES:
(1) A portable fire extinguisher required for a small space may be located outside and near the entrance to that space.
(2) For service spaces, a portable fire extinguisher required for that small space placed outside or near the entrance to that space may also be considered as part of the requirement for the space in which it is located.
(3) If the wheelhouse is adjacent with a chart room and has a door giving direct access to the chart room, no additional fire extinguisher is required in the chart room. The same applies to safety centres if they are within the boundaries of the wheelhouse in passenger ships.
(4) Two portable fire extinguishers, each having a capacity of not less than 6 kg of dry powder or equivalent, should be provided when dangerous goods are carried on the weather deck, in open ro-ro spaces and vehicle spaces, and in cargo spaces as appropriate. Two portable fire extinguishers, each having a suitable capacity, should be provided on weather deck for tankers.
(5) No portable fire extinguisher needs to be provided in cargo holds of containerships if motor vehicles with fuel in their tank for their own propulsion are carried in open or closed containers.
(6) Classes of extinguishers are as follows in accordance with Res.A 951(23)
(7) The separately enclosed room is to be enclosed by steel bulkheads extending from deck to deck and provided with self-closing steel doors. And, the room is to be provided with independent ventilation system, fire detecting system and fixed fire extinguishing installation.

< Class(es) of extinguisher(s) >

International Organization for Standardization (ISO standard 3941)	National Fire Protection Association (NEPA 10)
Class A: Fires involving solid materials, usually of an organic nature, in which combustion normally takes place with the formation of glowing embers.	Class A: Fires in ordinary combustible materials such as wood, cloth, paper, rubber and many plastics.
Class B: Fires involving liquids or liquefiable solids.	Class B: Fires in flammable liquids, oils, greases, tars, oil base paints, lacquers and flammable gases.
Class C: Fires involving gases.	Class C: Fires, which involve energized electrical equipment where the electrical non-conductivity of the extinguishing medium is of importance. (When electrical equipment is de-energized, extinguishers for class A or B fires may be used safely)
Class D: Fires involving metals.	Class D: Fires in combustible metals such as magnesium, titanium, zirconium, sodium, lithium and potassium.
Class F: Fires involving cooking oils.	Class K: Fires involving cooking grease, fats and oils.

3. In applying **402. 2** (2) of the Rules, it is recommended that the remaining portable fire extinguishers in the public spaces and workshops be located at or near the main entrances and exits.

403. Fixed fire-extinguishing systems

1. In applying **403. 1** (1) (A) of the Rules, fixed gas fire-extinguishing system is also to be complied with as follows.

(1) General

(A) Fire-extinguishing medium

(a) Where the quantity of the extinguishing medium is required to protect more than one space, the quantity of medium available need not be more than the largest quantity required for any one space so protected. The system shall be fitted with normally closed control valves arranged to direct the agent into the appropriate space.

(b) The volume of starting air receivers, converted to free air volume, shall be added to the gross volume of the machinery space when calculating the necessary quantity of extinguishing medium. Alternatively, a discharge pipe from the safety valves may be fitted and led directly to the open air.

(c) Means shall be provided for the crew to safely check the quantity of medium in the containers.

(d) Containers for the storage of fire-extinguishing medium, piping and associated pressure components shall be designed according to the following pressure codes of practice to the satisfaction of the Society having regard to their locations and maximum ambient temperatures expected in service.

(i) ISO-9809/1 : Refillable seamless steel gas cylinders (design, construction and testing)

(ii) ISO-3500 : Seamless steel CO2 cylinders. For fixed fire-fighting installations on ships, specifying the principal external dimensions, accessories, filling ratio and marking for seamless steel CO2 cylinders used in fixed fire-fighting installations on ships, in order to facilitate their interchange ability

(iii) ISO-5923 : Fire protection - Fire-extinguishing media - Carbon dioxide

(iv) ISO-13769 : Gas cylinders - Stamp marking

(v) ISO-6406 : Periodic inspection and testing of seamless steel gas cylinders

(vi) ISO-9329, part 1 : Seamless steel tubes for pressure purposes - Technical delivery conditions. Part 1 : Unalloyed steels with specified room temperature properties

(vii) ISO-9329, part 2 : Seamless steel tubes for pressure purposes - Technical delivery conditions. Part 2 : Unalloyed and alloyed steels with specified elevated temperature properties

(viii) ISO-9330, part 1 : Welded steel tubes for pressure purposes - Technical delivery conditions - Part 1 : Unalloyed steels tubes with specified room temperature properties

(ix) ISO-9330, part 2 : Welded steel tubes for pressure purposes - Technical delivery conditions - Part 2 : Electric resistance and induction welded unalloyed and alloyed steel tubes with specified elevated temperature properties

(B) Installation requirements

(a) The piping for the distribution of fire-extinguishing medium shall be arranged and discharge nozzles so positioned that a uniform distribution of medium is obtained. System flow calculations shall be performed using a calculation technique acceptable to the Society.

(b) Except as otherwise permitted by the Society, pressure containers required for the storage of fire-extinguishing medium, other than steam, shall be located outside protected spaces in accordance with **403. 3** of the Rules.

(c) Spare parts for the system shall be stored on board as below and be to the satisfaction of the Society.

(i) Rupture disc of all containers
(including for working rupture disc and packing)

(ii) Safety disc of 1/3 of all containers
(including for working safety disc and packing)

(iii) Necessary packing, o-ring and tools for maintenance, etc to recharge 1/10 of all containers

(d) In piping sections where valve arrangements introduce sections of closed piping, such sections shall be fitted with a pressure relief valve and the outlet of the valve shall be led to open deck

(e) All discharge piping, fittings and nozzles in the protected spaces shall be constructed of materials having a melting temperature which exceeds 925℃. The piping and associated equipment shall be adequately supported.

(f) A fitting shall be installed in the discharge piping to permit the air testing as required by (2) (C) (a) (i)

(C) System control requirements

(a) The necessary pipes for conveying fire-extinguishing medium into the protected spaces shall be provided with control valves so marked as to indicate clearly the spaces to which the pipes are led. Suitable provisions shall be made to prevent inadvertent release of the medium into the space. Where a cargo space fitted with a gas fire-extinguishing system is used as a passenger space, the gas connection shall be blanked during such use. The pipes may pass through accommodations providing that they are of substantial thickness and that their tightness is verified with a pressure test, after their installation, at a pressure head not less than 5 N/mm^2. In addition, pipes passing through accommodation areas shall be joined only by welding and shall not be fitted with drains or other openings within such spaces. The pipes shall not pass through refrigerated spaces.

(b) Means shall be provided for automatically giving audible and visual warning of the release of fire-extinguishing medium into any ro-ro spaces and other spaces in which personnel normally work or to which they have access(spaces that doors or access manholes are installed at and personnel normally access during voyage, such as specific machinery spaces, vehicle deck spaces, roll-on, roll-off cargo spaces, refrigerated container storage spaces, etc except general cargo holds, small compressor rooms, paint lockers, flammable liquid lockers). The audible alarms shall be located so as to be audible throughout the protected space with all machinery operating, and the alarms should be distinguished from other audible alarms by adjustment of sound pressure or sound patterns. The pre-discharge alarm shall be automatically activated, e.g. by opening of the release cabinet door. The alarm shall operate for the length of time needed to evacuate the space, but in no case less than 20 seconds before the medium is released. Conventional cargo spaces and small spaces (such as compressor rooms, paint lockers, etc.) with only a local release need not be provided with such an alarm.

(c) The means of control of any fixed gas fire-extinguishing system shall be readily accessible, simple to operate and shall be grouped together in as few locations as possible at positions not likely to be cut off by a fire in a protected space. At each location there shall be clear instructions relating to the operation of the system having regard to the safety of personnel.

(d) Automatic release of fire-extinguishing medium shall not be permitted, except as permitted by the Society.

(2) Carbon dioxide systems

(A) Quantity of fire-extinguishing medium

(a) For cargo spaces, the quantity of carbon dioxide available shall, unless otherwise provided, be sufficient to give a minimum volume of free gas equal to 30 % of the gross volume of the largest cargo space to be protected in the ship.

(b) For machinery spaces, the quantity of carbon dioxide carried shall be sufficient to give a minimum volume of free gas equal to the larger of the following volumes, either:

(i) forty percent of the gross volume of the largest machinery space so protected, the volume to exclude that part of the casing above the level at which the horizontal area of the casing is 40 % or less than of the horizontal area of the space concerned taken midway between the tank top and the lowest part of the casing : or

(ii) thirty-five percent of the gross volume of the largest machinery space protected, including the casing;

(c) The percentages specified in paragraph (13) above may be reduced to 35 % and 30 %, respectively, for cargo ships of less than 2,000 tons gross tonnage where two or more machinery spaces, which are not entirely separate, are considered as forming one space.

(d) For the purpose of this paragraph the volume of free carbon dioxide shall be calculated at 0.56 m^3/kg.

(e) For machinery spaces the fixed piping system shall be such that 85 % of the gas can be discharged into the space within 2 min. And this may be checked by suitable calculations.

(B) Controls

(a) Carbon dioxide systems shall comply with the following requirements. And then these requirements only apply to systems protecting those spaces which are specified in (1) (C) (b).

(i) two separate controls shall be provided for releasing carbon dioxide into a protected space and to ensure the activation of the alarm. One control shall be used for opening the valve of the piping which conveys the gas into the protected space and a second control shall be used to discharge the gas from its storage containers. Positive means shall be provided so they con only be operated in that order; and

(ii) the two controls shall be located inside a release box clearly identified for the particular space. If the box containing the controls is to be locked, a key to the box shall be in a break-glass-type enclosure conspicuously located adjacent to the box.

(C) Testing of the installation

(a) When the system has been installed, pressure -tested and inspected, the following shall be carried out;

(i) a test of the free air flow in all pipes and nozzles; and

(ii) a functional test of the alarm equipment

(D) Low-pressure CO_2 system

(a) Where a low pressure CO_2 system is fitted to comply with this regulation, the following applies.

(i) The system control devices and the refrigerating plants shall be located within the same room where the pressure vessels are stored.

(ii) The rated amount of liquid carbon dioxide shall be stored in vessels under the working pressure in the range of 1.8 N/mm^2 to 2.2 N/mm^2. The normal liquid charge in the container shall be limited to provide sufficient vapour space to allow for expansion of the liquid under the maximum storage temperatures than can be obtained corresponding to the setting of the pressure relief valves but shall not exceed 95% of the volumetric capacity of the container.

(iii) Provision shall be made for:

- pressure gauge;
- high pressure alarm: not more than setting of the relief valve;
- low pressure alarm: not less than 1.8 N/mm^2;
- branch pipes with stop valves for filling the vessel;
- discharge pipes;
- liquid CO_2 level indicator, fitted on the vessel(s);
- two safety valves.

(iv) The two safety relief valves shall be arranged so that either valve can be shut off while the other is connected to the vessel. The setting of the relief valves should not be less than 1,1 times working pressure. The capacity of each valve shall be such that the vapours generated under fire condition can be discharged with a pressure rise not more than 20 % above the setting pressure. The discharge from the safety valves should be led to the open.

(v) The vessel(s) and outgoing pipes permanently filled with carbon dioxide shall have thermal insulation preventing the operation of the safety valve in 24 hours after de-energizing the plant, at ambient temperature of 45 ℃ and an initial pressure equal to the starting pressure of the refrigeration unit.

(vi) The vessel(s) shall be serviced by two automated completely independent refrigerating units solely intended for this purpose, each comprising a compressor and the relevant prime mover, evaporator and condenser.

(vii) The refrigerating capacity and the automatic control of each unit shall be so as to maintain the required temperature under conditions of continuous operation during 24 hours at sea temperatures up to 32 ℃ and ambient air temperatures up to 45 ℃.

(viii) Each electric refrigerating unit shall be supplied from the main switchboard busbars by a separate feeder.

(ix) Cooling water supply to the refrigerating plant (where required) shall be provided from at least two circulating pumps one of which being used as a stand-by. The stand-by pump may be a pump used for other services so long as its use for cooling would not interfere with any other essential service of the ship. Cooling water shall be taken from not less than two sea connections, preferably one port and one starboard.

(x) Safety relief devices shall be provided in each section of pipe that may be isolated by block valves and in which there could be a build-up of pressure in excess of the design pressure of any of the components.

(xi) Audible and visual alarms shall be given in a central control station or, in accordance with regulation SOLAS Ⅱ-1/51, where a central control station is not provided, when:

- the pressure in the vessel(s) reaches the low and high values according to (C);
- any one of the refrigerating units fails to operate;
- the lowest permissible level of the liquid in the vessels is reached.

(xii) If the system serves more than one space, means for control of discharge quantities of CO2 should be provided, e.g automatic timer or accurate level indicators located at the control position(s).

(xiii) If a device is provided which automatically regulates the discharge of the rated quantity of carbon dioxide into the protected spaces, it should be also possible to regulate the discharge manually.

(3) Requirements of steam systems

The boiler or boilers available for supplying steam shall have an evaporation of at least 1.0 kg of steam per hour for each 0.75 cubic meters of the gross volume of the largest space so protected. In addition to complying with the foregoing requirements the systems in all respects shall be as determined by, and to the satisfaction of the Society.

(4) Systems using gaseous products of fuel combustion

(A) General

(a) In applying **403. 1** (4) of the Rules, where gas other than carbon dioxide or steam, as permitted by paragraph (3), is produced on the ship and is used as a fire-extinguishing medium, the system shall comply with the following requirements in (B).

(B) Requirements of the systems

(a) Gaseous products

Gas shall be a gaseous product of fuel combustion in which the oxygen content, the carbon monoxide content, the corrosive elements and any solid combustible elements in a gaseous product shall have been reduced to a permissible minimum.

(b) Capacity of fire-extinguishing systems

(i) Where such gas is used as the fire-extinguishing medium in a fixed fire-extinguishing system for the protection of machinery spaces, it shall afford protection equivalent to that provided by a fixed system using carbon dioxide as the medium.

(ii) Where such gas is used as the fire-extinguishing medium in a fixed fire-extinguishing system for the protection of cargo spaces, a sufficient quantity of such gas shall be available to supply hourly a volume of free gas at least equal to 25 % of the gross volume of the largest space protected in this way for a period of 72 hours.

(5) Equivalent fixed gas fire-extinguishing systems for machinery spaces and cargo pump-rooms

(A) Fixed gas fire-extinguishing systems equivalent to those specified in paragraphs (2) through (4) shall be approved by the Society based on the following guidelines developed by the IMO.

(a) Revised guidelines for the approval of equivalent fixed gas fire-extinguishing systems, as referred to in SOLAS, for machinery spaces and cargo pump rooms (MSC/Circ.848 & MSC.1/Circ.1267)

(b) Revised guidelines for the approval of fixed aerosol fire-extinguishing systems equivalent to fixed gas fire-extinguishing systems, as referred to in SOLAS, for machinery spaces (MSC/Circ.1007 & MSC.1/Circ.1270)

(B) Fixed gas fire-extinguishing systems referred to in the above (A) (a), whose agent containers are stored within the area it protects are to comply with the following (a) to (c).

(a) Agent containers stored in a protected space shall be distributed throughout the space with bottles or groups of bottles located in at least six separate locations except the below (c).

(b) Duplicate power release lines shall be arranged to release all bottles simultaneously. The release lines shall be so arranged that in the event of damage to any power release line, five sixths of the fire extinguishing gas can still be discharged. The bottle valves are to be considered to be part of the release lines and a single failure shall include also failure of the bottle valve.

(c) For systems that need less than six cylinders (using the smallest bottles available), agent containers need not to be distributed separately, provided that

(i) The total amount of extinguishing gas on the bottles shall be such that in the event of a single failure to one of the release lines (including bottle valve), five sixths of the fire extinguishing gas than required so that if one bottle is not discharging due to a single fault, the remaining bottles will discharge the minimum five sixths of the required amount of gas. This can be achieved with minimum two bottles.

(ii) NOAEL(no-observed-adverse-effect-level) valves calculated at the highest expected engine room temperature are not to be exceeded when discharging the total amount of extinguishing gas simultaneously. Systems that can not comply with the above, for instance systems using only one bottle located inside the protected space, can not be accepted. Such systems shall be designed with the bottles located outside the protected space, in a dedicated room in compliance with **403. 3** of the Rules.

2. In applying **403. 1** (1) (B) of the Rules, fixed high-expansion foam fire-extinguishing systems is also to be complied with as follows.

(1) Fixed high-expansion foam systems generating foam using outside air of the protected spaces(Refer to **Fig 8.3.8-1**) are to comply with the following (A) to (B)

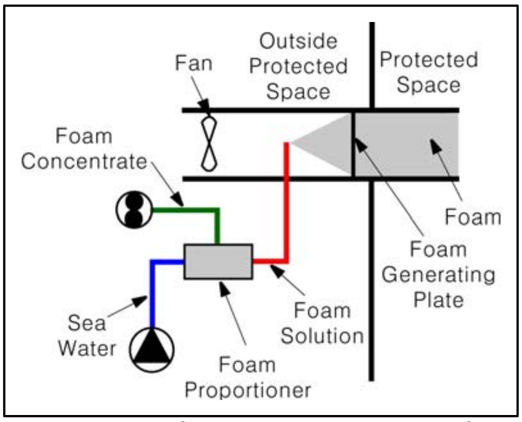

Fig 8.3.8-1(Outside air supply type)

(A) Quantity and performance of foam concentrates

(a) The foam concentrates of high-expansion foam fire-extinguishing systems shall be approved by the Flag Administration in which the ship is registered or to be registered based on the guideline developed by the IMO.* However, in case where there is no expressly provided national regulations, the foam concentrates of high-expansion foam fire-extinguishing systems shall be approved by the Contracting Government of the SOLAS or the Society.

* Refer to the Guidelines for performance and testing criteria and surveys of high expansion foam concentrates for fire-extinguishing systems (MSC/Circ.670).

(b) Any required fixed high-expansion foam system in machinery spaces shall be capable of rapidly discharging through fixed discharge outlets a quantity of foam sufficient to fill the greatest space to be protected at a rate of at least 1 m in depth per minute. The quantity of foam-forming liquid available shall be sufficient to produce a volume of foam equal to five times the volume of the largest space to be protected. The expansion ratio of the foam shall not exceed 1,000 to 1.

(c) The Society may permit alternative arrangements and discharge rates provided that it is satisfied that equivalent protection is achieved.

(B) Installation requirements

(a) Supply ducts for delivering foam, air intakes to the foam generator and the number of foam-producing units shall in the opinion of the Society be such as will provide effective foam production and distribution.

(b) The arrangement of the foam generator delivery ducting shall be such that a fire in the protected space will not affect the foam generating equipment. If the foam generators are located adjacent to the protected space, foam delivery ducts shall be installed to allow at least 450 mm of separation between the generators and the protected space. The foam delivery ducts shall be constructed of steel having a thickness of not less than 5 mm. In addition, stainless steel dampers (single or multi-bladed) with a thickness of not less than 3 mm shall be installed at the openings in the boundary bulkheads or decks between the foam generators and the protected space. The dampers shall be automatically operated (electrically, pneumatically or hydraulically) by means of remote control of the foam generator related to them.

(c) The foam generator, its sources of power supply, foam-forming liquid and means of controlling the system shall be readily accessible and simple to operate and shall be grouped in as few locations as possible at positions not likely to be cut off by a fire in the protected space.

(2) Fixed high-expansion foam systems generating foam using inside air of the protected spaces(Refer to **Fig 8.3.8-2**) are to be approved by the Society based on the guidelines developed by the IMO(MSC.1/Circ.1271)

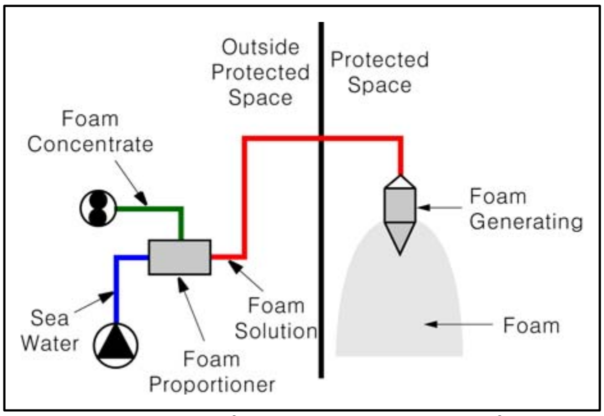

Fig 8.3.8-2(Inside air supply type)

(3) When such a system is to be fitted in any space than a machinery space, these requirements applies.

(4) In addition fixed low-expansion foam fire-extinguishing systems is also to be complied with as follows.

(A) Performance and Quantity of foam concentrates

(a) The foam concentrates of low-expansion foam fire-extinguishing systems shall be approved by the Flag Administration in which the ship is registered or to be registered based on the guidelines developed by the IMO* However, in case where there is no expressly provided national regulations, the foam concentrates of low-expansion foam fire-extinguishing systems shall be approved by the Contracting Government of the SOLAS or the Society.

* Refer to the Guidelines for performance and testing criteria and surveys of low expansion foam concentrates for fire-extinguishing systems (MSC/Circ.582 and Corr.1).

(b) The system shall be capable of discharging through fixed discharge outlets in no more than 5 min, a quantity of foam sufficient to produce an effective foam blanket over the largest single area over which oil fuel is liable to spread.

(B) Installation requirements

(a) Means shall be provided for the effective distribution of the foam through a permanent system of piping and control valves or cocks to suitable discharge outlets, and for the foam to be effectively directed by fixed sprayers on other main fire hazards in the protected space. The means for effective distribution of the foam shall be proven acceptable to the Society through calculation or by testing.

(b) The means of control of any such systems shall be readily accessible and simple to operate and shall be grouped together in as few locations as possible at positions not likely to be cut off by a fire in the protected space.

3. In applying **403. 1** (1) (C) of the Rules, fixed pressure water-spraying and water-mist fire-extinguishing systems are also to be complied with as follows.

(1) Fixed-pressure water-spraying fire-extinguishing systems & equivalent water-mist fire-extinguishing systems for machinery spaces and cargo pump-rooms shall be approved by the Society based on the Guidelines (MSC/Circ.1165 & MSC.1/Circ.1269) developed by the IMO.

(2) Fixed-pressure water-spraying fire-extinguishing systems & equivalent water-mist fire-extinguishing systems for the cabin balconies of passenger ship shall be approved by the Society based on the Guidelines (MSC.1/Circ.1268) developed by the IMO.

4. In applying **403. 3** of the Rules, storage room of fire extinguishing medium is used for carbon dioxide fire extinguishing system, Fire-extinguishing media protecting the cargo holds may be stored in a room located forward the cargo holds, but aft of the collision bulkhead, provided that both the local manual release mechanism and remote controls for the release of the media are fitted, and the latter is of robust construction or so protected as to remain operable in case of fire in the protected spaces. The remote controls shall be placed in the accommodation area in order to facilitate their accessibility by the crew. The capability to release different quantities of fire-extinguishing media into different cargo holds so protected shall be included in the remote release arrangement.

404. Fire-extinguishing arrangements in machinery spaces

1. In applying **404. 1** and **2** of the Rules,Fire-extinguishing arrangements in boiler rooms and internal combustion machinery rooms are to be referred to the following Table. And herein oil fired machinery other than boilers such as fired inert gas generators, incinerators and waste disposal units are to be considered the same as boilers insofar as the required number and type of fire fighting appliances are concerned.

Machinery spaces of category A \ System, Appliances & extinguishers		Fixed fire-extinguishing system	(1)Portable foam applicator	portable foam extinguisher	Additional portable foam extinguisher	135 L foam extinguisher	(2)45L foam extinguisher	(3)sand box
Boiler room	oil-fired boilers	1	1	2N	NA	1(4)	-	N
	oil-fired boilers and oil fuel units	1	1	2N + 2	NA	1(4)	-	N
Engine room	oil fuel units only	1	-	2	NA	-	-	-
	Internal combustion machinery	1	1	x		-	y	-
	Internal combustion machinery and oil fuel units	1	1	x		-	y	-
Boiler room / Engine room	Internal combustion machinery, oil-fired boilers and oil fuel units	1	1	(2N+2) or x whichever is greater		1(4)	y(5)	N

\- Notes -
herein
N = Number of firing spaces. “2N” means that two extinguishers are to located in each firing space.
x = sufficient number, minimum two in each space, so located that there are at least one portable fire extinguisher within 10 m walking distance from any point.
y = sufficient number to enable foam to be directed onto any part of the fuel and lubricating oil pressure systems, gearing and other hazards.
(1) may be located at outside of the entrance to the room.
(2) may be arranged outside of the space concerned for smaller spaces of cargo ships.
(3) the amount of sand is to be at least 0.1 m^3. A shovel is to be provided.
Sand boxes may be substituted by approval portable fire extinguisher.
(4) not required for such spaces in cargo ships wherein all boilers contained therin are for domestic services and are less than 175 kW.
(5) in case of machinery spaces containing both boilers and internal combustion engines the requirements apply, with the exception that one of the foam fire-extinguishers of at least 45 L capacity or equivalent may be omitted on the condition that the 135 L extinguisher can protect efficiently and readily the area covered by the 45 L extinguisher.

2. In applying **404. 5** of the Rules, a water fog applicator might consist of a metal L-shaped pipe, the long limb being about 2 m in length capable of being fitted to a fire hose and the short limb being about 250 mm in length fitted with a fixed water fog nozzle or capable of being fitted with a water spray nozzle.

3. In applying **404. 6** of the Rules, fixed water-based local application fire extinguishing systems is also to be complied with as follows,

(1) the protected spaces are to apply as follows, (See also **Fig 8.3.9**)

(A) The protected hazards means the risk parts as defined in **404. 6** (3) of the Rules.

(B) The protected spaces means the spaces which the protected hazards are located.

(C) The protected areas means the effective areas of the system which is fitted to suppress the fire in the protected hazards. These areas are not to be less than the protected hazards in any case.

(D) The adjacent areas means areas other than protected areas exposed to direct spray and areas other than those defined above where water may extend.

(E) Boiler fronts should be interpreted as the boiler burner location irrespective of the boiler design.

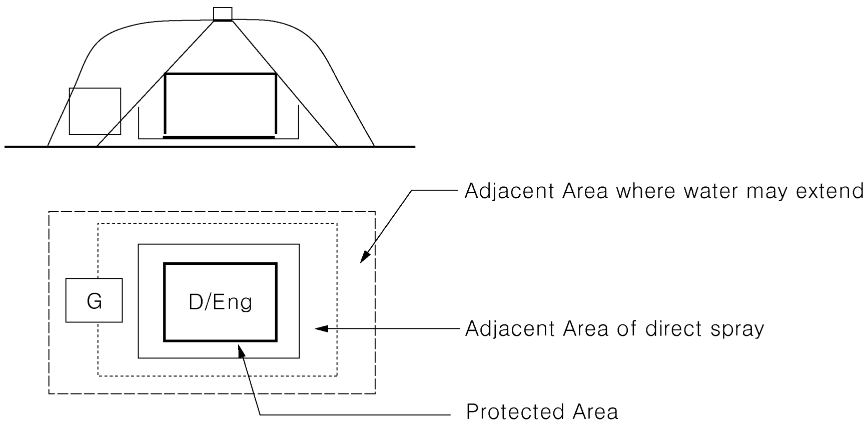

Fig 8.3.9 Protected spaces

(2) The system is to be capable of manual release. (except for periodically unattended machinery space)

(3) The fire extinguishing capability of the systems fitted on ships is to be approved by the Society in accordance with the requirements of MSC/Circ.913. As for fire nozzles they are to be approved by the Flag Administration in which the ship is registered or to be registered in accordance with the requirements of MSC/Circ. 668 and 728 of IMO respectively. However, in case where there is no expressly provided national regulations, the fire extinguishing capability of the system and nozzles fitted on ship approved by the Contracting Government of the SOLAS or the Society. Nozzle installations are to be determined as in the following (A) or (B) corresponding to the test results in accordance with MSC/Circ.913.

(A) For nozzles of a system that passed the fire tests referred to in 3.3.2.1 to 3.3.2.3 of Appendix of Annex to MSC/Cir.913 (Refer to the **Fig 8.3.10-7**)

(a) Nozzles installed in grid(3 x 3 nozzle) : See **Fig 8.3.10-1**

(b) Nozzles installed in a single row : See **Fig 8.3.10-2**

(c) Single Nozzle : See **Fig 8.3.10-3**

(B) For nozzles of a system that passed the fire tests referred to in 3.3.2.3 to 3.3.2.5 of Appendix of Annex to MSC/Circ.913 (Refer to the **Fig 8.3.10-8**)

(a) Nozzles installed in grid(2 x 2 nozzle) : See **Fig 8.3.10-4**

(b) Nozzles installed in grid(3 x 3 nozzle) : See **Fig 8.3.10-5**

(c) Nozzles installed in a single row : See **Fig 8.3.10-6**

(d) Single nozzle : See **Fig 8.3.10-3**

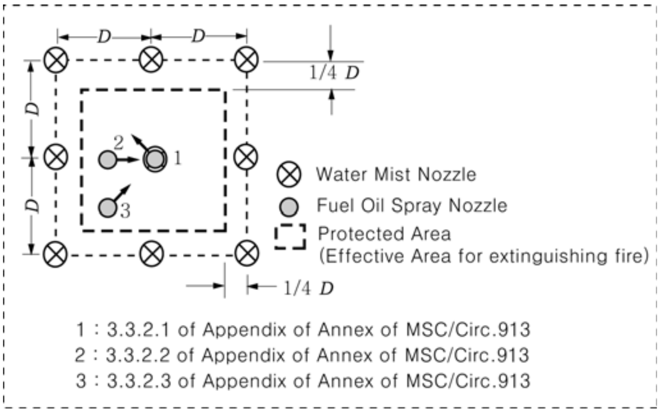

Fig 8.3.10-7

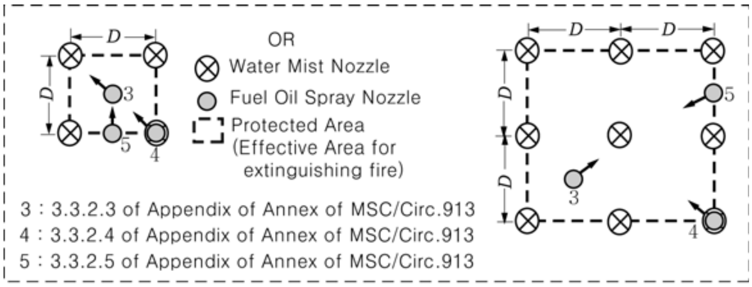

Fig 8.3.10-8

(4) The capacity and design of the system are to be based on the protected area demanding the greatest volume of water.
(5) The system is to be provided to suppress suitably and promptly against the fire which is occured in the protected hazard. However, the capacity of pumps is to be satisfied with the requirements of the flow and pressure which is required in each separate division.
(6) The activation of the fire-extinguishing system should not result in loss of electrical power or reduction of the maneuverability of the ship.(fixed water-based local application fire-fighting systems) Electrical and electronic equipment enclosures located within areas protected by FWBLAFFS and those within adjacent areas exposed to direct spray are to have a degree of protection not less than IP44, except where evidence of suitability is submitted to and approved by the Society. Electrical and electronic equipment within adjacent areas not exposed to direct spray may have a lower degree of protection provided evidence of stability for use in those areas is submitted taking into account the design and equipment lay out, e.g. position of inlet ventilation openings, cooling airflow for the equipment are to be assured.
(7) The system is to be capable of fire suppression with forced ventilation fans running and supplying air to the protected area, or a method of automatically shutting air supply fans upon release of the system is to be provided to ensure that the fire-extinguishing medium is not dispersed.
(8) The system and its components are to be suitably designed to withstand ambient temperature changes, vibration, humidity, shock, impact, clogging and corrosion normally encountered in machinery spaces.
(9) Components within the protected spaces are to be designed to withstand the elevated temperatures which could occur during a fire.
(10) The location of each nozzle is to be considered so as not to obstruct spray of water.
(11) The electrical components of the pressure source for the system should have a minimum rating of IP 54. Systems requiring an external power source need only be supplied by the main power source.
(12) The manual releasing devices, fitted within the protected spaces, are to be arranged outside of the protected area and fitted to a readily accessible places. And, the devices are not to lose their availability by a fire in the protected areas.
(13) Pressure source components of the system are to be located outside of the protected areas.

(14) The system is to be ensured availability on size of pipings and capacity of pumps in accordance with a hydraulic calculation technique and arrangement of pipings.
(15) In case where the main fixed fire-extinguishing systems for machinery spaces are an water based system, the supply for the systems may be fed from the supply of main fire-extinguishing system. However, in this case, the adequate water quantity and pressure are available to operate both systems for the required period of time.
(16) The system is to be available for immediate use and capable of continuously supplying water-based medium for at least 20 minutes in order to suppress or extinguish the fire and to prepare for the discharge of the main fixed fire-extinguishing system within that period of time.
(17) In case of periodically unattended machinery spaces, the system is to have both automatic and manual release capabilities and the automatic release should be activated by a detection system capable of reliably identifying the local zone. Consideration should be given to prevent accidental release. However, in case of continuously manned machinery spaces, the system is only required to have manual release capability.
(18) Alarms against operation of the systems is to be complied with the following.
(A) In case where the system is activated at a space, a visual and distinct audible alarm is to be given in the protected spaces, engine control station, in the wheelhouse and at continuously manned stations.
(B) In case where the alarm is given as the above (A), the specific system activated is to be indicated. Audible alarms may use a single tone.
(C) The requirements on alarm devices for the systems are to be required in addition to, and not a substitute for, the detection and fire alarm system required elsewhere in this Chapter.
(19) In case where automatically operated fire-extinguishing systems are fitted, a warning notice is to be displayed outside each entry point stating the type of medium used and the possibility of automatic release.
(20) Operating instructions for the system are to be displayed at each operating position.
(21) The system is not to be located to prevent access to engine or machinery for routine maintenance or operation of overhead hoists and/or other moving equipment which are fitted in machinery space.
(22) Operating and maintenance instructions for the system are to be provided on each ship. And, the nozzles corresponding to 2 % of total number of each type and tools which are necessary to replace them (except for the standard tools) are to be provided on each ship.

4. In applying **404. 6** (3) (A) of the Rules, in the fire hazards portions of multi-internal combustion engines, at least two sections should be arranged.

405. Fire-extinguishing arrangements in control stations, accommodation and service spaces

1. In applying **405. 1** (1) of the Rules, heat detectors are acceptable in refrigerated chambers and in other spaces where steam and fumes are produced such as saunas and laundries. Refrigerated chambers may be fitted with dry pipe sprinkler systems. And then automatic sprinkler, fire detection systems and fire alarm systems is also to be complied with as follows,

(1) The automatic sprinkler systems shall be of the wet pipe type, but small exposed sections may be of the dry pipe type where in the opinion of the Society this is a necessary precaution. Saunas shall be fitted with a dry pipe system, with sprinkler heads having an operating temperature up to 140 ℃.
(2) Automatic sprinkler systems equivalent to those specified in paragraphs (3) to (9) shall be approved by the Administration based on the guidelines developed by the IMO.*
* Refer to the Revised Guidelines for approval of sprinkler systems equivalent to that referred to in SOLAS as adopted by the IMO by resolution A.800(19) & MSC265(84).
(3) Source of power supply is to be complied with the following requirements.
(A) In passenger ships, there shall be not less than two sources of power supply for the sea water pump and automatic alarm and detection system. Where the sources of power for the pump are electrical, these shall be a main generator and an emergency source of power. One supply for the pump shall be taken from the main switchboard, and one from the emergency switchboard by separate feeders reserved solely for that purpose. The feeders shall be so arranged as to avoid galleys, machinery spaces and other enclosed spaces of high fire risk except in so far as it is necessary to reach the appropriate switchboards, and

shall be run to an automatic changeover switch situated near the sprinkler pump. This switch shall permit the supply of power from the main switchboard so long as a supply is available therefrom, and be so designed that upon failure of that supply it will automatically change over to the supply from the emergency switchboard. The switches on the main switchboard and the emergency switchboard shall be clearly labelled and normally kept closed. No other switch shall be permitted in the feeders concerned. One of the sources of power supply for the alarm and detection system shall be an emergency source. Where one of the sources of power for the pump is an internal combustion engine it shall, in addition to complying with the provisions of paragraph (9), be so situated that a fire in any protected space will not affect the air supply to the machinery.

(B) In cargo ships, there shall not be less than two sources of power supply for the sea water pump and automatic alarm and detection system. If the pump is electrically driven it shall be connected to the main source of electrical power, which shall be capable of being supplied by at least two generators. The feeders shall be so arranged as to avoid galleys, machinery spaces and other enclosed spaces of high fire risk except in so far as it is necessary to reach the appropriate switchboards. One of the sources of power supply for the alarm and detection system shall be an emergency source. Where one of the sources of power for the pump is an internal combustion engine it shall, in addition to complying with the provisions of paragraph (9), be so situated that a fire in any protected space will not affect the air supply to the machinery.

(4) Sprinkler requirements

The sprinklers shall be resistant to corrosion by marine atmosphere. In accommodation and service spaces the sprinklers shall come into operation within the temperature range from 68 ℃ to 79 ℃ , except that in locations such as drying rooms, where high ambient temperatures might be expected, the operating temperature may be increased by not more than 30 ℃ above the maximum deckhead temperature.

A quantity of spare sprinkler heads shall be provided for all types and ratings installed on the ship as the following table, and then the number of spare sprinkler heads of any type need not exceed the total number of heads installed of that type.

Total number of heads	Required number of spares
〈 300	6
300 ~ 1000	12
〉 1000	24

(5) Pressure tanks

A pressure tank having a volume equal to at least twice that of the charge of water specified in this subparagraph shall be provided. The tank shall contain a standing charge of fresh water, equivalent to the amount of water which would be discharged in one minute by the pump referred to in paragraph (6) (B), and the arrangements shall provide for maintaining an air pressure in the tank such as to ensure that where the standing charge of fresh water in the tank has been used the pressure will be not less than the working pressure of the sprinkler, plus the pressure exerted by a head of water measured from the bottom of the tank to the highest sprinkler in the system. Suitable means of replenishing the air under pressure and of replenishing the fresh water charge in the tank shall be provided. A glass gauge shall be provided to indicate the correct level of the water in the tank.

Means shall be provided to prevent the passage of sea water into the tank.

(6) Sprinkler pump is to be complied with the following requirements.

(A) An independent power pump shall be provided solely for the purpose of continuing automatically the discharge of water from the sprinklers. The pump shall be brought into action automatically by the pressure drop in the system before the standing fresh water charge in the pressure tank is completely exhausted.

(B) The pump and the piping system shall be capable of maintaining the necessary pressure at the level of the highest sprinkler to ensure a continuous output of water sufficient for the simultaneous coverage of a minimum area of 280 square meters at the application rate specified in paragraph (10) (D). The hydraulic capability of the system shall be confirmed by the review of hydraulic calculations, followed by a test of the system, if deemed necessary by the Society.

(C) The pump shall have fitted on the delivery side a test valve with a short open-ended discharge pipe. The effective area through the valve and pipe shall be adequate to permit the release of the required pump output while maintaining the pressure.

(7) Any parts of the system which may be subjected to freezing temperatures in service shall be suitably protected against freezing.

(8) Piping is to be complied with the following requirements.

(A) Sprinklers shall be grouped into separate sections, each of which shall contain not more than 200 sprinklers. In passenger ships any section of sprinklers shall not serve more than two decks and shall not be situated in more than one main vertical zone. However, the Society may permit such a section of sprinklers to serve more than two decks or be situated in more than one main vertical zone, if it is satisfied that the protection of the ship against fire will not thereby be reduced.

(B) Each section of sprinklers shall be capable of being isolated by one stop valve only. The stop valve in each section shall be readily accessible in a location outside of the associated section or in cabinets within stairway enclosures. The valve's location shall be clearly and permanently indicated. Means shall be provided to prevent the operation of the stop valves by any unauthorized person.

(C) A test valve shall be provided for testing the automatic alarm for each section of sprinklers by a discharge of water equivalent to the operation of one sprinkler. The test valve for each section shall be situated near the stop valve for that section.

(D) The sprinkler system shall have a connection from the ship's fire main by way of a lockable screw-down non-return valve at the connection which will prevent a backflow from the sprinkler system to the fire main.

(E) A gauge indicating the pressure in the system shall be provided at each section stop valve and at a central station.

(F) The sea inlet to the pump shall wherever possible be in the space containing the pump and shall be so arranged that when the ship is afloat it will not be necessary to shut off the supply of sea water to the pump for any purpose other than the inspection or repair of the pump.

(9) The sprinkler pump and tank shall be situated in a position reasonably remote from any machinery space of category A and shall not be situated in any space required to be protected by the sprinkler system.

(10) System control is to be complied with the following requirements.

(A) Any required automatic sprinkler, fire detection and fire alarm system shall be capable of immediate operation at all times and no action by the crew shall be necessary to set it in operation.
The automatic sprinkler system shall be kept charged at the necessary pressure and shall have provision for a continuous supply of water as required in this chapter.

(B) Each section of sprinklers shall include means for giving a visual and audible alarm signal automatically at one or more indicating units whenever any sprinkler comes into operation. Such alarm systems shall be such as to indicate if any fault occurs in the system. Such units shall indicate in which section served by the system a fire has occurred and shall be centralized on the navigating bridge or in the continuously manned central control station and, in addition, visible and audible alarms from the unit shall also be placed in a position other than on the aforementioned spaces to ensure that the indication of fire is immediately received by the crew.

(C) Switches shall be provided at one of the indicating positions referred to in paragraph (B) which will enable the alarm and the indicators for each section of sprinklers to be tested.

(D) Sprinklers shall be placed in an overhead position and spaced in a suitable pattern to maintain an average application rate of not less than 5 L/m^2/min over the nominal horizontal projection area covered by the sprinklers. However, the Society may permit the use of sprinklers providing such an alternative amount of water suitably distributed as has been shown to the satisfaction of the Society to be not less effective.

(E) A list or plan shall be displayed at each indicating unit showing the spaces covered and the location of the zone in respect of each section. Suitable instructions for testing and maintenance shall be available.

(11) Means shall be provided for testing the automatic operation of the pump on reduction of

pressure in the system.

2. In applying **405. 3** (2) & (3) of the Rules, these requirements given are not considered applicable for cargo service spaces intended for the stowage of cargo samples, when such spaces are positioned within cargo area onboard tankers.

406. Fire-extinguishing arrangements in cargo spaces

1. In applying **406. 1** of the Rules, the fire-fighting system for coal carriers is to comply with these requirements.

(1) Wiring and electrical equipment fitted in cargo holds, spaces having direct openings to cargo holds and zones within 3 m from ventilating openings of cargo holds are to comply with the requirements of electrical equipment for coal carriers in **Pt 7, Ch 3, Sec 16** of the Rules.

(2) Portable instruments to measure the atmosphere (densities of methane, oxygen and carbon monoxide) of upper parts in cargo holds are to be provided, and two restricted measuring holes (penetrating the walls and in use, permitting a small quantity of cargo vapour to be exposed to the atmosphere, but when not in use, completely closed) per hold, each both port and starboard sides of the hatch cover, are to be provided.

(3) Two self-contained breathing apparatuses required by **409.** of the Rules are to be provided, without no requirement of additional ones.

(4) Prohibition of arrangements adjacent to hot areas shall satisfy the following requirements.

(A) Hot areas of steam piping, exhaust gas piping, heaters, etc. in machinery spaces adjacent to cargo holds are to be separated as appropriate distances so as not to adjoin the cargo holds.

(B) In case where a bunker tank is provided in machinery spaces adjacent to cargo holds, heating coils are to be fitted so as not to adjoin the cargo holds as practicable, and appropriate measurements generally not exceeding 50 °C are to be taken.

(C) Heating coils in lubricating oil tanks adjacent to cargo holds are to be treated as same as the requirement of (B) above.

(D) In case where oil fuel systems of ships using oil fuel of low quality are fitted adjacent to cargo holds, their oil fuel tanks, in principle, are not to adjoin the cargo holds because of the higher normal operation temperature than limited temperature, but when avoidably fitted, appropriate measurements to prevent the temperature of bulkheads of cargo holds exceeding limited temperature are to be taken.

(E) In case where heating coils of tanks and their related equipment are provided so as not to exceed limited temperature, the Society may permit exemption from the requirements of (A), (B), (C) or (D) above in consideration of the data.

2. In applying **406. 1** (3) of the Rules, Ships of less than 2.000 tons gross tonnage carrying petroleum products having a flash point exceeding 60 °C (c.c. test) are not required to be fitted with a fixed fire extinguishing system. And the cargoes for which a fixed gas fire-extinguishing system is ineffective and for which a fire-extinguishing system giving equivalent protection should be available, are aluminium nitrate, ammonium nitrate, ammonium nitrate fertilizers, barium nitrate, calcium nitrate, lead nitrate, magnesium nitrate, potassium nitrate, sodium nitrate, Chilean natural nitrate, sodium nitrate and potassium nitrate mixture, and Chilean natural potassic nitrate.

3. In applying **406. 1** (4) of the Rules, “The non-combustible cargoes or cargoes which, in the opinion of the Society, constitute a low fire risk” means that all cargoes listed in appendices A, B and C of the Code of Safe Practice for Solid Bulk Cargoes (BC Code) are also specified in MSC/Circ.1146 and the updated version. And herein non-combustible cargoes such as in general products made only of glass, concrete, ceramic products, natural stone, masonry metals and metal alloys on the FTP code, need not be mentioned on exemption certificates.

4. In applying **406. 1** (4) of the Rules, all cargo sips, engaged in the carriage of dangerous goods, of 500 tons gross tonnage and above, shall be applied the requirement. And water supplies defined in **Ch 5, 202. 1** (2) of the Rules are considered as acceptable protection for cargoes listed in Table 2 of MSC/Circ.671.

407. Cargo tank protection

1. In applying **407. 1** of the Rules, fixed deck foam systems is also to be complied with as follows.

(1) The arrangements for providing foam shall be capable of delivering foam to the entire cargo

tanks deck area as well as into any cargo tank the deck of which has been ruptured.

(2) The deck foam system shall be capable of simple and rapid operation. And then the major equipment such as the foam concentrate tank and the pump may be located in the engine room.

(3) Operation of a deck foam system at its required output shall permit the simultaneous use of the minimum required number of jets of water at the required pressure from the fire main. A common line for fire main and deck foam line can only be accepted provided it can be demonstrated that the hose nozzles can be effectively controlled by one person when supplied from the common line at a pressure needed for operation of the monitors. Additional foam concentrate is to be provided for operation of 2 hose nozzles for the same period of time required for the foam system. The simultaneous use of the minimum required jets of water should be possible on deck over the full length of the ship, in the accommodation, service spaces, control stations and machinery spaces.

(4) The rate of supply of foam solution shall be not less than the greatest of the following:

(A) 0.6 liter/minute per square metre of cargo tanks deck area, where cargo tanks deck area means the maximum breadth of the ship multiplied by the total longitudinal extent of the cargo tank spaces;

(B) 6 liter/minute per square metre of the horizontal sectional area of the single tank having the largest such area; or

(C) 3 liter/minute per square metre of the area protected by the largest monitor, such area being entirely forward of the monitor, but not less than 1,250 liter/minute.

(5) Sufficient foam concentrate shall be supplied to ensure at least 20 min of foam generation in tankers fitted with an inert gas installation or 30 min of foam generation in tankers not fitted with an inert gas installation when using solution rates stipulated in paragraph (4), as appropriate, whichever is the greatest. The foam expansion ratio (i.e., the ratio of the volume of foam produced to the volume of the mixture of water and foam-making concentrate supplied) shall not generally exceed 12 to 1. Where systems essentially produce low expansion foam but an expansion ratio slightly in excess of 12 to 1, the quantity of foam solution available shall be calculated as for 12 to 1 expansion ratio systems. When medium expansion ratio foam(between 50 to 1 and 150 to 1 expansion ratio) is employed, the application rate of the foam and the capacity of a monitor installation shall be to the satisfaction of the Society.

Refer to the Guidelines for the performance and testing criteria, and surveys of low-expansion foam concentrates for fixed fire-extinguishing systems (MSC/Circ.582 and Corr.1).

Refer to the Guidelines for the performance and testing criteria, and surveys of medium expansion foam concentrates for fixed fire-extinguishing systems (MSC/Circ.798).

(6) Monitors and foam applicators are also to be complied with the following requirements

(A) Foam from the fixed foam system shall be supplied by means of monitors and foam applicators. At least 50 % of the foam solution supply rate required in paragraphs (4) (A) and (4) (B) shall be delivered from each monitor. On tankers of less than 4,000 tons deadweight the Society may not require installation of monitors but only applicators. However, in such a case the capacity of each applicator shall be at least 25 % of the foam solution supply rate required in paragraphs (4) (A) or (4) (B).

(B) The capacity of any monitor shall be at least 3 litre/minute of foam solution per square metre of deck area protected by that monitor, such area being entirely forward of the monitor. Such capacity shall be not less than 1,250 L/min.

(C) The capacity of any applicator shall be not less than 400 L/min and the applicator throw in still air conditions shall be not less than 15 m.

(7) The main control station for the system shall be suitably located outside the cargo area, adjacent to the accommodation spaces and readily accessible and operable in the event of fire in the areas protected.

(8) Monitors shall satisfy the following requirements.

(A) The number and position of monitors shall be such as to comply with paragraph (1)

(B) The distance from the monitor to the farthest extremity of the protected area forward of that monitor shall not be more than 75 % of the monitor throw in still air conditions.

(C) A monitor and hose connection for a foam applicator shall be situated both port and starboard at the front of the poop or accommodation spaces facing the cargo tanks deck. On tankers of less than 4,000 tons deadweight a hose connection for a foam applicator shall be situated both port and starboard at the front of the poop or accommodation spaces facing the cargo tanks deck. And port and starboard monitors required may be located in the cargo area, provided they are aft of cargo tanks and that they protect below and aft of each other.

(9) The number of foam applicators provided shall be not less than four. The number and disposition of foam main outlets shall be such that foam from at least two applicators can be directed on to any part of the cargo tanks deck area. Applicators shall be provided to ensure flexibility of action during fire-fighting operations and to cover areas screened from the monitors. And these foam applicators shall apply to all tankers regardless of size.

(10) Valves shall be provided in the foam main, and in the fire main when this is an integral part of the deck foam system, immediately forward of any monitor position to isolate damaged sections of those mains.

(11) Where an enclosed pipe trunk is situated within the cargo tanks deck area, the pipe trunk:

(A) should be protected by a fixed fire-extinguishing system in accordance with **408.** of the Rules. The extinguishing system should be operated from a readily accessible position outside the pipe trunk;

(B) is not considered part of the cargo tanks deck area;

(C) The area of the pipe trunk need not be included in the calculation of the foam solution rate of supply for the deck foam system required by **407.** of the Rules.;

(D) should be adequately ventilated and protected in accordance with **Ch 2, 104. 10** (2), (3) of the Rules.; and

(E) should contain no flammable gas sources other than pipes and flanges. If the pipe trunk contains any other source of flammable gas, i.e. valves and pumps, it should be regarded as a cargo pump-room.

408. Protection of cargo pump room

1. In applying **408. 1** of the Rules, in oil tankers carrying flammable high pressure gases, in addition, two portable carbon dioxide extinguishers or dry powder extinguishers are to be provided, one at the pumps and one at the pump room entrance. Instruments monitoring gas in any space where flammable high pressure gas is able to leak are to be fitted.

2. In applying **408. 1** (1) of the Rules, the audible alarms referred to in **403. 1** (9) of the Guidance are to be safe for use in a flammable cargo vapour/air mixture, and may be of the pneumatic type or electric type complying with the following requirements.

(1) In cases where the periodic testing of pneumatically operated alarms is required, CO_2 operated alarms are not to be used owing to the possibility of the generation of static electricity in the CO_2 cloud. Air operated alarms may be used, provided the air supply is clean and dry.

(2) When electrically operated alarms are used, the arrangements are to be such that the electric actuating mechanism is located outside the pump room except where the alarms are certified intrinsically safe.

409. Fire-fighter's outfit

1. In applying **409. 1** of the Rules, a fire-fighter's outfit shall consist of a set of personal equipment and a breathing apparatus and then also be complied with the following requirements.

(1) Personal equipment shall consist of the following:

(A) protective clothing of material to protect the skin from the heat radiating from the fire and from burns and scalding by steam. The outer surface shall be water-resistant. (Reference is made to ISO standard 6942 - 1983 evaluation of thermal behavior of materials and material assemblies when exposed to source of radiant heat) ;

(B) boots of rubber or other electrically non-conducting material (Reference is made to (KS C) IEC standard 60903 - 1988 Specification for gloves and mitts of insulating material for live working) ;

(C) rigid helmet providing effective protection against impact;

(D) electric safety lamp (hand lantern) of an approved type with a minimum burning period of 3 hours. Electric safety lamps on tankers and those intended to be used in hazardous areas shall be of an explosion-proof type (Reference is made to (KS C) IEC Publication 60079) ; and

(E) axe with a handle provided with high-voltage insulation.

(2) Breathing apparatus shall be a self-contained compressed air-operated breathing apparatus for which the volume of air contained in the cylinders shall be at least 1,200 liters, or other self-contained breathing apparatus which shall be capable of functioning for at least 30 min. All

air cylinders for breathing apparatus shall be interchangeable.

(3) For each breathing apparatus a fireproof lifeline of at least 30 m in length shall be provided. The lifeline shall successfully pass an approval test by statical load of 3.5 kN for 5 min. without failure. The lifeline shall be capable of being attached by means of a snap-hook to the harness of the apparatus or to a separate belt in order to prevent the breathing apparatus becoming detached when the lifeline is operated.

SECTION 5 Structural Integrity

501. Material of hull, superstructures, structural bulkheads, decks and deckhouses

In applying **501.** of the Rules, deckhouses, boatswain's stores, etc. which are independently arranged away from a group of accommodation spaces may be regarded as independent service spaces respectively. Accordingly, internal divisions in these spaces may be of "C" class standard. Accordingly, access hatches to under deck spaces (for example, cargo space) from these spaces may be weathertight. Access hatches to the under deck spaces from other machinery spaces having little risk of fire which are independently arranged away from a group of accommodation spaces, may also be weathertight. And stairs in control stations, accommodation and service spaces are to be of steel or equivalent materials.

502. Structure of aluminium alloy

In applying **502. 1** (1) of the Rules, “structure which is non-load bearing" means, for example, partition walls, if an aluminium deck is tested with insulation installed below the deck, then the result will apply to decks which are bare on the top. And the use of aluminium coatings is prohibited in cargo tanks, cargo tank deck area, pump room, cofferdams or any other area where cargo vapour may accumulate. However, aluminized pipes may be permitted in ballast tanks, in inerted cargo tanks and, provided the pipes are protected from accidental impact, in hazardous area on open deck.

503. Machinery spaces of category A

In applying **503. 1** of the Rules, crowns and casings exposed to the open air need not be insulated.

504. Materials of overboard fittings

1. In applying **504.** of the Rules, the parts where the use of materials readily rendered ineffective by heat (PVC, FRP, aluminium alloys, lead, copper and copper alloys) is prohibited for overboard scuppers and sanitary discharges are to be in accordance with the following requirements:

(1) The parts of pipes for scuppers below the freeboard deck and sanitary discharges having open ends on the shell plating below the freeboard deck (see **Fig 8.3.11** (a)).

(2) In case where scuppers and sanitary discharges having open ends on the shell plating above the freeboard deck with their lower edges located at 150 mm or less above the load line, the parts of pipes in the spaces having such openings (see **Fig 8.3.11** (b)).

(3) In case (1) above, if the distance between the freeboard deck and the load line is 150 mm or less, the requirements are also to apply to the parts of pipes in the spaces directly above the freeboard deck (see **Fig 8.3.11** (c)).

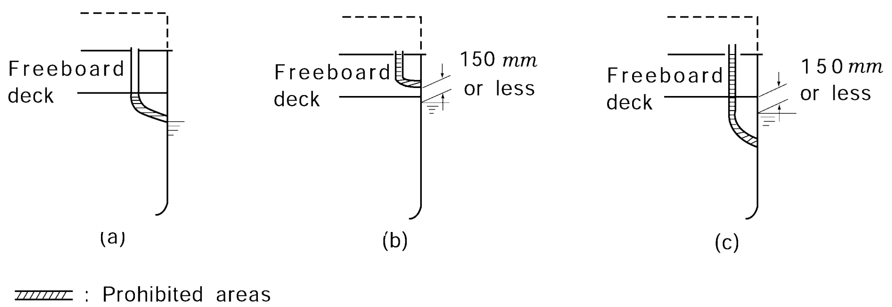

Fig 8.3.11 Areas prohibited from using materials readily rendered ineffective by heat

505. Protection of cargo tank structure against pressure or vacuum in tankers

1. In applying **505. 1** (1) of the Rules, the pressure setting, installation, tests and marking of "Pressure/Vacuum valve" are to be in accordance with following requirements. The Pressure/Vacuum valve is to be type approved by this Society.

(1) Pressure setting

(A) Pressure/Vacuum valves are to be set at a pressure within the range from 21 kPa to 14 kPa on the pressure side and 3 kPa to 7 kPa on the vacuum side. provided, however, that special reinforcements are made for the scantlings of cargo tanks, the set pressure on the pressure side may be of an appropriate value not exceeding 70 kPa.

(2) Installation

(A) In case where a Pressure/Vacuum valve is fitted on a vent branch pipe of the common venting system, the discharge outlet and the suction inlet are to be separated. The suction inlet is not to be fitted to the vent branch pipe to the cargo tanks.

(B) Means are to be provided for easy access to the valves.

(3) Tests and inspection

(A) The tests and inspection for the individual product are to be carried out in accordance with followings.

(a) Construction inspection

(b) Hydraulic test

(c) Confirmation of the pressure at which the valve opens and closes

(B) On board test

It is to be ascertained by a suitable method that the Pressure/Vacuum valves can be operable smoothly after installed on board.

(4) Test report

A test report for each finished device is to be prepared. This is to include followings.

(A) detailed drawings of the device and its components

(B) the types of test conducted and the results obtained, with all recorded data

(C) specific advice on approved attachments

(D) drawings of the test rig, to include a description of the inlet and outlet piping attached

(E) a record of all markings(refer to (6)) found on the device tested

(F) a report number

(5) Instruction manual

The manufacturer is to provide an instruction manual for each device. The instruction manual is to include the following items;

(A) Installation instructions

(B) Operating instructions, including information on the lowest MESG that the device is suitable for, if fitted with a flame screen or with a high-velocity vent. The instructions are to also include any service restrictions imposed for safe functioning of the device, including requirements imposed for the proper installation of the device

(C) Maintenance requirements, including information on maintenance of any corrosion protection system

(a) Instructions on how to determine when device cleaning is required and the method of cleaning. Where the manufacturer allows valve overhauls to be performed by the user, the manufacturer is to provide the necessary procedures, instructions and diagrams for the valve to restored to original, as-purchased condition with regard to set pressure and flow rate

(b) Instructions on the frequency of cleaning of the device to remove vapour condensate. The frequency of cleaning condensate residue from the valve will vary depending on the cargo

(c) Instruction clearly defining the method of setting the pressure, including information such as dismantling and reassembling the valve, numbering and ordering information, and diagrams for proper assembly of items

(d) Instructions to check valve lift by the user prior to each cargo loading and cargo unloading operation

(e) Instructions to conduct a complete inspection of the valve and the recommended frequency

(D) The test report described in **1** (4)

(E) Flow test data, including flow rates under both positive and negative pressures, operating

sensitivity, flow resistance, velocity and maximum pipe length on the inlet side
(F) The manufacturer's certification that the device has been constructed and tested in accordance with this International Standard

(6) Marking
Each device is to be permanently marked indicating followings.
(A) manufacturer's name or trademark
(B) style, type, model or other manufacturer's designation for the device, which is to form a unique identification of the device
(C) size of the inlet (and outlet, if applicable)
(D) serial number
(E) direction of flow through the device
(F) test laboratory and report number
(G) pressure and vacuum setting
(H) the reference number of this International Standard

(7) Combination type Pressure/Vacuum valve
In case where an exclusive automatic pressure valve and an exclusive automatic vacuum valve are provided in combination, such an arrangement may be regarded as to be provided with a Pressure/Vacuum valve. In this case, the exclusive automatic pressure valve and the exclusive automatic vacuum valve are to comply with the requirements for the discharge side or the suction side of the Pressure/Vacuum valves specified in (1) and (2) respectively.

2. In applying **505. 2** of the Rules, where area on open deck, or semi-enclosed spaces on open deck, within 3 m of cargo tank ventilation outlets which permit the flow of small volumes of vapour, air or inert gas mixtures caused by thermal variation are defined as Zone 1, electrical equipment shall be certified safe type equipments. And then areas within 2 m beyond zone 1 are defined as Zone 2 in which electrical equipment shall be of the following requirements.

(1) Certified safe type equipment for Zone 1,
(2) Equipment of a type, which ensure the absence of sparks, arcs and of "hot spots" during its normal operation,
(3) Equipment having an enclosure filled with a liquid dielectric, when required by the application, or encapsulated,
(4) Pressurized equipment,
(5) Equipment specifically designed for Zone 2(for example type "n" protection in accordance with (KS C) IEC 60079-15)

3. In applying **505. 3** (2) of the Rules, a P/V breaker fitted on the IG main may be utilized as the required as the required secondary means of venting. The height requirements of **Ch 2, 104. 3** (4) & **505. 2** of the Rules and the requirements for devices to prevent the passage of flame of **Ch 2, 104. 3** (3) are not applicable to the P/V breaker provided the settings are above those of the venting arrangements required by **505. 1** of the Rules. Where the venting arrangements are of the free flow type and the masthead isolation valve is closed for the unloading condition, the IG systems will serve as the primary underpressure protection with the P/V breaker serving as the secondary means. Inadvertent closure or mechanical failure of the isolation valves required by **Ch 2, 104. 3** (2) (B) of the Rules & **Annex 8-5, 7** (2) need not be considered in established the secondary means since the valves are operated under control of the responsible ships officer and a clear visual indication of the operational status of the valves, and the possibility of mechanical failure of the valves is remote to their simplicity.
And then pressure monitoring system as alternatives is to comply with the following requirements.

(1) The system is to be of a type approved by the Society.
(2) The pressure sensors are to be fitted in each tank.
(3) The following arrangements are to be provided in the ship's cargo control room or the position from which cargo operations are normally carried out.
(A) a monitoring system of the pressure within a tank
(B) an alarm facility which is activated by detection of over-pressure or under-pressure conditions within a tank.

4. In applying **505. 4** of the Rules, together with IBC code and IGC code where areas on open deck, or semi-enclosed spaces on open deck, within a vertical cylinder of unlimited height and 6 m radius centred upon the center of the outlet, and within a hemisphere of 6 m radius below the outlet which permit the flow of large volume of vapour, air or inlet gas mixtures during loading/discharging/ballasting are defined Zone 1, electrical equipment shall be certified safe type equipments. And then areas within 4 m beyond zone 1 are defined as Zone 2 in which electrical equipment shall be of the following requirements.

(1) Certified safe type equipment for Zone 1,
(2) Equipment of a type, which ensure the absence of sparks, arcs and of "hot spots" during its normal operation,
(3) Equipment having an enclosure filled with a liquid dielectric, when required by the application, or encapsulated,
(4) Pressurized equipment,
(5) Equipment specifically designed for Zone 2(for example type "n" protection in accordance with (KS C) IEC 60079-15) ⚓

CHAPTER 4 ESCAPE

SECTION 2 Means of escape

202. Means of escape from control stations, accommodation and service spaces

1. In applying **202. 1** (4) of the Rules, two means of escape from the radio room are to be those which are separated each other and the escape routes are not common.

2. In applying **202. 2** (5) (C) of the Rules, guidelines developed by the IMO refer to MSC/Circ.1167(Functional requirements and performance standards for the assessment of evacuation guidance systems) and MSC/Circ.1168(Interim guidelines for the testing, approval and maintenance of evacuation guidance systems used as an alternative to low-location lighting systems.

3. In applying **202. 2** (4) (E) of the Rules, the requirements in the Fire Safety Systems Code for the means of escape shall be as follows.

(1) Stairways shall not be less than 900 mm in clear width. The minimum clear width of stairways shall be increased by 10 mm for every one person provided for in excess of 90 persons. The total number of persons to be evacuated by such stairways shall be assumed to be two thirds of the crew and the total number of passengers in the areas served by such stairways. The width of the stairways shall not be inferior to those determined by Calculation method of stairway width as follows.

(A) This calculation method determines the minimum stairway width at each deck level, taking into account the consecutive stairways leading into the stairway under consideration.

(B) It is the intention that the calculation method shall consider evacuation from enclosed spaces within each main vertical zone individually and take into account all of the persons using the stairway enclosures in each zone, even if they enter that stairway from another vertical zone.

(C) For each main vertical zone the calculation shall be completed for the night time (case 1) and day time (case 2) and the largest dimension from either case used for determining the stairway width for each deck under consideration.

(D) The calculation of stairway widths shall be based upon the crew and passenger load on each deck. Occupant loads shall be rated by the designer for passenger and crew accommodation spaces, service spaces, control spaces and machinery spaces. For the purpose of the calculation the maximum capacity of a public space shall be defined by either of the following two values: the number of seats or similar arrangements, or the number obtained by assigning 2 square meters of gross deck surface area to each person.

(E) For calculation method for minimum value, in considering the design of stairway widths for each individual case which allow for the timely flow of persons evacuating to the muster stations from adjacent decks above and below, the following calculation methods shall be used (see **Fig 8.4.1** and **Fig 8.4.2**):

when joining two decks: W=(N1+N2) 10 mm;
when joining three decks: W=(N1+N2+0.5N3) 10 mm;
when joining four decks: W=(N1+N2+0.5N3+0.25N4) 10 mm;
when joining five decks or more decks the width of the stairways shall be determined by applying the above formula for four decks to the deck under consideration and to the consecutive deck,

where:
W = the required tread width between handrails of the stairway.
The calculated value of W may be reduced where available landing area S is provided in stairways at the deck level defined by subtracting P from Z, such that:
P = S 3.0 person/sq.m ; Pmax = 0.25Z
where:
Z = the total number of persons expected to be evacuated on the deck being considered;

P = the number of persons taking temporary refuge on the stairway landing, which may be subtracted from Z to a maximum value of P = 0.25Z (to be rounded down to the nearest whole number) ;

S = the surface area of the landing, minus the surface area necessary for the opening of doors and minus the surface area necessary for accessing the flow on stairs (see **Fig 8.4.1**);

N = the total number of persons expected to use the stairway from each consecutive deck under consideration; N1 is for the deck with the largest number of persons using that stairway; N2 is taken for the deck with the next highest number of persons directly entering the stairway flow such that, when sizing the stairway width as each deck level, N1 > N2 > N3 > N4 (see **Fig 8.4.2**). These decks are assumed to be on or upstream (i.e. away from the embarkation deck) of the deck being considered.

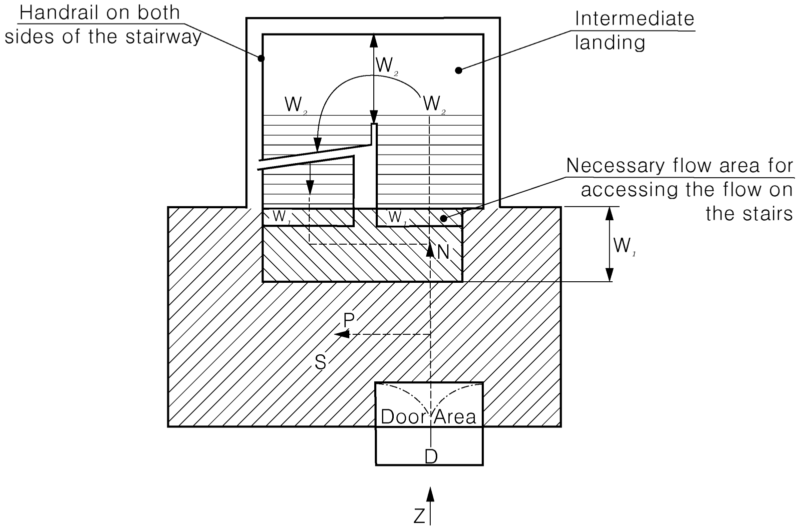

Fig 8.4.1 Landing calculation for stairway width reduction

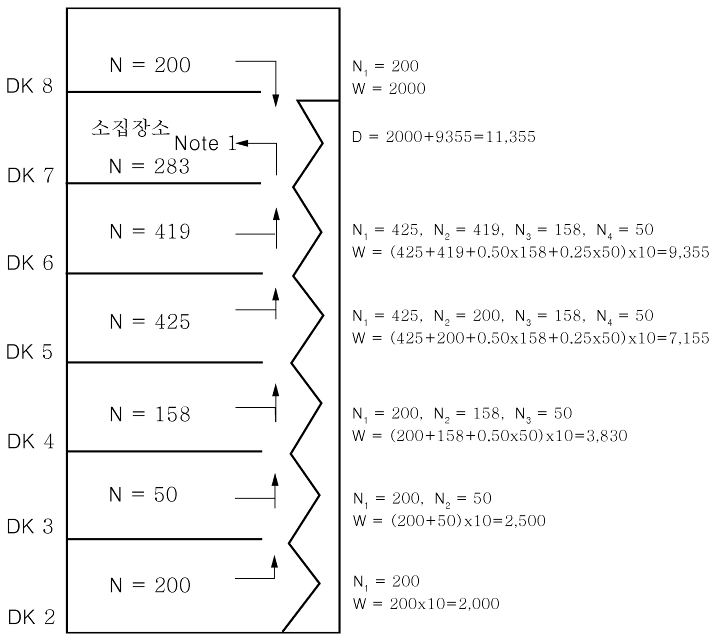

Fig 8.4.2 Minimum stair width (W) calculation example

Z (pers) = number of persons expected to evacuate through the stairway
N (pers) =number of persons directly entering the stairway flow from a given deck
W (mm) = $(N_1 + N_2 + 0.5 \times N_3 + 0.25 \times N_4) \times 10$ = calculated width of stairway

D (mm) = width of exit doors
$N_1 > N_2 > N_3 > N_4$ where:
N_1 (pers) = the deck with the largest number of persons N entering directly the stairway
N_2 (pers)= the deck with the next largest number of person N entering directly the stairway,etc.

(F) The dimension of the means of escape shall be calculated on the basis of the total number of persons expected to escape by the stairway and through doorways, corridors and landings (see **Fig 8.4.3**). Calculations shall be made separately for the two cases of occupancy of the spaces specified below. For each component part of the escape route, the dimension taken shall not be less than the largest dimension determined for each case:

(a) Case 1: Passengers in cabins with maximum berthing capacity fully occupied; members of the crew in cabins occupied to 2/3 of maximum berthing capacity; and service spaces occupied by 1/3 of the crew.

(b) Case 2: Passengers in public spaces occupied to 3/4 of maximum capacity; members of the crew in public spaces occupied to 1/3 of the maximum capacity; service spaces occupied by 1/3 of the crew; and crew accommodation occupied by 1/3 of the crew.

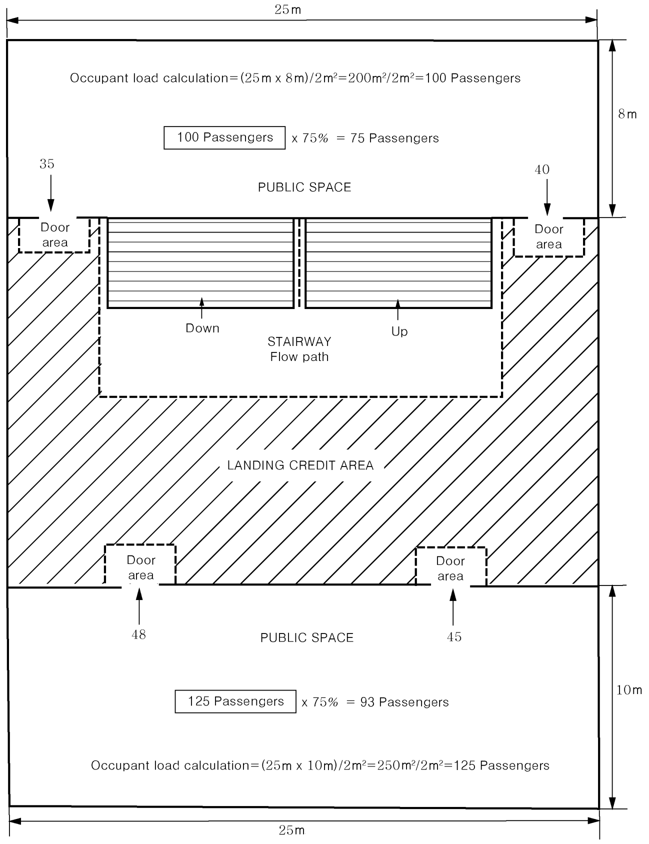

Fig 8.4.3 Occupant loading calculation example

(G) The maximum number of persons contained in a vertical zone, including persons entering stairways from another main vertical zone, shall not be assumed to be higher than the maximum number of persons authorized to be carried on board for the calculation of stairway width only.

(H) The stairway shall not decrease in width in the direction of evacuation to the assembly station, except in the case of several assembly stations in one main vertical zone the stairway width shall not decrease in the direction of the evacuation to the most distant assembly station.

(2) Details of stairways are also to be complied with the following requirements.

(A) Stairways shall be fitted with handrails on each side. The maximum clear width between handrails shall be 1800 mm.

(B) All stairways sized for more than 90 persons shall be aligned fore and aft.
(C) Stairways shall not exceed 3.5 m in vertical rise without the provision of a landing and shall not have an angle of inclination greater than 45 degrees.
(D) Landings at each deck level shall be not less than 2 m^2 in area and shall increase by 1 m^2 for every 10 persons provided for in excess of 20 persons but need not exceed 16 m^2, except for those landings servicing public spaces having direct access onto the stairway enclosure.

(3) Doorways and corridors shall satisfy the following requirements.
(A) Doorways and corridors and intermediate landings included in means of escape shall be sized in the same manner as stairways.
(B) The aggregate width of stairway exit doors to the assembly station * shall not be less than the aggregate width of stairways serving this deck.
* Refer to the Indication of the Assembly stations” in passenger ships (MSC/Circ.777).

(4) Evacuation routes to the embarkation deck shall satisfy the following requirements.
(A) It shall be recognized that the evacuation routes to the embarkation deck may include an assembly station. In this case consideration shall be given to the fire-protection requirements and sizing of corridors and doors from the stairway enclosure to the assembly station and from the muster station to the embarkation deck, noting that evacuation of persons from assembly stations to embarkation positions will be carried out in small control groups.
(B) Where the passengers and crew are held at an assembly station which is not at the survival craft embarkation position, the dimension of stairway width and doors from the assembly station to this position shall not be based on the number of persons in the controlled group. The width of these stairways and doors need not exceed 1,500 mm unless larger dimensions are required for evacuation of these spaces under normal conditions.

(5) Means of escape plans shall be provided indicating the following:
(A) the number of the crew and passengers in all normally occupied spaces;
(B) the number of crew and passengers expected to escape by stairway and through doorways, corridors and landings;
(C) assembly stations and survival craft embarkation positions;
(D) primary and secondary means of escape; and
(E) width of stairways, doors, corridors and landing areas.
(F) Means of escape plans shall be accompanied by detailed calculation for determining the width of escape stairways, doors, corridors and landing areas.

4. In applying **202. 2** (5) (A) of the Rules, the escape route or low location lighting(LLL) where satisfied by electric illumination should comply with the following requirements, having cognizance with IMO resolution A.752(18).

(1) The LLL system is to be connected to the emergency switchboard and capable of being powered either by the main source of electrical power, or by the emergency source of electrical power for a minimum period of 60 minutes after energizing in an emergency.
(2) The power supply arrangements to the LLL are to be arranged such that a single fault does not result in the complete loss of the lighting in any fire zone or deck and such that a fire in a fire zone or deck does not result in loss of the lighting in any other fire zone or deck. This requirement may be satisfied by the power supply circuit configuration, use of fire resistant cables complying with (KS C) IEC Publication 60331: Fire Characteristics of electric cables, and/or the provision of suitably located power supply units having integral batteries adequately rated to supply the connected LLL for a minimum period of 60 minutes.
(3) Single lights and lighting assemblies are to be designed or arranged so that any single fault or failure in a light or lighting assembly, other than a short circuit, will not result in a break in visible delineation exceeding 1 metre.
(4) Lighting fixtures and assemblies are to be flame retardant as a minimum, have an ingress protection of at least IP55 and are to meet the type test requirements as specified in UR E10.
(5) The LLL system is to be capable of being manually activated by a single action from the continuously manned central control station. It may, additionally, be continuously operating or be switched on automatically, e.g. by the presence of smoke within the space(s) being served.
(6) When powered the systems are to achieve the following minimum luminance. And then: spacing between sources is not to exceed 300 mm.
(A) for any planar source:- 10 cd/m^2 from the active parts in a continuous line of 15 mm minimum width.
(B) for any point source:- 35 mcd in the typical track directions of approach and viewing which

is to be considered:

(a) for sources which are required to be viewed from a horizontal position, i.e. deck mounted or horizontally bulkhead mounted fittings, within a 60° cone having its centre located 30´ from the horizontal mounting surface of the point source and in line with the track direction, see **Fig 8.4.4** (a).

(b) for sources which are required to be viewed vertically, i.e. the vertical LLL marking up to the door handles, within a 30° cone having its centre located perpendicular to the mounting service of the point source, see **Fig 8.4.4** (b).

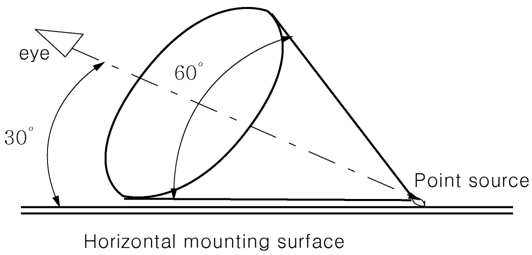
(7) The lights or lighting assemblies are to be continuous except as interrupted by constructional constraints, such as corridors or cabin doors etc. and are to provide a visible delineation along the escape route and, where applicable, are to lead to the exit door handles. Interruption of the LLL system, due to constructional constraints is not to exceed 2 meters.

(8) The lighting is to be provided on at least one side of the corridor or stairway. In corridors and stairways, in excess of 2 metre width, lighting is to be provided on both sides.

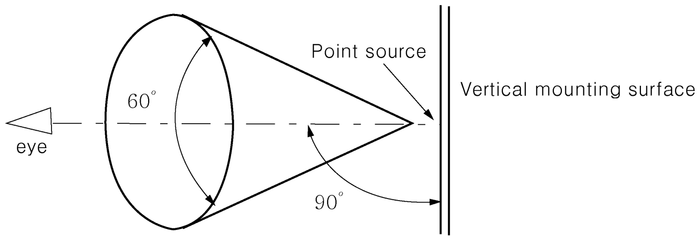
(9) In corridors the lighting is to be installed either on the bulkhead within 300 mm of the deck or alternatively, on the deck within 150 mm of the bulkhead.

(10) In stairways the lighting is to be installed within 300 mm above the steps such that each step may be readily identified from either above or below that step.

(11) The condition of the LLL system and its power source(s) is to be verified every 5 years.



(a)



(b)

Fig 8.4.4

5. In applying **202. 3.** of the Rules, the means of escape is, in principle, to be not less than those given below :

Positions	Dimensions
Manhole (including window)	600 mm× 400 mm
Small hatch	600 mm × 600 mm in square , 600 mm in dia.

The embarkation deck is to be accessible from the open decks to which escape routes lead. The means of escape may be accepted even where lifeboats and liferafts area can not directly be reached, provided that such area can be reached through corridors and stairways in normal ways. Such arrangement as to reach the area only by passing through the cabins or using vertical ladders is not to be accepted.

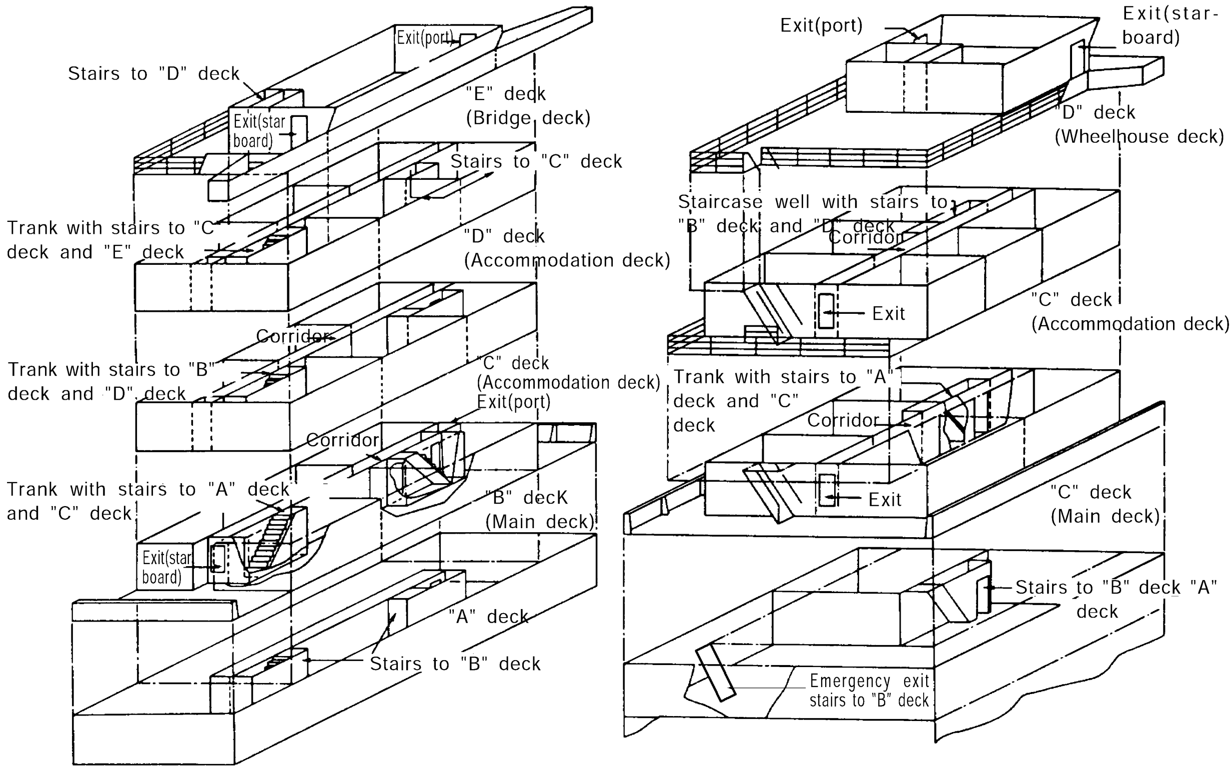
Stairways and corridors used as means of escape shall be not less than 700 mm in clear width and shall have a handrail on one side. Stairways and corridors with a clear width of 1,800 mm and over shall have handrails on both sides. "Clear width"” is considered the distance between the handrail and the bulkhead on the other side or between the handrails. The angle of inclination of stairways should be, in general, 45° but not greater than 50° and in machinery spaces and small spaces not more than 60° Doorways which give access to a stairway shall be of the same size as the stairway.

6. In applying **202. 3** (2) of the Rules, the means of second escape is to be either stairway which directly leads to open deck from the place concerned or hatch capable of being operated from both sides.

7. In applying **202. 3** (3) of the Rules, the following requirements shall be complied with :

(1) In case where two stairways protected by the divisions are provided, doors allowing to escape directly from at least two decks from where the lifeboats and liferafts area can be easily reached are to be provided on both sides (see **Fig 8.4.5** (a)).

(2) In case where only one stairway protected by the divisions is provided, at least one door through which direct escape to the open deck is possible, is to be provided on each deck (see **Fig 8.4.5** (b)).



(a) In case where two stairways protected by trunk (b) In case where one stairway protected by trunk

Fig 8.4.5 Means of Escape

8. In applying **202. 3** (4) of the Rules, dead-end corridors, which they can not be avoided, are to be so designed that persons do not easily enter such corridors in cases of emergency.

9. In applying **202. 4** (1) of the Rules, Emergency escape breathing devices (EEBD) shall satisfy the following requirements.

(1) An EEBD is a supplied-air or oxygen device only used for escape from a compartment that has a hazardous atmosphere and shall be of an approved type.

(2) EEBDs shall not be used for fighting fires, entering oxygen deficient voids or tanks, or worn by fire-fighters. In these events, a self-contained breathing apparatus, which is specifically suited for such applications, shall be used.

(3) Face piece means a face covering that is designed to form a complete seal around the eyes, nose and mouth which is secured in position by a suitable means.

(4) Hood means a head covering which completely covers the head, neck, and may cover portions of the shoulders.

(5) Hazardous atmosphere means any atmosphere that is immediately dangerous to life or health.

(6) The EEBD shall have a service duration at least 10 minutes.

(7) The EEBD shall include a hood or full face piece, as appropriate, to protect the eyes, nose and mouth during escape. Hoods and face pieces shall be constructed of flame resistant materials and include a clear window for viewing.

(8) An inactivated EEBD shall be capable of being carried hands-free.

(9) An EEBD, when stored, shall be suitably protected from the environment.

(10) Brief instructions or diagrams clearly illustrating their use shall be clearly printed on the EEBD. The donning procedures shall be quick and easy to allow for situations where there is little time to seek safety from a hazardous atmosphere.
(11) Maintenance requirements, manufacturer's trademark and serial number, shelf life with accompanying manufacture date and name of approving authority shall be printed on each EEBD. All EEBD training units shall be clearly marked.

203. Means of escape from machinery spaces

1. In applying **203. 1** and **2** of the Rules, the means of escape to the open deck from machinery spaces of category A shall satisfy the following requirements.

(1) One of the means of escape required by the Rules is to be arranged as follows:
  (A) It is to be enclosed and insulated as required for spaces of the Rules against the space it serves. Ladders are to be fixed in such a way that heat cannot, in case of a fire in the machinery space, be transferred to the ladder through non-insulated fixing points;
  (B) The self-closing door is to have the fire integrity of the bulkhead in which it is fitted. If there are other exits to this trunk they are also to be provided with such doors;
(2) It is not desirable to use ro-ro spaces or vehicle spaces as a part of the escape routes from machinery space of category A to the open deck. In case where such arrangement is unavoidable, the following requirements shall be satisfied:
  (A) The escape route through ro-ro spaces or vehicle spaces is to be restricted to one, and other routes are to be arranged either through spaces other than the above route or through enclosed escape trunks. The trunks are to be applied with insulation in accordance with the requirements of the Rules, as corridors.
  (B) The escape route through ro-ro spaces and vehicle spaces is to be as short as possible, and a corridor is to be secured by the permanent and strong construction so that passage may not be hampered by cargo.
(3) Insulation of the shelter is to be taken as equivalent to that of the passage way or lobby and be in compliance with **Table 8** of the Rules.
(4) In case where only one set of means of escape other than the shelter for machinery spaces of category A is provided, self-closing doors required at the lower part of the shelter are to be provided at each deck level.
(5) "Ladder" means stairways and ladders. Ladders having strings of flexible steel wire ropes are not acceptable in such escape routes.
(6) In case where machinery spaces of category A are recessed in toward the stern, one set of escape routes from the machinery space of category A, in addition to those required, is to be provided aft of the recess However, in case where the length of the recessed part (portion with asterisk in this **Fig 8.4.6**) is 7 m or less, this escape route is not required. (see **Fig 8.4.6**).

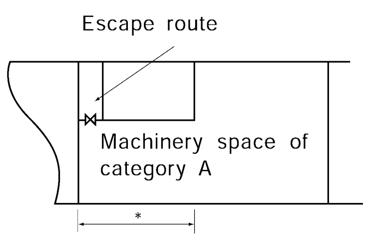


Fig 8.4.6 Escape of recessed category A

2. In applying **203. 2** (3) of the Rules, for machinery spaces which are regarded as those having little or no fire risk, machinery spaces in which the crew is not normally employed, or small spaces, only one set of means of escape may be provided. In this case, however, the escape route is not to pass through machinery spaces of category A. Where shaft tunnel is provided, an escape route is to be provided aft of the shaft tunnel (see **Fig 8.4.7**).

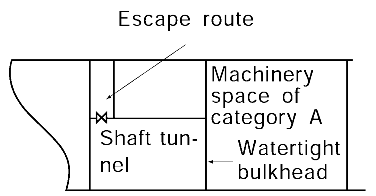

Fig 8.4.7 Escape of small spaces

3. In applying **203. 3** of the Rules, the minimum quantity of emergency escape breathing devices is to be as follows: one (1) in engine control room, one (1) at the workshop and two (2) in escape route of which one is to be provided at the lowest through the escape route. If there is no the engine control room and the workshop, at least three (3) of emergency escape breathing devices shall be provided.

4. In applying **203. 3** (3) of the Rules, emergency escape breathing devices (EEBD) are to be complied with **202. 8** requirements of the Guidance.

205. Means of escape from ro-ro spaces

1. In applying **205.** of the Rules, the escape (and access) routes are to be so arranged that there are adequate escape routes also during loading and unloading. ⚓

CHAPTER 5 SPECIAL REQUIREMENTS

SECTION 1 Helicopter facilities

101. Application

1. In applying **101. 3** of the Rules, "the relevant regulation of the Convention" means as follows.

(1) All ro-ro passenger ships shall be provided with a helicopter pick-up area approved by the Society having regard to Res. A229(VII) of the recommendation adapted by the IMO.

(2) Ro-ro passenger ships of 130 m in length and upwards, constructed on or after 1 July 1999, shall be fitted with a helicopter landing area approved by the Society having regard to MSC/Cic.895 of the recommendation adapted by the IMO.

SECTION 2 Carriage of dangerous goods

201. General requirements

1. In applying **201. 2** (2) of the Rules, A purpose built container space is a cargo spaces fitted with cell guides for stowage securing of containers;

2. In applying **201. 2** (3) of the Rules, Ro-ro spaces include special category spaces and vehicle deck spaces;

202. Special requirements

1. In applying **202. 1** of the Rules, for Open-Top Container Ships of dangerous goods the following requirements may comply with in lieu of the water spray system.

(1) Open top container holds are to be protected by a fixed water spray system. The system is to be capable of spraying water into the cargo hold from deck level downward. The system is to be designed and arranged to take account of the specific hold and container configuration. If found necessary, the Society may require a full-scale test.

(2) The water spray system is to be able to effectively contain a fire in the container bay of origin. The spray system is to be subdivided, with each subdivision to consist of a ring-line at deck in an open cargo hold around a container bay.

(3) The water spray system is to be capable of spraying the outer vertical boundaries of each container bay in an open cargo hold and of cooling the adjacent structure. The uniform application density is to be not less than 1.1 ℓ/m^2. At least one dedicated fire-extinguishing pump for the hold water spray system with a capacity to serve all container bays in any one open top container hold simultaneously is to be provided. The pump(s) is to be installed outside the open top area. The availability of water to the water spray system is to be at least 50 % of the total capacity, with adequate spray patterns in the open top container hold, and with any one dedicated pump inoperable. For the case of a single dedicated water spray pump this may be accomplished by an interconnection to an alternative source of water. The extinguishing system is to be supplemented by hose supply from the weather deck.

(4) The amount of water required for fire-fighting purposes in the largest hold is to allow simultaneous use of the water spray system plus four jets of water from hose nozzles.

2. In applying **202. 1** (2) of the Rules, the number and position of hydrants should be such that at least two of the required four jets of water, when supplied by single lengths of hose, may reach any part of the cargo space when empty; and all four jets of water, each supplied by single lengths of hose may reach any part of ro-ro cargo spaces. And the mount of water required for fire fighting purposes in the largest hold is to satisfy simultaneous use from the water spray systems plus 4 jets of water from hose nozzles.

3. In applying **202. 1** (4) of the Rules, a high expansion foam system is acceptable except if cargoes dangerously react with water.

4. In applying **202. 2** of the Rules, the electrical equipment are to be complied with the following requirements.

(1) The electrical equipment provided in the enclosed cargo spaces or vehicle spaces which are regarded as hazardous environment are to be of those approved by the Society taking into account the requirements of IMDG Code. However, even electrical equipment not approved by the Society may be provided in the above-mentioned spaces if they are of IP55 or equivalent, provided that they are not used while dangerous goods are loaded in such spaces.

(2) In case where electric cables, which are used while dangerous substances are loaded likely to evolve explosive mixture gases, are arranged in cargo spaces, the following requirements are to apply:

(A) Cables are to be mineral-insulated copper sheathed cables, lead sheathed and armoured cables or non-metal sheathed and armoured cables.

(B) Through runs of cables and those led to electrical equipment installed in cargo spaces are to be protected by metal coverings or the like.

(3) For electrical equipment other than specified in (A) and (B) above, refer to (KS C) IEC 60092-506.

(4) the following requirements are to be regarded as sources of ignition, and they are not to be installed in the proximity of the openings of ventilation for cargo spaces:
(A) Electrical equipment other than those of safe type approved for use in hazardous environment
(B) Windlasses and openings for chain lockers
(5) Reference is to be made to (KS C) IEC 60092-506 standard, Special features-Ships carrying specific dangerous goods and materials hazardous only in bulk.
(6) For pipes having open ends (e.g., ventilation and bilge pipes, etc.) in hazardous area, the pipe itself is to be classified as hazardous area. See (KS C) IEC 60092-506 table B1, item B)
(7) For the cargoes specified in (A) and (B) below, Enclosed spaces (e.g., pipe tunnels, bilge pumps, etc.) containing such pipes with equipment such as flanges, valves, pumps, etc. are to be regarded s extended hazardous area, unless provided with overpressure in accordance with (KS C) IEC 60092-506 clause 7.
(A) Class 2.1, and Class 3, Class 6.1, Class 8 having a flash point less than 23 ℃ in packaged form
(B) Class 4.3 in bulk

5. In applying **202. 4** of the Rules, mechanical ventilation systems provided in enclosed cargo spaces are to be of exhaust type. If the space has access from another enclosed space, the door shall be self-closing.

6. In applying **202. 4** (1) of the Rules, the following ventilation requirements for individual cargoes and open top container cargo holds are to be complied with.
(1) If adjacent spaces are not separated from cargo spaces by gastight bulkheads or decks, ventilation requirements are to apply as for the cargo space itself, required under **202. 4** (2) of the Rules.
(2) Individual cargoes are also to be complied with the following requirements.
(A) Cargoes liable to give off vapours or gases which can form an explosive mixture with air (refer to the BC Code, Appendix B, e.g. IMO Class 4.3 materials ; aluminium ferrosilicon, aluminium silicon, ferrosilicon, zinc ashes):
Two separate fans are to be permanently fitted or being of a portable type adopted for being permanently fitted prior to loading and during voyage. The fans are to be either explosion proof or arranged such that the escaping gas flow is separated from electrical cables and components. Ventilation is to be such that any escaping gases cannot reach living spaces on or under deck.
(B) Cargoes liable to spontaneous combustion (refer to the BC Code, Appendix B, only applicable to seed cake (b) and (c)) :
The requirements in (A) above are to be complied with.
(3) For open top container ships, power ventilation is to required only for the lower part of the cargo hold for which purpose ducting is required. The ventilation capacity is to be at least 2 air changes per hour, based on the empty hold volume below weather deck.

7. In applying **202. 4** (2) of the Rules, in case where electric motor driven ventilating fans are installed, the following requirements are to be complied with:
(1) Where a ventilating fan of internal motor-driven type is installed, the motor is to be of the one approved by the Society for use in hazardous environment taking into account the requirements of the IMDG Code (see **Fig. 8.5.1** (a)).
(2) Where a ventilating fan of external motor-driven type is installed on exposed deck, the motor is to be of the covering equivalent to IP55 or upward (see **Fig. 8.5.1** (b)).
(3) Even in the case of (2) above, where the motor is installed in the proximity of the exhaust opening, the motor is to comply with the requirements of (1) above (see **Fig. 8.5.1** (c)).
(4) Ventilating fans are to be of non-sparking type in accordance with **Pt 7, Ch 1, 1006.** of the Guidance, and "suitable wire mesh guards" are to be of the standard wire mesh guards having a size 13 mm × 13 mm.

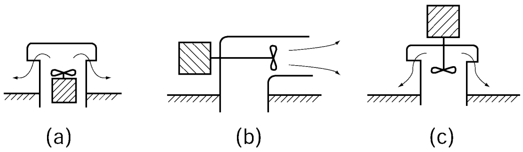

Fig 8.5.1 Ventilating fans of motor-driven type

8. In applying **202. 5** of the Rules, bilge systems for open top container holds should be independent of the machinery space bilge system and be located outside of the machinery space.

9. In applying **202. 5** (2) of the Rules, if a single drainage system completely independent of the machinery space is provided, the system is to comply with the Rules requirement to redundancy and capacity based on the size of the space or space which it services.

10. In applying **202. 5** (3) of the Rules, in case where bilge pipes are led to machinery spaces, the following requirements are to be complied with :

(1) Caution plate stating that the bilge pipes are to be blocked while dangerous goods are loaded on board are to be posted in the vicinity of the above-mentioned stop valves and blank flanges.

(2) Eductors are to be provided as the means of bilge discharging for cargo spaces so that bilges can be discharged overboard without passing through machinery spaces.

11. In applying **202. 6** (1) of the Rules, for solid bulk cargoes the protective clothing is to satisfy the equipment requirements specified in the respective schedules of the IMSBC Code for the individual substances. For packaged goods the protective clothing is to satisfy the equipment requirements specified in emergency procedures (EmS) of the Supplement to IMDG Code for the individual substances.

12. In applying **202. 6** (2) of the Rules, These spare bottles are to be in addition to the spare bottles required for fireman's outfit.

13. In applying **202. 8** of the Rules, In the case that a closed or semi-closed cargo space is located partly above a machinery space and the deck above the machinery space is not insulated, dangerous goods are prohibited in the whole of that cargo space. If the uninsulated deck above the machinery space is a weather deck, dangerous goods are prohibited only for the portion of the deck located above the machinery space.

In a case where dangerous goods are carried, no direct access is, in principle, to be provided between machinery spaces and cargo spaces. However, the access may be acceptable provided that air lock space with double self-closing steel doors of reasonably gastight is provided between those spaces. However, when dangerous goods without involving the hazard of generating noxious gas (including the case of fire) are carried, this requirement may be dispensed with.

In a case where explosives are stowed at least 3 m horizontally away from the machinery space boundaries, refer to **Fig 8.5.2**.

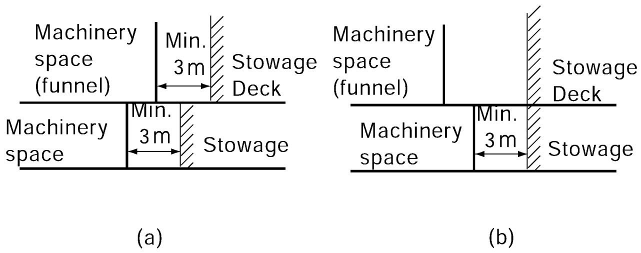

Fig 8.5.2 Areas acceptable to stowage of explosives

14. In applying **203. Table 8.5.1** of the Rules, a ro-ro space fully open above and with full openings in both ends may be treated as a weather deck.

SECTION 3 Protection of vehicle, special category and ro-ro spaces

301. General requirements

In applying **301. 2** (1) of the Rules, the "Total overall clear height for vehicles" is the sum of distances between deck and web frames of the decks forming one horizontal zone.

302. Precaution against ignition of flammable vapours in closed vehicle spaces, closed ro-ro spaces and special category spaces

1. In applying **302. 1** (3) of the Rules, the requirements to indicate any loss of ventilation capacity is considered complied with by an alarm on the bridge, initiated by fall-out of starter relay of fan motor.

2. In applying **302. 1** (4) (A) of the Rules, rapid shutdown of ventilation system is to be provided with dampers which can be isolated by a single action or closing appliances capable of isolation at equivalent closing speed. And ro-ro spaces capable of being sealed are to be capable of being sealed from a location outside of such cargo spaces, if they are protected with a fixed gas fire-extinguishing system.

3. In applying **302. 1** (5) of the Rules, "permanent openings" are to be arranged at the outside of the areas within the survival craft length plus 2 m from its ends in vertical direction on the shell plating under conditions of trim of up to 10 degrees and heel of list of up to 20 degrees. (Refer to **Fig 8.5.3**).

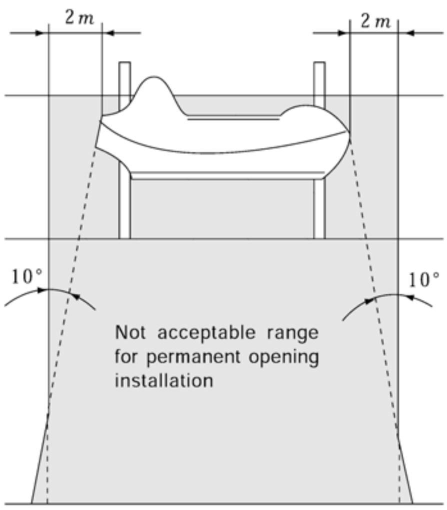

Fig 8.5.3 Not acceptable range for permanent opening installation

4. In applying **302. 2** (1) of the Rules, the electrical equipment "a type suitable for use in explosive petrol and air mixture" is to be of certified safe type and wiring, if fitted, and is to be suitable for use in Zone 1 areas as defined in (KS C) IEC 60079(Gas Group IIA, and Temperature Class T3), and exhaust fans are to be of non-sparking type in accordance with **Pt 7, Ch 1, 1006.** of the Guidance. The windlass and opening for chain lockers are to be regarded as sources of ignition.

5. In applying **302. 2** (2) of the Rules, "electrical equipment of a type so enclosed and protected as to prevent the escape of sparks" means a certified safe equipment with an enclosure of at least IP55 or suitable for use in Zone 2 areas as defined in (KS C) IEC 60079.

6. In applying **302. 3** of the Rules, air ventilation of ro-ro spaces is to be of the exhaust type. However, in the following cases, the ventilation may be of the suction type:

(1) In case where there are no openings except to exposed spaces.

(2) In case where machinery spaces of category A or accommodation spaces contiguous thereto are provided, and an air-locked corridor is available when access opening for the spaces is provided

(see **Fig 8.5.4**).

(3) In case where spaces other than those shown in (2) above are adjoining with the spaces and access opening thereto is provided, self-closing door of reasonable gas-tightness is to be provided.

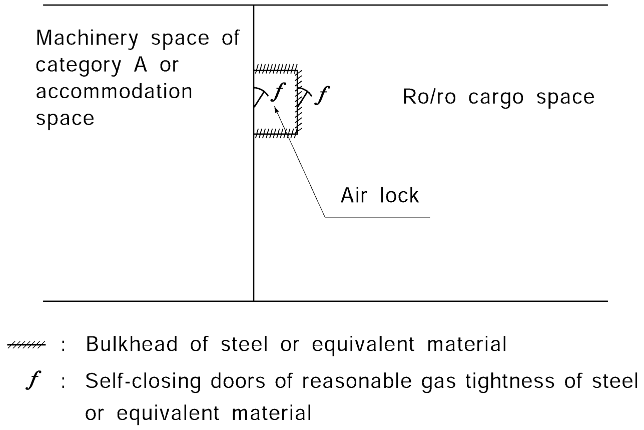

Fig 8.5.4 Air lock

305. Fire extinction

1. In applying **305. 1** (1) (A) of the Rules, these requirements may be checked by suitable calculations.

2. In applying **305. 1** (4) (A) of the Rules, (a), (b), (c) are to be applied above the bulkhead deck and (d) is to be applied below the bulkhead deck.

3. In applying **303. and 305** of the Rules, the regulations for a fixed fire extinguishing system, fire detection, foam applicators and portable extinguishers need not apply to weather decks used for the carriage of vehicle with fuel in their tanks.

4. In applying **305. 2** (2) of the Rules, cargo holds loaded with vehicles with fuel in their tanks which are stowed in open or closed containers need not to be provided with portable fire extinguishers, water-fog applicators and foam applicator units. ⚓

ANNEX

Annex 8-1 Fire Protection Materials

1. Fire protection materials for Method IC

Kinds of Components \ Requirements for components / **Pt 8, Ch 2** of the Rules		Noncombustible material **202. 1.(3)(A)**	Noncombustible material **202. 1.(1)**	Low flame spread **202. 2.(5)**	Equivalent volume **202. 2.(4).(A)**	Calorific value **202. 2.(3)**	Smoke production **301**	Not readily ignite **302**

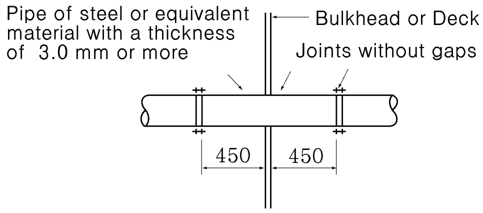
Annex 8-2 Penetrations through Divisions

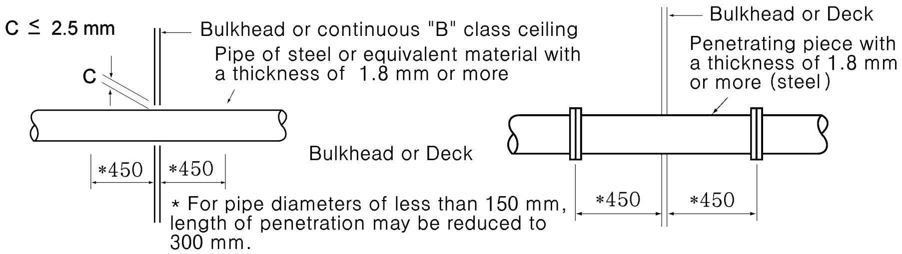
1. Penetrations of Pipes or Trunks

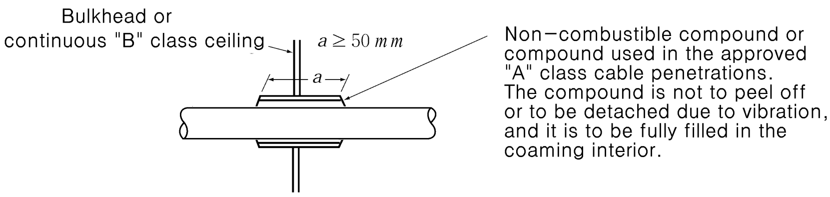
1.1 Penetrations through “A” and “B” class divisions (steel or equivalent material)

<table>
<tr><th>Divition</th><th>Details of penetrations</th></tr>
<tr><td>"A" class division</td><td>

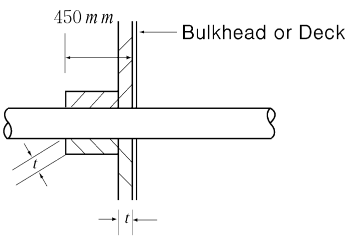


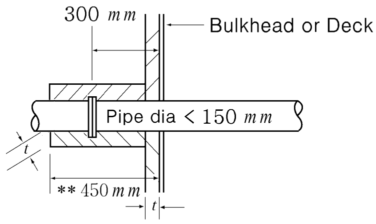
</td></tr>
<tr><td>"B" class division</td><td>





</td></tr>
<tr><td>Prevention of heat transmission</td><td>





** In case the penetrations passes the FTP code test(In case of having the equal fire integrity with 450 mm) or In case penetration piece and duct connection part have a structure that heat can not be transferred, 300 mm is admitted.
</td></tr>
</table>

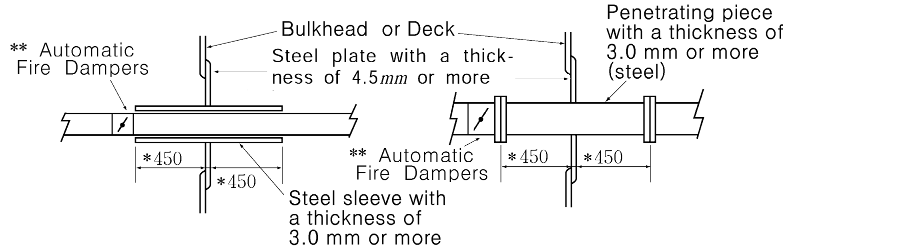
1.2 Pipes and trunks made of materials readily rendered ineffective by heat (PVC, FRP, aluminium alloy, lead, etc)

Division	Details of penetrations
"A" class division	 The thickness of penetrating pieces or steel sleeves may be that of the carbon steel pipes for ordinary piping of national standard according to their nominal diameter.
"B" class division	 Pipes or trunks with nominal diameter of 30 mm or less need not comply with this requirement.

NOTES:
1. l is the distance from the divisions to the end of sleeve or joint which is to be 450 mm or more, but in case of where in "B" class division, l is to be not less than 300 mm for pipe diameters of less than 150 mm. However, the shorter length may be permitted when the equivalent fire integrity is obtained by a standard fire test for division with a shorter steel sleeve or penetrating piece.
2. The steel penetrating piece or steel sleeve provided on the pipe or trunk on the side of the open end in case where the open end is located within l from the divisions, may be up to the open end.
3. Thermal insulation is to be applied to 150 mm or more of the length on one side of the penetrating pieces or steel sleeves according to the fire integrity of the divisions. The steel penetrating piece or steel sleeve provided on the pipe or trunk on the side of the open end in case where the open end is located within 50 mm from the divisions, may be up to the open end.
4. The pipe is to be connected to the ends of the sleeve by flanges or couplings; or the clearance (with mark ***) between the sleeve and the pipe is not to exceed 2.5 mm; or any clearance between pipe and sleeve is to be made tight by means of non-combustible or other suitable material.
5. Uninsulated metallic pipes penetrating "A-0" or "B-0" class divisions are to be of a suitable material, the melting temperature of which exceeds 950 ℃ for "A-0" and 850 ℃ for "B-0" class divisions.
6. For penetrations in "A" or "B" class divisions, a fire-tested penetration device other than that mentioned above, suitable for the fire resistance of the division pierced and the type of pipe used, may be accepted (reference is made to IMO Res. A.753 (18) and the Fire Test Procedures Code.).

2. Penetrations of Ventilation Ducts

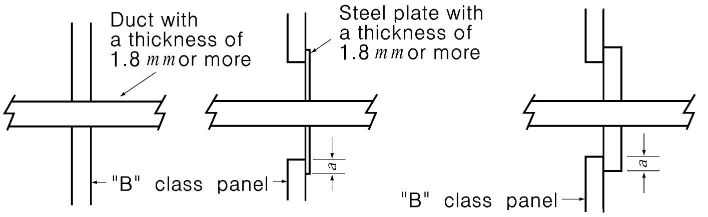
<table>
<tr><th>Division</th><th>Penetrations of ventilation ducts</th></tr>
<tr><td>"A" class</td><td>



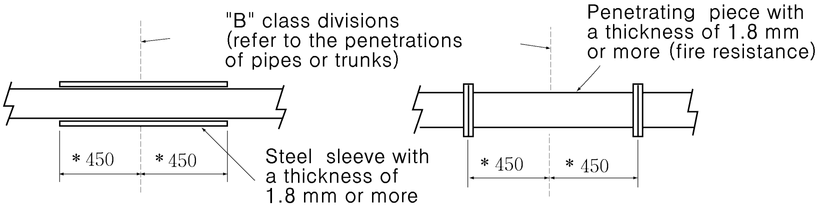
* When free cross-sectional Duct area ≤ 0.02 m², it may be reduced to 100 mm

(Only, in the case of the deck, wholly laid on the lower side of the decks pierced)

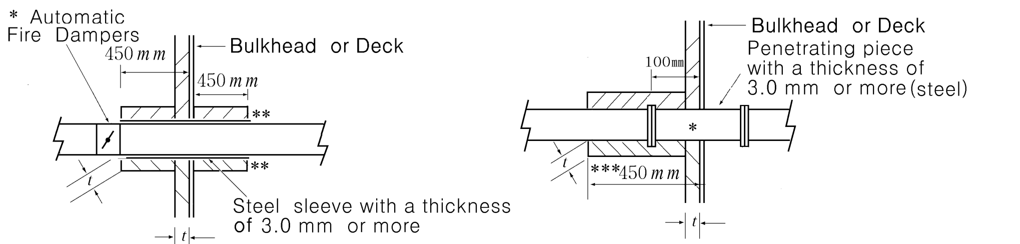
** When free cross-sectional Duct area > 0.075 m²
</td></tr>
<tr><td>"B" class</td><td>



a ≥ T where T is thickness of panel excluding finishes



* When free cross-sectional Duct area ≤ 0.02 m², it may be reduced to 100 mm
</td></tr>
<tr><td>Prevention of heat treatment</td><td>



* (If needed)

** May be omitted except in cases where fire damper

* Free cross-sectional area ≤ 0.02 m²

*** In case the penetrations passes the FTP code test(In case of having the equal fire integrity with 450mm) or In case penetration piece and duct connection part have a structure that heat can not be transferred, 100mm is admitted.
</td></tr>
</table>

3. Penetrations of Electric Cables

Division		Details of electrical cable penetrations
Single cable penetration	"A-0" class division		Division other than "A-0" class	Multi-cable penetration	"A-0" class bulkhead		"A-0" class deck	
NOTES:
1. * Compound means non-combustible compound or compound used in the approved "A" class penetration for cables.
2. Cable penetrations in "A" class divisions are to be tested and approved in accordance with **Ch 3.** of "Guidance for Approval of Manufacturing Process and Type Approval. Etc."
3. ** The thickness(t) & length(ℓ) should be used with the same dimensions passed in the type approval test in accordance with FTP code.

Division	Details of cable penetrations
"B" class	
Annex 8-3 Special Requirements for Ships which are not engaged in international voyage or Ships of less than 500 gross tonnage (Fire-fighting system of ships which are subject to Ships Safety Law of the Korean Government, but not SOLAS, shall follow the relevant requirements)

1. Fire pumps, etc may be also loosened as follows.

(1) In case ships of less than 300 gross tonnage, not engaged in international voyage and for restricted service, the requirements of fire fighting and fire detection are not sufficiently complied with.

(2) In case ships of 300 gross tonnage and over, not engaged in international voyage and for restricted service, one independent fire pump driven by power may be permitted.

(3) In case ships of less than 150 gross tonnage, instead of one independent fire pump driven by power one power driven pump may be used.

(4) For ships less than 500 gross tonnage, and ships of less than 1,000 gross tonnage, not engaged in international voyage, and ships of 1,000 gross tonnage and over, not engaged in international voyage and for restricted service, the requirements of emergency fire pump need not apply.

(5) In case ships of 300 gross tonnage and over but less than 500 gross tonnage, and 500 gross tonnage and over, not engaged in international voyage and for restricted service, the number and position of the hydrants are to be such that at least one jet of water from a single length of hose may reach any part of the ship normally accessible to the crew while the ship is being navigated and any part of any cargo space when empty (except ro/ro space).

(6) In case ships of 300 gross tonnage and over but less than 1,000 gross tonnage and for restricted service, and ships of 1,000 gross tonnage and over, not engaged in international voyage and for restricted service, the requirements for the number of fire hoses in machinery space or boiler space need not apply. And then spare fire hoses may be omitted.

(7) In case ships less than 300 gross tonnage, fire hoses may be omitted.

2. The quantity or mass of spare extinguishing medium is to be able to charge extinguishers not less than required numbers of extinguishers multiplied by 0.1.

3. Fire-extinguishing systems in accommodation and service spaces and control stations may be also loosened as follows.

(1) At least five portable fire extinguishers for ships of 1,000 gross tonnage and over, not engaged in international voyage and for restricted service, at least four extinguishers for ships of 500 gross tonnage and over but less than 1,000 gross tonnage, at least three extinguishers for ships of 100 gross tonnage and over but less than 500 gross tonnage, at least two extinguishers for ships of 50 gross tonnage and over but less than 100 gross tonnage, and at least one extinguisher for ships of less than 50 gross tonnage, are to be provided in accommodation and service spaces as appropriate.

(2) For ships for restricted service, fire-extinguishing systems, smoke detection systems, fixed fire detection and fire alarm systems and automatic sprinkler may be omitted.

4. Fire-extinguishing arrangements in machinery spaces may be also loosened as follows.

(1) For ships of less than 500 gross tonnage, fire-extinguishing foam system as a fixed fire-extinguishing system may be permitted to the satisfaction of the Society.

(2) Fixed fire-extinguishing systems for spaces containing oil fuel units (except oil-fired boilers) may be omitted.

(3) A portable fire extinguisher may be omitted for spaces containing parts of boiler firing places and oil fuel units, provided with foam fire extinguishers of not less than 135 ℓ and receptacles containing sand and so on. And herein portable foam applicator units may be omitted.

(4) For ships of less than 500 gross tonnage, smoke detection systems, fixed fire-extinguishing system may be omitted. However, in ships of less than 500 gross tonnage and having cargo spaces intended for the carriage of motor vehicles with fuel in their tanks for their own propulsion (except ships registered with the notation "S"), this requirement is not to apply for places containing internal combustion engines (only those of their total output of not less than 750 kW for main propulsion).

(5) In ships of less than 500 gross tonnage and ships of 500 gross tonnage and over but less than 1,000 gross tonnage, not engaged in international voyage and for restricted service, foam fire extinguishers of not less than 45 ℓ may be omitted.

5. Fireman''s outfits may be also loosened as follows.

(1) Ships for restricted service, fireman"s outfits may be omitted. However, for ships intended for the carriage of motor vehicles with fuel in their tanks for their own propulsion, this requirement is not to apply. Nevertheless for tankers of 500 gross tonnage and over but less than 2,000 gross tonnage which are not engaged in international voyage, one set of fireman's outfits may be omitted.
(2) For ships of less than 100 gross tonnage, for restricted service, fireman's outfits may be of an axe and a lifeline.

6. The international shore connection may be omitted.

7. The fire control plans and booklets may be omitted.

8. Fire detection systems for periodically unattended machinery space may be also loosened as follows.

(1) In cargo ships with machinery spaces watched by one person, for restricted service, the requirement of the immediate water delivery from fire main need not apply.
(2) Auto-spreading liquid fire extinguishers of sufficient capacity may be provided to the satisfaction of the Society, instead of a fixed fire detection and fire alarm system.
(3) The requirement of fire detection and alarm system need not apply for machinery spaces.

9. Fire-extinguishing arrangements for tankers may be also loosened as follows.

(1) In tankers of less than 500 gross tonnage, fire-extinguishing arrangements and deck foam systems in pump rooms may be omitted. And visual/audible alarm and temperature measuring devices given in **Ch 2, 104. 10** (1) of the Rules may be omitted.
(2) For ships of less than 2,000 gross tonnage, not engaged in international voyage and for restricted service, foam concentrate of the quantity capable of giving foam for at least 20 minutes may be provided.
(3) In ships of 500 gross tonnage and over but less than 2,000 gross tonnage, not engaged in international voyage and for restricted service, two foam applicator units may be omitted.
(4) For ships of less than 2,000 gross tonnage, not engaged in international voyage and for restricted service, the capacity of a foam applicator may be at least 250 ℓ/minute when the greater supply rate of foam solution between (A) and (B) is not more than 500 ℓ/minute.
  (A) 0.6 ℓ/minute per square metre of cargo tanks deck area, where cargo tanks deck area means the maximum breadth of the ship multiplied by the total longitudinal extent of the cargo tank spaces;
  (B) 6 ℓ/minute per square metre of the horizontal sectional area of the single tank having the largest such area;

10. In ships having closed ro/ro spaces and for restricted service, the flammable gas detector may be omitted.

11. In tankers for restricted service, the requirements of fixed gas detector may be replaced with portable gas detector.

12. Machinery spaces are to be complied with the following requirements,

(1) Means are to be provided in machinery spaces, capable of effectively ventilating to ensure prevention of accumulation of flammable vapours under normal service condition and releasing smoke in the event of fire.
(2) The number of skylights, doors, ventilators, openings in funnels to permit exhaust ventilation and other openings to machinery spaces is to be reduced to a minimum consistent with the needs of ventilation.
(3) The openings given in (2) above are to be provided with the closing arrangement which is capable of being operated from a place outside machinery spaces in the event of fire.
(4) In addition to the requirements given in (1), (2) and (3) above, the periodically unattended machinery spaces are to be provided with the fire protection arrangement as considered appropriately in consideration of the risk of fire where deemed necessary by the Society.

13. For unmanned barges not propelled by mechanical means, the requirements specified in **para 12** above need not to apply. For manned barges provided with machinery spaces, the requirements specified in **para 12** above are, in principle, to apply. However, the extent and degree of application of the requirements may be modified to a reasonable extent depending on the construction, purpose, etc. of the barges.

14. The cargo ships (cargo ferries, etc.) provided with spaces to carry motor vehicles with fuel in their tanks for their own propulsion (hereinafter referred as "car spaces"), are to comply with the Guidance **Pt 7, Annex 7-3 10** (2)

15. Where ships for restricted service comply with **para 12, 13** & **14** above. they may be registered with the notation "n·f " of the Register,

16. Where ship is not engaged in international voyage or Ships of less than 500 gross tonnage, the machinery system may be dispensed with as follows:

(1) Where the capacity of fuel oil tank (including fuel valve cooling oil tank, light oil tank, fuel oil additive tank) or lubricating oil tank is not more than 1 m^3, it is to be omitted for the valves or cocks having remote closing means.

(2) In case of passenger ships, it is to be omitted for the requirement of oil level gauges given in **Ch 2, 101. 2** (3) (E) (b) (i) of the Rules.

(3) In application to **Ch 2, 101. 2** (5) (B) of the Rules, the requirements specified in **Ch 2, 101. 2** (5) (B) of the Rules may not be applied except for the following.

(A) Internal combustion engines having a cylinder bore exceeding 300 mm

(B) Internal combustion engines having a cylinder bore not exceeding 300 mm and corresponding to the following.

(a) Where provided for UMA ships and used for main engines or driving generators

(b) Where provided for FRP ships with costal service(passenger ship only) and used for main engines having total output of 375 kW or over.

(4) It is to be omitted for the requirement of means of isolating fuel supply and spill piping given in **Ch 2, 101. 2** (5) (E) of the Rules.

(5) In application to **Ch 2, 101. 2** (3) (E) (b) of the Rules, where the glass level gauges comply with the following, tanks having 1 m or less in its full capacity may be provided with round glass level gauges. For small oil tanks other than fuel oil tanks, level gauges made of synthetic resin instead of glass may be used.

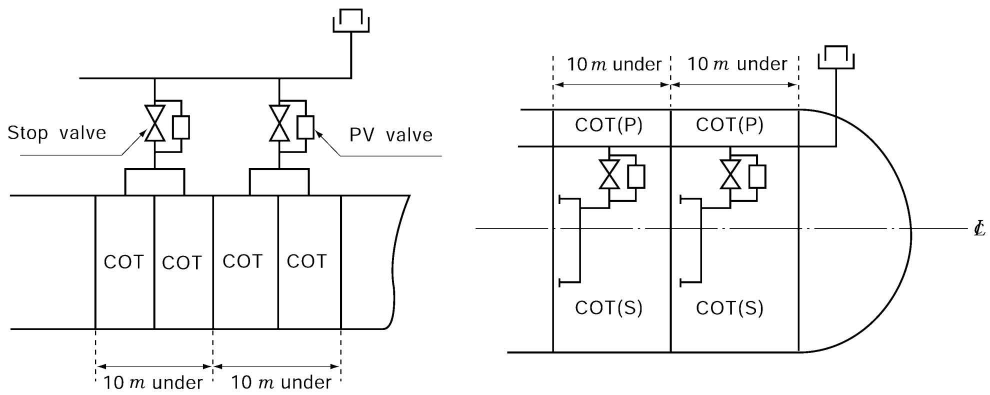
(A) Those are to be approved by the Society or to comply with "*KS V* 7222 (Glass Level Gauges with Self-closing Valve for Vessels)".

(B) Where connection pipe of glass level gauge is located under overflow pipe, valve or cock is to be provided on upper part of level gauge.

(C) Those are to be provided with *K* or *L* type protection according to *KS V* 7222.

17. In applying **104. 3** (2) (B) of the Rules, the alleviation provision for isolation requirement of cargo oil tank for tankers of less than 500 ton gross tonnage as follows ;

Where the arrangements are the plural cargo oil tank and each cargo oil tank of less than 10 mm length, these plural cargo oil tank may be regarded as one cargo oil tank.
(See **Fig Annex 8-3**)



(a) Longitudinal direction (b) Transverse direction

Fig. Annex 8-3 **Isolation of cargo oil tank for tankers of less than 500 ton gross tonnage.**

Annex 8-4 Alleviation Requirements for Fishing Vessels

1. Fire pumps may be also loosened as follows.

(1) In fishing vessels less than 80 gross tonnage, the requirement of fire pump may be omitted.
(2) For fishing vessels of 80 gross tonnage and over but less than 1,000 gross tonnage, one (1) of independently driven power fire pump may be provided.

2. The requirements of Emergency fire pumps may be not apply to fishing vessels.

3. The fire main may not be connected to the other pumps such as general service, bilge and ballast, etc., that are fitted in a machinery space.

4. Hydrants may be also loosened as follows.

(1) In fishing vessels of less than 80 gross tonnage. the requirements of hydrants may not be applied to.
(2) For fishing vessels of 80 gross tonnage and over but less than 500 gross tonnage, the number and position of the hydrants are to be such that at least one jet of water from a single length of hose may reach any part of the ship normally accessible to the crew while the ship is being navigated.
(3) The requirements of isolating valve, which is installed in machinery space to separate the section of the fire main within the machinery space containing the main fire pump from the rest of fire main, may not be applied to.

5. Fire hoses and nozzles may be loosened as follows.

(1) In fishing vessels less than 80 gross tonnage, the requirement of fire hose and nozzle may be omitted.
(2) For fishing vessels of 80 gross tonnage and over but less than 1,000 gross tonnage, the number of fire hoses may not be applied to.

6. Fixed fire detection and fire alarm systems need not apply to fishing vessels.

7. Fire-extinguishing systems in accommodation and service spaces and control stations may be loosened as follows.

(1) For fishing vessels of 80 gross tonnage and over but less than 500 gross tonnage, at least three portable fire extinguishers may be provided in accommodation and service spaces.
(2) In fishing vessels, two simple extinguishers may be provided instead of a portable fire extinguisher provided to in accommodation and service spaces.
(3) For fishing vessels less than 1,000 gross tonnage, the requirements of fixed extinguishing system for exhaust ducts from galley ranges may be omitted.

8. Fire-extinguishing arrangement in machinery spaces may be also loosened as follows.

(1) For fishing vessels less than 500 gross tonnage,the fixed low-expansion foam fire-extinguishing systems may be permitted in category "A" machinery space containing oil-fired boilers or oil fuel units.
(2) For fishing vessels less than 1,000 gross tonnage, fixed fire-extinguishing systems may be omitted in category "A" machinery spaces of not containing oil-fired boilers.
(3) For fishing vessels less than 500 gross tonnage, the portable foam applicator may be omitted in oil-fired boiler rooms.
(4) For fishing vessels less than 500 gross tonnage, a portable fire extinguisher or equivalent thereto, or such two simple extinguishers may be permitted instead of fire extinguishers provided in spaces containing boiler furnaces or parts of oil fuel units. However, for fishing vessels of 500 gross tons and over, a portable foam extinguisher or equivalent may be provided or alternative two simple extinguishers.
(5) The requirements of receptacle containing 0.1 m^3 of sand, sawdust and suitable shovel may be omitted in boiler furnaces.
(6) The requirements of category "A" machinery spaces, which is applied to main engines or internal combustion engines (except main engines) of a total power output of 375 kW and over, may be omitted. as follows.
(A) At least two portable foam fire extinguishers, carbon dioxide gas fire extinguishers or powder fire extinguishers for fishing vessels of not less than 80 but less than 500 gross tonnage, and at least one of such fire extinguishers for fishing vessels of less than 80 gross

tonnage are to be provided.

(B) In addition at least a portable foam fire extinguisher per output of 750 kW of internal combustion engines or each engine is to be provided.

(C) Two simple extinguishers may be permitted instead of one of fire extinguishers specified in (A) and (B).

(7) For machinery spaces containing steam turbines or enclosed steam engines and other machinery spaces, the requirements of fire fighting may be omitted.

9. For fishing vessels less than 1,000 gross tonnage, the requirements of fireman's outfits may be omitted.

10. The requirements of International shore connection may be omitted.

11. The requirements of Fire control plans may be omitted.

12. The requirements of Fire-extinguishing arrangements in cargo spaces may be omitted.

13. Besides the above paragraphs, the fishing vessel which is not engaged in international voyage and Ships of less than 500 gross tonnage shall be complied with the requirements of **Annex 8-3**.

Annex 8-5 Inert Gas Systems

1. The general requirements shall comply with as follows :

(1) Hereafter the term cargo tank includes also slop tanks.

(2) The inert gas system shall be designed, constructed and tested to the satisfaction of the Society. It shall be so designed and operated as to render and maintain the atmosphere of the cargo tanks non-flammable at all times, except when such tanks are required to be gas-free. In the event that the inert gas system is unable to meet the operational requirement set out above and it has been assessed that it is impracticable to effect a repair, then cargo discharge, deballasting and necessary tank cleaning shall only be resumed when the "emergency conditions" laid down in the Guidelines on Inert Gas Systems are complied with. (MSC/Circ.677.MSC/Circ.450/Rev.1, MSC/Circ.485), MSC/Circ.387)

(3) Inerting empty cargo tanks by reducing the oxygen content of the atmosphere in each tank to a level at which combustion cannot be supported;

(4) Maintaining the atmosphere in any part of any cargo tank with an oxygen content not exceeding 8 % by volume and at a positive pressure at all times in port and at aea except when it is necessary for such a tank to be gas-free.

(5) Eliminating the need for air to enter a tank during normal operations except when it is necessary for such a tank to be gas-free; and

(6) Purging empty cargo tanks of a hydrocarbon gas, so that subsequent gas-freeing operations will at no time create a flammable atmosphere within the tank.

(7) Inert gas system using stored carbon dioxide will not be permitted unless the Society is satisfied that there is no risk of ignition from generation of static electricity by the system itself.

(8) When two blowers are provided, the total required capacity of the inert gas system is preferably to be divided equally between the two blowers, and in no case is one blower to have a capacity less than 1/3 of the total capacity required.

(9) The compartment in which any oil fired inert gas generator is situated is to be treated as machinery space of Category A with respect to fire protection.

2. The inert gas supply shall be complied with the following requirements.

(1) The inert gas supply may be treated flue gas from main or auxiliary boilers. The Society may accept systems using flue gases from one or more separate gas generators or other sources or any combination thereof, provided that an equivalent standard of safety is achieved. Such systems shall, as far as practicable, comply with the requirements of this chapter. Systems using stored carbon dioxide shall not be permitted unless the Society is satisfied that the risk of ignition from generation of static electricity by the system itself is minimized.

(2) The system shall be capable of delivering inert gas to the cargo tanks at a rate of at least 125 % of the maximum rate of discharge capacity of the ship expressed as a volume.

(3) The system shall be capable of delivering inert gas with an oxygen content of not more than 5 % by volume in the inert gas supply main to the cargo tanks at any required rate of flow.

(4) Two fuel oil pumps shall be fitted to the inert gas generator. The Society may permit only one fuel oil pump on condition that sufficient spares for the fuel oil pump and its prime mover are carried on board to enable any failure of the fuel oil pump and its prime mover to be rectified by the ship's crew.

3. A flue gas scrubber shall be complied with the following requirements.

(1) A flue gas scrubber shall be fitted which will effectively cool the volume of gas specified in paragraphs **2** (1) and **2** (2) above and remove solids and sulphur combustion products. The cooling water arrangements shall be such that an adequate supply of water will always be available without interfering with any essential services on the ship. Provision shall also be made for an alternative supply of cooling water.

(2) Filters or equivalent devices shall be fitted to minimize the amount of water carried over to the inert gas blowers.

(3) The scrubber shall be located aft of all cargo tanks, cargo pump-rooms and cofferdams separating these spaces from machinery spaces of category A.

4. Blowers shall be complied with the following requirements.

(1) At least two blowers shall be fitted and be capable of delivering to the cargo tanks at least the volume of gas required by paragraphs **2** (1) and **2** (2). For systems with gas generators the

Administration may permit only one blower if that system is capable of delivering the total volume of gas required by paragraphs **2** (1) and **2** (2) to the protected cargo tanks, provided that sufficient spares for the blower and its prime mover are carried on board to enable any failure of the blower and its prime mover to be rectified by the ship's crew.

(2) The inert gas system shall be so designed that the maximum pressure which it can exert on any cargo tank will not exceed the test pressure of any cargo tank. Suitable shutoff arrangements shall be provided on the suction and discharge connections of each blower. Arrangements shall be provided to enable the functioning of the inert gas plant to be stabilized before commencing cargo discharge. If the blowers are to be used for gas-freeing, their air inlets shall be provided with blanking arrangements.

(3) The blowers shall be located aft of all cargo tanks, cargo pump-rooms and cofferdams separating these spaces from machinery spaces of category A.

(4) In particular those parts of scrubbers, blowers, non-return devices, scrubber effluent and other drain pipes which may be subjected to corrosive action of the gases and/or liquids are to be either constructed of corrosion resistant material or lined with rubber, glass fibre epoxy resin or other equivalent coating material.

5. The water seal shall be complied with the following requirements.

(1) The water seal referred to in paragraph **6** (6) shall be capable of being supplied by two separate pumps, each of which shall be capable of maintaining an adequate supply at all times.

(2) The arrangement of the seal and its associated fittings shall be such that it will prevent backflow of hydrocarbon vapours and will ensure the proper functioning of the seal under operating conditions.

(3) Provision shall be made to ensure that the water seal is protected against freezing, in such a way that the integrity of seal is not impaired by overheating.

(4) A water loop or other approved arrangement shall also be fitted to each associated water supply and drain pipe and each venting or pressure-sensing pipe leading to gas-safe spaces. Means shall be provided to prevent such loops from being emptied by vacuum.

(5) The deck water seal and loop arrangements shall be capable of preventing return of hydrocarbon vapours at a pressure equal to the test pressure of the cargo tanks.

(6) In respect of paragraph **8** (7) (G), the Administration shall be satisfied as to the maintenance of an adequate reserve of water at all times and the integrity of the arrangements to permit the automatic formation of the water seal when the gas flow ceases. The audible and visual alarm on the low level of water in the water seal shall operate when the inert gas is not being supplied.

6. Safety measures in the system shall be complied with the following requirements.

(1) Flue gas isolating valves shall be fitted in the inert gas supply mains between the boiler uptakes and the flue gas scrubber. These valves shall be provided with indicators to show whether they are open or shut, and precautions shall be taken to maintain them gas-tight and keep the seatings clear of soot. Arrangements shall be made to ensure that boiler soot blowers cannot be operated when the corresponding flue gas valve is open.

(2) Special consideration shall be given to the design and location of scrubber and blowers with relevant piping and fittings in order to prevent flue gas leakages into enclosed spaces.

(3) To permit safe maintenance, an additional water seal or other effective means of preventing flue gas leakage shall be fitted between the flue gas isolating valves and scrubber or incorporated in the gas entry to the scrubber.

(4) A gas regulating valve shall be fitted in the inert gas supply main. This valve shall be automatically controlled to close as required in paragraphs (10). It shall also be capable of automatically regulating the flow of inert gas to the cargo tanks unless means are provided to automatically control the speed of the inert gas blowers required in paragraph **4**.

(5) The valve referred to in paragraph (4) shall be located at the forward bulkhead of the forward most gas-safe space through which the inert gas supply main passes. Herein a gas-safe space is a space in which the entry of hydrocarbon gases would produce hazards with regard to flammability or toxicity.

(6) At least two non-return devices, one of which shall be a water seal, shall be fitted in the inert gas supply main, in order to prevent the return of hydrocarbon vapour to the machinery space uptakes or to any gas-safe spaces under all normal conditions of trim, list and motion of the ship. They shall be located between the automatic valve required by paragraph (4) and the after most connection to any cargo tank or cargo pipeline.

(7) The devices referred to in paragraph (6) shall be located in the cargo area on deck.

(8) The second device shall be a non-return valve or equivalent capable of preventing the return of vapours or liquids and fitted forward of the deck water seal required in paragraph (6). It shall be provided with positive means of closure. As an alternative to positive means of closure, an additional valve having such means of closure may be provided forward of the non-return valve to isolate the deck water seal from the inert gas main to the cargo tanks.

(9) As an additional safeguard against the possible leakage of hydrocarbon liquids or vapours back from the deck main, means shall be provided to permit this section of the line between the valve having positive means of closure referred to in paragraph (8) and the valve referred to in paragraph (4), (5) to be vented in a safe manner when the first of these valves is closed.

(10) Automatic shutdown of the inert gas blowers and gas regulating valve shall be arranged on predetermined limits being reached in respect of paragraphs **8** (7) (A), (B) and **8** (7) (C) And Automatic shutdown of the gas regulating valve shall be arranged in respect of paragraph **8** (7) (D).

(11) In respect of paragraph **8** (7) (E), when the oxygen content of the inert gas exceeds 8 % by volume, immediate action shall be taken to improve the gas quality. Unless the quality of the gas improves, all cargo tank operations shall be suspended so as to avoid air being drawn into the tanks and the isolation valve referred to in paragraph (8) shall be closed.

7. Inert gas lines shall be complied with the following requirements.

(1) The inert gas main may be divided into two or more branches forward of the non-return devices required by paragraphs **5** and **6** (6) (7) (8) (9).

(2) The inert gas supply main shall be fitted with branch piping leading to each cargo tank. Branch piping for inert gas shall be fitted with either stop valves or equivalent means of control for isolating each tank. Where stop valves are fitted, they shall be provided with locking arrangements, which shall be under the control of a responsible ship's officer. The control system operated shall provide unambiguous information of the operational status of such valves.

(3) In combination carriers, the arrangement to isolate the slop tanks containing oil or oil residues from other tanks shall consist of blank flanges which will remain in position at all times when cargoes other than oil are being carried except as provided for in the relevant section of the Guidelines on Inert Gas Systems (MSC/Circ.353 and MSC/Circ.387).

(4) Means shall be provided to protect cargo tanks against the effect of overpressure or vacuum caused by thermal variations when the cargo tanks are isolated from the inert gas mains.

(5) Piping systems shall be so designed as to prevent the accumulation of cargo or water in the pipelines under all normal conditions.

(6) Arrangements shall be provided to enable the inert gas main to be connected to an external supply of inert gas. The arrangements shall consist of a 250 mm nominal pipe size bolted flange, isolated from the inert gas main by a valve and located forward of the non-return valve referred to in paragraph **6** (8). The design of the flange should conform to the appropriate class in the standards adopted for the design of other external connections in the ship's cargo piping system.

(7) If a connection is fitted between the inert gas supply main and the cargo piping system, arrangements shall be made to ensure an effective isolation having regard to the large pressure difference which may exist between the systems. This shall consist of two shutoff valves with an arrangement to vent the space between the valves in a safe manner or an arrangement consisting of a spool-piece with associated blanks. (see **Fig Annex 8-5**)

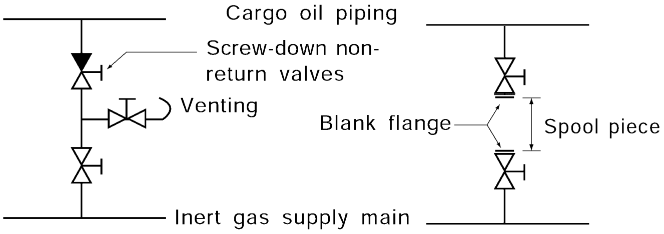


Fig. Annex 8-5

(8) The valve separating the inert gas supply main from the cargo main and which is on the cargo main side shall be a non-return valve with a positive means of closure. However, if only the spool piece is installed, stop valve also can be regarded as attached **Fig 8-5.**

8. Operation and control requirements shall comply with as follows.

(1) Means shall be provided for continuously indicating the temperature and pressure of the inert gas at the discharge side of the gas blowers, whenever the gas blowers are operating.

(2) Instrumentation shall be fitted for continuously indicating and permanently recording, when inert gas is being supplied:

(A) the pressure of the inert gas supply mains forward of the non-return devices required by paragraph **6** (6); and

(B) the oxygen content of the inert gas in the inert gas supply mains on the discharge side of the gas blowers.

(3) The devices referred to in paragraph (2) shall be placed in the cargo control room where provided. But where no cargo control room is provided, they shall be placed in a position easily accessible to the officer in charge of cargo operations.

(4) In addition, meters shall be fitted:

(A) in the navigating bridge to indicate at all times the pressure referred to in paragraph (2) (A) and the pressure in the slop tanks of combination carriers, whenever those tanks are isolated from the inert gas supply main; and

(B) in the machinery control room or in the machinery space to indicate the oxygen content referred to in paragraph (2) (B).

(5) Portable instruments for measuring oxygen and flammable vapour concentration shall be provided. In addition, suitable arrangement shall be made on each cargo tank such that the condition of the tank atmosphere can be determined using these portable instruments.

(6) Suitable means shall be provided for the zero and span calibration of both fixed and portable gas concentration measurement instruments, referred to in paragraphs (2) (3) (4) (5).

(7) For inert gas systems of both the flue, gas type and the inert gas generator type, audible and visual alarms shall be provided to indicate:

(A) low water pressure or low water flow rate to the flue gas scrubber as referred to in paragraph **3** (1);

(B) high water level in the flue gas scrubber as referred to in paragraph **3** (1);

(C) high gas temperature as referred to in paragraph (1);

(D) failure of the inert gas blowers referred to in paragraph **4**;

(E) oxygen content in excess of 8 by volume as referred to on para (2) (B).

(F) failure of the power supply to the automatic control system for the gas regulating valve and to the indicating devices as referred to in paragraphs **6** (4) (5) and (2) (A);

(G) low water level in the water seal as referred to in paragraph **6** (6);

(H) gas pressure less than 100 mm water gauge as referred to in paragraph (2) (A). The alarm arrangement shall be such as to ensure that the pressure in slop tanks in combination carriers can be monitored at all times; and

(I) high gas pressure as referred to in paragraph (2) (A).

(8) For inert gas systems of the inert gas generator type, additional audible and visual alarms shall be provided to indicate:

(A) insufficient fuel oil supply;

(B) failure of the power supply to the generator; and

(C) failure of the power supply to the automatic control system for the generator.

(9) The alarms required in paragraphs (7) (E) (F) and (7) (H) shall be fitted in the machinery space and cargo control room, where provided, but in each case in such a position that they are immediately received by responsible members of the crew.

(10) An audible alarm system independent of that required in paragraph (7) (H) or automatic shut-down of cargo pumps shall be provided to operate on predetermined limits of low pressure in the inert gas main being reached.

(11) Detailed instruction manuals shall be provided on board, covering the operations, safety and maintenance requirements and occupational health hazards relevant to the inert gas system and its application to the cargo tank system. The manuals shall include guidance on procedures to be followed in the event of a fault or failure of the inert gas system. (MSC/Circ.353 and MSC/Circ.387)

9. If nitrogen generator system is provided, the follows requirements shall be complied with;

(1) The following requirements are specific only to the gas generator system and apply where inert gas is produced by separating air into its component gases by passing compressed air through a bundle of hollow fibres, semi-permeable membranes or absorber materials.
(2) A nitrogen generator consists of a feed air treatment system and any number of membrane or absorber modules in parallel necessary to meet the required capacity which is to be at least 125 % of the maximum discharge capacity of the ship expressed as a volume.
(3) The air compressor and the nitrogen generator may be installed in the engine room or in a separate compartment. A separate compartment is to be treated as one of "other machinery spaces" with respect to fire protection.
(4) Where a separate compartment is provided, it is to be positioned outside the cargo area and is to be fitted with an independent mechanical extraction ventilation system providing 6 air changes per hour. A low oxygen alarm is to be fitted as well. The compartment is to have no direct access to accommodation spaces, service spaces and control stations.
(5) The nitrogen generator is to be capable of delivering high purity nitrogen with O_2 content not exceeding 5 % by volume. The system is to be fitted with automatic means to discharge "off-spec" gas to the atmosphere during start-up and abnormal operation.
(6) The system is to be provided with two air compressors. The total required capacity of the system is preferably to be divided equally between the two compressors, and in no case is one compressor to have a capacity less than 1/3 of the total capacity required. Only one air compressor may be accepted provided that sufficient spares for the air compressor and its prime mover are carried on board to enable their failure to be rectified by the ship's crew.
(7) A feed air treatment system is to be fitted to remove free water, particles and traces of oil from the compressed air, and to preserve the specification temperature.
(8) Where fitted, a nitrogen receiver/buffer tank may be installed in a dedicated compartment or in the separate compartment containing the air compressor and the generator or may be located in the cargo area. Where the nitrogen receiver/buffer tank is installed in an enclosed space, the access is to be arranged only from the open deck and the access door is to open outwards. Permanent ventilation and alarm are to be fitted as required by (4).
(9) The oxygen-enriched air from the nitrogen generator and the nitrogen-product enriched gas from the protective devices of the nitrogen receiver are to be discharged to a safe location on the open deck.
(10) In order to permit maintenance, means of isolation is to be fitted between the generator and the receiver.
(11) At least two non-return devices are to be fitted in the inert gas supply main, one of which is to be of the double block and bleed arrangement. The second non-return device is to be equipped with positive means of closure.
(12) Instrumentation is to be provided for continuously indicating the temperature and pressure of air, at the discharge side of the compressor and at the entrance side of the nitrogen generator.
(13) Instrumentation is to be fitted for continuously indicating and permanently recording the oxygen content of the inert gas downstream of the nitrogen generator when inert gas is being supplied.
(14) The instrumentation specified in (13) above is to be placed in the cargo control room where provided. But where no cargo control room is provided, they shall be placed in a position easily accessible to the officer of cargo operations.
(15) Audible and visual alarms are to be provided to indicate :
(A) Low feed-air pressure from compressor specified in (12) above.
(B) High air temperature specified in (12) above.
(C) High condensate level at automatic drain of water separator specified in (7) above.
(D) Failure of electrical heater, if fitted.
(E) Oxygen content in excess of that required in (5) above.
(F) Failure of power supply to the instrumentation specified in (13) above.
(16) Automatic shut-down of the system is to be arranged upon alarm conditions as required by (15) (A) to (E) above.
(17) The alarms required by (15) above are to be fitted in the machinery space and cargo control room, where provided, but in each case in such a position that they are immediately received by responsible members of the crew.

10. If nitrogen/inert gas systems are fitted for purpose other than inerting of the above 1 on oil tankers of less than 20,000 DWT, gas tankers or chemical tankers, the following requirements shall be complied with;

(1) The requirements apply except prescribed (1), (2) and (6) above.
(2) Where the connections to the cargo tanks, to the hold spaces or to cargo piping are not permanent, the non-return devices specified in (11) above may be substituted by two non-return valves.

11. In case where glass-fibre reinforced plastic pipes are used for the drainage piping from the scrubber and blower fan casing, the following requirements are to be complied with:

(1) The materials, design requirements, piping arrangements, connections of pipes, markings, tests and inspections are to be as specified in **Pt 5, Annex 5-6** of the Guidance.
(2) In case where glass-fibre reinforced plastic pipes are provided inside the machinery space, the following requirements are to be complied with:
(A) A valve operable from both inside and outside the machinery space either by pneumatic or hydraulic pressure led through steel piping is to be provided on a distance piece fitted to the shell plating. This valve is to be of automatic closing type in case of failure of the operating system.
(B) The valve specified in (A) above is to be provided with an indicator showing the opening/closing condition.
(C) The valve specified in (A) above is to be closed at all time when the inert gas system is not in operation as well as in the event of a fire in the machinery space.
(D) For the valve specified in (A) above, a short piece of steel pipe or spool piece is to be fitted. Further, a swing type non-return valve is to be attached to the piece. The piece is to be provided with a drain pipe of an inside diameter of approximately 12.5 mm and a drain valve.
(E) On the inboard side of the non-return valve specified in (D) above, a short piece of steel pipe or spool piece provided with a drain pipe with an inside diameter of approximately 12.5 mm and a drain valve is to be fitted.
(F) The distance piece and valve specified in (A) above, and short piece of steel pipe or spool piece and swing type non-return valve specified in (D) and (E) above are to be of corrosion resisting materials or are to be protected internally by rubber, glass fibers, epoxy resins or equivalent coating materials.
(G) Means for stopping the scrubber pump is to be provided outside the machinery space.

12. Installation inspection of inert gas system shall be complied with the following requirements:

(1) After installation inboard, inert gas system is to be tested at the working condition in accordance with **Annex 8-5** table as to airtight test and operation test, control device, safety system and warning device.
(2) The airtight test pressure for pipes and joints in the inert gas supply line is, in principle, to be 0.024 MPa. Note, however, that in case where the set pressure of the pressure/vacuum valve is 0.024 MPa or more, the test pressure is to be the set pressure of the pressure/vacuum valve.
(3) It is to be verified through the use of inert gas or fresh air that the capacity of the inert gas blower is equal to or greater than 1.25 times the maximum design discharge capacity of the ship. In case where fresh air is used in the test, such fresh air is to be taken in from the area in the proximity of the flue gas isolating valve. However, when a ship including its inert gas system is of the same design as a ship which has already tested, this test may be omitted.

Annex 8-5 table effectiveness test item

Item	Audible and visual alarm	Safety device	Note
(1) Supplied water pressure of scrubber and discharge drop	○	Inert gas control valve closing Inert gas blower stop	-
(2) A rising of the water level in the scrubber	○	Inert gas control valve closing Inert gas blower stop Stop of cooling water supply pump for scrubber	
(3) Inert gas high temperature of an outlet of inert gas blower	○	Inert gas control valve closing Inert gas blower stop	
(4) An obstacle of inert gas blower	○	Inert gas control valve closing	
(5) Oxygen content of inert gas blower outlet in excess of 8 % by volume	○	-	Closing passively to non-return device in addition to improvement of gas quality and water seal Alarm is to be given to machinery room and cargo control room
(6) Failure of the power supply to the automatic control system for the inert gas regulation valve	○	-	Alarm is to be given to machinery room and cargo control room
(7) Failure of the power the pressure of the inert gas supply mains afward of the non-return device	○		
(8) Failure of the power supply to the oxygen content of the inert gas blower outlet	○		
(9) Low water level in the water seal	○	-	-
(10) Gas pressure less than 100 mm water gause forward of non-return device	○	-	Alarm to machinery room and cargo control room
(11) Overpressure in inert gas supply main forward of non-return device	○	-	-
(12) Supply stop of inert gas	○	-	Low water level alarm is to be operated in the water seal Watertight is to be formed in the water seal
(13) Predetermined limits of low pressure in the inert gas mains being reached	○	-	Automation stop of cargo oil pump should be avaliable
(14) The automatic control system for the inert gas regulation valve	-	-	Provided where the automatic control system for the inert gas blower are not be provided
(15) Indicating device, recording device, measuring device	-	-	Operation and effectiveness test are to be accomplished

Annex 8-6 Other Operation Requirements, etc.

1. At all times while the ship is in service, the requirements that fire protection systems and fire-fighting systems and appliances are to be maintained ready for use shall be complied with. A ship is not in service when:
(1) it is in for repairs or lay-up (either at anchor or in port) or in dry-dock;
(2) it is declared not in service by the owner or the owner's representative; and
(3) in the case of passenger ships, there are no passengers on board.

2. The following fire protection systems shall be kept in good order so as to ensure their required performance if a fire occurs:
(1) structural fire protection including fire resisting divisions, and protection of openings and penetrations in these divisions;
(2) fire detection and fire alarm systems; and
(3) means of escape systems and appliances.

3. Fire-fighting systems and appliances shall be kept in good working order and readily available for immediate use. Portable extinguishers which have been discharged shall be immediately recharged or replaced with an equivalent unit.

4. Maintenance, testing and inspections shall be carried out based on the guidelines developed by the IMO Organization and in a manner having due regard to ensuring the reliability of fire-fighting systems and appliances.

5. The maintenance plan shall be kept on board the ship and shall be available for inspection whenever required by the Society.

6. The maintenance plan shall include at least the following fire protection systems and fire-fighting systems and appliances, where installed:
(1) fire mains, fire pumps and hydrants including hoses, nozzles and international shore connections;
(2) fixed fire detection and fire alarm systems;
(3) fixed fire-extinguishing systems and other fire extinguishing appliances;
(4) automatic sprinkler, fire detection and fire alarm systems;
(5) ventilation systems including fire and smoke dampers, fans and their controls;
(6) emergency shut down of fuel supply;
(7) fire doors including their controls;
(8) general emergency alarm systems;
(9) emergency escape breathing devices;
(10) portable fire extinguishers including space charges; and
(11) fire-fighter's outfits.

7. The maintenance programme may be computer-based.

8. In addition to the fire protection systems and appliances listed in paragraph **102. 3** ships carrying more than 36 passengers shall develop a maintenance plan for low-location lighting and public address systems.

9. In addition to the fire protection systems and appliances listed in paragraph **102. 3** tankers shall develop a maintenance plan for:
(1) inert gas systems;
(2) deck foam systems;
(3) fire safety arrangements in cargo pump rooms; and
(4) flammable gas detectors.

10. A training manual shall be provided in each crew mess room and recreation room or in each crew cabin.

11. The training manual shall be written in the working language of the ship.

12. The training manual, which may comprise several volumes, shall contain the instructions and information required in paragraph **4** in easily understood terms and illustrated wherever possible. Any part of such information may be provided in the form of audio-visual aides in lieu of the manual.

13. The training manual shall explain the following in detail:

(1) general fire safety practice and precautions related to the dangers of smoking, electrical hazards, flammable liquids and similar common shipboard hazards;
(2) general instructions on fire-fighting activities and fire-fighting procedures including procedures for notification of a fire and use of manually operated call points;
(3) meanings of the ship's alarms;
(4) operation and use of fire-fighting systems and appliances;
(5) operation and use of fire doors;
(6) operation and use of fire and smoke dampers; and
(7) escape systems

14. Fire Control Plans shall be permanently exhibited for the guidance of the ship's officers. Alternatively, at the discretion of the Society, the aforementioned details may be set out in a booklet, a copy of which shall be supplied to each officer, and one copy shall at all times be available on board in an accessible position. Plans and booklets shall be kept up to date; any alterations thereto shall be recorded as soon as practicable. Description in such plans and booklets shall be in the language or languages required by the Society. If the language is neither English nor French, a translation into one of those languages shall be included.

15. A duplicate set of fire control plans or a booklet containing such plans shall be permanently stored in a prominently marked weathertight enclosure outside the deckhouse for the assistance of shore-side fire-fighting personnel.

16. In ships carrying more than 36 passengers, plans and booklets required by this regulation shall provide information regarding fire protection, fire detection and fire extinction based on the guidelines issued by the IMO Organization.

17. The required fire safety operational booklet shall contain the necessary information and instructions for the safe operation of the ship and cargo handling operations in relation to fire safety. The booklet shall include information concerning the crew's responsibilities for the general fire safety of the ship while loading and discharging cargo and while underway. Necessary fire safety precautions for handling general cargoes shall be explained. For ships carrying dangerous goods and flammable bulk cargoes, the fire safety operational booklet shall also provide reference to the pertinent fire-fighting and emergency cargo handling instructions contained in the International Maritime Solid Bulk Cargoes Code, the International Bulk Chemical Code, the International Gas Carrier Code and the International Maritime Dangerous Goods Code, as appropriate.

18. The fire safety operational booklet shall be provided in each crew mess room and recreation room or in each crew cabin.

19. The fire safety operational booklet shall be written in the working language of the ship.

20. The fire safety operational booklet may be combined with the training manuals.

21. For Tankers, the fire safety operational booklet referred to in paragraph **1** shall include provisions for preventing fire spread to the cargo area due to ignition of flammable vapours and include procedures of cargo tank gas-purging and/or gas-freeing taking into account the provisions as follows,

Procedures for cargo tank purging and/or gas-freeing

(1) When the ship is provided with an inert gas system, the cargo tanks shall first be purged in accordance with **Ch 2, 104. 6** of the Rules until the concentration of hydrocarbon vapours in the cargo tanks has been reduced to less than 2 % by volume. Thereafter, gas-freeing may take place at the cargo tank deck level.
(2) When the ship is not provided with an inert gas system, the operation shall be such that the flammable vapour is discharged initially through:
  (A) the vent outlets as specified in **Ch 2, 104. 3** (4) of the Rules**;**
  (B) outlets at least 2 m above the cargo tank deck level with a vertical efflux velocity of at least 30 m/s maintained during the gas-freeing operation; or
  (C) outlets at least 2 m above the cargo tank deck level with a vertical efflux velocity of at least 20 m/s and which are protected by suitable devices to prevent the passage of flame.
(3) The above outlets shall be located not less than 10 m measured horizontally from the nearest air intakes and openings to enclosed spaces containing a source of ignition and from deck machinery, which may include anchor windlass and chain locker openings, and equipment which may constitute an ignition hazard.
(4) When the flammable vapour concentration at the outlet has been reduced to 30% of the lower

flammable limit, gas-freeing may e continued at cargo tank deck level.

Annex 8-7 Qualitative Failure Analysis for Propulsion and Steering on Passenger Ships

1. The scope is to be as specified in the followings.

A qualitative failure analysis for propulsion and steering for new passenger ships including those having of 120 m or more or having three or more main vertical zones.

2. The objectives are to be as specified in the followings.

(1) For ships having at least two independent means of propulsion and steering to comply with SOLAS requirements for a safe return to port, the following requirements are applicable.

(A) Provide knowledge of the effects of failure in all the equipment and systems due to fire in any space, or flooding of any watertight compartment that could affect the availability of the propulsion and steering.

(B) Provide solutions to ensure the availability of propulsion and steering upon such failures in item (a).

(2) Ships not required to satisfy the safe return to port concept will require the analysis of failure in single equipment and fire in any space to provide knowledge and possible solutions for enhancing availability of propulsion and steering.

3. The systems shall consider the following requirements and the analysis is to address the location and layout of equipment and systems to consider the effects of fire or flooding in a single compartment.

(1) The qualitative failure analysis is to consider the propulsion and steering equipment and all its associated systems which might impair the availability of propulsion and steering.

(2) The qualitative failure analysis should include:

(A) Propulsion and electrical power prime movers, e.g.,
- (a) Diesel engines
- (b) Electric motors

(B) Power transmission systems, e.g.,
- (a) Shafting
- (b) Bearings
- (c) Power converters
- (d) Transformers
- (e) Slip ring systems

(C) Steering gear, e.g,
- (a) Rudder actuator or equivalent for azimuthing propulsor
- (b) Rudder stock with bearings and seals
- (c) Rudder
- (d) Power unit and control gear
- (e) Local control systems and indicators
- (f) Remote control systems and indicators
- (g) Communication equipment

(D) Propulsors, e.g.,
- (a) Propeller
- (b) Azimuthing thruster
- (c) Water jet

(E) Main power supply systems, e.g.,
- (a) Electrical generators and distribution systems
- (b) Cable runs
- (c) Hydraulic
- (d) Pneumatic

(F) Essential auxiliary systems, e.g.,
- (a) Compressed air
- (b) Oil fuel
- (c) Lubricating oil
- (d) Cooling water
- (e) Ventilation
- (f) Fuel storage and supply systems

(G) Control and monitoring systems, e.g.,

(a) Electrical auxiliary circuits
(b) Power supplies
(c) Protective safety systems
(d) Power management systems
(e) Automation and control systems

(H) Support systems, e.g.,
(a) Lighting
(b) Ventilation

4. The failure criteria is to be as specified in the followings.

(1) Failures are deviations from normal operating conditions such as loss or malfunction of a component or system such that it cannot perform an intended or required function.
(2) The qualitative failure analysis should be based on single failure criteria, (not two independent failures occurring simultaneously).
(3) Where a single failure cause results in failure of more than one component in a system (common cause failure), all the resulting failures are to be considered together.
(4) Where the occurrence of a failure leads directly to further failures, all those failures are to be considered together.

5. The verification of Solutions is to be as specified in the followings.

(1) The shipyard is to submit a report to the Societies that identifies how the objectives have been addressed. The report is to include the following information:
(A) Identify the standards used for analysis of the design.
(B) Identify the objectives of the analysis.
(C) Identify any assumptions made in the analysis.
(D) Identify the equipment, system or sub-system, mode of operation of the equipment.
(E) Identify probable failure modes and acceptable deviations from the intended or required function.
(F) Evaluate the local effects (e.g. fuel injection failure) and the effects on the system as a whole (e.g. loss of propulsion power) of each failure mode as applicable.
(G) Identify trials and testing necessary to prove conclusions.
(2) The report is to be submitted prior to approval of detail design plans. The report may be submitted in two parts:
(A) A preliminary analysis as soon as the initial arrangements of different compartments and propulsion plant are known which can form the basis of discussion. This is to include a structured assessment of all essential systems supporting the propulsion plant after a failure in equipment, fire or flooding in any compartment casualty.
(B) A final report detailing the final design with a detailed assessment of any critical system identified in the preliminary report.
(3) Verification of the report findings are to be agreed between the Society and the shipyard. ⚓

KOREAN REGISTER OF SHIPPING

APPLICATION OF PART 9 "ADDITIONAL INSTALLATIONS"

1. Unless expressly specified otherwise, the requirements in the Rules apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date : 20 August 2010 (based on the application date for classification survey)

CHAPTER 3 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 3 Centralized Monitoring and Control Systems for Main Propulsion and Essential Auxiliary Machinery

- 310. 1 has been amended.

Effective Date 1 July 2011

CHAPTER 3 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 5 Automatic Equipment

- 503. 1 and 6 have been amended.

CHAPTER 4 DYNAMIC POSITIONING SYSTEMS

Section 1 General

- 102. (3) and (6) have been amended.

Section 2 Requirements of Dynamic Positioning Systems

- 202. 2 (3) has been amended.
- 202. 3 Table 9.4.1, (4) and (5) have been amended.
- 203. 1 (1) and 2 (3) have been amended.
- 203. 2 (6) has been newly added.
- 203. 3 (2) has been amended.

CHAPTER 5 NAVIGATION BRIDGE SYSTEMS

Section 2 Surveys of Navigation Bridge Systems

- 202. 3 (2) has been amended.

Section 5 Accident Prevention Systems

- 502. 2 has been amended.

CONTENTS

CHAPTER 1 CARGO REFRIGERATING INSTALLATIONS

Section 1 General

101. General

1. Application

(1) The Rules for Cargo Refrigerating Installations apply to the surveys and constructions of cargo refrigerating installations (hereinafter referred to as "refrigerating installations") of ships classed or to be classed with the requirements of **Pt 1, Ch 1** intended to be assigned and registered the class notations in accordance with **Pt 1, Ch 1, Sec 2.**

(2) For the refrigerating machinery within the refrigerating installations specified in above (1), the requirements in the Rules apply to the refrigerating machinery using the primary refrigerants listed below. The surveys and constructions of the refrigerating machinery using primary refrigerants other than those listed below are to be as deemed appropriate by the Society.

$R\ 22$: $CHClF_2$

$R\ 134a$: CH_2FCF_3

$R\ 404A$: $R\ 125/R\ 143a/R\ 134a$ (44/52/4 wt%)
$CHF_2CF_3/CH_3CF_3/CH_2FCF_3$

$R\ 407C$: $R\ 32/R\ 125/R\ 134a$ (23/25/52 wt%)
$CH_2F_2/CHF_2CF_3/CH_2FCF_3$

$R\ 410A$: $R\ 32/R\ 125$ (50/50 wt%)
CH_2F_2/CHF_2CF_3

$R\ 507A$: $R\ 125/R\ 143a$ (50/50 wt%)
CHF_2CF_3/CH_3CF_3

$R\ 717$: NH_3

(3) For refrigerating installations of ships with restricted area of service or those of small capacity, some of the requirements in the Rules may be modified appropriately provided that the Society considered it acceptable.

(4) At the request of the shipowner or his representative, the Surveyor may carry out Loading Port Surveys on registered refrigerating installations at the loading port in accordance with the requirements in **Ch 7.** On completion of the survey to the satisfaction of the Surveyor a Certificate on Loading Port Survey will be issued.

(5) The relevant requirements in the Rules for the Classification of Steel Ships apply to the materials, equipment, installation and workmanship of the systems, unless otherwise specified in the Rules.

2. Special installations

The surveys and constructions of refrigerating installations to which the requirements in this chapter can not be directly applied for a special reason are to be deemed appropriate at the discretion of the Society.

3. Equivalency

Refrigerating installations, which do not comply with requirements of the Rules may be accepted, provided that they are deemed by the Society to be equivalent to those specified in the Rules.

102. Definitions

The definitions of terms which appear in the Rules are to be as specified in the following **Par 1** to **5**, unless otherwise specified elsewhere.

1. **Refrigerating installations** means refrigerating machinery, insulation for refrigerated chambers and other related appliances in refrigerated chambers

2. **Refrigerating machinery** means a set of refrigerating units which compose refrigerating cycle, consisting of compressors, condensers, receivers, evaporators, coolers, piping and fittings, driving motors for the compressors and refrigerant pumps, automatic controllers, and electrical equipments.

3. **Refrigerating units** means in general such machinery as compressors, motors, condensers, evapo-

rators, pumps, etc., necessary to operate refrigerating cycles among the refrigerating machinery.

4. Brine is a general term for the secondary refrigerants which is cooled by the primary refrigerants and which is a thermal medium to cool the cargo.

5. Design pressures means the maximum working pressure. However, design pressures are not to be less than the values specified in **Table 9.1.1.**

Table 9.1.1 The Lowest Design Pressure

Refrigerants	High Pressure Side[1] (MPa)	Low Pressure Side[2] (MPa)
R 22	1.9	1.5
R 134*a*	1.4	1.1
R 404*A*	2.5	2.0
R 407*C*	2.4	1.9
R 410*A*	3.3	2.6
R 507*A*	2.5	2.0
R 717	2.3	1.8

(NOTES)
(1) High Pressure Side : The pressure part from the compressor delivery side to the expansion valve.
(2) Low Pressure Side : The pressure part from the expansion valve to the compressor suction valve. In case where a multistage compression system is adopted, the pressure part from the lower-stage delivery side to the higher-stage suction side is to be included.

Section 2 Surveys

201. General

1. Kinds of surveys

Kinds of surveys are as follows:
(1) Surveys for Classification (hereinafter referred to as "Classification Surveys")
 (A) Classification Surveys during Construction
 (B) Classification Surveys after Construction
(2) Surveys for Classification Maintenance
 (A) Annual Surveys
 (B) Special Surveys
 (C) Occasional Surveys

2. Classification Surveys and intervals of Classification Maintenance Surveys

(1) Classification Surveys
 (A) Classification Surveys during Construction
 For refrigerating installations intended to be constructed and registered with the Society, the construction, materials, scantlings and workmanship of the hull, equipment and machinery are to be undergo the Classification Survey during Construction. The presence of the Surveyor is required at the following stages of the work. However, the requirements may be modified having regard to the actual status of facilities, technical abilities and quality control at the works.
 (a) When the tests of materials in accordance with the requirements in **Pt 2** of the Rules and other tests necessary for the approval or acceptance described in **301. 3** (4), **502. 1** (1) and **502. 5** of the Rules are carried out.

(b) When the tests specified in **Ch 6** are carried out.
(c) When considered necessary by the Surveyor
(B) Classification Surveys after Construction
Refrigerating installations intended to be registered in a way other than that described in above (A) are to undergo the Classification Survey after Construction
(2) Classification Maintenance Surveys
Refrigerating installations which have been registered are to undergo surveys in accordance with the following intervals to maintain their Classification.
(A) Annual Surveys are to be carried out at intervals specified in **Pt 1, Ch 2, 201.**
(B) Special Surveys are to be carried out at intervals specified in **Pt 1, Ch 2, 401.**
(C) Occasional Surveys are to be carried out at a time falling on any of (a) to (c) mentioned below, independently of Special Surveys and Annual Surveys.
(a) When main parts of the installations have been damaged, repaired or renewed.
(b) When the installations are modified or altered.
(c) When a survey is needed for a reason other than the above.
(D) Continuous Surveys
(a) At the request of the Owner, and upon approval of the proposed arrangements by this Society, a system of Continuous Survey may be undertaken for all the items of machinery installations to be surveyed at the Special Survey. When such a system is adopted, all the requirements of the Special Survey are to be surveyed in regular rotation, as far as practicable, with uniform annual share within 5 year period and to be completed.
(b) The survey in such way as specified in above (a) is referred to as a Continuous Survey.

3. Preparation for surveys and others

(1) All such preparations as required for the Survey to be carried out as well as those which may be required by the Surveyor as necessary in accordance with the requirements in the Rules are to be made by the applicant of the survey. The preparations are to include provisions of an easy and safe access, necessary facilities, certificates and records for the execution of the survey, opening up of equipment, removal of obstacle and cleaning. Inspection, measuring and test equipment, which Surveyors rely on to make decisions affecting classification are to be individually identified and calibrated to a standard deemed appropriate by the Society. However, the Surveyor may accept simple measuring equipment(e.g. rulers, measuring tapes, micrometers, etc.) and gauge fitted on machinery(e.g. pressure gauges, temperature gauges, rpm gauges, etc.) without individual identification or confirmation of calibration, provided they are properly maintained and periodically compared with other similar equipment.
(2) The applicant for survey is to arrange a supervisor who is well conversant with the survey items intended for the preparation of the survey to provide the necessary assistance to the Surveyor according to his requests during the survey.
(3) The survey may be suspended where necessary preparations have not been made, any appropriate attendant mentioned in the previous (2) is not present, or the Surveyor considers that the safety for execution of the survey is not ensured.
(4) Where repairs are deemed necessary as a result of the survey, the Surveyor will notify his recommendations to the applicant of survey. Upon this notification, the repair is to be made to the satisfaction of the Surveyor.

202. Classification Surveys

1. Classification Surveys during Construction

(1) In a Classification Survey during construction, the construction, materials, scantlings and workmanship of the refrigerating installations are to be examined in detail in order to ascertain that they meet the full requirements of each chapter concerned of the Rules.
(2) For the refrigerating installations intended to undergo a Classification Survey during construction, the following plans and information in triplicate are to be submitted to the Society before the work is commenced.
(A) Specifications of the refrigerating installations(including particulars of refrigerating units)
(B) General arrangements of the refrigerating units(including detailed ventilating arrangements of the relevant compartment)
(C) Sectional assembly of refrigerant compressors for each type

(D) Detailed plans of pressure vessels subject to the primary refrigerant pressure
(E) Piping arrangements of primary refrigerants, brine and cooling water(materials, diameter and thickness of pipes are to be indicated)
(F) Arrangements of refrigerated chambers(including details of ductings for air circulation and ventilation)
(G) Wiring diagram for the refrigerating installations and arrangements of electric appliances
(H) Wiring diagram for detail construction of penetration of the insulation in refrigerated chambers
(I) Kind of insulation on all surfaces, physical properties, thickness and methods of attachment of the insulation and linings(including detailed construction and insulating methods of hatch covers, access doors, ventilating ducts, scupper and bilges)
(J) Drainage arrangements and defrosting arrangements in refrigerated chambers and spaces in which the air coolers are installed
(K) Arrangements of thermometers or sensors in refrigerated chambers and air coolers, and the name of manufacturer and the type of the sensors
(L) Explanatory documents to show the function of automatic temperature controls

2. Classification Surveys after Construction

(1) General
In an Classification Survey after Construction, the refrigerating installations are to be examined on their construction, materials, workmanship and actual conditions as required for the Special Survey corresponding to their age, in order to ascertain their effectiveness.
(2) Tests
(A) In the Classification Survey after Construction, operation tests and other various tests are to be carried out as required for the Special Survey.
(B) Where deemed necessary by the Surveyor, the tests and examination items may be added or omitted according to their age, service career and actual condition.
(3) Plans and documents for submission
When the refrigerating installations are intended to undergo the Classification Survey after Construction, plans and documents are to be submitted as may be required by the requirements in **202. 1** (2).

203. Classification Maintenance Surveys

1. Annual Surveys

At an Annual Survey, an external examination is to be carried out on the following items. Examination may also be made on the items which are prepared to be examined in detail or which are opened up by the Owners' option. If any defects are observed at such examinations, the Surveyor may require open-up examination of the suspected items.
(1) At examination of the refrigerating installation, log book is to be made to trace the operating condition of the installation during navigation.
(2) Insulation linings of refrigerated chambers and their fastening are to be examined. Any indication of dampness or deterioration of the insulation is to be investigated.
(3) Air circulation ducts, hatch covers and their seal, access doors in refrigerated chambers and their fastening, ventilating system and their closing means are to be examined. Care is to be given to the condition of penetrating parts where ducting or ventilating pipes pass through the deck plating.
(4) Bilge ways, bilge wells, strainers, non-return valves and water sealed traps of scupper pipes, suction and sounding pipes are to be cleaned and examined. The drainage arrangements of refrigerated chambers and the defrosting arrangements of air coolers are also to be examined.
(5) Condition of the cooling coils of air coolers and the cooling grids(including brine) in refrigerated chambers is to be examined.
(6) Shells of condensers, receivers, evaporators, separators, dryers, filters and other pressure vessels and their connections and piping are to be examined externally as far as possible.
(7) Insulation on the surfaces of pressure vessels, pipe connections and piping is to be examined for any indication of dampness or deterioration.

(8) Randomly selected thermometers and apparatus used for measuring the temperature in the suction and delivery side of cooling air in refrigerated chambers and air coolers are to be checked for their accuracy. However, the Surveyor may at the discretion accept the checking records made by some reliable persons.
(9) Condition of compressors, condenser cooling water pumps, primary refrigerant pumps, brine pumps, air circulation fans and their driving motors is to be examined externally.
(10) Water end covers of condenser selected by Surveyor are to be examined externally for their corrosion through inspection holes or other suitable openings.
(11) Tests for insulation resistance are to be made on the motors and controls of compressors, pumps, fans, etc. and their wiring, and the resistance is to be not less than 1 MΩ between insulated circuits and earth. However, when correct records are maintained, the above tests may be omitted at the discretion of the Surveyor.
(12) All automatic controls, safety devices and alarms are to be tested for their satisfactory function.

2. Special Surveys

At a Special Survey, items specified in **203. 1** (1) to (8) are to be examined. In addition, the examinations required by the followings are to be carried out.
(1) Compressors and their lubricating systems are to be opened up and examined. In the case of screwed-type compressors or compressors deemed appropriate by the Society, the interval of opened-up may be modified by the Society, provided their working condition is found satisfactory.
(2) Condenser cooling water pumps, primary refrigerant pumps and brine pumps are to be opened up and examined.
(3) Insulated pipes carrying the refrigerant are to be examined both outside and inside the insulated chambers, removing the insulation to the extent necessary for checking their condition, especially the locations which pipes are connected by butt welding in place.
(4) All pressure relief valves throughout the refrigerating plant are to be adjusted on their relieving pressure.
(5) All automatic controls, safety devices and alarms are to be tested for their satisfactory function.
(6) The insulation in refrigerated chambers is to be carefully examined, and bored where considered necessary in order to determine the integrity and dryness. These test holes are subsequently filled carefully.
(7) Brine pipe system is to be tested to the pressure of 1.5 times the design pressure or 0.4 MPa whichever is the greater.
(8) Pressure vessels are to be opened up for examination, and afterward pressure tested in accordance with the following procedures :
 (A) The coils of gas condensers of the coil-in-casing type are to be examined and tested to the pressure of 1.5 times the high pressure side design pressure. Where it is impracticable to remove the coils, they may be examined through inspection holes.
 (B) The coils of evaporators of the coil-in-casing type are to be examined and tested to the pressure of 1.5 times the low pressure side design pressure. Where it is impracticable to remove the coils, they may be examined through inspection holes.
 (C) The water end covers of the shell-and-tube type condensers and the shell-and-tube type evaporators in which the primary refrigerant is in the shell are to be removed and the tube plates, tube ends and inside the end covers are to be examined. Afterwards, the shells are to be tested to the pressure equal to the high pressure side design pressure.
 (D) The primary refrigerant end covers of the shell-and-tube type evaporators in which the brine is in the shell are to be removed and the tube ends and inside the end covers are to be examined. The shells are to be tested to the pressure of 1.5 times the design pressure or 0.4 MPa whichever is the greater. After refitting the end covers, the primary refrigerant side is to be tested to the pressure equal to the low pressure side design pressure.
 (E) Receivers are to be hydrostatically tested to the design pressure. However, when the receivers are designed to use such primary refrigerant as *R* 22, *R* 134*a*, *R* 404*A*, *R* 407*C*, *R* 410*A* or *R* 507*A*, or when they are proved to have no harmful defects such as erosions or cracks on the inner surface of the vessels by means of ultrasonic test or other effective non-destructive examinations, the above mentioned pressure test may be omitted.

(F) For pressure vessels for the refrigerant of *R* 22, *R* 134*a*, *R* 404*A*, *R* 407*C*, *R* 410*A* or *R* 507*A*, pressure tests specified in through above may be omitted at the first Special Survey provided that the vessels are found to be in good order.

(9) Current condition of the electrical equipment and electric cables are to be examined. It is to be ascertained that their insulation resistance is not less than 1 MΩ between all insulated circuits and earth. When correct records are maintained, the above examination may be omitted at the discretion of the Surveyor.

(10) Operation tests of the refrigerating installation are to be carried out.

3. Occasional Surveys

At an Occasional Survey, examinations or tests on items required are to be carried out in accordance with the requirements in **201. 2** (2) (C) to the satisfaction of the Surveyor.

Section 3 Refrigerating Machinery

301. General

1. General requirements

(1) Refrigerating machinery are to be designed taking into account their purpose and service conditions, etc.

(2) All components of the refrigerating machinery are to be so constructed and arranged that they can be easily maintained and readily opened up for repair or renewal.

(3) Where *R* 717 is used as refrigerant, the refrigerating machinery are to comply with the requirements in this section and in addition, they are to comply with the requirements in **Sec 4**.

(4) Primary refrigerant pipes for *R* 22, *R* 134*a*, *R* 404*A*, *R* 407*C*, *R* 410*A* or *R* 507*A* are to be classified into Class III specified in **Pt 5, Ch 6, 101. 4.**

(5) Pressure vessels for the refrigerant of *R* 22, *R* 134*a*, *R* 404*A*, *R* 407*C*, *R* 410*A* or *R* 507A are to be classified in accordance with the requirements in **Pt 5, Ch 5, 302.** according to the design pressure specified in **102. 5**.

(6) Refrigerating machinery are to be provided with the following equipment.
(A) Standard thermometer : 2 sets
(B) Hydrometer : 1 set (in the case of brine-cooling)
(C) Refrigerant leakage detector : 1 set

2. Capacity and number of refrigerating machinery

(1) At least two refrigerating units are to be provided and so arranged as to be readily interchanged with each other.

(2) The refrigerating capacity of the installation is to be sufficient to maintain the temperatures of the refrigerated chambers even though any one unit suspended.

3. Materials and welding

(1) Materials used for the refrigerating machinery are to be suitable for refrigerant, the design pressure, the minimum working temperature, etc.

(2) Materials used for the primary refrigerant pipes, valves and their fittings are to comply with the requirements in **301. 1** (4) and **402. 1** (1), according to the classes of pipes specified in **Pt 5, Ch 6, 102.**

(3) Materials used for the pressure vessels exposed to the refrigerant pressure (condensers, receivers and other pressure vessels)are to comply with the requirements in **301. 1** (5) and **402. 1** (1), according to the classes of pressure vessels specified in **Pt 5, Ch 5, 303.**

(4) Materials listed below are not to be used:
(A) For parts exposed to fluorine-substituted hydrocarbons:
aluminium alloys containing more than 2% of magnesium
(B) For parts always exposed to water:
aluminium of which purity is less than 99.7% (except corrosion protection treated materials)

(5) The use of cast-iron valves is to be in accordance with the requirements in **Table 9.1.2**. Even when the use of cast-iron valves is allowed in **Table 9.1.2**, such valves are not to be used where the design temperature is lower than 0℃ or higher than 220℃. In this case, such valves may be used at temperatures down to -50℃ even if the design temperature is lower than 0℃, provided that they are used under a pressure up to 1/2.5 of the design pressure.
(6) Refrigerating machinery using specific materials such as rubber hoses, plastic tubes, vinyl pipes or aluminium alloys, etc. is to be approved or accepted by the Society, considering the refrigerant used or service conditions.

Table 9.1.2 Service limitation of valves made of iron casting

Kind of valves	Materials	Application
Stop valves	*GC 100*, *GC 150* and *GC 200* in *KS D 4301* or equivalent thereto	Not to be used
	GC 250, *GC 300* and *GC 350* in *KS D 4301*, *KS D 4302* or equivalent thereto	1) May be used for design pressure not exceeding 1.6 MPa
Relief valves	*KS D 4301*, *KS D 4302* or equivalent thereto	Not to be used
Automatic control valves	*GC 100*, *GC 150* and *GC 200* in *KS D 4301* or equivalent thereto	Not to be used
	GC 250, *GC 300* and *GC 350* in *KS D 4301* or equivalent thereto	1) May be used for design pressure not exceeding 1.6 MPa 2) May be used for design pressure exceeding 1.6 MPa but not exceeding 2.6 MPa, provided nominal diameter does not exceed 100 mm and design temperature is 150℃ or below.
	KS D 4302 or equivalent thereto	Not to be used for design pressure exceeding 3.2 MPa

302. Construction, etc. of refrigerating machinery

1. Refrigerant compressors

(1) Compressor components subject to the refrigerant pressure(including crankcases in the case of reciprocating compressors) are to be so designed to withstand the design pressure for HP side. However, when a relief valve is fitted to the crankcase integral with compressor cylinder, the components mentioned above may be designed for the design pressure for the relief valve.
(2) Where the compressor is lubricated by pressure oil, the compressor is to be stopped automatically when the oil pressure falls below a preset value.
(3) The compressor is to be provided with an alarm or automatic cut off device which operates where condenser cooling water pressure falls below a predetermined value.

2. Driving machines and gearing

Prime movers and step-up gearing for compressors are to be in accordance with the relevant requirements in **Pt 5**.

3. Pressure vessels exposed to the refrigerant pressure

Design, construction and strength of pressure vessels exposed to the refrigerant pressure(condensers, receivers, and other pressure vessels) are to be in accordance with the requirements in **304.** to **316.** of **Pt 5, Ch 5, Sec 3**.

4. Oil separators

Suitable oil separators with drainage are to be provided to the discharge side of the compressor, except when a unit integrated with evaporator is provided to ensure oil recovery.

5. Filters

Suitable filters are to be provided in the refrigerant gas lines to the compressors and in the liquid lines to the automatic regulators. Filters may be omitted provided oil separators fitted have filtrating capability.

6. Refrigerating dryers

Dryers are to be provided to the refrigerant pipes for R 22, R 134a, R 404A, R 407C, R 410A or R 507A. Driers are to be so arranged that they can be by-passed or changed over to a stand-by unit without interrupting the operation of the plant in case of failure. However, such arrangement is not required when the change over to the stand-by unit is ensured by a unit integrated with the evaporator.

7. Refrigerant pumps

Where the primary and/or secondary refrigerants are circulated round the system by pumps, a stand-by pump so arranged as to be easily interchangeable with pumps for normal operation is to be provided. Its capacity is not to be less than that of the largest pump for normal operation.

8. Condenser cooling water pumps

(1) At least two separate condenser cooling water pumps are to be provided and so arranged as to be interchangeable with each other. In this case, one of the pumps may be used for other purposes, provided that it is of adequate capacity and its use on other services does not interfere with the supply of cooling water to the condenser.
(2) Condenser cooling water is to be taken from at least two sea connections(suctions). One of the sea connections is to be provided on the port side and the other on the starboard side.

9. Piping systems

Design, construction, strength, fabrication and outfitting of piping systems are to be in accordance with the requirements in **Pt 5, Ch 6, 102.** to **107.**

10. Safety devices against excessive pressure

(1) A high pressure cut out switch and a relief valve are to be fitted between each compressor (except turbo compressors) and its delivery stop valve. The gas discharged from the relief valve is to be led to the open air or the low pressure side of the refrigerant system.
(2) The refrigerant side of the condenser, the receiver and parts containing liquid refrigerant, which may be isolated and exposed to a pressure exceeding their design pressure, are to be provided with relief valves or other suitable pressure relieving devices.
(3) Pressure vessels used for low pressure side containing liquid refrigerants(including brine coolers and closed type brine tanks) and isolated by stop valves are to be provided with pressure relief valves or other suitable pressure relieving devices.
(4) All pumps and piping systems which may be exposed to a pressure exceeding their design pressure are to be provided with relief valves or other suitable pressure relieving devices.
(5) Where gas discharged from the relief valve on the high pressure side of the primary refrigerant is led to the low pressure side, the arrangement is to be made so that the operation of the relief valve is not affected by back pressure accumulation.
(6) Where gas discharged from relief valves or other pressure relieving devices are led to the open air, the openings are to be located at safe places above the weather deck.
(7) Pressure relieving devices are to be capable of preventing the pressure accumulation exceeding 1.1 times the design pressure of the parts to which the devices are fitted.

11. Automatic control

Automatic control is to be in accordance with the requirements in **Pt 6, Ch 2, 102.**

12. Electrical equipment

(1) The electric power supply to the refrigerating installation is to be fed by at least two sets of generating units.
(2) The capacity of the generating units mentioned above (1) is to be such that in the event of any one generating unit being stopped the remaining generating units are capable of maintaining the temperature of the refrigerated chambers.
(3) The construction of electrical equipment arranged in the refrigerating installation is to comply with the requirements in **Pt 6, Ch 1.**

303. Cooling appliances in refrigerated chambers

1. Cooling grids

Brine cooling grids or direct expansion cooling grids in each refrigerated chamber are to be divided in at least two sections so arranged that each section can be shut off, where necessary.

2. Air cooler

Cooling coils of each air cooler are to be arranged in not less than two sections, each of which can be shut off where necessary. Alternatively, at least two independent air coolers are to be provided.

3. Refrigerated air circulating fans

Where circulation of air is dependent on a single fan and motor, access arrangements are to be such that the fan and motor can be readily removed for repair or renewal even when the chamber is loaded with refrigerated cargo. Where the chamber temperature can be maintained in an allowable range even if one unit is out of use, the above requirement is not applied.

4. Automatic temperature regulating devices

Where automatic regulating devices for controlling the temperatures in the refrigerated chambers are provided, a manually operated regulating valve or system is to be provided as stand-by service. Alternatively, two sets of automatic regulating systems so arranged that each system can be readily operated by changing over may be provided.

5. Temperature difference

The temperature difference between the refrigerated chamber and the refrigerant is to be controlled so that the dehydration of cargo and frosting of the cooling appliances in each chamber can be minimized.

6. Galvanizing of brine tanks and pipes

Internal surfaces(brine side) of brine tanks and pipes exposed to brine are not to be galvanized. However, this requirement is not applied where brine tanks are closed type and they are provided with a ventilating pipe or pipes led to the open air in a location where no damage will arise from the gas discharged and their open ends are fitted with non corrosive metalic wire gauze diaphragms, or where the tanks are open type and the compartments in which they are situated are efficiently ventilated.

7. Corrosion protection of refrigerant pipes in refrigerated chambers

External surfaces of primary refrigerant or brine pipes of steel within refrigerated chambers or embedded in insulation thereof are to be suitably protected from corrosion by galvanizing, coating of any corrosion protective paint or other methods. Where pipes are connected by screwed couplings or by welding, ungalvanized or uncoated portions of the pipes are to be coated with an efficient corrosion resisting material after pressure testing.

304. Other arrangements in refrigerated chambers

1. Defrosting arrangements

Where refrigerated chambers are operated below 0℃, means for effectively defrosting air cooler coils in refrigerated chambers are to be provided.

2. Ventilating arrangements in refrigerated chambers

Where chambers are intended for the carriage of refrigerated cargoes requiring controlled ventilation, air refreshing arrangements are to be provided. In this case, each chamber is to be provided with its own separate inlet and exhaust vent, and each vent is to be provided with an airtight closing appliance. The positions of the air inlet and exhaust vent are to be selected to minimize the possibility of contaminated air entering into the chambers.

3. Heating arrangements for fruit cargoes

Where it is intended to carry fruit cargoes which may be adversely affected by low temperatures into areas where the ambient temperature may become below the carrying temperature, arrangements for heating the chambers are to be provided.

305. Refrigerating machinery compartments

Refrigerating machinery compartments are to be provided with efficient arrangements of drainage and ventilation, and separated by gastight bulkheads from the adjacent refrigerated chambers.

Section 4 Special Requirements for Refrigerating Machinery Using Ammonia as Refrigerant

401. General

1. General requirements

Refrigerating machinery using ammonia as refrigerant is to be of an indirect refrigerating system using brine, and to use *R* 717 refrigerant as the primary refrigerant only.

2. Definition

The definitions of terms which appear in this chapter are to be as specified in the following (1) to (4), unless otherwise specified specially in other chapter.
(1) **Gas** means ammonia gas used as the refrigerant.
(2) **Gas purging** means the discharge of non-condensing gases from the condenser.
(3) **Storage container** means a vessel used for storing gas for replenishment.
(4) **Gas expulsion system** means the system for excluding gas quickly from a compartment, and consists of ventilation system, gas absorption system, water screening system, gas absorption water tanks, etc.

3. Drawings and data

Drawings and data to be submitted in addition to those specified in other chapters, are generally as follows:
(1) Gas Detector Arrangement
(2) General Arrangement of Refrigerating Machinery Compartment

402. Design

1. General requirements

(1) Pressure vessels used in the refrigerating machinery are to be in accordance with the requirements of Class I specified in **Pt 5, Ch 5**, and the primary refrigerant pipes(hereinafter referred to as "refrigerant pipes".) are to be classified into Class I piping specified in **Pt 5, Ch 6**.
(2) Refrigerating machinery is to be provided with auxiliary receivers of adequate capacity so that repairs and maintenance may be carried out without discharging the gas to the atmosphere. However, the auxiliary receivers can be dispensed with, if at least the refrigerant in the receiver with the largest capacity can be stored in some other receiver.

2. Materials

(1) Materials capable of highly corrosion(copper, zinc, cadmium, or their alloys) and materials containing mercury are to be not used at locations where ammonia comes in contact.
(2) Nickel steel is not to be used in pressure vessels and piping systems.
(3) Cast-iron valves are not to be used in the refrigerant piping system.
(4) Material for sea-water cooled condensers is to be selected considering the corrosion due to sea water.

403. Refrigerating machinery

1. Refrigerant compressors

Refrigerant compressors are to be provided with means for automatically stopping the compressor when the pressure on the high pressure side of the refrigerant piping system becomes excessively high. Also, an alarm system which generates visible and audible alarms when this means are in operation is to be installed in the refrigerating machinery compartment and monitoring position.

2. Piping joints

Piping joints for the refrigerant piping system are to be butt welded as far as practicable.

3. Pressure relieving devices

The refrigerant gas discharged from a pressure relief valve is to be absorbed in water, except when leading the gas to the low pressure side.

4. Liquid level gauge

If liquid level gauges made of glass are used at locations where pressure exists permanently, they are to comply with the requirements given below.

(1) Flat type glass is to be used in the liquid level gauge, and the construction is to be such that the gauge is adequately protected against external impacts.

(2) The construction of the stop valve for the liquid level gauge is to be such that the flow of liquid is automatically cut off if the glass breaks.

5. Gas purging

Gas discharged from the purging valve is to be not discharged directly to the atmosphere, but absorbed in water.

6. Condenser

Independent piping for discharge of cooling sea water for the condenser is to be used. The piping is to be led directly overboard without passing through accommodation spaces.

404. Refrigerating machinery compartment

1. Construction and arrangement

(1) The compartment where the refrigerating machinery and storage vessels are installed(hereinafter referred to as "refrigerating machinery compartment".) is to be a special compartment isolated by gastight bulkheads and decks from all other compartments so that leaked ammonia does not enter other compartments. The refrigerating machinery compartment is to be provided with access doors which comply with the following requirements:

(A) At least two access doors are to be provided in the refrigerating machinery compartment as far apart as possible from each other. At least one access door is to lead directly to the weather deck. However, if it is not possible to provide access door directly to the weather deck, then at least one access is to have airlock type doors.

(B) Access doors not leading to weather deck are to be of high tightly and self-closing type.

(C) Access doors are to be capable of being operated easily and are to open outward.

(2) The refrigerating machinery compartment is to be not adjacent to accommodation spaces, hospital room or control room.

(3) Passages leading to the refrigerating machinery compartment are to comply with the following requirements:

(A) If a passage is adjacent to accommodation spaces, hospital room or control room, it is to be isolated by gastight bulkheads and decks.

(B) The passage is to be isolated from passages to accommodation spaces, and led directly to the weather deck.

(4) Penetrations on gastight bulkheads and decks where cables and piping from the refrigerating machinery compartment pass through, are to be of gastight construction.

(5) Drain pans of adequate size are to be provided at a position which is lower than the refrigerating machinery and storage vessels in the refrigerating machinery compartment so that liquid ammonia does not leak outside the compartment.

(6) An independent drainage system is to be provided in the refrigerating machinery compartment so that the drainage of this compartment is not discharged into open bilge wells or bilge ways of other compartments.

405. Gas expulsion system

1. General

A gas expulsion system consisting of ventilation system, gas absorption system, water screening system, and gas absorption water tanks is to be installed in the refrigerating machinery compartment so that the gas leaked out accidentally can be expelled quickly from the refrigerating machinery compartment.

2. Ventilation system

(1) A mechanical ventilation system, which complies with the following requirements as a rule, is to be installed in the refrigerating machinery compartment so that this space can be ventilated all the time.

(A) The ventilation system is to have adequate capacity to ensure at least 30 air changes per hour in the refrigerating machinery compartment.

(B) The ventilation system is to be independent of other ventilation systems on board the ship, and is to be capable of being operated from outside the refrigerating machinery compartment.

(C) Exhaust outlets are to be installed at a horizontal distance of more than 10 m from the nearest air intake opening, openings of accommodation spaces, service spaces and control stations, and at a vertical distance of more than 4 m from the weather decks.

(D) The air intake opening is to be provided at a low position and the exhaust opening is to be provided at a high position in the refrigerating machinery compartment so that the gas does not accumulate in the compartment and the exhaust ducts.

(E) Exhaust fans and the exhaust ducts in which the fans are installed, are to be of a construction such that sparks are not generated according to any of the (a) to (c) mentioned below.

(a) Either the impeller or the casing, or both, are made of non-electrostatic, non-metallic materials.

(b) Non-ferrous metallic material is used in the impeller and the casing.

(c) In case where ferrous material is used in the impeller and the casing, the tip clearance is greater than 13 mm. However, use of a combination of aluminium or magnesium alloy with ferrous materials has possibilities of generating sparks regardless of the tip clearance, therefore, such materials are not to be used in the refrigerating machinery compartment. As a rule, motors for driving the fans are to be of the exterior mount type.

(2) Independent ventilation systems are to be installed in passages leading to the refrigerating machinery compartment. However, if the ventilation system specified in above (1) is provided with ducts so that it can be used for exhausting air in the passages, then an independent ventilation system need not be installed.

3. Gas absorption system

A gas absorption system satisfying any of the requirements given below, capable of excluding leaked gases quickly from the refrigerating machinery compartment, and capable of being operated from outside the compartment, is to be installed.

(1) Scrubber

(A) The scrubber is to be designed with an adequate processing capacity which restricts the gas concentration at the exhaust fan to well below 25 ppm, and absorbs ammonia in the largest receiver within 30 minutes.

(B) The pump for the scrubber is to start automatically when the gas concentration in the refrigerating machinery compartment exceeds 300 ppm.

(2) Water sprinkler system

(A) The quantity of sprinkled water is to be such that the leaked gas can be satisfactorily absorbed.

(B) Nozzles are to be of type approved by the Society. As a rule, nozzles are to be positioned so that their range covers all the refrigerating machinery in the compartment.

(C) When the gas concentration in the refrigerating machinery compartment exceeds 300 ppm, the pump for sprinkling water is to start automatically.

4. Water screening system

All doors of the refrigerating machinery compartment are to be provided with water screening system which can be operated from outside the compartment.

5. Gas absorption water tanks

Gas absorption water tanks complying with the requirements given below, are to be installed at a position lower than the refrigerating machinery compartment so that the leaked liquid ammonia can be recovered quickly.

(1) The tank is to have such a capacity that the water which can absorb the refrigerant filled in at least one refrigerating machinery can be fully recovered.
(2) An automatic water supply system is to be installed in the tank so that the fully-filled condition of the tank is always maintained.
(3) Overflow from the tank is to be diluted or neutralized and then discharged overboard directly, without leading the discharge pipes through accommodation spaces.
(4) Means are to be provided in the tank to recover the drain of the liquid ammonia generated in the refrigerating machinery compartment. An appropriate drain trap is to be provided to prevent reverse flow of the gas from the tank.
(5) All the vent pipe of the tank is to be connected to the exhaust pipe of the ventilation system of **405. 2.**

406. Gas detection and alarm system

1. Installation requirements

(1) Gas detection and alarm systems are to be provided in the refrigerating machinery compartment complying with the following requirements:
  (A) At least one gas detector complying with the requirements given below, is to be installed above each refrigerating machinery.
    (a) The detectors are to activate an alarm when the gas concentration exceeds 25 ppm.
    (b) When the gas concentration exceeds 300 ppm, the detector is to automatically stop the refrigerating machinery, automatically activate the gas expulsion, and activate the alarm.
  (B) An adequate number of flammable gas detectors are to be provided so that when the gas concentration reaches up to 4.5%, the power supply to the electrical equipment in the refrigerating machinery compartment is cut off and the alarm systems are activated.
  (C) The alarm systems are to generate visible and audible alarms near the doors, within and outside the refrigerating machinery compartment and at monitoring locations.
  (D) A manually-operated transmitter for leakage warnings is to be provided, near the doors and outside the refrigerating machinery compartment.
(2) Gas detection and alarm system complying with the following requirements are to be provided in passages leading to the refrigerating machinery compartment:
  (A) The gas detectors are to activate the alarm system when the gas concentration exceeds 25 ppm
  (B) The alarm systems are to generate visible and audible alarms in the passage and near the doors of the refrigerating machinery compartment.
(3) Detectors are to be capable of continuous detection and considered to be appropriate by the Society.

407. Electrical equipment

1. General

(1) Electrical equipment in the refrigerating machinery compartment required to be operated in the event of leakage accidents, gas detection and alarm system, and emergency lights are to be of certified safety types for use in the flammable atmosphere concerned.
(2) Electrical equipment in the refrigerating machinery compartment other than mentioned in above (1), are required to switch off automatically, by means of circuit breakers installed outside the refrigerating machinery compartment when the flammable gas detector specified in **406. 1** (1) (B) activates.
(3) If a water sprinkler system is installed in the refrigerating machinery compartment as the gas absorption system, all electrical machinery and equipment in the refrigerating machinery compartment are to be of the waterproof type.

408. Safety and protective equipment

1. General

As a rule, safety and protective equipment as given below are to be provided, and are to be stored at locations outside the refrigerating machinery compartment so that they can be easily retrieved in the event of leakage of the refrigerant. Storage locations are to be marked with signs so that they can be identified easily.

(1) Protective clothing(helmet, safety boots, gloves, etc.) × 2
(2) Self-contained breathing apparatus(capable of functioning for at least 30 minutes) × 2
(3) Protective goggles × 2
(4) Eye washer × 1
(5) Boric acid
(6) Emergency electric torch × 2
(7) Electric insulation resistance meter × 1

Section 5 Refrigerated Chambers

501. Construction of refrigerated chambers

1. Materials used for refrigerated chambers

Decks, floors and boundary bulkheads of refrigerated chambers are to be constructed of materials confirmed to be airtight. However, divisional bulkheads between refrigerated chambers, where the chambers concerned are intended for cargo which will not taint or adversely affect the cargo in any other chamber, may be constructed of appropriate materials subject to the approval of the Society.

2. Airtightness of closing appliances

Closing appliances such as hatch covers, access doors, bilge and manhole covers forming part of the insulated envelope of independently refrigerated chambers, are to be made airtight. Where hatch covers or plugs are exposed to the ambient conditions, they are to be provided with a double seal.

3. Welding and materials of steelworks in refrigerated chambers

Special attention is to be paid to welding and materials of members which are directly welded to the main structural hull members, and structural discontinuities and/or defects in welded joint are to be avoided.

4. Coamings of manholes, etc.

Tank top insulation in way of manholes and bilge hats is to be provided with a liquidtight coaming with a suitable height to prevent seepage into the insulation.

5. Penetration of ventilation ducts and pipes through decks, bulkheads, etc.

(1) Ventilation ducts are not to pass through the collision bulkheads below the freeboard deck. Ducts passing through the other watertight bulkheads are to be provided with an efficient closing appliance which can be operated from a position above the freeboard deck accessible at all times. In the operating position, an indicator is to be provided to show whether the duct is opened or closed.
(2) Refrigerating pipes passing through bulkheads or decks of refrigerated chambers are not to be in direct contact with the steelwork. Airtightness of the bulkheads or decks is to be maintained. Where these pipes pass through deck plating or watertight bulkheads, the fittings and packing of the glands are to be both fireresisting and watertight.
(3) Ventilators, air ducts or pipes passing through refrigerated chambers to other compartments are to be made airtight in way of penetrating parts of insulation, and they are to be effectively insulated in the refrigerated chamber.
(4) Air pipes, sounding pipes, bilge suction pipes and other pipes led from the outside of refrigerated chambers and passing through refrigerated chambers are to be effectively insulated and special consideration is to be given to the arrangement of these pipe lines to prevent freezing of liquid in these pipes.

6. Insulating linings, etc.

Insulation linings, bilge limbers and their covers, hatch covers and access doors to refrigerated chambers are to be constructed of water-vapour-resisting material or covered with such material.

7. Cargo battens

Cargo battens are to be fitted and so arranged on all vertical walls of refrigerated chambers as to provide sufficient space for air circulation and prevent the cargo from coming to contact with the insulation or cooling grids. However, where the form of insulation lining, storage method of cargo, etc. are adequate, and need not provided battens, they may not be required.

8. Gratings

Gratings of suitable form and strength are to be provided on floors of refrigerated chambers so as to provide sufficient space between floors and cargo for free air circulation and prevent the floor insulation from mechanical damage by cargo handling. However, where the floor insulation lining meets the above requirements or cargoes to be loaded are supported on suitable pallets, gratings are not required.

502. Insulation and insulation materials

1. Insulation materials

(1) Insulation materials approved or accepted by the Society are to be used.
(2) If slab formed insulant is used, it is to have suitable strength. Where a binder is used to join slabs each other, it is to be odourless and not to absorb any of the odours from the cargo.

2. Protective coatings

(1) Steelworks to be insulated are to be thoroughly cleaned and coated with an anti-corrosive composition before they are insulated.
(2) All steel bolts, nuts and other fixtures which support or secure insulation materials, joints, coverings, etc. are to be galvanized or protected against corrosion with suitable means.

3. Insulation

(1) The thickness of insulation over all surfaces and the manner in which it is supported are to be in accordance with the approved specification and plans. The insulation is to be strongly fixed so as not to be loose. Where the insulation is of slab form, the joints are to be butted closely together and staggered so as not to be made a gap between the slab forms. Unavoidable crevices between insulations or insulation and structural member are to be filled with suitable insulating material.
(2) Structural members which extend into refrigerated chambers are to be effectively insulated over a sufficient length in the refrigerated chambers to prevent heat penetration into the chambers and supercooling of each member at the place of penetration.

4. Removal of insulation

(1) The insulation of such places that easy access to bilge hats, bilge ways and tank manhole lids is required is to be of plug type and removable.
(2) The insulation in way of bilge suction pipes, air and sounding pipes and other pipe lines is to be removable to the extent necessary for access for inspection.

5. Insulation of oil tank plating

Where the tank top and bulkhead of the oil storage tank form part of the refrigerated chamber walls, air space of sufficient width is to be provided between the tank plating and the insulation, or the surface of the tank plating is to be coated with an oil-proof and oil-tight composition of sufficient thickness approved by the Society, before the insulation is fitted. Where air space is provided between the tank plating and the insulation, free drainage of oil seepage to the gutter way and bilges is to be ensured. Furthermore, such air spaces are to be provided with ventilating pipes led to the open air, and corrosion resisting metalic wire gauze diaphragms are to be fitted at the outlet.

503. Temperature measuring arrangements

1. Number of thermometers and sensors

(1) Two sets of thermometers are to be provided in each refrigerated chamber. At least two sensors are to be connected to each set of thermometer for each chamber.
(2) Unless otherwise required, at least the following number of sensors are to be provided in each chamber, depending upon the volume of the chamber.
(A) Volume up to 300 m^3 : 4
(B) Volume up to 600 m^3 : 5
(C) Volume above 600 m^3 : 5 plus one for above 400 m^3 or fraction thereof.
(3) In addition to those specified in above (2), one sensor is to be fitted in each main stream of air in the suction and delivery sides of each air cooler.

2. Electric thermometers

(1) Electric power supply to each instrument in refrigerated chambers is to be fed by a separate final sub-circuit.
(2) Sensors connected to thermometers in refrigerated chambers are to be properly protected from mechanical damage.

504. Drainage arrangements

1. General

(1) Drainage arrangements are to be in accordance with the relevant requirements in **Pt 5, Ch 6, Sec 4** in addition to the requirements in this chapter.
(2) All refrigerated chambers and air coolers are to have ample continuous drainage.

2. Non-return valves and sealed traps in scupper pipes

(1) Scupper pipes led from refrigerated chambers and air cooler trays are to be provided with non-return valves and liquid sealed traps. However, the pipes led from between deck chambers and air cooler trays may be not provided with non-return valves.
(2) Where scupper pipes from refrigerated chambers and air cooler trays are connected to a common header, each branch pipe is to be provided with a liquid sealed trap, and those from lower hold spaces are to be fitted, in addition, with non-return valves.
(3) Where the chamber temperature contemplated is 0℃ or below, scupper pipes together with non-return valves and liquid sealed traps specified in above (1) and (2) are, if necessary, to be well insulated.
(4) Liquid sealed traps are to have an adequate depth and arranged so as to be accessible for cleaning and refilling with liquid.

Section 6 Tests

601. Tests at the manufacturers works

1. Pressure tests and leak Tests

(1) Machinery components, pressure vessels and pressure piping exposed to a primary refrigerant pressure are to be subjected to hydrostatic tests to the pressure of 1.5 times the design pressure. After hydrostatic tests, they are to be leak tested to a pressure equal to the design pressure.
(2) Machinery components, pressure vessels and pressure piping intended for use with brine are to be subjected to hydrostatic tests to a pressure of 1.5 times the design pressure or 0.4 MPa whichever is the greater.
(3) In general, pressure tests are to be carried out with water or oil and leak tests are to be carried out with air or suitable inert gases or any inert gas with a small amount of the refrigerant added to it.

2. Performance tests

(1) Compressors, fans, primary refrigerant or brine pumps and their prime movers are to be tested for their performance.
(2) Welded parts in pressure vessels and piping are to be tested in accordance with the relevant requirements in **Pt 5, Ch 5, Sec 4** and **Pt 5, Ch 6, Sec 13.**
(3) Electrical equipment is to be tested in accordance with the requirements in **Pt 6, Ch 1.**

602. Shop tests

1. Leak tests

(1) The primary refrigerant system is to be leak tested after the piping arrangement is completed on board the ship, generally with inert gases or inert gases with a small amount of refrigerant added, to a pressure of 90% of the respective design pressures.
(2) The brine system is to be leak tested after the piping arrangement is completed on board the ship to a pressure of 1.5 times the maximum working pressure of the brine pump or 0.4 MPa whichever is the greater.

2. Calibration of thermometers

Thermometers are to be checked for accuracy at the freezing point of water, after they are set up on board the ship, and their accuracy is to comply with the required specification. The records of checking are to be submitted to the Surveyor.

3. Air circulation tests

Where air circulating fans are provided in refrigerated chambers, it is to be ascertained that the velocity of circulating air and the state of air circulation are satisfactory.

4. Functional tests

Automatic control devices, safety devices and alarms are to be ascertained that they operate satisfactorily.

5. Tests after installation

All components of the refrigerating machinery are to be operated under full load condition as far as possible, and changing over to stand-by units is smooth.

6. Defrosting tests

The defrosting arrangement for air coolers are to be tested for satisfactory operation.

Section 7 Loading Port Surveys

701. General

1. General

(1) At the request of the shipowner or his representative, the Surveyor may carry out Loading Port Surveys on a registered refrigerating installation at a loading port in accordance with the requirements in **701. 2**. On completion of the survey to the satisfaction of the Surveyor, Certificate on Loading Port Survey will be issued.
(2) A Loading Port Survey may be carried out concurrently with other surveys of the refrigerating installations such as Annual Surveys.
(3) If there is no Surveyor available at the loading port, the Society may accept the report of a survey held at the loading port by a reliable competent person as considered appropriate by the Society, provided that all requirements of Loading Port Surveys are fulfilled.

2. Items to be Examined

At the Loading Port Survey, the following items are to be confirmed or examined.
(1) The refrigerating installation is to be examined under working condition to confirm that it operates in good order, and the temperatures at that time in the refrigerated chambers are to be noted.
(2) The Surveyor is to ascertain that there is ample generating capacity available for the ships essential services and maximum required power to the refrigerating installation, even when one generator is out of use. Where the electric power source is also used as the ships main power supply, it is to be ascertained that the chamber temperature can be maintained at the specified value with the remaining generators used.
(3) The refrigerated chambers are to be examined in an empty state to ascertain that:
(A) They are clean and free from odour which may adversely affect the cargo to be loaded.
(B) Brine or refrigerant pipe grids, coils of air coolers and connections are free from leakage.
(C) Cargo battens, where fitted to the vertical walls, are in good order.
(D) Cargo gratings or dunnages are available as necessary for the floors or decks.
(E) There is no damage sustained to the insulation or its linings in the refrigerated cargo holds.
(F) All scuppers and bilge suctions for draining the refrigerated cargo holds are in good working order, and water sealed traps are provided. ⚓

CHAPTER 2 CARGO HANDLING APPLIANCES

Section 1 General

101. General

1. Application

(1) The Rules apply to the cargo handling appliances which are installed on the ships classed with the Society, and which are intended to be registered under the Society.
(2) The relevant requirements in the Rules apply to the materials, equipment, installation and workmanship of the cargo handling appliances, unless otherwise specified in the Rules.

2. Equivalency

(1) Cargo gear, cargo ramps and loose gear which do not comply with the requirements of the Rules may be accepted, provided that they are considered by the Society to have the effectiveness equivalent to those complying with the Rules.
(2) Any existing cargo gear, cargo ramps and loose gear designed and manufactured not under the requirements of the Rules may be deemed by the Society to comply with the Rules, provided that they comply with any rules or standards recognized by the Society to be appropriate and have passed the tests and inspection required by the Society.

3. Precautions in Application

(1) As for the cargo gear, cargo ramps and loose gear, precautions are to be taken to any manners of their treatment different from the requirements of the Rules in the flag state of the ship or state of call.
(2) The Society may carry out inspection and issue necessary certificates for the cargo handling appliances according to the designated rules in the capacity of the government of the state concerned or other organization under the authorization by such state or organization.

102. Definitions

For the purpose of the Rules, the terms are defined as following below unless otherwise defined

1. Cargo handling appliances are lifting appliances and loose gear.

2. Lifting appliances are cargo gears and cargo ramps include their installations of driving systems and cargo fittings.

3. Cargo gears are derrick systems, cranes, cargo lifts and other machinery used for the loading and unloading of cargo and other articles except cargo ramps, and include their installations of driving systems and cargo fittings.

4. Structural members are those of cargo handling appliances carrying the safe working load, including cargo fittings and cargo blocks permanently incorporated in the cargo gear and the cargo ramps.

5. Cargo fittings are goose neck brackets, topping brackets, fittings at the derrick boom head, derrick heel lugs, guy cleats, eye fittings, etc. which are permanently fitted to the structural members or the hull structure for the purpose of cargo handling.

6. Loose gears are blocks, ropes, chains, rings, hooks, shackles, swivels, clamps, grabs, lifting magnets, spreaders, etc. which are removable parts used for transmitting the loads of cargo to the structural members.

7. Safe working load is the maximum allowable mass of cargoes specified by the Rules with which the cargo gear and the cargo ramp can be safely operated. It is abbreviated to "*SWL*" and expressed in tons (t).

8. Allowable minimum angle is the angle to horizontal of a derrick boom at which the derrick system is permitted to operate under the safe working load, and expressed in degrees (°).

9. Maximum slewing radius is the radius at which a jib crane is permitted to operate under the safe working load, and expressed in meters (m).

10. Safe working load, etc. are safe working load, allowable minimum angle and other restrictive conditions in case of the derrick systems, safe working load, maximum slewing radius and other restrictive conditions in case of the jib cranes, safe working load and other restrictive conditions deemed necessary by the Society in case of other machinery used for the loading and unloading of cargo, and safe working load and other restrictive conditions deemed necessary by the Society in case of the cargo ramps.

11. Safe working load of a loose gear is the maximum allowable mass of cargoes specified by the Rules with which the loose gear can be used safely. It is abbreviated to "*SWL*" and expressed in tons (t). For cargo blocks, the safe working load is defined according to (1) or (2) below:

(1) The safe working load of a single sheave block is the maximum mass of cargoes that can be safely lifted by that block when it is suspended by its head fitting and the mass is secured to a wire rope passing round its sheave.

(2) The safe working load of a multiple sheave block is the maximum mass of cargoes that may be applied to its head fitting of the block.

12. Derrick systems are installations for handling cargo by suspending the cargo from the top of the derrick boom fitted to derrick post or mast, including those specified in (1), (2) and (3) below:

(1) The end of topping lift being fixed, two guy ropes fitted at the top of the derrick boom are wound by independent winches respectively to swing the boom horizontally(hereinafter referred to as "swinging derrick system").

(2) Two derrick booms, on port and starboard sides, in pair are fixed at predetermined positions. The cargo falls of two derricks are connected to load or unload the cargo(hereinafter referred to as "union-purchase derrick system").

(3) The cargo fall can be paid out or heaved in and luffing and slewing of derrick boom can be carried out singly or simultaneously while the cargo is suspended(hereinafter referred to as "derrick crane system").

13. Cranes cover jib cranes, gantry cranes, overhead cranes and hoists, cargo davits, etc. and are capable of performing the works of cargo loading and unloading, slewing and/or horizontal movement simultaneously or separately.

14. Cargo lifts are the installations designed to contain the cargo in their structure to loading and unloading the cargo.

15. Cargo ramps are the installation mounted on the shell or provided in the ship, and arranged to permit passage of vehicles as cargo or vehicles loaded with cargo on themselves and having mechanism enabling its opening and closing or turning.

16. Lifting load is the sum of the safe working load defined as the maximum mass of cargoes themselves to be suspended and the mass of accessories such as hooks, cargo blocks, grabs, buckets, lifting beams, spreaders, etc. Unless otherwise deemed necessary by the Society, the mass of wire ropes used as cargo falls need not be taken into account except when the installation is designed for a lift of 50 m or more.

17. The acceleration of gravity is to be equal to 9.81 m/sec^2.

103. Arrangement, Construction, Materials and Welding

1. Arrangement

(1) The arrangement and dimensions of the cargo gear and the cargo ramps are to be determined with due consideration given to avoid interference with maneuvering lights, navigation lights and other functions of the ship.

(2) When same parts of the cargo gear are utilized commonly for other functions, such as ventilators, or important systems or equipment designed for other purposes, or further, when some systems or equipment for other purposes are mounted on them, due considerations are to be given to avoid undue interference with each other in relation to their functions and strength.

(3) When any parts of the cargo gear or the cargo ramps project beyond the ship’s side under the working condition, it is recommended that such parts are to be of retractable, foldable or removable type designed for stowing within the line of ship’s side when not in use.

(4) The cargo gear and the cargo ramps are to be provided with equipments for securing the movable parts when not in use.

2. General Construction

(1) The cargo gear and the cargo ramps other than those used ordinary trim and heel in calm weather and sea states, are to comply with, in addition to the requirements in the Rules, such additional requirements as considered appropriate by the Society for the actual working condition.
(2) The requirements in **Sec 3, 4** and **8** assume the use of hull structural rolled steels specified in **Pt 2, Ch 1, 301.** High tensile steels used in the structural members, if any, are to comply with requirements specially made up by the Society. The construction and dimensions of the structural members containing or made of materials other than those steel specified herebefore are to be specially considered by the Society.
(3) The structural members are to be designed to avoid structural discontinuities and abrupt change of sections as far as practicable. The welded joints are to be arranged to avoid the parts where concentration of stress is expected.
(4) Corners of openings in the structural members are to be appropriately rounded off.
(5) Openings causing dimensional anisotropy in the structural members are to be so arranged as their long sides or long axes may assume parallel to the direction of principal stresses.
(6) Where two members having remarkably different stiffness are directly connected with each other, proper reinforcement is to be made by means of brackets, etc. to maintain the continuity of stiffness. Special consideration is to be given to the connection to the hull structures.
(7) The cargo blocks of the structural members are to comply with the requirements in **602.**

3. Direct Calculation of Strength

The dimensions of the structural members are to be determined by the method of direct calculation of strength approved by the Society using the design loads and allowable stresses specified in respective Sections concerned, with the exception of those members for which calculation formulae are given in **Sec 3.**

4. Materials

(1) The hull structural rolled steel used in the structural members are to be as given in **Table 9.2.1** depending on their thickness, except in cases considered appropriate by the Society.
(2) For the cargo gear and the cargo ramps always used in especially cold zones or refrigerated hold chambers and for any other cases considered to be necessary by the Society, the Society may require the use of steel materials of higher notch toughness notwithstanding the requirement specified in (1) above.
(3) Steel casting and steel forgings used in the structural members are, as a rule, to comply with the requirements in **Pt 2, Ch 1, Sec 5** and **Sec 6** respectively or of equivalent qualities.
(4) The materials of bolts and nuts used for connection of components of the structural members are to be considered appropriate by the Society.
(5) Wire ropes used as components of the structural members are to be those specified in **Pt 4** for use as standing riggings or of an equivalent quality.
(6) The materials used in the main parts of the installations of driving systems are to comply with the requirements in **Pt 2, Ch 1** or any standards recongnized by the Society to be of equivalent qualities.

Table 9.2.1 Thickness and Grades of Steels

Thickness t (mm)	$t \leq 20$	$20 < t \leq 25$	$25 < t \leq 40$	$40 < t$
Grade	A/AH	B/AH	D/DH	E/EH

(NOTES)
AH, DH and EH in the Table correspond to the following material grades.
AH : AH 32, AH 36 and AH 40
DH : DH 32, DH 36 and DH 40
EH : EH 32, EH 36 and EH 40

5. Welding

(1) The Welding of the structural members is to comply with the requirements in **Pt 2, Ch 2** and the additional requirements considered necessary by the Society according to the types of construction.
(2) The arrangement of welded joints in the structural members is to be specially considered to avoid remarkable difficulties in welding work.

6. Prevention of Corrosion

(1) The structural members are to be protected against corrosion with coating of a good quality or using other proper means.
(2) Any parts liable to the accumulation of rainwater or dew condensation are to be provided with proper draining means.

Section 2 Surveys

201. General

1. Application

(1) The requirements in this Section apply to the tests and surveys for the cargo handling appliances.
(2) Where the structural members of the cargo handling appliances are permanently fitted to the hull structure or where they form an integral part thereof, the tests and surveys for these parts are to comply with the requirements in this Section and, in addition they are to comply with the relevant requirements of the other Part of the Rules.
(3) At the Periodical Surveys, the Surveyor may require surveys other than those specified in **202.** through **205.** in this Section where deemed necessary.
(4) At Annual Surveys, the Surveyor may reduce the extent and contents of the tests and surveys specified in **202.** through **205.** in this Section, where deemed appropriate, having regard to the purpose, construction, age, history, results of the previous surveys and the current condition of the cargo handling appliances.

2. Preparation for Surveys and Others

(1) All such preparations as required for the survey to be carried out as well as those which may be required by the Surveyor as necessary in accordance with the requirements in the Rules are to be made by the applicant of the survey. The preparations are to include provisions of an easy and safe access, necessary facilities and necessary records for the execution of the survey. Inspection, measuring and test equipment, which Surveyors rely on to make decisions affecting classification are to be individually identified and calibrated to a standard deemed appropriate by the Society. However, the Surveyor may accept simple measuring equipment(e.g. rulers, measuring tapes, weld gauges, micrometers) without individual identification or confirmation of calibration, provided they are of standard commercial design, properly maintained and periodically compared with other similar equipment or test pieces. The Surveyor may also accept equipment fitted on board a ship and used in examination of shipboard equipment(e.g. pressure, temperature or rpm gauges and meters) based either on calibration records or comparison of readings with multiple instruments.
(2) The applicant for the survey is to arrange a supervisor who is well conversant with the survey items intended for the preparation of the survey to provide the necessary assistance to the Surveyor according to his requests during the survey.
(3) The survey may be suspended where necessary preparations have not been made, any appropriate attendant mentioned in the previous (2) is not present, or the Surveyor considers that the safety for execution of the survey is not ensured.
(4) Where repairs are deemed necessary as a result of the survey, the Surveyor will notify his recommendations to the applicant of the survey. Upon this notification, the repair is to be made to the satisfaction of the Surveyor.

3. Presentation of Certificates

All of the certificates for cargo handling appliances issued by the Society are to be kept on board and presented to the Surveyor when requested at the tests and surveys.

4. Records of the Surveys

The "Register of Ship’s Lifting Appliances including Cargo Handling Gears" is to be made necessary entries on it and endorsed by the Surveyor at the completion of the Surveys.

5. Notification of Survey Results

(1) The Society is to notify the results of the Survey to the applicant in a form of Survey Report.
(2) In case where repairing is requested on the Survey Report, the repairs are to be made to the satisfaction of the Society.
(3) The Survey Report in (1) above is to be kept on board and presented to the Surveyor when requested at the subsequent Survey.

6. Re-Survey

In case where the applicant has any complaints in the Survey carried out in accordance with the Rules, he may request execution of re-survey in writing to the Society.

202. Surveys of Cargo Handling Appliances

1. Kinds of Surveys

The kinds of Surveys for cargo handling appliances are as follows:
(1) Registration Survey
(A) Registration Survey during Construction
(B) Registration Survey after Construction
(2) Periodical Survey for maintaining registration
(A) Annual Survey
(B) Load Test
(3) Occasional Survey

2. Due range

The timing of the Surveys of cargo handling appliances are to be in accordance with the followings:
(1) A Registration Surveys are to be carried out when the safety working load, etc. are assigned for the first time.
(2) Annual Survey is to be carried out within 3 months before or after each anniversary date.
(3) Load Test is to be carried out at the Registration Survey and at the dates not exceeding 5 years from the date of completion of the Registration Survey or the previous Load Test.
(A) When serious damage is caused on the structural members and the repair or conversion is made
(B) When major conversion is made in the cargo handling procedures, rigging arrangements, operation and control methods
(C) When the assignment and marking of safe working load, etc. is altered
(D) Other cases when considered necessary by the Society

3. Periodical Surveys carried out in Advance

Periodical Surveys may be carried out in advance of the due date of each Survey upon application by the Owner.

203. Registration Surveys

1. Drawings and Other Documents to be Submitted

(1) At a Registration Survey, it is to be ascertained that the strength and construction of the cargo handling appliances comply with the Rules based on the drawings and documents submitted to the Society. In this case, the applicant is to submit the relevant drawings and documents out of listed in (2), (3) and (4) below.
(2) The relevant drawings and documents listed in the following (A) through (K) are to be submitted for approval for cargo handling appliances to be newly constructed;
(A) General arrangement of cargo gears and cargo ramps
(B) Construction drawings of cargo gears and cargo ramps(including the dimensions of structural members, specifications of materials and joint details)
(C) Drawings of cargo fittings(including the dimensions, specifications of materials and the fixing methods of these fittings with structural members or hull structure)
(D) Arrangement of loose gears(including rigging arrangement)
(E) List of loose gears(showing the construction, dimensions, materials and locations. For those in compliance with the well-known code or standard, the type symbol may be used in place of dimensions and materials)
(F) Construction drawings of driving gears
(G) Power system diagram
(H) Drawings of operation and control mechanism
(I) Drawings of safety devices
(J) Drawings of protective devices
(K) Other drawings and documents as deemed necessary by the Society

(3) The relevant drawings and documents listed in the following (A) through (G) are to be submitted for reference for cargo handling appliances to be newly constructed;
 (A) Specifications for cargo gears and cargo ramps
 (B) Calculation sheets or check sheets relevant to drawings and documents for approval specified in (2) above
 (C) Operation manual for cargo gears and cargo ramps
 (D) Procedures of non-destructive testing
 (E) Procedures of Load tests
 (F) Where materials which contain asbestos are used, documents including the location and other detailed information.
 (G) Other drawings and documents as deemed necessary by the Society
(4) At a Registration Survey of cargo handling appliances not built under Survey, the drawings and data to be submitted for the cargo handling appliances are to be same as specified in (2) and (3) above. However, some of these drawings and documents may be omitted submitting the past survey records and certificates with respect to them subject to approval by the Society.

2. Examinations for Workmanship

(1) Workmanship of cargo handling appliances is to be examined and ascertained to be in good order when any of the following (A) through (E) is relevant;
 (A) When, in process of manufacturing and assembling of structural members, requested by the Society
 (B) When structural members are installed on board the ship
 (C) For driving gears, at the times when the finishing work on major parts is completed and when the Surveyor considers necessary during the process of manufacture
 (D) When the subcontracted materials, parts or equipment are incorporated to the cargo handling appliances
 (E) Other cases when considered necessary by the Society
(2) Cargo handling appliances are to be examined and ascertained to be in good order by the following tests and surveys;
 (A) Testing as specified in **Pt 2, Ch 1** where the materials need to be in compliance with the requirements in **Pt 2, Ch 1**
 (B) Testing as specified in **Pt 2, Ch 2** where the welding works need to be in compliance with the requirements in **Pt 2, Ch 2**
 (C) Non-destructive testing where requested by the Surveyor
 (D) Shop trial of the driving gears
 (E) Operation tests of the cargo handling appliances
 (F) Operation tests of the safety devices and protective devices(including braking tests and electric power source cut-off tests with a testing weight equal to the safe working load applied)
 (G) Other tests considered necessary by the Society

204. Annual Surveys

1. Derrick Systems

(1) At Annual Surveys, the following items in (A) are to be visually examined for derrick systems and ascertained to be in good order. Where considered necessary by the Surveyor, the items in (B) are to be examined.
 (A) Items to be examined
  (a) Structural members
  (b) Connection between the structural members and hull structure
  (c) Driving systems
  (d) Safety devices and protective devices
  (e) Markings of the safe working load, etc., and the effectiveness of the relevant certificates
  (f) Preservation of the instruction manuals on board the ship
 (B) Items to be examined where considered necessary by the Surveyor
  (a) Checking of plate thickness of the structural members, non-destructive testing and open-up examinations of the topping brackets, goose neck brackets and derrick heel lugs
  (b) Open-up examination of the driving systems
  (c) Operation tests of the safety devices and protective devices
(2) At the fifth Annual Survey from the date of completion of the Registration Survey or the previous open-up examination but not exceeding 5 years, the open-up examination of the topping brackets, goose neck brackets and derrick heel lugs is to be carried out.

2. Cranes

At Annual Surveys, the following items in (A) are to be visually examined for cranes and ascertained to be in good order. Where considered necessary by the Surveyor, the items in (B) are to be examined.

(A) Items to be examined
 (a) Structural members
 (b) For stationary cranes, the connection between the structural members and hull structure
 (c) For track-mounted cranes, rails, buffers and the connection between those members and hull structure
 (d) Installations of driving system
 (e) Safety devices and protective devices
 (f) Markings of the safe working load, etc., and the effectiveness of the relevant certificates
 (g) Preservation of instruction manuals on board the ship
(B) Items to be examined where considered necessary by the Surveyor
 (a) Checking of plate thickness of the structural members, non-destructive testing and open-up examinations of the bearings
 (b) Inside of the posts, their legs and stiffeners of cranes
 (c) Open-up examinations of the driving gears
 (d) Operation tests of the safety devices and protective devices

3. Cargo Ramps

At Annual Surveys, the items in (A) are to be visually examined for cargo ramps in detail and ascertained to be in good order. Where considered necessary by the Surveyor, the items in (B) are to be examined.

(A) Items to be examined
 (a) Structural members
 (b) Connection between the structural members and hull structure
 (c) Connection between the stoppers and hull structure
 (d) Water-tight or weather-tight arrangements of cargo ramps that are used as water-tight or weather-tight doors when closed
 (e) The driving gears
 (f) Safety devices and protective devices
 (g) Markings of the safe working load and the effectiveness of the relevant certificates
 (h) Preservation of the instruction manuals on board the ship
(B) Items to be examined where considered necessary by the Surveyor
 (a) Plate thickness measurements, open-up-inspection of lifting pins, nondestructive tests, etc.
 (b) Hose testing or airtight testing for cargo ramps that are used as water-tight or weather-tight doors when closed
 (c) Open-up examinations of the driving gears
 (d) Operation tests of safety devices and protective devices

4. Cargo Lifts, etc.

(1) At Annual Surveys, the items in (A) are to be visually examined for cargo lifts in detail and ascertained to be in good order. Where considered necessary by the Surveyor, the items in (B) are to be examined.
 (A) Items to be examined
  (a) Structural members
  (b) Connection between the holding parts of cargo lifts and hull structure
  (c) Connection between the lifting/lowering devices of cargo lifts and hull structure
  (d) Driving gears
  (e) Safety devices and protective devices
  (f) Markings of the safe working load and the effectiveness of the relevant certificates
  (g) Preservation of the instruction manuals on board the ship
 (B) Items to be examined where considered necessary by the Surveyor
  (a) Plate thickness measurements, open-up-inspection of lifting pins, nondestructive tests, etc.
  (b) Open-up examinations of the driving gears
  (c) Operation tests of the safety devices and protective devices
(2) At Annual Surveys for other cargo handling appliances used for loading and unloading of cargoes and other articles, they are to be visually examined and ascertained to be in good order. When considered necessary by the Surveyor, a further examination may be carried out.

5. Loose Gears

(1) At Annual Surveys, the following items in (A) through (C) of loose gears are to be visually examined and ascertained to be in good order. However, where considered necessary by the Surveyor, the items in (B) are to be opened up and examined.
(A) Wire ropes for their full length
(B) Cargo blocks, chains, rings, hooks, shackles, swivels, lifting beams, cramps, rigging screw grabs, lifting magnets, spreaders, etc.
(C) Markings of the safe working load and identification symbols, and the effectiveness of the relevant certificates

(2) In case where some of loose gears need to be repaired or renewed at times other than at the Periodical Surveys, the Society may accept an autonomous inspection carried out by ship's master or his representative. In this case, the personnel who carried out an autonomous inspection is to record the following (A) through (F) for the loose gears renewed in the Inspection Record Book of Loose Gear, and show this Inspection Record Book and the certificates of the loose gears concerned to the Surveyor for his approval at the next Periodical Survey or Occasional Survey.
(A) Names and identification symbols
(B) Locations in service
(C) Safe working loads
(D) Testing loads
(E) Dates of renewal or repairs and dates of commencement of use
(F) Reasons for renewal or repairs

205. Load Tests

(1) At Load Tests, cargo handling appliances are to be examined by applying movable weights or loads at least equal to the test loads as specified in (2) below and in the manners specified in (3) or (4) depending on the types of cargo handling appliances and ascertained that they are in good order. However, Load Tests of loose gears may be omitted provided that the certificates with testing records of them are examined.

(2) The test loads used for Load Tests are to comply with the requirements of the following (A) through (C) depending on the types of cargo handling appliances;
(A) The test loads for cargo gears and cargo ramps are to be as given in **Table 9.2.2**
(B) The test loads for loose gears except for ropes are to be as given in **Table 9.2.3**
(C) The test loads for ropes are to satisfy the following formula;

$$T \geq W \cdot f$$

where,

T : Test loads for ropes (t)

W : Safe working loads of ropes (t)

f : Safety factors specified in **603. 1** (E) or **603. 2** (C)

Table 9.2.2 Test Load for Cargo Gear and Cargo Ramps

Safe working load SWL (t)	Test load (t)
$SWL < 20$	$1.25 \times SWL$
$20 \leq SWL < 50$	$SWL + 5$
$50 \leq SWL < 100$	$1.1 \times SWL$
$100 \leq SWL$	Load as considered appropriate by the Society

Table 9.2.3 Test Loads for Loose Gears

Article of Gear		Safe Working Load SWL (t)	Test Load (t)
Pulley blocks	Single-sheave block without becket	-	$4 \times SWL$
	Single-sheave block with becket	-	$6 \times SWL$
	Multi-sheave block	$SWL \leq 25$	$2 \times SWL$
		$25 < SWL \leq 160$	$(0.933 \times SWL) + 27$
		$160 < SWL$	$1.1 \times SWL$
Chain hook, shackle, ring, link, swivel, clamp and similar gear		$SWL \leq 25$	$2 \times SWL$
		$25 < SWL$	$(1.22 \times SWL) + 20$
Lifting beam, Lifting magnet, spreader and similar gear		$SWL \leq 10$	$2 \times SWL$
		$10 < SWL \leq 160$	$(1.04 \times SWL) + 9.6$
		$160 < SWL$	$1.1 \times SWL$

(3) For cargo handling appliances of which the safe working loads, etc. are assigned for the first time, the methods of load tests are to comply with the following requirements in (A) through (E);

(A) Derrick systems

(a) In case of a swinging derrick system, the test weight is to be slewed throughout the working range at the allowable minimum angle and then lifted/lowered at some position of the working range.

(b) In case of a derrick crane, in addition to (a) above, the derrick boom is to be luffed with suspending the test weight at the position of outreach and ship's centre line.

(c) In case of a union-purchase derrick system, the test weight is to be maneuvered throughout the working range within the allowable lifting height or the maximum angle between two cargo falls specified in **902. 3.**

(B) Cranes

(a) In case of a jib crane, the test weight is to be slewed throughout the working range at the maximum slewing radius and then lifted/lowered at some position of the working range.

(b) In case of a track-mounted cranes, the crane with the test weight suspended is to be transveresed throughout the working range and test weight is to be lifted/lowered at some position. Further, jib is to be luffed at some position of the working range.

(c) In case of a track-mounted hoisting gear, the hoisting gear with suspending the test weight is to be traversed from one end of the bridge span to the other and the test weight is to be lifted/lowered at some position.

(C) Cargo lifts

In case of a cargo lift, the test weight is to be so spaced that the most severe working condition is available taking into account one side loading, and the cargo lift is to be moved between each stop position, and to be lifted/lowered within the entire stroke of motion.

(D) Cargo ramps

In case of a cargo ramp, the test weight is to be placed on the severest position of loading in the designed loading conditions, and the deflection is to be measured. As far as practicable, a vehicle with the mass corresponding to the safe working load is to run on the cargo ramp.

(E) In case of loose gear, the test load is to be loaded in the method considered as appropriate by the Society.

(4) For the cargo handling appliances other than described in (3) above, the methods of load tests are to comply with the following requirements in (A) or (B).

(A) The load test specified in (3) (A), (B), (C), or (D) above is to be carried out.

(B) The load test may be carried out using a spring or hydraulic weighing machine anchored suitably and safely in accordance with the method considered appropriate by the Society.

Section 3 Derrick Systems

301. General

1. Application

The requirements in this Section apply to the structural members of derrick systems.

302. Design Loads

1. Load Considerations

The loads to be taken into the calculations of dimensions of the structural members are to be as specified in (A) through (F) below:
(A) Safe working load of the derrick systems
(B) Self-weight of derrick boom and cargo fittings attached thereto
(C) Self-weight of loose gear
(D) Friction of cargo blocks
(E) Loads due to ship inclination
(F) Other loads considered to be necessary by the Society

2. Friction of Cargo Blocks

In calculating the load at the rope end, the following friction load coefficients are to be taken into account depending on the types of bearing:
Bush bearing : 0.05
Roller bearing : 0.02

3. Load due to Ship Inclination

The angles of inclination used for the calculation of the loads due to ship inclination are to be the angles expected to occur in service condition, but they are not to be taken as less than 5° in angle of heel and 2° in angle of trim. If data on the angles of inclination of the ship concerned are submitted and recognized as appropriate by the Society, however, these angles may be used in the calculations.

4. Load Combinations

(1) The load to be used in the strength analysis of the structural members is to be such a combined load that these members may be put in the most severe load condition considering the loads specified in **Par 1** above.
(2) The union-purchase derrick system is to be analyzed as a swinging derrick system and a union-purchase derrick system respectively using the combined load according to the requirement in (1) above.

303. Strength and Construction of Derrick Posts, Masts and Stays

1. Strength Analysis

(1) The strength of derrick posts, masts(hereinafter referred to as "posts") and stays are to be analyzed for the combined load specified in **302. 4** to determine the dimensions of their members in accordance with the requirement in **Par 2** and **Par 3** below.
(2) The Young's modulus of the wire ropes to be used in the analysis of strength of stayed posts is to be 30.4 kN/mm^2 and 45.1 kN/mm^2 for the case of determining the dimensions of posts and stays respectively.

2. Allowable Stress for Combined Loads

(1) The combined stress calculated by the following formula on the basis of the compressive stress due to bending moment, the compressive stress due to axial compression and the shearing stress due to twisting of the member is not to exceed the allowable stress σ_a given in **Table 9.2.4.**

$$\sqrt{(\sigma_b+\sigma_c)^2+3\tau^2} \quad (N/mm^2)$$

Where,

σ_b : Compressive stress due to bending moment (N/mm^2)

σ_c : Compressive stress due to axial compression (N/mm^2)

τ : Shearing stress due to twisting of member (N/mm^2)

Table 9.2.4 Allowable Stress σ_a

Safe working load W (t)	Allowable stress σ_a (N/mm^2)
$W < 10$	$0.50\sigma_y$
$10 \le W < 15$	$(0.016W+0.34)\sigma_y$
$15 \le W < 50$	$0.58\sigma_y$
$50 \le W < 60$	$(0.005W+0.33)\sigma_y$
$60 \le W$	$0.63\sigma_y$
(NOTES) σ_y : Specified yield stress or proof stress of material (N/mm^2)	

(2) The tension of the wire ropes used for stay is not to exceed the value obtained by dividing the value of breaking test loads specified in **Pt 4, Table 4.8.11** by the safety factor specified in **603. 1** (E).

3. Minimum Plate Thickness of Posts

The plate thickness of posts is not to be less than 6 mm.

4. Construction of Posts

(1) The lower part of the post is to be effectively connected to hull structures by any of the following methods (A), (B) or (C), or any other method approved as appropriate by the Society:
(A) To be supported by two or more superposed decks
(B) To be supported by deckhouse of an enough strength
(C) To be supported by bulkhead for an ample depth beneath the deck

(2) The post well below the base to well above the goose neck bracket is to be of the dimensions equivalent to that at the base as far as practicable.

(3) The post is to be locally reinforced by the use of thicker plating, doubling plates, additional reinforcing members, etc. in the connection of post body and portal beam, the parts where the goose neck brackets and topping brackets are fitted, etc. and the parts where stress concentration expected.

(4) At the ends of the upper portal, its depth and plate thickness are to be properly increased. When opening hole at the end of the upper portal is avoidable, properly reinforcement is to be provided around the opening hole.

304. Strength and Construction of Derrick Booms

1. General

The strength of derrick booms is to be analyzed for the load conditions specified in **302. 4** and their dimensions are to be determined according to the requirements in **Par 2** to **Par 5** below.

2. Strength for Combined Load

The combined stress calculated by the following formula on the basis of the compressive stress due to twisting of the member is not to exceed the allowable stress σ_a given in **Table 9.2.5.**

$$\sqrt{(\sigma_b + \sigma_c)^2 + 3\tau^2} \qquad (\mathrm{N/mm^2})$$

Where,

σ_b : Compressive stress due to bending moment $(\mathrm{N/mm^2})$

σ_c : Compressive stress due to axial compression $(\mathrm{N/mm^2})$

τ : Shearing stress due to twisting of member $(\mathrm{N/mm^2})$

Table 9.2.5 Allowable Stress σ_a

Safe working load W (t)	Allowable stress σ_a $(\mathrm{N/mm^2})$
$W < 10$ $10 \leq W < 15$ $15 \leq W$	$0.34\sigma_y$ $(0.018W + 0.16)\sigma_y$ $0.43\sigma_y$
(NOTES) σ_y : Specified yield stress or proof stress of material $(\mathrm{N/mm^2})$	

3. Buckling Strength

For member subjected to compression, the value obtained from the following formula is not to exceed the allowable stress σ_a given in **Table 9.2.5.**

$$1.15\omega\sigma_c \qquad (\mathrm{N/mm^2})$$

Where,

σ_c : Axial compressive stress $(\mathrm{N/mm^2})$

ω : Coefficient calculated by the formula in **Table 9.2.6** and **Table 9.2.7** for the slenderness ratio and type of the member concerned

4. Combined Compressive Stress

The compressive stress due to combination of the compressive stress due to axial compression and that due to bending moment is to meet the following formula:

$$\frac{\sigma_c}{\sigma_{ca}} + \frac{\sigma_b}{\sigma_a} \leq 1.0$$

where,

σ_a : Allowable bending stress given in **Table 9.2.5** $(\mathrm{N/mm^2})$

σ_{ca} : Allowable compressive stress to be taken as a quotient of σ_a divided 1.15 $(\mathrm{N/mm^2})$

σ_b : Compressive stress due to bending moment $(\mathrm{N/mm^2})$

σ_c : Compressive stress due to axial compression $(\mathrm{N/mm^2})$

Table 9.2.6 Formula for ω

Relation of λ and λ_0	Type of member	Formulae for ω
$\lambda \geq \lambda_0$	All members	$2.9\left(\frac{\lambda}{\lambda_0}\right)^2$
$\lambda < \lambda_0$	Plate members	$\frac{1+0.45(\lambda/\lambda_0)}{1-0.5(\lambda/\lambda_0)^2}$
	Cylindrical members	$\frac{0.87+0.46(\lambda/\lambda_0)+0.12(\lambda/\lambda_0)^2}{1-0.5(\lambda/\lambda_0)^2}$

(NOTES)
1. λ is the slenderness ratio of the member subjected to compression to be obtained from the following formula:

$$l_e\sqrt{\frac{A}{I}}$$

where,
A : Sectional area of the member (m^2)
I : Moment of inertia of section of member (m^4)
l_e : Effective length of the member to be determined as the product of the actual length of the member and coefficient K obtained from the following **Table 9.2.7** for respective end conditions (m):

2. λ_0 is the value obtained from the following formula:

$$\sqrt{\frac{2\pi^2 E}{\sigma_y}}$$

where,
π : The circular constant
E : Young's modulus (N/mm^2)
σ_y : Specified yield stress or proof stress of material (N/mm^2)

Table 9.2.7 Values of K

R : free D : free	2.0	-	-	-

(NOTES)
R : Rotation D : Displacement con. : constrained

5. Minimum Plate Thickness of Derrick Booms

The plate thickness used for the body of derrick booms is not to be less than 2 % of the outside diameter at middle of the effective length of the boom or 6 mm, whichever is the greater.

6. Reinforcement of Derrick Booms

(1) The plating at the head of the derricks booms to which fittings are attached is to be provided with doubling plates or reinforced by other suitable means.
(2) Where cargo fittings for whipped rigging are attached to the boom, proper reinforcement is to be made by doubling plates or other suitable means.

7. Derrick Boom Stopper for Dropping Out

Derrick booms are to be supported by a goose neck bracket and to be safeguarded against dropping out of their sockets or supports.

305. Simplified Calculation Method for Post and Stays of Swinging Derrick Systems

1. Application

Notwithstanding the provisions in **303. 1** through **3,** the dimensions of posts and stays of swinging derrick systems may be determined according to the requirements in **305.**

2. Diameter of Post at the Base

The outside diameter of post at the base is not to be less than the value obtained from the following formula. For elliptic or oval section, its minor diameter is to be regarded as the outside diameter, while the short side is to be regarded as the outside diameter for rectangular cross section.

$$5h \quad (\text{cm})$$

where,

h : Vertical distance from the base of post to the topping bracket (m)

3. Section Modulus of Post at the Base

(1) The section modulus of unstayed posts at the base is not to be less than the value obtained according to (A) through (C) below depending upon the arrangement of derrick booms.
(A) When a derrick boom is fitted on either of forward or afward side of the post, the section modulus is to be the value obtained from the following formula:

$$C_1 C_2 \rho W \quad (\text{cm}^3)$$

where,

W : Safe working load (t)

ρ : Slewing radius at the allowable minimum angle (m)

C_1 and C_2 : Coefficients obtained from **Table 9.2.8.** For intermediate values of W, the coefficients C_1 and C_2 are to be obtained by interpolation.

Table 9.2.8 Values of C_1 and C_2

W (t)	2 or less	3	4	5	6	7	8	9	10
C_1	1.35	1.25	1.20	1.17	1.15	1.14	1.13	1.12	1.10
C_2	125	120	117	115	114	113	112	111	110

(B) The section modulus about the axis parallel to the longitudinal direction of the ship is to be the value obtained from (A) above or the value obtained from the following formula, whichever is the greater, when two derrick booms are fitted on both the forward and aftward the post.

$$\sum C_2 W u \quad (\mathrm{cm}^3)$$

where,

$\sum C_2 W$: Sum of $C_2 W$ for derrick booms situated forward and aftward the post respectively Where C_2 and W are those obtained from (A) above

u : Distance from the center of the post to the side of the ship, plus the outreach (m)

(C) Where derrick booms are supported by an independent structure other than the post, the section modulus is not to be less than obtained from the formula in (A) and (B) above, multiplied by the value obtained from the following formula. In this case, the coefficient C_1 in the formula specified in (A) above is to be taken as 1.0.

$$\frac{h}{h-h'}$$

where,

h' : Vertical distance from the base of the post to the center of horizontal pin of the goose neck bracket (m)

h : As specified in **Par 2** above

(2) The section modulus of stayed posts at the base may be the value specified in (1) above reduced by the value obtained from the following formula:

$$10\frac{h^3}{d_m}\sum R \quad (\mathrm{cm}^3)$$

where,

h : As specified in **Par 2** above

d_m : Outside diameter of the post at the base in the direction in which R assumes minimum in the slewing range for the formula in (1) (A) above, or in the axis parallel to the athwartship direction of the ship for the formula in (1) (B) above (cm)

$\sum R$: Sum of the values obtained from the following formula for each effective stay:

$$\frac{d_s^2 a^2}{l_0 l_s^2}$$

where,

d_s : Diameter of the wire rope for stays (mm)

l_s : Length of stays between the upper and lower ends (m)

l_0 : Length equal to l_s reduced by the value obtained from the following formula: (m)

$0.045 d_s + 0.26$ (m)

a : Length of horizontal projection of the stays measured in the same direction as the measurement of d_m (m)

(3) Where the derrick booms are supported by a king post with a portal having uniform cross section, the section modulus of the post at the base is not to be less than the values obtained from (A), (B) and (C) below:

(A) The section modulus about the axis parallel to the athwartship direction of the ship is to be the value obtained by the formula in (1) (A) multiplied by the following coefficient C_P :

0.7 for $r \geq 0.6$
$1-0.5r$ for $r < 0.6$

where,

r : Ratio of the breadth of the cross section of the portal to the diameter of the post at the base in the longitudinal of the ship

(B) The section modulus about the axis parallel to the longitudinal direction of the ship is to be the values obtained from (1) (A) or (B) above, whichever is the greater, multiplied by the following coefficient:

0.35 for $r' \geq 0.3$
$0.5-1.67r'^2$ for $r' < 0.3$

where,

r' : Ratio of the depth of the cross section of the portal to the diameter of the post at the base in the athwarship direction

(C) Where the distance between posts on the port and starboard sides exceed 2/3 of the height of the post, the coefficients specified in (A) and (B) above are to be suitably increased.

(4) The section modulus of the stayed king post at the base is not to be less than the values obtained from (A) and (B) below:

(A) The section modulus about the axis parallel to the athwartship direction of the ship is to be the value obtained from the following formula:

$$C_P\left(C_1 C_2 \rho W - 10\frac{h^3}{d_m}\sum R\right) \quad (\text{cm}^3)$$

where,

C_P : As specified in (3) (A) above
C_1, C_2 and ρ : As specified in (1) (A) above
$10\frac{h^3}{d_m}\sum R$: Values obtained according to (2) above, provided that stays on one side only are to be taken into account

(B) The section modulus about the axis parallel to the longitudinal direction of the ship is to be the value given in (3) (B) above.

(5) The section modulus of the short side post at the base supporting the derrick boom is not to be less than the value obtained according to (A) or (B) below:

(A) When a derrick boom is fitted on either of the forward or aftward the side post, the section modulus is to be the value obtained from the following formula:

$$85\frac{h'}{h-h'}\rho W \quad (\mathrm{cm}^3)$$

where,

W and ρ : As specified in (1) (A) above

h' : As specified in (1) (C) above

h : As specified in **Par 2** above

(B) Where derrick booms are fitted on the forward and aftward the side post, the section modulus of the side post about the parallel to the longitudinal direction of the ship is to be the greater of the value obtained from (A) above or the value obtained from the formula in (A) above using, in place of ρW, the product of the sum of W values for the forward and aftward booms and the value u given in (1) (B) above, provided that u is to be measured from the center of the side post.

4. Dimensions of Post other than at the Base

(1) The post from well below the base to well above the goose neck bracket is to be of the dimensions equivalent to that at the base as far as practicable.

(2) The diameter and thickness of the post above the position specified in (1) above may be gradually reduced according to the following (A) and (B).

(A) The outside diameter where the outrigger or the topping bracket are fitted may be 85 % of the diameter at the base.

(B) The plate thickness at any arbitrary position of the post is not to be less than obtained from the following formula.

$$0.1d_m + 2.5 \quad (\mathrm{mm})$$

where,

d_m : Minimum outside diameter of the post at each position (cm)

5. Outriggers

Outriggers are to be properly constructed and of sufficient strength.

6. Portals

(1) The section modulus of the portal of uniform section fitted to the king post is not to be less than the values obtained from (A) to (C) below:

(A) The section modulus about the vertical axis is to the value obtained from the formula given in **Par 3** (1) (A) above multiplied by the coefficient obtained from the following formula. Where this coefficient exceeds 0.2, it may be taken as 0.2.

$$0.1 + 0.235\frac{r}{c}$$

where,

r : As specified in **Par 3** (3) (A) above

c : Ratio of the actual section modulus (cm^3) of the post at the base about the axis parallel to the athwarship direction of the ship to that obtained from the formula in **Par 3** (1) (A) above

(B) Notwithstanding the requirements in (A) above, the section modulus of the portal about the vertical axis may be reduced to a half of the value in (A) above where derrick boom is fitted only on one side of the forward of post.

(C) The section modulus about the horizontal axis is to be the value obtained from the formula in **Par 3** (1) (B) above multiplied by the coefficient obtained from the following formula. Where this coefficient exceeds 0.2, it may be taken as 0.2.

$$0.25\frac{r'}{c'}$$

where,

r' : As specified in **Par 3** (3) (B) above

c' : Ration of the actual section modulus (cm^3) of the post at the base about the axis parallel to the longitudinal direction of the ship to that obtained from the formula in **Par 3** (1) (B) above

(2) The portal is to be properly stiffened so as to prevent the deformation due to bending.

7. Stays

The tension in wire ropes used for stays is to be less than the value obtained from the following formula.

$$18\frac{d_s^2 a}{l_0 l_s}\delta \qquad (\mathrm{kN})$$

where,

a, d_s, l_0 and l_s : As specified in **Par 3** (2) above. In this case, a is to be measured in the same direction as in the calculation of the value of δ.

δ : Value obtained from the following formula:

$$C_s\frac{h}{h-h'} \cdot \frac{\rho W}{\frac{I}{h^2}+7.32h\sum R}$$

where,

I : Moment of inertia of section (cm^4) of the post at the base about the axis parallel to the athwarship direction of the ship. For the king posts, however, the value of I divided by the coefficient C_P given in **Par 3** (3) (A) above is to be used in place of I.

h : As specified in **Par 2** above

h', W and ρ : As specified in **Par 3** (1) (A) and (C)

$\sum R$: As specified in **Par 3** (2) above. In this case, a is to be measured in all directions in the slewing range of the derrick boom in calculating $\sum R$

C_s : Value given in **Table 9.2.9.** For intermediate values of W, the coefficient C_s is to be obtained by interpolation.

Table 9.2.9 Values of C_s

W (t)	2 or less	3	4	5	6	7	8	9	10	15 and above
C_s	2.64	2.52	2.46	2.41	2.38	2.35	2.33	2.31	2.29	2.22

306. Simplified Calculation Methods for Derrick Booms

1. General

Notwithstanding the requirements in **304. 1** through **5**, the dimensions of derrick booms may be determined in accordance with requirements in this **306.**

2. Derrick Booms without Whipped Rigging

(1) The dimensions of derrick booms of derrick system without whipped rigging are not to be less than obtained according to (A), (B) and (C) below:

(A) The moment of inertia of derrick boom at the middle post is not to be less than obtained from the following formula:

$$C_B P l^2 \qquad (\mathrm{cm}^4)$$

where,

C_B : Value obtained from **Table 9.2.10**

l : Effective length of derrick boom (m) (See **Fig 9.2.1**)

P : Axial compression of derrick boom to be determined according to (a) or (b) depending on the type of the derrick systems. When the self-weight of derrick boom and its fitting are accurately estimated, the value obtained from the force diagram may be used as P.

(a) Swinging Derrick Systems

$$P=\left(\alpha_1 \frac{l}{h-h'}+f\right) Wg \qquad (\mathrm{kN})$$

where,

W and h' : As specified in **305. 3** (1) (A) and (C)

h : As specified in **305. 2**

α_1 : Value obtained from **Table 9.2.11.** For intermediate values of W, α_1 is to be obtained by interpolation.

f : Coefficient obtained from **Table 9.2.12.** depending on the number of cargo block for cargo fall. Where the cargo fall is carried to the top of the post through the sheave fixed to the top of the boom, f may be taken as zero.

Table 9.2.10 Values of C_B

Safe working load W (t)	C_B
$W \leq 10$	0.28
$10 < W < 15$	$0.40-0.012W$
$15 \leq W \leq 50$	0.22
$50 < W$	Value as considered appropriate by the Society

Table 9.2.11 Values of α_1

W (t)	2 or less	3	4	5	6	7	8	9	10	above 10
α_1	1.28	1.23	1.20	1.18	1.16	1.15	1.14	1.13	1.13	Value as considered appropriate by the Society

Table 9.2.12 Values of f

n	1	2	3	4	5	6	7	8
f	1.102	0.570	0.392	0.304	0.251	0.216	0.192	0.172

(NOTES)
n : The sum of sheaves of cargo block for cargo fall.

(b) Derrick systems other than swinging derrick systems

$$P=\left(\alpha_1\frac{l}{h-h'}+f\right)Wg+\frac{Kn_1\alpha_1\alpha_2}{n_2\sqrt{b^2+l^2}}l\,Wg \quad \text{(kN)}$$

where,

α_1, l, h, h', f and W : As specified in (a) above
α_2 : As specified **502. 2**
b : Horizontal distance from the goose neck bracket to guy post (m)
n_1 : Number of guy ropes
n_2 : Number of topping ropes
K : Values given in **Table 9.2.13** depending on the type of rigging

Table 9.2.13 Values of K

Rigging system	K
Type A	0
Type B	1.2
Type C	2.0

(NOTES)
1. Type A is rigging system having two guy tackles on port and starboard sides of the top of the post so that these guy tackles may also serve as topping lifts.
2. Type B is a rigging system having a deltaplate connecting the end of topping lift and ends of port and starboard side guy ropes so that the tension of topping lift may absorb the slackening of guy ropes.
3. Type C is a rigging systems having a connecting block connecting the end of guy rope(s) of both sides (or of one side) and the topping lift led along the derrick post so that the slackening of guy rope(s) may be absorbed by the topping lift.

(B) In derrick booms with tapered end parts, the parallel part in the midlength is, as a standard, to be of a length equal to 1/3 of the effective length, and the diameter at the ends is not to be less than 60 % of the diameter of the parallel midlength part.
(C) The thickness of steel plate used for the body of derrick booms is not to be less than the value obtained from the following formula or 2 % of the outside diameter at the middle part whichever is the greater.

6 (mm) for $P < 75.5$ (kN)
$5+0.0133P$ (mm) for $P \geq 75.5$ (kN)

(2) The shape and dimensions of the derrick boom of swinging derrick system may be in accordance with any other standards recognized by the Society to be equivalent.

3. Derrick Booms with Whipped Rigging

The dimensions of derrick booms of derrick system with whipped rigging are not to be less than obtained according to (A) and (B).

(A) The moment of inertia of section at an arbitrary position at a distance of x (m) from the center of eye fitting at derrick heel is not to be less than obtained from the following formula. Where a doubling plate is fitted for a sufficient length, 70 % of the doubling plate may be added to $D(x)$ and $A(x)$ in the formula.

$$I(x) = C_B P l^2 \left\{ 1 - 3.136 \left(\frac{x}{l} - 0.5 \right)^2 \right\} + \frac{D(x) l_1 x}{2\left(\sigma_0 - \frac{P}{A(x)} \times 10 \right) l} \cdot \frac{Wg}{N} \cos\theta \times 10^3$$

where,

$I(x)$: Required moment of inertia of section at a distance of x (m) from the derrick heel (cm^4)

C_B : As specified in **Par 2** above

P : Axial compression of boom specified in **Par 2** (1) (A) (kN)

l : Effective length of boom (m)

W : Safe working load as specified in **305. 3** (1) (A) (t)

N : Sum of sheaves of cargo block for cargo fall(except cargo block for cargo relief)

θ : Allowable minimum angle of boom (degree)

l_1 : Distance between the eye fittings for whipped rigging (m) (See **Fig 9.2.1**)

$D(x)$: Outside diameter of derrick boom at a distance of x (m) from the boom heel minus plate thickness (cm)

$A(x)$: Sectional area of derrick boom at a distance of x (m) from the boom heel (cm^2)

σ_0 : Value given in **Table 9.2.14** (N/mm^2)

(B) The length of parallel part at the middle, the diameter at ends and the plate thickness of the boom body are to be as specified in **Par 2** (1) (B) and (C) above.

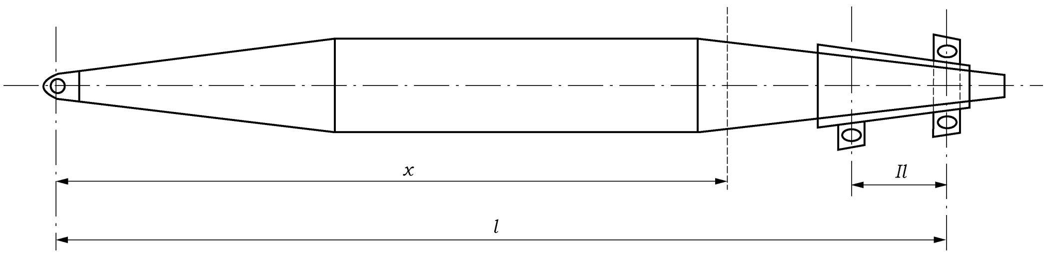

Fig 9.2.1 Derrick Boom with Whipped Rigging

Table 9.2.14 Values of σ_0

Safe working load W (t)	σ_0
$W \leq 10$	80.4
$10 < W < 15$	$4.04W + 40.0$
$15 \leq W \leq 50$	100.6
$50 < W$	Value as considered appropriate by the Society

Section 4 Cranes

401. General

1. Application

The requirements in this Section apply to the structural members of cranes.

402. Design Loads

1. Load Considerations

The loads to be taken into the calculation of dimensions of structural members are to be those related to the crane concerned among the items enumerated from (A) to (K) below:

(A) Safe working load of the cranes
(B) Additional impact loads
(C) Self-weight of crane system and cargo fittings attached thereto
(D) Self-weight of loose gear
(E) Friction of cargo blocks
(F) Horizontal forces
(G) Wind loading
(H) Buffer forces
(I) Loads due to ship inclination
(J) Loads due to ship motion
(K) Other loads considered necessary by the Society

2. Additional Impact Loads

(1) The additional impact load is to be the product of the lifting load and the impact load coefficient given in **Table 9.2.15** depending on the type of cranes. When the stress due to hoisting of cargo and the stress due to the self weight have different signs in a member, 50 % of additional impact load is to be taken into account in addition to the self-weight, considering the shock due to unloading.
(2) Notwithstanding the requirements specified in (1) above, additional impact load coefficient based on actual measurements taking into account the hoisting speed, deflections of girders, length of ropes, etc. may be used in place of the values given in **Table 9.2.15.**

Table 9.2.15 Additional Impact Load Coefficient

Types of cranes	Additional impact load coefficient
Provision handling crane, machinery handling crane, maintenance crane and hose handling crane	0.10
Jib crane and gantry crane for cargo handling	0.25
Jib crane and gantry crane occasionally used with hydraulically operated or rope-operated bucket, etc. for cargo handling	0.40
Jib crane and gantry crane always using grab, lifting magnet, etc. for cargo handling and offshore jib crane	0.60

3. Friction of Cargo Blocks

The friction of cargo blocks is to be as specified in **302. 2.**

4. Horizontal Forces

(1) In track-mounted cranes, the transverse forces due to travel motion is to be taken into consideration as a factor of horizontal force in addition to the inertial force and centrifugal force.

(2) The inertial force is to be obtained by multiplying the sum of the mass of the moving parts and the lifting load(in slewing motion, the load is assumed to be at the top of jib) by the following coefficient depending on the condition of motion. In the case of travelling by driven wheels, however, this inertial force need not exceed 15 % of the driving wheel load.

Level luffing motions : $0.01\sqrt{V}$
Traversing or travelling motions : $0.008\sqrt{V}$
Slewing motions : $0.006\sqrt{V}$

where,
V : Velocity of motion concerned to be determined by the designer (m/min)

(3) Notwithstanding the requirements in (2) above, the values of the actual acceleration deceleration characteristics, the actual braking time, etc. for the mode of motion concerned may be used as the inertial forces, if such values are known.

(4) For a system having structural members which will make slewing motions while supporting the safe working load, the centrifugal force determined from following formula is to be taken into consideration

$$\frac{Wv^2}{R} \quad (\mathrm{kN})$$

where,
W : Safe working load (t)
R : Slewing radius (m)
v : Circular speed (m/sec)

(5) The transverse force due to travel motions is to be calculated from the following formula:

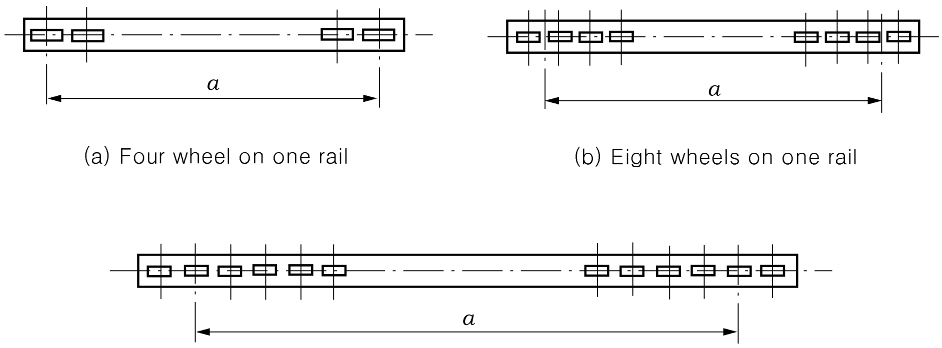
$$\lambda D \quad (\mathrm{kN})$$

where,
D : Wheel load (kN)
λ : Transverse force coefficient to be determined from the following formula depending on the value of l/a. However, λ need not exceed 0.15:

$$0.05 \qquad \text{for} \quad \frac{l}{a} \leq 2$$

$$\frac{1}{60}\left(\frac{l}{a}+1\right) \qquad \text{for} \quad \frac{l}{a} \leq 2$$

Where,
l : Span of rails (m)
a : Effective wheel base to be determined according to **Fig 9.2.2**



(a) Four wheel on one rail

(b) Eight wheels on one rail

(c) More than eight wheels on one rail

Fig 9.2.2 Measurement of Effective Wheel Base

5. Wind Loading

(1) The wind loading is to be calculated by the following formula:

$$F = PA \times 10^{-3} \quad (\mathrm{kN})$$

where,

F : Wind loading (kN)

A : Sum of structural members and cargo under wind pressure in projection in respective wind direction, corresponding to respective conditions of the cargo gear (m^2). When a girder is wholly or party protected from wind by another girder, the areas of the superposed portions may be multiplied by the reduction factor (η) obtained from **Fig 9.2.3.** The distance b between girders is to be as given in **Fig 9.2.4.**

P : Wind pressure calculated by the following formula (Pa)

$$\frac{1}{16} C_h C_s g V^2 \quad (\mathrm{Pa})$$

where,

V : Wind velocity according to (A) and (B) below (m/sec)

(A) The velocity of wind giving effect on the structural members and cargo in the service conditions is to be the design wind velocity specified by the applicant, but not be less than 16 m/sec.

(B) The velocity of wind giving effect on the structural members in the stowage conditions is to be the design wind velocity specified by the applicant. In no case is the design wind velocity to be less than 51.5 m/sec. In ships with restricted navigation areas, however, the design wind velocity may be decreased according to the degree of restriction as approved by the Society in the range down to 25.8 m/sec.

C_h : "Height factor" to be determined according to **Table 9.2.16** depending on the height of the position is question from the light weight waterline.

C_s : "Shape factor" to be determined according to **Table 9.2.17** depending on the shapes of various parts of the cargo gear and the cargo.

(2) Notwithstanding the requirements in (1), the data on wind loading obtained by wind tunnel tests for the structural members and cargo may be used for calculations.

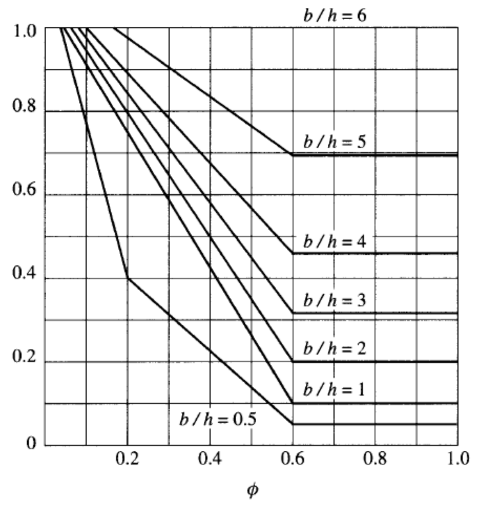


Fig 9.2.3 Repleteness Ratio, ϕ and versus Reduction Factor, η

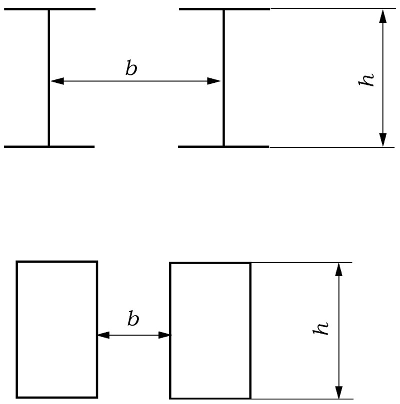

Fig 9.2.4 Distance between two neighbouring girders, b

Table 9.2.16 Height Factor C_h

Vertical height h (m)	C_h
$h < 15.3$	1.00
$15.3 \leq h < 30.5$	1.10
$30.5 \leq h < 46.0$	1.20
$46.0 \leq h < 61.0$	1.30
$61.0 \leq h < 76.0$	1.37
$76.0 \leq h$	Value as considered appropriate by the Society

Table 9.2.17 Shape Factor C_s

Type of area under wind pressure			C_s
Truss of angle		$\phi < 0.1$ $0.1 \le \phi < 0.3$ $0.3 \le \phi < 0.9$ $0.9 \le \phi$	2.0 1.8 1.6 2.0
Plate girder or Box girder		$\frac{l}{h} < 5$ $5 \le \frac{l}{h} < 10$ $10 \le \frac{l}{h} < 15$ $15 \le \frac{l}{h} < 25$	1.2 1.3 1.4 1.6
Cylindrical member or truss of cylindrical member		$d\sqrt{q} < 1.0$ $1.0 \le d\sqrt{q}$	1.2 0.7

(NOTES)
ϕ : Repleteness ratio equal to the ratio of projected area under wind pressure to the projected area surrounded by the outer contour of the area under wind pressure
l : Length of plate girder or box girder (m)
h : Height of plate girder or box girder looked at from windward (m)
d : Outer diameter of cylindrical member (m)
q : Value calculated by the following formula:
$$\frac{1}{16} C_h \cdot g V^2 \times 10^{-3} \quad (\text{kPa})$$

6. Buffer Forces

(1) The buffer forces are assumed to be the loads in the crane system originating from collision with buffer at a speed equal to 70% of the rated speed when no cargo is suspended from the crane. In a crane system having a rigid guide, etc. to limit the swinging of suspended cargo due to collision, the influence of the cargo weight is also to be taken into consideration.
(2) Notwithstanding the requirement in (1) above, in a crane system designed to be automatically decelerated before colliding the buffer, the speed after deceleration may be regarded as the rated speed in the requirement in (1) above.

7. Loads due to Ship Inclination

The angles of inclination used for the calculation of loads due to ship inclination are not to be less than the values specified below:

In service conditions : 5° in angle of heel and 2° in angle of trim occurring simultaneously
In stowage conditions : 30° in angle of heel

8. Loads due to Ship Motion

The accelerations used for the calculation of loads due to ship motion are the severest of the combinations (A) or (B) below for the stowage condition, and values recognized by the Society to be appropriate for the service condition. If data on the ship's motions are submitted and recognized by the Society to be appropriate, the values in such data may be used in the calculations.

(A) $\pm 1.0g$ in the direction normal to the deck and $\pm 0.5g$ in the longitudinal direction parallel to the deck
(B) $\pm 1.0g$ in the direction normal to the deck and $\pm 0.5g$ in the transverse direction parallel to the deck

9. Load Combinations

(1) The load to be used in the strength analysis of structural members is to be such a combined load that these members may be put in the severest loading condition considering the loads specified in (2) through (5) below.

(2) When the wind loading is not taken into account in service condition, the sum of loads from (A) to (I) below multiplied by a work coefficient given in **Table 9.2.18** according to the type of crane concerned is to be considered.

(A) Safe working load of the cranes
(B) Additional impact loads
(C) Self-weights of crane system and cargo fittings attached thereto
(D) Self-weights of loose gear
(E) Friction of cargo blocks
(F) Horizontal loads
(G) Loads due to ship inclination
(H) Loads due to ship motion(except those intended to cargo handling in harbours only)
(I) Other loads considered necessary by the Society

(3) When the wind loading are to be taken into consideration in the service conditions, the wind loading is to be added to the design load as specified in (2) above.

(4) The buffer forces as given in **Par 6** above are to be taken into consideration for the track-mounted cranes.

(5) In stowage condition, the loads from (A) to (E) below are to be considered

(A) Self-weights of crane system and cargo fittings attached thereto
(B) Wind Loading in the stowage conditions
(C) Loads due to ship inclination in the stowage conditions
(D) Loads due to ship motion stowage conditions
(E) Other loads considered necessary by the Society

Table 9.2.18 Work Coefficient of Crane Systems

Type of crane	Work coefficient
Provision handling crane, machinery handling crane, maintenance crane and hose handling crane	1.00
Jib crane and gantry crane for cargo handling	1.05
Jib crane and gantry crane occasionally used with hydraulically operated or rope-operated bucket, etc. for cargo handling	1.10
Jib crane and gantry crane always using grab, lifting magnet, etc. for cargo handling and offshore jib crane	1.20

403. Strength and Construction

1. General

(1) The strength of structural members is to be analyzed on the load conditions specified in **402. 9** to determine their dimensions according to requirements in **Par 2** through **Par 9** below.
(2) For structures connected by bolts and nuts, proper considerations are to be given to the decrease of effective sectional areas.
(3) When considered necessary the Society may require the confirmation of the appropriateness of strength analyses by examination of models or the things in question.

2. Allowable Stress for Combined Loads

The allowable stress given in **Table 9.2.19** are to be used for components subjected to combined loads.

3. Buckling Strength

For members subjected to compression, the values obtained from the following formula is not to exceed the allowable compressive stress given in **Table 9.2.19.**

$$\omega\sigma_c \quad (\mathrm{N/mm^2})$$

where,

ω and σ_c : As specified in **304. 3**

4. Combined Compressive Stress

When the compressive stress of a member is determined as a combination of compressive stress due to axial compression and that due to bending moment such a compressive stress is to comply with the following formula:

$$\frac{\sigma_c}{\sigma_{ca}} + \frac{\sigma_b}{\sigma_a} \leq 1.0$$

where,

σ_b : Compressive stress due to bending moment $(\mathrm{N/mm^2})$

σ_c : Compressive stress due to axial compression $(\mathrm{N/mm^2})$

σ_a : Allowable bending stress given in **Table 9.2.19** $(\mathrm{N/mm^2})$. For fixed posts at the base, however, the allowable stress σ_a in **Table 9.2.4** is to be used.

σ_{ca} : Allowable compressive stress given in **Table 9.2.19** $(\mathrm{N/mm^2})$. For fixed post at the base, however, the allowable stress $(\mathrm{N/mm^2})$ is to be taken equal to the allowable stress in **Table 9.2.4** divided by 1.15.

Table 9.2.19 Allowable Stress σ_a

Load Condition	Kind of stress					
	Tension	Bending	Shear	Compression	Bearing	Combined stress
Condition specified in **402. 9** (2)	$0.67\sigma_Y$	$0.67\sigma_Y$	$0.39\sigma_Y$	$0.58\sigma_Y$	$0.94\sigma_Y$	$0.77\sigma_Y$
Condition specified in **402. 9** (3)	$0.77\sigma_Y$	$0.77\sigma_Y$	$0.45\sigma_Y$	$0.67\sigma_Y$	$1.09\sigma_Y$	$0.89\sigma_Y$
Condition specified in **402. 9** (4) and (5)	$0.87\sigma_Y$	$0.87\sigma_Y$	$0.50\sigma_Y$	$0.76\sigma_Y$	$1.23\sigma_Y$	$1.00\sigma_Y$

(NOTES)
1. σ_Y : Specified yield stress or proof stress of material (N/mm^2)
2. The combined stress is to be the value obtained from the following formula:

$$\sqrt{\sigma_x^2+\sigma_y^2-\sigma_x\sigma_y+3\tau_{xy}^2} \quad (N/mm^2)$$

where,

σ_x : Applied stress in x-direction at the middle of plate thickness (N/mm^2)
σ_y : Applied stress in y-direction at the middle of plate thickness (N/mm^2)
τ_{xy} : Applied shear stress in the $x-y$ plane (N/mm^2)

5. Fatigue Strength

Where the influence of repeated stress cannot be neglected, the member is to have an ample strength against fatigue with due consideration for the magnitude and frequency of repeated stress, the form of the member in question, etc.

6. Minimum Thickness

The thickness of structural members is not to be less than 6 mm.

7. Strength of Bolts, Nuts and Pins

Bolts, nuts and pins are to have sufficient strength for the magnitudes and directions of the loads they are subjected to.

8. Fixed Posts

(1) The fixed posts are to be effectively connected to the hull structure in accordance with the requirements in **303. 4** (1).
(2) The upper part of fixed post where the flange is attached is to be sufficiently reinforced by increasing the plate thickness or by providing of brackets.

9. Slewing-Ring Fixing Bolts

(1) Any material having a tensile strength exceeding 1.18 kN/mm^2 and yield stress exceeding 1.06 kN/mm^2 is not to be used for the bolts fixing the slewing-rings except when special considerations have given to the strength characteristics of the bolts.
(2) Special considerations are to be given to the tightening force of fixing bolts.
(3) The stress generated in fixing bolts is not to exceed the allowable stress given in **Table 9.2.20** according to the load conditions specified in **402. 9.** In this case, the stress in bolts is taken as the value of the axial compression determined by the following formula divided by the minimum sectional area of fixing bolts.

$$\frac{4M}{D \cdot N}-\frac{W}{N} \quad (N)$$

where,

M : Upsetting moment ($N \cdot mm$)
D : Pitch circle diameter of fixing bolts (mm)
N : Number of fixing bolts
W : Axial compression on the slewing-ring (N)

Table 9.2.20 Allowable Stress of Fixing Bolts σ_a

Load condition	σ_a
Condition specified in **402. 9** (2) and (3)	$0.4\,\sigma_y$
Condition specified in **402. 9** (5)	$0.54\,\sigma_y$
(NOTES) σ_y : Specified yield stress or proof stress of the material (N/mm^2)	

404. Special Requirements for Track-mounted Cranes

1. Stability

The track-mounted cranes are to have an sufficient stability under the load conditions specified in **402. 9.**

2. Prevention of Upsetting

The track-mounted cranes are to be designed with sufficient considerations for the stability to prevent upsetting even if the wheel shafts or wheels are damaged.

3. Deflection Criteria

When suspending the safe working load, deflection of the traveling girder of the track-mounted cranes is not to exceed 1/800 of the span between the supporting points.

4. Travel Gear

The travel gear is to be securely fixed to the main body of the track-mounted cranes by bolts, welding or pins. The inclinations of hull in service condition and stowage condition are to be taken into consideration.

5. Buffers

The track-mounted cranes are to be provided with buffers in accordance with (A) and (B) below, except when automatic system for prevention of collision is provided.

(A) At both ends of tracks or any other equivalent positions. These buffers may be replaced by stops of a height not less than 1/2 of the diameter of wheels.

(B) Where more than two track-mounted cranes are provided on one track, between these track-mounted cranes.

Section 5 Cargo Fittings

501. General

1. Application

The requirements in this Section apply to the cargo fittings.

502. Cargo Fittings

1. Goose Neck Brackets and Derrick Heel Lugs

(1) The sizes of goose neck pin, cross bolt and derrick heel lug shown in **Fig 9.2.5** are to be not less than the following values. The sizes of other parts are to be as deemed appropriate by the Society.

$$b = e_1 \sqrt{\frac{P}{g}} \quad (\mathrm{mm})$$

$$c = 0.55 e_1 \sqrt{\frac{P}{g}} \quad (\mathrm{mm})$$

$$d = e_1 \sqrt{\frac{P}{g}} \quad (\mathrm{mm})$$

where,

P : Design axial compressive force acting on derrick boo (kN)

e_1 : 15.6. However, in the swinging derrick system, the values given in **Table 9.2.21** may be used according to the safe working load.

(2) It is recommended that clearance at parts where the cross bolt penetrates through the derrick heel lug and the gooseneck pin of gooseneck bracket is to be less than 2 mm in diameter. The size of the outer parts of bolt holes for the gooseneck pin and derrick heel lug is to be of the same size at the cross bolt radius, as a standard.

(3) Notwithstanding the requirements in (1) above, the sizes of gooseneck bracket and derrick heel lug may be in accordance with any other standards recognized by the Society. However, for the cargo fittings used for other than the swinging derrick systems, consideration to the effect of increasing load caused by the guy ropes is to be given.

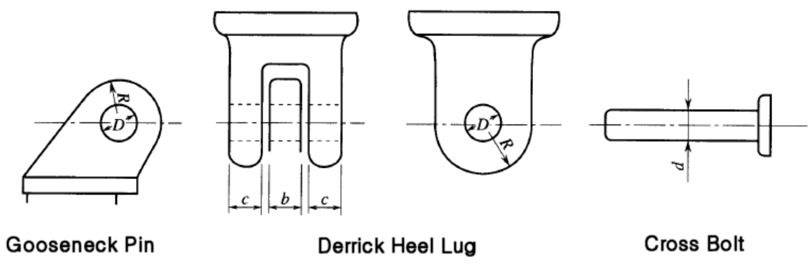

Fig 9.2.5 Gooseneck Pin, Derrick Heel Lug and Cross Bolt

Table 9.2.21 Values of e_1

Safe working load W (t)	e_1
$W \le 10$	15.6
$10 < W < 15$	$18.8 - 0.32W$
$15 \le W \le 50$	14.0
$50 < W$	Value as considered appropriate by the Society

2. Cargo Fittings attached to Head of Derrick Booms

(1) The sizes of cargo fittings attached to the head of derrick booms are not to be less than the values given in the following (A) to (C) according to the respective purpose and shapes of the fittings:

(A) Where the shape of cargo fittings attached to the head of derrick boom are as given in **Fig. 9.2.6**, the sizes of them are not to be less than the following values. The sizes of other parts are to be as deemed appropriate by the Society.

$$d = e_2\sqrt{\frac{T}{g}} \ (\mathrm{mm})$$

$$t = e_2\sqrt{\frac{T}{g}} \ (\mathrm{mm})$$

where,

e_2 : Value as given in **Table 9.2.22**

T : Maximum tension applied to cargo fitting at the head of derrick boom (kN). However, in the swinging derrick system, the following value may be used:

$\alpha_1\alpha_2 Wg$ for topping lift

λWg for cargo fall

where,

W : Safe working load (t)

α_1 : As specified in **306. 2**

α_2 : As given in **Table 9.2.23** depending on the value of $l/(h-h')$. However, for intermediate values of α_2, it is to be obtained by interpolation.

λ : Value given in **Table 9.2.24** depending on the number of sheaves of blocks for cargo fall. However, the value of λ may be taken as 1.0 where the cargo fall is led to the top of derrick post through the sheave incorporated in the head of the derrick boom.

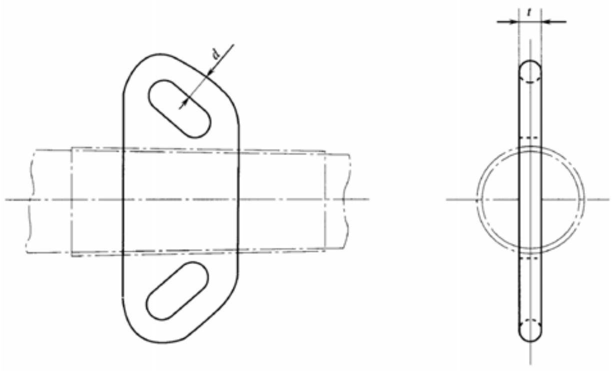

Fig 9.2.6 Cargo Fitting attached at Head of Derrick Boom

Table 9.2.22 Values of e_2

Safe working load W (t)	e_2
$W \leq 10$	12.5
$10 < W < 15$	$15.1 - 0.26W$
$15 \leq W \leq 50$	11.2
$50 < W$	Value as considered appropriate by the Society

Table 9.2.23 Values of α_2

$l/(h-h')$		2.0	1.9	1.8	1.7	1.6	1.5	1.4	1.3	1.2
α_2	$W < 10$	1.99	1.90	1.81	1.73	1.65	1.57	1.49	1.42	1.35
	$15 \leq W < 50$	1.82	1.73	1.65	1.57	1.49	1.41	1.33	1.26	1.19
(NOTES) l, h and h' : As specified in **306. 2.**										

Table 9.2.24 Values of λ

Sum of the number of sheaves of blocks for cargo fall	1	2	3	4	5	6	7	8
λ	2.10	1.58	1.40	1.31	1.26	1.23	1.20	1.18

(B) Where the shape of cargo fitting attached to the head of cargo derrick boom is as shown in **Fig 9.2.7**, the sizes of them are not to be less than the following values. The sizes of other parts are to be as deemed appropriate by the Society.

$$R \geq D$$

$$t = e_1 \sqrt{\frac{T}{g}} \quad \text{(mm)}$$

However, where the value of R is larger than $1.15D$, the value obtained from the following formula may be taken:

$$t = \frac{e_3}{\left(R - \frac{D}{2}\right)} \cdot \frac{T}{g} \quad \text{(mm)}$$

where,

e_1 : As specified in **Par 1** (1) above

T : As specified in (A) above

e_3 : As given in **Table 9.2.25**

(C) The sizes of guy fittings attached the head of derrick boom are to be enough against the design load.

(2) Notwithstanding the requirements in (1) above, the sizes of cargo fittings attached at the head of derrick boom may be in accordance with any other standards recognized by the Society to be equivalent. However, for the cargo fittings used for other than the swinging derrick systems, consideration to the effect of increasing load caused by the guy ropes is to be given.

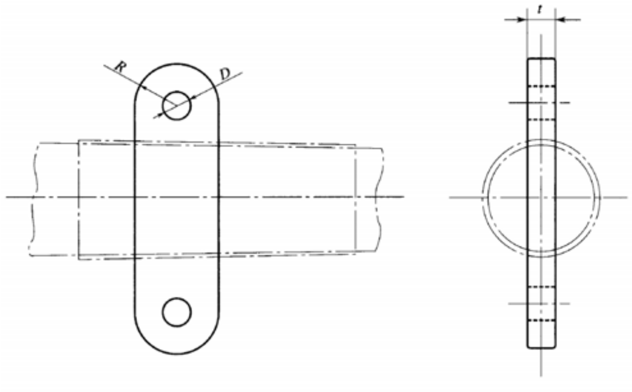

Fig 9.2.7 Fitting attached at Head of Derrick Boom

Table 9.2.25 Values of e_3

Safe working load W (t)	e_3
$W \le 10$	122
$10 < W < 15$	$170 - 4.8W$
$15 \le W \le 50$	98
$50 < W$	Value as considered appropriate by the Society

3. Other Cargo Fittings

The sizes of the other cargo fittings such as topping bracket, guy cleat, eye and so on, may be in accordance with any other standards recognized by the Society. However, for the topping bracket used for other than the swinging derrick systems, consideration to the effect of increasing load caused by the guy ropes is to be given.

Section 6 Loose Gear

601. General

1. Application

The requirements in this Section apply to the loose gear.

2. General Requirements

When the safe working load is applied to the cargo gear and cargo ramps, the load created in the important part of those loose gears and ropes is not to be exceed the respective specified safe working load.

602. Cargo Blocks

1. Cargo Blocks for Wire Ropes

The cargo blocks for wire ropes are to comply with the following requirements (A) through (D). However, in sheaves for equalizer sheaves or those for overload sensors, they are to be as deemed appropriate by the Society. (See **Fig 9.2.8**)

(A) The diameter of the sheave at the bottom of the rope groove is not to be less than 14 times the wire rope diameter.
(B) The depth of the groove of the sheave is not to be less than the wire rope diameter.
(C) The bottom of the groove of the sheave is to have a circular contour over a segment sustained by angle of not less than 120°
(D) The groove diameter of the sheave is to be 1.1 times the wire rope diameter, as a standard.

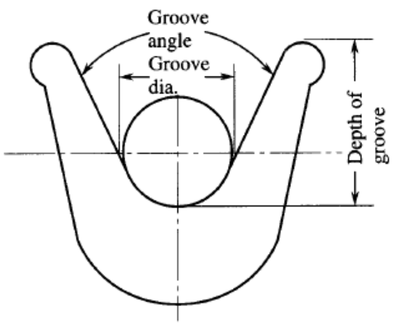

Fig 9.2.8 Sheave Groove

2. Cargo Blocks for Fibre Ropes

The cargo blocks for fibre ropes are to comply with the following requirements (A) through (C) below:

(A) The diameter of the bottom of the rope groove is not be less than 5.5 times the fibre rope diameter.
(B) The depth of the groove of the sheave is not be less than the fibre rope diameter.
(C) The groove diameter of the sheave is to be the fibre rope diameter plus 2 mm, as a standard.

603. Ropes

1. Wire Ropes

The wire ropes are to comply with the following requirements (A) through (E) below:

(A) The wire ropes are to be subjected to suitable corrosion prevention treatment.
(B) The wire ropes are to be suitable for the purpose of application, and in addition are to attach a certificate stating that they conform to the requirements of **Pt 4, Ch 8** of the Rules for the Survey and Construction of Steel Ships or the requirements of the standards as deemed appropriate by the Society.
(C) No splicing of the wire ropes is permitted.
(D) Terminal connection of wire ropes is to be made in a method approved by the Society to have sufficient strength.
(E) The safety factor of the wire ropes is not to be less than the following value according to their purpose and their safe working load. However, the safety factor of the wire ropes for running rigging may not exceed 5, and those for standing rigging, 4.

$$\frac{10^4}{8.85W+1910} \quad \text{for } W \leq 160$$

$$3 \quad \text{for } W > 160$$

where,

W : Safe working load (t)

2. Fibre Ropes

Fibre ropes are to comply with the following requirements (A) through (C) below:

(A) The fibre ropes are to comply with the recognized standards and to be provided with the certificate deemed appropriate by the Society.
(B) The diameter of the fibre ropes is not to be less than 12 mm.
(C) The safety factor of fibre ropes is not be less than the value given in **Table 9.2.26** depending on the rope diameter.

Table 9.2.26 Safety Factor of Fibre Ropes

Rope diameter D (mm)	Safety Factor
$12 \leq D < 14$	12
$14 \leq D < 18$	10
$18 \leq D < 24$	8
$24 \leq D < 40$	7
$40 \leq D$	6

604. Other Loose Gears

1. General

The design loads of loose gears such as chain, rings, hooks, shackles, swivels, clamps, grabs, lifting beams, lifting magnets, spreader, etc. are not to be more than the value obtained by dividing the breaking strength of each gears by the safety factor of 5.

605. Equivalent Requirements

1. General

Notwithstanding the requirements in **602.** through **604.** above, the constructions of loose gear may be in accordance with any other standards recognized by the Society.

Section 7 Machinery, Electrical Installations and Control Engineering Systems

701. General

1. Application

The requirement in this Section apply to the machinery, electrical installations and control engineering systems used in the cargo handling appliances. However, in applying the requirements in this Section to winches used for cargo ramps, they may be suitably modified.

702. Machinery

1. General

The driving systems of the cargo handling appliances are to be steadily operated in the rated speed under the safe working load.

2. Hoisting Machinery

(1) The construction of the hoisting machinery is to comply with the following requirements (A) through (F) below:

(A) The drum end flange diameter is to have an allowance corresponding to not less than 2.5 times the rope diameter as measured from the outer rim of the outermost layer of ropes in service condition. However, where rope disengagement prevention system is provided or in case of single layer winding on the drum, this requirement may be dispensed with.

(B) The pitch circle diameter of winch drum is to be not less than 18 times the rope diameter.

(C) Winches are to be installed on the winch foundation with foundation bolts having sufficient proof strength against the drum load(the maximum rope tension applied on the drum when the rope is wound under the single winding at a nominal rope hoisting speed) created when the safe working load is applied to the cargo handling appliances.

(D) Braking system complying with the following requirements (a) through (c) below is to be provided:

(a) The braking system is to be able to exert a breaking torque 50 % in excess of the torque required when the safe working load is applied to the cargo handling appliances.

(b) The power operated braking system is to operate automatically when the manoeuvring is returned to its neutral position.

(c) The power operated braking system is to operate automatically when there is any failure in the power supply. In this case, emergency retrieval for cargo lowering is to be provided.

(E) Clutchable drums are to be provided with effective locking system capable of restricting rotation of the drum. The locking system is be, as a rule, capable of resisting the torque not less than 1.5 times the torque required when the safe working load is applied to the cargo handling appliances.

(F) Rope guards or suitable other means of protection are to be provided.

(2) The rope at its end is to be secured to the drum in such a manner that will not damage any part of the rope and to have such a length that not less than 3 complete turns in case of an ungrooved drum, or 2 complete turns in case of a grooved drum are remaining on the drum when the complete working length of rope has been paid out.

703. Power Supply

1. General

(1) The equipment, piping and cables consisting of the electric, hydraulic, pneumatic or steam power supply system and their arrangements are, as a rule, to comply with the relevant requirements of the Rules for the Classification of Steel Ships.

(2) The construction, strength, materials, etc. of internal combustion engine used as the prime mover are to comply with the requirements in **Pt 5.**

704. Control Engineering Systems

1. General

(1) The electric, hydraulic or pneumatic equipments used for the control, alarm and safety systems are, as a rule, to comply with the relevant requirements of the Rules for the Classification of Steel Ships.
(2) The control, alarm and safety systems are to be designed on the basis of the principle of fail-safe.

2. Control System

(1) Control systems are to be so arranged as not interfere with the operator or qualified other personnel giving signals for operation.
(2) Control systems are, as a rule, to be of such design that controls automatically return to the neutral position when control operation by the operator is interrupted.
(3) For electric winches, local power disconnecting switch is to be provided at the position in the proximity of the place of operation.
(4) Cranes and cargo lifts are to be provided with emergency switch capable of stopping all the motions at the position readily accessible for the operator.
(5) Cargo lifts are to be provided with a suitable automatic speed control system that reduces the starting acceleration and stopping deceleration as far as practicable.
(6) Cargo lifts are to be provided with a suitable control system that stops the lift at the specified deck position.
(7) Where cargo lifts are secured by locking latches, suitable means is to be provided so as to prevent the impact load to be induced on the lift in case of withdrawal of the latches.

3. Safety System

(1) The cargo handling appliances are, as a rule, to be provided with an overload protection system.
(2) The cargo handling appliances are to be provided with suitable safety systems capable of preventing the abnormalities given in the following (A) through (F) according to kind of appliances and their motion:
(A) Over hoisting
(B) Over slewing
(C) Over luffing
(D) Excessive travelling speed
(E) Over run on the track
(F) Other items of abnormality recognized by the Society
(3) In cranes where the safe working load varies according to the operating radius, rating chart showing the relationship between the operating radius and safe working load are to be provided in the control cab and in addition, equipment satisfying the following (A) and (B) or (C) is, as a rule, to be provided:
(A) Operating radius indicator
(B) Lifting load indicator
(C) Overload preventer with respect to the safe working load according to the operating radius

4. Protection System

(1) For the rotating parts of the driving machinery, electrical installations and steam pipes, necessary means to protect the operator are to be provided.
(2) Steam winches are to be arranged not to interfere with the operator's field of vision by the steam.
(3) Cargo lifts are to be provided with the protection systems given in the following (A) through (D):
(A) Protective barriers of a height of not less than 1 m above deck level around the deck opening provided for lift platform.
(B) Interlocking system so that cargo lifts cannot be moved unless the barriers are all closed.
(C) Interlocking system that prevents opening of protective barriers unless cargo lifts are at the opening position of the barriers.
(D) Warning lights or suitable other warning signs at the boarding place of cargo lifts.

Section 8 Cargo Lifts and Cargo Ramps

801. General

1. Application

The provisions in this Section apply to the structural members of cargo lifts and cargo ramps.

802. Design Loads

1. Load Considerations

Consideration is to be given to the utilization and duty of the particular type of cargo lifts and cargo ramp in the "in service" and stowage conditions with respect to the following loads listed from (A) to (G) below.

(A) Safe working load
(B) Self-weight of the installation
(C) Wind loading
(D) Wave loading
(E) Loads due to ship inclination
(F) Loads due to ship motion
(G) Other loads considered necessary by the Society

2. Wind Loading

The wind loading is to be calculated according to **402. 5.**

3. Wave Loading

For the structural members forming parts of shell plating and subjected to the wave load, the head of water is not to be less than that obtained from the following formula:

$$\{d - 0.125D + 0.05L' + \Delta H_w(x)\}\frac{gD}{D+2h_s} \quad (\text{kPa})$$

where,

x : Distance from the forward face of stem on the designed maximum load line defined in **Pt 3, Ch 1, 110.** (m)

d : Designed maximum load draught defined in **Pt 3, Ch 1, 111.** (m)

D : Depth of ship defined in **Pt 3, Ch 1, 106.** (m)

L' : Length of ship defined in **Pt 3, Ch 1, 102.** (m). L' is to be taken as 230 m when the length exceeds 230 m.

$\Delta H_w(x)$: Value obtained from the following formula for respective value of x

$$(38 - 45C_b')\left(1 - \frac{x}{0.3L}\right)^2 \quad \text{for} \quad x \le 0.3L$$

$$0 \quad \text{for} \quad x > 0.3L$$

Where,

C_b' : Block coefficient defined in **Pt 3, Ch 1, 113.** C_b' is to be taken as 0.85 when the block coefficient exceeds 0.85.

L : Length of ship defined in **Pt 3, Ch 1, 102.** (m)

h_s : Value shown in **Table 9.2.27** depending on the length of ship

Table 9.2.27 Values of h_s

Length of ship L (m)	h_s
$L \leq 90$	1.95
$90 < L < 125$	$0.01L+1.05$
$125 \leq L$	2.30

4. Loads due to Ship Inclination

The loads due to ship inclination are to be as recognized by the Society to be appropriate.

5. Loads due to Ship Motion

The loads due to ship motion are to be as specified in **402. 8.**

6. Load Combinations

(1) The load combinations to be used in strength analysis of structural members is to be those causing the more severe loading condition of the structural members resulting from the load combinations specified in (2) to (5) below.
(2) The load combination of the following loads (A) to (E) are to be taken into consideration "in service" conditions:
(A) Safe working load
(B) Self-weight of slewing or moving parts of the cargo lifts and cargo ramps
(C) Self-weight of the fixed parts of the cargo lifts and cargo ramps
(D) Loads due to ship inclination
(E) Other loads considered necessary by the Society
(3) The loads (2) (A) and (B) above are to be multiplied by 1.2 for the installations designed to slew or move with cargo loaded thereon/therein and by 1.1 for the cargo ramps designed not to slew or move with cargo loaded thereon.
(4) The following loads (A) to (F) are to be taken into consideration for cargo lifts in stowage conditions.
(A) Loads in stowage conditions
(B) Self-weight of the cargo lifts
(C) Wind loading
(D) Loads due to ship inclinations in navigation
(E) Loads due to ship motions in navigation
(F) Other loads considered necessary by the Society
(5) The following loads (A) to (E) are to be taken into consideration for cargo ramps in stowage conditions.
(A) Self-weight of the cargo ramps
(B) Wind loading
(C) Loads due to ship inclinations in navigation
(D) Loads due to ship motions in navigation
(E) Other loads considered necessary by the Society

803. Strength and Construction

1. General

(1) The strength of structural members is to be analyzed for the load conditions specified in **802. 6** according to the requirements in **Par 2** to **Par 7** below.
(2) For the installations loaded with vehicles, the concentrated loads from wheels corresponding to their loading or running conditions are to be taken into account.
(3) The strength of structural members forming parts of shell plating is, in general, to be equivalent to that of the surrounding hull structure.
(4) The structural members are to have proper stiffeners and, in addition, suitable lashing devices for preventing their vertical and horizontal movements when stowed in position.

2. Allowable Stress for Combined Loads

The allowable stress prescribed in **Table 9.2.28** are to be used for components subjected to combined loads.

Table 9.2.28 Allowable Stress σ_a

Load Condition	Kind of stress					
	Tension	Bending	Shear	Compression	Bearing	Combined stress
Condition given in **802. 6** (2)	$0.67\sigma_Y$	$0.67\sigma_Y$	$0.39\sigma_Y$	$0.58\sigma_Y$	$0.94\sigma_Y$	$0.77\sigma_Y$
Condition given in **802. 6** (4) and (5)	$0.77\sigma_Y$	$0.77\sigma_Y$	$0.45\sigma_Y$	$0.67\sigma_Y$	$1.09\sigma_Y$	$0.89\sigma_Y$

(NOTES)
1. σ_Y : Specified yield stress or proof stress of material (N/mm^2)
2. The combined stress is to be the value obtained from the following formula:

$$\sqrt{\sigma_x^2+\sigma_y^2-\sigma_x\sigma_y+3\tau_{xy}^2} \quad (N/mm^2)$$

where,

σ_x : Applied stress in x-direction at the middle of plate thickness (N/mm^2)
σ_y : Applied stress in y-direction at the middle of plate thickness (N/mm^2)
τ_{xy} : Applied shear stress in the $x-y$ plane (N/mm^2)

3. Lift Deck Plating and Ramp Plating Thickness

(1) The thickness of the plating forming a part of shell plating is not to be less than the thickness of shell plating at the position concerned to be determined regarding the actual stiffener spacing as the frame spacing.
(2) The plate thickness of the plating forming a part of bulkhead is not to be less than the thickness of bulkhead plating at the position concerned to be determined regarding the actual stiffener spacing as the bulkhead stiffener spacing.
(3) For the installations loaded with vehicles the thickness of lift deck plating or ramp plating is not to be less than required for deck plating of the car deck.

4. Minimum Thickness

The thickness of structural members is not to be less than 6 mm in the parts exposed to weather and 5 mm in the parts not exposed to weather.

5. Deflection Criteria

The deflection of the structural members due to the safe working load is to be limited, as a rule, to 1/400 of the span between supports in cargo lifts and 1/250 of the span between supports in cargo ramps.

6. Strength of Bolts, Nuts and Pins

Bolts, nuts and pins are to have ample strength for the magnitudes and directions of the loads they are subjected to.

7. Locking Devices of Cargo Ramps

(1) Stowage locks are to be provided to resist the load resulting from consideration of loads specified in **802. 6** (5).
(2) The hydraulic locking devices are to be designed to keep the ramp locked mechanically even in the event of failure of the hydraulic pressure.
(3) For a cargo ramp utilized commonly as a means for closing openings, the closing devices may be utilized as locking devices, if the area of opening is larger than half of the projected area of the stowed ramp. The design load of the closing devices is to include also the loads specified in **802. 6** (5) in addition to the loads in **Pt 4, Ch 3.**

Section 9 Certification, Marking and Documentation

901. General

1. Application

The requirements in this Section apply to the certification, marking and documentation of the cargo handling appliances.

902. Assignment of Safe Working Load, etc.

1. General

The Society assigns the safe working load, etc., for the cargo handling appliances that have passed the inspection and load tests specified in **Sec 2.**

2. Duplicated Assignment of Safe Working Load, etc.

The Society will assign, at the application of the shipowner, the following (A) or (B) in addition to the safe working load etc. in accordance with the requirements in **Par 1** above:

(A) The maximum load corresponding to an angle smaller than the assigned allowable minimum angle in case of derrick systems
(B) The maximum load corresponding to a radius exceeding the assigned maximum slewing radius in case of jib cranes

3. Assignment for Union-Purchase Derrick Systems

(1) The assignments of the safe working load, etc. for the union-purchase derrick systems are the safe working load and maximum angle between two cargo falls or the safe working load and allowable lifting height (the vertical distance between the highest position of the structure above the upper deck with hatch opening and the delta plate or ring attached to the cargo falls).
(2) The maximum angle between two cargo falls specified in (1) above is not to be assigned to exceed 120 °.

903. Marking of Safe Working Load, etc.

1. Marking for Cargo Gear and Cargo Ramps

(1) On the cargo gear and cargo ramps assigned by the requirements specified in **902.** above, the safe working load, allowable minimum angle, maximum slewing radius and other restrictive conditions are to be marked by using stamps in accordance with the following requirement in (A) through (C):
(A) Derrick systems
At the conspicuous place of the base of derrick boom, the stamp mark of the Society, the safe working load, the allowable minimum angle of the boom and other restrictive conditions are to be marked.
(B) Jib cranes
At the conspicuous place of the base of jib or the similar position, the stamp mark of the Society, the safe working load, the maximum slewing radius and other restrictive conditions are to be marked.
(C) Other cargo gear and cargo ramps
At the conspicuous place which is hardly fouled, the stamp mark of the Society, the safe working load and other restrictive conditions are to be marked.
(2) In the case of the duplicated assignment of safe working loads are assigned to derrick systems and jib cranes in accordance with the requirements of **902. 2**, the necessary markings for respective combinations are to be made correspondingly in according to the requirements of (1) above.
(3) For the cargo gear which is used with grabs, lifting beams, lifting magnets, spreaders and similar other loose gear and assigned the maximum cargo load excluding the self-weight of such loose gear to safe working load, the notation in this connection to be marked as other restrictive conditions correspondingly according to (1) above.
(4) The stamp marks are to be coated with anti-corrosive paint and framed with paint for easy recognition.

(5) In addition to the markings specified in (1), (2) and (3) above, the same markings (except the stamp mark of the Society) are to be made at the conspicuous places with paint, etc. In this case, the size of letters should not be less than 77 mm in height.

2. Marking for Loose Gear

(1) On the loose gear other than wire ropes and fibre ropes, the test load, the safe working load and the identification symbols are to be marked by using stamps at the conspicuous place and no adverse effects are to be caused for both their strength and service. On grabs, lifting beams, lifting magnets, spreaders and similar other loose gear, the self-weight of them are to be stamped additionally.
(2) The stamp marks are to be coated with anti-corrosive paint and framed with paint for easy recognition.
(3) In addition to the markings specified in (1) above, grabs, lifting beams, lifting magnets, spreaders and similar other loose gear are to be marked with the safe working load and the self-weight of them with paint, etc. In this case the size of letters should not be less than 77 mm in height.
(4) Notwithstanding the requirements in (1) and (3) above, where it is difficult to make direct stamp mark or marking with paint, other means may be taken when approved by the Society.

904. Documentation

1. Kinds of Documents

The kinds of the documents issued by the Society for cargo gears, cargo ramps and loose gear are to be as specified in the followings:

(A) Register of Ship’s Lifting Appliances including Cargo Handling Gears(Form CG1)
(B) Certificate of Test and Thorough Examination of Lifting Appliances(Form CG2)
(C) Certificate of Test and Thorough Examination of Lifting Appliances for Operation in Union Purchase(Form CG2(U))
(D) Certificate of Test and Thorough Examination of Loose Gear(Form CG3)
(E) Certificate of Test and Thorough Examination of Wire Rope(Form CG4)
(F) Certificate of Test and Thorough Examination of Fibre Rope(Form CG5)

2. Timing of Issuance of Documents

The timing of issuance of documents specified in **Par 1** above is to be as given in **Table 9.2.29** depending on the tests and survey.

3. Revocation of the Documents

(1) The whole or part of the certificates specified in **Par 1** above will be revoked when either of the following (A) through (I) is relevant:
(A) When application is made by the shipowner for cancellation or alteration of the assignment of the safe working load, etc.
(B) When the construction, arrangement or rigging of the cargo handling appliances are altered
(C) When the cargo handling appliances are removed
(D) When the surveys specified in **Sec 2** are not subjected to
(E) When the cargo handling appliances are considered to be unserviceable by the Surveyor
(F) When the contents in the certificates are intentionally altered
(G) When the contents in the certificates have become illegible due to foul or damage
(H) When the specified fee covering the survey is not paid
(I) In case where the Society has a doubt on the effectiveness of the certificates, etc.
(2) The certificates which become invalid in accordance with the provisions in (1) above are to be returned to the Society without delay.

4. Reissuance and Corrections of Documents

In case where the certificates, etc. become invalid in accordance with the provisions of the preceding **Par 3** (1) above or lost, the Society will reissue the certificates or make necessary corrections thereto depending on the circumstances involved.

905. Preservation of Documents

1. General

The Certificates issued depend on the requirements in **905.** by the Society and the instruction manual for cargo handling appliances are to be preserved aboard the ship or by shipowner's responsible person in case of towing boat not manned.

2. Instruction Manual

The instruction manual mentioned in **Par 1** above is to note essential items necessary for operation and maintenance of the cargo handling appliances among those given in the following (A) through (H):

(A) General arrangement of cargo gear and cargo ramps
(B) Arrangement drawing of loose gear(including rigging arrangement)
(C) List of loose gear
(D) Design conditions(including safe working load, wind speed, trim and heel of ship, etc.)
(E) List of materials
(F) Operation manual(including functions of safety systems and protective systems)
(G) Load testing procedure
(H) Maintenance and control procedures

CHAPTER 3 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 1 General

101. General

1. Scope

The Rules for the Automatic and Remote Control Systems (hereinafter referred to as "the Rules") apply to the survey and construction of centralized monitoring and control systems for main propulsion and essential auxiliary machinery, operating systems for periodically unattended machinery spaces and specific automation equipment (hereinafter referred to as "automatic and remote control systems") of ships classed or to be classed with the requirements of **Pt 1, Ch 1** intended to be assigned and registered the class notations in accordance with **Pt 1, Ch 1, Sec 2.**

2. Equivalency

Automatic and remote control systems which do not fully comply with the requirements of the Rules may be accepted provided that they are deemed by the Society to be equivalent to those specified in the Rules.

3. Modification of requirements

The Society may modify parts of the requirements specified in the Rules taking the national requirements of the ships nationality, purpose and service areas of the ship into consideration.

4. Automatic and remote control systems with novel design features

For automatic and remote control systems with novel design features the Society may impose appropriate requirements of the Rules to the extent practically applicable with additional requirements made on design and test procedures other than those specified in the Rules.

5. Definitions

The definitions of terms which appear in the Rules are specified as the following unless otherwise specified in other Sections.

(1) **Specific automation equipment** is a general term for Class 1 specific automation equipment, Class 2 specific automation equipment and Class 3 specific automation equipments detailed below:

(A) Class 1 specific automation equipment
Automatic or remote control equipment for remote controlled ballasting/deballasting arrangement, automatic steering system, remote-controlled handling system for liquid cargo in bulk, power-driven opening and closing devices, automatic recording devices for main engine, remote-controlled mooring arrangements and air-conditioning arrangements for control stations.

(B) Class 2 specific automation equipment
In addition to those in (A), Automatic or remote control equipment for remote-controlled fuel oil filling arrangements, centralized monitoring device for refrigerating containers, cargo hose handling winches, automatic deck washing arrangements, remote-controlled mooring arrangements at ship-sides, power-operated pilot ladder winding appliances and emergency towing rope winches

(C) Class 3 specific automation equipment
In addition to those in (B), Automatic or remote control equipment centralized monitoring systems for machinery, centralized control systems for machinery, remote control arrangements for main engines and steering gear at the outside of the navigating bridge, high level alarm devices for cargo hold bilge, independent remote-controlled mooring arrangements and towing rope winches

(2) An **CMA ship** is the ship of which centralized monitoring and control systems for main propulsion and essential auxiliary machinery comply with the requirements of **Sec 3** and is registered.

(3) An **UMA ship** is the ship of which operating systems for periodically unattended machinery spaces comply with the requirements of **Sec 4** and is registered.

(4) An **UMA1 ship** is the UMA ship of which Class 1 specific automation equipment complies with the requirements of **502.** and is registered.

(5) An **UMA2 ship** is the UMA ship of which Class 2 specific automation equipment complies with the requirements of **503.** and is registered.
(6) An **UMA3 ship** is the UMA ship of which Class 3 specific automation equipment complies with the requirements of **504.** and is registered.

6. Installations characters

(1) Character **CMA** is given in the Register for the centralized monitoring and control systems for main propulsion and essential auxiliary machinery of the CMA ship.
(2) Character **UMA** is given in the Register for the operating systems for periodically unattended machinery spaces of the UMA ship.
(3) Character **UMA1** is given in the Register for the Class 1 specific automation equipment of the UMA1 ship.
(4) Character **UMA2** is given in the Register for the Class 2 specific automation equipment of the UMA2 ship.
(5) Character **UMA3** is given in the Register for the Class 3 specific automation equipment of the UMA3 ship.

7. Terminology

Terms used in the Rules are defined as follows:

(1) **Monitoring station** (excluding control station) is a position where measuring instruments, indicators, alarms, etc. for the machinery and equipment are centralized and necessary information to grasp the operating condition of them can be obtained. Where, however, a monitoring station is provided with the ship in addition to a control station mentioned in (2) below, the requirements of the Rules relating to a monitoring station do not apply to the monitoring station concerned.
(2) **Control station** is a position which has a function as a monitoring station and from which the machinery and equipment can be controlled.
(3) **Main control station** is a control station provided with equipment necessary and sufficient to control the main propulsion machinery (this equipment will be referred to as "main control equipment" in this (3) and (4) and from which the main propulsion machinery is normally controlled, of the ship which provides the main control equipment at the outside of the navigation bridge.
(4) **Main control station on bridge** is a navigation bridge of the ship which provides main control equipment at the navigation bridge and that the main propulsion machinery is normally controlled there.
(5) **Sub-control station** is such a control station at which the main propulsion machinery is capable of being controlled, except for local control station for the main propulsion machinery, that is provided in the machinery room of the ship provided with a main control station on bridge.
(6) **Bridge control devices** are remote control devices for the main propulsion machinery or controllable pitch propellers provided on a navigation bridge or a main control station on bridge.
(7) **Sequential control** is a pattern of control that can be carried out automatically in the redetermined sequence.
(8) **Program control** is a pattern of control that desired values can be changed in the predetermined schedule.
(9) **Local control** is direct manual control of the machinery and equipment performed at or near their locations, receiving the necessary information from the measuring instruments, indicators and so on.
(10) **Safety system** is a system which operates automatically, in order to prevent damages to the machinery and equipment in case where serious impediments to functioning should occur on them during operation so that one of the following actions will take place.
(A) Starting of standby machinery or equipment.
(B) Reduction of outputs of the machinery or equipment.
(C) Shutting off the fuel or power supplies thereby stopping the machinery or equipment.
(11) **Override arrangements** are arrangements for stopping temporarily the functions of safety system in part or in whole.

(12) **Centralized control station** is one of the control stations of a ship which has necessary and sufficient systems to control main propulsion machinery, generating sets, auxiliary machinery essential for main propulsion of the ship(hereinafter referred to as "essential auxiliary machinery") and other auxiliaries considered necessary by the Society (hereinafter such are referred to as centralized monitoring and control systems for machinery in (12) and (13) outside the navigation bridge, and a room specially provided for the purpose of installing centralized monitoring and control systems for machinery, from which main propulsion machinery is normally controlled.

(13) **Centralized monitoring and control station on bridge** is a navigation bridge of a ship which has centralized monitoring and control systems for machinery on her bridge and from which main propulsion machinery is normally controlled.

(14) **Unattended machinery operation** is an operation of machinery and equipment specified as following (A) to (G) without watchkeeping personnel with the specific duty of the operation and surveillance during a predetermined period.
- (A) Main propulsion machinery (propulsion generating set in electric propulsion ships are excluded)
- (B) Controllable pitch propeller
- (C) Steam generating set
- (D) Electric generating set (propulsion generating set in electric propulsion ship are included)
- (E) Auxiliary machinery associated with machinery and equipment listed in (A) to (G)
- (F) Fuel oil systems
- (G) Bilge systems

(15) **Bridge** is an area from which the navigation and control of the ship is exercised, including the wheelhouse and bridge wings.

(16) **Bridge wings** are parts of the bridge on both sides of the ships wheelhouse which extended to the ships side.

(17) **Wheelhouse** is an enclosed area of the bridge.

(18) **Computer-based system** is a system of one or more computers, associated software, peripherals and interfaces, and the computer network with its protocol.

(19) **Integrated system** is a system consisting of two or more subsystem having independent functions connected by a data transmission network and operated from one or more workstations.

(20) **Expert system** is an intelligent knowledge-based system that is designed to solve a problem with information that has been compiled using some form of human expertise.

(21) **Software** is the program, procedures and associated documentation pertaining to the operation of the computer system.

(22) **Basic software** is the minimum software, which includes firmware and middleware, required to support the application software.

(23) **Application software** is a software performing tasks specific to the actual configuration of the computer-based system and supported by the basic software.

(24) **Redundancy** is the existence of more than one means for performing a required function.

(25) **Interface** is a transfer point at which information is exchanged. (examples : interfaces including input/output interface; communications interface)

(26) **Peripheral** is a device performing an auxiliary function in the system. (examples : printer, data storage device)

(27) **Failure mode and effect analysis(FMEA)** is a failure analysis methodology used during design to postulate every failure mode and the corresponding effect or consequences.

Section 2 Surveys of Automatic and Remote Control Systems

201. General

1. Kinds of surveys

Kinds of surveys are as follows:
(1) Surveys for registration (hereinafter referred to as "Registration Surveys")
(2) Surveys for registration maintenance
  (A) Annual Surveys
  (B) Special Surveys
  (C) Occasional Surveys

2. Survey intervals

Surveys are to be carried out in accordance with the following requirements.
(1) A Classification Survey is to be carried out at the time when application for registration is made.
(2) Classification Maintenance Surveys are to be carried out at the times as prescribed below.
  (A) Annual Surveys are to be carried out at intervals specified in **Pt 1, Ch 2, 201.**
  (B) Special Surveys are to be carried out at intervals specified in **Pt 1, Ch 2, 401.**
  (C) An Occasional Survey: at a time falling on any of mentioned below, independently of Special Surveys and Annual Surveys.
    (a) When main parts of the systems have been damaged, repaired or renewed
    (b) When the systems are modified or altered
    (c) Whenever considered necessary by the Society

3. Preparation for surveys and others

(1) All such preparations as required for the survey to be carried out as well as those which may be required by the Surveyor as necessary in accordance with the requirements in the Rules are to be made by the applicant of the survey. The preparations are to include provisions of an easy and safe access, necessary facilities and necessary records for the execution of the survey. inspection, measuring and test equipment, which Surveyors rely on to make decisions affecting classification are to be individually identified and calibrated to a standard deemed appropriate by the Society. However, the Surveyor may accept simple measuring equipment (e.g. rulers, measuring tapes, weld gauges, micrometers) without individual identification or confirmation of calibration, provided they are of standard commercial design, properly maintained and periodically compared with other similar equipment or test pieces. The Surveyor may also accept equipment fitted on board a ship and used in examination of shipboard equipment (e.g. pressure, temperature or rpm gauges and meters) based either on calibration records or comparison of readings with multiple instruments.
(2) The applicant for the survey is to arrange a supervisor who is well conversant with the survey items intended for the preparation of the survey to provide the necessary assistance to the Surveyor according to his requests during the survey.
(3) The survey may be suspended where necessary preparations have not been made, any appropriate attendant is not present, or the Surveyor considers that the safety for execution of the survey is not ensured.
(4) Where repairs are deemed necessary as a result of the survey, the Surveyor will notify his recommendations to the applicant of the survey. Upon this notification, the repair is to be made to the satisfaction of the Surveyor.

202. Classification surveys

1. Drawings and data

(1) For centralized monitoring and control systems for main propulsion and essential auxiliary machinery or operating systems for periodically unattended machinery spaces intended to be registered, three copies of the following drawings and data are to be submitted.
- (A) Drawings and data concerning automation
  - (a) List of measuring points
  - (b) List of alarm points
  - (c) Control devices and safety devices
    - (i) List of controlled objects and controlled variables
    - (ii) Kinds of sources of control energy (self-actuated, pneumatic, electric, etc.)
    - (iii) List of conditions for emergency stopping, speed reduction (automatic or demand for reduction), etc.
- (B) Following drawings and data for the automatic control devices and remote control devices for main propulsion machinery or controllable pitch propellers:
  - (a) Operating instructions of main propulsion machinery such as starting and stopping, changeover of direction of revolution, increase and decreased of output, etc.
  - (b) Arrangements of safety devices (including those attached to the engines) and indicating lamps
  - (c) Controlling diagrams
- (C) Following drawings and data for the automatic control devices and remote control devices for boilers:
  - (a) Operating instructions of sequential control, feed water control, pressure control, combustion control and safety devices.
  - (b) Diagrams for automatic combustion control devices and automatic feed water control devices
- (D) Diagrams and operating instructions for automatic control devices for electric generating sets (automatic load sharing devices, preference tripping devices, automatic starting devices, automatic synchronous making devices, sequential starting devices, etc.)
- (E) Panel arrangements of monitoring panels, alarming panels and control stands at respective control stations
- (F) Schedules of on-board tests and sea trials

(2) For computer-based systems intended to be registered, three copies of following drawings and data are to be submitted.
- (A) Computer hardware
  The documentation to be submitted is to include:
  - (a) Hardware information of importance for the application and a list of documents that apply to the system
  - (b) The supply circuit diagram
  - (c) A description of hardware and software tools for equipment configuration
  - (d) The information to activate the system
  - (e) General information for trouble shooting and repair when the system is in operation
- (B) Computer software
  The documentation to be submitted is to include:
  - (a) A list of all main software modules installed per hardware unit with names and version numbers
  - (b) A description of all main software which is to include at least:
    - (i) A description of basic software installed per hardware unit, including communication software, when applicable
    - (ii) A description of application software
- (C) System reliability analysis
  The documentation to be submitted is to demonstrate the reliability of the system by means of appropriate analysis such as:
  - (a) A failure mode analysis describing the effects due to failures leading to the destruction of the automation system, In addition, this documentation is to show the consequences on other systems, if any.
  - (b) Mean time between failures (MTBF) calculation
  - (c) Any other documentation demonstrating the reliability of the system

(D) User interface description
The documentation is to contain:
(a) A description of the functions allocated to each operator interface(keyboard/screen or equivalent)
(b) A description of individual screen views (schematics, colour photos, etc.)
(c) A description of how menus are operated (tree presentation)
(d) An operator manual providing necessary information for installation and use.
(E) Test programs
The following test program are to be submitted:
(a) Software module/unit test
(b) Software integration test
(c) System validation test
(d) On-board test
Each test program is to include:
(i) A description of each test item
(ii) A description of the acceptance criteria for each tests.
(3) For specific automation equipment intended to be registered, three copies of the following drawings and data are to be submitted.
(A) Drawings showing the construction and layout of the specific automation equipment
(B) Drawings and data relative to the automatic and remote control systems of the specific automation equipment
(C) Particulars of the specific automation equipment
(D) Drawings and data other than above where deemed necessary by the Society

203. Shop tests

1. Type approval

Devices, units and sensors (hereinafter referred to as "automatic devices" in the Rules) and automatic equipment composed of automatic devices and basic software (if applicable) are to be type approved, in principle, according to the test methods approved by the Society before being taken into use.

2. Shop tests of automatic systems

The automatic devices which have passed through the type approval tests specified in **Par 1** are to be subjected to the following tests after completion of assembly as automatic system.
(1) Hardware
(A) External examination
(B) Operation tests and performance tests
(C) Insulation resistance tests and high voltage tests (to be applied to electric devices, electronic devices and so on)
(D) Pressure tests (to be applied to hydraulic devices, pneumatic devices and so on)
(E) Other tests considered necessary by the Society
(2) Software
Software acceptance tests of computer-based systems are to be carried out to verify their adaptation to their use on board, and concern mainly the application software
(A) The software modules of the application software are to be tested individually and subsequently subjected to an integration test. The test results are to be documented and to be part of the final file. The followings are to be checked.
(a) The development work has been carried out in accordance with the plan
(b) The documentation includes the proposed test, the acceptance criteria and the result.
Repetition tests may be required to verify the consistency of test results.
(B) Software acceptance will be granted subject followings.
(a) Examination of the avaliable documentation
(b) A function test of the whole system

204. On-board tests

The systems of automatic or remote control of the machinery and equipment are to be, after installed on board, confirmed that they operate effectively, respectively under as far practical condition as possible. Further, where deemed necessary by the Society, automatically or remotely controlled machinery and equipment are to be confirmed that they operate so as not to endanger the safety of the ship and machinery plant even in the case of failure of control systems as well. However, part of these tests may be carried out during sea trials. The proper documents, in which test procedures, set value for alarms and for operation of safety systems and so on are recorded, are to be kept on board.

205. Sea trials for the centralized monitoring and control systems for main propulsion and essential auxiliary machinery

1. Main propulsion machinery and controllable pitch propellers

The control systems for main propulsion machinery or controllable pitch propellers are to be subjected to the following tests and other tests considered necessary by the Society in accordance with the schedule of sea trials submitted in advance. After completion of the test on transfer of control specified in (3), it is to be shown that the main propulsion machinery or the controllable pitch propellers can be smoothly operated from the respective control stations.

(1) The main propulsion machinery or the controllable pitch propellers are to be subjected to starting tests, ahead-astern tests and running tests in the whole range of output, by means of the remote control devices from the main control station or the main control station on bridge.

(2) In addition to output increase and decrease tests, the operation tests of the main propulsion machinery or the controllable pitch propellers using the bridge control devices are to be carried out as deemed appropriate by the Society.

(3) In case where there are two or more control stations for main propulsion machinery or controllable pitch propellers, the test on transfer of control is to be carried out during ahead and astern operations of the main propulsion machinery or the controllable pitch propellers. In case where the transfer of control of the remote control devices for main propulsion machinery or controllable pitch propellers is carried out in accordance with **305. 2** (2) (C) (b), the above-mentioned test may be carried out during the stopping condition of the main propulsion machinery.

2. Boilers

The control systems for boilers are to be subjected to the following tests.

(1) With respect to main boilers, it is to be confirmed that the feed water control devices, combustion control devices and so on can operate stably in response to load variation of the main boilers, and the main boilers can supply steam stably to the main propulsion machinery, the electric generating sets and the auxiliary machinery essential for main propulsion of the ship without local manual operation.

(2) With respect to essential auxiliary boilers, it is to be confirmed that they can supply steam stably to the auxiliary machinery essential for main propulsion of the ship without manual operation.

(3) In case where an exhaust gas economizer is used as a source of steam supply to a turbine for driving a generator and steam is supplied from a boiler automatically in case of low power condition of the main propulsion machinery, operation tests of automatic control devices for this system are to be carried out.

3. Electric generating sets

In case where generators which supply electrical power to the loads necessary for propulsion of the ship and whose motive power is relying upon the propulsion systems, the systems of automatic or remote control of electric generating sets are to be subjected to operation tests.

206. Sea trials for the operating systems for periodically unattended machinery spaces

1. In sea trials, the tests specified in **205.** and this **206.** and other tests considered necessary by the Society are to be carried out in accordance with the schedule of sea trials submitted in advance.

2. The main propulsion machinery or the controllable pitch propellers are to show that they can be safely and surely operated in starting tests and ahead-astern tests and in the whole range of output, by means of the bridge control devices.

3. The electric generating sets are to be subjected to the following tests while the ship is navigating at normal sea going speed.

(1) In case where only one electric generating set is normally used, when stopping the main source of electrical power by tripping the circuit breaker, it is to be confirmed that automatic starting of the standby generator, automatic making of the air circuit breaker and sequential starting of important auxiliaries are performed.

(2) In case where two electric generating sets are normally used, when tripping the circuit breaker for one set, it is to be confirmed that preference tripping of non-important loads is performed, and propulsion and steering of the ship are maintained.

4. The auxiliary machinery is to be subjected to the following tests while controlling the main propulsion machinery or the controllable pitch propellers from the navigation bridge.

(1) Automatic starting tests of the standby pumps specified in **Table 9.3.1** to **9.3.6** and **Table 9.3.8** to **9.3.9.**

(2) For ships fitted with sea inlet scoops, automatic change over test to the circulating pumps.

(3) While the ship is navigating at normal sea going speed, it is to be confirmed that the exclusive air reservoirs for control use, if fitted, are capable of supplying air for at least five minutes after operation of a low pressure alarm for control air in a condition that the automatic starting function of control air compressor is stopped.

5. The exhaust gas economizer for supplying steam to turbine driving generator is to be subjected to the following tests.

(1) Operation tests such as steam supply from boilers and automatic starting of diesel engine driving generators, when putting back rapidly the handle of main propulsion machinery to the stop position while the ship is navigating at normal speed.

(2) When the main propulsion machinery is put into action expeditiously, it is to be confirmed that no critical condition occurs to water separator drums, piping, steam turbines and so on.

6. After completion of tests of automatic devices and automatic equipment, it is to be confirmed that the machinery can be safely and surely monitored and controlled under an unattended machinery operating condition as far similar to the normal sea going condition as practicable.

In this case, except where the operation mode is changed over, the running condition of the machinery is not to be adjusted by means of manual operation from any control station other than that on navigation bridge (including the centralized monitoring and control station on bridge).

207. Classification maintenance surveys

1. Annual surveys

(1) At each Annual Survey for the centralized monitoring and control systems for main propulsion and essential auxiliary machinery, the following performance tests are to be tested and placed in order. Where appropriate records of daily checks and periodical maintenances have been kept, some of the tests may be dispensed with at the Surveyors discretion.

(A) Safety devices for main propulsion machinery or controllable pitch propellers, and emergency stopping devices for main propulsion machinery fitted in the remote control station for the main propulsion machinery or controllable pitch propellers

(B) Safety devices for boilers

(C) Safety devices for electric generating sets

(2) At each Annual Survey for the operating systems for periodically unattended machinery spaces, the following performance tests are to be tested and placed in order. Where appropriate records of daily checks and periodical maintenances have been kept, some of the tests may be dispensed with at the Surveyors discretion.

(A) Safety devices for main propulsion machinery or controllable pitch propellers, and emergency stopping devices for main propulsion machinery fitted in the remote control station for the main propulsion machinery or controllable pitch propellers
(B) Safety devices for boilers
(C) Safety devices for electric generating sets
(D) Communication systems specified in **403. 3**

(3) At each Annual Survey for the specific automation equipment, general examination is to be carried out. Where considered necessary by the Surveyor, performance tests for the equipment may be required.

2. Special surveys

(1) At each special Survey for the centralized monitoring and control systems for main propulsion and essential auxiliary machinery, the followings are to be tested and placed in order. Where appropriate records of daily checks and periodical maintenances throughout the period since the last Periodical Survey have been kept, some of the tests may be abbreviated for the some parts which are in good condition.
(A) Main propulsion machinery and controllable pitch propellers
(a) Change-over devices of control positions between navigation bridge and centralized control station and between centralized control station and local control station; or between centralized monitoring and control station on bridge and local control station or sub-control station (where applicable to the ships which provide bridge control devices); and remote control systems installed in these positions
(b) Safety devices
(B) Boilers
(a) Automatic and remote control systems
(b) Safety devices
(C) Electric generating sets
(a) Automatic and remote control systems
(b) Safety devices
(D) Automatic change-over devices of essential pumps and automatic starting devices (or remote start/stop devices) of air compressors
(E) Alarm systems
(a) Function of alarm systems and indicator devices
(b) Confirmations of setting points of alarms
(F) Remote monitoring systems

(2) At each Special Survey for the operating systems for periodically unattended machinery spaces, the followings are to be tested and placed in order.
(A) Main propulsion machinery and controllable pitch propellers
(a) Change-over devices of control positions between navigation bridge and centralized control station and between centralized control station and local control station; or between centralized monitoring and control station on bridge and local control station or sub-control station; and remote control systems installed in these positions
(b) Safety devices
(B) Boilers
(a) Automatic and remote control systems
(b) Safety devices
(C) Electric generating sets
(a) Automatic and remote control systems
(b) Safety devices
(c) Automatic start of stand-by power supply unit after black-out
(d) Preferential trip systems
(D) Automatic change-over devices of essential pumps and automatic starting devices of air compressors
(E) Communication systems specified in **403. 3**
(F) Alarm systems

(3) At each Special Survey for the specific automation equipment, general examination and performance tests are to be carried out.

(4) Where considered necessary by the Surveyor, sea trials may be required after completion of the above mentioned tests in (1), (2) or (3).

Section 3 Centralized Monitoring and Control Systems for Main Propulsion and Essential Auxiliary Machinery

301. General

1. Scope

(1) The requirements in this Section apply to the centralized monitoring and control systems for main propulsion and essential auxiliary machinery of CMA ships.
(2) Automatic and remote control systems of CMA ships, which are specified in **Sec 4** or **Sec 5**, are to comply with the requirements in the Section concerned.

302. System design

1. System design

(1) Control systems, alarm systems and safety systems are to be so designed that one fault does not result in other faults as far as practicable and the extent of the damage could be kept to a minimum.
(2) Control systems, alarm systems and safety systems are to be designed on the fail-to-safe principle. The characteristic of fail-to-safe is to be evaluated on the basis not only of the respective systems themselves and associated machinery and equipment, but also the total safety of the ship.
(3) Systems of automatic or remote control are to be sufficiently reliable under service conditions.
(4) Cables for signals are to be installed in such a manner that harmful induced interference can be avoided.
(5) Constitution of systems is to comply with the following requirements:
(A) Control systems, alarm systems and safety systems are to be independent each other as far as practicable.
(B) Safety systems intended for the functions specified in **101. 7** (10) (C) are to be, in any case, independent of the other systems.
(C) Means are to be provided for the safety systems to investigate the cause of the action of the safety systems.

2. Supply of power

(1) Supply of electrical power
The supply of electrical power is to be in accordance with the following:
(A) Electrical supply circuits to control systems, alarm systems and safety systems are not to branch off from the power circuits and lighting circuits, except that the electrical power to the control systems, alarm systems and safety systems may be supplied from the power circuits to the machinery and equipment they serve.
(B) The electrical power to alarm systems and safety systems for electric generating sets is also to be supplied from an accumulator battery.
(2) Supply of oil pressure
The supply of control oil pressure is to be in accordance with the following:
(A) Sources of oil pressure are to be capable of supplying stably necessary pressure and quantity of purified oil.
(B) Overpressure preventive devices are to be provided on the delivery side of oil pressure pumps.
(C) Two or more sets of oil pressure pumps for the control of main propulsion machinery and main shaftings are to be provided and they are to be so arranged that in case where one of the pumps in operation becomes out of operation standby pump(s) may start automatically or may be readily remotely started. In this case, the oil pressure pumps are not to be used for the control of other machinery and equipment than main propulsion machinery and main shaftings.
(3) Supply of pneumatic pressure
The supply of control air is to be in accordance with the following:
(A) Control systems are to be provided with an air reservoir having a capacity capable of supplying air to control devices at least for 5 minutes in the event of failure of the control air compressor.

(B) Where starting air reservoirs for diesel engines used as main propulsion machinery are used as control air reservoirs, pressure reducing valves are to be duplicated.
(C) There are to be two or more sets of air compressors which may be used as a source of control air. Each air compressor is to have redundant capacity even in the event of failure of either one of them.
(D) Control air is to pass through a filter and, if necessary, a drier so that solid, oil and water may be removed to a minimum.
(E) Control air pipes are to be independent of general service air pipes and starting air pipes.

3. Environmental conditions

Systems of automatic or remote control are to be capable of withstanding the environmental conditions of the places where they are installed.

4. Control systems

(1) Independency of control systems
Control systems for main propulsion machinery or controllable pitch propellers, boilers, electric generating sets and auxiliary machinery essential for main propulsion of the ship are to be independent each other or designed such that failure of one system does not degrade the performance of other system.
(2) Interconnection devices
In case of plural main propulsion machinery or controllable pitch propellers, electric generating sets, or essential auxiliary machinery which are designed to be operated simultaneously in multiple under the same condition, interconnection devices may be provided between the control devices of these installations.
(3) Control characteristics
Remote control devices and automatic control devices are to have control characteristics in conformity with the dynamic properties of the machinery and equipment they serve and to be considered not to invite malfunction and hunting due to disturbance.
(4) Interlock
Control devices are to be provided with suitable interlocking arrangements in order to prevent damages to the machinery and equipment due to anticipated malfunction and maloperation of the machinery and equipment.
(5) Change-over to manual operating
Change-over to manual operating is to comply with the following requirements:
(A) Main propulsion machinery or controllable pitch propellers, boilers, electric generating sets and auxiliary machinery essential for main propulsion of the ship are to be so arranged as to be manually started, operated and controlled even in the event where automatic control devices become out of operation.
(B) Automatic control devices are generally to be provided with provisions to stop manually the automatic function of these devices.
(C) The provisions specified in (B) are to be capable of stopping the automatic function of the automatic control devices, even where any part of the automatic control devices become out of operation.
(6) Cancellation of remote control function
For remote control devices, the function of remote control is to be capable of being manually cancelled.
(7) Indication of control locations
In case where the machinery and equipment are capable of being operated from more than one station, the following requirements are to be complied with. However, this requirement need not be complied with in case the safety of the machinery and equipment and the safety at the time of maintenance work can be obtained by means of other measures considered appropriate by the Society.
(A) At each control station there is to be an indicator showing which station is in control of the machinery and equipment.
(B) Control of the machinery and equipment is to be possible only from one station at a time.

5. Alarm systems

(1) Function of alarm systems is to comply with the following requirements:
(A) In case where an abnormal condition is detected devices to issue a visual and audible alarm (hereinafter referred to as "alarm devices" in the Rules) are to operate.
(B) In case where arrangements are made to silence audible alarms they are not to extinguish visual alarms.
(C) Two or more faults are to be indicated at the same time.
(D) Audible alarms for machinery and equipment are to be clearly distinguishable from other audible alarms such as general alarm, fire alarm, CO_2 flooding alarm, etc.
(E) Alarm systems are to be designed with self-monitoring properties and alarms are to be given in the case of power and sensors failure.
(F) Alarm systems are to be capable of being tested during normal machinery operation.
(G) Where practicable, means are to be provided at convenient and accessible positions to permit the sensors to be tested without affecting the operation of the machinery.
(H) For the detection of transient faults which are subsequently self-correcting, a visual and audible alarm is required to lock in until accepted.
(2) Function of the alarm systems provided in the monitoring station for main propulsion machinery or controllable pitch propellers is to comply with the following requirements, in addition to the requirements in (1) :
(A) The visual indication of the alarm is to remain until the fault has been corrected.
(B) The acceptance of any alarm is not to inhibit another alarm.
(C) If an alarm has been acknowledged and a second fault occurs prior to the first being rectified, alarm devices are again to operate.
(D) Manual stopping of each alarm system is to be clearly indicated.
(3) Visual alarms are to be so arranged that each abnormal condition of the machinery and equipment is readily distinguishable.

6. Safety systems

(1) Constitution of systems
Constitution of safety systems is to comply with the following requirements:
(A) Safety systems are to be, as far as practicable, provided independently of control systems and alarm systems.
(B) Safety systems for the main propulsion machinery, boilers, electric generating sets and auxiliary machinery essential for main propulsion of the ship are to be independent each other.
(2) Function of safety systems
Function of the safety systems is to comply with the following requirements:
(A) Alarm systems which have functions prescribed in **302. 5** are to operate when safety systems are put into action.
(B) In case where safety systems are put into action and the operation of the machinery or equipment is stopped, it is not to automatically restart before manual reset is made.
(3) Override arrangements
Override arrangements are to be complied with:
(A) A visual indication is to be given at the relevant control stations of the machinery and equipment when an override is operated.
(B) The override arrangements are to be such that inadvertent operation is prevented.

7. Computer-based Systems

(1) Application
(A) Computer-based systems where used for control, monitoring and safety systems are to comply with the provisons of this **Par**.
(B) Computerized control systems, alarm systems and safety systems are divided into three categories as shown in **Pt 6, Ch 2, Table 6.2.1** based on the impact a single failure has on human and vessel safety, and the environment.
(2) Systems requirements
(A) System security
Computer-based systems are to be protected against unintentional or unauthorized modification of software.
(a) The systems categorized in Categories Ⅱ and Ⅲ in **Pt 6, Ch 2, Table 6.2.1** are to be protected against program modification by end users.

(b) For the systems categorized in Categories Ⅲ in **Pt 6, Ch 2, Table 6.2.1** modifications of parameters by manufacturers are to be approved by the Society.
(c) Any modifications made after shipment are to be documented and traceable.

(B) Program and memory data
To preclude the possible loss or corruption of data as a result of power disruption, programs and associated memory data considered to be essential for the operation of the specific system are to be stored in non-volatile memory.

(C) Start-up after power failure
The system's software and hardware is to be designed so that upon restoration of power supply after power failure, automatic or remote control and monitoring capabilities can immediately be available after the pre-established computer control access (sign-in) procedure has been completed.

(D) Self monitoring
Computer-based systems are to be self-monitoring and any incorrect operation or abnormal condition is to be alarmed at the computer workstation.

(E) Power supply
The power supply is to be monitored for voltage failure and protected for short circuit. Where redundant computer systems are provided to satisfy (F), they are to be separately fed.

(F) System independence
Control, monitoring and safety systems are to be arranged such that a single failure or malfunction of the computer equipment will not affect more than one of these system functions.

(G) Response time
Computer system's memory is to be of sufficient capacity to handle the operation of all computer programs as configured in the computer system. The time response for processing and transmitting data is to be such that an undesirable chain of events may not arise as a result of unacceptable data delay or response time during the computer system's worst data overload operating condition. For propulsion related system applications, the time limit on response delays for safety and alarm displays is not to exceed two (2) seconds. The response delay is to be taken as the time between detection of an alarm or safety critical condition and the display of the alarm or actuation of the safety system.

(H) Fail-safe
Computer-based system is to be designed such that failure of any of the system's components will not cause unsafe operation of the process or the equipment it controls. FMEA is to be used to determine that any component failure will not result in the complete loss of control, the shutdown of the process or equipment, or other undesirable consequences.

(3) Additional requirements for integrated systems

(A) General
Common hardware in an integrated system serving many subsystems, e.g., monitor, keyboard, microprocessor, etc., is to be duplicated or otherwise provided with a means of backup.

(B) Component independence
Failure of one part (individual module, equipment or subsystem) of the integrated system is not to affect the functionality of other parts, except for those functions directly dependent upon information from the defective part.

(C) Data communication

(a) Data link
(i) Any detected abnormal condition is to be alarmed at the centralized control station and on the navigation bridge.
(ii) Safeguards are to be provided to prevent unacceptable data transmission delays (overloading of network).
(iii) Alarm is to be activated prior to a critical data overload condition.

(b) Duplicated data link
(i) When the same data link is used for two or more essential functions (e.g., propulsion control and generator control), this link is to be duplicated, and each is to be routed as far apart from the other as practical.
(ii) The duplicate link is for standby purpose only and not to be used to reduce traffic in the online link.

(iii)Duplicated data link is to be arranged so that upon the failure of the on-line link, the standby link is automatically connected to the system. Switching between duplicated links is not to disturb data communication or continuous functioning of the system.

(iv)The failure of one link is to be alarmed at the centralized control station and on the navigation bridge.

(c) Connection failure

A complete failure in connectivity between component systems and the data highway is not to affect individual functionality of the component systems.

(d) Transmission software

(i) The transmission software is to be so designed that alarm or control data have priority over any other data.

(ii) The transmission protocol is to be chosen among international standards.

(iii)A means of transmission control is to be provided and designed so as to verify the completion of the data transmitted (Cyclic Redundancy Check(CRC) or equivalent acceptable method).

(iv)When corrupted data is detected, th number of retries is to be limited so as to keep an acceptable global response time.

(4) Expert system

The expert system software is not to be implemented on a computer linked with essential functions and is not to be used for direct control or operation.

(5) Hardware

(A) Design for ease of maintenance

(a) The design and layout of the hardware is to ensure ease of access to interchangeable parts for repairs and maintenance.

(b) Each replaceable part is to be simple to replace and is to be constructed for easy and safe handling.

(c) All replaceable parts are to be so designed that it is not possible to connect them incorrectly or to use incorrect replacements. Where this is not practicable, the replaceable parts and their mounting location, including their means of electrical connection, are to be clearly marked.

(B) User interface and input devices

(a) General

Input devices are to have clearly marked functions and, as far as practicable, are to be arranged to avoid conceivable inadvertent errors in their operations.

(b) Security

Input devices, such as keyboard, which can be used to effect changes to equipment or processes under control, are to be provided with security arrangement, such as password, so as to limit access to authorized personnel only.

Where a single action of, for example, pressing of a key is able to cause dangerous operating conditions or malfunctions, measures such as use of two or more keys are to be taken to prevent execution by a single action.

(c) Control Status

Where control action can be effected from more than one station, conflicting control station actions are to be prevented by means of interlock or warning. Control status is to be indicated at all stations.

(C) Visual display unit

(a) General

The size, color and density of text and graphic information displayed on a visual display unit are to be such that it may be easily read from the normal operator position under all operational lighting conditions. The brightness and contrast are to be capable of being adjusted.

(b) Alarm display

Where alarms are displayed by means of visual display unit, they are to appear in the sequence as the incoming signals are received. Alarming of the incoming fault signals is to appear on the screen, regardless of the mode the computer or the visual display unit is in.

(c) Propulsion monitoring
Where visual display unit is used to display monitored parameters, unless other display means are provided capable of displaying the same information, the centralized control station is to be provided with at least two computer monitors.
(d) Color monitor
The failure of a primary color is not to prevent an alarm from being distinctly indicated.
(D) Graphical display
(a) General
Information is to be presented clearly and intelligibly, according to its functional relations. Display presentations are to be restricted to the data which is directly relevant for the user.
(b) Alarms
Alarms are to be clearly distinguishable from other information and are to be visually and audibly presented with priority over other information, regardless of the mode the computer or the visual display unit is in.
(6) Software
(A) General
(a) The basic software is to be developed in consistent and independent modules and a self checking function is to be provided to identify failure of software module. When hardware (e.g. input/output devices, communication links, memory, etc.) is arranged to limit the consequences of failures, the corresponding software is also to be separated in different software modules ensuring the same degree of independence.
(b) Loading of software, when necessary, is to be performed in the aided conversational mode.
(c) A clear warning is to be displayed when using functions such as alteration of control condition, or change of data or programs in the memory of the system.
(B) Software development quality
(a) Software development si to be carried out according to a quality plan defined by the builder and records are to be kept.
(b) The standard ISO/IEC 90003:2004 Software Engineering - Guidelines - Application of ISO 9001:2000 or equivalent international standards, is to be taken as guidance for the quality procedure.
(c) The quality plan is to include the test procedure for software and the results of the tests are to be documented.

303. Prevention of flooding and fire safety measures

1. Prevention of flooding

(1) Bilge wells in the spaces where main propulsion machinery, main shaftings, boilers, electric generating sets and auxiliary machinery essential for main propulsion of the ship are situated and other spaces considered necessary by the Society are to be large enough to accommodate easily the normal drainage during operation of the machinery installations and high liquid level alarm devices are to be provided at two or more places so that the increase of bilge can be detected at normal angles of heel and trim, except for such spaces that the Society appreciated that there is no fear of flooding.
(2) Where bilge pumps are capable of being started and stopped automatically, small bilge wells may be accepted in consideration of the operating frequency of the pump.
(3) Where bilge pumps are capable of being started and stopped automatically, alarm devices are to be provided to indicate either one of the following conditions:
(A) When the influx of liquid is greater than the pump capacity.
(B) When the pump is operating more frequently than would be normally expected.
(4) The controls of any valve serving a sea inlet, a discharge below the load water line or a bilge discharge system are to be so sited as to allow adequate time for operation in case of influx of water to the space with the ship in the fully loaded condition, having regard to the time likely to be required in order to reach and operate such controls.

2. Fire Safety Measures

(1) Fuel oil arrangements and lubricating oil arrangements installed in the spaces where main engines, boilers, electric generating sets and auxiliaries for propulsion of the ship are situated and other spaces which are considered necessary by the Society, are to comply with the following requirements, in addition to the requirements in **Pt 5, Ch 6, Sec 8** and **9**.

(A) Fuel oil piping system and lubricating oil piping system are, if necessary, to be shielded or appropriately protected in order to prevent, as far as practicable, scattering or leaking oil from touching the hot surfaces or from entering into the air inlets. The number of joints of piping systems is to be limited to a minimum.
(B) Where fuel oil service tanks are filled automatically or by remote control, means are to be provided to prevent overflow spillages.
(C) Equipment (except for tanks) which treats flammable liquids, e.g, fuel oil purifiers, which, whenever practicable, is to be installed in a special space reserved for purifiers and their heaters, is to have arrangements to prevent overflow spillages.
(D) In case where fuel oil service tanks or settling tanks are fitted with heating arrangements, a high temperature alarm device is to be provided, if the flash point of the fuel oil can be exceeded.

304. Centralized monitoring and control systems

1. General

Centralized control station or centralized monitoring and control station on bridge, designed and equipped to ensure the operation of the main propulsion and essential auxiliary machinery as safe as that under direct supervision under all sailing conditions including manoeuvring is to be provided.

2. Centralized monitoring and control systems for main propulsion and essential auxiliary machinery

Following devices are to be provided in the centralized control station or the centralized monitoring and control station on bridge:

(1) Remote control devices and monitoring devices for main propulsion machinery or controllable pitch propellers
(2) Remote control devices and monitoring devices for boilers
In this case, the remote control devices are to be in accordance with the following:
(A) Main boilers
Control devices for the control of the number of firing burners and combustion control devices, this does not include the ignition of the main boilers.
Where, however, the combustion and the number of the firing burners are automatically controlled, these control devices need not be fitted.
(B) Auxiliary boilers
Remote control devices for boilers which are required to be operated to supply steam to the turbines of exhaust gas turbo generator set in order to maintain stable electrical power in the case of low power condition of the main propulsion machinery.
However, where the boilers are arranged to operate automatically, the remote control devices may be dispensed with.
(3) Remote control devices and monitoring devices for electric generating sets
In case where the equipment specified in **403. 1** is provided, the remote control devices may be dispensed with.
(4) Remote starting and stopping devices and monitoring devices for pumps used as auxiliary machinery essential for main propulsion
In case where the standby pumps for these pumps are arranged to start automatically, the remote starting and stopping devices may be dispensed with.
(5) Remote starting and stopping devices and monitoring devices for air compressors for starting of main propulsion machinery and for controlling
In case where these air compressors are arranged to operate automatically, the remote starting and stopping devices may be dispensed with.

(6) Alarm devices to indicate the operation of the safety systems and the faults of the machinery specified in **305.** to **310.**
(7) Emergency stopping devices for main propulsion machinery specified in **305. 2** (3) (E).
(8) Communication means specified in **Pt 5, Ch 1, 106.** and engineers alarm specified in **Pt 5, Ch 1, 107.**
(9) Bilge alarm device specified in **303. 1** (1) and (3)
(10) Fire detectors
(11) Remote indications specified in **Table 9.3.1** to **9.3.9**
(12) Override arrangements

305. Automatic and remote control of main propulsion machinery or controllable pitch propellers

1. General

Devices for remote or automatic control by which the main propulsion machinery or the controllable pitch propellers are controlled are to comply with the requirements in this **305.**

2. Remote control devices for main propulsion machinery or controllable pitch propellers

(1) General
Remote control devices for main propulsion machinery or controllable pitch propellers are to be complied with the following requirements:
(A) Remote control devices for main propulsion machinery or controllable pitch propellers are to be capable of controlling the propeller speed and the direction of thrust (the blade angle of propellers in the case of controllable pitch propellers) by means of a simple operation.
(B) Remote control devices for main propulsion machinery or controllable pitch propellers are to be provided for each propeller. Where multiple propellers are designed to operate simultaneously, they may be control by one control device.
(C) In case where the speed of the diesel engines used as main propulsion machinery is controlled by governors, the governors are to be adjusted so that main propulsion machinery may not exceed 103 % of the maximum continuous revolutions. The governors are to be capable of maintaining the safe minimum speed.
(D) In case where a program control is adopted, the program for increase and decrease of output is to be so designed that undue mechanical stresses and thermal stresses do not occur in any parts of machinery.
(E) In the remote control stations or monitoring stations and at the maneuvering platform for the main propulsion machinery or controllable pitch propellers, the following instruments are to be provided.
(a) Indicators for propeller speed and direction of rotation in the case of solid propellers.
(b) Indicators for propeller speed and pitch position in the case of controllable pitch propeller.
(F) In the remote control stations for main engines or controllable pitch propellers, alarm devices necessary for the control of main engines are to be provided.
(2) Transfer of control
Remote control devices for main propulsion machinery or controllable pitch propellers are to comply with the following requirements with respect to transfer of control:
(A) Each control station for main propulsion machinery or controllable pitch propellers is to be provided with means to indicate which of them is in control.
(B) Remote control of main propulsion machinery or controllable pitch propellers is to be possible only from one location at a time.
(C) Transfer of control is to be possible only with order by the serving station and acknowledgement by the receiving station except for the following cases:
(a) Transfer of control between local control station for main propulsion machinery or controllable pitch propellers and main control station or subcontrol station; and
(b) Transfer of control during the stopping condition of the main propulsion machinery.
(D) While main propulsion machinery or controllable pitch propellers are controlled from the navigation bridge or the main control station on bridge, transfer of control is to be possible from the local control station for the main propulsion machinery or controllable pitch propellers, the main control station or the sub-control station with no order of the transfer of control from the navigation bridge or the main control station on bridge.

(E) Means are to be provided to prevent the propelling thrust from altering significantly when transferring control from one location to another except for the transfer of control described in (C) (a) and (D).

(3) Failure of remote control systems of main propulsion machinery or controllable pitch propellers
The following requirements are to be complied with in case of failure of remote control devices for main propulsion machinery or controllable pitch propellers:

(A) In the remote control stations for main propulsion machinery or controllable pitch propellers alarm devices which operate in the event of failure of the remote control devices for main propulsion machinery or controllable pitch propellers are to be provided.

(B) In the event of failure of the remote control devices for main propulsion machinery or controllable pitch propellers, the main propulsion machinery or the controllable pitch propellers are to be possible to control locally.

(C) In the event of failure of the remote control devices for main propulsion machinery or controllable pitch propellers, the preset speed and direction of the propeller thrust are to be maintained until the control is in operation at the main control station, the sub-control station or the local control station for main propulsion machinery or controllable pitch propellers, unless this is considered impracticable by the Society.

(D) In the event of failure of the remote control devices for main propulsion machinery or controllable pitch propellers, the transfer of control to the main control station, the sub-control station or the local control station for main propulsion machinery or controllable pitch propellers is to be possible by a simple operation.

(E) Remote control stations for main propulsion machinery or controllable pitch propellers are to be provided with independent emergency stopping devices for the main propulsion machinery, which are effective in the event of failure of the remote control devices for the main propulsion machinery or the controllable pitch propellers.

(4) Remote starting of main propulsion machinery in diesel ships
Starting by means of remote control devices for main propulsion machinery is to comply with the following:

(A) The number of starting of main propulsion machinery is to satisfy the number specified in **Pt 5, Ch 6, 1001.**

(B) Remote control devices for main propulsion machinery arranged to automatically start are to be so designed that the number of automatic consecutive attempts which fail to produce a start is limited to three times. In the event of failure of starting, a visual and audible alarm is to be issued at the relevant control station as well as the main control station on bridge, the main control station or the monitoring station (where the main control station on bridge and the main control station are not provided) for the main propulsion machinery or the controllable pitch propellers.

(C) Where compressed air is used for starting of the main propulsion machinery, alarm devices to indicate the low starting air pressure are to be provided at the remote control station and the monitoring station for the main propulsion machinery.

(D) The low starting air pressure mentioned in (C) for the operation of alarm devices is to be set at a level to permit further main propulsion machinery starting operations.

3. Bridge control devices

Bridge control devices are to comply with the following requirements as well as those in **305. 2.**

(1) Even when main propulsion machinery or controllable pitch propellers is controlled from the navigation bridge or the main control station on bridge, the telegraph orders at the navigation bridge or the main control station on bridge are to be indicated in the control stations and at the maneuvering platform which are capable of controlling main propulsion machinery or controllable pitch propellers.

(A) Sub-control station or local control station for main propulsion machinery or controllable pitch propellers for ships provided with main control station on bridge, or

(B) Main control station for ships not provided with main control station on bridge.

(2) Bridge control devices are to be provided with either one of the following devices in order to prevent prolonged running of main propulsion machinery in critical speed range:

(A) Devices to make to pass automatically and rapidly through the critical speed range.

(B) Alarm devices which operate in case where the main propulsion machinery operate exceeding a predetermined period in the critical speed range.

4. Safety measures

(1) Safety measures for main propulsion machinery or controllable pitch propellers
Safety measures for main propulsion machinery or controllable pitch propellers are to comply with the following requirements:
(A) The following safety measures are to be taken to remote control devices for main propulsion machinery or controllable pitch propellers:
(a) Necessary interlocking devices are to be provided to prevent serious damage due to mis-operation.
(b) Where the auxiliary machinery essential for main propulsion of the ship are driven by electric motors, the main propulsion machinery is to be so designed as to stop automatically in the event of failure of the main source of electrical power or to be capable of being stopped.
(c) The main propulsion machinery is to be so arranged as not to re-start automatically when electrical power is restored after the failure of the main source of electrical power whereas the main propulsion machinery was stopped.
(d) The remote control devices for main propulsion machinery or controllable pitch propellers are to be so designed that the engine may not be abnormally overloaded in the event of failure of them.
(B) Stopping devices for main propulsion machinery are to be provided at the monitoring station for main propulsion machinery or controllable pitch propellers.
(2) Safety systems of main propulsion machinery
Safety systems of main propulsion machinery are to comply with the following requirements:
(A) A device to shut off the fuel or steam supply (this device hereinafter being referred to as "safety device") for the main propulsion machinery is not to be automatically activated except in cases which could lead to complete breakdown, serious damage or explosion.
(B) The safety systems for the main propulsion machinery are to be so designed as not to lose their function or as to fail to safe, even in the event of failure of main electrical source or air source.
(3) Self-reversing diesel engines
At least the following safety measures are to be taken to the remote control devices for self-reversing diesel engines:
(A) Starting operation is to be possible only when the camshaft is surely at the position of "Ahead" or "Astern".
(B) During reversing operation, fuel is not to be injected.
(C) Reversing operation is to be conducted after "Ahead" revolution is reduced to a predetermined value.
(4) Main propulsion machinery of a multi-engines coupled to a single shaft ship
At least the following safety measures are to be taken to the remote control devices for multi-engines coupled to a single shaft:
(A) Each main propulsion machinery is to be provided with an overload preventive device.
(B) Each main propulsion machinery is not to be subjected to an abnormally unbalanced load.
(5) Main propulsion machinery with clutch
At least the following safety measures are to be taken to the remote control devices for engines with clutch:
(A) The clutch equipped to a main propulsion machinery in a multi-engines coupled to a single shaft is to be disengaged when the main propulsion machinery is stopped in an emergency. While multi-engines are operating in different directions of rotation their clutches are not to be engaged simultaneously.
(B) Engaging and disengaging of clutches are to be carried out below a predetermined revolutions of the main propulsion machinery.
(C) An overspeed protective devices specified in **Pt 5, Ch 2, 203. 1** and **2** or **Pt 5, Ch 2, 304. 1** of the Rules for the Survey and Construction of Steel Ships is to be provided.
(D) In case where there is fear that the speed of the propulsion motor would exceed 125 % of the rated revolution when the clutch is disengaged, an overspeed protective device as deemed appropriate by the Society it to be provided.
(6) Main propulsion machinery driving controllable pitch propellers
At least the following safety measures are to be taken to the remote control devices for engines driving controllable pitch propellers:

(A) In overload preventive device is to be provided.
(B) Starting of engines or engaging of clutches is to be performed while the propeller blades are in a neutral position.
(C) An overspeed protective device as specified in **Pt 5, Ch 2, 203. 1** or **Pt 5, Ch 2, 304. 1** is to be provided.
(D) In case where there is fear that the speed of the propulsion motor would exceed 125 % of the rated revolution when the propeller pitch is altered, an overspeed protective device as deemed appropriate by the Society is to be provided.

(7) Slow speed(crosshead) main diesel engines
For the slow speed main diesel engines, safety system specified in **Table 9.3.1** is to be provided.
(8) Medium and high speed(trunk piston) main diesel engines
For medium and high speed main diesel engines, safety system specified in **Table 9.3.2** is to be provided.
(9) Propulsion steam turbine
For propulsion steam turbines, safety system specified in **Table 9.3.3** is to be provided.
(10) Electric propulsion equipments
For electric propulsion equipments, safety system specified in **Table 9.3.4** is to be provided.
(11) Controllable pitch propellers
For controllable pitch propellers, safety system specified in **Table 9.3.5** is to be provided.

306. Automatic and remote control of boilers

1. General

(1) The systems of automatic control for both combustion and feed water of oil-fired boilers are to comply with the requirements in **Par 2** to **Par 4** respectively.
(2) The systems of automatic control for either combustion or feed water of oil-fired boilers are to comply with the relevant requirements in **Par 2** or **Par 3** as well as the requirements in **Par 4.**
(3) Automatic control of boilers other than oil-fired boilers or having a special feature is to be deemed appropriate by the Society.
(4) Remote water level indicators are to comply with the requirements in **Pt 5, Ch 5, 129.** for the Survey and Construction of Steel Ships.

2. Automatic combustion control systems

(1) General
Automatic combustion control systems are to comply with the following requirements:
(A) The automatic combustion control systems are to be able to control so as to obtain planned steam amount, steam pressure and steam temperature and to secure stable combustion.
(B) The devices to control the fuel supply to meet the load imposed are to be capable of ensuring stable combustion in the controllable range of fuel supply.
(C) Where combustion control is carried out according to the pressure of the boiler, the upper limit of this pressure is to be lower than the set pressure of the safety valves.

(2) Combustion control devices for intermittent operation
The combustion control devices for intermittent operation are to comply with the following requirements and they are to operate according to the planned sequence:
(A) Before ignition on the pilot burner or before ignition on the main burner if the pilot burner is not fitted, the combustion chamber and the flue are to be pre-purged by air of not less than 4 times the volume of the combustion chamber and the flue up to the boiler uptake. For small boilers with only one burner, pre-purge for not less than 30 seconds will be accepted.
(B) In case of direct ignition which is a method of ignition that the main burner is fired by ignition spark, opening of the fuel valve is not to precede the ignition spark.
(C) In case of indirect ignition which is a method of ignition that the main burner is fired by the pilot burner, opening of the fuel valve for the pilot burner (hereinafter referred to as " ignition fuel valve") is not to precede the ignition spark, and opening of the fuel valve for the main burner (hereinafter referred to as "main fuel valve") is not to precede opening of the ignition fuel valve.

(D) Firing is to be surely carried out within the planned period. Main fuel valve is to be so designed as to close after opening of the valve not exceeding 10 seconds in the case of direct ignition and 15 seconds in the case of indirect ignition if the firing on the main burner has failed.
(E) Firing on the main burners is to be carried out at their low firing position.
(F) After closure of the main fuel valve, post-purge is to be carried out for not less than 20 seconds to ensure adequate combustion air to completely burn all fuel oil remaining between the fuel oil valve and the burner nozzle. This requirements need not to be complied with in the case of auxiliary boilers as deemed appropriate by the Society.

(3) Combustion control devices for the control of the number of firing burners
The combustion control devices for the control of the number of firing burners are to comply with the following requirements:
(A) Each burner is to be fired and extinguished according to the planned sequence. However, the base burner may be fired by manual operation and other burners may be fired by flame of a burner(s) already fired.
(B) The remaining fuel in the extinguished burner is to be automatically burnt up in order not to interfere the restarting. However, while the pilot burner is not fired, the remaining fuel in the base burner is not to be removed by steam or air when it is in place.
(C) The burners for main boilers are to be capable of being fired and extinguished from the main control station or the main control station on bridge, except for the firing of base burner.

(4) Other combustion control devices
Other combustion control devices are to be deemed appropriate by the Society, as well as they are to comply with the relevant requirements in (2) and (3).

3. Automatic feed water control devices

(1) Automatic feed water control devices are to be capable of controlling automatically the feed water in order to maintain the water level in the boilers in a predetermined range.
(2) Main boilers are to be provided with not less than three water level detectors used for a feed water control device, a remote water level indicator, a low-water level safety device and a low-water level alarm device.

4. Safety measures

(1) Safety devices
Safety devices are to comply with the following requirements.
(A) A self-closing valve is to be provided in the feed water piping of the main boiler, and is to operate automatically in the event of abnormal rise of the water level in the main boiler.
(B) Safety devices for low water level in the main boilers are to be put into action by means of a signal from either one of the two low water level detectors which are independent each other. However, one of those detectors may be used for other purpose.

(2) For main boilers, safety system specified in **Table 9.3.6** is to be provided.
(3) For essential auxiliary boilers, safety system specified in **Table 9.3.7** is to be provided.

307. Automatic and remote control of electric generating sets

1. General

(1) Electric generating sets arranged to be automatically or remotely started are to be provided with interlocking devices necessary for safe operation.
(2) Electric generating sets arranged to be automatically started are to be so designed that the number of automatic consecutive attempts which fail to produce a start is limited to two times and to be provided with an alarm device which operate at the time of the failure of starting.
(3) In case where a diesel engine to drive a propulsion generator is remote started, the number of starting is to conform to the required number specified in **Pt 5, Ch 2, 202. 5.**
(4) Where automatic start of the standby generating set with automatic connection to the switchboard busbars is provided, automatic closure on to the busbars is to be limited to one attempt in the event of the original power failure being caused by short circuit.

(5) Automatic control and remote control systems for the electric generating set, whose generator is driven by the main propulsion machinery and supplies electrical power to the electrical installations relating to the services specified in **Pt 6, Ch 1, 201. 1** (1) and is operated while the main propulsion machinery is controlled by the bridge control devices are to comply with the requirement in **Pt 6, Ch 1, 201. 2** in addition to those in this **Sec 307.**

2. Safety measures

For auxiliary diesel engines and auxiliary steam turbines, safety system specified in **Table 9.3.8**. For main generators, safety system specified **Table 9.3.9** is to be provided.

308. Automatic and remote control of thermal oil installations

1. Control devices

Control devices are to comply with the requirements in **306. 2** (1) and (2) as well as those in **Pt 5, Ch 5, 202. 1** and **2.**

2. Safety measures

Safety devices are to comply with **Pt 5, Ch 5, 201.** and **Pt 5, Ch 5, 202. 5** and safety system specified in **Table 9.3.10**.

309. Automatic and remote control of other machinery

1. Air compressors

(1) Automatic operation of air compressors
In case where air compressors for starting and air compressors for controlling are automatically operated, alarm devices are to be provided to indicate pressure drop in air reservoirs.
(2) Safety devices
Air compressors are to be so arranged as to stop automatically in the event of drop of lubricating oil pressure.

2. Heat exchangers

The following heat exchangers used for main propulsion machinery, main boilers, important auxiliary boilers, generators and prime movers driving auxiliary machinery essential for main propulsion of ships are to be provided with temperature control devices in order to regulate the temperatures of lubricating oil, coolant and fuel oil in a predetermined range:
(1) Lubricating oil coolers
(2) Coolers for cylinder coolant water
(3) Coolers for piston coolant
(4) Coolers for fuel valve coolant
(5) Fuel oil heaters
(6) Heaters for fuel oil purifiers
(7) Heaters for lubricating oil purifiers

3. High temperature alarm for oil heaters

In case where a temperature for fuel oil and lubricating oil is automatically controlled, high temperature alarm devices are to be provided, except where oils are not heated above the flash point.

4. Opening and closing devices for sea valves

In case where sea valves fitted on the shell plating below the load water line are remotely or automatically controlled, other opening and closing devices which can be easily operated even in the event of failure of the automatic or remote control devices are to be provided.

5. Liquid level alarm systems for fuel oil tanks

In case where fuel transfer to fuel oil tanks is automatically controlled, the receiving tanks are to be provided with a high and low level alarm.

6. Mooring arrangements

In case where mooring arrangements are provided with remote control devices, the mooring arrangements are to be capable of being locally operated.

7. Fuel oil filling arrangements

In case where arrangements for filling fuel oil into respective fuel oil tanks from the outside of the ships (hereinafter referred to as "fuel oil filling arrangements") are provided with remote control devices, the fuel oil filling arrangements are to be such as not to interfere with filling of fuel even in the event of failure of the remote control devices.

8. Alarms

For other machinery alarm devices specified in **Table 9.3.11** are to be provided

310. Override arrangements

1. Application

(1) Automatic slowdowns and automatic shutdowns specified in **Table 9.3.1** to **Table 9.3.8** are to be provided with override arrangements, regardless of the mode of control(manual, remote or automatic). However, override arrangements do not need to be fitted in those cases where override may result in total failure of the engine and/or propulsion equipment within a short time. Automatic slowdowns and automatic shutdowns where provided in excess of those indicated in **Table 9.3.1** to **Table 9.3.8** are to be provided with override arrangements.

Table 9.3.1 Slow speed (Crosshead) diesel engines

Systems	Monitored parameters [H: High L: Low O: Abnormal status]		AA	RI	Auto slow down with alarm	Auto start of Stand by pump with alarm	Auto shut down with alarm	Notes [AA = Alarm Activation RI = Remote Indication ●=apply]

	Coolant expansion tank, level	L	●					
Engine	Speed/direction of rotation			●				
	Rotation-wrong way	O	●					
	Engine overspeed	O	●				●	
	Remote start failure	O	●					
Power	Control, alarm or safety system, power supply failure	O	●					

(NOTES)

(1) Oil mist detection system is to be of the approved type by the Society, tested by **Ch 3, Sec. 10 of the Guidance for Approval of Manufacturing Process and Type Approval, Etc.** and applied to **Pt 5, Ch 2, 203.**

(2) Where outlet temperature from each bearing cannot be monitored due to the engine/turbocharger design, alternative arrangements may be accepted. Continuous monitoring of inlet pressure and inlet temperature in combination with specific intervals for bearing inspection in accordance with the turbocharger manufacturer's instructions may be accepted as an alternative.

Table 9.3.2 Medium and high speed (trunk piston) diesel engines

Section 4 Operating Systems for Periodically Unattended Machinery Spaces

401. General

1. Scope

(1) The requirements in this Section apply to the operating systems for periodically unattended machinery spaces of UMA ships.
(2) Automatic and remote control systems of UMA ships, which are specified in **Sec 5**, are to comply with the requirements in the Section.

2. General

(1) UMA ships are to be designed and arranged as to ensure that the safety of the ship is equivalent under all sailing conditions including maneuvering to that of a ship operated with watch keeping personnel at all times.
The design and arrangements are to be capable of performing unattended machinery operation for at least 24 consecutive hours.
(2) Operating systems for periodically unattended machinery spaces of UMA ships are to comply with the requirements in this Section as well as those in **Sec 3**. However, in **Sec 3**, standby pumps specified in **Table 3.1** to **Table 3.6** and in **Table 3.8** to **Table 3.9** are to be automatically started and those relevant alarms are to be activated.

402. Monitoring and control systems in navigation

1. Bridge control devices

The bridge control devices specified in **305. 3** are to be provided in the navigation bridge. The bridge control devices provided in the navigation bridge or at the bridge the centralized monitoring and control station are to include the following devices:
(1) Bypass devices to temporarily override the function of the program control devices or other devices considered appropriate by the Society which are provided according to the requirement in (2) and an indicator to show the activation of the bypass devices.
(2) The bridge control devices are to be provided with program control devices or other approved means to ensure that the main propulsion machinery will not suffer undue mechanical stress and thermal stress and speed of the main propulsion machinery is easily increased and decreased or easily increased. In case where, however, specially approved by the Society taking the kind of engines and so on into consideration, the program control devices or other means as may be dispensed with.

2. Navigation bridge

The alarm devices specified in the following are to be provided in the navigation bridge.
(1) Alarm devices for main propulsion machinery or controllable pitch propellers, electric generating sets and auxiliary machinery essential for main propulsion of the ship. The visual alarms may be displayed as group alarms. However, the visual alarms for automatic stoppage and for automatic reduction of speed of or load to the main propulsion machinery are to be displayed separately.
(2) Bilge alarm devices
(3) An alarm device for prolonged running in critical speed range

3. Bridge centralized monitoring and control station

(1) The alarm devices provided at the bridge centralized monitoring and control station are to comply with the following requirements.
(A) At least the following visual alarms of alarms required in **304. 2** (6) are to be equipped at confirmable positions from the place to control the operating handle of the main propulsion machinery.
(a) The alarms for automatic stoppage
(b) The alarms for automatic reduction of speed or load, or the alarms for demanding speed or load reduction
(c) The alarms for failure of remote control systems specified in **305. 2** (3) (A)
(d) The alarms for low starting air pressure specified in **305. 2** (4) (C)
(e) The alarms for failure of remote starting specified in **Table 3.1** and **Table 3.2**

(f) The alarms for prolonged running in critical speed range specified in **Table 3.11**

(B) The alarm devices required in **304. 2** (6) and (10), excluding those specified in (A), are to be so arranged that the working conditions of machinery are perceived at a glance from the place to control the operating handle of the main propulsion machinery. Where it is impracticable to comply with this requirement, additional visual alarms which may be of group indication are to be provided.

(2) The bridge centralized monitoring and control station are to comply with the following requirements in their shapes, sizes and arrangements.

(A) The bridge centralized monitoring and control station is to be situated within one deck floor and not to be provided with any partition walls (steel walls, wooden walls, glass walls, etc.) inside of the station except where it is considered inevitable by the Society.

(B) At the bridge centralized monitoring and control station any audible alarm and order issued from any position is to be capable of being heard clearly and directly at any other position.

403. Safety measures, means of communication, etc.

1. Continuity of electrical source

(1) Where the electrical power can normally be supplied by one generator, the main source of electrical power is to comply with the followings:

(A) Suitable load shedding arrangements are to be provided to ensure the integrity of supply to services required for propulsion and steering as well as safety of the ship in case where the generator is overloaded.

(B) In case of loss of electrical power of the generator in operation, adequate provision is to be made for automatic starting and connecting to the main switchboard of a standby generator of sufficient capacity to permit propulsion and steering and to ensure safety of the ship with automatic re-starting of the important auxiliaries including sequential operations.

(C) The standby generator specified in (B) is to be capable of supplying electrical power in not more than 30 seconds after the loss of electrical power.

(2) If the electrical power is normally supplied by more than one generator simultaneously in parallel operation, provision is to be made, for instance by load shedding, to ensure that, in case of loss of electrical power of one of these generating sets, the remaining ones are kept in operation without overload to permit propulsion and steering, and to ensure safety of the ship.

2. Air compressors

(1) Starting air compressors are to be capable of operating automatically so as to maintain the pressure in the starting air reservoirs in a predetermined range.

(2) Air compressors used for charging the control air reservoirs are to be capable of operating automatically so as to maintain the pressure in the control air reservoirs in a predetermined range.

3. Means of communication

A means of vocal communication which is operable even in the event of failure of the main electrical power supply is to be provided between the bridge centralized monitoring and control station the local control station of main propulsion machinery (when a sub-control station is provided, the station may be acceptable instead) and the engineers accommodation for the ship provided with a bridge centralized monitoring and control station and between the navigating bridge, the centralized control station, the local control station of main propulsion machinery and the engineers accommodation for the other ships.

4. Alarm systems

Alarm systems are to comply with the following requirements.

(1) Alarm systems are to be arranged with automatic change-over to an independent standby power supply in the event of loss of the normal power supply.

(2) Failure of the normal power supply and standby power supply specified in (1) is to be indicated by independent alarms.

(3) Alarm devices are to be provided on the engineers accommodation to indicate the fault of main propulsion machinery, electric generating sets, and auxiliary machinery essential for main propulsion. For this requirements, the visual alarms may be displayed as group alarms.

(4) Alarm devices provided on the engineers accommodation are to comply with the following requirements:
(A) Alarm devices are to be provided in engineers public rooms
(B) Alarm devices are to be provided in the respective private rooms for engineers and to have connection to each of the engineers cabins through a selector switch, to ensure connection to at least a cabin of an engineer on watch.
(C) Alarm devices are to be capable of activating the engineers alarm required by **Pt 5, Ch 1, 107.** of the Rules for the Survey and Construction of Steel Ships if an alarm function has not received attention locally within a limited time.
(5) Audible alarm devices which will provide warning of faults in machinery and equipment specified in **107. 7** (14) (A) to (G) are to be installed in the spaces where main propulsion machinery, boilers, electric generating sets, etc. are situated.
(6) For the ships provided with a bridge centralized monitoring and control station the local silencing of the audible alarms equipped in engineers accommodation is not to stop the audible alarm required in (5) and the audible and visual alarms equipped at the bridge centralized monitoring and control station. For the other ships than the foregoing, the local silencing of the audible alarms equipped in the navigation bridge and engineers accommodation is not to stop the audible alarm required in (5) and the audible and visual alarms equipped at the centralized control station.
(7) Where unattended machinery operation is adopted, alarm systems which will provide warning of faults in machinery and equipment specified in **101. 7** (14) (A) to (G) are to be such that the person on watch in the navigation bridge is made aware when:
(A) a fault has occurred,
(B) the fault is being attended to, and
(C) the fault has been rectified.
However, communication system specified in **403. 3** will be accepted as a substitute for the alarm for (C).

Section 5 Automatic Equipment

501. General

1. Scope

The requirements of this section is to apply specific automation equipments.

502. Class 1 specific automation equipment

The ships intended to be registered as ships provided with Class 1 automation equipment are to be provided with the automation equipment specified in following **Par 1** to **7.** However, the equipment which considered acceptable by the Society may be omitted in consideration of the purpose of the ship, the method of the cargo handling and so on.

1. Remote-controlled ballasting / deballasting arrangement

The remote-controlled ballasting/deballasting arrangements are to comply with the following requirements:

(1) Ballast pumps are to be provided with the following remote control devices, alarm devices, etc. at suitable positions and to be capable of being monitored and controlled in those positions:
  (A) Speed control devices or start/stop devices of ballast pumps.
  (B) Control devices necessary for ballasting and deballasting, such as opening and closing of valves.
  (C) Monitoring devices for ballast tank level.
  (D) Audible and visible alarm devices which operate in the following cases where ballast pumps or prime movers driving a ballast pump are located in dangerous spaces:
    (a) When the lubricating oil pressure of pumps or prime movers falls abnormally (only in the case of forced lubrication system).
    (b) When the temperature of the bearings or the lubrication oil of pumps or prime movers rises abnormally.
    (c) When the temperature of stuffing box provided at the penetration parts of the bulkhead between the engine room and the cargo pump room rises abnormally.

(2) Steam turbines driving ballast pumps are to be provided with the following devices:
  (A) An automatic shut-off device which operates in the overspeed of the turbine and its alarm device.
  (B) An alarm device which operates in the case of abnormal increase of exhaust pressure of the turbines.

2. Automatic steering system

When the steering gear is operated with automatic pilot, the automatic steering system is to comply with the following requirements:

(1) Running indication of the automatic pilot is to be provided.
(2) The function of compass and other equipment necessary to maintain the maneuverability of ship is not to be affected.
(3) Changing over from automatic to manual steering and vice versa is to be possible at the bridge.
(4) Except for the course setting control, the actuation of any other control is not to be significantly affect the course of the ship.
(5) Means are to be incorporated to prevent unnecessary activation of the rudder due to abnormal yaw motion.
(6) The automatic pilots are to enable automatically the ship to keep a preset course by interlocking with a magnetic compass or gyrocompass.
(7) When changing over from manual to automatic steering, the automatic pilot is to be capable of bringing the ship to the preset course.
(8) Means are to be incorporated to enable rudder angle limitation, and also to be available to indicate when the angle of limitation has been reached.
(9) Audible and visual alarms are to be issued on the navigating bridge when the heading direction of a ship is deviated exceeding the course deviation of a preset amount.
(10) Audible and visual alarms are to be issued on the navigating bridge in order to indicate the failure in the power supply to the automatic pilot and the alarm system specified in (9) above.
(11) Any other items considered necessary by the Society.

3. Remote-controlled handling system for liquid cargo in bulk

The remote-controlled handling system for liquid cargo in bulk is to comply with the following requirements:

(1) For ships carrying liquid cargoes in bulk, cargo-handling centralized control stations are to be provided.
(2) Steam turbines driving cargo pumps are to be provided with the following devices:
 (A) An automatic shut-off device which operates in the overspeed of the turbine and its alarm device.
 (B) An alarm device which operate in the case of abnormal increase of exhaust pressure of the turbine.
(3) At cargo-handling centralized control stations, the following remote control devices and alarm devices are to be provided:
 (A) Control devices for controlling the number of revolutions of cargo pumps.
 (B) Control devices necessary for loading and unloading of cargoes such as opening and closing of valves.
 (C) Monitoring devices for cargo tank level.
 (D) Audible and visible alarm devices which operate in the following cases in case where ballast pumps or their prime movers are located in dangerous spaces:
  (a) When the lubricating oil pressure of pumps or prime movers falls abnormally (only in the case of forced lubrication system).
  (b) When the temperature of bearings or lubricating oil of pumps or prime movers rises abnormally.
  (c) When the temperature of stuffing box at the penetrating part of pump room bulkheads (in case where pumps are driven by the prime movers installed in the engine room) has become high.
  (d) When the temperature of casings of cargo oil pumps has become high.
 (E) Other devices deemed necessary by the Society.

4. Power-driven opening and closing devices

Side ports, ramp ways and steel hatch covers of hatchways on weather decks (except for those of pontoon type) (hereinafter referred to as "side port, etc.") are to be provided with power-driven opening and closing devices in compliance with the following requirements:

(1) At the place where opening and closing operation is carried out, the operation necessary for opening and closing of the relevant side ports, etc. is to be easily executed.
(2) At the place where opening and closing operation is carried out, the open or closed condition of side ports, etc. is to be capable of being confirmed.
(3) In case where deemed necessary by the Society, appropriate measures to maintain the safety at the time of opening and closing operation are to be taken.

5. Automatic recording devices for main engine

Automatic recording devices for main engine are to be capable of recording the lubricating oil pressure, the cooling water temperature and other necessary information in order to ascertain the operating condition of main engine automatically.

6. Remote-controlled mooring arrangements

Remote-controlled mooring arrangements are to comply with the following requirements:

(1) Mooring winches are to be provided with the remote control devices to be capable of effectively controlling releasing and winding of mooring lines.
(2) The remote control devices specified in (1) above are to be capable of handling three or more mooring lines respectively at bow and stern on the positions where the devices are installed.

7. Air-conditioning arrangements for control stations

Air-conditioning arrangements for control stations are to have sufficient capacity to maintain a normal environmental condition in the control stations and are to be provided with alarm devices which give visual and audible alarms in the event of abnormal operation of the air-conditioning arrangements.

503. Class 2 automation equipment

The ships intended to be registered as ships provided with Class 2 automation equipment are to be provided with the automation equipment specified in the following **Par 1** to **7** in addition to those in **502.** However, the equipment which considered acceptable by the Society may be omitted in consideration of the purpose of the ship, the method of the cargo handling and so on.

1. Remote-controlled fuel oil filling arrangements

Remote-controlled fuel oil filling arrangements(limited to the case of filling fuel oil for main engines) are to be provided with the following remote control devices, alarm devices, etc. at suitable positions and to be capable of being monitored and controlled in those positions. However, the devices specified in (1) may be omitted when the Society considers acceptable in consideration of the valve arrangements and fuel oil tanks. In this case, the devices specified in (2) and (3) are not required.

(1) Remote control devices for opening and closing of valves.
(2) Level monitoring devices for fuel oil tanks (except for fuel oil tanks not built in as a part of hull in the engine room).
(3) High level alarm devices for the fuel oil tanks (except for fuel oil tanks not built in as a part of hull in the engine room).
(4) Speed control devices for the pumps when fuel oil is filled by pumps provided on board.

2. Centralized monitoring device for refrigerating containers

The centralized monitoring device for the refrigerating containers is to be capable of carrying out the following functions for carrying refrigerating containers loaded with refrigerated cargo:

(1) Monitoring of operating condition of the refrigerating machinery, working condition of the defrosting device and inside temperature of refrigerating containers are to be clearly indicated.
(2) An alarm device which gives visual and audible alarms in the event of the abnormal conditions of inside temperature of refrigerating containers is to be provided.

3. Cargo hose handling winches

For oil tanker, the cargo hose handling winch is to be easily operated in connecting and disconnecting the cargo hoses with manifolds.

4. Automatic deck washing arrangements

For ships carrying coals, ores or similar cargoes in bulk, the automatic deck washing arrangement are to be of fixed type and are to comply with the following requirements:

(1) The automatic deck washing arrangements are to be capable of washing decks and hatch covers.
(2) The deck washing machines are to have enough strength against its working pressure and enough corrosion resistance to sea water.
(3) The pipes for washing water are to be firmly fixed to the hull.

5. Remote-controlled mooring arrangements at ship-sides

Remote-controlled mooring arrangements at ship-sides are to be capable of effectively controlling three or more mooring lines both at the bow and at the stern of the ship. And they are to be located where leaving and berthing of the ship is visible by the operators.

6. Power-operated pilot ladder winding appliances

The power-operated pilot ladder winding appliances are to be capable of operating easily to wind the ladder for pilots at the control position. However, the power-operated pilot ladder winding appliances need not to be provided where one person can operate.

7. Emergency towing rope winches

For ships carrying dangerous goods exclusively, the emergency towing rope winches are to be easily operated in heaving and releasing the emergency towing ropes, which are arranged at the time of berthing.

504. Class 3 automation equipment

The ships intended to be registered as ships provided with Class 3 automation equipment are to be provided with the automation equipment specified in the following **Par 1** to **7** in addition to those in **502.** and **503.** However, the equipment which considered acceptable by the Society may be omitted in consideration of the purpose of the ship, the method of the cargo handling and so on.

1. Centralized monitoring systems for machinery

The centralized monitoring systems for machinery are to be capable of clearly indicating the lubricating oil pressure, the cooling water temperature and other necessary information in order to monitor the conditions of main engines, prime movers for driving generators (excluding emergency generators), main boilers, essential auxiliary boilers and other machinery which affects the propulsion of ships at the navigating bridge.

2. Centralized control systems for machinery

The centralized control systems for machinery are to be capable of effectively controlling main engines, prime movers for driving generators (excluding emergency generators), main boilers, essential auxiliary boilers and other machinery which are necessary in order to operate these machinery at the navigating bridge.

3. Remote control arrangement for main engines and steering gear at the outside of the navigating bridge

The remote control arrangements for main engines and steering gear are to be capable of effectively starting, stopping, reversing and speed controlling of main engines and effectively controlling the rudder angle at the control station outside of the navigating bridge.

4. High level alarm devices for cargo hold bilge

For ships deemed necessary by the Society, high level alarm devices which will operate in the event that the bilge reaches the pre-determined level, are to be provided.

5. Independent remote-controlled mooring arrangements

The independent remote-controlled mooring arrangements are to be capable of controlling each drum of mooring winches independently at the remote control position, in addition to the requirement in **502. 6.**

6. Towing rope winches

Towing rope winches are to be effectively operated by one man in heaving and releasing the towing ropes at the control position. ⚓

CHAPTER 4 DYNAMIC POSITIONING SYSTEMS

Section 1 General

101. General

1. **Application** The requirements in this Chapter apply to the ships intended to be registered as ships provided with dynamic positioning systems.

2. **Related requirements** In addition to complying with the requirements in this Chapter, those are to be applied respectively such as follows: For machinery installations, **Pt 5;** For electorial installations, **Pt 6, Ch 1;** For Automatic and remote control systems, **Pt 6, Ch 2.**

3. **Classes of dynamic positioning systems** Dynamic positioning systems are classed as follows:

(1) DPS(0)
(2) DPS(1)
(3) DPS(2)
(4) DPS(3)

102. Terminology

Terms used in this Chapter are defined as follows:

(1) **Dynamic positioning systems** comprise the following sub-systems, control panels, and back-up systems which are necessary to dynamically positioning the ship.
 (A) Thruster units
 (B) Electrical equipment
 (C) Control systems
  (a) Control system
   (i) Remote control system
   (ii) Automatic control system
  (b) Measuring system
  (c) Control panel

(2) **Thruster units** comprise the followings:
 (A) Thruster, power transmission gears driving thruster, thruster control hardware for control of thruster speed, pitch and heading
 (B) Main propellers and other propulsion units when these are included in dynamic positioning control mode.

(3) **Power system** comprise all units necessary to supply the dynamic positioning system with power and include the followings
 (A) Prime movers with necessary auxiliary systems including piping
 (B) Generators
 (C) Switchboards
 (D) Distributing system (cabling and cable routing)

(4) **Control system** comprises all central hardware and software necessary to dynamically position the vessel.

(5) **Remote control system** is a semi-automatic control system, which enables the operator to give a defined thrust (force and direction) and a turning moment to the vessel.

(6) **Measuring system** comprise all hardware and software for the following position reference system and environmental sensor to supply information and corrections necessary to give position and heading reference.
 (A) Position reference system
  (a) Position reference system
  Position reference system is to incorporate suitable position measurement techniques which may be by means of the followings.
  - Acoustic device
  - Radio
  - Radar
  - Inertial navigation
  - Satellite navigation

- Taut wire
- or, other acceptable means depending on the service conditions for which the ship is intended

(B) Environmental sensor
(a) Vertical reference sensor to measure the pitch and roll of the ship
(b) Means to ascertained the wind speed and direction acting on the ship
(c) Heading reference system
- Gyrocompass or equivalent means

(7) **Control panels** comprise centrally and locally situated panels for operating the dynamic positioning system.

(8) **Performance capability rating** is calculated by the data specified in **103. 2** and this rating indicates the percentage of time that a ship is capable of holding heading and position under a standard set of environmental conditions.

103. Drawings and data

1. General In the case of the ships intended to be registered as ships provided with dynamic positioning systems, the drawings and data to be submitted for approval before the commencement of work are generally as follows:

(1) Drawings
(A) Plans showing the construction and layout of the dynamic positioning system
(B) Plans with respect to the automatic and remote control of the dynamic positioning system
(a) Functional block diagrams of the control system
(b) Functional block diagrams of the measuring system
(c) Details of monitoring functions of the control system and measuring system together with a description of the monitoring functions
(d) Details of the overall alarm system
(e) Details of the control stations, e.g. control panels and consoles, including the location of the control stations
(C) Electrical diagrams for control system and measuring system

(2) Data
(A) Equipment list of dynamic positioning systems (Name of equipment, model, type, Manufacturer)
(B) Failure modes and effect analysis(FMEA) data (in the case of the ships intended to be registered as ships provided with DPS(2) or DPS(3))
(C) Operation manuals (including details of the dynamic positioning system operation, installation of equipment, maintenance and fault finding procedures together with a section on the procedure to be adopted in emergency)
(D) Test schedules including the methods of testing and the test facilities

2. Performance capability rating In addition to the requirements in **Par 1** above, the following data is to be submitted when the assignment of the supplementary notation PCR is required:

(1) Drawings
(A) Lines plan
(B) General arrangement
(C) Details of thruster arrangement

(2) Data
(A) Thruster power and thrusts
(B) Details of between thruster and thruster, between thruster and hull, and between thruster and current interaction
(C) Design maximum environmental conditions
(D) Details of sea current loads, wave drift forces and wind forces on ship
(E) Allocation logic

Section 2 Requirements of Dynamic Positioning Systems

201. General

The ships intended to be registered as ships provided with dynamic positioning systems are to be provided dynamic positioning systems specified in **202.** and **203.**

202. Requirements of dynamic positioning systems

1. Thruster

(1) Design and location of thruster
(A) Thrusters are to be designed to minimize potential interference with other thrusters, sensors, hull or other surfaces which could be encountered in the service for which the ship is intended.
(B) Thruster intakes are to be located at sufficient depth to reduce the possibility of ingesting floating debris and vortex formation.
(2) Performance of thruster
The response and repeatability of thrusters to changes in propeller pitch, speed or direction of rotation are to be suitable for maintaining the area of operation and the heading deviation specified.
(3) Alarm for thruster
Each thruster unit is to be provided with a high power alarm. The setting of this alarm is to be adjustable and below the maximum thruster output.

2. Power system

(1) Electrical generating system
(A) Capacity of electrical generating system For electrically driven thruster, the total capacity of electrical generating system is to be not less than the maximum auxiliary load. This may be achieved by parallel operation of two or more generating sets provided that the requirements of **Pt 6, Ch 1, 201. 2** are complied with.
(B) Continuity of electric source
When the electrical power requirements are supplied by one generator set, on loss of power there is to be provision for automatic starting and connection to the switchboard of a stand-by set and automatic restarting of essential auxiliary services.
(2) Electrical supply for thruster auxiliaries, control computers and measuring system
Thruster auxiliaries, control computers and measuring systems are to be served by individual circuits. Services that are duplicated are to be separated throughout their length as widely as is practical and without the use of common feeders, transformers, converters, protective devices or control circuits.
(3) Electrical supply for actuating mechanism
(A) Steerable thrusters are to be provided with two or more independent supplies of motive power to the pitch and direction actuating mechanisms.
(B) Thrusters having variable pitch propellers are to be provided with two or more independent supplies of motive power to the pitch actuating mechanisms.
(4) Common source
Where the electrical auxiliary services necessary for maintaining the ship normally in operational and habitable conditions, and the electorial service necessary for operating e the dynamic positioning thrusters are supplied from a common source, the following requirements are to be complied with:
(A) The voltage regulation and current sharing requirements defined in **Pt 6, Ch 1, 205. 4** and **5** or **206. 2** and **4** are to be maintained over the full range of power factors that may occur in service.
(B) Where silicon controlled converters (inverter, cycloconverter, rectifier, etc.) are used to feed the thruster motor and the instantaneous value of the line-to-line voltage wave-form on the *a.c.* auxiliary system busbars deviates by more than 10 percent of the maximum value of the fundamental harmonic, the electrical auxiliary services necessary for maintaining the ship normally in operational and habitable conditions are to be capable of withstanding the additional temperature rise due to the harmonic distortion. Control systems, alarms and safety equipment are to operate satisfactorily with the maximum supply system waveform distortion,

or be provided with suitably filtered or converted supplies.

(C) When the control system incorporates volatile memory, it is to be supplied via uninterruptible power supply.

(5) Number and rating of transformers
The number and ratings of power transformers are to be sufficient to ensure full load operation of the dynamic positioning system even when one transformer is out of service.

(6) Alarm for electrical generating system
An alarm is to be initiated at the dynamic positioning control stations when the total electrical load of all operating thruster units exceeds a preset percentage of the running generators capacity. This alarm is to be adjustable between 50 and 100 percent of the full load capacity having regard to the number of electrical generators in service.

3. Control system

(1) General Minimum number of control system, position reference system and environmental sensor for dynamic positioning systems is to be in accordance with the **Table 9.4.1**:

Table 9.4.1 Minimum Number of Control System, Position reference System and Environmental Sensor

Class	Control system		Position reference system	Environmental sensor		
				Heading reference system	Vertical reference sensor	Means to ascertained the wind and direction
DPS(0)	Remote control system(1)	1 set	1 set	1 set	1 set	each 1 set
DPS(1)	Automatic control system(2) Remote control system(1)(2)	1 set 1 set	2 sets(3)	1 set	1 set	1 set
DPS(2)	Automatic control system(2)	2 sets	3 sets(3)(4)	3 sets(3)	3 sets(3)	each 3 sets(3)
DPS(3)	Automatic control system(2) Emergency automatic control system(2)	2 sets 1 set	3 sets(3)(4)	3 sets(3)	3 sets(3)	each 3 sets(3)

(NOTES)
(1) To be provided to maintain the desired heading of the ship.
(2) To be arranged to operate independently so that a failure in one control system will not render the other control system inoperative.
(3) To be arranged to operate independently so that a failure in on position reference system(or environmental sensor) will not render the other position reference system(or environmental sensor) inoperative.
(4) To be provided with at least two different measurement techniques.

(2) Control system
The control system for dynamic positioning operation is to be stable throughout its operational range and is to meet the specified performance and accuracy criteria.

(3) Measuring system

(A) Measuring systems are to be provided to ensure the specified area of operation and heading deviation can be effectively maintained.

(B) Set point for the desired heading
The deviation from the desired heading is to be adjustable, but is not to exceed the specified limits. Arrangements are to be provided to fix and identify the set point for the desired heading.

(C) Validation for measuring system
Suitable processing and comparative techniques are to be provided to validate the. control system inputs from position reference systems and other environmental sensors, to ensure the optimum performance of the dynamic positioning system.

(4) Indicators
Indications of the following are to be provided at each station from which it is possible to control the dynamic positioning system.

(A) The heading and location of the vessel relative to the desired reference point or course

(B) Vectorial thrust output of thrusters, individual and total
(C) Operational status of position reference systems and environmental sensors
(D) Environmental conditions, e.g. wind strength and direction
(E) Available status of standby thruster units

(5) Alarms
Alarms are to be provided for the following fault conditions:
(A) Control computer system fault
(B) Automatic changeover to a standby control computer system
(C) Abnormal signal errors revealed by the validity checks required by (3) (C)
(D) When the ship deviates from its predetermined area of operation
(E) When the ship deviates from its predetermined heading limits
(F) Taut wire excursion limit
(G) Fault of position reference system
(H) Fault of environmental sensor
(I) Automatic changeover to a standby position reference system or environmental sensor

203. Additional requirements for dynamic positioning systems

1. DPS(1)

(1) In the event of a failure of a position reference system, the control systems are to continue operating on signals from the remaining position reference system without manual intervention.
(2) The area of operation is to be adjustable, but is not to exceed the specific limits which are to be based on a percentage of water depth, or if applicable a defined absolute surface movement. Arrangements are to be provided to fix and identify the set point for the area of operation.
(3) In the event of failure of the most effective thruster the ship is to be capable of maintaining its predetermined area of operation and desired heading in the environmental conditions for which the ship is designed and classed.
(4) A manually initiated emergency alarm, clearly distinguishable from all other alarms associated with the dynamic positioning system is to be provided at the dynamic positioning control station to warn all relevant personnel in the event of a total. loss of dynamic positioning capability. In this respect consideration is to be given to additional alarms being provided at locations such as the master's accommodation and operational control stations.
(5) For electrically driven thruster units, the following requirements are to be complied with:
(A) With one generating set out of action, the capacity of the remaining generating sets is to be not less than the maximum dynamic positioning load with the most effective thruster inoperative together with all electrical auxiliary services necessary for maintaining the ship in normal operational and habitable conditions.
(B) Where generating sets are arranged to operate in parallel, the supplies to, essential services are to be protected by the tripping of non-essential loads as required by **Pt 6, Ch 1, 305. 10** and additionally, on loss of a running generating set, a reduction in thrust demand may be accepted provided the, arrangements are such that a sufficient level of dynamic position capability is retained to permit the maneuverability of the ship.
(C) Indication of absorbed electrical power and available on-line generating capacity is to be provided at the main dynamic positioning control station.
(D) Means are to be provided to prevent starting of thruster motors until sufficient electrical generating capacity is available.

2. DPS(2)

(1) The requirements of **Par 1** above are to be complied with.
(2) In the event of a failure of the working system the standby control system is to be arranged to changeover automatically without manual intervention and without any adverse effect on the ship s station keeping performance.
(3) The power system should be divisible into two or more systems such that in the event of failure of one system at least one other system will provide enough power for essential services of the DP operation. The power system may be run as one system during operation, but should be arranged by bus-tie breakers to separate automatically upon failures which could be transferred from one system to another, including overloading and short-circuits.
(4) For electrically driven thruster units, the following requirements are to be complied with:
(A) The requirements as specified in **1** (5).

(B) To carter for operating conditions whereby all the generator sets required by (A) above are not being utilized, provision is to be made for automatic starting synchronization and load sharing of a non-running generator before the load reaches the alarm level required by **202. 2** (6).

(5) Control, alarm and safety systems are to incorporate a computer based consequence analysis which may be continuous or at predetermined intervals and is to analyse the consequence of predetermined failures to verify that position and heading deviation remain within acceptable limits. In the event of a possible hazardous condition being indicated from the consequence analysis an alarm is to be initiated.

(6) Power, control and thruster systems and other systems necessary for, or which could affect, the correct functioning of the DP system are to be provided and configured such that a fault in any active component or system will not result in a loss position. This is to be verified by means of a FMEA according to (KS A) IEC 60812 (Failure Mode and Effects Analysis) or equivalent. Active components may include, but are not restricted to, the following

(A) Prime movers (e.g. auxiliary engines)
(B) Generators and their excitation equipment
(C) Gearing
(D) Pumps
(E) Fans
(F) Switchgear and control gear, including their assemblies
(G) Thrusters
(H) Valves (where power actuated)

System which are not part of the DP System but which, in the event of a fault, could affect the correct functioning of the DP System (for example, fire suppression systems, engine ventilation systems, etc.) are to be included in the FMEA.

3. DPS(3)

(1) The requirements of **Par 2** above are to be complied with.

(2) The power system arrangement is to comply with the following requirements :

(A) The divided power system should be located in different spaces separated by A-60 class division.

(B) Where the power systems are located below the operational waterline, each power system is to be separated by independent watertight compartment.

(C) Bus-tie breakers should be open during DPS operations unless it can be accepted according to **203. 2** (3).

(3) The electrical power generating sets are to be arranged so that they are located in at least two separate machinery compartments.

(4) The switchboard supplying the dynamic positioning system is to be split into at least two equal sections each fitted in a separate compartment and capable of being connected by bus section switches.

(5) An emergency automatic control system is to be provided at an emergency control station, in a compartment separate from that for the main control station.

(6) Arrangements are to be provided such that in the event of a failure of the working and standby control systems a smooth transfer of control to the emergency control system may be effected from the emergency control station by manual means.

(7) The control and indication unit of one of the position reference systems required by the **Table 9.4.1** is to be located at the emergency control station. A repeater control and indication unit from this system is to be located at the main control station.

(8) An independent heading reference system among those required by **Table 9.4.1** is to be located at the emergency control station to provide heading reference to the emergency automatic control system.

(9) Signals from the environmental sensors required by **Table 9.4.1** are to supply the emergency automatic control system.

(10) The emergency automatic control system is to be supplied from its own independent uninterruptible power supplies.

Section 3 Testing and Inspection

301. Hydraulic Test

Thruster housing is to be tested at a hydraulic pressure of not less than 1.5 times the maximum service immersion head of water or 1.5 bar, whichever is greater.

302. On-board tests

After installation on board, the dynamic positioning system is to be tested under the condition as close to the actual operation as practicable and confirmed that each equipment functions appropriately. However, the tests may be carried out at the sea trial, when their testing items are considered impracticable to be conducted at occasions other than the sea trials.

303. Sea trials

In the sea trials, performance tests of the dynamic positioning system are to be carried out in accordance with the sea trial schedule including the followings approved by the Society.

(1) Response of the system to simulated failures of major items of control and mechanical equipment, including loss of electrical power.
(2) Response of the system under a set of predetermined manoeuvres for changing of the followings:
- location of area of operation
- heading of the ship.

(3) Continuous operation of the system over a period of four to six hours.

304. Maintaining records and data regarding the performance capability of the dynamic positioning system

Records and data regarding the performance capability of the dynamic positioning system are to be maintained on board the ship and are to be made available at the time of the periodical survey.

305. Survey Assigned to Maintain Classification

Periodical survey interval and survey items of dynamic positioning systems(DPS) are to be applied as follows.

1. Annual survey

(1) System maintenance documentation, including information regarding hardware and software changes, shall be reviewed.
(2) The electrical installations comprising the DPS, such as controllers and operating stations for DP and independent joystick, references systems, sensors and mode change system, shall be visually inspected.
(3) The technical condition of the DPS shall be verified during the survey.
(4) If the survey is carried out when the vessel is undergoing regular operations, then tests that possibly can introduce unacceptable risks shall not be performed.
(5) Capacity of UPS and other battery systems serving the DP control system, including its peripherals, shall be verified. If the survey is carried out during regular operations, then the capacity of the batteries need not be proven by testing. Additionally, the alarm for loss of charging power shall be verified.
(6) For class notation DPS(3), normal working condition of the back-up DP control system shall be verified. If the survey is carried out during regular operations, then control need not be transferred to the back-up DP control system.
(7) Emergency stop of thrusters from the DP control centre shall be tested. If the survey is carried out when the vessel is undergoing regular operations, then testing shall not be performed if there is any possibility of introducing unacceptable risks.

2. Special survey

(1) With the vessel in DP mode, a sea trial shall be performed.
(2) The complete system shall be tested in all operational modes. The testing shall include simu-

lation of different failure conditions to verify switching of modes, back-up systems and the alarm system.

(3) The different modes of thruster control from the DP control centre shall be tested.
  (A) Manual control
  (B) Joystick control(independent joystick, if installed)
  (C) DP control
  (D) Transfer of control

(4) Manual override i.e. by thruster lever control and independent joystick control shall be demonstrated during normal operation and during failure conditions.

(5) Emergency stop of DP thrusters from DP control centre to be tested.

(6) All sensors, peripheral equipment and reference systems shall be tested.
  (A) Verify correct operation and adequate accuracy
  (B) Failure of sensors and reference systems shall be simulated to check the alarm system and the switching logic
  (C) Switch-over between reference systems as input to controller shall be carried out to assure that warnings, alarms and information to operator are satisfactory.

(7) Alarm for loss of position and heading out of limit shall be demonstrated.

(8) The electrical installations comprising the DPS, such as controllers and operating stations for DP and independent joystick, references systems, sensors and mode change system, shall be visually inspected.

(9) Single failures in thruster control systems including signal wire breaks of thruster command and feedback signals shall be tested in order to verify safe response on the thrust output. Equivalent testing may also be required for rudders controlled by the DP control system.

(10) Overload prevention shall be tested.

(11) Capacity of UPS and other battery systems serving the DP control system, including its peripherals, shall be verified by testing. Alarm for loss of charging power shall also be verified.

(12) For class notation DPS(2) & DPS(3), the required redundancy with respect to defined single failures modes shall be verified by redundancy testing.

(13) For class notation DPS(2) & DPS(3), the FMEA report and FMEA test program shall be verified to ensure that they have been updated when alterations have been done.

(14) For class notation DPS(2) & DPS(3), correct functioning of the Consequence Analysis facility shall be verified as far as possible.

(15) For class notation DPS(3), testing shall also be performed on the back-up DP control system. Switchover to back-up shall be tested, and monitoring of back-up control system status on the main control system shall be verified. ⚓

CHAPTER 5 NAVIGATION BRIDGE SYSTEMS

Section 1 General

101. General

1. Scope

The requirements in this Chapter apply to bridge layouts and bridge working environments, navigational equipment and accident prevention systems (hereinafter collectively referred to as "navigation bridge systems") of ships classed with the Society and intended to be registered.

2. Equivalency

Navigation bridge systems which do not fully comply with the requirements of this Chapter may be accepted provided that they are deemed by the Society to be equivalent to those specified in this Chapter.

3. Navigation bridge systems with novel design features

For navigation bridge systems with novel design features, the Society may apply the requirements of this Chapter so far as practicable and other requirements as considered appropriate by the Society.

4. Modification of requirements

The Society may modify parts of the requirements specified in this Chapter taking the national requirements of the ship's flag state, kind of the ship and intended service areas of the ship into consideration.

5. Installations Characters

(1) NBS : the ship of which bridge layout and bridge working environment and navigational equipment comply with the requirements of **Sec 3** and **Sec 4.**
(2) NBS1 : the ship of which bridge layout and bridge working environment, navigational equipment and accident prevention systems comply with the requirements of **Sec 3** to **Sec 5.**
(3) NBS2 : the ship of which bridge layout and bridge working environment, navigational equipment, accident prevention systems and bridge work assist systems comply with the requirements of **Sec 3** to **Sec 6.**

6. Definitions

Terms used in this Chapter are defined as follows:
(A) **Back-up navigator** is any individual, generally an officer, who has been designated by the ship master to be on call if assistance is needed on the bridge.
(B) **Bridge** is an area from which the navigation and control of the ship is exercised, including the wheelhouse and bridge wings.
(C) **Bridge wings** are parts of the bridge on both sides of the ship's wheelhouse which extend to the ship's side.
(D) **Conning position** is a place on the bridge with a commanding view and which is used by navigators when commanding, maneuvering and controlling a ship.
(E) **Main conning position** is a conning position which is mainly used by navigators.
(F) **Field of vision** is an angular size of a scene that can be observed from a position on the ship's bridge.
(G) **Navigator** is a person navigating, operating bridge equipment and maneuvering the ship.
(H) **Wheelhouse** is an enclosed area of the bridge.
(I) **Workstation** is a position at which one or several tasks constituting a particular activity are carried out.
(J) **Centralized bridge workstation** is a workstation at which navigational equipment needed for navigation and maneuvering are arranged centrally, including the main conning position.
(K) **Ocean areas** are areas in which the freedom of course setting in any direction for a distance equivalent to at least 30 minutes sailing with the navigating speed of the ship is not restricted.

Section 2 Surveys of Navigation Bridge Systems

201. General

1. Kinds of surveys

Navigation bridge systems, which are registered or intended to be registered to the Society, are to be subjected to the following surveys:

(A) Survey for classification of navigation bridge systems (hereinafter referred to as "Classification Survey")
(B) Survey for maintaining classification of the navigation bridge systems (hereinafter referred to as "Survey Assigned to Maintain Classification"), which are:
  (a) Special Survey
  (b) Annual Survey
  (c) Occasional Survey

2. Time of classification survey and intervals of survey assigned to maintain classification

(1) Classification Survey is to be carried out when the application for classification is made.
(2) Survey Assigned to Maintain Classification is to be carried out at the periodical survey.

202. Classification Survey

1. Drawings and data

(1) For the classification survey of navigation bridge systems of a NBS ships, three copies of the following drawings and data are to be submitted for the approval by the Society.
  (A) General arrangement of the bridge (showing the main conning position, other conning positions, workstations, locations of control consoles and panels, and passage ways)
  (B) Particulars of the navigational equipment specified in **Sec 4, 402. 2.**
  (C) Electrical wiring diagrams for the navigational equipment specified in **Sec 4, 402.**
  (D) Schemes of on board tests and sea trials including methods of tests and test facilities provided
  (E) Other drawings and data deemed necessary by the Society
(2) For the classification survey of navigation bridge systems of a NBS1 ships, three copies of the following drawings and data are to be submitted for the approval by the Society.
  (A) The drawings and data specified in the preceding (1).
  (B) Particulars of the accident prevention systems specified in **Sec 5, 502.**
  (C) Electrical wiring diagrams for the accident prevention systems specified in **Sec 5, 502.**
(3) For the classification survey of navigation bridge systems of a NBS2 ships, three copies of the following drawings and data are to be submitted for the approval by the Society.
  (A) The drawings and data specified in the preceding (2).
  (B) Particulars of the bridge work assist systems specified in **Sec 6, 602.**
  (C) Electrical wiring diagrams for the bridge work assist systems specified in **Sec 6, 602.**
  (D) Detail arrangement of the centralized bridge workstation specified in **Sec 6, 601. 3.** (dimensions of control consoles, panel arrangement, etc., are to be shown)

2. Shop tests

The equipments listed below are to be approved by the Society. However, the equipment approved by the Government of State in which the ship is registered or to be registered, other Contracting Governments of the International Convention for The Safety of Life at Sea or the parties approved by the Governments mentioned above may be accepted provided that it is deemed appropriate by the Society.

(A) Automatic radar plotting aids (ARPA)
(B) Electronic position-fixing systems
(C) Radars
(D) Gyro compass systems
(E) Automatic steering systems
(F) Speed log systems
(G) Echo sounding systems
(H) Maritime safety information receivers

(I) VHF radio telephone installations
(J) Other equipment deemed necessary by the Society

3. Tests after installation on board

(1) Bridge layouts and bridge working environments, navigational equipment, and accident prevention systems are to be, after installation on board, tested and inspected in accordance with the scheme of on board tests approved by the Society to verify that they are constructed, installed and functioning properly under the normal working conditions, as far as practicable. A part of the verification may be carried out during sea trials.
(2) The following particulars are to be verified at the tests after installation on board.
(A) Bridge layouts and bridge working environments
The bridge layouts and bridge working environments are adequate to enable the navigator to perform navigational duties and other functions allocated to the bridge as well as to maintain a proper lookout from workstations on the bridge.
(B) Navigational equipment
(a) Gyro compass repeaters
Each repeater compass is installed parallel with a centre line of the ship.
(b) Echo sounding systems
A measuring error is within a permissible range.
(c) Steering pump selective control switches
The steering pumps are smoothly switched over.
(d) Electrical power supply
(i) When the main source of electrical power to the local distribution board for the navigational equipment is off, the audible and visual alarm is initiated, and the electrical power supply to the board is automatically switched over to the emergency source.
(ii) All primary functions of the navigational equipment are readily reinstated after 45 seconds interruption of the electrical power supply.
(C) Accident prevention systems (NBS1 ships and NBS2 ships)
(a) Bridge navigational watch alarm system
The bridge navigational watch alarm system is to initiate alarms that are able to be verified in the bridge and other places if the setting interval has elapsed.
(b) Alarm and warning transfer system
The alarm and warning transfer system automatically transfers an alarm and warning which requires the navigator response and which is not acknowledged on the bridge within 30 seconds to the master, to the selected back-up navigator and to the public rooms. The alarm of the bridge navigational watch alarm system is also transferred.
(c) System monitor
(i) The indicator lamps in the master room showing the bridge navigational watch alarm system, and the alarm and warning transfer system are functioning properly.
(ii) The audible and visual alarms are initiated on the bridge and in the master room when the bridge navigational watch alarm system, and the alarm and warning transfer system are malfunctioning.
(d) Electrical power supply
(i) When the main source of electrical power to the local distribution board for the accident prevention systems is off, the audible and visual alarm is given, and the electrical power supply to the board is automatically switched over to the emergency source.
(ii) All primary functions of the accident prevention systems are readily reinstated after 45 seconds interruption of the electrical power supply.
(D) Bridge work assist systems(NBS2 ships)
(a) Bridge information systems
The information display and alarm system deemed necessary for navigation and maneuvering are functioning properly.
(b) ECDIS
A chart, ship's position, planned route, radar and ARPA information are added to the display.

(c) System monitor
Audible and visual alarms for a malfunction of the bridge information systems, ECDIS and auto tracking system are given.

(d) Electrical power supply
(i) When the main source of electrical power to the local distribution board for the bridge work assist systems is off, the audible and visual alarm is given, and the electrical power supply to the board is automatically switched over to the emergency source.
(ii) All primary functions of the bridge work assist systems are readily reinstated after 45 seconds interruption of the electrical power supply.

4. Sea trials

(1) Bridge layouts and bridge working environments, navigational equipment, and accident prevention systems are to be tested and inspected in accordance with the scheme of sea trials approved by the Society to verify that they are constructed, installed and functioning properly.

(2) The following are to be verified during the sea trials.

(A) Bridge layouts and bridge working environments
(a) The bridge layouts and bridge working environments are adequate to enable the navigator to perform navigational duties and other functions allocated to the bridge as well as to maintain a proper lookout from workstations on the bridge under all navigating conditions day and night.
(b) The vibration level and the noise level satisfy the requirements of **Sec 3, 302. 2** and **3.**

(B) Navigational equipment
Among the tests of the navigational equipment verification of the prewarning required by **Ch 5, 501. 4** (1) (for NBS1 ships and NBS2 ships only) and the following are to be included.
(a) An automatic radar plotting aids (ARPA)
(i) Targets are acquired, and the course and speed information for acquired targets are displayed by both true and relative vectors.
(ii) The bearing and range of the acquired target are displayed.
(iii) The CPA and TCPA are displayed.
(iv) An audible and visual alarm is initiated when any acquired target approaches close to a range or transits a zone chosen by the navigator.
(b) Radars
(i) The bearing and range of at least two objects(one of them is to be an object on shore) which appear forward of the beam are displayed.
(ii) A measured error of the installed radar is not greater than the original error of the radar.
(c) Automatic steering systems
(i) The heading direction of the ship is automatically maintained at the preset course.
(ii) An audible and visual alarm is initiated when the rudder reaches a preset limit of angle.
(iii) An audible and visual alarm is initiated when the heading direction of the ship deviates beyond a preset amount of course deviation.
(d) Speed log systems
(i) The indicated speed is to be compared with the result of the speed trial.
(ii) The speed and distance are indicated during the speed trial.
(e) Echo sounding systems
The water depth is recorded while the ship is maneuvering.
(f) Whistle control systems
The fog signals are generated properly.
(g) Internal communication systems
(i) The internal communication system functions properly in the event of main electrical power failure.
(ii) The bridge has priority over the communication system.

(C) Accident prevention systems (NBS1 ships and NBS2 ships)
The system is in accordance with **3** (2) (C) (a) and (b).

(D) Bridge work assist systems (NBS2 ships)
(a) The system is in accordance with **3** (2) (D) (a) and (b).
(b) Auto tracking system
(i) The auto tracking system performs automatic steering of the ship along a planned route on an electronic chart.
(ii) Automatic course change occurs after acknowledgement by the navigator.
(iii) When there is no acknowledgement by the navigator at a waypoint, the course is maintained and the audible and visual alarm is given.
(iv) Change-over to manual steering mode is possible.

203. Survey Assigned to Maintain Classification

1. Special survey

(1) At each Special Survey for navigation bridge systems of NBS ships, the following tests and examination are to be carried out.
(A) General examination of the systems
(B) Function tests of navigational equipment specified in **Sec 4, 402. 2** (1) to (5), (7) to (11) and (13) to (16).
(C) Verification on the capability of navigational equipment to readily reinstate after 45 seconds interruption of the electrical power supply.
(2) At each Special Survey for navigation bridge systems of NBS1 ships, the following tests and examination are to be carried out.
(A) The tests and examination specified in the preceding (1).
(B) Function tests of accident prevention systems specified in **Sec 5, 502.**
(C) Verification on the capability of accident prevention systems to readily reinstate after 45 seconds interruption of the electrical power supply.
(3) At each Special Survey for navigation bridge systems of NBS2 ship, the following tests and examination are to be carried out;
(A) The tests and examination specified in the preceding (2).
(B) Function tests of bridge work assist systems specified in **Sec 6, 602.**
(C) Verification on the capability of bridge work assist systems to readily reinstate after 45 seconds interruption of the electrical power supply.

2. Annual survey

(1) At each Annul Survey for navigation bridge systems of NBS ships, the following tests and examination are to be carried out.
(A) General examination of the systems
(B) Function tests of the following equipment
(a) Automatic radar plotting aids (ARPA)
(b) Electronic position-fixing systems
(c) Radars
(d) VHF radio telephone installations
(e) Internal communication systems
(f) Other equipment deemed necessary by the Society
(2) At each Annual Survey for navigation bridge systems of NBS1 ships, the following tests and examination are to be carried out.
(A) The tests and examination specified in the preceding (1).
(B) Function tests of the following equipment
(a) Bridge navigational watch alarm systems
(b) Alarm and warning transfer systems
(3) At each Annual Survey for navigation bridge systems of NBS2 ships, the following tests and examination are to be carried out.
(A) The tests and examination specified in the preceding (2).
(B) Function tests of the following equipment
(a) Bridge information systems
(b) Electronic Chart Display Information System (ECDIS)
(c) Auto tracking system

Section 3 Bridge Layouts and Bridge Working Environments

101. General

1. Scope

The requirements in this Section apply to bridge layouts and bridge working environments for NBS ships, NBS1 ships and NBS2 ships.

2. General

(1) The bridge configuration, the arrangements of consoles, equipment location and the bridge working environments are to enable the navigator to perform navigational duties and other functions allocated to the bridge as well as to maintain a proper lookout from workstations on the bridge.
(2) Navigating and maneuvering workstations are to be so arranged to enable efficient operation under normal operating conditions. All relevant instrumentation and controls are to be easily visible, audible and accessible from the workstation.
(3) For the purpose of performing duties related to navigation and maneuvering, the field of vision from a navigating and maneuvering workstation and a conning position is to be such as to enable observation of all objects which may affect safety of the ship.
(4) The navigator is, as far as practicable, to be able to approach close to at least one bridge front window in order to watch the area immediately in front of the bridge superstructure from the wheelhouse.
(5) The bridge is, as far as practicable, to be placed above all other decked structures, not including funnels, which are on or above the freeboard deck.
(6) The navigation bridge visibility of the ship is to be as follows.
 (A) The view of the sea surface from the conning position is not to be obscured by more than two ship lengths or 500 m, whichever is less, forward of the bow to 10° on either side irrespective of the ship's draught, trim and deck cargo(e.g. containers). (See **Fig 9.5.1**)

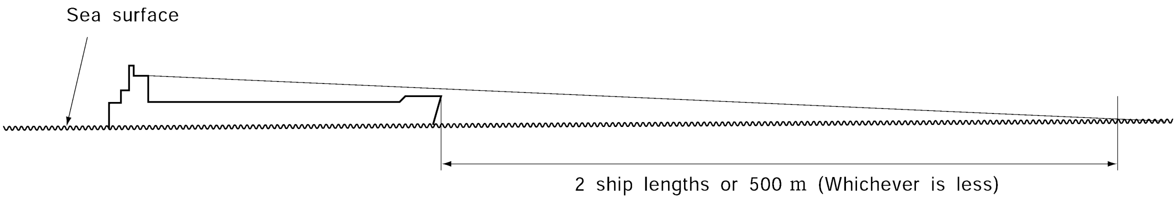

Fig 9.5.1 Forward view

 (B) The height of the lower edge of the front windows is to allow a forward view over the bow for person in a sitting position at the workstation.
 The height of the lower edge of front windows above the deck is to be kept as low as possible, and is not to, as far as practicable, be more than 1000 mm.
 (C) It is to be possible to observe all objects necessary for navigation, such as ships and lighthouses, in any direction from inside the wheelhouse.
  (a) There is to be a field of view around the vessel of 360° obtained by an observer moving within the confines of the wheelhouse. (See **Fig 9.5.2**)

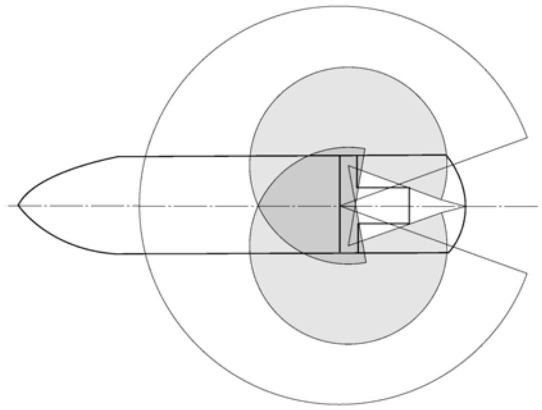

Fig 9.5.2 360° Field of vision

(D) At the navigating and maneuvering workstation and at the conning position, the navigator's field of view is to be sufficient to enable him to comply with the International Regulations for Preventing Collisions at Sea (COLREG 72).
   (a) The horizontal field of vision from the navigating and maneuvering workstation and from the conning position is to extend at least over an arc from 22.5° abaft the beam on one side, through forward, to 22.5° abaft beam on the other side. (See **Fig 9.5.3**)
   (b) From a monitoring workstation, the field of vision is to extend at least over an arc from 9° on the port bow, through forward, to 22.5° abaft the beam on starboard. (See **Fig 9.5.4**)
   (c) The field of vision from a workstation on the bridge wing is to extend over an arc from at least 45° on the opposite bow through dead ahead and then aft to 180° from dead ahead. (See **Fig 9.5.5**)

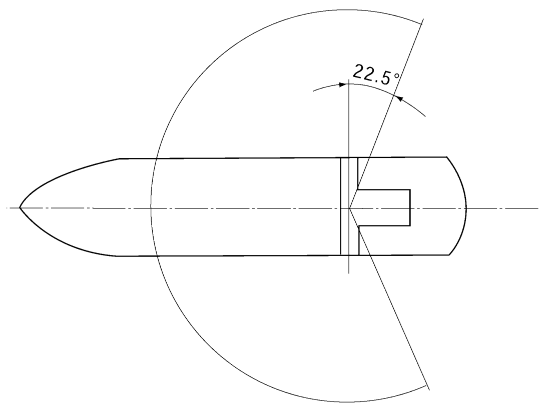

Fig 9.5.3 Navigating and maneuvering workstation and conning position

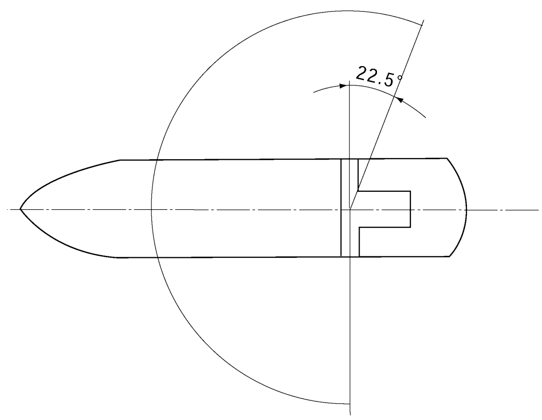

Fig 9.5.4 Monitoring workstation

(E) The helmsman's field of vision is to be sufficiently wide to enable him to carry out his functions safely.
   (a) The helmsman's field of vision from the workstation for manual steering is to extend over an arc from dead ahead to at least 60° on each side. (See **Fig 9.5.6**)
   (b) The workstation is not to be placed immediately abaft the front windows in order to obtain the required field of vision.

(F) Blind sectors caused by cargo, cargo gear and other obstructions are to be as few and as small as possible, and not in any way influence a safe look-out from the navigating and maneuvering workstation and from the conning position.
  (a) The total arc of blind sectors forward of the beam seen from the navigating and maneuvering workstation and from the conning position is not to exceed 20°. Each individual blind sector is not to exceed 10°.
  (b) Over an arc from dead ahead to at least 10° on each side, each individual blind sector is not to exceed 5°. The clear sector between two blind sectors is not to be less than 5°.

(G) The ship's side is always to be visible from the bridge wing especially where tugs or pilot boats come alongside and where the ship touches the jetty.
  (a) Bridge wings are to be provided out to the maximum beam of the ship. The view over the ship's side is not to be obstructed.

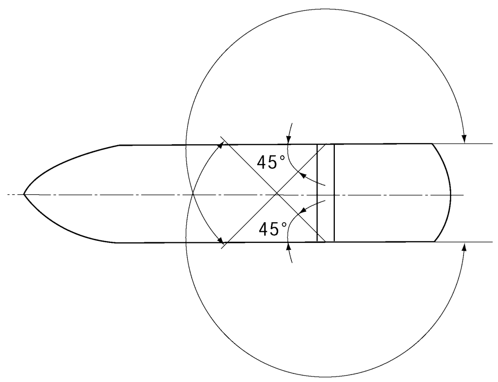

Fig 9.5.5 Bridge wing workstation

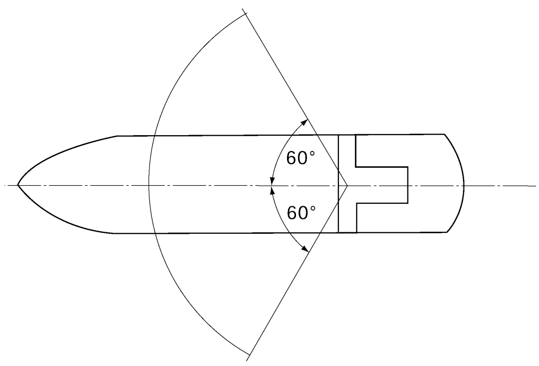

Fig 9.5.6 Helmsman's workstation

302. Bridge Working Environments

1. General

(1) Through the various stages of the design of a ship, care is to be taken to ensure a good working environment for bridge personnel.
(2) A ceiling and walls inside the wheelhouse are to be designed not to interfere with reading of the indication of instruments.
(3) Toilet facilities are to be provided on or adjacent to the bridge.

2. Vibration

The vibration level on the bridge is not to be uncomfortable to bridge personnel.

3. Noise

The noise level on the bridge is not to interfere with verbal communication, mask audible alarms or be uncomfortable to bridge personnel.

4. External sound signals

External sound signals such as fog signals that are audible on the bridge wings are also to be audible inside the wheelhouse.

5. Lighting

(1) The lighting required on the bridge is to be designed so as not to impair the night vision of the navigator.
(2) The lighting used in areas and at items of equipment requiring illumination whilst the ship is navigating is to be such that night vision adaptation is not impaired, e.g. red lighting. Such lighting is to be arranged so that it can not be mistaken for a navigation light by another ship. It is to be noted that red lighting is not to be fitted over chart tables so that possible confusion in colour discrimination is avoided.

6. Air conditioning system

The wheelhouse spaces are to be provided with an air conditioning system. System controls are to be readily available to the navigator.

7. Bridge personnel safety

(1) There are to be no sharp edges or protuberances on surfaces of the equipment and the instruments installed on the bridge which could cause injury to bridge personnel.
(2) Sufficient hand-rails or equivalent thereto are to be fitted inside of the wheelhouse or around equipment in the wheelhouse for safety in bad weather.
(3) Adequate means are to be made for anti-slip of the bridge floor whether it be dry or wet condition.
(4) Doors to the bridge wings are to be easy to open and close. Means are to be provided to hold the doors open at any position.
(5) Where provision for seating for the navigator is made in the wheelhouse, means for securing are to be provided having regard to storm conditions.

Section 4 Navigational Equipment

401. General

1. Scope

The requirements in this Section apply to navigational equipment for NBS ships, NBS1 ships and NBS2 ships.

2. General

(1) Navigational equipment is to be capable of continuous operation under the conditions of various sea states, vibration, humidity, temperature and electromagnetic interferences likely to be experienced in the ship which it is installed.
(2) Where computerized equipment is interconnected through a computer network, failure of the network is not to prevent individual equipment from performing their individual functions.

3. Electrical power supply

(1) Local distribution boards are to be arranged in the wheelhouse for all items of electrically operated navigational equipment. These boards are to be supplied by two exclusive circuits, one fed from the main source of electrical power and one fed from the emergency source of electrical power, and these circuits are to be separated throughout their length as widely as practicable. Each item of navigational equipment is to be individually connected to the distribution board. These boards may also be used for accident prevention systems specified in **Ch 5.**
(2) The power supplies to the distribution boards are to be arranged with automatic changeover facilities between the two sources.
(3) Failure of the main electrical power supply to the distribution board is to initiate an audible and visual alarm at the distribution board.
(4) Following a loss of electrical power supply which has lasted for 45 seconds or less, all primary functions of the navigational equipment are to be readily reinstated.

402. Navigational Equipment

1. General

(1) The instrumentation and controls at the navigating and maneuvering workstation are to be arranged to enable the navigator to;
(A) determine and plot the ship's position, course, track and speed,
(B) analyse the traffic situation,
(C) decide on collision avoidance manoeuvres,
(D) alter course,
(E) change speed,

(F) effect internal communication and external communication using a VHF radio telephone installation related navigation and maneuvering,
(G) give sound signals,
(H) hear sound signals,
(I) monitor navigational data such as course, speed, track, propeller revolutions (pitch), rudder angle, depth of water.
(J) record navigational data.
(2) Navigational equipment is to be arranged to avoid inadvertent operation.
(3) Navigational equipment is to be designed to permit easy and correct reading by day and by night.
(4) Each navigational equipment is to be placed with its face normal to the navigator's line of sight, or to the mean value if the navigator's line of sight varies through an angle.
(5) Navigational equipment is to be designed and fitted to minimize glare or reflection or being obscured by strong light.

2. Navigational equipment

Navigational equipment listed below are to be provided on the bridge.
(1) An automatic radar plotting aid (ARPA) independent or built into the radar equipment which complies with the following.
(A) A warning is to be given to the navigator at a time which is adjustable in the range of 6 to 30 minutes, having regard to the time to danger.
(B) True motion and relative motion modes are to be provided.
(C) Daylight visible display is to be provided.
(D) Capability of automatic acquisition and tracking of 20 radar targets or more is to be provided.
(E) Guard zone system, featuring adjustable parameters, notable warning and alarm set for closest point of approach (CPA) and for time to closest point of approach (TCPA) are to be provided.
(F) Simulator function showing the likely effects of a course or speed change in relation with tracked targets is to be provided.
(G) Incorporated self-checking properties are to be provided.
(2) An electronic position-fixing system appropriate to the intended service areas
(3) Two independent radars. One of them is to operate within X-band.
(4) Gyro compass repeaters and a calibration facility
(5) An automatic steering system which complies with the following.
(A) An off-course alarm addressed to the navigator derived from a system independent from the automatic steering system is to be provided.
(B) An overriding control device is to be provided at the navigating and maneuvering workstation.
(6) A speed log system
(7) An echo sounding system
(8) A control device of the wheelhouse air conditioning system
(9) A NAVTEX receiver and an EGC receiver depending upon the intended service areas
(10) Control switches and indicators of signaling lights such as navigation lights
(11) Steering pump selector control switches
(12) A whistle control system
(13) A window wipe and wash control device
(14) Control devices for the lighting of main workstation consoles
(15) An internal communication system which complies with the following.
(A) At all times, even in the event of failure of the main electrical power supply, the navigator is to have access to facilities enabling two way communication with another qualified officer.
(B) The bridge is to have priority over the communication system.
(16) A VHF radio telephone installation which is immediately available at the conning positions.
(17) A main propulsion machinery remote control system which complies with the Rules for Automatic and Remote Control Systems

3. Illumination and individual lighting of equipment

(1) The indicator lights and the illumination of all equipment are to be designed and fitted to avoid unnecessary glare or reflection or the equipment being obscured by strong light.
(2) To avoid unnecessary light sources in the front area of the bridge, only equipment necessary for the safe navigation and maneuvering of the ship is to be located in the area.
(3) Warning and alarm indicators are to be designed to show no light in normal conditions or in safe situations. Means are to be provided to test the lamps.
(4) All illumination and lighting of equipment are to be adjustable down to zero, except the lighting of warning and alarm indicators and the control of the dimmers which are to be remain readable.
(5) Each equipment is to be fitted with an individual light adjustment. In addition, groups of equipment normally working together may be equipped with common light adjustment.

Section 5 Accident Prevention Systems

501. General

1. Scope

The requirements in this Section apply to systems to prevent accidents caused by the navigator's unfitness (hereinafter referred to as "accident prevention systems") for ships intended for one-man bridge operation in ocean areas under normal operating conditions.

2. General

(1) Accidents prevention systems are to be capable of continuous operation under the conditions of various sea states, vibration, humidity, temperature and electromagnetic interferences likely to be experienced in the ship which they are installed.
(2) Where computerized equipment is interconnected through a computer network, failure of the network is not to prevent individual equipment from performing their individual functions.

3. External sound signals

To enable the navigator inside the wheelhouse to hear external sound signals such as fog signals that are audible on the bridge wings with the doors to the bridge wings closed, a transmitting device is to be provided to reproduce such signals inside the wheelhouse.

4. Navigational equipment

(1) Navigational equipment specified in **Sec 4, 402. 2** is to give an alarm when;
  (A) The ship approaches a way-point.
  (B) The ship's position is deviated from a planned route.
  (C) The water depth beneath the ship is less than a predetermined value.
(2) The systems or controls under **Sec 4, 402. 2** (1) to (5) and (11) to (17) are to be arranged so that the navigator has easy access to them and is able to maintain a proper lookout from the bridge.

5. Electrical power supply

(1) Local distribution boards are to be arranged in the wheelhouse for all items of electrically operated accident prevention systems. These boards are to be supplied by two exclusive circuits, one fed from the main source of electrical power and one fed from the emergency source of electrical power, and these circuits are to be separated throughout their length as widely as practicable. Each item of accident prevention systems is to be individually connected to the distribution board. These boards may also be used for navigational equipment specified in **Sec 4**.
(2) The power supplies to the distribution boards are to be arranged with automatic changeover facilities between the two sources.
(3) Failure of the main electrical power supply to the distribution board is to initiate an audible and visual alarm at the distribution board.
(4) Following a loss of electrical power supply which has lasted for 45 *seconds* or less, all primary functions of the accident prevention systems are to be readily reinstated.

502. Accident Prevention Systems

1. General

(1) Indicator lamps are to be provided in the ship master's room which indicate the bridge navigational watch alarm system specified in **Sec 5, 502. 2** and the alarm and warning transfer system specified in **Sec 5, 502. 3** are functioning properly.
(2) Audible and visual alarms for a malfunction of the bridge navigational watch alarm system specified in **Sec 5, 502. 2** and the alarm and warning transfer system specified in **Sec 5, 502. 3** are to be provided on the bridge and in the ship master's room.

2. Bridge Navigational Watch Alarm System

A bridge navigational watch alarm system which complies with the following is to be provided.

(1) The bridge navigational watch alarm system is to be a vigilance system to verify periodically that the alert navigator is present on the bridge.
(2) The bridge navigational watch alarm system is not to cause undue interference with the performance of bridge functions.
(3) The bridge navigational watch alarm system is to be so designed and arranged that it could not be operated in an unauthorized manner.
(4) The bridge navigational watch alarm system is to be adjustable of its verification period up to 12 minutes intervals and constructed, fitted and arranged so that only the ship master has access to the component for setting the appropriate intervals.
(5) The bridge navigational watch alarm system is to initiate alarms that are able to be verified in the bridge and other places if the setting interval has elapsed.
(6) The bridge navigational watch alarm system is to provide for the acknowledgement by the navigator at the navigating and maneuvering workstation and other appropriate locations on the bridge from where a proper lookout may be kept.
(7) The bridge navigational watch alarm system is to be connected to the alarm and warning transfer system specified in **Sec 5, 502. 3.**

3. Alarm and warning transfer system

An alarm and warning transfer system which complies with the following is to be provided.

(1) Acknowledgement of alarms and warnings that require the navigator response is to only be possible from the bridge.
(2) Any alarm and warning that requires the navigator response is to be automatically transferred to the ship master, to the selected back-up navigator and to the public rooms if not acknowledged on the bridge within 30 seconds.
(3) The alarm and warning transfer is to be operated through a fixed installation.
(4) Provision which initiates a call-alarm clearly audible in the spaces specified in (B) is to be provided on the bridge for the operation of the navigator. The fixed installation required under (C) may serve the purpose.

Section 6 Bridge Work Assist Systems

601. General

1. Scope

The requirements in this Section apply to systems to assist navigator's works for one-man bridge operation under normal operating conditions (hereinafter referred to as "bridge work assist systems").

2. General

(1) Bridge work assist systems are to be capable of continuous operation under the conditions of various sea states, vibration, humidity, temperature and electro-magnetic interference likely to be experienced in the ship which they are installed.
(2) Where computerized equipment is interconnected through a computer network, failure of the network is not to prevent individual functions.

3. Centralized bridge workstation

(1) The centralized bridge workstation is to be arranged to enable a navigator to perform navigating and maneuvering works specified in **Sec 4, 402. 1** (1) and also two or more navigators to do those works together.
(2) The systems or controls under **Sec 4, 402. 2** (1), (5), (11) to (17), **Sec 6, 602. 2** and **3** are to be arranged centrally to enable the navigator to operate them easily at the centralized bridge workstation.

4. Electrical power supply

(1) Local distribution boards are to be arranged in the wheel house for all items of electrically operated bridge working assist systems. These boards are to be supplied by two exclusive circuits, one fed from main source of electrical power, and these circuits are to be separated throughout their length as widely as practicable. Each item of bridge working assist systems is to be individually connected to the distribution board. These boards may also be used for navigational equipment and accident prevention systems specified in **Sec 4** and **Sec 5.**
(2) The power supplies to the distribution boards are to be arranged with automatic changeover facilities between the two sources.
(3) Failure of the main electrical power supply to the distribution board is to initiate an audible and visual alarm at the distribution board.
(4) Following a loss of electrical power supply which has lasted for 45 seconds or less, all primary functions of the bridge work assist systems are to be readily reinstated.

602. Bridge Work Assist Systems

1. General

(1) Audible and visual alarms for a malfunction of the bridge information systems specified in **Sec 6, 602. 2**, ECDIS specified in **Sec 6, 602. 3** and the auto-trucking system specified in **Sec 6, 602. 4** are to be provided on the bridge and in the master's room.
(2) Electronic charts deemed appropriate by the Society are to be used for the ECDIS.

2. Bridge information system

Bridge information system which complies with the followings is to be provided.
(A) The system is to be capable of displaying at least the following information a) to l) for easy viewing from centralized bridge workstation.
(a) Ship's actual and planned course
(b) Rudder angle including its order value or direction
(c) Ship's speed (against water)
(d) Main engine revolution and direction (in the case of Controllable Pitch Propellers, main engine revolution and propeller pitch angle)
(e) Ship's position (longitude and latitude)
(f) Depth of water
(g) Wind direction (relative direction)
(h) Wind speed (relative speed)
(i) Rate of turn (10,000 GT or more)
(j) Side thruster pitch angle or its motor amperes and its thrust direction (if any)
(k) Onboard time
(l) Distance to a way-point and estimated time of arrival
(B) In order to display the information appropriate for each navigation areas, the system is to be capable of changing-over between harbor, ocean and other mode (if any). In addition, the system is to be capable of displaying the minimum information necessary for all modes at all times.
(C) The system is to be capable of displaying at least following information for harbor and ocean mode specified in the preceding (B) at all times.
(a) Harbour mode
Information of the preceding (A) (a) to (k).
(b) Ocean mode
Information of the preceding (A) (a) to (e), (g), (h), (k) and (l).

(D) The system is to be capable of acknowledging alarms and warnings which requires the navigator response.
(E) Other functions deemed necessary by the Society are to be provided.

3. Electronic chart display and information system (ECDIS)

An ECDIS, including associated back-up arrangements, which complies with the following is to be provided.
(A) The ECDIS is to be capable of displaying an electronic chart at centralized bridge work station.
(B) The ECDIS is to be capable of ship's position and vector on the electronic chart.
(C) The ECDIS is to be capable of displaying the electronic chart in a north-up and course-up orientation.
(D) The ECDIS is to be capable of carrying out route planning.
(E) The ECDIS is to be capable of adding a chart, ship's position, planned route, radar and ARPA information to the display.
(F) Other functions deemed necessary by the Society are to be provided.

4. Auto tracking system

An auto tracking system which complies with the following is to be provided.
(A) Auto tracking system is to be capable of performing automatic steering of the ship along a planned route on an electronic chart.
(B) Automatic course changes are not to occur without acknowledgement by the navigator.
(C) When there is no acknowledgement at a waypoint, the course is to be maintained and the audible and visual alarm is to be initiated after through the point. In the case, the audible alarm is to be distinguished from the pre-warning at the approach of a way point specified in **Sec 5, 501. 4**.
(D) It is to be possible to adjust a width of planned route within one mile.
(E) When the position of ship cannot be received continuously, the course of ship is to be maintained and the audible and visual alarm is to be initiated.
(F) Change-over to manual steering mode is to be easily possible.
(G) Other functions deemed necessary by the Society are to be provided. ⚓

CHAPTER 6 HULL MONITORING SYSTEMS

Section 1 General

101. Definition

Hull monitoring system (hereinafter referred to as "systems") are to monitor a behavior of hull girder during navigation, loading and unloading, and to provide real-time information on stress level due to longitudinal bending moment and acceleration level due to ship's motion. The systems will give warning when stress levels and acceleration of ship motions approach levels which require corrective action.

102. General

1. Application:

The requirements in this Chapter apply for a ship that the class notations assigned to the hull monitoring system to be classed or intended to be classed with the Society.

2. Class notations:

Ships complying with this Chapter may be assigned with one of the following class notations:
HMS : This notation will be assigned when the ship has been provided with a basic hull stress monitoring system in accordance with **Sec 2, 201.** and **202.**
HMS1 : This notation will be assigned when the ship has been provided with the **Sec 2, 203.** in addition to HMS.

3. Liability:

This system is intended as an aid to the Master's judgement and not as a substitute for it. Accordingly, any failure of the system does not, in anyway, remove the master from his/her absolute responsibility to take correct action in operation the ship.

103. Information and Plans

The following plans and information are to be submitted or approval:
(1) Drawings
- arrangement and layout of the system
- block diagram of the electric system
- flowchart of functions of sensors and the system

(2) Information
- list of instruments and equipment (name, kind, type, manufacturer, etc.)
- operating manual including procedures of maintenance, fault detection and management ad setting up and calibration
- in-service test program
- list of software modules and the description of the calculation method
- sensor specifications (accuracy, range, frequency response, etc.)
- description of the method to display the output

Section 2 System Requirements

201. General

All components are to be replaceable and designed for easy maintenance. Sensors are to be approved by this Society or to be approved by the other recognized organization.

202. System Requirements

1. Sensors

(1) Long based strain gauge
(A) Each long strain gauge is instrument for measure the longitudinal bending stress of ship. It is to be able to measure the strain which is characteristic for the structural response considered.
(B) The type and installation are in general to exclude the effects of local stress concentrations. The length of the long based strain gauge is recommended to be between 1.5 m and 2.5 m.
(C) The position of the long based strain gauge is to be planned to measure longitudinal hull girder bending stress. The minimum required number and approximate position of the strain gauges are as follows:
(a) Tankers, Bulk Carriers and General dry cargo ships:
- 2 at midship (one port, one starboard on deck)
- 1 at L/4 from the bow(on deck)
- 1 at L/4 from the stern(on deck)
(b) Container ship :
- 4 at midship in a ring around the section(two port, two starboard; on deck and upper turn of bilge)
- 1 at L/4 from the bow(on deck)
(D) Strain gauges are to have an accuracy better than ±20 $\mu\epsilon$. The linear range of each strain gauge is to be in excess of the full range of expected still water and dynamic stress variation. For dynamic stress range each strain gauge is to have a frequency response capable of measuring strain in the frequency range 0 to 5 Hz.
(E) When measuring longitudinal bending stresses of ship and corresponding loads the effects of temperature variations due to the daily environmental changes are to be considered. If possible, these effects are to be removed from any display of still water loading.
(F) Thermal loads due to cargo temperatures are to be considered separately. Consideration as to whether or not the thermal loads should be included in the still water or water loads are to be determined when taking into account the type of vessel and cargo and the approved ship's scantlings and their conditions of approval. (The data of calculation were to be submitted of the Society.)
(2) Accelerometer
(A) The vertical acceleration is to be measured on the centerline, at the main deck level within the forward 0.01 L of the ship.
(B) Accelerations are to be measured over a range of ±1 g. The measurement uncertainty of the acceleration is to be less than 1 % of the measured value in the frequency range of 0 to 5 Hz.
(3) Pressure Transducer
(A) If possible, the pressure transducers may be installed to measure the number of slam.
(B) Pressure gauge where fitted through the hull are to be arranged so that the pressure diaphragm is flush with the outside of the plating. The gauge is to be arranged with a suitable valve to enable the gauge to be removed and refitted with the vessel in the water at an operational draft.
(4) Clinometer
In order to measure the motion characteristics, the clinometer may be installed.

2. Date Processing and Output Display

(1) Display and alarm devices

(A) The hull monitoring system is to be able to provide real-time information to the bridge of the measured values while at sea and during loading and unloading operations. The system is to be able to record and display the following sets of data for each strain gauge and accelerometer:
- the peak value of the longitudinal hull girder bending stress or vertical acceleration
- the mean value of the longitudinal hull girder bending stress or vertical acceleration
- the standard deviation of the longitudinal hull girder bending stress or vertical acceleration

(B) The system is to include a computer that can process sensor signals and compare these with threshold levels approved by the Society. When values exceed these pre-set threshold values, the system is to give visual and audible alarm on the bridge.

(C) In order to verify intermediate and final stages of loading and unloading operations, the hull monitoring system is to have a direct link or easy connection to the loading computer.

(D) Each update of the display is to be based on statistics of the recorded data within 30 minutes interval. The sensor readings are to be displayed in a manner that enables the trends in the data over at least the last 1 hours to be seen.

(E) The number of acceleration peak exceeding a pre-set acceleration level, which indicates a slam in the bow are to be recorded and displayed. The pre-set acceleration level is to be reported.

(F) The recordings from strain sensors are to be processed using a type of cycle count method (e. g. "rain flow" method) to produce response histogram. The stress spectra may be used as basis for fatigue life predictions. The size of strain interval is not to exceed 50 $\mu\varepsilon$. The cycle count method is to be reported and submitted.

(2) Signal processing

(A) The sampling rates are to be suitable for the frequency response of the transducer and the use of the signal. In general the sampling rate is not to be less than 3 times the required frequency response. Special attention is to be paid to the sampling rate if it is intended to capture transient components of signals.

(B) The measured signal induced by wave is to be statistically calculated with the time interval of between 5 minutes and 30 minutes.

3. Storage device

(1) General

(A) For the purpose of verifying that all sensors are working under sea-going conditions the system is to have a minimum recording capability. This requires that a semi-permanent data storage medium is to be used to record, at least once per month and the following information processed over a period of 5 minutes.
- maximum peak to peak value of stress/acceleration
- mean value of stress/acceleration
- standard deviation of stress/acceleration
- average zero crossing period of stress/acceleration
- time reference

(B) Automatic post-processing of data on-board or ashore is to be available on shore or on the vessel to enable the data to be evaluated. Proposals will be considered for recording to be replaced by sending the data ashore via satellite on a regular basis.

(C) Where manual input, for example via a computer keyboard, is used, the input procedures are to be included in the operating manual and are to be submitted for review. This data is to be checked regularly against the criteria described in the checking procedure.

4. Electrical and mechanical equipment

(1) Flame proof

All electrical and mechanical equipments associated with the hull monitoring system located in hazardous areas is to be in accordance with the requirements in **Pt 7, Ch 1, Ch 5** and **Ch 6.**

(2) Uninterruptible Power Supply (UPS)

(A) The monitoring system is to be powered through an Uninterruptible Power Supply (UPS).

(B) In case of failure of the main input voltage the battery capacity is to be sufficient to maintain normal operation of the monitoring system for at least 10 minutes. Failure of any power supply to the system is to initiate an audible and visual alarm.

(C) In the case of power failure the system software and recorded date is stored safely. The system is to be able to return automatically to normal operating condition when the power is restored.

203. Additional Requirement for Hull Monitoring System(HMS1)

1. General :

Ship assigned with the class notation of HMS1 is to be complying with the sea environment and voyage data in accordance with the term **203. 2** in addition to **201.** and **202.** The necessary information suitable for this additional requirement is to be displayed and stored.

2. Additional requirement

(1) Ship position
The ship position is to be informed by Global Position System(GPS).
(2) Wind speed and direction
The system is to indicate the wind speed and direction provided by wind speed indicator and anemoscope.
(3) Ship speed and direction
The system is to indicate the real-time information of ship speed and direction provided by GPS and speed and distance indicator onboard.

Section 3 Approval for Plans and Documents, Installation and Installation Survey

301. Approval for plans and documents

(1) Instruction manuals
Instruction manuals are to be described in relevant language and kept on board. The manuals are to contain necessary instructions on:
- instruction of system
- interpretation of measuring results
- systematic maintenance and function testing
- identification of faults and repairs
- procedures of installation
- procedures of initial calibration and checking
- checking procedure
- components list

(2) Checking procedure
The plan for systematic maintenance and function testing is to show how components and systems are to be tested and what is to be observed during the tests. The procedure is to describe how to check the normal operation of the signal acquisition and analysis and display. The check list of checking procedure is to be included in instruction manuals.

302. Installation

1. General:

Information on how to initialize the sensors is to be verified by the Society. The system is to be installed with attendance of a surveyor.

2. Installation of the sensors

(1) Sensors are to be protected from mechanical damage, humidity by the sea water, effects of very high and low temperature and damage due to local vibration.
(2) Sensors mounted on deck of the ship are to be protected from heavy sea condition. For container ship, the system is to be located in the safety area where it is not disturb to remove/install the dropped container securing appliances during loading/unloading operation.
(3) Deck mounted strain gauge is to be protected from green sea on deck by appropriate siting of by using substantially constructed breakwaters or similar means. Attention is to be paid to the possibility of green water damage to other gauge, junction boxes, cable conduits, etc.

(4) Motion sensors to measure motions are to be placed in positions where their functioning will not be affected by vibrations. Accelerometers and motion monitoring devices are to be mounted on a hard structural point where local structural vibration will be minimal. If resilient mounts are used, it is to be demonstrated that they have frequency characteristics that do not affect the signal in the frequency range of interest.
(5) When gauges are welded to the hull welding procedures are to comply with Class Rules of the Society. Consideration is to be given to the damage and repair of coatings.
(6) Pressure gauges where fitted through the hull are to be constructed in accordance with the Class Rules of the Society.

303. Installation survey

1. Initial calibration and test

(1) Initial calibration
(A) Each long based strain gauge is to be initially set to a stress calculated in an associated loading condition.
(B) This calculated stress is to be compatible with the output of the loading instrument and calculations made using the loading manual. The set-up is not to be carried out when dynamic stresses are present and are to be made when temperature effects are minimized and in absence of large gradients due to loading condition. In the case of measuring local stresses the sensor stress is to be set to the stress calculated through the detailed structural analysis.
(C) Also, the motion measuring device is to be set according to the ship condition.
(2) Checking of the initialized value
(A) After installation, the initial set-up of each long strain gauge is to be checked at least one time within 6 months.
(B) This is to be undertaken by the ships operating personnel taking the relevant values from the Loading Instrument and the Hull Condition Monitor in accordance with the Verification Procedure and submitting them to the Surveyor.
(C) In the event that differences greater than 10 % of the calculated value occur, the set-up and subsequent checking procedure are to be repeated.

3. Sensor re-calibration

Each strain gauge is to be re-calibrated annually in accordance with the manufacturer's recommendations. The certificates of calibration, signed by an authorized person, are to be kept onboard the ship.

4. Other survey

In the case of set-up sensor on exposed deck, to be carried out hose test according to **Pt 3, Ch 1, Sec 2.**

Section 4 Periodical Survey

401. General

Periodical survey for the systems is to be carried out at the time of Annual/Intermediate/Special Survey specified in **Pt 1, Ch 2.**

402. Survey items

The general conditions of electrical, mechanical and hazardous area equipment are to be carried out so far as practicable on hull monitoring systems, with special attention being paid to the following;

1. The verification of location of sensors.

2. The operation of the system is to be verified in accordance with the approved verification procedure.

3. Current calibration certificates for the sensors and Operating Manual is to be established on board.

4. The protection of sensors is to be inspected. ⚓

KOREAN REGISTER

2011

Guidance Relating to the Rules for the Classification of Steel Ships

Part 9

Additional Installations

GA-09-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance relating to the Rules for the Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidelines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF PART 9 "ADDITIONAL INSTALLATIONS"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date 20 May 2010 (based on the application date for classification survey)

CHAPTER 3 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 2 Surveys of Automatic and Remote Control Systems

- 206. Fig 9.3.1 and 9.3.2 have been amended.

Effective Date 1 July 2011

CHAPTER 2 CARGO HANDLING APPLIANCES

Section 2 Surveys

- 205. 1 (4) has been amended.

CHAPTER 3 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 2 Surveys of Automatic and Remote Control Systems

- 203. 1 (1) has been amended.

CHAPTER 4 DYNAMIC POSITIONING SYSTEMS

Section 2 Requirements of Dynamic Positioning Systems

- 203. has been newly added.

CHAPTER 5 NAVIGATION BRIDGE SYSTEMS

Section 5 Accident Prevention Systems

- 502. has been newly added.

CONTENTS

CHAPTER 1 CARGO REFRIGERATING INSTALLATIONS

Section 1 General

101. General

1. Scope

The refrigerants listed below are not to be used as refrigerants.

(1) Methyl chloride (CH_3Cl)
(2) R 12 (CCl_2F_2)
(3) R 502 (R 22/R 115 (48.8/51.2 wt%) $CHClF_2/CClF_2CF_3$)
(4) R 13B1 (CF_3Br)
(5) Other refrigerants as deemed inappropriate by the Society

Section 2 Surveys

203. Classification Maintenance Surveys

1. Special Surveys

(1) The wording ‘the interval of opening up’ specified in **203. 2** (1) of the Rules means the interval of 25,000 hours of operation.
(2) The wording 'operation tests' specified to in **203. 2** (10) of the Rules means the confirmation of the effectiveness of each unit under operating condition. At this time, leak tests of refrigerant are to be carried out. When necessary, the concentration of brine is to be measured.
(3) 'Continuous Surveys' specified in **201. 2** (2) (D) of the Rules is conform to the following requirements:
  (A) Submission of application for Continuous Survey system.
  When the shipowner or his representative desires to adopt a Continuous Survey system, he is to submit application to the Society for approval on application for that system.
  (B) Plans for Undergoing Continuous Surveys
  The owner of a ship to which continuous survey system is applied is to prepare 'Plan for Undergoing Continuous Surveys on Cargo Refrigerating Installations' or 'Plan for Maintaining Cargo Refrigerating Installations' taking into account items listed in the following (a) to (d) and carry it on board the ship so that it can be presented to the Surveyor whenever he requires it.
    (a) All items to be covered by continuous surveys are to be included in the plan.
    (b) Inspection interval of each survey item is not to exceed five years.
    (c) Inspection of each compressor is to be carried out alternately and with the same interval, as far as possible.
    (d) Inspection of each pump is to be carried out alternately and with the same interval, as far as possible, by its use.
  (C) Items to be covered by Continuous Surveys At continuous surveys, open-up inspection and pressure tests are to be carried out on the following machinery and equipment.
    (a) Compressors
    (b) Condenser cooling water pumps
    (c) Primary refrigerant pumps
    (d) Brine pumps
    (e) Condensers
    (f) Evaporators
    (g) Others to be considered appropriate by the Society

(D) Confirmatory Surveys
On the items listed in (a) to (d) of (C) above, confirmatory surveys may be carried out in accordance with the procedures specified in **Pt 1, Annex 1-7, 2** (2) (D) of the Guidance. For compressors, at least one unit of them is to be subject to open-up inspection during the period of one cycle of continuous surveys.

(E) Cancellation of Continuous Survey System
(a) Where the shipowner or his representative requests the cancellation of applying the continuous survey system, the subsequent surveys are to be in accordance with the following (i) and (ii).
(i) Where there are machinery and equipment of which their inspection intervals will exceed five years before the next special survey, they are to be inspected within five years from the dates on which the previous surveys were carried out.
(ii) At the next special survey, inspection is to be made on all items to be required at a special survey.
(b) Where continuous surveys are not carried out in accordance with the Guidance, the application of continuous survey system may be cancelled.

Section 3 Refrigerating Machinery

302. Construction, etc. of refrigerating machinery

1. Refrigerant compressors

'Automatic cut off devices' specified in **302. 1** (3) of the Rules includes flow switches.

303. Cooling appliances in refrigerated chambers

5. Temperature difference

Temperature difference between the refrigerated chamber and the refrigerant is, as a rule, to be within 5℃ for fruit, and 10℃ for frozen meat.

Section 4 Special Requirements for Refrigerating Machinery Using Ammonia as Refrigerant

407. Electrical installations

1. General

The wording 'certified safe types for use in the flammable atmosphere concerned' in **407. 1** (1) of the Rules means electrical equipment having intrinsically safe, flame-proof or pressurized construction grouped into Apparatus Group IIA and Temperature Class T1 as specified in (KS C) IEC 60079. ⚓

Annex 9-1 Spare Parts (for Reference)

101. Spare parts for general tools and equipment

1. One set of motor coupling bolts with nuts and washers of each size used.

2. One expansion valve of each size used.

3. One float regulator assembly of each size used.

4. At least two glass thermometers in the case of thermometers.

5. In the case of thermometers: 5 % of the total number of temperature sensors, but not less than one of each type used. Two sets of standard resisters of each size used.

6. Two sets of relief valves of each size used.

102. Spare parts for refrigerant compressors

1. Where screw type compressors are installed, the following spare parts are to be provided.

(1) One set of main bearing of each size used.
(2) One set of thrust bearing of each size used.
(3) One set of rotor seals of each size used.

2. Where reciprocating compressors are installed, the following spare parts are to be provided.

(1) One set of piston and piston rod or connecting rod of each size used.
(2) One set of crankshaft main bearing of each size used.
(3) One complete assembly of each size of compressor suction and delivery valves.
(4) One set of wearing parts of the crankshaft seals where the crankcase is subjected to the refrigerant pressure.
(5) One set of crankshaft coupling bolts with nuts and washers of each size used.
(6) One set of driving belts of each size used.

103. Spare parts for electrical equipment

Spare parts for the electrical equipment are to comply with the requirements in **Pt 6, Ch 1, Sec 19** of the Rules. ⚓

CHAPTER 2 CARGO HANDLING APPLIANCES

Section 1 General

101. General

1. Application

In application to **101. 1** (1) of the Rules, cargo handling appliances means that come under either of the followings:

(1) The cargo handling appliances, except cargo ramps, of safe working load not less than 1 ton which are installed in ships subject to the requirements of *Korean Ship Safety Act*.

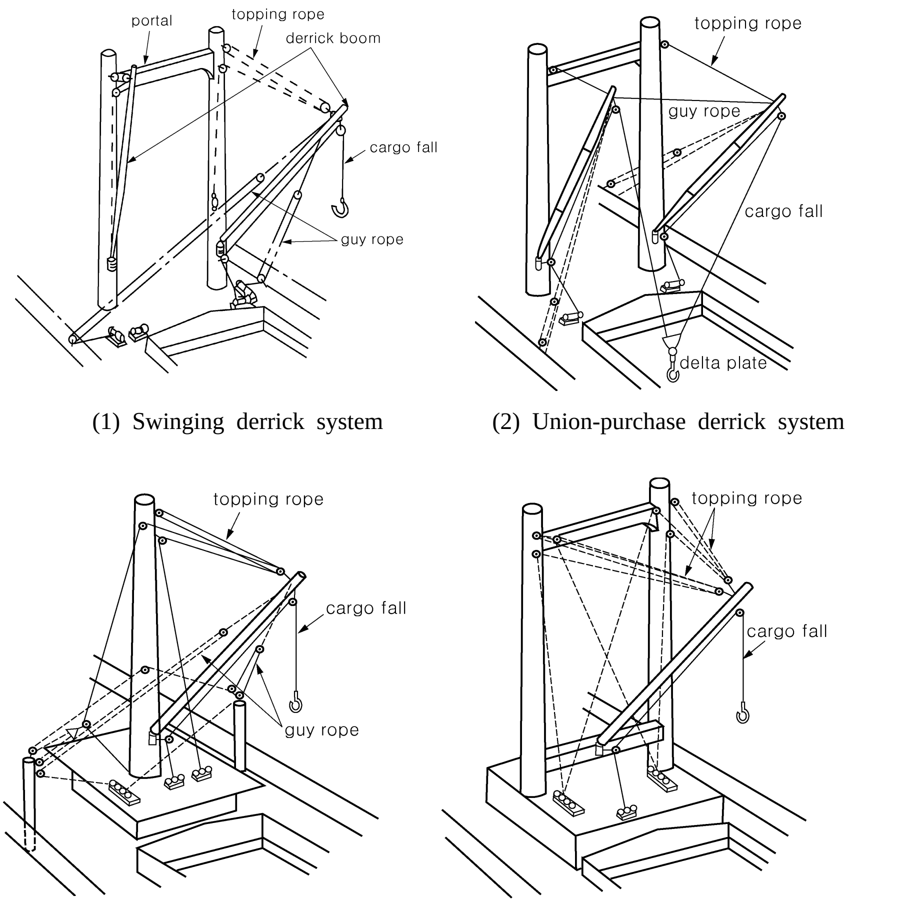
(2) The cargo handling appliances installed in the ships other than those specified in (1) above, for which the assignment of the safe working load, etc. is requested.

2. Equivalency

"Tests and inspection required by the Society" specified in **101. 2** (2) of the Rules mean, as a rule, the Design Examination specified in **203. 1** of the Rules and the Work Examination specified in **203. 2** of the Rules thereof. However, the Society may dispense with part of the plan investigation and examination for the machinery and gear which passed the plan investigation and examination of the official or third-party organizations considered appropriate by the Society and were certified by them.

102. Definitions

The derricks come under the requirements of the Rules include those illustrated in **Fig 9.2.1.**



(1) Swinging derrick system (2) Union-purchase derrick system

(3) One topping derrick crane system (4) Tow topping derrick crane system

Fig 9.2.1 Derrick Systems

103. Arrangement, Construction, Materials and Welding

1. General Construction

(1) The cargo gear which are to comply with the additional requirements considered appropriate by the Society in applying the Rules as specified in **103. 2** (1) of the Rules include the following (A) through (D):
(A) Cargo gear installed on mobile offshore units
(B) Cargo gear installed on workboats
(C) Hoisting and stowing equipment for submersibles and diving
(D) Other equipment to which the Society deems necessary to pay special attention

(2) "The Guidance relating to the Rules" specified in **103. 2** (2) of the Rules include the following requirements (A) through (D):
(A) Where steel materials of various strengths are used in the structural members, due considerations are to be given to the stress caused in the material of lower strength adjoining that of higher strength.
(B) For the members in which high tensile steels are used, special attention is to be paid to the structural details so that significant stress concentration may not take place.
(C) Where high tensile steels are extensively used in the structural members, careful considerations are required. In such cases, a thorough study with regard to ensuring buckling strength and the results of the study are to be submitted to the Society.
(D) Dimensions of the members are to comply with the following requirements (a) through (e):
(a) The minimum thickness of post specified in **303. 3** of the Rules may be obtained from the following formula:

$$5.0K+1.0 \quad (\mathrm{mm})$$

where:
$K=\sigma_{yM}/\sigma_{yH}$
σ_{yM} : Specified value of yield stress of mild steel
σ_{yH} : Specified value of yield stress of high tensile steel

(b) The minimum outside diameter of post at the base specified in **305. 2** of the Rules may be as obtained from the following formula:

$$5hK \quad (\mathrm{cm})$$

where :
h : As specified in **305. 2** of the Rules
K : As specified in (a) above

(c) The value of the coefficient C_2 specified in **Table 9.2.8** and **305. 3** (1) (A) of the Rules may be substituted by the value of C_2 multiplied by the coefficient K specified in (a) above.
(d) The minimum thickness of the structural members specified in **403. 6** of the Rules may be substituted by the value obtained from the following formula:

$$5.0K+1.0 \quad (\mathrm{mm})$$

where:
K : As specified in (a) above

(e) The minimum thickness of the structural members specified in **803. 4** of the Rules may be substituted by the value obtained from the following formula:

Weather part : $5.0K + 1.0$ (mm)

Enclosed part : $5.0K$ (mm)

where:

K : As specified in (a) above

2. Materials

(1) "Cases considered appropriate by the Society" mentioned in **103. 4** (1) of the Rules are the following cases (A) to (C):

(A) Where B of more than 25 mm in thickness are used in the following members (a) to (c) of the structural members of cranes:

(a) Flange for mounting slewing ring (bearing) of jib crane

(b) Housing base of jib crane

(c) Members constituting movable parts of gantry crane, etc. with increased plate thickness to ensure stiffness. However, requirements specified in **Table 9.2.1** of the Rules may be applied according to the magnitude of working stresses

(B) Where steel pipes conforming to the following requirements (a) through (d) are used to manufacture the structural members such as derrick booms, derrick posts, crane jibs, crane posts and other similar members:

(a) The steel pipes are to be of 20 mm or less in thickness.

(b) The steel pipes are to be of Grade 1 or 2 of steel pipes for pressure piping specified in **Pt 2** of the Rules, or the equivalent thereto.

(c) Steel pipes to be welded are to be of 0.23 % or less in carbon contents.

(C) Where rolled steel material and steel pipes, not exceeding 12.5 mm thick, complying with the standards recognized to be appropriate by the Society are used in the structural members of cargo gears which are not employed in cargo handling services excluding those used for cargo hoses. The materials of the structural members welded directly to the hull structure, however, are to comply with the requirements in **103. 4** (1) of the Rules or (2) (a) to (c) above.

(2) Classification of the steel materials used in the structural members, travelling girders, tracks, etc. of cargo gear regularly used in especially cold zones or refrigerated hold chambers are to comply with **Table 9.2.1** according to design temperatures.

(3) Forged or cast steel parts used in the following structural members (A) through (F) may be of the materials conforming to standards considered appropriate by the Society.

(A) Topping bracket of derrick system

(B) Gooseneck bracket and gooseneck pin of derrick system

(C) Derrick heel lugs and head fitting of derrick boom

(D) Heel bracket of jib crane

(E) Heel fitting of crane jib

(F) Bracket and pin for movable parts of gantry crane, cargo lift and cargo ramps

Table 9.2.1 Classification of Steel Materials Exposed to Low Temperature

Design temperature T (℃)	Material thickness t (mm)				
	$t \le 10$	$10 < t \le 20$	$20 < t \le 25$	$25 < t \le 40$	$40 < t$
$-10 \le T$	A/AH		B/AH	D/DH	E/EH
$-20 \le T < -10$	B/AH	D/DH	E/EH		
$-30 \le T < -20$	E/EH			$RL24A$	$RL24B$
$-40 \le T < -30$	$RL24A$		$RL24B$		*
$-50 \le T < -40$	$RL24B$		*		

(NOTES)
1. Steel grades for the construction capable of relieving thermal stress will be specially considered by the Society.
2. The Society may require materials having higher notch toughness according to the material thickness and construction if the design temperature is below -50℃ or working stress of the material exposed to low temperatures exceeds 60% of the yield point.
3. Steel grades for the members corresponding to classification asterisked * will be specially considered by the Society.
4. Symbols used in this Table are same as those in **Table 9.2.1** of the Rules.

3. Welding

In application to **103. 5** of the Rules, the followings are to be applied.

(1) Welding of derrick posts is to comply with the following requirements (A) through (H):

(A) Welding of post is to be both side welding as far as practicable.

(B) Welding of post to deck is to be of double grooved at the foot of post. If inside work of the post is difficult due to small diameter or any other reasons, penetration welding with the backing metal for single groove may be permitted.

(C) As for the welding of side plates to upper and lower plates constituting portal, the fillet size, at the portal ends and at the portions where topping brackets, eyes, etc. are fitted are to be of $F1$ weld specified in **Pt 3, Table 3.1.6** of the Rules.

(D) Welding for portal and post are to be both side welding as far as practicable. If the angle (α) shown in **Fig 9.2.2** is small, the ends of portal are to intersect orthogonally with the post surface by providing knuckle to carry out fillet welding as completely as practicable.

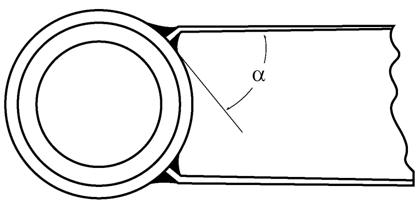


Fig 9.2.2 Welding for Portal and Post

(E) Topping brackets and gooseneck brackets are to be fitted by penetrating the post or mounting the base. If the plate thickness of the post or the mounting base exceeds 12.5 mm, the welding is to be penetration welding with grooves.

(F) The joint of derrick boom for circumferential is to be both side welding and back welding after removing defects of face run by back chipping. However, penetration welding with backing metal may be permitted limiting to such an unavoidable case as partial replacement for repair. In this case, the welded joint concerned is to be verified by suitable non-destructive inspection carried out along the whole length of weld line that it is free from injurious defects.

(G) The backing metal used for the joint derrick boom for longitudinal joint is to be jointless along the whole length with smooth surface.
(H) The requirements in (B), (E) and (F) above may be modified for the derricks not used in cargo handling service in consideration of the safe working load and the type of construction.

(2) Welding for cranes is to comply with the following requirements (A) to (E):
(A) The requirements in (1) (F) and (G) above are to be applied to the butt welding and longitudinal seam welding of jib by constructing the words "derrick boom" as "jib".
(B) Where welding from both sides (including fillet weld) is difficult for the welded joints other than butt welding and longitudinal seam welding of the jib, penetration bead welding or welding with backing strip is to be carried out.
(C) As for the welding of crane post, the requirements in (1) (A) and (B) above are to be applied.
(D) The following parts are, as a rule, to be fixed by full penetration type welding.
(a) Fixing part of crane post and post flange for slewing ring
(b) Fixing part of bracket for sheave to jib top
(c) Fixing part of bracket for sheave to crane house
(d) Fixing part of base bracket of jib
(e) Fixing part of crane house well and turning table
(E) The fillet weld applied to the primary structural members is, as a rule, to be *F*1 weld specified in **Pt 3, Table 3.1.6** of the Rules, or equivalent thereto.

(3) Welding for cargo lifts and cargo ramps is to comply with the following requirements (A) to (C):
(A) The fillet weld applied to the primary structural members is to comply with the requirements in (2) (E) above.
(B) Welding for non-slip bar, etc. fitted directly to the primary structural members is to be carried out in such a way that it may not give any injurious effect on the members.
(C) The method of welding for stoppers, their braces and similar fittings used in stowing the machinery are to be selected or carried out in such a way that they do not give any adverse effect on the structural members or hull structures.

(4) Welding for the structural members of cargo gear used regularly in especially cold zones or refrigerated hold chambers is to be carried out in such a way that it may not give any adverse effect on prevention of occurrence of low temperature brittle fracture in consideration of the structure, working stress, etc.

(5) When cast steel or forged steel parts are connected to steel plates by butt welding or lap welding, the details of welded joints are to comply with the requirements specified in **Pt 2, Sec 2, Ch 3** of the Rules.

(6) Non-destructive inspection for welded joints of structural members of cargo gear and cargo ramps is to comply with the following requirements (A) to (C):
(A) The following places (a) to (c) are to be subjected to radiographic test or ultrasonic test:
(a) Places specified in (1) (F) above
(b) For structural members of cranes, places specially considered by the Society according to their structure and method of construction as well as the places specified in (2) (A) above
(c) Places being suspicious in integrity of welded joints
(B) When the Society deems necessary, the following places corresponding to (a) to (d) are to be subjected to the magnetic particle test or dye penetrant test:
(a) Welded joint of rolled steel plate to cast or forged steel
(b) Trace of removing hanging pieces, jigs, etc. welded temporarily to the structural members
(c) Weld of cargo fitting
(d) Fillet welds of structural members being suspicious in integrity
(C) Method of non-destructive test specified in (A) and (B) above and judging criteria of defects are to be in accordance with the discretion of the Society according to the construction of the places concerned.

Section 2 Surveys

201. General

1. Application

In application to **201. 1** of the Rules, the followings are to be applied.

(1) Posts for derricks and cranes and supports for cargo lifts/ramps fixed directly to the hull structure are to be subjected to the tests and examinations specified in **Pt 1** of the Rules for the Survey and Construction of Steel Ships in addition to this chapter.

(2) Where cargo lifts and cargo ramps constitute part of the hull structure, they are to be subjected to the tests and examinations in compliance with the requirements in **Pt 1** of the Rules, according to the type and arrangement of hull structure.

(3) In applying the requirement in **201. 1** (4) of the Rules, the Load Tests specified in **202.** of the Rules may be omitted provided that the cargo gear is to comply with the condition in either of the following (A) or (B).

(A) For heavy derrick systems: they are not frequently used and the Load Tests will be carried out before use.

(B) For union-purchase derrick systems: they passed the Load Tests as a swinging derrick system and eye plates of preventer stays are in good order.

2. Preparation and Attendance for Tests and Surveys

In application to **201. 2** (3) of the Rules, "The Surveyor considers that the safety for execution of the tests and examinations is not ensured" means that the safety measure of prevention for downfall is not taken at high position survey, etc.

203. Registration Surveys

1. Drawings and Other Documents to be Submitted

In application to **203. 1** of the Rules, the followings are to be applied.

(1) Notwithstanding the requirements in **203. 1** of the Rules, where whole cargo handling appliances or any components thereof are manufactured on the basis of the drawings and documents already approved at the same works, submission of the drawings and documents other than the following documents (A) and (B) may be dispensed with.

(A) Application for omission of submission of drawings

(B) General arrangement of cargo handling appliances

(2) Submission of drawings of hydraulic motors, hydraulic pumps, steam cylinders, pneumatic motors or internal combustion engines for driving various winches and travelling machines used in cargo handling appliances are to be in accordance with the following requirements (A) to (C) according to the output:

(A) Where the output is less than 375 kW :
Submission of drawings may be dispensed with. However, name of manufacturer, type and principal particulars are to be described in the approval drawings of winches or travelling machines employed.

(B) Where the output is 375 kW or more:
Principal particulars, drawings of structural details and strength calculation sheet are to be submitted in one set for reference.

(C) Others:
Where the machinery is installed in ships under the classification of the Society for the first time, the requirements in (B) above are to be applied even when the output is less than 375 kW.

(3) General arrangement plan and structural drawings of derricks are to include at least the following items (A) and (B):

(A) General arrangement plan

(a) Masts, posts, guy posts, shrouds, stays(including attached rigging screws), derrick booms, and arrangement of cargo fittings fitted to hull structure, etc.

(b) Breadth of ship and outreach

(c) Positions and name of cargo blocks and arrangement of running ropes(for lifting and slewing)

(d) Positions, types and capacities of winches

(e) Self-weight of lifting beams, grabs, lifting magnets, spreaders, etc.

(B) Structural drawings

(a) Construction, dimensions and materials of masts, posts, guy posts and derrick booms

(b) Dimensions and materials of shrouds and stays

(c) Dimensions and materials of gooseneck brackets, topping brackets, eye plates at upper and lower ends of preventer stays and other cargo fittings

2. Examinations for Workmanship

In application to **203. 2** of the Rules, the followings are to be applied.

(1) Tests and examinations for driving machines, etc. for cargo gear and cargo ramps are to be in accordance with the following requirements (A) to (D):

(A) Hydraulic motors and regulating valves attached thereto:

(a) Where the output is less than 375 kW, shop tests may be replaced with the tests conducted by the manufacturer. In this case the Society may require submission of the test results, if it deems necessary.

(b) Where the output is 375 kW or more, hydraulic test may be dealt with in a same way as (a), but performance verification test and open-up examinations are to be carried out in the presence of the Surveyor. The hydraulic(water or oil) test is to be carried out at a pressure of 1.5 times the design pressure.

(c) Notwithstanding the requirements (a) and (b) where the driving machines are installed on the class ship of the Society for the first time, the hydraulic test, performance verification test, and open-up examination are all to be carried out in the presence of the Surveyor.

(B) Hydraulic pumps:

Hydraulic pumps are to be dealt with in similar ways to (A) (a) to (c) above depending on the outputs of the driving motors.

(C) Steam cylinders, pneumatic motors and internal combustion engines:

These are to be dealt with in similar ways to (A) (a) to (c) above depending on each output. The hydraulic tests for the steam cylinders are to be carried out at a pressure of 1.5 times the design steam pressure and those for the valves directly connected to the cylinder are to be carried out at a pressure of 2 times the design steam pressure.

(D) Driving motors for winches or hydraulic pumps and their control equipment:

These are to comply with the requirements specified in **Pt 6** of the Rules and to pass the tests and examinations specified in **Pt 6** of the Rules thereof.

(2) Winches which are used for the cargo gear and cargo ramps(except those specified in (3) below) are to be subjected to the tests and examinations mentioned in the following (A) and (B) at the shop tests after completion of assembly including installation of driving machines, etc. In this case, one winch selected from those of the same type manufactured at the same time and to be installed on the same ship is to be tested in the presence of the Surveyor, and, if the results are satisfactory, tests and examinations for other winches may be substituted by confirmation of the test results issued by the manufacturer.

(A) Electro-hydraulic winches

(a) Visual examinations and checking of the construction:

It is to be ascertained that no practically injurious defects exist in materials and workmanship and each movable part moves smoothly.

(b) No-load test:

The winch is to be operated with no load at the maximum speed for 30 minutes(15 minutes for each normal and reverse rotation) and be ascertained that the performance and each structural part is in good order.

(c) Load tests:
The winch is to hoist and lower the rated load for a period of 30 minutes continuously. (Pause of 20 seconds may be inserted between each hoisting and lowering operation, and effective lift is desirable to be 10 m or more.) During this operation, the temperature rise of the bearings, the hoisting speeds, the lowering speeds and the input power are to be measured and ascertained that they are in good order.

(d) Braking tests:
During hoisting and lowering the rated load for the winch, return the control handle to the neutral position and check the slip of the load to be 1.5 m or less. Manual releasing test of the brake is also to be carried out and ascertained to be in good order.

(e) Speed control tests

(f) Emergency assurance tests:
The emergency assurance devices provided in the winches is to be ascertained of the performance by cutting off power supply during lowering the rated load.

(g) Overload tests:
The winch is to hoist and lower a load weighing 125 % of the rated load several times. The winch is to be stopped at least three times during lowering the load and ascertained to be in good order.

(h) Adjustment of the over-pressure preventive device:
The adjusted pressure is to be checked as necessary.

(i) Open-up examinations
The Society may require an open-up examination of the part where abnormality is found.

(j) Other tests deemed necessary by the Surveyor.

(B) The shop test for steam winches, electric winches and winches driven by internal combustion engines are also to be carried out in accordance with the requirement specified in (A) above for electro-hydraulic winches(except (A) (h) above).

(3) Winches that are used for cranes, special derricks, cargo lifts or cargo ramps and are integrated in their moving bodies are, as a rule, to be handled in accordance with the requirements in (2) above. However, in case where deemed impracticable by taking into account the construction or arrangement of the winch, part or whole of the tests and examinations specified in (2) above may be permitted to be carried out at the time of the Load Tests specified in **205.** of the Rules.

204. Annual Surveys

In application to **204. 1** of the Rules, at Annual Surveys, the structural members and loose gear in which corrosion, abrasion or other defects specified in the followings are found are, as a rule, to be repaired or renewed:

(A) Structural members(plate members and cargo fittings other than pin construction):
Structural members in which amount of wear and tear reaches 10 % of the original dimensions. However, this may not be applied where steel plates having enough margin to the thickness required by the Rules is used.

(B) Cargo fittings of pin construction:
Structural members where clearance between pin or similar fitting and its mating hole increases up to 10 % of the original diameter of the pin. However, for gooseneck pin the limit of clearance between the cross bolt and the bracket hole is to be 5 % of the original diameter of the cross bolt.

(C) Loose gear(except wire ropes)
For loose gear except wire ropes, those corresponding to any of the followings:
(a) Those in which injurious deformation occurred
(b) Those in which injurious deformation occurred
(c) Those in which amount of abrasion or corrosion reaches 10 % or more of the original dimensions
(d) Blocks whose sheaves do not rotate smoothly

(D) Wire ropes
Wire ropes corresponding to any of the followings:
(a) Those in which 5 % or more of total number of independent wires(except filler wires) were broken within a length of 10 times the diameter of wire rope
(b) Those in which reduction in diameter of the wire rope reaches 7 % or more of the diameter
(c) Those in which kink or other injurious deformation occurred
(d) Those in which significant corrosion occurred at the surface of independent wires or inside the wire rope
(e) Those deemed necessary by the Surveyor

205. Load Tests

1. Load Tests

In application to **205.** of the Rules, the followings are to be applied.

(1) Load Tests for cranes which are newly constructed, as a rule, are to be carried out after having been assembled at the shops, as well as after having been installed on board the ships. If the results of the shop tests are satisfactory for one crane selected from those of the same type manufactured at the same time and to be installed on the same ship, those for other cranes my be substituted by confirmation of the test results issued by the manufacturer. Where any special reason is admitted by the Surveyor, the Load Tests at the shop may be dispensed with.

(2) For cargo gear exclusively using grabs, lifting beams, magnets, spreaders and other similar loose gear (hereinafter referred to as "cargo holding gear"), the test load and safe working load may be dealt with in either case of the following (A) or (B) in accordance with the application:

(A) Where the mass of loose gears is included in the safe working load:

Test load = α × {(maximum cargo mass) + (mass of cargo holding gear)}
Safe working load = (maximum cargo mass) + (mass of cargo holding gear)

where:
α : a factor obtained from the test load specified in **Table 9.2.2** of the Rules divided by the safe working load. However, for the safe working load not less than 20 t but less than 50 t, the test load is to be the safe working load plus 5 t.

(B) Where the mass of loose gears is not included in the safe working load and the maximum cargo mass only is assigned as the safe working load, the cargo gear whose safe working load is assigned by this procedure is to satisfy the following conditions:
(a) The load tests are to be carried out employing the loose gears used in the cargo gear concerned or other loose gears having same construction and mass.
(b) The loose gears used on board the ship is to be the same gears as used in the load test or those having same construction and mass.

Test load = α × (maximum cargo mass)
Safe working load = maximum cargo mass

where:
α : As specified in (A) above

(3) Load Tests for cargo gear which are used for solely conventional cargo handling by cargo hook are, as a rule, to be handled in accordance with the manners specified in (2) (B) above.

(4) Details of Load Tests and operation tests for cargo gear and cargo ramps are to comply with the following requirements in (A) to (E), in addition to those specified in the Rules.

(A) Derricks

Where assignment of additional safe working load specified in **902. 2** (A) of the Rules is made, the Load Test for the additional safe working load may be dispensed with. In this case the relationship between the safe working load, etc. and additional safe working load, etc. is to satisfy the following formula:

$$B = W\frac{\cos\alpha}{\cos\beta}$$

where:

W : Safe working load (t)

α : Allowable minimum angle (degree)

B : Additional safe working load (t)

β : Additional allowable angle (degree)

(B) Jib cranes

(a) Where assignment of additional safe working load specified in **902. 2** (B) of the Rules is made, the Load Test for the additional safe working load must not be dispensed with.

(b) For cranes with constant safe working load regardless of slewing radius, slewing tests are to be carried out at the maximum radius with test load based on the safe working load suspended on it and luffing operation to the minimum radius or the smallest possible radius is to be carried out and slewing test at that radius is also to be carried out as far as practicable.

(c) For cranes whose safe working load changes depending on the slewing radius, slewing tests are to be carried out at both the maximum and minimum slewing radius after hoisting the test loads corresponding to each radius.

(d) For cranes capable of doing all three of hoisting, slewing and luffing operations or any two out of these three operations simultaneously, these combined operations prescribed in the design specifications are to be verified that they are in satisfactory condition with the test loads corresponding to the limited radius suspended on it.

(C) Gantry cranes and other track-mounted cranes

(a) The crane is to run on the track within the traveling limits with the safe working load suspended on it. In this case, the hull structure supporting the traveling track is also to be confirmed that it is free from defects.

(b) Where traveling trolley is employed, it is to run the whole traveling range through with the safe working load suspended on it.

(c) Where sponson girder of stowing type for traveling trolley is employed, stretching and stowing operations of the girder are to be ascertained that they are in good order.

(D) In case of hydraulic cranes where limitations of pressure make it impossible to lift a test load 25 percent in excess of the safe working load, it will be sufficient to lift the greatest possible load, but in general this should not be less than 10 percent in excess of the safe working load.

(E) "The method considered appropriate by the Society" in **205. 1** (4) (B) of the Rules means the following requirements at least.

(a) Accuracy of the load weighing machine is to be within the range of ± 2.5 %.

(b) Load applying position is to be selected in such a way that the stress generated in the structural members be the most severe within the approved operating range.

(c) The load is to be sustained for a period of 5 minutes or more being sufficient to ensure the load indicator remains constant.

Section 3 Derrick Systems

302. Design Loads

1. Load Considerations

In application to **302. 1** of the Rules, where strength of derrick systems is to be calculated directly, external forces exerting on top of boom are to include tension in topping lifts, tension in guy ropes, tension in cargo falls(which is caused by the weight of cargo), tension in cargo relief, half of self-weight of boom, and additional loads including self-weight of cargo blocks, hooks, ropes, etc. However, the additional loads may be as given in **Table 9.2.2.**

2. Loads due to Ship Inclination

In application to **302. 3** of the Rules, the followings are to be applied.

(1) Where an angle of heel less than that specified in the Rules is used for the design of structural members, data concerning ship inclination in service condition in at least the following conditions (A) through (C) are to be submitted to the Society. Longitudinal strength of hull and stability in these conditions are to be separately examined.
   (A) Ship light condition
   (B) On going condition in service of cargo loading
   (C) Immediately before fully loaded condition

(2) In ships conducting ballast adjustment to keep angle of heel within that specified in **302. 3** of the Rules in working condition, data concerning the following (A) through (C) are to be submitted to the Society. All these date are to be entered in the Instruction Manual to Cargo Handling Machinery and Gear referred to in **905. 2** of the Rules.
   (A) Specifications of equipment for ballast adjustment
   (B) Method and procedure of ballast adjustment
   (C) Trouble-shooting of equipment for ballast adjustment

Table 9.2.2 Additional Loads

Safe working load W (t)	Additional Loads (t)
$W \leq 2$	$0.283W$
$2 < W \leq 15$	$0.4\sqrt{W}$
$15 < W \leq 50$	$0.1W$
$50 < W$	As considered appropriate by the Society

Section 4 Cranes

402. Design Loads

1. Load due to Ship Inclination

In application to **402. 7** of the Rules, in calculating loads due to ship inclination to be taken into consideration in the design of cranes, requirements in **302. 3** (1) and (2) specified for derrick systems may be also applied to cranes.

2. Load Combinations

In application to **402. 9** of the Rules, wind loading need not be taken into account for cargo gear mentioned in the following (A) and (B):

(A) Cargo gear used in cargo hold, engine room, and other enclosed spaces in ship
(B) Cargo gear installed on weather deck and used only for loading and unloading articles other than cargo. The Society may, however, require to take the wind loading into account considering the construction system, method of operation, and safe working load of the machinery and gear.

403. Strength and Construction

1. General

In application to **403. 1** of the Rules, the followings are to be applied.

(1) As for slewing ring of the crane, drawings and data given in the following (A) through (E) are to be submitted to the Society. However, for those having operational experiences aboard ships under the classification of the Society, the requirements may be reduced to only those specified in (B).
(A) Those giving structural details and materials of slewing ring
(B) Allowable values of vertical load, radial load, and upsetting moment exerting on the slewing ring
(C) Installation criteria of slewing ring
(D) Strength calculation sheet
(E) Data on operating experience and quality control during period of manufacture.
(2) In construction of jib crane house, such portions subjected to concentrated load as fixing parts of brackets for sheaves and wire rope stoppers are to be effectively reinforced.

2. Fixed Posts

In application to **403. 8** of the Rules, the followings are to be applied.

(1) Where the fixing flange of slewing ring of jib crane at the upper part of post is reinforced by brackets, the brackets are at least to be fitted at every two fixing bolts for the slewing ring.
(2) The method of reinforcement specified in (1) above is to be applied also to gantry cranes and other special cranes having slewing ring.

404. Special Requirements for Track-mounted Cranes

1. Stability

In application to **404. 1** of the Rules, Tracks for track-mounted cranes are to comply with the following requirements (A) through (C):

(A) The tracks are to have proper cross section, to be properly laid considering expansion and construction due to hull deformation and thermal effect, to be rigid and horizontal, and to have sufficient strength and monolithic travel surface.
(B) Where intended to serve as anchor to stop the crane under strong wind condition, the tracks are to be properly designed for the purpose intended.
(C) Tracks for electric cranes are to be properly earthed.

Section 6 Loose Gear

602. Cargo Blocks

1. Cargo Blocks for Wire Ropes

In application to **602. 1** of the Rules, diameters of equalizer sheaves and sheaves of overload sensing devices at the bottom of groove are to be not less than 10 times and 5 times the diameters of wire ropes to be used, respectively.

603. Ropes

1. Wire Ropes

In application to **603. 1** of the Rules, terminal connections of ropes are to comply with the following (A) through (F), as a standard:

(A) A loop splice should have at least three tucks with a whole strand of rope, followed by two tucks with half the wires cut out of each strand.

(B) All tucks other than the first should be against the lay of the rope. If another form of splice is used, it should be as efficient as that described in (A) above.

(C) A splice in which all the tucks are with the lay of the rope should not be used in the construction of a sling or in any part of a cargo handling appliance where the rope is apt to twist about its axis.

(D) If a loop is made or a thimble secured to a wire rope by means of a compressed metal ferrule, the ferrule should be made to a manufacturer’s standard conforming to the following (a) through (e):

- (a) The material used for the manufacture of the ferrule should be suitable, particularly to withstand plastic deformation without any sign of cracking.
- (b) The correct size(both in diameter and length) of ferrule should be used for the diameter of the rope.
- (c) The end of the rope that looped back should pass completely through the ferrule.
- (d) The correct dies should be used for the size of the ferrule.
- (e) The correct closing or compression pressure should be applied to the dies.

(E) Where zinc or other alloy is cast in socket to hold the end of rope, work is to be done in accordance with the manufacturer’s criteria conforming to the following requirements (a) through (d):

- (a) Rope length necessary to make alloy casting is to be ensured.
- (b) Oil and dirt adhering to independent wires are to be completely removed and proper clean surfaces are to be ensured by treatment before casting work.
- (c) Casting temperature suitable to the characteristics of the alloy is to be properly maintained.
- (d) Socket is to be preheated before casting of alloy.

(F) The terminal fitting of any wire rope should be capable of withstanding the following loads (a) or (b).

- (a) Not less than 95 % of the minimum breaking load of the rope in the case of a rope of a diameter of 50 mm or less
- (b) Not less than 90 % of the minimum breaking load of the rope in the case of a rope of a diameter above 50 mm

605. Equivalent Requirements

1. General

In application to **605. 1** of the Rules, the followings are to be applied.

(1) Construction and materials of cargo blocks and hooks are to comply with the following requirements in (A) through (C).

- (A) Steel blocks are to comply with other standards considered appropriate by the Society.
- (B) Wooden blocks are to comply with other standards considered appropriate by the Society.
- (C) Hooks are to comply with other standards considered appropriate by the Society.

(2) Sheaves, main parts of which are fabricated by welding steel plates, are to be verified prior to application that they have sufficient structural strength by the tests and inspections specified in the following (A) through (F):

(A) Welding procedure test(The test items are in accordance with the requirements specified in **Pt 2, Ch 2, Sec 4** of the Rules. They are, however, increased or decreased according to the type of joint.)

(B) Structural strength test(Local and/or total strength)

(C) Fatigue test(Test is to be carried out by rotating the sheave at least 10^6 turns under the most severe load condition of the block.)

(D) Load Test

(E) Verifying test for special process of manufacture such as quenching

(F) Verification test for process of manufacture conforming to manufacturing standard(No occurrence of defects such as distortion is to be verified.)

Section 7 Machinery, Electrical Installations and Control Engineering Systems

701. General

1. Application

In application to **701. 1** of the Rules, "They may be suitably modified" specified in the requirement of winches used for cargo ramps means that the requirements specified in **702. 2** (1) (A), (B), (E), (F), **704. 2** (3) and **704. 3** (1) of the Rules are not applied.

702. Machinery

1. Hoisting Machinery

In application to **702. 2** of the Rules, the followings are to be applied.

(1) Winches are to be so designed that the safety factor of the structural parts based on the ultimate tensile strength of the material is not less than the value given as follows according to the safe working load of cargo gear incorporating the winches concerned:

5 : for safe working load is 10 t or less
4 : for safe working load exceeds 10 t

(2) Winches which may have to continue stalling condition for a given period with load applied to winch drums are to be provided with devices capable of preventing positively rotation of the drum by means of such mechanism as ratchet in addition to the braking devices specified in **702. 2** (1) (D) of the Rules. In general, winches having mechanism shown in the following (A) and (B) correspond to these winches:

(A) Topping drum(or guy drum) of a winch, which drives its cargo hoist drum and topping drum(or guy drum) by a same driving unit through clutch

(B) Drum of a topping winch or guy winch, which is used as the end stopper of wire rope holding the boom at its working position

(3) "The rope at its end is to be secured to the drum" specified in **702. 2** (2) of the Rules means a force to sustain a load being double the drum load on condition that the wire rope is wound on the drum by four full turns.

703. Power Supply

1. General

In application to **703. 1** of the Rules, among cables used in power circuit of 600 V or less for electric equipment for movable cargo gear, rubber flexible cords used in portions requiring flexibility and bending strength are to be those conforming to other standards considered appropriate by the Society.

704. Control Engineering Systems

1. Safety System

In application to **704. 3** of the Rules, the followings are to be applied.

(1) It recommended that derrick systems are to be provided with limit switches to prevent over winding up, slewing and over luffing.

(2) Cranes are to be provided with safety devices specified in the following (A) through (D):

(A) Overload preventive device and overload alarm. Cranes not serving cargo handling may dispense with these devices.

(B) Limit switches to prevent over winding up, over slewing over luffing

(C) Where trolley or crab travels on horizontal jib or luffing jib and safe working load varies depending on the load and radial position of trolley or crab, radial load indicator clearly visible to the operator indicating the following items (a) and (b):
(a) Safe working load of crane corresponding to the radial position of hook or other hoisting gear fitted to the hoist rope
(b) Limit value for luffing motion of jib or longitudinal motion of trolley/crab. This, however, does not apply to the case where rated load diagram is posted in the operator cab.
(D) For cranes having travelling equipment on the body or hoisting device, overrun preventive device on the travelling tracks. In addition, it is recommended that overspeed preventive device be provided.
(3) Cargo lifts are to be provided with the safety devices given in the following (A) through (C) as far as practicable:
(A) Overload alarm
(B) Automatic cutout device for power supply to the driving equipment when hoisting rope or chain slacks
(C) Interlock device capable of functioning the following (a) and (b) where locking bars are used in stowing device of the lift
(a) Power is not to be supplied to the lift unless all locking bars are pulled out.
(b) For hydraulic lifts, locking bars can not be pulled out until oil pressure reaches a pressure sufficient to sustain the lift.
(4) The emergency stopping device specified in **704. 2** (4) of the Rules is to operate independently of other control devices.
(5) Cargo ramps are to be provided with the safety devices specified in the following (A) and (B):
(A) An alarm device generating alarm before inclination of the ship reaches the value determined in accordance with the requirements in **802. 1** (1)
(B) For ramps slewing or travelling with cargo loaded, safety devices determined by the requirements in (1) to (3) above depending on the operating system

Section 8 Cargo Lifts and Cargo Ramps

802. Design Loads

1. Loads due to Ship Inclination

In application to **802. 4** of the Rules, the followings are to be applied.
(1) The load due to ship inclination is, as a rule, to comply with the requirements in **402. 7** of the Rules. The Society, however, may permit to apply value of ship inclination offered, if the data on ship inclination in service conditions are submitted to and deemed appropriate by the Society.
(2) Cargo ramps are not, as a rule, to be designed to be capable of operating at a slope of exceeding 1/10.

803. Strength and Construction

1. Deflection Criteria

In application to **803. 5** of the Rules, concerning deflections of the cargo lifts and cargo ramps, the Society may permit application of values larger than those specified in **803. 5** of the Rules if it considers no obstruction exists in strength and operation of the equipment judging from the operating experience, results of model tests, etc. ⚓

CHAPTER 3 AUTOMATIC AND REMOTE CONTROL SYSTEMS

Section 2 Surveys of Automatic and Remote Control Systems

202. Classification surveys

1. Drawings and data

The following drawings and data are to be submitted as those for the specific automation equipment specified in **202. 1** (3) (D) of the Rules.

(1) Remote-controlled ballasting/deballasting arrangements
(A) Schematic diagrams for ballasting/deballasting piping systems(with arrangements of ballast tanks, valves, pumps and sea chests, and including the exclusive heel adjusting pipe lines)
(B) Arrangements of instruments on remote monitoring and alarm panels for ballasting/deballasting and remote control panels for pumps and valves
(C) Schematic diagrams of tank liquid level remote monitoring systems
(D) Schematic diagrams of valve operating and remote control systems for valves

(2) Automatic steering systems
The drawings for approval concerning the automatic steering systems are to include, at least, the following items:
(A) Constitution of systems for steering
(B) Block diagrams of alarms and indicators
(C) Arrangements of instruments on steering stand, alarm panels, etc.
(D) Explanatory notes on the functions of the systems

(3) Remote-controlled handling systems for liquid cargo in bulk
(A) Schematic diagrams of liquid cargo piping systems(with arrangements of cargo tanks, valves, and pumps, and tank capacities)
(B) Arrangement plans of equipment in the cargo-handling centralized cargo control room (station)
(C) Arrangements of instruments on remote monitoring and alarm panels, and remote control panels for pumps, valves, etc., installed in the cargo-handling centralized cargo control room (station)
(D) Schematic diagrams of tank liquid level remote monitoring systems
(E) Schematic diagrams of valve operating and remote control systems

(4) Power-driven opening/closing arrangements
(A) Arrangement plans of the systems, including their control positions
(B) Schematic diagrams of power source
(C) schematic diagrams of control source(only in case where separately provided from the power source)
(D) Detailed drawings for indicators or alarms, etc. to ensure the safety in opening/closing operations, if provided.

(5) Automatic recording devices for operating condition of main engine
(A) Service instructions for automatic recording devices of operating condition(with notations on constitution of systems, intervals of regular recordings, and details of recording functions including those for regular recording, alarm recording and arbitrary recording)

(6) Remote-controlled mooring arrangements
(A) Arrangement plans of mooring systems(with location of remote control stands and arrangements of mooring lines)
(B) Schematic diagrams of power source for mooring systems

(7) Air-conditioning arrangements for control stations
(A) Service instructions for air-conditioning arrangements for control stations
(B) Layout of the alarm panel
(C) Electrical diagrams of air-conditioning arrangements

(8) Remote-controlled fuel oil filling arrangements
  (A) Schematic diagrams of fuel oil filling piping system(with arrangements of tanks, valves, and pumps, and tank capacities)
  (B) Schematic diagrams of remote monitoring and alarm systems of the liquid level in tanks
  (C) Schematic diagrams of valve operating and remote control systems
  (D) Arrangement of instruments on remote monitoring and alarm panels and remote valve control panels
(9) Centralized monitoring devices for refrigerating containers
  (A) Arrangements of instruments on monitoring panels
  (B) Electrical diagrams of monitoring panels
  (C) Lists of monitoring and alarming items
(10) Cargo hose handling winches
  (A) General arrangements and layout drawings of cargo hose handling winches
  (B) Schematic diagrams of power source
  (C) Schematic diagrams of control source(only in case where separately provided from the power source)
(11) Automatic washing arrangements
  (A) General arrangements and layout drawings of washing arrangements
  (B) Schematic diagrams of washing water piping systems
  (C) Schematic diagrams of power source for washing arrangements and control systems
(12) Remote-controlled mooring arrangements at ship-sides
  (A) Layout of mooring arrangements(including layout of remote control stand and mooring rope)
  (B) Schematic diagrams of power source for mooring arrangements
(13) Power-operated pilot ladder winding appliances
  (A) General arrangements and Layout drawings of winding appliances
  (B) Schematic diagrams of power source
  (C) Schematic diagrams of control source(only in case where the control source is provided separately from the power source)
(14) Centralized monitoring systems for machinery
  (A) Arrangements of instruments on monitoring panels
  (B) Lists of monitoring and alarming items
(15) Centralized control systems for machinery
  (A) Arrangements of instruments on control panels
  (B) Lists of monitoring, alarm and control items
(16) Bridge wing control devices for main engine remote control and remote steering systems
  (A) General arrangements and layout drawings of bridge wing control devices for main engine remote control and remote steering systems
  (B) Schematic diagrams of power source
  (C) System diagram of control source(only in case of source independent of main power source)
(17) High level alarm for cargo hold bilge
  (A) Diagram and general arrangement of alarm system
  (B) Layout of the alarm panel
(18) Independent remote-controlled mooring arrangements
  (A) Layout of mooring arrangements(including layout of remote control stand and mooring rope)
  (B) Schematic diagrams of power source for mooring arrangements
  (C) Schematic diagrams of remote control systems for mooring arrangements
(19) Emergency towing rope winches
  (A) General arrangements and layout drawings of emergency towing rope winches
  (B) Schematic diagrams of power source
  (C) Schematic diagrams of control source(only in case where separately provided from the power source)

203. Shop tests

1. Type approval

(1) In application to **203. 1** of the Rules, "automatic equipments" to be type-approved are, in principle, as follows:
  (A) Alarm and monitoring systems
  (B) Control systems for, main engine, generators, boilers and essential auxiliary machinery, etc.
  (C) Computer-based systems
  (D) Fire detection systems
  (E) Gas detection systems
  (F) Electronic governor systems
  (G) Speed and shaft horsepower sensing equipment
  (H) Controller
  (I) Flow, level, limit, pressure, temperature switches
  (J) Oil mist detectors
  (K) UPS
  (L) Electrical and electronic indicators
  (M) Electric power converters for electric propulsion unit
  (N) Optical sensors and optical application device applied to the above (A) ~ (M)
  (O) Those considered necessary by the Society
(2) "Test methods approved by the Society" specified in **203. 1** of the Rules means the requirements specified in **Ch 3, Sec 23** of the Guidance for Approval of Manufacturing Process and Type Approval, Etc.

204. On-board tests

(1) The confirmations of the machinery and equipment's operation in case of failures of control systems as deemed necessary by the Society, in general, are to include followings:
  (A) In **204**. of the Rules, the confirmation that the rotational speed of propeller and direction of thrust are maintained as before failure, in case of failure of remote control devices for main propulsion machinery or controllable pitch propellers specified in **305. 2** of the Rules.
  (B) The confirmation that the boilers burning systems cease burning in case of failure of automatic and remote control system of boilers specified in **306.** of the Rules.
  (C) The confirmation that the burning systems cease burning in case of failure of automatic and remote control system of thermal oil installations specified in **308.** of the Rules.
(2) Following conditions, at least, are to be included as assumed failure conditions of control system
  (A) Power failure of control systems
  (B) Malfunction of computer for control use

206. Sea trials for the operating systems for periodically unattended machinery spaces

(1) As for the test procedures specified in **206. 2** of the Rules to test the main engine or controllable pitch propellers by bridge control devices, those shown in **Fig 9.3.1** (for diesel ships) or **Fig 9.3.2** (for steam turbine ships) of the Guidances are to be considered as the standard practice.
(2) In case of 2-engine 1-shaft propulsion systems, the following tests are to be carried out additionally.
  (A) While two engines are running at the maximum speed, one engine is to be stopped and the other engine is to be tested under the running condition and the other is to be equally tested.
  (B) While one engine is running at the maximum output, the other engine is to be put into parallel running.
  (C) While two engines are running at the maximum speed (at the 85 % output or more), one engine is to be declutched. Tests are to be carried out on each of the two engines.
(3) The test for controllable pitch propellers are to be applied with appropriate modification of the Guidances specified in above (2).
(4) Other tests considered necessary by the Society are to be carried out.
(5) In **206. 6** of the Rules, 4 hours of unattended machinery operation is to be regarded as the standard practice.

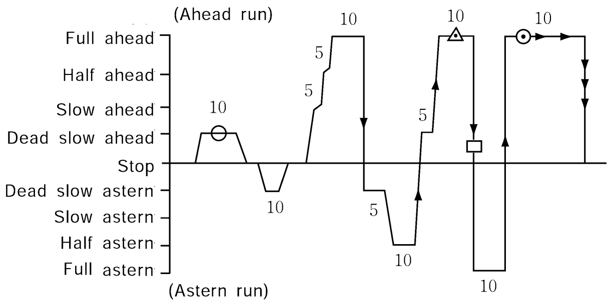

Fig 9.3.1 Trial Procedures for Diesel Ships

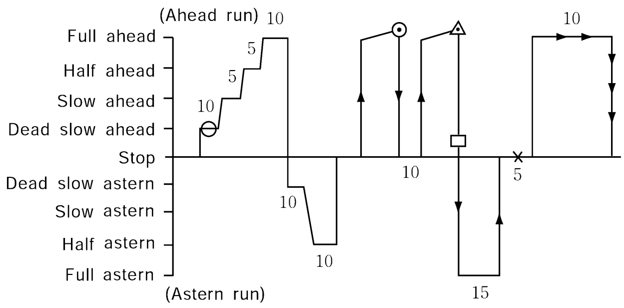

Fig 9.3.2 Trial Procedures for Steam Turbines Ships

[Remarks]

1. ⊖signifies putting over the rudder to hard port or bard starboard while proceeding at dead slow ahead.
2. ➤ signifies to operate as quick as practicable. However, where crash astern is performed and admitted by the Surveyor in a separate way(by shipyard's practice standard, etc), it (☐) may be dispensed.
3. ➤➤ signifies to cut off the power supply(electric, pneumatic or hydraulic) for the remote control systems and to confirm that the preset speed and direction of the propeller thrust for main propulsion machinery or controllable pitch propellers will be maintained and any abnormal condition will not take place, and the Society needs to confirm if the change-over from this condition to ECR is possible.
4. ➤➤➤ signifies to stop the main propulsion machinery by the emergency stop button.
5. ⊙signifies to raise the output of main propulsion machinery to that of the normal service condition.
6. △signifies to raise the ship's speed to that of the normal service condition.
7. ×signifies to stop the rotating of the main shaft.
8. Numerals signify running hours(in a unit of minute).

Section 3 Centralized Monitoring and Control Systems for Main Propulsion and Essential Auxiliary Machinery

302. System design

1. Computer-based systems

In application to **201. 7** (1) of the Rules, examples of computer-based systems are shown in **Pt 6, Ch 2, Table 6.2.1** of the Guidance. Where independent effective backup or other means of averting danger is provided, the system category Ⅲ may be downgraded to category Ⅱ.

303. Prevention of flooding and fire safety measures

2. Fire Safety Measures

(1) For the prevention of fires, the requirements specified below are to be complied with, in addition to those specified in **303. 2** of the Rules.
  (A) Joints for Class I piping used in fuel oil pipelines and lubricating oil pipe lines are to be of welded joints as far as practicable.
  (B) Flexible pipes used in fuel oil pipelines and lubricating oil pipe lines are to be of the approved type and to be protected by adequate means, considering their use, pressure and arrangement.
  (C) In case where either electric or steam heater is installed in fuel oil systems or lubricating oil systems, at least high temperature alarm or low flow alarm is to be provided in addition to the temperature controller, except when the maximum temperature of the heated oil can not be reached to the flash point.

305. Automatic and remote control of main engines or controllable pitch propellers

1. General

In case where the local control handle fitted to main propulsion machinery is moved to the main control station, the requirements in **305.** of the Rules may not apply except the case that the main control station is provided outside the space where main propulsion machinery is installed.

2. Remote control devices for main engines or controllable pitch propellers

(1) For the remote control system of main propulsion steam turbine, menas for automatic opening of astern intermediate valves at the operation into astern manoeuvring are to be provided.
(2) Effective countermeasures are to be provided against a failure of remote control system such that loss of power supply(electric, pneumatic or hydraulic power).
(3) Main engine starting by remote control system for main propulsion machinery and starting air low pressure alarm are in accordance with the followings:
  (A) In case where the low pressure alarm activate after satisfying the number of starting specified in **Pt 5, Ch 6, 1001. 1** of the Rules, startings after this are be controlled at the main control station.
  (B) In case where the low pressure alarm activate before satisfying the number of starting specified in **Pt 5, Ch 6, 1001. 1** of the Rules, the next startings is to be capable at the remote control station and the number of starting is to be satisfied in the requirements.

3. Bridge Control Devices

It is recommended that the operating handle (or button) of the bridge control devices is linked with the engine room telegraph.

4. Safety Measures

(1) For the remote control devices for the main propulsion machinery, inter-locking devices are to be provided so as not to allow main propulsion machinery to start on the following conditions:
  (A) When the turning gear is engaged.
  (B) When the lubricating oil pressure is low.

Section 5 Automatic Equipment

502. Class 1 automation equipment

1. In application to **502.** of the Rules, the wording "equipment considered acceptably by the Society may be omitted in consideration of the purpose of the ship, the method of cargo handling and so on" means those shown below :

(1) Items which may be omitted according to the purpose of the ship

(A) In case of oil tankers, ships carrying liquefied gases in bulk and ships carrying dangerous chemicals in bulk; Power-operated opening/closing appliances specified in **502. 4** of the Rules

(B) In case of ships other than above (A); Remote-controlled handling systems for liquid cargo in bulk specified in **502. 3** of the Rules

(2) Items which may be omitted according to the method of cargo handling

In case of ships where no ballasting/deballasting is necessary during cargo handling (Roll-on/Roll-off ships, etc.);

Remote-controlled ballasting/deballasting arrangements specified in **502. 1** of the Rules

(3) Other items which may be omitted based on the acceptance of the Society

In case less than 3 mooring ropes are required in each of fore and aft of the vessel according to the equipment number in **Pt 4, Ch 8, table 4.8.1** of the Rules, the remote-controlled mooring arrangements may control only that number of ropes, if it can be operated without failure.

2. Remote-controlled Ballasting/Deballasting Arrangements

The wording "control devices necessary for ballasting/deballasting" specified in **502. 1** (1) (B) of the Rules means the control valves fitted on the piping system to enable the ballasting/deballasting.

3. Remote-controlled Handling System for Liquid Cargo in Bulk

The wording "control devices necessary for cargo loading and unloading of cargos" specified in **502. 3** (3) (B) of the Rules means the control valves fitted on the piping system to enable the cargo loading and unloading.

4. Power-driven operated opening/closing appliances

In application to **502. 4** of the Rules, power operated opening/closing appliances are in accordance with the followings:

(1) An indicator showing opening/closing condition is to be provided at the operating position, in case where no visual verification is available.

(2) An audible alarm or a yellow rotating warning light is to be provided to ensure the safety at the time of opening/closing operation, in case where no visual verification is available at the operating position.

5. Automatic recording devices for main engine In application to **502. 5** of the Rules, automatic recording devices are in accordance with the followings:

(1) The automatic recording devices are to have a function of taking records once four hours (corresponding to one watch).

(2) The running conditions of main propulsion machinery are to include, at least, the following items:

(A) Lubricating oil pressure at main bearing inlet
(B) Cooling water temperature at each cylinder outlet.
(C) Steam pressure of main boiler
(D) Exhaust gas temperature at each cylinder outlet
(E) Revolutions per minute of main propulsion machinery or propeller shaft

6. Remote-controlled mooring arrangements

The wording "to be capable of effectively controlling" specified in **502. 6** (1) of the Rules means that speed controls (including starting/stopping controls) in both paying out and heaving in the mooring line are available.

503. Class 2 automation equipment

1. In application to **503.** of the Rules, the wording equipment considered acceptable by the Society may be omitted in consideration of the purpose of the ship, the method of cargo handling, etc. means those as shown below:

(1) Items which may be omitted according to the purpose of the ship

(A) Oil tankers, ships carrying liquefied gases in bulk and ships carrying dangerous chemicals in bulk;

(a) Power-driven opening/closing appliances specified in **502. 4** of the Rules

(b) Centralized monitoring devices for refrigerating containers specified in **503. 2** of the Rules

(B) Container carriers;

(a) Remote-controlled handling systems for liquid cargo in bulk specified in **502. 3** of the Rules

(b) Emergency towing rope winches specified in **503. 7** of the Rules

(c) Cargo hose handling winches specified in **503. 3** of the Rules

(C) Ships other than (A) and (B) above;

(a) Those specified in (B) above

(b) Centralized monitoring devices for refrigerating containers specified in **503. 2** of the Rules

(2) Items which may be omitted according to the method of cargo handling

Ships where no ballasting/deballasting is necessary during cargo handling;

Remote-controlled ballasting/deballasting arrangements specified in **502. 1** of the Rules

(3) Other items which may be omitted based on the acceptance of the Society

In case less than 3 mooring ropes are required in each of fore and aft of the vessel according to the equipment number in **Pt 4, Ch 8, table 4.8.1** of the Rules, the remote-controlled mooring arrangements at ship-side may control only that number of ropes, if it can be operated without failure.

2. Remote-controlled fuel oil filling arrangements

In application to **503. 1** of the Rules, the wording "cases considered acceptable by the Society in consideration of layout of tanks and valve, etc. for fuel oil filling arrangement" means that all valves required operating for fuel oil filling are located in one place and that maximum 4 fuel oil storage tanks are provided.

3. Cargo hose handling winches

In application to **503. 3** of the Rules, the wording "winch is to be easily operated" means those operable by one person.

4. Automatic deck washing arrangements

In application to **503. 4** (2) of the Rules, the wording "to have enough strength against its working pressure" means to be tested by 1.5 times the design pressure for hydraulic test.

504. Class 3 automation equipment

1. In application to **504.** of the Rules, "equipment considered acceptably by the Society may be omitted in consideration of the purpose of the ship, the method of cargo handling, and so on" means those specified below:

(1) Items which may be omitted according to the purpose of the ship

(A) Oil tankers, ships carrying liquefied gases in bulk and ships carrying dangerous chemicals in bulk;

(a) Power-driven opening/closing device specified in **502. 4** of the Rules

(b) Centralized monitoring devices for refrigerating containers specified in **503. 2** of the Rules

(c) Automatic deck washing arrangements specified in **503. 4** of the Rules

(B) Container carriers;

(a) Remote-controlled handling systems for liquid cargo in bulk specified in **502. 3** of the Rules

(b) Emergency towing rope winches specified in **503. 7** of the Rules

(c) Cargo hose handling winches specified in **503. 3** of the Rules
(d) Automatic deck washing arrangements specified in **503. 4** of the Rules

(C) In case of ore carriers or coal carriers in bulk;
(a) Remote-controlled handling systems for liquid cargo in bulk specified in **502. 3** of the Rules
(b) Centralized monitoring devices for refrigerating containers specified in **503. 2** of the Rules
(c) Emergency towing rope winches specified in **503. 7** of the Rules
(d) Cargo hose handling winches specified in **503. 3** of the Rules

(D) Ship other than (A) to (C) above;
(a) Those specified in (C) above
(b) Automatic deck washing arrangements specified in **503. 4** of the Rules

(2) Items which may be omitted according to the method of cargo handling
Ships where no ballasting/deballasting is necessary during cargo handling;
Remote-controlled ballasting/deballasting arrangements specified in **502. 1** of the Rules

(3) Other items which may be omitted based on the acceptance of the Society
In case less than 3 mooring ropes are required in each of fore and aft of the vessel according to the equipment number in **Pt 4, Ch 8, table 4.8.1** of the Rules, the remote-controlled mooring arrangements at ship-side may control only that number of ropes, if it can be operated without failure.

2. Centralized monitoring systems for machinery The centralized monitoring systems for machinery specified in **504. 1** of the Rules is to have the following functions. However, for those provided on the navigation bridge by other requirements of the Rules, these functions may be dispensed with.

(1) Monitoring of alarms for the abnormal conditions on the items given in **Table 9.3.1** through **Table 9.3.5** of the Guidance.
(2) Indications of the items given in **Table 9.3.1** through **Table 9.3.5** of the Guidance. But when two or more items to be indicated are delivered from a same pump or heat exchanger, indication for only one item may be accepted.

Table 9.3.1 Indications and Alarm Items for Diesel Engine

Item		For main propulsion machinery	For generator engine
Temperature	Cylinder cooling water	Each cylinder outlet	-
	Piston cooling water (oil)	Each cylinder outlet	-
	Lubricating oil (main)	Inlet	-
	Fuel oil	Inlet	-
	Exhaust gas	Each cylinder outlet	Each inlet of turbocharger or each cylinder outlet
	Scavenging air	Air cooler outlet	-
Pressure	Cylinder cooling water	Inlet	-
	Piston cooling water (oil)	Inlet	-
	Fuel oil valve cooling water (oil)	Inlet	-
	Lubricating oil (main)	Inlet	-
	Fuel oil	Inlet	-
	Cooling seawater	Pump outlet	-

Table 9.3.2 Indications and Alarm Items for Steam Turbine

Item		For main Propulsion machinery	For generator engine
Temperature	Lubricating oil	Inlet and each bearing outlet	-
Pressure	Lubricating oil	Inlet	-
	Exhaust steam	Condenser	-

Table 9.3.3 Indications and Alarm Items for Shafting

Item		For main Propulsion machinery	For generator engine
Temperature	Reduction gear lubricating oil	Inlet	−
Pressure	Reduction gear lubricating oil	Inlet	−

Table 9.3.4 Indications and Alarm Items for Boiler and Thermal Oil Installations

Item		Main boiler	Essential auxiliary boiler	Thermal oil installations
Temperature	Fuel oil Exhaust gas Superheated steam, thermal oil	Inlet Outlet Outlet	- - -	- - Outlet
Pressure	Fuel oil Steam	Inlet Outlet	- Outlet	- -

Table 9.3.5 Indications and Alarm Items for Other Machinery

Item	Points of indication
Items deemed necessary by the Society according to the construction and purpose of the machinery installations concerned.	Points required by the Society

3. Centralized control systems for machinery

(1) "to be capable of effectively controlling" specified in **504. 2** of the Rules means to be capable of controlling as follows.
  (A) For control of main propulsion diesel engines
    (a) Starting/stopping of the auxiliary blowers (However, in case where the auxiliary blowers are provided with automatic starting/stopping system, they may be omitted)
    (b) Starting/stopping of the fuel oil supply pumps
    (c) Starting/stopping fuel oil booster pumps
    (d) Starting/stopping of the main lubricating oil pump
    (e) Starting/stopping of the crosshead lubricating oil pumps
    (f) Starting/stopping of the piston cooling water (oil) pumps
    (g) Starting/stopping of the cylinder cooling water pumps
    (h) Starting/stopping of the cooling sea water pumps
  (B) For control of main propulsion steam turbine
    (a) Main boiler control (But, except starting at the cold condition of the main boiler)
      (i) Starting/stopping of the feed water pumps
      (ii) Starting/stopping of the fuel oil pumps
      (iii) Starting/stopping of the blowers
      (iv) Oil burning assembly control
    (b) Pump control for steam turbine
      (i) Starting/stopping of the lubricating oil pumps
      (ii) Starting/stopping of the cooling water pumps
      (iii) Starting/stopping of the control hydraulic oil pumps
    (c) Starting/stopping of the soot blower for economizer
  (C) For control of diesel engines driving generators
    (a) Starting/stopping of the diesel engines
    (b) Control of the fuel oil change-over devices
    (c) Starting/stopping of the cooling sea water pumps
    (d) Selection of the automatic starting engine in **503. 3** (1) (B) of the Rules
  (D) For control of steam turbines driving generators
    (a) Starting/stopping of the water circulating pumps

(b) Change-over of the steam supply between exhaust gas economizers and boilers in case where the steam turbine generators are usually driven by the steam from exhaust gas economizers and are used at anchoring.

(E) For control of essential auxiliary boilers

(a) Starting/stopping of the soot blowers for exhaust gas economizers in case where the steam turbine generators are driven by the steam from exhaust gas economizers

(b) Starting/stopping of the boiler water circulating pumps

(F) For control of other machinery which are necessary

(a) Operating of automatic synchronous making devices and automatic load sharing devices

(b) Operating of automatic load shifting devices and load tripping devices

4. Independent remote-controlled mooring arrangements

In application to **504. 5** of the Rules, independent remote-controlled mooring arrangements are in accordance with the followings:

(1) "To be capable of controlling each drum of mooring winches independently" of the Rules means those of an arrangement having one winch to which an exclusive drum is belonging or an arrangement capable of remote-controlling the clutches and brakes.

(2) In case where minimum 5 drums are provided at the bow or stern of a ship, it may be acceptable to control 5 drums independently at the bow or stern. ⚓

CHAPTER 4 DYNAMIC POSITIONING SYSTEMS

Section 2 Requirements of Dynamic Positioning Systems

203. Additional requirements for dynamic positioning systems

DPS(2)

(1) In application to **203. 2** (3) of the Rules, essential services are those defined in **Pt 6, Ch 1. 101. 4** (12) of the Rules together with thruster auxiliaries, computers, generator and thruster control equipment, position reference systems, environmental sensors and electrically driven thrusters.

(2) In application to **203. 2** (6) (F) of the Rules, when considering single failures of switchboards, the possibility of short-circuit of the bus-bars has to be considered. ⚓

CHAPTER 5 NAVIGATION BRIDGE SYSTEMS

Section 5 Accident Prevention Systems

502. Accident Prevention Systems

In application to **502. 2** (E) of the Rules, bridge navigational watch alarm system(BNWAS) is to comply with the following requirements.

(1) At the end of this setting period, the alarm system should initiate a visual indication on the bridge.

(2) If not reset, the BNWAS should additionally sound a first stage audible alarm on the bridge 15 seconds after the visual indication is initiated.

(3) If not reset, the BNWAS should additionally sound a second stage remote audible alarm in the back-up officer's and/or master's location 15 seconds after the first stage audible alarm is initiated.

(4) If not reset, the BNWAS should additionally sound a third stage remote audible alarm at the locations of further crew members capable of taking corrective actions 90 seconds after the second stage remote audible alarm is initiated.

(5) In vessels other than passenger vessels, the second or third stage remote audible alarms may sound in all the above locations at the same time. If the second stage audible alarm is sounded in this way, the third stage alarm may be omitted.

(6) In larger vessels, the delay between the second and third stage alarms may be set to a longer value on installation, up to a maximum of 3 minutes, to allow sufficient time for the back-up officer and/or master to reach the bridge. ⚓

Hull Structure and Equipment of Small Steel Ships

RA-10-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF PART 10
"HULL STRUCTURE AND EQUIPMENT OF SMALL STEEL SHIPS"

1. Unless expressly specified otherwise, the requirements in these Rules apply to ships for which contracts for construction are signed on or after 1 July 2011.

2. The amendments to the Rules for 2010 edition and their effective date are as follows;

Effective Date 1 July 2011

CHAPTER 1 GENERAL

Section 2 General
- 202. has been amended.

Section 3 Materials, Welding and Construction
- 308. has been amended.

CHAPTER 6 SINGLE BOTTOMS

Section 1 General
- 101. has been amended.

CHAPTER 14 WATERTIGHT BULKHEADS

Section 1 Arrangement
- 101. 1. has been amended.

Section 3 Watertight Doors
- 301. 2. has been amended.
- 302. 2. has been amended.
- 304. 3. has been deleted.

CONTENTS

CHAPTER 1 GENERAL

Section 1 Definitions

101. Application

The definitions of term which appear in this rule are to be as specified in this section, unless otherwise specified elsewhere, and the definitions of terms not specified in this rule are to be as specified **Part 3** and **4.**

102. Length

The length of ship (L) is the distance in *metres* on the load line defined in **108.** from the fore side of stem to the after side of rudder post in case of a ship with rudder post, or to the axis of rudder stock in case of a ship without rudder post. However, L is not to be less than 96 % and need not be greater than 97 % of the extreme length on the load line.

103. Length for freeboard

The length of ship for freeboard (L_f) is 96 % of the length in *metres* measured from the fore side of stem to the aft side of aft end shell plate on a waterline at 85 % of the least moulded depth measured from the top of keel, or the length in metres measured from the fore side of stem to the axis of rudder stock on that waterlines, whichever is the greater. However, where the stem contour is concave above the waterline at 85 % of the least moulded depth, the forward terminal of this length is to be taken at the vertical projection to this waterline of the after most point of the stem contour. The waterline on which this length is measured is to be parallel to the load line defined in **108.**

104. Breadth

The breadth of ship (B) is the horizontal distance in *metres* from the outside of frame to the outside of frame measured at the broadest part of the hull.

105. Depth

The depth of ship (D) is the vertical distance in *metres* at the middle of L measured from the top of keel to the top of the freeboard deck beam at side. Where watertight bulkheads extend to a deck above the freeboard deck and are to be registered as effective to that deck, D is the vertical distance to that bulkhead deck.

106. Midship

The midship part of ship is the part for 0.4 L amidships unless otherwise specified.

107. Fore and aft end

The fore and aft end means the part covering 0.1 L from the fore and aft end of the ship.

108. Load line

The load line is the waterline corresponding to the designed summer load draught in case of a ship which is required to be marked with load lines and the waterline corresponding to the designed maximum draught in case of a ship which is not required to be marked with load lines.

109. Load draught

The load draught (d) is the vertical distance in *metres* from the top of keel to the load line measured at the middle of L_f in case of a ship which is required to be marked with load lines and at the middle of L in case of a ship which is not required to be marked with load lines.

110. Full load displacement

The full load displacement (Δ) is the displacement (including shell platings and appendages, etc.) in tons corresponding to the summer load line.

111. Block coefficient

Block coefficient (C_b) is the coefficient given by dividing the volume of moulded displacement by LBd.

112. Strength deck

The strength deck at a part of ship's length is the uppermost deck at that part to which the shell plates extend. However, in way of superstructures, except sunken superstructures, not exceeding 0.15 L in length, the strength deck is the deck just below the superstructure deck. The deck just below the superstructure deck may be taken as the strength deck even in way of the superstructure exceeding 0.15 L in length at the option of the designer.

113. Freeboard deck

1. The freeboard deck is normally the uppermost continuous deck. However, in cases where openings without permanent closing means exist on the exposed part of the uppermost continuous deck or where openings without permanent watertight closing means exist on the side of the ship below that deck, the freeboard deck is the continuous deck below that deck.

2. In a ship having a discontinuous freeboard deck, the lowest line of the exposed deck and the continuation of that line parallel to the upper part of the deck is taken as the freeboard deck.

3. Where the designed load draught is less than the draught determined assuming the existing deck below the freeboard deck as the freeboard deck in accordance with the provision in **Pt 1, Ch 1, 1202.** The existing lower deck is taken as the freeboard deck in the application of this rule. In this case, the lower deck is to be continuous at least between the machinery space and peak bulkheads and continuous athwartships. Where a lower deck in stepped, the lowest line of the deck and the continuation of that line parallel to the upper part of the deck is taken as the freeboard deck.

114. Fore end and after end

Fore end is the start point of forward side, where measuring the length of ship L in **102.,** and after end is the end point of afterward side of L.

Section 2 General

201. Application

1. The requirements in this Part, unless otherwise specified elsewhere, are framed for ships of normal form and proportions of less than 90 m in length to be classed for unrestricted service. The requirements not specified in this Part are generally to comply with those in **Pt 3** and **4.**

2. Hull construction, equipment and scantlings of ships to be classed for restricted service may be appropriately modified according to the condition of service.

3. In the application of relevant provisions in this rule to ships which are not required to be marked with load line, L_f is to be read as L and B_f as B.

202. Exception in application

In ships of which length is less than 24 m or in ships to which requirements in this rule for some special reason are not directly applicable, hull construction, equipment, arrangement and scantlings are to be at the discretion of the Society, notwithstanding the provisions in **201.**

203. Ships of unusual form or proportion, or intended for carriage of special cargoes

In ships of unusual form or proportion, or intended for carriage of special cargoes, the requirements concerning hull construction, equipment, arrangement and scantlings will be decided individually basing upon the general principle of this rule, notwithstanding the requirements in this rule.

204. Equivalency

Alternative hull construction, equipment, arrangement and scantlings will be accepted by the Society, provided that the Society is satisfied that such construction, equipment, arrangement and scantlings are equivalent to those required in this rule.

205. Passenger ships

Hull construction, equipment, arrangement and scantlings of passenger ships are to be specially considered with respect to the design features in addition to the requirements in **201.** to **203.**

206. Stability of ship

The requirements in this rule are framed for ships having appropriate stability in all conceivable conditions. The Society emphasizes that the special attention be paid to the stability by the builders in design and construction stage and by the masters while in service.

207. Carriage of oil or other flammable liquid substances

1. The requirements for construction and arrangement for carriage of fuel oils specified in this rule are to be applied to the case intended to carry fuel oils having a flashpoint of 60°C or above at a closed cup test.

2. The construction and arrangement for carriage of fuel oils having a flashpoint 60°C or below at a closed cup test, are to be in accordance with the requirements provided in Part, and to comply with the requirements in **Pt 8, Ch 1, Sec 4** in addition.

3. The construction and arrangement of deep oil tanks intended to carry cargo oils are to be correspondingly in accordance with the requirements in **Ch 23** and **24.**

208. Equipments

Masts, riggings, cargo handling gears, anchoring and mooring arrangements, and other than those specified in this rule are to be suitably arranged according to their uses and are to satisfy the tests as may be required by the Surveyor.

209. Fittings for examination

In ships registered in Korea, ladders, steps or other facilities, by which internal examination can be performed safely, are to be provided in fore and after peak tanks, deep tanks, cofferdams and enclosed compartments which are similar to the above-mentioned tanks, except those exclusively used for fuel oil or lubricating oil.

Section 3 Materials, Welding and Construction

301. Materials

1. The materials used for hull construction and equipments are to be those complying with the requirements in **Pt 2, Ch 1,** unless otherwise specified.

2. Where high tensile steels are used, the construction and scantlings are to be in accordance with the discretion of the Society, unless otherwise specified.

3. Where materials other than those specified in this rule are used, the use of such materials and corresponding scantlings are to be specially approved by the Society.

4. Materials used for the hull construction of ships classed for smooth water service are to be in accordance with the discretion of the Society.

5. Application of steels

(1) The steels used for hull structures are to be of the grades provided in **Pt 2, Ch 1** in accordance with the requirements given in **Tables 10.1.1** and **10.1.3.** In applying these requirements, *B*, *D* or *E* may be substituted for *A*; *D* or *E* for *B*; *E* for *D*; *DH* 32 or *EH* 32 for *AH* 32; *EH* 32 for *DH* 32; *DH* 36 or *EH* 36 for *AH* 36; and *EH* 36 for *DH* 36; *DH* 40 or *EH* 40 for *AH* 40; and *EH* 40 for *DH* 40, respectively.

(2) For strength members not mentioned in **Table 10.1.1,** grades *A*, *AH* 32, *AH* 36 and *AH* 40 may generally be used. The steel grade is to correspond to the as-built plate thickness when this is greater than the Rule requirement.

(3) The grades of steel to be used in the hull construction are to be clearly indicated on the hull structural plans.

Table 10.1.1 Material classes

Structural member category	Material classes
○ SECONDARY : A1 Longitudinal bulkhead strakes, other than those belonging to the Primary category A2 Deck plating exposed to weather, other than that belonging to the Primary or Special category A3 Side plating	- Within 0.4 L amidships : I - Outside 0.4 L amidships : *A/AH*
○ PRIMARY : B1 Bottom plating including keel plate B2 Strength deck plating, excluding that belonging to the Special category B3 Continuous longitudinal members above strength deck, ex cluding longitudinal hatch coamings B4 Uppermost strake in longitudinal bulkhead B5 Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank B6 Longitudinal hatch coamings of length greater than 0.15L	- Within 0.4 L amidships : II - Outside 0.4 L amidships : *A/AH*
○ SPECIAL : C1 Sheer strake at strength deck(1) C2 Stringer plate in strength deck(1) C3 Deck strake at longitudinal bulkhead, excluding deck plating in way of inner-skin bulkhead of double-hull ships(1)	- Within 0.4 L amidships : III - Outside 0.4 L amidships : II - Outside 0.6 L amidships : I
C4 Strength deck plating at outboard corners of cargo hatch openings (bulk carriers, ore carriers, combination carriers and other ships with similar hatch opening configurations)	- Within 0.6 L amidships : III - Outside 0.6 L amidships : II
C5 Bilge strake in ships with double bottom over the full breadth and length less than 150 m(1)	- Within 0.6 L amidships : II - Outside 0.6 L amidships : I
C6 Bilge strake in other ships(1)	- Within 0.4 L amidships : III - Outside 0.4 L amidships : II - Outside 0.6 L amidships : I

Notes:
(1) Single strakes required to be class III within 0.4 L amidships are to have breadths not less than $800+5L$ (mm), need not be greater than 1800 mm, unless limited by the geometry of the ship's design.
(2) The symbols in the table mean the grades of steel as follows :
AH : *AH* 32, *AH* 36 and *AH* 40
DH : *DH* 32, *DH* 36 and *DH* 40
EH : *EH* 32, *EH* 36 and *EH* 40

Table 10.1.2 Minimum Material Grades for ships with ice strengthening

Structural member category	Material grade
Shell strakes in way of ice strengthening area for plates	*B/AH*

Table 10.1.3 Steel grades

Thickness(mm) \ Class	I		II		III	
	MS	*HT*	*MS*	*HT*	*MS*	*HT*
$t \le 15$ $15 < t \le 20$	*A* *A*	*AH* *AH*	*A* *A*	*AH* *AH*	*A* *B*	*AH* *AH*
$20 < t \le 25$ $25 < t \le 30$	*A* *A*	*AH* *AH*	*B* *D*	*AH* *DH*	*D* *D*	*DH* *DH*
$30 < t \le 35$ $35 < t \le 40$	*B* *B*	*AH* *AH*	*D* *D*	*DH* *DH*	*E* *E*	*EH* *EH*
$40 < t \le 50$	*D*	*DH*	*E*	*EH*	*E*	*EH*

Note:
The symbols in the table mean the grades of steel as follows:
AH : *AH* 32, *AH* 36 and *AH* 40
DH : *DH* 32, *DH* 36 and *DH* 40
EH : *EH* 32, *EH* 36 and *EH* 40
MS : Mild steels
HT : High tensile steels

302. Scantlings

1. Unless otherwise specially specified, the section modulus of members required by this rule are those including the steel plates with the effective breadth of 0.1 l on either side of the members. However, the breadth of 0.1 l is not to exceed one-half of the spacing of member. l is the length specified in the relevant chapter.

2. Where flat bars, bulb plates, inverted angles or flanged plates are welded to form beams, frames or stiffeners for which section moduli are specified, they are to be of suitable depth and thickness in proportion to the section modulus specified in this Part.

3. The inside radius of flanged plates is not to be less thant twice but not more than three times the thickness of steel plates.

4. As for the face plates composing girders and transverses, the thickness is not to be less than that of web plates and the full width is not to be less than that obtained from the following formula:

$$b = 2.7\sqrt{d_0 l} \text{ (mm)}$$

where:

d_0 = depth of girders and transverses specified in the relevant chapter (mm).

l = distance between supports of girders and transverses specified in the relevant chapter (m). Where, however, effective tripping brackets are provided, they may be taken as supports.

303. Welding

Welding to be used in hull construction and important equipment is to be in accordance with the requirements in **Pt 2, Ch 2.**

304. Connection of ends of stiffeners, girders and frames

1. Where the ends of girders are connected to the bulkheads, tank tops, etc., the end connections of all girders are to be balanced by effective supporting members on the opposite sides of bulkheads, tank tops, etc.

2. Length of the frame-side arm of bracket, connected to the frames or stiffeners of the bulkhead or deep tanks, etc., is not to be less than one-eighth of l specified in the relevant chapter, unless otherwise specially specified.

305. Brackets

1. Secondary members, such as longitudinals, beams, frames and stiffeners forming part of the hull structure, are generally to be connected at their ends with t_b not to be less than that obtained from the following formula. Where it is desired to adopt bracketless connections, the proposed arrangements will be individually considered.

$$t_b = C_1\sqrt{Z} + 4.5 \quad \text{(mm)}$$

where :

Z = section modulus (cm^3) specified in the following (a) through (c) :

(a) Bracket connecting stiffener to primary member, section modulus of the stiffener.
(b) Bracket at the head of a main transverse frame where frame terminates, section modulus of the frame.
(c) Elsewhere the lesser section modulus of the members being connected by the bracket.

C_1 = coefficient given in followings.

C_1 = 0.27, where a flange is not fitted.

C_1 = 0.23, where a flange is fitted.

2. Where a flange is fitted, its breadth w_f is not to be less than that obtained from following formula. Where the length of larger arm exceeds 800 mm, the free edges of brackets are to be stiffened by flange or other means, except where tripping brackets or the like are provided.

$$w_f = \frac{Z}{33} + 45 \quad \text{(mm)}$$

where :

Z = as specified in **Par 1.**

3. The lengths of bracket arms measured from shown in **Fig 10.1.1** are not to be less than those obtained from the following formulae. The lengths of bracket arms of tank side and hopper side are to be increased by 20 % greater than those required.

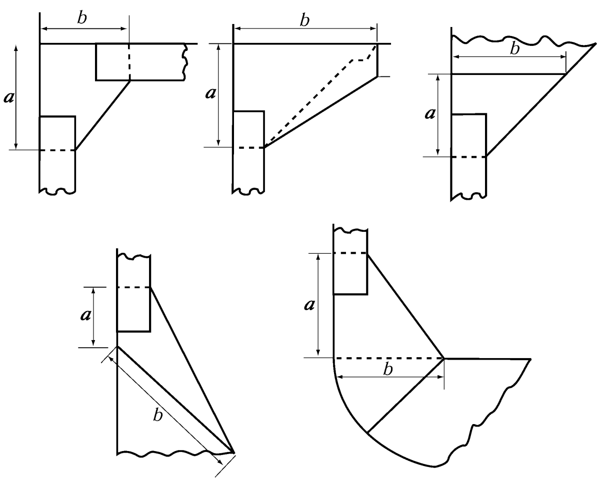

Fig 10.1.1 Measurement of a and b for arms

$a+b \geq 2.0\,l$ $\quad$ a and $b \geq 0.8\,l$

where :

l = as given by the following formula, but in no case is to be taken as less than twice the web depth of the stiffener on which the bracket scantlings are to be based.

$$l = 180\sqrt{\frac{Z}{14+\sqrt{Z}}} - 90 \ \ \text{(mm)}$$

where : Z = as specified in **Par 1.**

306. Modification of l

Where brackets of not less thickness than that of the girder plates, the value of l specified in **Ch 9, 11, 12, 14** and **15** may be modified in accordance with the following:

(1) Where the face area of the bracket is not less than one-half of that of the girder and the face plates or flange on the girder is carried to the bulkhead, deck, tank top, etc., the length l may be measured to a point 0.15 m inside the toe of bracket. (See **Fig 10.1.2** (a))

(2) Where the face sectional area of the bracket is less than one-half of that of the girder and the face plate or flange on the girder is carried to the bulkhead, deck, tank top, etc., l may be measured to a point where the sum of sectional area of the bracket outside the line of girder and its free flanges is equal to the sectional area of free flanges of girder, or to a point 0.15 m inside the toe of bracket, whichever is the greater. (See **Fig 10.1.2** (b))

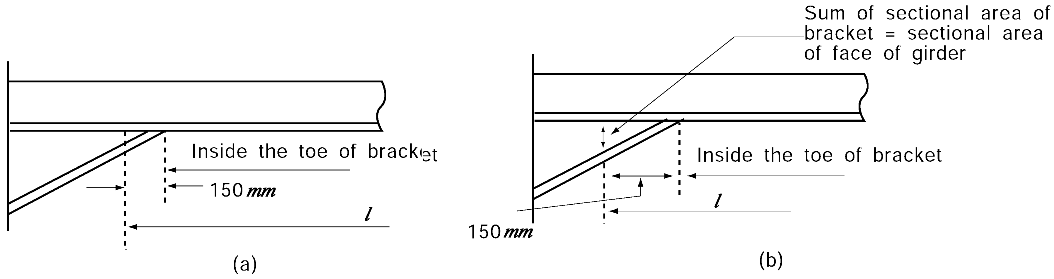

Fig 10.1.2 Modification of l

(3) Where brackets are provided and the face plate or flange on the girder are extended along the brackets to the bulkhead, deck, tank top, etc., the face plate or flange of bracket may be curved, but l is to be measured to the toe of bracket.
(4) Brackets are not to be considered effective beyond the point where the arm on the girder is 1.5 times the length of arm on the bulkhead, deck, tank top, etc.
(5) In no case is the allowance in l at either end to exceed one-quarter of the overall length of the girder.

307. Approved corrosion control

1. Where an approved measure of corrosion control is applied to tanks, the required scantlings of structural members in the tanks may be reduced at the discretion of the Society.

2. For the ships of the scantlings reduced in accordance with **Par 1,** the notation "*CoC*" will be entered in the Register of Ships.

308. Corrosion protection coating

1. For ships not intended to receive a corrosion control notation specified in **307.,** all sea water ballast spaces having boundaries formed by the hull envelop are to have an effective corrosion protection coating in accordance with the manufacturer's requirements.

2. Corrosion protection coating for dedicated sea water ballast tanks in all types of Ships and double-side skin space of bulk carriers are to be in accordance with the requirements in the **Guidance Pt 3, Ch 1, 803.** ⚓

CHAPTER 2 STEMS AND STERN FRAMES

Section 1 Stems

101. Plate stems

1. The thickness of steel plate stems at the load waterline is not to be less than that obtained from the following formula. However, above and below the load waterline, the thickness may be gradually tapered toward the stem head and the keel. And at the upper end of stem, it may be equal to the thickness of the side shell plating (at the fore end part) of the ship, and at the lower end of stem, it may be equal to the thickness of plate keel.

$t = 0.1L + 3.0$ (mm)

2. Horizontal ribs are to be provided on the stem plates at an interval preferably not exceeding 1 m, and where the radius of curvature at the fore end of stem is large, proper reinforcement is to be made by providing with a centre line stiffener or by other means.

Section 2 Stern Frames

201. Application

The requirements in this section apply only to stern frames without rudder post.

202. Propeller posts

1. Propeller posts of cast steel stern frames and those of plate stern frames are to be of shape suitable for the stream line at the after part of hull, and the scantlings are to be equivalent to the standards given by the formulae and figures in **Table 10.2.1.** Below the propeller boss, the breadth and thickness of propeller post are to be gradually increased in order to provide with strength and stiffness in proportion to those of the shoe pieces.

2. The thickness of boss of propeller post is not to be less than that obtained from the following formula:

$t = 0.23d_p + 30$ (mm)

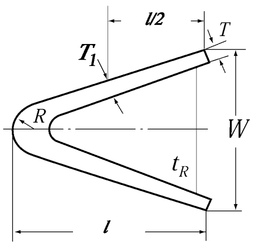
where :

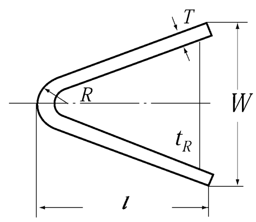
d_p = diameter (mm) of propeller shaft specified in **Pt 5, Ch 3, 204.**

3. The propeller posts of cast steel stern frames and those of plate stern frames are to be provided with ribs at a suitable interval. Where the radius of curvature is large, a centre line stiffener is to be provided.

4. In ships with relatively high speed for their length and in ships exclusively engaging in towing purposes, the scantlings of various parts of propeller posts are to be suitably increased.

Table 10.2.1 Standards of propeller posts

Cast steel	Steel plate
$W = 30\sqrt{L}$ $l = 40\sqrt{L}$ (mm) $T = \frac{3\sqrt{L}}{\sqrt{K^{(1)}}}$ (mm) $T_1 = \frac{3.7\sqrt{L}}{\sqrt{K^{(1)}}}$ (mm) $t_R = 0.6T$ (mm) $R_{min} = 40$ (mm)	$W = 37\sqrt{L}$ $l = 53\sqrt{L}$ (mm) $T = \frac{2.4\sqrt{L}}{\sqrt{K^{(2)}}}$ (mm) $t_R = 0.55T$ (mm) $R_{min} = 40$ (mm)
	




Note :
(1) Material factor K for the Propeller post of cast steel is to be as **Pt 4, Ch 1, Table 4.1.1.**
(2) Material factor K for the Propeller post of steel plate is to be as **Pt 4, Ch 1, Table 4.1.2.**

203. Shoe pieces

1. The scantlings of each cross-section of the shoe piece is to be determined by the following formulae (1) to (4), considering the bending moment and shear force acting on the shoe piece when the rudder force specified in **Pt 4, Ch 1, 201.** is applied to the rudder.

(1) The section modulus Z_Z around the vertical Z-axis is not to be less than obtained from the following formula:

$$Z_z = \frac{MK_{sp}}{80} \quad (\text{cm}^3)$$

where:

M = bending moment at the section considered, which is obtained from the following formula (N・m).

$$M = Bx \quad (\text{N}\cdot\text{m})$$
$$M_{max} = Bl \quad (\text{N}\cdot\text{m})$$

where :

B = supporting force in the pintle bearing (N), as given in **Pt 4, Ch 1, 102.**

x = distance from the mid-point of the pintle bearing to the section considered (m). (See **Fig. 10.2.1**).

l = distance from the mid-point of the pintle bearing to the fixed point of the shoe piece (m). (See **Fig 10.2.1**)

K_{sp} = material factor for the shoe piece as given in **Pt 4, Ch 1, 102.**

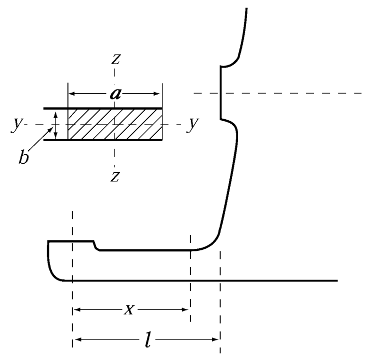


Fig 10.2.1 Shoe piece

(2) The section modulus Z_y around the transverse Y-axis is not to be less than obtained from the following formula:

$$Z_y = 0.5\,Z_z \text{ (cm}^3\text{)}$$

where :

Z_z = as specified in (1).

(3) The total sectional area A_s of the members in the Y-direction is not to be less than obtained from the following formula:

$$A_s = \frac{BK_{sp}}{48} \text{ (mm}^2\text{)}$$

where :

B and K_{sp} = as specified in (1).

(4) At no section within length l the equivalent stress σ_e is to exceed $115/K_{sp}$ (N/mm^2). The equivalent stress σ_e is to be obtained from the following formula:

$$\sigma_e = \sqrt{\sigma_b^2 + 3\tau^2} \quad \text{(N/mm}^2\text{)}$$

where :

σ_b = the bending stress acting on the shoe piece, are to be obtained from the following formula (N/mm^2).

$$\sigma_b = \frac{M}{Z_z(x)} \text{ (N/mm}^2\text{)}$$

τ = the shear stress acting on the shoe piece, are to be obtained from the following formula (N/mm^2).

$$\tau = \frac{B}{A_s(x)} \quad (\text{N/mm}^2)$$

where :

$Z_z(x)$ = the actual section modulus around the Z-direction at the section considered (cm^3).

$A_s(x)$ = the actual sectional area around the Y-direction at the section considered (mm^2).

M and B = as specified in (1).

2. The thickness of steel plates forming the main part of shoe piece of steel plate stern frame is not to be less than that of steel plates forming the main part of propeller post. Ribs are to be arranged in the shoe piece below the propeller post, under brackets and at other suitable positions.

204. Heel pieces

Heel piece of stern frame is to be of length at least three times the frame space at that part and is to be strongly connected to the keel.

205. Attachment of stern frame to floor plates

Stern frame is to be sufficiently extended upward immediately in front of the rudder stock, and is to be strongly connected to the transom floor of thickness not less than that obtained from the following formula. The transom floor is to be reinforced at the top of extended portion of the stern frame in order to avoid abrupt change of rigidity.

$$t = 0.035L + 9.0 \quad (\text{mm})$$

206. Gudgeons

1. The bearing length of the pintle lp is to be such that :

$$d_p \leq l_p \leq 1.2d_p \quad (\text{mm})$$

where :

d_p = diameter of pintle (mm).

2. The length of the pintle housing in the gudgeon is not to be less than pintle diameter d_p.

3. The thickness of the pintle housing is not to be less than 0.25 d_p. For ships specified in **Pt 4, Ch 1, 103.,** however, the thickness of the pintle housing is to appropriately increased. ⚓

CHAPTER 3 LONGITUDINAL STRENGTH

Section 1 General

101. Special case in application

In case there are items for which direct application of the requirements in this chapter is deemed unreasonable, these items are to be in accordance with the discretion of the Society.

102. Continuity of strength

Longitudinal members are to be so arranged as to maintain the continuity of strength.

103. Loading manual

As specified in **Pt 3, Ch 3, 103.**

104. Longitudinal strength loading instrument

As specified in **Pt 3, Ch 3, 103.**

Section 2 Bending Strength

201. Bending strength at amidships

1. The section modulus of the transverse sections of the hull, at the midship part is not to be less than the value of Z_1 obtained from the formula given in **Table 10.3.1.** However, application of the requirement may be dispensed with to ships not exceeding 65 m in length at the discretion of the Society.

2. Notwithstanding the requirements of the preceding paragraph, the section modulus of the transverse section of hull at the midship part is not to be less than the value of Z_{min} obtained from the formula given in **Table 10.3.1.**

3. Moment of inertia of the transverse section of hull at the middle point of L is not to be less than the value of I_{min} obtained from the formula given in **Table 10.3.1.** and the calculation method for moment of inertia of the actual transverse section is to be correspondingly in accordance with the requirements in **203.**

4. Scantlings of all continuous longitudinal members of hull girder based on the section modulus requirement in **Pars 2** and **3** are to be maintained within 0.4 L amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the 0.4 L part.

202. Bending strength at sections other than amidships

The bending strength of hull at sections other than 0.4 L amidships is to be determined according to the requirements of **Ch 5, Sec 2.**

Table 10.3.1 Section modulus of transverse sections of hull, etc.

Item	Requirement
Section modulus	$Z_1 = \dfrac{(M_s + M_w)}{\sigma} \times 10^3$ (cm^3)
Minimum section modulus	$Z_{min} = C_1 L^2 B (C_b + 0.7) K$ (cm^3)
Minimum moment of inertia	$I_{min} = 3 C_1 L^3 B (C_b + 0.7)$ (cm^4)

M_s = maximum longitudinal bending moments in still water (kN・m) for sagging and hogging, respectively, which are calculated at the transverse section under consideration along the length of hull for all conceivable loading conditions by a method of calculation deemed appropriate by the Society.

M_w = wave induced longitudinal bending moment (kN・m) at the transverse section under consideration along the length of hull, which is to be obtained from the following table.

Condition		M_w (kN・m)
M_s	Hogging	$0.19 C_1 C_2 L^2 B C_b$
	Sagging	$0.11 C_1 C_2 L^2 B (C_b + 0.7)$

σ = allowable bending stress obtained from the following formula.

σ = $175/K$ (N/mm^2)

K = material factor given by the following table.

Steel grades	K
A, *B*, *D* and *E*	1.0
AH 32, *DH* 32 and *EH* 32	0.78
AH 36, *DH* 36 and *EH* 36	0.72
AH 40, *DH* 40 and *EH* 40	0.68

C_1 = coefficient given by the following formula.
$C_1 = 0.03 L_1 + 5$

L_1 = length of ship (m) specified in **Ch 1,102.**, or 0.97 times the length of ship (m) on the load line, whichever is the smaller.

C_2 = distribution factor specified along the length of L at positions where the transverse section of the hull is under consideration, as given in **Fig. 10.3.1.**

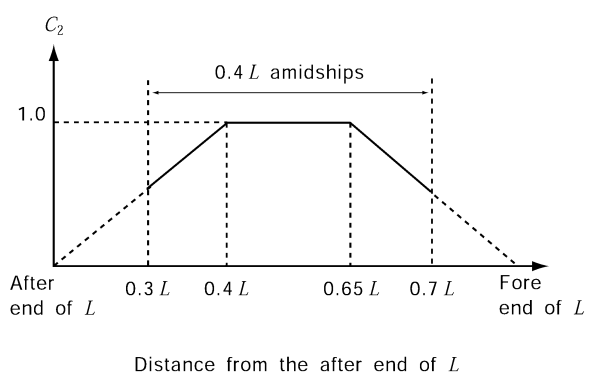

Fig 10.3.1 Distribution factor of bending moment C_2

C_b = block coefficient, however, to be taken as 0.6, where it is less than 0.6.

203. Calculation of hull section modulus

As for calculation of the hull section modulus, the following (1) through (6) are to be applied:

(1) All longitudinal members which are considered effective to the longitudinal strength of the ship may be included in the calculation.

(2) Deck openings on the strength deck are to be deducted from the sectional area used in the section modulus calculation. However, small openings not exceeding 2.5 m in length or 1.2 m in breadth need not be deducted, provided that the sum of their breadths in one transverse section is not more than $0.06(B-\Sigma b)$. Where, Σb is the sum of the openings exceeding 1.2 m in breadths or 2.5 m in length (m).

(3) Notwithstanding the requirement in (2), deck openings on the strength deck need not be deducted, provided that the sum of their breadths in one transverse section is not reducing the section modulus at deck or bottom by more than 3 %.

(4) Deck openings prescribed in (2) and (3) include shadow area which is obtained by drawing two tangential lines with an opening angle of 30 degrees having the focus on the longitudinal line of the ship.

(5) The section modulus at the strength deck is to be calculated by dividing the moment of inertia of the athwartship section about its horizontal neutral axis by the following distance (a) or (b), whichever is the greater.

(a) Vertical distance from the neutral axis to the top of the strength deck beam at side.

(b) Distance obtained from the following formula:

$$Y\left(0.9+0.2\frac{X}{B}\right)$$

where:

X = horizontal distance from the top of continuous strength member to the centre line of the ship (m).

Y = vertical distance from the neutral axis to the top of continuous strength member (m).

X and Y are to be measured to the point giving the largest value of the above formula.

(6) The section modulus at the bottom is to be calculated by dividing the moment of inertia of the athwartship section about its horizontal neutral axis by the vertical distance from the neutral axis to the top of keel.

Section 3 Buckling Strength

301. Compressive buckling strength

The requirements in this section apply to the strength deck plating and bottom shell plating, etc. subject to large compressive stresses due to longitudinal bending, and only compressive stress is to be considered among the requirements in **Pt 3, Ch 3, Sec 4.** ⚓

CHAPTER 4 PLATE KEELS AND SHELL PLATINGS

Section 1 General

101. Consideration for corrosion

The thickness of shell plating at such parts that the corrosion is considered excessive due to the location and/or special service condition of the ship is to be properly increased over that required in this chapter.

102. Special consideration for contact with quay, etc.

In case where the service condition of the ship is considered to be such that there is possibility of indent of shell plating due to contact with the quay, etc., special consideration is to be given to the thickness of shell plating.

103. Continuity in thickness of the shell plating

Sufficient consideration is to be paid to the continuity in the thickness of shell plating and to the avoidance of remarkable difference between the thickness of the shell plating under consideration and that of the adjacent shell plating.

Section 2 Plate Keels

201. Breadth and thickness

1. The breadth of plate keel over whole length of the ship is not to be less than that obtained from the following formula:

$b = 4.5L + 775$ (mm)

2. The thickness of plate keel over whole length of the ship is not to be less than the bottom shell thickness obtained from the requirement in **304.** increased by 1.5 mm. This thickness, however, is not to be less than that of the adjacent bottom shell plating.

Section 3 Shell Plating for Midship Part of Ship

301. Minimum thickness

The minimum thickness of shell plating below the strength deck for the midship part of ship is not to be less than that obtained from the following formula:

$t = 0.044L + 4.6$ (mm)

302. Thickness of side shell plating

The thickness of side shell plating other than the sheer strake at the strength deck for the midship part of ship is not to be less than that obtained from the following formula:

$t = 4.1S\sqrt{d + 0.04L} + 1.5$ (mm)

where:

S = spacing of longitudinal or transverse frames (m).

303. Sheer strakes for midship part

The thickness of sheer strakes at the strength deck for midship part is not to be less than 0.75 times that of the stringer plate of the strength deck. In no case, however, is the thickness to be less than that of the adjacent side shell plating.

304. Thickness of bottom shell plating

The thickness of bottom shell plating including bilge strake (excluding keel plate) for the midship part of ship is not to be less than that obtained from the formulae given in **Table 10.4.1.**

Table 10.4.1 Thickness of bottom shell plating

Framing	Thickness (mm)
Transverse	$t=4.7S\sqrt{d+0.035L}+1.5$
Longitudinal	$t=4.0S\sqrt{d+0.035L}+1.5$
S = spacing of longitudinal or transverse frames (m).	

Section 4 Shell Plating for End Parts

401. Shell plating for end parts

Beyond the midship part, the thickness of shell plating below the strength deck may be gradually reduced, but at the end parts the thickness is not to be less than that obtained from the following formula. However, for the parts specified in **402.** to **405.,** the thickness is not to be less than that required in the respective provisions.

$t=0.044L+4.6$ (mm)

402. Shell plating for 0.3L from the fore end

The thickness of shell plating for 0.3 L from the fore end is not to be less than that obtained from the following formula:

$t=1.34\,S\sqrt{L}+1.5$ (mm)

where:

S = spacing of longitudinal or transverse frames (m).

403. Shell plating for 0.3 L from the after end

The thickness of shell plating for 0.3 L from the after end is not to be less than that obtained from the following formula. In ships with machinery aft or in ships with high power engines, the thickness is to be properly increased:

$t=1.20\,S\sqrt{L}+1.5$ (mm)

where:

S = spacing of longitudinal or transverse frames (m).

404. Strengthened bottom forward

1. The thickness of shell plating at the strengthened bottom forward specified in **Ch 7, 902.** is to be in accordance with the requirements in **Pt 3, Ch 4, 404.**
2. Notwithstanding the requirement of **Par 1,** in ship of which C_b is less than 0.7 and $V/\sqrt{L}$ (kt/m) is 1.4 and over, the area and thickness of shell plating at the strengthened bottom forward of the ship is to be stiffened to an extent in accordance with the discretion of the Society.

405. Shell plating fitted up on spectacle bossings and stern frames

The thickness of shell plating fitted up on spectacle bossings and stern frames is not to be less than that obtained from the following formula:

$t = 0.09L + 3.5$ (mm)

Section 5 Side Plating in way of Superstructure

501. Side platings in way of superstructure deck designed as strength deck

Where the superstructure deck is designed as strength deck, the thickness of superstructure side plating is to be as specified in **301., 302.** and **401.** to **403.** However, superstructure side plating at end parts may be of thickness specified in **502.**

502. Side platings in way of superstructure deck not designed as strength deck

Where the superstructure deck is not designed as strength deck, the thickness of superstructure side plating is not to be less than obtained from the formulae given in **Table 10.4.2,** but in no case is it to be less than 5.5 mm.

Table 10.4.2 Thickness of superstructure side plating

Location	Thickness (mm)
For 0.25 L from the fore end	$t = 1.15S\sqrt{L} + 1.0$
Elsewhere	$t = 0.94S\sqrt{L} + 1.0$
S = spacing of longitudinal or transverse frames (m).	

503. Compensation at ends of superstructure

Side plating at the ends of superstructure is to be suitably constructed to maintain the continuity of strength.

Section 6 Local Compensation of Shell Plating

601. Openings in shell

All openings in the shell plating are to have well rounded corners and to be compensated as necessary.

602. Thickness of sea chest

In case where a sea chest is provided in the shell plating for sea suction or discharge, the thickness of sea chest is not to be less than obtained from the following formula and to be suitably stiffened so as to provide sufficient rigidity as necessary.

$t = 0.07L + 4.0$ (mm)

603. Hawse pipes and the plating below

The shell plating fitted with hawse pipes and the plating below is to be increased in thickness or to be doubled, and their longitudinal seams are to be protected against damages by anchors or cables.

604. Shell plating framed transversely

In ships with transverse framing, sufficient consideration is to be paid to the prevention of buckling of the shell. ⚓

CHAPTER 5 DECKS

Section 1 General

101. Steel deck plating

Decks are to be plated from side to side of the ship except deck openings, etc. Decks, however, may be provided with only stringer plates and tie plates, subject to the approval by the Society.

102. Watertightness of decks

Weather decks are to be made watertight.

103. Continuity of steps of decks

Where strength decks or effective decks (the decks below the strength deck which are considered as strength members in the longitudinal strength of hull) change in level, the change is to be accomplished by gradual sloping, or each of structural members which form deck is to be extended, and is to be effectively tied together by diaphragms, girders, brackets, etc. and special care is to be taken for the continuity of strength.

104. Compensation for openings

Hatchways or other openings on strength or effective decks are to have well rounded corners, and compensation is to be suitably provided as necessary.

105. Rounded gunwales

Rounded gunwales, where adopted, are to have a sufficient radius for the thickness of plates.

Section 2 Effective Sectional Area of Strength Deck

201. Definition

The effective sectional area of strength deck is the sectional area, on each side of the ship's centre line, of steel plating, longitudinal beams, longitudinal girders, etc. extending for 0.5 L amidships.

202. Effective sectional area of strength deck

1. The effective sectional area for the midship part is to be so determined as not to give less modulus of athwartship section of the hull specified in **Ch 3.**

2. Beyond the midship part, the effective sectional area may be gradually reduced. However, at 0.15 L from each end it is not to be less than 40 % for ships with machinery amidship and 50 % for ships with machinery aft, of the area required for the midship part.

3. Where the section modulus of the hull at 0.15 L from each end is calculated and approved by the Society, the requirements specified in **Par 2** may not be applied.

203. Strength deck beyond 0.15 L from each end

Beyond 0.15 L from each end, the effective sectional area and the thickness of strength deck may be gradually reduced avoiding abrupt change.

204. Long poop

Notwithstanding the requirements of **202.,** the effective sectional area of strength deck within long poop may be properly modified.

205. Superstructure deck designed as strength deck

Where the superstructure deck is designed as strength deck, the strength deck plating clear of the superstructure is to extend into the superstructure for about 0.05 L without reducing the effective sectional area, and may be gradually reduced within.

Section 3 Deck Plating

301. Thickness

1. The thickness of deck plating is not to be less than obtained from the formula given in **Table 10.5.1.** However, within such enclosed spaces as superstructures, deckhouses, etc., the thickness may be reduced by 1 mm.

2. Where strength deck is transversely framed, or decks inside the line of openings are longitudinally framed, sufficient care is to be taken to prevent buckling of the deck plating.

Table 10.5.1 Thickness of deck plating

Kind of deck	Location	Framing	Thickness (mm)
Strength deck	Outside the line of openings for the midship part	Longitudinal	$t = 1.47S\sqrt{h} + 1.5$
		Transverse	$t = 1.63S\sqrt{h} + 1.5$
	Elsewhere	$t = 1.25S\sqrt{h} + 1.5$	
Other deck			
S = spacing of longitudinal or transverse beams (m). h = deck load as specified in **Ch 10, 201.** (kN/m^2).			

302. Thickness of the top of tanks

The thickness of deck plating forming the top of tanks is not to be less than required in **Ch 15, 206.** for deep tank bulkhead plating, taking the beam spacing as the stiffener spacing.

303. Thickness of the bulkhead recesses

The thickness of deck plating forming the top of shaft tunnels, thrust recesses or bulkhead recesses is not to be less than required in **Ch 14, 207.** for watertight bulkhead plating, taking the beam spacing as the stiffener spacing.

304. Under boilers or refrigerated cargoes

1. The thickness of effective deck plating under boilers is to be increased by 3 mm above the normal thickness.

2. The thickness of deck plating under refrigerated cargoes is to be increased by 1 mm above the normal thickness. Where special means for the protection against the corrosion of the deck is provided, the thickness need not be increased.

305. Deck plating carrying unusual cargoes

The thickness of deck plating subject to cargo loads which can not be treated as evenly distributed loads is to be determined taking account of load distribution for particular cargoes. ⚓

CHAPTER 6 SINGLE BOTTOMS

Section 1 General

101. Application

The requirements in this chapter apply to ships whose double bottom is omitted partially or wholly in accordance with the requirements in **Ch 7, 101. 2** to **3.**

Section 2 Centre Keelsons

201. Arrangements and construction

1. All single bottom ships are to have centre girder composed of web plates and face plates, and the centre keelsons are to extend as far forward and afterward as practicable.

2. The bottom constructions in way of fore and after peaks are to be in accordance with the requirements in **Ch 13, Sec 2** and **3.**

202. Web plates

1. The thickness of web plates is not to be less than that obtained from the following formula. Beyond the midship part, the thickness may be gradually reduced and it may be 0.85 times the midship value at the ends of the ship.

$$t = 0.065L + 4.2 \text{ (mm)}$$

2. The height of web plates is not to be less than that of floors.

203. Face plates

1. The thickness of face plates is not to be less than that of web plate amidships and the face plates are to extend from the collision bulkhead to the after peak bulkhead.

2. The sectional area of face plates is not to be less than that obtained from the following formula. Beyond the midship part, the sectional area may be gradually reduced and it may be 0.85 times the midship value at the ends of the ship.

$$A = 0.6L + 9 \text{ (cm}^2\text{)}$$

3. The breadth of face plates is not to be less than that obtained from the following formula:

$$b = 2.3L + 160 \text{ (mm)}$$

Section 3 Side Keelsons

301. Arrangements

Side keelsons are to be so arranged that their spacing is not more than 2.5 m between the centre keelsons and the side shell plating.

302. Construction

The side keelsons are to be composed of continuous web plates in association with face plates, and they are to extend as far forward and afterward as practicable.

303. Web plates

1. The thickness of web plates is not to be less than that obtained from the following formula for the midship part. Beyond the midship part, the thickness may be gradually reduced and it may be 0.85 times the midship value at the ends of the ship.

$$t = 0.042L + 4.8 \text{ (mm)}$$

2. In the engine space, the thickness of web plates is not to be less than that required for the centre keelsons web plates specified in **202.**

304. Face plates

The thickness of face plates is not to be less than that required for the web plates, and the sectional area of face plates amidships is not to be less than obtained from the following formula. Beyond the midship part, the sectional area may be gradually reduced and it may be 0.85 times the midship value at the ends of the ship.

$$A = 0.45L + 8.8 \text{ (cm}^2\text{)}$$

Section 4 Floor Plates

401. Arrangements

1. In ships with the bottom of transverse framing, the standard spacing of floors is to comply with the requirements in **Ch 8, 201.**

2. In ships with the bottom of longitudinal framing, floors are to be so arranged that their spacing is not more than about 3.5 m.

402. Shapes

1. Upper edges of floor plates at any part are not to be below the level of upper edge at the centre line.

2. In the midship part, the depth of floors measured at a distance d_0 specified in **403. 1** from the inner edge of frames along the upper edge of floors, is not to be less than 0.5 d_0. Where frame brackets are provided, the depth of floors at the inner edge of brackets may be 0.5 d_0.

3. In ships having unusually large rise of floor, the depth of floor plates at the centre line is to be suitably increased.

4. Face plates provided on the floor plates are to be continuous from the upper part of bilge at one side to the upper part of bilge on the opposite side in case of curved floors, and extending over the floor plate in case of floors connected by frame brackets.

403. Scantlings

1. The scantlings of floor plates are not to be less than obtained from the formulae given in **Table 10.6.1.**

Table 10.6.1 Scantlings of floor plates

Items	Scantlings
(1) Depth at the centre line (2) Thickness (3) Section modulus	$d_0 = 62.5l$ (mm) $t^{(1)} = 0.01d_0 + 3$ (mm) $Z = 4.27Shl^2$ (cm^3)
S = spacing of floor (m). h = d or 0.66 D, whichever is the greater (m). l = span between the toes of frame brackets measured at amidship plus 0.3 m, Where curved floors are provided, the length l may be suitably modified, (See **Fig 10.6.1**).	
NOTE (1) The thickness of floor plates need not exceed 12 mm.	

2. The thickness of face plates on the floor plates is not to be less than that required for the floor plates, and the breadth of face plates is to be adequate for lateral stability of the floors.

3. Beyond 0.5 L amidships, the thickness of floor plates may be gradually reduced and at the end parts of the ship it may be 0.85 time the value specified in **Par 1,** except for the forward flat bottom.

4. Floors under engines and thrust seats are to be of ample depth and to be specially strengthened. Their thickness is not to be less than that of the centre girder web plates.

5. At the strengthened bottom forward specified in **Ch 7, 902.** the depth of floor plates is to be increased, or alternatively, the section modulus of floor plates required by **Par 1** is to be suitably increased.

404. Frame brackets

The scantlings of frame brackets are to be determined in accordance with the requirements of the following. The free edge of the bracket is to be flanged.

(1) The height of the bracket measured from the top of keel is not to be less than twice the required depth of the floor plate at the centreline of the ship. (See **Fig 10.6.1**).

(2) The arm of the bracket measured along the upper edge of the floor plate from the inner edge of frame is not to be less than the depth of the floor plate required at the centreline of the ship. (See **Fig 10.6.1**).

(3) The thickness of frame brackets is not to be less than that of floor plates.

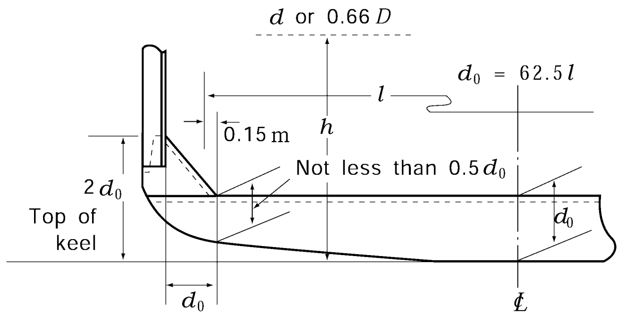

Fig 10.6.1 Shape of floors

405. Drainage holes

Drainage holes are to be provided on the floor plates on both sides of the centreline and for ships with flat bottom also at the low parts of the turn of bilge.

406. Lightening holes

Lightening holes may be provided in floor plates. Where the holes are provided, appropriate strength compensation is to be made by increasing the floor depth or by some other suitable means.

407. Floor plates forming part of bulkheads

Floor plates forming part of bulkheads are to be in accordance with the requirements in **Ch 14, 15.**

Section 5 Longitudinals

501. Spacing

The standard spacing of bottom longitudinals is obtained from the following formula:

$$S = 2L + 550 \text{ (mm)}$$

502. Scantlings

The section modulus of bottom longitudinals is not to be less than that obtained from the following formula:

$$Z_b = 9Shl^2 \quad \text{(cm}^3\text{)}$$

where:

l = spacing of solid floors (m).

S = spacing of bottom longitudinals (m).

h = vertical distance from the longitudinals to a point of $d + 0.026L$ above the top of keel (m).

Section 6 Strengthened Bottom Forward

601. Application

Strengthening of the forward bottom is to be in accordance with the requirements in **Ch 7, Sec 9.**
⚓

CHAPTER 7 DOUBLE BOTTOMS

Section 1 General

101. Application

1. Ships, in principle, are to be provided with double bottoms extending from the collision bulkhead to the after peak bulkhead.

2. For ships which are impossible to apply double bottom construction due to their structural configuration, hull form and purposes etc, and whose gross tonnages are less than 500 gross tonnage or not engaged in international voyage, double bottom may be omitted partially or wholly.

3. Double bottoms may be omitted in way of tanks of moderate size used exclusively for the carriage of liquids subject to the approval by the Society.

4. The requirements in this chapter may be suitably modified, where partial double bottoms are provided and where special arrangements such as longitudinal bulkheads or inner skins are made to reduce the unsupported breadth of double bottoms.

5. Where the longitudinal system of framing is transformed into the transverse system, or the depth of double bottom changes suddenly, special care is to be taken for the continuity of strength by means of additional intercostal girders or floors.

6. Bottom structure of holds is to be subjected to special consideration when the hold is intended to carry heavy cargoes or where cargo loads can not be treated as evenly distributed loads.

102. Manholes and lightening holes

1. Manholes and lightening holes are to be provided in all non-watertight members to ensure accessibility and ventilation, except in way of widely spaced pillars and where such openings are not permitted by this rule.

2. The number of manholes in tank tops is to be kept to the minimum compatible with securing free ventilation and ready access to all parts of the double bottom. Care is to be taken for locating the manholes to avoid the possibility of inter connection of main subdivision compartments through the double bottom so far as practicable.

3. Covers of manholes specified in **Par 2** are to be of steel, and where no ceiling is provided in the cargo holds, the covers and their fittings are to be effectively protected against damages by cargoes.

4. Air and drainage holes are to be provided in all non-watertight members of the double bottom structure.

5. The proposed locations and sizes of manholes and lightening holes are to be indicated in the plans submitted for approval.

103. Drainage

1. Efficient size of bilge wells are to be provided for draining water on the tank top.

2. The bottoms of bilge wells, except after the tunnel well, are to be situated at a distance of at least 460 mm from the top of keel.

3. Bilge wells specified in **Par 2** are not to be formed by shell plating. Where, however, the bilge wells are inevitably formed by shell platings due to the hull arrangement subject to the approval by the Society, the thickness of the side shell platings forming of bilge wells is to be increased by 2.5 mm than those of the adjacent shell platings.

104. Cofferdams

1. The following dedicated tanks are to be separated from adjacent tanks of other uses by cofferdams. However, these cofferdams may be omitted provided that the common boundaries of lubricating oil and fuel oil tank have full penetration welds.

(1) Fuel oil
(2) Lubrication oil
(3) Vegetable oil
(4) Fresh water

2. The cofferdams specified in **Par 1** are to be provided with the air pipes to comply with the requirements in **Pt 5, Ch 6, 201.** and with the manholes of adequate size which are well accessible.

105. Watertight girders and floors

The thickness of watertight girders and floors, and the scantlings of stiffeners attached to them are to comply with the relevant requirements for girders and floors, as well as the requirements in **Ch 15, 202.** and **203.**

106. Minimum thickness

No member of the double bottom structure is to be less than 6 mm in thickness.

Section 2 Centre Girders

201. Arrangement and construction

1. Centre girders are to extend as far forward and afterward as practicable.

2. Where double bottoms are used for carriage of fuel oil or fresh water, the centre girders are to be watertight and may be suitably modified in narrow tanks at the end parts of the ship or

3. Where double bottoms are used for carriage of fuel oil or fresh water, the centre girders are to be watertight.

4. The requirements in **Par 3** may be suitably modified, in narrow tanks at the end parts of the ship or where other watertight longitudinal divisions are provided at about 0.25 B from the centre line or where deemed appropriate by the Society.

202. Manholes

1. Manholes may be provided on centre girders in every frame space outside 0.75 L amidships.

2. Manholes may be provided on centre girders in alternate frame spaces for 0.75 L amidships, provided that the depth of holes does not exceed one-third of the depth of centre girder.

203. Depth

The depth of centre girders is not to be less than $B/16$ unless specially approved by the Society, but in no case is it to be less than 700 mm.

204. Thickness

The thickness of centre girder plates is not to be less than that obtained from the following formula:

$$t = 0.05L + 5 \text{ (mm)}$$

205. Brackets

1. Where longitudinal framing system is adopted in the double bottom, transverse brackets are to be provided between the solid floors with a spacing not more than about 1.75 m connecting the centre girder plates to the bottom shell plating as well as the adjacent bottom longitudinals. Where the spacing of these brackets exceeds 1.25 m, additional stiffeners are to be provided for the centre girder plates.

2. The thickness of the brackets specified in **Par 1** is not to be less than that obtained from the following formula. However, it need not be greater than that of the solid floors at the same location.

$$t = 0.6\sqrt{L} + 1.5 \ \text{(mm)}$$

3. The strength of stiffeners specified in **Par 1** is not to be less than that of a flat bar having the same thickness as that of girder plates and having the depth not less than 0.08 d_0, where d_o is the depth of centre girder (mm).

Section 3 Side Girders

301. Arrangement

1. Side girders in 0.5 L amidships are to be so arranged that the distance from the centre girder to the first side girder, between girders, or from the outermost girder to the side shell plating does not exceed approximately 4.6 m and to extend as far forward and afterwards as practicable.

2. In the strengthened bottom forward specified in **902.** of ships, side girders and half-height girders are to be provided as required in **903.**

3. Adequate strengthening is to be made under main engines and thrust seatings by means of additional full or half-height girders.

302. Thickness

The thickness of side girder plates is not to be less than that obtained from the following formula and in engine room it is to be increased by 1.5 mm.

$$t = 0.65\sqrt{L} + 1.5 \ \text{(mm)}$$

303. Thickness of half-height girders

The thickness of half-height girders is not to be less than obtained from the formula specified in **302.**

304. Scantlings of vertical stiffeners and struts

1. Vertical stiffeners are to be provided to side girders at every open floor, or at a suitable distance if the double bottom is framed longitudinally, and vertical struts are to be provided on half-height girders at every open floor.

2. The strength of vertical stiffeners required by **Par 1** is not to be less than that of a flat bar having the same thickness as that of the girder plates and having the depth not less than 0.08 d_0 (mm), where d_0 is the height of side girder (mm).

3. The sectional area of vertical struts required by **Par 1** is not to be less than obtained from the formula in **503.** with necessary modification.

305. Lightening holes

Within 10 % of the length of a hold from its end bulkheads, the diameter of lightening holes in the side girder is not to exceed one-third of the depth of girders. This requirement may, however, be modified in a short hold and outside 0.75 L amidships and where suitable compensation is made to the girder plate.

Section 4 Solid Floors

401. Arrangements

1. Solid floors are to be provided at a spacing not exceeding about 3.5 m.

2. In addition to complying with the requirements in **Par 1,** solid floors are to be provided at the following locations:

(1) At every frame in the main engine room. Solid floors may, however, be provided at alternate frames outside the engine seatings, if the double bottom is framed longitudinally.
(2) Under thrust seatings and boiler bearers.
(3) Under transverse bulkheads.
(4) At the location specified in **903.,** between the collision bulkhead and the after end of the strengthened bottom forward specified in **902.**

3. Watertight floors are to be so arranged that the subdivision of the double bottom generally corresponds to that of the ship.

402. Thickness

The thickness of solid floors is not to be less than that obtained from the following formulae and in the engine room the thickness is to be increased by 1.5 mm.

In ships with transverse framing : $t = 0.6\sqrt{L} + 1.5$ (mm)

In ships with longitudinal framing : $t = 0.7\sqrt{L} + 1.5$ (mm)

403. Vertical stiffeners

1. Vertical stiffeners are to be provided on the solid floors at a suitable spacing in case of the double bottom framed transversely, and at every longitudinal in case of the double bottom framed longitudinally.

2. The vertical stiffeners prescribed in **Par 1** is to be a flat bar having the same thickness as that of the floor plate and the depth not less than 0.08 d_0 or the equivalent, where d_0 is the depth of the floor at the point under consideration (mm).

404. Lightening holes

Within $0.1B$ from side shell plating, the diameter of lightening holes provided in the solid floors in the middle half length of a hold is not to exceed about one-fifth of the depth of floors. This requirement may, however, be suitably modified at the end parts of ship and in exceptionally short holds and where the solid floors are suitably compensated for.

Section 5 Bottom Longitudinals

501. Spacing

The standard spacing of longitudinals is obtained from the following formula :

$$S = 2L + 550 \text{ (mm)}$$

502. Scantlings

1. The section modulus of bottom longitudinals is not to be less than that obtained from the following formula and in no case is it to be less than 30 cm^3.

$$Z_b = CShl^2 \ (\text{cm}^3)$$

where:

l = spacing of solid floors (m).

S = spacing of longitudinals (m).

h = vertical distance from the longitudinals to a point of $d + 0.026L$ above the top of keel (m).

C = coefficient given in **Table 10.7.1.**

Table 10.7.1 Coefficient C

Case		C
In case where no strut specified in **503.** is provided midway between floors		8.6
In case where a strut specified in **503.** deep tanks is provided midway between floors	Lower part of deep tanks	6.2
	Elsewhere	4.1

2. The section modulus of inner bottom longitudinals is not to be less than obtained from the formula in **Par 1** with C equal to 0.85 times the value specified for bottom longitudinals in the same location. Where vertical struts are not provided to the longitudinals under deep tanks, the section modulus of inner bottom longitudinals is to be as specified in **Ch 15, 203.**

503. Vertical struts

1. Vertical struts are to be rolled sections other than flat bars or bulb plates and to be well overlapped with the webs of bottom and inner bottom longitudinals.

2. The sectional area of the vertical struts is not to be less than that obtained from the following formula:

$$A = 2.2Sbh \ (\text{cm}^2)$$

where:

S = spacing of longitudinals (m).

b = breadth of the area supported by the strut (m). (See **Fig 10.7.1**)

h = as specified in **502. 1.**

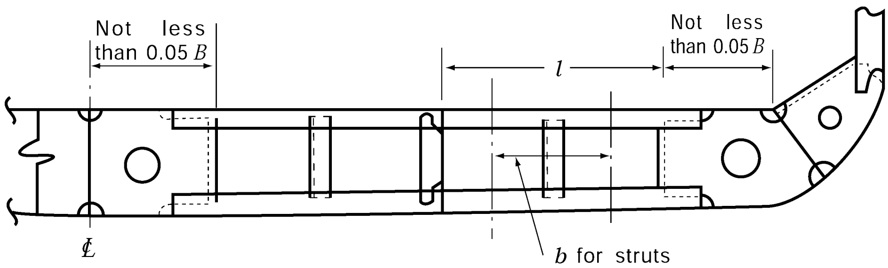

Fig 10.7.1 Open Floors

Section 6 Inner Bottom Plating and Margin Plates

601. Thickness of inner bottom plating

The thickness of inner bottom plating is not to be less than that obtained from the following formula and the thickness is to be increased by 2 mm in main engine room and under hatchway, if no ceiling is provided:

$$t = 3.8S\sqrt{d} + 1.5 \text{ (mm)}$$

where:

S = spacing of inner bottom longitudinals for longitudinally framed inner bottom plating, or spacing of floor plates for transversely framed inner bottom plating (m).

602. Ships handling cargoes regularly by mechanical appliances such as grabs

In ships which regularly handle cargoes by grabs or similar mechanical appliances, the thickness of inner bottom plating is to be increased by 2 mm above that specified in **601.,** unless ceiling is provided.

603. Arrangements of margin plates

It is recommended that the margin plates are to be of sufficient height to protect the bottom up to the turn of bilge and for forward 0.2 L from the stem the margin plates are to extend to the ship's sides horizontally as far as practicable.

604. Thickness of margin plates

The thickness of margin plates is to be increased by 1.5 mm above that obtained from the formula in **601.**

605. Breadth of margin plates

Margin plates are to be of adequate breadth and to extend well inside from the line of toes of tank side brackets.

606. Brackets

1. Where the double bottom is framed longitudinally, brackets are to be transversely provided at every hold frame extending from the margin plate to the adjacent bottom and inner bottom longitudinals.

2. The thickness of brackets specified in **Par 1** is not to be less than that obtained from the formula in **205. 2.**

Section 7 Hold Frame Brackets

701. Tank side brackets

1. The thickness of brackets connecting hold frames to margin plates is to be increased by 1.5 mm above that obtained from the formula in **205. 2.**

2. The free edges of brackets are to be stiffened.

3. Where the shape of ship requires exceptionally long brackets, additional stiffness is to be provided by fitting angles longitudinally across the top of flanges, or by other suitable means.

Section 8 Open Floors

801. Arrangements

Where the double bottom is framed transversely, open floors are to be provided at every hold frame between solid floors in accordance with the requirements in this section.

802. Scantlings of frames and reverse frames

1. The section modulus of frames is not to be less than that obtained from the following formula and in no case is it to be less than 30 cm^3.

$$Z_b = CShl^2 \quad (cm^3)$$

where:

l = distance between the brackets attached to the centre girder and the margin plate (m). Where side girders are provided, l is the greatest distance between the vertical stiffeners on side girders and the brackets. (See **Fig. 10.7.1**)

S = spacing of frames (m).

h = $d + 0.026L$ (m).

C = coefficient given in **Table 10.7.2.**

Table 10.7.2 Coefficient C

Case		C
In case where no vertical strut specified in **803.** is provided		6.0
In case where vertical struts specified in **803.** are provided.	Under deep tanks	4.4
	Elsewhere	2.9

2. The section modulus of reverse frames is not to be less than that obtained from the formula in **Par 1** with C equal to 0.85 times the value specified for frames at the same location. Where no vertical strut is provided to the open floors under deep tanks, C is to be the value as specified in **Ch 15, 203.**

803. Vertical struts

1. Vertical struts are to be rolled sections other than flat bars and bulb plates and to be well overlapped with the webs of frames and reverse frames.

2. The sectional area of vertical struts is not to be less than that specified in **503.** with necessary modifications.

804. Brackets

1. Frames and reverse frames are to be connected to the centre girder and margin plates by brackets of not less thickness than obtained from the formula in **205. 2.**

2. The breadth of brackets specified in **Par 1** is not to be less than 0.05 B and the brackets are to be well overlapped with frames and reverse frames. The free edges of brackets are to be properly stiffened.

Section 9 Construction of Strengthened Bottom Forward

901. Application

1. The requirements in this section are framed for ships having the minimum bow draught not more than 0.037 L at the ballast condition.

2. Notwithstanding the requirement in **Par 1,** in ships of which C_b is less than 0.7 and $V / \sqrt{L}$ (kt/m) is 1.4 and over, the area of strengthened bottom forward of ship is to be in accordance with the discretion of the Society.

902. Strengthened bottom forward

1. The strengthened bottom forward is the part of the ship's bottom up to a height of 0.05 d_F (d_F : Bow draught at the ballast condition) from the top of keel at forward from the position specified in **Table 10.7.3.**

Table 10.7.3 Range of strengthened bottom forward

$V/\sqrt{L}$ $(=a)$	Position (from Fore Perpendicular)
$a \leq 1.1$	0.15 L
$1.1 < a \leq 1.25$	0.175 L
$1.25 < a \leq 1.4$	0.2 L
$1.4 < a \leq 1.5$	0.225 L
$1.5 < a \leq 1.6$	0.25 L
$1.6 < a \leq 1.7$	0.275 L
$1.7 < a$	0.3 L

2. Notwithstanding the requirement of **Par 1,** in case of the ships of which C_b are especially small, the ships of which the draft in the ballast condition are especially small, and so on, the extent of the strengthened bottom forward is to be extended up to the satisfaction of the Society.

903. Construction

1. Between the collision bulkhead and 0.05 L abaft the after end of strengthened bottom forward, full or half height girders are to be provided in accordance with **Table 10.7.4.** Where transverse framing is adopted between the collision bulkhead and 0.025 L abaft the after end of strengthened bottom forward, half height girders or longitudinals shell stiffeners are to be provided between the side girders.

2. Between the collision bulkhead and the after end of strengthened bottom forward, solid floors are to be provided in accordance with **Table 10.7.4.**

Table 10.7.4 Construction of strengthened bottom forward

Double bottom \ Side \ Members		Side girders	Half-height girders or longitudinals shell stiffeners	Solid floors
Transverse framing	Transverse framing	To be provided at intervals within 2.5 m	To be provided between side girders	To be provided at every frame
	Longitudinal framing			To be provided at intervals within 2.5 m
Longitudinal framing	Transverse framing		-	To be provided at alternate frames
	Longitudinal framing			To be provided at intervals within 2.5 m

3. The solid floors are to be strengthened by fitting vertical stiffeners in way of half-height girders or longitudinal shell stiffeners except where the shell stiffeners are spaced considerably close and the solid floors are adequately strengthened, the vertical stiffeners may be provided on alternate shell stiffeners.

4. Solid floors and side girders are to be adequately stiffened for those ships, of which the minimum bow draught is not less than 0.025 L but not more than 0.037 L, where the construction and arrangement of the strengthened bottom forward are not in accordance with the requirements in **Par 1** and **2.**

904. Scantlings of longitudinal shell stiffeners or bottom longitudinals

The section modulus of longitudinal shell stiffeners or bottom longitudinals in way of the strengthened bottom forward are to be in accordance with **Pt 3, Ch 7, 804.** ⚓

CHAPTER 8 FRAMES

Section 1 General

101. Application

The requirements in this chapter apply to ships having transverse strength due to bulkheads not less effective than that specified in **Ch 14.** Where the transverse strength due to bulkheads is not sufficient or hold length is over 25 m in length, additional stiffening is to be made by means of increasing scantlings of frames, provision of web frames, etc.

102. Frames in way of deep tanks

The strength of frames in way of deep tanks is not to be less than that required for stiffeners on deep tank bulkheads.

103. Frames in way of tank tops

Frames are not to extend through the tops of tanks, unless the effective watertight or oiltight arrangements are specially submitted and approved.

104. Frames in boiler spaces and in way of bossing

1. In boiler spaces, the scantlings of frames and side stringers are to be appropriately increased.

2. The construction and scantlings of frames in way of bossing are to be to the satisfaction of the Society.

Section 2 Frame Spacing

201. Transverse frame spacing

1. The standard spacing of transverse frame is obtained from the following formula:

$$S = 2L + 450 \text{ (mm)}$$

2. Transverse frame spacing in peaks or cruiser sterns as well as between 0.2 L from the fore end and the collision bulkhead is not to exceed 610 mm or the standard spacing specified in **Par 1**, whichever is the smaller.

3. The requirements in **Par 2** may be modified, where structural arrangement or scantlings are suitably considered.

202. Longitudinal frame spacing

The standard spacing of longitudinal frames is to be obtained from the following formula:

$$S = 2L + 550 \text{ (mm)}$$

203. Consideration for frame spacing exceeding the standard

Where the spacing of frames is equal to or above the spacing of 170 mm greater than the standard spacing in **201.** and **202.,** the scantlings and structural arrangement of single and double bottoms and of other relevant structures are to be specially considered.

Section 3 Transverse Hold Frames

301. Application

1. Transverse hold frame is the frame provided below the lowest deck from the collision bulkhead to the after peak bulkhead, including the machinery space.

2. The transverse hold frames of ships which have hopper side tanks, top side tanks, or which have a special construction such as inner hulls, will be specially considered.

302. Scantlings of transverse hold frames

1. The section modulus of transverse hold frames is not to be less than obtained from the formulae given in **Table 10.8.1,** but in no case is it to be less than 30 cm^3.

Table 10.8.1 Section modulus

Location	Section modulus (cm^3)
(1) Between 0.15 L from the fore end and the after peak bulkhead	$Z = 2.6 S h l^2$
(2) Between 0.15 L from the fore end and the collision bulkhead	$Z = 3.4 S h l^2$
(3) For the frames under transverse web beams supporting deck longitudinals	$Z = 2.4n \left\{0.17 + \frac{1}{9.81} \cdot \frac{h_1}{h} \cdot \left(\frac{l_1}{l}\right)^2 - 0.1 \frac{l}{h}\right\} S h l^2$

S = frame spacing (m).
l = vertical distance from the top of inner bottom plating or single bottom floors at side to the top of deck beams above the frames (m).
h = vertical distance from the lower end of l at the place of measurement to a point of $d + 0.044L - 0.54$ above the top of keel (m).
n = ratio of the transverse web beam spacing to the frame spacing.
h_1 = deck load stipulated in **Ch 10, Sec 2** for the deck beam at the top of frame (kN/m^2).
l_1 = total length of the transverse web beam (m).

2. Where the depth of bottom centre girder is less than B/16, the scantlings of frames are to be suitably increased.

303. Connection

1. Transverse hold frames are to be overlapped with tank side brackets by at least 1.5 times the depth of frame sections and are to be effectively connected thereto.

2. The upper end of transverse hold frame are to be effectively connected by brackets with the deck or deck beams, and where the deck at the top of frames is longitudinally framed, the upper end brackets are to be extended and connected to the deck longitudinals adjacent to the frames.

Section 4 Side Longitudinals

401. Side longitudinals

1. The section modulus of side longitudinals in the midship part below the freeboard deck is not to be less than that obtained from the following formulae, whichever is the greater, but in no case is it to be less than 30 cm^3.

$Z_1 = 8.6 Shl^2$ (cm³)

$Z_2 = 2.9\sqrt{L} Sl^2$ (cm³)

where:

S = spacing of longitudinals (m).

l = distance between the web frames or between the transverse bulkhead and the web frame including the length of connection (m).

h = vertical distance from the longitudinals to a point of $d + 0.044L - 0.54$(m) above the top of keel.

2. Beyond the midship part, the section modulus of side longitudinals may be gradually reduced towards the ends of ships, and may be 0.85 times that obtained from the formula in **Par 1** at the ends. However, the section modulus of side longitudinals between 0.15 L from the fore end and the collision bulkhead is not to be less than obtained from the formula in **Par 1.**

3. The depth of flat bars used for longitudinals is not to exceed 15 times the thickness of flat bars.

4. Side longitudinals on sheer strakes in midship part are to be, as far as possible, of slenderness ratio not greater than 60.

5. The section modulus of bilge longitudinals need not exceed that of bottom longitudinals.

402. Side transverse

1. The side transverses supporting side longitudinals are to be arranged at an interval not exceeding 4.8 m at sections where solid floors are provided.

2. The scantlings of side transverses are not to be less than those obtained from the following formulae:

Depth: $d = 100l$ (mm) or 2.5 times the depth of slot for the longitudinals, whichever is the greater.

Section modulus: $Z = C_1 Shl^2$ (cm³)

Thickness of web: $t = \dfrac{C_2 Shl}{d_0} + 1.5$ (mm)

where:

S = side transverses spacing (m).

l = vertical distance from the top of inner bottom plating or single bottom floors at side to the deck at the top of side transverses. Where, however, there are effective deck transverses, l may be measured up to the lower surface of such transverses (m).

d_0 = depth of side transverses (mm). However, the depth of slots for side longitudinals is to be deducted from the web depth.

h = vertical distance measured from the midpoint of l to a point of $d + 0.044L - 0.54$ (m) above the top of keel, but in no case is it to be less than 1.43 l (m).

C_1, C_2 = coefficients as defined in **Table 10.8.2.**

Table 10.8.2 Coefficients C_1 and C_2

Coefficient	For side transverses abaft 0.15 L from the fore end	For side transverses between 0.15 L from the fore end and the collision bulkhead.
C_1	4.7	6.0
C_2	45	58

3. Side transverses are to be provided with tripping brackets at an interval of about 3 m and stiffeners are to be provided on the webs at every longitudinal except for the middle part of the span of side transverses where they may be provided at alternate longitudinals.

Section 5 Tween Deck Frames

501. General

1. The scantlings of tween deck frames are to be determined in relation to the strength of hold frames, the arrangement and transverse stiffness of bulkheads, etc.

2. In the design of tween deck framing, considerations are to be given to the provision of a reasonable degree of continuity in the framing from the bottom to the top of hull in conjunction with hold frames.

3. The provisions in this section are based on the standard structural arrangement so as to maintain transverse stiffness of ships by means of efficient tween deck bulkheads provided above the hold bulkheads or by web frames extended to the top of superstructures at a proper interval.

502. Scantlings

1. The section modulus of tween deck frames is not to be less than that obtained from the following formula:

$$Z = CSlL \quad (\text{cm}^3)$$

where:

S = frame spacing (m).

l = tween deck height (m), but to be taken as 1.8 m where the height is less than 1.8 m for superstructure frames and as 2.15 m where the height is less than 2.15 m for others, respectively.

C = coefficient given in **Table 10.8.3.**

2. The scantlings of tween deck frames below the free board deck within 0.125 L from the fore and after ends are to be appropriately increased above those given by **Par 1.**

Table 10.8.3 Coefficient C

Description of tween deck frames	C
Superstructure frames (excluding the following two lines)	0.44
Superstructure frames for 0.125 L from after end of ship	0.57
Superstructure frames for 0.125 L from fore end and cant frames at stern	0.74
Tween deck frames between the freeboard deck and the second deck	0.74
Tween deck frames between the second deck and the third deck	0.89
Tween deck frames between the third deck and the fourth deck	0.97

3. Where decks are supported by longitudinal beams and transverse strong beams, the section modulus of tween deck strong frames which support beams is not to be less than that given by **Pars 1** and **2** multiplied by the coefficient obtained from the following formula. In this case, the section modulus of tween deck frames between strong frames is not to be less than 0.85 times that given by **Pars 1** and **2** and the upper ends are to be connected with brackets.

$$C = 0.2n + 1$$

where:

n = number of tween deck frames between web frames.

503. Special care to tween deck frames

1. Care is to be taken so that the strength and stiffness of framing at the ends of ship may be increased in proportion to the actual unsupported length of frame as well as the vertical height of tween decks.

2. In ships having specially large freeboard, the scantlings of tween deck frames may be properly reduced.

504. Superstructure frames

1. Superstructure frames are to be provided at every frame located below.

2. Superstructure frames for four frame spaces at the ends of bridges and of detached superstructures within 0.5 L amidships are not to be less than the section modulus obtained from the formula in **502.** using 0.74 as the coefficient C.

3. Web frames or partial bulkheads are to be provided above the bulkheads required by **Ch 14** or at other positions such as may be considered necessary to give effective transverse rigidity to the superstructures.

Section 6 Frames in Both Peaks

601. Transverse frames in fore peaks

The section modulus of transverse frames below the freeboard deck forward collision bulkhead is not to be less than that obtained from the following formula, but in no case is it to be less than 30 cm^3.

$$Z = 8Shl^2 \quad (cm^3)$$

where:

S = web frame spacing (m).

l = distance between the supports of transverses (m), but to be taken as 2 m where the distance is less than 2 m.

h = vertical distance from the midpoint of l to a point of 0.12 L above the top of keel (m).

602. Longitudinal frames in fore peaks

The section modulus of longitudinals below the freeboard deck forward collision bulkhead is not to be less than that obtained from the following formula. However, the modulus obtained from the formula is to be increased by 25 % between 0.05 D and 0.15 D from the top of keel and 50 % below 0.05 D from the top of keel.

$$Z = 8Shl^2 \quad (\text{cm}^3)$$

where:

S, l = as specified in **401.**

h = vertical distance from the longitudinals to a point of 0.12 L above the top of keel (m), but in no case is it to be less than 0.06 L (m).

603. Transverse frames in after peaks

The section modulus of transverse frames below the freeboard deck abaft after peak bulkhead is not to be less than that obtained from the following formula, but in no case is it to be less than 30 cm^3:

$$Z = 8Shl^2 \quad (\text{cm}^3)$$

where:

S = web frame spacing (m).

l = as specified in **Table 8.1,** but to be taken as 2 m where the height is less than 2 m.

h = vertical distance from the midpoint of l to a point of $d + 0.044L - 0.54$ (m) above the top of keel. ⚓

CHAPTER 9 CANTILEVER BEAM CONSTRUCTION

Section 1 Cantilever Beams

101. Construction and scantlings

Cantilever beams are to comply with the requirements in (1) to (7):

(1) The root depth of cantilever beams measured at the toe of end brackets at side is not to be less than one-fifth of the horizontal distance from the inboard end of cantilever beam to the toe of end bracket at side.

(2) The depth of cantilever beams may be gradually tapered from the root towards the inboard end where it may be reduced to about a half of the root depth.

(3) The section modulus of cantilever beams at the toe of end brackets is not be less than obtained from the following formula: (See **Fig 10.9.1**)

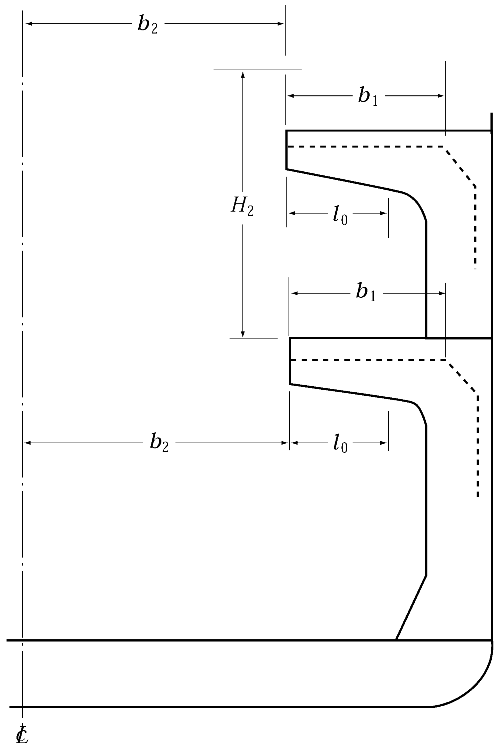

Fig 10.9.1 Measurement of l_0, b_1, b_2, etc.

$$Z = 7.1\,Sl_0\left(\frac{1}{2}b_1h_1 + b_2h_2\right) \quad (\text{cm}^3)$$

where:

S = cantilever beam spacing (m).

l_0 = horizontal distance from the inboard end of cantilever beams to the toe of end brackets (m).

b_1 = horizontal distance from the inboard end of cantilever beams to the toe of end brackets of beam or transverse deck girder at side (m). Where, however, the deck is framed longitudinally and no deck transverse is provided between the cantilever beams, b_1 is to be taken as l_0.

b_2 = a half of the breadth of hatch opening in the deck supported by the cantilever beams (m).

h_1 = deck load stipulated in **Ch 10, Sec 2** for the deck transverses supported by the cantilever beams (kN/m^2).

h_2 = load on hatch covers of the deck supported by the cantilever beams which is not to be less than obtained from the following (a) to (c), depending on the type of the deck (kN/m^2):

(a) For the weather deck, $h_2 h_2$ is the deck load stipulated in **Ch 10, 201. 2** for the deck transverses or the maximum design cargo weight on hatches per unit area (kN/m^2), whichever is the greater. In **Ch 10, 201. 2**(1), the value of y may be taken as the vertical distance from the load line to the upper edge of hatch coaming. In either case, h_2 is not to be less than 17.5 (kN/m^2) for hatches at Position I and 12.8 (kN/m^2) for those at Position II, specified in **Ch 19,** respectively.

(b) For decks other than the weather deck where ordinary cargoes or stores are intended to be carried, h_2 is the deck load stipulated in **Ch 10, 201. 1.**

(c) For decks other than those specified in (a) or (b) above, h_2 is the value equals to h_1.

(4) The section modulus of cantilever beams may be gradually tapered from the inner edge of end brackets toward the inboard end of cantilever beams, where it may be reduced to 0.60 times that at the inner edge of end brackets.

(5) The web thickness of cantilever beams is not to be less than obtained from the following formulae, whichever is the greater:

$$t_1 = 9.5\frac{S\left(\frac{1}{2}b_1 h_1 + b_2 h_2\right)}{d_c} + 1.5 \text{ (mm)}$$

$$t_2 = 0.0075 d_c + 0.46 t_1 + 0.5 \text{ (mm)}$$

where:

S, b_1, b_2, h_1 and h_2 = as stipulated in (3). Where, however, the deck is framed longitudinally and no deck transverse is provided between the cantilever beams, a horizontal distance in *metre* from the inboard end of cantilever beams to the section under consideration is to be substituted for $b_1/2$ in the formula for t_1.

d_c = depth of the cantilever beams at the section under consideration (mm), However, in the calculation of t_1, the depth of slots for deck longitudinals, if any, is to be deducted from the depth of cantilever beams. Where the webs are provided with horizontal stiffeners, the divided web depth may be used for d_c in the formula for t_2.

(6) Cantilever beams are to be provided with tripping brackets at an interval of about 3 m. Where the breadth of face bars of cantilever beams exceeds 180 mm on either side of the web, the tripping brackets are to support the face bars as well. And stiffeners are to be provided on the webs at every deck longitudinal adjacent to the root of cantilever beams and at alternate longitudinals elsewhere.

(7) Web plates adjacent to the inner edge of end brackets are to be specially reinforced.

Section 2 Web Frames

201. Construction and scantlings

Web frames supporting cantilever beams are to comply with the requirements in (1) to (7):

(1) The depth of web frames is not to be less than one-eighth of the length including the length of connections at both ends.

(2) The section modulus is not to be less than that obtained from the following formula. Where, however, a tween deck web frame in association with cantilever beam supporting the deck above is provided at the top of web frame, the value of the formula may be reduced to 60 %.

$$Z = 7.1 S l_1 \left(\frac{1}{2} b_1 h_1 + b_2 h_2 \right) \quad (\text{cm}^3)$$

where:

S = web frame spacing (m).

l_1 = horizontal distance from the end of supported cantilever beams to the inside of web frames (m).

b_1, b_2, h_1 and h_2 = as stipulated in **101.** (3) for the supported cantilever beams. Where, however, the deck is framed longitudinally and no deck transverse is provided between the cantilever beams, l_1 is to be substituted for b_1.

(3) The section modulus of tween deck web frames is to be in accordance with the requirements in (2), and additionally, it is not to be less than that obtained from the following formula:

$$Z = 7.1\, C_1 S l_1 \left(\frac{1}{2} b_1 h_1 + b_2 h_2 \right) \quad (\text{cm}^3)$$

where:

S, l_1, b_1, b_2, h_1 and h_2 = as stipulated in (2).

C_1 = coefficient obtained from the following formula:

$$C_1 = 0.5 \left(\frac{\frac{1}{2} b_1' h_1' + b_2' h_2'}{\frac{1}{2} b_1 h_1 + b_2 h_2} \right) + 0.15$$

b_1', b_2', h_1' and h_2' = b_1, b_2, h_1 and h_2 respectively stipulated in (2) in respect of cantilever beams to be provided below the web frames concerned.

(4) The web thickness is not to be less than that obtained from the following formulae, whichever is the greater:

$$t_1 = 9.5 \frac{C_2 S \left(\frac{1}{2} b_1 h_1 + b_2 h_2 \right)}{d_w} \cdot \frac{l_1}{l} + 1.5 \quad (\text{mm})$$

$$t_2 = 0.0075 d_w + 0.46 t_1 + 0.5 \quad (\text{mm})$$

where:

S, b_1, b_2, h_1, h_2 and l_1 = as stipulated in (2).

d_w = the smallest depth of web frames (mm). However, in the calculation of t_1, the depth of slots for side longitudinals, if any, is to be deducted from the web depth. Where the depth of webs is divided by vertical stiffeners, in the calculation of t_2, the divided depth may be used for d_w.

l = length of web frames including the length of connections at the both ends (m).

C_2 = coefficient given in **Table 10.9.1,** where, however, C_1 is as specified in (3).

Table 10.9.1 Coefficient C_2

Location		C_2
For hold web frames	Where web frame in association with cantilever beam supporting the deck above is provided at the top of them	0.9
	Elsewhere	1.5
For tween deck web frames		C_1 + 0.6

(5) Where the web frames supporting cantilever beams also support side longitudinals or side stringers, their scantlings are to comply with the following requirements in addition to those in **Ch 8, 402.**

(a) The section modulus is not to be less than that obtained from the formula in (2), in which is to be multiplied by the following coefficient:

Where tween deck web frame together with cantilever beam is provided above:

$$\alpha = 9.81\left\{\frac{0.05hl^2 + 0.09\,h_u l_u^2}{1.4\left(\frac{1}{2}b_1 h_1 + b_2 h_2\right)l_1}\right\} + 0.6$$

Elsewhere: $\alpha = 1.0$

where:

l = length of hold web frames including the length of end connections (m).

l_u = length of tween deck web frames provided directly above, including the length of end connections (m).

h = vertical distance from the middle of l to a point of $d + 0.038L$ above the top of keel (m).

h_u = vertical distance from the middle of l_u to a point to which h is to be measured (m). However, in case where the point is below the middle of l_u, h_u is to be taken as zero.

b_1, b_2, h_1, h_2 and l_1 = as given by (2).

(b) The web thickness is not to be less than that given by (4), in which the value of t_1 is to be increased by the amount obtained from the following formula:

$$\beta = 30\frac{Shl}{d_w} \quad \text{(mm)}$$

where:

S = web frame spacing (m).

h, l = as stipulated in (a) above.

d_w = as stipulated in (4).

(6) Tripping brackets are to be provided on the webs at an interval of about 3 m and stiffeners are to be provided at every side longitudinal at the ends of frames and at alternate longitudinals elsewhere.

(7) The web frames are to be effectively connected with those located beneath or solid floors so as to maintain strength continuity.

Section 3 Connection of Cantilever Beams to Web Frames

301. Connections

Cantilever beams and their supporting web frames are be effectively connected by brackets to meet the requirements in (1) to (4).

(1) The radius of curvature of the free edges of brackets is not to be less than the depth of cantilever beams at the toe of brackets.

(2) The thickness of brackets is not to be less than that of webs of cantilever beams or web frames, whichever is the greater.

(3) The brackets are to be sufficiently strengthened by stiffeners.

(4) The free edges of brackets are to have face bars of a sectional area not less than that of cantilever beams or web frames, whichever is the greater, and the face bars are to be connected with those of cantilever beams and web frames. ⚓

CHAPTER 10 BEAMS

Section 1 General

101. Standard camber

The standard camber of weather decks is 0.02 B at midship.

102. Connections of ends of beams

1. Longitudinal beams are to be continuous or to be connected with brackets at their ends in such a manner as to effectively develop the sectional area and to have sufficient strength to bending and tension.

2. Transverse beams are to be connected to frames by brackets.

3. Transverse beams provided at positions where frames are omitted in tween decks or superstructures, are to be connected to the side plating by brackets.

4. Transverse beams on boat decks, promenade decks, etc. may be connected by clips at their ends.

103. Continuity of strength

In parts where longitudinal beams are transformed to transverse beams, special care is to be taken to keep the continuity of strength.

Section 2 Deck Load

201. Value of h

1. Deck load h (kN/m^2) for decks intended to carry ordinary cargoes or stores is to be in accordance with the following (1) through (3):

(1) h is to be equivalent to the standards given by 7 times the tween deck height at side of the space (m), or 7 times the height from the deck concerned to the upper edge of hatch coaming of the above deck (m). However, h may be specified as the maximum design cargo weight per unit area of deck (kN/m^2). In this case, the value of h is to be determined by considering the loading height of cargo.

(2) Where timber and/or other cargoes are intended to be carried on the weather deck, h is to be the maximum design cargo weight per unit area of deck (kN/m^2), or the value specified in **Par 2,** whichever is the greater.

(3) Where cargoes are suspended from the deck beams or deck machinery is installed, h is to be suitably increased.

2. Deck load h (kN/m^2) for the weather deck is to be as specified in the following (1) to (4):

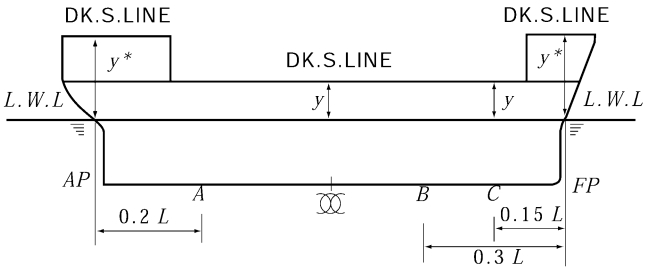
(1) For the freeboard decks, superstructure deck and top of deckhouses on the freeboard deck, h is not to be less than that obtained from the following formula:

$$h = a(0.067bL - y) \quad (\text{kN/m}^2)$$

where:

a, b = as given by **Table 10.10.1** according to the position of decks. However, where C_b is less than 0.7, value of b will be specially considered.

y = vertical distance from the load line to the weather deck at side (m), and y is to be measured at fore end for deck forward of 0.15 L abaft the fore end; at 0.15 L abaft the fore end for deck between 0.3 L and 0.15 L abaft the fore end; at midship for deck between 0.3 L abaft the fore end and 0.2 L afore the aft end; and at aft end for deck afterward of 0.2 L afore the aft end. (See **Fig 10.10.1**)



* In case of no superstructure, y is the distance to the upper deck.

Abaft A	y is measured at AP
Between A and B	y is measured at ⊗
Between B and C	y is measured at C
Afore C	y is measured at FP

Fig 10.10.1 Position of measuring y

(2) h for deck given in Column II in **Table 10.10.2** need not exceed that in Column I.
(3) Notwithstanding the provision in (1) and (2), h is not to be less than that obtained from the formulae given by **Table 10.10.2,** but to be taken as 12.8 where h for decks is less than 12.8.
(4) Value of h is to be in accordance with the discretion of the Society, where the ship has an unusual large freeboard.

Table 10.10.1 Values of a and b

Column	Position of Deck	a				b
		Deck plating	Beams	Pillars	Deck girders	
I	Forward of 0.15 L abaft the fore end	14.7	9.80	4.90	7.35	1.42
II	Between 0.1 L and 0. L abaft the fore end	11.8	7.85	3.90	5.90	1.20
III	Between 0. L abaft the fore end and 0. L afore the aft end	6.90	4.60	2.25	2.25(1), 3.45(2)	1.00
IV	Afterward of 0. L afore the aft end	9.80	6.60	3.25	4.90	1.15

NOTES:
(1) In case of longitudinal deck girders outside the line of hatchway opening of the strength deck in midship part of ship.
(2) In case of deck girders other than (1).

<tr><td colspan="2">Second tier superstructure deck above the freeboard deck</td><td>1.28</td><td>0.69</td><td>1.95</td></tr>
</table>

3. For an enclosed part of superstructure decks and of top of deckhouses in accommodation or navigation spaces, at the first and second tier above the freeboard deck, h is to be 5.0 kN/m^2.

Section 3 Longitudinal Beams

301. Spacing

The standard spacing of the longitudinal beams is obtained from the following formula:

$$S = 2L + 550 \text{ (mm)}$$

302. Proportion

1. Longitudinal beams are to be supported by deck transverses of appropriate spacing. In midship part of the strength deck, the slenderness ratio of deck longitudinals is not to exceed 60. This requirement may, however, be suitably modified where longitudinal beams are given a sufficient strength to prevent buckling.

2. Flat bars used for longitudinals are not to be of depth thickness ratio exceeding 15.

303. section modulus

1. The section modulus of longitudinal beams outside the line of openings of the strength deck for the midship part is not to be less than that obtained from the following formula:

$$Z = 1.14 S h l^2 \text{ (cm}^3\text{)}$$

where:

S = spacing of longitudinal beams (m).

h = deck load specified in **Sec 2** (kN/m^2).

l = horizontal distance between bulkhead and deck transverse or between deck transverses (m).

2. The section modulus of longitudinal beams outside the line of openings of the strength deck at 0.1 L of fore end and after end of ship is not to be less than that obtained following formula:

$$Z = 0.43 S h l^2 \text{ (cm}^3\text{)}$$

where:

S, h, l = as specified in **Par 1.**

3. The section modulus of longitudinal beams outside the line of openings of the strength deck for the parts forward and afterward midship part of ship may be gradually reduced section modulus by **Par 1.** In no case, however, is the section modulus to be less than obtained from **Par 2** at 0.1 L of fore end and after end of ship.

4. The section modulus of longitudinal beams for the parts other than stipulated in **Pars 1** and **2** is not to be less than obtained from the formula in **Par 2.**

304. Deck transverses

In single deck ships, the deck transverses are to be provided in line with the solid floors in double bottom, and in two deck ships, the transverses are also to be provided in line with the solid floors in double bottoms as far as practicable.

Section 4 Transverse Beams

401. Arrangements

Transverse beams are to be provided on every frame.

402. Proportion

It is preferable that the length depth ratio of transverse beams be 30 or less at the strength deck, and 40 or less at effective decks (the decks below the strength deck which are considered as strength members in the longitudinal strength of hull) and superstructure decks as far as practicable.

403. Section modulus

The section modulus of transverse beams is not to be less than that obtained from the following formula:

$$Z = 0.43\,S h l^2 \quad (\text{cm}^3)$$

where:

S = spacing of transverse beams (m).

h = deck load specified in **Sec 2** (kN/m^2).

l = horizontal distance from the inner edge of beam brackets to the longitudinal deck girder, or between the longitudinal deck girders (m).

Section 5 Beams on Bulkhead Recesses and Others

501. Section modulus

The section modulus of beams at deck forming the top of bulkhead recesses, tunnels and tunnel recesses is not to be less than that obtained from the formula in **Ch 14, 207.**

Section 6 Beams on the Top of Deep Tanks

601. Section modulus

The section modulus of beams at deck forming the top of deep tanks is to be in accordance with this chapter, and not to be less than that obtained from the formula in **Ch 15, 203.,** taking the top of deck beams as the lower end of h and beams as stiffeners.

Section 7 Deck Beams Supporting Specially Heavy Loads

701. Reinforcement of deck beams

The deck beams supporting specially heavy loads or arranged at the ends of superstructures or deckhouses, in way of masts, windlasses and auxiliary machinery, etc. are to be properly reinforced by increasing the scantlings of beams, or by the additional deck girders or pillars.

Section 8 Beams on Deck Carrying Unusual Cargoes

801. Section modulus of beams

The section modulus of beams on deck subject to cargo loads which can not be treated as evenly distributed loads is to be determined taking account of load distribution for particular cargoes. ⚓

CHAPTER 11 DECK GIRDERS

Section 1 General

101. Application

Transverse deck girders supporting longitudinal deck beams and longitudinal deck girders supporting transverse deck beams are to be in accordance with the requirements in this chapter.

102. Arrangement

In way of the bulkhead recesses and the top of tanks, deck girders are to be arranged at an interval not exceeding 4.6 m as far as practicable.

103. Construction

1. Deck girders are to be composed of face plates provided along the lower edge.

2. Tripping brackets are to be provided at an interval of about 3 m and where the breadth of face plates exceeds 180 mm on either side of the girder, these brackets are to be so arranged as to support the face plates as well.

3. The thickness of face plates forming girders is not to be less than that of web plates and the width of the face plates is not to be less than that obtained from the following formula:

$$b = 2.7\sqrt{d_0 l} \quad \text{(mm)}$$

where:

d_0 = depth of webs (mm).

l = distance between the supports of girders (m). Where, however, effective tripping brackets are provided, they may be taken as supports.

4. The depth of girders is more than 2.5 times that of slots for beams, and is to be kept constant between two adjacent bulkheads for the longitudinal girders.

5. The girders are to have a sufficient rigidity to prevent excessive deflection of decks and excessive additional stresses in deck beams.

104. End connection

1. End connections of deck girders are to be in accordance with the requirements in **Ch 1, 304.**

2. Bulkhead stiffeners or girders at the ends of deck girders are to be suitably strengthened to support deck girders.

3. Longitudinal deck girders are to be continuous or to be effectively connected so as to maintain the continuity at ends.

Section 2 Longitudinal Deck Girders

201. Section modulus

1. The section modulus of longitudinal deck girders outside the lines of hatchway opening of the strength deck for midship part is not to be less than that obtained from the following formula:

$Z = 1.29l(bhl + kW)$ (cm^3)

where:

l = distance between the centres of pillars or from the centre of pillar to the bulkhead (m). Where the deck girder is effectively bracketed to bulkhead, l may be modified as specified in **Ch 1, 306.** (See **Fig 10.11.1**)

b = distance between the centres of two adjacent spans of beams supported by the girders or the frames (m). (See **Fig 10.11.1**)

h = deck load specified in **Ch 10, Sec 2** for the deck supported (kN/m^2).

W = deck load supported by the tween deck pillar (kN).

k = as specified in the following (a) and (b):

(a) Coefficient obtained from the following formula according to the ratio of the horizontal distance from the pillar or bulkhead supporting the deck girder to the tween deck pillar a (m) and l. (See **Fig 10.11.1**)

$$k = 12\frac{a}{l}\left(1 - \frac{a}{l}\right)^2$$

(b) Where there is only one tween deck pillar, k is to be obtained basing upon the smaller value of a. Where there are two or more tween deck pillars, a is to be measured from the same end of l for each tween deck pillar, and the sum of kW is to be used for the computation of the formula. In this case, the greater value between the sums of kW obtained basing upon a measured from each end of l is to be used.

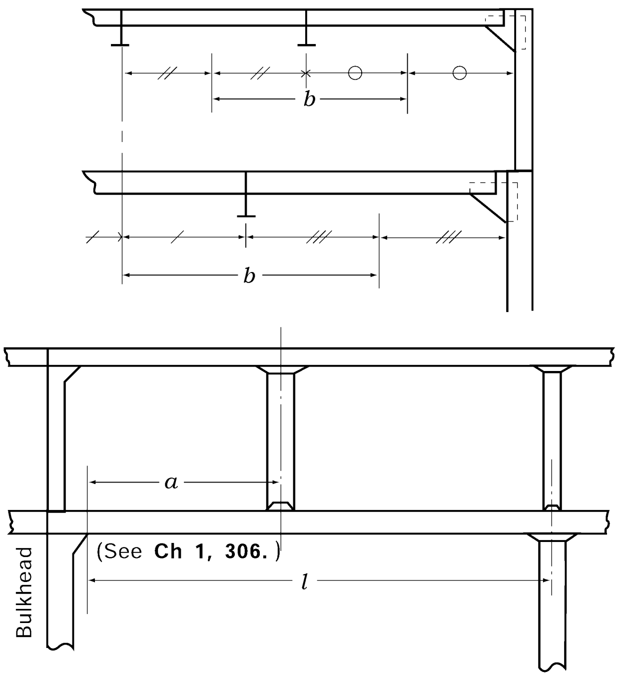

Fig 10.11.1 Measurement of b, l and a

2. The section modulus of longitudinal deck girders outside the lines of hatchway opening of the strength deck for the parts forward and afterward the midship part may be gradually reduced. In no case, however, is the section modulus to be less than that obtained from the following formula:

$$Z = 0.484l(bhl + kW) \quad (\text{cm}^3)$$

where: b, h, l, W, k = as specified in **Par 1.**

3. The section modulus of longitudinal deck girders for the parts other than stipulated in **Pars 1** and **2** is not to be less than obtained from the formula in **Par 2.**

4. Where a deck carrying cargoes which loads can not be treated as evenly distributed loads, deck load supported by a pillar is to be determined taking account of load distribution for particular cargoes. Where cargo loads can be treated as concentrated loads acting on specific points, the provisions of **1.** to **3.** above may be applied so that such concentrated loads are treated as deck loads supported by the upper tween deck pillar (W).

202. Moment of inertia

It is advised that the moment of inertia of girders is not to be less than obtained from the following formula:

$$I = CZl \quad (\text{cm}^4)$$

where:

C = coefficient obtained from the following:

For deck girders arranged outside the line of deck openings of strength deck of midship part of ship ························· 1.6

For other deck girders ························· 4.2

Z = required section modulus of girders specified in **201.** (cm^3).

l = as specified in **201.1.**

203. Thickness of web plates

1. The thickness of web plates is not to be less than that obtained from the following formula:

$$t = 10S_1 + 1.5 \quad (\text{mm})$$

where:

S_1 = spacing of web stiffeners or depth of girders, whichever is the smaller (m).

2. The thickness of web plates at both end parts for 0.2 l is not to be less than that specified in **Par 1** and obtained from the following formula, whichever is the greater:

$$t = \frac{4.43bhl}{d_0} + 1.5 \quad (\text{mm})$$

where:

d_0 = depth of webs (mm).

b, h, l = as specified in **201. 1.**

3. The thickness of web plates provided in the deep tanks is to be 1 mm thicker than those obtained from the formulae in **Pars 1** and **2.**

Section 3 Transverse Deck Girders

301. Section modulus

1. The section modulus of transverse deck girders is not to be less than that obtained from the following formula:

$$Z = 0.484l(bhl + kW) \ (\text{cm}^3)$$

where:

l = distance between the centres of pillars or from the centre of pillar to the inner edge of beam bracket (m).

b = distance between the centres of two adjacent girders or bulkhead (m).

h = deck load specified in **Ch 10, Sec 2** (kN/m^2)

W, k = in accordance with **201.**

2. Where a deck carrying cargoes which loads can not be treated as evenly distributed loads, deck load supported by a pillar is to be determined taking account of load distribution for particular cargoes. Where cargo loads can be treated as concentrated loads acting on specific points, the provisions of **1.** above may be applied so that such concentrated loads are treated as deck loads supported by the upper tween deck pillar (W).

302. Moment of inertia

It is advised that the moment of inertia of girders is not to be less than that obtained from the following formula:

$$I = 4.2Zl \ (\text{cm}^4)$$

where:

Z = required section modulus of girders specified in **301.** (cm^3).

l = as specified in **301.**

303. Thickness of web plates

The thickness of web plates is to be in accordance with the requirements in **203.**

Section 4 Deck Girders in Tanks

401. Section modulus

The section modulus of deck girders in tanks is to be in accordance with the requirements in **201.** or **301.**, and is to be in compliance with the requirements in **Ch 15, 204.1** as well.

402. Moment of inertia

The moment of inertia of girders is to be in accordance with the requirement in **Ch 15, 204. 2.**

403. Thickness of web plates

The thickness of web plates is to be in accordance with the requirements in **203.** or **303.** and is to be in compliance with the requirements in **Ch 15, 204. 3** as well.

Section 5 Hatch Side Girders

501. Deep coamings on decks

Where deep coamings are provided on decks as in the case of hatchway on weather deck, the horizontal coaming stiffener and the coaming up to its stiffener may be included in the calculation of the section modulus, subject to the approval by the Society.

502. Strength continuity

At hatchway corners, the face plates of hatch coamings and longitudinal deck girders or their extension parts and the face plates on both sides of hatch end girders are to be effectively connected so as to maintain the strength continuity.

Section 6 Hatch End Girders

601. Scantling

The scantlings of hatch end girders are to be in accordance with the requirements in **Sec 3** and **4.**
⚓

CHAPTER 12 PILLARS

Section 1 General

101. Pillars in tween decks

Pillars in tween decks are to be arranged directly above those under the deck, or effective means are to be provided for transmitting their loads to the supports below.

102. Pillars in holds

Pillars in holds are to be provided in line with the keelsons or double bottom girders or as close thereto as practicable, and the structure under pillars is to be of ample strength to provide effective distribution of the load.

103. End connection of pillars

The head and heel of pillars are to be secured by thick doubling plates and brackets as necessary. Where the pillars which may be subjected to tensile loads such as under bulkhead recesses, tunnel tops or deep tank tops, the head and heel of pillars are to be efficiently secured to withstand the tensile loads.

104. Reinforcements

Where the pillars are connected to the deck plating, the top of shaft tunnels, or the frames, these structures are to be efficiently strengthened.

Section 2 Scantling of Pillars

201. Sectional area

1. The sectional area of pillars is not to be less than that obtained from the following formula:

$$A = \frac{0.223\,W}{2.72 - \frac{l}{k_0}} \quad (\mathrm{cm}^2)$$

where:

l = distance from the top of inner bottom, deck or other structures on which the pillars are based to the underside of beam or girder supported by the pillars (m). (See **Fig. 10.12.1**)

k_0 = minimum radius of gyration of the section of pillars (cm).

W = deck load (kN) supported by the pillar obtained from the following formula:

$$W = kw_0 + Sbh \quad (\mathrm{kN})$$

where:

S = distance between the mid-points of two adjacent spans of girders supported by the pillars or the bulkhead stiffeners or bulkhead girders (m). (See **Fig. 10.12.1**)

b = mean distance between the mid-points of two adjacent spans of beams supported by the pillars or the frames (m). (See **Fig. 10.12.1**)

h = deck load specified in **Ch 10, Sec 2** for the deck supported ($\mathrm{kN/m^2}$).

w_0 = deck load supported by the upper tween deck pillar (kN)

k = as obtained from the following formula according to the ratio of the horizontal distance a_i (m) from the pillar to the tween deck pillar above to the distance l_i (m) from the pillar to the pillar or bulkhead. (See **Fig 10.12.1**)

$$k = 2\left(\frac{a_i}{l_j}\right)^3 - 3\left(\frac{a_i}{l_j}\right)^2 + 1$$

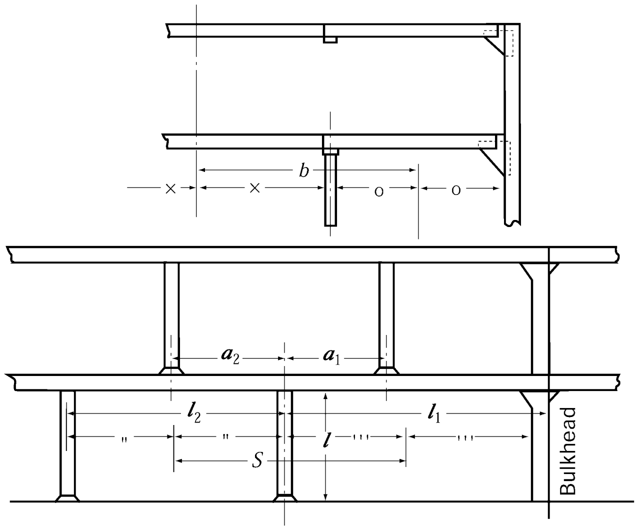

Fig 10.12.1 Measurement of S, b, l, etc.

2. Where there are two or more tween deck pillars provided on the deck girder supported by a line of lower pillars, the lower pillar is to be of the scantlings required by **Par 1,** taking kw_0 for each tween deck pillar provided on two adjacent spans supported by the lower pillars.

3. Where tween deck pillars are shifted from the lower pillars in athwartship direction, the scantlings of lower pillars are to be determined in accordance with the principle in **Pars 1** and **2.**

4. Where a deck carrying cargoes which loads can not be treated as evenly distributed loads, deck load supported by pillar is to be determined taking account of load distribution for particular cargoes. Where cargo loads can be treated as concentrated loads acting on specific points, the provisions of **1.** and **2.** above may be applied so that such concentrated loads are treated as deck loads supported by the upper tween deck pillar (w_o).

202. Thickness

1. The plate thickness of tubular pillars is not to be less than that obtained from the following formula. This requirement may, however, be suitably modified for the pillars provided in accommodation spaces.

$$t = 0.022 d_p + 3.6 \text{ (mm)}$$

where:

d_p = outside diameter of the tubular pillar (mm).

2. The thickness of web and flange plates of built-up pillars is to be sufficient for the prevention of local buckling.

203. Outside diameter of round pillars

The outside diameter of solid round pillars and tubular pillars is not to be less than 50 mm.

204. Pillars provided in deep tank

1. Pillars provided in deep tank are not to be tubular pillars.

2. The sectional area of pillars is not to be less than that specified in **201.** or obtained from the following formula, whichever is the greater.

$$a = 1.09\,Sbh \quad (\text{cm}^3)$$

where:

S, b = as specified in **201.**

h = 0.7 times the vertical distance from the top of deep tank to the point of 2 m above the top of over flow pipe (m).

205. Longitudinal bulkheads and others provided in lieu of pillars

The transverse bulkheads supporting longitudinal deck girders and the longitudinal bulkheads provided in lieu of pillars are to be stiffened in such a manner as to provide supports not less effective than required for pillars.

206. Casings provided in lieu of pillars

The casings provided in lieu of pillars are to be of sufficient scantlings to withstand the deck load and side pressure. ⚓

CHAPTER 13 ARRANGEMENTS TO RESIST PANTING

Section 1 General

101. Application

1. The requirements in this chapter are to apply to the bottom and the side constructions in way of both peaks.

2. The side frames are to be in accordance with the requirements in **Ch 8.**

102. Swash plates

In fore and after peaks to be used as deep tanks, effective swash plates are to be provided at the centre line of the ship or the scantlings of structural members are to be suitably increased.

103. Stringers fitted up with extremely small angles

Where the angle between the web of stringers and the shell plating is extremely small, the scantlings of stringers are to be suitably increased above the normal requirements and, where necessary, appropriate supports are to be provided to prevent tripping.

Section 2 Arrangements to resist Panting Forward the Collision Bulkhead

201. Constructions and arrangements

1. In the place forward the collision bulkhead, the deep centre girder or the longitudinal bulkhead at the centre line is to be provided.

2. In ships with transverse framing, the floor is to be arranged in every frame with sufficient depth and they are to be supported by the side girders provided at an interval of about 2.5 m and below. Frames are to be supported by the constructions specified in **Pars 5** to **7** of **202.** with the spacing of about 2.5 m.

3. In ships with longitudinal framing, bottom and side longitudinals are to be supported by bottom and side transverse girders having an interval of about 2.5 m. Bottom and side transverse girders are to be supported by side girders and side stringers, or cross tie provided at an interval of about 4.6 m, respectively. And side transverse girders are to be effectively connected with bottom transverse girders.

202. Transverse framing

1. The thickness of floors and centre girders is not to be less than that obtained from the following formula:

$$t = 0.045L + 4.5 \text{ (mm)}$$

2. The floors are to be of adequate depth and to be properly stiffened with stiffeners as may be required.

3. The upper edges of the floors and centre girders are to be properly stiffened.

4. The thickness of side girders is to be approximately equal to that of centre girders and side girders are to extend to such a proper height as may be required according to the height of floors.

5. Where the panting beams are provided at every frame together with perforated steel plates fitted up thereon from side to side, the scantlings of panting beams and steel plates are not to be less than that obtained from the following formulae:

Sectional area of panting beams : $A = 0.1L + 5$ (cm^2)

Thickness of steel plates : $t = 0.02L + 4.5$ (mm)

6. Where the side stringers are provided, their scantlings are not to be less than those obtained from the following formulae:

Depth : $d_1 = 200l$ (mm), $d_2 = 5.3L + 250$ (mm) or 2.5 times the depth of slot for the transverse frames(mm), whichever is the greatest.

Section modulus : $Z = 8Shl^2$ (cm^3)

Thickness of web : $t = 0.02L + 5.5$ (mm)

where:
S = breadth of area supported by the side stringer (m).
h = vertical distance from the centre of S to a point of 0.12 L (m) above the top of keel (m), but in no case is it to be less than 0.06 L (m).
l = distance between the supports of side stringers (m).

7. Where panting beams are provided on alternate frames and stringer plates which are connected to the shell plating are provided at each tier of panting beams, the scantling of panting beams and stringer plates are to comply with the following requirements.

Sectional area of panting beam : $A = 0.3L$ (cm^2)

Scantlings of stringer plates :
Breadth : $b = 5.3L + 250$ (mm)
Thickness : $t = 0.02L + 5.5$ (mm)

203. Longitudinal framing

1. Where the bottom transverses are supported along the centre line, their scantlings are not to be less than those obtained from the following formulae:
Web depth : $d_1 = 200l$ (mm) or $d_2 = 8.5L + 180$ (mm), whichever is the greater.

Section modulus : $Z = 1.2SLl^2$ (cm^3)

Web thickness : $t_1 = 5\frac{SLl}{d_0} + 1.5$ (mm), $t_2 = 0.6\sqrt{L} + 3$ (mm)

whichever is the greater.

where:
S = spacing of transverses (m).

l = length of transverses between the supporting points (m).

d_0 = depth of transverses subtracted by the depth of slot for longitudinals (mm).

2. The scantlings of centre girders are not to be less than those of bottom transverses specified in **Par 1.**

3. The scantlings of side transverses supporting longitudinals are not to be less than those obtained from the following formulae:

Web depth : $d_1 = 200 l_0$ (mm), $t_2 = 0.6\sqrt{L} + 3$ (mm) or 2.5 times the depth of slots for longitudinals (mm), whichever is the greatest.

Section modulus : $Z = 8 S h l_0^2$ (cm^3)

Thickness of web : $t_1 = 42 \dfrac{S L l_0}{d_0} + 1.5$ (mm), $t_2 = 0.02L + 5.5$ (mm)

whichever is the greater.

where:

S = spacing of transverses (m).

d_0 = as specified in **Par 1.**

h = vertical distance from the centre of l_0 to a point of 0.12 L (m) above the top of keel (m), but in no case is it to be less than 0.06 L (m)

l_0 = length of side transverses between the supporting points (m).

4. Side transverses are to be provided with tripping brackets at an interval of about 3 m and with stiffeners on webs at every longitudinals.

5. The scantlings of side stringers which support side transverses are not to be less than those obtained from the following formulae:

Web depth : $d_1 = 200 l_1$ (mm) or $d_2 = 5.3L + 250$ (mm), whichever is the greater.

Section modulus : $Z = 4 S h l_0 l_1$ (cm^3)

Thickness of web:

$$t_1 = 31 \frac{S h l_1}{d_0} + 1.5 \text{ (mm)}$$

$$t_2 = 0.02L + 5.5 \text{ (mm)}$$

whichever is the greater.

where:

S = breadth of area supported by the stringer (m).

h = vertical distance from the centre of S to a point of 0.12 L (m) above the top of keel (m), but in no case is it to be less than 0.06 L (m).

l_0 = as stipulated in **Par 3.**

l_1 = length of side stringers (m).

d_0 = depth of side stringers subtracted by the depth of slot (m).

6. The sectional area of cross ties supporting the transverses is not to be less than that obtained from the following formulae:

Where l/k is 0.6 and above : $A = \dfrac{0.77Sbh}{1 - 0.5\dfrac{l}{k}}$ (cm^2)

Where l/k is less than 0.6 : $A = 1.1Sbh$ (cm^2)

where:

S = spacing of transverses (m).

b = breadth of area supported by the cross ties (m).

h = vertical distance from the centre of b to a point of 0.12 L (m) above the top of keel (m), but in no case is it to be less than 0.06 L (m).

l = length of cross ties (m).

k = minimum radius of gyration of cross ties, obtained from the following formula (cm).

$$k = \sqrt{\frac{I}{A}}$$

I = the least moment of inertia of the cross ties (cm^4).

A = sectional area of the cross ties (cm^2).

(1) Cross ties are to be effectively connected to the transverses by brackets or other suitable arrangements and the transverses are to be provided with tripping brackets in way of the cross ties.

(2) Where the breadth of face plate of cross ties on either side of the web exceeds 150 mm, stiffeners are to be provided on the webs and so arranged as to support the face plate at a suitable interval.

Section 3 Arrangements to resist Panting Abaft Aft Peak Bulkhead

301. Floors

The scantlings and arrangements of floors in after peak are to be in accordance with the requirements in **202.**

302. Frames

Where the length of girth between the supporting points of frames exceeds 2.5 m, the scantlings of frames are to be increased or suitably strengthened to give adequate stiffness to the structure.

303. Other construction members

Where the constructions in after peak are in compliance with the requirements for fore peak in **Sec 2,** the scantlings of transverses, stringers and struts may be 0.67 times the values specified in **Sec 2.** ⚓

CHAPTER 14 WATERTIGHT BULKHEADS

Section 1 Arrangement

101. Collision bulkheads

1. All ships are to have a collision bulkhead, at a position not less than 0.05 L_f, but not more than 0.08 L_f or 0.05 $L_f + 3$ m, whichever greater except where the larger distance be accepted by the Society due to a special reason as to structure, from the forward terminal of the length for freeboard. However, where any part of the ship below the waterline at 85 % of the least moulded depth extends forward beyond the forward terminal of the length for freeboard, the above-mentioned distance is to be measured from a point either:

(a) at the mid-length of such extension; or
(b) at a distance 0.015 L_f forward from the abovementioned forward terminal;
whichever gives the smaller measurement.

2. The bulkhead may have steps or recesses within the limits specified in the above **Par 1.**

3. Arrangement of collision bulkhead in a ship provided with bow door is to be at the discretion of the Society. However, where a slopping ramp forms a part of the collision bulkhead above the freeboard deck, the part of the ramp which is more than 2.3 m above the freeboard deck may extend forward of the limit specified in the above **Par 1.** In this case, the ramp is to be weathertight over its complete length.

102. After peak bulkheads

1. All ships are to have an after peak bulkhead situated at a suitable position.

2. The stern tube is to be enclosed in a watertight compartment by the after peak bulkhead or other suitable arrangements.

103. Machinery space bulkheads

1. A watertight bulkhead is to be provided at each end of the machinery space.

2. Where the machinery space is arranged in aft end of ship, the after side bulkhead of machinery space among the bulkheads in **Par 1** may be regarded as an aft peak bulkhead of ship.

104. Hold bulkheads

1. Cargo ships, of the ordinary type and of 67 m or above in length are to have hold bulkheads in addition to the bulkheads specified in **101.** to **103.** at a reasonable interval so that the total number of the watertight bulkheads may not be less than that given by **Table 10.14.1.**

2. The arrangement of bulkheads may not apply the requirement in **Par 1** subject to the approval by the Society.

Table 10.14.1 Number of watertight bulkheads

Length of ships (m)	Total number of bulkheads	
	Ships with machinery space at aft end of ship	Ships with machinery space other than at aft end of ship
$67 \le L < 87$	4	4
$87 \le L < 90$	4	5

105. Height of watertight bulkheads

The watertight bulkheads required in **101.** to **104.** are to extend to the freeboard deck with the following exceptions:

(1) A watertight bulkheads in way of the raised quarter or the sunken forecastle deck is to extend up to the said deck.

(2) Where a forecastle having opening without closing appliances led to a space below the freeboard deck, or a long forecastle is provided, the collision bulkhead is to extend to the superstructure deck and to be made weathertight. However, where the extension is located within the limits specified in **101.** and the part of the deck which forms the step is made effectively weathertight, it need not be fitted directly above the bulkhead thereunder.

(3) The aft peak bulkhead may terminate at a deck below the freeboard deck and above the load line, provided that this deck is made watertight to the stern of the ship.

106. Construction

1. Where the watertight bulkheads required in **101.** to **105.** are not extended up to the strength deck, deep webs or partial bulkheads situated immediately or nearly above the main watertight bulkheads are to be provided so as to maintain the transverse strength and stiffness of the hull.

2. Where the length of a hold exceeds 30 m, suitable means are to be provided so as to maintain the transverse strength and stiffness of the hull.

107. Chain lockers

1. Chain lockers located abaft the collision bulkhead or in forepeak tanks are to be watertight and to be provided with means for effective drainage by pumps.

2. Chain lockers are to be subdivided by centre line screen walls.

Section 2 Construction

201. Thickness

The thickness of bulkhead plating is not to be less than that obtained from the following formula:

$$t = 3.2S\sqrt{h} + 1.5 \text{ (mm)}$$

where:

S = spacing of stiffeners (m).

h = vertical distance from the lower edge of plate to the bulkhead deck at centre (m), but in no case is it to be less than 3.4 m.

202. Increase of thickness

1. The thickness of lowest strake of plating is not to be less than obtained from the above formula given in **201.** plus 1 mm.

2. The lowest strake of bulkhead plating is to extend at least 610 mm above the top of inner bottom plating in way of double bottom or 915 mm above the top of keel in way of single bottom. Where the double bottom is provided only on one side of the bulkhead, the extension of the lowest strake is to be of the greater value among the two cases above.

3. The bulkhead platings in way of bilge wells are to be at least 2.5 mm thicker than given by **201.**

4. The bulkhead plating is to be doubled or increased in thickness in way of stern tube opening, notwithstanding the requirements in **201.**

203. Stiffeners

The section modulus of bulkhead stiffeners is not to be less than that obtained from the following formula:

$$Z = CShl^2 \ (\text{cm}^3)$$

where :

l = span measured between the adjacent supports of stiffeners including the length of connection (mm). Where girders are provided, it is the distance from the heel of end connection to the first girder or the distance between the girders.

S = spacing of stiffeners (m).

h = vertical distance measured from the midpoint of l for vertical stiffeners, and from the midpoint of distance between the adjacent stiffeners for horizontal stiffeners, to the top of bulkhead deck at the centre line of ship (mm). Where the vertical distance is less than 6.0 m, h is to be taken as 1.2 m greater than 0.8 times the vertical distance.

C = coefficient given in **Table 10.14.2** according to the type of end connection.

204. Collision bulkheads

For collision bulkheads, the plate thickness and section modulus of stiffeners are not to be less than those specified in **201.** and **203.** taking h as 1.25 times the specified height.

205. Girders

1. The section modulus of girders supporting bulkhead stiffeners (hereinafter referred to as girder) is not to be less than that obtained from the following formula:

$$Z = 4.75\,Shl^2 \ (\text{cm}^3)$$

where:

S = breadth of the area supported by the girder (m).

h = vertical distance measured from the midpoint of l for vertical girders, and from the mid-point of S for horizontal girders, to the top of bulkhead deck at the centre line of ship (m). Where the vertical distance is less than 6.0 m, h is to be taken as 1.2 m greater than 0.8 times the vertical distance.

l = span measured between the adjacent supports of girders (m).

2. The moment of inertia of girders is not to be less than obtained from the following formula. In no case is the depth of girders to be less than 2.5 times the depth of slots for stiffeners.

$$I = 10\,hl^4 \ (\text{cm}^4)$$

where:

h, l = as specified in **Par 1.**

Table 10.14.2 Value of C

<table>
<tr><td rowspan="6">Vertical Stiffener</td><td rowspan="2">Upper end / Lower end</td><td rowspan="2">Lug-connection of supported by horizontal girders</td><td colspan="2">Connection</td><td rowspan="2">End of stiffener unattached</td></tr>

<tr><td>End of stiffener unattached</td><td colspan="3">3.78</td><td>5.60</td></tr>
</table>

NOTE:

1. "Lug-connection" is such a connection as both web and face bar of stiffener are effectively attached to the bulkhead plating, decks or inner bottoms which are strengthened by effective supporting members on the opposite side of plating.
2. "Connection-Type A" of vertical stiffeners is a connection by bracket to the longitudinal members or to the adjacent members, in line with the stiffeners, of the same or larger sections. (See **Fig 10.14.1** (a))
3. "Connection-Type B"of vertical stiffeners is a connection by bracket to the transverse members such as beams, or other connections equivalent to the connections mentioned above. (See **Fig 10.14.1** (b))

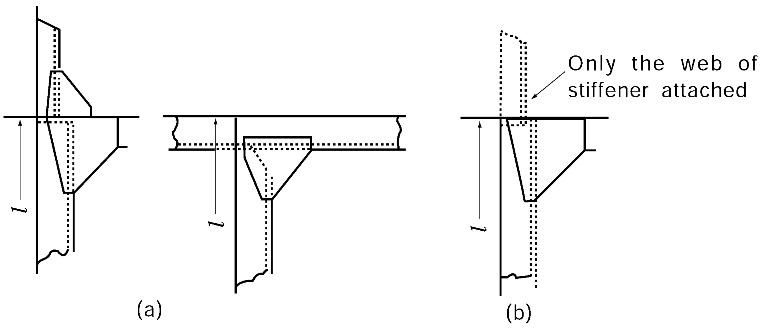

Fig 10.14.1 Types of end connection

3. The thickness of web plates is not to be less than that obtained from the following formula;

$$t = 0.01S_1 + 1.5 \text{ (mm)}$$

where:

S_1 = spacing of web stiffeners or depth of girders, whichever is the smaller (mm).

4. Tripping brackets are to be provided at an interval of about 3 m and where the breadth of face plates exceeds 180 mm on either side of the girder, these brackets are to be so arranged as to support the face plates.

206. Strengthening of bulkhead plating, deck plating, etc.

Platings of bulkheads, decks, inner bottoms, etc. are to be, if necessary, strengthened at the location of the end brackets of stiffeners and the end of girders.

207. Bulkhead recesses

1. In way of bulkhead recesses, beams are to be provided at every frame and under the upper bulkhead in accordance with the requirements in **Ch 10, 403.** and **Ch 14, 203.** taking the beam spacing as the stiffener spacing, Where the lower end of upper bulkhead is specially strengthened, the beam under the upper bulkhead may be dispensed with.

2. The thickness of deck plating in way of bulkhead recesses is to be at least 1 mm greater than that given by **201.,** regarding the deck plating as bulkhead plating and the beams as stiffeners respectively. In no case is the thickness to be less than that required for deck plating in that location.

3. The thickness of pillars supporting bulkhead recesses is to be determined taking account of the water pressure which might be applied on the upper surface of recesses, and their end connections are to be sufficient to withstand the water pressure which might be applied on the under surface.

208. Construction of bulkheads in way of watertight doors

Where stiffeners are cut or the spacing of stiffeners is increased in order to provide the watertight door in the bulkhead, the opening is to be suitably framed and strengthened as to maintain the full strength of the bulkhead. In no case are the door frames to be considered as stiffeners.

Section 3 Watertight Doors

301 General

1. Any access openings, doors, manholes or ducts for ventilation, etc. are not to be cut in the collision bulkhead below freeboard deck. The number of openings in collision bulkheads above the freeboard deck is to be kept to a minimum as possible and all such openings are to be provided with weathertight means of closing.

2. Watertight doors(or access hatch cover) are to be provided for all access openings in the watertight bulkheads or openings to ensure the watertight integrity of the inner decks in accordance with the requirements in the following **302.** to **305.**

302. Type of watertight doors

1. Watertight doors are to be of sliding type. Hinged or rolling type may, however, be accepted having regard to the position or the service condition of the door.

2. Notwithstanding the provisions in **1.** above, where watertight door is as small as crew can pass, the watertight door may be of hinged type or rolling type, except where the doors are required to be capable of being closed remotely in accordance with **304. 2.**

3. Notwithstanding the provisions in **1.** above, watertight doors in large cargo hold division may be of a type other than sliding type provided that such doors are permanently closed at sea.

4. Doors which are closed by dropping or by the action of a dropping weight are not permitted.

303. Strength and watertightness

1. Watertight doors are to be of ample strength and watertightness for water pressure to a head up to the bulkhead deck, and door frames are to be effectively secured to the bulkheads. Where deemed necessary by the Society, watertight doors are to be tested by water pressure before they are fitted.

2. Where watertight doors are provided in cargo spaces, such doors are to be protected against damages due to cargoes, etc. by suitable means.

304. Control

1. All watertight doors, except those which are to be permanently closed at sea, are to be capable of being opened and closed by hand locally, from both sides of the doors, with the ship listed of 30 degrees to either side.

2. In addition to the requirements of **1.** above, watertight doors which are used at sea or normally open at sea, are to be capable of being remotely closed by power from the navigation bridge.

3. It is not to be possible to remotely open any watertight door. In addition, watertight doors which are applying to the provisions of **302. 3**, are not to be remotely controlled.

305. Indication

1. Watertight doors, except those permanently closed at sea, are to be provided with position indicators showing whether the doors are opened or closed at all operating positions.

2. In addition to the requirements of **1.** above, for watertight doors which are to be capable of being remotely closed, an indication is to be placed locally showing that the door is in remote control mode.

306. Alarms

Watertight doors which are capable of being remotely closed are to be provided with an audible alarm which will sound at the door position whenever such a door is remotely closed.

307. Source of power

1. The remote controls, indications and alarms required in **404.** to **406.** are to be operable in the event of main power failure.

2. Electrical installations for devices specified in **1.** except water-proof type approved by the Society are to be not provided with under freeboard deck.

3. Cables for devices specified in **1.** are to comply with the requirements of **Pt. 6 Ch 1, Sec 4** of the Rules.

308. Notices

1. Watertight doors which are to be normally closed at sea are to have notices fixed to both sides of the doors stating "**To be kept closed at sea**".

2. Watertight doors which are to be permanently closed at sea are to have notices fixed to both sides stating "**Not to be opened at sea**". Such doors which are accessible during the voyage are to be fitted with a device which prevents opening.

309 Sliding doors

1. Sliding watertight doors are to be capable of being operated from an accessible position above the bulkhead deck and are to have an index at the operating position showing whether the door is open or closed, This remote control of the door may, however, be omitted where the Society is satisfied with such an arrangement having regard to the service condition of the door.

2. Where the above control means is operated by rods, the lead of operating rods is to be as direct as possible and the screw is to work in a nut of gun-metal or other approved material.

3. Sliding doors controlled from remote positions are also to be capable of being operated at the position of the door.

4. The frames of vertical sliding watertight doors are to have no groove at the bottom in which dirt might lodge and prevent the door from closing.

310. Hinged and rolling doors

1. For hinged and rolling watertight doors, the hinge pins and the wheel axle of these doors are to be of gun-metal or other approved materials.

2. Hinged and rolling watertight doors except those are to be permanently closed at sea, are to be of quick acting or single acting type which is capable of being closed and secured from both sides of the doors. ⚓

CHAPTER 15 DEEP TANKS

Section 1 General

101. Definition

The deep tank is a tank used for carriage of water, fuel oil and other liquids, forming a part of the hull in holds. The deep tanks used for carriage of oils are designated as “deep oil tanks”, if necessary.

102. Application

1. Peak tank bulkheads and boundary bulkheads of deep tank (excluding the deep tanks for carriage of oils having flashpoint below 60°C) are to be constructed in accordance with the requirements in this chapter. Where the bulkhead of deep tank partly serves as a watertight bulkhead, the part of the bulkhead is to be in accordance with the requirements in **Ch 14.**

2. The requirements in **Ch 23** and **24** are to be applied to the bulkheads of the deep tanks for carriage of oils having a flashpoint below 60°C, in addition to those in this chapter.

103. Divisions in tanks

1. Deep tanks are to be of proper size and to be provided with such longitudinal watertight divisions as necessary to meet the requirements for stability in service conditions as well as while the tanks are being filled or discharged.

2. Tanks for fresh water or fuel oil or those which are not intended to be kept entirely filled in service conditions are to have additional divisions or deep wash plates as necessary to minimize the dynamic forces acting on the structure.

3. Where it is impracticable to comply with the requirements in **Par 2,** the scantlings required in this chapter are to be properly increased.

4. Longitudinal watertight divisions which will be subjected to pressure from both sides, in tanks which are to be entirely filled or emptied in service conditions, may be of the scantlings required for ordinary watertight bulkheads by **Ch 14.** In such cases, the tanks are to be provided with deep hatches, etc., fitted with inspection plugs in order to ensure that the tanks are kept full in service conditions.

Section 2 Bulkheads of Deep Tanks

201. Application

The construction of bulkheads and decks forming boundaries of deep tanks is to be in accordance with the requirements in **Ch 14,** unless otherwise specified in this chapter.

202. Bulkhead plates

The thickness of deep tank bulkhead plating is not to be less than that obtained from the following formula:

$$t = 3.6S\sqrt{h} + 2.5 \text{ (mm)}$$

where :

S = spacing of stiffeners. (m).

h = distance given below, whichever is the greater:

(1) Vertical distance measured from the lower edge of plate to the midpoint of the distance between the top of tanks and the top of overflow pipes (m). For bulkheads of large tanks, additional water pressure is to be considered.
(2) 0.7 times the vertical distance measured from the lower edge of plate to the point of 2.0 m above the top of overflow pipes (m).

203. Bulkhead stiffeners

The section modulus of bulkhead stiffeners is not to be less than that obtained from the following formula:

$$Z = CShl^2 \quad (\text{cm}^3)$$

where:

S, l = as specified in **Ch 14, 203.**

h = vertical distance given below, whichever is the greater, the lower end being regarded as the midpoint of l for vertical stiffeners and as the midpoint of distance between the adjacent stiffeners for horizontal stiffeners.

(1) Vertical distance measured from the lower end to the mid-point of the distance between the top of tanks and the top of overflow pipes (m).
For bulkhead stiffeners of large tanks, additional water pressure is to be considered.
(2) 0.7 times the vertical distance measured from the lower end to the point of 2.0 m above the top of overflow pipes (m).

C = coefficient given in **Table 10.15.1** according to the type of end connections.

Table 10.15.1 Value of C

The other end of stiffeners \ One end of stiffeners	Connection by hard bracket	Connection by soft bracket	Supported by girders or lug connection	Snip
Connection by hard bracket	4.90	8.05	5.95	9.10
Connection by soft bracket	8.05	5.95	9.10	8.05
Supported by girders or lug connection	5.95	9.10	7.00	10.50
Snip	9.10	8.05	10.50	10.50

NOTES:
1. Connection by hard bracket is a connection by bracket to the double bottoms or to the adjacent members, such as longitudinals or stiffeners in line, of the same or larger sections, or a connection by bracket to the equivalent members mentioned above. (See **Fig. 10.14.1** (a)).
2. Connection by soft brackets is a connection by bracket to the transverse members such as beams or equivalent thereto. (See **Fig. 10.14.1** (b)).

204. Girders supporting bulkhead stiffeners

1. The section modulus of girders supporting bulkhead stiffeners (hereinafter referred to as girder) is not to be less than that obtained from the following formula:

$$Z = 7.13\,Shl^2 \quad (\text{cm}^3)$$

where:

S = breadth of the area supported by the girders (m).

h = vertical distance measured from the midpoint of S for horizontal girders, and from the mid-point of l for vertical girders, to the top of h specified in **203.** (m).

l = span specified in **Ch 14, 203.** (m).

2. The moment of inertia of girders is not to be less than that obtained from the following formula. In no case is the depth of girders to be less than 2.5 times the depth of slots for stiffeners.

$$I = 30hl^4 \quad (\text{cm}^4)$$

where:

h, l = as specified in **Par 1.**

3. The thickness of plates of web parts is not to be less than that obtained from the following formula:

$$t = 0.01S_1 + 2.5 \quad (\text{mm})$$

where:

S_1 = spacing of web stiffeners or the depth of girders, whichever is the smaller (mm).

205. Cross ties

1. Where efficient cross ties are provided across deep tanks connecting girders on each side of the tanks, the span of girders specified in **204.** may be measured between the end of girder and the centre line of cross tie or between the centre lines of adjacent cross ties.

2. The sectional area of cross ties is not to be less than that obtained from the following formula:

$$A = 1.3\,Sb_s h \quad (\text{cm}^2)$$

where:

S, h = as specified in **204.**

b_s = breadth of the area supported by the cross ties (m).

3. The end of cross ties is to be bracketed to girders.

206. Top and bottom construction

The scantlings of the members forming the top or the bottom of deep tanks are to be in accordance with the requirements in this chapter, regarding the members as the members forming the deep tank bulkheads at the location. In no case are they to be less than required for the deck plating or the bottom plating at the location. For top plating of deep tanks the thickness of plates is to be at least 1 mm greater than the thickness specified in **202.**

207. Scantling of members not in contact with sea water

The thickness of plates of bulkheads and girders which are not in contact with sea water in service conditions may be reduced from the requirements in **202.** and **204.** by the values given below:

For the plates of which only one side is in contact with sea water ···················· 0.5 mm

For the plates of which neither side is in contact with sea water ······················· 1.0 mm

However, bulkhead plates in way of the location such as bilge wells are to be regarded as the plates in contact with sea water.

Section 3 Fittings of Deep Tanks

301. Limbers and air holes

Limbers and air holes are to be cut suitably in the structural members to ensure that air or water does not remain stagnated in any part of the tank.

302. Drainage

Efficient arrangement is to be made for draining bilge water on the top of deep tanks.

303. Inspection plugs

The inspection plugs provided on deep tank tops as required in **103.4** are to be located in readily accessible positions, and the filling of water is to be done leaving the plugs open as far as possible.

304. Cofferdams

1. The following dedicated tanks are to be separated from adjacent tanks of other uses by cofferdams. However, these cofferdams may be omitted provided that the common boundaries of lubricating oil and fuel oil tank have full penetration welds.

(1) Fuel oil
(2) Lubrication oil
(3) Vegetable oil
(4) Fresh water

2. The cofferdams specified in **Par 1** are to be provided with the air pipes to comply with the requirements in **Pt 5, Ch 6, 201.** and with the manholes of adequate size which are well accessible.

3. Crew spaces and passenger spaces are not to be directly adjacent to the tanks for carriage of fuel oil. Such compartments are to be separated from the fuel oil tanks by cofferdams which are well ventilated and are not less than 600 mm in width for easy access. Where the top of fuel oil tanks has no opening and is coated with incombustible coverings of 38 mm and over in thickness, the cofferdam between such compartments and the top of fuel oil tanks may be omitted. ⚓

CHAPTER 16 SUPERSTRUCTURES AND DECKHOUSES

Section 1 General

101. Application

1. All ships are to have forecastles except where an adequate bow freeboard is deemed sufficient by the Society.

2. The construction and scantlings of superstructures and deckhouses are to be in accordance with the requirements in the relevant chapters in addition to this chapter.

3. The requirements in this chapter are prescribed for the superstructures and deckhouses up to the third tier above the freeboard deck. As for the superstructures and deckhouses above the third tier, the construction and scantlings thereof are to be as deemed appropriate by the Society.

4. As for the superstructures and deckhouses in ships with specially large freeboard, the construction of bulkhead may be suitably modified subject to the approval by the Society.

Section 2 Construction

201. Head of water

1. The head of water for the calculation of the scantlings of superstructure end bulkheads and boundary wall of deckhouses is not to be less than that obtained from the following formula:

$$h = ac(0.067bL - y) \text{ (m)}$$

where:

a = as given in **Table 10.16.1.**

b = as given in **Table 10.16.2.**

c = as given in **Table 10.16.3.**

y = vertical distance from the summer waterline to the mid-point of span of stiffener in case where the scantlings of stiffeners are determined, and to the mid-point of plate in case where the thickness of bulkhead plating is determined (m).

2. The head of water for the calculation of the scantlings of superstructure end bulkheads and boundary walls of deckhouses is not to be less than obtained from the formulae in **Table 10.16.4,** irrespective of the provisions in **Par 1.**

Table 10.16.1 Values of a

Bulkhead and wall	Location	a
Exposed front bulkhead and wall	First tier	$\frac{L}{120}+2.0$
	Second tier	$\frac{L}{120}+1.0$
	Third tier	$\frac{L}{150}+0.5$
Side Walls and protected end bulkheads and front walls of the all tier		
Aft bulkhead and wall	Afterward of the midship	$\frac{L}{1000}-0.8\frac{x}{L}+0.7$
	Forward of the midship	$\frac{L}{1000}-0.4\frac{x}{L}+0.5$

L = length of ship (m).
x = distance from the bulkhead or end wall to the after perpendicular, or distance from the mid-point of side wall to the after perpendicular (m). Where, however, the length of side wall exceeds $0.15L$, the side wall is to be nearly equally subdivided as not to exceed $0.15L$ and the distance from the mid-point of the subdivision to the after perpendicular is to be taken.

Table 10.16.2 Values of b

$\frac{x}{L}$	b
$\frac{x}{L}<0.45$	$\left(0.5-1.1\frac{x}{L}\right)^2+1.0$
$\frac{x}{L}\geq 0.45$	$1.5\left(1.1\frac{x}{L}-0.5\right)^2+1.0$

L, x = as specified in **Table 10.16.1.**

Table 10.16.3 Values of c

Locations	c
End bulkheads of superstructures	1.0
Boundary walls of deckhouses	$0.7\frac{b'}{B'}+0.3$ However, $\frac{b'}{B'}$ is less than 0.25, b'/B' is to be taken as 0.25

b' = breadth of deckhouse at the position under consideration (m).
B' = breadth of ship on the exposed deck at the position under consideration (m).

Table 10.16.4 Head of water, h (m)

Length of ship (m)	Exposed front bulkhead of the 1st tier superstructure	Others
$L \leq 50$	3.0	1.5
$50 < L < 90$	$\frac{L}{100}+2.5$	$\frac{L}{200}+1.25$

202. Thickness of bulkhead and wall platings

1. The thickness of unprotected front bulkhead and side wall plating at the first and second tier for ships not less than 50 m in length, is not to be less than obtained from the following formula, however, it is not to be less than that obtained from the formula in **Par 2.**

$t = 3S\sqrt{h}$ (mm)

where:

h = head of water specified in **201.** (m).

S = spacing of stiffeners (m).

2. The thickness of bulkhead and wall platings other than that specified in **Par 1** is not to be less than that obtained from the following formulae or 5 mm, whichever is the greater.

For the first tier: $t = \frac{L}{100} + 4.0$ (mm)

For others: $t = \frac{L}{100} + 3.0$ (mm)

203. Stiffeners

1. The section modulus of stiffeners on superstructure end bulkheads and deckhouse boundary walls is not to be less than that obtained from the following formula:

$Z = 3.5Shl^2$ (cm^3)

where:

S, h = as specified in **202.**

l = tween deck height (m). Where, however, l is less than 2 m, l is to be taken as 2 m.

2. Both ends of stiffeners on the exposed bulkheads of superstructures and boundary walls of deckhouses are to be connected to the deck by welding except where otherwise approved by the Society.

Section 3 Access Openings in Superstructure End Bulkheads

301. Closures for access openings.

1. The doors to be provided on the access openings in the end bulkheads of enclosed superstructures and deckhouses protecting companion ways giving access to the spaces under the freeboard deck or the spaces in the enclosed superstructures are to be in accordance with the requirements in (1) through (5) :

(1) The doors are to be made of steel or other equivalent materials and to be permanently and rigidly fitted up to the bulkheads.
(2) The doors are to be rigidly constructed, to be of equivalent strength to that of intact bulkhead and to be weathertight when closed.
(3) The means for securing weathertightness are to consist of gaskets and clamping devices or other equivalent devices and to be permanently fitted up to the bulkhead or the door itself.
(4) The doors are to be operated from the both sides of the bulkheads.
(5) Hinged doors are, as a rule, to open outward.

2.

(1) The height of sills of access openings specified in **Par 1** is not to be less than 380 mm above the upper surface of the deck except where higher sills may be required when deemed necessary by the Society.

(2) In principle, portable sills are not permitted.

3. Openings in the top of a deckhouse on a raised quarterdeck or superstructure of less than standard height, having a height equal to or greater than the standard quarterdeck height, are to be provided with an acceptable means of closing but need not be protected by an efficient deckhouse or companionway, provided that the height of the deckhouse is at least the standard height of a superstructure. Openings in the top of the deckhouse on a deckhouse of less than a standard superstructure height may be treated in a similar manner. ⚓

CHAPTER 17 MACHINERY SPACES AND ENGINE CASINGS

Section 1 General

101. Application

The construction of machinery space in addition to this chapter is to be in accordance with the requirements in relevant chapters.

102. Compensation

Machinery space is to be sufficiently strengthened by means of web frames, strong beams and pillars or other suitable arrangements.

103. Construction

Machineries, shafting, etc are to be efficiently supported and the adjacent structures are to be adequately stiffened.

104. Twin screw ships and others of high power

In twin screw ships and others of high power, the structure and attachments of the seatings are to be specially strengthened in relation to the proportion of the height of engines to their length or width, weight, power, type, etc.

Section 2 Main Engine Foundations

201. Ships with single bottoms

1. In ships with single bottoms, the main engines are to be seated upon thick rider plates laid across the top of deep floors or heavy foundation girders efficiently bracketed and stiffened and having sufficient strength in proportion to the power and size of engines.

2. Girder plates are to be provided beneath the main lines of bolting of main engines and the holding down bolts are to pass through the rider plates on the girder plates.

3. In ships having the engine on the centre line of hull, where the longitudinal girders are to be provided under the engine and their spacing is not very wide, the centre girder may be omitted.

202. Ships with double bottoms

1. In ships with double bottoms, the main engines are to be seated directly upon thick inner bottom plating or thick seat plates on the top of heavy foundations so arranged as to effectively distribute the weight.

2. Additional side girders are to be provided within the double bottom beneath the main lines of bolting and other suitable positions so as to ensure satisfactory distribution of the weight and rigidity of the structure.

Section 3 Construction of Boiler Rooms

301. Boiler foundations

1. Boilers are to be supported by deep saddle type floors or by transverse or longitudinal girders so arranged as to effectively distribute the weight.

2. Where boilers are supported by transverse saddles or girders, the floors in way of same are to be specially stiffened.

302. Boiler location

1. Boilers are to be so placed as to ensure accessibility and proper ventilation.

2. Boilers are to be at least 457 mm clear of tank tops, etc. The thickness of adjacent members is to be increased as may be required where the clear space is unavoidably less. The available clearance is to be indicated on the plans submitted for approval.

3. Hold bulkheads and decks are to be kept well clear of the boilers and uptakes, or provided with suitable insulating arrangements.

4. Side sparrings are to be provided on the bulkheads adjacent to the boilers, keeping suitable clearance on their hold sides.

Section 4 Thrust Blocks and Foundations

401. Thrust blocks and foundations

1. Thrust blocks are to be bolted to efficient foundations extending well beyond the thrust blocks and so arranged as to effectively distribute the loads into the adjacent structures.

2. Additional girders are to be provided in way of the foundations as necessary.

402. Plummer blocks and auxiliary machinery seats

Plummer blocks and auxiliary machinery seats are to be of ample strength and stiffness in proportion to the weight supported and to the height of foundations.

Section 5 Machinery Space Openings

501. Protection of machinery space openings

Machinery space openings are to be enclosed by steel casings.

502. Exposed machinery space casings

1. Exposed machinery space casings are to have scantlings not less than those required in **Ch 16, 201.** and **202.,** taking C value as 1.0.

2. The thickness of top plating of exposed machinery space casing is not to be less than that obtained from the formulae given in **Table 10.17.1.**

Table 10.17.1 Thickness of top plating of exposed casing

Position	Thickness (mm)
I	$t = 6.3S + 1.5$
II	$t = 6.0S + 1.5$
S = spacing of stiffeners (m).	

503. Machinery space casings below freeboard deck or within enclosed spaces

The scantlings of machinery space casings below the freeboard deck or within enclosed superstructures or deckhouses are to comply with the following requirements:

(1) The thickness of plating is to be at least 6.5 mm, where the spacing of stiffeners is greater than 760 mm, the thickness is to be increased at the rate of 0.5 mm per 100 mm excess in spacing. In accommodation spaces the thickness of plating may be reduced by 2 mm.

(2) The section modulus of stiffeners is not to be less than that obtained from the following formula:

$$Z = 1.2 S l^3 \quad (\mathrm{cm}^3)$$

where:

l = tween deck height (m).

S = spacing of stiffeners (m).

504. Access openings to machinery spaces

1. All access openings to machinery spaces are to be located in protected positions as far as possible and provided with steel doors capable of being closed and secured from both sides. Such doors in exposed machinery space casings on the freeboard deck are to comply with the requirements in **Ch 16, 301. 1.**

2. The sills of doorways in machinery space casings are not to be less than 600 mm in height above the upper surface of the deck in Position I and 380 mm in Position II.

3. In ships having a reduced freeboard, doorways in the exposed machinery space casings on the freeboard or raised quarter deck are to lead to a space or passageway which is of strength equivalent to that of the casing and is separated from the stairway to the machinery spaces by a second steel weathertight door of which the doorway sill is to be at least 230 mm in height.

505. Miscellaneous openings in machinery space casing

1. Coamings of any fiddle, funnel and machinery space ventilator in an exposed position on the freeboard or superstructure deck are to be as high above the deck as reasonable and practicable.

2. In exposed positions on the freeboard and superstructure decks, fiddle openings and all other openings in the machinery space casings are to be provided with strong steel weathertight covers permanently fitted up in their proper positions.

3. Annular spaces around funnels and all other openings in the machinery space casings are to be provided with closing means capable of being operated from outside the machinery space in case of a fire.

506. Machinery space casings within unenclosed superstructure or deckhouses

Machinery space casings within unenclosed superstructures or deckhouses and doors provided thereon are to be constructed to the satisfaction of the Society, having regard to the degree or protection afforded by the superstructure or deckhouse. ⚓

CHAPTER 18 TUNNELS AND TUNNEL RECESSES

Section 1 General

As specified in **Pt 3, Ch 19, Sec 1.** ⫝̸

CHAPTER 19 HATCHWAYS AND OTHER DECK OPENINGS

Section 1 General

101. Application

1. The requirements in this Chapter apply to steel hatch covers and coaming in position I and II on weather decks. The requirements in **Pt 4, Ch 9** apply to steel hatch covers of small hatches fitted on exposed fore deck. Except for those specially provided for in this Chapter, **Pt 4, Ch 2** is to be applied.

2. Relaxation from the requirements in this chapter will be specially considered where the ship has an unusually large freeboard.

3. The construction and means for securing the watertightness of cargo and other hatchways in position 1 and 2 defined in **102.** shall be at least equivalent to the requirements of hatchways closed by weathertight covers of steel or other equivalent materials unless the application of regulation **Sec 3** to such hatchways is granted by the Administration.

102. Position of exposed deck openings

For the purpose of this chapter, two positions of exposed deck openings are defined as follows:

Position I : Upon exposed freeboard and raised quarter decks and upon exposed superstructure decks situated forward of a point 0.25 L_f from the forward perpendicular.

Position II : Upon exposed superstructure decks situated abaft 0.25 L_f from the forward perpendicular and located at least one standard heights of superstructure above the freeboard deck.
Upon exposed superstructure decks situated forward of a point 0.25 L_f from the forward perpendicular and located at least two standard heights of superstructure above the freeboard deck.

103. External pressures on hatch covers

1. The wave pressure acting on hatch cover plate is as following **Table 10.19.1**. The still water lateral pressure and loads are to be considered when the hatch cover is intended to carry uniform cargoes, wheeled cargoes or containers.

Table 10.19.1 Wave pressures on hatch covers

Pressure P_W (kN/m^2)		
Location	Position I	Position II
$0 \le x/L_f \le 0.75$	$14.9+0.195L_f$	$11.3+0.142L_f$
$0.75 < x/L_f < 1$	$12.2+\frac{L_f}{9}(5\frac{x}{L_f}-2)+3.6\frac{x}{L_f}$	-

Note
L_f : length for freeboard defined in **Ch 1 Sec 1** (m)
$x(m)$: distance from the end of astern to the center of hatch cover that should be considered.

104. Corrosion additions

The corrosion addition for both sides to be considered for the plating and internal members of hatch covers, hatch coamings and coaming stays is equal to the value specified as follows

Corrosion addition t_c (mm)		
Member	Bulk carriers Ore carriers Combination carriers	Others except left column
Plating and stiffeners of single skin hatch cover	2.0	2.0 *
Top and bottom plating of double skin hatch cover	2.0	1.5 *
Internal structures of double skin hatch cover	1.5	1.0
Hatch coamings structures and coaming stays	1.5	1.5
* Corrosion addition t_c=1.0 mm for the hatch covers in may of cellular cargo holds intended for containers.		

105. Allowable stresses

The allowable stresses σ_a and τ_a, in N/mm^2, are to be obtained as follows.

Members of:	σ_a (N/mm^2)	τ_a (N/mm^2)
Weathertight hatch cover	0.80 σ_y	0.46 σ_y
Pontoon hatch cover	0.68 σ_y	0.39 σ_y
Hatch coaming	0.95 σ_y	0.50 σ_y

σ_a : normal Stresses
τ_a : shear Stresses
σ_y : yielding Stresses

Section 2 Hatchways

201. Application

The construction and the closing means of cargo and other hatchways are to comply with the requirements in this section.

202. Height of hatchway coamings

1. The height of coamings above the upper surface of deck is to be at least 600 mm in Position I and 450 mm in Position II.

2. For hatchways closed by weathertight steel hatch covers as specified in **401.,** the height of coamings may be reduced from those prescribed in **Par 1** or omitted entirely subject to the satisfaction of the Society.

3. The height of hatchway coamings other than those provided in exposed portions of the freeboard or superstructure decks is to be to the satisfaction of the Society having regard to the position of hatchways or the degree of protection provided.

203. Construction of hatchway coamings

1. The thickness of hatchway coamings including the corrosion addition is not to be less than that obtained from the following formula:

$t = 0.05L + 6$ (mm)

2. Coamings for hatchways in Position I or coamings of 760 mm or more in height provided to hatchways in Position II are to be stiffened in a suitable position below the upper edge by a horizontal stiffener: the breadth of horizontal stiffener is not to be less than that obtained from the following formula, but need not exceed 180 mm.

$b = 1.7L + 50$ (mm)

3. Coamings are to be additionally supported by efficient brackets or stays provided from the horizontal stiffeners specified in **Par 2** to the deck at an interval of approximately 3 m.

4. Coamings for all exposed hatchways are to be stiffened on their upper edges by half-round bars or similar section bars and their lower parts are to be constructed efficiently by flanging or other suitable means.

5. For the construction and scantlings of coamings of small hatchways, the requirements in **Pars 1** to **4** may be suitably modified.

6. The construction and scantlings of coamings over 900 mm in height, coamings of hatchways to deep tanks and coamings of hatchways closed by a special type of closing means to which the requirements in **203.** are not applicable, are to be to the satisfaction of the Society.

Section 3 Hatch Openings closed by Portable Covers and secured Weathertight by Tarpaulins and Battening Devices

301. Hatch rests

Hatch rests are to be provided with at least 65 mm bearing surface and are to be bevelled, if required, to suit the slope of the hatchways.

302. Wood hatch covers

Wood covers are to comply with the following requirements:

(1) The finished thickness is not to be less than obtained from the following formula. Covers intended to carry cargoes on them are to be increased in thickness in direct proportion either where the tween deck height exceeds 2.6 m or the weight of cargoes to be carried on the hatchway covers exceeds 17.5 kN/m^2, but in no case is the finished thickness to be less than 60 mm.

$t = 40S$ (mm)

where:

S = spacing of portable beams (m)

(2) The wood for hatchway covers is to be of good quality, straight grained and reasonably free from knots, sap and shakes.

(3) The ends of all wood covers are to be protected by encircling steel band.

(4) Where portable beams for supporting wooden hatch covers are made of steel, the maximum allowable stress and deflection of the member not considering the corrosion margin under the design loads in **103.** are as follows.

Maximum allowable stress : in accordance with **105**. in this chapter
Maximum allowable deflection : 0.0044 times the span

Where the cross section of portable beams is not constant along the span, article in **304.** may be used to determine required beam scantlings. Thickness is to be added an appropriate corrosion margin in **104**.

303. Steel Hatch Cover

1. Where steel hatch covers are fitted the maximum allowable stress and deflection of the member not considering the corrosion margin under the design loads in **103.** are as follows.

Maximum allowable stress : in accordance with **105.** in this chapter

Maximum allowable deflection : 0.0056 times the span

2. Top plate thickness is to be 0.01 times the spacing of stiffeners, but not less than 6 mm.

3. Where the cross section of portable beams is not constant along the span, article in **304.** may be used to determine required beam scantlings.

4. Thickness is to be added an appropriate corrosion margin in **104.**

304. Primary supporting members

1. Application

The requirements in **3.** to **5.** apply to primary supporting members which may be analysed through isolated beam models.

Primary supporting members whose arrangement is of a grillage type and which cannot be analysed through isolated beam models are to be checked by direct calculations, using the checking criteria in **4.**

2. Normal and shear stress for isolated beam

In case that grillage analysis or finite element analysis are not carried out, according to the requirements in **1**, the maximum normal stress σ and shear stress τ in the primary supporting members are to be obtained from the following formulae:

$$\sigma = \frac{SP_w l^2 10^3}{8Z} \quad (\text{N/mm}^2)$$

$$\tau = \frac{5SP_w l}{A_{sh}} \quad (\text{N/mm}^2)$$

l : span of the primary supporting member (m)

A_{sh} : shear sectional area (cm^2)

S : the spacing of stiffeners (m)

3. Checking criteria

The normal stress σ and the shear stress τ, calculated according to 3. or determined through a grillage analysis or finite element analysis, as the case may be, are to comply with the following formulae:

$$\sigma \le \sigma_a$$

$$\tau \le \tau_a$$

4. Deflection limit

Deflection does not exceed the values as follows :
- 0.0056 times the span of stiffeners for weathertight hatch covers
- 0.0044 times the span of stiffeners for pontoon hatch covers

5. Primary supporting members of variable cross-section

The net section modulus of primary supporting members with a variable cross-section is to be not less than the greater of the value obtained from the following formulae. But the use of these formulae is limited to the determination of the strength of primary supporting members in which abrupt changes in the cross-section do not occur along their length.

$$Z_V = Z \quad (\mathrm{cm}^3)$$

$$Z_V = \left(1 + \frac{3.2\alpha - \psi - 0.8}{7\psi + 0.4}\right) Z \quad (\mathrm{cm}^3)$$

Z : net section modulus for constant cross-section

$$\alpha = \frac{l_1}{l}$$

$$\psi = \frac{Z_1}{Z_0}$$

l_1 : length of the variable section part

l : span measured between end supports

Z_1 : net section modulus at end

Z_0 : net section modulus at mid-span

Moreover, the net moment of inertia of primary supporting members with a variable cross-section is to be not less than the greater of the values obtained from the following formulae :

$$I_V = I \quad (\mathrm{cm}^4)$$

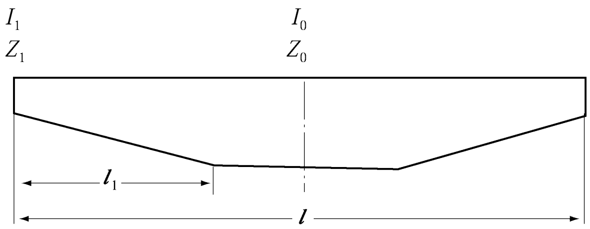
$$I_V = \left(1 + 8\alpha^3\left(\frac{1-\phi}{0.2 + 3\sqrt{\phi}}\right)\right) I \quad (\mathrm{cm}^4)$$

I : net moment of inertia with a constant cross-section

$$\phi = \frac{I_1}{I_0}$$

I_1 : net moment of inertia at end

I_0 : net moment of inertia at mid-span,



305. Pontoon Covers

1. Where steel pontoon covers are fitted the maximum allowable stress and deflection of the member not considering the corrosion margin under the design loads in **103.** are as follows :

Maximum allowable stress : in accordance with **105.** in this chapter
Maximum allowable deflection : 0.0044 times the span

2. Top plate thickness is to be 0.01 times the spacing of stiffeners, but not less than 6 mm.

3. Where the cross section of stiffener is not constant along the span, article in **304.** may be used to determine required scantlings.

4. Thickness is to be added an appropriate corrosion margin in **104.**

5. The depth of steel pontoon covers at supports is not to be less than one-third the depth at mid-span or 150 mm, whichever is greater.

6. The width of bearing surface for steel pontoon covers is to be not less than 75 mm.

Section 4 Hatchways Closed by Weathertight Covers Fitted with Gaskets and Clamping Devices

401. Steel weathertight covers

1. Where steel weathertight covers are fitted the maximum allowable stress and deflection of the member not considering the corrosion margin under the design loads in **103.** are as follows :

Maximum allowable stress : in accordance with **105.** in this chapter
Maximum allowable deflection : 0.0056 times the span

2. Top plate thickness is to be 0.01 times the spacing of stiffeners, but not less than 6 mm.

3. Where the cross section of stiffener is not constant along the span, article in **304.** may be used to determine required scantlings.

4. Thickness is to be added an appropriate corrosion margin in **104.**

5. The depth of steel pontoon covers at supports is not to be less than one-third the depth at mid-span or 150 mm, whichever is greater.

6. The strength and closing arrangements of small or special types of steel weathertight covers to which the requirements in **1.** through **5.** above are not applicable and those of covers for hatchways, coaming of which is omitted by article **2** of **202**, will be specially considered.

Section 5 Hatchway Covers for Sand Carrier and Dredger

501. Hatchway covers for sand carrier and dredger

In the case of sand carriers and dredgers, hatchway covers may be omitted at the discretion of the Society.
In this article sand carrier and dredger mean that the ships are be engaged in gathering, transporting, dredging or reclamation etc. for sand, soil, gravel etc.

1. For the ship which operates in domestic-costal service area, the requirement for exemption of hatchway covers of sand carrier and dredger is as follows.

(1) Barge and Ship having hopper door
Ships which is fitted with a buoyancy tank in each side and hopper door in bottom should have sufficient reserved buoyancy and stability in assumed the worst flooded condition of cargo hold.

(2) Barge not having a hopper door
Barge which is fitted with a buoyancy tank in each side and operates within 20 nautical miles

out of the Korean peninsula(excluding those intend to sail to Che-ju Island) should have sufficient reserved buoyancy and stability in assumed the worst flooded condition of cargo hold.

(3) For the exemption of hatchway cover installation, it should be met with the following conditions in assumed the worst flooded condition.
  (A) The upper deck side line should be not flooded
  (B) For self-propelled ship : $G_0M \geq 0.15$ m
  For non self-propelled ship : $G_0M \geq 0.095B$ m
  (where, B = Breadth)

2. For the ship which operates in international service area and is fitted with door or valve in bottom, the requirement for exemption of hatchway cover installation of sand carrier and dredger is as follows.

(1) The intact stability is to be met with the requirement of **Pt 1, annex 1-2** of the Guidance. In this case, the calculation is to include the homogeneous full load condition of cargo in each cargo hold loaded up to the top of the hatchway coaming.
(2) When the wetted cargo with the design bulk density of minimum 2.2 ton/m^3 is homogeneously loaded to the assigned freeboard in each hold and assuming that the void space of the cargo hold above the cargo surface is filled with the sea water induced by the flooding, the stability of the above (1) is to be satisfied.
(3) The damage stability is to be met with **SOLAS Ch. II-1, B-1**
(4) The doors or valves on bottom area are to be met with following requirements.
  (A) The opening of the bottom dump doors should be effective in less than one(1) minute.
  (B) In the case of bottom door not to be opened by gravity, the opening should be possible even after the main power source or the ram mechanism actuating the bottom dump doors have been put out of order.
  In this case, it should be possible to operate both systems from bridge, and the cargo releasing arrangements should be such that asymmetrical jettisoning of the cargo should not be possible even partially.
(5) Draft indicator is to be fitted on the bridge.
(6) Where the additional requirements other than described above are necessary, the ship is to be met with those requirements also.

Section 6 Companion ways and Other Deck Openings

601. Manholes and flush scuttles

Manholes and flush scuttles in exposed positions on the freeboard and superstructure decks or within superstructures other than enclosed superstructures are to be closed by steel covers capable of being made watertight. These covers are to be secured by closely spaced bolts or to be permanently fitted up.

602. Companion ways

1. Access openings in the freeboard deck are to be protected by enclosed superstructures or by deckhouses or companion ways of equivalent strength and weathertightness.

2. Access openings in exposed superstructure decks or in the top of deckhouses on the freeboard deck which give access to a space below the freeboard deck or a space within an enclosed superstructure are to be protected by efficient deckhouses or companion ways.

3. Doorways in deckhouses or companion ways such as specified in **Pars 1** and **2** are to be provided with doors complying with the requirements in **Ch 16, 301.1.**

4. The sills of doorways specified in **Pars 1** to **3** are not to be less than 600 mm in height above the upper surface of the deck in Position I and 380 mm in Position II.

603. Openings to cargo spaces

Access and other openings to cargo spaces are to be provided with closing means capable of being operated from outside the spaces in case of a fire. Such closing means for any opening leading to any other space inboard the ship is to be of steel. ⚓

CHAPTER 20 BOW DOORS, SIDE AND STERN DOORS

Section 1 Bow doors and Inner doors

As specified in **Pt 4, Ch 3, Sec 1.**

Section 2 Side and Stern door

As specified in **Pt 4, Ch 3, Sec 2.** ⚓

CHAPTER 21 BULWARKS FREEING PORTS, SIDE SCUTTLES, VENTILATORS AND PERMANENT GANGWAYS

Section 5 Permanent Gangways

As specified in **Pt 4, Ch 4, Sec 5.** ⚓

CHAPTER 22 EQUIPMENT NUMBER AND EQUIPMENT

Section 1 General

101. General and application

1. All ships, according to their equipment number of provisions in **201.** are to be provided with anchors, chain cables, ropes, etc. which are not less than given in **Table 10.22.1.**

2. Anchors, chain cables, ropes, etc. for ships having equipment number not more than 50 or more than 1,670 are to be at the discretion of the Society.

3. The bower anchors given in **Table 10.22.1** are to be connected to their cables and stored on board ready for use. A spare anchor in addition to the requirements given in **Table 10.22.1** may be required for the ships such as cable layer, observation, research, patrol and fishing vessels in consideration of kind of ships, condition in service area, etc.

4. The anchors, chain cables and ropes, etc. which are required to be tested and inspected to be used for ships classed with the Society are to comply with the requirements in **Pt 4, Ch 8.**

5. All ships are to be provided with suitable appliances for handling of anchors.

6. The inboard end of chain cable is to be secured to the hull through a strong eye plate by means of shackle or by other equivalent means.

Section 2 Equipment Number

201. Equipment number

1. Equipment number is the value obtained from the following formula :

$$E = \triangle^{\frac{2}{3}} + 2.0Bh + 0.1A$$

where:

Δ = molded displacement in tons to the summer load waterline.

h, A = values specified in the following (1), (2) and (3).

(1) h is the value obtained from the following formula :

$$h = f + h' \text{ (m)}$$

where:

f = vertical distance, at the midship, from the load line to the top of uppermost continuous deck beam at side (m).

h' = height from the uppermost continuous deck to the top of uppermost superstructures or deckhouses having a breadth greater than $B/4$ (m). In the calculation of h, sheer and trim may be ignored. Where a deckhouse having a breadth greater than $B/4$ is located above a deckhouse with a breadth of $B/4$ or less, the narrow deckhouse may be ignored.

(2) A is the value obtained from the following formula :

$$A = fL + \sum h'' l \quad (\mathrm{m}^2)$$

where:

f = value specified in (1).

$\sum h'' l$ = summing up of the products of the height h''(m) and length l(m) of superstructures, deckhouses or trunks which are located above the uppermost continuous deck within the length of ship and also have a breadth greater than $B/4$ and a height greater than 1.5 m.

(3) In the application of (1) and (2), screens and bulwarks more than 1.5 m in height are to be regarded as parts of superstructures or deckhouses.

2. Notwithstanding **1** above, for tugs the equipment number is to be obtained from the following formula :

$$E = \triangle^{\frac{2}{3}} + 2.0(fB + \sum h'' b) + 0.1A$$

Δ, f, A : As specified in **1**. above.

$\sum h'' b$ = Summing up the products of the height h''(m) and the breadth b(m) of each widest superstructure and deckhouse which have a breadth greater than $B/4$ and are located above the uppermost continuous deck.

202. Weight of anchors

1. The weight of individual bower anchors may vary by ± 7 % of the weight given in **Table 10.22.1,** provided that the total weight of stipulated number of bower anchors is not less than obtained from multiplying the weight per anchor by the number given in **Table 10.22.1.** Where, however, an approval by the Society is obtained, the anchors which are increased in weight by more than 7 % may be used.

2. Where stocked anchors are used, the weight excluding the stock, is not to be less than 0.80 times the weight specified in **Table 10.22.1** for ordinary stockless bower anchors.

3. Where high holding power anchors are used, the weight of each anchor may be 0.75 times the weight specified in **Table 10.22.1.**

4. Where super high holding power anchors are used, the mass of each anchor may be 0.5 times the mass required for the ordinary stockless anchor. However, super high holding power anchor mass is generally not to exceed 1,500 kg.

203. Chain cables and stream lines

Chain cables for bower anchors are to be stud link chains of Grade 1, 2 or 3 specified in **Pt 4, Ch 8, Sec 4.** However, Grade 1 chains made of Class 1 chains bars (*RSBC* 31) are not to be used in association with high holding power anchors.

204. Tow lines and mooring lines

1. As for wire ropes and hemp ropes used as tow lines and mooring lines, the breaking test load specified in **Pt 4, Ch 8, Sec 5** or **6** is not to be less than the breaking load given in **Table 10.22.1** respectively.

2. For ships having the ratio A/E above 0.9, the number of ropes given in **Table 10.22.2** should be added to the number required by **Table 10.22.1** for mooring lines.

3. The requirements for synthetic fibre ropes used as tow lines or mooring lines are to be as deemed appropriate by the Society.

4. The length of individual mooring lines may be reduced up to 7 % of the length given in **Table 10.22.1,** provided that total length of the stipulated number of mooring lines is not less than obtained from multiplying the length by the number given in **Table 10.22.2.**

5. For mooring lines connected with powered winches where the rope is stored on the drum, steel cored wire ropes of suitable flexible construction may be used instead of fibre cored wire ropes subject to the approval by the Society.

NOTES:
1. Where steel wire ropes are used, the following wire ropes corresponding to the marks shown in the Table, ● (6×12), ⊗ (6×24), ◎ (6×37), are to be provided.
2. Length of chain cables may be that including shackles for connection.
3. Tow line is not a condition of classification, but is listed in this table only for guidance.

Table 10.22.2 Number of ropes

$\frac{A}{E}$	Number of mooring line
$0.9 < \frac{A}{E} \leq 1.1$	1
$1.1 < \frac{A}{E} \leq 1.2$	2
$\frac{A}{E} > 1.2$	3

NOTES:
A =value specified in **201**. (2).
E =equipment number.

Section 3 Shipboard Fittings and Supporting Hull Structures associated with Towing and Mooring

301. As specified in **Pt 4, Ch 10.** ⚓

CHAPTER 23 OIL TANKERS

Section 1 General

101. Application

1. The construction and equipment of ships intended to be registered and classed as "tanker" are to be in accordance with the requirements in this chapter, where "tanker" means a ship intended to carry crude oil, petroleum products having the vapour pressure (absolute pressure) less than 0.28 MPa at 37.8°C or other similar liquid cargoes in bulk.

2. Except where specifically required in this chapter, the general requirements for steel ships are to be applied.

3. The requirements in this chapter are framed for tankers with machinery aft, having one or more rows of longitudinal bulkheads, single decks, single bottoms and longitudinal framing.

4. In tankers intended to carry liquid cargoes other than crude oil and petroleum products, having the vapour pressure (absolute pressure) less than 0.28 MPa at 37.8°C and having no hazard as poisonous, corrosive, etc. and moreover less inflammability than that of crude oil and petroleum products, the structural arrangements and scantlings are to be to the satisfaction of the Society, having regard to the properties of the cargoes to be carried.

102. Arrangement of bulkheads

In cargo oil tanks, longitudinal and transverse oiltight bulkheads and wash bulkheads are to be arranged suitably.

103. Cofferdams

1. Cofferdams of airtight construction and of sufficient width as required for ready access are to be provided at the forward and after ends of cargo oil spaces and between cargo oil spaces and accommodation spaces. In tankers intended to carry oils having a flashpoint exceeding 60°C, however, the preceding requirements may be modified.

2. The cofferdams described in the preceding paragraph may be used as pump rooms.

3. Ullage plugs, sighting ports and tank cleaning openings are not to be arranged in enclosed spaces.

4. Fuel oil or ballast water tanks may be concurrently used as the cofferdams to be provided between cargo oil tanks and fuel oil or ballast water tanks, subject to the approval by the Society.

5. Location and separation of spaces in tankers of 500 tons gross and above carrying oils having a flashpoint not exceeding 60°C are to be in accordance with the requirements in **Pt 8, Ch 1.**

104. Airtight bulkheads

Airtight bulkheads are to be provided for the isolation of all cargo oil pumps and pipings from spaces containing stoves, boilers, propelling machinery, electric installations other than those of explosion-proof type specified in **Pt 6, Ch 1, Sec 9** or machinery space where source of ignition is normally present. In tankers carrying oils having a flashpoint exceeding 60°C, however, the preceding requirements may be modified.

105. Ventilation

1. Efficient ventilation is to be provided in spaces adjacent to cargo oil tanks. Air holes are to be cut in every part of the structure where there might be a chance of gases being "pocketed".

2. Efficient means are to be provided for cleaning oil tanks and pump rooms of dangerous vapours by means of mechanical ventilation or by steam.

3. Ventilation systems of mechanical extraction type are to be provided for the cargo oil pump room specified in **Par 2.** The outlets of exhaust ducts are to be led to the safe position above the open deck and to be fitted with wire mesh screens with mesh of suitable size. This ventilation systems are to be capable of circulating sufficient air to give at least 20 air changes per hour for the total volume of the pump room to prevent accumulation of cargo vapours. The ventilation fan is to be of non-sparking construction. Also the ducts are to be arranged, to permit ventilation from the vicinity of the pump room bilge, above the transverse floor plate or bottom longitudinals. An emergency intake located nearly 2 m above the pump room lower grating is to be arranged to the ducts, and this emergency intake is to have a damper which is capable of being opened or closed from the weather deck and lower grating level.

4. In tankers carrying oils having a flashpoint above 60°C, the capacity of ventilation in the pump rooms specified in **Par 3** may be modified.

5. The requirements in **Par 3** are applied to the ventilation fans and wire mesh screen for the spaces adjacent to the cargo oil tank specified in **Par 1**.

106. Openings for ventilation

Ventilation inlets and outlets are to be arranged so as to minimize the possibilities of vapours of cargoes being admitted to an enclosed space containing a source of ignition, or collecting in the vicinity of deck machinery and equipment which may constitute an ignition hazard. Especially, openings of ventilation for machinery spaces are to be situated as far afterwards apart from the cargo spaces as practicable.

107. Openings of superstructure and deckhouse

The arrangement of openings on the boundaries of superstructure and deckhouse are to be such as to minimize the possibility of accumulation of vapours of cargoes. Due consideration in this regard is to be given when the ship is equipped to load or unload at the stern. Side scuttles to the poop front or other similar walls are to be of fixed type. Such openings of tankers of 500 gross tons and above carrying oils having a flash point not exceeding 60°C are to be in accordance with the requirements in **Pt 8, Ch 1, 402.**

108. Thickness of structural members in cargo oil spaces

The thickness of structural members in cargo oil spaces is to be in accordance with the following:

(1) The shell plating is not to be of less thickness than that obtained from the formulae in **Ch 4, 302., 304., 402., 403.** and **404.** using 2.0 instead of 1.5 in the formulae.

(2) The deck plating of freeboard deck is not to be of less thickness than that obtained from the formulae in **Ch 5, 301.** using 2.0 instead of 1.5 in the formulae.

(3) Where frames, beams, stiffeners and other members for which the scantlings are specified by the section modulus only consist of flanged plates, special sections of web and face plates, the thickness of web plates is not to be less than that obtained from the following formula. Where the depth of web plates, however, is specially made deeper due to other reasons than of strength, the preceding requirements may be modified.

$$t = 0.015 d_0 + 2.5 \text{ (mm)}$$

where:

d_0 = depth of web plates (mm)

(4) The thickness of various girders, longitudinal, transverse, vertical or horizontal, the cross ties and end connecting brackets thereof and various bulkhead platings is not to be less than 8 mm.

(5) The thickness of flat bars, tripping brackets, etc. fitted up on webs of longitudinal girders, transverses and stiffeners of bulkheads is not to be less than that obtained from the following formula. The thickness, however, need not exceed that of web plates to which they are connected.

$$t = 0.5\sqrt{L} + 2.5 \text{ (mm)}$$

(6) In no case is the thickness of structural members to be less than 7 mm.

Section 2 Hatchways, Gangways and Freeing Arrangements

201. Ships having unusually large freeboard

Relaxation from the requirements specified hereunder will be considered to ships having an extra-ordinarily large freeboard.

202. Hatchways to cargo oil tanks

1. The thickness of coaming plates is not to be less than 10 mm. Where the length and coaming height of a hatchway exceed 1.25 m and 760 mm respectively, vertical stiffeners are to be provided to the side or end coamings and the upper edge of coamings is to be suitably stiffened.

2. Hatchway covers are to be of steel or other approved materials. The construction of steel hatch-way covers is to comply with the following requirements. The construction of hatchway covers of materials other than steel is to be in accordance with the discretion of the Society.

(1) The thickness of cover plates is not to be less than 12 mm. In ships not more than 60 m in length, however, the requirement may be modified.
(2) Where the area of a hatchway exceeds 1 m^2 but does not exceed 2.5 m^2, cover plates are to be stiffened by flat bars of 100 mm in depth spaced not more than 610 mm apart. Where, how-ever, the cover plates are 15 mm or more in thickness, the stiffeners may be dispensed with.
(3) Where the area of a hatchway exceeds 2.5 m^2, cover plates are to be stiffened by flat bars of 125 mm in depth spaced not more than 610 mm apart.
(4) The covers are to be secured by fastenings spaced not more than 457 mm apart in circular hatchways or 380 mm apart and not more than 230 mm from the corners in rectangular hatchways.

3. The cover is to be provided with an opening at least 150 mm in diameter which is to be so con-structed as to be capable of being closed oiltight by means of a screw plug or a cover of peep hole.

4. Hatchway coamings are to be provided with gas cocks or other suitable exhausting devices.

203. Hatchways to spaces other than cargo oil tanks

In exposed positions on the freeboard and forecastle decks or on the top of expansion trunks, hatchways serving spaces other than cargo oil tanks are to be provided with steel watertight covers having scantlings complying with the requirements in **Ch 20, Sec 4.**

204. Permanent gangway and passage

1. A fore and aft permanent gangway complying with the requirements of **Ch 22, 503.** is to be pro-vided at the level of the superstructure deck between the midship bridge or deck house and the poop or aft deck house, or equivalent means of access is to be provided to carry out the purpose of the gangway, such as passage below deck. Elsewhere and in ships without midship bridge or deck house, arrangements to the satisfaction of the Society are to be provided to safeguard the crew in reaching all parts used in the necessary work of the ship.

2. Safe and satisfactory access from the gangway level is to be available between crew accom-modations and machinery space or between separated crew accommodations spaces.

205. Freeing arrangements

1. Ships with bulwarks are to have open rails fitted for at least a half of the length of the exposed part of the freeboard deck or to have other effective freeing arrangements. The upper edge of sheer strake is to be kept as low as practicable.

2. Where superstructures are connected by trunks, open rails are to be provided for the whole length of the exposed parts of the freeboard deck.

Section 3 Longitudinal Frames and Beams in Cargo Oil Spaces

301. General

Longitudinal frames and beams provided in permanent ballast water tanks and such spaces that cargo oil is loaded including void spaces and pump rooms are to be in accordance with the requirements stated hereunder.

302. Scantlings

1. The section modulus of bottom longitudinals and side longitudinals including bilge frames is not to be less than that obtained from the formulae given in **Table 10.23.1.**

Table 10.23.1 Section modulus of bottom and side longitudinals

Positions	Section modulus (cm^3)		
	Bottom longitudinals	Side longitudinals including bilge frames	
Midship part and between a point 0.15 L from the fore end and the collision bulkhead	$Z=10Shl^2$	$Z=9.3Shl^2$ $Z_{min}=3.2\sqrt{L}Sl^2$	However, this value need not exceed the requirements for the bottom longitudinsls and it may be suitably modified for side longitudinals within 0.25 D_s from a point of 0.5 D_s above the top of keel.
Forward and afterward end parts	$Z=8.5Shl^2$	$Z=7.9Shl^2$ $Z_{min}=2.72\sqrt{L}Sl^2$	

l = spacing of bottom transverses (m)
S = spacing of bottom longitudinals (m).
h = distance from the longitudinal under consideration to the point of h' above the top of keel (m).
h' = as specified in the following table.

	h' (m)
Bottom longitudinals	$h'=d+0.026L$
Side longitudinals including bilge frames	$h'=d+0.044L-0.54$

2. The section modulus of longitudinal beams is not to be less than 1.1 times that obtained from the formula in **Ch 10, 303.**

3. Notwithstanding the provisions in **Pars 1** and **2,** the section modulus of longitudinal frames and beams is not to be less than obtained assuming them as stiffeners on deep tank bulkhead and taking the distance from the longitudinal frames or longitudinal beams to the top of hatchways as h.

4. Longitudinal beams and side longitudinals attached to the sheer strake are to be of such dimensions as slenderness ratio not exceeding 60 at the midship part as far as practicable.

5. As for flat bars used for longitudinal beams and frames, the ratio of depth to thickness is not to exceed 15.

6. The extreme width of face plates of longitudinal beams and frames is not to be less than that obtained from the following formula:

$b = 2.2\sqrt{d_0 l}$ (mm)

where:

d_0 = depth of web of longitudinal beams or frames (mm).

l = spacing of transverses (m).

303. Attachment

Longitudinal frames and beams are to be continuous or to be attached at their ends in such a manner as to effectively develop the sectional area and the resistance to bending.

Section 4 Girders and Transverses in Cargo Oil Spaces

101. General

1. The requirements specified hereunder are framed for structures consisting of two to five transverses arranged at approximately equal intervals between transverse bulkheads or between the transverse bulkhead and the wash bulkhead.

2. Girders or transverses in the same plane are to be so arranged that abrupt change in the strength and rigidity is avoided; they are to have brackets of sufficient scantlings and with properly rounded corners at their ends.

3. The depth of girders or transverses is not to be less than 2.5 times that of slots for frames, beams and stiffeners.

4. As for the face plates composing girders, the thickness is not to be less than that of web plates and the width of the face plates is not to be less than that obtained from the following formula:

$b = 2.7\sqrt{d_0 l}$ (mm)

where:

d_0 = depth of girder (mm). In case where it is a balanced girder, d_0 is the depth from the surface of plate to the face plate (mm).

l = distance between supports of girder (m). Where, however, effective tripping brackets are provided, they may be taken as supports.

5. The requirements in this section are also to be applied to pump rooms, ballast water tanks or void spaces in the midship part as far as practicable.

402. Transverses in cargo oil spaces

1. The depth and section modulus of bottom transverses are not to be less than those obtained from the following formulae respectively:

Depth : $d = 160 l_0$ (mm)

Section modulus : $Z = 9.7k^2(d + 0.026L)Sl_0^2$ (cm^3)

where:

l_0 = overall length of transverses (m), which is equal to the distance from the inner surface of face plates of side transverses to the inner surface of face plates of vertical webs on the centre line bulkhead. (See **Fig. 10.23.1**)

S = spacing of transverses (m).

k = correction factor due to bracket given by the following formula : $k = 1 - \frac{0.65(b_1 + b_2)}{l_0}$

b_1, b_2 = arm length of brackets at both ends of transverses (m). (See **Fig. 10.23.1**)

2. The depth and section modulus of side transverses are not to be less than those obtained from the following formulae respectively.

Depth : $d = 150 l_0$ (mm)

Section modulus : $Z = 8.7 k^2 S h l_0^2$ (cm^3)

where:

l_0 = overall length of side transverses (m), which is equal to the distance between the inner surfaces of face plates of bottom transverses and deck transverses.

S = spacing of transverses (m).

h = distance from the mid-point of l_0 to the point of $h = d + 0.044L - 0.54$ above the top of keel (m).

k = correspondingly as specified in **Par 1.**

3. The section modulus of transverses at bilge is not to be less than that obtained from the following formula. However, in calculating the section modulus of transverses, the neutral axis of section is to be assumed as to situate at the mid-point of the depth of transverses. (See **Fig. 10.23.2**).

$Z = 7.8 S h l_0^2$ (cm^3)

where:

S, h, l_0 = as specified in **Par 2** respectively.

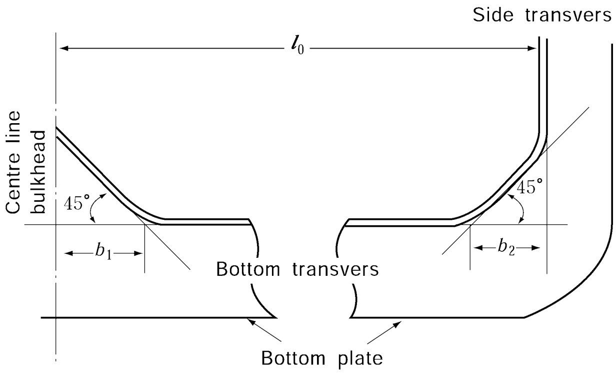

Fig. 10.23.1 Measurement of b_1, b_2, and l_0

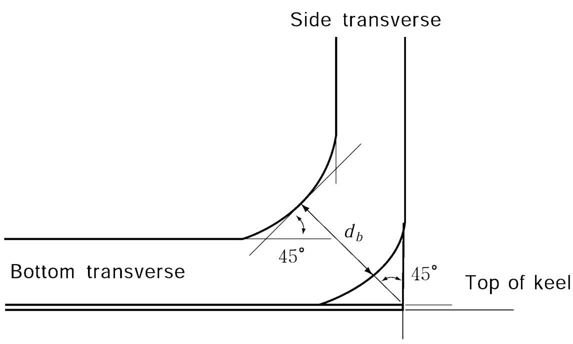

Fig. 10.23.2 Measurement of d_b

4. The depth and section modulus of deck transverses are not to be less than those obtained from the following formulae respectively:

Depth of transverses : $d = 100 l_0$ (mm)

Section modulus of transverses : $Z = 1.82k^2 \sqrt{L} S l_0^2$ (cm^3)

where:

l_0 = overall length of deck transverse (m), which is equal to the distance between the inner surface of face plate of side transverses and the centre line bulkhead.

S = spacing of transverses (m).

k = as specified in **Par 1.**

5. As for vertical webs provided on the centre line bulkhead, the requirements in **Par 3** for side transverses are to be correspondingly applied, but the depth and section modulus are not to be less than obtained from the formulae with each coefficient multiplied by 0.8 respectively.

Section 5 Trunks

501. Construction and scantlings

1. In ships with trunks, deck transverses extending from side to side of the ship across the trunk are to be provided as far as practicable In this case, the depth of deck transverses regarded as being supported by trunks may be 0.03 B.

2. Trunks are to be provided with stiffening transverses in line with the deck transverses. The section modulus of stiffening transverses is not to be less than that obtained from the following formula:

$Z = 1.4 \sqrt{L} S l^2$ (cm^3)

where:

l = half breadth of trunks (m).

S = spacing of transverses (m).

3. The thickness of trunk top and side plating is not to be less than that obtained from the following formula:

$t = 6.5S + 2.0$ (mm)

where:

S = spacing of longitudinal stiffeners (m).

4. The section modulus of longitudinal stiffeners provided on trunks is not to be less than that obtained from the following formula:

$Z = 2 \sqrt{L} S l^2$ (cm^3)

where:

l = spacing of transverses (m).

S = spacing of longitudinal stiffeners (m).

5. Both ends of trunk are to be sufficiently stiffened for the continuity of strength.

Section 6 Bulkheads in Cargo Oil Space

601. Thickness of bulkhead plating

1. The thickness of bulkhead plating is not to be less than obtained from the formula in **Ch 15** for deep tank bulkhead plating, using h measured from the lower edge of plating to the top of hatches (m) or $0.3\sqrt{L}$ (m), whichever is the greater.

2. The breadth of the uppermost and lowest strakes of longitudinal bulkhead plating is not to be less than 0.1 D and the thickness of these is not to be less than that obtained from the following formulae:

For the lowest strakes : $t = 1.1S\sqrt{L} + 2.5$ (mm)

For the uppermost strakes : $t = 0.8S\sqrt{L} + 2.5$ (mm)

where:

S = spacing of stiffeners (m).

602. Stiffeners

1. The section modulus of stiffeners is not to be less than that obtained from the formula in **Ch 15** for deep tank bulkhead stiffeners, using h measured from the midpoint of l in case of vertical stiffeners or from the centre of the width of plating supported by the stiffener in case of horizontal stiffeners to the top of hatches (m) or $0.3\sqrt{L}$ (m), whichever is the greater.

2. Horizontal stiffeners provided on upper and lower parts of longitudinal bulkhead plating are to be of increased scantlings above those specified in the preceding paragraph.

3. The full width of face plates of horizontal stiffeners on longitudinal bulkhead is not to be less than required in **302. 6.**

603. Additional strengthening of bulkhead in large tanks

Additional strengthening of bulkhead in large tanks is to be as required by the Society.

604. Wash bulkheads

1. Stiffeners and girders are to be of adequate strength in conformity with the size and opening ratio of tanks.

2. The thickness of bulkhead plating is not to be less than that required by **108.** (4) or obtained from the following formula, whichever is the greater. The thickness of the lowest strake of transverse wash bulkheads is to be properly increased.

$t = 0.3S\sqrt{L+150} + 2.5$ (mm)

where:

S = spacing of stiffeners (m).

3. It is recommended that a special consideration be given to the thickness of wash bulkhead plating to prevent the plating from shear buckling. ⚓

CHAPTER 24 DOUBLE HULL TANKERS

Section 1 General

101. Application

1. The requirements in this chapter are applied to tankers with machinery aft having one or more longitudinal bulk heads and single decks with double bottom or with double hull structures. Where, tanker means a ship intended to carry crude oil, petroleum products having a vapour pressure (absolute pressure) less than 0.28 MPa at 37.8°C or other similar liquid cargoes in bulk.

2. The construction, equipment and scantlings of ships intended to carry liquid cargoes having a vapour pressure (absolute pressure) less than 0.28 MPa at 37.8°C in bulk other than crude oil and petroleum products are to be the satisfaction of the Society, having regard to the properties of the cargoes to be carried.

3. In case where the construction differs from that specified in **Par 1** and the requirements in this chapter are considered to be not applicable, matters are to be determined as deemed appropriate by the Society.

4. Except where specially required in this chapter, is to be complied with the requirement in chapter concerned.

5. In addition to the requirements specified in **Par 4** the relevant requirements in **Pt 7, Ch 1, Sec 10** and **Pt 8, Ch 1, Sec 4** are to be applied to ships specified in **1.**

102. Arrangement and separation of spaces

1. In cargo oil spaces, longitudinal and transverse oil-tight bulkheads and swash bulkheads are to be suitably arranged.

2. Cofferdams are to be provided in accordance with the following (1) to (3):

(1) Cofferdams of air-tight construction with 600 mm and over in width for access are to be provided at fore and aft terminations of cargo oil spaces and the space between the cargo space and accommodation space. Where, however, for oil tankers intended to carry cargo oil having a flashpoint above 60°C, the preceding requirements may be suitably modified.
(2) Cofferdams specified in (1) may be used as pump rooms.
(3) Fuel oil or ballast water tanks may be concurrently used as the cofferdams subject to the approval by the Society.

3. Passageways leading to cargo areas are to be provided in accordance with the following (1) through (4):

(1) Access to cofferdams, ballast tanks, cargo oil tanks and other spaces in the cargo area are to be direct from the open deck and such as to ensure their complete inspection. Access to double bottom spaces may be through a cargo pump room, pump room, deep cofferdam, pipe tunnel or similar compartments, subject to consideration of ventilation aspects.
(2) For access through horizontal openings, hatches or manholes, the dimensions are to be sufficient to allow a person wearing a self contained air breathing apparatus and protective equipment to ascend or descend any ladder, without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening is not to be less than 600 mm × 600 mm.
(3) For access through vertical openings, or manholes providing passage through the length and breadth of the space, the minimum clear opening should be not less than 600 mm × 800 mm at a height of not more than 600 mm from the bottom shell plating unless gratings or other footholds are provided.
(4) For tankers with a deadweight tonnage of less than 5,000 tons, smaller dimensions of minimum clear opening specified in (2) and (3) may be approved by the Society in special circumstances, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of the Society.

4. Airtight bulkhead

All areas, where cargo oil pumps and cargo oil piping are provided, are to be segregated by an air-tight bulkhead from areas where stoves, boilers, propelling machinery, electric installations other than those of explosion-proof type in accordance with the requirements in **Pt 6, Ch 1, Sec 9** or machinery where source of ignition is normally present. Where, however, for oil tankers carrying cargo oil having a flashpoint above 60°C the requirements may be suitably modified.

5. Ventilation inlets and outlet

Ventilation inlets and outlets are to be arranged so as to minimize the possibilities of vapours of cargoes being admitted to an enclosed space containing a source of ignition, or collecting in the vicinity of deck machinery and equipment which may constitute an ignition hazard. Especially, openings of ventilation for machinery spaces are to be situated as far afterwards apart from the cargo spaces as practicable.

6. Ullage openings, sighting ports and tank cleaning openings are not to be arranged in enclosed spaces.

7. Openings on the boundaries of superstructures and deckhouses

The arrangement of openings on the boundaries of superstructures and deckhouses are to be such as to minimize the possibility of accumulation of vapours of cargoes. Due consideration in this regard is to be given for the openings in superstructures and deckhouses when the ship is equipped with cargo piping to load or unload at the stern.

8. Pipe duct in double bottom

Pipe ducts in the double bottom are to comply with the following requirements:

(1) They are not to communicate with the engine room.
(2) Provision is to be made for at least two exits to the open deck arranged at a maximum distance from each other. One of these exits fitted with a watertight closure may lead to the cargo pump room.
(3) In the duct, provision is to be made for adequate mechanical ventilation.
(4) For ships to which the convention applies, refer to SOLAS 1974(as amended) Regulation ll-2/56.9

103. Minimum thickness

1. The thickness of structural members in cargo oil tanks and deep tanks such as bulkhead platings, floors, girders including struts and their end brackets is not to be less than 8 mm.

2. In no case is the thickness of structural members in cargo oil tanks and deep tanks other than structural members in **Par 1** to be less than 7 mm.

Section 2 Bulkhead Plating

201. Bulkhead plating of cargo oil tanks and deep tanks

1. Thickness of bulkhead plating is not to be less than that obtained from the following formula when h is substituted with h_1 or h_2 :

$$t = 3.6S\sqrt{h} + 2.5 \quad \text{(mm)}$$

where :

S = spacing of stiffeners (m)

h = a head of water given in **Table 10.24.1.**

Table 10.24.1 A head of water

	Cargo Oil Tank	Deep Tank
h_1	Vertical distance from the lower edge of the bulkhead plating under consideration to the top of hatchway. For bulkheads of large tanks, a suitable water head given in **Pt 3, Ch 15** is to be considered.	Vertical distance from the lower edge of the bulkhead plating under consideration to the midpoint between the point on tank top and the upper end of the overflow pipe. For bulkheads of large tanks, suitable water head given in **Pt 3, Ch 15** is to be considered,
h_2	$h_2 = 0.3\sqrt{L}$ (m)	0.7 times the vertical distance from the lower edge of the bulkhead plating under consideration to the point 2.0 mabove the top of overflow pipe.

2. For the uppermost and lowermost plating of longitudinal bulkheads, the breadth is not to be less than 0.1 D, and the thickness is not to be less than that obtained from the following formulae:

Lowermost plating : $t = 1.1S\sqrt{L} + 2.5$ (mm)
Uppermost plating : $t = 0.85S\sqrt{L} + 2.5$ (mm)

where
S = spacing of stiffeners (m)

202. Swash bulkheads

1. Stiffeners and girders are to be of sufficient strength deemed appropriate by the Society considering the size of tanks and opening ratios.

2. Thickness of bulkhead plating is not to be less than that obtained from the following formula:

$$t = 0.3S\sqrt{L+150} + 2.5 \quad \text{(mm)}$$

where:
S = spacing of stiffeners (m)

3. In determining the thickness of swash bulkhead plating, sufficient consideration is to be given for buckling.

203. Trunks

1. The thickness of trunk top plating and side wall plating are to be obtained applying the requirements in **Ch 5** in addition to the requirements in **201.**

2. Both ends of trunk are to be sufficiently stiffened for the continuity of strength.

Section 3 Frames, Stiffeners and Longitudinal Beams

301. Longitudinals

1. The section modulus of bottom longitudinals is not to be less than that obtained from the following formula :

$Z = 8.6\,Shl^2$ (cm^3)

where:

l = spacing of floors (m.

S = spacing of bottom longitudinals (m)

h = distance from the bottom longitudinals under consideration to a point of $d+0.026L$ above top of keel (m)

2. The section modulus Z of side longitudinals, including bilge longitudinals is to be the greater of that obtained from the following formulae:

$Z_1 = 8.6\,Shl^2$ (cm^3)

$Z_2 = 2.9\sqrt{L}\,Sl^2$ (cm^3)

where

l = spacing of transverses (m).

S = spacing of side longitudinals (m).

h = distance from the side longitudinals under consideration to a point of $d+0.044L-0.54$ above top of keel (m).

3. For the parts forward and afterward of the midship part, the section modulus of side longitudinals may be gradually reduced to 85 % of that obtained from the requirements in **Par 2** at the end parts of the ship in no case longitudinals to be less than required in **Par 2** for the part between a point 0.15 L from the fore end and the collision bulkhead.

4. In addition to **Pars 1** to **3**, the section modulus of longitudinal frames and beams forming boundaries of deep tank is to be in accordance with the requirements in **302.**

302. Bulkhead stiffeners in cargo oil tanks and deep tanks

1. The section modulus of stiffeners is not to be less than that obtained from the following formula:

$Z = 7\,CShl^2$ (cm^3)

where:

S = spacing of stiffeners (m).

l = overall length between supporting points of stiffeners (m) including the length of connected parts at ends. However, in case where stiffening girders are provided, the distance to the nearest stiffening girder from the connected heel end or the distance between stiffening girders is to be taken.

h = as specified in **Table 10.24.1** where, however, "from the lower edge of the bulkhead plating under consideration" is to be construed as "from the mid-point of l" for vertical stiffeners, and as "from the mid-point of the upper and lower stiffeners" for horizontal stiffeners.

C = coefficient given in **Table 10.24.2** according to the type of end connection.

Table 10.24.2 Value of C

The other end of stiffeners \ One end of stiffeners	Connection by hard bracket	Connection by soft bracket	Supported by girders or lug connection	Snip
Connection by hard bracket	0.70	1.15	0.85	1.30
Connection by soft bracket	1.15	0.85	1.30	1.15
Supported by girders or lug connection	0.85	1.30	1.00	1.50
Snip	1.30	1.15	1.50	1.50

NOTES:
1. Connection by hard bracket is a connection by bracket to the double bottoms or to the adjacent members, such as longitudinals or stiffeners in line, of the same or larger sections, or a connection by bracket to the equivalent members mentioned above. (See **Fig. 10.14.1** (a))
2. Connection by soft brackets is a connection by bracket to the transverse members such as beams or equivalent thereto. (See **Fig. 10.14.1** (b))

303. Buckling strength

1. Buckling strength of longitudinal frames, beams and stiffeners is to be in accordance with the requirements in (1) to (3) below. In case where, the Society specially considers necessary according to the materials, scantlings, geometries and the point of arrangement of these structural members, detailed assessment may be required.

(1) Longitudinal beams, side longitudinals attached to the sheer strakes and longitudinal stiffeners attached to the longitudinal bulkhead within 0.1 D from the strength deck are to have a slenderness ratio not exceeding 60 at the midship part as far as practicable.

(2) As for flat bars used for longitudinal beams, frames and stiffeners, the ratio of depth to thickness is not to exceed 15.

(3) The full width of face plates of longitudinal beams, frames and stiffeners is not to be less than that obtained from the following formula:

$$b = 2.2\sqrt{d_0 l} \quad \text{(mm)}$$

where:

d_0 = depth of web of longitudinal beams, frames or stiffeners (m).

l = spacing of transverses (m).

2. In case where flanged plates other than flat bars are used for frames, longitudinal beams or stiffeners in cargo oil tanks and deep tanks whose scantlings are specified only in terms of section modulus, the thickness of webs is not to be less than that obtained from the following formula. In case where, however, the depth of webs is intended to be greater than the required level due to reasons other than strength, it may be suitably modified.

$$t = 0.015 d_0 + 2.5 \quad \text{(mm)}$$

where:

d_0 = depth of web (mm).

Section 4 Structural Members in Double Bottoms

401. Scantlings of girders and floors

The arrangements and scantlings of girders, floors and various structural members connected to them provided in double bottoms are to be in accordance with the relevant requirements in **Ch 7** in addition to the requirements in this chapter.

402. Other structural members

Structural members other than specified in **401** are to be in accordance with the requirements in **Ch 7** in addition to the requirements in this chapter.

Section 5 Structural Members in Double Side Hull

501. Arrangement

1. In case where a ship is provided with double side hull, the width of the double side hull is not to be less than 760 mm.

2. In double side hull, transverses are to be provided at a spacing not exceeding about 3.5 m.

3. In addition to the requirements in **Par 2**, the following spaces are to be provided with transverses:
(1) Spaces where solid floors are provided in double bottom
(2) Side of transverse bulkheads

502. Thickness of transverses

Thickness of transverses is not to be less than that obtained from the following formulae:

Transverse system : $t = 0.6\sqrt{L} + 1.5$ (mm)
Longitudinal system : $t = 0.7\sqrt{L} + 1.5$ (mm)

503. Lightening holes

Within about 0.2 D from inner bottom plating, the diameter of lightening holes provided in transverses in the middle half length of cargo oil tank is not to exceed about 1/5 of the width of transverses. However, if adequate reinforcements are provided, this requirements may be suitably modified for cases where the length of cargo oil tank is especially short.

Section 6 Girders and Transverses in Cargo Oil Tanks and Deep Tanks

601. Scantlings

1. The section modulus of girders is not to be less than that obtained from the following formula:

$Z = 7.13\,Shl^2$ (cm^3)

where:

S = breadth of area supported by girders (m).
l = overall length of girder (m), which is equal to the distance between the inner surfaces of face plates of girders.
h = as specified in **Table 24.1.1,** where, however, "from the lower edge of the bulkhead

Plating under consideration" is to be construed as "from the mid-point of S" for horizontal girders, and as "from the mid-point of l" for vertical girders.

2. Moment of inertial of girders is not to be less than that obtained from the following formula. However, the depth of girders is not to be less than 2.5 times the depth of slots.

$$I = 30hl^4 \quad (\text{cm}^4)$$

where:

h, l = as specified in **Par 1.**

3. Thickness of girders is not to be less than that obtained from the following formula:

$$t = 10S_1 + 2.5 \quad (\text{mm})$$

where:

S_1 : spacing of stiffeners or depth of girders, whichever is the smaller (m).

4. Thickness of flat bar stiffeners and tripping brackets provided on girders, transverses and stiffeners attached to bulkhead is not to be less than obtained that from the following formula. However, it needs not exceed the thickness of webs of the girder to which they are provided.

$$t = 0.5\sqrt{L} + 2.5 \quad (\text{mm})$$

5. The thickness of face plates forming a girder is not to be less than the thickness of webs, and the full width is not to be less than that obtained from the following formula:

$$b = 2.7\sqrt{d_0 l} \quad (\text{mm})$$

where

d_0 = depth of girder (m). In case where girders are of the balanced girder type, depth from the plate surface to face plate (m).

l = distance between supporting points of girder. In case where, however, effective tripping brackets are provided, they may be regarded as supporting points.

602. Side transverses for ships without double side hull

1. In addition to the requirements in **601. 1** depth and the section modulus of side transverses in areas carrying cargo oil are not to be less than the value obtained from the following formulae respectively, where, however, the depth of side transverses is not to be less than 2.5 times the depth of slots:

$$d_0 = 0.15l_0 \quad (\text{m})$$
$$Z = 8.7k^2Shl_0^2 \quad (\text{cm}^3)$$

where:

l_0 = overall length of side transverses (m), which is equal to the distance between the inner surfaces of face plates of deck transverses and inner bottom plating.

S = spacing of transverse (m).

h = distance from the mid-point of l0 to a point of $d+0.044L-0.54$ above top of keel (m).

k = correction factor for brackets obtained from the following formula. (See **Fig.10.23.1**)

$$k=1-\frac{0.65(b_1+b_2)}{l_0}$$

where :

b_1, b_2 = length of bracket arm at ends of transverse (m).

2. For ships with trunks, the construction of providing continuous deck transverses across the trunks is to be considered as the standard. In this case, the depth of deck transverses that can be regarded as those supported by trunks may be 0.03 B.

Section 7 Strengthened Bottom Forward

701. Strengthened area of the forward bottom

The area of strengthened bottom forwards to be in accordance with the requirements in **Ch 4, 404** and **Ch 7, Sec 9.**

Section 8 Structural Details

801. General

1. The principal structural members are to be arranged so that continuity of strength can be secured throughout the cargo area. In forward and afterward parts of the cargo area, the structures are to be effectively strengthened so that continuity of strength is not impaired sharply.

2. For the principal structural members, sufficient consideration is to be given for fixity at ends, supporting and stiffening systems against out-of plane deflections, and the construction is to minimize local stress concentrations.

802. Frames and stiffeners

Longitudinal beams, frames and stiffeners are to be of continuous structures, or to be connected securely so that their sectional areas at ends can be properly maintained providing sufficient resistance against bending moments.

803. Girders and cross ties

1. Girders provided within the same plane are to be arranged to avoid sharp changes in strength an rigidity, and brackets in suitable size are to be provided at the ends of girders, and bracket toes are to sufficiently rounded.

2. In case where the depth of longitudinal girders is large, stiffeners are to be arranged in paralled with face plates.

3. Tripping brackets are to be provided on the web plate transverses at the inner edge of end brackets, etc. and also at proper intervals in order to support transverses effectively.

4. The upper and lower end brackets for transverses and transverses for longitudinal bulkheads and webs in the vicinity are to be suitably stiffened.

Section 9 Special Requirements for Corrosion

901. Thickness of shell plating

1. The thickness of shell plating forming the casing of cargo oil tanks planned to carry ballast water in ships without double side hull is not to be less than a thickness added with 0.5 mm to that obtained from the requirements in **Ch 4.**

2. 0.5 mm may be reduced for the thickness of shell plating when applying the requirements of this chapter from the thickness obtained from the formula given in **201.**

902. Thickness of deck plating

1. 0.5 mm may be reduced for the thickness of freeboard deck plating when applying the requirements in this chapter from the obtained by the formula given in **201.**

2. At least 0.5 mm is to be added for the thickness of freeboard deck plating in spaces carrying cargo oil from the thickness obtained by the formula given in **Ch 5.**

903. Thickness of tank top plating

The thickness of tank top plating in cargo oil tanks and deep tanks is not to be less than the thickness corresponding to that obtained from the formula given in **201.** added by 1.0 mm. Such an addition, however, is not required for the thickness of inner bottom plating.

904. Section modulus of longitudinal beams, frames and stiffeners

1. The section modulus of longitudinal beams provided on deck plating in spaces carrying cargo oil is not to be less than 1.1 times that calculated according to the requirements of **302.**

2. The section modulus of frames and stiffeners provided on shell plating and bulkheads forming cargo oil tanks planned to carry ballast water, except the tank to carry ballast water only in heavy weather conditions, is not to be less than the value obtained from the Z_1 in the requirements of **301. 2** using a coefficient as 9.3, and the Z_2 using a coefficient as 3.2 respectively. The section modulus of stiffeners in above mentioned cargo oil tanks is not to be less than 1.1 times that calculated in accordance with the requirements in **302.**

Section 10 Special requirements for Hatchways and Permanent Gangways

1001. Ships having unusually large freeboard

Relaxation from the requirements in this section will be considered to ships having an unusually large freeboard.

1002. Hatchways to cargo oil tanks

1. The thickness of coaming plates is not to less than 10 mm. Where the length and coaming height of a hatchway exceed 1.25 m and 760 mm respectively, vertical stiffeners are to be provided to the side or end coamings, and the upper edge of coamings is to be suitably stiffened.

2. Hatch covers are to be of steel or other approved materials. The construction of steel hatch covers is to comply with the following requirements (1) through (4). The construction of hatch covers of materials other than steel is to be in accordance with the discretion of the Society.

(1) The thickness of cover plates is not to be less than 12 mm. In ships not exceeding 60 m, in length, however, the requirement may be modified.

(2) Where the area of a hatchway exceeds 1 m^2 but does not exceed 2.5 m^2, cover plates are to be stiffened by flat bars of 100 mm in depth spaced not more than 610 mm apart. Where, however, the cover plates are 15 mm or more in thickness the stiffener may be dispensed with.

(3) Where the area of a hatchway exceed 2.5 m^2 cover plates are to be stiffened by flat bars of 125 mm in depth spaced not more than 610 mm apart.
(4) The covers are to be secured by fastenings spaced not more than 457 mm apart in circular hatchways or 380 mm apart and not more than 230 mm from the corners in rectangular hatchways.

3. The cover is to be provided with an opening at least 150 mm in diameter which is to be so constructed as to be capable of being closed oiltight by means of a screw plug or a cover of peep hole.

4. Hatchway coamings are to be provided with gas cocks or other suitable exhausting devices.

1003. Hatchways to spaces other than cargo oil tanks

In exposed positions on the freeboard and forecastle decks or on the top of expansion trunks, hatchways serving spaces other than cargo oil tanks are to be provided with steel watertight covers having scantlings complying with the requirements in **Ch 19, Sec 4.**

1004. Gangway and Access

1. A fore and after permanent gangway complying with the requirements in **Ch 21, 503.** is to be provided at the level of the superstructure deck between the midship bridge or deckhouse and the poop or after deckhouse, or equivalent means of access is to be provided to carry out the purpose of the gangway such as passage below deck. Elsewhere, and in ships without midship bridge and deckhouse, arrangements to the satisfaction of the Society are to be provided to safeguard the crew in reaching all parts used in the necessary work of the ship.

2. Safe and satisfactory access from the gangway level is to be available between crew accommodation spaces and machinery spaces or between separated crew accommodation spaces.

3. Where superstructures are connected by trunks, open rails are to be provided for the whole length of exposed parts of freeboard deck. ⚓

KOREAN REGISTER

2011

Guidance Relating to the Rules for the Classification of Steel Ships

Part 10

Hull Structures and Equipment of Small Steel Ships

GA-10-E

KOREAN REGISTER OF SHIPPING

APPLICATION OF THE GUIDANCE

This "Guidance relating to the Rules for Classification of Steel Ships" (hereafter called as the Guidance) is prepared with the intent of giving guidines as to the treatment of the various provisions for items required the unified interpretations and items not specified in details in the Rules, and the requirements specified in the Guidance are to be applied, in principle, in addition to the various provisions in the Rules.
As to any technical modifications which can be regarded as equivalent to any requirements in the Guidance, their flexible application will be properly considered.

APPLICATION OF PART 10
"HULL STRUCTURE AND EQUIPMENT OF SMALL STEEL SHIPS"

1. Unless expressly specified otherwise, the requirements in the Guidance apply to ships for which contracts for construction are signed on or after 1 July 2011.
2. The amendments to the Guidance for 2010 edition and their effective date are as follows;

Effective Date : 10 Jan. 2011

CHAPTER 15 DEEP TANKS

Section 2 Bulkheads of Deep Tanks

- 202. has been newly added.

Effective Date : 1 July 2011

CHAPTER 1 GENERAL

Section 2 General

- 201. Table 10.1.2 has been amended.

CONTENTS

CHAPTER 1 GENERAL

Section 1 Definitions

101. Application

As specified in **Pt 3, Ch 1, 101.** of the Guidance.

102. Length

As specified in **Pt 3, Ch 1, 102.** of the Guidance.

104. Breadth

As specified in **Pt 3, Ch 1, 104.** of the Guidance.

105. Depth

As specified in **Pt 3, Ch 1, 106.** of the Guidance.

Section 2 General

201. Application

1. For the ships classed for coastal service area, reduction for scantlings of the ship is to be as followings.

(1) For the requirements of the applicable chapters of Rules, scantlings of structural members may be lightened with the rate specified in **Table 10.1.1,** however, not less than the minimum dimensions specified in **Table 10.1.1.**

(2) For the reduction for scantlings of the members not specified in **Table 10.1.1,** it is to be in accordance with the discretion of the Society.

(3) When the cargoes loaded on the deck beams or heavy cargoes loaded on inner bottom plates and longitudinals, deep tanks and etc, the reduction for scantlings of the members is not permitted

(4) The height of hatch coaming and seals for every access opening may be in accordance with **Table 10.1.2.** However, closures of hatchways are to be in accordance with the discretion of the Society.

(5) The equipment number and equipment are to be in accordance with **Ch. 22** of the Rules. However, one anchor is to be more than the weight specified in **Table 10.22.1** of the Rules. and another anchor is to be more than 85 % the weight specified in **Table 10.22.1** of the Rules.

2. For the ships classed for smooth water service area, reduction for scantlings of the members is to be as followings.

(1) For the requirements of the applicable chapters of Rules, scantlings of structural members may be lightened with the rate specified in **Table 10.1.1,** however, not less than the minimum dimensions specified in **Table 10.1.1.**

(2) For the reduction for scantlings of the members not specified in **Table 10.1.1,** it is to be in accordance with the discretion of the Society.

(3) When the cargoes loaded on the deck beams or heavy cargoes loaded on inner bottom plates and longitudinals, deep tanks and etc, the reduction for scantlings of the members is not permitted

(4) The height of hatch coaming and seals for every access opening may be in accordance with **Table 10.1.2.** However, closures of hatchways are to be in accordance with the discretion of the Society.

(5) In case of the cargoes being not loaded on the steel hatch covers, 4.5 mm thick plates may be used for the steel hatch covers.

(6) The steel hatch covers are to be set up stiffeners in proper space and for not intended to carry cargos or stores on them, the section modulus of the stiffeners may be properly considered as the scantlings of provisions specified in **Ch. 19, 303.** of the Rules.
(7) The equipment number and equipment are to be in accordance with above **1,** (5). However, for the equipment letters specified in **Table 10.22.1** of the Rules. one lower grade of the letter may be applied according to the equipment number required in **Ch. 22, 201** of the Rules.

Table 10.1.1 Minimum dimension and lightening of the members

Item		Coastal services	Smooth water services	Minimum dimension
Longitudinal strength	M_w	20 %	30 %	-
	Z_{min}	10 %	15 %	-
Shell plating(including plate keels)		5 %	10 %	6 mm, (excluding superstructure)
Min. thickness of deck		1 mm	1 mm	5 mm
Section modulus of frame(including bottom longitudinals)		10 %	20%	30 cm^3
Section modulus of deck frame		15 %	15 %	-
Section modulus of girder under deck		15 %	15 %	-
Plate thick. of double bottom		1 mm	1 mm	5.5 mm
Plate thick. of single bottom		0.5 mm	10 % or 1 mm whichever is smaller	-
Plate thick. of B.H.D of super. structure end and section modulus of B.H.D stiffener		10 %	10 %	-

Note :
1. For the ships engaging in international services may not be lightened the thickness of B.H.D of superstructure end and moment of inertia of B.H.D stiffeners.
2. Z_{min} & M_w : refer to **Table 10.3.1** of the Rules

Table 10.1.2 Height of sills of hatch coaming and other access openings

Service area	Type	Normal Hatchway		Small Hatchway (area of hatchway) less than 0.45 m^2		Small Hatchway (area of hatchway) 0.45～1.5 m2		Companion ways		Access opening of superstructure end		Ventilation tunnel	
	Ship length / Position	less than 30 m	more than 30 m	less than 30 m	more than 30 m	less than 30 m	more than 30 m	less than 30 m	more than 30 m	less than 30 m	more than 30 m	less than 30 m	more than 30 m
Costal service	I	450	600	230	380	380	450	300	450	300	380	760	900
	II	300	450	180	230	230	380	150	300	100	300	450	760
Smooth water service	I	300	450	150	230	230	380	150	300	150	300	450	760*
	II	150	300	100	180	150	230	100	100	100	100	450	450

Note:
1. For the ships engaging in international services are to be excluded
2. * : For the tug boats not engaging in international services, the height of ventilation tunnel may be more than 450 mm

203. Ships on unusual form or proportion, or intended for carriage of special cargoes

As specified in **Pt 3, Ch 1, 203.** of the Guidance.

Section 3 Materials, Welding and Construction

301. Materials

1. As for ships 60 m and above in length, plating materials for stern frames, rudder horns, rudders and shaft brackets are to be used of higher than Grade I of **Table 10.1.2** of the Rules.

2. Where high tensile steels are used, the formulas for thickness of deck and shell platings, the section modulus of stiffeners, and other scantlings etc., are to be in accordance with the requirements of **Pt 3.** ⚓

CHAPTER 2 STEMS AND STERN FRAMES

Section 1 Stems

101. Plate stems

As specified in **Pt 3, Ch 2, 101.** of the Guidance.

Section 2 Stern Frames

202. Propeller posts

1. The welding of cast steel stern frames are to be in accordance with the **Pt 3, Ch 2, 202.** of the Guidance.

2. The connection of cast steel boss and plate parts of built-up stern frame is to be in accordance with the **Pt 3, Ch 2, 203.** of the Guidance.

203. Shoe pieces

As specified in **Pt 3, Ch 2, 205.** of the Guidance.

204. Heel pieces

As specified in **Pt 3, Ch 2, 206.** of the Guidance. ⚓

CHAPTER 3 LONGITUDINAL STRENGTH

Section 1 General

101. Special case in application

As specified in **Pt 3, Ch 3, 101.** of the Guidance.

103. Loading manual

As specified in **Pt 3, Ch 3, 103.** of the Guidance.

104. Longitudinal strength loading instrument

As specified in **Pt 3, Ch 3, 104.** of the Guidance.

Section 2 Bending Strength

201. Bending strength at amidships

As specified in **Pt 3, Ch 3, 201.** of the Guidance.

203. Calculation of hull section modulus

As specified in **Pt 3, Ch 3, 203.** of the Guidance. ⚓

CHAPTER 4 PLATE KEELS AND SHELL PLATINGS

Section 3 Shell Plating for Midship Part of Ship

303. Sheer strakes for midship part

As specified in **Pt 3, Ch 4, 303.** of the Guidance.

Section 4 Shell Plating for End Parts

401. Shell plating for end parts

1. The thickness of shell plating of curved parts within 0.3 L from the forward and aft end may be calculated with the value of S taken as equal to 1.1times the vertical or horizontal distance between frames a as shown in **Fig. 10.4.1.**

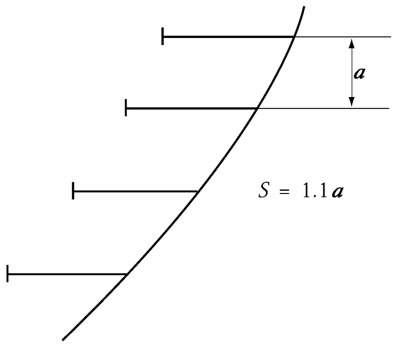

Fig 10.4.1 Relation of S and a in end parts

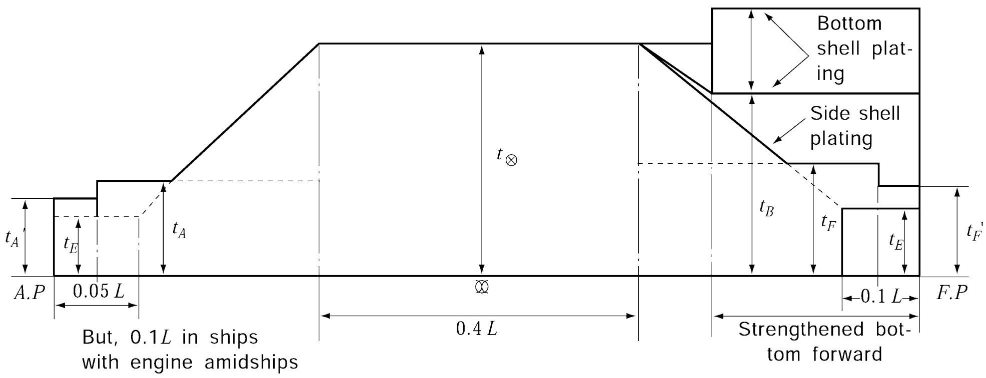
2. The thickness of shell plating is not to be less than the thickness shown in **Fig. 10.4.2** approximately at the middle of length of each plates.



$t_{\otimes}$: Required thickness of shell plating in midship part(to be the actual thickness, if actual thickness is greater than required due to assuring the longitudinal strength)
t_E : Required thickness of shell plating in end parts($4.6 + 0.44L$) (mm)
$t_F(t_F')$: Required thickness of shell plating within 0.3L from the fore end($1.34\,S\sqrt{L} + t_C$) (mm)
$t_A(t_A')$: Required thickness of shell plating within 0.3L from the aft end($1.20\,S\sqrt{L} + t_C$) (mm)
t_B : Required thickness of shell plating in strengthened bottom forward (mm)

Fig 10.4.2 Tapering of shell plating thickness

404. Strengthened bottom forward

As specified in **Pt 3, Ch 4, 404.** of the Guidance.

Section 5 Side Plating in way of Superstructure

503. Compensation at end Superstructure

As specified in **Pt 3, Ch 4, 601.** of the Guidance.

Section 6 Local Compensation of Shell Plating

601. Opening in shell

As specified in **Pt 3, Ch 4, 701.** of the Guidance.

602. Thickness of sea chest

As specified in **Pt 3, Ch 4, 702.** of the Guidance. ⚓

CHAPTER 5 DECKS

Section 1 General

101. Steel deck plating
As specified in **Pt 3, Ch 5, 101.** of the Guidance.

102. Watertightness of decks
As specified in **Pt 3, Ch 5, 102.** of the Guidance.

104. Compensation for openings
As specified in **Pt 3, Ch 5, 104.** of the Guidance.

105. Rounded gunwales
As specified in **Pt 3, Ch 5, 105.** of the Guidance.

Section 2 Effective Sectional Area of Strength Deck

202. Effective sectional area of strength deck
As specified in **Pt 3, Ch 5, 202.** of the Guidance.

204. Long poop
As specified in **Pt 3, Ch 5, 204.** of the Guidance.

205. Superstructure deck designed as strength deck
As specified in **Pt 3, Ch 5, 205.** of the Guidance. ⚓

CHAPTER 7 DOUBLE BOTTOMS

Section 1 General

101. Application

1. For the ships subject to **SOLAS** or **Korean Ship Safety Act.,** inner bottom plate is to be continued out to the ship's sides in such a manner as to protect the bottom to the turn of the bilge. And the inner bottom is not to be lower at any part than a plan parallel with the keel line and which is located not less than a vertical distance h measured from the keel line, as calculated by the formula:

$$h = B/20$$

However, in no case is the value of h to be less than 760 mm, and need not be taken as more than 2,000 mm.

2. For the ships subject to **SOLAS** or **Korean Ship Safety Act.,** and whose gross tonnages are more than 500 and engaged in international service, a double bottom may be omitted provided it is satisfied for flooding calculation of **Pt 3, Ch 7, 101. 2.**

103. Drainage

1. Small wells constructed in the double bottom in connection with drainage arrangements of holds are not to be extend downward more than necessary. A well extending to the outer bottom is, however, permitted at the after end of the shaft tunnel.

2. Other wells (e.g., for lubricating oil under main engines) may be permitted by the Society if satisfied that the arrangements give protection equivalent to that afforded by a double bottom complying with this Chapter.

3. For the ships subject to **SOLAS** or **Korean Ship Safety Act.,** except a well at the end of the shaft tunnel, the vertical distance from the bottom of such a well to a plane coinciding with the keel line is not to be less than 500 mm.

Section 5 Bottom Longitudinals

502. Scantlings

As specified in **Pt 3, Ch 7, 403. 2.** of the Guidance.

Section 6 Inner Bottom Plating and Margin Plates

601. Thickness of inner bottom plating

As specified in **Pt 3, Ch 7, 501. 4.** of the Guidance.

Section 9 Construction of Strengthened Bottom Forward

901. Application

As specified in **Pt 3, Ch 7, 801.** of the Guidance.

902. Strengthened bottom forward

As specified in **Pt 3, Ch 7, 802.** of the Guidance. ⚓

CHAPTER 8 FRAMES

Section 3 Transverse Hold Frames

302. Scantlings of transverse hold frames

As specified in **Pt 3, Ch 8, 302.** of the Guidance.

Section 5 Tween Deck Frames

502. Scantlings

As specified in **Pt 3, Ch 8, 502.** of the Guidance.

503. Special care to tween deck frames

As specified in **Pt 3, Ch 8, 503.** of the Guidance. ⚓

CHAPTER 9 CANTILEVER BEAM CONSTRUCTION

Section 3 Connection of Cantilever Beams to Web Frames

301. Connections

As specified in **Pt 3, Ch 9, 503.** of the Guidance. ⫝̸

CHAPTER 10 BEAMS

Section 1 General

102. Connections of ends of beams

As specified in **Pt 3, Ch 10, 102.** of the Guidance.

Section 2 Deck Load

201. Value of h

As specified in **Pt 3, Ch 10, 201.** of the Guidance.

Section 3 Longitudinal Beams

303. Section modulus

As specified in **Pt 3, Ch 10, 303.** of the Guidance.

Section 4 Transverse Beams

402. Propotion

As specified in **Pt 3, Ch 10, 402.** of the Guidance. ⚓

CHAPTER 11 DECK GIRDERS

Section 1 General

103. Construction

As specified in **Pt 3, Ch 11, 103.** of the Guidance.

104. End connection

As specified in **Pt 3, Ch 11, 104.** of the Guidance.

Section 2 Longitudinal Deck Girders

201. Section modulus

As specified in **Pt 3, Ch 11, 201.** of the Rules. ⚓

CHAPTER 12 PILLARS

Section 1 General

102. Pillar in holds

As specified in **Pt 3, Ch 12, 102.** of the Guidance.

Section 2 Scantling of Pillars

201. Sectional area

As specified in **Pt 3, Ch 12, 201.** of the Guidance. ⚓

CHAPTER 13 ARRANGEMENTS TO RESIST PANTING

Section 1 General

102. Swash Plates

As specified in **Pt 3, Ch 13, 102.** of the Guidance.

103. Stringers fitted up with extremely small angles

As specified in **Pt 3, Ch 13, 103.** of the Guidance.

Section 2 Arrangements to resist Panting Forward the Collision Bulkhead

201. Constructions and arrangements

Where bottom plates of chain lockers, which are located forward collision bulkhead and reach side shell, are not situated in the level of side stringer, horizontal girders are recommended to be fitted in chain lockers at the stringer level.(See **Fig. 10.13.1**) ⚓

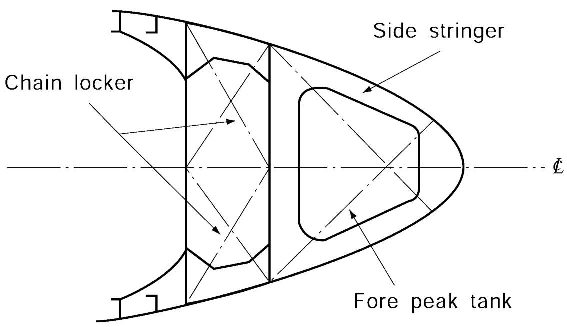


Fig 10.13.1 Construction and arrangement to resist panting in way of chain locker

CHAPTER 14 WATERTIGHT BULKHEADS

Section 1 Arrangement

101. Collision bulkheads

As specified in **Pt 3, Ch 14, 201.** of the Guidance.

104. Hold bulkheads

As specified in **Pt 3, Ch 14, 204.** of the Guidance.

Section 2 Construction

203. Stiffeners

As specified in **Pt 3, Ch 14, 303.** of the Guidance.

Section 3 Watertight Doors

302. Type of Watertight Doors

As specified in **Pt 3, Ch 14, 402.** of the Guidance.

309. Sliding Doors

As specified in **Pt 3, Ch 14, 409.** of the Guidance. ⚓

CHAPTER 15 DEEP TANKS

Section 1 General

103. Divisions in tanks

As specified in **Pt 3, Ch 15, 103.** of the Guidance.

Section 2 Bulkheads of Deep Tanks

202. Bulkhead plates

As specified in **Pt 3, Ch 15, 202.** of the Guidance.

203. Bulkhead stiffeners

As specified in **Pt 3, Ch 15, 203.** of the Guidance. ⚓

CHAPTER 16 SUPERSTRUCTURES AND DECKHOUSES

Section 3 Access Openings in Superstructure End Bulkheads

301. Closures for access openings

As specified in **Pt 3, Ch 16, 301.** of the Guidance. ⚓

CHAPTER 17 MACHINERY SPACES AND ENGINE CASINGS

Section 1 General

102. Compensation

Sectional area of face plates of web frames in machinery spaces is not to be less than the values obtained from following formula. However, scantlings of web frames may be determined by the other suitable calculation approved by the Society.

$$A = \frac{8KlSL}{d_w} - \frac{d_w t_w}{600} \quad (\text{cm}^2)$$

Where :

K = coefficient obtained in following formula

in case that P is equal to C and over : $K = 0.4(P/C-1)+l$

in case that P is less than C and over : $K = 0.2(P/C-1)+l$

P = maximum continuous output of main engine (PS)

C = coefficient obtained in following formula

in case that ships are 50 m in length and smaller : C = 10 L

in case that ships are over 50 m in length : C = 35 L - 1250

l = vertical distance from the top of inner bottom platings to the top of beams of lowest deck at side of ships (m)

S = spacing of web frames (m)

L = length of ships (m)

d_w = depth of web plates of web frames (mm)

t_w = thickness of web plates of web frames (mm)

Section 2 Main Engine Foundations

201. Sips with single bottoms

Where spacing of girders beneath main engines is narrow, center girder may be omitted. However, intercostal plates are recommended to be fitted with along centre line.

202. Ships with double bottoms

As specified in **Pt 3, Ch 18, 202.** of the Guidance. ⚓

CHAPTER 19 HATCHWAYS AND OTHER DECK OPENINGS

Section 1 General

101. Application

The regulation of **101. 3** of the Rules is not to be applied to the vessel which engaged in domestic service only.

102. Position of exposed deck openings

As specified in **Pt 4, Ch 2, 102.** of the Guidance.

Section 2 Hatchways

202. Height of hatchway coamings

As specified in **Pt 4, Ch 2, 201.** of the Guidance.

203. Construction of hatchway coamings

1. The thickness of small hatch way coaming (t) provided with weathertight steel hatch covers is to be as following formula;

$$t = 0.05L + 4 \quad \text{(mm)}$$

2. Construction and scantling of hatch way coamings for deep tanks is to be complied with **Pt 3, Ch 15** of the Rules as well as **Pt 4, Ch 2** of the Rules.

Section 4 Hatchways Closed by Weathertight Covers fitted with Gaskets and Clamping Devices

401. Steel weathertight covers

The details of gaskets and clamping devices for steel weathertight covers are to apply the provisions in **Pt 4, Ch 2, Sec 7** of the Rules. However, the standard spacings of securing devices are 0.5 m or less at the corner of the cover, and 1.0 m or less elsewhere.

Section 6 Companion Ways and Other Deck Openings

602. Companion ways

As specified in **Pt 4, Ch 2, 901.** of the Guidance. ⚓

CHAPTER 21 BULWARKS, FREEING PORTS, SIDE SCUTTLES, VENTILATORS AND PERMANENT GANGWAYS

Section 2 Freeing Ports

202. Area of freeing ports

As specified in **Pt 4, Ch 4, 202.** of the Guidance.

203. Arrangement of freeing ports

As specified in **Pt 4, Ch 4, 204.** of the Guidance.

Section 3 Side Scuttles

302. Application

As specified in **Pt 4, Ch 4, 302.** of the Guidance. ⚓

CHAPTER 22 EQUIPMENT NUMBER AND EQUIPMENT

Section 1 General

101. General and application

1. Where Danforth anchors having constructions of special shape and dimensions are used,(provided with ships less than 30 m in length) drawings and data related to the anchor are to be submitted to the Society for obtaining approval prior to making it.

2. Where the equipment number is to be calculated in accordance with the requirements of **57** of **Regulation for Ships Equipments**, danforth anchor, anchor ropes and mooring ropes in specified **Table 10.22.1** may be provided with according to the equipment number.

Table 10.22.1 Danforth anchor and ropes

Equipment Number		Danforth Anchor		Ropes for anchor(per each anchor)						Tow Line		Mooring Line		
					Diameter (mm)									
								Chain						
Exceeding	Not exceeding	Number	Weight per abchor (kg)	Length (m)	Manilar Rope	Nylon Rope	Vinyl Rope	Grade 1	Grade 2	Length (mm)	Diameter (mm)	Number	Length (mm)	Diameter (mm)
80	90	2	20	60	24	17	20	·		110	28	·	·	·
90	105	2	25	70	28	20	24	·		110	30	1	165	20
105	140	2	30	80	32	22	27	·		110	32	1	165	20
140	175	2	40	90	35	25	30	·		135	34	1	165	22
175	215	2	50	100	38	27	33	·		135	36	1	165	24
215	255	2	60	100	42	30	36	14	12.5	135	40	1	165	24
255	295	2	70	110	45	32	38	14	12.5	135	45	1	165	24
295	390	2	95	110	50	35	42	16	14	135	50	1	165	32
390	445	2	125	120	60	42	50	17.5	16	135	50	1	165	32

3. Dimensions of danforth anchor are to be in accordance with the **Table 10.22.2.** and other denforth anchors having dimensions not specified in above **1** and **2** are to be in accordance with the discretion of the Society.

Table 10.22.2 Dimensions of danforth anchor

Size(mm) / Weight(kg)	A	B	C	D	E	F	G
20	825	463	361	685	95	18	23
25	890	500	390	740	104	20	25
30	945	565	414	784	109	21	26
40	1,049	590	460	872	122	24	29

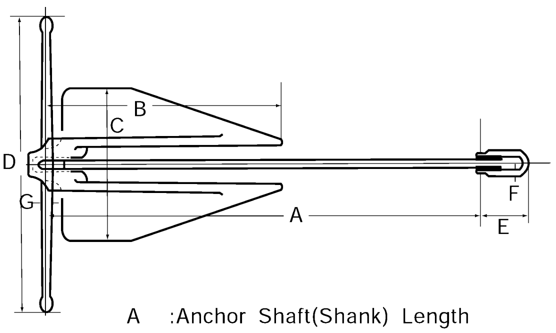
75	1,280	719	561	1,063	149	29	35
100	1,400	790	616	1,170	163	31	43
120	1,500	840	657	1,240	174	34	45



A :Anchor Shaft(Shank) Length
B :Bill(pea)↔Stock Center
C :Anchor Arm(p)↔Anchor Arm(s)
D :Stock length
E :Anchor Ring(Shackle) Length
F :Anchor Ring(Shackle) Dia.
G :Stock Dia.

Section 2 Equipment Number

201. Equipment number

As specified in **Pt 4, Ch 8, 201.** of the Guidance.

202. Weight of anchors

"High holding power anchors" in **202. 3** of the Rules means the anchors that have the holding power more than 2 times the holding power of stockless anchor with the same weight when the holding power test specified in **Ch 3, Sec 14.** of the Guidance for approval of manufacturing process and type approval, etc is to be carried out. ⚓

CHAPTER 23 OIL TANKERS

Section 1 General

101. Application

As specified in **Pt 7, Ch 1, 101. 3.** of the Guidance.

102. Arrangement of bulkheads

As specified in **Pt 7, Ch 1, 102.** of the Guidance.

103. Cofferdams

As specified in **Pt 7, Ch 1, 103.** of the Guidance.

104. Airtight bulkheads

As specified in **Pt 7, Ch 1, 104.** of the Guidance.

Section 2 Hatchways, Gangways and Freeing Arrangements

205. Freeing arrangements

As specified in **Pt 7, Ch 1, 205.** of the Guidance. ⚓

CHAPTER 24 DOUBLE HULL TANKERS

Section 1 General

101. Application

As specified in **Pt 7, Ch 10, 101.** of the Guidance.

102. Arrangement and separation of spaces

As specified in **Pt 7, Ch 10, 102.** of the Guidance.

Section 2 Bulkhead Plating

202. Swash bulkheads

As specified in **Pt 7, Ch 10, 202.** of the Guidance. ⚓

Rules for the Classification of Steel Ships
Guidance Relating to the Rules for the Classification of Steel Ships

PART 10 HULL STRUCTURE AND EQUIPMENT OF SMALL STEEL SHIPS

Rules for the Classification of Steel Ships

Part 11

Common Structural Rules for Bulk Carriers

RA-11-E

KOREAN REGISTER OF SHIPPING

COMMON STRUCTURAL RULES FOR BULK CARRIERS

Foreword

1. This version of the Rules is effective as of 1st July 2010.

2. This version incorporates rule changes made to the 1 July 2008 consolidated edition.

2.1 Note that changes included in Rule Change Notice 1 to the 1 July 2008 consolidated edition are effective from 1 July 2009.

3. The Rules contain structural requirements for the Classification of Bulk Carriers of 90 m in length or greater.

4. The Rules contain thirteen chapters.

5. The following table provides a revision history of the Rules.

	Amendment Type / No.	Approval Date	Effective Date*	Reference Rule Edition
1	Corrigenda 1	15 May 2006	1 April 2006	1 Jan 2006 edition
2	Corrigenda 2	29 Jan 2007	1 April 2006	1 Jan 2006 edition
3	Corrigenda 3	19 July 2007	1 April 2006	1 Jan 2006 edition
4	Corrigenda 4	3 Sept 2007	1 April 2006	1 Jan 2006 edition
5	Rule Change Notice 1	30 Nov 2007	1 April 2008	1 Jan 2006 edition
6	Rule Change Notice 2	25 Feb 2008	1 July 2008	1 Jan 2006 edition
7	Corrigenda 5	15 May 2008	1 April 2006	1 Jan 2006 edition
8	Rule Change Notice 3 (Urgent)	12 Sept 2008	12 Sept 2008	1 Jan 2006 edition

	Amendment Type / No.	Approval Date	Effective Date*	Reference Rule Edition
9	Rule Change Notice 1 (1 July 2008 consolidated edition)	30 Jan 2009	1 July 2009	1 July 2008 consolidated edition
10	Rule Change Notice 2 (1 July 2008 consolidated edition)	12 Apr 2010	1 July 2010	1 July 2008 consolidated edition

* For effective date, refer to the implementation statements of relevant Corrigenda / Rule Changes.

Note: When the word '(void)' appears in the text, it means that the concerned part has been deleted. This is to keep the numbering of the remainder unchanged.

Table of Contents

Chapter 1

General Principles

Section 1 – APPLICATION

1. General

1.1 Structural requirements

1.1.1

These Rules apply to ships classed with the Society and contracted for construction on or after 1 April 2006.

Note: The "contracted for construction" means the date on which the contract to build the ship is signed between the prospective owner and the shipbuilder. For further details regarding the date of "contracted for construction", refer to IACS Procedural Requirement (PR) No.29.

1.1.2

These Rules apply to the hull structures of single side skin and double side skin bulk carriers with unrestricted worldwide navigation, having length L of 90 m or above.

With bulk carrier is intended sea going self-propelled ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo length area and intended primarily to carry dry cargoes in bulk, excluding ore and combination carriers.

Hybrid bulk carriers, where at least one cargo hold is constructed with hopper tank and topside tank, are covered by the present Rules. The structural strength of members in holds constructed without hopper tank and/or topside tank is to comply with the strength criteria defined in the Rules.

1.1.3

The present Rules contain the IACS requirements for hull scantlings, arrangements, welding, structural details, materials and equipment applicable to all types of bulk carriers having the following characteristics:

- $L < 350$ m
- $L / B > 5$
- $B / D < 2.5$
- $C_B \geq 0.6$

1.1.4

The Rule requirements apply to welded hull structures made of steel having characteristics complying with requirements in **Ch 3, Sec 1**. The requirements apply also to welded steel ships in which parts of the hull, such as superstructures or small hatch covers, are built in material other than steel, complying with requirements in **Ch 3, Sec 1**.

1.1.5

Ships whose hull materials are different than those given in **[1.1.4]** and ships with novel features or unusual hull design are to be individually considered by the Society, on the basis of the principles and criteria adopted in the present Rules.

1.1.6

The scantling draught considered when applying the present Rules is to be not less than that corresponding to the assigned freeboard.

1.1.7

Where scantlings are obtained from direct calculation procedures which are different from those specified in **Ch 7**, adequate supporting documentation is to be submitted to the Society, as detailed in **Sec 2**.

1.2 Limits of application to lifting appliances

1.2.1

The fixed parts of lifting appliances, considered as an integral part of the hull, are the structures permanently connected by welding to the ship's hull (for instance crane pedestals, masts, king posts, derrick heel seatings, etc., excluding cranes, derrick booms, ropes, rigging accessories, and, generally, any dismountable parts), only for that part directly interacting with the hull structure. The shrouds of masts embedded in the ship's structure are considered as fixed parts.

1.2.2

The fixed parts of lifting appliances and their connections to the ship's structure may be covered by the Society's Rules for lifting appliances, and / or by the certification (especially the issuance of the Cargo Gear Register) of lifting appliances when required.

1.2.3

The design of the structure supporting fixed lifting appliances and the structure that might be called to support a mobile appliance should be designed taking into account the additional loads that will be imposed on them by the operation of the appliance as declared by the shipbuilder or its sub-contractors.

1.3 Limits of application to welding procedures

1.3.1

The requirements of the present Rules apply also for the preparation, execution and inspection of welded connections in hull structures. They are to be complemented by the general requirements relevant to fabrication by welding and qualification of welding procedures given by the Society when deemed appropriate by the Society.

2. Rule application

2.1 Ship parts

2.1.1 General

For the purpose of application of the present Rules, the ship is considered as divided into the following three parts:

- fore part
- central part
- aft part.

2.1.2 Fore part

The fore part includes the structures located forward of the collision bulkhead, i.e.:

- the fore peak structures
- the stem.

In addition, it includes:

- the reinforcements of the flat bottom forward area
- the reinforcements of the bow flare area.

2.1.3 Central part

The central part includes the structures located between the collision bulkhead and the after peak bulkhead. Where the flat bottom forward area or the bow flare area extend aft of the collision bulkhead, they are considered as belonging to the fore part.

2.1.4 Aft part

The aft part includes the structures located aft of the after peak bulkhead.

2.2 Rules applicable to various ship parts

2.2.1

The various chapters and sections are to be applied for the scantling of ship parts according to **Table 1**.

Table 1: Chapters and sections applicable for the scantling of ship parts

<table>
<tr><th rowspan="2">Part</th><th colspan="2">Applicable Chapters and Sections</th></tr>
<tr><th>General</th><th>Specific</th></tr>
<tr><td>Fore part</td><td rowspan="3">Ch 1

<tr><td>Central part</td><td>Ch 6
Ch 7
Ch 8</td></tr>
<tr><td>Aft part</td><td>Ch 9, Sec 2</td></tr>
<tr><td colspan="3">(1) See also [2.3].</td></tr>
</table>

2.3 Rules applicable to other ship items

2.3.1

The various Chapters and Sections are to be applied for the scantling of other ship items according to **Table 2**.

Table 2: Chapters and sections applicable for the scantling of other items

Item	Applicable Chapters and Sections
Machinery spaces	Ch 9, Sec 3
Superstructures and deckhouses	Ch 9, Sec 4
Hatch covers	Ch 9, Sec 5
Hull and superstructure openings	Ch 9, Sec 6
Rudders	Ch 10, Sec 1
Bulwarks and guard rails	Ch 10, Sec 2
Equipment	Ch 10, Sec 3

3. Class Notations

3.1 Additional service features BC-A, BC-B and BC-C

3.1.1

The following requirements apply to ships, as defined in **[1.1.2]**, having length L of 150 m or above.

3.1.2

Bulk carriers are to be assigned one of the following additional service features:

a) BC-A : for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 t/m^3 and above with specified holds empty at maximum draught in addition to BC-B conditions.

b) BC-B : for bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with all cargo holds loaded in addition to BC-C conditions.

c) BC-C : for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 t/m^3.

3.1.3

The following additional service features are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design in the following cases:

- {maximum cargo density (in t/m^3)} for additional service features BC-A and BC-B if the maximum cargo density is less than 3.0 t/m^3(see also **Ch 4, Sec 7, [2.1]**).
- {no MP} for all additional service features when the ship has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in **Ch 4, Sec 7, [3.3]**.
- {allowed combination of specified empty holds} for additional service feature BC-A(see also **Ch 4, Sec 7, [2.1]**).

3.2 Additional class notation GRAB [X]

3.2.1 Application

The additional class notation GRAB [X] is mandatory for ships having one of the additional service features BC-A or BC-B, according to **[3.1.2]**. For these ships the requirements for the GRAB [X] notation given in **Ch 12, Sec 1** are to be complied with for an unladen grab weight X equal to or greater than 20 tons.

For all other ships the additional class notation GRAB [X] is voluntary.

3.3 Class notation CSR

3.3.1 Application

In addition to the class notations granted by the assigning Society and to the service features and additional class notations defined hereabove, ships fully complying with the present Rules will be assigned the notation CSR.

Section 2 - VERIFICATION OF COMPLIANCE

1. General

1.1 New buildings

1.1.1

For new buildings, the plans and documents submitted for approval, as indicated in **[2]**, are to comply with the applicable requirements in **Ch 1** to **Ch 12** of the present Rules, taking account of the relevant criteria, as the additional service features and classification notation assigned to the ship or the ship length.

1.1.2

When a ship is surveyed by the Society during construction, the Society:

- approves the plans and documentation submitted as required by the Rules
- proceeds with the appraisal of the design of materials and equipment used in the construction of the ship and their inspection at works
- carries out surveys or obtains appropriate evidence to satisfy itself that the scantlings and construction meet the rule requirements in relation to the approved drawings
- attends tests and trials provided for in the Rules
- assigns the construction mark.

1.1.3

The Society defines in specific Rules which materials and equipment used for the construction of ships built under survey are, as a rule, subject to appraisal of their design and to inspection at works, and according to which particulars.

1.1.4

As part of his interventions during the ship's construction, the Surveyor will:

- conduct an overall examination of the parts of the ship covered by the Rules
- examine the construction methods and procedures when required by the Rules
- check selected items covered by the rule requirements
- attend tests and trials where applicable and deemed necessary.

1.2 Ships in service

1.2.1

For ships in service, the requirements in **Ch 13** of the present Rules are to be complied with.

2. Documentation to be submitted

2.1 Ships surveyed by the Society during the construction

2.1.1 Plans and documents to be submitted for approval

The plans and documents to be submitted to the Society for approval are listed in **Table 1**. In addition, the Society may request for approval or information, other plans and documents deemed necessary for the review of the design.

Structural plans are to show details of connections of the various parts and are to specify the design materials, including, in general, their manufacturing processes, welding procedures and heat treatments. See also **Ch 11, Sec 2, [1.4]**.

2.1.2 Plans and documents to be submitted for information

In addition to those in **[2.1.1]**, the following plans and documents are to be submitted to the Society for information:

- general arrangement
- capacity plan, indicating the volume and position of the centre of gravity of all compartments and tanks
- lines plan
- hydrostatic curves
- lightweight distribution
- docking plan.

In addition, when direct calculation analyses are carried out by the Designer according to the rule requirements, they are to be submitted to the Society (see **[3]**).

2.2 Ships for which the Society acts on behalf of the relevant Administration

2.2.1 Plans and documents to be submitted for approval

The plans required by the National Regulations concerned are to be submitted to the Society for approval, in addition to those in **[2.1]**.

Table 1: Plans and documents to be submitted for approval

Plan or document	Containing also in formation on
Midship section Transverse sections Shell expansion Decks and profiles Double bottom Pillar arrangements Framing plan Deep tank and ballast tank bulkheads, wash bulkheads	Class characteristics Main dimensions Minimum ballast draught Frame spacing Contractual service speed Density of cargoes Design loads on decks and double bottom Steel grades Corrosion protection Openings in decks and shell and relevant compensations Boundaries of flat areas in bottom and sides Details of structural reinforcements and/or discontinuities Bilge keel with details of connections to hull structures
Watertight subdivision bulkheads Watertight tunnels	Openings and their closing appliances, if any
Fore part structure	
Aft part structure	
Machinery space structures Foundations of propulsion machinery and boilers	Type, power and rpm of propulsion machinery Mass and centre of gravity of machinery and boilers
Superstructures and deckhouses Machinery space casing	Extension and mechanical properties of the aluminium alloy used (where applicable)
Hatch covers and hatch coamings	Design loads on hatch covers Sealing and securing arrangements, type and position of locking bolts Distance of hatch covers from the summer load waterline and from the fore end
Transverse thruster, if any, general arrangement, tunnel structure, connections of thruster with tunnel and hull structures	

Plan or document	Containing also in formation on
Bulwarks and freeing ports	Arrangement and dimensions of bulwarks and freeing ports on the freeboard deck and superstructure deck
Windows and side scuttles, arrangements and details	
Scuppers and sanitary discharges	
Rudder and rudder horn(1)	Maximum ahead service speed
Sternframe or sternpost, sterntube Propeller shaft boss and brackets(1)	
Plan of watertight doors and scheme of relevant manoeuvring devices	Manoeuvring devices Electrical diagrams of power control and position indication circuits
Plan of outer doors and hatchways	
Derricks and cargo gear Cargo lift structures	Design loads (forces and moments) Connections to the hull structures
Sea chests, stabiliser recesses, etc.	
Hawse pipes	
Plan of manholes	
Plan of access to and escape from spaces	
Plan of ventilation	Use of spaces and location and height of air vent outlets of various compartments
Plan of tank testing	Testing procedures for the various compartments Height of pipes for testing
Loading manual and loading instruments	Loading conditions as defined in **Ch 4, Sec 7** (see also **Ch 4, Sec 8**)
Equipment number calculation	Geometrical elements for calculation List of equipment Construction and breaking load of steel wires Material, construction, breaking load and relevant elongation of synthetic ropes

(1) Where other steering or propulsion systems are adopted (e.g. steering nozzles or azimuth propulsion systems), the plans showing the relevant arrangement and structural scantlings are to be submitted. For azimuth propulsion systems, see **Ch 10, Sec 1, [11]**.

3. Computer programs

3.1 General

3.1.1

In order to increase the flexibility in the structural design direct calculations with computer programs are acceptable (see **Ch 7**). The aim of such analyses is to assess the structure compliance with the rule requirements.

3.2 General programs

3.2.1

The choice of computer programs according to currently available technology is free. The programs are to be able to manage the model and load cases as required in **Ch 7** and/or **Ch 8**. The programs may be checked by the Society through comparative calculations with predefined test examples. A generally valid approval for a computer program is, however, not given by the Society.

3.2.2

Direct calculations may be used in the following fields:

- global strength
- longitudinal strength
- beams and grillages
- detailed strength.

3.2.3

For such calculation the computer model, the boundary condition and load cases are to be agreed upon with the Society.
The calculation documents are to be submitted including input and output. During the examination it may prove necessary that the Society performs independent comparative calculations.

Section 3 – FUNCTIONAL REQUIREMENTS

1. General

1.1 Application

1.1.1

This section defines the set of requirements relevant to the functions of the ship structures to be complied with during design and construction, to meet the following objectives.

1.2 Design life

1.2.1

The ship is to remain safe and environment-friendly, if properly operated and maintained, for her expected design life, which, unless otherwise specifically stated, is assumed to be equal to 25 years. The actual ship life may be longer or shorter than the design life, depending on the actual conditions and maintenance of the ship, taking into account aging effects, in particular fatigue, coating deterioration, corrosion, wear and tear.

1.3 Environmental conditions

1.3.1

The ship's structural design is to be based on the assumption of trading in the North Atlantic environment for the entire design life. Hence the respective wave conditions, i.e. the statistical wave scatter takes into account the basic principle for structural strength layout.

1.4 Structural safety

1.4.1

The ship is to be designed and constructed, and subsequently operated and maintained by its builders and operators, to minimise the risk for the safety of life at sea and the pollution of the marine environment as the consequence of the total loss of the ship due to structural collapse and subsequent flooding, loss of watertight integrity.

1.5 Structural accessibility

1.5.1

The ship is to be designed and constructed to provide adequate means of access to all spaces and internal structures to enable overall and close-up inspections and thickness measurements.

1.6 Quality of construction

1.6.1

As an objective, ships are to be built in accordance with controlled quality production standards using approved materials as necessary.

2. Definition of functional requirements

2.1 General

2.1.1

The functional requirements relevant to the ship structure are indicated in **[2.2]** to **[2.6]**.

2.2.1

Ships are to be designed to withstand, in the intact condition, the environmental conditions during the design life, for the appropriate loading conditions. Structural strength is to be determined against buckling and yielding. Ultimate strength calculations have to include ultimate hull girder capacity and ultimate strength of plates and stiffeners.

2.2.2

Ships are to be designed to have sufficient reserve strength to withstand the wave and internal loads in damaged conditions that are reasonably foreseeable, e.g. collision, grounding or flooding scenarios. Residual strength calculations are to take into account the ultimate reserve capacity of the hull girder, considering permanent deformation and post-buckling behaviour.

2.2.3

Ships are to be assessed according to the expected design fatigue life for representative structural details.

2.3 Coating

2.3.1

Coating, where required, is to be selected as a function of the declared use of the ship spaces, e.g. holds, tanks, cofferdams, etc., materials and application of other corrosion prevention systems, e.g. cathodic protection or other alternative means. The protective coating systems, applied and maintained in accordance with manufacturer's specifications concerning steel preparation, coating selection, application and maintenance, are to comply with the SOLAS requirements, the flag administration requirements and the Owner specifications.

2.4 Corrosion addition

2.4.1

The corrosion addition to be added to the net scantling required by structural strength calculations is to be adequate for the operating life. The corrosion addition is to be assigned in accordance with the use and exposure of internal and external structure to corrosive agents, such as water, cargo or corrosive atmosphere, in addition to the corrosion prevention systems, e.g. coating, cathodic protection or by alternative means.

2.5 Means of access

2.5.1

Ship structures subject to overall and close-up inspection and thickness measurements are to be provided with means capable of ensuring safe access to the structures. The means of access are to be described in a Ship Structure Access Manual for bulk carriers of 20,000 gross tonnage and over. Reference is made to SOLAS, Chapter II-1, Regulation 3-6.

2.6 Construction quality procedures

2.6.1

Specifications for material manufacturing, assembling, joining and welding procedures, steel surface preparation and coating are to be included in the ship construction quality procedures.

3. Other regulations

3.1 International regulations

3.1.1

Attention of designers, shipbuilders and shipowners of ships covered by these Rules is drawn on the following :
Ships are designed, constructed and operated in a complex regulatory framework prescribed internationally by IMO and implemented by flag states or by classification societies on their behalf. Statutory requirements set the standard for statutory aspects of ships such as life saving, subdivisions, stability, fire protection, etc.
These requirements influence the operational and cargo carrying arrangements of the ship and therefore may affect its structural design.
The main international instruments normally to be applied with regard to the strength of bulk carriers are:

- International Convention for Safety of Life at Sea (SOLAS)
- International Convention on Load Lines

3.2 National regulations

3.2.1

Attention is drawn on the applicable national flag state regulations.
Compliance with these regulations of national administrations is not conditional for class assignment.

4. Workmanship

4.1 Requirements to be complied with by the manufacturer

4.1.1

The manufacturing plant is to be provided with suitable equipment and facilities to enable proper handling of the materials, manufacturing processes, structural components, etc.
The manufacturing plant is to have at its disposal sufficiently qualified personnel. The Society is to be advised of the names and areas of responsibility of the supervisory and control personnel in charge of the project.

4.2 Quality control

4.2.1

As far as required and expedient, the manufacturer's personnel has to examine all structural components both during manufacture and on completion, to ensure that they are complete, that the dimensions are correct and that workmanship is satisfactory and meets the standard of good shipbuilding practice.
Upon inspection and corrections by the manufacturing plant, the structural components are to be shown to the surveyor of the Society for inspection, in suitable sections, normally in unpainted condition and enabling proper access for inspection.
The Surveyor may reject components that have not been adequately checked by the plant and may demand their re-submission upon successful completion of such checks and corrections by the plant.

5. Structural Details

5.1 Details in manufacturing documents

5.1.1

Significant details concerning quality and functional ability of the component concerned are to be entered in the manufacturing documents (workshop drawings, etc.). This includes not only scantlings but – where relevant - such items as surface conditions (e.g. finishing of flame cut edges and weld seams), and special methods of manufacture involved as well as inspection and acceptance requirements and where relevant permissible tolerances. So far as for this aim a standard is used (works or national standard etc.) it is to be submitted to the Society. For weld joint details, see **Ch 11, Sec 2**.
If, due to missing or insufficient details in the manufacturing documents, the quality or functional ability of the component is doubtful, the Society may require appropriate improvements to be submitted by the manufacturer. This includes the provision of supplementary or additional parts (for example reinforcements) even if these were not required at the time of plan approval.

Section 4 - SYMBOLS AND DEFINITIONS

1. Primary symbols and units

1.1

1.1.1

Unless otherwise specified, the general symbols and their units used in the present Rules are those defined in **Table 1**.

Table 1: Primary symbols

Symbol	Meaning	Units
A	Area	m^2
	Sectional area of ordinary stiffeners and primary members	cm^2
B	Moulded breadth of ship (see **[2]**)	m
C	Coefficient	-
D	Depth of ship (see **[2]**)	m
E	Young's modulus	N/mm^2
F	Force and concentrated loads	kN
I	Hull girder inertia	m^4
	Inertia of ordinary stiffeners and primary members	cm^4
L	Length of ship (see **[2]**)	m
M	Bending moment	kN.m
Q	Shear force	kN
S	Spacing of primary supporting members	
T	Draught of ship (see **[2]**)	m
V	Ship's speed	knot
Z	Hull girder section modulus	m^3
a	Acceleration	m/s^2
b	Width of attached plating	m
	Width of face plate of ordinary stiffeners and primary members	mm
g	Gravity acceleration (see **[2]**)	m/s^2
h	Height	m
	Web height of ordinary stiffeners and primary members	mm
k	Material factor (see **[2]**)	-
ℓ	Length / Span of ordinary stiffeners and primary supporting members	m
m	Mass	t
n	Number of items	-
p	Pressure	kN/m^2

Symbol	Meaning	Units
r	Radius	mm
	Radius of curvature of plating or bilge radius	m
s	Spacing of ordinary stiffeners	m
t	Thickness	mm
w	Section modulus of ordinary stiffeners and primary supporting members	cm^3
x	X coordinate along longitudinal axis (see **[4]**)	m
y	Y coordinate along transverse axis (see **[4]**)	m
z	Z coordinate along vertical axis (see **[4]**)	m
γ	Safety factor	-
δ	Deflection / Displacement	mm
θ	Angle	deg
ξ	Weibull shape parameter	-
ρ	Density	t/m^3
σ	Bending stress	N/mm^2
τ	Shear stress	N/mm^2

2. Symbols

2.1 Ship's main data

2.1.1

L : Rule length, in m, defined in **[3.1]**

L_{LL} : Freeboard length, in m, defined in **[3.2]**

L_{BP} : Length between perpendiculars, in m, is the length of the ship measured between perpendiculars taken at the extremities of the deepest subdivision load line, i.e. of the waterline which corresponds to the greatest draught permitted by the subdivision requirements which are applicable

FP_{LL} : Forward freeboard perpendicular. The forward freeboard perpendicular is to be taken at the forward end of the length L_{LL} and is to coincide with the foreside of the stem on the waterline on which the length L_{LL} is measured

AP_{LL} : After freeboard perpendicular. The after freeboard perpendicular is to be taken at the aft end of the length L_{LL}.

B : Moulded breadth, in m, defined in **[3.4]**

D : Depth, in m, defined in **[3.5]**

T : Moulded draught, in m, defined in **[3.6]**

T_S : Scantling draught, in m, taken equal to the maximum draught (see also **Ch 1, Sec 1, [1.1.6]**)

T_B : Minimum ballast draught at midship, in m, in normal ballast condition as defined in **Ch 4, Sec 7, [2.2.1]**

T_{LC} : Midship draught, in m, in the considered loading condition

Δ : Moulded displacement, in tonnes, at draught T, in sea water (density $\rho = 1.025\ t/m^3$)

C_B : Total block coefficient

$$C_B = \frac{\triangle}{1.025LBT}$$

V : Maximum ahead service speed, in knots, means the greatest speed which the ship is designed to maintain in service at her deepest seagoing draught at the maximum propeller RPM and corresponding engine MCR (Maximum Continuous Rating).

x, y, z : X, Y and Z co-ordinates, in m, of the calculation point with respect to the reference co-ordinate system.

2.2 Materials

2.2.1

E : Young's modulus, in N/mm^2,tobetakenequalto:

$E = 2.06 \times 10^5\ N/mm^2$, for steels in general

$E = 1.95 \times 10^5\ N/mm^2$, for stainless steels

$E = 7.0 \times 10^4\ N/mm^2$, for aluminium alloys

R_{eH} : Minimum yield stress, in N/mm^2,of the material

k : Material factor, defined in **Ch 3, Sec 1, [2.2]**

ν : Poisson's ratio. Unless otherwise specified, a value of 0.3 is to be taken into account,

R_m : Ultimate minimum tensile strength, in N/mm^2,of the material

R_Y : Nominal yield stress, in N/mm^2, of the material, to be taken equal to $\frac{235}{k}\ N/mm^2$, unless otherwise specified.

2.3 Loads

2.3.1

g : Gravity acceleration, taken equal to 9.81 m/s^2

ρ : Sea water density, taken equal to 1.025 t/m^3

ρ_L : Density, in t/m^3, of the liquid carried

ρ_C : Density, in t/m^3, of the dry bulk cargo carried

C : Wave parameter, taken equal to:

$C = 10.75 - \left(\frac{300-L}{100}\right)^{1.5}$ for $90 \leq L < 300$ m

$C = 10.75$ for $300 \leq L < 350$ m

h : Height, in m, of a tank, to be taken as the vertical distance from the bottom to the top of the tank, excluding any small hatchways

z_{TOP} : Vertical distance, in m, of the highest point of the tank from the baseline. For ballast holds, z_{TOP} is the vertical distance, in m, of the top of the hatch coaming from the baseline

ℓ_H : Length, in m, of the compartment

M_{SW} : Design still water bending moment, in kN.m, at the hull transverse section considered:

$M_{SW} = M_{SW,H}$ in hogging conditions

$M_{SW} = M_{SW,S}$ in sagging conditions

M_{WV} : Vertical wave bending moment, in kN.m, at the hull transverse section considered:

$M_{WV} = M_{WV,H}$ in hogging conditions

$M_{WV} = M_{WV,S}$ in sagging conditions

M_{WH} : Horizontal wave bending moment, in kN.m, at the hull transverse section considered,

Q_{SW} : Design still water shear force, in kN, at the hull transverse section considered

Q_{WV} : Vertical wave shear force, in kN, at the hull transverse section considered

p_S : Still water pressure, in kN/m^2

p_W : Wave pressure or dynamic pressures, in kN/m^2

p_{SF}, p_{WF} : Still water and wave pressure, in kN/m^2, in flooded conditions

σ_X : Hull girder normal stress, in N/mm^2

a_X, a_Y, a_Z : Accelerations, in m/s^2, along X, Y and Z directions, respectively

T_R : Roll period, in s

θ : Roll single amplitude, in deg

T_P : Pitch period, in s

Φ : Single pitch amplitude, in deg

k_r : Roll radius of gyration, in m

GM : Metacentric height, in m

λ : Wave length, in m

2.4 Scantlings

2.4.1 Hull girder scantlings

I_Y : Moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis

I_Z : Moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis

Z_{AB}, Z_{AD} : Section moduli, in m^3, at bottom and deck, respectively

N : Vertical distance, in m, from the base line to the horizontal neutral axis of the hull transverse section

2.4.2 Local scantlings

s : Spacing, in m, of ordinary stiffeners, measured at mid-span along the chord

S : Spacing, in m, of primary supporting members, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffener or primary supporting member, as the case may be, measured along the chord

ℓ_b : Length, in m, of brackets

t_C : Corrosion addition, in mm

h_w : Web height, in mm, of ordinary stiffener or primary supporting member, as the case may be

t_w : Net web thickness, in mm, of ordinary stiffener or primary supporting member, as the case may be

b_f : Face plate width, in mm, of ordinary stiffener or primary supporting member, as the case may be

t_f : Net face plate thickness, in mm, of ordinary stiffener or primary supporting member, as the case may be

t_p : Net thickness, in mm, of the plating attached to an ordinary stiffener or a primary supporting member, as the case may be

b_p : Width, in m, of the plating attached to the stiffener or the primary supporting member, for the yielding check

A_s : Net sectional area, in cm^2, of the stiffener or the primary supporting member, with attached plating of width s

A_{sh} : Net shear sectional area, in cm^2, of the stiffener or the primary supporting member

I : Net moment of inertia, in cm^4, of ordinary stiffener or primary supporting member, as the case may be, without attached plating, around its neutral axis parallel to the plating

I_p : Net polar moment of inertia, in cm^4, of ordinary stiffener or primary supporting member, as the case may be, about its connection to plating

I_w : Net sectional moment of inertia, in cm^6, of ordinary stiffener or primary supporting member, as the case may be, about its connection to plating

I_S : Net moment of inertia, in cm^4, of the stiffener or the primary supporting member, with attached shell plating of width s, about its neutral axis parallel to the plating

Z : Net section modulus, in cm^3, of an ordinary stiffener or a primary supporting member, as the case may be, with attached plating of width b_p

3. Definitions

3.1 Rule length

3.1.1

The rule length L is the distance, in m, measured on the summer load waterline, from the forward side of the stem to the after side of the rudder post, or to the centre of the rudder stock where there is no rudder post. L is to be not less than 96 % and need not exceed 97 % of the extreme length on the summer load waterline.

3.1.2

In ships without rudder stock (e.g. ships fitted with azimuth thrusters), the rule length L is to be taken equal to 97 % of the extreme length on the summer load waterline.

3.1.3

In ships with unusual stem or stern arrangements, the rule length L is considered on a case by case basis.

3.2 Freeboard length

3.2.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 3(1,a))
The freeboard length L_{LL} is the distance, in m, on the waterline at 85 % of the least moulded depth from the top of the keel, measured from the forward side of the stem to the centre of the rudder stock. L_{LL} is to be not less than 96 % of the extreme length on the same waterline.

3.2.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 3(1,c))
*Where the stem contour is concave above the water-line at 85 % of the least moulded depth, both the forward end of the extreme length and the forward side of the stem are to be taken at the vertical projection to that waterline of the aftermost point of the stem contour (above that waterline) (see **Fig 1**).*

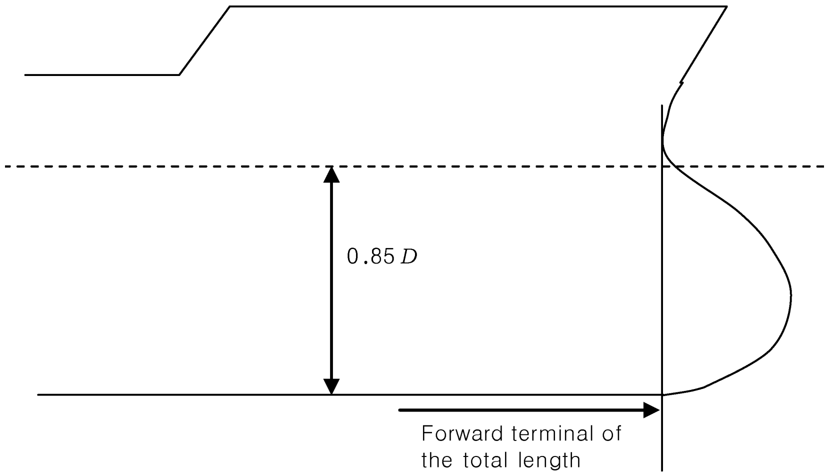

Fig 1: Concave stem contour

3.3 Ends of rule length *L* and midship

3.3.1 Fore end

The fore end (FE) of the rule length *L*, see **Fig 2**, is the perpendicular to the summer load waterline at the forward side of the stem.

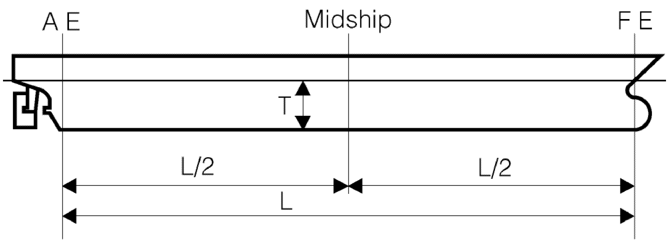

Fig 2: Ends and midship

The aft end (AE) of the rule length *L*, see **Fig 2**, is the perpendicular to the waterline at a distance *L* aft of the fore end.

3.3.2 Midship

The midship is the perpendicular to the waterline at a distance $0.5L$ aft of the fore end.

3.3.3 Midship part

The midship part of a ship is the part extending $0.4L$ amidships, unless other wise specified.

3.4 Moulded breadth

3.4.1

The moulded breadth *B* is the greatest moulded breadth, in m, measured amidships below the weather deck.

3.5 Depth (The least moulded depth)

3.5.1

The depth D is the distance, in m, measured vertically on the midship transverse section, from the moulded base line to the top of the deck beam at side on the upper-most continuous deck.

3.6 Moulded draught

3.6.1

The moulded draught T is the distance, in m, measured vertically on the midship transverse section, from the moulded base line to the summer load line.

3.7 Lightweight

3.7.1

The lightweight is the displacement, in t, without cargo, fuel, lubricating oil, ballast water, fresh water and feed water, consumable stores and passengers and crew and their effects.

3.8 Deadweight

3.8.1

The deadweight is the difference, in t, between the displacement, at the summer draught in sea water of density $\rho = 1.025\ \mathrm{t/m^3}$, and the lightweight.

3.9 Freeboard deck

3.9.1

Ref. ILLC, as amended (Resolution MSC. 143(77) Reg. 3(9))
The freeboard deck is defined in Regulation 3 of the International Load Line Convention, as amended.

3.10 Bulkhead deck

3.10.1

Ref. SOLAS Reg.II-1/2 .5
The bulkhead deck is the uppermost deck to which the transverse watertight bulkheads, except both peak bulkheads, extend and are made effective.

3.11 Strength deck

3.11.1

The strength deck at a part of ship’s length is the uppermost continuous deck at that part to which the shell plates extend.

3.12 Superstructure

3.12.1 General

Ref. ILLC. As amended (Resolution MSC.143(77) Reg. 3(10,a))
A superstructure is a decked structure on the free-board deck, extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 0.04 B.

3.12.2 Enclosed and open superstructure

A superstructure may be:

- enclosed, where:
  (1) it is enclosed by front, side and aft bulkheads complying with the requirements of **Ch 9, Sec 4**
  (2) all front, side and aft openings are fitted with efficient weathertight means of closing
- open, where it is not enclosed.

3.13 Forecastle

3.13.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 3(10,g))
A forecastle is a superstructure which extends from the forward perpendicular aft to a point which is forward of the after perpendicular. The forecastle may originate from a point forward of the forward perpendicular.

3.14 Raised quarterdeck

3.14.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 3(10,i))
A raised quarterdeck is a superstructure which extends forward from the after perpendicular, generally has a height less than a normal superstructure, and has an intact front bulkhead (sidescuttles of the non-opening type fitted with efficient deadlights and bolted man hole covers)(see ***Fig 3****). Where the forward bulkhead is not intact due to doors and access openings, the superstructure is then to be considered as a poop.*

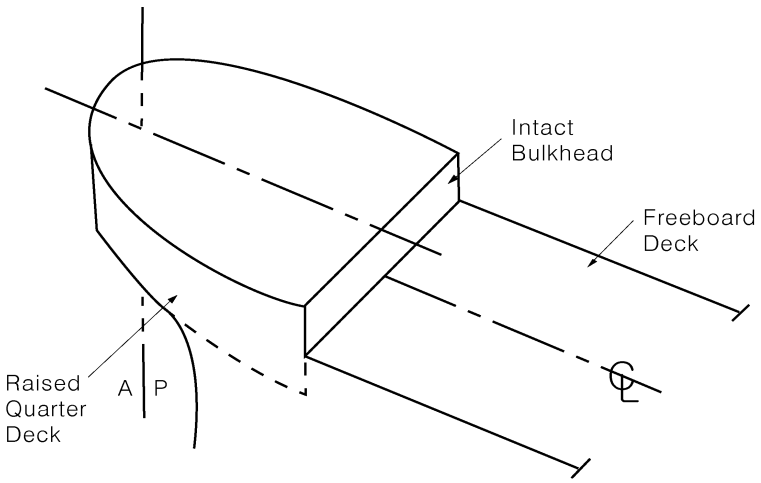

Fig 3: Raised quarter deck

3.15 Deckhouse

3.15.1

A deckhouse is a decked structure other than a superstructure, located on the freeboard deck or above.

3.16 Trunk

3.16.1

A trunk is a decked structure similar to a deckhouse, but not provided with a lower deck.

3.17 Wash bulkhead

3.17.1

A wash bulkhead is a perforated or partial bulkhead in a tank.

3.18 Standard height of superstructure

3.18.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 33)
The standard height of superstructure is defined in ***Table 2****.*

Table 2: Standard height of superstructure

Freeboard length L_{LL}, in m	Standard height h_S, in m	
	Raised quarter deck	All other superstructures
$90 < L_{LL} < 125$	$0.3 + 0.012\ L_{LL}$	$1.05 + 0.01\ L_{LL}$
$L_{LL} \geq 125$	1.80	2.30

3.19 Type A and Type B ships

3.19.1 Type A ship

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 27.1)
A Type A ship is one which:

- *is designed to carry only liquid cargoes in bulk;*
- *has a high integrity of the exposed deck with only small access openings to cargo compartments, closed by watertight gasketed covers of steel or equivalent material*
- *has low permeability of loaded cargo compartments.*

A Type A ship is to be assigned a freeboard following the requirements reported in the International Load Line Convention 1966, as amended.

3.19.2 Type B ship

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 27.5)
All ships which do not come within the provisions regarding Type A ships stated in ***[3.19.1]*** *are to be considered as Type B ships.*
A Type B ship is to be assigned a freeboard following the requirements reported in the International Load Line Convention 1966, as amended.

3.19.3 Type B-60 ship

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 27.9)
A Type B-60 ship is any Type B ship of over 100 metres in length which, according to applicable requirements of in the International Load Line Convention 1966, as amended, is assigned with a value of tabular freeboard which can be reduced up to 60 per cent of the difference between the "B" and "A" tabular values for the appropriate ship lengths.

3.19.4 Type B-100 ship

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 27.10)
A Type B-100 ship is any Type B ship of over 100 metres in length which, according to applicable requirements of in the International Load Line Convention 1966, as amended, is assigned with a value of tabular freeboard which can be reduced up to 100 per cent of the difference between the "B" and "A"

tabular values for the appropriate ship lengths.

3.20 Positions 1 and 2

3.20.1 Position 1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 13)
Position 1 includes:

- *exposed freeboard and raised quarter decks,*
- *exposed superstructure decks situated forward of 0.25* L_{LL} *from the perpendicular, at the forward side of the stem, to the waterline at 85 % of the least moulded depth measured from the top of the keel.*

3.20.2 Position 2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 13)
Position 2 includes:

- *exposed superstructure decks situated aft of 0.25* L_{LL} *from the perpendicular, at the forward side of the stem, to the waterline at 85 % of the least moulded depth measured from the top of the keel and located at least one standard height of superstructure above the freeboard deck,*
- *exposed superstructure decks situated forward of 0.25* L_{LL} *from the perpendicular, at the forward side of the stem, to the waterline at 85 % of the least moulded depth measured from the top of the keel and located at least two standard heights of superstructure above the freeboard deck.*

4. Reference co-ordinate system

4.1

4.1.1

The ship's geometry, motions, accelerations and loads are defined with respect to the following right-hand co-ordinate system (see **Fig 4**):

- Origin: at the intersection among the longitudinal plane of symmetry of ship, the aft end of *L* and the baseline
- X axis: longitudinal axis, positive forwards
- Y axis: transverse axis, positive towards portside
- Z axis: vertical axis, positive upwards.

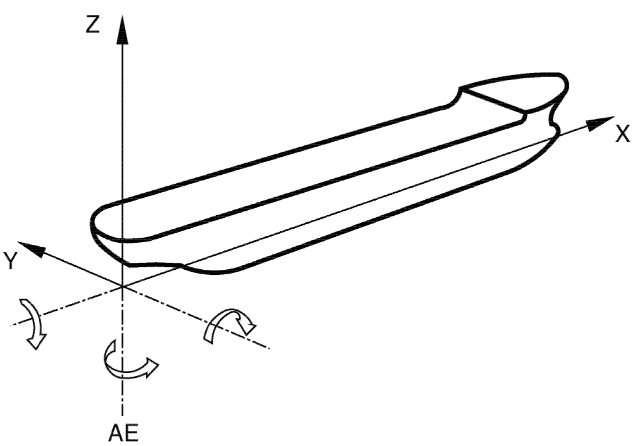

Fig 4: Reference co-ordinate system

4.1.2

Positive rotations are oriented in anti-clockwise direction about the X, Y and Z axes. ⫝̸

Chapter 2

General Arrangement Design

Section 1 - SUBDIVISION ARRANGEMENT

1. Number and arrangement of transverse watertight bulkheads

1.1 Number of watertight bulkheads

1.1.1 General

All ships, in addition to complying with the requirements of **[1.1.2]**, are to have at least the following transverse watertight bulkheads:

- one collision bulkhead
- one after peak bulkhead
- two bulkheads forming the boundaries of the machinery space in ships with machinery amidships, and a bulkhead forward of the machinery space in ships with machinery aft. In the case of ships with an electrical propulsion plant, both the generator room and the engine room are to be enclosed by watertight bulkheads.

1.1.2 Additional bulkheads

For ships not required to comply with subdivision regulations, transverse bulkheads adequately spaced, and not less in number than indicated in **Table 1**, are to be fitted.

Table 1: Number of bulkheads

Length (m)	Number of bulkheads for ships with aft machinery(1)	Numbers of bulkheads for other ships
$90 \leq L < 105$	4	5
$105 \leq L < 120$	5	6
$120 \leq L < 145$	6	7
$145 \leq L < 165$	7	8
$165 \leq L < 190$	8	9
$L \geq 190$	To be defined on a case by case basis	
(1) After peak bulkhead and aft machinery bulkhead are the same.		

2. Collision bulkhead

2.1 Arrangement of collision bulkhead

2.1.1

Ref. SOLAS Ch. II-1, Part B, Reg. 11
A collision bulkhead is to be fitted which is to be watertight up to the freeboard deck. This bulkhead is to be located at a distance from the forward perpendicular FP_{LL} of not less than 5 per cent of the length L_{LL} of the ship or 10 m, whichever is the less, and not more than 8 per cent of L_{LL}.

2.1.2

Ref. SOLAS Ch. II-1, Part B, Reg. 11
*Where any part of the ship below the waterline extends forward of the forward perpendicular, e.g. a bulbous bow, the distances, in metres, stipulated in **[2.1.1]** are to be measured from a point either:*

- *at the mid-length of such extension, or*
- *at a distance 1.5 per cent of the length L_{LL} of the ship forward of the forward perpendicular, or*

- *at a distance 3 metres forward of the forward perpendicular,*

whichever gives the smallest measurement.

2.1.3

Ref. SOLAS Ch. II-1, Part B, Reg. 11
*The bulkhead may have steps or recesses provided they are within the limits prescribed in [**2.1.1**] or [**2.1.2**]. No door, manhole, ventilation duct or any other opening is to be fitted in this bulkhead.*

3. After peak, machinery space bulkheads and stern tubes

3.1

3.1.1 General

Ref. SOLAS Ch. II-1, Part B, Reg. 11
An after peak bulkhead, and bulkheads dividing the machinery space from the cargo spaces forward and aft, are also to be fitted and made watertight up to the freeboard deck. The after peak bulkhead may, however, be stepped below the bulkhead deck, provided the degree of safety of the ship as regards subdivision is not thereby diminished.

3.1.2 Sterntubes

Ref. SOLAS Ch. II-1, Part B, Reg. 11
Sterntubes are to be enclosed in a watertight space (or spaces) of moderate volume. Other measures to minimise the danger of water penetrating into the ship in case of damage to sterntube arrangements may be taken at the discretion of the Society.

4. Number and arrangement of tank bulkheads

4.1 Bulkheads in compartments intended for the carriage of liquid cargoes

4.1.1

The number and location of transverse and longitudinal watertight bulkheads in compartments intended for the carriage of liquid cargoes are to comply with the subdivision requirements to which the ship is subject.

5. Arrangement of transverse watertight bulkheads

5.1 General

5.1.1

Where it is not practicable to arrange a watertight bulkhead in one plane, a stepped bulkhead may be fitted. In this case, the part of the deck which forms the step is to be watertight and equivalent in strength to the bulkhead.

6. Openings in watertight bulkheads

6.1 General

6.1.1

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9 and IMO Res. A.684(17) - Part B
The number of openings in watertight subdivisions is to be kept to a minimum compatible with the design and proper working of the ship. Where penetrations of watertight bulkheads and internal decks are

necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity. The Society may permit relaxation in the watertightness of openings above the freeboard deck, provided that it is demonstrated that any progressive flooding can be easily controlled and that the safety of the ship is not impaired.

6.1.2

No door, manhole ventilation duct or any other opening is permitted in the collision bulkhead below the subdivision deck.

6.1.3

Lead or other heat sensitive materials may not be used in systems which penetrate watertight subdivision bulkheads, where deterioration of such systems in the event of fire would impair the watertight integrity of the bulkheads.

6.1.4

Valves not forming part of a piping system are not permitted in watertight subdivision bulkheads.

6.1.5

The requirements relevant to the degree of tightness, as well as the operating systems, for doors or other closing appliances complying with the provisions in **[6.2]** and **[6.3]** are specified in **Table 2.**

6.2 Openings in the watertight bulkheads below the freeboard deck

6.2.1 Openings used while at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9
Doors provided to ensure the watertight integrity of internal openings which are used while at sea are to be sliding watertight doors capable of being remotely closed from the bridge and are also to be operable locally from each side of the bulkhead. Indicators are to be provided at the control position showing whether the doors are open or closed, and an audible alarm is to be provided at the door closure. The power, control and indicators are to be operable in the event of main power failure. Particular attention is to be paid to minimise the effect of control system failure. Each power-operated sliding watertight door is to be provided with an individual hand-operated mechanism. The possibility of opening and closing the door by hand at the door itself from both sides is to be assured.

6.2.2 Openings normally closed at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9
Access doors and access hatch covers normally closed at sea, intended to ensure the watertight integrity of internal openings, are to be provided with means of indication locally and on the bridge showing whether these doors or hatch covers are open or closed. A notice is to be affixed to each such door or hatch cover to the effect that it is not to be left open. The use of such doors and hatch covers is to be authorised by the officer of the watch.

6.2.3 Doors or ramps in large cargo spaces

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9
Watertight doors or ramps of satisfactory construction may be fitted to internally subdivide large cargo spaces, provided that the Society is satisfied that such doors or ramps are essential. These doors or ramps may be hinged, rolling or sliding doors or ramps, but are not to be remotely con-trolled.
Such doors are to be closed before the voyage commences and are to be kept closed during navigation. Should any of the doors or ramps be accessible during the voyage, they are to be fitted with a device which prevents unauthorised opening.
The word "satisfactory" means that scantlings and sealing requirements for such doors or ramps are to be sufficient to withstand the maximum head of the water at the flooded waterline.

6.2.4 Openings permanently kept closed at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9
Other closing appliances which are kept permanently closed at sea to ensure the watertight integrity of internal openings are to be provided with a notice which is to be affixed to each such closing appliance to the effect that it is to be kept closed. Manholes fitted with closely bolted covers need not be so marked.

6.3 Openings in the bulkheads above the freeboard deck

6.3.1 General

The openings in flooding boundaries located below the waterline at the equilibrium of the final stage of flooding are to be watertight. The openings immersed within the range of the positive righting lever curve are only to be weathertight.

Table 2: Doors

			Sliding type			Hinged type			Rolling type (cargo between deck spaces)
			Remote operation indication on the bridge	Indicator on the bridge	Local operation only	Remote operation indicatio n on the bridge	Indicator on the bridge	Local operation only	
Watertight	Below the freeboard deck	Open at sea	X						
		Normally closed (2)		X			X (3)		
		Remain closed (2)			X (4) (5)			X (4) (5)	X (4) (5)
Weathertight/ watertight(1)	Above the freeboard deck	Open at sea	X						
		Normally closed (2)		X			X		
		Remain closed (2)						X (4) (5)	

(1) Watertight doors are required when they are located below the waterline at the equilibrium of the final stage of flooding; otherwise a weathertight door is accepted.
(2) Notice to be affixed on both sides of the door: “to be kept closed at sea”.
(3) Type A ships of 150 m and upwards, and Type B ships with a reduced freeboard may have a hinged watertight door between the engine room and the steering gear space, provided that the sill of this door is above the summer load waterline.
(4) The door is to be closed before the voyage commences.
(5) If the door is accessible during the voyage, a device which prevents unauthorised opening is to be fitted.

6.3.2 Doors used while at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9
The doors used while at sea are to be sliding doors capable of being remotely closed from the bridge and are also to be operable locally from each side of the bulkhead. Indicators are to be provided at

the control position showing whether the doors are open or closed, and an audible alarm is to be provided at the door closure. The power, control and indicators are to be operable in the event of main power failure. Particular attention is to be paid to minimise the effect of control system failure. Each power-operated sliding watertight door is to be provided with an individual hand-operated mechanism. It should be possible to open and close the door by hand at the door itself from both sides.

6.3.3 Doors normally closed at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9
The doors normally closed at sea are to be provided with means of indication locally and on the bridge showing whether these doors are open or closed. A notice is to be affixed to each door to the effect that it is not to be left open.

6.3.4 Openings kept permanently closed at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9
The doors kept closed at sea are to be hinged doors. Such doors and the other closing appliances which are kept closed at sea are to be provided with a notice affixed to each closing appliance to the effect that it is to be kept closed. Manholes fitted with closely bolted covers need not be so marked.

Section 2 – COMPARTMENT ARRANGEMENT

1. Definitions

1.1 Cofferdam

1.1.1

A cofferdam means an empty space arranged so that compartments on each side have no common boundary; a cofferdam may be located vertically or horizontally. As a rule, a cofferdam is to be properly ventilated and of sufficient size to allow proper inspection, maintenance and safe evacuation.

1.2 Machinery spaces of category A

1.2.1

Ref. SOLAS Ch. II-2, Part A, Reg. 3.31
Machinery spaces of category A are those spaces or trunks to such spaces which contain:

- *internal combustion machinery used for main propulsion; or*
- *internal combustion machinery used for purposes other than propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or*
- *any oil fired boiler or fuel oil unit.*

2. Cofferdams

2.1 Cofferdam arrangement

2.1.1

Cofferdams are to be provided between compartments intended for liquid hydrocarbons (fuel oil, lubricating oil) and those intended for fresh water (drinking water, water for propelling machinery and boilers) as well as tanks intended for the carriage of liquid foam for fire extinguishing.

2.1.2

Cofferdams separating fuel oil tanks from lubricating oil tanks and the latter from those intended for the carriage of liquid foam for fire extinguishing or fresh water or boiler feed water may be waived when deemed impracticable or unreasonable by the Society in relation to the characteristics and dimensions of the spaces containing such tanks, provided that:

- the thickness of common boundary plates of adjacent tanks is increased, with respect to the thickness obtained according to **Ch 6, Sec 1**, by 2 mm in the case of tanks carrying fresh water or boiler feed water, and by 1 mm in all other cases
- the sum of the throats of the weld fillets at the edges of these plates is not less than the thickness of the plates themselves
- the structural test is carried out with a head increased by 1 m with respect to **Ch 11, Sec 3**.

2.1.3

Spaces intended for the carriage of flammable liquids are to be separated from accommodation and service spaces by means of a cofferdam.

2.1.4

Cofferdams are only required between fuel oil double bottoms and tanks immediately above where the inner bottom plating is subjected to the head of fuel oil contained therein, as in the case of a double bottom with its top raised at the sides.
Where a corner to corner situation occurs, tanks are not be considered to be adjacent.

Adjacent tanks not separated by cofferdams are to have adequate dimensions to ensure easy inspection.

3. Double bottoms

3.1 General

3.1.1

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1
A double bottom is to be fitted extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

3.1.2

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1
Where a double bottom is required to be fitted, its depth is to satisfy the provisions of ***Ch 3, Sec 6, [6]*** *and the inner bottom is to be continued out to the ship side in such a manner as to protect the bottom to the turn of the bilge.*

3.1.3

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1
Small wells constructed in the double bottom, in connection with the drainage arrangements of holds, are not to extend in depth more than necessary. A well extending to the outer bottom, may, however, be permitted at the after end of the shaft tunnel of the ship. Other wells may be permitted by the Society if it is satisfied that the arrangements give protection equivalent to that afforded by a double bottom complying with ***[3.1].***

3.1.4

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1
A double bottom need not be fitted in way of water-tight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not, in the opinion of the Society, thereby impaired.

4. Compartment forward of the collision bulkhead

4.1 General

4.1.1

The fore peak and other compartments located forward of the collision bulkhead may not be arranged for the carriage of fuel oil or other flammable products.

5. Minimum bow height

5.1 General

5.1.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39(1))
The bow height F_b, defined as the vertical distance at the forward perpendicular between the waterline corresponding to the assigned summer freeboard and the designed trim and the top of the exposed deck at side, is to be not less than:

$$F_b=(6075(L_{LL}/100)-1875(L_{LL}/100)^2+200(L_{LL}/100)^3)\times(2.08+0.609C_B-1.603C_{wf}-0.0129(L/T_1))$$

where:

F_b : *Calculated minimum bow height, in mm*

T_1 : *Draught at 85 % of the least moulded depth, in m*

C_{wf} : *Waterplane area coefficient forward of* $L_{LL}/2$:

$$C_{wf} = \frac{A_{wf}}{\frac{L_{LL}}{2}B}$$

A_{wf} : *Waterplane area forward of* $L_{LL}/2$ *at draught* T_1, *in* m^2.

For ships to which timber freeboards are assigned, the summer freeboard (and not the timber summer freeboard) is to be assumed when applying the formula above.

5.1.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39.(2))
Where the bow height required in paragraph ***[5.1.1]*** *is obtained by sheer, the sheer is to extend for at least 15 % of the length of the ship measured from the forward perpendicular. Where it is obtained by fitting a superstructure, such superstructure is to extend from the stem to a point at least 0.07 L abaft the forward perpendicular, and is to be enclosed as defined* ***Ch 9, Sec 4.***

5.1.3

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39(3))
Ships which, to suit exceptional operational requirements, cannot meet the requirements in ***[5.1.1]*** *and* ***[5.1.2]*** *will be considered by the Society on a case by case basis.*

5.1.4

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39(4, a))
The sheer of the forecastle deck may be taken into account, even if the length of the forecastle is less than 0.15 L, but greater than 0.07 L, provided that the forecastle height is not less than one half of standard height of superstructure between 0.07 L and the forward perpendicular.

5.1.5

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39(4, b))
Where the forecastle height is less than one half of the standard height of superstructure, the credited bow height may be determined as follows:

a) *Where the freeboard deck has sheer extending from abaft 0.15 L, by a parabolic curve having its origin at 0.15 L abaft the forward perpendicular at a height equal to the midship depth of the ship, extended through the point of intersection of forecastle bulkhead and deck, and up to a point at the forward perpendicular not higher than the level of the forecastle deck (as illustrated in* ***Fig 1****). However, if the value of the height denoted ht in* ***Fig 1*** *is smaller than the value of the height denoted* h_b *then* h_t *may be replaced by* h_b *in the available bow height, where:*

$$h_t = Z_b\left(\frac{0.15L}{x_b}\right)^2 - Z_t$$

Z_b : *As defined in* ***Fig 1***

Z_t : *As defined in* ***Fig 1***

h_f : *Half standard height of superstructure*

b) *Where the freeboard deck has sheer extending for less than 0.15 L or has no sheer, by a line from the forecastle deck at side at 0.07 L extended parallel to the base line to the forward perpendicular (as illustrated in* ***Fig 2****).*

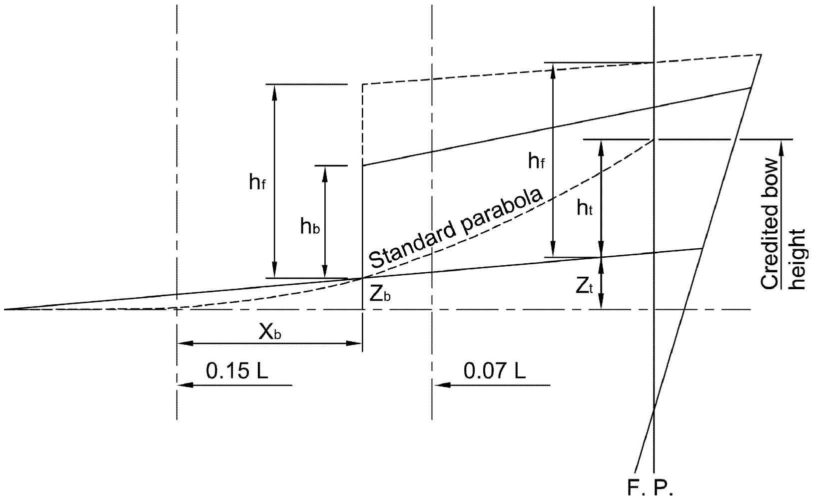

Fig 1: Credited bow height where the freeboard deck has sheer extending from abaft 0.15*L*

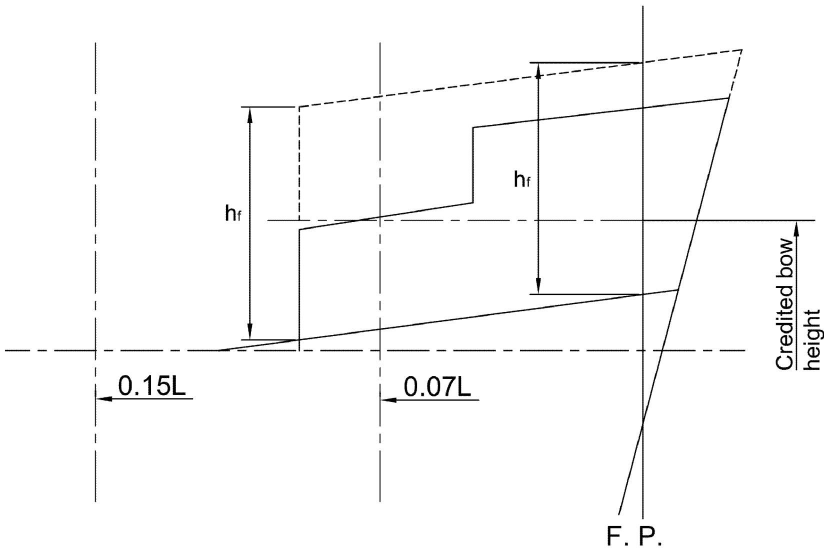

Fig 2: Credited bow height where the freeboard deck has sheer extending for less than 0.15*L*

6. Shaft tunnels

6.1 General

6.1.1

Shaft tunnels are to be watertight.

7. Watertight ventilators and trunks

7.1 General

7.1.1

Ref. SOLAS Ch. II-1, Part B, Reg. 19.1
Watertight ventilators and trunks are to be carried at least up to the freeboard deck.

8. Fuel oil tanks

8.1 General

8.1.1

Ref. SOLAS Ch. II-2, Part B, Reg. 4.2
The arrangements for the storage, distribution and utilisation of the fuel oil are to be such as to ensure the safety of the ship and persons on board.

8.1.2

Ref. SOLAS Ch. II-2, Part B, Reg. 4.2
As far as practicable, fuel oil tanks are to be part of the ship's structure and are to be located outside machinery spaces of category A.
Where fuel oil tanks, other than double bottom tanks, are necessarily located adjacent to or within machinery spaces of category A, at least one of their vertical sides is to be contiguous to the machinery space boundaries, they are preferably to have a common boundary with the double bottom tanks and the area of the tank boundary common with the machinery spaces is to be kept to a minimum.
Where such tanks are situated within the boundaries of machinery spaces of category A, they may not contain fuel oil having a flashpoint of less than 60 °C.

8.1.3

Ref. SOLAS Ch. II-2, Part B, Reg. 4.2
Fuel oil tanks may not be located where spillage or leakage therefrom can constitute a hazard by falling on heated surfaces.
Precautions are to be taken to prevent any oil that may escape under pressure from any pump, filter or heater from coming into contact with heated surfaces.
Fuel oil tanks in boiler spaces may not be located immediately above the boilers or in areas subjected to high temperatures, unless special arrangements are provided in agreement with the Society.

8.1.4

Where a compartment intended for goods or coal is situated in proximity of a heated liquid container, suitable thermal insulation is to be provided.

Section 3 – ACCESS ARRANGEMENT

1. General

1.0 Application

1.0.1

This section applies to ships of 20,000 gross tonnage and over.

1.1 Means of access to cargo and other spaces

1.1.1

Ref. SOLAS Reg.II-1/3-6 .2.1 (Resolution MSC.151(78))
Each space is to be provided with means of access to enable, throughout the life of a ship, overall and close-up inspections and thickness measurements of the ship's structures. Such means of access are to comply with ***[1.3]*** *and* ***[2].***

1.1.2

Ref. SOLAS Reg.II-1/3-6 .2.2 (Resolution MSC.151(78))
Where a permanent means of access may be susceptible to damage during normal cargo loading and unloading operations or where it is impracticable to fit permanent means of access, the Administration may allow, in lieu thereof, the provision of movable or portable means of access, as specified in ***[2]****, provided that the means of attaching, rigging, suspending or supporting the portable means of access forms a permanent part of the ship's structure. All portable equipment are to be capable of being readily erected or deployed by ship's personnel.*

1.1.3

Ref. SOLAS Reg.II-1/3-6 .2.3 (Resolution MSC.151(78))
The construction and materials of all means of access and their attachment to the ship's structure are to be to the satisfaction of the Society.

1.2 Safe access to cargo holds, ballast tanks and other spaces

1.2.1

Ref. SOLAS Reg.II-1/3-6 .3.1 (Resolution MSC.151(78)) and IACS UI SC191
Safe access to cargo holds, cofferdams, ballast tanks and other spaces in the cargo area are to be direct from the open deck and such as to ensure their complete inspection. Safe access to double bottom spaces or to forward ballast tanks may be from a pump-room, deep cofferdam, pipe tunnel, cargo hold, double hull space or similar compartment not intended for the carriage of oil or hazardous cargoes.
Access to a double side skin space may be either from a topside tank or double bottom tank or from both.

1.2.2

Ref. SOLAS Reg.II-1/3-6 .3.2 (Resolution MSC.151(78))
Tanks, and subdivisions of tanks, having a length of 35 m or more, are to be fitted with at least two access hatchways and ladders, as far apart as practicable.
Tanks less than 35 m in length are to be served by at least one access hatchway and ladder.
When a tank is subdivided by one or more swash bulkheads or similar obstructions which do not allow ready means of access to the other parts of the tank, at least two hatchways and ladders are to be fitted.

1.2.3

Ref. SOLAS Reg.II-1/3-6 .3.3 (Resolution MSC.151(78))
Each cargo hold is to be provided with at least two means of access as far apart as practicable. In general, these accesses are to be arranged diagonally, for example one access near the forward bulkhead on the port side, the other one near the aft bulkhead on the starboard side.

1.3 General technical specifications

1.3.1

Ref. SOLAS Reg.II-1/3-6 .5.1 (Resolution MSC.151(78)) and IACS UI SC191
For access through horizontal openings, hatches or manholes, the dimensions are to be sufficient to allow a person wearing a self-contained air-breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening is to be not less than 600 mm × 600 mm, with corner radii up to 100 mm maximum.
In such a case where as a consequence of structural analysis the stress is to be reduced around the opening, it is considered appropriate to take measures to increase the clear opening, e.g. 600 × 800 with 300 mm radii, in which a clear opening of 600 × 600 mm with corner radii up to 100 mm maximum fits.
When access to a cargo hold is arranged through the cargo hatch, the top of the ladder is to be placed as close as possible to the hatch coaming. Access hatch coamings having a height greater than 900 mm are also to have steps on the outside in conjunction with the ladder.

1.3.2

Ref. SOLAS Reg.II-1/3-6 .5.2 (Resolution MSC.151(78)) and IACS UI SC191
For access through vertical openings, or manholes, in swash bulkheads, floors, girders and web frames providing passage through the length and breadth of the space, the minimum opening is to be not less than 600 mm × 800 mm with corner radii of 300 mm at a height of not more than 600 mm from the bottom shell plating unless gratings or other foot holds are provided.
*Subject to verification of easy evacuation of injured person on a stretcher the vertical opening 850 mm × 620 mm with wider upper half than 600 mm, while the lower half may be less than 600 mm with the overall height not less than 850 mm is considered acceptable alternative to the opening of 600 mm × 800 mm with corner radii of 300 mm (see **Fig 1**).*

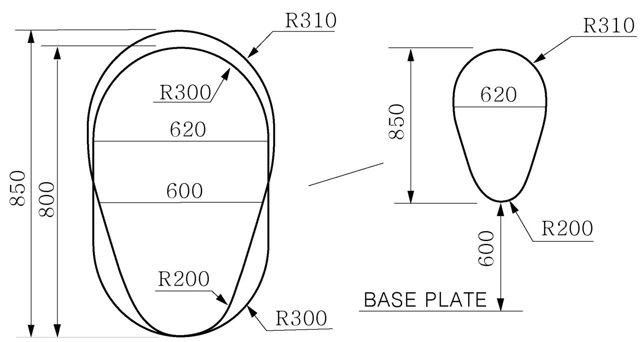

Fig 1: Alternative vertical opening

2. Technical provisions for means of access

2.1 Definitions

Ref. IMO Technical Provisions, 2 (Resolution MSC.158(78))

2.1.1 Rung

Rung means the step of vertical ladder or step on the vertical surface.

2.1.2 Tread

Tread means the step of inclined ladder, or step for the vertical access opening.

2.1.3 Flight of a ladder

*Flight of an inclined ladder means the actual stringer length of an inclined ladder.
For vertical ladders, it is the distance between the platforms.*

2.1.4 Stringer

Stringer means:

1) *the frame of a ladder; or*
2) *the stiffened horizontal plating structure fitted on side shell, transverse bulkheads and/or longitudinal bulkheads in the space. For the purpose of ballast tanks of less than 5 m width forming double side spaces, the horizontal plating structure is credited as a stringer and a longitudinal permanent means of access, if it provides a continuous passage of 600 mm or more in width past frames or stiffeners on the side shell or longitudinal bulkhead. Openings in stringer plating utilized as permanent means of access are to be arranged with guard rails or grid covers to provide safe passage on the stringer or safe access to each transverse web.*

2.1.5 Vertical ladder

Vertical ladder means a ladder of which the inclined angle is 70º and over up to 90º. Vertical ladder is to be not skewed by more than 2º.

2.1.6 Overhead obstructions

Overhead obstructions mean the deck or stringer structure including stiffeners above the means of access.

2.1.7 Distance below deck head

Distance below deck head means the distance below the plating.

2.1.8 Cross deck

Cross deck means the transverse area of main deck which is located inboard and between hatch coamings.

2.2 Permanent means of access

2.2.1

Ref. IMO Technical Provisions, 3.1 & 3.2 (Resolution MSC.158(78))
*Structural members, except those in double bottom spaces, are to be provided with a permanent means of access to the extent as specified in **[2.7]** to **[2.13]**.*
Permanent means of access are, as far as possible, to be integral to the structure of the ships , thus ensuring that they are robust and at the same time contributing to the overall strength of the structure, of the ship.

2.2.2

Ref. IMO Technical Provisions, 3.3 (Resolution MSC.158(78)) and IACS UI SC191
Elevated passageways forming sections of a permanent means of access, where fitted, are to have a minimum clear width of 600 mm, except for going around vertical webs where the minimum clear width

may be reduced to 450 mm, and to have guard rails over the open side of their entire length. For stand alone passageways guard rails are to be fitted on both sides of these structures.
Sloping structure providing part of the access and that are sloped by 5 or more degrees from horizontal plane when a ship is in upright position at even-keel, is to be of a non-skid construction.
Guard rails are to be 1000 mm in height and consist of a rail and intermediate bar 500 mm in height and of substantial construction. Stanchions are to be not more than 3 m apart.

2.2.3

Ref. IMO Technical Provisions, 3.4 (Resolution MSC.158(78))
Access to permanent means of access and vertical openings from the ship's bottom are to be provided by means of easily accessible passageways, ladders or treads. Treads are to be provided with lateral support for the foot. Where the rungs of ladders are fitted against a vertical surface, the distance from the centre of the rungs to the surface is to be at least 150 mm. Where vertical manholes are fitted higher than 600 mm above the walking level, access is to be facilitated by means of treads and hand grips with platform landings on both sides.

2.3 Construction of ladders

2.3.1 General

Ref. IMO Technical Provisions, 3.5 (Resolution MSC.158(78))
Permanent inclined ladders are to be inclined at an angle of less than 70°. There are to have no obstructions within 750 mm of the face of the inclined ladder, except that in way of an opening this clearance may be reduced to 600 mm. Resting platforms of adequate dimensions are normally to be provided at a maximum of 6 m vertical height. Ladders and handrails are to be constructed of steel or equivalent material of adequate strength and stiffness and securely attached to the tank structure by stays. The method of support and length of stay is to be such that vibration is reduced to a practical minimum. In cargo holds, ladders are to be designed and arranged so that cargo handling difficulties are not increased and the risk of damage from cargo handling gear is minimized.

2.3.2 Inclined ladders

Ref. IMO Technical Provisions, 3.6 (Resolution MSC.158(78))
The width of inclined ladders between stringers is to be not less than 400 mm. The treads are to be equally spaced at a distance apart, measured vertically, of between 200 mm and 300 mm. When steel is used, the treads are to be formed of two square bars of not less than 22 mm by 22 mm in section, fitted to form a horizontal step with the edges pointing upward. The treads are to be carried through the side stringers and attached thereto by double continuous welding. All inclined ladders are to be provided with handrails of substantial construction on both sides, fitted at a convenient distance above the treads.

2.3.3 Vertical or spiral ladders

Ref. IMO Technical Provisions, 3.7 (Resolution MSC.158(78))
For vertical ladders or spiral ladders, the width and construction are to be in accordance with international or national standards.

2.4 Access through openings

2.4.1 Access through horizontal openings, hatches or manholes

Ref. IMO Technical Provisions, 3.10 (Resolution MSC.158(78))
For access through horizontal openings, hatches or manholes, the minimum clear opening is to be not less than 600 mm × 600 mm. When access to a cargo hold is arranged through the cargo hatch, the top of the ladder is to be placed as close as possible to the hatch coaming.
Access hatch coamings having a height greater than 900 mm are also to have steps on the outside in conjunction with the ladder.

2.4.2 Access through vertical openings, or manholes

Ref. IMO Technical Provisions, 3.11 (Resolution MSC.158(78))
For access through vertical openings, or manholes, in swash bulkheads, floors, girders and web frames providing passage through the length and breadth of the space, the minimum opening is to be not less than 600 mm × 800 mm at a height of not more than 600 mm from the passage unless gratings or other foot holds are provided.

2.5 Access ladders to cargo holds and other spaces

2.5.1 General

Ref. IMO Technical Provisions, 3.13.1 & 3.13.2 (Resolution MSC.158(78))
Access ladders to cargo holds and other spaces are to be:

a) where the vertical distance between the upper surface of adjacent decks or between deck and the bottom of the cargo space is not more than 6 m, either a vertical ladder or an inclined ladder.
b) where the vertical distance between the upper surface of adjacent decks or between deck and the bottom of the cargo space is more than 6 m, an inclined ladder or series of inclined ladders at one end of the cargo hold, except the uppermost 2.5 m of a cargo space measured clear of overhead obstructions and the lowest 6 m may have vertical ladders, provided that the vertical extent of the inclined ladder or ladders connecting the vertical ladders is not less than 2.5 m.

2.5.2

Ref. IMO Technical Provisions, 3.13.2 (Resolution MSC.158(78))
The second means of access at the other end of the cargo hold may be formed of a series of staggered vertical ladders, which have to comprise one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. Adjacent sections of ladder are to be laterally offset from each other by at least the width of the ladder. The uppermost, entrance section, of the ladder directly exposed to a cargo hold is to be vertical for a distance of 2.5 m measured clear of overhead obstructions and connected to a ladder-linking platform.

2.5.3

Ref. IMO Technical Provisions, 3.13.3 (Resolution MSC.158(78))
A vertical ladder may be used as a means of access to topside tanks, where the vertical distance is 6 m or less between the deck and the longitudinal means of access in the tank or the stringer or the bottom of the space immediately below the entrance. The uppermost, entrance section from deck, of the vertical ladder of the tank is to be vertical for a distance of 2.5 m measured clear of the overhead obstructions and comprises a ladder linking platform unless landing on the longitudinal means of access, the stringer or the bottom within the vertical distance, it should be displaced to one side of a vertical ladder.

2.5.4

Ref. IMO Technical Provisions, 3.13.4 (Resolution MSC.158(78))
Unless allowed in ***[2.5.3]****, an inclined ladder or combination of ladders are to be used for access to a tank or a space where the vertical distance is greater than 6 m between the deck and a stringer immediately below the entrance, between stringers, or between the deck or a stringer and the bottom of the space immediately below the entrance.*

2.5.5

Ref. IMO Technical Provisions, 3.13.5 (Resolution MSC.158(78))
In case of ***[2.5.4]****, the uppermost, entrance section from deck, of the ladder is to be vertical for a distance of 2.5 m clear of the overhead obstructions and connected to a landing platform and continued with an inclined ladder. The flights of inclined ladders are to be not more than 9 m in actual length and the vertical height is normally to be not more than 6 m. The lowermost section of the ladders may be vertical for a vertical distance of not less than 2.5 m.*

2.5.6

Ref. IMO Technical Provisions, 3.13.6 (Resolution MSC.158(78))
In double side skin spaces of less than 2.5 m width, the access to the space may be by means of vertical ladders that comprises one or more ladder linking platforms spaced not more than 6 m apart vertically and displace to one side of the ladder.
Adjacent sections of ladder are to be laterally offset from each other by at least the width of the ladder.

2.5.7

Ref. IMO Technical Provisions, 3.13.7 (Resolution MSC.158(78))
A spiral ladder is considered acceptable as an alternative for inclined ladders. In this regard, the uppermost 2.5 m can continue to be comprised of the spiral ladder and need not change over to vertical ladders.

2.6 Access ladders to tanks

2.6.1

Ref. IMO Technical Provisions, 3.14 (Resolution MSC.158(78))
The uppermost, entrance section from deck, of the vertical ladder providing access to a tank should be vertical for a distance of 2.5 m measured clear of the overhead obstructions and comprises a ladder linking platform. It should be displaced to one side of a vertical ladder. The vertical ladder can be between 1.6 m and 3 m below deck structure if it lands on a longitudinal or athwartship permanent means of access fitted within that range.

2.7 Access to underdeck structure of cargo holds

2.7.1

Ref. IMO Technical Provisions, Tab 2, 1.1 (Resolution MSC.158(78))
Permanent means of access are to be fitted to provide access to the overhead structure at both sides of the cross deck and in the vicinity of the centerline.
Each means of access is to be accessible from the cargo hold access or directly from the main deck and installed at a minimum of 1.6 m to a maximum of 3 m below the deck.

2.7.2

Ref. IMO Technical Provisions, Tab 2, 1.2 (Resolution MSC.158(78))
An athwartship permanent means of access fitted on the transverse bulkhead at a minimum 1.6 m to a maximum 3 m below the cross-deck head is accepted as equivalent to ***[2.7.1].***

2.7.3

Ref. IMO Technical Provisions, Tab 2, 1.3 (Resolution MSC.158(78))
Access to the permanent means of access to overhead structure of the cross deck may also be via the upper stool.

2.7.4

Ref. IMO Technical Provisions, Tab 2, 1.4 (Resolution MSC.158(78)) and IACS UI SC191
Ships having transverse bulkheads with full upper stools, i.e. stools with a full extension between top side tanks and between hatch end beams, with access from the main deck which allows monitoring of all framing and plates from inside, do not require permanent means of access of the cross deck.

2.7.5

Ref. IMO Technical Provisions, Tab 2, 1.5 (Resolution MSC.158(78))
Alternatively, movable means of access may be utilized for access to the overhead structure of cross

deck if its vertical distance is 17 m or less above the tank top.

2.8 Access to double side skin tanks in double side bulk carriers

2.8.1

Ref. IMO Technical Provisions, Tab 2, 2.8 & Tab 1, 2.1 (Resolution MSC.158(78))
For double side spaces above the upper knuckle point of the bilge hopper sections, permanent means of access are to be provided in accordance with the following requirements:

a) where the vertical distance between horizontal uppermost stringer and deck head is 6 m or more, one continuous longitudinal permanent means of access is to be provided for the full length of the tank with a means to allow passing through transverse webs installed at a minimum of 1.6 m to a maximum of 3 m below the deck head with a vertical access ladder at each end of the tank;

b) continuous longitudinal permanent means of access, which are integrated in the structure, at a vertical distance not exceeding 6 m apart; and

c) plated stringers are to be, as far as possible, in alignment with horizontal girders of transverse bulkheads.

2.9 Access to vertical structures of cargo holds in single side bulk carriers

2.9.1

Ref. IMO Technical Provisions, Tab 2, 1.6 (Resolution MSC.158(78))
Permanent means of vertical access are to be provided in all cargo holds and built into the structure to allow for an inspection of a minimum of 25 % of the total number of hold frames port and starboard equally distributed throughout the hold including at each end in way of transverse bulkheads. But in no circumstance is this arrangement to be less than 3 permanent means of vertical access fitted to each side (fore and aft ends of hold and mid-span).
Permanent means of vertical access fitted between two adjacent hold frames is counted for an access for the inspection of both hold frames. A means of portable access may be used to gain access over the sloping plating of lower hopper ballast tanks.

2.9.2

Ref. IMO Technical Provisions, Tab 2, 1.7 (Resolution MSC.158(78))
In addition, portable or movable means of access are to be utilized for access to the remaining hold frames up to their upper brackets and transverse bulkheads.

2.9.3

Ref. IMO Technical Provisions, Tab 2, 1.8 (Resolution MSC.158(78))
Portable or movable means of access may be utilized for access to hold frames up to their upper bracket in place of the permanent means required in ***[2.9.1]****. These means of access are to be carried on board the ship and readily available for use.*

2.9.4

Ref. IMO Technical Provisions, Tab 2, 1.9 (Resolution MSC.158(78))

The width of vertical ladders for access to hold frames is to be at least 300 mm, measured between stringers.

2.9.5

Ref. IMO Technical Provisions, Tab 2, 1.10 (Resolution MSC.158(78))
A single vertical ladder over 6 m in length is acceptable for the inspection of the hold side frames in a single skin construction.

2.10 Access to vertical structures of cargo holds in double side bulk carriers

2.10.1

Ref. IMO Technical Provisions, Tab 2, 1.11 (Resolution MSC.158(78))
For double side skin construction no vertical ladders for the inspection of the cargo hold surfaces are required. Inspection of this structure should be provided from within the double hull space.

2.11 Access to top side ballast tanks in single side bulk carriers

2.11.1

Ref. IMO Technical Provisions, Tab 2, 2.1 (Resolution MSC.158(78))
For each topside tank of which the height is 6 m and over, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.6 m to a maximum of 3 m below deck with a vertical access ladder in the vicinity of each access to that tank.

2.11.2

Ref. IMO Technical Provisions, Tab 2, 2.2 (Resolution MSC.158(78))
If no access holes are provided through the transverse webs within 600 mm of the tank base and the web frame rings have a web height greater than 1 m in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safe access over each transverse web frame ring.

2.11.3

Ref. IMO Technical Provisions, Tab 2, 2.3 (Resolution MSC.158(78))
Three permanent means of access, fitted at the end bay and middle bay of each tank, are to be provided spanning from tank base up to the intersection of the sloping plate with the hatch side girder. The existing longitudinal structure, if fitted on the sloping plate in the space may be used as part of this means of access.

2.11.4

Ref. IMO Technical Provisions, Tab 2, 2.4 (Resolution MSC.158(78))
For topside tanks of which the height is less than 6 m, alternative or a portable means may be utilized in lieu of the permanent means of access.

2.12 Access to bilge hopper ballast tanks

2.12.1

Ref. IMO Technical Provisions, Tab 2, 2.5 (Resolution MSC.158(78)) and IACS UI SC191
For each bilge hopper tank of which the height is 6 m and over, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.2 m below the top of the clear opening of the web ring with a vertical access ladder in the vicinity of each access to the tank.
An access ladder between the longitudinal continuous permanent means of access and the bottom of the space is to be provided at each end of the tank.
Alternatively, the longitudinal continuous permanent means of access can be located through the upper web plating above the clear opening of the web ring, at a minimum of 1.6 m below the deck head, when this arrangement facilitates more suitable inspection of identified structurally critical areas. An enlarged longitudinal frame, of at least 600 mm clear width canbeusedforthepurposeofthewalkway.
For double side skin bulk carriers the longitudinal continuous permanent means of access may be installed within 6 m from the knuckle point of the bilge, if used in combination with alternative methods to gain access to the knuckle point.

2.12.2

Ref. IMO Technical Provisions, Tab 2, 2.6 (to Resolution MSC.158(78))
If no access holes are provided through the transverse ring webs within 600 mm of the tank base and the web frame rings have a web height greater than 1 m in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safe access over each transverse web frame ring.

2.12.3

Ref. IMO Technical Provisions, Tab 2, 2.7 (Resolution MSC.158(78))
For bilge hopper tanks of which the height is less than 6 m, alternative or a portable means may be utilized in lieu of the permanent means of access. Such means of access are to be demonstrated that they can be deployed and made readily available in the areas where needed.

2.13 Access to fore peak tanks

2.13.1

Ref. IMO Technical Provisions, Tab 2, 2.9 (Resolution MSC.158(78))
For fore peak tanks with a depth of 6 m or more at the centreline of the collision bulkhead, a suitable means of access is to be provided for access to critical areas such as the underdeck structure, stringers, collision bulkhead and side shell structure.

2.13.2

Ref. IMO Technical Provisions, Tab 2, 2.9.1 (Resolution MSC.158(78))
Stringers of less than 6 m in vertical distance from the deck head or a stringer immediately above are considered to provide suitable access in combination with portable means of access.

2.13.3

Ref. IMO Technical Provisions, Tab 2, 2.9.2 (Resolution MSC.158(78))
In case the vertical distance between the deck head and stringers, stringers or the lowest stringer and the tank bottom is 6 m or more, alternative means of access are to be provided.

3. Shaft tunnels

3.1 General

3.1.1

Tunnels are to be large enough to ensure easy access to shafting.

3.1.2

Access to the tunnel is to be provided by a watertight door fitted on the aft bulkhead of the engine room in compliance with **Ch 2, Sec 1, [6]**, and an escape trunk which can also act as watertight ventilator is to be fitted up to the subdivision deck, for tunnels greater than 7 m in length.

4. Access to steering gear compartment

4.1 General

4.1.1

The steering gear compartment is to be readily accessible and, as far as practicable, separated from machinery spaces.

4.1.2

Suitable arrangements to ensure working access to steering gear machinery and controls are to be provided.
These arrangements are to include handrails and gratings or other non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage. ⚓

Chapter 3

Structural Design Principles

Section 1 - MATERIAL

1. General

1.1 Standard of material

1.1.1

The requirements in this Section are intended for ships of welded construction using steels having characteristics complying with the Society Rules for Materials.

1.1.2

Materials with different characteristics may be accepted, provided their specification (manufacture, chemical composition, mechanical properties, welding, etc.) is submitted to the Society for approval.

1.2 Testing of materials

1.2.1

Materials are to be tested in compliance with the applicable requirements of Society Rules for Materials.

1.3 Manufacturing processes

1.3.1

The requirements of this Section presume that welding and other cold or hot manufacturing processes are carried out in compliance with current sound working practice defined in IACS UR W and the applicable requirements of Society Rules for Materials. In particular:

- parent material and welding processes are to be within the limits stated for the specified type of material for which they are intended
- specific preheating may be required before welding
- welding or other cold or hot manufacturing processes may need to be followed by an adequate heat treatment.

2. Hull structural steel

2.1 General

2.1.1

Table 1 gives the mechanical characteristics of steels currently used in the construction of ships.

Table 1: Mechanical properties of hull steels

Steel grades for plates with $t \leq 100$ mm	Minimum yield stress R_{eH}, in N/mm^2	Ultimate tensile strength R_m, in N/mm^2
A-B-D-E	235	400 - 520
AH32-DH32-EH32-FH32	315	440 - 570
AH36-DH36-EH36-FH36	355	490 - 630
AH40-DH40-EH40-FH40	390	510 - 660

2.1.2

Where higher strength steels are to be used for hull construction, the drawings showing the scope and locations of the used place together with the type and scantlings are to be submitted for the approval of the Society.

2.1.3

Higher strength steels other than those indicated in **Table 1** are considered by the Society on a case by case basis.

2.1.4

When steels with a minimum guaranteed yield stress R_{eH} other than 235 $\mathrm{N/mm^2}$ are used on a ship, hull scantlings are to be determined by taking into account the matrial factor k defined in **[2.2].**

2.1.5

It is required to keep on board a plan indicating the steel types and grades adopted for the hull structures. Where steels other than those indicated in **Table 1** are used, their mechanical and chemical properties, as well as any workmanship requirements or recommendations, are to be available on board together with the above plan.

2.2 Material factor k

2.2.1

Unless otherwise specified, the material factor k of normal and higher strength steel for scantling purposes is to be taken as defined in **Table 2**, as a function of the minimum yield stress R_{eH}.
For intermediate values of R_{eH}, k may be obtained by linear interpolation.
Steels with a yield stress greater than 390 $\mathrm{N/mm^2}$ are considered by the Society on a case by case basis.

Table 2: Material factor k

Minimum yield stress R_{eH}, in $\mathrm{N/mm^2}$	k
235	1.0
315	0.78
355	0.72
390	0.68

2.3 Grades of steel

2.3.1

Steel materials in the various strength members are not to be of lower grade than those corresponding to classes I, II and III, as given in **Table 3** for the material classes and grades given in **Table 4-1,** while additional requirements for ships with length (L) exceeding 150 m and 250 m, BC-A and BC-B ships are given in **Table 4-2** to **Table 4-4.**
For strength members not mentioned in **Table 4-1** to **Table 4-4**, grade A/AH may be used.

Table 3 : Material grade requirements for classes I, II and III

Class	I		II		III	
As-built thickness (mm)	NSS	HSS	NSS	HSS	NSS	HSS
$t \le 15$	A	AH	A	AH	A	AH
$15 < t \le 20$	A	AH	A	AH	B	AH
$20 < t \le 25$	A	AH	B	AH	D	DH
$25 < t \le 30$	A	AH	D	DH	D	DH
$30 < t \le 35$	B	AH	D	DH	E	EH
$35 < t \le 40$	B	AH	D	DH	E	EH
$40 < t \le 50$	D	DH	E	EH	E	EH
Notes NSS : Normal strength steel, HSS : Higher strength steel						

Table 4 : (void)

Table 4-1: Material Classes and Grades for ships in general

SECONDARY:		
A1	Longitudinal bulkhead strakes, other than that belonging to the Primary category	- Class I within 0.4 *L* amidships - Grade A/AH outside 0.4 *L* amidships
A2	Deck plating exposed to weather, other than that belonging to the Primary or Special category	
A3	Side plating	
PRIMARY:		
B1	Bottom plating, including keel plate	- Class II within 0.4 *L* amidships - Grade A/AH outside 0.4 *L* amidships
B2	Strength deck plating, excluding that belonging to the Special category	
B3	Continuous longitudinal members above strength deck, excluding hatch coamings.	
B4	Uppermost strake in longitudinal bulkhead	
B5	Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank	
SPECIAL:		
C1	Sheer strake at strength deck (1)	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships
C2	Stringer plate in strength deck (1)	
C3	Deck strake at longitudinal bulkhead, excluding deck plating in way of inner-skin bulkhead of double-hull ships (1)	
C5	Strength deck plating at corners of cargo hatch openings	- Class III within 0.6 *L* amidships - Class II within rest of cargo region
C6	Bilge strake in ships with double bottom over the full breadth and length less than 150 m (1)	- Class II within 0.6 *L* amidships - Class I outside 0.6 *L* amidships
C7	Bilge strake in other ships (1)	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships
C8	Longitudinal hatch coamings of length greater than 0.15L	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships - Not to be less than Grade D/DH
C9	End brackets and deck house transition of longitudinal cargo hatch coamings (2)	

(1) Single strakes required to be of Class III within 0.4 *L* amidships are to have breadths not less than 800+5 *L* (mm), and need not be greater than 1800 (mm), unless limited by the geometry of the ship's design.
(2) Applicable to bulk carriers having the longitudinal hatch coaming of length greater than 0.15 *L*.

Table 4-2: Minimum material grades for ships with ship's length (*L*) exceeding 150 m and single strength deck

Structural member category	Material Grade
Longitudinal strength members of strength deck plating	Grade B/AH within 0.4 L amidships
Continuous longitudinal strength members above strength deck	Grade B/AH within 0.4 L amidships
Single side strakes for ships without inner continuous longitudinal bulkheads between bottom and the strength deck	Grade B/AH within cargo region

Table 4-3: Minimum Material Grades for ships with ship's length (*L*) exceeding 250 m

Structural member category	Material Grade
Shear strake at strength deck(1)	Grade E/EH within 0.4 L amidships
Stringer plate in strength deck(1)	Grade E/EH within 0.4 L amidships
Bilge strake (1)	Grade D/DH within 0.4 L amidships
(1) Single strakes required to be of Class III within 0.4 L amidships are to have breadths not less than 800+5 L (mm), and need not be greatert han 1800 (mm), unless limited by the geometry of the ship's design	

Table 4-4: Minimum material grades for BC-A and BC-B ships

Structural member category	Material Grade
Lower bracket of ordinary side frame(1),(2)	Grade D/DH
Side shell strakes included totally or partially between the two points located to 0.125 l above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate(2)	Grade D/DH
(1) The term "lower bracket" means webs of lower brackets and webs of the lower part of side frames up to the point 0.125 l above the intersection of side shell and bilge hopper sloping plate or inner bottom plate. (2) The span of the side frame, l, is defined as the distance between the supporting structure (See **Ch 3, Sec 6, Fig 19**)	

2.3.2

Plating materials for stern frames, rudders, rudder horns and shaft brackets are in general not to be of lower grades than corresponding to class II. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders) class III is to be applied.

2.3.3

Bedplates of seats for propulsion and auxiliary engines inserted in the inner bottom within 0.6 L amidships are to be of class I. In other cases, the steel is to be at least of grade A/AH.

2.3.4 (void)

2.3.5

The steel grade is to correspond to the as-built thickness.

2.3.6

Steel grades of plates or sections of as-built thickness greater than the limiting thicknesses in **Table 3** are considered by the Society on a case by case basis.

2.3.7

In specific cases, such as **[2.3.8]**, with regard to stress distribution along the hull girder, the classes required within 0.4 L amidships may be extended beyond that zone, on a case by case basis.

2.3.8

The material classes required for the strength deck plating, the sheerstrake and the upper strake of longitudinal bulkheads within 0.4 L amidships are to be maintained for an adequate length across the poop front and at the ends of the bridge, where fitted.

2.3.9

Rolled products used for welded attachments of length greater than 0.15 L on outside of hull plating, such as gutter bars, are to be of the same grade as that used for the hull plating in way.

2.3.10

In the case of full penetration welded joints located in positions where high local stresses may occur perpendicular to the continuous plating, the Society may, on a case by case basis, require the use of rolled products having adequate ductility properties in the through thickness direction, such as to prevent the risk of lamellar tearing (Z type steel).

2.3.11 (void)

2.4 Structures exposed to low air temperature

2.4.1

The application of steels for ships designed to operate in area with low air temperatures is to comply with **[2.4.2]** to **[2.4.6].**

2.4.2

For ships intended to operate in areas with low air temperatures (below and including −20 °C), e.g. regular service during winter seasons to Arctic or Antarctic waters, the materials in exposed structures are to be selected based on the design temperature t_D , to be taken as defined in **[2.4.3].**

2.4.3

The design temperature t_D is to be taken as the lowest mean daily average air temperature in the area of operation, where:

Mean : Statistical mean over observation period (at least 20 years).

Average : Average during one day and night.

Lowest : Lowest during year.

Fig 1 illustrates the temperature definition for Arctic waters.
For seasonally restricted service the lowest value within the period of operation applies.

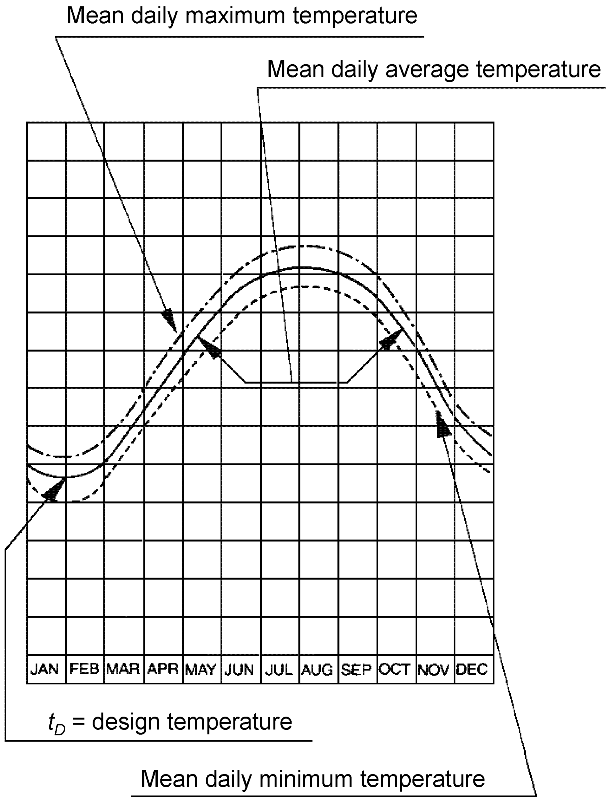

Fig 1: Commonly used definitions of temperatures

2.4.4

Materials in the various strength members above the lowest ballast water line (BWL) exposed to air are not to be of lower grades than those corresponding to classes I, II and III as given in **Table 5** depending on the categories of structural members (SECONDARY, PRIMARY and SPECIAL).
For non-exposed structures and structures below the lowest ballast water line, see **[2.3]**

2.4.5

The material grade requirements for hull members of each class depending on thickness and design temperature are defined in **Table 6**, **Table 7** and **Table 8**. For design temperatures t_D < -55 °C, materials are to be specially considered by the Society.

2.4.6

Single strakes required to be of class III or of grade E/EH and FH are to have breadths not less than the values, in m, given by the following formula, but need not to be greater than 1.8 m:

$b = 0.005\,L + 0.8$

Table 5: Application of material classes and grades – Structures exposed at low temperature

Structural member category	Material class	
	Within 0.4 L amidship	Outside 0.4 L amidship
SECONDARY		
Deck plating exposed to weather, in general	I	I
Side plating above BWL		
Transverse bulkheads above BWL		
PRIMARY		
Strength deck plating(1)	II	I
Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings		
Longitudinal bulkhead above BWL		
Top wing tank bulkhead above BWL		
SPECIAL		
Sheer strake at strength deck(2)	III	II
Stringer plate in strength deck(2)		
Deck strake at longitudinal bulkhead(3)		
Continuous longitudinal hatch coamings(4)		

Notes:
(1) Plating at corners of large hatch openings to be specially considered. Class III or grade E/EH to be applied in positions where high local stresses may occur.
(2) Not to be less than grade E/EH within 0.4 L amidships in ships with length exceeding 250 m.
(3) In ships with a breadth exceeding 70 m at least three deck strakes to be class III.
(4) Not to be less than grade D/DH.

3. Steels for forging and casting

3.1 General

3.1.1

Mechanical and chemical properties of steels for forging and casting to be used for structural members are to comply with the applicable requirements of the Society Rules for Materials.

3.1.2

Steels of structural members intended to be welded are to have mechanical and chemical properties deemed appropriate for this purpose by the Society on a case by case basis.

3.1.3

The steels used are to be tested in accordance with the applicable requirements of the Society Rules for Materials.

3.2 Steels for forging

3.2.1

Rolled bars may be accepted in lieu of forged products, after consideration by the Society on a case by case basis.
In such case, compliance with the applicable requirements of the Society Rules for Materials, relevant to the quality and testing of rolled parts accepted in lieu of forged parts, may be required.

3.3 Steels for casting

3.3.1

Cast parts intended for stems, sternframes, rudders, parts of steering gear and deck machinery in general may be made of C and C-Mn weldable steels, having specified minimum tensile strength $R_m = 400$ N/mm^2 or 440 N/mm^2, in accordance with the applicable requirements of the Society Rules for Materials.

3.3.2

The welding of cast parts to main plating contributing to hull strength members is considered by the Society on a case by case basis.
The Society may require additional properties and tests for such casting, in particular impact properties which are appropriate to those of the steel plating on which the cast parts are to be welded and non-destructive examinations.

3.3.3

Heavily stressed cast parts of steering gear, particularly those intended to form a welded assembly and tillers or rotors mounted without key, are to be subjected to surface and volumetric non-destructive examination to check their internal structure.

4. Aluminium alloy structures

4.1 General

4.1.1

The characteristics of aluminium alloys are to comply with the requirements of the Society Rules for Materials. Series 5000 aluminium-magnesium alloys or series 6000 aluminium-magnesium-silicon alloys are to be used.

4.1.2

In the case of structures subjected to low service temperatures or intended for other specific applications, the alloys to be employed are to be agreed by the Society.

4.1.3

Unless otherwise agreed, the Young's modulus for aluminium alloys is equal to 70,000 N/mm^2 and the Poisson's ratio equal to 0.33.

4.2 Extruded plating

4.2.1

Extrusions with built-in plating and stiffeners, referred to as extruded plating, may be used.

4.2.2

In general, the application is limited to decks, bulkheads, superstructures and deckhouses. Other uses may be permitted by the Society on a case by case basis.

4.2.3

Extruded plating is to be oriented so that the stiffeners are parallel to the direction of main stresses.

4.2.4

Connections between extruded plating and primary members are to be given special attention.

4.3 Mechanical properties of weld joints

4.3.1

Welding heat input lowers locally the mechanical strength of aluminium alloys hardened by work hardening (series 5000 other than condition O or H111) or by heat treatment (series 6000).

4.3.2

The as-welded properties of aluminium alloys of series 5000 are in general those of condition O or H111. Higher mechanical characteristics may be taken into account, provided they are duly justified.

4.3.3

The as-welded properties of aluminium alloys of series 6000 are to be agreed by the Society.

4.4 Material factor k

4.4.1

The material factor k for aluminium alloys is to be obtained from the following formula:

$$k = \frac{235}{R'_{\lim}}$$

where:

$R'_{\lim}$: Minimum guaranteed yield stress of the parent metal in welded condition $R'_{p0.2}$, in $\mathrm{N/mm^2}$, but not to be taken greater than 70 % of the minimum guaranteed tensile strength of the parent metal in welded condition R'_m, in $\mathrm{N/mm^2}$

$R'_{p0.2} = \eta_1 R_{p0.2}$

$R'_m = \eta_2 R_m$

$R_{p0.2}$: Minimum guaranteed yield stress, in $\mathrm{N/mm^2}$, of the parent metal in delivery condition

R_m : Minimum guaranteed tensile strength, in $\mathrm{N/mm^2}$, of the parent metal in delivery condition

η_1, η_2 : Specified in **Table 9.**

4.4.2

In the case of welding of two different aluminium alloys, the material factor k to be considered for the scantlings is the greater material factor of the aluminium alloys of the assembly.

Table 9: Aluminium alloys for welded construction

Aluminium alloy	η_1	η_2
Alloys without work-hardening treatment (series 5000 in annealed condition O or annealed flattened condition H111)	1	1
Alloys hardened by work hardening (series 5000 other than condition O or H111)	$R'_{p0.2} / R_{p0.2}$	R'_m / R_m
Alloys hardened by heat treatment (series 6000) (1)	$R'_{p0.2} / R_{p0.2}$	0.6

Notes:
(1) : When no information is available, coefficient η_1 is to be taken equal to the metallurgical efficiency coefficient β defined in **Table 10**
$R'_{p0.2}$: Minimum guaranteed yield stress, in N/mm^2, of material in welded condition
R'_m : Minimum guaranteed tensile strength, in N/mm^2, of material in welded condition

Table 10: Aluminium alloys – Metallurgical efficiency coefficient β

Aluminium alloy	Temper condition	Gross thickness, in mm	β
6005 A (Open sections)	T5 or T6	$t \leq 6$	0.45
		$t > 6$	0.40
6005 A (Closed sections)	T5 or T6	All	0.50
6061 (Sections)	T6	All	0.53
6082 (Sections)	T6	All	0.45

5. Other materials and products

5.1 General

5.1.1

Other materials and products such as parts made of iron castings, where allowed, products made of copper and copper alloys, rivets, anchors, chain cables, cranes, masts, derrick posts, derricks, accessories and wire ropes are to comply with the applicable requirements of the Society Rules for Materials.

5.1.2

The use of plastics or other special materials not covered by these Rules is to be considered by the Society on a case by case basis. In such cases, the requirements for the acceptance of the materials concerned are to be agreed by the Society.

5.1.3

Materials used in welding processes are to comply with the applicable requirements of the Society Rules for Materials.

5.2 Iron cast parts

5.2.1

As a rule, the use of grey iron, malleable iron or spheroidal graphite iron cast parts with combined ferritic/perlitic structure is allowed only to manufacture low stressed elements of secondary importance.

5.2.2

Ordinary iron cast parts may not be used for windows or sidescuttles; the use of high grade iron cast parts of a suitable type will be considered by the Society on a case by case basis.

Section 2 - NET SCANTLING APPROACH

Symbols

t_{as_built} : As-built Thickness: the actual thickness, in mm, provided at the newbuilding stage, including $t_{voluntary\_addition}$, if any.

t_C : Corrosion Addition Thickness: as defined in **Ch 3**, **Sec 3**, in mm.

$t_{gross\_offered}$: Gross Thickness Offered: the actual gross (full) thickness, in mm, provided at the newbuilding stage, excluding $t_{voluntary\_addition}$, the owner's extra margin for corrosion wastage, if any.

$t_{gross\_required}$: Gross Thickness Required: the gross (full) thickness, in mm, obtained by adding t_C to the Net Thickness Required.

$t_{net\_offered}$: Net Thickness Offered: the net thickness, in mm, obtained by subtracting t_C from the Gross Thickness Offered

$t_{net\_required}$: Net Thickness Required: the net thickness, in mm, as required by the Rules that satisfy all the structural strength requirements, rounded to the closest half millimetre.

$t_{voluntary\_addition}$: Thickness for Voluntary Addition: the thickness, in mm, voluntarily added as the owner's extra margin for corrosion wastage in addition to t_C.

1. General philosophy

1.1

1.1.1

Net Scantling Approach is to clearly specify the "net scantling" that is to be maintained right from the newbuilding stage throughout the ship's design life to satisfy the structural strength requirements. This approach clearly separates the net thickness from the thickness added for corrosion that is likely to occur during the ship-in-operation phase.

2. Application criteria

2.1 General

2.1.1

The scantlings obtained by applying the criteria specified in this Rule are net scantlings as specified in **[3.1]** to **[3.3]**; i.e. those which provide the strength characteristics required to sustain the loads, excluding any addition for corrosion and voluntarily added thickness such as the owner's extra margin, if any. The following gross offered scantlings are exceptions; i.e. they already include additions for corrosion but without voluntarily added values such as the owner's extra margin:

- scantlings of superstructures and deckhouses, according to **Ch 9**, **Sec 4**
- scantlings of rudder structures, according to **Ch 10**, **Sec 1**
- scantlings of massive pieces made of steel forgings, steel castings.

2.1.2

The required strength characteristics are:

- thickness, for plating including that which constitutes primary supporting members
- section modulus, shear area, moments of inertia and local thickness for ordinary stiffeners and, as the

case may be, primary supporting members

- section modulus, moments of inertia and first moment for the hull girder.

2.1.3

The ship is to be built at least with the gross scantlings obtained by adding the corrosion additions, specified in **Ch 3**, **Sec 3** to the net scantlings. The thickness for voluntary addition is to be added as an extra.

3. Net scantling approach

3.1 Net scantling definition

3.1.1 Required thickness

The gross thickness required, $t_{gross\_required}$, is not less than the gross thickness which is obtained by adding the corrosion addition t_C as defined in **Ch 3**, **Sec 3** to net thickness required, as follows:

$$t_{gross\_required} = t_{net\_required} + t_C$$

3.1.2 Offered thickness

The gross thickness offered, $t_{gross\_offered}$, is the gross thickness provided at the newbuilding stage, which is obtained by deducting the thickness for voluntary addition from the as-built thickness, as follows:

$$t_{gross\_offered} = t_{as\_built} - t_{voluntary\_addition}$$

3.1.3 Net thickness for plate

Net thickness offered, $t_{net\_offered}$, is obtained by subtracting t_C from the gross thickness offered, as follows:

$$t_{net\_offered} = t_{gross\_offered} - t_C = t_{as\_built} - t_{voluntary\_addition} - t_C$$

3.1.4 Net section modulus for stiffener

The net transverse section scantling is to be obtained by deducting t_C from the gross thickness offered of the elements which constitute the stiffener profile as shown in **Fig 1**.
For bulb profiles, an equivalent angle profile, as specified in **Ch 3**, **Sec 6, [4.1.1],** may be considered.
The net strength characteristics are to be calculated for the net transverse section.
In assessing the net strength characteristics of stiffeners reflecting the hull girder stress and stress due to local bending of the local structure such as double bottom structure, the section modulus of hull girder or rigidity of structure is obtained by deducting $0.5\,t_C$ from the gross thickness offered of the related elements.
Shadow area is corrosion addition.
For attached plate, the half of the considered corrosion addition specified in **3.2** is deducted from both sides of the attached plate.

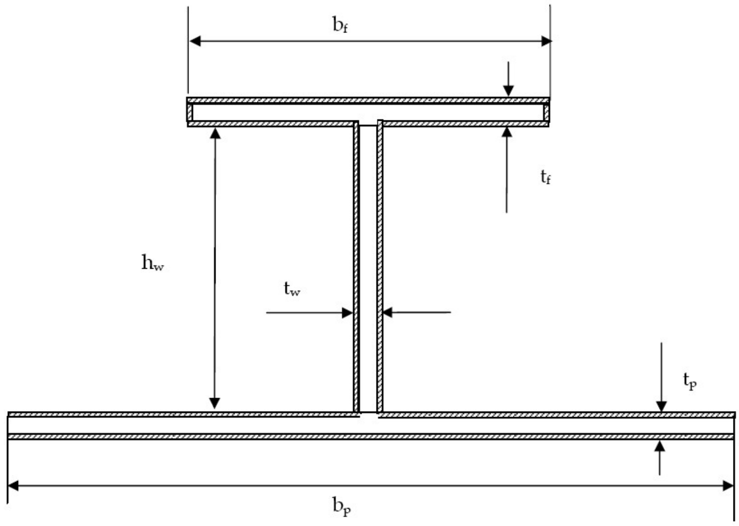

Fig 1: Net scantling of stiffener

3.2 Considered net scantling

3.2.1 Yielding check of the hull girder

The net thickness of structural members to be considered for the yielding check of the hull girder, according to **Ch 5**, **Sec 1**, is to be obtained by deducting 0.5 t_C from the gross thickness offered.

3.2.2 Global stress such as stress due to hull girder bending moment and shear force

The net thickness of structural members to be considered for stress due to hull girder bending moment and shear force according to **Ch 5**, **Sec 1**, is to be obtained by deducting 0.5 t_C from the gross thickness offered.

3.2.3 Buckling check of the hull girder

The net thickness of structural members to be considered for the buckling check, according to **Ch 6**, **Sec 3**, is to be obtained by deducting t_C from the gross thickness offered.

3.2.4 Ultimate strength check of the hull girder

The net thickness of structural members to be considered for the ultimate strength check of the hull girder, according to **Ch 5**, **Sec 2**, is to be obtained by deducting 0.5 t_C from the gross thickness offered.

3.2.5 Direct strength analysis

The net thickness of plating which constitutes primary supporting members to be checked stresses according to **Ch 7** is to be obtained by deducting 0.5 t_C from the gross thickness offered.
The net thickness of plating members to be considered for the buckling check according to **Ch 6**, **Sec 3,** using the stresses obtained from direct strength analysis, is to be obtained by deducting t_C from the gross thickness offered.

3.2.6 Fatigue check

The net thickness of structural members to be checked for fatigue according to **Ch 8** is to be obtained by deducting 0.5 t_C from the gross thickness offered.

3.2.7 Check of primary supporting members for ships less than 150 m in length *L*

The net thickness of plating which constitutes primary supporting members for ships less than 150 m in length L, to be checked according to **Ch 6**, **Sec 4, [2]**, is to be obtained by deducting t_c from the gross thickness.

3.3 Available information on structural drawings

3.3.1

The structural drawings are to indicate for each structural element the gross scantling and the renewal thickness as specified in **Ch 13**, **Sec 2**.
If thickness for voluntary addition is included in the as-built thicknesses, this is to be clearly mentioned and identified on the drawings.

Section 3 – CORROSION ADDITIONS

Symbols

t_C : Total corrosion addition, in mm, defined in **[1.2]**

t_{C1}, t_{C2} : Corrosion addition, in mm, on one side of the considered structural member, defined in **Table 1**

$t_{reserve}$: Reserve thickness, in mm, defined in **Ch 13**, **Sec 2** and taken equal to:

$t_{reserve} = 0.5$

1. Corrosion additions

1.1 General

1.1.1

The values of the corrosion additions specified in this section are to be applied in relation with the relevant protective coatings required by **Sec 5**.
For materials different from carbon steel, special consideration is to be given to the corrosion addition.

1.2 Corrosion addition determination

1.2.1 Corrosion additions for steel

The corrosion addition for each of the two sides of a structural member, t_{C1} or t_{C2}, is specified in **Table 1**. The total corrosion addition t_C, in mm, for both sides of the structural member is obtained by the following formula:

$$t_C = Roundup_{0.5}(t_{C1} + t_{C2}) + t_{reserve}$$

For an internal member within a given compartment, the total corrosion addition t_C is obtained from the following formula:

$$t_C = Roundup_{0.5}(2t_{C1}) + t_{reserve}$$

where t_{C1} is the value specified in **Table 1** for one side exposure to that compartment.
When a structural member is affected by more than one value of corrosion addition (e.g. a plate in a dry bulk cargo hold extending above the lower zone), the scantling criteria are generally to be applied considering the severest value of corrosion addition applicable to the member.
In addition, the total corrosion addition t_C is not to be taken less than 2 mm, except for web and face plate of ordinary stiffeners.

1.2.2 Corrosion additions for aluminium alloys

For structural members made of aluminium alloys, the corrosion addition t_C is to be taken equal to 0.

Table 1: Corrosion addition on one side of structural members

</table>

Notes
(1) Dry bulk cargo hold includes holds, intended for the carriage of dry bulk cargoes, which may carry water ballast.
(2) The corrosion addition of a plating between water ballast and heated fuel oil tanks is to be increased by 0.7 mm.
(3) This is only applicable to ballast tanks with weather deck as the tank top.
(4) Upper part of the cargo holds corresponds to an area above the connection between the top side and the inner hull or side shell. If there is no top side, the upper part corresponds to the upper one third of the cargo hold height.
(5) Horizontal member means a member making an angle up to 20° as regard as a horizontal line.
(6) The corrosion addition on the outer shell plating in way of pipe tunnel is to be considered as water ballast tank.
(7) Outer side shell between normal ballast draught and scantling draught is to be increased by 0.5 mm.

Section 4 - LIMIT STATES

1. General

1.1 General principle

1.1.1

The structural strength assessments indicated in **Table 1** are covered by the requirements of the present Rules.

Table 1: Structural strength assessment

		Yielding check	Buckling check	Ultimate strength check	Fatigue check
Local Structures	Ordinary stiffeners	√	√	√[1]	√[2]
	Plating subjected to lateral pressure	√	√	√[3]	—
Primary supporting members		√	√	√	√[2]
Hull girder		√	√[4]	√	—

Note: √ indicates that the structural assessment is to be carried out.
(1) The ultimate strength check of stiffeners is included in the buckling check of stiffeners.
(2) The fatigue check of stiffeners and primary supporting members is the fatigue check of connection details of these members.
(3) The ultimate strength check of plating is included in the yielding check formula of plating.
(4) The buckling check of stiffeners and plating taking part in hull girder strength is performed against stress due to hull girder bending moment and hull girder shear force.

1.1.2

Strength of hull structures in flooded condition is to be assessed.

1.2 Limit states

1.2.1 Serviceability limit state

Serviceability limit state, which concerns the normal use, includes:

- local damage which may reduce the working life of the structure or affect the efficiency or appearance of structural members
- unacceptable deformations which affect the efficient use and appearance of structural members or the functioning of equipment.

1.2.2 Ultimate limit state

Ultimate limit state, which corresponds to the maximum load-carrying capacity, or in some cases, the maximum applicable strain or deformation, includes:

- attainment of the maximum resistance capacity of sections, members or connections by rupture or excessive deformations
- instability of the whole structure or part of it.

1.2.3 Fatigue limit state

Fatigue limit state relate to the possibility of failure due to cyclic loads.

1.2.4 Accidental limit state

Accidental limit state considers the flooding of any one cargo hold without progression of the flooding to the other compartments and includes:

- the maximum load-carrying capacity of hull girder
- the maximum load-carrying capacity of double bottom structure
- the maximum load-carrying capacity of bulkhead structure

Accidental single failure of one structural member of any one cargo hold is considered in the assessment of the ultimate strength of the entire stiffened panel.

2. Strength criteria

2.1 Serviceability limit states

2.1.1 Hull girder

For the yielding check of the hull girder, the stress corresponds to a load at 10^{-8} probability level.

2.1.2 Plating

For the yielding check and buckling check of platings constituting a primary supporting member, the stress corresponds to a load at 10^{-8} probability level.

2.1.3 Ordinary stiffener

For the yielding check of an ordinary stiffener, the stress corresponds to a load at 10^{-8} probability level.

2.2 Ultimate limit states

2.2.1 Hull girder

The ultimate strength of the hull girder is to withstand the maximum vertical longitudinal bending moment obtained by multiplying the partial safety factor and the vertical longitudinal bending moment at 10^{-8} probability level.

2.2.2 Plating

The ultimate strength of the plating between ordinary stiffeners and primary supporting members is to withstand the load at 10^{-8} probability level.

2.2.3 Ordinary stiffener

The ultimate strength of the ordinary stiffener is to withstand the load at 10^{-8} probability level.

2.3 Fatigue limit state

2.3.1 Structural details

The fatigue life of representative structural details such as connections of ordinary stiffeners and primary supporting members is obtained from reference pressures at 10^{-4}.

2.4 Accidental limit state

2.4.1 Hull girder

Longitudinal strength of hull girder in cargo hold flooded condition is to be assessed in accordance with **Ch 5, Sec 2.**

2.4.2 Double bottom structure

Double bottom structure in cargo hold flooded condition is to be assessed in accordance with **Ch 6**, **Sec 4**

2.4.3 Bulkhead structure

Bulkhead structure in cargo hold flooded condition is to be assessed in accordance with **Ch 6**, **Sec 1**, **Sec 2** and **Sec 3.**

3. Strength check against impact loads

3.1 General

3.1.1

Structural response against impact loads such as forward bottom slamming, bow flare slamming and grab falling depends on the loaded area, magnitude of loads and structural grillage.

3.1.2

The ultimate strength of structural members that constitute the grillage, i.e. platings between ordinary stiffeners and primary supporting members and ordinary stiffeners with attached plating, is to withstand the maximum impact loads acting on them.

Section 5 – CORROSION PROTECTION

1. General

1.1 Structures to be protected

1.1.1

All seawater ballast tanks, cargo holds and ballast holds are to have a corrosion protective system fitted in accordance with **[1.2]**, **[1.3]** and **[1.4]** respectively.

1.1.2

Void double side skin spaces in cargo length area for vessels having a length (L_{LL}) of not less than 150 m are to be coated in accordance with **[1.2]**.

1.1.3

Corrosion protective coating is not required for internal surfaces of spaces intended for the carriage of fuel oil.

1.1.4

Narrow spaces are generally to be filled by an efficient protective product, particularly at the ends of the ship where inspections and maintenance are not easily practicable due to their inaccessibility.

1.2 Protection of seawater ballast tanks and void double side skin spaces

1.2.1

All dedicated seawater ballast tanks anywhere on the ship (excluding ballast hold) for vessels having a length (L) of not less than 90 m and void double side skin spaces in the cargo length area for vessels having a length (L_{LL}) of not less than 150 m are to have an efficient corrosion prevention system, such as hard protective coatings or equivalent, applied in accordance with the manufacturer's recommendation.
The coatings are to be of a light colour, i.e. a colour easily distinguishable from rust which facilitates inspection.
Where appropriate, sacrificial anodes, fitted in accordance with **[2]**, may also be used.

1.2.2

For ships contracted for construction on or after the date of IMO adoption of the amended SOLAS regulation II-1/3-2, by which an IMO "Performance standard for protective coatings for ballast tanks and void spaces" will be made mandatory, the coatings of internal spaces subject to the amended SOLAS regulation are to satisfy the requirements of the IMO performance standard.
Consistent with IMO Resolution A.798(19) and IACS UI SC 122, the selection of the coating system, including coating selection, specification, and inspection plan, are to be agreed between the shipbuilder, coating system supplier and the owner, in consultation with the Society, prior to commencement of construction. The specification for the coating system for these spaces is to be documented and this documentation is to be verified by the Society and is to be in full compliance with the coating performance standard.
The shipbuilder is to demonstrate that the selected coating system with associated surface preparation and application methods is compatible with the manufacturing processes and methods.
The shipbuilder is to demonstrate that the coating inspectors have proper qualification as required by the IMO standard.
The attending surveyor of the Society will not verify the application of the coatings but will review the reports of the coating inspectors to verify that the specified shipyard coating procedures have been followed.

1.3 Protection of cargo hold spaces

1.3.1 Coating

It is the responsibility of the shipbuilder and of the owner to choose coatings suitable for the intended cargoes, in particular for the compatibility with the cargo.

1.3.2 Application

All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of cargo holds (side and transverse bulkheads), excluding the inner bottom area and part of the hopper tank sloping plate and lower stool sloping plate, are to have an efficient protective coating, of an epoxy type or equivalent, applied in accordance with the manufacturer's recommendation.
The side and transverse bulkhead areas to be coated are specified in **[1.3.3]** and **[1.3.4]** respectively.

1.3.3 Side areas to be coated

The areas to be coated are the internal surfaces of:

- the inner side plating
- the internal surfaces of the topside tank sloping plates
- the internal surfaces of the hopper tank sloping plates for a distance of 300 mm below the frame end bracket for single side bulk carriers or below the hopper tank upper end for double side bulk carriers.

These areas are shown in **Fig 1**.

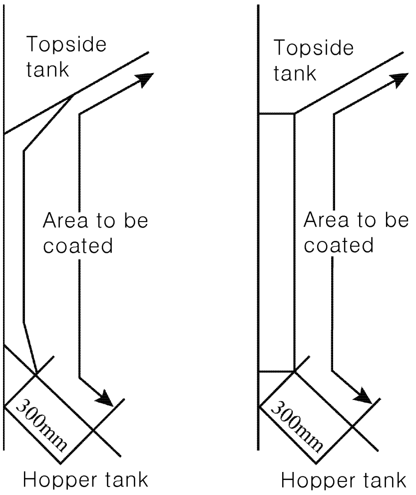

Fig 1: Side areas to be coated

1.3.4 Transverse bulkhead areas to be coated

The areas of transverse bulkheads to be coated are all the areas located above an horizontal level located at a distance of 300 mm below the frame end bracket for single side bulk carriers or below the hopper tank upper end for double side bulk carriers.

1.4 Protection of ballast hold spaces

1.4.1 Application

All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of ballast holds are to have an effective protective coating, of an epoxy type or equivalent, applied in accordance with the manufacturer's recommendation.

2. Sacrificial anodes

2.1 General

2.1.1

Anodes are to have steel cores and are to be fitted sufficiently rigid by the anode support designed so that they retain the anode even when it is wasted.
The steel inserts are to be attached to the structure by means of a continuous weld. Alternatively, they may be attached to separate supports by bolting, provided a minimum of two bolts with lock nuts are used. However, other mechanical means of clamping may be accepted.

2.1.2

The supports at each end of an anode may not be attached to separate items which are likely to move independently.

2.1.3

Where anode inserts or supports are welded to the structure, the welds are to be smoothly.

3. Protection of inner bottom by ceiling

3.1 General

3.1.1

Ceiling on the inner bottom, if any, is to comply with **[3.2]** and **[3.3]**.

3.2 Arrangement

3.2.1

Planks forming ceiling over the bilges and on the inner bottom are to be easily removable to permit access for maintenance.

3.2.2

Where the double bottom is intended to carry fuel oil, ceiling on the inner bottom is to be separated from the plating by means of battens 30 mm high, in order to facilitate the drainage of oil leakages to the bilges.

3.2.3

Where the double bottom is intended to carry water, ceiling on the inner bottom may lie next to the plating, provided a suitable protective composition is applied beforehand.

3.2.4

The shipyard is to take care that the attachment of ceiling does not affect the tightness of the inner bottom.

3.3 Scantlings

3.3.1

The thickness of ceiling boards, when made of pine, is to be not less than 60 mm. Under cargo hatchways, the thickness of ceiling is to be increased by 15 mm.

Where the floor spacing is large, the thicknesses may be considered by the Society on a case by case basis.

Section 6 – Structural Arrangement Principles

Symbols

For symbols not defined in this Section, refer to the list defined in **Ch 1, Sec 4**.

b_h : Breadth, in m, of cargo hatch opening

ℓ_b : Length, in m, of the free edge of the end bracket

1. Application

The requirements of this section apply to the cargo hold area. For other areas, the requirements of **Ch 9, Sec 1** to **Ch 9, Sec 4** are to be applied.

2. General principles

2.1 Definition

2.1.1 Primary frame spacing

Primary frame spacing, in m, is defined as the distance between the primary supporting members.

2.1.2 Secondary frame spacing

Secondary frame spacing, in m, is defined as the distance between ordinary stiffeners.

2.2 Structural continuity

2.2.1 General

The reduction in scantling from the midship part to the end parts is to be effected as gradually as practicable.
Attention is to be paid to the structural continuity in way of changes in the framing system, at the connections of primary supporting members or ordinary stiffeners and in way of the ends of the fore and aft parts and machinery space and in way of the ends of superstructures.

2.2.2 Longitudinal members

Longitudinal members are to be so arranged as to maintain the continuity of strength.
Longitudinal members contributing to the hull girder longitudinal strength are to extend continuously for a sufficient distance towards the end of ship.
In particular, the continuity of the longitudinal bulkheads, including vertical and horizontal primary supporting members, extended over the cargo hold area is to be ensured beyond the cargo hold area. Scarfing brackets are a possible means.

2.2.3 Primary supporting members

Primary supporting members are to be arranged in such a way that they ensure adequate continuity of strength.
Abrupt changes in height or cross section are to be avoided.

2.2.4 Ordinary stiffeners

Ordinary stiffeners contributing to the hull girder longitudinal strength are generally to be continuous when crossing primary supporting members.

2.2.5 Platings

A change in plating thickness in as-built is not to exceed 50 % of thicker plate thickness for load carrying direction. The butt weld preparation is to be in accordance with the requirements of **Ch 11**, **Sec 2**, **[2.2]**.

2.2.6 Stress concentrations

Where stress concentration may occur in way of structural discontinuity, sufficient consideration is to be paid to reduce the stress concentration and adequate compensation and reinforcements are to be provided.
Openings are to be avoided, as far as practicable, in way of highly stressed areas.
Where openings are arranged, the shape of openings is to be such that the stress concentration remains within acceptable limits.
Openings are to be well rounded with smooth edges.
Weld joints are to be properly shifted from places where the stress may highly concentrate.

2.3 Connections with higher tensile steel

2.3.1 Connections with higher tensile steel

Where steels of different strengths are mixed in a hull structure, due consideration is to be given to the stress in the lower tensile steel adjacent to higher tensile steel.
Where stiffeners of lower tensile steel are supported by primary supporting members of higher tensile steel, due consideration is to be given to the stiffness of primary supporting members and scantlings to avoid excessive stress in the stiffeners due to the deformation of primary supporting members.
Where higher tensile steel is used at deck structures and bottom structure, longitudinal members not contributing to the hull girder longitudinal strength and welded to the strength deck or bottom plating and bilge strake, such as longitudinal hatch coamings, gutter bars, strengthening of deck openings, bilge keel, etc., are to be made of the same higher tensile steel. The same requirement is applicable for non continuous longitudinal stiffeners welded on the web of a primary member contributing to the hull girder longitudinal strength as hatch coamings, stringers and girders.

3. Plating

3.1 Structural continuity of plating

3.1.1 Insert plate

Where a local increase in plating thickness is generally to be achieved to through insert plates, an insert plate is to be made of the materials of a quality (yield & grade) at least equal to that of the plates on which they are welded.

4. Ordinary stiffener

4.1 Profile of stiffeners

4.1.1 Stiffener profile with a bulb section

A bulb section may be taken as equivalent to a built-up section. The dimensions of the equivalent angle section are to be obtained, in mm, from the following formulae.

$$h_w = h'_w - \frac{h'_w}{9.2} + 2$$

$$b_f = \alpha\left(t'_w + \frac{h'_w}{6.7} - 2\right)$$

$$t_f = \frac{h'_w}{9.2} - 2$$

where:

h'_w, t'_w : Height and net thickness of a bulb section, in mm, as shown in **Fig 1.**

α : Coefficient equal to:

$$\alpha = 1.1 + \frac{(120 - h'_w)^2}{3000} \quad \text{for } h'_w \le 120$$

$$\alpha = 1.0 \quad \text{for } h'_w > 120$$

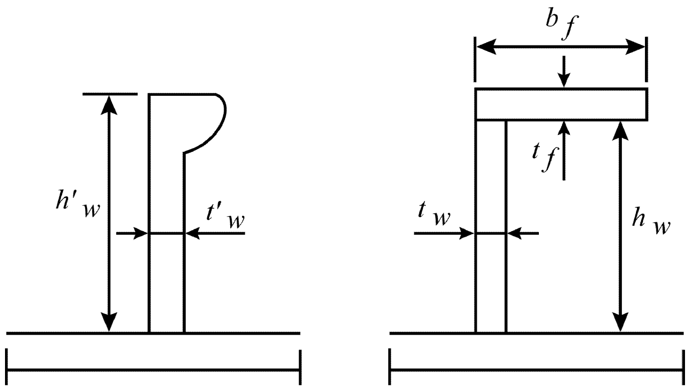

Fig 1: Dimensions of stiffeners

4.2 Span of ordinary stiffeners

4.2.1 Ordinary stiffener

The span ℓ of ordinary stiffeners is to be measured as shown in **Fig 2** For curved stiffeners, the span is measured along the chord.

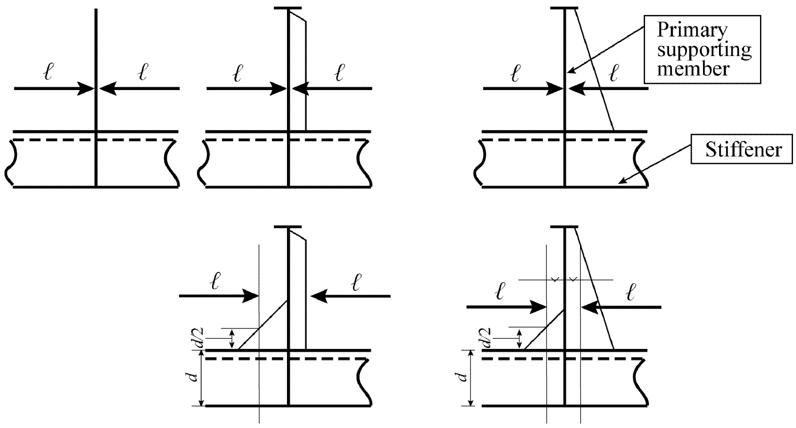

Fig 2: Span of ordinary stiffeners

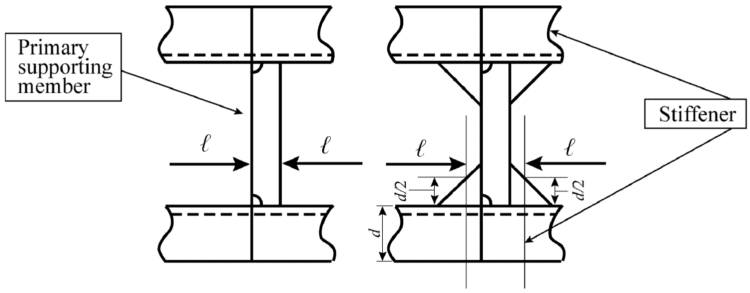

Fig 3: Span of ordinary stiffeners within a double hull

4.2.2 Ordinary stiffener within a double hull

The span ℓ of ordinary stiffeners fitted inside a double hull, i.e. when the web of the primary supporting members is connected with the inner hull and the outer shell acting as its flanges, is to be measured as shown in **Fig 3**.

4.2.3 Ordinary stiffeners supported by struts

The arrangement of ordinary stiffeners supported by struts is not allowed for ships over 120 m in length.
The span ℓ of ordinary stiffeners supported by one strut fitted at mid distance of the primary supporting members is to be taken as 0.7 ℓ_2.
In case where two struts are fitted between primary supporting members, the span ℓ of ordinary stiffeners is to be taken as the greater of 1.4 ℓ_1 and 0.7 ℓ_2.
ℓ_1 and ℓ_2 are the spans defined in **Figs 4** and **5**.

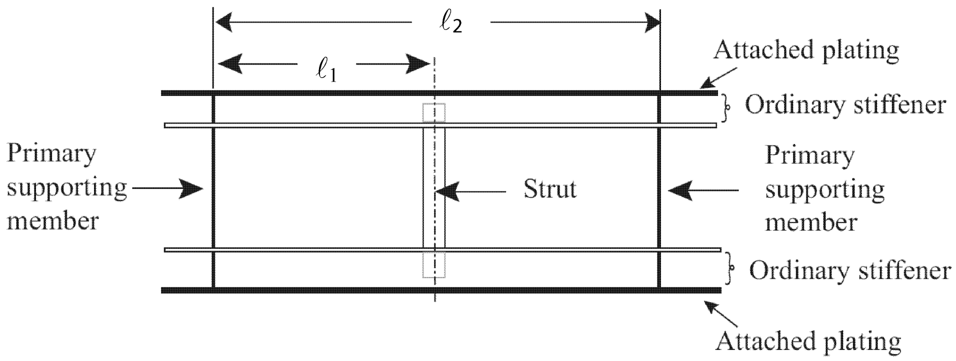

Fig 4: Span of ordinary stiffeners with one strut

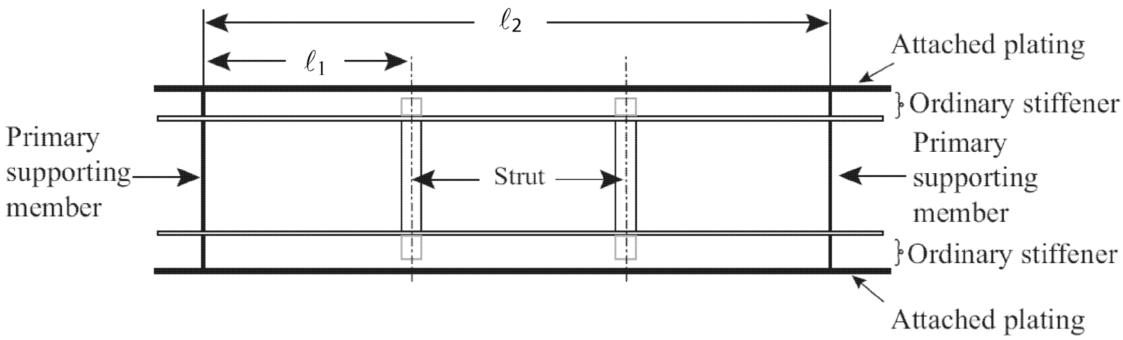

Fig 5: Span of ordinary stiffeners with two struts

4.3 Attached plating

4.3.1 Effective breadth for yielding check

The effective width b_p of the attached plating to be considered in the actual net section modulus for the yielding check of ordinary stiffeners is to be obtained, in m, from the following formulae:

- where the plating extends on both sides of the ordinary stiffener:

  $b_p = 0.2\ell$, or

  $b_p = s$

  whichever is lesser.
- where the plating extends on one side of the ordinary stiffener (i.e. ordinary stiffeners bounding openings):

  $b_p = 0.5s$

  $b_p = 0.1\ell$

  whichever is lesser.

4.3.2 Effective width for buckling check

The effective width of the attached plating of ordinary stiffeners for checking the buckling of ordinary stiffeners is defined in **Ch 6**, **Sec 3**, **[5]**.

4.4 Geometric property of ordinary stiffeners

4.4.1 General

Geometric properties of stiffeners such as moment of inertia, section modulus, shear sectional area, slenderness ratio of web plating, etc., are to be calculated based on the net thickness as defined in **Ch 3, Sec 2.**

4.4.2 Stiffener not perpendicular to the attached plating

The actual stiffener's net section modulus is to be calculated about an axis parallel to the attached plating.
Where the stiffener is not perpendicular to the attached plating, the actual net section modulus can be obtained, in cm^3, from the following formula:

$$w = w_0 \sin\alpha$$

where:

w_0 : Actual net section modulus, in cm^3, of the stiffener assumed to be perpendicular to the attached plating

α : Angle, in degrees, between the stiffener web and the attached plating, as shown in **Fig 6**, but not to be taken less than 50.

The correction is to be applied when α is between 50 and 75 degrees.

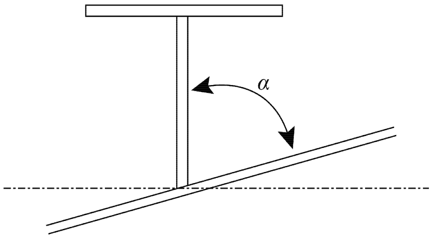

Fig 6: Angle between stiffener web and attached plating

Where the angle between the web plate of stiffener and the attached plating is less than 50 degrees, tripping bracket is to be fitted at suitable spacing. If the angle between the web plate of an unsymmetrical stiffener and the attached plating is less than 50 degrees, the face plate of the stiffener is to be fitted on the side of open bevel, as shown in **Fig 7.**

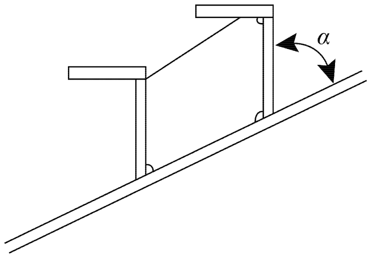

Fig 7: Orientation of stiffener when the angle is less than 50 degrees

4.5 End connections of ordinary stiffeners

4.5.1 General

Where ordinary stiffeners are to be continuous through primary supporting members, they are to be properly connected to the web plating so as to ensure proper transmission of loads. Some sample connections are shown in **Fig 8** to **Fig 11**.

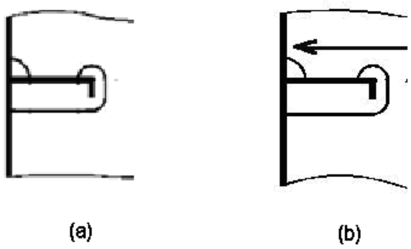

Fig 8: (a) Connection without collar plate and
(b) Connection with stiffener at side of longitudinal

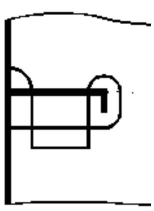

Fig 9: Connection with collar plate

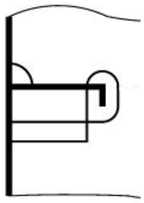

Fig 10: Connection with one large collar plate

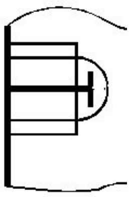

Fig 11: Connection with two large collar plates

4.5.2 Structural continuity of stiffeners

Where ordinary stiffeners are cut at primary supporting members, brackets are to be fitted to ensure structural continuity. In this case, the net section modulus and net sectional area of the brackets are to be not less than those of the ordinary stiffener.
The minimum net thickness of brackets is to be not less than that required for web plate of ordinary stiffeners.
The brackets are to be flanged or stiffened by a welded face plate where:

- the net thickness of the bracket, in mm, is less than 15 ℓ_b, where ℓ_b is the length, in m, of the free edge of the end bracket or brackets; or
- the longer arm of the bracket is greater than 800 mm.

The net sectional area, in cm^2, of the flanged edge or faceplate is to be at least equal to 10 ℓ_b.

4.5.3 End connections

End connection of stiffeners is to be sufficiently supported by the primary supporting members. Generally, a stiffener or a bracket to support the ordinary stiffener is to be provided.
Where slots for penetration of stiffeners are reinforced with collars, they are to be of the same materials as the primary supporting members.
Brackets or stiffeners to support the ordinary stiffeners are to be of sufficient sectional area and moment of inertia with respect to structural continuity, and are to have appropriate shape with respect to fatigue strength. If brackets or stiffeners to support the ordinary stiffeners are not fitted, or special slot configurations considering the fatigue strength are provided, fatigue strength assessment for slots are required by the Society.

5. Primary supporting members

5.1 General

5.1.1

Primary supporting members are to be arranged in such a way that they ensure adequate continuity of strength. Abrupt changes in height or in cross-section are to be avoided.

5.1.2

Where arrangements of primary supporting members are ensured adequate based on the results of FE analysis, fatigue assessment and ultimate strength assessment, primary supporting members are to be arranged in accordance with the result of such assessment.

5.2.1

Webs of primary supporting members are to be stiffened where the height, in mm, is greater than 100 t, where t is the net web thickness, in mm, of the primary supporting member.
In general, the web stiffeners of primary supporting members are to be spaced not more than 110 t.
The net thickness of web stiffeners and brackets are not to be less than the minimum net thickness of the primary members on which they are fitted.
Additional stiffeners are to be fitted in way of end brackets, at the connection with cross ties, etc. of transverse primary supporting members where shearing stress and/or compressive stress is expected to be high. These parts are not to have holes. Cut outs for penetration of ordinary stiffeners in these parts are to be reinforced with collar plates.
Depth of stiffener is to be more than 1/12 of stiffener length.

5.2.2

Tripping brackets (see **Fig 12**) welded to the face plate are generally to be fitted:

- at every fourth spacing of ordinary stiffeners, without exceeding 4 m.
- at the toe of end brackets
- at rounded face plates
- in way of concentrated loads
- near the change of section.

Where the width of the symmetrical face plate is greater than 400 mm, backing brackets are to be fitted in way of the tripping brackets.
Where the face plate of the primary supporting member exceeds 180 mm on either side of the web, tripping bracket is to support the face plate as well.

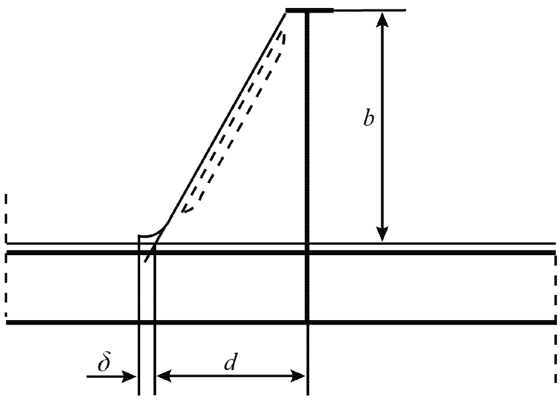

Fig 12: Primary supproting member: web stiffener in way of ordinary stiffener

5.2.3

The width of face plate of the primary supporting member except ring shape such as transverse ring in bilge hopper tanks and top side tank is to be not less than one tenth of the depth of the web, where tripping brackets are spaced as specified in **[5.2.2].**

5.2.4

The arm length of tripping brackets is to be not less than the greater of the following values, in m:

$$d = 0.38b$$

$$d = 0.85\sqrt{\frac{s_t}{t}}$$

where:

b : Height, in m, of tripping brackets, shown in **Fig 12**

s_t : Spacing, in m, of tripping brackets

t : Net thickness, in mm, of tripping brackets.

5.2.5

Tripping brackets with a net thickness, in mm, less than 10 ℓ_b are to be flanged or stiffened by a welded face plate.
The net sectional area, in cm^2, of the flanged edge or the face plate is to be not less than 7 ℓ_b, where ℓ_b is the length, in m, of the free edge of the bracket.
Where the height or breadth of tripping brackets is greater than 3 m, an additional stiffener is to be fitted parallel to the bracket free edge.

5.3 Span of primary supporting members

5.3.1 Definitions

The span ℓ, in m, of a primary supporting member without end bracket is to be taken as the length of the member between supports.
The span ℓ, in m, of a primary supporting member with end brackets is taken between points where the depth of the bracket is equal to half the depth of the primary supporting member as shown in **Fig 13(a)**.
However, in case of curved brackets where the face plate of the member is continuous along the face of the bracket, as shown in **Fig 13(b)**, the span is taken between points where the depth of the bracket is equal to one quarter the depth of the primary supporting member.

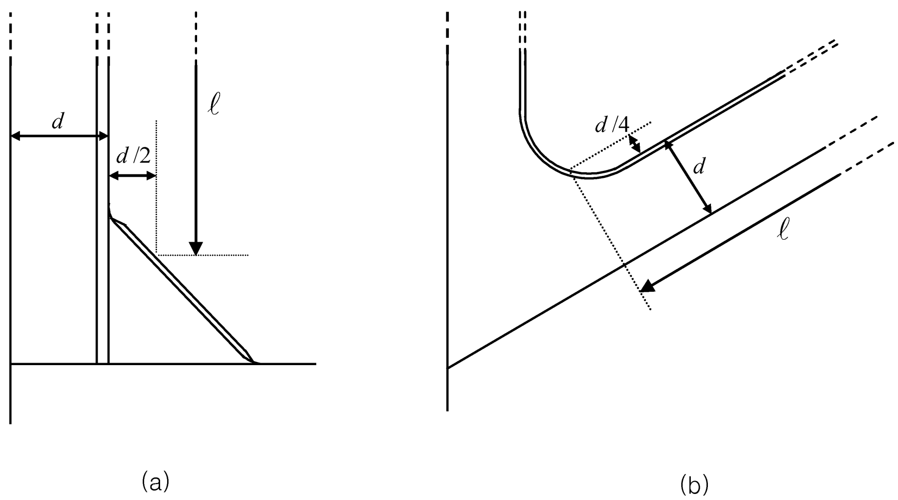

Fig 13 : Span of primary support member

5.4 Effective breadth of primary supporting member

5.4.1 General

The effective breadth of the attached plating of a primary supporting member to be considered in the actual net section modulus for the yielding check is to be taken as the mean spacing between adjacent primary supporting members.

5.5 Geometric properties

5.5.1 General

Geometric properties of primary supporting members such as moment of inertia, section modulus, shear sectional area, slenderness ratio of web plating, etc., are to be calculated based on the net thickness as specified in **Ch 3, Sec 2.**

5.6 Bracketed end connection

5.6.1 General

Where the ends of the primary supporting members are connected to bulkheads, inner bottom, etc., the end connections of all primary supporting members are to be balanced by effective supporting members on the opposite side of bulkheads, inner bottoms, etc..
Tripping brackets are to be provided on the web plate of the primary supporting members at the inner edge of end brackets and connection parts of the other primary supporting members and also at the proper intervals to support the primary supporting members effectively.

5.6.2 Dimensions of brackets

Arm length of bracket is generally not to be less than one-eighth of span length of the primary member, unless otherwise specified. Arm lengths of brackets at both ends are to be equal, as far as practicable.
The height of end brackets is to be not less than that of the primary supporting member. The net thickness of the end bracket web is not to be less than that of the web plate of the primary supporting member.
The scantlings of end brackets are to be such that the section modulus of the primary supporting member with end brackets is not less than that of the primary supporting member at mid-span point.
The width, in mm, of the face plate of end brackets is to be not less than $50(\ell_b+1)$.
Moreover, the net thickness of the face plate is to be not less than that of the bracket web.
Stiffening of end brackets is to be designed such that it provides adequate buckling web stability.
The following prescriptions are to be applied:

- where the length ℓ_b is greater than 1.5 m, the web of the bracket is to be stiffened
- the net sectional area, in cm^2, of web stiffeners is to be not less than $16.5\,\ell$, where ℓ is the span, in m, of the stiffener
- tripping flat bars are to be fitted to prevent lateral buckling of web stiffeners. Where the width of the symmetrical face plate is greater than 400 mm, additional backing brackets are to be fitted.

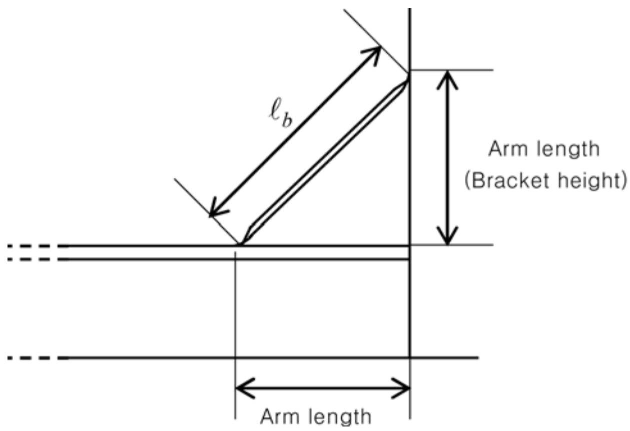

Fig 14: Dimension of brackets

5.7 Cut-outs and holes

5.7.1

Cut-outs for the passage of ordinary stiffeners are to be as small as possible and well rounded with smooth edges.
The depth of cut-outs is to be not greater than 50 % of the depth of the primary supporting member.

5.7.2

Where openings such as lightening holes are cut in primary supporting members, they are to be equidistant from the face plate and corners of cut-outs and, in general, their height is to be not greater than 20 % of the web height.
Where lightening holes with free edges are provided, the dimensions and locations of lightening holes are generally to be as shown in **Fig 15.**

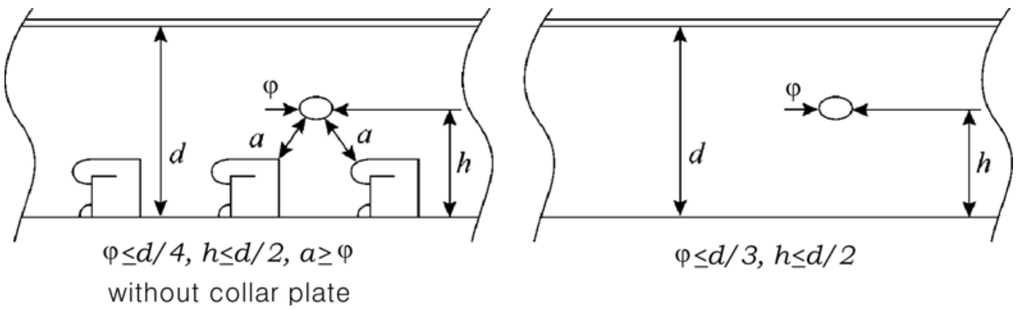

Fig 15: Location and dimensions of lightening holes

Where lightening holes are cut in the brackets, the distance from the circumference of the hole to the free flange of brackets is not to be less than the diameter of the lightening hole.

5.7.3

Openings are not be fitted in way of toes of end brackets.

5.7.4

At the mid-part within 0.5 times of the span of primary supporting members, the length of openings is to be not greater than the distance between adjacent openings.
At the ends of the span, the length of openings is to be not greater than 25 % of the distance between adjacent openings.

5.7.5

In the case of large openings in the web of primary supporting members (e.g. where a pipe tunnel is fitted in the double bottom), the secondary stresses in primary supporting members are to be considered for the reinforcement of the openings.
This may be carried out by assigning an equivalent net shear sectional area to the primary supporting member obtained, in cm^2, according from the following formula:

$$A_{sh} = \frac{A_{sh1}}{1 + \frac{0.0032\ell^2 A_{sh1}}{I_1}} + \frac{A_{sh2}}{1 + \frac{0.0032\ell^2 A_{sh2}}{I_2}}$$

where (see **Fig 16**):

I_1, I_2 : Net moments of inertia, in cm^4, of deep webs(1) and (2), respectively, with attached plating around their neutral axes parallel to the plating

A_{sh1}, A_{sh2}: Net shear sectional areas, in cm^2, of deep webs(1) and (2), respectively, taking account of the web height reduction by the depth of the cut out for the passage of the ordinary stiffeners, if any

ℓ : Span, in cm, of deep webs (1) and (2).

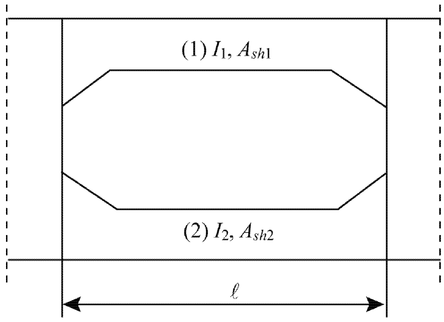

Fig 16: Large openings in the web of primary supporting members

6. Double bottom

6.1 General

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1
A double bottom is to be fitted extending from the collision bulkhead to the afterpeak bulkhead.

6.1.2 Framing system

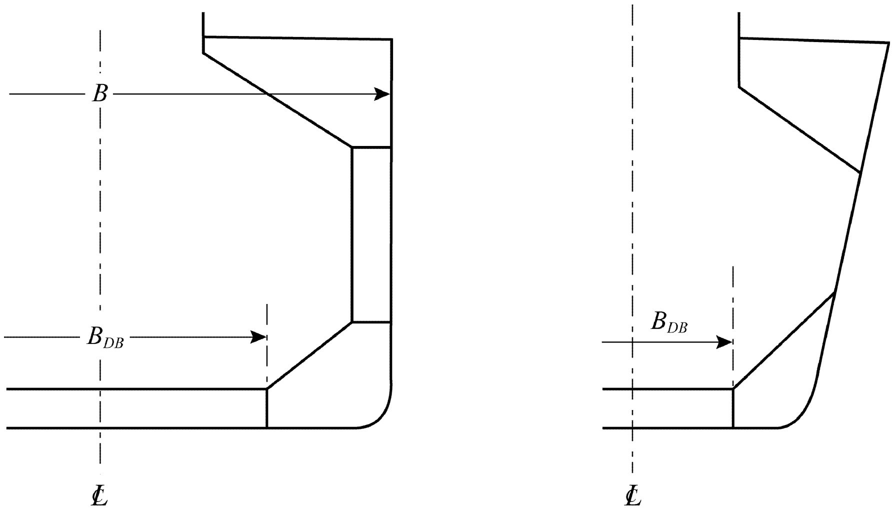
For ships greater than 120 m in length, the bottom, the double bottom and the sloped bulkheads of hopper tanks are to be of longitudinal system of frame arrangement at least within the cargo hold area. The spacing of the floors and bottom girders is not only governed by frame spaces but requirement in absolute value, in metres, is also indicated in **[6.3.3]** and **[6.4.1].**

6.1.3 Height of double bottom

Unless otherwise specified, the height of double bottom is not to be less than $B/20$ or 2 m whichever is the lesser.
Where the height of the double bottom varies, the variation is generally to be made gradually and over an adequate length; the knuckles of inner bottom plating are to be located in way of plate floors.
Where this is impossible, suitable longitudinal structures such as partial girders, longitudinal brackets etc., fitted across the knuckle are to be arranged.

6.1.4 Dimensions of double bottom

The breadth of double bottom is taken as shown in **Fig 17.**



Ships with inclined sides

Fig 17: Breadth of double bottom

6.1.5 Docking

The bottom is to have sufficient strength to withstand the loads resulting from the dry-docking of the ship.
Where docking brackets are provided between solid floors and connecting the centreline girder to the bottom shell plating, the docking brackets are to be connected to the adjacent bottom longitudinals.

6.1.6 Continuity of strength

Where the framing system changes from longitudinal to transverse, special attention is to be paid to the continuity of strength by means of additional girders or floors. Where this variation occurs within 0.6 L amidships, the inner bottom is generally to be maintained continuous by means of inclined plating.
Bottom and inner bottom longitudinal ordinary stiffeners are generally to be continuous through the floors.
The actual net thickness and the yield stress of the lower strake of the sloped bulkhead of hopper tanks, if any, are not to be less than these ones of the inner bottom with which the connection is made.

6.1.7 Reinforcement

The bottom is to be locally stiffened where concentrated loads are envisaged such as under the main engine and thrust seat.
Girders and floors are to be fitted under each line of pillars, toes of end brackets of bulkhead stiffeners and slant plate of lower stool of bulkhead. In case girders and floors are not fitted, suitable reinforcement is to be provided by means of additional primary supporting members or supporting brackets.
When solid ballast is fitted, it is to be securely positioned. If necessary, intermediate floors may be required for this purpose.

6.1.8 Manholes and lightening holes

Manholes and lightening holes are to be provided in floors and girders to ensure accessibility and ventilation as a rule.
The number of manholes in tank tops is to be kept to the minimum compatible with securing free ventilation and ready access to all parts of the double bottom.
Manholes may not be cut in the girders and floors below the heels of pillars.

6.1.9 Air holes and drain holes

Air and drain holes are to be provided in floors and girders.
Air holes are to be cut as near to the inner bottom and draining holes as near to the bottom shell as

practicable.
Air holes and drain holes are to be designed to aid full ballast water and sediment removal to allow for effective ballast water exchange.

6.1.10 Drainage of tank top

Effective arrangements are to be provided for draining water from the tank top. Where wells are provided for the drainage, such wells are not to extend for more than one-half depth of the height of double bottom

6.1.11 Striking plate

Striking plates of adequate thickness or other equivalent arrangements are to be provided under sounding pipes to prevent the sounding rod from damaging the bottom plating.

6.1.12 Duct keel

Where a duct keel is arranged, the centre girder may be replaced by two girders generally spaced, no more than 3 m apart.
The structures in way of the floors are to ensure sufficient continuity of the latter.

6.2 Keel

6.2.1

The width of the keel is to be not less than the value obtained, in m, from the following formula:

$$b = 0.8 + L/200$$

6.3 Girders

6.3.1 Centre girder

The centre girder is to extend within the cargo hold area and is to extend forward and aft as far as practicable, and structural continuity thereof to be continuous within the full length of the ship.
Where double bottom compartments are used for the carriage of fuel oil, fresh water or ballast water, the centre girder is to be watertight, except for the case such as narrow tanks at the end parts or when other watertight girders are provided within 0.25 B from the centreline, etc.

6.3.2 Side girders

The side girders are to extend within the parallel part of cargo hold area and are to extend forward and aft of cargo hold area as far as practicable.

6.3.3 Spacing

The spacing of adjacent girders is generally to be not greater than 4.6 m or 5 times the spacing of bottom or inner bottom ordinary stiffeners, whichever is the smaller. Greater spacing may be accepted depending on the result of the analysis carried out according to **Ch 7.**

6.4 Floors

6.4.1 Spacing

The spacing of floors is generally to be not greater than 3.5 m or 4 frame spaces as specified by the designer, whichever is the smaller. Greater spacing may be accepted depending on the result of the analysis carried out according to **Ch 7.**

6.4.2 Floors in way of transverse bulkheads

Where transverse bulkhead is provided with lower stool, solid floors are to be fitted in line with both sides of lower stool. Where transverse bulkhead is not provided with lower stool, solid floors are to be fitted in line with both flanges of the vertically corrugated transverse bulkhead or in line of plane transverse bulkhead.

6.4.3 Web stiffeners

Floors are to be provided with web stiffeners in way of longitudinal ordinary stiffeners. Where the web stiffeners are not provided, fatigue strength assessment for the cut out and connection of longitudinal stiffener is to be carried out.

6.5 Bilge strake and bilge keel

6.5.1 Bilge strake

Where some of the longitudinal stiffeners at the bilge part are omitted, longitudinal stiffeners are to be provided as near to the turns of bilge as practicable.

6.5.2 Bilge keel

Bilge keels are not be welded directly to the shell plating. An intermediate flat is required on the shell plating. The ends of the bilge keel are to be sniped as shown in **Fig 18** or rounded with large radius. The ends are to be located in way of transverse bilge stiffeners inside the shell plating and the ends of intermediate flat are not to be located at the block joints.
The bilge keel and the intermediate flat are to be made of steel with the same yield stress as the one of the bilge strake. The bilge keel with a length greater than 0.15 L is to be made with the same grade of steel as the one of bilge strake.
The net thickness of the intermediate flat is to be equal to that of the bilge strake. However, this thickness may generally not be greater than 15 mm.
Scallops in the bilge keels are to be avoided.

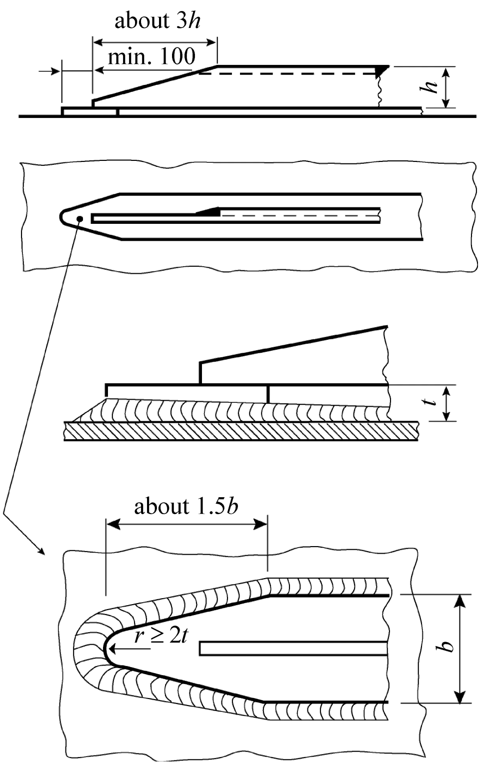


Fig 18: Example of bilge keel arrangement

7. Double Side structure

7.1 Application

7.1.1

The requirement of this article applies to longitudinally or transversely framed side structure.
The transversely framed side structures are built with transverse frames possibly supported by horizontal side girders.
The longitudinally framed side structures are built with longitudinal ordinary stiffeners supported by vertical primary supporting members.
The side within the hopper and topside tanks is, in general, to be longitudinally framed. It may be transversely framed when this is accepted for the double bottom and the deck according to **[6.1.2]** and **[9.1.1]**, respectively.

7.2 Design principles

7.2.1

Where the double side space is void, the structural members bounding this space are to be structurally designed as a water ballast tank according to **Ch 6.** In such case the corresponding air pipe is considered as extending 0.76 m above the freeboard deck at side.
For corrosion addition, the space is still considered as void space.

7.3 Structural arrangement

7.3.1 General

Double side structures are to be thoroughly stiffened by providing web frames and side stringers within the double hull.
Continuity of the inner side structures, including stringers, is to be ensured within and beyond the cargo area. Scarfing brackets are a possible means.

7.3.2 Primary supporting member spacing

For transverse framing system, the spacing of transverse side primary supporting members is, in general, to be not greater than 3 frame spaces.
Greater spacing may be accepted depending on the results of the analysis carried out according to **Ch 7** for the primary supporting members in the cargo holds.
The vertical distance between horizontal primary members of the double side is not to exceed 6 m, unless the appropriate structural members complying with the requirements for safe access are provided.

7.3.3 Primary supporting member fitting

Transverse side primary supporting members are to be fitted in line with web frames in topside and hopper tanks. However where it is not practicable for top side web frames, large brackets are to be fitted in the topside space in line with double side web frames
Transverse bulkheads in double side space are to be arranged in line with the cargo hold transverse bulkheads.
Vertical primary supporting members are to be fitted in way of hatch end beams.
Unless otherwise specified, horizontal side girders are to be fitted aft of the collision bulkhead up to 0.2 L aft of the fore end, in line with fore peak girders.

7.3.4 Transverse ordinary stiffeners

The transverse ordinary stiffeners of the shell and the inner side are to be continuous or fitted with bracket end connections within the height of the double side. The transverse ordinary stiffeners are to be effectively connected to stringers. At their upper and lower ends, opposing shell and inner side transverse ordinary stiffeners and supporting stringer plates are to be connected by brackets.

7.3.5 Longitudinal ordinary stiffeners

The longitudinal side shell and inner side ordinary stiffeners, where fitted, are to be continuous within the length of the parallel part of cargo hold area and are to be fitted with brackets in way of transverse bulkheads aligned with cargo hold bulkheads. They are to be effectively connected to transverse web frames of the double side structure. For the side longitudinal and ordinary stiffeners of inner skin out of parallel part of cargo hold area, special attention is to be paid for a structural continuity.

7.3.6 Sheer strake

The width of the sheer strake is to be not less than the value obtained, in m, from the following formula:

$$b = 0.715 + 0.425L/100$$

The sheer strake may be either welded to the stringer plate or rounded.
If the shear strake is rounded, its radius, in mm, is to be not less than 17 t_s, where t_s is the net thickness, in mm, of the sheer strake.
The fillet weld at the connection of the welded sheer strake and deck plate may be either full penetration or deep penetration weld.
The upper edge of the welded sheer strake is to be rounded smooth and free of notches. Fixtures such as bulwarks, eye plates are not to be directly welded on the upper edge of sheer strake, except in fore and aft parts.
Longitudinal seam welds of rounded sheer strake are to be located outside the bent area at a distance not less than 5 times the maximum net thicknesses of the sheer strake.
The transition from a rounded sheer strake to an angled sheer strake associated with the arrangement of superstructures at the ends of the ship is to be carefully designed so as to avoid any discontinuities.

7.3.7 Plating connection

At the locations where the inner hull plating and the inner bottom plating are connected, attention is to be paid to the structural arrangement so as not to cause stress concentration.
Knuckles of the inner side are to be adequately stiffened by ordinary stiffeners or equivalent means, fitted in line with the knuckle.
The connections of hopper tank plating with inner hull and with inner bottom are to be supported by a primary supporting member.

7.4 Longitudinally framed double side

7.4.1 General

Adequate continuity of strength is to be ensured in way of breaks or changes in the width of the double side.

7.5 Transversely framed double side

7.5.1 General

Transverse frames of side and inner side may be connected by means of struts. Struts are generally to be connected to transverse frames by means of vertical brackets.

8. Single side structure

8.1 Application

8.1.1

This article applies to the single side structure with transverse framing.

If single side structure is supported by transverse or longitudinal primary supporting members, the requirements in **[7]** above apply to these primary supporting members as regarded to ones in double side skin.

8.2 General arrangement

8.2.1

Side frames are to be arranged at every frame space.
If air pipes are passing through the cargo hold, they are to be protected by appropriate measures to avoid a mechanical damage.

8.3 Side frames

8.3.1 General

Frames are to be built-up symmetrical sections with integral upper and lower brackets and are to be arranged with soft toes.
The side frame flange is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature is not to be less than r ,in mm, given by:

$$r = \frac{0.4 b_f^2}{t_f + t_C}$$

where:

t_C : Corrosion addition, in mm, specified in **Ch 3**, **Sec 3**

b_f and t_f : Flange width and net thickness of the curved flange, in mm. The end of the flange is to be sniped.

In ships less than 190 m in length, mild steel frames may be asymmetric and fitted with separate brackets. The face plate or flange of the bracket is to be sniped at both ends. Brackets are to be arranged with soft toes.
The dimensions of side frames are defined in **Fig 19.**

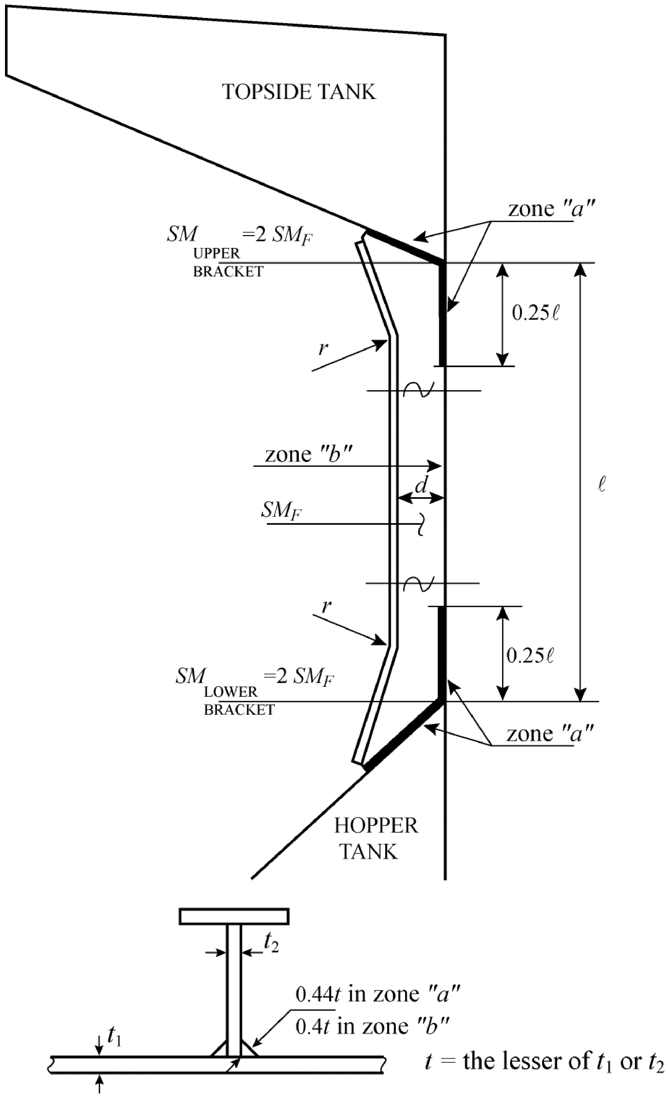

Fig 19: Dimensions of side frames

8.4 Upper and lower brackets

8.4.1

The face plates or flange of the brackets is to be sniped at both ends.
Brackets are to be arranged with soft toes.
The as-built thickness of the brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.

8.4.2

The dimensions (in particular the height and length) of the lower brackets and upper brackets are to be not less than those shown in **Fig 20.**

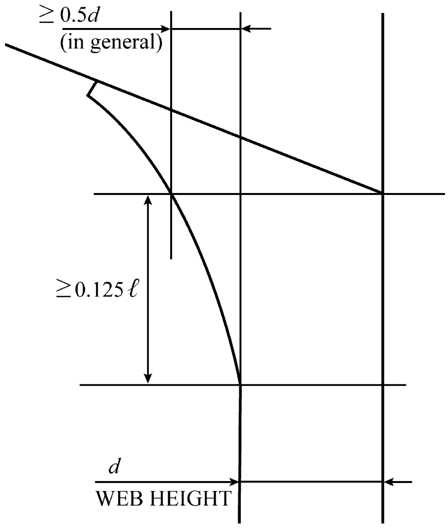

Fig 20: Dimensions of lower and upper brackets

8.5 Tripping brackets

8.5.1

In way of the foremost hold and in the holds of BC-A ships, side frames of asymmetrical section are to be fitted with tripping brackets at every two frames, as shown in **Fig 21.**
The as-built thickness of the tripping brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.
Double continuous welding is to be adopted for the connections of tripping brackets with side shell frames and plating.

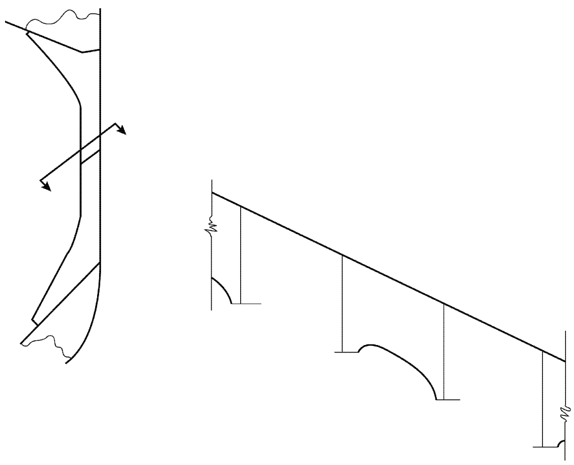

Fig 21: Tripping brackets to be fitted in way of foremost hold

8.6 Support structure

8.6.1

Structural continuity with the lower and upper end connections of side frames is to be ensured within hopper and topside tanks by connecting brackets as shown in **Fig 22.** The brackets are to be stiffened against buckling according to **[5.6.2].**

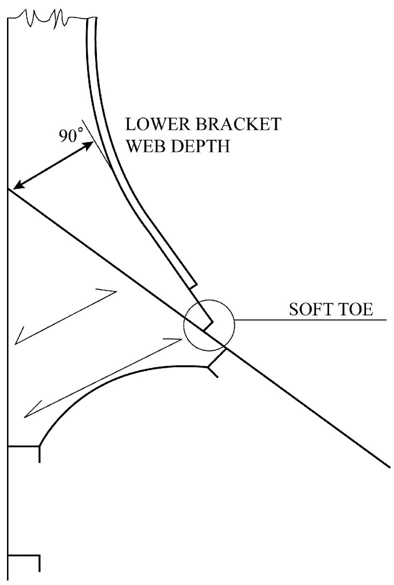

Fig 22: Example of support structure for lower end

9. Deck structure

9.1 Application

9.1.1

The deck outside the line of hatches and the topside tank sloping plates are to be longitudinally framed. Within the line of hatches, other arrangement than longitudinal framing may be considered provided that adequate structural continuity is ensured.

9.2 General arrangement

9.2.1

The spacing of web frames in topside tanks is generally to be not greater than 6 frame spaces.
Greater spacing may be accepted by the Society, on a case-by-case basis, depending on the results of the analysis carried out according to **Ch 7.**

9.2.2

The deck supporting structure is to be made of ordinary stiffeners longitudinally or transversely arranged, supported by primary supporting members.

9.2.3 Deck between hatches

Inside the line of openings, a transverse structure is to be generally adopted for the cross deck structures, beams are to be adequately supported by girders and extended up to the second longitudinal from the hatch side girders towards the bulwark. Where this is impracticable, intercostal stiffeners are to be fitted between the hatch side girder and the second longitudinal.
Smooth connection of the strength deck at side with the deck between hatches is to be ensured by a plate of intermediate thickness.

9.2.4 Topside tank structures

Topside tank structures are to extend as far as possible within the machinery space and are to be adequately tapered.
Where a double side primary supporting member is fitted outside the plane of the topside tank web

frame, a large bracket is to be fitted in line with.

9.2.5 Stringer plate

The width of the stringer plate is to be not less than the value obtained, in m, from the following formula:

$$b = 0.35 + 0.5L/100$$

Rounded stringer plate, where adopted, are to have a radius complying with the requirements in **[7.3.6].**

9.2.6

Adequate continuity of strength by providing proper overlapping of structures and adequate scarphing members is to be ensured in way of:

- stepped strength deck
- changes in the framing system

9.2.7

Deck supporting structures under deck machinery, cranes, king post and equipment such as towing equipment, mooring equipment, etc., are to be adequately stiffened.

9.2.8

Pillars or other supporting structures are to be generally fitted under heavy concentrated loads.

9.2.9

A suitable stiffening arrangement is considered in way of the ends and corners of deckhouses and partial superstructures.

9.2.10 Connection of hatch end beams with deck structures

The connection of hatch end beams with deck structures is to be properly ensured by fitting inside the topside tanks additional web frames or brackets.

9.2.11 Construction of deck plating

Hatchways or other openings on decks are to have rounded corners, and compensation is to be suitably provided.

9.3 Longitudinally framed deck

9.3.1 General

Deck longitudinals within the parallel part of cargo hold area except within the line of hatch openings are to be continuous in way of deck transverses and transverse bulkheads. For the deck longitudinals out of parallel part of cargo hold area, other arrangements may be considered, provided adequate continuity of longitudinal strength is ensured.
Connections at ends of longitudinal stiffeners are to ensure a sufficient strength to bending and shear.

9.4 Transversely framed deck

9.4.1 General

Where the deck structure is transversely framed, deck beams or deck transverse stiffeners are to be fitted at each frame.

Transverse beams or deck transverse stiffeners are to be connected to side structure or frames by brackets.

9.5 Hatch supporting structures

9.5.1

Hatch side girders and hatch end beams of reinforced scantlings are to be fitted in way of cargo hold openings.

9.5.2

The connection of hatch end beams to web frames is to be ensured. Hatch end beams are to be aligned with transverse web frames in topside tanks.

9.5.3

Clear of openings, adequate continuity of strength of longitudinal hatch coamings is to be ensured by under deck girders.
At hatchway corners, deck girders or their extension parts provided under deck in line with hatch coamings and hatch end beams are to be effectively connected so as to maintain the continuity in strength.

9.5.4

For ships with holds designed for loading/discharging by grabs and having the additional class notation GRAB[X], wire rope grooving in way of cargo holds openings is to be prevented by fitting suitable protection such as half-round bar on the hatch side girders (i.e. upper portion of top side tank plates)/hatch end beams in cargo hold and upper portion of hatch coamings.

9.6 Openings in the strength deck

9.6.1 General

Openings in the strength deck are to be kept to a minimum and spaced as far as practicable from one another and from the breaks of effective superstructures. Openings are to be cut as far as practicable from hatchway corners, hatch side coamings and side shell platings.

9.6.2 Small opening location

Openings are generally to be cut outside the limits as shown in **Fig 23** in dashed area, defined by:

- the bent area of a rounded sheer strake, if any, or the side shell
- $e = 0.25(B-b)$ from the edge of opening
- $c = 0.07\ell + 0.1b$ or $0.25b$, whichever is greater

where:

b : Width, in m, of the hatchway considered, measured in the transverse direction. (see **Fig 23**)

ℓ : Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction. (see **Fig 23**).

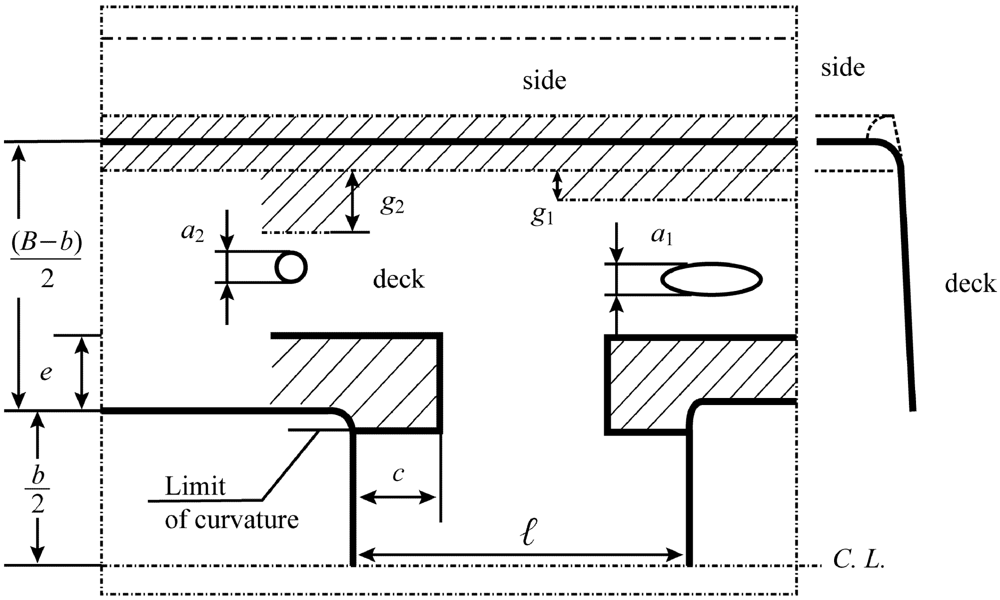

Fig 23: Position of openings in strength deck

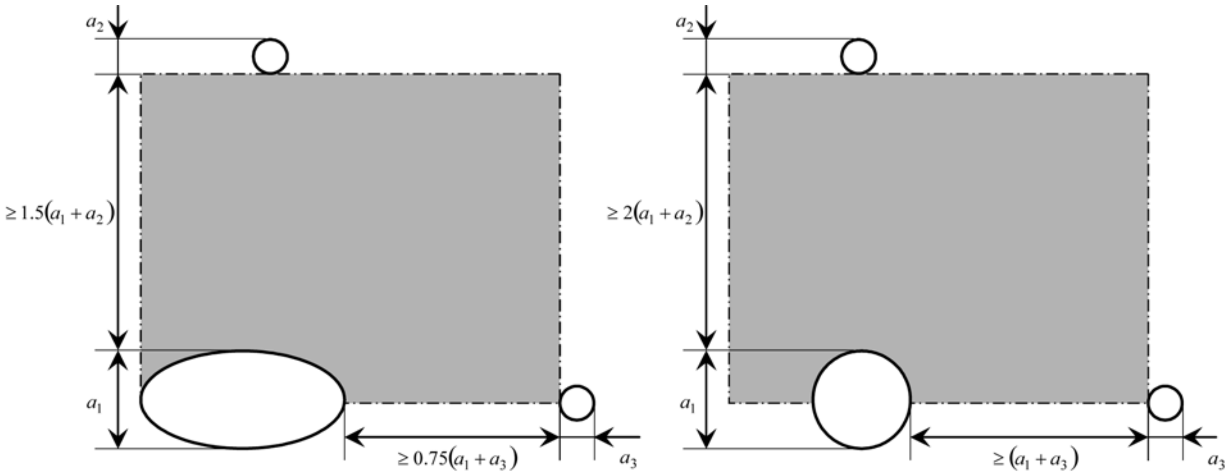

Fig 24: Elliptical and circular openings in strength deck

Moreover the transverse distance between these limits and openings or between openings together is not to be less than the followings:

- Transverse distance between the above limits and openings or between hatchways and openings as shown in **Fig 23**:

  $g_2 = 2a_2$ for circular openings

  $g_1 = a_1$ for elliptical openings

- Transverse distance between openings as shown in **Fig 24**:

  $2(a_1 + a_2)$ for circular openings

  $1.5(a_1 + a_2)$ for elliptical openings

where

a_1 : Transverse dimension of elliptical openings, or diameter of circular openings, as the case may be

a_2 : Transverse dimension of elliptical openings, or diameter of circular openings, as the case may be

a_3 : Longitudinal dimension of elliptical openings, or diameter of circular openings, as the case may be

- Longitudinal distance between openings is not to be less than the followings:

$(a_1 + a_3)$ for circular openings

$0.75(a_1 + a_3)$ for elliptical openings and for an elliptical opening in line with a circular one.

If the opening arrangements do not comply with these requirements, the longitudinal strength assessment in accordance with **Ch 5** is to be carried out by subtracting such opening areas.

9.6.3 Corner of hatchways

For hatchways located within the cargo area, insert plates, whose thickness is to be determined according to the formula given after, are generally to be fitted in way of corners where the plating cut-out has a circular profile.
The radius of circular corners is to be not less than 5 % of the hatch width, where a continuous longitudinal deck girder is fitted below the hatch coaming.
Corner radius, in the case of the arrangement of two or more hatchways athwartship, is considered by the Society on a case by case basis.
For hatchways located within the cargo area, insert plates are, in general, not required in way of corners where the plating cut-out has an elliptical or parabolic profile and the half axes of elliptical openings, or the half lengths of the parabolic arch, are not less than:

- 1/20 of the hatchway width or 600 mm, whichever is the lesser, in the transverse direction
- twice the transverse dimension, in the fore and aft direction.

Where insert plates are required, their net thickness is to be obtained, in mm, from the following formula:

$$t_{INS} = (0.8 + 0.4\ell / b)\, t$$

without being taken less than t or greater than 1.6t

where:

ℓ : Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction (see **Fig 23**)

b : Width, in m, of the hatchway considered, measured in the transverse direction (see **Fig 23**)

t : Actual net thickness, in mm, of the deck at the side of the hatchways.

For the extreme corners of end hatchways, the thickness of insert plates is to be 60 % greater than the actual thickness of the adjacent deck plating. A lower thickness may be accepted by the Society on the basis of calculations showing that stresses at hatch corners are lower than permissible values.
Where insert plates are required, the arrangement is shown in **Fig 25**, in which d_1, d_2, d_3 and d_4 are to be greater than the ordinary stiffener spacing.
For hatchways located outside the cargo area, a reduction in the thickness of the insert plates in way of corners may be considered by the Society on a case by case basis.
For ships having length L of 150 m or above, the corner radius, the thickness and the extent of insert plate may be determined by the results of a direct strengt hassessment according to **Ch 7, Sec 2** and **Sec 3**, including buckling check and fatigue strength assessment of hatch corners according to **Ch 8, Sec 5.**

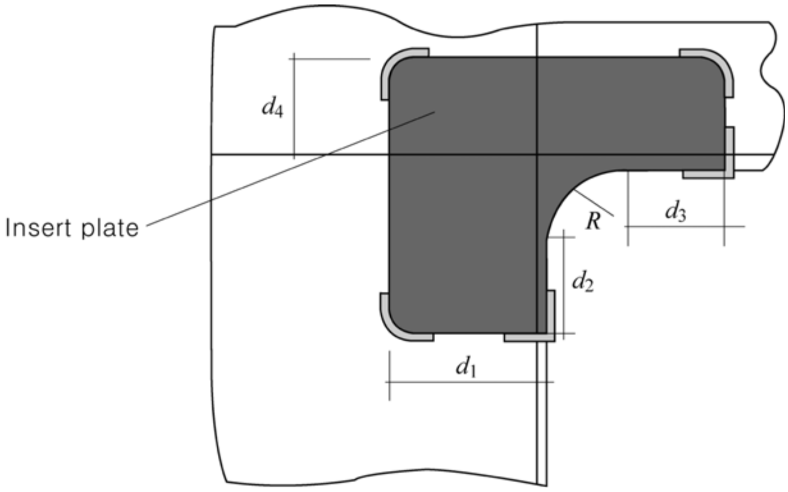

Fig 25: Hatch corner insert plate

10. Bulkhead structure

10.1 Application

10.1.1

The requirements of this article apply to longitudinal and transverse bulkhead structures which may be plane or corrugated.

10.1.2 Plane bulkheads

Plane bulkheads may be horizontally or vertically stiffened.
Horizontally framed bulkheads are made of horizontal ordinary stiffeners supported by vertical primary supporting members.
Vertically framed bulkheads are made of vertical ordinary stiffeners which may be supported by horizontal girders.

10.2 General

10.2.1

The web height of vertical primary supporting members of bulkheads may be gradually tapered from bottom to deck.

10.2.2

The net thickness of the after peak bulkhead plating in way of the stern tube is to be increased by at least 60 % of other part of after peak bulkhead plating

10.3 Plane bulkheads

10.3.1 General

Where a bulkhead does not extend up to the uppermost continuous deck, suitable strengthening is to be provided in the extension of the bulkhead.
Bulkheads are to be stiffened in way of the deck girders.
The bulkhead stiffener webs of hopper and topside tank watertight bulkheads are required to be aligned with the webs of longitudinal stiffeners of sloping plates of inner hull.
A primary supporting member is to be provided in way of any vertical knuckle in longitudinal

bulkheads. The distance between the knuckle and the primary supporting member is to be taken not greater than 70 mm. When the knuckle is not vertical, it is to be adequately stiffened by ordinary stiffeners or equivalent means, fitted in line with the knuckle.
Plate floors are to be fitted in the double bottom in line with the plate transverse bulkhead.

10.3.2 End connection of ordinary stiffeners

The crossing of ordinary stiffeners through a watertight bulkhead is to be watertight.
In general, end connections of ordinary stiffeners are to be bracketed. If bracketed end connections cannot be applied due to hull lines, etc., they are to be terminated on transverse headers between adjacent longitudinal or if not possible, sniped ends may be accepted, provided the scantling of ordinary stiffeners and corresponding plating are modified accordingly.

10.3.3 Sniped end of ordinary stiffener

Sniped ends are not allowed on bulkheads subject to hydrostatic pressure. Where sniped ordinary stiffeners are fitted, the snipe angle is not to be greater than 30 degrees, and their ends are to be extended as far as practicable to the boundary of the bulkhead.

10.3.4 Bracketed ordinary stiffeners

Where bracketed ordinary stiffeners are fitted, the arm lengths of end brackets of ordinary stiffeners, as shown in **Figs 26** and **27**, are to be not less than the following values, in mm:

- for arm length a:
  - brackets of horizontal stiffeners and bottom bracket of vertical stiffeners:

    $a = 100\ell$
  - upper bracket of vertical stiffeners:

    $a = 80\ell$
- for arm length b,thegreaterof

  $b = 80\{(w+20)/t\}^{0.5}$ and

  $b = \alpha p s \ell / t$

where:

ℓ : Span, in m, of the stiffener measured between supports

w : Net section modulus, in cm^3, of the stiffener

t : Net thickness, in mm, of the bracket

p : Design pressure, in kN/m^2, calculated at mid-span

α : Coefficient equal to:

α = 4.9 for tank bulkheads

α = 3.6 for watertight bulkheads.

The connection between the stiffener and the bracket is to be such that the net section modulus of the connection is not less than that of the stiffener.

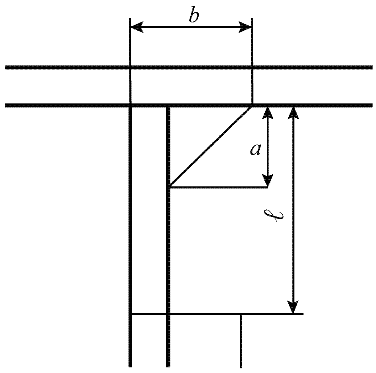

Fig 26: Bracket at upper end of ordinary stiffener on plane bulkhead

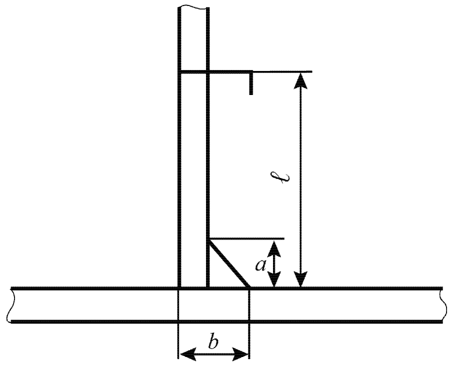

Fig 27: Bracket at lower end of ordinary stiffener on plane bulkhead

10.4 Corrugated bulkheads

10.4.1 General

For ships of 190 m of length L and above, the transverse vertically corrugated watertight bulkheads are to be fitted with a lower stool, and generally with an upper stool below deck. For ships less than 190 m in length L, corrugations may extend from inner bottom to deck provided the global strength of hull structures are satisfactorily proved for ships having ship length L of 150 m and above by DSA as required by **Ch 7** of the Rules

10.4.2 Construction

The main dimensions a, R, c, d, t, φ and s_C of corrugated bulkheads are defined in **Fig 28**.
The bending radius is not to be less than the following values, in mm:

$$R = 3.0t$$

where :

t : As-built thickness, in mm, of the corrugated plate.

The corrugation angle φ shown in **Fig 28** is to be not less than 55°.
When welds in a direction parallel to the bend axis are provided in the zone of the bend, the welding procedures are to be submitted to the Society for approval.

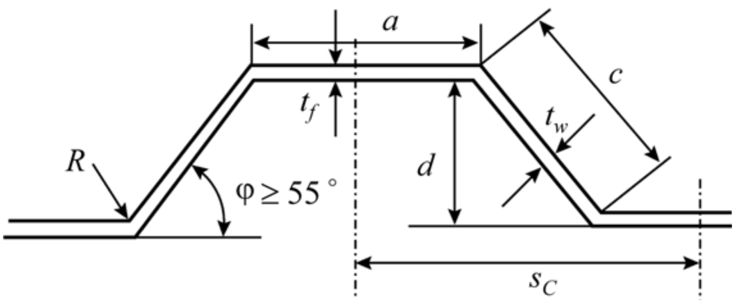

Fig 28: Dimensions of a corrugated bulkhead

10.4.3 Actual section modulus of corrugations

The net section modulus of a corrugation may be obtained, in cm^3, from the following formula:

$$w = \left[\frac{d(3at_f + ct_w)}{6} \right] 10^{-3}$$

where:

t_f, t_w : Net thickness of the plating of the corrugation, in mm, shown in **Fig 28**

d, a, c : Dimensions of the corrugation, in mm, shown in **Fig 28.**

Where the web continuity is not ensured at ends of the bulkhead, the net section modulus of a corrugation is to be obtained, in cm^3, from the following formula:

$$w = 0.5\, a\, t_f\, d \cdot 10^{-3}$$

10.4.4 Span of corrugations

The span ℓ_C of the corrugations is to be taken as the distance shown in **Fig 29**.
For the definition of ℓ_C, the internal end of the upper stool is not to be taken more than a distance from the deck at the centre line equal to:

- 3 times the depth of corrugation, in general
- 2 times the depth of corrugation, for rectangular stool

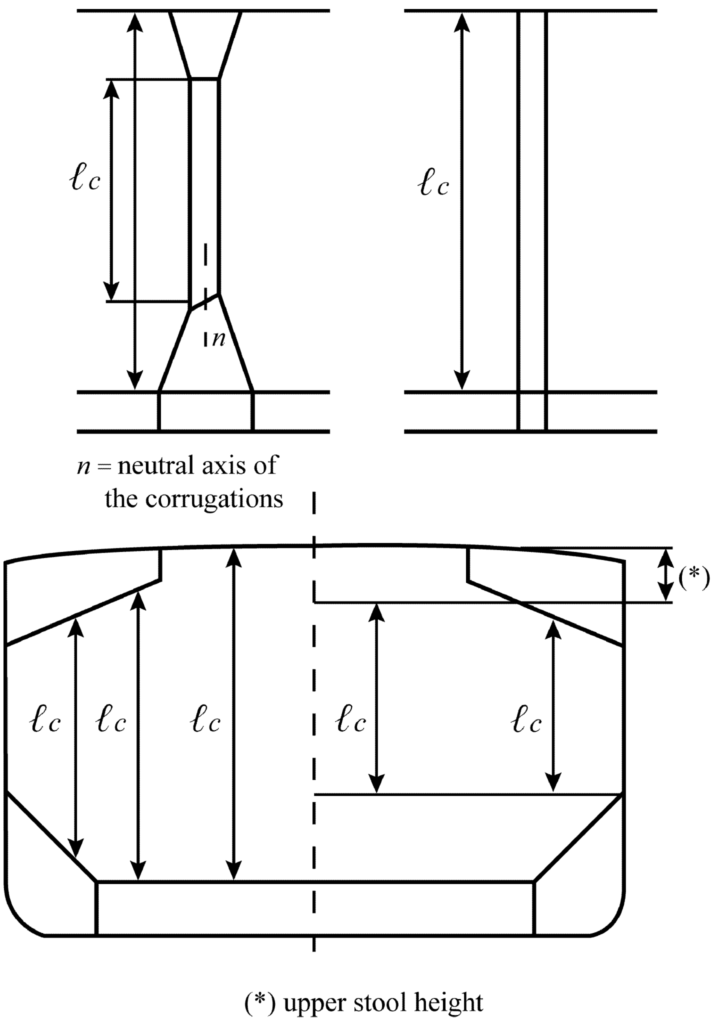

Fig 29: Span of the corrugations

10.4.5 Structural arrangements

The strength continuity of corrugated bulkheads is to be ensured at the ends of corrugations.
Where corrugated bulkheads are cut in way of primary supporting members, attention is to be paid to ensure correct alignment of corrugations on each side of the primary member.
Where vertically corrugated transverse bulkheads or longitudinal bulkheads are welded on the inner bottom plate, floors or girders are to be fitted in way of flanges of corrugations, respectively.
In general, the first vertical corrugation connected to the boundary structures is to have a width not smaller than typical width of corrugation flange.

10.4.6 Bulkhead stools

Plate diaphragms or web frames are to be fitted in bottom stools in way of the double bottom longitudinal girders or plate floors, as the case may be.
Brackets or deep webs are to be fitted to connect the upper stool to the deck transverse or hatch end beams, as the case may be.

10.4.7 Lower stool

The lower stool, when fitted, is to have a height in general not less than 3 times the depth of the corrugations. The ends of stool side ordinary stiffeners, when fitted in a vertical plane, are to be attached to brackets at the upper and lower ends of the stool.
The distance d from the edge of the stool top plate to the surface of the corrugation flange is to be in accordance with **Fig 30**.
The stool bottom is to be installed in line with double bottom floors or girders as the case may be, and is to have a width not less than 2.5 times the mean depth of the corrugation.
The stool is to be fitted with diaphragms in line with the longitudinal double bottom girders or floors as the case may be, for effective support of the corrugated bulkhead. Scallops in the brackets and diaphragms in way of the connections to the stool top plate are to be avoided.
Where corrugations are cut at the lower stool, corrugated bulkhead plating is to be connected to the stool top plate by full penetration welds. The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or deep penetration welds. The supporting floors are to be connected to the inner bottom by either full penetration or deep penetration weld.

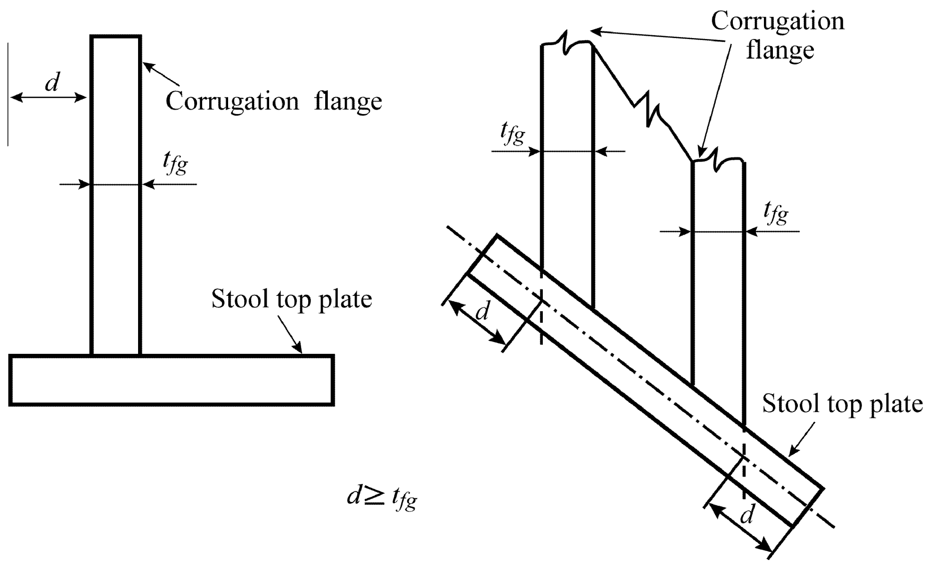

Fig 30: Permitted distance, *d*, from the edge of the stool top plate to the surface of the corrugation flange

10.4.8 Upper stool

The upper stool, when fitted, is to have a height in general between two and three times the depth of corrugations. Rectangular stools are to have a height in general equal to twice the depth of corrugations,

measured from the deck level and at the hatch side girder.
The upper stool of transverse bulkhead is to be properly supported by deck girders or deep brackets between the adjacent hatch end beams.
The width of the upper stool bottom plate is generally to be the same as that of the lower stool top plate. The stool top of non-rectangular stools is to have a width not less than twice the depth of corrugations.
The ends of stool side ordinary stiffeners when fitted in a vertical plane, are to be attached to brackets at the upper and lower end of the stool.
The stool is to be fitted with diaphragms in line with and effectively attached to longitudinal deck girders extending to the hatch end coaming girders or transverse deck primary supporting members as the case may be, for effective support of the corrugated bulkhead.
Scallops in the brackets and diaphragms in way of the connection to the stool bottom plate are to be avoided.

10.4.9 Alignment

At deck, if no upper stool is fitted, two transverse or longitudinal reinforced beams as the case may be, are to be fitted in line with the corrugation flanges.
At bottom, if no lower stool is fitted, the corrugation flanges are to be in line with the supporting floors or girders.
The weld of corrugations and floors or girders to the inner bottom plating are to be full penetration ones.
The cut-outs for connections of the inner bottom longitudinals to double bottom floors are to be closed by collar plates. The supporting floors or girders are to be connected to each other by suitably designed shear plates.
Stool side plating is to be aligned with the corrugation flanges. Lower stool side vertical stiffeners and their brackets in the stool are to be aligned with the inner bottom structures as longitudinals or similar, to provide appropriate load transmission between these stiffening members.
Lower stool side plating is not to be knuckled anywhere between the inner bottom plating and the stool top plate.

10.4.10 Effective width of the compression flange

The effective width of the corrugation flange in compression to be considered for the strength check of the bulkhead is to be obtained, in m, from the following formula:

$$b_{ef} = C_E a$$

where:

C_E : Coefficient to be taken equal to:

$$C_E = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \quad \text{for} \quad \beta > 1.25$$

$$C_E = 1.0 \quad \text{for} \quad \beta \le 1.25$$

β : Coefficient to be taken equal to:

$$\beta = 10^3 \frac{a}{t_f} \sqrt{\frac{R_{eH}}{E}}$$

a : Width, in m, of the corrugation flange (see **Fig 28**)

t_f : Net flange thickness, in mm.

10.4.11 Effective shedder plates

Effective shedder plates are those which:

- are not knuckled
- are welded to the corrugations and the lower stool top plate according to **Ch 11**

- are fitted with a minimum slope of 45°, their lower edge being in line with the lower stool side plating
- have thickness not less than 75 % of that required for the corrugation flanges
- have material properties not less than those required for the flanges.

10.4.12 Effective gusset plates

Effective gusset plates are those which:

- are in combination with shedder plates having thickness, material properties and welded connections as requested for shedder plates in **[10.4.11],**
- have a height not less than half of the flange width,
- are fitted in line with the lower stool side plating,
- are welded to the lower stool top plate, corrugations and shedder plates according to **Ch 11,**
- have thickness and material properties not less than those required for the flanges.

10.4.13 (void)

Fig 32: (void)
Fig 33: (void)
Fig 34: (void)
Fig 35: (void)

10.4.14 (void)

10.4.15 (void)

10.5 Non-tight bulkheads

10.5.1 Non-tight bulkheads not acting as pillars

Non-tight bulkheads not acting as pillars are to be provided with bulkhead stiffeners with a maximum spacing equal to:

- 0.9 m, for transverse bulkheads
- two frame spacings, with a maximum of 1.5 m, for longitudinal bulkheads.

  The depth of bulkhead stiffener is not to be less than 1/12 of stiffener length. The net thickness of bulkhead stiffener is not to be less than the minimum thickness required for the considered bulkhead Plate.

Non-tight bulkheads acting as pillars are to be provided with bulkhead stiffeners with a maximum spacing equal to:

- two frame spacings, when the frame spacing does not exceed 0.75 m,
- one frame spacing, when the frame spacing is greater than 0.75 m.

Each vertical stiffener, in association with a width of plating equal to 35 times the plating net thickness or 1/12 of stiffener length, whichever is the smaller, is to comply with the applicable requirements in **Ch 6, Sec 2**, for the load being supported.
In the case of non-tight bulkheads supporting longitudinally framed decks, vertical girders are to be provided in way of deck transverse.

10.6 Watertight bulkheads of trunks and tunnels

10.6.1

Ref. SOLAS Ch. II-1, Part B, Reg. 19.1
Watertight trunks, tunnels, duct keels and ventilators are to be of the same strength as watertight bulkheads at corresponding levels. The means used for making them watertight, and the arrangements adopted for closing openings in them, are to be to the satisfaction of the Society.

11. Pillars

11.1 General

11.1.1

Pillars are to be fitted, as far as practicable, in the same vertical line. If not possible, effective means are to be provided for transmitting their loads to the supports below.

11.1.2

Pillars are to be provided in line with the double bottom girder or as close thereto as practicable, and the structure above and under the pillars is to be of sufficient strength to provide effective distribution of the load. Where pillars connected to the inner bottom are not located in way of the intersection of floors and girders, partial floors or girders or equivalent structures suitable to support the pillars are to be arranged.

11.1.3

Pillars provided in tanks are to be of solid or open section type. Pillars located in spaces intended for products which may produce explosive gases are to be of open section type.

11.1.4 Connections

Heads and heels of pillars are to be secured by thick doubling plates and brackets as necessary. Where the pillars are likely to be subjected to tensile loads such as those in tanks, the head and heel of pillars are to be efficiently secured to withstand the tensile loads and the doubling plates replaced by insert plate.
In general, the net thickness of doubling plates is to be not less than 1.5 times the net thickness of the pillar.
Pillars are to be attached at their heads and heels by continuous welding. ⚓

Chapter 4

Design Loads

Appendix 3 Standard Loading Conditions for Fatigue Assessment

Section 1 – GENERAL

1. General

1.1

1.1.1

The equivalent design wave (EDW) method is used to set the design loads which include lateral loads normal to plating and hull girder loads in still water and in waves.

1.1.2

External hydrostatic pressure and internal static pressure due to cargo and ballast are considered as lateral loads in still water. External hydrodynamic pressure and internal inertial pressure due to cargo and ballast are considered as lateral loads in waves.

1.1.3

Still water vertical shear force and bending moment, wave-induced vertical shear force and bending moment and wave-induced horizontal bending moment are considered as the hull girder loads.

1.1.4

The stresses due to the lateral loads in waves and the hull girder loads in waves are to be combined using load combination factors determined for each equivalent design wave.

Section 2 - SHIP MOTIONS AND ACCELERATIONS

Symbols

For symbols not defined in this Section, refer to **Ch 1**, **Sec 4.**

a_0 : Acceleration parameter, taken equal to:

$$a_0 = f_p(1.58 - 0.47C_B)\left(\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2}\right)$$

T_R : Roll period, in s, defined in **[2.1.1]**

θ : Single roll amplitude, in deg, defined in **[2.1.1]**

T : Pitch period, in s, defined in **[2.2.1]**

Φ : Single pitch amplitude, in deg, defined in **[2.2.1]**

f_p : Coefficient corresponding to the probability level, taken equal to:

$f_p = 1.0$ for strength assessments corresponding to the probability level of 10^{-8}

$f_p = 0.5$ for strength assessments corresponding to the probability level of 10^{-4}

1. General

1.1

1.1.1

Ship motions and accelerations are assumed to be periodic. The motion amplitudes, defined by the formulae in this Section, are half of the crest to trough amplitudes.

1.1.2

As an alternative to the formulae in this Section, the Society may accept the values of ship motions and accelerations derived from direct calculations or obtained from model tests, when justified on the basis of the ship's characteristics and intended service. In general, the values of ship motions and accelerations to be determined are those which can be reached with a probability level of 10^{-8} or 10^{-4}. In any case, the model tests or the calculations, including the assumed sea scatter diagrams and spectra, are to be submitted to the Society for approval.

2. Ship absolute motions and accelerations

2.1 Roll

2.1.1

The roll period T_R, in s, and the single roll amplitude θ , in deg, are given by:

$$T_R = \frac{2.3k_r}{\sqrt{GM}}$$

$$\theta = \frac{9000(1.25 - 0.025T_R)f_p k_b}{(B + 75)\pi}$$

where:

k_b : Coefficient taken equal to:

k_b =1.2 for ships without bilge keel

k_b =1.0 for ships with bilge keel

k_r : Roll radius of gyration, in m, in the considered loading condition. When k_r is not known, the values indicated in **Table 1** may be assumed.

GM : Metacentric height, in m, in the considered loading condition. When GM is not known, the values indicated in **Table 1** may be assumed.

Table 1: Values of k_r and GM

Loading condition		k_r	GM
Full load condition	Alternate or homogeneous loading	0.35 B	0.12 B
	Steel coil loading	0.42 B	0.24 B
Normal ballast condition		0.45 B	0.33 B
Heavy ballast condition		0.40 B	0.25 B

2.2 Pitch

2.2.1

The pitch period T_P, in s, and the single pitch amplitude Φ, in deg, are given by:

$$T_P = \sqrt{\frac{2\pi\lambda}{g}}$$

$$\Phi = f_p \frac{960}{L} \sqrt[4]{\frac{V}{C_B}}$$

where:

$$\lambda = 0.6\left(1 + \frac{T_{LC}}{T_S}\right)L$$

2.3 Heave

2.3.1

The vertical acceleration due to heave, in m/s^2, is given by:

$$a_{heave} = a_0 g$$

2.4 Sway

2.4.1

The transverse acceleration due to sway, in m/s^2, is given by:

$$a_{sway} = 0.3 a_0 g$$

2.5 Surge

2.5.1

The longitudinal acceleration due to surge, in m/s^2, is given by:

$$a_{surge} = 0.2 a_0 g$$

3. Ship relative accelerations

3.1 General

3.1.1

At any point, the accelerations in X, Y and Z directions are the acceleration components which result from the ship absolute motions and accelerations defined in **[2.1]** to **[2.5].**

3.2 Accelerations

3.2.1

The reference values of the longitudinal, transverse and vertical accelerations at any point are obtained from the following formulae:

- In longitudinal direction:

$$a_X = C_{XG} g \sin \Phi + C_{XS} a_{surge} + C_{XP} a_{pitch\,x}$$

- In transverse direction:

$$a_Y = C_{YG} g \sin \theta + C_{YS} a_{sway} + C_{YR} a_{roll\,y}$$

- In vertical direction:

$$a_Z = C_{ZH} a_{heave} + C_{ZR} a_{roll\,z} + C_{ZP} a_{pitch\,z}$$

where:

C_{XG}, C_{XS}, C_{XP}, C_{YG}, C_{YS}, C_{YR}, C_{ZH}, C_{ZR} and C_{ZP} : Load combination factors defined in **Ch 4**, **Sec 4**, **[2.2]**

a_{pitchx} : Longitudinal acceleration due to pitch, in m/s^2

$$a_{pitch\,x} = \Phi \frac{\pi}{180} \left(\frac{2\pi}{T_P} \right)^2 R$$

a_{rolly} : Transverse acceleration due to roll, in m/s^2

$$a_{roll\,y} = \theta \frac{\pi}{180} \left(\frac{2\pi}{T_R} \right)^2 R$$

a_{rollz} : Vertical acceleration due to roll, in m/s^2

$$a_{roll\,z} = \theta \frac{\pi}{180} \left(\frac{2\pi}{T_R} \right)^2 y$$

a_{pitchz} : Vertical acceleration due to pitch, in m/s^2

$$a_{pitch\,z} = \Phi \frac{\pi}{180} \left(\frac{2\pi}{T_P} \right)^2 \left| (x - 0.45L) \right|$$

where $\left| (x - 0.45L) \right|$ is to be taken not less than $0.2\,L$

R = $z - \min\left(\frac{D}{4} + \frac{T_{LC}}{2}, \frac{D}{2} \right)$

x, y, z : X, Y and Z co-ordinates, in m, of any point considered with respect to the reference co-ordinate system defined in **Ch 1, Sec 4**

Section 3 – HULL GIRDER LOADS

Symbols

For symbols not defined in this Section, refer to **Ch 1**, **Sec 4**.

x : X co-ordinate, in m, of the calculation point with respect to the reference co-ordinate system

f_p : Coefficient corresponding to the probability, defined in **Ch 4**, **Sec 2**.

1. General

1.1 Sign conventions of bending moments and shear forces

1.1.1

Absolute values are to be taken for bending moments and shear forces introduced in this Section. The sign of bending moments and shear forces is to be considered according to **Sec 4**, **Table 3**. The sign conventions of vertical bending moments, horizontal bending moments and shear forces at any ship transverse section are as shown in **Fig 1**, namely:

- the vertical bending moments M_{SW} and M_{WV} are positive when they induce tensile stresses in the strength deck (hogging bending moment) and are negative in the opposite case (sagging bending moment)
- the horizontal bending moment M_{WH} is positive when it induces tensile stresses in the starboard and is negative in the opposite case.
- the vertical shear forces Q_{SW}, Q_{WV} are positive in the case of downward resulting forces preceding and upward resulting forces following the ship transverse section under consideration, and is negative in the opposite case.

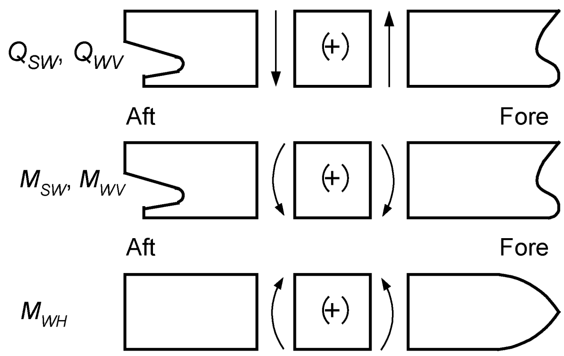

Fig 1: Sign conventions for shear forces Q_{SW}, Q_{WV} and bending moments M_{SW}, M_{WV} and M_{WH}

2. Still water loads

2.1 General

2.1.1

In general the vertical still water bending moment and the shear force of the individual loading condition is to be applied. The shipbuilder has to submit for each of the loading condition defined in **Ch 4, Sec 7** a longitudinal strength calculation.

The values of still water vertical bending moment and shear force are to be treated as the upper limits with respect to hull girder strength.

In general, the design cargo and ballast loading conditions, based on amount of bunker, fresh water and stores at departure and arrival, are to be considered for the M_{SW} and Q_{SW} calculations. Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also, where any ballasting and/or deballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or deballasting any ballast tank are to be submitted and where approved included in the loading manual for guidance.

2.1.2 Partially filled ballast tanks in ballast loading conditions

Ballast loading conditions involving partially filled peak and/or other ballast tanks at departure, arrival or during intermediate conditions are not permitted to be used as design conditions unless:

- design stress limits are satisfied for all filling levels between empty and full, and
- for BC-A and BC-B ships, longitudinal strength of hull girder in flooded condition according to **Ch 5**, **Sec 1**, **[2.1.3]** is complied with for all filling levels between empty and full.

To demonstrate compliance with all filling levels between empty and full, it will be acceptable if, in each condition at departure, arrival, and where required by **[2.1.1]**, any intermediate condition, the tanks intended to be partially filled are assumed to be:

- empty
- full
- partially filled at intended level

Where multiple tanks are intended to be partially filled, all combinations of empty, full or partially filled at intended level for those tanks are to be investigated.

2.1.3 Partially filled ballast tanks in cargo loading conditions

In cargo loading conditions, the requirement in **[2.1.2]** applies to the peak tanks only.

2.1.4 Sequential ballast water exchange

Requirements of **[2.1.2]** and **[2.1.3]** are not applicable to ballast water exchange using the sequential method.

2.2 Still water bending moment

2.2.1

The design still water bending moments $M_{SW,H}$ and $M_{SW,S}$ at any hull transverse section are the maximum still water bending moments calculated, in hogging and sagging conditions, respectively, at that hull transverse section for the loading conditions, as defined in **[2.1.1]**. Greater values may be considered if defined by the Designer.

2.2.2

If the design still water bending moments are not defined, at a preliminary design stage, at any hull transverse section, the longitudinal distributions shown in **Fig 2** may be considered.
In **Fig 2**, M_{SW} is the design still water bending moment amidships, in hogging or sagging conditions, whose values are to be taken not less than those obtained, in kN.m, from the following formulae:

- hogging conditions:

$$M_{SW,H} = 175CL^2B(C_B + 0.7)10^{-3} - M_{WV,H}$$

- sagging conditions:

$$M_{SW,S} = 175CL^2B(C_B + 0.7)10^{-3} - M_{WV,S}$$

where $M_{WV,H}$ and $M_{WV,S}$ are the vertical wave bending moments, in kN.m, defined in **[3.1].**

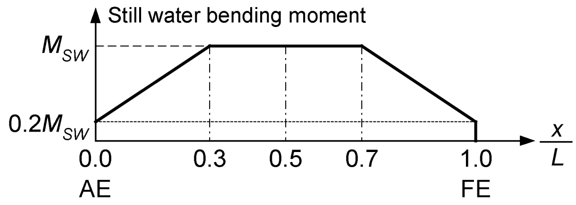

Fig 2: Preliminary still water bending moment distribution

2.3 Still water shear force

2.3.1

The design still water shear force Q_{SW} at any hull transverse section is the maximum positive or negative shear force calculated, at that hull transverse section, for the loading conditions, as defined in **[2.1.1]**. Greater values may be considered if defined by the Designer.

2.4 Still water bending moment and still water shear force in flooded condition

2.4.1

The still water bending moments $M_{SW,F}$, in hogging and sagging conditions, and the still water shear force $Q_{SW,F}$, in flooded condition are to be determined for the flooding scenario considering each cargo hold individually flooded up to the equilibrium waterline.
This means that double side spaces may not be considered flooded, and the cargo holds may not be considered completely flooded, but only up to the equilibrium waterline.

2.4.2

To calculate the weight of ingressed water, the following assumptions are to be made:

a) The permeability of empty cargo spaces and volume left in loaded cargo spaces above any cargo is to be taken as 0.95.

b) Appropriate permeabilities and bulk densities are to be used for any cargo carried. For iron ore, a minimum permeability of 0.3 with a corresponding bulk density of 3.0 t/m^3 is to be used. For cement, a minimum permeability of 0.3 with a corresponding bulk density of 1.3 t/m^3 is to be used. In this respect, "permeability" for solid bulk cargo means the ratio of the floodable volume between the particles, granules or any larger pieces of the cargo, to the gross volume of the bulk cargo.

For packed cargo conditions (such as steel mill products), the actual density of the cargo should be used with a permeability of zero.

2.4.3

To quantify the effects of ingressed water on the hull girder still water bending moments and still water shear forces, specific calculations are to be carried out. The loading conditions on which the design of the ship has been based are to be considered and, for each of them, the cargo holds are to be considered as being individually flooded up to the equilibrium waterline. The still water bending moments and still water shear forces are therefore to be calculated for any combination of considered loading conditions and flooded cargo holds.

3. Wave loads

3.1 Vertical wave bending moments

3.1.1 Intact condition

The vertical wave bending moments in intact condition at any hull transverse section are obtained, in kN.m, from the following formulae:

- hogging conditions:
  $M_{WV,H} = 190 F_M f_p C L^2 B C_B 10^{-3}$
- sagging conditions:
  $M_{WV,S} = 110 F_M f_p C L^2 B (C_B + 0.7) 10^{-3}$

where:

F_M : Distribution factor defined in **Table 1** (see also **Fig 3**).

Table 1: Distribution factor F_M

Hull transverse section location	Distribution factor F_M
$0 \le x < 0.4L$	$2.5\frac{x}{L}$
$0.4L \le x \le 0.65L$	1.0
$0.65L \le x < L$	$2.86\left(1-\frac{x}{L}\right)$

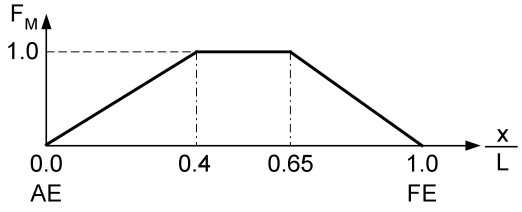

Fig 3: Distribution factor F_M

3.1.2 Flooded condition

The vertical wave bending moments in flooded condition at any hull transverse section are obtained, in kN.m, from the following formula:

$$M_{WV,F} = 0.8 M_{WV}$$

where M_{WV} is defined in **[3.1.1]**.

3.1.3 Harbour condition

The vertical wave bending moments in harbour condition at any hull transverse section are obtained, in kN.m, from the following formula:

$$M_{WV,P} = 0.4 M_{WV}$$

where M_{WV} is defined in **[3.1.1]**.

3.2 Vertical wave shear force

3.2.1 Intact condition

The vertical wave shear force in intact condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_{WV} = 30 F_Q f_p CLB(C_B + 0.7)10^{-2}$$

where:

F_Q : Distribution factor defined in **Table 2** for positive and negative shear forces (see also **Fig 4**).

Table 2: Distribution factor F_Q

Hull transverse section location	Distribution factor F_Q	
	Positive wave shear force	Negative wave shear force
$0 \le x < 0.2L$	$4.6A\frac{x}{L}$	$4.6\frac{x}{L}$
$0.2L \le x \le 0.3L$	$0.92A$	0.92
$0.3L < x < 0.4L$	$(9.2A-7)\left(0.4-\frac{x}{L}\right)+0.7$	$2.2\left(0.4-\frac{x}{L}\right)+0.7$
$0.4L \le x \le 0.6L$	0.7	0.7
$0.6L < x < 0.7L$	$3\left(\frac{x}{L}-0.6\right)+0.7$	$(10A-7)\left(\frac{x}{L}-0.6\right)+0.7$
$0.7L \le x \le 0.85L$	1	A
$0.85L < x \le L$	$6.67\left(1-\frac{x}{L}\right)$	$6.67A\left(1-\frac{x}{L}\right)$
Note : $A = \frac{190C_B}{110(C_B+0.7)}$		

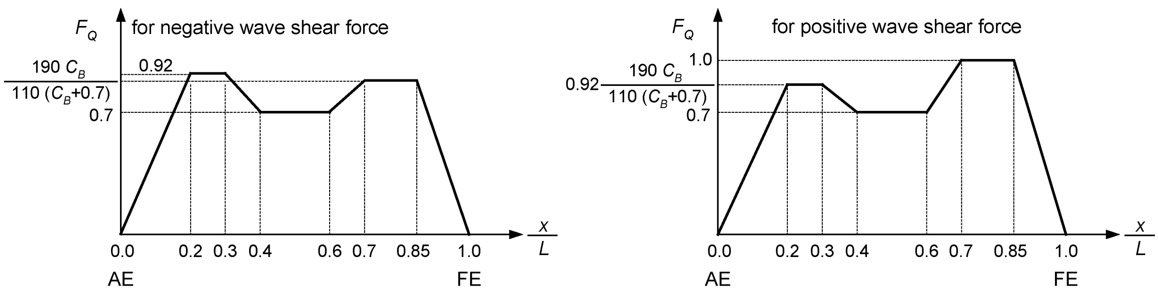

Fig 4: Distribution factor F_Q

3.2.2 Flooded condition

The vertical wave shear force in flooded condition at any hull transverse section are obtained, in kN, from the following formula:

$$Q_{WV,F} = 0.8 Q_{WV}$$

where Q_{WV} is defined in **[3.2.1]**.

3.2.3 Harbour condition

The vertical wave shear force in harbour condition at any hull transverse section are obtained, in kN, from the following formula:

$$Q_{WV,P} = 0.4Q_{WV}$$

where Q_{WV} is defined in **[3.2.1].**

3.3 Horizontal wave bending moment

3.3.1

The horizontal wave bending moment at any hull transverse section, in kN.m, is given by:

$$M_{WH} = (0.3 + \frac{L}{2000}) F_M f_p C L^2 T_{LC} C_B$$

where F_M is the distribution factor defined in **[3.1.1].**

3.4 Wave torsional moment

3.4.1

The wave torsional moment at any hull transverse section, in kN.m, is given by:

$$M_{WT} = f_p (|M_{WT1}| + |M_{WT2}|)$$

where:

$$M_{WT1} = 0.4 \cdot C \sqrt{\frac{L}{T}} \cdot B^2 D \cdot C_B \cdot F_{T1}$$

$$M_{WT2} = 0.22 CLB^2 C_B \cdot F_{T2}$$

F_{T1}, F_{T2} : Distribution factors, defined as follows:

$$F_{T1} = \sin\left(\frac{2\pi x}{L}\right)$$

$$F_{T2} = \sin^2\left(\frac{\pi x}{L}\right)$$

Section 4 - LOAD CASES

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

a_{surge}, a_{pitchx}, a_{sway}, a_{rolly}, a_{heave}, a_{rollz}, a_{pitchz} : Components of accelerations, defined in **Ch 4, Sec 2.**

1. General

1.1 Application

1.1.1

The load cases described in this section are those to be used for:

- the local strength analysis of plating and ordinary stiffeners and primary supporting members according to the applicable requirements of **Ch 6**, **Sec 1**, **Ch 6**, **Sec 2** and **Ch 6**, **Sec 4** respectively,
- the direct strength analysis of structural members, according to the applicable requirements of **Ch 7**,
- the fatigue check of structural details, according to the applicable requirements of **Ch 8**.

1.1.2

For the local strength analysis and for the direct strength analysis, the load cases are the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2 described in **[2].**

1.2 Equivalent design wave

1.2.1

Regular waves that generate response values equivalent to the long-term response values of the load components considered being predominant to the structural members are set as Equivalent Design Waves (EDWs). They consist of:

- regular waves when the vertical wave bending moment becomes maximum in head sea (EDW "H")
- regular waves when the vertical wave bending moment becomes maximum in following sea (EDW "F")
- regular waves when the roll motion becomes maximum (EDW "R")
- regular waves when the hydrodynamic pressure at the waterline becomes maximum (EDW "P")

The definitions of wave crest and wave trough in the EDW "H" and EDW "F" are given in **Fig 1**. The definitions of weather side down and weather side up for the EDW "R" and EDW "P" are given in **Fig 2.**

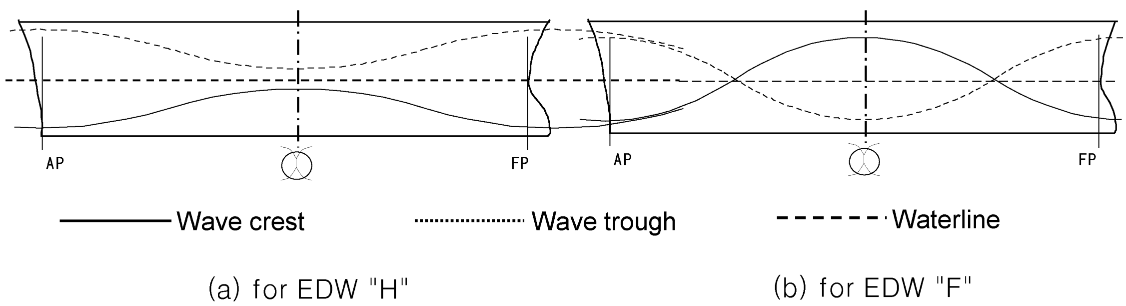

Fig 1: Definition of wave crest and wave trough for EDWs "H" and "F"

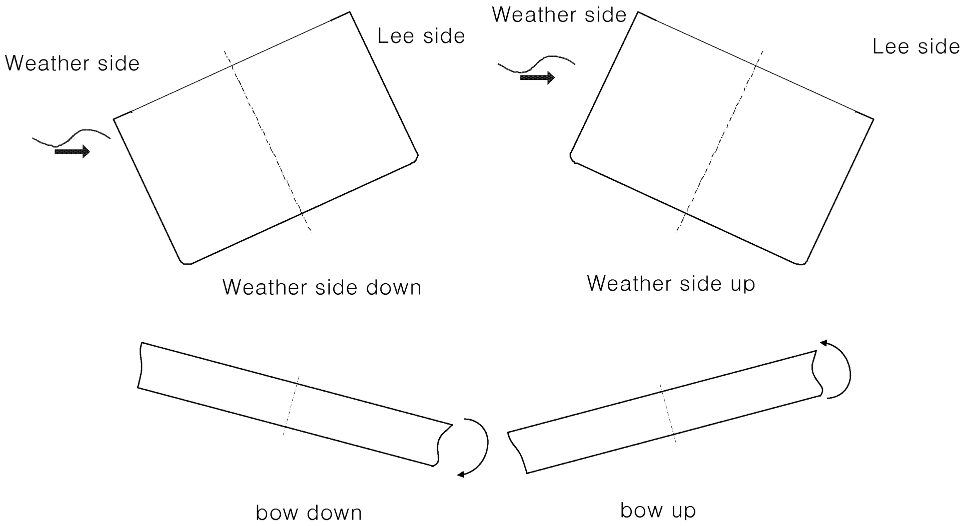

Fig 2: Definitions of ship motion

2. Load cases

2.1 General

2.1.1

The load cases corresponding to the Equivalent Design Waves (EDWs) are defined in **Table 1**. The corresponding hull girder loads and motions of the ship are indicated in **Table 2**. If the ship structure or the ship loading condition is not symmetrical with respect to the centreline plane of ship, the load cases (R1, R2, P1 and P2) corresponding to the beam conditions in which the encounter wave comes from the starboard (in this case the starboard is the weather side), should be also included in the structural strength assessment.

Table 1: Definition of load cases

Load case	H1	H2	F1	F2	R1	R2	P1	P2
EDW	"H"		"F"		"R"		"P"	
Heading	Head		Follow		Beam (Port: weather side)		Beam (Port: weather side)	
Effect	Max. Bending Moment		Max. Bending Moment		Max. Roll		Max. Ext. Pressure	
	Sagging	Hogging	Sagging	Hogging	(+)	(-)	(+)	(-)

Table 2: Reference hull girder loads and motions of ship

Load case	H1	H2	F1	F2	R1	R2	P1	P2
Vert. BM & SF	Yes		Yes		-		Yes	
Hor. BM	-		-		Yes		-	
Heave	Down	Up	-	-	Down	Up	Down	Up
Pitch	Bow down	Bow up	-	-	-	-	-	-
Roll	-	-	-	-	Stbd up	Stbd down	Stbd up	Stbd down
Surge	Stern	Bow	-	-	-	-	-	-
Sway	-	-	-	-	-	-	Port	Stbd

2.2 Load combination factors

2.2.1

The hull girder loads and the acceleration components to be considered in each load case H1, H2, F1, F2, R1, R2, P1 and P2 are to be obtained by multiplying the reference value of each component by the relevant load combination factor LCF defined in **Table 3**.

2.2.2

The still water vertical bending moment is to be added to the hull girder loads in waves, calculated with load combination factors.

2.2.3

The internal loads are the sum of static pressures or forces induced by the weights carried, including those carried on decks, and of inertial pressures or forces induced by the accelerations on these weights and calculated with load combination factors.

Table 3: Load combination factors LCF

	LCF	H1	H2	F1	F2	R1	R2	P1	P2
M_{WV}	C_{WV}	-1	1	-1	1	0	0	$0.4-\frac{T_{LC}}{T_S}$	$\frac{T_{LC}}{T_S}-0.4$
Q_{WV}	C_{QW}(1)	-1	1	-1	1	0	0	$0.4-\frac{T_{LC}}{T_S}$	$\frac{T_{LC}}{T_S}-0.4$
M_{WH}	C_{WH}	0	0	0	0	$1.2-\frac{T_{LC}}{T_S}$	$\frac{T_{LC}}{T_S}-1.2$	0	0
a_{surge}	C_{XS}	-0.8	0.8	0	0	0	0	0	0
a_{pitchx}	C_{XP}	1	-1	0	0	0	0	0	0
$gsinF$	C_{XG}	1	-1	0	0	0	0	0	0
a_{sway}	C_{YS}	0	0	0	0	0	0	1	-1
a_{rolly}	C_{YR}	0	0	0	0	1	-1	0.3	-0.3
$gsinq$	C_{YG}	0	0	0	0	1	-1	0.3	-0.3
a_{heave}	C_{ZH}	$0.6\frac{T_{LC}}{T_S}$	$-0.6\frac{T_{LC}}{T_S}$	0	0	$\frac{\sqrt{L}}{40}$	$-\frac{\sqrt{L}}{40}$	1	-1
a_{rollz}	C_{ZR}	0	0	0	0	1	-1	0.3	-0.3
a_{pitchz}	C_{ZP}	1	-1	0	0	0	0	0	0

(1) The LCF for C_{QW} is only used for the aft part of midship section. The inverse value of it should be used for the forward part of the midship section.

Section 5 - EXTERNAL PRESSURES

Symbols

For symbols not defined in this Section, refer to **Ch 1**, **Sec 4**.

L_2 : Rule length L, but to be taken not greater than 300 m

C : Wave coefficient, as defined in **Ch 1**, **Sec 4**, **[2.3.1]**

λ : Wave length, in m, corresponding to the load case, defined in **[1.3.1]**, **[1.4.1]**, and **[1.5.1]**

f_p : Coefficient corresponding to the probability, defined in **Ch 4**, **Sec 2**

T_{LCi} : Draught in the considered cross section, in m, in the considered loading condition

B_i : Moulded breadth at the waterline, in m, in the considered cross section

x, y, z : X, Y and Z co-ordinates, in m, of the load point with respect to the reference co-ordinate system defined in **Ch 1, Sec 4.**

1. External sea pressures on side shell and bottom

1.1 General

1.1.1

The total pressure p at any point of the hull, in kN/m^2, to be obtained from the following formula is not to be negative:

$$p = p_S + p_W$$

Where:

p_S : Hydrostatic pressure defined in **[1.2]**

p_W : Wave pressure equal to the hydrodynamic pressure defined in **[1.3]**, **[1.4]** or **[1.5]**, as the case may be, and corrected according to **[1.6]**

1.2 Hydrostatic pressure

1.2.1

The hydrostatic pressure p_S at any point of the hull, in kN/m^2, corresponding to the draught in still water is obtained, for each loading condition, from the formulae in **Table 1** (see also **Fig 1**).

Table 1: Hydrostatic pressure p_S

Location	Hydrostatic pressure, p_S, in kN/m^2
Points at and below the waterline ($z \le T_{LCi}$)	$\rho g(T_{LCi} - z)$
Points above the waterline ($z > T_{LCi}$)	0

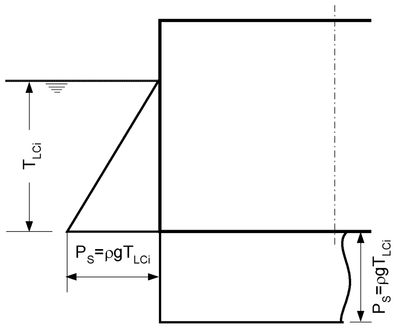

Fig 1: Hydrostatic pressure p_S

1.3 Hydrodynamic pressures for load cases H1, H2, F1 and F2

1.3.1

The hydrodynamic pressures p_H and p_F, for load cases H1, H2, F1 and F2, at any point of the hull below the waterline are to be obtained, in kN/m^2, from **Table 2.**
The distribution of pressure p_{F2} is schematically given in **Fig 2**.

Table 2: Hydrodynamic pressures for load cases H1, H2, F1 and F2

Load case	Hydrodynamic pressure, in kN/m^2
H1	$p_{H1} = -k_\ell k_p p_{HF}$
H2	$p_{H2} = k_\ell k_p p_{HF}$
F1	$p_{F1} = -p_{HF}$
F2	$p_{F2} = p_{HF}$

where:

$p_{HF} = 3 f_p f_{nl} C \sqrt{\frac{L+\lambda-125}{L}} \left(\frac{z}{T_{LCi}} + \frac{|2y|}{B_i} + 1 \right)$; with $\frac{|2y|}{B_i} \le 1.0$ and z is to be taken not greater than T_{LCi}

f_{nl} : Coefficient considering nonlinear effect, taken equal to:

f_{nl} = 0.9 for the probability level of 10^{-8}

f_{nl} = 1.0 for the probability level of 10^{-4}

k_ℓ : Amplitude coefficient in the longitudinal direction of the ship, taken equal to:

$$k_\ell = 1 + \frac{12}{C_B}\left(1 - \sqrt{\frac{|2y|}{B}}\right)\left|\frac{x}{L} - 0.5\right|^3 \quad \text{for } 0.0 \le x/L \le 0.5$$

$$k_\ell = 1 + \frac{6}{C_B}\left(3 - \frac{|4y|}{B}\right)\left|\frac{x}{L} - 0.5\right|^3 \quad \text{for } 0.5 \le x/L \le 1.0$$

k_p : Phase coefficient in the longitudinal direction of the ship, taken equal to:

$k_p = \left(1.25 - \frac{T_{LC}}{T_S}\right)\cos\left(\frac{2\pi|x-0.5L|}{L}\right) - \frac{T_{LC}}{T_S} + 0.25$, for local strength analysis in conditions other than full load condition, for direct strength analysis and for fatigue strength assessments

k_p = -1.0, for local strength analysis in full load condition

λ : Wave length, in m, taken equal to:

$$\lambda = 0.6\left(1+\frac{T_{LC}}{T_S}\right)L$$ for load cases H1 and H2

$$\lambda = 0.6\left(1+\frac{2}{3}\frac{T_{LC}}{T_S}\right)L$$ for load cases F1 and F2

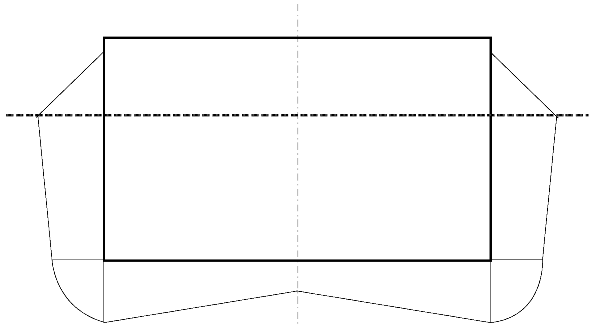

Fig 2: Distribution of hydrodynamic pressure p_{F2} at midship

1.4 Hydrodynamic pressures for load cases R1 and R2

1.4.1

The hydrodynamic pressures p_R, for load cases R1 and R2, at any point of the hull below the waterline are to be obtained, in kN/m^2, from the following formulae. The distribution of pressure p_{R1} is schematically given in **Fig 3**.

$$p_{R1} = f_{nl}\left(10y\sin\theta + 0.88 f_p C\sqrt{\frac{L+\lambda-125}{L}}\left(\frac{|2y|}{B}+1\right)\right)$$

$$p_{R2} = -p_{R1}$$

where:

f_{nl} : Coefficient considering nonlinear effect, taken equal to:

f_{nl} = 0.8 for the probability level of 10^{-8}

f_{nl} = 1.0 for the probability level of 10^{-4}

$\lambda = \frac{g}{2\pi}T_R^2$

y : Y co-ordinate of the load point, in m, taken positive on the portside.

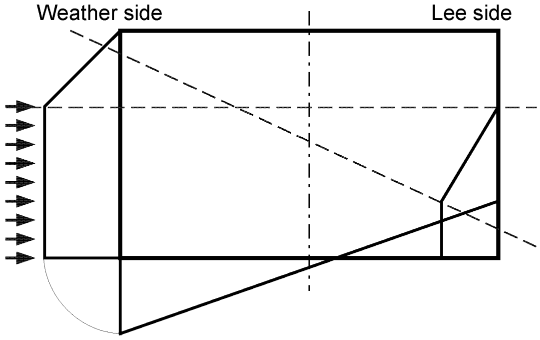

Fig 3: Distribution of hydrodynamic pressure p_{R1} at midship

1.5 Hydrodynamic pressures for load cases P1 and P2

1.5.1

The hydrodynamic pressures p_P, for the load cases P1 and P2, at any point of the hull below the waterline are to be obtained, in kN/m^2, from **Table 3**. The distribution of pressure p_{P1} is schematically given in **Fig 4.**

Table 3: Hydrodynamic pressures for load cases P1 and P2

Load case	Hydrodynamic pressure, in kN/m^2	
	weather side	lee side
P1	$p_{P1} = p_P$	$p_{P1} = p_P/3$
P2	$p_{P2} = -p_P$	$p_{P2} = -p_P/3$

where:

$$p_P = 4.5 f_p f_{nl} C \sqrt{\frac{L+\lambda-125}{L}} \left(2\frac{|z|}{T_{LCi}} + 3\frac{|2y|}{B}\right)$$

f_{nl} : Coefficient considering nonlinear effect, taken equal to:

$f_{nl} = 0.65$ for the probability level of 10^{-8}

$f_{nl} = 1.0$ for the probability level of 10^{-4}

$$\lambda = \left(0.2 + 0.4\frac{T_{LC}}{T_S}\right)L$$

y : Y co-ordinate of the load point, in m, as defined in **[1.4.1]**

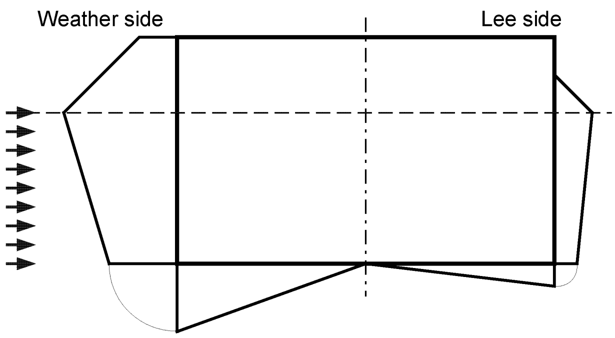

Fig 4: Distribution of hydrodynamic pressure p_{P1} at midship

1.6 Correction to hydrodynamic pressures

1.6.1

For the positive hydrodynamic pressure at the waterline (in load cases H1, H2, F2, R1, R2 and P1), the hydrodynamic pressure $P_{W,C}$ at the side above waterline is given (see **Fig 5**), in kN/m^2, by:

- $p_{W,C} = p_{W,WL} + \rho g (T_{LCi} - z)$ for $T_{LCi} \le z \le h_W + T_{LCi}$
- $p_{W,C} = 0$ for $z \ge h_W + T_{LCi}$

where:

$p_{W,WL}$: positive hydrodynamic pressure at the waterline for the considered load case

$$h_W = \frac{p_{W,WL}}{\rho g}$$

1.6.2

For the negative hydrodynamic pressure at the waterline (in load cases H1, H2, F1, R1, R2, and P2), the hydrodynamic pressure $P_{W,C}$, under the waterline is given (see **Fig 5**), in kN/m^2, by:
$p_{W,C} = p_W$, without being taken less than $\rho g(z - T_{LCi})$

where

p_W : Negative hydrodynamic pressure under the waterline for the considered load case

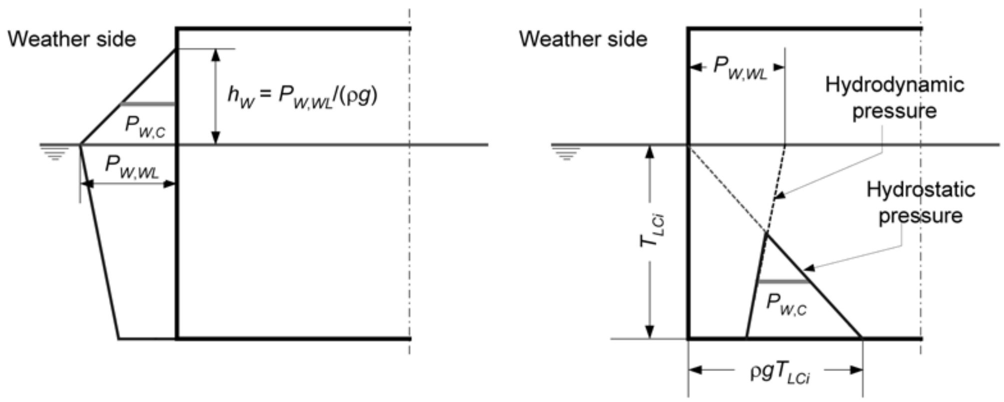

Fig 5: Correction to hydrodynamic pressure

2. External pressures on exposed decks

2.1 General

2.1.1

The external pressures on exposed decks are to be applied for the local scantling check of the structures on exposed deck but not applied for fatigue strength assessment.
If a breakwater is fitted on the exposed deck, no reduction in the external pressures defined in **[2.2]** and **[2.3]** is allowed for the area of the exposed deck located aft of the breakwater.

2.2 Load cases H1, H2, F1 and F2

2.2.1

The external pressure p_D, for load cases H1, H2, F1 and F2, at any point of an exposed deck is to be obtained, in kN/m^2, from the following formula:

$$p_D = \varphi p_W$$

where:

p_W : Pressure obtained from the formulae in **Table 4**

φ : Coefficient defined in **Table 5**.

Table 4: Pressures on exposed decks for H1, H2, F1 and F2

Location	Pressure p_W, in $\mathrm{kN/m^2}$	
	$L_{LL} \geq 100$ m	$L_{LL} < 100$ m
$0 \leq x_{LL}/L_{LL} \leq 0.75$	34.3	$14.9 + 0.195\,L_{LL}$
$0.75 < x_{LL}/L_{LL} < 1$	$34.3+(14.8+a(L_{LL}-100))\left(4\frac{x_{LL}}{L_{LL}}-3\right)$	$12.2+\frac{L_{LL}}{9}\left(5\frac{x_{LL}}{L_{LL}}-2\right)+3.6\frac{x_{LL}}{L_{LL}}$

where:
a : Coefficient taken equal to:
$a = 0.0726$ for Type B freeboard ships
$a = 0.356$ for Type B-60 or Type B-100 freeboard ships.
x_{LL} : X coordinate of the load point measured from the aft end of the freeboard length L_{LL}.

Table 5: Coefficient for pressure on exposed decks

Exposed deck location	φ
Freeboard deck	1.00
Superstructure deck, including forecastle deck	0.75
1st tier of deckhouse	0.56
2nd tier of deckhouse	0.42
3rd tier of deckhouse	0.32
4th tier of deckhouse	0.25
5th tier of deckhouse	0.20
6th tier of deckhouse	0.15
7th tier of deckhouse and above	0.10

2.3 Load cases R1, R2, P1 and P2

2.3.1

The external pressure p_D, for load cases R1, R2, P1 and P2, at any point of an exposed deck is to be obtained, in $\mathrm{kN/m^2}$, from the following formula:

$$p_D = 0.4\varphi p_W$$

where:

p_W : Hydrodynamic pressure at side of the exposed deck for the load cases P1, P2 , R1 and R2, in $\mathrm{kN/m^2}$, can be determined by **[1.6]** at the z co-ordinate. p_W is to be taken greater one of the hydrodynamic pressures $p_{W,C}$ at both sides of the exposed deck (portside and starboard), and is not to be taken less than zero.

φ : Coefficient defined in **Table 5**.

2.4 Load carried on exposed deck

2.4.1 Pressure due to distributed load

If a distributed load is carried on an exposed deck, the static pressure p_S corresponding to this load is to be defined by the Designer and, in general, is not to be taken less than 10 kN/m^2.
The total pressure p due to this load is to be considered not simultaneously to the pressures defined in **[2.2]** and **[2.3]**. It is to be taken equal, in kN/m^2, to the greater value obtained from the following formulae:

$$p = p_S + p_W$$

$$p = p_D$$

where:

p_S : Static pressure due to the distributed load carried, if any

p_W : Dynamic pressure due to the distributed load carried, in kN/m^2, taken equal to:

$$p_W = \frac{a_Z}{g} p_S$$

a_Z : Vertical acceleration at the centre of gravity of the distributed load carried for the load case considered, in m/s^2, obtained by the formulae defined in **Ch 4, Sec 2, [3.2]**

p_D : Pressure for the exposed deck, for the load case considered, as defined in **[2.2.1]** and **[2.3.1].**

2.4.2 Concentrated forces due to unit load

If a unit load is carried on an exposed deck, the static and dynamic forces due to the unit load carried are considered.
The total force F due to this load is to be considered not simultaneously to the pressures defined in **[2.2]** and **[2.3]**. It is to be taken, in kN, equal to value obtained from the following formula:

$$F = F_S + F_W$$

where:

F_S : Static force due to the unit load carried, in kN, taken equal to:

$$F_S = m_U g$$

F_W : Dynamic force due to unit load carried, in kN, taken equal to:

$$F_W = m_U a_Z$$

m_U : Mass of the unit load carried, in t

a_Z : Vertical acceleration at the centre of gravity of the unit load carried for the load case considered, in m/s^2, obtained by the formulae defined in **Ch 4, Sec 2, [3.2].**

3. External pressures on superstructure and deckhouses

3.1 Exposed decks

3.1.1

External pressures on exposed decks of superstructures and deckhouses are to be obtained according to **[2]**.

3.2 Exposed wheel house tops

3.2.1

The lateral pressure for exposed wheel house tops, in kN/m^2, is not to be taken less than:

$p = 12.5$

3.3 Sides of superstructures

3.3.1

The lateral pressure for sides of superstructures, in kN/m^2, is to be obtained from the following formula:

$$p_{SI} = 2.1 C f_p c_F (C_B + 0.7) \frac{20}{10 + z - T}$$

f_p : Probability factor, taken equal to:

$f_P = 1.0$ for plate panels

$f_P = 0.75$ for ordinary stiffeners and primary supporting members

c_F : Distribution factor according to **Table 6.**

Table 6: Distribution factor c_F

Location	c_F
$0 \le \frac{x}{L} < 0.2$	$1.0 + \frac{5}{C_B}\left(0.2 - \frac{x}{L}\right)$, without taking $\frac{x}{L}$ less than 0.1
$\frac{x}{L} \ge 0.2$	1.0

3.4 End bulkheads of superstructure and deckhouse walls

3.4.1

The lateral pressure, in kN/m^2, for determining the scantlings is to be obtained from the greater of the following formulae:

$$p_A = nc[bC - (z - T)]$$

$$p_A = p_{A\min}$$

where:

n : Coefficient defined in **Table 7**, depending on the tier level.

The lowest tier is normally that tier which is directly situated above the uppermost continuous deck to which the depth D is to be measured. However, where the actual distance ($D-T$) exceeds the minimum non-corrected tabular freeboard according to ILLC as amended by at least one standard superstructure height as defined in **Ch1, Sec4, [3.18.1],** this tier may be defined as the 2nd tier and the tier above as the 3rd tier

c : Coefficient taken equal to:

$$c = 0.3 + 0.7\frac{b_1}{B_1}$$

For exposed parts of machinery casings, c is not to be taken less than 1.0

b_1 : Breadth of deckhouse at the position considered

B_1 : Actual maximum breadth of ship on the exposed weather deck at the position considered. b_1/B_1 is not to be taken less than 0.25

b : Coefficient defined in **Table 8**

x : X co-ordinate, in m, of the calculation point for the bulkhead considered. When determining sides of a deckhouse, the deckhouse is to be subdivided into parts of approximately equal length, not exceeding $0.15L$ each, and x is to be taken as the X co-ordinate of the centre of each part considered.

z : Z co-ordinate, in m, of the midpoint of stiffener span, or to the middle of the plate field

ℓ : Span, in m, to be taken as the superstructure height or deckhouse height respectively, and not less than 2.0 m

$p_{A\min}$: Minimum lateral pressure, in kN/m^2, defined in **Table 9**.

Table 7: Coefficient *n*

Type of bulkhead	Location	n
Unprotected front	Lowest tier	$20 + \frac{L_2}{12}$
	Second tier	$10 + \frac{L_2}{12}$
	Third tier and above	$5 + \frac{L_2}{15}$
Protected front	All tiers	$5 + \frac{L_2}{15}$
Sides	All tiers	$5 + \frac{L_2}{15}$
Aft end	Abaft amidships	$7 + \frac{L_2}{100} - 8\frac{x}{L_2}$
	Forward of amidships	$5 + \frac{L_2}{100} - 4\frac{x}{L_2}$

Table 8: Coefficient *b*

Location of bulkhead	b
$\frac{x}{L} < 0.45$	$1.0 + \left(\frac{\frac{x}{L} - 0.45}{C_B + 0.2} \right)^2$
$\frac{x}{L} \geq 0.45$	$1.0 + 1.5 \left(\frac{\frac{x}{L} - 0.45}{C_B + 0.2} \right)^2$
Where: C_B : Block coefficient with $0.6 \leq C_B \leq 0.8$. When determining scantlings of aft ends forward of amidships, C_B need not be taken lessthan 0.8.	

Table 9: Minimum lateral pressure $p_{A\min}$

L	$P_{A\min}$ (kN/m^2)	
	Lowest tier of unprotected fronts	Elsewhere(1)
$90 < L \leq 250$	$25 + \frac{L}{10}$	$12.5 + \frac{L}{20}$
$L > 250$	50	25
(1) For the 4th tier and above, $P_{A\min}$ is to be taken equal to 12.5 kN/m^2.		

4. Pressure in bow area

4.1

4.1.1

The bow pressure, in kN/m^2, to be considered for the reinforcement of the bow flare area is to be obtained from the following formula:

$$p_{FB} = K(p_S + p_W)$$

where:

p_S, p_W : Hydrostatic pressure and maximum hydrodynamic pressures among load cases H, F, R and P, calculated in normal ballast condition at T_B

K : Coefficient taken equal to:

$$K = \frac{c_{FL}\left(0.2V + 0.6\sqrt{L}\right)^2}{42C(C_B + 0.7)\left(1 + \frac{20}{C_B}\left(\frac{x}{L} - 0.7\right)^2\right)}(10 + z - T_B)$$

to be taken not less than 1.0

c_{FL} : Coefficient taken equal to:

$c_{FL} = 0.8$ in general

$c_{FL} = \dfrac{0.4}{1.2 - 1.09\sin\alpha}$ where the flare angle α is greater than 40°

Where, the flare angle α at the load calculation point is to be measured in plane of the frame between a vertical line and the tangent to the side shell plating. (see **Fig 6**)

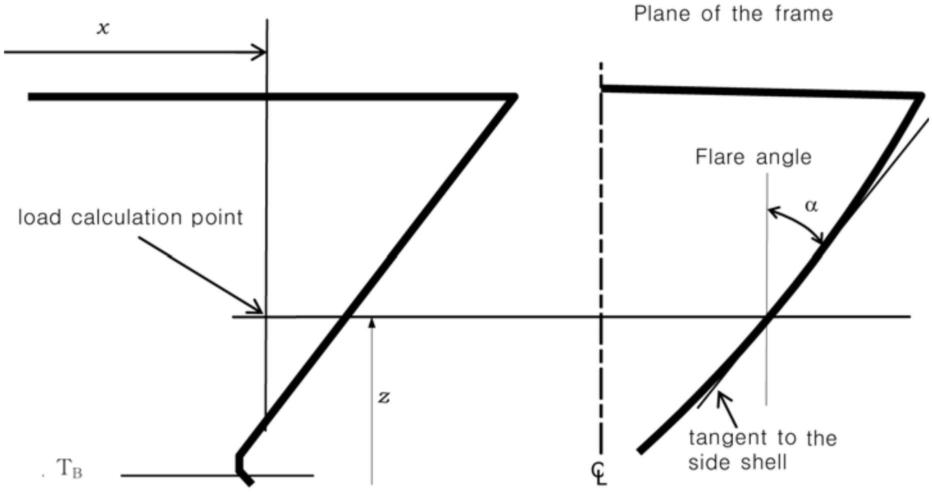

Fig 6 : The definition of the flare angle

4.2 Design bottom slamming pressure

4.2.1

The bottom slamming pressure, in kN/m², to be considered for the reinforcement of the flat bottom forward is to be obtained from the following formula:

$p_{SL} = 162 c_1 c_{SL} \sqrt{L}$ for $L \le 150$ m

$p_{SL} = 1984 c_1 c_{SL} (1.3 - 0.002L)$ for $L > 150$ m

where:

c_1 : Coefficient taken equal to:

$c_1 = 3.6 - 6.5\left(\dfrac{T_{BFP}}{L}\right)^{0.2}$, to be taken not greater than 1.0

T_{BFP} : Smallest design ballast draught, in m, defined at forward perpendicular for normal ballast conditions. Where the sequential method for ballast water exchange is intended to be ap plied, T_{BFP} is to be considered for the sequence of exchange.

c_{SL} : Distribution factor taken equal to(see **Fig 7**):

$c_{SL} = 0$ for $\dfrac{x}{L} \le 0.5$

$c_{SL} = \dfrac{\frac{x}{L} - 0.5}{c_2}$ for $0.5 < \dfrac{x}{L} \le 0.5 + c_2$

$c_{SL} = 1.0$ for $0.5 + c_2 < \dfrac{x}{L} \le 0.65 + c_2$

$$c_{SL} = 0.5\left(1+\frac{1-\frac{x}{L}}{0.35-c_2}\right) \qquad \text{for } \frac{x}{L} > 0.65+c_2$$

c_2 : Coefficient taken equal to:

$c_2 = 0.33C_B + \frac{L}{2500}$, to be taken not greater than 0.35.

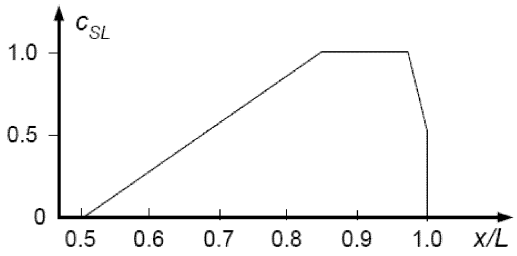

Fig 7: Distribution Factor c_{SL}

4.2.2

It is the Master's responsibility to observe, among others, the weather conditions and the draught at forward perpendicular during water ballast exchange operations, in particular when the forward draught during these operations is less than T_{BFP}.
The above requirement and the draught T_{BFP} is to be clearly indicated in the operating manuals.

5. External pressures on hatch covers

5.1 General

5.1.1

If a specific load is carried on a hatch cover, the pressure is to be obtained according to **[2.4]**.

5.2 Wave pressure

5.2.1

The pressure at any point of the hatch cover is to be obtained according to **[2.2.1]**, considering φ equal to 1.0.
However, when the hatchway is located at least one superstructure standard height, as defined in **Ch 1, Sec 4, [3.18],** higher than the freeboard deck, the pressure p_W may be taken equal to 34.3 kN/m^2.

Section 6 – INTERNAL PRESSURES AND FORCES

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4**.

ρ_C : Density of the dry bulk cargo, in t/m^3, taken equal to:

- the value given in **Table 1** for ships having a length L of 150 m and above
- the maximum density from the loading manual for ships having a length L less than 150 m

Table 1: Density of dry bulk cargo

Type of loading	Density	
	BC-A, BC-B	BC-C
Cargo hold loaded up to the upper deck	max(M_H/V_H, 1.0)	1.0
Cargo hold not loaded up to the upper deck	3.0(1)	-
(1) Except otherwise specified by the designer.		

ρ_L : Density of internal liquid, in t/m^3, taken equal to 1.025 when internal liquid is ballast water

M_H : The actual cargo mass in a cargo hold corresponding to a homogeneously loaded condition at maximum draught, in t

V_H : Volume, in m^3, of cargo hold excluding the volume enclosed by hatch coaming

K_C : Coefficient taken equal to:

$K_C = \cos^2\alpha + (1-\sin\psi)\sin^2\alpha$ for inner bottom, hopper tank, transverse and longitudinal bulkheads, lower stool, vertical upper stool, inner side and side shell:

$K_C = 0$ for top side tank, upper deck and sloped upper stool:

a : Angle, in deg, between panel considered and the horizontal plane

ψ : Assumed angle of repose, in deg, of bulk cargo (considered drained and removed); in the absence of more precise evaluation, the following values may be taken:

ψ = 30° in general

ψ = 35° for iron ore

ψ = 25° for cement

h_C : Vertical distance, in m, from the inner bottom to the upper surface of bulk cargo, as defined in **[1.1.1]** or **[1.1.2]**

h_{DB} : Height, in m, of the double bottom in the centreline

h_{LS} : Mean height, in m, of the lower stool, measured from the inner bottom

z_{TOP} : Z co-ordinate, in m, of the top of the tank, in upright condition

z_{BO} : Z co-ordinate, in m, of the top of the overflow pipe

a_X : Longitudinal acceleration at the centre of gravity of the hold or tank considered, in m/s^2, obtained by the formulae defined in **Ch 4, Sec 2, [3.2]**

a_Y : Transverse acceleration at the centre of gravity of the hold or tank considered, in m/s^2, obtained by the formulae defined in **Ch 4, Sec 2, [3.2]**

a_Z : Vertical acceleration at the centre of gravity of the hold or tank considered, in m/s^2, obtained by the formulae defined in **Ch 4, Sec 2, [3.2]**

B_H : Mean breadth of the cargo hold, in m

b_{IB} : Breadth of inner bottom, in m, as defined on **Fig 2**

D_1 : Distance, in m, from the base line to the freeboard deck at side amidships

s_C : Spacing of corrugations, in m; see **Ch 3, Sec 6, Fig 28**

x, y, z : X, Y and Z co-ordinates, in m, of the load point with respect to the reference co-ordinate system defined in **Ch 1, Sec 4**. y is to be taken positive on the weather side

x_G, y_G, z_G: X, Y and Z co-ordinates, in m, of the centre of gravity of the hold or tank considered with respect to the reference co-ordinate system defined in **Ch 1, Sec 4**

d_{AP} : Distance from the top of air pipe to the top of compartment, in m, taken equal to:

$d_{AP} = z_{BO} - z_{TOP}$

1. Lateral pressure due to dry bulk cargo

1.1 Dry bulk cargo upper surface

1.1.1

When the dry bulk cargo density is such that the cargo hold is loaded to the top of hatch coaming, the upper surface of the dry bulk cargo is an equivalent horizontal surface to be determined in considering the same loaded cargo volume in the considered hold bounded by the side shell or inner hull, as the case may be.
For holds of cylindrical shape, the equivalent horizontal surface of the dry bulk cargo may be taken at a distance h_C, in m, above the inner bottom obtained from the following formula (see **Fig 1**):

$$h_C = h_{HPU} + h_0$$

where:

$$h_0 = \frac{S_A}{B_H}$$

$$S_A = S_0 + \frac{V_{HC}}{\ell_H}$$

h_{HPU} : Vertical distance, in m, between inner bottom and lower intersection of top side tank and side shell or inner side, as the case may be, as defined in **Fig 1**

S_0 : Shaded area, in m^2, above the lower intersection of top side tank and side shell or inner side, as the case may be, and up to the upper deck level, as defined in **Fig 1**

V_{HC} : Volume, in m^3, enclosed by the hatch coaming.

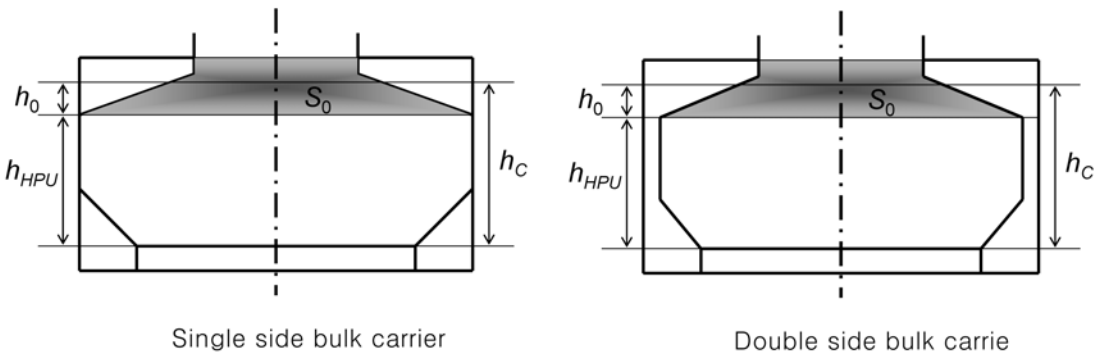

Fig 1: Definitions of h_C ,h_0, h_{HPU} and S_0

1.1.2

When the dry bulk cargo density is such that the cargo hold is not loaded up to the upper deck, the upper surface of the dry bulk cargo is considered as having a plane surface of width $B_H/2$ in the centreline and inclined parts with an angle equal to half the angle of repose ($\psi/2$) at sides, and is to be determined in considering the same loaded cargo volume in the considered hold, taken equal to M/ρ_C.
For holds of cylindrical shape, the upper surface of the dry bulk cargo may be taken at a distance h_C, in m, above the inner bottom obtained from the following formula (see **Fig 2**):

$$h_C = h_{HPL} + h_1 + h_2$$

where:

h_{HPL} : Vertical distance, in m, between inner bottom and upper intersection of hopper tank and inner side, as defined in **Fig 2**. h_{HPL} is to be taken equal to 0 if there is no hopper tank.

h_1 : Vertical distance, in m, obtained from the following formula, see **Fig 2**.

$$h_1 = \frac{M}{\rho_C \cdot B_H \ell_H} - \frac{B_H + b_{IB}}{2B_H} h_{HPL} - \frac{3}{16} B_H \tan\frac{\psi}{2} + \frac{V_{TS}}{B_H \ell_H}$$

M : Mass, in t, of the bulk cargo to be considered, as defined in **Ch 4 Sec 7**

V_{TS} : Total volume, in m^3, of transverse stools at bottom of transverse bulk heads within the concerned cargo hold length ℓ_H. This volume excludes the part of hopper tank passing through the transverse bulkhead.

h_2 : Bulk cargo upper surface, in m, depending on y, given by:

$$h_2 = \frac{B_H}{4}\tan\frac{\psi}{2}, \qquad \text{if } 0 \le |y| \le \frac{B_H}{4}$$

$$h_2 = \left(\frac{B_H}{2} - |y|\right)\tan\frac{\psi}{2}, \qquad \text{if } \frac{B_H}{4} \le |y| \le \frac{B_H}{2}$$

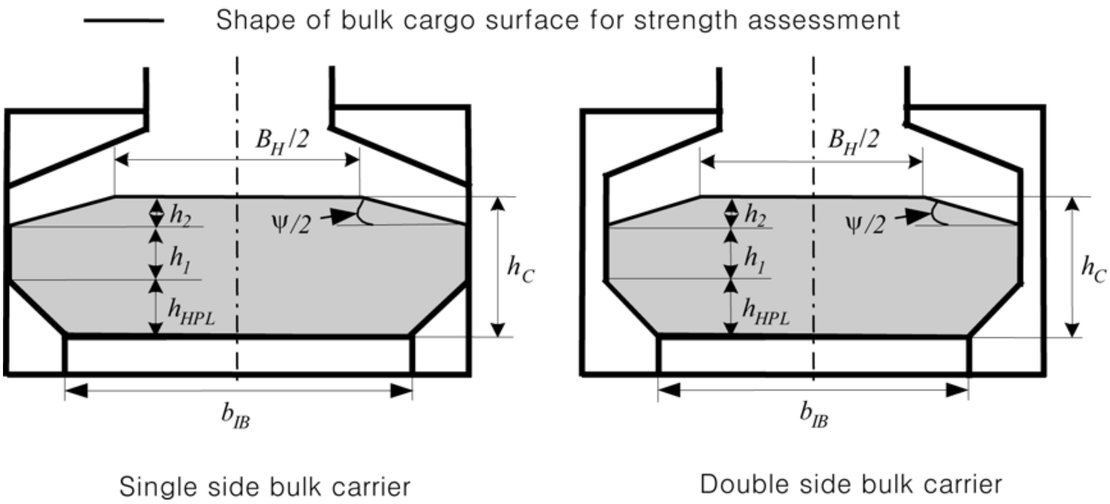

Fig 2: Definitions of h_C, h_1, h_2 and h_{HPL}

For holds of non-cylindrical shape, and in case of prescriptive rule requirements, the upper surface of the bulk cargo may be taken at the upper deck level with a density of dry bulk cargo equal to M/V_H.

1.2 Dry bulk cargo pressure in still water

1.2.1

The dry bulk cargo pressure in still water p_{CS}, in kN/m², is given by:

$$p_{CS} = \rho_C g K_C (h_C + h_{DB} - z)$$

1.3 Inertial pressure due to dry bulk cargo

1.3.1

The inertial pressure induced by dry bulk cargo p_{CW}, in kN/m², for each load case is given by the following formulae.

- for load case H: $p_{CW} = \rho_C [0.25 a_X (x - x_G) + K_C a_Z (h_C + h_{DB} - z)]$
- for load case F: $p_{CW} = 0$
- for load cases R and P: $p_{CW} = \rho_C [0.25 a_Y (y - y_G) + K_C a_Z (h_C + h_{DB} - z)]$

$(x\text{-}x_G)$ is to be taken as $0.25\,\ell_H$ in the load case H1 or $-0.25\,\ell_H$ in the load case H2 for local strength by **Ch 6** and fatigue check for longitudinal stiffeners by **Ch 8.**
The total pressure (p_{CS} + p_{CW}) is not to be negative.

1.4 Shear load due to dry bulk cargo

1.4.1

In order to evaluate the total force in the vertical direction, shear load due to dry bulk cargo acting along sloping plates in way of bilge hopper tank and lower stool is to be considered.
The shear load due to dry bulk cargo acting along the sloping members in still water $p_{CS\text{-}S}$ (positive down to inner bottom plating), in kN/m², is given by:

$$p_{CS-S} = \rho_C g \frac{(1 - K_C)(h_C + h_{DB} - z)}{\tan\alpha}$$

The shear load due to dry bulk cargo acting along the sloping members in waves $p_{CW\text{-}S}$ (positive down to inner bottom plating), in kN/m², is given by:

- for load cases H, R and P: $p_{CW-S} = \rho_C a_Z \dfrac{(1 - K_C)(h_C + h_{DB} - z)}{\tan\alpha}$
- for load case F: $p_{CW-S} = 0$

1.4.2

In order to evaluate the total force in the longitudinal and transverse directions, shear load due to dry bulk cargo in way of inner bottom plating is to be considered.
The shear load due to dry bulk cargo in the longitudinal direction in waves $p_{CW\text{-}S}$ (positive forward), in kN/m², is given by:

- for load case H: $p_{CW\text{-}S} = 0.75 \rho_C a_X h_C$
- for load cases F, R and P: $p_{CW\text{-}S} = 0$

The shear load due to dry bulk cargo in the transverse direction in waves $p_{CW\text{-}S}$ (positive weather side), in kN/m², is given by:

- for load cases R and P: $p_{CW\text{-}S} = 0.75 \rho_C a_Y h_C$
- for load cases H and F: $p_{CW\text{-}S} = 0$

2. Lateral pressure due to liquid

2.1 Pressure due to liquid in still water

2.1.1

The liquid pressure in still water p_{BS}, in kN/m^2, is given by the greater of the following values:

$$p_{BS} = \rho_L g(z_{TOP} - z + 0.5 d_{AP})$$

$$p_{BS} = \rho_L g(z_{TOP} - z) + 100 P_{PV}$$

where:

P_{PV} : Setting pressure, in bar, of safety valves to be considered if any

For local strength assessments, the static pressure p_{BS} is to be taken not less than 25 kN/m^2.

2.1.2

When checking ballast water exchange operations by means of the flow through method, the static pressure p_B for local strength assessments and direct strength analysis by **Ch 7** is to be not less than:

$$p_{BS} = \rho_L g(z_{TOP} - z + d_{AP}) + 25$$

Additional calculation may be required where piping or pumping arrangements may lead to a higher pressure.

2.1.3

For fatigue strength assessment, the liquid pressure in still water p_{BS}, in kN/m^2, is given by the following formula.

$$p_{BS} = \rho_L g(z_{TOP} - z)$$

If the p_{BS} is negative, p_{BS} is to be taken equal to 0.
Where the considered load point is located in the fuel oil, other oils or fresh water tanks, liquids are assumed to be fulfilled up to the half height of the tanks and z_{TOP} is taken to the Z coordinate of the liquid surface at the upright condition.

2.2 Inertial pressure due to liquid

2.2.1

The inertial pressure due to liquid p_{BW}, in kN/m^2, for each load case is given as follows. When checking ballast water exchange operations by means of the flow through method, the inertial pressure due to ballast water is not to be considered for local strength assessments and direct strength analysis.

- for load case H: $p_{BW} = r_L[a_Z(z_{TOP} - z) + a_X(x - x_B)]$

  $(x - x_B)$ is to be taken as $0.75\,\ell_H$ in the load case H1 or $-0.75\,\ell_H$ in the load case H2 for local strength by **Ch 6** and fatigue check for longitudinal stiffeners by **Ch 8**
- for load case F: $p_{BW} = 0$
- for load cases R and P: $p_{BW} = r_L[a_Z(z_B - z) + a_Y(y - y_B)]$

where:

x_B : X co-ordinate, in m, of the aft end of the tank when the bow side is downward, or of the fore end of the tank when the bow side is upward, as defined in **Fig 3**

y_B : Y co-ordinate, in m, of the tank top located at the most lee side when the weather side is downward, or of the most weather side when the weather side is upward, as defined in **Fig 3**

z_B : Z co-ordinate of the following point:

- for completely filled spaces: the tank top
- for ballast hold: the top of the hatch coaming

The reference point B is defined as the upper most point after rotation by the angle φ between the vertical axis and the global acceleration vector $\overrightarrow{A_G}$ shown in **Fig 3**. φ is obtained from the following formulae:

- load cases H1 and H2:

$$\varphi = \tan^{-1}\left(\frac{|a_X|}{g\cos\Phi + a_Z}\right)$$

- load cases R1(P1) and R2(P2):

$$\varphi = \tan^{-1}\left(\frac{|a_Y|}{g\cos\theta + a_Z}\right)$$

where:

θ : Single roll amplitude, in deg, defined in **Ch 4, Sec 2, [2.1.1]**

Φ : Single pitch amplitude, in deg, defined in **Ch 4, Sec 2, [2.2.1]**

The total pressure (p_{BS}+p_{BW}) is not to be negative.

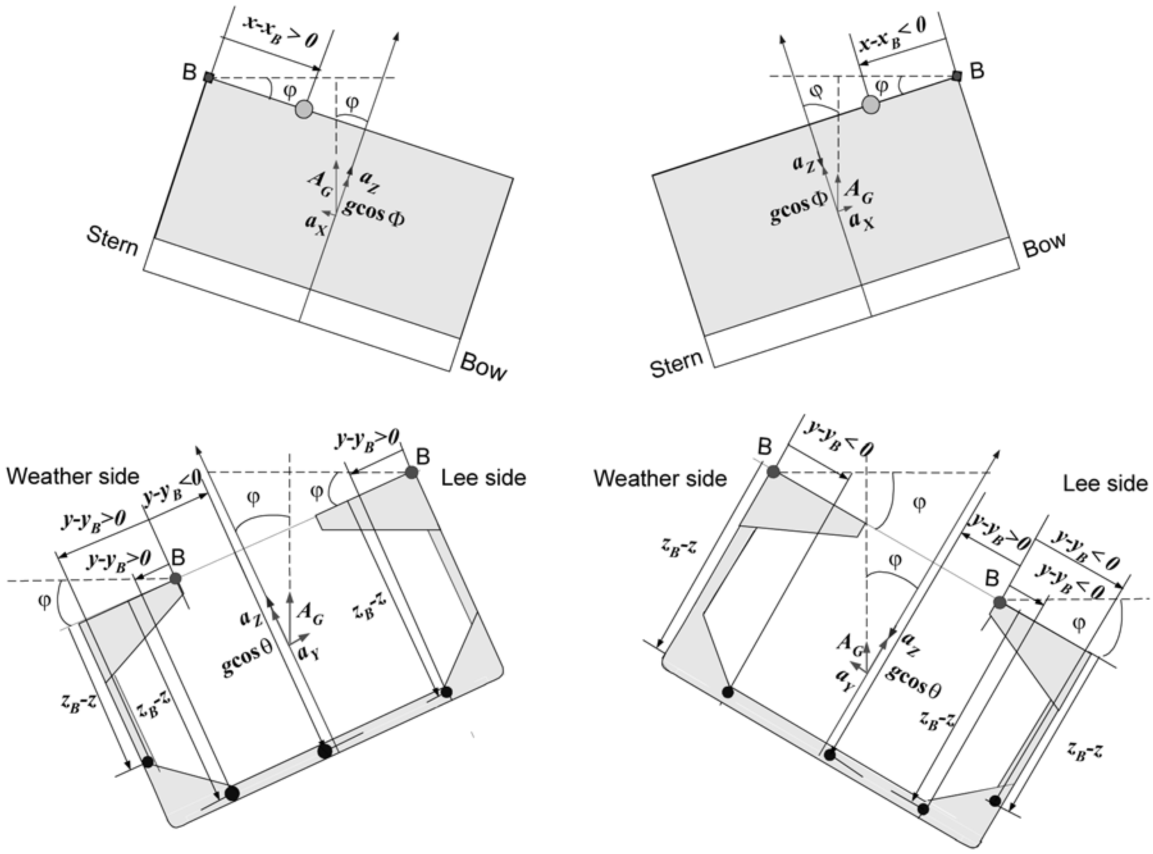

Fig 3: Definition of x_B and y_B

3. Lateral pressures and forces in flooded condition

3.1 Application

3.1.1

The lateral pressures to be considered in flooded condition are indicated in:

- **[3.2]** in general cases
- **[3.3]** for the particular case of transverse corrugated bulkheads
- **[3.4]** for the particular case of double bottom

3.2 General

3.2.1

The pressure p_F to be considered as acting on plating (excluding bottom and side shell plating) which constitute boundaries of compartments not intended to carry liquids is to be obtained, in $\mathrm{kN/m^2}$, from the following formula:

$$p_F = \rho g\left(1 + 0.6\frac{a_Z}{g}\right)(z_F - z)$$, without being less than gd_0

where:

z_F : Z co-ordinate, in m, of the freeboard deck at side in way of the transverse section considered. Where the results of damage stability calculations are available, the deepest equilibrium waterline may be considered in lieu of the freeboard deck; in this case, the Society may require transient conditions to be taken into account

d_0 : Distance, in m, to be taken equal to:

$d_0 = 0.02\,L$ for $90\text{ m} \le L < 120\text{ m}$

$d_0 = 2.4$ for $L \ge 120\text{ m}$

3.3 Transverse vertically corrugated watertight bulkheads

3.3.1 Application

Each cargo hold is to be considered individually flooded.

3.3.2 General

The loads to be considered as acting on each bulkhead are those given by the combination of those induced by cargo loads with those induced by the flooding of one hold adjacent to the bulkhead under examination. In any case, the pressure due to the flooding water alone is to be considered.
The most severe combinations of cargo induced loads and flooding loads are to be used for the check of the scantlings of each bulkhead, depending on the loading conditions included in the loading manual:

- homogeneous loading conditions
- non-homogeneous loading conditions,

considering the individual flooding of both loaded and empty holds.
For the purpose of this item, homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for each hold, does not exceed 1.20, to be corrected for different cargo densities.
Non-homogeneous part loading conditions associated with multiport loading and unloading operations for homogeneous loading conditions need not be considered according to these requirements.
The specified design load limits for the cargo holds are to be represented by loading conditions defined

by the Designer in the loading manual.
For the purpose of this item, holds carrying packed cargoes are to be considered as empty.
Unless the ship is intended to carry, in non-homogeneous conditions, only iron ore or cargo having bulk density equal to or greater than 1.78 t/m^3, the maximum mass of cargo which may be carried in the hold is also to be considered to fill that hold up to the upper deck level at centreline.

3.3.3 Flooding level

The flooding level z_F is the distance, in m, measured vertically from the base line with the ship in the upright position, and equal to:

- in general:
  - *D1* for the foremost transverse corrugated bulkhead
  - 0.9 *D1* for other bulkheads;

where the ship is to carry cargoes having bulk density less than 1.78 t/m^3 in non-homogeneous loading conditions, the following values may be assumed:
  - 0.95 *D1* for the foremost transverse corrugated bulkhead
  - 0.85 *D1* for other bulkheads
- for ships less than 50000 *t* deadweight with type B freeboard:
  - 0.95 *D1* for the foremost transverse corrugated bulkhead
  - 0.85 *D1* for other bulkheads;

where the ship is to carry cargoes having bulk density less than 1.78 t/m^3 in non-homogeneous loading conditions, the following values may be assumed:
  - 0.9 *D1* for the foremost transverse corrugated bulkhead
  - 0.8 *D1* for other bulkheads.

3.3.4 Pressures and forces on a corrugation in non-flooded bulk cargo loaded holds

At each point of the bulkhead, the pressure is to be obtained, in kN/m^2, from the following formula:

$$p_B = \rho_C g(h_C + h_{DB} - z)\tan^2\left(45 - \frac{\psi}{2}\right)$$

The force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F_B = \rho_C g s_C \frac{(h_C - h_{LS})^2}{2}\tan^2\left(45 - \frac{\psi}{2}\right)$$

3.3.5 Pressures and forces on a corrugation in flooded bulk cargo loaded holds

Two cases are to be considered, depending on the values of z_F and h_C (see **[3.3.3]** and **[1.1]**):

- First case, when $z_F \geq h_C + h_{DB}$

  At each point of the bulkhead located at a distance between z_F and $h_C + h_{DB}$ from the base line, the pressure, in kN/m^2, is to be obtained from the following formula:

$$p_{B,F} = \rho g(z_F - z)$$

  At each point of the bulkhead located at a distance lower than hC+hDB from the base line, the pressure, in kN/m^2, is to be obtained from the following formula:

$$p_{B,F} = \rho g(z_F - z) + [\rho_C - \rho(1 - perm)]g(h_C + h_{DB} - z)\tan^2\left(45 - \frac{\psi}{2}\right)$$

  where perm is the permeability of cargo, to be taken as 0.3 for iron ore, coal cargoes and cement.

The force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F_{B,F} = s_C\left[\rho g\frac{(z_F - h_C - h_{DB})^2}{2} + \frac{\rho g(z_F - h_C - h_{DB}) + (p_{B,F})_{LE}}{2}(h_C - h_{LS})\right]$$

where $(p_{B,F})_{LE}$ is the pressure $p_{B,F}$, in $\mathrm{kN/m^2}$, calculated at the lower edge of the corrugation.

- Second case, when $z_F < h_C + h_{DB}$

At each point of the bulkhead located at a distance between z_F and $h_C + h_{DB}$ from the base line, the pressure is to be obtained, in $\mathrm{kN/m^2}$, from the following formula:

$$p_{B,F} = \rho_C g(h_C + h_{DB} - z)\tan^2\left(45 - \frac{\psi}{2}\right)$$

At each point of the bulkhead located at a distance lower than z_F from the base line, the pressure is to be obtained, in $\mathrm{kN/m^2}$, from the following formula:

$$p_{B,F} = \rho g(z_F - z) + [\rho_C(h_C + h_{DB} - z) - \rho(1 - perm)(z_F - z)]g\tan^2\left(45 - \frac{\psi}{2}\right)$$

where perm is the permeability of cargo, to be taken as 0.3 for iron ore, coal cargoes and cement. The force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F_{B,F} = s_C\left[\rho_C g\frac{(h_C + h_{DB} - z_F)^2}{2}\tan^2\left(45 - \frac{\psi}{2}\right)\right] + s_C\left[\frac{\rho_C g(h_C + h_{DB} - z_F)\tan^2\left(45 - \frac{\psi}{2}\right) + (p_{B,F})_{LE}}{2}(z_F - h_{DB} - h_{LS})\right]$$

where $(p_{B,F})_{LE}$ is the pressure $p_{B,F}$, in $\mathrm{kN/m^2}$, calculated at the lower edge of the corrugation.

3.3.6 Pressures and forces on a corrugation in flooded empty holds

At each point of the bulkhead, the still water pressure induced by the flooding to be considered is to be obtained, in $\mathrm{kN/m^2}$, from the following formula:

$$p_F = \rho g(z_F - z)$$

The force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F_F = s_C \rho g\frac{(z_F - h_{DB} - h_{LS})^2}{2}$$

3.3.7 Resultant pressures and forces

Resultant pressures and forces to be calculated for homogeneous and non-homogeneous loading conditions are to be obtained according to the following formulae:

- Homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure to be considered for the scantlings of the bulkhead is to be obtained, in $\mathrm{kN/m^2}$, from the following formula:

$$p = p_{B,F} - 0.8p_B$$

The resultant force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F = F_{B,F} - 0.8F_B$$

where:

p_B : Pressure in the non-flooded holds, in kN/m^2, to be obtained as specified in **[3.3.4]**

$p_{B,F}$: Pressure in the flooded holds, in kN/m^2, to be obtained as specified in **[3.3.5]**

$F_{B,F}$: Force acting on a corrugation in the flooded holds, in kN, to be obtained as specified in **[3.3.5].**

F_B : Force acting on a corrugation in non-flooded holds, in kN, to be obtained as specified in **[3.3.4].**

- Non-homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure to be considered for the scantlings of the bulkhead is to be obtained, in kN/m^2, by the following formula:

$$p = p_{B,F}$$

The resultant force acting on a corrugation is to be obtained, in kN, by the following formula:

$$F = F_{B,F}$$

where:

$p_{B,F}$: Pressure in the flooded holds kN/m^2, to be obtained as specified in **[3.3.5]**

$F_{B,F}$: Force acting on a corrugation in the flooded holds kN/m^2, to be obtained as specified in **[3.3.5].**

3.4 Double bottom

3.4.1 Application

Each cargo hold is to be considered individually flooded.

3.4.2 General

The loads to be considered as acting on the double bottom are those given by the external sea pressures and the combination of the cargo loads with those induced by the flooding of the hold which the double bottom belongs to.
The most severe combinations of cargo induced loads and flooding loads are to be used, depending on the loading conditions included in the loading manual:

- homogeneous loading conditions
- non-homogeneous loading conditions
- packed cargo conditions (such as in the case of steel mill products).

For each loading condition, the maximum dry bulk cargo density to be carried is to be considered in calculating the allowable hold loading.

3.4.3 Flooding level

The flooding level z_F is the distance, in m, measured vertically from the base line with the ship in the upright position, and equal to:

- for ships less than 50000 t deadweight with type B freeboard:
- 0.95 D_1 for the foremost hold
- 0.85 D_1 for other holds;

- for other ships:
- D_1 for the foremost hold
- 0.9 D_1 for other holds;

4. Testing lateral pressure

4.1 Still water pressures

4.1.1

The total pressure to be considered as acting on plates and stiffeners subject to tank testing is obtained, in kN/m^2, from the following formula:

$$p_{ST} = 10(z_{ST} - z)$$

where:

z_{ST} : Testing load height, in m, as defined in **Table 2.**

Table 2: Testing load height

Compartment or structure to be tested	Testing load height, in m
Double bottom tanks	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_{ml}$
Hopper side tanks, topside tanks, double side tanks, fore and after peaks used as tank, cofferdams	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_{TOP} + 2.4$
Tank bulkheads, deep tanks, fuel oil bunkers	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_{TOP} + 2.4$ $z_{ST} = z_{TOP} + 10\,p_{PV}$
Ballast hold	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_h + 0.9$
Fore and aft peak not used as tank	The greater of the following: $z_{ST} = z_F$ $z_{ST} = z_{ml}$
Watertight doors below freeboard deck	$z_{ST} = z_{fd}$
Chain locker (if aft of collision bulkhead)	$z_{ST} = z_{TOP}$
Independent tanks	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_{TOP} + 0.9$
Ballast ducts	Testing load height corresponding to ballast pump maximum pressure

where:
z_{ml} : Z co-ordinate, in m, of the margin line.
z_h : Z co-ordinate, in m, of the top of hatch.
z_F : As defined in [3.2.1].
z_{fd} : Z co-ordinate, in m, of the freeboard deck.
p_{PV} : Setting pressure, in bar, of safety valves.

Section 7 - LOADING CONDITIONS

Symbols

M_H : The actual cargo mass in a cargo hold corresponding to a homogeneously loaded condition at maximum draught, in t

M_{Full} : The cargo mass in a cargo hold corresponding to cargo with virtual density (homogenous mass / hold cubic capacity, minimum 1.0 t/m^3) filled to the top of the hatch coaming, in t.

$$M_{Full} = V_{Full} \cdot \max(M_H / V_H, 1.0)$$

M_{Full} is in no case to be less than M_H

M_{HD} : The maximum cargo mass allowed to be carried in a cargo hold according to design loading condition(s) with specified holds empty at maximum draught, in t

V_{Full} : Volume, in m^3, of the cargo hold including the volume enclosed by the hatch coaming

V_H : Volume, in m^3, defined in **Ch4**, **Sec6**

T_{HB} : Deepest ballast draught, in m.

1. Application

1.1 Ships having a length *L* less than 150 m

1.1.1

The severest loading conditions from the loading manual, midship section drawing or otherwise specified by the Designer are to be considered for the longitudinal strength according to **Ch 5, Sec 1** and for the local strength check of plating, ordinary stiffeners and primary supporting members according to **Ch 6.**

1.2 Ships having a length *L* of 150 m and above

1.2.1

The requirements in **[2]** to **[4]** are applicable to ships having a length L of 150 m and above.

1.2.2

These requirements are not intended to prevent any other loading conditions to be included in the loading manual for which calculations are to be submitted. It is not intended to replace in any way the required loading manual/instrument.

1.2.3

The maximum loading condition draught is to be taken as the moulded summer load line draught.

1.2.4

The loading conditions listed in **[2]** are to be applied for the check of longitudinal strength as required by **Ch 5, Sec 1**, the check of local strength by **Ch 6**, the direct strength analysis by **Ch 7**, for capacity and disposition of ballast tanks and stability purposes. The loading conditions listed in **[3]** are to be applied for the check of local strength. The loading conditions listed in **[4]** are to be applied for direct strength analysis.

1.2.5

In operation, a bulk carrier may be loaded differently from the design loading conditions specified in the loading manual, provided longitudinal and local strength as defined in the loading manual and onboard loading instrument and applicable stability requirements are not exceeded.

2. General

2.1 Design loading conditions - General

2.1.1

For the determination of the maximum cargo mass in cargo holds, the condition corresponding to the ship being loaded at maximum draught with 50% of consumables is to be considered.

2.1.2 BC-C

Homogeneous cargo loaded condition where the cargo density corresponds to all cargo holds, including hatchways, being 100 % full at maximum draught with all ballast tanks empty.

2.1.3 BC-B

As required for BC-C, plus:
Homogeneous cargo loaded condition with cargo density 3.0 t/m^3, and the same filling ratio (cargo mass/hold cubic capacity) in all cargo holds at maximum draught with all ballast tanks empty.
In cases where the cargo density applied for this design loading condition is less than 3.0 t/m^3, the maximum density of the cargo that the ship is allowed to carry is to be indicated with the additional service feature **{maximum cargo density x.y** t/m^3**}.**

2.1.4 BC-A

As required for **BC-B**, plus:
At least one cargo loaded condition with specified holds empty, with cargo density 3.0 t/m^3, and the same filling ratio (cargo mass/hold cubic capacity) in all loaded cargo holds at maximum draught with all ballast tanks empty.
The combination of specified empty holds is to be indicated with the additional service feature **{holds a, b, ... may be empty}**.
In such cases where the design cargo density applied is less than 3.0 t/m^3, the maximum density of the cargo that the ship is allowed to carry is to be indicated within the additional service feature **{holds a, b, ... maybe empty with maximum cargo density x.y** t/m^3**}**.

2.2 Applicable ballast conditions

2.2.1 Ballast tank capacity and disposition

All bulk carriers are to have ballast tanks of sufficient capacity and so disposed to at least fulfill the following requirements.

Normal ballast condition
Normal ballast condition is a ballast (no cargo) condition where:

- the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in **Ch 4, Sec 3** are to be complied with
- any cargo hold or holds adapted for the carriage of water ballast at sea are to be empty
- the propeller is to be fully immersed, and
- the trim is to be by the stern and is not to exceed 0.015 L_{BP}.

In the assessment of the propeller immersion and trim, the draughts at the forward and after perpendiculars may be used.

Heavy ballast condition
Heavy ballast condition is a ballast (no cargo) condition where:

- the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in **Ch 4, Sec 3** are to be complied with
- at least one cargo hold adapted for carriage of water ballast at sea is to be full
- the propeller immersion *I/D* is to be at least 60 %, where:

  I = Distance from propeller centerline to the waterline

  D = Propeller diameter
- the trim is to be by the stern and is not to exceed 0.015 L_{BP}
- the moulded forward draught in the heavy ballast condition is not to be less than the smaller of 0.03 L_{BP} or 8 m.

2.2.2 Strength requirements

All bulk carriers are to meet the following strength requirements:

Normal ballast condition:

- the structures of bottom forward are to be strengthened in accordance with the Rules against slamming for the condition of **[2.2.1]** for normal ballast condition at the lightest forward draught,
- the longitudinal strength requirements according to **Ch 4, Sec 3** are to be met for the condition of **[2.2.1]** for normal ballast condition, and
- in addition, the longitudinal strength requirements according to **Ch 4, Sec 3** are to be met with all ballast tanks 100 % full.

Heavy ballast condition:

- the longitudinal strength requirements according to **Ch 4, Sec 3** are to be met for the condition of **[2.2.1]** for heavy ballast condition
- in addition, the longitudinal strength requirements according to **Ch 4, Sec 3** are to be met with all ballast tanks 100 % full and one cargo hold adapted and designated for the carriage of water ballast at sea, where provided, 100 % full, and
- where more than one hold is adapted and designated for the carriage of water ballast at sea, it will not be required that two or more holds be assumed 100 % full simultaneously in the longitudinal strength assessment, unless such conditions are expected in the heavy ballast condition. Unless each hold is individually investigated, the designated heavy ballast hold and any/all restrictions for the use of other ballast hold(s) are to be indicated in the loading manual.

2.3.1

Unless otherwise specified, each of the design loading conditions defined in **[2.1]** and **[2.2]** is to be investigated for the arrival and departure conditions as defined as follows:

- Departure condition : with bunker tanks not less than 95 % full and other consumables 100 %
- Arrival condition : with 10 % of consumables

3. Design loading conditions for local strength

3.1 Definitions

3.1.1

The maximum allowable or minimum required cargo mass in a cargo hold, or in two adjacently loaded holds, is related to the net load on the double bottom. The net load on the double bottom is a function of draft, cargo mass in the cargo hold, as well as the mass of fuel oil and ballast water contained in double bottom tanks.

3.2 Applicable general conditions

3.2.1

Any cargo hold is to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100 % full and ballast water tanks in the double bottom in way of the cargo hold being empty, at maximum draught.

3.2.2

Any cargo hold is to be capable of carrying minimum 50 % of M_H, with all double bottom tanks in way of the cargo hold being empty, at maximum draught.

3.2.3

Any cargo hold is to be capable of being empty, with all double bottom tanks in way of the cargo hold being empty, at the deepest ballast draught.

3.3 Additional conditions applicable except when additional service feature {no MP} is assigned

3.3.1

Any cargo hold is to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100 % full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67 % of maximum draught.

3.3.2

Any cargo hold is to be capable of being empty with all double bottom tanks in way of the cargo hold being empty, at 83 % of maximum draught.

3.3.3

Any two adjacent cargo holds are to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100 % full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67 % of the maximum draught. This requirement to the mass of cargo and fuel oil in double bottom tanks in way of the cargo hold applies also to the condition where the adjacent hold is filled with ballast, if applicable.

3.3.4

Any two adjacent cargo holds are to be capable of being empty, with all double bottom tanks in way of the cargo hold being empty, at 75 % of maximum draught.

3.4 Additional conditions applicable for BC-A only

3.4.1

Cargo holds, which are intended to be empty at maximum draught, are to be capable of being empty with all double bottom tanks in way of the cargo hold also being empty.

3.4.2

Cargo holds, which are intended to be loaded with high density cargo, are to be capable of carrying M_{HD} plus 10 % of M_H, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100 % full and ballast water tanks in the double bottom being empty in way of the cargo hold, at maximum draught.
In operation the maximum allowable cargo mass shall be limited to M_{HD}.

3.4.3

Any two adjacent cargo holds which according to a design loading condition may be loaded with the next holds being empty, are to be capable of carrying 10% of M_H in each hold in addition to the maximum cargo load according to that design loading condition, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100 % full and ballast water tanks in the double bottom in way of the cargo hold being empty, at maximum draught.
In operation the maximum allowable mass shall be limited to the maximum cargo load according to the design loading conditions.

3.5 Additional conditions applicable for ballast hold(s) only

3.5.1

Cargo holds, which are designed as ballast water holds, are to be capable of being 100 % full of ballast water including hatchways, with all double bottom tanks in way of the cargo hold being 100 % full, at any heavy ballast draught. For ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty.

3.6 Additional conditions applicable during loading and unloading in harbour only

3.6.1

Any single cargo hold is to be capable of holding the maximum allowable seagoing mass at 67 % of maximum draught, in harbour condition.

3.6.2

Any two adjacent cargo holds are to be capable of carrying M_{Full}, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100 % full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67 % of maximum draught, in harbour condition.

3.6.3

At reduced draught during loading and unloading in harbour, the maximum allowable mass in a cargo hold may be increased by 15 % of the maximum mass allowed at the maximum draught in sea-going condition, but shall not exceed the mass allowed at maximum draught in the sea-going condition. The minimum required mass may be reduced by the same amount.

3.7 Hold mass curves

3.7.1

Based on the design loading criteria for local strength, as given in **[3.2]** to **[3.6]** except **[3.5.1]**, hold mass curves are to be included in the loading manual and the loading instrument, showing maximum allowable and minimum required mass as a function of draught in sea-going condition as well as during loading and unloading in harbour. Hold mass curves are to be calculated according to **Ch 4, App 1.**

3.7.2

At other draughts than those specified in the design loading conditions, the maximum allowable and minimum required mass is to be adjusted for the change in buoyancy acting on the bottom. Change in buoyancy is to be calculated using water plane area at each draught.
Hold mass curves for each single hold, as well as for any two adjacent holds, are to be included in the loading manual and the loading instrument.

4. Design loading conditions for direct strength analysis

4.1 Loading patterns

4.1.1

The loading patterns applicable to types of bulk carriers with various service feature notations are summarized in **Table 1,** which are to be considered in direct strength analysis in accordance with **[2]** and **[3].**

Table 1: Applicable loading patterns according to additional service features

No.	Loading pattern	Ref.	BC-			BC-,(no MP)		
			A	B	C	A	B	C
1	Full load in homogeneous condition	**3.2.1**	x	x	x	x	x	x
2	Slack load	**3.2.2**	x	x	x	x	x	x
3	Deepest ballast	**3.2.3**	x	x	x	x	x	x
4	Multiport -1	**3.3.1**	x	x	x			
5	Multiport -2	**3.3.2**	x	x	x			
6	Multiport -3	**3.3.3**	x	x	x			
7	Multiport -4	**3.3.4**	x	x	x			
8	Alternate load	**3.4.1** & **.2**	x			x		
9	Alternate block load	**3.4.3**	x			x		
10	Heavy ballast	**3.5.1**	x	x	x	x	x	x
11	Harbour condition -1	**3.6.1**				x	x	x
12	Harbour condition -2	**3.6.2**				x	x	x

4.1.2

Other loading conditions from the loading manual, which are not covered in **Table 1**, if any, are also to be considered.

4.2 Still water bending moment and shear force

4.2.1

Load cases defined in **Sec 4** are to be considered for each loading pattern given in **Table 1.** The still water vertical bending moment provided in **Table 2** and the still water vertical shear force provided in **Table 3** are to be used for each combination of loading pattern and load case.

4.2.2

If one loading condition in the loading manual has a still water vertical bending moment more severe than the value in **Table 2** for the corresponding loading pattern, the value in **Table 2** for this loading pattern is to be replaced with the value from the loading manual.

4.3 Application

4.3.1

The minimum required loading conditions for direct strength analysis, including vertical shear force analysis, are defined in **Ch 4, App 2.**

4.3.2

The standard loading conditions for fatigue assessment are defined in **Ch 4, App 3.**

Table 2: Vertical still water bending moment

Section 8 - LOADING MANUAL AND LOADING INSTRUMENT

1. General

1.1 All ships

1.1.1

An approved loading manual is to be supplied on board for all ships.
In addition, an approved loading instrument is to be supplied for all ships.
The loading instrument is ship specific onboard equipment and the results of the calculations are only applicable to the ship for which it has been approved.
An approved loading instrument may not replace an approved loading manual.

1.2 Ships equal to or greater than 150 m in length *L*

1.2.1

BC-A, BC-B, and BC-C ships are to be provided with an approved loading manual and an approved computer-based loading instrument, in accordance with the applicable requirements of this Section.
A guidance for loading and unloading sequences is given in **[5].**

2. Loading manual

2.1 Definitions

2.1.1 All ships

A loading manual is a document which describes:

- the loading conditions on which the design of the ship has been based, including permissible limits of still water bending moment and shear force. The conditions specified in the ballast water exchanging procedure and dry docking procedure are to be included in the loading manual.
- the results of the calculations of still water bending moments and shear forces
- the allowable local loading for the structure (hatch covers, decks, double bottom, etc.).

2.1.2 Ships equal to or greater than 150 m in length *L*

In addition to **[2.1.1]**, for BC-A, BC- and BC-C ships, the loading manual is also to describe:

- envelope results and permissible limits of still water bending moments and shear forces in the hold flooded condition according to **Ch 5, Sec 1**
- the cargo hold(s) or combination of cargo holds that might be empty at full draught. If no cargo hold is allowed to be empty at full draught, this is to be clearly stated in the loading manual
- maximum allowable and minimum required mass of cargo and double bottom contents of each hold as a function of the draught at mid-hold position
- maximum allowable and minimum required mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds. This mean draught may be calculated by averaging the draught of the two mid-hold positions
- maximum allowable tank top loading together with specification of the nature of the cargo for cargoes other than bulk cargoes
- maximum allowable load on deck and hatch covers. If the ship is not approved to carry load on deck or hatch covers, this is to be clearly stated in the loading manual
- maximum rate of ballast change together with the advice that a load plan is to be agreed with the terminal on the basis of the achievable rates of change of ballast.

2.2 Conditions of approval

2.2.1 All ships

The approved loading manual is to be based on the final data of the ship. The manual is to include the design (cargo and ballast) loading conditions, subdivided into departure and arrival conditions as appropriate, upon which the approval of the hull scantlings is based.
In the case of modifications resulting in changes to the main data of the ship, a new approved loading manual is to be issued.

2.2.2 Ships equal to or greater than 150 m in length *L*

In addition to **[2.2.1]**, for BC-A, BC-B and BC-C ships, the following loading conditions, subdivided into departure and arrival conditions as appropriate, are also to be included in the loading manual:

- homogeneous light and heavy cargo loading conditions at maximum draught
- alternate light and heavy cargo loading conditions at maximum draught, where applicable
- ballast conditions. For ships having ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty
- short voyage conditions where the ship is to be loaded to maximum draught but with limited amount of bunkers
- multiple port loading / unloading conditions
- deck cargo conditions, where applicable
- typical loading sequences where the ship is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, relevant part load conditions and alternate conditions where applicable. Typical unloading sequences for these conditions are also to be included. The typical loading / unloading sequences are also to be developed to not exceed applicable strength limitations. The typical loading sequences are also to be developed paying due attention to loading rate and the deballasting capability. **Table 1** contains, as guidance only, an example of a Loading Sequence Summary Form
- typical sequences for change of ballast at sea, where applicable.

2.3 Language

2.3.1

The loading manual is to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

3. Loading instrument

3.1 Definitions

3.1.1 All ships

A loading instrument is an instrument which is either analog or digital and by means of which it can be easily and quickly ascertained that, at specified read-out points, the still water bending moments, shear forces, in any load or ballast condition, do not exceed the specified permissible values.

3.1.2 Ships equal to or greater than 150 m in length *L*

For BC-A, BC-B and BC-C ships, the loading instrument is an approved digital system as defined in **[3.1.1]**. In addition to **[3.1.1]**, it is also to ascertain as applicable that:

- the mass of cargo and double bottom contents in way of each hold as a function of the draught at mid-hold position
- the mass of cargo and double bottom contents of any two adjacent holds as a function of the mean

draught in way of these holds
- the still water bending moment and shear forces in the hold flooded conditions do not exceed the specified permissible values.

3.2 Conditions of approval

3.2.1 All ships

The loading instrument is subject to approval, which is to include:
- verification of type approval, if any
- verification that the final data of the ship have been used
- acceptance of number and position of all read-out points
- acceptance of relevant limits for read-out points
- checking of proper installation and operation of the instrument on board, under agreed test conditions, and that a copy of the operation manual is available.

3.2.2 Ships equal to or greater than 150 m in length *L*

In addition, for BC-A, BC-B and BC-C ships, the approval is also to include, asapplicable:
- acceptance of hull girder bending moment limits for all read-out points
- acceptance of hull girder shear force limits for all read-out points
- acceptance of limits for the mass of cargo and double bottom contents of each hold as a function of draught
- acceptance of limits for the mass of cargo and double bottom contents in any two adjacent holds as a function of draught.

3.2.3

In the case of modifications implying changes in the main data of the ship, the loading instrument is to be modified accordingly and approved.

3.2.4

An operational manual is always to be provided for the loading instrument.
The operation manual and the instrument output are to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

3.2.5

The operation of the loading instrument is to be verified upon installation under the agreed test conditions. It is to be checked that the agreed test conditions and the operation manual for the instrument are available on board.

4. Annual and class renewal survey

4.1 General

4.1.1

At each annual and class renewal survey, it is to be checked that the approved loading manual is available on board.

4.1.2

The loading instrument is to be checked for accuracy at regular intervals by the ship's Master by applying test loading conditions.

4.1.3

At each class renewal survey this checking is to be done in the presence of the Surveyor.

5. Guidance for loading/unloading sequences

5.1 General

5.1.1

The typical loading/unloading sequences shall be developed paying due attention to the loading/unloading rate, the ballasting/deballasting capacity and the applicable strength limitations.

5.1.2

The shipbuilder will be required to prepare and submit for approval typical loading and unloading sequences.

5.1.3

The typical loading sequences as relevant should include:

- alternate light and heavy cargo load condition
- homogeneous light and heavy cargo load condition
- short voyage condition where the ship is loaded to maximum draught but with limited bunkers
- multiple port loading/unloading condition
- deck cargo condition
- block loading.

5.1.4

The loading/unloading sequences may be port specific or typical.

5.1.5

The sequence is to be built up step by step from commencement of cargo loading to reaching full dead-weight capacity. Each time the loading equipment changes position to a new hold defines a step. Each step is to be documented and submitted to the Society. In addition to longitudinal strength, the local strength of each hold is to be considered.

5.1.6

For each loading condition a summary of all steps is to be included. This summary is to highlight the essential information for each step such as:

- how much cargo is filled in each hold during the different steps,
- how much ballast is discharged from each ballast tank during the different steps,
- the maximum still water bending moment and shear at the end of each step,
- the ship’s trim and draught at the end of each step.

Appendix 1 - HOLD MASS CURVES

Symbols

h : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline, in m.

h_a : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline of the aft cargo hold in a block loading, in m.

h_f : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline of the fore cargo hold in a block loading, in m.

M_H : As defined in **Ch 4, Sec 7**

M_{Full} : As defined in **Ch 4, Sec 7**

M_{HD} : As defined in **Ch 4, Sec 7**

M_D : The maximum cargo mass given for each cargo hold, in t

M_{BLK} : The maximum cargo mass in a cargo hold according to the block loading condition in the loading manual, in t

T_{HB} : As defined in **Ch 4, Sec 7**

T_i : Draught in loading condition No. i, at mid-hold position of cargo hold length ℓ_H, in m

V_H : As defined in **Ch 4, Sec 6**

V_f and V_a: Volume of the forward and after cargo hold excluding volume of the hatchway part, in m^3

$T_{\min}$: 0.75 T_S or draught in ballast conditions with the two adjacent cargo holds empty, which ever is greater, in m.

Σ : The sum of masses of two adjacent cargo holds

1. General

1.1 Application

1.1.1

The requirements of this Appendix apply to ships of 150 m in length L and above.

1.1.2

This Appendix describes the procedure to be used for determination of:

- the maximum and minimum mass of cargo in each cargo hold as a function of the draught at mid-hold position of cargo hold
- the maximum and minimum mass of cargo in any two adjacent holds as a function of the mean draught in way of these holds.

1.1.3

Results of these calculations are to be included in the reviewed loading manual which has also to indicate the maximum permissible mass of cargo at scantling draught in each hold or in any two adjacent holds, as obtained from the design review.

1.1.4

The following notice on referring to the maximum permissible and the minimum required mass of cargo is to be described in loading manual.

Where ship engages in a service to carry such hot coils or heavy cargoes that have some adverse effect on the local strength of the double bottom and that the loading is not described as cargo in loading manual, the maximum permissible and the minimum required mass of cargo are to be considered specially.

2. Maximum and minimum masses of cargo in each hold

2.1 Maximum permissible mass and minimum required masses of single cargo hold in seagoing condition

2.1.1 General

The cargo mass curves of single cargo hold in seagoing condition are defined in **[2.1.2]** to **[2.1.5].** However if the ship structure is checked for more severe loading conditions than the ones considered in **Ch 4, Sec 7, [3.7.1],** the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

2.1.2 BC-A ship not having {No MP} assigned

- For loaded holds

  The maximum permissible mass ($W_{max}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{max}(T_i) = M_{HD} + 0.1M_H - 1.025V_H \frac{(T_S - T_i)}{h}$$

  However, $W_{max}(T_i)$ is no case to be greater than M_{HD}.

  The minimum required cargo mass ($W_{min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{min}(T_i) = 0 \qquad \text{for } T_i \le 0.83T_S$$

$$W_{min}(T_i) = 1.025V_H \frac{(T_i - 0.83T_S)}{h} \qquad \text{for } T_S \ge T_i > 0.83T_S$$

- For empty holds which can be empty at the maximum draught

  The maximum permissible mass ($W_{min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{max}(T_i) = M_{Full} \qquad \text{for } T_S \ge T_i \ge 0.67T_S$$

$$W_{max}(T_i) = M_{Full} - 1.025V_H \frac{(0.67T_S - T_i)}{h} \qquad \text{for } T_i < 0.67T_S$$

  The minimum required mass ($W_{min}(T_i)$) is obtained, in t, by the following formula:

$$W_{min}(T_i) = 0 \qquad \text{for } T_i \le T_S$$

Examples for mass curve of loaded cargo hold and cargo hold which can be empty at the maximum draught for BC-A ships not having {No MP} assigned are shown in **Fig 1.**

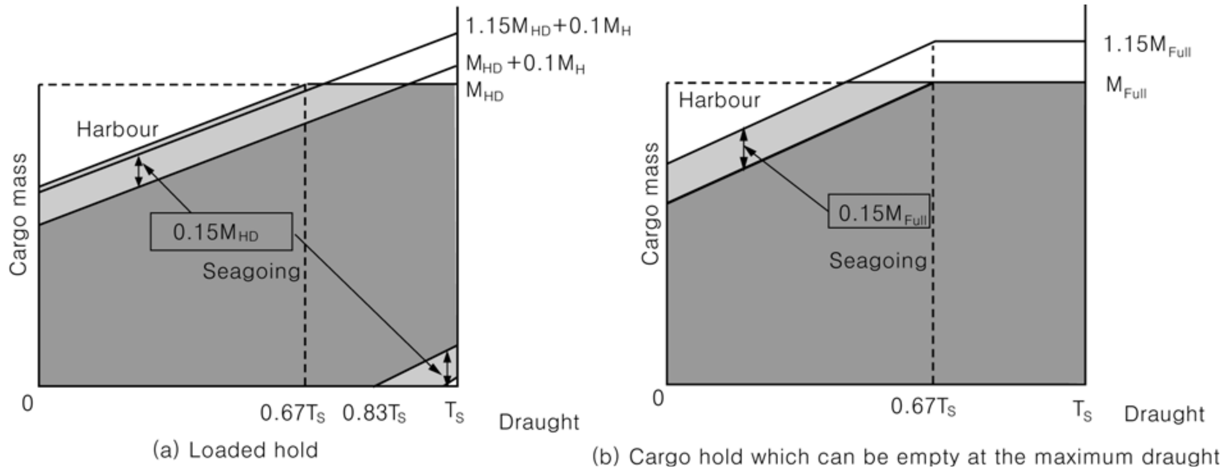

Fig 1: Example of mass curve for BC-A ships not having {No MP} assigned

2.1.3 BC-A ship having {No MP} assigned

- For loaded holds

  The maximum permissible mass ($W_{max}(T_i)$) at various draughts (T_i) is the same specified in **[2.1.2].** The minimum required mass ($W_{min}(T_i)$) is obtained, in t, by the following formulae:

$$W_{min}(T_i) = 0 \quad \text{for} \quad T_i \le T_{HB}$$

$$W_{min}(T_i) = 1.025 V_H \frac{(T_i - T_{HB})}{h} \quad \text{for} \quad T_S \ge T_i > T_{HB} \quad \text{or}$$

$$W_{min}(T_i) = 0.5 M_H - 1.025 V_H \frac{(T_S - T_i)}{h} \ge 0 \quad \text{for} \quad T_S \ge T_i$$

- For empty hold which can be empty at the maximum draught

  The maximum permissible mass ($W_{max}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{max}(T_i) = M_{Full} - 1.025 V_H \frac{(T_S - T_i)}{h}$$

  The minimum required cargo mass ($W_{min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{min}(T_i) = 0 \quad \text{for} \quad T_i \le T_S$$

  Examples for mass curve of cargo hold for BC-A ships, having {No MP} assigned are shown in **Fig 2.**

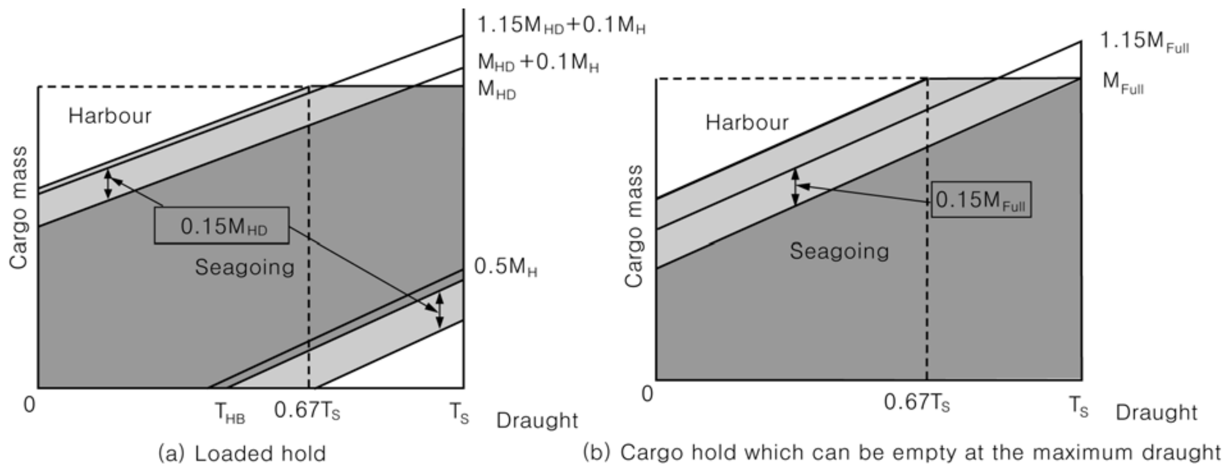

Fig 2: Example of mass curve for BC-A ships having {No MP} assigned

2.1.4 BC-B and BC-C ships not having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{max}(T_i) = M_{Full} \qquad \text{for } T_S \geq T_i \geq 0.67T_S$$

$$W_{max}(T_i) = M_{Full} - 1.025V_H \frac{(0.67T_S - T_i)}{h} \qquad \text{for } T_i < 0.67T_S$$

The minimum required cargo mass ($W_{min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{min}(T_i) = 0 \qquad \text{for } T_i \leq 0.83T_S$$

$$W_{min}(T_i) = 1.025V_H \frac{(T_i - 0.83T_S)}{h} \qquad \text{for } T_S \geq T_i > 0.83T_S$$

Example for mass curve of cargo hold for BC-B and BC-C ships is shown in **Fig 3.**

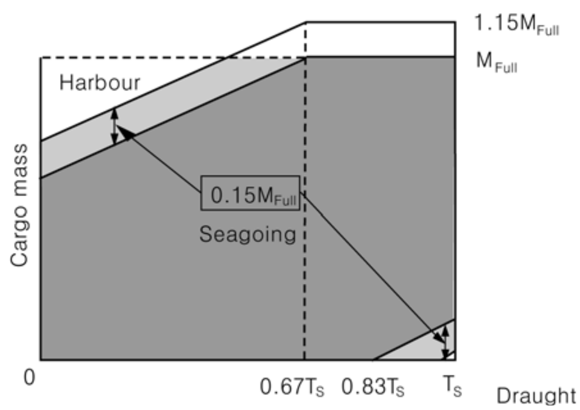

Fig 3: Example of mass curve for BC-B and BC-C ships not having {No MP} assigned

2.1.5 BC-B and BC-C ships having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts T_i is obtained, in t, by the following formulae:

$$W_{\max}(T_i) = M_{Full} - 1.025V_H \frac{(T_S - T_i)}{h}$$

The minimum required cargo mass ($W_{\min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$W_{\min}(T_i) = 0$ for $T_i \le T_{HB}$

$W_{\min}(T_i) = 1.025V_H \dfrac{(T_i - T_{HB})}{h}$ for $T_S \ge T_i > T_{HB}$ or

$W_{\min}(T_i) = 0.5M_H - 1.025V_H \dfrac{(T_S - T_i)}{h}$ for $T_S \ge T_i$

$W_{\min}(T_i) \ge 0.0$

Example for mass curve of cargo hold for BC-B or BC-C ships with {No MP} is shown in **Fig 4.**

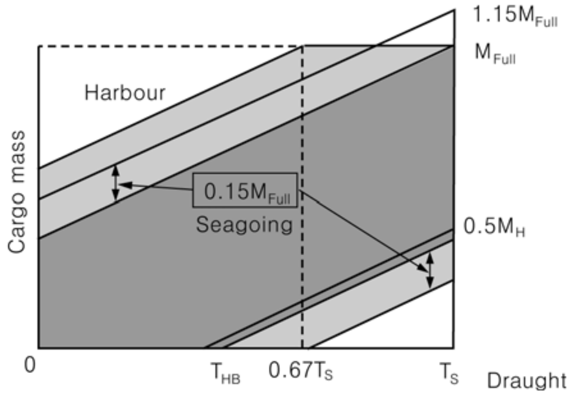

Fig 4: Example of mass curve for BC-B and BC-C ships having {No MP} assigned

2.2 Maximum permissible mass and minimum required masses of single cargo hold in harbour condition

2.2.1 General

The cargo mass curves of single cargo hold in harbour condition are defined in **[2.2.2]**. However if the ship structure is checked for more severe loading conditions than ones considered in **Ch 4, Sec 7, [3.7.1],** the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

2.2.2 All ships

The maximum permissible cargo mass and the minimum required cargo mass corresponding to draught for loading/unloading conditions in harbour may be increased or decreased by 15 % of the maximum permissible mass at the maximum draught for the cargo hold in seagoing condition. However, maximum permissible mass is in no case to be greater than the maximum permissible cargo mass at designed maximum load draught for each cargo hold.

2.2.3 BC-A ship not having {No MP} assigned

The maximum permissible mass ($W_{\max}(T_i)$) at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in **[2.1.2]**:

For loaded hold

$W_{max}(T_i) = M_{HD}$ for $T_i \geq 0.67T_S$

$W_{max}(T_i) = M_{HD} + 0.1M_H - 1.025V_H \dfrac{0.67T_S - T_i}{h}$ for $T_i < 0.67T_S$

2.2.4 BC-A ship having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in **[2.1.3]**:

For empty hold which can be empty at the maximum draught

$W_{max}(T_i) = M_{Full}$ for $T_S \geq T_i \geq 0.67T_S$

$W_{max}(T_i) = M_{Full} - 1.025V_H \dfrac{(0.67T_S - T_i)}{h}$ for $T_i < 0.67T_S$

2.2.5 BC-B and BC-C ships having {No MP} assigned

The maximum permissible mass $W_{max}(T_i)$ at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in **[2.2.2]**:

$W_{max}(T_i) = M_{Full}$ for $T_S \geq T_i \geq 0.67T_S$

$W_{max}(T_i) = M_{Full} - 1.025V_H \dfrac{(0.67T_S - T_i)}{h}$ for $T_i < 0.67T_S$

3. Maximum and minimum masses of cargo of two adjacent holds

3.1 Maximum permissible mass and minimum required masses of two adjacent holds in seagoing condition

3.1.1 General

The cargo mass curves of two adjacent cargo holds in seagoing condition are defined in **[3.1.2]** and **[3.1.3]**. However if the ship structure is checked for more severe loading conditions than ones considered in **Ch 4, Sec 7, [3.7.1],** the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

3.1.2 BC-A ships with "Block loading" and not having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts (T_i) is obtained, in t, by the greater of the following formulae:

$$W_{max}(T_i) = \sum(M_{BLK} + 0.1M_H) - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_s - T_i)$$

or

$$W_{max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(0.67T_s - T_i)$$

However, $W_{max}(T_i)$ is no case to be greater than ΣM_{BLK}.

The minimum required cargo mass ($W_{min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$W_{min}(T_i) = 0$ for $T_i \leq 0.75T_S$

$$W_{min}(T_i) = 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_i - 0.75T_S) \quad \text{for} \quad T_S \geq T_i > 0.75T_S$$

3.1.2 bis BC-A ships with "Block loading" and having {No MP} assigned

The maximum permissible mass $W_{max}(T_i)$ at various draughts T_i is obtained, in t, by the following formula:

$$W_{max}(T_i) = \sum(M_{BLK} + 0.1M_H) - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_s - T_i)$$

However, $W_{max}(T_i)$ is no case to be greater than M_{BLK}.

The minimum required cargo mass $W_{min}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{min}(T_i) = 0 \quad \text{for} \quad T_i \leq T_{HB}$$

$$W_{min}(T_i) = 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_i - T_{HB}) \quad \text{for} \quad T_S \geq T_i > T_{HB}$$

Examples for mass curve of cargo hold for BC-A with block loading ships are shown in **Fig 5**.

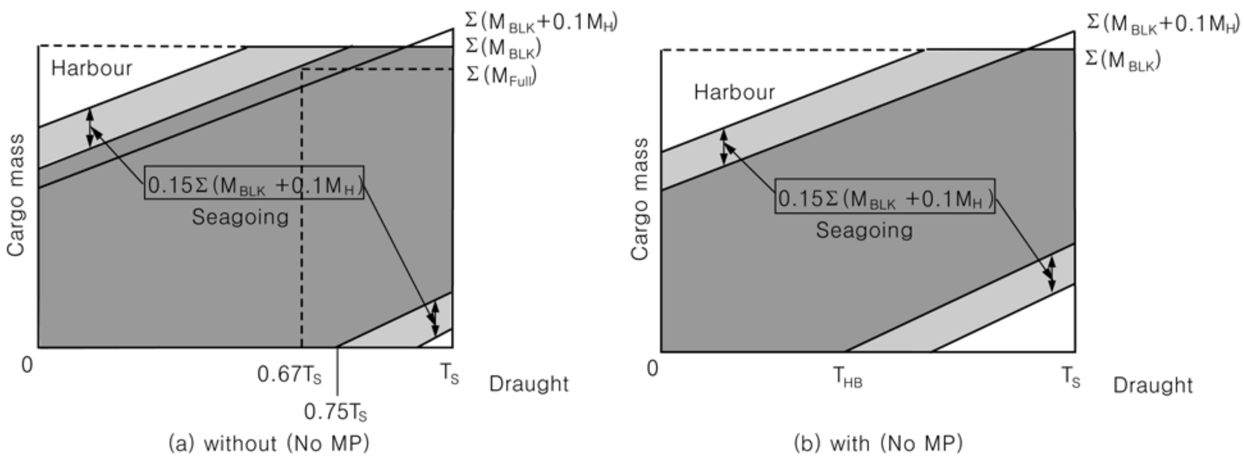

Fig 5: Example of mass curve for BC-A ships with "Block loading"

3.1.3 (void)

3.1.4 BC-A ships without "Block loading" and BC-B, BC-C ships, not having {No MP} assigned

The maximum permissible mass $W_{max}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{max}(T_i) = \sum M_{Full} \quad \text{for} \quad T_S \geq T_i \geq 0.67T_S$$

$$W_{max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(0.67T_S - T_i) \quad \text{for} \quad T_i < 0.67T_S$$

The minimum required cargo mass $W_{min}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{min}(T_i) = 0 \quad \text{for} \quad T_i \le 0.75T_S$$

$$W_{min}(T_i) = 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_i - 0.75T_S) \quad \text{for} \quad T_S \ge T_i > 0.75T_S$$

3.1.5 BC-A ships without "Block loading" and BC-B, BC-C ships, having {No MP} assigned

The maximum permissible mass $W_{max}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_S - T_i) \quad \text{for} \quad T_i < T_S$$

The minimum required cargo mass $W_{min}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{min}(T_i) = 0 \quad \text{for} \quad T_i \le T_{HB}$$

$$W_{min}(T_i) = 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_i - T_{HB}) \quad \text{for} \quad T_S \ge T_i > T_{HB}$$

Examples for mass curve of cargo hold for BC-A without block loading and BC-B or BC-C are shown in **Fig 6.**

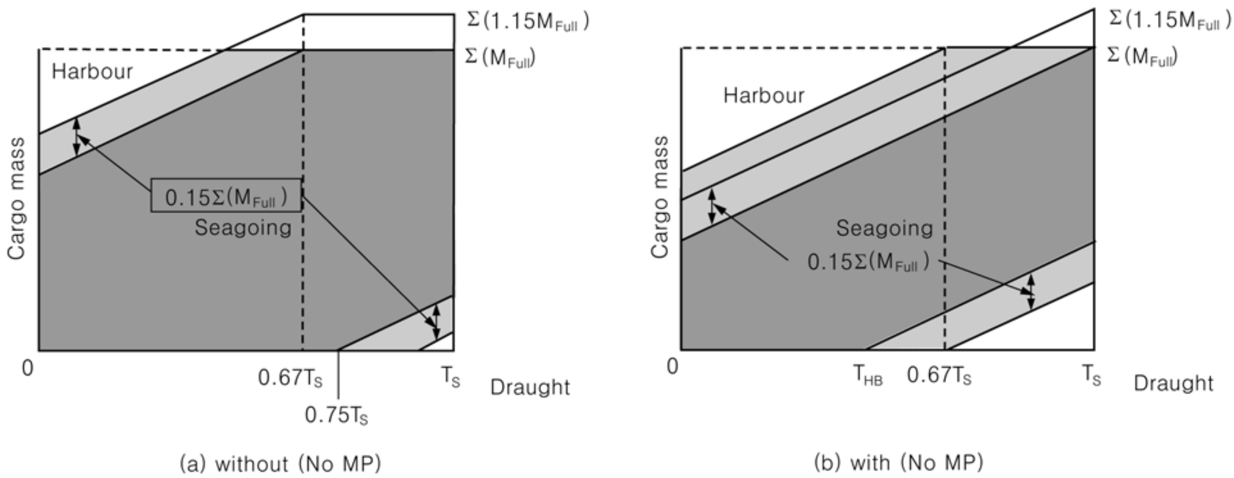

Fig 6: Example of mass curve for BC A-ship without block loading and BC-B or BC-C ships

3.2 Maximum permissible mass and minimum required masses of two adjacent cargo holds in harbour condition

3.2.1 General

The cargo mass curves of two adjacent cargo holds in harbour condition are defined in **[3.2.2]**. However if the ship structure is checked for more severe loading conditions than ones considered in **Ch 4, Sec 7, [3.7.1],** the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

3.2.2 All ships

The maximum permissible cargo mass and minimum required cargo mass corresponding to draught for loading/unloading conditions in harbour may be increased or decreased by 15 % of the maximum permissible mass at the maximum draught for the cargo hold in seagoing condition. However, maximum permissible mass is in no case to be greater than the maximum permissible cargo mass at designed maximum load draught for each cargo hold.

3.2.3 BC-A ships with “Block loading” and having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in **[3.1.2 bis]**:

$$W_{max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(0.67T_S - T_i)$$

$$W_{max}(T_i) \le \sum M_{BLK}$$

3.2.4 BC-A ships without “Block loading” and BC-B, BC-C ships, having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in **[3.1.5]:**

$$W_{max}(T_i) = \sum M_{Full} \qquad \text{for} \quad T_S \ge T_i \ge 0.67T_S$$

$$W_{max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(0.67T_S - T_i) \qquad \text{for} \quad T_i < 0.67T_S$$

Appendix 2 - Standard Loading Condition for Direct Strength Analysis

Table 1: Bending moment analysis applicable to empty hold in alternate condition of BC-A (mid-hold is empty hold)

No.	Description[a]	Draught	Loading Pattern	Aft	Mid	Fore	Load Case (Design Wave) / Still water vertical bending moment[b]				Remarks (see below)

No.	Description[a)]	Draught	Loading Pattern	Aft	Mid	Fore	Load Case (Design Wave)				Remarks (see below)
							Still water vertical bending moment[b)]				
16	Harbour Condition-2 ([3.6.2])	0.67 T_S					---	---			3), 14), 15)
							$M_{SW,P,H}$	$M_{SW,P,S}$			

a) Referred paragraph number corresponds to loading pattern prescribed in **Ch 4, Sec 7.**
b) $M_{SW,H}$, $M_{SW,S}$: Allowable still water vertical bending moment for seagoing condition, hogging or sagging respectively
$M_{SW,P,H}$, $M_{SW,P,S}$: Allowable still water vertical bending moment for harbour condition, hogging or sagging respectively

Remarks

1) Single loading pattern in M_{Full} with cargo density of 3.0 t/m^3 can be analyzed in lieu of these two loading patterns.
2) Cargo density 3.0 t/m^3 is to be used for calculation of dry cargo pressure in principle.
3) M_H/V_H or 1.0 t/m^3, whichever is greater, is to be used as cargo density for calculation of dry cargo pressure.
4) In case of no ballast hold, normal ballast condition with assuming $M_{SW,S} = 0$ is to be analyzed.
5) Position of ballast hold is to be adjusted as appropriate.
6) This condition is not required when {no MP} notation is assigned.
7) For vertical shear force analysis, maximum shear force ($Q_{SW} + Q_{WV}$) with reduced vertical bending moment (0.8 M_{SW} + 0.65 $C_{WV}M_{WV}$) is to be considered.
8) This condition is only required when such a condition is prepared in the loading manual.
9) "M_{BLK}" is maximum cargo mass according to the design loading condition in the loading manual.
10) Actual still water vertical bending moment, as given in the loading manual, may be used in stead of design value.
11) This condition is to be considered for the empty hold which is assigned as ballast hold if any.
12) Minimum draught among heavy ballast conditions is to be used in principle.
13) This condition is not required when such a condition is explicitly prohibited in the loading manual.
14) This condition is to be analyzed when {noMP} notation is assigned.
15) External sea pressures and internal pressures can be considered as static.

b) $M_{S(1)}$, $M_{S(2)}$, $M_{S(3)}$, $M_{S(4)}$: Still water vertical bending moment as defined in **[3.2.2]** of **Ch 8, Sec 3**

Remarks

1) M_H / V_H is to be used as cargo density for calculation of dry cargo pressure.

2) This condition is to be applied only for the mid-hold which is not assigned as ballast hold. Position of ballast hold is to be adjusted as appropriate.

3) This condition is to be applied only for the mid-hold which is assigned as ballast hold. ⚓

Chapter 5

Hull Girder Strength

Section 1 – Yielding check

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

M_{SW} : Design still water bending moment in intact condition, in kN.m, at the hull transverse section considered, defined in **Ch 4, Sec 3, [2.2]**:

$M_{SW} = M_{SW,H}$ in hogging conditions

$M_{SW} = M_{SW,S}$ in sagging conditions

M_{WV} : Vertical wave bending moment in intact condition, in kN.m, at the hull transverse section considered, defined in **Ch 4, Sec 3, [3.1]**

$M_{SW,F}$: Still water bending moment, in kN.m, in flooded conditions, at the hull transverse section under consideration, to be calculated according to **Ch 4, Sec 3**

$M_{WV,F}$: Vertical wave bending moment, in kN.m, in flooded conditions, at the hull transverse section under consideration, to be calculated according to **Ch 4, Sec 3**

$M_{WV,P}$: Vertical wave bending moment, in kN.m, in harbour conditions, at the hull transverse section under consideration, to be calculated according to **Ch 4, Sec 3**

M_{WH} : Horizontal wave bending moment, in kN.m, at the hull transverse section considered, defined in **Ch 4, Sec 3, [3.3]**

Q_{SW} : Design still water shear force in intact condition, in kN, at the hull transverse section considered, defined in **Ch 4, Sec 3, [2.3]**

Q_{WV} : Vertical wave shear force in intact condition, in kN, at the hull transverse section considered, defined in **Ch 4, Sec 3, [3.2]**

$Q_{SW,F}$: Still water shear force, in kN, in flooded conditions, at the hull transverse section under consideration, to be calculated according to **Ch 4, Sec 3**

$Q_{WV,F}$: Vertical wave shear force, in kN, in flooded conditions, at the hull transverse section under consideration, to be calculated according to **Ch 4, Sec 3**

$Q_{WV,P}$: Vertical wave shear force, in kN, in harbour conditions, at the hull transverse section under consideration, to be calculated according to **Ch 4, Sec 3**

k : Material factor, as defined in **Ch 1, Sec 4, [2.2.1]**

x : X co-ordinate, in m, of the calculation point with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**

z : Z co-ordinate, in m, of the calculation point with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**

N : Z co-ordinate, in m, of the centre of gravity of the hull transverse section defined in **[1.2]**, with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**

V_D : Vertical distance, in m, defined in **[1.4.2]**

I_Y : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to **[1.5]**

I_Z : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to **[1.5]**

S : Net first moment, in m^3, of the hull transverse section, to be calculated according to **[1.6]**

Z_A : Net section modulus, in m^3,at any point of the hull transverse section, to be calculated according **[1.4.1]**

Z_{AB}, Z_{AD}: Net section moduli, in m^3, at bottom and deck, respectively, to be calculated according to **[1.4.2]**

C : Wave parameter defined in **Ch 1, Sec 4, [2.3.1]**

$\sigma_{1,ALL}$: Allowable normal stress, in N/mm^2, defined in **[3.1.1]**

$\tau_{1,ALL}$: Allowable shear stress, in N/mm^2, defined in **[3.2.1]**

ρ : Sea water density, taken equal to 1.025 t/m^3.

1. Strength characteristics of the hull girder transverse sections

1.1 General

1.1.1

This Article specifies the criteria for calculating the hull girder strength characteristics to be used for the checks in **[2]** to **[5]**, in association with the hull girder loads specified in **Ch 4, Sec 3.**

1.2 Hull girder transverse sections

1.2.1 General

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder longitudinal strength, i.e. all continuous longitudinal members below and including the strength deck defined in **[1.3]**, taking into account the requirements in **[1.2.2]** to **[1.2.9]**.
These members are to be considered as having (see also **Ch 3, Sec 2**) net offered scantlings based on gross offered thickness reduced by 0.5 t_C, when the hull girder strength characteristics are used for:

- the hull girder yielding check according to **[2]** to **[5]**
- the ultimate strength check in **Ch 5, Sec 2**
- the calculation of the hull girder stresses for the strength checks of plating, ordinary stiffeners and primary supporting members according to **Ch 6.**

1.2.2 Continuous trunks and continuous longitudinal hatch coamings

Continuous trunks and continuous longitudinal hatch coamings may be included in the hull girder transverse sections, provided they are effectively supported by longitudinal bulkheads or primary supporting members.

1.2.3 Longitudinal ordinary stiffeners or girders welded above the strength deck

Longitudinal ordinary stiffeners or girders welded above the strength deck (including the deck of any trunk fitted as specified in **[1.2.2]**) are to be included in the hull girder transverse sections.

1.2.4 Longitudinal girders between hatchways, supported by longitudinal bulkheads

Where longitudinal girders, effectively supported by longitudinal bulkheads, are fitted between hatchways, the sectional area of these longitudinal girders are to be included in the hull girder transverse.

1.2.5 Longitudinal bulkheads with vertical corrugations

Longitudinal bulkheads with vertical corrugations are not to be included in the hull girder transverse sections.

1.2.6 Members in materials other than steel

Where a member contributing to the longitudinal strength is made in material other than steel with a

Young's modulus E equal to 2.06×10^5 N/mm^2, the steel equivalent sectional area that may be included in the hull girder transverse sections is obtained, in m^2, from the following formula:

$$A_{SE} = \frac{E}{2.06 \cdot 10^5} A_M$$

where:

A_M : Sectional area, in m^2, of the member under consideration.

1.2.7 Large openings

Large openings are:

- elliptical openings exceeding 2.5 m in length or 1.2 m in breadth
- circular openings exceeding 0.9 m in diameter.

Large openings and scallops, where scallop welding is applied, are always to be deducted from the sectional areas included in the hull girder transverse sections.

1.2.8 Small openings

Smaller openings than those in **[1.2.7]** in one transverse section in the strength deck or bottom area need not be deducted from the sectional areas included in the hull girder transverse sections, provided that:

$$\Sigma b_S \leq 0.06 (B - \Sigma b)$$

where:

Σb_S : Total breadth of small openings, in m, in the strength deck or bottom area at the transverse section considered, determined as indicated in **Fig 1**

Σb : Total breadth of large openings, in m, at the transverse section considered, determined as indicated in **Fig 1.**

Where the total breadth of small openings Σb_S does not fulfil the above criteria, only the excess of breadth is to be deducted from the sectional areas included in the hull girder transverse sections.

1.2.9 Lightening holes, draining holes and single scallops

Lightening holes, draining holes and single scallops in longitudinals need not be deducted if their height is less than 0.25 h_w, without being greater than 75 mm, where h_w is the web height, in mm.
Otherwise, the excess is to be deducted from the sectional area or compensated.

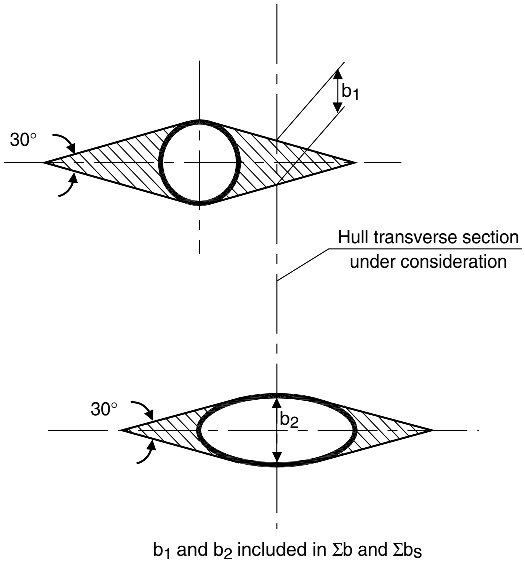

Fig 1: Calculation of Σb and Σb_S

1.3 Strength deck

1.3.1

The strength deck is, in general, the uppermost continuous deck.
In the case of a superstructure or deckhouses contributing to the longitudinal strength, the strength deck is the deck of the superstructure or the deck of the uppermost deckhouse.

1.3.2

A superstructure extending at least $0.15\,L$ within $0.4\,L$ amidships may generally be considered as contributing to the longitudinal strength.
For other superstructures and for deckhouses, their contribution to the longitudinal strength is to be assessed on a case by case basis, to evaluate their percentage of participation to the longitudinal strength.

1.4 Section modulus

1.4.1

The section modulus at any point of a hull transverse section is obtained, in m^3, from the following formula:

$$Z_A = \frac{I_Y}{|z - N|}$$

1.4.2

The section moduli at bottom and at deck are obtained, in m^3, from the following formulae:

- at bottom:

$$Z_{AB} = \frac{I_Y}{N}$$

- at deck:

$$Z_{AD} = \frac{I_Y}{V_D}$$

where:

V_D : Vertical distance, in m, taken equal to:

- in general:

  $V_D = z_D - N$

  where:

  z_D : Z co-ordinate, in m, of strength deck at side, defined in **[1.3]**, with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**

- if continuous trunks or hatch coamings are taken into account in the calculation of I_Y, as specified in **[1.2.2]**:

  $$V_D = (z_T - N)\left(0.9 + 0.2\frac{y_T}{B}\right) \geq z_D - N$$

  where:

  y_T, z_T: Y and Z co-ordinates, in m, of the top of continuous trunk or hatch coaming with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**; y_T and z_T are to be measured for the point which maximises the value of V_D

- if longitudinal ordinary stiffeners or girders welded above the strength deck are taken into account in the calculation of I_Y, as specified in **[1.2.3]**, V_D is to be obtained from the formula given above for continuous trunks and hatch coamings. In this case, y_T and z_T are the Y and Z co-ordinates, in m, of the top of the longitudinal stiffeners or girders with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4].**

1.5 Moments of inertia

1.5.1

The moments of inertia I_Y and I_Z, in m^4, are those, calculated about the horizontal and vertical neutral axes, respectively, of the hull transverse sections defined in **[1.2].**

1.6 First moment

1.6.1

The first moment S, in m^3, at a level z above the baseline is that, calculated with respect to the horizontal neutral axis, of the portion of the hull transverse sections defined in **[1.2]** located above the z level.

2. Hull girder stresses

2.1 Normal stresses

2.1.1 General

The normal stresses in a member made in material other than steel with a Young's modulus E equal to 2.06×10^5 N/mm^2, included in the hull girder transverse sections as specified in **[1.2.6]**, are obtained from the following formula:

$$\sigma_1 = \frac{E}{2.06\cdot10^5}\sigma_{1S}$$

where:

σ_{1S} : Normal stress, in N/mm^2, in the member under consideration, calculated according to **[2.1.2]** and **[2.1.3]** considering this member as having the steel equivalent sectional area A_{SE} defined in **[1.2.6].**

2.1.2 Normal stresses induced by vertical bending moments

The normal stresses induced by vertical bending moments are obtained, in N/mm^2, from the following formulae:

- at any point of the hull transverse section, located below z_{VD}, where $z_{VD} = V_D + N$:

$$\sigma_1 = \frac{M_{SW} + M_{WV}}{Z_A} 10^{-3}$$

- at bottom:

$$\sigma_1 = \frac{M_{SW} + M_{WV}}{Z_{AB}} 10^{-3}$$

- at deck:

$$\sigma_1 = \frac{M_{SW} + M_{WV}}{Z_{AD}} 10^{-3}$$

2.1.3 Normal stresses in flooded conditions of BC-A or BC-B ships

This requirement applies to BC-A or BC-B ships, in addition to **[2.1.2].**
The normal stresses, in the flooded conditions specified in **Ch 4, Sec 3**, are to be obtained at any point, in N/mm^2, from the following formula:

$$\sigma_1 = \frac{M_{SW,F} + M_{WV,F}}{Z_A} 10^{-3}$$

2.2 Shear stresses

2.2.1 General

The shear stresses induced by vertical shear forces Q_{SW} and Q_{WV} in intact condition and, for BC-A and BC-B ships by vertical shear forces $Q_{SW,F}$ and $Q_{WV,F}$ in flooded condition are normally to be obtained through direct analyses.
When they are combined, vertical shear forces Q_{SW} and Q_{WV} in intact condition are to be taken with the same sign. The same is to be applied also for combination of vertical shear forces $Q_{SW,F}$ and $Q_{WV,F}$ in flooded condition.
The shear force correction ΔQ_C is to be taken into account, in accordance with **[2.2.2]**. The shear force correction need not to be considered at the fore end of foremost hold and aft end of aftermost hold.
As an alternative to this procedure, the shear stresses induced by the vertical shear forces Q_{SW} and Q_{WV} in intact condition and, for BC-A and BC-B ships by the vertical shear forces $Q_{SW,F}$ and $Q_{WV,F}$ in flooded condition may be obtained through the simplified procedure in **[2.2.2]** and **[2.2.3]** respectively.

2.2.2 Simplified calculation of shear stresses induced by vertical shear forces

The shear stresses induced by the vertical shear forces in the calculation point are obtained, in N/mm^2, from the following formula:

$$\tau_1 = (Q_{SW} + Q_{WV} - \varepsilon \Delta Q_C) \frac{S}{I_Y t} \delta$$

where:

t : Minimum net thickness, in mm, of side and inner side plating, as applicable according to **Table 1**

δ : Shear distribution coefficient defined in **Table 1**

$\varepsilon = \text{sgn}(Q_{SW})$

ΔQ_C : Shear force correction (see **Fig 2**) at the section considered. The shear force correction is to be considered independently forward and aft of the transverse bulkhead for the hold considered. The shear force correction takes into account, when applicable, the portion of loads transmitted by the double bottom girders to the transverse bulkheads:

- for ships with any non-homogeneous loading conditions, such as alternate hold loading conditions and heavy ballast conditions carrying ballast in hold(s):

  $$\Delta Q_C = \alpha \left| \frac{M}{B_H \ell_H} - \rho T_{LC,mh} \right|$$ for each non-homogenous loading condition

- for other ships and homogenous loading conditions:

  $\Delta Q_C = 0$

$\varphi = 1.38 + 1.55 \frac{\ell_0}{b_0}$, to be taken not greater than 3.7

$$\alpha = g \frac{\ell_0 b_0}{2 + \varphi \frac{\ell_0}{b_0}}$$

ℓ_0, b_0 : Length and breadth, respectively, in m, of the flat portion of the double bottom in way of the hold considered; b_0 is to be measured on the hull transverse section at the middle of the hold

ℓ_H : Length, in m, of the hold considered, measured between the middle of the transverse corrugated bulkheads depth

B_H : Ship's breadth, in m, measured at the level of inner bottom on the hull transverse section at the middle of the hold considered

M : Mass, in t, in the considered section.

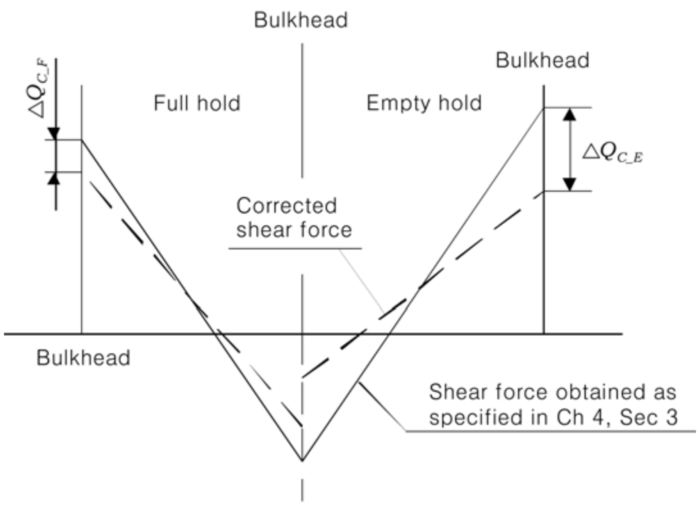
- Adjacent cargo hold is loaded in a non homogenous loading condition for the condition under consideration

  M is to include the total mass in the hold and the mass of water ballast in double bottom tank, bounded by side girders in way of hopper tank plating or longitudinal bulkhead.

- Other cases

  M is the total mass in the hold.

$T_{LC,mh}$: Draught, in m, measured vertically on the hull transverse section at the middle of the hold considered, from the moulded baseline to the waterline in the loading condition considered.



ΔQ_{C_F} : shear force correction for the full hold
ΔQ_{C_E} : shear force correction for the empty hold

Fig 1: Shear force correction ΔQ_C

Table 1: Shear stresses induced by vertical shear forces

Ship typology	Location	t, in mm	δ
Single side ship	Sides	t_S	0,5
Double side ship	Sides	t_S	0.5(1-ϕ)
	Inner sides	t_{IS}	0.5ϕ

where:

t_S, t_{IS} : Minimum net thicknesses, in mm, of side and inner side, respectively

t_{SM}, t_{ISM} : Mean net thicknesses, in mm, over all the strakes of side and inner side, respectively. They are calculated as $\Sigma(\ell_i t_i)/\Sigma\ell_i$, where ℓ_i and t_i are the length, in m, and the net thickness, in mm, of the ith strake of side and inner side.

ϕ : Coefficient taken equal to: $\phi = 0.275 + 0.25\dfrac{t_{ISM}}{t_{SM}}$

2.2.3 Shear stresses in flooded conditions of BC-A or BC-B ships

This requirement applies to BC-A or BC-B ships, in addition to **[2.2.1]** and **[2.2.2].**
The shear stresses, in the flooded conditions specified in **Ch 4, Sec 3**, are to be obtained at the calculation point, in $\mathrm{N/mm^2}$, from the following formula:

$$\tau_1 = \left(Q_{SW,F} + Q_{WV,F} - \varepsilon\Delta Q_C\right)\frac{S}{I_Y t}\delta$$

$$\varepsilon = \mathrm{sgn}\,(Q_{SW,F})$$

ΔQ_C : Shear force correction, to be calculated according to **[2.2.2]**, where the mass of the ingressed water is to be added to M, and where the draught $T_{LC,mh}$ is to be measured up to the equilibrium waterline.

t : Net thickness, in mm, of the side plating.

3. Checking criteria

3.1 Normal stresses

3.1.1

It is to be checked that the normal stresses s1 calculated according to **[2.1.2]** and, when applicable, **[2.1.3]** are in compliance with the following formula:

$$\sigma_1 \leq \sigma_{1,ALL}$$

where:

$\sigma_{1,ALL}$: Allowable normal stress, in N/mm^2, obtained from the following formulae:

$$\sigma_{1,ALL} = \frac{130}{k} \quad \text{for} \quad \frac{x}{L} \leq 0.1$$

$$\sigma_{1,ALL} = \frac{190}{k} - \frac{1500}{k}\left(\frac{x}{L} - 0.3\right)^2 \quad \text{for} \quad 0.1 < \frac{x}{L} < 0.3$$

$$\sigma_{1,ALL} = \frac{190}{k} \quad \text{for} \quad 0.3 \leq \frac{x}{L} \leq 0.7$$

$$\sigma_{1,ALL} = \frac{190}{k} - \frac{1500}{k}\left(\frac{x}{L} - 0.7\right)^2 \quad \text{for} \quad 0.7 < \frac{x}{L} < 0.9$$

$$\sigma_{1,ALL} = \frac{130}{k} \quad \text{for} \quad \frac{x}{L} \geq 0.9$$

3.2 Shear stresses

3.2.1

It is to be checked that the shear stresses t1 calculated according to **[2.2.1]** or **[2.2.2]** and, when applicable, **[2.2.3]** are in compliance with the following formula:

$$\tau_1 \leq \tau_{1,ALL}$$

where:

$\tau_{1,ALL}$: Allowable shear stress, in N/mm^2:

$$\tau_{1,ALL} = 120/k$$

4. Section modulus and moment of inertia

4.1 General

4.1.1

The requirements in **[4.2]** to **[4.5]** provide the minimum hull net girder section modulus, complying with the checking criteria indicated in **[3]**, and the midship net section moment of inertia required to ensure sufficient hull girder rigidity.

4.1.2

The *k* material factors are to be defined with respect to the materials used for the bottom and deck members contributing to the longitudinal strength according to **[1]**. When material factors for higher strength steels are used, the requirements in **[4.5]** apply.

4.2 Section modulus within 0.4 *L* amidships

4.2.1

The net section moduli Z_{AB} and Z_{AD} at the midship section are to be not less than the value obtained, in m^3, from the following formula:

- $Z_{R,MIN} = 0.9CL^2B(C_B + 0.7)k10^{-6}$

4.2.2

In addition, the net section moduli Z_{AB} and Z_{AD} within 0.4 L amidships are to be not less than the value obtained, in m^3, from the following formula:

- $Z_R = \frac{M_{SW}+M_{WV}}{\sigma_{1,ALL}}10^{-3}$
- in addition, for BC-A and BC-B ships:

  $Z_R = \frac{M_{SW,F}+M_{WV,F}}{\sigma_{1,ALL}}10^{-3}$

4.2.3

Where the total breadth Σb_S of small openings, as defined in **[1.2.8]**, is deducted from the sectional areas included in the hull girder transverse sections, the values $Z_{R,MIN}$ and Z_R defined in **[4.2.1]** or **[4.2.2]** may be reduced by 3 %.

4.2.4

Scantlings of members contributing to the longitudinal strength (see **[1]**), based on the section modulus requirement in **[4.2.1]**, are to be maintained within 0.4 L amidships.

4.3 Section modulus outside 0.4 *L* amidships

4.3.1

The net section moduli Z_{AB} and Z_{AD} outside 0.4 L amidships are to be not less than the value obtained, in m^3, from the following formula:

- $Z_R = \frac{M_{SW}+M_{WV}}{\sigma_{1,ALL}}10^{-3}$
- in addition, for BC-A and BC-B ships:

  $Z_R = \frac{M_{SW,F}+M_{WV,F}}{\sigma_{1,ALL}}10^{-3}$

4.3.2

Scantlings of members contributing to the hull girder longitudinal strength (see **[1]**) may be gradually reduced, outside 0.4 L amidships, to the minimum required for local strength purposes at fore and aft parts, as specified in **Ch 9, Sec 1** or **Ch 9, Sec 2**, respectively.

4.4 Midship section moment of inertia

4.4.1

The net midship section moment of inertia about its horizontal neutral axis is to be not less than the value obtained, in m^4, from the following formula:

$$I_{YR} = 3Z'_{R,MIN} L \cdot 10^{-2}$$

where $Z'_{R,MIN}$ is the required net midship section modulus $Z_{R,MIN}$, in m^3, calculated as specified in **[4.2.1]** but assuming $k = 1$.

4.5 Extent of higher strength steel

4.5.1

When a material factor for higher strength steel is used in calculating the required section modulus at bottom or deck according to **[4.2]** or **[4.3]**, the relevant higher strength steel is to be adopted for all members contributing to the longitudinal strength (see **[1]**), at least up to a vertical distance, in m, obtained from the following formulae:

- above the baseline (for section modulus at bottom):

$$V_{HB} = \frac{\sigma_{1B} - k\sigma_{1,ALL}}{\sigma_{1B} + \sigma_{1D}} z_D$$

- below a horizontal line located at a distance V_D (see **[1.4.2]**) above the neutral axis of the hull transverse section (for section modulus a tdeck):

$$V_{HD} = \frac{\sigma_{1D} - k\sigma_{1,ALL}}{\sigma_{1B} + \sigma_{1D}} (N + V_D)$$

where:

σ_{1B}, σ_{1D}: Normal stresses, in N/mm^2, at bottom and deck, respectively, calculated according to **[2.1]**

z_D : Z co-ordinate, in m, of the strength deck defined in **[1.3]**, with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**

4.5.2

The higher strength steel is to extend in length at least throughout $0.4L$ amidships where it is required for strength purposes according to the provision of the present Rules.

5. Permissible still water bending moment and shear force

5.1 Permissible still water bending moment and shear force in intact condition

5.1.1 Permissible still water bending moment

The permissible still water bending moment at any hull transverse section in intact condition, in hogging or sagging conditions, is the value M_{SW} considered in the hull girder section modulus calculation according to **[4.2]** and **[4.3]**.
In the case of structural discontinuities in the hull transverse sections, the distribution of permissible still water bending moments is considered on a case by case basis.

5.1.2 Permissible still water shear force – Direct calculation

Where the shear stresses are obtained through calculation analyses according to **[2.2.1]**, the permissible positive or negative still water shear force in intact condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_P = \varepsilon |Q_T| - Q_{WV}$$

where:

$\varepsilon = \mathrm{sgn}(Q_{SW})$

Q_T : Shear force, in kN, which produces a shear stress $\tau = 120/k$ N/mm² in the most stressed point of the hull net transverse section, taking into account the shear force correction ΔQ_C in accordance with **[2.2.2].**

A lower value of the permissible still water shear force may be considered, if requested by the Shipbuilder.

5.1.3 Permissible still water shear force – Simplified calculation

Where the shear stresses are obtained through the simplified procedure in [2.2.2], the permissible positive or negative still water shear force in intact condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_P = \varepsilon \left(\frac{120}{k\delta} \frac{I_Y t}{S} + \Delta Q_C \right) - Q_{WV}$$

where:

$\varepsilon = \mathrm{sgn}(Q_{SW})$

δ : Shear distribution coefficient defined in **Table 1**

t : Minimum net thickness, in mm, of side and inner side plating, as applicable according to **Table 1**

ΔQ_C : Shear force corrections defined in **[2.2.2]**, to be considered independently forward and aft of the transverse bulkhead.

A lower value of the permissible still water shear force may be considered, if requested by the Shipbuilder.

5.2 Permissible still water bending moment and shear force in harbour conditions

5.2.1 Permissible still water bending moment

The permissible still water bending moment at any hull transverse section in harbour conditions, in hogging or sagging conditions, is obtained, in kN.m, from the following formula:

$$M_{P,P} = M_{SW} + M_{WV} - M_{WV,P}$$

A lower value of the permissible still water bending moment in harbour conditions may be considered, if requested by the Shipbuilder.

5.2.2 Permissible still water shear force

The permissible positive or negative still water shear force at any hull transverse section, in harbour conditions, is obtained, in kN, from the following formula:

$$Q_{P,P} = \varepsilon Q_P + Q_{WV} - Q_{WV,P}$$

where:

$\varepsilon = \mathrm{sgn}(Q_{SW})$

Q_P : Permissible still water shear force during navigation, in kN, to be calculated according to **[5.1.3].**

A lower value of the permissible still water shear force in harbour conditions may be considered, if requested by the Shipbuilder.

5.3 Permissible still water bending moment and shear force in flooded condition

5.3.1 Permissible still water bending moment

The permissible still water bending moment at any hull transverse section in flooded condition, in hogging or sagging conditions, is the value $M_{SW,F}$ considered in the hull girder section modulus calculation according to **[4.2]** and **[4.3].**
In the case of structural discontinuities in the hull transverse sections, the distribution of permissible still water bending moments is considered on a case by case basis.

5.3.2 Permissible still water shear force – Direct calculation

Where the shear stresses are obtained through calculation analyses according to [2.2.1], the permissible positive or negative still water shear force in flooded condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_{P,F} = \varepsilon |Q_T| - Q_{WV,F}$$

where:

$\varepsilon = \mathrm{sgn}(Q_{SW,F})$

Q_T : Shear force, in kN, which produces a shear stress $\tau = 120/k\ \mathrm{N/mm^2}$ in the most stressed point of the hull net transverse section, taking into account the shear force correction ΔQ_C in accordance with **[2.2.2].**

5.3.3 Permissible still water shear force – Simplified calculation

Where the shear stresses are obtained through the simplified procedure in [2.2.2], the permissible positive or negative still water shear force in flooded condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_{P,F} = \varepsilon \left(\frac{120}{k\delta} \frac{I_Y t}{S} + \Delta Q_C \right) - Q_{WV,F}$$

where:

$\varepsilon = \mathrm{sgn}(Q_{SW})$

δ : Shear distribution coefficient defined in **Table 1**

t : Minimum net thickness, in mm, of side and inner side plating, as applicable according to **Table 1**

ΔQ_C : Shear force correction, to be calculated according to **[2.2.2]**, where the mass M is to include the mass of the ingressed water in the hold considered and the draught T_{LC} is to be measured up to the equilibrium waterline.

Section 2 – ULTIMATE STRENGTH CHECK

1. Application

1.1 General

1.1.1

The requirements of this Section apply to ships equal to or greater than 150 m in length L.

2. Hull girder ultimate strength check

2.1 Hull girder loads

2.1.1 Bending moment

The bending moment M in sagging and hogging conditions, to be considered in the ultimate strength check of the hull girder, is to be obtained, in kN.m, in intact, flooded and harbour conditions, from the following formula:

$$M = M_{SW} + \gamma_W M_{WV}$$

where:

$M_{SW}, M_{SW,F}, M_{SW,P}$: Design still water bending moment, in kN.m, in sagging and hogging conditions at the hull transverse section considered, to be calculated respectively in intact (M_{SW}), flooded ($M_{SW,F}$) and harbour ($M_{SW,P}$) conditions

$M_{WV}, M_{WV,F}, M_{WV,P}$: Vertical wave bending moment, in kN.m, in sagging and hogging conditions at the hull transverse section considered, defined in **Ch 4, Sec 3**, respectively in intact (M_{WV}), flooded ($M_{WV,F}$) and harbour ($M_{WV,P}$) conditions

γ_W : Safety factor on wave hull girder bending moments, taken equal to:
$\gamma_W = 1.20$

2.2 Hull girder bending moment

2.2.1 Curve $M-\chi$

The ultimate bending moment capacities of a hull girder transverse section, in hogging and sagging conditions, are defined as the maximum values of the curve of bending moment capacity M versus the curvature χ of the transverse section considered (see **Fig 1**).
The curvature χ is positive for hogging condition and negative for sagging condition.
The curve $M-\chi$ is to be obtained through an incremental-iterative procedure, according to the criteria specified in **App 1.**

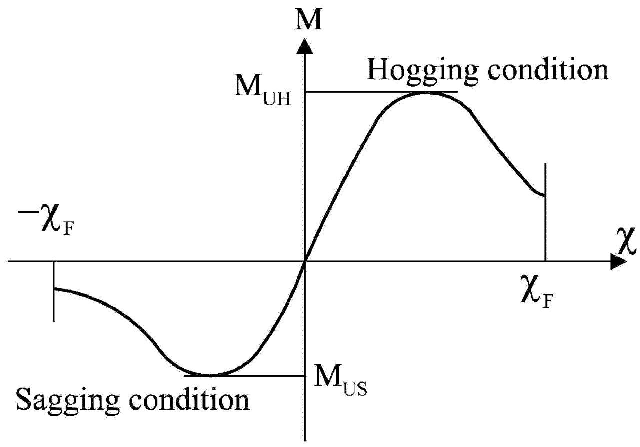


Fig 1: Curve bending moment capacity *M* versus curvature χ

2.2.2 Hull girder transverse sections

The hull girder transverse sections are constituted by the elements contributing to the hull girder longitudinal strength, considered with their net offered scantlings according to **Ch 3, Sec 2, [3.2.4].**

2.3 Checking criteria

2.3.1

It is to be checked that the hull girder ultimate bending capacity at any hull transverse section is in compliance with the following formula:

$$M \le \frac{M_U}{\gamma_R}$$

where:

M_U : Ultimate bending moment capacity of the hull transverse section considered, calculated with net offered scantlings based on gross offered thickness reduced by $0.5\,t_C$, in kN.m:

$M_U = M_{UH}$ in hogging conditions

$M_U = M_{US}$ in sagging conditions

M_{UH} : Ultimate bending moment capacity in hogging conditions, in kN.m, defined in **[2.2.1]**

M_{US} : Ultimate bending moment capacity in sagging conditions, in kN.m, defined in **[2.2.1]**

M : Bending moment, in kN.m, defined in **[2.1.1]** for the ship in intact, flooded and harbour conditions

γ_R : Safety factor taken equal to 1.10

Appendix 1 - HULL GIRDER ULTIMATE STRENGTH

Symbols

For symbols not defined in this Appendix, refer to **Ch 1, Sec 4.**

I_Y : Moment of inertia, in m^4, of the hull transverse section around its horizontal neutral axis, to be calculated according to **Ch 5, Sec 1, [1.5.1]**

Z_{AB} ,Z_{AD} : Section moduli, in m^3, at bottom and deck, respectively, defined in **Ch 5, Sec 1, [1.4.2].**

R_{eHs} : Minimum yield stress, in N/mm^2, of the material of the considered stiffener.

R_{eHp} : Minimum yield stress, in N/mm^2, of the material of the considered plate.

A_s : Net sectional area, in cm^2, of stiffener, without attached plating

A_p : Net sectional area, in cm^2, of attached plating

1. Hull girder ultimate strength check

1.1 Introduction

1.1.1

This Appendix provides the criteria for obtaining the curve $M-\chi$ and the ultimate longitudinal bending moment capacity M_U that are to be calculated according to the simplified incremental-iterative approach, as specified in **[2.1].**

2. Criteria for the calculation of the curve $M-\chi$

2.1 Simplified method based on a incremental-iterative approach

2.1.1 Procedure

The curve $M-\chi$ is to be obtained by means of an incremental-iterative approach, summarised in the flow chart in **Fig 1.**
In this approach, the ultimate hull girder bending moment capacity M_U is defined as the peak value of the curve with vertical bending moment M versus the curvature χ of the ship cross section as shown in **Fig 1**. The curve is to be obtained through an incremental-iterative approach.
Each step of the incremental procedure is represented by the calculation of the bending moment M_i which acts on the hull transverse section as the effect of an imposed curvature χ_i.
For each step, the value χ_i is to be obtained by summing an increment of curvature $\triangle\chi$ to the value relevant to the previous step χ_{i-1}. This increment of curvature corresponds to an increment of the rotation angle of the hull girder transverse section around its horizontal neutral axis.
This rotation increment induces axial strains ε in each hull structural element, whose value depends on the position of the element. In hogging condition, the structural elements above the neutral axis are lengthened, while the elements below the neutral axis are shortened. Vice-versa in sagging condition.
The stress σ induced in each structural element by the strain ε is to be obtained from the load-end shortening curve $\sigma-\varepsilon$ of the element, which takes into account the behaviour of the element in the non-linear elasto-plastic domain.
The distribution of the stresses induced in all the elements composing the hull transverse section determines, for each step, a variation of the neutral axis position, since the relationship $\sigma-\varepsilon$ is non-linear. The new position of the neutral axis relevant to the step considered is to be obtained by means of an iterative process, imposing the equilibrium among the stresses acting in all the hull elements.
Once the position of the neutral axis is known and the relevant stress distribution in the section structural elements is obtained, the bending moment of the section M_i around the new position of the neutral axis, which corresponds to the curvature χ_i imposed in the step considered, is to be obtained by summing the contribution given by each element stress.
The main steps of the incremental-iterative approach described above are summarised as follows (see also

Fig 1):

Step 1 Divide the transverse section of hull into stiffened plate elements.

Step 2 Define stress-strain relationships for all elements as shown in **Table 1**

Step 3 Initialize curvature χ_1 and neutral axis for the first incremental step with the value of incremental curvature (curvature that induces a stress equal to 1 % of yield strength in strength deck) as:

$$\chi_1 = \Delta\chi = \frac{0.01\frac{R_{eH}}{E}}{z_D - N}$$

where:

z_D : Z co-ordinate, in m, of strength deck at side, with respect to reference co-ordinate defined in **Ch 1, Sec 4, [4]**

Step 4 Calculate for each element the corresponding strain $\varepsilon_i = \chi(z_i - z_{NA})$ and the corresponding stress σ_i

Step 5 Determine the neutral axis z_{NA_cur} at each incremental step by establishing force equilibrium over the whole transverse section as:

$\Sigma A_i\sigma_i = \Sigma A_j\sigma_j$ (i-th element is under compression, j-th element under tension)

Step 6 Calculate the corresponding moment by summing the contributions of all elements as:

$M_U = \sum \sigma_{Ui} A_i \left|(z_i - z_{NA\_cur})\right|$

Step 7 Compare the moment in the current incremental step with the moment in the previous incremental step. If the slope in $M-\chi$ relationship is less than a negative fixed value, terminate the process and define the peak value of M_U. Otherwise, increase the curvature by the amount of $\Delta\chi$ and go to **Step 4.**

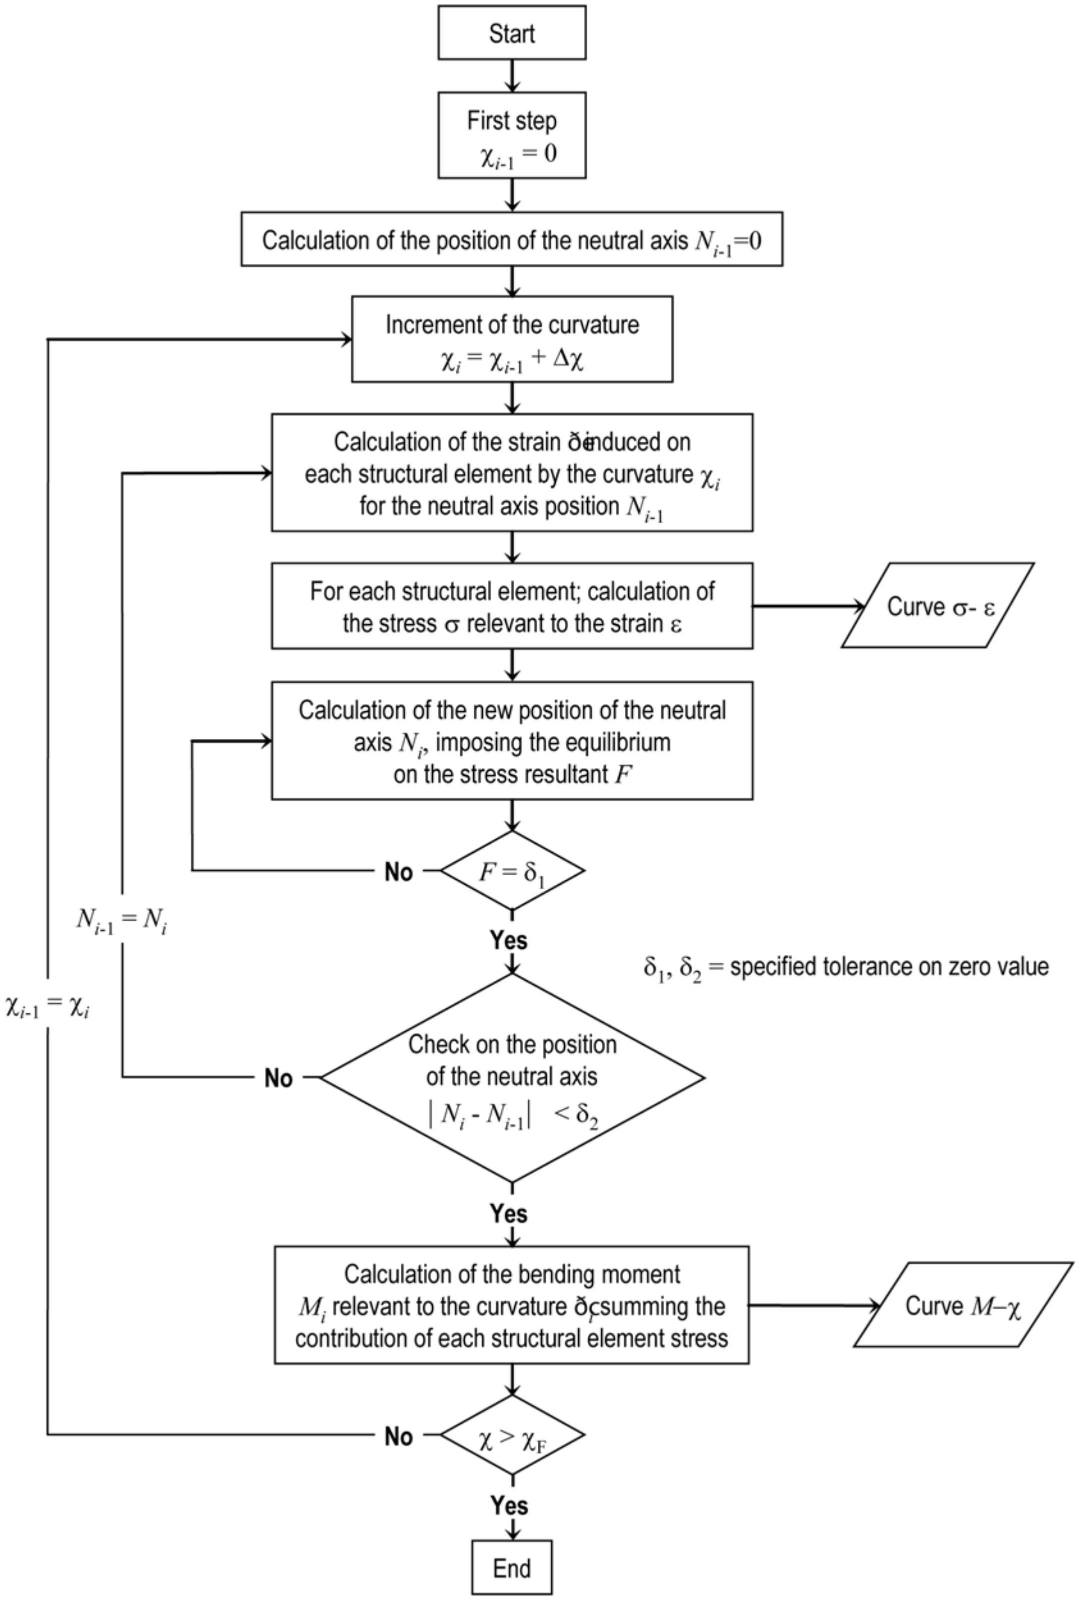

Fig 1: Flow chart of the procedure for the evaluation of the curve $M-\chi$

2.1.2 Assumption

In applying the procedure described in **[2.1.1]**, the following assumptions are generally to be made:

- the ultimate strength is calculated at hull transverse sections between two adjacent transverse webs.

- the hull girder transverse section remains plane during each curvature increment.
- the hull material has an elasto-plastic behaviour.
- the hull girder transverse section is divided into a set of elements, which are considered to act independently.

  These elements are:

  - transversely framed plating panels and/or ordinary stiffeners with attached plating, whose structural behaviour is described in **[2.2.1]**
  - hard corners, constituted by plating crossing, whose structural behaviour is described in **[2.2.2].**
- according to the iterative procedure, the bending moment M_i acting on the transverse section at each curvature value χ_i is obtained by summing the contribution given by the stress σ acting on each element. The stress σ, corresponding to the element strain ε, is to be obtained for each curvature increment from the non-linear load-end shortening curves $\sigma - \varepsilon$ of the element.

  These curves are to be calculated, for the failure mechanisms of the element, from the formulae specified in **[2.2]**. The stress σ is selected as the lowest among the values obtained from each of the considered load-end shortening curves $\sigma - \varepsilon$.
- The procedure is to be repeated until the value of the imposed curvature reaches the value χ_F, in m^{-1}, in hogging and sagging condition, obtained from the following formula:

$$\chi_F = \pm 0.003 \frac{M_Y}{EI_Y}$$

where:

M_Y : the lesser of the values M_{Y1} and M_{Y2}, in kN.m:

$M_{Y1} = 10^3 R_{eH} Z_{AB}$

$M_{Y2} = 10^3 R_{eH} Z_{AD}$

If the value χ_F is not sufficient to evaluate the peaks of the curve $M - \chi$, the procedure is to be repeated until the value of the imposed curvature permits the calculation of the maximum bending moments of the curve.

2.1.3 Modeling of the hull girder cross section

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder ultimate strength.
Sniped stiffeners are also to be modeled imaginarily, taking account that they doesn't contribute to the hull girder strength.
The structural members are categorized into an ordinary stiffener element, a stiffened plate element or a hard corner element.
The plate panel including web plate of girder or side stringer is idealized into either a stiffened plate element, an attached plate of an ordinary stiffener element or a hard corner element.
The plate panel is categorized into the following two kinds:

- longitudinally stiffened panel of which the longer side is in the longitudinal direction, and
- transversely stiffened panel of which the longer side is in the perpendicular direction to the longitudinal direction.

- Hard corner element

  Hard corner elements are sturdier elements composing the hull girder transverse section, which collapse mainly according to an elasto-plastic mode of failure (material yielding); they are generally constituted by two plates not lying in the same plane.

  The extent of a hard corner element from the point of intersection of the plates is taken equal to 20 t_p on transversely stiffened panel and to $0.5s$ on a longitudinally stiffened panel. (see **Fig 6**)

  where:

  t_p : Gross offered thickness of the plate, in mm

  s : Spacing of the adjacent longitudinal stiffener, in m

Bilge, sheer strake-deck stringer elements, girder-deck connections and face plate-web connections on large girders are typical hard corners.

- Ordinary stiffener element

The ordinary stiffener constitutes an ordinary stiffener element together with the attached plate.

The attached plate width is in principle:

- equal to the mean spacing of the ordinary stiffener when the panels on both sides of the stiffener are longitudinally stiffened, or
- equal to the width of the longitudinally stiffened panel when the panel on one side of the stiffener is longitudinally stiffened and the other panel is of the transversely stiffened. (See **Fig 6**)

- Stiffened plate element

The plate between ordinary stiffener elements, between an ordinary stiffener element and a hard corner element or between hard corner elements is to be treated as a stiffened plate element. (See **Fig 6**)

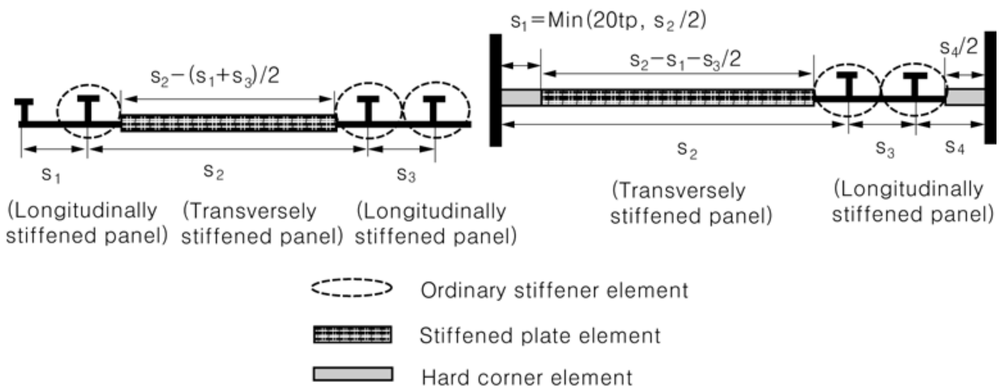

Fig 6: Extension of the breadth of the attached plating and hard corner element

The typical examples of modeling of hull girder section are illustrated in **Figs 7** and **8.**
Notwithstanding the foregoing principle these figures are to be applied to the modeling in the vicinity of upper deck, sheer strake and hatch side girder.

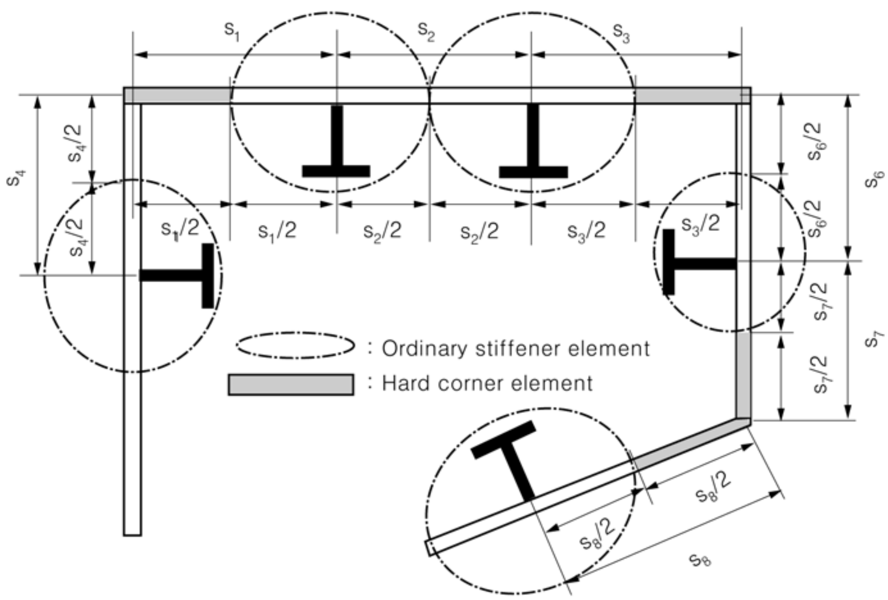

Fig 7: Extension of the breadth of the attached plating and hard corner element

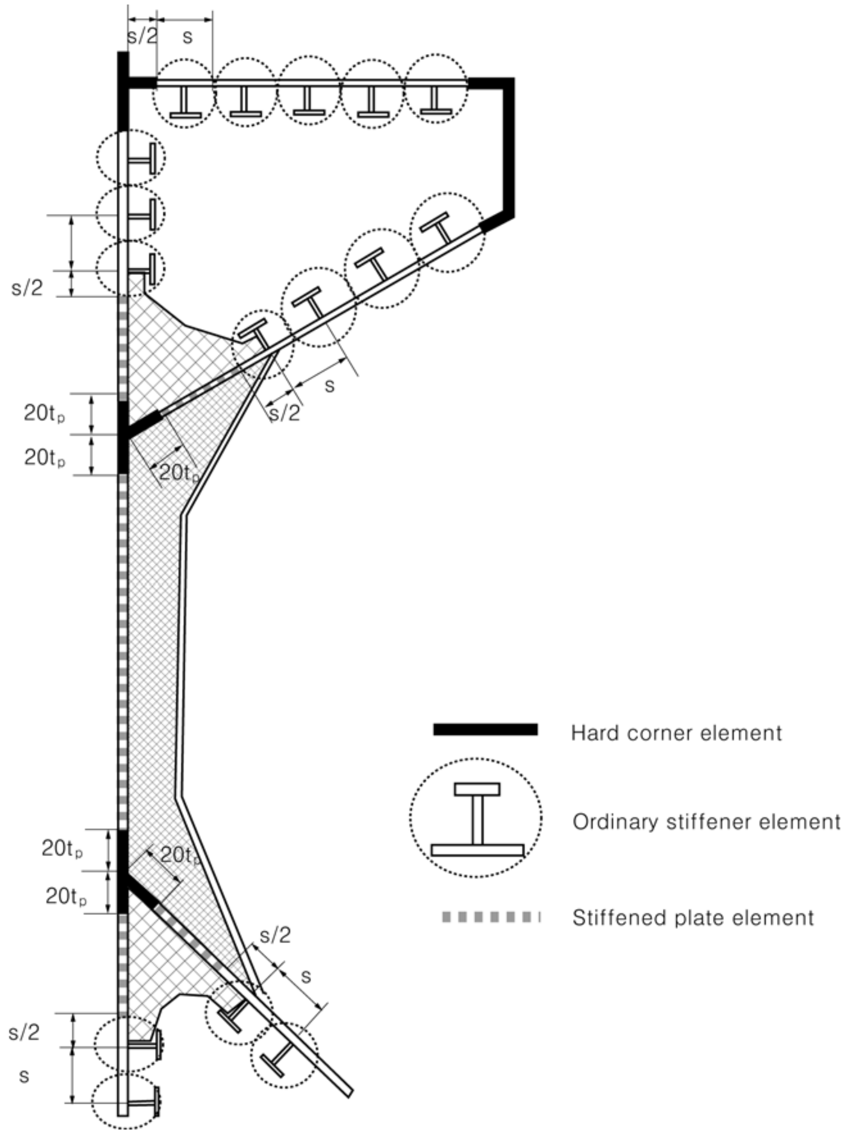

Fig 8: Examples of the configuration of stiffened plate elements, ordinary stiffener elements and hard corner elements on a hull section

(Note)

(1) In case of the knuckle point as shown in **Fig 9**, the plating area adjacent to knuckles in the plating with an angle greater than 30 degrees is defined as a hard corner. The extent of one side of the corner is taken equal to $20\,t_p$ on transversely framed panels and to $0.5\,s$ on longitudinally framed panels from the knuckle point.

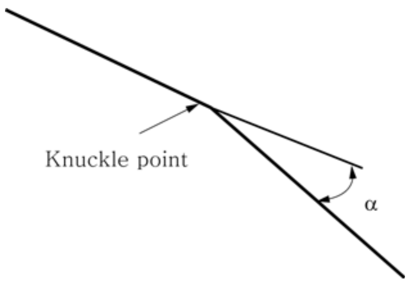

Fig 9: The case of plating with knuckle point

(2) Where the plate members are stiffened by non-continuous longitudinal stiffeners, the non-continuous stiffeners are considered only as dividing a plate into various elementary plate panels.

(3) Where the opening is provided in the stiffened plate element, the openings are to be considered in accordance with **Ch 5, Sec 1, [1.2.7], [1.2.8]** and **[1.2.9].**

(4) Where attached plating is made of steels having different thicknesses and/or yield stresses, an average thickness and/or average yield stress obtained from the following formula are to be used for the calculation.

$$t = \frac{t_1 s_1 + t_2 s_2}{s}, \qquad R_{eHp} = \frac{R_{eHp1} t_1 s_1 + R_{eHp2} t_2 s_2}{ts}$$

Where,

R_{eHp1}, R_{eHp2}, t_1, t_2, s_1, s_2 and s are shown in **Fig 10.**

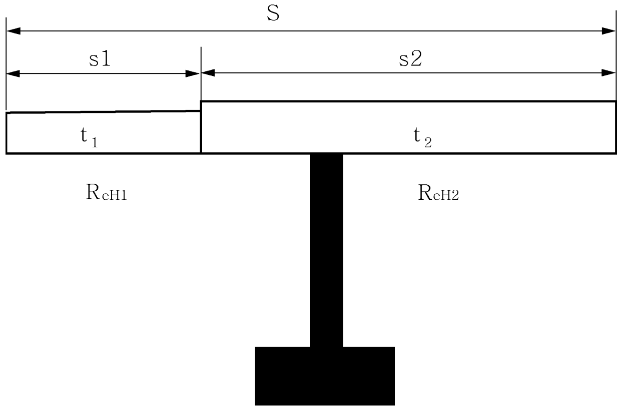

Fig 10: Element with different thickness and yield strength

2.2 Load-end shortening curves $\sigma - \varepsilon$

2.2.1 Stiffened plate element and ordinary stiffener element

Stiffened plate element and ordinary stiffener element composing the hull girder transverse sections may collapse following one of the modes of failure specified in **Table 1.**

- Where the plate members are stiffened by non-continuous longitudinal stiffeners, the stress of the element is to be obtained in accordance with **[2.2.3]** to **[2.2.7]**, taking into account the non-continuous longitudinal stiffener.

  In calculating the total forces for checking the hull girder ultimate strength, the area of non-continuous longitudinal stiffener is to be assumed as zero.

- Where the opening is provided in the stiffened plate element, the considered area of the stiffened plate element is to be obtained by deducting the opening area from the plating in calculating the total forces for checking the hull girder ultimate strength. The consideration of the opening is in accordance with the requirement in **Ch 5, Sec 1, [1.2.7]** to **[1.2.9].**

- For stiffened plate element, the effective breadth of plate for the load shortening portion of the stress-strain curve is to be taken as full plate breadth, i.e. to the intersection of other plate or longitudinal stiffener - not from the end of the hard corner element nor from the attached plating of ordinary stiffener element, if any. In calculating the total forces for checking the hull girder ultimate strength, the area of the stiffened plate element is to be taken between the hard corner element and the ordinary stiffener element or between the hard corner elements, as applicable.

Table 1: Modes of failure of stiffened plate element and ordinary stiffener element

Element	Mode of failure	Curve $\sigma-\varepsilon$ defined in
Lengthened stiffened plate element or ordinary stiffener element	Elasto-plastic collapse	[2.2.3]
Shortened ordinary stiffener element	Beam column buckling Torsional buckling Web local buckling of flanged profiles Web local buckling of flat bars	[2.2.4] [2.2.5] [2.2.6] [2.2.7]
Shortened stiffened plate element	Plate buckling	[2.2.8]

2.2.2 Hard corner element

The relevant load-end shortening curve $\sigma-\varepsilon$ is to be obtained for lengthened and shortened hard corners according to **[2.2.3].**

2.2.3 Elasto-plastic collapse of structural elements

The equation describing the load-end shortening curve $\sigma-\varepsilon$ for the elasto-plastic collapse of structural elements composing the hull girder transverse section is to be obtained from the following formula, valid for both positive (shortening) and negative (lengthening) strains (see **Fig 2**):

$$\sigma = \Phi R_{eHA}$$

where:

R_{eHA} : Equivalent minimum yield stress, in N/mm^2, of the considered element, obtained by the following formula

$$R_{eHA} = \frac{R_{eHp} A_p + R_{eHs} A_s}{A_p + A_s}$$

Φ : Edge function, equal to:

$\Phi = -1$ for $\varepsilon < -1$

$\Phi = \varepsilon$ for $-1 \le \varepsilon \le 1$

$\Phi = 1$ for $\varepsilon > 1$

ε : Relative strain, equal to:

$$\varepsilon = \frac{\varepsilon_E}{\varepsilon_Y}$$

ε_E : Element strain

ε_Y : Strain at yield stress in the element, equal to:

$$\varepsilon_Y = \frac{R_{eHA}}{E}$$

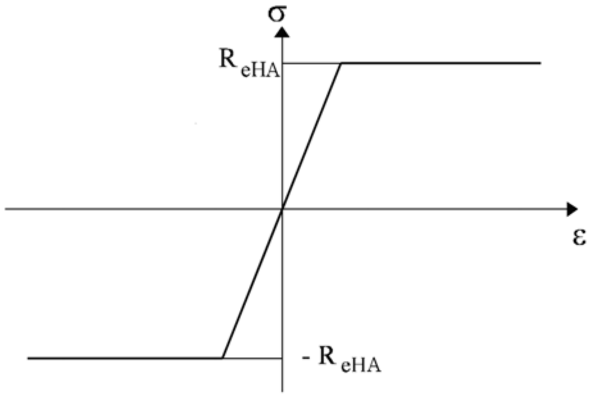

Fig 2: Load-end curve $\sigma-\varepsilon$ for elasto plastic collapse

2.2.4 Beam column buckling

The equation describing the load-end shortening curve $\sigma_{CR1}-\varepsilon$ for the beam column buckling of ordinary stiffeners composing the hull girder transverse section is to be obtained from the following formula (see **Fig 3**):

$$\sigma_{CR1} = \Phi\sigma_{C1}\frac{A_s + A_{pE}}{A_s + A_p}$$

where:

Φ : Edge function defined in **[2.2.3]**

σ_{C1} : Critical stress, in N/mm^2, equal to:

$$\sigma_{C1} = \frac{\sigma_{E1}}{\varepsilon} \quad \text{for} \quad \sigma_{E1} \le \frac{R_{eHB}}{2}\varepsilon$$

$$\sigma_{C1} = R_{eHB}\left(1 - \frac{R_{eHB}\varepsilon}{4\sigma_{E1}}\right) \quad \text{for} \quad \sigma_{E1} > \frac{R_{eHB}}{2}\varepsilon$$

R_{eHB} : Equivalent minimum yield stress, in N/mm^2, of the considered element, obtained by the following formula

$$R_{eHB} = \frac{R_{eHB}A_{pE1}l_{pE} + R_{eHs}A_s l_{sE}}{A_{pE1}l_{pE} + A_s l_{sE}}$$

A_{pE1} : Effective area, in cm^2, equal to

$$A_{pE1} = 10\,b_{E1}t_p$$

l_{pE} : Distance, in mm, measured from the neutral axis of the stiffener with attached plate of width b_{E1} to the bottom of the attached plate

l_{sE} : Distance, in mm, measured from the neutral axis of the stiffener with attached plating of width b_{E1} to the top of the stiffener

ε : Relative strain defined in **[2.2.3]**

σ_{E1} : Euler column buckling stress, in N/mm^2, equal to:

$$\sigma_{E1} = \pi^2 E\frac{I_E}{A_E l^2}10^{-4}$$

I_E : Net moment of inertia of ordinary stiffeners, in cm^4, with attached shell plating of width b_{E1}

b_{E1} : Effective width, in m, of the attached shell plating, equal to:

$$b_{E1} = \frac{s}{\beta_E} \quad \text{for} \quad \beta_E > 1.0$$

$b_{E1} = s$ for $\beta_E \le 1.0$

$$\beta_E = 10^3 \frac{s}{t_p} \sqrt{\frac{\varepsilon R_{eHP}}{E}}$$

A_{pE} : Net sectional area, in cm^2, of attached shell plating of width b_E, equal to:

$A_{pE} = 10\, b_E t_p$

b_E : Effective width, in m, of the attached shell plating, equal to:

$b_E = \left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2}\right) s$ for $\beta_E > 1.25$

$b_E = s$ for $\beta_E \le 1.25$

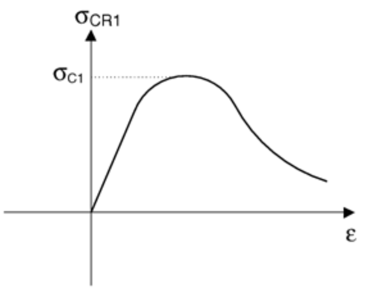

Fig 3: Load-end shortening curve $\sigma_{CR1} - \varepsilon$ for beam column buckling

2.2.5 Torsional buckling

The equation describing the load-end shortening curve $\sigma_{CR2} - \varepsilon$ for the flexural-torsional buckling of ordinary stiffeners composing the hull girder transverse section is to be obtained according to the following formula (see **Fig 4**).

$$\sigma_{CR2} = \Phi \frac{A_s \sigma_{C2} + A_p \sigma_{CP}}{A_s + A_p}$$

where:

Φ : Edge function defined in **[2.2.3]**

σ_{C2} : Critical stress, in $\mathrm{N/mm^2}$, equal to:

$\sigma_{C2} = \frac{\sigma_{E2}}{\varepsilon}$ for $\sigma_{E2} \le \frac{R_{eHs}}{2}\varepsilon$

$\sigma_{C2} = R_{eHs}\left(1 - \frac{R_{eHs}\,\varepsilon}{4\sigma_{E2}}\right)$ for $\sigma_{E2} > \frac{R_{eHs}}{2}\varepsilon$

σ_{E2} : Euler torsional buckling stress, in $\mathrm{N/mm^2}$, defined in **Ch 6, Sec 3, [4.3]**

ε : Relative strain defined in **[2.2.3]**

σ_{CP} : Buckling stress of the attached plating, in $\mathrm{N/mm^2}$, equal to:

$\sigma_{CP} = \left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2}\right) R_{eHp}$ for $\beta_E > 1.25$

$\sigma_{CP} = R_{eHp}$ for $\beta_E \le 1.25$

β_E : Coefficient defined in **[2.2.4]**

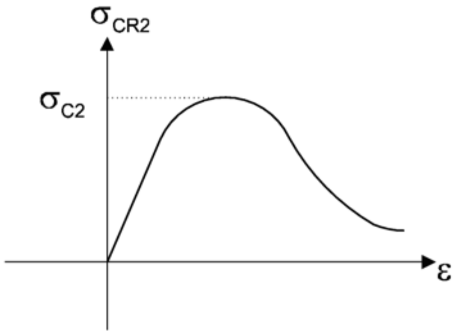

Fig 4: Load-end shortening curve $\sigma_{CR2} - \varepsilon$ for flexural-torsional buckling

2.2.6 Web local buckling of ordinary stiffeners made of flanged profiles

The equation describing the load-end shortening curve $\sigma_{CR3} - \varepsilon$ for the web local buckling of flanged ordinary stiffeners composing the hull girder transverse section is to be obtained from the following formula:

$$\sigma_{CR3} = \Phi \frac{10^3 b_E t_p R_{eHp} + (h_{we} t_w + b_f t_f) R_{eHs}}{10^3 s t_p + h_w t_w + b_f t_f}$$

where

Φ : Edge function defined in **[2.2.3]**

b_E : Effective width, in m, of the attached shell plating, defined in **[2.2.4]**

h_{we} : Effective height, in mm, of the web, equal to:

$$h_{we} = \left(\frac{2.25}{\beta_w} - \frac{1.25}{\beta_w^2}\right) h_w \quad \text{for} \quad \beta_w > 1.25$$

$$h_{we} = h_w \quad \text{for} \quad \beta_w \le 1.25$$

$$\beta_w = \frac{h_w}{t_w}\sqrt{\frac{\varepsilon R_{eHs}}{E}}$$

ε : Relative strain defined in **[2.2.3]**

2.2.7 Web local buckling of ordinary stiffeners made of flat bars

The equation describing the load-end shortening curve $\sigma_{CR4} - \varepsilon$ for the web local buckling of flat bar ordinary stiffeners composing the hull girder transverse section is to be obtained from the following formula (see **Fig 5**):

$$\sigma_{CR4} = \Phi \frac{A_P \sigma_{CP} + A_s \sigma_{C4}}{A_p + A_s}$$

where:

Φ : Edge function defined in **[2.2.3]**

σ_{CP} : Buckling stress of the attached plating, in $\mathrm{N/mm^2}$, defined in **[2.2.5]**

σ_{C4} : Critical stress, in $\mathrm{N/mm^2}$, equal to:

$$\sigma_{C4} = \frac{\sigma_{E4}}{\varepsilon} \quad \text{for} \quad \sigma_{E4} \le \frac{R_{eHs}}{2}\varepsilon$$

$$\sigma_{C4} = R_{eHs}\left(1 - \frac{R_{eHs}\varepsilon}{4\sigma_{E4}}\right) \quad \text{for} \quad \sigma_{E4} > \frac{R_{eHs}}{2}\varepsilon$$

σ_{E4} : Local Euler buckling stress, in $\mathrm{N/mm^2}$, equal to:

$$\sigma_{E4} = 160{,}000\left(\frac{t_w}{h_w}\right)^2$$

ε : Relative strain defined in **[2.2.3].**

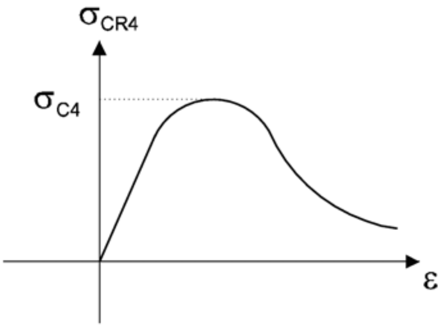

Fig 5: Load-end shortening curve $\sigma_{CR4} - \varepsilon$ for web local buckling

2.2.8 Plate buckling

The equation describing the load-end shortening curve $\sigma_{CR5} - \varepsilon$ for the buckling of transversely stiffened panels composing the hull girder transverse section is to be obtained from the following formula:

$$\sigma_{CR5} = \min\begin{cases} R_{eHp}\Phi \\ \Phi R_{eHp}\left[\dfrac{s}{\ell}\left(\dfrac{2.25}{\beta_E} - \dfrac{1.25}{\beta_E^2}\right) + 0.1\left(1 - \dfrac{s}{\ell}\right)\left(1 + \dfrac{1}{\beta_E^2}\right)^2\right] \end{cases}$$

where:

Φ : Edge function defined in **[2.2.3].**

$$\beta_E = 10^3\frac{s}{t_p}\sqrt{\frac{\varepsilon R_{eHp}}{E}}$$

s : plate breadth, in m, taken as the spacing between the ordinary stiffeners.

ℓ : longer side of the plate, in m. ⚓

Hull Scantlings

Section 1 - PLATING

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

I_Y : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to **Ch 5, Sec 1, [1.5]**, on gross offered thickness reduced by $0.5\,t_C$ for all structural members

I_Z : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to **Ch 5, Sec 1, [1.5]**, on gross offered thickness reduced by $0.5\,t_C$ for all structural members

N : Z co-ordinate with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**, in m, of the centre of gravity of the hull net transverse section, defined in **Ch 5, Sec 1, [1.2]**, considering gross offered thickness reduced by $0.5\,t_C$ for all structural members

t : Net thickness, in mm, of a plate panel.

p_S, p_W : Still water and wave pressure, in kN/m^2, in intact conditions, defined in **[3.1.2]**

p_F : Pressure, in kN/m^2, in flooded conditions, defined in **[3.1.3]**

p_T : Pressure, in kN/m^2, in testing conditions, defined in **[3.1.4]**

σ_X : Normal stress, in kN/m^2, defined in [3.1.5]

ℓ : Length, in m, of the longer side of the elementary plate panel, measured along the chord

s : Length, in m, of the shorter side of the elementary plate panel, measured along the chord at mid-span of ℓ

c_a : Coefficient of aspect ratio of the plate panel, equal to:

$$c_a = 1.21\sqrt{1+0.33\left(\frac{s}{\ell}\right)^2} - 0.69\frac{s}{\ell}$$, to be taken not greater than 1.0

c_r : Coefficient of curvature of the panel, equal to:

$$c_r = 1 - 0.5\frac{s}{r}$$, to be taken not less than 0.4

r : Radius of curvature, in m.

1. General

1.1 Application

1.1.1

The requirements of this Section apply for the strength check of plating subjected to lateral pressure and, for plating contributing to the longitudinal strength, to in-plane hull girder normal stress.
In addition, the buckling check of platings and stiffened panels is to be carried out according to **Ch 6, Sec 3.**

1.2 Net thicknesses

1.2.1

As specified in **Ch 3, Sec 2**, all thicknesses referred to in this Section are net, i.e. they do not include any corrosion addition.

The gross thicknesses are obtained as specified in **Ch 3, Sec 2, [3].**

1.2.2

The net thickness, in mm, of each plating is given by the greatest of the net thicknesses calculated for each load calculation point, as defined in **[1.5.1]**, representative of the considered plating (see **Table 1**). The geometry to be considered is that of the elementary plate panel related to the load calculation point.

1.3 Pressure combination

1.3.1 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering independently the following cases:

- the still water and wave external sea pressures
- the still water and wave internal pressure considering the compartment adjacent to the outer shell as being loaded. If the compartment adjacent to the outer shell is intended to carry liquids, this still water and wave internal pressures are to be reduced from the corresponding still water and wave external sea pressures.

1.3.2 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

1.4 Elementary plate panel

1.4.1

The elementary plate panel (EPP) is the smallest unstiffened part of plating between stiffeners.

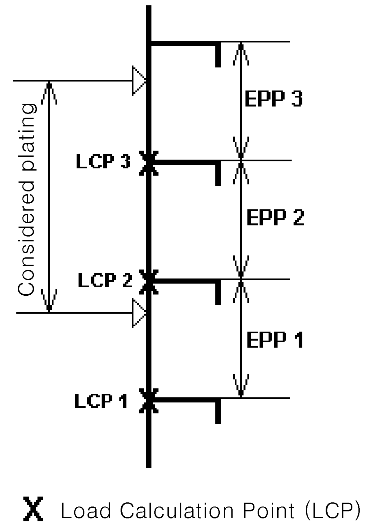
1.5 Load calculation point

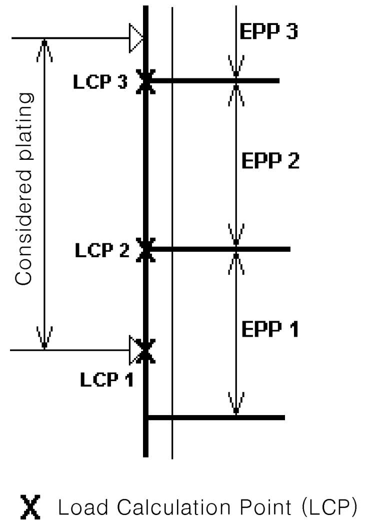
1.5.1

Unless otherwise specified, lateral pressure and hull girder stresses are to be calculated:

- for longitudinal framing, at the lower edge of the elementary plate panel (see **Table 1**) or, in the case of horizontal plating, at the point of minimum y-value among those of the elementary plate panel considered, as the case may be
- for transverse framing, at the lower edge of the elementary plate panel or at the lower edge of the strake (see **Table 1**) or, in the case of horizontal plating, at the point of minimum y-value among those of the elementary plate panel considered, as the case may be.

Table 1: Load calculation points

Longitudinally stiffened plating	Transversely stiffened plating
	




2. General requirements

2.1 Corrugated bulkhead

2.1.1

Unless otherwise specified, the net plating thickness of a corrugated bulkhead is to be not less than that obtained for a plate panel with s equal to the greater of a and c, where a and c are defined in **Fig 1.**

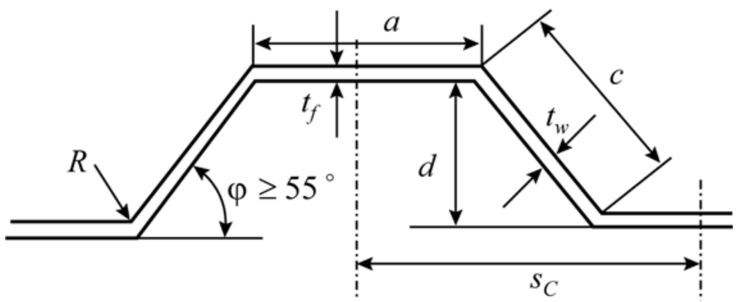


Fig 1: Corrugated bulkhead

2.2 Minimum net thicknesses

2.2.1

The net thickness of plating is to be not less than the values given in **Table 2.**
In addition, in the cargo area, the net thickness of side shell plating, from the normal ballast draught to 0.25 T_S (minimum 2.2 m) above T_S, is to be not less than the value obtained, in mm, from the following formula:

$$t = 28(s + 0.7)\frac{(BT_s)^{0.25}}{\sqrt{R_{eH}}}$$

Table 2: Minimum net thickness of plating

Plating	Minimum net thickness, in mm
Keel	$7.5 + 0.03L$
Bottom, inner bottom	$5.5 + 0.03L$
Weather strength deck and trunk deck, if any	$4.5 + 0.02L$
Side shell, bilge	$0.85L^{1/2}$
Inner side, hopper sloping plate and topside sloping plate	$0.7L^{1/2}$
Transverse and longitudinal watertight bulkheads	$0.6L^{1/2}$
Wash bulkheads	6.5
Accommodation deck	5.0

2.3 Bilge plating

2.3.1

The net thickness of the longitudinally framed bilge plating, in mm, is to be not less than the value obtained from **[3.2].**

2.3.2

The net thickness of the transversely framed bilge plating, in mm, is to be not less than the value obtained from the following formula:

$$t = 0.76\left[(p_S + p_W)s_b\right]^{0.4} R^{0.6} k^{0.5}$$

where :

R : Bilge radius, in m

s_b : Spacing of floors or transverse bilge brackets, in m.

2.3.3

The net thickness of the bilge plating is to be not less than the actual net thicknesses of the adjacent 2 m width bottom or side plating, whichever is the greater.

2.4 Keel plating

2.4.1

The net thickness of the keel plating is to be not less than the actual net thicknesses of the adjacent 2 m width bottom plating.

2.5 Sheerstrake

2.5.1 Welded sheerstrake

The net thickness of a welded sheerstrake is to be not less than the actual net thicknesses of the adjacent 2 m width side plating, taking into account higher strength steel corrections if needed.

2.5.2 Rounded sheerstrake

The net thickness of a rounded sheerstrake is to be not less than the actual net thickness of the adjacent deck plating.

2.5.3 Net thickness of the sheerstrake in way of breaks of effective superstructures

The net thickness of the sheerstrake is to be increased in way of breaks of effective superstructures occurring within $0.5\,L$ amidships, over a length of about one sixth of the ship's breadth on each side of the superstructure end.
This increase in net thickness is not to be less than 40 % of the net thickness of sheerstrake, but need not exceed 4.5 mm.
Where the breaks of superstructures occur outside $0.5\,L$ amidships, the increase in net thickness may be reduced to 30 %, but need not exceed 2.5 mm.

2.5.4 Net thickness of the sheerstrake in way of breaks of non-effective superstructures

The net thickness of the sheerstrake is to be increased in way of breaks of non-effective superstructures occurring within $0.6\,L$ amidships, over a length of about one sixth of the ship's breadth on each side of the superstructure end.
This increase in net thickness is to be equal to 15 %, but need not exceed 4.5 mm.

2.6 Stringer plate

2.6.1 General

The net thickness of the stringer plate is to be not less than the actual net thickness of the adjacent deck plating.

2.6.2 Net thickness of the stringer plate in way of breaks of long superstructures

The net thickness of the stringer plate is to be increased in way of breaks of long superstructures occurring within $0.5\,L$ amidships, over a length of about one sixth of the ship's breadth on each side of the superstructure end.
This increase in net thickness is not to be less than 40 % of the net thickness of stringer plate, but need not exceed 4.5 mm.
Where the breaks of superstructures occur outside $0.5\,L$ amidships, the increase in net thickness may be reduced to 30 %, but need not exceed 2.5 mm.

2.6.3 Net thickness of the stringer plate in way of breaks of short superstructures

The net thickness of the stringer plate is to be increased in way of breaks of short superstructures occurring within $0.6\,L$ amidships, over a length of about one sixth of the ship breadth on each side of the superstructure end.
This increase in net thickness is to be equal to 15 %, but need not exceed 4.5 mm.

2.7 Inner bottom loaded by steel coils on a wooden support

2.7.1 General

The net thickness of inner bottom, bilge hopper sloping plate and inner hull for ships intended to carry steel coils is to comply with **[2.7.2]** to **[2.7.4].**
The provision is determined by assuming **Fig 2** as the standard means of securing steel coils.

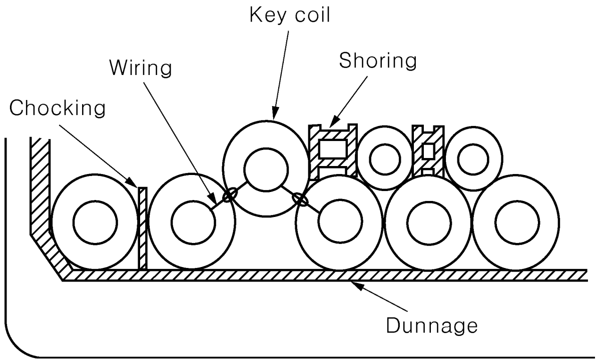

Fig 2: Inner bottom loaded by steel coils

2.7.1 bis1 Accelerations

In order to calculate the accelerations, the following coordinates are to be used for the centre of gravity.

x_{G-sc} = 0.75 ℓ_H forward of aft bulkhead, where the hold of which the mid position is located forward from 0.45 L from A.E.

x_{G-sc} = 0.75 ℓ_H afterward of fore bulkhead, where the hold of which the mid position is located afterward from 0.45 L from A.E.

$$y_{G-sc} = \varepsilon \frac{B_h}{4}$$

$$z_{G-sc} = h_{DB} + \left\{1 + (n_1 - 1)\frac{\sqrt{3}}{2}\right\}\frac{d_{sc}}{2}$$

where:

ε : 1.0 when a port side structural member is considered, or -1.0 when a starboard side structural member is considered.

B_h : breadth in m, at the mid of the hold, of the cargo hold at the level of connection of bilge hopper plate with side shell or inner hull

d_{sc} : diameter of steel coils, in m

h_{DB} : height of inner bottom, in m

ℓ_H : Cargo hold length, in m

Vertical acceleration a_Z, in m/s², are to be calculated by the formulae defined in **Ch 4, Sec 2, [3.2]** and tangential acceleration a_R due to roll, in m/s², is to be calculated by the following formula.

$$a_R = \theta \frac{\pi}{180}\left(\frac{2\pi}{T_R}\right)^2 \sqrt{y_{G\_sc}^{\ 2} + R^2}$$

where:

θ, T_R and R: as defined in **Ch 4, Sec 2, [3.2].**

2.7.2 Inner bottom plating

The net thickness of plating of longitudinally framed inner bottom is to be not less than the value obtained, in mm, from the following formula:

$$t = K_1 \sqrt{\frac{\{g(\cos(C_{ZP}\Phi)\cos(C_{ZR}\theta)) + a_z\}F}{\lambda_P R_Y}}$$

where:

K_1 : Coefficient taken equal to:

$$K_1 = \sqrt{\frac{1.7s\ell K_2 - 0.73s^2K_2^2 - (\ell - \ell')^2}{2\ell'(2s + 2\ell K_2)}}$$

a_Z : Vertical acceleration, in m/s^2, defined in **[2.7.1 bis1]**

Φ : Single pitch amplitude, in deg, defined in **Ch 4, Sec 2, [2.2]**

θ : Single roll amplitude, in deg, defined in **Ch 4, Sec 2, [2.1]**

C_{ZP}, C_{ZR} : Load combination factor defined in **Ch 4, Sec 4, [2.2]**

F : Force, in kg, taken equal to:

$F = K_S \frac{Wn_1n_2}{n_3}$ for $n_2 \le 10$ and $n_3 \le 5$

$F = K_S n_1 W \frac{l}{l_s}$ for $n_2 > 10$ or $n_3 > 5$

λ_P : Coefficient defined in **Table 6**

K_S : Coefficient taken equal to:

K_S = 1.4 when steel coils are lined up in one tier with a key coil

K_S = 1.0 in other cases

W : Mass of one steel coil, in kg

n_1 : Number of tiers of steel coils

n_2 : Number of load points per elementary plate panel (See **Figs 3** and **4**)

When $n_3 \le 5$, n_2 can be obtained from **Table 3** according to the values of n_3 and ℓ/ℓ_s

n_3 : Number of dunnages supporting one steel coil

ℓ_S : Length of a steel coil, in m

K_2 : Coefficient taken equal to:

$$K_2 = -\frac{s}{\ell} + \sqrt{\left(\frac{s}{\ell}\right)^2 + 1.37\left(\frac{\ell}{s}\right)^2\left(1 - \frac{\ell'}{\ell}\right)^2 + 2.33}$$

ℓ' : Distance, in m, between outermost load points per elementary plate panel in ship length (See **Figs 3** and **4**). When $n_2 \le 10$ and $n_3 \le 5$, ℓ' can be obtained from **Table 4** according to the values of ℓ, ℓ_S, n_2 and n_3. When $n_2 > 10$ or $n_3 > 5$, ℓ' is to be taken equal to ℓ.

2.7.3 Bilge hopper sloping plate and inner hull plate

The net thickness of plating of longitudinally framed bilge hopper sloping plate and inner hull is to be not less than the value obtained, in mm, from the following formula:

$$t = K_1 \sqrt{\frac{a_{hopper}F'}{\lambda_P R_y}}$$

where:

K_1 : Coefficient defined in **[2.7.2]**

θ_h : Angle, in deg, between inner bottom plate and bilge hopper sloping plate or inner hull plate

$$a_{hopper} = -C_{YR} a_R \sin\left(\tan^{-1}\left|\frac{y_{G\_sc}}{R}\right| - \theta_h\right) + g\cos(\theta_h - C_{YG}\theta)\cos(C_{XG}\Phi) + C_{YS} a_{sway} \sin\theta_h$$

a_R : tangential acceleration defined in **[2.7.1 bis1].**

a_{sway} : Transverse acceleration due to sway, in m/s^2, defined in **Ch 4, Sec 2, [2.4]**

C_{XG}, C_{YS}, C_{YR}, C_{YG} : Load combination factors defined in **Ch 4, Sec 4, [2.2]**

y_{G_sc} : Centre of gravity in transverse direction, in m, defined in **[2.7.1 bis1]**

R : Coefficient defined in **Ch 4, Sec 2, [3.2.1]**

F' : Force, in kg, taken equal to:

$$F' = \frac{W n_2 C_k}{n_3} \quad \text{for} \quad n_2 \le 10 \text{ and } n_3 \le 5$$

$$F' = C_k W \frac{l}{l_s} \quad \text{for} \quad n_2 > 10 \text{ or } n_3 > 5$$

λ_P : Coefficient defined in Tab 6

W, n_2, n_3, Φ and θ: As defined in [2.7.2]

C_k : Coefficient taken equal to:

C_k = 3.2 when steel coils are lined up two or more tier, or when steel coils are lined up one tier and key coil is located second or third from bilge hopper sloping plate or inner hull plate

C_k = 2.0 for other cases

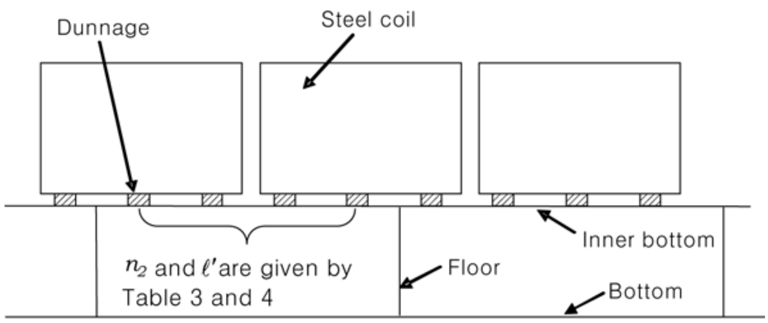

Fig 3: Loading condition of steel coils (example of n_2= 4, n_3= 3)

3. Strength check of plating subjected to lateral pressure

3.1 Load model

3.1.1 General

The still water and wave lateral pressures induced by the sea and the various types of cargoes and ballast in intact conditions are to be considered, depending on the location of the plating under consideration and the type of the compartments adjacent to it.
The plating which constitutes the boundary of compartments not intended to carry liquid (excluding bottom and side shell plating) is to be subjected to lateral pressure in flooded conditions.
The wave lateral pressures and hull girder loads are to be calculated, for the probability level of 10^{-8}, in the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2, as defined in **Ch 4, Sec 4.**

3.1.2 Lateral pressure in intact conditions

The lateral pressure in intact conditions is constituted by still water pressure and wave pressure.
Still water pressure p_S includes:

- the hydrostatic pressure, defined in **Ch 4, Sec 5, [1]**
- the still water internal pressure, defined in **Ch 4, Sec 6** for the various types of cargoes and for ballast.

Wave pressure p_W includes for each load case H1, H2, F1, F2, R1, R2, P1 and P2:

- the hydrodynamic pressure, defined in **Ch 4, Sec 5, [1]**
- the inertial pressure, defined in **Ch 4, Sec 6** for the various types of cargoes and for ballast.

3.1.3 Lateral pressure in flooded conditions

The lateral pressure in flooded conditions pF is defined in **Ch 4, Sec 6, [3.2.1].**

3.1.4 Lateral pressure in testing conditions

The lateral pressure p_T in testing conditions is taken equal to:

- $p_T = p_{ST} - p_S$ for bottom shell plating and side shell plating

- $p_T = p_{ST}$ otherwise,

where:

p_{ST} : Testing pressure defined in **Ch 4, Sec 6, [4]**

p_S : Pressure taken equal to:

- if the testing is carried out afloat: hydrostatic pressure defined in **Ch 4, Sec 5, [1]** for the draught T_1, defined by the Designer, at which the testing is carried out. If T_1 is not defined, the testing is considered as being not carried out afloat
- if the testing is not carried out afloat: p_S = 0

3.1.5 Normal stresses

The normal stress to be considered for the strength check of plating contributing to the hull girder longitudinal strength is the maximum value of σ_X between sagging and hogging conditions, when applicable, obtained, in N/mm², from the following formula:

$$\sigma_X = \left[C_{SW} \left| \frac{M_{SW}}{I_Y} \right| (z - N) + C_{WV} \left| \frac{M_{WV}}{I_Y} \right| (z - N) - C_{WH} \left| \frac{M_{WH}}{I_Z} \right| y \right] 10^{-3}$$

where:

M_{SW} : Permissible still water bending moments, in kN.m, in hogging or sagging as the case may be

M_{WV} : Vertical wave bending moment, in kN.m, in hogging or sagging as the case may be, as defined in **Ch 4, Sec 3**

M_{WH} : Horizontal wave bending moment, in kN.m, as defined in **Ch 4, Sec 3**

C_{SW} : Combination factor for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and defined in **Table 5**

C_{WV}, C_{WH} : Combination factors defined in **Ch 4, Sec 4, [2.2]** for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and given in **Table 5**.

Table 5: Combination factors C_{SW}, C_{WV} and C_{WH}

LC	Hogging			Sagging		
	C_{SW}	C_{WV}	C_{WH}	C_{SW}	C_{WV}	$C_{WH.}$
H1	-			-1	-1	0
H2	1	1	0	-		
F1	-			-1	-1	0
F2	1	1	0	-		
R1	1	0	$1.2 - \frac{T_{LC}}{T_S}$	-1	0	$1.2 - \frac{T_{LC}}{T_S}$
R2	1	0	$\frac{T_{LC}}{T_S} - 1.2$	-1	0	$\frac{T_{LC}}{T_S} - 1.2$
P1	1	$0.4 - \frac{T_{LC}}{T_S}$	0	-1	$0.4 - \frac{T_{LC}}{T_S}$	0
P2	1	$\frac{T_{LC}}{T_S} - 0.4$	0	-1	$\frac{T_{LC}}{T_S} - 0.4$	0

3.2 Plating thickness

3.2.1 Intact conditions

The net thickness of laterally loaded plate panels is to be not less than the value obtained, in mm, from the following formula:

$$t = 15.8 c_a c_r s \sqrt{\frac{p_S + p_W}{\lambda_P R_Y}}$$

where:

λ_P : Coefficient defined in **Table 6**

Table 6: Coefficient λ_P

Plating		Coefficient λ_P
Contributing to the hull girder longitudinal strength	Longitudinally framed plating	$0.95 - 0.45\left\lvert\frac{\sigma_X}{R_Y}\right\rvert$, without being taken greater than 0.9
	Transversely framed plating	$0.95 - 0.90\left\lvert\frac{\sigma_X}{R_Y}\right\rvert$, without being taken greater than 0.9
Not contributing to the hull girder longitudinal strength		0.9

3.2.2 Net thickness under flooded conditions excluding corrugations of transverse vertically corrugated bulkhead separating cargo holds

The plating which constitutes the boundary of compartments not intended to carry liquids (excluding bottom plating and side shell plating), and excluding corrugations of transverse vertically corrugated bulkhead separating cargo holds is to be checked in flooded conditions. To this end, its net thickness is to be not less than the value obtained, in mm, from the following formula:

$$t = 15.8 c_a c_r s \sqrt{\frac{p_F}{\alpha \lambda_P R_Y}}$$

where:

λ_P : Coefficient defined in **Table 6**, determined by considering α_X in flooded condition

α : Coefficient taken equal to:

$\alpha = 0.95$ for the plating of collision bulkhead

$\alpha = 1.15$ for the plating of other watertight boundaries of compartments.

3.2.3 Net thickness of corrugation of transverse vertically corrugated watertight bulkheads separating cargo holds for flooded conditions

The net plate thickness t, in mm, of transverse vertically corrugated watertight bulkheads separating cargo holds is to be not less than that obtained from the following formula:

$$t = 14.9 s \sqrt{\frac{1.05 p}{R_{eH}}}$$

p : Resultant pressure, in kN/m^2, as defined in **Ch 4, Sec 6, [3.3.7]**

s : plate width, in m, to be taken equal to the width of the corrugation flange or web, whichever is greater

For built-up corrugation bulkheads, when the thicknesses of the flange and web are different:

- the net thickness of the narrower plating is to be not less than that obtained, in mm, from the following formula:

$$t_N = 14.9s\sqrt{\frac{1.05p}{R_{eH}}}$$

s : plate width, in m, of the narrower plating.

- the net thickness of the wider plating is not to be less than the greater of those obtained, in mm, from the following formulae:

$$t_W = 14.9s\sqrt{\frac{1.05p}{R_{eH}}}$$

$$t_W = \sqrt{\frac{462s^2p}{R_{eH}} - t_{NP}^2}$$

where:

t_{NP} : Actual net thickness of the narrower plating, in mm, to be not taken greater than:

$$t_{NP} = 14.9s\sqrt{\frac{1.05p}{R_{eH}}}$$

s : plate width, in m, to be taken equal to the width of the corrugation flange or web, whichever is greater.

The net thickness of the lower part of corrugations is to be maintained for a distance from the inner bottom (if no lower stool is fitted) or the top of the lower stool not less than 0.15 ℓ_C, where ℓ_C is the span of the corrugations, in m, to be obtained according to **Ch 3, Sec 6, [10.4.4]**. The net thickness is also to comply with the requirements in **[3.2.1], Sec 2, [3.6.1 & 3.6.2]**, and **Sec 3, [6]**.
The net thickness of the middle part of corrugations is to be maintained for a distance from the deck (if no upper stool is fitted) or the bottom of the upper stool not greater than 0.3 ℓ_C. The net thickness is also to comply with the requirements in **[3.2.1]** and **Sec 2, [3.6.1 & 3.6.2]**.

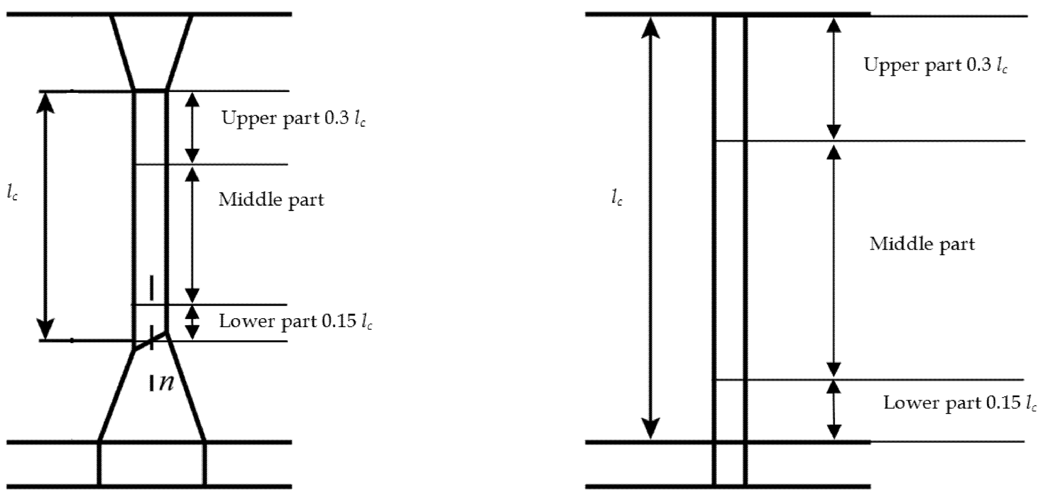

Fig 5: Parts of Corrugation

3.2.3 bis1 Net thickness of lower stool and upper stool

The net thickness and material of the stool top plate of lower stool are to be not less those for the corrugated bulkhead plating above required by **[3.2.3]**.
The net thickness and material of the upper portion of vertical or sloping stool side plating of lower stool within the depth equal to the corrugation flange width from the stool top are to be not less than the flange plate at the lower end of the corrugation required by **[3.2.3]**, as applicable, whichever is the greater.
The net thickness and material of the stool bottom plate of upper stool are to be the same as those of the bulkhead plating required by **[3.2.3]**, as applicable, whichever is the greater.
The net thickness of the lower portion of stool side plating is to not be less than 80 % of the upper part of the bulkhead plating required by **[3.2.3]**, as applicable, whichever is the greater, where the same material is used.
The net thickness of lower stool and upper stool are to be not less than those required by **[3.2.1], [3.2.2]** and **[3.2.4].**

3.2.3 bis 2 Net thickness of supporting floors of corrugated bulkhead

The net thickness and material of the supporting floors and pipe tunnel beams of corrugated bulkhead, when no stool is fitted, are to be not less than those of the corrugation flanges required by **[3.2.3].**
When a lower stool is fitted, the net thickness of supporting floors are to be not less than that of the stool side plating required by the first sentence of **[3.2.2].**

3.2.4 Testing Conditions

The plating of compartments or structures as defined in **Ch 4, Sec 6, [4]** is to be checked in testing conditions. To this end, its net thickness is to be not less than the value obtained, in mm, from the following formula:

$$t = 15.8 c_a c_r s \sqrt{\frac{p_T}{1.05 R_Y}}$$

Section 2 - ORDINARY STIFFENERS

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

L_2 : Rule length L, but to be taken not greater than 300 m

I_Y : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to **Ch 5, Sec 1, [1.5]**, on gross offered thickness reduced by $0.5\,t_C$ for all structural members

I_Z : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to **Ch 5, Sec 1, [1.5]**, on gross offered thickness reduced by $0.5\,t_C$ for all structural members

N : Z co-ordinate with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**, in m, of the centre of gravity of the hull net transverse section defined in **Ch 5, Sec 1, [1.2]**, considering gross offered thickness reduced by $0.5\,t_C$ for all structural members

p_S, p_W : Still water and wave pressure, in kN/m^2, in intact conditions, defined in **[3.1.2]**

p_F : Pressure, in kN/m^2, in flooded conditions, defined in **[3.1.3]**

p_T : Pressure, in kN/m^2, in testing conditions, defined in **[3.1.4]**

σ_X : Normal stress, in N/mm^2, defined in **[3.1.5]**

s : Spacing, in m, of ordinary stiffeners, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffeners, measured along the chord between the supporting members, see **Ch 3, Sec 6, [4.2]**

h_w : Web height, in mm

t_w : Net web thickness, in mm

b_f : Face plate width, in mm

t_f : Net face plate thickness, in mm

b_p : Width, in m, of the plating attached to the stiffener, for the yielding check, defined in **Ch 3, Sec 6, [4.3]**

w : Net section modulus, in cm^3, of the stiffener, with an attached plating of width b_p, to be calculated as specified in **Ch 3, Sec 6, [4.4]**

A_{sh} : Net shear sectional area, in cm^2, of the stiffener, to be calculated as specified in **Ch 3, Sec 6, [4.4]**

m : Coefficient taken equal to:

m = 10 for vertical stiffeners

m = 12 for other stiffeners

τ_a : Allowable shear stress, in N/mm^2, taken equal to:

$$\tau_a = \frac{R_Y}{\sqrt{3}}$$

1. General

1.1 Application

1.1.1

The requirements of this Section apply for the yielding check of ordinary stiffeners subjected to lateral pressure and, for ordinary stiffeners contributing to the hull girder longitudinal strength, to hull girder normal stresses.
The yielding check is also to be carried out for ordinary stiffeners subjected to specific loads, such as concentrated loads.
In addition, the buckling check of ordinary stiffeners is to be carried out according to **Ch 6, Sec 3.**

1.2 Net scantlings

1.2.1

As specified in **Ch 3, Sec 2**, all scantlings referred to in this Section are net, i.e. they do not include any corrosion addition.
The gross scantlings are obtained as specified in **Ch 3, Sec 2, [3].**

1.3 Pressure combination

1.3.1 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering independently the following cases:

- the still water and wave external sea pressures
- the still water and wave internal pressure considering the compartment adjacent to the outer shell as being loaded. If the compartment adjacent to the outer shell is intended to carry liquids, this still water and wave internal pressures are to be reduced from the corresponding still water and wave external sea pressures.

1.3.2 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

1.4 Load calculation point

1.4.1 Horizontal stiffeners

Unless otherwise specified, lateral pressure and hull girder stress, if any, are to be calculated at mid-span of the ordinary stiffener considered.

1.4.2 Vertical stiffeners

The lateral pressure p is to be calculated as the maximum between the value obtained at mid-span and the value obtained from the following formula:

- $p = \frac{p_U + p_L}{2}$, when the upper end of the vertical stiffener is below the lowest zero pressure level
- $p = \frac{\ell_1}{\ell}\frac{p_L}{2}$, when the upper end of the vertical stiffener is at or above the lowest zero pressure level (see **Fig 1**)

where:

ℓ_1 : Distance, in m, between the lower end of vertical stiffener and the lowest zero pressure level

p_U, p_L : Lateral pressures at the upper and lower end of the vertical stiffener span ℓ, respectively.

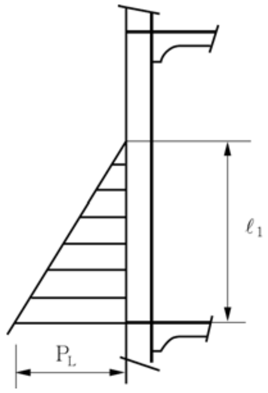

Fig 1: Definition of pressure for vertical stiffeners

2. General requirements

2.1 (void)

2.1.1 (void)

Fig 2: (void)

2.2 Net thickness of web of ordinary stiffeners

2.2.1 Minimum net thickness of webs of ordinary stiffeners other than side frames of single side bulk carriers

The net thickness of the web of ordinary stiffeners, in mm, is to be not less than the greater of:
- $t = 3.0 + 0.015 L_2$
- 40 % of the net required thickness of the attached plating, to be determined according to **Ch 6, Sec 1**.

2.2.2 Minimum net thickness of side frames of single side bulk carriers

The net thickness of side frame webs within the cargo area, in mm, is to be not less than the value obtained from the following formula:

$$t_{MIN} = 0.75\,\alpha(7 + 0.03L)$$

where:

α : Coefficient taken equal to:

$\alpha = 1.15$ for the frame webs in way of the foremost hold

$\alpha = 1.00$ for the frame webs in way of other holds.

2.2.3 Maximum net thickness of web of ordinary stiffener

The net thickness of the web of ordinary stiffeners, in mm, is to be less than 2 times the net offered thickness of the attached plating.

2.3 Net dimensions of ordinary stiffeners

2.3.1 Flat bar

The net dimensions of a flat bar ordinary stiffener (see **Fig 3**) are to comply with the following requirement:

$$\frac{h_W}{t_W} \le 20\sqrt{k}$$

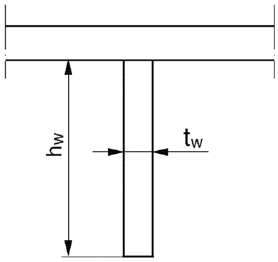

Fig 3: Net dimensions of a flat bar

2.3.2 T-section

The net dimensions of a T-section ordinary stiffener (see **Fig 4**) are to comply with the following requirements:

$$\frac{h_W}{t_W} \le 65\sqrt{k}$$

$$\frac{b_f}{t_f} \le 33\sqrt{k}$$

$$b_f t_f \ge \frac{h_W t_W}{6}$$

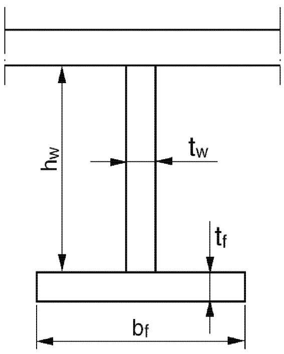

Fig 4: Net dimensions of a T-section

2.3.3 Angle

The net dimensions of an angle ordinary stiffener (see **Fig 5**) are to comply with the following requirements:

$$\frac{h_W}{t_W} \le 55\sqrt{k}$$

$$\frac{b_f}{t_f} \le 16.5\sqrt{k}$$

$$b_f t_f \ge \frac{h_W t_W}{6}$$

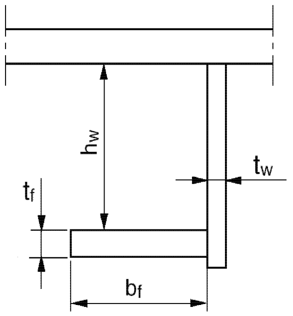

Fig 5: Net dimensions of an angle

2.4 Struts connecting ordinary stiffeners

2.4.1

The net sectional area A_{SR}, in cm^2, and the net moment of inertia I_{SR} about the main axes, in cm^4, of struts connecting ordinary stiffeners are to be not less than the values obtained from the following formulae:

$$A_{SR} = \frac{p_{SR} s \ell}{20}$$

$$I_{SR} = \frac{0.75 s\ell (p_{SR1} + p_{SR2}) A_{ASR}\ \ell_{SR}^2}{47.2 A_{ASR} - s\ell(p_{SR1} + p_{SR2})}$$

where:

p_{SR} : Pressure to be taken equal to the greater of the values obtained, in $\mathrm{kN/m}^2$, from the following formulae:

$$p_{SR} = 0.5(p_{SR1} + p_{SR2})$$

$$p_{SR} = p_{SR3}$$

p_{SR1} : External pressure in way of the strut, in $\mathrm{kN/m}^2$, acting on one side, outside the compartment in which the strut is located

p_{SR2} : External pressure in way of the strut, in $\mathrm{kN/m}^2$, acting on the opposite side, outside the compartment in which the strut is located

p_{SR3} : Internal pressure at mid-span of the strut, in $\mathrm{kN/m}^2$, in the compartment in which the strut is located

ℓ : Span, in m, of ordinary stiffeners connected by the strut (see **Ch 3, Sec 6, [4.2.3]**)

ℓ_{SR} : Length, in m, of the strut

A_{ASR} : Actual net sectional area, in cm^2, of the strut.

2.5 Ordinary stiffeners of inner bottom loaded by steel coils on a wooden support

2.5.1 General

The requirements of this sub-article apply to the ordinary stiffeners located on inner bottom plate, bilge hopper sloping plate and inner hull plate when loaded by steel coils on a wooden support (dunnage), as indicated in **Fig 2** of **Ch 6, Sec 1.**

2.5.2 Ordinary stiffeners located on inner bottom plating

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners located on inner bottom plating are to be not less than the values obtained from the following formulae:

$$w = K_3 \frac{\{g(\cos(C_{ZP}\Phi)\cdot\cos(C_{ZR}\theta)) + a_z\}F}{8\lambda_s R_Y}$$

$$A_{sh} = \frac{5\{g(\cos(C_{ZP}\Phi)\cdot\cos(C_{ZR}\theta)) + a_z\}F}{\tau_a \sin\phi}10^{-3}$$

where:

K_3 : Coefficient defined in **Table 1**. When n_2 is greater than 10, K_3 is to be taken equal to $2\ell/3$

a_Z : Vertical acceleration, in m/s^2, defined in **Ch 6, Sec 1, [2.7.1 bis1]**

Φ : Single pitch amplitude, in deg, defined in **Ch 4, Sec 2, [2.2]**

θ : Single roll amplitude, in deg, defined in **Ch 4, Sec 2, [2.1]**

C_{ZP}, C_{ZR} : Load combination factor defined in **Ch 4, Sec 4, [2.2]**

F : Force, in kg, defined in **Ch 6, Sec 1, [2.7.2]**

λ_S : Coefficient defined in **Table 3**

ϕ : Angle, in deg, defined in **[3.2.3].**

2.5.3 Ordinary stiffeners located on bilge hopper sloping plate or inner hull plate

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners located on bilge hopper sloping plate and inner hull plate are to be not less than the values obtained from the following formulae:

$$w = K_3 \frac{a_{hopper}F'}{8\lambda_S R_Y}$$

$$A_{sh} = \frac{5a_{hopper}F'}{\tau_a \sin\phi}10^{-3}$$

where:

K_3 : Coefficient defined in **Table 1**. When $n_2 > 10$, K_3 is taken equal to $2\ell/3$.

θ : Angle, in deg, between inner bottom plate and bilge hopper sloping plate or inner hull plate

a_{hopper} : Acceleration, in m/s^2, defined in **Ch 6, Sec 1, [2.7.4]**

F' : Force, in kg, defined in **Ch 6, Sec 1, [2.7.3]**

λ_S : Coefficient defined in **Table 3**

ϕ : Angle, in deg, defined in **[3.2.3]**

ℓ' : Distance, in m, between outermost load points per elementary plate panel in ship length

Table 1: Coefficient K_3

n_2	1	2	3	4	5	6	7	8	9	10
K_3	ℓ	$\ell - \frac{\ell'^2}{\ell}$	$\ell - \frac{2\ell'^2}{3\ell}$	$\ell - \frac{5\ell'^2}{9\ell}$	$\ell - \frac{\ell'^2}{2\ell}$	$\ell - \frac{7\ell'^2}{15\ell}$	$\ell - \frac{4\ell'^2}{9\ell}$	$\ell - \frac{3\ell'^2}{7\ell}$	$\ell - \frac{5\ell'^2}{12\ell}$	$\ell - \frac{11\ell'^2}{27\ell}$

2.5.4 (void)

2.6 Deck ordinary stiffeners in way of launching appliances used for survival craft or rescue boat

2.6.1

The scantlings of deck ordinary stiffeners are to be determined by direct calculations.

2.6.2

The loads exerted by launching appliance are to correspond to the Safe Working Load of the launching appliance.

2.6.3

The combined stress, in N/mm^2, is not to exceed the smaller of:

$$\frac{100}{235} R_{eH} \quad \text{and} \quad \frac{54}{235} R_m$$

where R_m is the ultimate tensile strength of the stiffener material, in N/mm^2.

3. Yielding check

3.1 Load model

3.1.1 General

The still water and wave lateral loads induced by the sea and the various types of cargoes and ballast in intact conditions are to be considered, depending on the location of the ordinary stiffener under consideration and the type of the compartments adjacent to it.
Ordinary stiffeners located on plating which constitutes the boundary of compartments not intended to carry liquids (excluding those on bottom and side shell plating) are to be subjected to the lateral pressure in flooded conditions.
The wave lateral loads and hull girder loads are to be calculated, for the probability level of 10^{-8}, in the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2, as defined in **Ch 4, Sec 4.**

3.1.2 Lateral pressure in intact conditions

The lateral pressure in intact conditions is constituted by still water pressure and wave pressure.
Still water pressure p_S includes:

- the hydrostatic pressure, defined in **Ch 4, Sec 5, [1]**
- the still water internal pressure, defined in **Ch 4, Sec 6** for the various types of cargoes and for ballast.

Wave pressure p_W includes for each load case H1, H2, F1, F2, R1, R2, P1 and P2:

- the hydrodynamic pressure, defined in **Ch 4, Sec 5, [1]**

- the inertial pressure, defined in **Ch 4, Sec 6** for the various types of cargoes and for ballast.

3.1.3 Lateral pressure in flooded conditions

The lateral pressure in flooded conditions p_F is defined in **Ch 4, Sec 6, [3.2.1].**

3.1.4 Lateral pressure in testing conditions

The lateral pressure p_T in testing conditions is taken equal to:

- $p_T = p_{ST} - p_S$ for bottom shell plating and side shell plating
- $p_T = p_{ST}$ otherwise,

where:

p_{ST} : Testing pressure defined in **Ch 4, Sec 6, [4]**

p_S : Pressure taken equal to:

- if the testing is carried out afloat: hydrostatic pressure defined in **Ch 4, Sec 5, [1]** for the draught T_1, defined by the Designer, at which the testing is carried out. If T_1 is not defined, the testing is considered as being not carried out afloat
- if the testing is not carried out afloat: $p_S = 0$

3.1.5 Normal stresses

The normal stress to be considered for the strength check of ordinary stiffeners contributing to the hull girder longitudinal strength is the maximum value of σ_X between sagging and hogging conditions, when applicable, obtained, in N/mm², from the following formula:

$$\sigma_X = \left[C_{SW} \left| \frac{M_{SW}}{I_Y} \right| (z - N) + C_{WV} \left| \frac{M_{WV}}{I_Y} \right| (z - N) - C_{WH} \left| \frac{M_{WH}}{I_Z} \right| y \right] 10^{-3}$$

where:

M_{SW} : Permissible still water bending moments, in kN.m, in hogging or sagging as the case may be

M_{WV} : Vertical wave bending moment, in kN.m, in hogging or sagging as the case may be, as defined in **Ch 4, Sec 3**

M_{WH} : Horizontal wave bending moment, in kN.m, as defined in **Ch 4, Sec 3**

C_{SW} : Combination factor for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and defined in **Table 2**

C_{WV}, C_{WH}: Combination factors defined in **Ch 4, Sec 4, [2.2]** for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and given in **Table 2.**

Table 2: Combination factors C_{SW}, C_{WV} and C_{WH}

LC	Hogging			Sagging		
	C_{SW}	C_{WV}	C_{WH}	C_{SW}	C_{WV}	C_{WH}
H1	Not Applicable			-1	-1	0
H2	1	1	0	Not Applicable		
F1	Not Applicable			-1	-1	0
F2	1	1	0	Not Applicable		
R1	1	0	$1.2-\frac{T_{LC}}{T_S}$	-1	0	$1.2-\frac{T_{LC}}{T_S}$
R2	1	0	$\frac{T_{LC}}{T_S}-1.2$	-1	0	$\frac{T_{LC}}{T_S}-1.2$
P1	1	$0.4-\frac{T_{LC}}{T_S}$	0	-1	$0.4-\frac{T_{LC}}{T_S}$	0
P2	1	$\frac{T_{LC}}{T_S}-0.4$	0	-1	$\frac{T_{LC}}{T_S}-0.4$	0

3.2 Strength criteria for single span ordinary stiffeners other than side frames of single side bulk carriers

3.2.1 Boundary conditions

The requirements of this sub-article apply to ordinary stiffeners considered as clamped at both ends. For other boundary conditions, the yielding check is to be considered on a case by case basis.

3.2.2 Groups of equal ordinary stiffeners

Where a group of equal ordinary stiffeners is fitted, it is acceptable that the minimum net section modulus in **[3.2.3]** to **[3.2.7]** is calculated as the average of the values required for all the stiffeners of the same group, but this average is to be taken not less than 90 % of the maximum required value.
The same applies for the minimum net shear sectional area.

3.2.3 Net section modulus and net shear sectional area of single span ordinary stiffeners under intact conditions

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners subjected to lateral pressure are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{m\lambda_S R_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

where:

λ_S : Coefficient defined in **Table 3.**

ϕ : Angle, in deg, between the stiffener web and the shell plate, measured at the middle of the stiffener span; the correction is to be applied when ϕ is less than 75 deg.

Table 3: Coefficient λ_S

Ordinary stiffener	Coefficient λ_S
Longitudinal stiffener ccontributing to the hull girder longitudinal strength	$1.2\left(1.0-0.85\left\lvert\frac{\sigma_X}{R_Y}\right\rvert\right)$, without being taken greater than 0.9
Other stiffeners	0.9

3.2.4 Net section modulus of corrugated bulkhead of ballast hold for ships having a length *L* less than 150 m

The net section modulus w, in cm^3, of corrugated bulkhead of ballast hold for ships having a length L less than 150 m subjected to lateral pressure are to be not less than the values obtained from the following formula:

$$w = K\frac{(p_S + p_W)s_C\ell^2}{m\lambda_S R_Y}10^3$$

where:

K : Coefficient given in **Table 4** and **5**, according to the type of end connection. When $d_H < 2.5\,d_0$, both section modulus per half pitch of corrugated bulkhead and section modulus of lower stool at inner bottom are to be calculated.

s_C : Half pitch length, in m, of the corrugation, defined in **Ch 3, Sec 6, Fig 28**

ℓ : Length, in m, between the supports, as indicated in **Fig 6**

λ_S : Coefficient defined in **Table 3.**

The effective width of the corrugation flange in compression is to be considered according to **Ch 3, Sec 6, [10.4.10]** when the net section modulus of corrugated bulkhead is calculated.

Table 4: Values of *K*, in case $d_H \geq 2.5\,d_0$

Upper end support		
Supported by girders	Welded directly to deck	Welded to stool efficiently supported by ship structure
1.25	1.00	0.83

Table 5: Values of *K*, in case $d_H < 2.5\,d_0$

Section modulus of	Upper end support		
	Supported by girders	Connected to deck	Connected to stool
Corrugated bulkhead	0.83	0.71	0.65
Stool at bottom	0.83	1.25	1.13

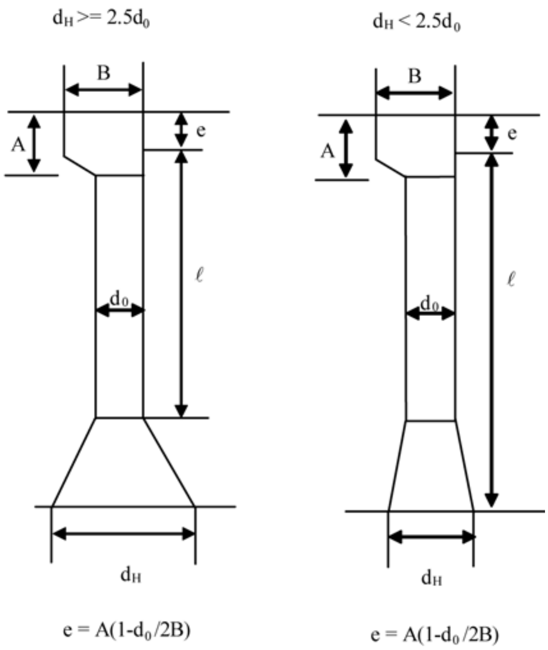

Fig 6: Measurement of ℓ

3.2.5 Net section modulus and net shear sectional area of single span ordinary stiffeners under flooded conditions excluding corrugations of transverse vertically corrugated bulkhead separating cargo holds

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners excluding corrugations of transverse vertically corrugated bulkhead separating cargo holds subjected to flooding are to be not less than the values obtained from the following formulae:

$$w = \frac{p_F s \ell^2}{16 \alpha \lambda_S R_Y} 10^3$$

$$A_{sh} = \frac{5 p_F s \ell}{\alpha \tau_a \sin\phi}$$

where:

λ_S, ϕ : Coefficient and angle defined in **[3.2.3]**, λ_S being determined by considering σ_X in flooded condition.

α : Coefficient taken equal to:

α = 0.95 for the ordinary stiffeners of collision bulkhead,

α = 1.15 for the ordinary stiffeners of other watertight boundaries of compartments.

without taken $\alpha\lambda_S$ greater than 1.0

3.2.6 (void)

3.2.7 Net section modulus and net shear sectional area of single span ordinary stiffeners under testing conditions

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners subjected to testing are to be not less than the values obtained from the following formulae:

$$w = \frac{p_T s \ell^2}{1.05 m R_Y} 10^3$$

$$A_{sh} = \frac{5 p_T s \ell}{1.05 \tau_a \sin\phi}$$

where:

ϕ : Angle, in deg, defined in **[3.2.3].**

3.3 Strength criteria for side frames of single side bulk carriers

3.3.1 Net section modulus and net shear sectional area of side frames

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side frames subjected to lateral pressure are to be not less, in the mid-span area, than the values obtained from the following formulae:

$$w = 1.125 \alpha_m \frac{(p_S + p_W) s \ell^2}{m \lambda_S R_Y} 10^3$$

$$A_{sh} = 1.1 \alpha_S \frac{5(p_S + p_W) s \ell}{\tau_a \sin\phi} \left(\frac{\ell - 2\ell_B}{\ell} \right)$$

where:

α_m : Coefficient taken equal to:

α_m = 0.42 for BC-A ships

α_m = 0.36 for other ships

λ_S : Coefficient taken equal to 0.9

ℓ : Side frame span, in m, defined in **Ch 3, Sec 6, Fig 19**, to be taken not less than $0.25D$

α_S : Coefficient taken equal to:

α_S = 1.1 for side frames of holds specified to be empty in BC-A ships

α_S = 1.0 for other side frames

ℓ_B : Lower bracket length, in m, defined in **Fig 7**

p_s, p_w : Still water and wave pressures, in $\mathrm{kN/m}^2$, in intact conditions calculated as defined in **[1.3]** and **[1.4.2].**

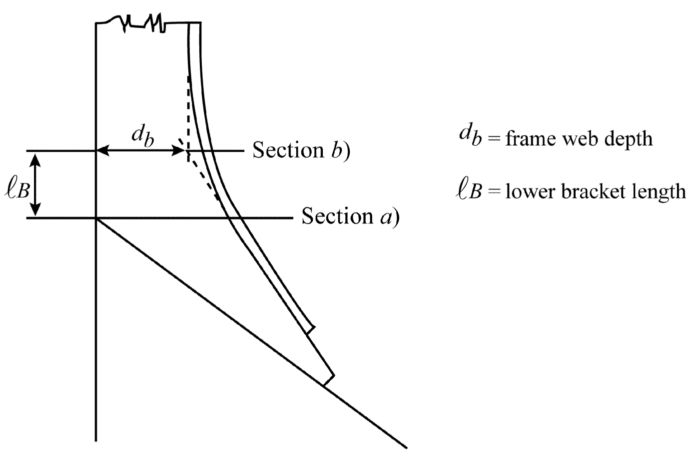

Fig 7: Side frame lower bracket length

In addition, for side frames of holds intended to carry ballast water in heavy ballast condition, the net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, all along the span are to be in accordance with **[3.2.3]**, ℓ being the span of the side frame as defined in **Ch 3, Sec 6, [4.2]**, with consideration to brackets at ends.

3.3.2 Supplementary strength requirements

In addition to **[3.3.1]**, the net moment of inertia, in cm^4, of the 3 side frames located immediately abaft the collision bulkhead is to be not less than the value obtained from the following formula:

$$I = 0.18\frac{(p_S + p_W)\ell^4}{n}$$

where:

ℓ : Side frame span, in m

n : Number of frames from the bulkhead to the frame in question, taken equal to 1, 2 or 3

As an alternative, supporting structures, such as horizontal stringers, are to be fitted between the collision bulkhead and a side frame which is in line with transverse webs fitted in both the topside tank and hopper tank, maintaining the continuity of forepeak stringers within the foremost hold.

3.3.3 Lower bracket of side frame

At the level of lower bracket as shown in **Ch 3, Sec 6, Fig 19**, the net section modulus of the frame and bracket, or integral bracket, with associated shell plating, is to be not less than twice the net section modulus w required for the frame mid-span area obtained from **[3.3.1]**.
In addition, for holds intended to carry ballast water in heavy ballast condition, the net section modulus w, in cm^3, at the level of lower bracket is to be not less than twice the greater of the net section moduli obtained from **[3.3.1]** and **[3.2.3].**
The net thickness t_{LB} of the frame lower bracket, in mm, is to be not less than the net thickness of the side frame web plus 1.5 mm.
Moreover, the net thickness t_{LB} of the frame lower bracket is to comply with the following formula:

- for symmetrically flanged frames : $\frac{h_{LB}}{t_{LB}} \le 87\sqrt{k}$
- for asymmetrically flanged frames : $\frac{h_{LB}}{t_{LB}} \le 73\sqrt{k}$

The web depth h_{LB} of lower bracket may be measured from the intersection between the sloped bulkhead of the hopper tank and the side shell plate, perpendicularly to the face plate of the lower bracket (see **Ch 3, Sec 6, Fig 22**).
For the 3 side frames located immediately abaft the collision bulkhead, whose scantlings are increased according to **[3.3.2]**, when t_{LB} is greater than $1.73\, t_w$, the thickness t_{LB} may be taken as the value t'_{LB} obtained from the following formula:

$$t'_{LB} = \left(t_{LB}^2\, t_W\right)^{1/3}$$

where t_w is the net thickness of the side frame web, in mm, corresponding to A_{sh} determined in accordance to **[3.3.1].**
The flange outstand is not to exceed $12\, k^{0.5}$ times the net flange thickness.

3.3.4 Upper bracket of side frame

At the level of upper bracket as shown in **Ch 3, Sec 6, Fig 19**, the net section modulus of the frame and bracket, or integral bracket, with associated shell plating, is to be not less than twice the net section modulus w required for the frame mid-span area obtained from **[3.3.1]**.
In addition, for holds intended to carry ballast water in heavy ballast condition, the net section modulus w, in cm^3, at the level of upper bracket is not to be less than twice the greater of the net sections

moduli obtained from **[3.2.3]** and **[3.3.1].**
The net thickness t_{UB} of the frame upper bracket, in mm, is to be not less than the net thickness of the side frame web.

3.4 Upper and lower connections of side frames of single side bulk carriers

3.4.1

The section moduli of the:

- side shell and hopper tank longitudinals that support the lower connecting brackets,
- side shell and topside tank longitudinals that support the upper connecting brackets

are to be such that the following relationship is separately satisfied for each lower and upper connecting bracket (see also **Ch 3, Sec 6, Fig 22**):

$$\sum_n w_i d_i \geq \alpha_T \frac{(p_S + p_W)\ell^2 \ell_1^2}{16 R_Y}$$

where:

n : Number of the longitudinal stiffeners of side shell and hopper / topside tank that support the lower / upper end connecting bracket of the side frame, as applicable

w_i : Net section modulus, in cm^3, of the i-th longitudinal stiffener of the side shell or hopper / topside tank that support the lower / upper end connecting bracket of the side frame, as applicable

d_i : Distance, in m, of the above i-th longitudinal stiffener from the intersection point of the side shell and hopper / topside tank

ℓ_1 : Spacing, in m, of transverse supporting webs in hopper / topside tank, as applicable

R_y : Lowest value of equivalent yield stress, in N/mm^2, among the materials of the longitudinal stiffeners of side shell and hopper / topside tanks that support the lower / upper end connecting bracket of the side frame

α_T : Coefficient taken equal to:
α_T = 150 for the longitudinal stiffeners supporting the lower connecting brackets
α_T = 75 for the longitudinal stiffeners supporting the upper connecting brackets

ℓ : Side frame span, in m, as defined in **[3.3.1]**

p_s, p_w : Still water and wave pressures as those for the side frame.

3.4.2

The net connection area, A_i, in cm^2, of the bracket to the i-th longitudinal stiffener supporting the bracket is to be obtained from the following formula:

$$A_i = 0.4 \frac{w_i s}{\ell_1^2} \frac{k_{bkt}}{k_{lg,i}}$$

where:

w_i : Net section modulus, in cm^3, of the i-th longitudinal stiffener of the side or sloped bulkheads that support the lower or the upper end connecting bracket of the side frame, as applicable

ℓ_1 : As defined in **[3.4.1]**

k_{bkt} : Material factor for the bracket

$k_{lg,i}$: Material factor for the i-th longitudinal stiffener.
s : Frame spacing, in m

3.5 Strength criteria for multi-span ordinary stiffeners

3.5.1 Checking criteria

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener, calculated according to **[3.5.2]**, are to comply with the formulae in **Table 6.**

Table 6: Checking criteria for multi-span ordinary stiffeners

Condition	Intact	Flooded	Testing
Normal stress	$\sigma \le \lambda_S R_Y$	$\sigma \le \alpha\lambda_S R_Y$	$\sigma \le 1.05 R_Y$
Shear stress	$\tau \le \tau_a$	$\tau \le \alpha\tau_a$	$\tau \le 1.05\tau_a$
Note 1: λ_S : Coefficient defined in **[3.2.3]** α : Coefficient defined in **[3.2.5]**			

3.5.2 Multi-span ordinary stiffeners

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to be determined by a direct calculation taking into account:

- the distribution of still water and wave pressure and forces, if any
- the number and position of intermediate supports (decks, girders, etc.)
- the condition of fixity at the ends of the stiffener and at intermediate supports
- the geometrical characteristics of the stiffener on the intermediate spans.

3.6 Scantlings of transverse vertically corrugated watertight bulkheads separating cargo holds for flooded conditions

3.6.1 Bending capacity and shear capacity of the corrugations of transverse vertically corrugated watertight bulkheads separating cargo holds

The bending capacity and the shear capacity of the corrugations of watertight bulkheads between separating cargo holds are to comply with the following formulae:

$$0.5W_{LE} + W_M \ge \frac{M}{0.95R_{eH}}10^3$$

$$\tau \le \frac{R_{eH}}{2}$$

where:

M : Bending moment in a corrugation, to be obtained, in kN.m, from the following formula:

$$M = F\ell_C/8$$

F : Resultant force, in kN, to be calculated according to **Ch 4, Sec 6, [3.3.7]**

ℓ_C : Span of the corrugations, in m, to be obtained according to **[3.6.2]**

W_{LE} : Net section modulus, in cm^3 of one half pitch corrugation, to be calculated at the lower end of the corrugations according to **[3.6.2]**, without being taken greater than the value obtained from the following formula:

$$W_{LE,M} = W_G + \left(\frac{Qh_G - 0.5h_G^2 s_C p_G}{R_{eH}} \right) 10^3$$

W_G : Net section modulus, in cm^3 of one half pitch corrugation, to be calculated in way of the upper end of shedder or gusset plates, as applicable, according to **[3.6.2]**

Q : Shear force at the lower end of a corrugation, to be obtained, in kN, from the following formula:

$Q = 0.8F$

h_G : Height, in m, of shedders or gusset plates, as applicable (see **Fig 11** to **Fig 15**)

p_G : Resultant pressure, in kN/m^2, to be calculated in way of the middle of the shedders or gusset plates, as applicable, according to **Ch 4, Sec 6, [3.3.7]**

s_C : Spacing of the corrugations, in m, to be taken according to **Ch 3, Sec 6, Fig 28**

W_M : Net section modulus in cm^3 of one half pitch corrugation, to be calculated at the mid-span of corrugations according to **[3.6.2]** without being taken greater than $1.15\,W_{LE}$

τ : Shear stress in the corrugation, in N/mm^2 to be obtained from the following formula:

$$\tau = 10 \frac{Q}{A_{SH}}$$

A_{sh} : Shear area, in cm^2 calculated according to the followings.

The shear area is to be reduced in order to account for possible non-perpendicular between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by ($\sin\varphi$), φ being the angle between the web and the flange (see **Ch 3, Sec 6, Fig 28**).

The actual net section modulus of corrugations is to be calculated according to **[3.6.2].**

The net section modulus of the corrugations upper part of the bulkhead, as defined in **Sec 1, Fig 5**, is not to be less than 75 % of that of the middle part complying with this requirement and **Sec 1, [3.2.1]**, corrected for different minimum yield stresses.

3.6.2 Net section modulus at the lower end of the corrugations

a) The net section modulus at the lower end of the corrugations (**Fig 11** to **Fig 15**) is to be calculated with the compression flange having an effective flange width b_{ef} not larger than that indicated in **Ch 3, Sec 6, [10.4.10].**

b) Webs not supported by local brackets

Except in case e), if the corrugation webs are not supported by local brackets below the stool top plate (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30 % effective.

c) Effective shedder plates

Provided that effective shedder plates, as defined in **Ch 3, Sec 6, [10.4.11]** are fitted (see **Fig 11** and **Fig 12**), when calculating the section modulus of corrugations at the lower end (cross-sections 1 in **Fig 11** and **Fig 12**), the net area of flange plates may be increased by the value obtained, in cm^2, from the following formula:

$I_{SH} = 2.5a\sqrt{t_f t_{SH}}$ without being taken greater than $2.5\,at_f$,

where:

a : Width, in m, of the corrugation flange (**Ch 3, Sec 6, Fig 28**)

t_{SH} : Net shedder plate thickness, in mm

t_f : Net flange thickness, in mm.

d) Effective gusset plates

Provided that effective gusset plates, as defined in **Ch 3, Sec 6, [10.4.12]**, are fitted (see **Fig 13** to **Fig 15**), when calculating the net section modulus of corrugations at the lower end (cross-sections 1 in **Fig 13** to **Fig 15**), the area of flange plates may be increased by the value obtained, in cm^2, from the following formula:

$$I_G = 7 h_G t_f$$

where:

h_G : Height, in m, of gusset plates (see **Fig 13** to **Fig 15**) to be taken not greater than $(10/7)S_{GU}$

S_{GU} : Width, in m, of gusset plates

t_f : Net flange thickness, in mm

e) Sloping stool top plate

If the corrugation webs are welded to a sloping stool top plate which has an angle not less than 45º with the horizontal plane, the section modulus of the corrugations may be calculated considering the corrugation webs fully effective. For angles less than 45º, the effectiveness of the web may be obtained by linear interpolation between 30 % for 0º and 100 % for 45º.

Where effective gusset plates are fitted, when calculating the net section modulus of corrugations the net area of flange plates may be increased as specified in d) above. No credit may be given to shedder plates only.

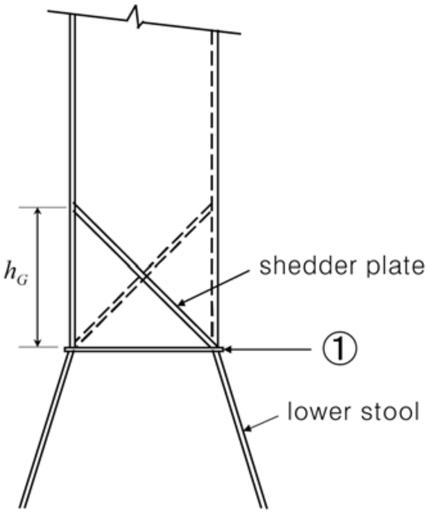

Fig 11: Symmetrical shedder plates

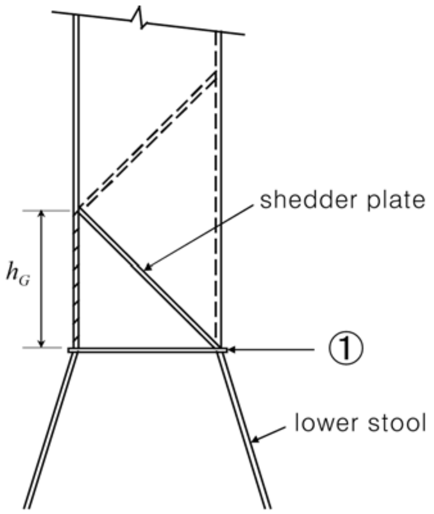

Fig 12: Asymmetrical shedder plates

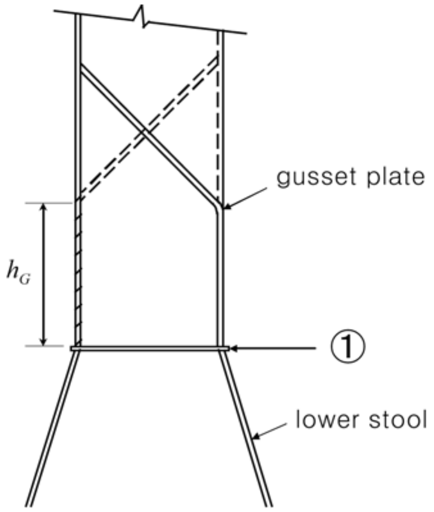

Fig 13: Symmetrical gusset/shedder plates

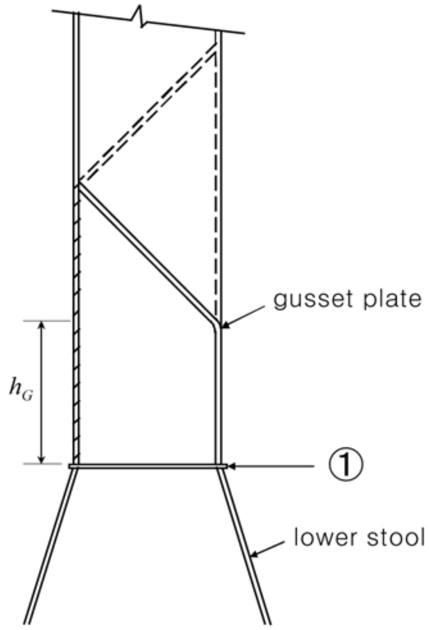

Fig 14: Asymmetrical gusset/shedder plates

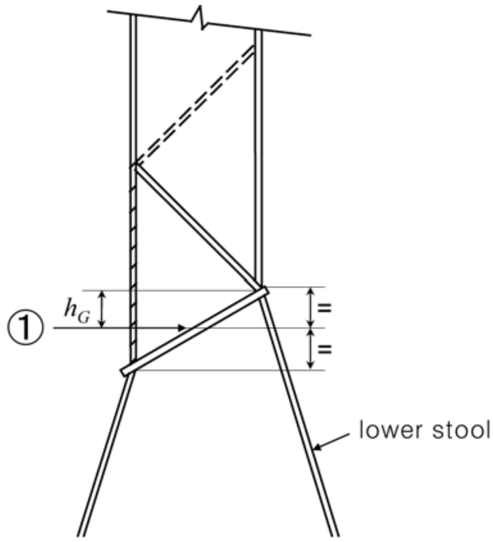

Fig 15: Asymmetrical gusset/shedder plates

3.6.3 Stiffeners in lower stool and upper stool

The net section modulus of stiffeners in lower stool and upper stool is to be greater of the values obtained from the following formula or required by [3.2.5].

$$w = \frac{psl^2}{16\alpha\lambda_s R_Y}10^3$$

Where,

p : Pressure, in kN/m^2, as defined in **Ch 4, Sec 6, [3.3.7]**

α and λ_s : defined in **[3.2.5]**

4. Web stiffeners of primary supporting members

4.1 Net scantlings

4.1.1

Where primary supporting member web stiffeners are welded to ordinary stiffener face plates, their net sectional area at the web stiffener mid-height is to be not less than the value obtained, in cm^2, from the following formula:

$$A = 0.1 k_1 p s \ell$$

where:

k_1 : Coefficient depending on the web connection with the ordinary stiffener, to be taken as:

k_1 = 0.30 for connections without collar plate (see **Ch 3, Sec 6, Fig 8**)

k_1 = 0.225 for connections with a collar plate (see **Ch 3, Sec 6, Fig 9**)

k_1 = 0.20 for connections with one or two large collar plates (see **Ch 3, Sec 6, Fig 10** and **11**)

p : Pressure, in kN/m^2, acting on the ordinary stiffener.

4.1.2

The net section modulus of web stiffeners of non-watertight primary supporting members is to be not less than the value obtained, in cm^3, from the following formula:

$$w = 2.5 s^2 t S_S^2$$

where:

s : Length, in m, of web stiffeners

t : Web net thickness, in mm, of the primary supporting member

S_S : Spacing, in m, of web stiffeners.

4.1.3 Connection ends of web stiffeners

Where the web stiffeners of primary supporting members are welded to ordinary stiffener face plates, the stress at ends of web stiffeners of primary supporting members in water ballast tanks, in N/mm^2, is to comply with the following formula when no bracket is fitted

$$\sigma \le 175$$

where:

$$\sigma = 1.1 K_{con} K_{longi} K_{stiff} \frac{\Delta\sigma}{\cos\theta}$$

K_{con} : Coefficient considering stress concentration, taken equal to:

K_{con} = 3.5 for stiffeners in the double bottom or double side space (see **Fig 8**)

K_{con} = 4.0 for other cases (e.g. hopper tank, top side tank, etc.) (see **Fig 8**)

K_{longi} : Coefficient considering shape of cross section of the longitudinal, taken equal to:

K_{longi} = 1.0 for symmetrical profile of stiffener (e.g. T-section, flat bar)

K_{longi} = 1.3 for asymmetrical profile of stiffener (e.g. angle section, bulb profile)

K_{stiff} : Coefficient considering the shape of the end of the stiffener, taken equal to:

K_{stiff} = 1.0 for standard shape of the end of the stiffener (see **Fig 9**)

K_{stiff} = 0.8 for the improved shape of the end of the stiffener (see **Fig 9**)

θ : As given in Fig 10

$\Delta\sigma$: Stress range, in $\mathrm{N/mm^2}$, transferred from longitudinals into the end of web stiffener, as obtained from the following formula:

$$\Delta\sigma = \frac{2W}{0.322h'[(A_{w1}/\ell_1)+(A_{w2}/\ell_2)]+A_{s0}}$$

W : Dynamic load, in N, as obtained from the following formula:

$$W = 1{,}000(\ell - 0.5s)sp$$

p : Maximum inertial pressure due to liquid in the considered compartment where the web stiffener is located according to **Ch 4, Sec 6, [2.2.1]**, in $\mathrm{kN/m^2}$, of the probability level of 10^{-4}, calculated at mid-span of the ordinary stiffener

ℓ : Span of the longitudinal, in m

s : Spacing of the longitudinal, in m

A_{s0}, A_{w1}, A_{w2} : Geometric parameters as given in **Fig 10**, in $\mathrm{mm^2}$

ℓ_1, ℓ_2 : Geometric parameters as given in **Fig 10**, in mm

h' : As obtained from following formula, in mm:

$$h' = h_s + h_0'$$

h_s : As given in **Fig 10**, in mm

h_0' : As obtained from the following formula, in mm

$h_0' = 0.636b'$ for $b' \le 150$

$h_0' = 0.216b' + 63$ for $150 < b'$

b' : Smallest breadth at the end of the web stiffener, in mm, as shown in **Fig 9**

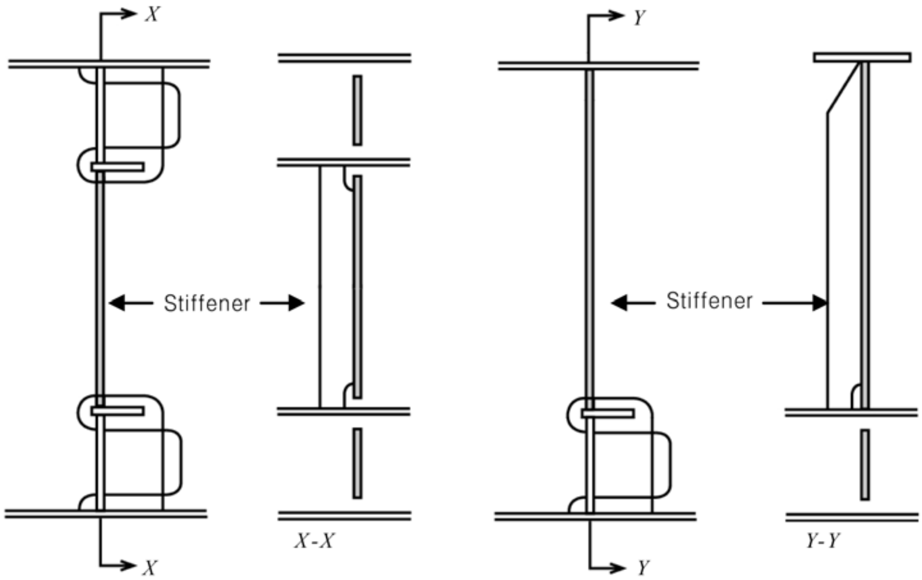

Fig 8: Web stiffeners fitted on primary supporting members

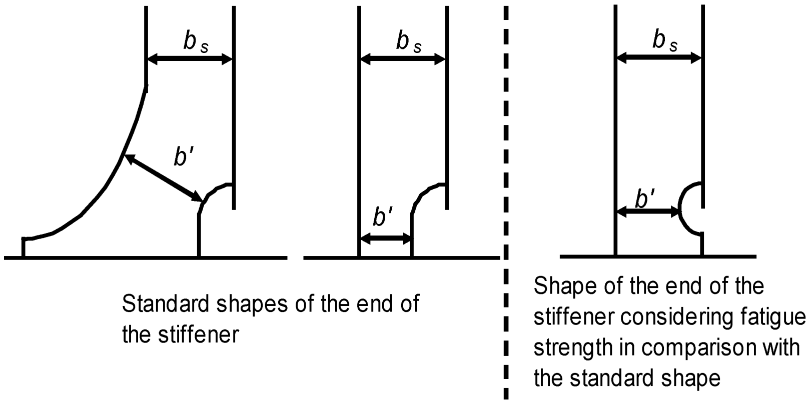

Fig 9: Shape of the end of the web stiffener

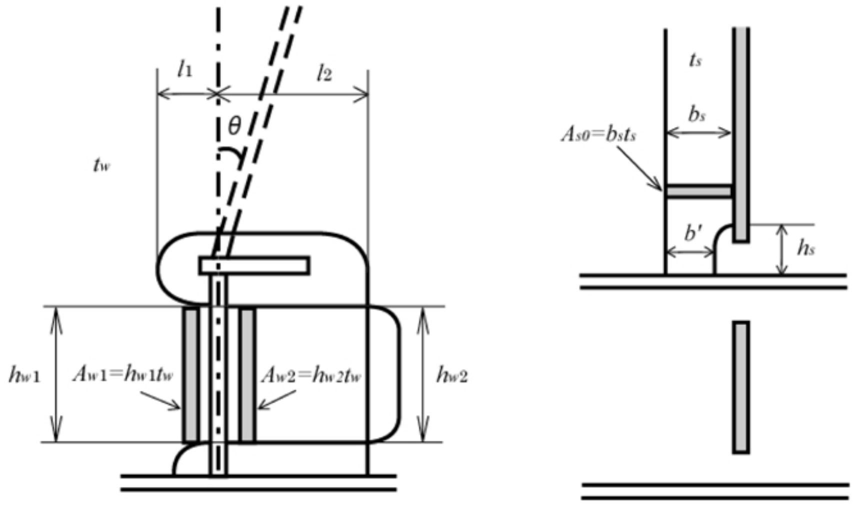

Note:

t_s : net thickness of the web stiffener, in mm.

t_w : net thickness of the collar plate, in mm.

Fig 10: Definitions of geometric parameters

Section 3 – BUCKLING & ULTIMATE STRENGTH OF ORDINARY STIFFENERS AND STIFFENED PANELS

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

In this section, compressive and shear stresses are to be taken positive, tension stresses are to be taken negative.

a : Length in mm of the longer side of the partial plate field in general or length in mm of the side of the partial plate field according **Table 2**, BLC 3 - 10

b : Length in mm of the shorter side of the partial plate field in general or length in mm of the side of the partial plate field according **Table 2**, BLC 3 - 10

α : Aspect ratio of elementary plate panel, taken equal to:

$\alpha = a/b$

n : Number of elementary plate panel breadths within the partial or total plate panel

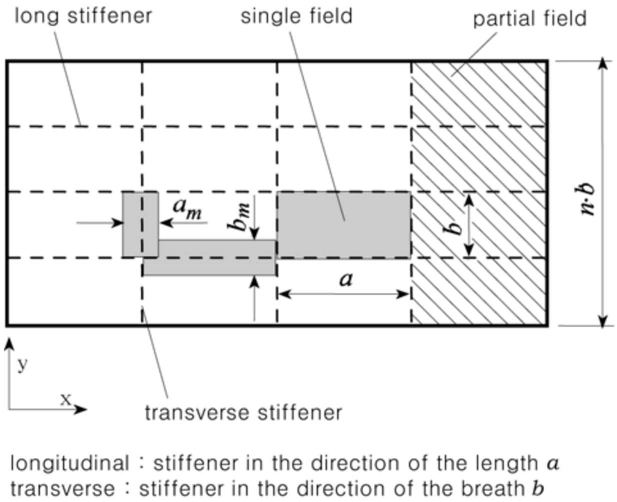

Fig 1: General arrangement of panel

t : Net plate thickness, in mm

σ_n : Normal stress resulting from hull girder bending, in N/mm^2

τ_{SF} : Shear stress induced by the shear forces as defined in **[2.1.3]**, in N/mm^2

σ_x : Membrane stress in x-direction, in N/mm^2

σ_y : Membrane stress in y-direction, in N/mm^2

τ : Shear stress in the x-y plane, in N/mm^2

λ : Reference degree of slenderness, taken equal to:

$$\lambda = \sqrt{\frac{R_{eH}}{K\sigma_e}}$$

K : Buckling factor according to **Table 2** and **Table 3**

Reference stress, to be the following for LC 1 and 2:

σ_e : Reference stress, taken equal to:

$$\sigma_e = 0.9E\left(\frac{t}{b'}\right)^2$$

b' : shorter side of elementary plate panel

Reference stress, to be the following for LC 3 through 10:

σ_e : Reference stress, taken equal to:

$$\sigma_e = 0.9E\left(\frac{t}{b}\right)^2$$

ψ : Edge stress ratio taken equal to:

$\psi = \sigma_2 / \sigma_1$

where:

σ_1 : maximum compressive stress

σ_2 : minimum compressive stress or tensile stress

S : Safety factor, taken equal to:

S = 1.0 except for the case mentioned below

S = 1.1 for structures which are exclusively exposed to local loads (e.g. hatch covers, foundations)

S = 1.15 for the ultimate strength in lateral buckling mode of longitudinal and transverse ordinary stiffeners of the hatchway coamings, sloping plating of the topside tanks and hopper tanks, inner bottom, inner side if any, side shell of single side skin construction and top and bottom stools of transverse bulkheads, assessed according to **[4.2]**.

For constructions of aluminium alloys the safety factors are to be increased in each case by 0.1

F_1 : Correction factor for boundary condition of stiffeners on the longer side of elementary plate panels according to **Table 1**. If the clamping is unequal on the longitudinal sides of the panel, the minimum value of the appropriate F_1-parameter has to be used.

Table 1: Correction factor F_1

	F_1 (2)	Edge stiffener
Stiffeners sniped at both ends	1.00	
Guidance values where both ends are effectively connected to adjacent structures (1)	1.05	Flat bar
	1.10	Bulb section
	1.20	Angle and tee-sections
	1.30	Girders of high rigidity (e.g. bottom transverses)
(1) Exact values may be determined by direct calculations. (2) An average value of F_1 is to be used for plate panels having different edge stiffeners.		

1. General

1.1

1.1.1

The requirements of this Section apply for the buckling check of structural members subjected to compressive stresses, shear stresses and lateral pressure.

1.1.2

The buckling checks have to be performed for the following elements:

a) according to requirements of **[2], [3]** and **[4]** and for all load cases as defined in **Ch 4, Sec 4** in intact condition:
   - elementary plate panels and ordinary stiffeners in a hull transverse section analysis,
   - elementary plate panels modeled in FEM as requested in **Ch 7.**

b) according to requirements of **[6]** and only in flooded condition:
   - transverse vertically corrugated watertight bulkheads.

1.1.3

The boundary condition for elementary plate panels are to be considered as simply supported. If the boundary condition differs significantly from simple support, more appropriate boundary condition can be applied according to cases 3, 4 and 7 to 10 of **Table 2.**

2. Application

2.1 Load model for hull transverse section analysis

2.1.1 General

The structural members at a considered hull transverse section are to be checked for buckling criteria under the combination of:

- the normal stress σ_n resulting from hull girder bending, as defined in **[2.1.2]**
- the shear stress τ_{SF} as defined in **[2.1.3]**
- the lateral pressure in intact condition applied on the members as the case may be.

The lateral pressures and hull girder loads are to be calculated, for the probability level of 10^{-8}, in the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2, as defined in **Ch 4, Sec 4.**

2.1.2 Normal stress σ_n

The normal stress σ_n to be considered for each of the mutually exclusive load cases as referred in **[2.1.1]** is the maximum compressive stress on the considered structural member according to the formulas given in **Ch 6, Sec 1, [3.1.5]** and **Ch 6, Sec 2, [3.1.5]**, respectively for elementary plate panels and ordinary stiffeners.
For transverse ordinary stiffeners, the normal stress σ_n for each of the mutually exclusive load cases is the maximum compressive stress calculated at each end.

2.1.3 Shear stress τ_{SF}

The shear stress τ_{SF} to be considered for each of the mutually exclusive load cases as referred in **[2.1.1]** is the shear stress induced by the shear forces, in kN, equal to:

$$Q = Q_{SW} + C_{QW}\, Q_{WV}$$

where:

Q_{SW} : Design still water shear force in intact condition, in kN, at the hull transverse section considered, defined in **Ch 4, Sec 3, [2.3]**

Q_{WV} : Vertical wave shear force in intact condition, in kN, at the hull transverse section considered, defined in **Ch 4, Sec 3, [3.2]**

C_{QW} : Load combination factor as defined in **Ch 4, Sec 4, Table 3**

If the design still water shear force is not available at preliminary design stage, the following default value, in kN, may be used:

$$Q_{SW0} = 30CLB(C_B + 0.7)10^{-2}$$

2.1.4 Lateral pressure

The lateral pressure to be considered for the buckling check is defined in **Ch 6, Sec 1, [3.1]** for curved plate panel and in **Ch 6, Sec 2, [3.1]** for ordinary stiffeners.
The load calculation point for the curved plate panel is located at mid distance of the curved plate panel extremities along the curve.
The load calculation point of ordinary stiffeners is defined in **Ch 6, Sec 2, [1.4]**

2.2 Application

2.2.1

Application of the buckling and ultimate strength criterion is described in **App 1.**

Table 2: Buckling and reduction factors for plane elementary plate panels

Buckling Load Case	Edge stress ratio ψ	Asp. ratio $\alpha = a/b$	Buckling factor K	Reduction factor k
1 	$1 \ge \psi \ge 0$	$\alpha \ge 1$	$K = \dfrac{8.4}{\psi + 1.1}$	$\kappa_x = 1$ for $\lambda \le \lambda_c$ $\kappa_x = c\left(\dfrac{1}{\lambda} - \dfrac{0.22}{\lambda^2}\right)$ for $\lambda > \lambda_c$ $c = (1.25 - 0.12\psi) \le 1.25$ $\lambda_c = \dfrac{c}{2}\left(1 + \sqrt{1 - \dfrac{0.88}{c}}\right)$
	$0 > \psi > -1$		$K = 7.63 - \psi(6.26 - 10\psi)$	
	$\psi \le -1$		$K = (1-\psi)^2 \cdot 5.975$	
2 	$1 \ge \psi \ge 0$	$\alpha \ge 1$	$K = F_1\left(1 + \dfrac{1}{\alpha^2}\right)^2 \dfrac{2.1}{(\psi + 1.1)}$	$\kappa_y = c\left(\dfrac{1}{\lambda} - \dfrac{R + F^2(H - R)}{\lambda^2}\right)$ $c = (1.25 - 0.12\psi) \le 1.25$ $R = \lambda\left(1 - \dfrac{\lambda}{c}\right)$ for $\lambda < \lambda_c$ $R = 0.22$ for $\lambda \ge \lambda_c$ $\lambda_c = \dfrac{c}{2}\left(1 + \sqrt{1 - \dfrac{0.88}{c}}\right)$ $F = \left(1 - \dfrac{\dfrac{K}{0.91} - 1}{\lambda_p^{\ 2}}\right) \cdot c_1 \ge 0$ $\lambda_p^{\ 2} = \lambda^2 - 0.5$ for $1 \le \lambda_p^{\ 2} \le 3$ $c_1 = 1$, for σ_y due to direct loads $c_1 = \left(1 - \dfrac{F_1}{\alpha}\right) \ge 0$, for σ_y due to bending (in general) $c_1 = 0$, for σ_y due to bending in extreme load cases (e.g. wt. bulkheads) $H = \lambda - \dfrac{2\lambda}{c\left(T + \sqrt{T^2 - 4}\right)} \ge R$ $T = \lambda + \dfrac{14}{15\lambda} + \dfrac{1}{3}$
	$0 > \psi > -1$	$1 \le \alpha \le 1.5$	$K = F_1\left[\left(1 + \dfrac{1}{\alpha^2}\right)^2 \dfrac{2.1(1+\psi)}{1.1} - \dfrac{\psi}{\alpha^2}(13.9 - 10\psi)\right]$	
		$\alpha > 1.5$	$K = F_1\left[\left(1 + \dfrac{1}{\alpha^2}\right)^2 \dfrac{2.1(1+\psi)}{1.1} - \dfrac{\psi}{\alpha^2}(5.87 + 1.87\alpha^2 + \dfrac{8.6}{\alpha^2} - 10\psi)\right]$	
	$\psi \le -1$	$1 \le \alpha \le \dfrac{3(1-\psi)}{4}$	$K = F_1\left(\dfrac{1-\psi}{\alpha}\right)^2 \cdot 5.975$	
		$\alpha > \dfrac{3(1-\psi)}{4}$	$K = F_1\left[\left(\dfrac{1-\psi}{\alpha}\right)^2 \cdot 3.9675 + 0.5375\left(\dfrac{1-\psi}{\alpha}\right)^4 + 1.87\right]$

	$\frac{b}{R} > 8.7\sqrt{\frac{R}{t}}$	$K_\tau = 0.28\frac{b^2}{R\sqrt{Rt}}$	

Explanations for boundary conditions
- - - - - - - - - plate edge free
——— plate edge simply supported
━━━ plate edge clamped

1. For curved plate fields with a very large radius the κ-value need not to be taken less than for the expanded plane field
2. For curved single fields, e.g. bilge stake, which are located within plane partial or total fields, the reduction factor κ may taken as follow:

Load case 1b : $\kappa_x = \frac{0.8}{\lambda^2} \le 1.0$ Load case 2 : $\kappa_y = \frac{0.65}{\lambda^2} \le 1.0$

3. Buckling criteria of elementary plate panels

3.1 Plates

3.1.1 General

The net thickness of the elementary plate panel is to comply with the following:

$t \geq b/100$

The verification of an elementary plate panel in a transverse section analysis is to be carried out according to **[3.1.2]**. It is to be performed for the two different following combinations of stresses:

- stress combination 1: 100 % of the normal stress as defined in **[2.1.2]** and 70 % of the shear stress as defined in **[2.1.3]**
- stress combination 2: 70 % of the normal stress as defined in **[2.1.2]** and 100 % of the shear stress as defined in **[2.1.3].**

The verification of elementary plate panel in a FEM analysis is to be carried out according to **[3.2].**

3.1.2 Verification of elementary plate panel in a transverse section analysis

Each elementary plate panel is to comply with the following criteria, taking into account the loads defined in **[2.1]**:

- longitudinally framed plating

$$\left(\frac{|\sigma_x|S}{\kappa_x R_{eH}}\right)^{e1} + \left(\frac{|\tau|S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$

for stress combination 1 with $\sigma_x = \sigma_n$ and $\tau = 0.7\tau_{SF}$

$$\left(\frac{|\sigma_x|S}{\kappa_x R_{eH}}\right)^{e1} + \left(\frac{|\tau|S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$

for stress combination 2 with $\sigma_x = 0.7\sigma_n$ and $\tau = \tau_{SF}$

- transversely framed plating

$$\left(\frac{|\sigma_y|S}{\kappa_y R_{eH}}\right)^{e2} + \left(\frac{|\tau|S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$

for stress combination 1 with $\sigma_y = \sigma_n$ and $\tau = 0.7\tau_{SF}$

$$\left(\frac{|\sigma_y|S}{\kappa_y R_{eH}}\right)^{e2} + \left(\frac{|\tau|S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$

for stress combination 2 with $\sigma_y = 0.7\sigma_n$ and $\tau = \tau_{SF}$

Each term of the above conditions must be less than 1.0.
The reduction factors k_x and k_y are given in **Table 2** and/or **Table 3.**
The coefficients $e1$, $e2$ and $e3$ are defined in **Table 4.**
For the determination of $e3$, k_y is to be taken equal to 1 in case of longitudinally framed plating and k_x is to be taken equal to 1 in case of transversely framed plating.

3.2 Verification of elementary plate panel within FEM analysis

3.2.1 General

The buckling check of the elementary plate panel is to be performed under the loads defined in **[3.2.2]**, according to the requirements of **[3].**
The determination of the buckling and reduction factors is made for each relevant case of **Table 2** according to the stresses calculated in **[3.2.2]** loading the considered elementary plate panel.

3.2.2 Stresses

For the buckling check, the buckling stresses are to be determined according to **Table 2** and **Table 3** including their stress ratio ψ for the loading conditions required in **Ch 4, Sec 7** and according to the requirements of **Ch 7.**

3.2.3 Poisson effect

Stresses derived with superimposed or direct method have to be reduced for buckling assessment because of the Poisson effect, which is taken into consideration in both analysis methods. The correction has to be carried out after summation of stresses due to local and global loads.
Both stresses σ_x^* and σ_y^* are to be compressive stresses, in order to apply the stress reduction according to the following formulae:

$$\sigma_x = (\sigma_x^* - 0.3\sigma_y^*)/0.91$$

$$\sigma_y = (\sigma_y^* - 0.3\sigma_x^*)/0.91$$

where:

σ_x^*, σ_y^* : Stresses containing the Poisson effect

Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$

Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$

3.2.4 Checking Criteria

Each elementary plate panel is to comply with the following criteria, taking into account the loads defined in **[2.1]**

$$\left(\frac{|\sigma_x|S}{\kappa_x R_{eH}}\right)^{e1} + \left(\frac{|\sigma_y|S}{\kappa_y R_{eH}}\right)^{e2} - B\left(\frac{\sigma_x \sigma_y S^2}{R_{eH}^2}\right) + \left(\frac{|\tau|S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \le 1.0$$

In addition, each compressive stress σ_x and σ_y, and the shear stress τ are to comply with the following formulae:

$$\left(\frac{|\sigma_x|S}{\kappa_x R_{eH}}\right)^{e1} \le 1.0$$

$$\left(\frac{|\sigma_y|S}{\kappa_y R_{eH}}\right)^{e2} \le 1.0$$

$$\left(\frac{|\tau|S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \le 1.0$$

The reduction factors k_x, k_y and k_τ are given in **Table 2** and/or **Table 3**.

- where $\sigma_x \le 0$ (tensile stress), k_x = 1.0.
- where $\sigma_y \le 0$ (tensile stress), k_y = 1.0.

The coefficients $e1$, $e2$ and $e3$ as well as the factor B are defined in **Table 4.**

Table 4: Coefficients *e*1, *e*2, *e*3 and factor *B*

Exponents $e1-e3$ and factor B	Plate panel	
	plane	curved
$e1$	$1+k_x^4$	1.25
$e2$	$1+k_y^4$	1.25
$e3$	$1+k_x\,k_y\,k_\tau^2$	2.0
B σ_x and σ_y positive (compressive stress)	$(k_x k_y)^5$	0
B σ_x or σ_y negative (tensile stress)	1	-

3.3 Webs and flanges

3.3.1

For non-stiffened webs and flanges of sections and girders proof of sufficient buckling strength as for elementary plate panels is to be provided according to **[3.1].**

4. Buckling criteria of partial and total panels

4.1 Longitudinal and transverse stiffeners

4.1.1

In a hull transverse section analysis, the longitudinal and transverse ordinary stiffeners of partial and total plate panels are to comply with the requirements of **[4.2]** and **[4.3].**

4.2 Ultimate strength in lateral buckling mode

4.2.1 Checking criteria

The longitudinal and transverse ordinary stiffeners are to comply with the following criteria:

$$\frac{\sigma_a+\sigma_b}{R_{eH}}S \le 1$$

where:

σ_a : Uniformly distributed compressive stress, in N/mm^2 in the direction of the stiffener axis.

$\sigma_a = \sigma_n$ for longitudinal stiffeners

$\sigma_a = 0$ for transverse stiffeners

σ_b : Bending stress, in N/mm^2, in the stiffener.

σ_b calculated as in **[4.2.2]** with $\sigma_x = \sigma_n$ and $\tau = \tau_{SF}$

4.2.2 Evaluation of the bending stress σ_b

The bending stress σ_b, in N/mm^2, in the stiffeners is equal to:

$$\sigma_b = \frac{M_0 + M_1}{W_{st} 10^3}$$

where:

M_0 : Bending moment, in N.mm, due to the deformation w of stiffener, taken equal to:

$$M_0 = F_{Ki} \frac{p_z w}{c_f - p_z}$$

with $(c_f - p_z) > 0$

M_1 : Bending moment, in N.mm, due to the lateral load p, taken equal to:

$$M_1 = \frac{pba^2}{24 \cdot 10^3}$$ for longitudinal stiffeners

$$M_1 = \frac{pa(n \cdot b)^2}{8c_S 10^3}$$ for transverse stiffeners, with n equal to 1 for ordinary transverse stiffeners.

W_{st} : Net section modulus of stiffener (longitudinal or transverse), in cm^3, including effective width of plating according to **[5]**, taken equal to:

- if a lateral pressure is applied on the stiffener:
  W_{st} is the net section modulus calculated at flange if the lateral pressure is applied on the same side as the stiffener.
  W_{st} is the net section modulus calculated at attached plate if the lateral pressure is applied on the side opposite to the stiffener.
- if no lateral pressure is applied on the stiffener:
  W_{st} is the minimum net section modulus among those calculated at flange and attached plate

c_s : Factor accounting for the boundary conditions of the transverse stiffener

c_s = 1.0 simply supported stiffeners

c_s = 2.0 for partially constraint stiffeners

p : Lateral load in kN/m^2, as defined in **Ch 4, Sec 5** and **Ch 4, Sec 6** calculated at the load point as defined in **Ch 6, Sec 2, [1.4]**

F_{Ki} : Ideal buckling force, in N, of the stiffener, taken equal to:

$$F_{Kix} = \frac{\pi^2}{a^2} EI_x 10^4$$ for longitudinal stiffeners

$$F_{Kiy} = \frac{\pi^2}{(nb)^2} EI_y 10^4$$ for transverse stiffeners

I_x, I_y : Net moments of inertia, in cm^4, of the longitudinal or transverse stiffener including effective width of attached plating according to **[5]**. I_x and I_y are to comply with the following criteria:

$$I_x \geq \frac{bt^3}{12 \cdot 10^4}$$

$$I_y \geq \frac{at^3}{12 \cdot 10^4}$$

p_z : Nominal lateral load, in N/mm^2, of the stiffener due to σ_x, σ_y and τ

$$p_{zx} = \frac{t_a}{b}\left(\sigma_{xl}\left(\frac{\pi b}{a}\right)^2 + 2c_y\sigma_y + \tau_1\sqrt{2}\right)$$ for longitudinal stiffeners

$$p_{zy} = \frac{t_a}{a}\left(2c_x\sigma_{xl} + \sigma_y\left(\frac{\pi a}{nb}\right)^2\left(1+\frac{A_y}{at_a}\right) + \tau_1\sqrt{2}\right)$$ for transverse stiffeners

$$\sigma_{xl} = \sigma_x\left(1+\frac{A_x}{b\cdot t_a}\right)$$

t_a : Net thickness offered of attached plate, in mm

c_x, c_y : Factor taking into account the stresses vertical to the stiffener's axis and distributed variable along the stiffener's length taken equal to:

$0.5(1+\psi)$ for $0 \leq \psi \leq 1$

$\frac{0.5}{1-\psi}$ for $\psi < 0$

A_x, A_y : Net sectional area, in mm^2, of the longitudinal or transverse stiffener respectively without attached plating

$$\tau_1 = \left[\tau - t\sqrt{R_{eH}E\left(\frac{m_1}{a^2}+\frac{m_2}{b^2}\right)}\right] \geq 0$$

m_1, m_2 : Coefficients taken equal to:

for longitudinal stiffeners:

$\frac{a}{b} \geq 2.0$: $m_1 = 1.47$, $m_2 = 0.49$

$\frac{a}{b} < 2.0$: $m_1 = 1.96$, $m_2 = 0.37$

for transverse stiffeners:

$\frac{a}{n\cdot b} \geq 0.5$: $m_1 = 0.37$, $m_2 = \frac{1.96}{n^2}$

$\frac{a}{n\cdot b} < 0.5$: $m_1 = 0.49$, $m_2 = \frac{1.47}{n^2}$

$w = w_0 + w_1$

w_0 : Assumed imperfection, in mm, taken equal to:

$w_0 = \min(\frac{a}{250}, \frac{b}{250}, 10)$ for longitudinal stiffeners

$w_0 = \min(\frac{a}{250}, \frac{n\cdot b}{250}, 10)$ for transverse stiffeners

For stiffeners sniped at both ends w_0 must not be taken less than the distance from the midpoint of attached plating to the neutral axis of the stiffener calculated with the effective width of its attached plating.

w_1 : Deformation of stiffener, in mm, at midpoint of stiffener span due to lateral load p. In case of uniformly distributed load the following values for w_1 may be used:

$$w_1 = \frac{pba^4}{384\cdot 10^7 EI_x}$$ for longitudinal stiffeners

$$w_1 = \frac{5ap(nb)^4}{384\cdot 10^7 EI_y c_S^2}$$ for transverse stiffeners

c_f : Elastic support provided by the stiffener, in N/mm^2, taken equal to:

- for longitudinal stiffeners

$$c_f = F_{Kix}\frac{\pi^2}{a^2}(1+c_{px})$$

$$c_{px} = \frac{1}{1+\frac{0.91\left(\frac{12\cdot 10^4 I_x}{t^3 b}-1\right)}{c_{xa}}}$$

c_{xa} : Coefficient taken equal to

$$c_{xa} = \left[\frac{a}{2b}+\frac{2b}{a}\right]^2 \quad \text{for} \quad a \geq 2b$$

$$c_{xa} = \left[1+\left(\frac{a}{2b}\right)^2\right]^2 \quad \text{for} \quad a < 2b$$

- for transverse stiffeners

$$c_f = c_S F_{Kiy} \frac{\pi^2}{(n\cdot b)^2}(1+c_{py})$$

$$c_{py} = \frac{1}{1+\frac{0.91\left(\frac{12\cdot 10^4 I_y}{t^3 a}-1\right)}{c_{ya}}}$$

c_{ya} : Coefficient taken equal to

$$c_{ya} = \left[\frac{nb}{2a}+\frac{2a}{nb}\right]^2 \quad \text{for} \quad nb \geq 2a$$

$$c_{ya} = \left[1+\left(\frac{nb}{2a}\right)^2\right]^2 \quad \text{for} \quad nb < 2a$$

4.2.3 Equivalent criteria for longitudinal and transverse ordinary stiffeners not subjected to lateral pressure

Longitudinal and transverse ordinary stiffeners not subjected to lateral pressure are considered as complying with the requirement of **[4.2.1]** if their net moments of inertia I_x and I_y, in cm^4, are not less than the value obtained by the following formula:

- For longitudinal stiffener : $$I_x = \frac{p_{zx} a^2}{\pi^2 10^4}\left(\frac{w_0 h_w}{\frac{R_{eH}}{S}-\sigma_x}+\frac{a^2}{\pi^2 E}\right)$$
- For transverse stiffener : $$I_y = \frac{p_{zy}(nb)^2}{\pi^2 10^4}\left(\frac{w_0 h_w}{\frac{R_{eH}}{S}-\sigma_y}+\frac{(nb)^2}{\pi^2 E}\right)$$

4.3 Torsional buckling

4.3.1 Longitudinal stiffeners

The longitudinal ordinary stiffeners are to comply with the following criteria:

$$\frac{\sigma_x S}{\kappa_T R_{eH}} \leq 1.0$$

k_T : Coefficient taken equal to:

$k_T = 1.0$ for $\lambda_T \le 0.2$

$k_T = \dfrac{1}{\Phi + \sqrt{\Phi^2 - \lambda_T^2}}$ for $\lambda_T > 0.2$

$\Phi = 0.5\left(1 + 0.21(\lambda_T - 0.2) + \lambda_T^2\right)$

λ_T : Reference degree of slenderness taken equal to:

$\lambda_T = \sqrt{\dfrac{R_{eH}}{\sigma_{KiT}}}$

$\sigma_{KiT} = \dfrac{E}{I_P}\left(\dfrac{\pi^2 I_\omega 10^2}{a^2}\varepsilon + 0.385 I_T\right)$, in $\mathrm{N/mm^2}$

I_p : Net polar moment of inertia of the stiffener, in cm^4, defined in **Table 5**, and related to the point C as shown in **Fig 2**

I_T : Net St. Venant's moment of inertia of the stiffener, in cm^4, defined in **Table 5**,

I_w : Net sectorial moment of inertia of the stiffener, in cm^6, defined in **Table 5**, related to the point C as shown in **Fig 2**

ε : Degree of fixation taken equal to:

$\varepsilon = 1 + 10^{-3}\sqrt{\dfrac{a^4}{\dfrac{4}{3}\pi^4 I_\omega \left(\dfrac{b}{t^3} + \dfrac{4h_w}{3t_w^3}\right)}}$

A_w : Net web area equal to: $A_w = h_w t_w$

A_f : Net flange area equal to: $A_f = b_f t_f$

$e_f = h_w + \dfrac{t_f}{2}$, in mm

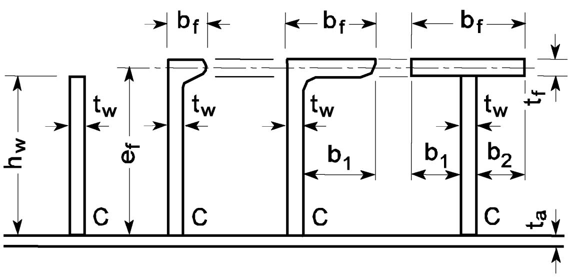

Fig 2: Dimensions of stiffeners

Table 5: Moments of inertia

Profile	I_P	I_T	I_w
Flat bar	$\frac{h_w^3 \cdot t_w}{3 \cdot 10^4}$	$\frac{h_w \cdot t_w^3}{3 \cdot 10^4}\left(1 - 0.63\frac{t_w}{h_w}\right)$	$\frac{h_w^3 \cdot t_w^3}{36 \cdot 10^6}$
Sections with bulb or flange	$\left(\frac{A_w \cdot h_w^2}{3} + A_f \cdot e_f^2\right)10^{-4}$	$\frac{h_w \cdot t_w^3}{3 \cdot 10^4}\left(1 - 0.63\frac{t_w}{h_w}\right)$ + $\frac{b_f \cdot t_f^3}{3 \cdot 10^4}\left(1 - 0.63\frac{t_f}{b_f}\right)$	for bulb and angle sections: $\frac{A_f \cdot e_f^2 \cdot b_f^2}{12 \cdot 10^6}\left(\frac{A_f + 2.6A_W}{A_f + A_W}\right)$ for tee-sections: $\frac{b_f^3 \cdot t_f \cdot e_f^2}{12 \cdot 10^6}$

4.3.2 Transverse stiffeners

Transverse stiffeners loaded by axial compressive stresses and which are not supported by longitudinal stiffeners are to comply with the requirements of **[4.3.1]** analogously.

5. Effective width of attached plating

5.1 Ordinary stiffeners

5.1.1

The effective width of attached plating of ordinary stiffeners is determined by the following formulae (see also **Fig 1**):

- for longitudinal stiffeners: $b_m = \min(\kappa_x b; \kappa_s s)$
- for transverse stiffeners: $a_m = \min(\kappa_y a; \kappa_s s)$

where:

$$\kappa_s = 0.0035\left(\frac{\ell_{eff}}{s}\right)^3 - 0.0673\left(\frac{\ell_{eff}}{s}\right)^2 + 0.4422\left(\frac{\ell_{eff}}{s}\right) - 0.0056$$, to be taken notgreater than 1,0

s : Spacing of the stiffener, in mm

ℓ_{eff} : Value taken as follows:

- for longitudinal stiffeners:
  - $\ell_{eff} = a$ if simply supported at both ends
  - $\ell_{eff} = 0.6\,a$ if fixed at both ends
- for transverse stiffeners:
  - $\ell_{eff} = b$ if simply supported at both ends
  - $\ell_{eff} = 0.6\,b$ if fixed at both ends

5.2 Primary supporting members

5.2.1

The effective width e'_m of stiffened flange plates of primary supporting members may be determined as described in a) and b), with the notations:

e : Width of plating supported, in mm, measured from centre to centre of the adjacent unsupported fields

e_m : Effective width, in mm, of attached plating of primary supporting member according to **Table 6** considering the type of loading (special calculations may be required for determining the effective width of one-sided or non-symmetrical flanges).

e_{m1} is to be applied where primary supporting members are loaded by uniformly distributed loads or else by not less than 6 equally spaced single loads.

e_{m2} is to be applied where primary supporting members are loaded by 3 or less single loads.

a) Stiffening parallel to web of the primary supporting member (see **Fig 3**)

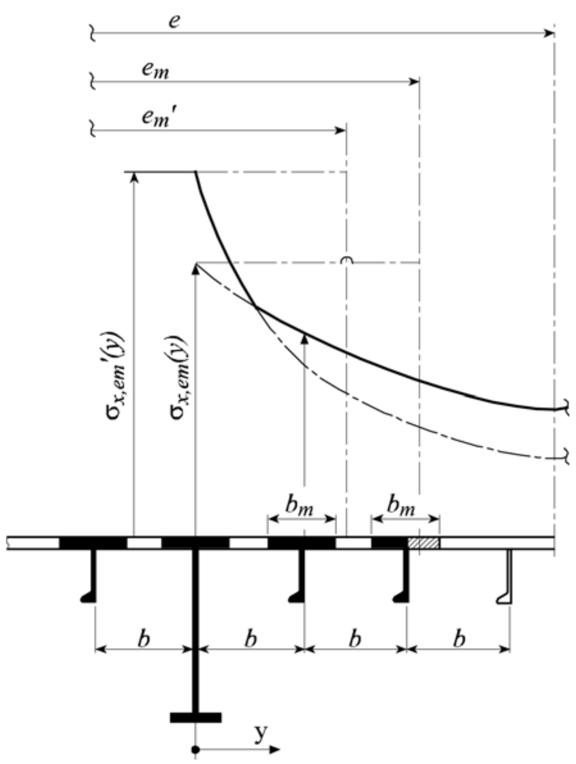

Fig 3: Stiffening parallel to web

$b < e_m$

$e'_m = n \cdot b_m$

n : Integral number of the stiffener spacing b inside the effective width e_m, taken equal to:

$$n = \mathrm{int}\left(\frac{e_m}{b}\right)$$

b) Stiffening perpendicular to web of the primary supporting member (see **Fig 4**)

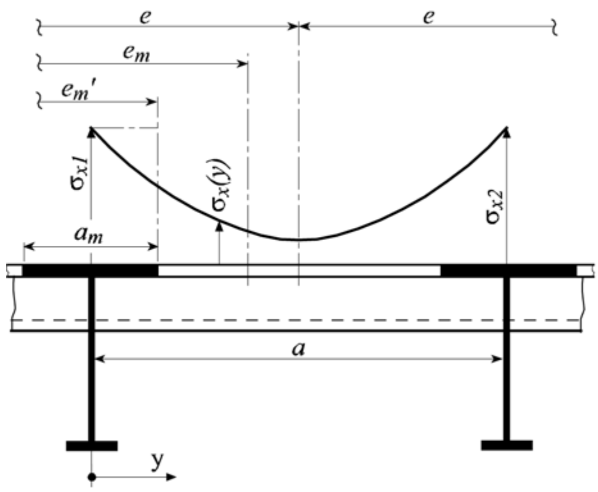

Fig 4: Stiffening perpendicular to web

$a \ge e_m$

$e_m' = n \cdot a_m < e_m$

$n = 2.7\frac{e_m}{a}$, to be taken not greater than 1.0

For $b \ge e_m$ or $a < e_m$ respectively, b and a must be exchanged.

Table 6: Effective Width of attached plating

ℓ/e	0	1	2	3	4	5	6	7	≥ 8
e_{m1}/e	0	0.36	0.64	0.82	0.91	0.96	0.98	1.00	1.00
e_{m2}/e	0	0.20	0.37	0.52	0.65	0.75	0.84	0.89	0.90
Intermediate values may be obtained by direct interpolation. ℓ : Length between zero-points of bending moment curve, i.e. unsupported span in case of simply supported girders and 0.6 times the unsupported span in case of constraint of both ends of girder									

6. Transverse vertically corrugated watertight bulkhead in flooded conditions

6.1 General

6.1.1 Shear buckling check of the bulkhead corrugation webs

The shear stress τ, calculated according to **Ch 6, Sec 2, [3.6.1]**, is to comply with the following formula:

$$\tau < \tau_C$$

where:

τ_C : Critical shear buckling stress to be obtained, in $\mathrm{N/mm^2}$, from the following formulae:

$$\tau_C = \tau_E \qquad \text{for} \quad \tau_E \le \frac{R_{eH}}{2\sqrt{3}}$$

$$\tau_C = \frac{R_{eH}}{\sqrt{3}}\left(1 - \frac{R_{eH}}{4\sqrt{3}\tau_E}\right) \quad \text{for} \quad \tau_E > \frac{R_{eH}}{2\sqrt{3}}$$

τ_E : Euler shear buckling stress to be obtained, in N/mm^2, from the following formula:

$$\tau_E = 0.9 k_t E \left(\frac{t_w}{10^3 c}\right)^2$$

k_t : Coefficient, to be taken equal to 6.34

t_W : Net thickness, in mm, of the corrugation webs

c : Width, in m of the corrugation webs (see **Ch 3, Sec 6, Fig 28**).

Section 4 – PRIMARY SUPPORTING MEMBERS

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

L_2 : Rule length L, but to be taken not greater than 300 m

I_Y : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to **Ch 5, Sec 1, [1.5]**, on gross of fered thickness reduced by 0.5 t_C for all structural members

I_Z : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to **Ch 5, Sec 1, [1.5]**, on gross offered thickness reduced by 0.5 t_C for all structural members

N : Z co-ordinate with respect to the reference co-ordinate system defined in **Ch 1, Sec 4, [4]**, in m, of the centre of gravity of the hull net transverse section defined in **Ch 5, Sec 1, [1.2]**, considering gross offered thickness reduced by 0.5 t_C for all structural members

p_S , p_W : Still water and wave pressure, in kN/m^2, in intact conditions, defined in **[2.1.2]**

σ_X : Normal stress, in N/mm^2, defined in **[2.1.5]**

s : Spacing, in m, of primary supporting members

ℓ : Span, in m, of primary supporting members, measured between the supporting members, see **Ch 3, Sec 6, [5.3]**

h_w : Web height, in mm

t_w : Net web thickness, in mm

b_f : Face plate width, in mm

t_f : Net face plate thickness, in mm

b_p : Width, in m, of the plating attached to the member, for the yielding check, defined in **Ch 3, Sec 6, [4.3]**

w : Net section modulus, in cm^3, of the member, with an attached plating of width b_p, to be calculated as specified in **Ch 3, Sec 6, [4.4]**

A_{sh} : Net shear sectional area, in cm^2, of the member, to be calculated as specified in **Ch 3, Sec 6, [5.5]**

m : Coefficient taken equal to 10

τ_a : Allowable shear stress, in N/mm^2, taken equal to:

$\tau_a = 0.4 R_Y$

k : Material factor, as defined in **Ch 1, Sec 4, [2.2.1]**

x, y, z : X, Y and Z co-ordinates, in m, of the evaluation point with respect to the reference co-ordinate system defined in **Ch 1, Sec 4**

1. General

1.1 Application

1.1.1

The requirements of this Section apply to the strength check of pillars and primary supporting members, subjected to lateral pressure and/or hull girder normal stresses for such members contributing to the hull girder longitudinal strength.

The yielding check is also to be carried out for such members subjected to specific loads.

1.2 Primary supporting members for ships less than 150 m in length *L*

1.2.1

For primary supporting members for ships having a length L less than 150 m, the strength check of such members is to be carried out according to the provisions specified in **[2]** and **[4].**

1.2.2

Notwithstanding the above, the strength check of such members may be carried out by a direct strength assessment deemed as appropriate by the Society.

1.3 Primary supporting members for ships of 150 m or more in length *L*

1.3.1

For primary supporting members for ships having a length L of 150 m or more, the direct strength analysis is to be carried out according to the provisions specified in **Ch 7**, and the requirements in **[4]** are also to be complied with. In addition, the primary supporting members for BC-A and BC-B ships are to comply with the requirements in **[3].**

1.4 Net scantlings

1.4.1

As specified in **Ch 3, Sec 2**, all scantlings referred to in this Section are net, i.e. they do not include any corrosion addition.
The gross scantlings are obtained as specified in **Ch 3, Sec 2, [3].**

1.5 Minimum net thicknesses of webs of primary supporting members

1.5.1

The net thickness of the web of primary supporting members, in mm, is to be not less than $0.6\sqrt{L_2}$.

2. Scantling of primary supporting members for ships of less than 150 m in length *L*

2.1 Load model

2.1.1 General

The still water and wave lateral loads induced by the sea and the various types of cargoes and ballast in intact conditions are to be considered, depending on the location of the primary supporting members under consideration and the type of the compartments adjacent to it.
The wave lateral loads and hull girder loads are to be calculated, for the probability level of 10^{-8}, in the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2, as defined in **Ch 4, Sec 4.**

2.1.2 Lateral pressure in intact conditions

The lateral pressure in intact conditions is constituted by still water pressure and wave pressure.
Still water pressure (p_S) includes:

a) the hydrostatic pressure, defined in **Ch 4, Sec 5, [1]**
b) the still water internal pressure, defined in **Ch 4, Sec 6** for the various types of cargoes and for ballast.

Wave pressure (p_W) includes for each load case H1, H2, F1, F2, R1, R2, P1 and P2:
c) the hydrodynamic pressure, defined in **Ch 4, Sec 5, [1]**
d) the inertial pressure, defined in **Ch 4, Sec 6** for the various types of cargoes and for ballast.

2.1.3 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering separately:

- the still water and wave external sea pressures
- the still water and wave internal pressure, considering the compartment adjacent to the outer shell as being loaded

If the compartment adjacent to the outer shell is not intended to carry liquids, only the external sea pressures are to be considered.

2.1.4 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

2.1.5 Normal stresses

The normal stress to be considered for the strength check of primary supporting members contributing to the hull girder longitudinal strength is the maximum value of σ_X between sagging and hogging conditions, when applicable, obtained, in N/mm^2, from the following formula:

$$\sigma_X = \left[C_{SW} \left| \frac{M_{SW}}{I_Y} \right| (z - N) + C_{WV} \left| \frac{M_{WV}}{I_Y} \right| (z - N) - C_{WH} \left| \frac{M_{WH}}{I_Z} \right| y \right] 10^{-3}$$

where:

M_{SW} : Permissible still water bending moments, in kN.m, in hogging or sagging as the case may be

M_{WV} : Vertical wave bending moment, in kN.m, in hogging or sagging as the case may be, as defined in **Ch 4, Sec 3**

M_{WH} : Horizontal wave bending moment, in kN.m, as defined in **Ch 4, Sec 3**

C_{SW} : Combination factor for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and defined in the **Table 1**

C_{WV}, C_{WH} : Combination factors defined in **Ch 4, Sec 4, [2.2]** for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and given in the **Table 1**

Table 1: Combination factors C_{SW}, C_{WV} and C_{WH}

LC	Hogging			Sagging		
	C_{SW}	C_{WV}	C_{WH}	C_{SW}	C_{WV}	C_{WH}
H1	Not Applicable			-1	-1	0
H2	1	1	0	Not Applicable		
F1	Not Applicable			-1	-1	0
F2	1	1	0	Not Applicable

2.2 Center Girders and Side Girders

2.2.1 Net web thickness

The net thickness of girders in double bottom structure, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$$t_1 = C_1 \frac{pS|x-x_c|}{(d_0-d_1)\tau_a}\left\{1-4\left(\frac{y}{B_{DB}}\right)^2\right\}$$ where $|x-x_c|$ is less than 0.25 ℓ_{DB}, $|x-x_c|$ is to be taken as 0.25 ℓ_{DB}

$$t_2 = 1.75\cdot\sqrt[3]{\frac{H^2a^2\tau_a}{C_1'}t_1}$$

$$t_3 = \frac{C_1''a}{\sqrt{k}}$$

where:

P : Differential pressure given by the following formula in $\mathrm{kN/m^2}$:

$$p = \left|\left(p_{S,IB}+p_{W,IB}\right)-\left(p_{S,BM}+p_{W,BM}\right)\right|$$

$P_{S,IB}$: Cargo or ballast pressure of inner bottom plating in still water, in $\mathrm{kN/m^2}$, as calculated at the center of the double bottom structure under consideration, according to **Ch 4, Sec 6**

$P_{W,IB}$: Cargo or ballast pressure of inner bottom plating due to inertia, in $\mathrm{kN/m^2}$, as calculated at the center of the double bottom structure under consideration, according to **Ch 4, Sec 6**

$P_{S,BM}$: External sea and ballast pressure of bottom plating in still water, in $\mathrm{kN/m^2}$, as calculated at the center of the double bottom structure under consideration, according to **Ch 4, Sec 5** and **Ch 4, Sec 6**

$P_{W,BM}$: External sea and ballast pressure of bottom plating due to inertia, in $\mathrm{kN/m^2}$, as calculated at the center of the double bottom structure under consideration, according to **Ch 4, Sec 5** and **Ch 4, Sec 6**

S : Distance between the centers of the two spaces adjacent to the center or side girder under consideration, in m

d_0 : Depth of the center or side girder under consideration, in m

d_1 : Depth of the opening, if any, at the point under consideration, in m

ℓ_{DB} : Length of the double bottom, in m. Where stools are provided at transverse bulkheads, ℓ_{DB} may be taken as the distance between the toes.

x_c : X co-ordinate, in m, of the center of double bottom structure under consideration with respect to ther eference co-ordinate system defined in **Ch 1, Sec 4**

B_{DB} : Distance between the toes of hopper tanks at the midship part, in m, see **Fig 3**

C_1 : Coefficient obtained from **Table 2** depending on B_{DB} / ℓ_{DB}. For intermediate values of B_{DB} / ℓ_{DB}, C_1 is to be obtained by linear interpolation

a : Depth of girders at the point under consideration, in m. However, where horizontal stiffeners are fitted on the girder, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance between the horizontal stiffeners under consideration

S_1 : Spacing, in m, of vertical ordinary stiffeners or floors

C_1' : Coefficient obtained from **Table 3** depending on S_1 / a. For intermediate values of S_1 / a, C_1' is to be determined by linear interpolation

H : Value obtained from the following formulae:

- where the girder is provided with an unreinforced opening : $H = 1 + 0.5\dfrac{\phi}{\alpha}$
- In other cases : $H = 1.0$

ϕ : Major diameter of the openings, in m

α : The greater of a or S_1, in m.

C_1'' : Coefficient obtained from **Table 4** depending on S_1 / a. For intermediate values of S_1 / a, C_1'' is to be obtained by linear interpolation.

Table 2: Coefficient C_1

2.3 Floors

2.3.1 Net web thickness

The net thickness of floors in the double bottom structure, in mm, is not to be less than the greatest of values t_1 to t_3 specified in the following according to each location:

$$t_1 = C_2 \frac{pSB_{DB}}{(d_0 - d_1)\tau_a}\left(\frac{2|y|}{B'_{DB}}\right)\left\{1 - 2\left(\frac{x - x_c}{l_{DB}}\right)^2\right\}$$, where $|x - x_c|$ is less than 0.25 ℓ_{DB}, $|x - x_c|$ is to be taken as 0.25 ℓ_{DB}, and where $|y|$ is less than $B'_{DB}/4$, $|y|$ is to be taken as $B'_{DB}/4$

$$t_2 = 1.75 \cdot \sqrt[3]{\frac{H^2 a^2 \tau_a}{C'_2} t_1}$$

$$t_3 = \frac{8.5 S_2}{\sqrt{k}}$$

where :

S : Spacing of solid floors, in m

d_0 : Depth of the solid floor at the point under consideration in m

d_1 : Depth of the opening, if any, at the point under consideration in m

B'_{DB} : Distance between toes of hopper tanks at the position of the solid floor under consideration, in m

C_2 : Coefficient obtained from **Table 5** depending on B_{DB} / ℓ_{DB}. For intermediate values of B_{DB} / ℓ_{DB}, C_2 is to be obtained by linear interpolation

p, B_{DB}, x_c, ℓ_{DB} : As defined in **[2.2.1]**

a : Depth of the solid floor at the point under consideration, in m. However, where horizontal stiffeners are fitted on the floor, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or the inner bottom plating or the distance between the horizontal stiffeners under consideration

S_1 : Spacing, in m, of vertical ordinary stiffeners or girders

C'_2 : Coefficient given in **Table 6** depending on S_1 / d_0. For intermediate values of S_1 / d_0, C'_2 is to be determined by linear interpolation.

H : Value obtained from the following formulae:

a) where openings with reinforcement or no opening are provided on solid floors:

1) where slots without reinforcement are provided:

$$H = \sqrt{4.0 \frac{d_2}{S_1} - 1.0}$$, without being taken less than 1.0

2) where slots with reinforcement are provided: H = 1.0

b) where openings without reinforcement are provided on solid floors:

1) where slots without reinforcement are provided:

$H = \left(1 + 0.5\frac{\phi}{d_0}\right)\sqrt{4.0\frac{d_2}{S_1} - 1.0}$, without being taken less than $1 + 0.5\frac{\phi}{d_0}$

2) where slots with reinforcement are provided: $H = 1 + 0.5\frac{\phi}{d_0}$

d_2 : Depth of slots without reinforcement provided at the upper and lower parts of solid floors, in m, whichever is greater

ϕ : Major diameter of the openings, in m

S_2 : The smaller of S_1 or a, in m.

Table 5: Coefficient C_2

2.4 Stringer of double side structure

2.4.1 Net web thickness

The net thickness of stringers in double side structure, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$t_1 = C_3 \frac{pS|x - x_c|}{(d_0 - d_1)\tau_a}$, where $|x - x_c|$ is under 0.25 ℓ_{DS}, $|x - x_c|$ is to be taken as 0.25 ℓ_{DS}

$$t_2 = 1.75\sqrt[3]{\frac{H^2 a^2 \tau_a}{C_3'} t_1}$$

$$t_3 = \frac{8.5S_2}{\sqrt{k}}$$

where :

P : Differential pressure given by the following formula in kN/m^2:

$$p = \left|\left(p_{S,SS} + p_{W,SS}\right) - \left(p_{S,LB} + p_{W,LB}\right)\right|$$

$P_{S,SS}$: External sea and ballast pressure of side shell plating in still water, in kN/m^2, as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}, according to **Ch 4, Sec 5** and **Ch 4, Sec 6**

$P_{W,SS}$: External sea and ballast pressure of side shell plating due to inertia, in kN/m^2, as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}, according to **Ch 4, Sec 5** and **Ch 4, Sec 6**

$P_{S,LB}$: Ballast pressure of longitudinal bulkhead in still water, in kN/m^2, as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}, according to **Ch 4, Sec 6**

$P_{W,LB}$: Ballast pressure of longitudinal bulkhead due to inertia, in kN/m^2, as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}, according to **Ch 4, Sec 6**

S : Breadth of part supported by stringer, in m

d_0 : Depth of stringers, in m

d_1 : Depth of opening, if any, at the point under consideration, in m.

x_c : X co-ordinate, in m, of the center of double side structure under consideration with respect to the reference co-ordinate system defined in **Ch 1, Sec 4**

ℓ_{DS} : Length of the double side structure between the transverse bulkheads under consideration, in m

h_{DS} : Height of the double side structure between the upper end of hopper tank and the lower end of topside tank, in m

C_3 : Coefficient obtained from **Table 7** depending on h_{DS}/ℓ_{DS}. For intermediate values of h_{DS}/ℓ_{DS}, C_3 is to be obtained by linear interpolation.

a : Depth of stringers at the point under consideration, in m. However, where horizontal stiffeners are fitted on the stringer, a is the distance from the horizontal stiffener under consideration to the side shell plating or the longitudinal bulkhead of double side structure or the distance between the horizontal stiffeners under consideration

S_1 : Spacing, in m, of transverse ordinary stiffeners or web frames

C_3' : Coefficient obtained from **Table 8** depending on S_1/a. For intermediate values of S_1/a, C_3' is to be obtained by linear interpolation.

H : Value obtained from the following formulae:

- where the stringer is provided with an unreinforced opening: $H = 1 + 0.5\dfrac{\phi}{\alpha}$
- in other cases: $H = 1.0$

ϕ : Major diameter of the openings, in m

α : The greater of a or S_1, in m

S_2 : The smaller of a or S_1, in m

Table 7: Coefficient C_3

$\dfrac{h_{DS}}{\ell_{DS}}$	0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over

2.5 Transverse web in double side structure

2.5.1 Net web thickness

The net thickness of transverse webs in double side structure, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$$t_1 = C_4 \frac{pSh_{DS}}{(d_0 - d_1)\tau_a}\left(1 - 1.75\frac{z - z_{BH}}{h_{DS}}\right)$$, where $z - z_{BH}$ is greater than 0.4 h_{DS}, $z - z_{BH}$ is to be taken as 0.4 h_{DS}

$$t_2 = 1.75\sqrt[3]{\frac{H^2 a^2 \tau_a}{C_4'} t_1}$$

$$t_3 = \frac{8.5 S_2}{\sqrt{k}}$$

where :

S : Breadth of part supported by transverses, in m

d_0 : Depth of transverses, in m

d_1 : Depth of opening at the point under consideration, in m

C_4 : Coefficient obtained from **Table 9** depending on h_{DS} / ℓ_{DS}. For intermediate values of h_{DS} / ℓ_{DS}, C_4 is to be obtained by linear interpolation

z_{BH} : Z co-ordinates, in m, of the upper end of hopper tank with respect to the reference co-ordinate system defined in **Ch 1, Sec 4**

p, h_{DS} and ℓ_{DS} : as defined in the requirements of **[2.4.1]**

a : Depth of transverses at the point under consideration, in m. However, where vertical stiffeners are fitted on the transverse, a is the distance from the vertical stiffener under consideration to the side shell or the longitudinal bulkhead of double side hull or the distance between the vertical stiffeners under consideration.

S_1 : Spacing, in m, of horizontal ordinary stiffeners or stringers

C_4' : Coefficient obtained from **Table 10** depending on S_1 / a. For intermediate values of S_1 / a, C_4' is to be obtained by linear interpolation.

H : Value obtained from the following formulae :

- where the transverse is provided with an unreinforced opening: $H = 1 + 0.5\frac{\phi}{\alpha}$
- in other cases: $H = 1.0$

ϕ : Major diameter of the openings, in m

α : The greater of a or S_1. in m

S_2 : The smaller of a or S_1, in m

Table 9: Coefficient C_4

2.6 Primary supporting member in bilge hopper tanks and topside tanks and other structures

2.6.1 Load calculation point

For horizontal members, the lateral pressure and hull girder stress, if any, are to be calculated at mid-span of the primary supporting members considered, unless otherwise specified.
For vertical members, the lateral pressure p is to be calculated as the maximum between the values obtained at mid-span and the pressure obtained from the following formula:

- $p = \frac{p_U + p_L}{2}$, when the upper end of the vertical member is below the lowest zero pressure level
- $p = \frac{\ell_1}{\ell}\frac{p_L}{2}$, when the upper end of the vertical member is at or above the lowest zero pressure level (see **Fig 1**)

where:

ℓ_1 : Distance, in m, between the lower end of vertical member and the lowest zero pressure level

P_U, P_L : Lateral pressures at the upper and lower end of the vertical member span ℓ, respectively

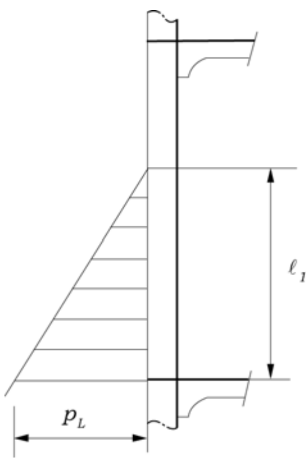

Fig 1: Definition of pressure for vertical members

2.6.2 Boundary conditions

The requirements of this sub-article apply to primary supporting members considered as clamped at both ends. For boundary conditions deviated from the above, the yielding check is to be considered on a case by case basis.

2.6.3 Net section modulus, net shear sectional area and web thickness under intact conditions

The net section modulus w, in cm^3, the net shear sectional area A_{sh}, in cm^2, and the net web thickness t_w, in mm, subjected to lateral pressure are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{m\lambda_S R_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

$$t_w = 1.75 \cdot \sqrt[3]{\frac{h_w \tau_a}{10^4 C_5} A_{sh}}$$

where:

λ_S : Coefficient defined in **Table 11**

ϕ : Angle, in deg, between the primary supporting member web and the shell plate, measured at the middle of the member span; the correction is to be applied when f is less than 75 deg.

C_5 : Coefficient defined in **Table 12** according to s_1 and d_0. For intermediate values of s_1 / d_0, coefficient C_5 is to be obtained by linear interpolation.

s_1 : Spacing of stiffeners or tripping brackets on web plate, in m

d_0 : Spacing of stiffeners parallel to shell plate on web plate, in m

Table 11: Coefficient λ_S

Primary supporting members	Coefficient λ_S
Longitudinal members contributing to the hull girder longitudinal strength	$1.1\left(1.0 - 0.85\left\|\frac{\sigma_X}{R_Y}\right\|\right)$, without being taken greater than 0.8
Other members	0.8

Table 12: Coefficient C_5

C_5	60.0	40.0	26.8	20.0	16.4	14.4	13.0	12.3	11.1	10.2

3. Additional requirements for primary supporting members of BC-A and BC-B ships

3.1 Evaluation of double bottom capacity and allowable hold loading in flooded conditions

3.1.1 Shear capacity of the double bottom

The shear capacity of the double bottom is to be calculated as the sum of the shear strength at each end of:

- all floors adjacent to both hopper tanks, less one half of the shear strength of the two floors adjacent to each stool, or transverse bulkhead if no stool is fitted (see **Fig 2**); the floor shear strength is to be calculated according to **[3.1.2]**
- all double bottom girders adjacent to both stools, or transverse bulkheads if no stool is fitted; the girder shear strength is to be calculated according to **[3.1.3].**

Where in the end holds, girders or floors run out and are not directly attached to the boundary stool or hopper tank girder, their strength is to be evaluated for the one end only.
The floors and girders to be considered in calculating the shear capacity of the double bottom are those inside the hold boundaries formed by the hopper tanks and stools (or transverse bulkheads if no stool is fitted). The hopper tank side girders and the floors directly below the connection of the stools (or transverse bulkheads if no stool is fitted) to the inner bottom may not be included.
When the geometry and/or the structural arrangement of the double bottom is/are such as to make the above assumptions inadequate, the shear capacity of the double bottom is to be calculated by means of direct calculations to be carried out according to the requirements specified in **Ch 7**, as far as applicable.

3.1.2 Floor shear strength

The floor shear strength, in kN, is to be obtained from the following formulae:

- in way of the floor panel adjacent to the hopper tank:

$$S_{f1} = A_f \frac{\tau_A}{\eta_1} 10^{-3}$$

- in way of the openings in the outermost bay (i.e. that bay which is closer to the hopper tank):

$$S_{f2} = A_{f,h} \frac{\tau_A}{\eta_2} 10^{-3}$$

where:

A_f : Net sectional area, in mm^2, of the floor panel adjacent to the hopper tank

$A_{f,h}$: Net sectional area, in mm^2, of the floor panels in way of the openings in the outermost bay (i.e. that bay which is closer to the hopper tank)

τ_A : Allowable shear stress, in N/mm^2, equal to the lesser of:

$$\tau_A = 0.645 \frac{R_{eH}^{0.6}}{(s/t_N)^{0.8}} \quad \text{and} \quad \tau_A = \frac{R_{eH}}{\sqrt{3}}$$

t_N : Floor web net thickness, in mm

s : Spacing, in m, of stiffening members of the panel considered

η_1 : Coefficient to be taken equal to 1.1

η_2 : Coefficient to be taken equal to 1.2. It may be reduced to 1.1 where appropriate reinforcements are fitted in way of the openings in the outermost bay, to be examined by the Society on a case-by-case basis.

3.1.3 Girder shear strength

The girder shear strength, in kN, is to be obtained from the following formulae:

- in way of the girder panel adjacent to the stool (or transverse bulkhead, if no stool is fitted):

$$S_{g1} = A_g \frac{\tau_A}{\eta_1} 10^{-3}$$

- in way of the largest opening in the outermost bay (i.e. that bay which is closer to the stool, or transverse bulk-head, if no stool is fitted):

$$S_{g2} = A_{g,h} \frac{\tau_A}{\eta_2} 10^{-3}$$

where:

A_g : Net sectional area, in mm^2, of the girder panel adjacent to the stool (or transverse bulkhead, if no stool is fitted)

$A_{g,h}$: Net sectional area, in mm^2, of the girder panel in way of the largest opening in the outermost bay (i.e. that bay which is closer to the stool, or transverse bulkhead, if no stool is fitted)

τ_A : Allowable shear stress, in N/mm^2, defined in **[3.1.2]**, where t_N is the girder web net thickness

η_1 : Coefficient to be taken equal to 1.1

η_2 : Coefficient to be taken equal to 1.15. It may be reduced to 1.1 where appropriate reinforcements are fitted in way of the largest opening in the outermost bay, to be examined by the Society on a case-by-case basis.

3.1.4 Allowable hold loading

The allowable hold loading is to be obtained, in t, from the following formula:

$$W = \rho_C V \frac{1}{F}$$

where:

F : Coefficient to be taken equal to:
F = 1.1 in general
F = 1.05 for steel mill products

V : Volume, in m^3, occupied by cargo at a level h_B

h_B : Level of cargo, in m^2, to be obtained from the following formula:

$$h_B = \frac{X}{\rho_C g}$$

X : Pressure, in kN/m^2, to be obtained from the following formulae:

- for dry bulk cargoes, the lesser of:

$$X = \frac{Z + \rho g(z_F - 0.1D_1 - h_F)}{1 + \frac{\rho}{\rho_C}(perm - 1)}$$

$$X = Z + \rho g(z_F - 0.1D_1 - h_F\,perm)$$

- for steel mill products:

$$X = \frac{Z + \rho g(z_F - 0.1D_1 - h_F)}{1 - \frac{\rho}{\rho_C}}$$

D_1 : Distance, in m, from the base line to the freeboard deck at side amidships

h_F : Inner bottom flooding head is the distance, in m, measured vertically with the ship in the upright position, from the inner bottom to a level located at a distance z_F, in m, from the baseline.

z_F : Flooding level, in m, defined in **Ch 4, Sec 6, [3.4.3]**

$perm$: Permeability of cargo, which need not be taken greater than 0.3

Z : Pressure, in kN/m^2, to be taken as the lesser of:

$$Z = \frac{C_H}{A_{DB,H}}$$

$$Z = \frac{C_E}{A_{DB,E}}$$

C_H : Shear capacity of the double bottom, in kN, to be calculated according to **[3.1.1]**, considering, for each floor, the lesser of the shear strengths S_{f1} and S_{f2} (see **[3.1.2]**) and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (see **[3.1.3]**)

C_E : Shear capacity of the double bottom, in kN, to be calculated according to **[3.1.1]**, considering, for each floor, the shear strength S_{f1} (see **[3.1.2]**) and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (see **[3.1.3]**)

- $A_{DB,H} = \sum_{i=1}^{n} S_i B_{DB,i}$
- $A_{DB,E} = \sum_{i=1}^{n} S_i (B_{DB} - s)$

n : Number of floors between stools (or transverse bulkheads, if no stool is fitted)

S_i : Space of i-th floor, in m

$B_{DB,i}$: Length, in m, to be taken equal to :

$B_{DB,i} = B_{DB} - s$ for floors for which $S_{f1} < S_{f2}$ (see **[3.1.2]**)

$B_{DB,i} = B_{DB,h}$ for floors for which $S_{f1} \geq S_{f2}$ (see **[3.1.2]**)

B_{DB} : Breadth, in m, of double bottom between the hopper tanks (see **Fig 3**)

$B_{DB,h}$: Distance, in m, between the two openings considered (see **Fig 3**)

s : Spacing, in m, of inner bottom longitudinal ordinary stiffeners adjacent to the hopper tanks.

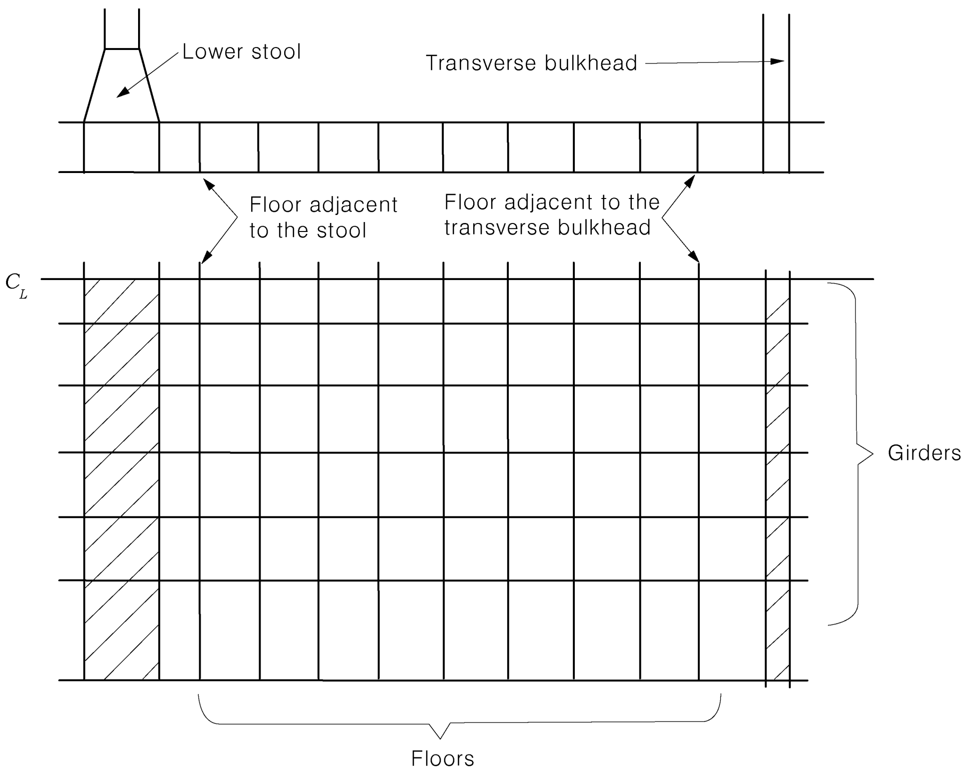

Fig 2: Double bottom structure

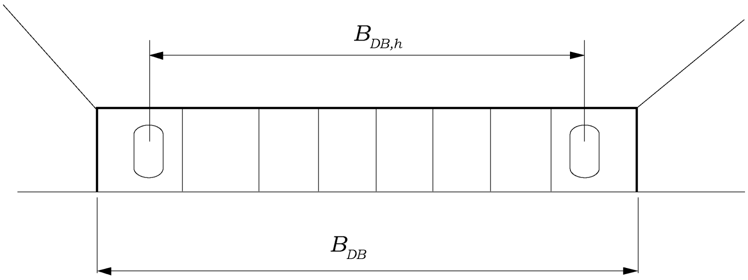

Fig 3: Dimensions B_{DB} and $B_{DB,h}$

4. Pillars

4.1 Buckling of pillars subjected to compressive axial load

4.1.1 General

It is to be checked that the compressive stress of pillars does not exceed the critical column buckling stress calculated according to **[4.1.2].**

4.1.2 Critical column buckling stress of pillars

The critical column buckling stress of pillars is to be obtained, in N/mm^2, from the following formulae:

$$\sigma_{cB} = \sigma_{E1} \quad \text{for} \quad \sigma_{E1} \le \frac{R_{eH}}{2}$$

$$\sigma_{cB} = R_{eH}\left(1 - \frac{R_{eH}}{4\sigma_{E1}}\right) \quad \text{for} \quad \sigma_{E1} > \frac{R_{eH}}{2}$$

where:

σ_{E1} : Euler column buckling stress, to be obtained, in N/mm^2, from the following formula:

$$\sigma_{E1} = \pi^2 E \frac{I}{A(fl)^2} 10^{-4}$$

I : Minimum net moment of inertia, in cm^4, of the pillar

A : Net cross-sectional area, in cm^2, of the pillar

f : Coefficient to be obtained from **Table 13.**

Table 13: Coefficient *f*

Boundary conditions of the pillar	f
Both ends fixed 	0.5
One end fixed, one end pinned 	$\frac{\sqrt{2}}{2}$
Both ends pinned 	1.0

Appendix 1 - BUCKLING & ULTIMATE STRENGTH

1. Application of Ch 6, Sec 3

1.1 General application

1.1.1 Mutable shear stress

If shear stresses are not uniform on the width b of the elementary plate panel, the greater of the two following values is to be used:

- mean value of τ
- $0.5\,\tau_{max}$

1.1.2 Change of thickness within an elementary plate panel

If the plate thickness of an elementary plate panel varies over the width b, the buckling check may be performed for an equivalent elementary plate panel $a \times b'$ having a thickness equal to the smaller plate thickness t_1.
The width of this equivalent elementary plate panel is defined by the following formula:

$$b' = b_1 + b_2 \left(\frac{t_1}{t_2} \right)^{1.5}$$

where:

b_1 : Width of the part of the elementary plate panel with the smaller plate thickness t_1

b_2 : Width of the part of the elementary plate panel with the greater plate thickness t_2

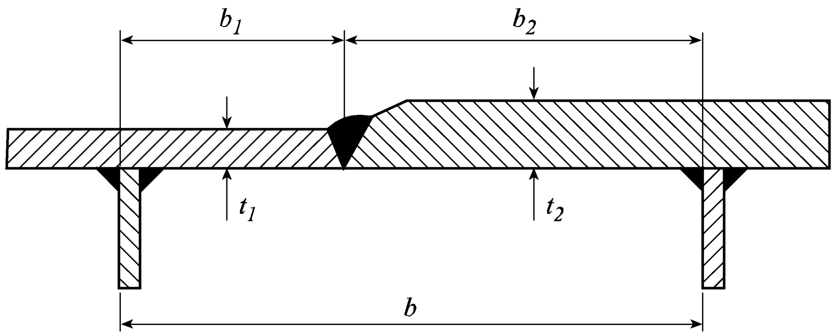

Fig 1: Plate thickness change within the field breath

1.1.3 Evaluation of floors or other high girders with holes

The following procedure may be used to assess high girders with holes:

a) Divide the plate field in sub elementary plate panels according the **Fig 2**

b) Assess the elementary plate panel and all sub elementary plate panels separately with the following boundary conditions:

- for sub panels 1 to 4: all edges are simply supported (load cases 1 and 2 in **Ch 6, Sec 3, Table 2**)
- for sub panels 5 and 6: simply supported, one side free (load case 3 in **Ch 6, Sec 3, Table 2**).

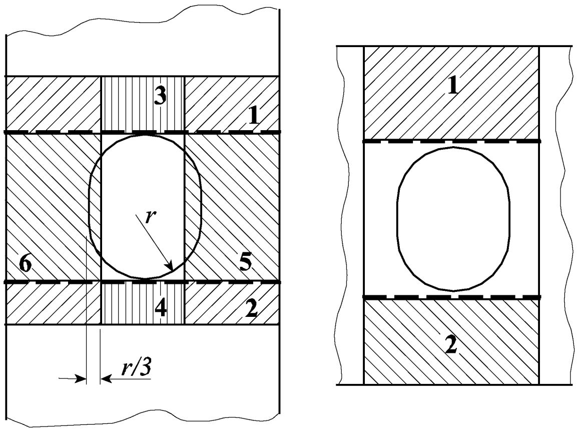

Fig 2: Elementary plate panels of high girder with hole

1.2 Application to hull transverse section analysis

1.2.1 Idealization of elementary plate panels

The buckling check of the elementary plate panel is to be performed under the loads defined in **Ch 6, Sec 3, [2.1]**, according to the requirements of **Ch 6, Sec 3, [3].**
The determination of the buckling and reduction factors is made according to the **Ch 6, Sec 3, Table 2** for the plane plate panel and **Ch 6, Sec 3, Table 3** for the curved plate panel.
For the determination of the buckling and reduction factors in **Ch 6, Sec 3, Table 2**, the following cases are to be used according to the type of stresses and framing system of the plating:

- For the normal compressive stress:
  - Buckling load case 1 for longitudinally framed plating, the membrane stress in x-direction σ_x being the normal stress σ_n defined in **Ch 6, Sec 3, [2.1.2]**
  - Buckling load case 2 for transversely framed plating, the membrane stress in y-direction σ_y being the normal stress σ_n defined in **Ch 6, Sec3, [2.1.2]**, and the values a and b being exchanged to obtain α value greater than 1 as it is considered in load case 2.
- For the shear stress: Buckling case 5, τ being the shear stress τ_{SF} defined in **Ch 6, Sec 3, [2.1.3].**

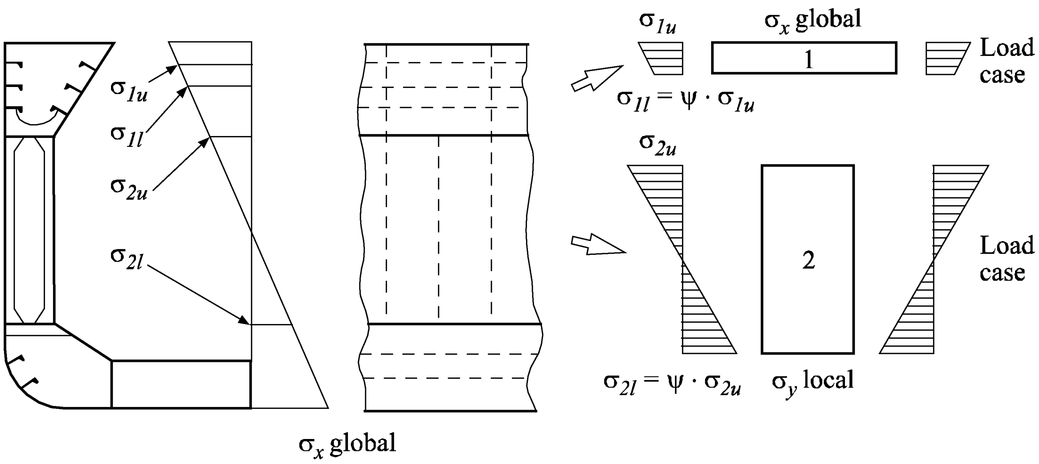

Fig 3: Idealization of elementary plate panels

1.2.2 Ordinary stiffeners

The buckling check of the longitudinal and transverse ordinary stiffeners of partial and total plate panels is to be performed under the loads defined in **Ch 6, Sec 3, [2.1]**, according to **Ch 6, Sec 3, [4]** with:

- σ_x = normal stress σ_n defined in **Ch 6, Sec 3, [2.1.2]**
- σ_y = 0

The effective width of the attached plating of the stiffeners is to be determined in accordance with **Ch 6, Sec 3, [5]**. A constant stress is to be assumed corresponding to the greater of the following values:

- stress at half length of the stiffener
- 0.5 of the maximum compressive stress of adjacent elementary plate panels

1.2.3 Primary supporting members with stiffeners in parallel

The effective width of the attached plating of the primary supporting members is to be determined in accordance with **Ch 6, Sec 3, [5.2].**
In addition, when ordinary stiffeners are fitted on the attached plate and parallel to a primary supporting member, the buckling check is to consider a moment of inertia I_x taking account the moments of inertia of the parallel ordinary stiffeners connected to its attached plate (see **Ch 6, Sec 3, Fig 3**).

1.2.4 Primary supporting members with stiffener perpendicular to girder

The effective width of the attached plating of the primary supporting members is to be determined in accordance with **Ch 6, Sec 3, [5.2].**
In addition, when ordinary stiffeners are fitted on the attached plate and perpendicular to a primary supporting member, the buckling check is to consider a moment of inertia I_x taking account the effective width according to (see **Ch 6, Sec 3, Fig 4**).

1.3 Additional application to FEM analysis

1.3.1 Non uniform compressive stresses along the length of the buckling panel

If compressive stresses are not uniform over the length of the unloaded plate edge (e.g. in case of girders subjected to bending), the compressive stress value is to be taken at a distance of $b/2$ from the transverse plate edge having the largest compressive stress (see **Fig 4**). This value is not to be less than the average value of the compressive stress along the longitudinal edge.

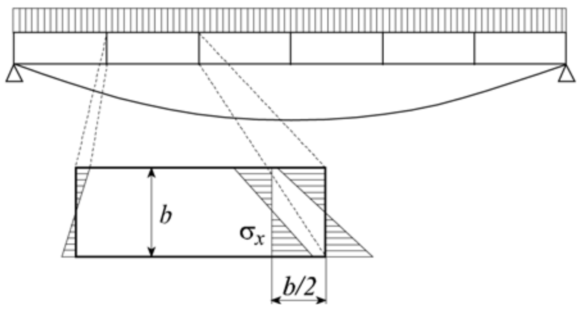

Fig 4: Non uniform compressive stress along longitudinal edge *a*

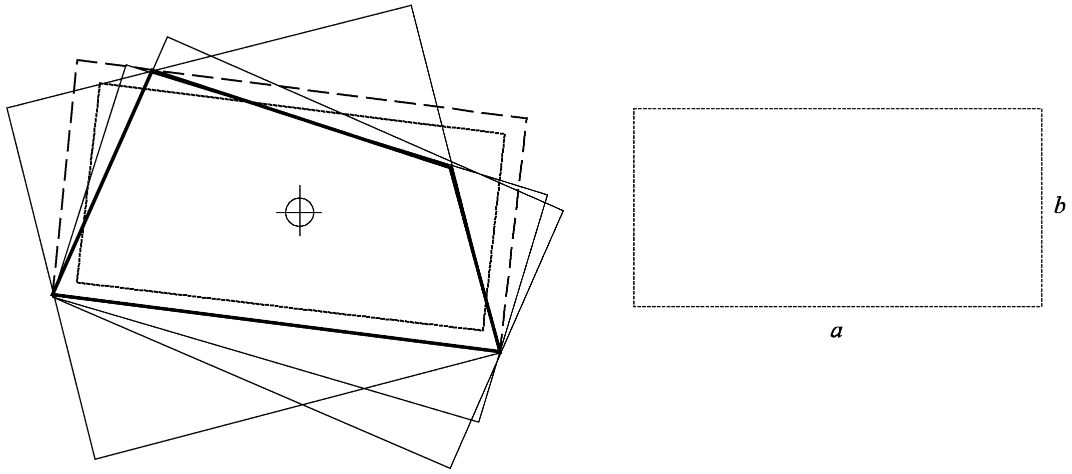
1.3.2 Buckling stress calculation of non rectangular elementary plate panels

a) Quadrilateral panels

According to **Fig 5**, rectangles that completely surround the irregular buckling panel are searched. Among several possibilities the rectangle with the smallest area is taken. This rectangle is shrunk to the area of the original panel, where the aspect ratio and the centre are maintained. This leads to the final rectangular panel with the dimensions a, b.



Original irregular panel (———)
Intermediate rectangles (———)
Rectangle with smallest area (— — — -)
Final rectangle (----------)

Fig 5: Approximation of non rectangular elementary plate panels

b) Trapezoidal elementary plate panel
A rectangle is derived with a being the mean value of the bases and b being the height of the original panel.

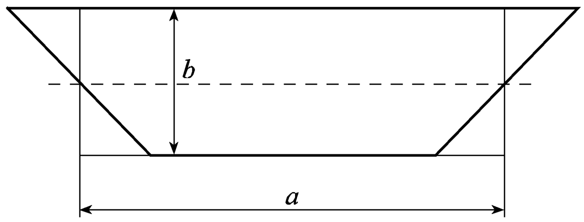


Fig 6: Approximation of trapezoidal elementary plate panel

c) Right triangle
The legs of the right triangle are reduced by $\sqrt{0.5}$ to obtain a rectangle of same area and aspect ratio.

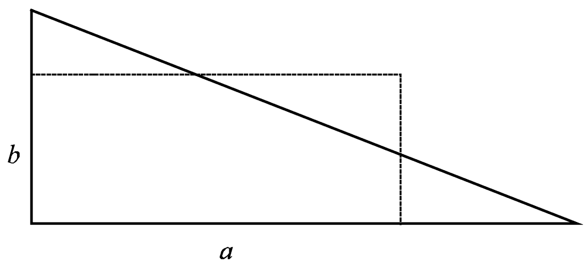

Fig 7: Approximation of right triangle

d) General triangle
General triangle is treated according to a) above.

1.3.3 Buckling assessment of side shell plates

In order to assess the buckling criteria for vertically stiffened side shell plating, the following cases have to be considered:
In case vertical and shear stresses are approximately constant over the height of the elementary plate panel:

- Buckling load cases 1, 2 and 5, according to **Ch 6, Sec 3, Table 2** are to be considered
- $\psi = f(\sigma_1, \sigma_2)$ for horizontal stresses
- $\psi = 1.0$ for vertical stresses
- $t = t_{min}$ (Elementary plate panel)

In case of distributed horizontal, vertical and shear stresses over the height of the elementary plate panel, the following stress situations are to be considered separately:

a) Pure vertical stress
   - The size of buckling field to be considered is b times b ($\alpha = 1$)
   - $\psi = 1.0$
   - The maximum vertical stress in the elementary plate panel is to be considered in applying the criteria

b) Shear stress associated to vertical stress
   - The size of buckling field to be considered is $2b$ times b ($\alpha = 2$)
   - $\psi = 1.0$
   - The following two stress combinations are to be considered:
     - The maximum vertical stress in the elementary plate panel plus the shear stress and longitudinal stress at the location where maximum vertical stress occurs
     - The maximum shear stress in the elementary plate panel plus the vertical stress and longitudinal stress at the location where maximum shear stress occurs
   - The plate thickness t to be considered is the one at the location where the maximum vertical/shear stress occurs

c) Distributed longitudinal stress associated with vertical and shear stress
   - The actual size of the elementary plate panel is to be used ($\alpha = f(a, b)$).
   - The actual edge factor ψ for longitudinal stress is to be used
   - The average values for vertical stress and shear stress are to be used.
   - $t = t_{min}$ (Elementary plate panel)

1.3.4 Buckling assessment of corrugated bulkheads

The transverse elementary plate panel (face plate) is to be assesed using the normal stress parallel to the corrugation. The slanted elementary plate panel (web plate) is to be assessed using the combination of normal and shear stresses.
The plate panel breadth b is to be measured according to **Fig 8.**

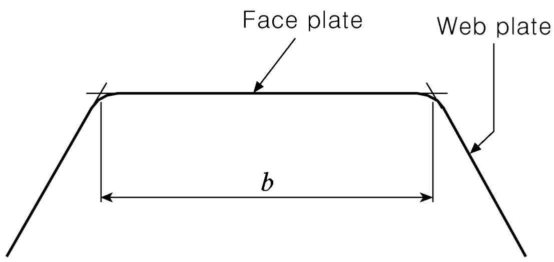

Fig 8: Measuring *b* of corrugated bulkheads

a) Face plate assessment

- The buckling load case 1, according to **Ch 6, Sec 3, Table 2**, is to be used
- The size of the buckling field to be considered is b times b ($\alpha = 1$)
- $\psi = 1.0$
- The maximum vertical stress in the elementary plate panel is to be considered in applying the criteria
- The plate thickness t to be considered is the one at the location where the maximum vertical stress occurs

b) Web plate assessment

- The buckling load cases 1 and 5, according to **Ch 6, Sec 3, Table 2**, are to be used.
- The size of the buckling field to be considered is $2b$ times b ($\alpha = 2$)
- $\psi = 1.0$
- The following two stress combinations are to be considered:
  - The maximum vertical stress in the elementary plate panel plus the shear stress and longitudinal stress at the location where maximum vertical stress occurs
  - The maximum shear stress in the elementary plate panel plus the vertical stress and longitudinal stress at the location where maximum shear stress occurs
- The plate thickness t to be considered is the one at the location where the maximum vertical/shear stress occurs. ⚓

Chapter 7

Direct Strength Analysis

Section 1 – DIRECT STRENGTH ASSESSMENT OF THE PRIMARY SUPPORTING MEMBERS

1. General

1.1 Application

1.1.1

Direct strength assessment of primary supporting members based on a three-dimensional (3D) finite element (FE) analysis is to be applied to ships having length L of 150 m or above.

1.1.2

Three kinds of FE analysis procedures are specified in this Chapter:

a) global strength FE analysis (first FE analysis step) to assess global strength of primary supporting members of the cargo hold structure, according to **Sec 2.**

b) detailed stress assessment (second FE analysis step) to assess highly stressed areas with refined meshes, according to **Sec 3**

c) hot spot stress analysis (third FE analysis step) to calculate hot spot stresses at stress concentration points with very fine meshes for fatigue strength assessment, according to **Sec 4.**

A flowchart of FE analysis procedure for direct strength assessment is shown in **Fig 1.**

1.2 Computer program

1.2.1

Computer programs for FE analysis are to be suitable for the intended analysis. Reliability of unrecognized programs is to be demonstrated to the satisfaction of the Society prior to the commencement of the analysis.

1.3 Submission of analysis report

1.3.1

A detailed report of direct strength FE analysis is to be submitted, including background information of the analysis. This report is to include the following items:

a) list of drawings/plans used in the analysis, including their versions and dates

b) detailed description of structural modeling principles and any deviations in the model from the actual structures

c) plots of structural model

d) material properties, plate thickness and beam properties used in the model

e) details of boundary conditions

f) all loading conditions analyzed

g) data for loads application

h) summaries and plots of calculated deflections

i) summaries and plots of calculated stresses

j) details of buckling strength assessment

k) tabulated results showing compliance with the design criteria

l) reference of the finite element computer program, including its version and date.

1.4 Net scantling

1.4.1

Direct strength analysis is to be based on the net scantling approach according to **Ch 3, Sec 2.**

1.5 Applied loads

1.5.1 Design loads

Direct strength analysis is to be carried out by applying design loads given in **Ch 4** at a probability level of 10^{-8}, except for fatigue strength assessment where probability level is 10^{-4}. Combination of static and dynamic loads which are likely to impose the most severe load regime are to be applied to the 3D FE model.

1.5.2 Structural weight

Effect of the hull structure weight is to be included in static loads, but is not to be included in dynamic loads. Standard density of steel is to be taken as 7.85 t/m^3.

1.5.3 Loading conditions

The loading conditions specified in **Ch 4, Sec 7** are to be considered in 3D FE analysis.

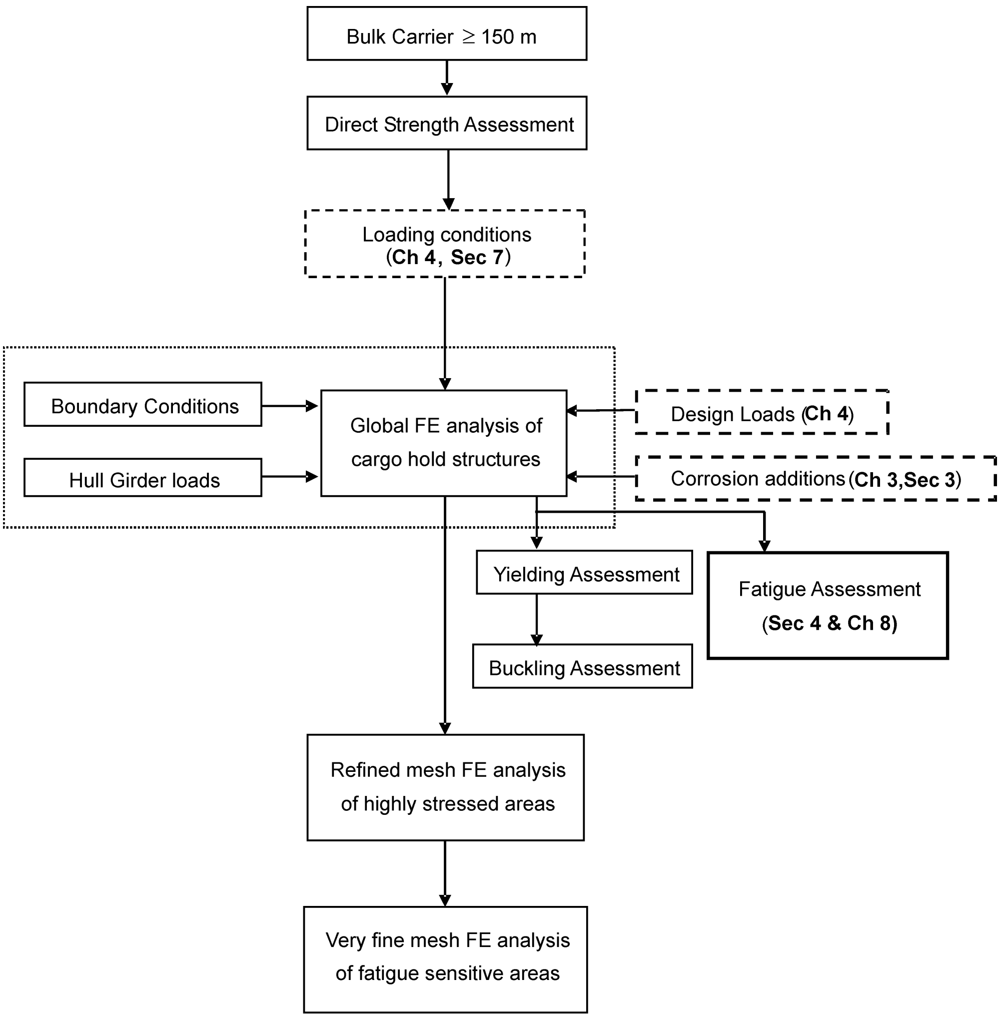

Fig 1: Flowchart of FE analysis procedure

Section 2 – GLOBAL STRENGTH FE ANALYSIS OF CARGO HOLD STRUCTURES

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

M_{SW} : Design vertical bending moment as defined in **Ch 4, Sec 7, Table 2.**

M_{WV} : Vertical wave bending moment, in hogging or sagging condition, as defined in **Ch 4, Sec 3, [3.1.1]**

M_{WH} : Horizontal wave bending moment, as defined in **Ch 4, Sec 3, [3.3.1]**

Q_{SW} : Allowable still water shear force at the considered bulkhead position as provided in **Ch 4, Sec 7, Table 3**

Q_{WV} : Vertical wave shear force as defined in **Ch 4, Sec 3, [3.2.1]**

C_{WV}, C_{WH} : Load combination factors, as defined in **Ch 4, Sec 4, Table 3.**

1. General

1.1 Application

1.1.1

The procedure given in this Section focuses on direct strength analysis of cargo hold structures in mid-ship area.

1.1.2

The global strength FE analysis of cargo hold structures is intended to verify that the following are within the acceptance criteria under the applied static and dynamic loads:

a) stress level in the hull girder and primary supporting members

b) buckling capability of primary supporting members

c) deflection of primary supporting members.

2. Analysis model

2.1 Extent of model

2.1.1

The longitudinal extent of FE model is to cover three cargo holds and four transverse bulkheads. The transverse bulkheads at the ends of the model extent are to be included, together with their associated stools. Both ends of the model are to form vertical planes and to include any transverse web frames on the planes if any. The details of the extent of the model are given in **App 1.**

2.1.2

FE model is to include both sides of ship structures considering unsymmetrical wave-induced loads in the transverse direction.

2.1.3

All main structural members are to be represented in FE model. These include inner and outer shell, floor and girder system in double bottom, transverse and vertical web frames, stringers, transverse and longitudinal bulkhead structures. All plates and stiffeners on these structural members are to be modelled.

2.2 Finite element modeling

2.2.1

All main structural members (plates and stiffeners) detailed in **[2.1.3]** are to be represented in FE model.

2.2.2

Mesh boundaries of finite elements are to simulate the stiffening systems on the actual structures as far as practical and are to represent the correct geometry of the panels between stiffeners.

2.2.3

Stiffness of each structural member is to be represented correctly by using proper element type for the structural member. The principle for selection of element type is given below.

(1) Stiffeners are to be modeled by beam or bar element having axial, torsional, bi-directional shear and bending stiffness. However, web stiffeners and face plates of primary supporting members may be modeled by rod element having only axial stiffness and a constant cross-sectional area along its length.

(2) Plates are to be modeled by shell element having out-of-plane bending stiffness in addition to bi-axial and in-plane stiffness. However, membrane element having only bi-axial and in-plane stiffness can be used for plates that are not subject to lateral pressures.

For membrane and shell elements, only linear quad or triangle elements, as shown in Fig 1, are to be adopted.

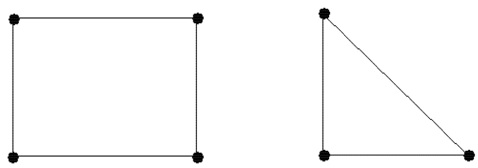

Fig 1: Linear membrane and shell quad and triangle elements

Triangle elements are to be avoided as far as possible, especially in highly stressed areas and in such areas around openings, at bracket connections and at hopper connections where significant stress gradient should be predicted.

(3) Stiffened panels may be modeled by two-dimensional (2D) orthotropic elements that can represent the stiffness of the panels properly.

2.2.4

When orthotropic elements are not used in FE model:

- mesh size is to be equal to or less than the representative spacing of longitudinal stiffeners or transverse side frames
- stiffeners are to be modeled by using rod and/or beam/bar elements
- webs of primary supporting members are to be divided by at least three elements height-wise. However, for transverse primary supporting members inside hopper tank and top side tank, which are less in height than the space between ordinary longitudinal stiffeners, two elements on the height of supporting primary members are accepted.
- side shell frames and their end brackets are to be modeled by using shell elements for web and shell/beam/rod elements for face plate. Webs of side shell frames need not be divided along the direction of depth
- aspect ratio of elements is not to exceed 1:4.

An example of typical mesh is given in **App 1.**

2.2.5

When orthotropic elements are used in FE model for stiffened panels:

- for the members such as the double bottom girder or floor, the element height is to be the double bottom height.
- where a stiffener is located along the edge between two orthotropic elements, either it is to be modelled by using beam/rod element, or it is virtually modelled by reporting the stiffness of the stiffener onto the two orthotropic elements
- where a stiffener is located along the edge between an orthotropic element and a membrane/shell element, it is to be modelled by using beam/rod element
- where a stiffener is located along the edge between two membrane/shell elements, it is to be modelled by using beam/rod element
- where a double hull is fitted, the web of the primary supporting members is to be modelled with one element on its height
- where no double hull construction is fitted, at least one over three frame and its associated end brackets are to be modelled by using shell elements for the webs and shell/beam elements for the flanges
- the aspect ratio of the elements is not to exceed 1:2.

2.3 Boundary conditions

2.3.1

Both ends of the model are to be simply supported according to **Table 1** and **Table 2**. The nodes on the longitudinal members at both end sections are to be rigidly linked to independent points at the neutral axis on the centreline as shown in **Table 1**. The independent points of both ends are to be fixed as shown in **Table 2**.

Table 1: Rigid-link of both ends

Nodes on longitudinal members at both ends of the model	Translational			Rotational		
	Dx	Dy	Dz	Rx	Ry	Rz
All longitudinal members	RL	RL	RL	-	-	-
RL means rigidly linked to the relevant degrees of freedom of the independent point						

Table 2: Support condition of the independent point

Location of the independent point	Translational			Rotational		
	Dx	Dy	Dz	Rx	Ry	Rz
Independent point on aft end of model	-	Fix	Fix	Fix	-	-
Independent point on fore end of model	Fix	Fix	Fix	Fix	-	-

2.4 Loading conditions

2.4.1 General

The loading conditions, combined with loading patterns and load cases, as illustrated in **Ch 4, App 2**, are to be considered as mandatory conditions for the conventional designs.

2.5 Consideration of hull girder loads

2.5.1 General

Each loading condition is to be associated with its corresponding hull girder loads. The load combination is to be considered using Load Combination Factors (LCFs) of the wave-induced vertical and horizontal bending moments and of the wave-induced vertical shear forces specified in **Ch 4, Sec 4** for each Load Case.

2.5.2 Vertical bending moment analysis

Vertical bending moment analysis is to be performed for cases listed in **Ch 4, Sec 7, Table 2**, the minimum required cases being listed in **Ch 4, App 2.**

In vertical bending moment analysis the target hull girder loads are the maximum vertical bending moments which may occur at the centre of the mid-hold in the FE model. The target values of hull girder loads are to be obtained in accordance with **Table 3** with considering still water vertical bending moments specified in **Ch 4, Sec 7, Table 2**, and in **Ch 4, App 2.**

Table 3: Target loads for vertical bending moment analysis

Hull girder effect	Still water	Wave	Considered Location
Vertical bending moment	M_{SW}	$C_{WV}M_{WV}$	Centre of mid-hold
Vertical shear force	0	0	Centre of mid-hold
Horizontal bending moment	---	$C_{WH}M_{WH}$	Centre of mid-hold
Horizontal shear force	---	0	Centre of mid-hold

2.5.3 Vertical shear force analysis

Vertical shear force analysis is to be performed for cases listed in **Ch 4, Sec 7, Table 3**, the minimum required cases being listed in **Ch 4, App 2**.

In vertical shear force analysis the target hull girder loads are the maximum vertical shear force which may occur at one of the transverse bulkheads of the mid-hold in the FE model. Reduced vertical bending moments are considered simultaneously. The target values of hull girder loads are to be obtained in accordance with Table 4 with considering still water vertical bending moments and shear forces specified in **Ch 4, Sec 7, Table 2** and **Ch 4, Sec 7, Table 3**, and in **Ch 4, App 2.**

Table 4: Target loads for vertical shear force analysis

Hull girder effect	Still water	Wave	Location
Vertical bending moment	0.8 M_{SW}	0.65 $C_{WV}M_{WV}$	Transverse bulkhead
Vertical shear force	Q_{SW}	Q_{WV}	Transverse bulkhead
Horizontal bending moment	---	0	Transverse bulkhead
Horizontal shear force	---	0	Transverse bulkhead

2.5.4 Influence of local loads

The distribution of hull girder shear force and bending moment induced by local loads applied on the model are calculated using a simple beam theory for the hull girder.

Reaction forces at both ends of the model and distributions of shearing forces and bending moments induced by local loads can be determined by following formulae:

$$R_{V\_fore} = -\frac{\sum_i (x_i - x_{aft})\vec{f}_i \cdot \vec{z}}{x_{fore} - x_{aft}} \qquad R_{V\_aft} = \sum_i \vec{f}_i \cdot \vec{z} + R_{V\_fore}$$

$$R_{H\_fore} = \frac{\sum_i (x_i - x_{aft})\vec{f}_i \cdot \vec{y}}{x_{fore} - x_{aft}} \qquad R_{H\_aft} = -\sum_i \vec{f}_i \cdot \vec{y} + R_{H\_fore}$$

$$Q_{V\_FEM}(x) = R_{V\_aft} - \sum_i \vec{f}_i \cdot \vec{z} \qquad \text{when } x_i < x$$

$$Q_{H\_FEM}(x) = R_{H\_aft} + \sum_i \vec{f}_i \cdot \vec{y} \qquad \text{when } x_i < x$$

$$M_{V\_FEM}(x) = (x - x_{aft})R_{V\_aft} - \sum_i (x - x_i)\vec{f}_i \cdot \vec{z} \qquad \text{when } x_i < x$$

$$M_{H\_FEM}(x) = (x - x_{aft})R_{H\_aft} + \sum_i (x - x_i)\vec{f}_i \cdot \vec{y} \qquad \text{when } x_i < x$$

where:

x_{aft} : Location of the aft end support,

x_{fore} : Location of the fore end support,

x : Considered location,

R_{V_aft}, R_{V_fore}, R_{H_aft} and R_{H_fore} : Vertical and horizontal reaction forces at the fore and aft ends

Q_{V_FEM}, Q_{H_FEM}, M_{V_FEM} and M_{H_FEM} : Vertical and horizontal shear forces and bending moments created by the local loads applied on the FE model. Sign of Q_{V_FEM}, M_{V_FEM} and M_{H_FEM} is in accordance with the sign convention defined in **Ch 4, Sec 3**. The sign convention for reaction forces is that a positive creates a positive shear force.

$\vec{f}_i$: Applied force on node i due to all local loads,

x_i : Longitudinal coordinate of node i.

2.5.5 Methods to account for hull girder loads

For bending moment analysis, two alternative methods can be used to consider the hull girder loads/stresses in the assessment of the primary supporting members:

a) to add the hull girder loads directly to FE model (direct method), or

b) to superimpose the hull girder stresses separately onto the stresses obtained from the structural analysis using the lateral loads (superimposition method).

For shear force analysis, the “direct method” is to be used.

2.5.6 Direct method

In direct method the effect of hull girder loads are directly considered in 3D FE model. The equilibrium loads are to be applied at both model ends in order to consider the hull girder loads as specified in **[2.5.2]** and **[2.5.3]** and influence of local loads as specified in **[2.5.4].**

In order to control the shear force at the target locations, two sets of enforced moments are applied at both ends of the model. These moments are calculated by following formulae:

$$M_{Y\_aft\_SF} = M_{Y\_fore\_SF} = \frac{(x_{fore} - x_{aft})}{2}\left[Q_{V\_T}(x_{eq}) - Q_{V\_FEM}(x_{eq})\right]$$

$$M_{Z\_aft\_SF} = M_{Z\_fore\_SF} = \frac{(x_{fore} - x_{aft})}{2}\left[Q_{H\_T}(x_{eq}) - Q_{H\_FEM}(x_{eq})\right]$$

In order to control the bending moments at the target locations, another two sets of enforced moments are applied at both ends of the model. These moments are calculated by following formulae:

$$M_{Y\_aft\_BM} = -M_{Y\_fore\_BM} = -\left[M_{V\_T}(x_{eq}) - M_{V\_FEM}(x_{eq}) - M_{Y\_aft\_SF}\left(2\frac{x_{eq} - x_{aft}}{x_{fore} - x_{aft}} - 1\right)\right]$$

$$M_{Z\_aft\_BM} = -M_{Z\_fore\_BM} = -\left[M_{H\_T}(x_{eq}) - M_{H\_FEM}(x_{eq}) - M_{Z\_aft\_SF}\left(2\frac{x_{eq} - x_{aft}}{x_{fore} - x_{aft}} - 1\right)\right]$$

where:

x_{eq} : Considered location for the hull girder loads evaluation,

$Q_{V\_FEM}, Q_{H\_FEM}, M_{V\_FEM}, M_{H\_FEM}$: As defined in **[2.5.4]**

$Q_{V\_T}, Q_{H\_T}, M_{V\_T}, M_{H\_T}$: Target vertical and horizontal shear forces and bending moments, defined in **Table 3** or **Table 4**, at the location x_{eq}. Sign of Q_{V_T}, M_{V_T} and M_{H_T} is in accordance with sign convention defined in **Ch 4, Sec 3.**

$M_{Y\_aft\_SF}, M_{Y\_fore\_SF}, M_{Y\_aft\_BM}, M_{Y\_fore\_BM}$: Enforced moments to apply at the aft and fore ends for vertical shear force and bending moment control, positive for clockwise around y-axis. The sign convention for $M_{Y\_aft\_SF}$, $M_{Y\_fore\_SF}$, $M_{Y\_aft\_BM}$ and $M_{Y\_fore\_BM}$ is that of the FE model axis. The sign convention for other bending moment, shear forces and reaction forces is in accordance with the sign convention defined in **Ch 4, Sec 3.**

$M_{Z\_aft\_SF}, M_{Z\_fore\_SF}, M_{Z\_aft\_BM}, M_{Z\_fore\_BM}$: Enforced moments to apply at the aft and fore ends for horizontal shear force and bending moment control, positive for clockwise around z-axis. The sign convention for $M_{Z\_aft\_SF}$, $M_{Z\_fore\_SF}$, $M_{Z\_aft\_BM}$ and $M_{Z\_fore\_BM}$ is that of the FE model axis. The sign convention for other bending moment, shear forces and reaction forces is in accordance with the sign convention defined in **Ch 4, Sec 3.**

The enforced moments at the model ends can be generated by one of the following methods:

- to apply distributed forces at the end section of the model, with a resulting force equal to zero and a resulting moment equal to the enforced moment. The distributed forces are applied to the nodes on the longitudinal members where boundary conditions are given according to **Table 1**. The distributed forces are to be determined by using the thin wall beam theory
- to apply concentrated moments at the independent points defined in **[2.3.1].**

2.5.7 Superimposition method

For vertical bending moment analysis in the superimposition method, the stress obtained from the following formula is to be superimposed to the longitudinal stress of each element in longitudinal members obtained from 3D FE analysis. Vertical shear force analyses are to be in accordance with **[2.5.6].**

$$\sigma_{SIM} = \frac{M_{V\_T}}{I_Y/(z-N)} - \frac{M_{H\_T}}{I_Z/y}$$

where

M_{V_T}, M_{H_T} : Target vertical and horizontal bending moments at considering section, respectively, with corrections due to local loads, taken equal to:

$$M_{V\_T} = M_{SW} + C_{WV} \cdot M_{WV} - M_{V\_FEM}$$
$$M_{H\_T} = C_{WH} \cdot M_{WH} - M_{H\_FEM}$$

I_Y : Vertical inertia of the section around horizontal neutral axis, calculated according to **Ch 3, Sec 2, [3.2.1]**

I_Z : Horizontal inertia of the section, calculated according to **Ch 3, Sec 2, [3.2.1]**

N : Z co-ordinate of the centre of gravity of the hull transverse section, as defined in **Ch 5, Sec 1**

y : Y co-ordinate of the element

z : Z co-ordinate of the element.

3. Analysis criteria

3.1 General

3.1.1 Assessment holds

All the primary supporting members in the mid-hold of the three-hold (1+1+1) FE model, including bulkheads, are to be evaluated in 3D FE analysis.

3.1.2

The results of the structural analysis are to satisfy the criteria for yielding strength, buckling strength and deflection of primary members.

3.2 Yielding strength assessment

3.2.1 Reference stresses

Reference stress is Von Mises equivalent stress at the centre of a plane element (shell or membrane) or axial stress of a line element (bar, beam or rod) obtained by FE analysis through considering hull girder loads according to **[2.5.4]** or **[2.5.5].**
Where the effects of openings are not considered in the FE model, the reference stresses in way of the openings are to be properly modified with adjusting shear stresses in proportion to the ratio of web height and opening height.
Where elements under assessment are smaller than the standard mesh size specified in **[2.2.4]** or **[2.2.5]**, the reference stress may be obtained from the averaged stress over the elements within the standard mesh size.

3.2.2 Equivalent stress

Von Mises equivalent stress is given by the following formula:

$$\sigma_{eq} = \sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3\tau_{xy}^2}$$

σ_x, σ_y : Element normal stresses, in N/mm^2

τ_{xy} : Element shear stress, in N/mm^2

In superimposition method, the stress σ_{SIM}, defined in **[2.5.7]**, is to be superimposed onto to longitudinal stress component.

3.2.3 Allowable stress

The reference stresses in FE model that does not include orthotropic elements, as specified in **[2.2.4]**, are not to exceed $235/k$ N/mm^2, where k is the material factor defined in **Ch3, Sec1.**
The reference stresses in FE model that includes orthotropic elements, as specified in **[2.2.5]**, are not to exceed $205/k$ N/mm^2,where k is the material factor defined in **Ch3, Sec1.**

3.3 Buckling and ultimate strength assessment

3.3.1 General

Buckling and ultimate strength assessment is to be performed for the panels on primary supporting members according to **Ch 6, Sec 3.**

3.3.2 Stresses of panel

The stresses in each panel are to be obtained according to the following procedures:

1) when the mesh model differs from the elementary plate panel geometry, the stresses σ_x, σ_y and τ acting on an elementary plate panel are to be evaluated by extrapolation and/or interpolation of surrounding meshes using the elements stresses or using the displacement based method described in App 2.
2) stresses obtained from with superimposed or direct method have to be reduced for buckling assessment because of the Poisson effect, which is taken into consideration in both analysis methods. The correction has to be carried out after summation of stresses due to local and global loads.

   When the stresses σ_x^* and σ_y^* are both compressive stresses, a stress reduction is to be made according to the following formulae:

   $\sigma_x = (\sigma_x^* - 0.3\sigma_y^*)/0.91$

   $\sigma_y = (\sigma_y^* - 0.3\sigma_x^*)/0.91$

   Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$

   Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$

   σ_x^*, σ_y^* : Stresses containing the Poisson effect

3) determine stress distributions along edges of the considered buckling panel by introducing proper linear approximation as shown in **Fig 2.**
4) calculate edge factor Ψ according to **Ch 6, Sec 3.**

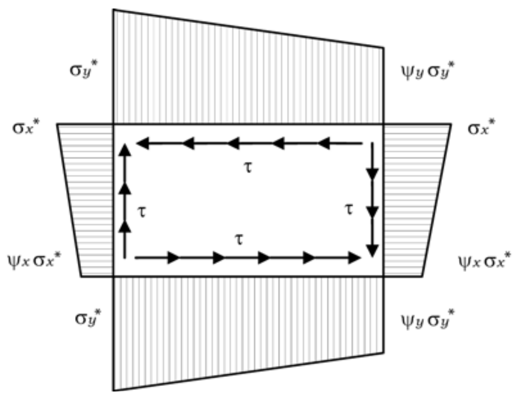

Fig 2: Stresses of panel for buckling assessment

3.3.3 Boundary conditions

Buckling load cases 1, 2, 5 or 6 of **Ch 6, Sec 3, Table 2** are to be applied to the buckling panel under evaluation, depending on the stress distribution and geometry of openings.
If the actual boundary conditions are significantly different from simple support condition, another case in **Ch 6, Sec 3, Table 2** can be applied.

3.3.4 Safety factor

The safety factor for the buckling and ultimate strength assessment of the plate is to be taken equal to 1.0.

3.4 Deflection of primary supporting members

The relative deflection, δ_{max}, in mm, in the outer bottom plate obtained by FEA is not to exceed the following criteria:

$$\delta_{max} \le \frac{\ell_i}{150}$$

where:

δ_{max} : Maximum relative deflection, in mm, obtained by the following formula, and not including secondary deflection

$$\delta_{max} = \max(|\delta_{B1}|, |\delta_{B2}|)$$

where, δ_{B1} and δ_{B2} are shown in **Fig 3.**

ℓ_i : Length or breadth of the flat part of the double bottom, in mm, whichever is the shorter.

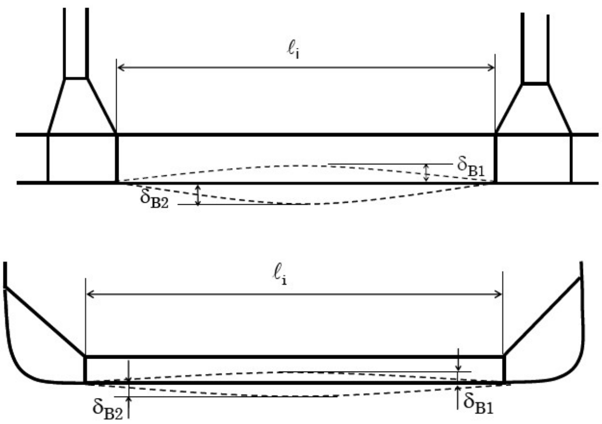

Fig 3: Definition of relative deflection

Section 3 – DETAILED STRESS ASSESSMENT

1. General

1.1 Application

1.1.1

This Section describes the procedure for the detailed stress assessment with refined meshes to evaluate highly stressed areas of primary supporting members.
Where the global cargo hold analysis of **Sec 2** is carried out using a model complying with the modeling criteria of **Sec 2, [2.2.4]**, the areas listed in Table 1 are to be refined at the locations whose calculated stresses exceed 95 % for non-orthotropic elements or 85 % for orthotropic element but do not exceed 100 % of the allowable stress as specified in **Sec 2, [3.2.3].**

2. Analysis model

2.1 Areas to be refined

2.1.1

Where the global cargo hold analysis of **Sec 2** is carried out using a model complying with the modeling criteria of **Sec 2, [2.2.4]**, the areas listed in **Table 1** are to be refined at the locations whose calculated stresses exceed 95 % of the allowable stress as specified in **Sec 2, [3.2.3].**

2.1.2

Where the global cargo hold analysis of **Sec 2** is carried out using a model complying with the modeling criteria of **Sec 2, [2.2.5]**, all the high stressed areas listed below are to be refined:

- areas whose calculated stresses exceed 85 % of the allowable stress as specified in **Sec 2, [3.2.3].**
- typical details of the primary supporting members as shown in **Table 1.**
- typical details of the transverse bulkheads of the considered hold as shown in **Table 1.**

Table 1: Typical details to be refined

Structural member	Area of interest	Additional specifications	Description
Primary supporting member	Most stressed transverse primary supporting member for double skin side bulk carriers	Refining of the most stressed transverse primary supporting members located in: • double bottom • hopper tank • double skin side • topside tank		Most stressed transverse primary supporting member for single skin side bulk carriers	Refining of the most stressed transverse primary supporting members located in: • double bottom • hopper tank • topside tank side shell frame with end brackets and connections to hopper tank and topside tank	Transverse bulkhead and its associated lower stool	Most stressed connection of the corrugations with the lower stool	High stressed elements, including the diaphragm(s) of the lower stool, are to be modeled		Most stressed connection of the lower stool with the inner bottom	High stressed elements are to be modeled	
Structural member	Area of interest	Additional specifications	Description
Inner bottom and hopper sloping plates with their associated supporting members	Most stressed connection of the inner bottom with the hopper sloping plate	Refining of the most stressed following members: • inner bottom • hopper sloping plate • floor • girder	Deck plating	Deck plating in way of the most stressed hatch corners	High stressed elements are to be modeled	
2.2 Refining method

2.2.1

Two methods can be used for refining the high stressed areas:

- refined areas can be directly included in FE model used for the global cargo hold analysis of **Ch 7, Sec 2** (See **Fig 1**).
- detailed stresses in refined areas can be analysed by separate sub-models.

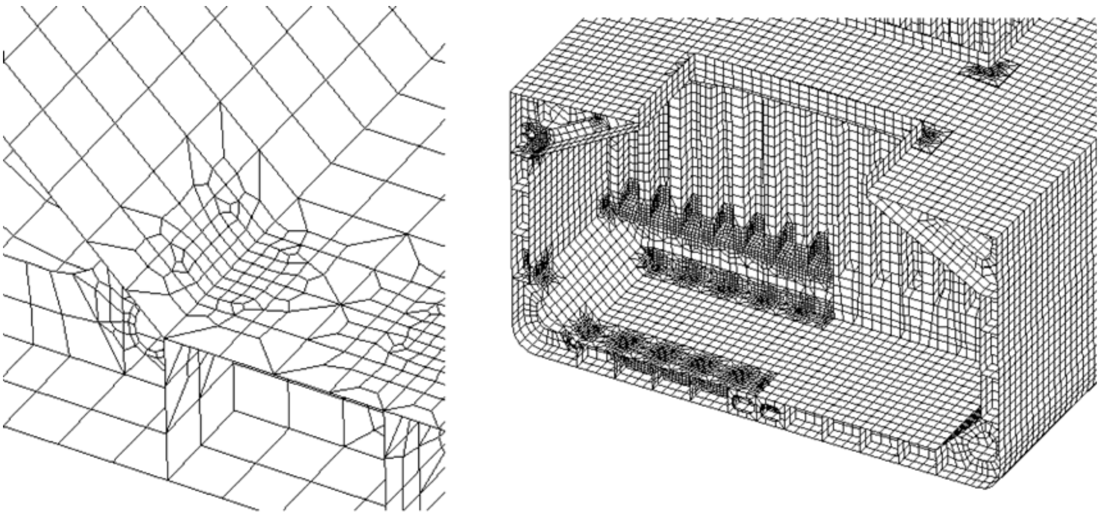

Fig 1: "Direct" modelling with refined meshes

2.3 Modeling

2.3.1 Element type

Each structural members is to be modeled by using proper element type for the structure in accordance with the principle in **Sec 2, [2.2.3]**. Orthotropic elements are not to be used in refined areas.

2.3.2 Mesh

The element size in refined areas is to be approximately one fourth of the representative spacing of ordinary stiffeners in the corresponding area, i.e. 200 × 200 mm mesh size for structures whose ordinary stiffener spacing is 800 mm.
In addition, the web height of primary supporting members and web frames of single side bulk carriers is to be divided at least into 3 elements.
The aspect ratio of element is not to exceed 3. Quad elements are to have 90° angles as much as practicable, or to have angles between 45° and 135°.

2.3.3 Extent of sub-model

The minimum extent of sub-model is to be such that the boundaries of the sub-model correspond to the locations of adjacent supporting members (see **Fig 2**).

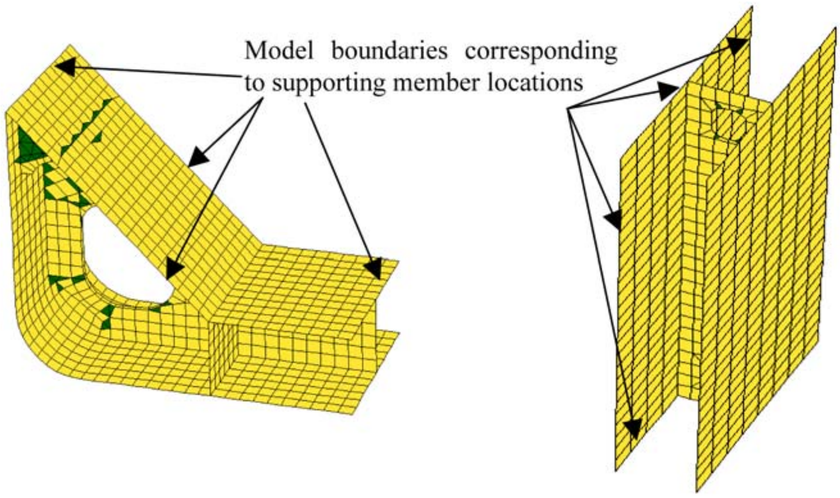

Fig 2: Boundaries of sub-models

2.4 Loading conditions

2.4.1

Loading conditions, which are applied to 3D FE model for the global cargo hold analysis according to **Sec 2** and which induce stresses at considered locations exceeding the criteria specified in **[2.1]**, are to be considered in the detailed stress assessment.

2.5 Boundary conditions

2.5.1

Boundary conditions as specified in **Sec 2, [2.3.1]** are to be applied to the global cargo hold FE model with refined meshes.

2.5.2

Nodal forces or nodal displacements obtained from the global cargo hold analysis of **Sec 2** are to be applied to the sub-models. Where nodal forces are given, the supporting members located at the boundaries of a sub-model are to be included in the sub-model. Where nodal displacements are given and additional nodes are provided in sub-models, nodal displacements at the additional nodes are to be determined by proper interpolations.

3. Analysis criteria

3.1 Allowable stress

3.1.1

Von Mises equivalent stresses in plate elements and axial stresses in line elements within refined areas are not to exceed $280/k\ N/mm^2$, where k is the material factor defined in **Ch 3, Sec 1.**
In case elements significantly smaller than the size defined in **[2.3.2]** are used, this criteria applies to the average stress of all elements included in an area corresponding to a single element having the size specified in **[2.3.2].**

Section 4 – HOT SPOT STRESS ANALYSIS FOR FATIGUE STRENGTH ASSESSMENT

1. General

1.1 Application

1.1.1

This Section describes the procedure to compute hot spot stresses for fatigue strength assessment of each location specified in **Ch 8, Sec 1, Table 1** by using finite element method.

1.1.2

The loading conditions and the load cases specified in **[2.2]** are to be considered for hot spot stress analysis.

2. Analysis model

2.1 Modeling

2.1.1

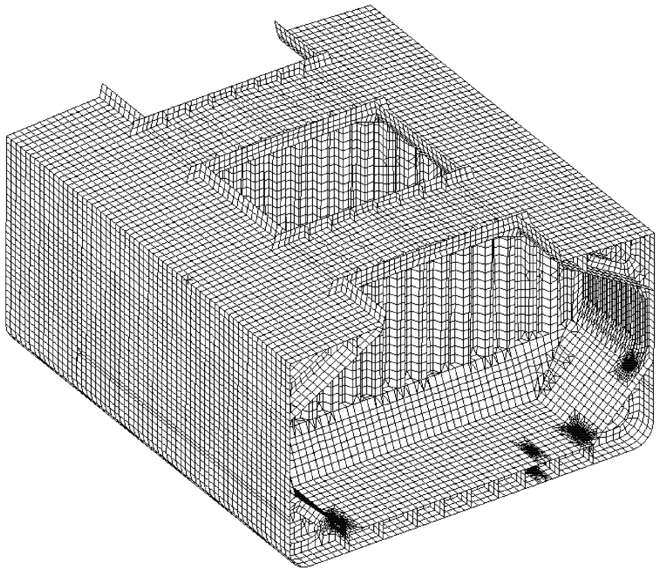
Hot spot stresses for fatigue assessment are to be obtained by the global cargo hold models where the areas for fatigue assessment are modeled by very fine meshes, as shown in **Fig 1.**
Alternatively, hot spot stresses can be obtained from sub-models, by using the similar procedures specified in **Sec 3, [2].**

2.1.2

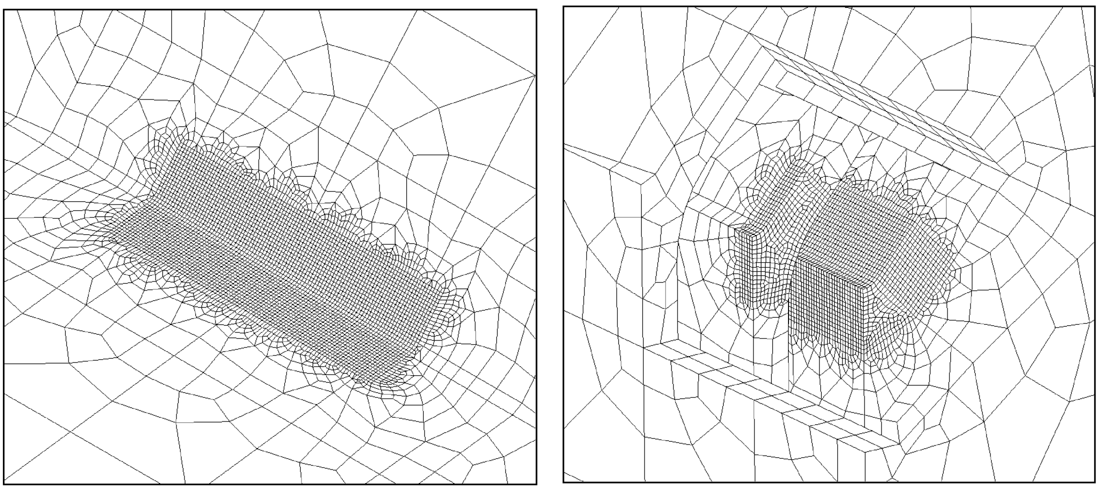
Areas within at least a quarter of frame spacing in all directions from the hot spot position are to be modeled by very fine meshes. The element size in very fine mesh areas is to be approximately equal to the representative net thickness in the assessed areas, and the aspect ratio of elements is to be close to 1.

2.1.3

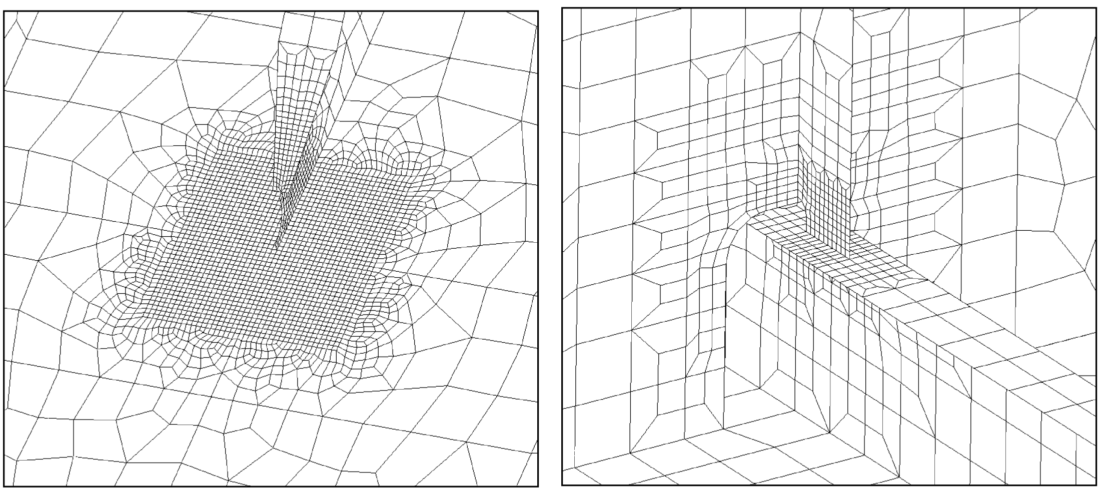
The mesh size is to be gradually changed from very fine mesh to fine mesh through the transition areas as shown in **Fig 2**. All structural members, including brackets, stiffeners, longitudinals and faces of transverse rings, etc., within transition areas are to be modeled by shell elements with bending and membrane properties. Geometries of welds are not to be modeled.



(a) Part of global cargo hold model with very fine mesh



(b) Bilge hopper knuckle part



(c) End of hold frame (d) Longitudinal

Fig 1: Example of very fine mesh model

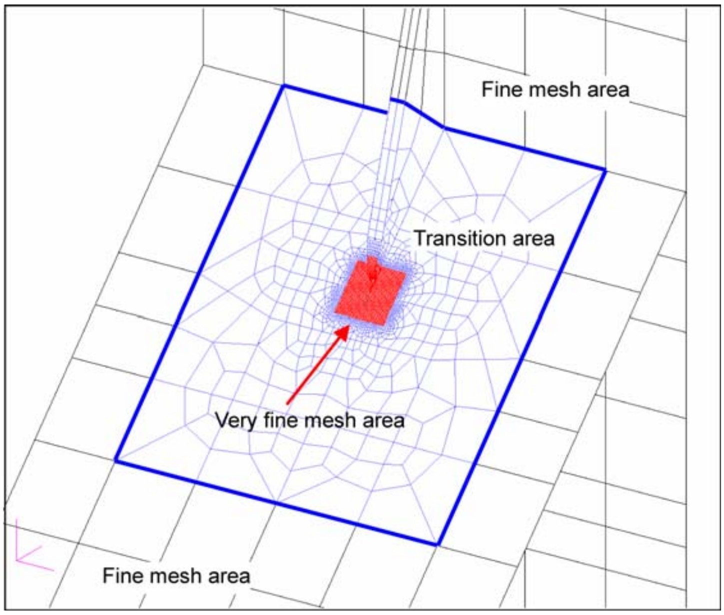


Fig 2: Very fine mesh area, transition area and fine mesh area

2.2 Loading conditions

2.2.1

The loading conditions, specified in **Ch 8, Sec 1, Table 2** and illustrated in **Ch 4, App 3**, are to be considered.

2.2.2

Probability level of 10^{-4} is to be used for calculation of design loads.

2.3 Boundary conditions

2.3.1

The boundary conditions specified in **Sec 2, [2.3.1]** are to be applied to the cargo hold model with localized very fine meshes or the mother model for sub-models. When using sub-models, nodal displacements or forces obtained from the mother model are to be applied to sub-models.

3. Hot spot stress

3.1 Definition

3.1.1

The hot spot stress is defined as the structural geometric stress on the surface at a hot spot.

3.1.2

The hot spot stresses obtained by using superimposition method are to be modified according to **Ch 8, Sec 3, [2.2]** and **[3.2].**

3.2 Evaluation of hot spot stress

3.2.1

The hot spot stress in a very fine mesh is to be obtained using a linear extrapolation. The surface stresses located at 0.5 times and 1.5 times the net plate thickness are to be linearly extrapolated at the hot spot location, as described in **Fig 3** and **Fig 4.**
The principal stress at the hot spot location having an angle with the assumed fatigue crack greater than 45° is to be considered as the hot spot stress.

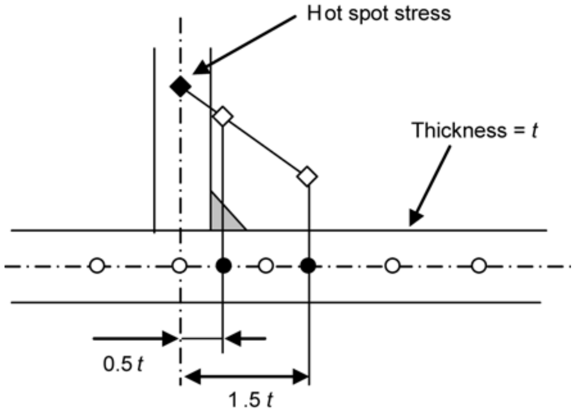

Fig 3: Definition of hot spot stress at an intersection of two plates

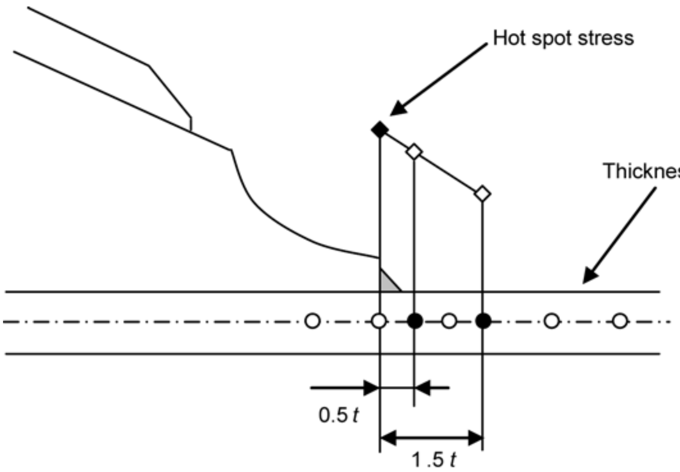

Fig 4: Definition of hot spot stress at an intersection of plating and bracket

3.2.2

The hot spot stress at the intersection of two plates, as obtained from **[3.2.1]**, is to be multiplied by the correction factor λ defined below, considering the difference between the actual hot spot location and assumed location and the difference of stress gradient depending on the angle θ, in deg, between the two plates, to be measured between 0° and 90°.

- welded intersection between plane plates:

$$\lambda = \begin{cases} 0.8 & : \ \theta \le 75 \\ 0.8 - \dfrac{0.2}{15}(\theta - 75) & : \ 75 < \theta \end{cases}$$

- welded intersection between bent plate and plane plate: $\lambda = 0.7$ (i.e. bend type bilge knuckle part)

3.2.3

The hot spot stress in a non-welded area or along free edge is to be determined by extrapolating the principal stresses of the two adjacent elements, as shown in **Fig 5.**

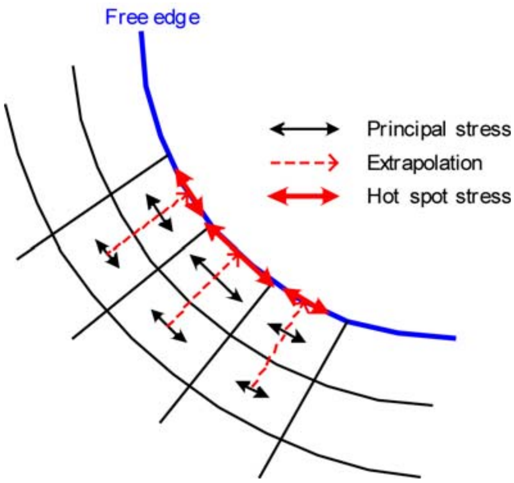

Fig 5: Definition of the hot spot stress along free edge

3.3 Simplified method for the bilge hopper knuckle part

3.3.1

At the bilge knuckle part, the hot spot stress $\sigma_{hotspot}$ may be computed by multiplying the nominal stress $\sigma_{nominal}$ with the stress concentration factor K_{gl} defined in **[3.3.3].**

$$\sigma_{hotspot} = K_{gl}\, \sigma_{nominal}$$

3.3.2

The nominal stress at the hot spot location is to be determined by extrapolating the membrane stresses located at 1.5 times and 2.5 times the frame spacing from the hot spot location, as shown in **Fig 6.**

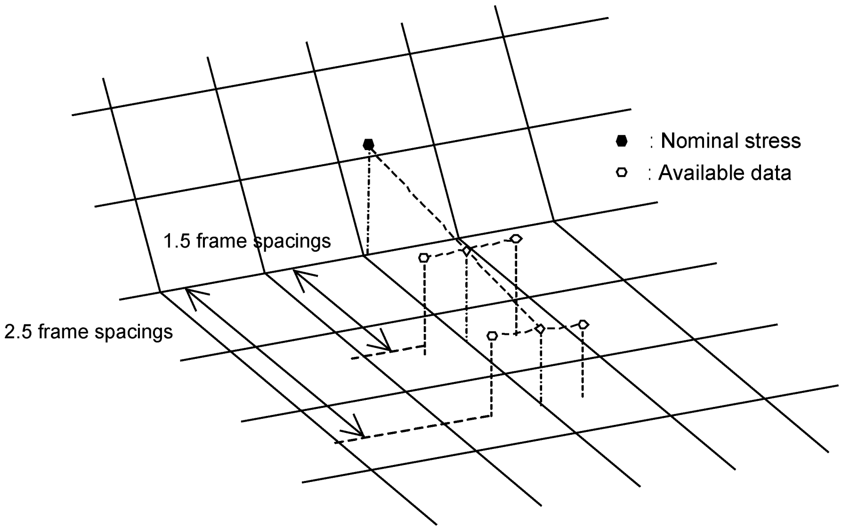

Fig 6: Definition of nominal stress at the bilge hopper knuckle part

3.3.3

The geometrical stress concentration factor K_{gl} for the bilge hopper knuckle part is given by the following equation:

$$K_{gl} = K_0 K_1 K_2 K_3 K_4$$

where:

K_0 : Stress concentration factor depending on the dimensions of the considered structure, defined in **Table 1**

K_1 : Correction coefficient depending on the type of knuckle connection, defined in **Table 2**

K_2 : Correction coefficient depending on the thickness increment of the transverse web, defined in **Table 2** or taken equal to 1.0 if there is no thickness increment

K_3 : Correction coefficient depending on the insertion of horizontal gusset or longitudinal rib (see **Fig 7**), defined in **Table 2** or taken equal to 1.0 if there is no horizontal gusset or longitudinal rib

K_4 : Correction coefficient depending on the insertion of transverse rib, defined in **Table 2** (see **Fig 8**) or taken equal to 1.0 if there is no transverse rib

Table 1: Stress concentration factor K_0

Plate net thickness in FE model t (mm)	Angle of hopper slope plate to the horizontal θ(deg.)			
	40	45	50	90
16	3.0	3.2	3.4	4.2
18	2.9	3.1	3.3	4.0
20	2.8	3.0	3.2	3.8
22	2.7	2.9	3.1	3.6
24	2.6	2.8	3.0	3.5
26	2.6	2.7	2.9	3.4
28	2.5	2.7	2.8	3.3
30	2.4	2.6	2.7	3.2

Note: Alternatively, K_0 can be determined by the following formula.

$$K_0 = \frac{0.14\theta \cdot (1.15 - 0.0033\theta)}{(0.5t)^{(0.2+0.0028\theta)}}$$

Table 2: Correction coefficients

Type of knuckle	K_1	K_2	K_3	K_4
Weld Type	1.7	0.9	0.9	0.9
Bend Type	1.75 ; $R/t < 4$ 2.80 ; $R/t > 8$		0.85 ; $R/t < 4$ 0.55 ; $R/t > 8$	

Notes :
(1) The linear interpolation is applied between $4 \le R/t \le 8$
"R" denotes the radius of bend part and "t" denotes the plate thickness
(2) In using the correction coefficient K_2, the members should be arranged such that the bending deformation of the radius part is effectively suppressed.
(3) The increase in web thickness is taken based on the plate thickness of the inner bottom plating.

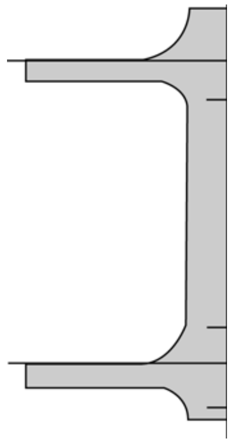

Fig 7: Example of insertion of horizontal gusset or longitudinal rib

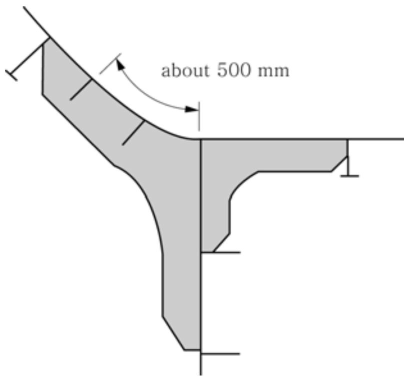

Fig 8: Example of insertion of transverse rib

Appendix 1 - Longitudinal extent of the finite element models

1. Longitudinal extent

A three-hold length finite element model is recommended for the analysis, with the mid-hold as the target of assessment.
The three-hold length finite element model reduces the adverse effects of the boundary conditions to a minimum in the assessed mid-hold.

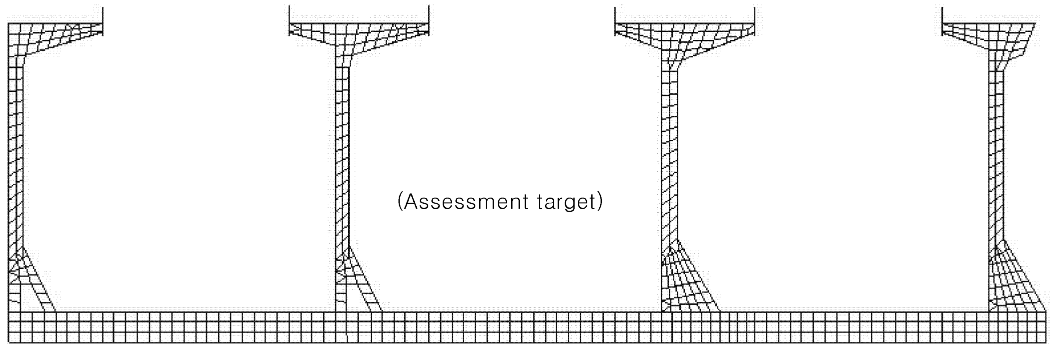

Fig 1: Longitudinal extent of the finite element model

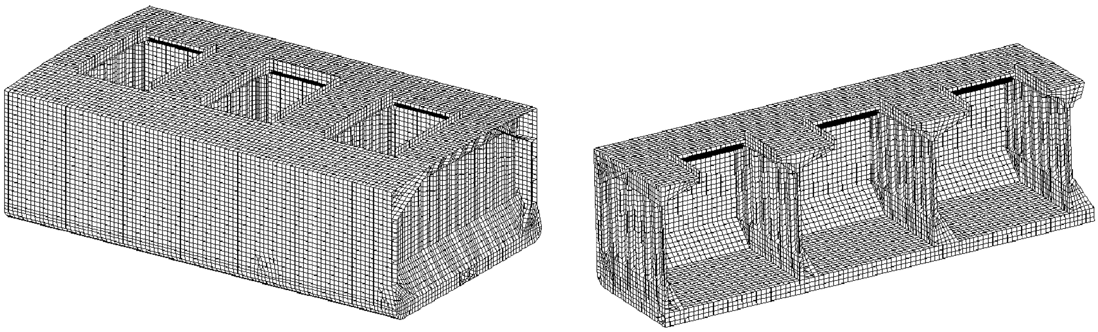

Fig 2: Example of a finite element model

2. Typical Mesh

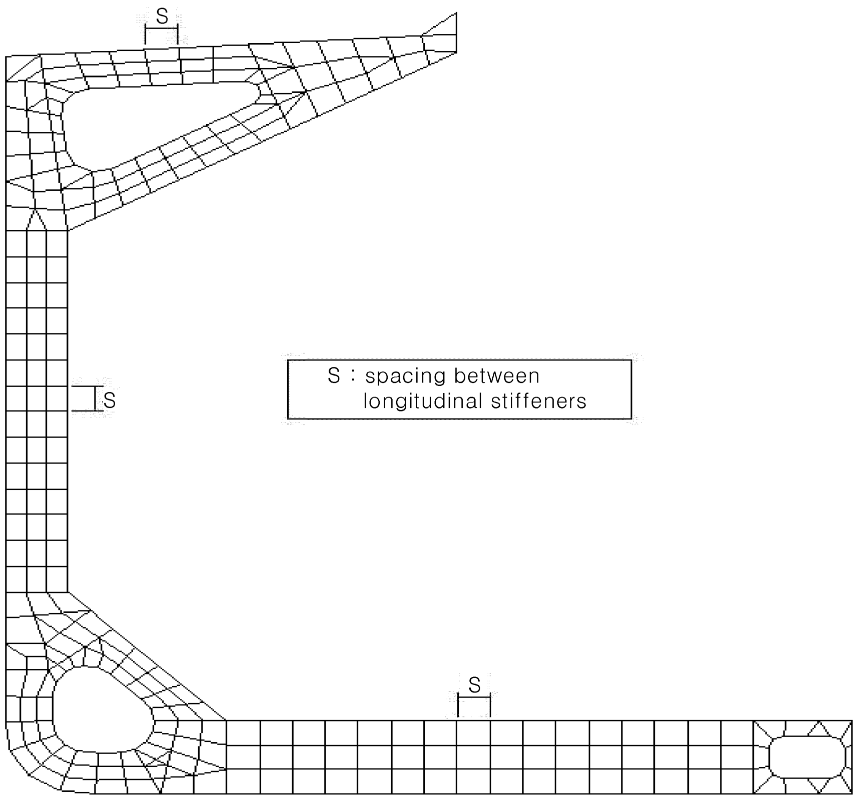

Fig 3: Typical mesh of a web frame

Appendix 2 – DISPLACEMENT BASED BUCKLING ASSESSMENT IN FINITE ELEMENT ANALYSIS

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

a : Length of the longer plate panel side

b : Length of the shorter plate panel side

x : Direction parallel to a, taken as the longitudinal direction

y : Direction parallel to b, taken as the transverse direction

C : Coefficient taken equal to:

for 4-node buckling panel: $C = \frac{E}{2(1-\nu^2)}$

for 8-node buckling panel: $C = \frac{E}{4(1-\nu^2)}$

ν : Poisson ratio

m : Coefficient taken equal to:

$m = 1 - \nu$

1. Introduction

1.1

1.1.1

This Appendix provides a method to obtain the buckling stresses and edge stress ratios for elementary plate panels (EPP) from a finite element calculation. This method is called "Displacement Method".

2. Displacement method

2.1 General

2.1.1

As the mesh of the finite elements does not correspond, in general, to the buckling panels the nodal points of the EPP can be mapped onto the FE-mesh and the displacements of these nodes can be derived from the FE-calculation.
Whenever operations on displacements are performed, full numerical accuracy of the displacements should be used.

2.1.2 4-node and 8-node panels

When the aspect ratio of the EPP is less than 3 and the variation of the longitudinal stresses in longitudinal direction of the EPP is small, a 4-node panel may be used. Otherwise an 8-node panel is to be taken.

2.1.3 Calculation of nodal displacements

Three different node locations are possible:

- If a node of the buckling panel is located at an FE-node, then the displacements can be transferred directly.
- If a node of the buckling panel is located on the edge of a plane stress element, then the displace-

ments can be linearly interpolated between the FE-nodes at the edge.

- If a node of the buckling panel is located inside of an element, then the displacements can be obtained using bi-linear interpolation of all nodes of the element.

2.1.4 Transformation in local system

The transformation of the nodal displacements from the global FE-system into the local system of the buckling panel is performed by

$$(u) = [\lambda] \cdot (u_g)$$

where:

(u) : Local displacement vector

(u_g) : Global displacement vector

$[\lambda]$: Transformation matrix (2×3), of direction cosines of angles formed between the two sets of axes.

2.2 Calculation of buckling stresses and edge stress ratios

2.2.1

The displacements, derived at the corners of the elementary plate panel, are to be considered as input from which the stresses at certain stress-points are derived. In the 4-node buckling panel these points are identical but in the 8-node buckling panel they differ. The locations and the numbering convention may be taken from **Fig 1** and **Fig 2.**
The derived stresses at EPP corner nodes can be directly used as input for the buckling assessment according **Ch 6, Sec 3.** The buckling load cases, which have to be considered in the FEM buckling assessment and defined in **Ch 7** are buckling load cases 1, 2 and 5 of **Ch 6, Sec 3, Table 2** and 1a, 1b, 2 and 4 of **Ch 6, Sec 3, Table 3.** In special cases, other buckling load cases may be used for the buckling assessment by a hand calculation.

2.2.2 4-node buckling panel

Stress displacement relationship for a 4-node buckling panel (compressive Stresses are positive)

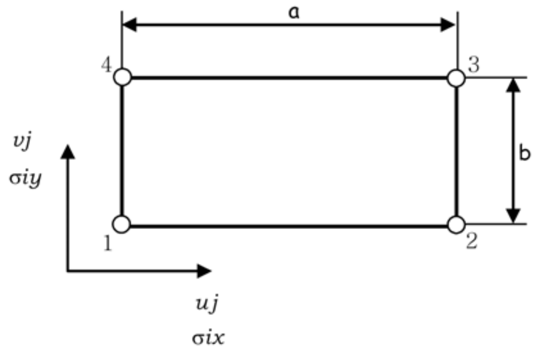

Fig 1: 4-node buckling panel

From the displacements of the EPP corner nodes the stresses of these nodes can be obtained using

$$\begin{pmatrix} \sigma_{1x}^{*} \\ \sigma_{1y}^{*} \\ \tau_1 \\ \sigma_{2x}^{*} \\ \sigma_{2x}^{*} \\ \tau_2 \\ \sigma_{3x}^{*} \\ \sigma_{3y}^{*} \\ \tau_3^{*} \\ \sigma_{4x}^{*} \\ \sigma_{4y}^{*} \\ \tau_4 \end{pmatrix} = -C \cdot \begin{pmatrix} -2/a & -2\nu/b & 2/a & 0 & 0 & 0 & 0 & 2\nu/b \\ -2\nu/a & -2/b & 2\nu/a & 0 & 0 & 0 & 0 & 2/b \\ -m/b & -m/a & 0 & m/a & 0 & 0 & m/b & 0 \\ -2/a & 0 & 2/a & -2\nu/b & 0 & 2\nu/b & 0 & 0 \\ -2\nu/a & 0 & 2\nu/a & -2/b & 0 & 2/b & 0 & 0 \\ 0 & -m/a & -m/b & m/a & m/b & 0 & 0 & 0 \\ 0 & 0 & 0 & -2\nu/b & 2/a & 2\nu/b & -2/a & 0 \\ 0 & 0 & 0 & -2/b & 2\nu/a & 2/b & -2\nu/a & 0 \\ 0 & 0 & -m/b & 0 & m/b & m/a & 0 & -m/a \\ 0 & -2\nu/b & 0 & 0 & 2/a & 0 & -2/a & 2\nu/b \\ 0 & -2/b & 0 & 0 & 2\nu/a & 0 & -2\nu/a & 2/b \\ -m/b & 0 & 0 & 0 & 0 & m/a & m/b & -m/a \end{pmatrix} \cdot \begin{pmatrix} u_1 \\ v_1 \\ u_2 \\ v_2 \\ u_3 \\ v_3 \\ u_4 \\ v_4 \end{pmatrix}$$

where:

$(\sigma_{1x}^{*}, \sigma_{1y}^{*}, \tau_1, \cdots, \sigma_{4x}^{*}, \sigma_{4y}^{*}, \tau_4)^T = (\sigma^{*})$: Element stress vector

$(u_1, v_1, \cdots, u_4, v_4)^T = (u)$: Local node displacement vector

If both σ_x^{*} and σ_y^{*} are compressive stresses then the stresses sx and sy must be obtained as follows:

$$\sigma_x = (\sigma_x^{*} - 0.3\sigma_y^{*}) / 0.91$$

$$\sigma_y = (\sigma_y^{*} - 0.3\sigma_x^{*}) / 0.91$$

Where compressive stress fulfils the condition $\sigma_y^{*} < 0.3\sigma_x^{*}$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^{*}$

Where compressive stress fulfils the condition $\sigma_x^{*} < 0.3\sigma_y^{*}$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^{*}$

This leads to the following stress vector:

$$(\sigma) = (\sigma_{1x}, \sigma_{1y}, \tau_1, \cdots, \sigma_{4x}, \sigma_{4y}, \tau_4)^T$$

Finally the relevant buckling stresses and edge stress ratios are obtained by:

- LC 1: longitudinal compression

$$\sigma_l = \max\left(\frac{\sigma_{1x} + \sigma_{4x}}{2}, \frac{\sigma_{2x} + \sigma_{3x}}{2}\right)$$

$$\Delta\sigma_l = \frac{1}{2}\left(-\sigma_{1x} + \sigma_{4x} - \sigma_{2x} + \sigma_{3x}\right)$$

$$\sigma_x = \sigma_l + 0.5\left|\Delta\sigma_l\right|$$

$$\psi_x = 1 - \left|\Delta\sigma_l\right| / \sigma_x$$

- LC 2: transverse compression

$$\sigma_t = 0.25\sum_{i=1}^{4}\sigma_{iy}$$

$$\Delta\sigma_t = \frac{1}{2}\left(-\sigma_{1y} - \sigma_{4y} + \sigma_{2y} + \sigma_{3y}\right)$$

$$\sigma_y = \sigma_t + 0.5\left|\Delta\sigma_t\right|$$

$$\psi_y = 1 - \left|\Delta\sigma_t\right| / \sigma_y$$

- LC 5: shear

$$\tau = \left|\frac{\tau_1 + \tau_2 + \tau_3 + \tau_4}{4}\right|$$

2.2.3 8-node buckling panel

Stress displacement relationship for a 8-node buckling panel (compressive stresses are positive)

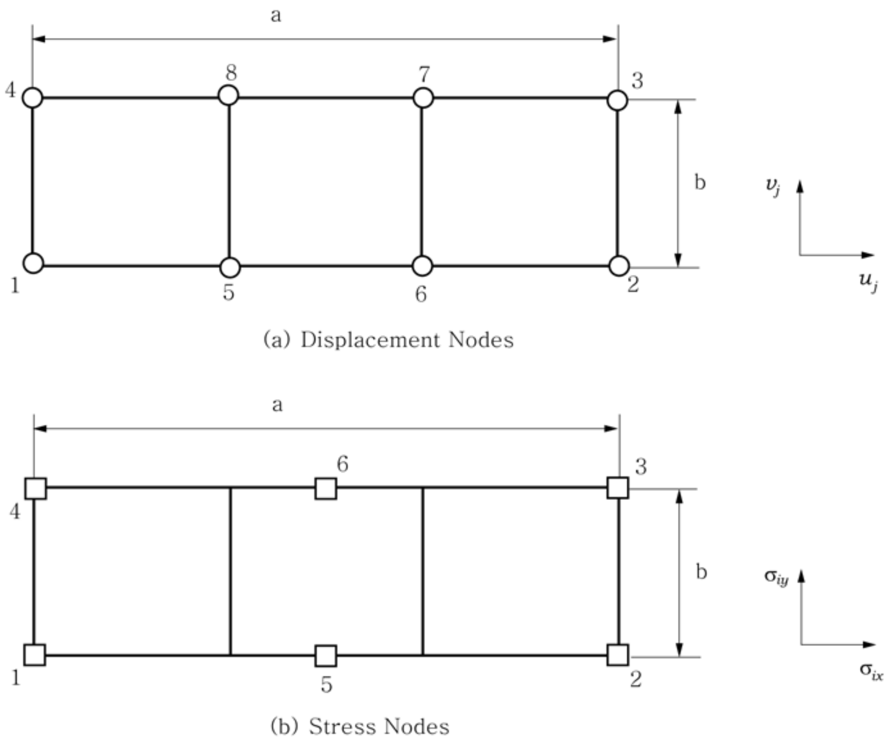

Fig 2: 8-node buckling panel

From the displacements of the EPP corner nodes the stresses of these nodes and on mid positions can be obtained using:

$$\begin{pmatrix} \sigma^*_{1x} \\ \sigma^*_{1y} \\ \tau_1 \\ \sigma^*_{2x} \\ \sigma^*_{2y} \\ \tau_2 \\ \sigma^*_{3x} \\ \sigma^*_{3y} \\ \tau_3 \\ \sigma^*_{4x} \\ \sigma^*_{4y} \\ \tau_4 \\ \sigma^*_{5x} \\ \sigma^*_{5y} \\ \tau_5 \\ \sigma^*_{6x} \\ \sigma^*_{6y} \\ \tau_6 \end{pmatrix} = -C \cdot \begin{pmatrix}
-12/a & -4\nu/b & 0 & 0 & 0 & 0 & 0 & 4\nu/b & 12/a & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
-12\nu/a & -4/b & 0 & 0 & 0 & 0 & 0 & 4/b & 12\nu/a & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
-2m/b & -6m/a & 0 & 0 & 0 & 0 & 2m/b & 0 & 0 & 6m/a & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 12/a & -4\nu/b & 0 & 4\nu/b & 0 & 0 & 0 & 0 & -12/a & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 12\nu/a & -4/b & 0 & 4/b & 0 & 0 & 0 & 0 & -12\nu/a & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & -2m/b & 6m/a & 2m/b & 0 & 0 & 0 & 0 & 0 & 0 & -6m/a & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & -4\nu/b & 12/a & 4\nu/b & 0 & 0 & 0 & 0 & 0 & 0 & -12/a & 0 & 0 & 0 \\
0 & 0 & 0 & -4/b & 12\nu/a & 4/b & 0 & 0 & 0 & 0 & 0 & 0 & -12\nu/a & 0 & 0 & 0 \\
0 & 0 & -2m/b & 0 & 2m/b & 6m/a & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -6m/a & 0 & 0 \\
0 & -4\nu/b & 0 & 0 & 0 & 0 & -12/a & 4\nu/b & 0 & 0 & 0 & 0 & 0 & 0 & 12/a & 0 \\
0 & -4/b & 0 & 0 & 0 & 0 & -12\nu/a & 4/b & 0 & 0 & 0 & 0 & 0 & 0 & 12\nu/a & 0 \\
-2m/b & 0 & 0 & 0 & 0 & 0 & 2m/b & -6m/a & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 6m/a \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -12/a & -2\nu/b & 12/a & -2\nu/b & 0 & 2\nu/b & 0 & 2\nu/b \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -12\nu/a & -2/b & 12\nu/a & -2/b & 0 & 2/b & 0 & 2/b \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -m/b & -6m/a & -m/b & 6m/a & m/b & 0 & m/b & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -2\nu/b & 0 & -2\nu/b & 12/a & 2\nu/b & -12/a & 2\nu/b \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -2/b & 0 & -2/b & 12\nu/a & 2/b & -12\nu/a & 2/b \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -m/b & 0 & -m/b & 0 & m/b & 6m/a & m/b & -6m/a
\end{pmatrix} \cdot \begin{pmatrix} u_1 \\ v_1 \\ u_2 \\ v_2 \\ u_3 \\ v_3 \\ u_4 \\ v_4 \\ u_5 \\ v_5 \\ u_6 \\ v_6 \\ u_7 \\ v_7 \\ u_8 \\ v_8 \end{pmatrix}$$

where:

$$(\sigma^*) = (\sigma^*_{1x}, \sigma^*_{1y}, \tau_1, \cdots, \sigma^*_{6x}, \sigma^*_{6y}, \tau_6)^T$$

$$(u) = (u_{1x}, v_{1y}, \cdots, u_{8x}, v_{8y})^T$$

If both σ^*_x and σ^*_y are compressive stresses then the stresses sx and sy must be obtained as follows:

$\sigma_x = (\sigma_x^* - 0.3 \cdot \sigma_y^*) / 0.91$

$\sigma_y = (\sigma_y^* - 0.3 \cdot \sigma_x^*) / 0.91$

Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$

Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$

This leads to the following stress vector:

$(\sigma) = (\sigma_{1x}, \sigma_{1y}, \tau_1, \cdots, \sigma_{6x}, \sigma_{6y}, \tau_6)^T$

The relevant buckling stresses can be obtained by:

- LC 1: longitudinal compression

$$\sigma_l = \max\left(\frac{\sigma_{1x} + \sigma_{4x}}{2}, \frac{\sigma_{6x} + \sigma_{5x}}{2}, \frac{\sigma_{2x} + \sigma_{3x}}{2}\right)$$

$$\Delta\sigma_l = \frac{1}{3}\left(\sigma_{4x} - \sigma_{1x} - \sigma_{5x} + \sigma_{6x} + \sigma_{3x} - \sigma_{2x}\right)$$

$$\sigma_x = \sigma_l + 0.5|\Delta\sigma_l|$$

$$\psi_x = 1 - |\Delta\sigma_l| / \sigma_x$$

- LC 2: transverse compression

$$\sigma_t = \frac{1}{6}\sum_{i=1}^{6}\sigma_{iy}$$

$$\Delta\sigma_t = \frac{1}{2}\left(-\sigma_{1y} - \sigma_{4y} + \sigma_{2y} + \sigma_{3y}\right)$$

$$\sigma_y = \sigma_t + 0.5|\Delta\sigma_t|$$

$$\psi_y = 1 - |\Delta\sigma_t| / \sigma_y$$

- LC 5: shear

$$\tau = Max\left\{\left|\frac{\tau_1 + \tau_4 + \tau_5 + \tau_6}{4}\right|, \left|\frac{\tau_2 + \tau_3 + \tau_5 + \tau_6}{4}\right|\right\}$$

Chapter 8

Fatigue Check of Structural Details

Section 1 – GENERAL CONSIDERATION

1. General

1.1 Application

1.1.1

The requirements of this Chapter are to be applied to ships having length L of 150 m or above, with respect to 25 years operation life in North Atlantic.

1.1.2

The requirements of this Chapter apply to fatigue cycles induced by wave loads. Fatigue induced by vibrations, low cycle loads or impact loads such as slamming, is out of the scope of this Chapter.

1.1.3

The requirements of this Chapter are applicable where steel materials have a minimum yield stress less than 400 N/mm^2.

1.2 Net scantlings

1.2.1

All scantlings and stresses referred to in this Chapter are net scantlings obtained in accordance with **Ch 3, Sec 2.**

1.3 Subject members

1.3.1

Fatigue strength is to be assessed, in cargo hold area, for members described in **Table 1**, at the considered locations.

Table 1: Members and locations subjected to fatigue strength assessment

Members	Details
Inner bottom plating	Connection with sloping and /or vertical plate of lower stool
	Connection with sloping plate of hopper tank
Inner side plating	Connection with sloping plate of hopper tank
Transverse bulkhead	Connection with sloping plate of lower stool
	Connection with sloping plate of upper stool
Hold frames of single side bulk carriers	Connection to the upper and lower wing tank
Ordinary stiffeners in double side space	Connection of longitudinal stiffeners with web frames and transverse bulkhead
	Connection of transverse stiffeners with stringer or similar
Ordinary stiffeners in upper and lower wing tank	Connection of longitudinal stiffeners with web frames and transverse bulkhead
Ordinary stiffeners in double bottom	Connection of longitudinal stiffeners with floors and floors in way of lower stool or transverse bulkhead
Hatch corners	Free edges of hatch corners

2. Definitions

2.1 Hot spot

2.1.1

Hot spot is the location where fatigue crack may initiate.

2.2 Nominal stress

2.2.1

Nominal stress is the stress in a structural component taking into account macro-geometric effects but disregarding the stress concentration due to structural discontinuities and to the presence of welds.
Nominal stresses are to be obtained either with the coarse mesh FE analysis specified in **Ch 7, Sec 4**, or with the simplified procedure specified in **Sec 4.**

2.3 Hot spot stress

2.3.1

Hot spot stress is defined as the local stress at the hot spot. The hot spot stress takes into account the influence of structural discontinuities due to the geometry of the connection but excludes the effects of welds.
Hot spot stresses are to be obtained either by fine mesh FE analysis specified in **Ch 7, Sec 4**, or by multiplying nominal stresses by stress concentration factors defined in **Sec 4.**

2.4 Notch stress

2.4.1

Notch stress is defined as the peak stress at the weld toe taking into account stress concentrations due to the effects of structural geometry as well as the presence of welds.
Notch stress is to be obtained by multiplying hot spot stress by fatigue notch factor defined in **Sec 2, [2.3.1], Table 1.**

3. Loading

3.1 Loading condition

3.1.1

The loading conditions to be considered are defined in **Table 2** depending on the ship type. The standard loading conditions illustrated in **Ch 4, App 3** are to be considered.

Table 2: Loading conditions

Ship type	Full load condition		Ballast condition	
	Homogeneous	Alternate	Normal ballast	Heavy ballast
BC-A	√	√	√	√
BC-B	√	---	√	√
BC-C	√	---	√	√

3.2 Load case

3.2.1 Load cases

For each loading condition, the load cases to be considered, defined in **Ch 4, Sec 4, [2]**, are:

(a) “H1” and “H2” corresponding to the EDW “H” (head sea)

(b) “F1” and “F2” corresponding to the EDW “F” (following sea)

(c) “R1” and “R2” corresponding to the EDW “R” (beam sea)

(d) “P1” and “P2” corresponding to the EDW “P” (beam sea)

3.2.2

In the case of fatigue assessment of hatch corners, only oblique sea is to be considered, taking into account the wave torsional moments defined in **Ch 4, Sec 3, [3.4].**

3.2.3 Predominant load case

From the above mentioned load cases and for each loading condition, the load case where the combined stress range is maximum, corresponds to the predominant load case.

Section 2 – FATIGUE STRENGTH ASSESSMENT

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

i : Suffix which denotes load case “H”, “F”, “R” or “P” specified in **Ch 4, Sec 4**
“i1” denotes load case “H1”, “F1”, “R1” or “P1” and “i2” denotes load case “H2”, “F2”, “R2” or “P2”

(k) : Suffix which denotes loading condition “homogeneous condition”, “alternate condition”, “normal ballast condition” or “heavy ballast condition” as defined in **Sec 1, Table 2**

$\Delta\sigma_{W,i(k)}$: Hot spot stress range, in N/mm^2, in load case “i” of loading condition “(k)”

$\sigma_{mean,i(k)}$: Structural hot spot mean stress, in N/mm^2, in load case “i” of loading condition “(k)”

1. General

1.1 Application

1.1.1

This Section gives the linear cumulative damage procedure for the fatigue strength assessment of this Chapter.

1.1.2

Fatigue strength is assessed based on an equivalent notch stress range obtained by multiplying an equivalent hot spot stress range by a fatigue notch factor.

1.1.3

Hot spot stress ranges and hot spot mean stresses of primary members, longitudinal stiffeners connections and hatch corners are to be assessed respectively by **Sec 3, Sec 4** and **Sec 5.**

1.1.4 Primary members and longitudinal stiffeners connections

Predominant load cases and ‘condition 1’ are to be obtained respectively in **[2.1]** and **[2.2]**. The hot spot stress ranges calculated in **Sec 3** or **Sec 4**, corresponding to the predominant load case for each loading condition, are to be used in **[2.3.2]** to calculate the equivalent hot spot stress range.

1.1.5 Hatch corners

The hot spot stress range calculated in **Sec 5** is to be used in **[2.3.2]** to calculate the equivalent hot spot stress range.

2. Equivalent notch stress range

2.1 Predominant load case

2.1.1

The predominant load case “I” in fatigue assessment for each loading condition is the load case for which the combined stress range for the considered member is the maximum among the load cases “H”, “F”, “R” and “P” specified in **Sec 1, [3.2.1].**

$$\Delta\sigma_{W,I(k)} = \max_i\left(\Delta\sigma_{W,i(k)}\right)$$

where:

$\Delta\sigma_{W,i(k)}$: Combined hot spot stress range, in N/mm^2, defined either in **Sec 3, [2.1.1], [2.2.1]** or **Sec 4, [2.3.1].**

I : Suffix which denotes the selected predominant load case of loading condition "(k)".

2.2 Loading 'condition 1'

2.2.1

The 'condition 1' is the condition in which the maximum stress calculated by the equation below for the considered member is the largest on the tension side among the loading conditions "homogeneous", "alternate", "normal ballast" and "heavy ballast" specified in **Sec 1, Table 2.**

$$\sigma_{\max,1} = \max_k \left(\sigma_{mean,\,I(k)} + \frac{\Delta\sigma_{W,\,I(k)}}{2} \right)$$

where:

$\sigma_{mean,I(k)}$: Structural hot spot mean stress, in N/mm^2, in predominant load case of loading condition "(k)" defined in **[2.1.1]**

$\Delta\sigma_{W,I(k)}$: Hot spot stress range, in N/mm^2, in predominant load case of loading condition "(k)" defined in [2.1.1]

2.2.2

Further to the determination of 'condition 1' according to **[2.2.1]**, the corresponding loading condition is to be indexed with the suffix "j" equal1.

2.3 Equivalent notch stress range

2.3.1 Equivalent notch stress range

The equivalent notch stress range, in N/mm^2, for each loading condition is to be calculated with the following formula:

$$\Delta\sigma_{eq,\,j} = K_f \Delta\sigma_{equiv,\,j}$$

where:

$\Delta\sigma_{equiv,j}$: Equivalent hot spot stress range, in N/mm^2, in loading condition "j" obtained by **[2.3.2].**

K_f : Fatigue notch factor defined in **Table 1.**

Table 1: Fatigue notch factors K_f

Subject	Without weld grinding	With weld grinding (not applicable for ordinary stiffeners and boxing fillet welding[*1])
Butt welded joint	1.25	1.10
Fillet welded joint	1.30	1.152
Non welded part	1.00	-

Note:

*1 Boxing fillet welding is defined as a fillet weld around a corner of a member as an extension of the principal weld.

*2 This is applicable for deep penetration welding, or full penetration welding only
In case where grinding is performed, full details regarding grinding standards including the extent, smoothness particulars, final welding profiles and grinding workmanship as well as quality acceptance criteria are to be submitted to the Society for approval.
It is preferred that any grinding is carried out by rotary burrs, is to extend below plate surfaces in order to remove any toe defects and ground areas are to have sufficient corrosion protection. Such treatments are to procedure smooth concave profiles at weld toes with the depth of these depressions penetrating into plate surfaces to at least 0.5 mm below the bottom of any visible undercuts.
The depth of any grooves produced is to be kept to a minimum and, in general, kept to a maximum of 1 mm.
Under no circumstances is grinding depth to exceed 2 mm or 7 % of plate growth thickness, whichever is smaller.
Grinding has to extend to 0.5 longitudinal spacing or 0.5 frame spacing at the each side of hot spot locations.

2.3.2 Equivalent hot spot stress range

The equivalent hot spot stress range, in N/mm², is to be calculated for each loading condition with the following formula:

$$\Delta\sigma_{equiv,j} = f_{mean,j}\,\Delta\sigma_{W,j}$$

where:

$f_{mean,j}$: Correction factor for mean stress:

- for hatch corners $f_{mean,j} = 0.77$
- for primary members and longitudinal stiffeners connections, $f_{mean,j}$ corresponding to the condition "j" taken equal to:

$$f_{mean,j} = \max\left\{0.4,\left[\max\left(0,\frac{1}{2}+\frac{-\ln\left(10^{-4}\right)}{4}\frac{\sigma_{m,j}}{\Delta\sigma_{W,j}}\right)\right]^{0.25}\right\}$$

$\sigma_{m,1}$: Local hot spot mean stress, in N/mm², in the condition "1", obtained from the following formulae:

- if $0.6\Delta\sigma_{W,1} \geq 2.5R_{eH}$:

$$\sigma_{m,1} = -0.18\Delta\sigma_{W,1}$$

- if $0.6\Delta\sigma_{W,1} < 2.5R_{eH}$:

$$\sigma_{m,1} = R_{eH} - 0.6\Delta\sigma_{W,1} \quad \text{for} \quad 0.6\Delta\sigma_{W,1} > R_{eH} - \sigma_{res} - \sigma_{mean,1}$$

$$\sigma_{m,1} = \sigma_{mean,1} + \sigma_{res} \quad \text{for} \quad 0.6\Delta\sigma_{W,1} \leq R_{eH} - \sigma_{res} - \sigma_{mean,1}$$

$\sigma_{m,j}$: Local hot spot mean stress, in N/mm², in the condition "j", obtained from the following formulae:

- if $0.24\Delta\sigma_{W,j} \geq R_{eH}$:

$$\sigma_{m,j(j\neq 1)} = -0.18\Delta\sigma_{W,j}$$

- if $0.24\Delta\sigma_{W,j} < R_{eH}$:

$$\sigma_{m,j(j\neq 1)} = -R_{eH} + 0.24\Delta\sigma_{W,j} \quad \text{for} \quad 0.24\Delta\sigma_{W,j} > R_{eH} + \sigma_{m,1} - \sigma_{mean,1} + \sigma_{mean,j}$$

$$\sigma_{m,j(j\neq 1)} = \sigma_{m,1} - \sigma_{mean,1} + \sigma_{mean,j} \quad \text{for} \quad 0.24\Delta\sigma_{W,j} \leq R_{eH} + \sigma_{m,1} - \sigma_{mean,1} + \sigma_{mean,j}$$

$\sigma_{mean,j}$: Structural hot spot mean stress, in N/mm^2, corresponding to the condition "*j*"

σ_{res} : Residual stress, in N/mm^2, taken equal to:

$\sigma_{res} = 0.25R_{eH}$ for stiffener end connection

$s_{res} = 0$ for non welded part and primary members (cruciform joint or butt weld)

3. Calculation of fatigue damage

3.1 Correction of the equivalent notch stress range

3.1.1

The equivalent notch stress range is to be corrected with the following formula:

$$\Delta\sigma_{E,j} = f_{coat}\, f_{material}\, f_{thick}\, \Delta\sigma_{eq,j}$$

where:

f_{coat} : Correction factor for corrosive environment, taken equal to:

f_{coat} = 1.05 for water ballast tanks and fuel oil tank

f_{coat} = 1.03 for dry bulk cargo holds and void space

$f_{material}$: Correction factor for material, taken equal to:

$$f_{material} = \frac{1200}{965 + R_{eH}}$$

f_{thick} : Correction factor for plate thickness, taken equal to 1.0 for hatch corners, flat bar or bulb stiffeners, otherwise to be taken equal to:

$$f_{thick} = \left(\frac{t}{22}\right)^{0.25} \quad \text{for} \quad t \geq 22 \text{ mm}$$

$$f_{thick} = 1.0 \quad \text{for} \quad t < 22 \text{ mm}$$

t : Net thickness, in mm, of the considered member, taken as the flange in case of stiffeners

$\Delta\sigma_{eq,j}$: Equivalent notch stress range, in N/mm^2, defined in **[2.3.1]**.

3.2 Long-term distribution of stress range

3.2.1

The cumulative probability density function of the long-term distribution of combined notch stress ranges is to be taken as a two-parameter Weibull distribution:

$$F(x) = 1 - \exp\left[-\left(\frac{x}{\Delta\sigma_{E,j}}\right)^{\xi}(\ln N_R)\right]$$

where:

ξ : Weibull shape parameter, taken equal to 1.0

N_R : Number of cycles, taken equal to 10^4.

3.3 Elementary fatigue damage

3.3.1

The elementary fatigue damage for each loading condition is to be calculated with the following formula:

$$D_j = \frac{\alpha_j N_L}{K} \frac{\Delta\sigma_{E,j}{}^4}{(\ln N_R)^{4/\xi}} \left[\Gamma\left(\frac{4}{\xi}+1, \nu\right) + \nu^{-3/\xi} \gamma\left(\frac{7}{\xi}+1, \nu\right) \right]$$

where:

K : S-N curve parameter, taken equal to 1.014×10^{15}

α_j : Coefficient taken equal to 1.0 for the assessment of hatch corners and depending on the loading condition specified in Table 2 for primary members and longitudinal stiffeners connections.

N_L : Total number of cycles for the design ship's life, taken equal to:

$$N_L = \frac{0.85 T_L}{4 \log L}$$

T_L : Design life, in seconds, corresponding to 25 years of ship's life, taken equal to 7.884×10^8

$$\nu = \left(\frac{100.3}{\Delta\sigma_{E,j}}\right)^{\xi} \ln N_R$$

Γ : Type 2 incomplete gamma function

γ : Type 1 incomplete gamma function

Table 2: Coefficient α_j depending on the loading condition

	Loading Conditions	BC-A	BC-B, BC-C
L < 200 m	Homogeneous	0.6	0.7
	Alternate	0.1	---
	Normal ballast	0.15	0.15
	Heavy ballast	0.15	0.15
$L \geq$ 200 m	Homogeneous	0.25	0.5
	Alternate	0.25	---
	Normal ballast	0.2	0.2
	Heavy ballast	0.3	0.3

4. Fatigue strength criteria

4.1 Cumulative fatigue damage

4.1.1

The cumulative fatigue damage D calculated for the combined equivalent stress is to comply with the following criteria:

$$D = \sum_j D_j \leq 1.0$$

where

D_j : Elementary fatigue damage for each loading condition "j".

Section 3 – STRESS ASSESSMENT OF PRIMARY MEMBERS

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

i : Suffix which denotes load case "H", "F", "R" or "P" specified in **Ch 4, Sec 4**
"$i1$" denotes load case "H1", "F1", "R1" or "P1" and "$i2$" denotes load case "H2", "F2", "R2" or "P2"

(k) : Suffix which denotes loading condition, "homogeneous condition", "alternate condition", "normal ballast condition" or "heavy ballast condition" as defined in **Sec 1, Table 2**

$\Delta\sigma_{W,i(k)}$: Hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)"

$\sigma_{mean,i(k)}$: Structural hot spot mean stress, in N/mm^2, in load case "i" of loading condition "(k)".

1. General

1.1 Application

1.1.1

Hot spot stress ranges and structural hot spot mean stresses of primary members are to be assessed according to the requirements of this Section, with the requirements given in **Ch 7, Sec 4.**

2. Hot spot stress range

2.1 Stress range according to the direct method

2.1.1

The hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)" is to be obtained from the following formula:

$$\Delta\sigma_{W,i(k)} = \left|\sigma_{W,i1(k)} - \sigma_{W,i2(k)}\right|$$

where:

$\sigma_{W,i1(k)}$, $\sigma_{W,i2(k)}$: Hot spot stress, in N/mm^2, in load case "$i1$" and "$i2$" of loading condition "(k)", obtained by direct FEM analysis using fine mesh model specified in **Ch 7, Sec 4.**

2.2 Stress range according to the superimposition method

2.2.1 Hot spot stress range

The hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)" is to be obtained from the following formula:

$$\Delta\sigma_{W,i(k)} = \left|\left(\sigma_{GW,i1(k)} + \sigma_{LW,i1(k)}\right) - \left(\sigma_{GW,i2(k)} + \sigma_{LW,i2(k)}\right)\right|$$

where:

$\sigma_{LW,i1(k)}$, $\sigma_{LW,i2(k)}$: Hot spot stress, in N/mm^2, due to local loads in load cases "$i1$" and "$i2$" for loading condition "(k)" obtained by the direct analysis using fine mesh FE model specified in **Ch 7,**

Sec 4

$\sigma_{GW,i1(k)}$, $\sigma_{GW,i2(k)}$: Hot spot stress, in N/mm², due to hull girder moments in load cases "*i*1" and "*i*2" for loading condition "(*k*)" obtained according to **[2.2.2].**

2.2.2 Stress due to hull girder moments

The hull girder hot spot stress, in N/mm², in load cases "*i*1" and "*i*2" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{GW,ij(k)} = C_{WV,ij}\,\sigma_{WV,ij} - C_{WH,ij}\,\sigma_{WH,(k)} \qquad (j = 1, 2)$$

where:

$C_{WV,i1}$, $C_{WV,i2}$, $C_{WH,i1}$, $C_{WH,i2}$: Load combination factors for each load case defined in **Ch 4, Sec 4, [2.2]**

$\sigma_{WV,i1}$: Nominal hull girder stress, in N/mm², in sagging condition induced by vertical wave bending moment

$$\sigma_{WV,i1} = \frac{M_{WV,S}\,(z-N)}{I_Y}\,10^{-3}$$

$\sigma_{WV,i2}$: Nominal hull girder stress, in N/mm², in hogging condition induced by vertical wave bending moment

$$\sigma_{WV,i2} = \frac{M_{WV,H}\,(z-N)}{I_Y}\,10^{-3}$$

$M_{WV,H}$, $M_{WV,S}$: Vertical wave bending moments, in kN.m, in hogging and sagging conditions defined in **Ch 4, Sec 3, [3.1.1]**, with $f_p = 0.5$

N : Z co-ordinate, in m, of the neutral axis , as defined in **Ch 5, Sec 1**

z : Z co-ordinate, in m, of the point considered

$\sigma_{WH,(k)}$: Nominal hull girder stress, in N/mm², induced by horizontal wave bending moment

$$\sigma_{WH,(k)} = \frac{M_{WH,(k)}\,y}{I_Z}\,10^{-3}$$

$M_{WH,(k)}$: Horizontal wave bending moment, in kN.m, in loading condition "(*k*)" defined in **Ch 4, Sec 3, [3.3.1]**, with $f_p = 0.5$

y : Y co-ordinate, in m, of the point considered, to be taken positive at port side and negative at starboard side

I_Y, I_Z : Net moments of inertia of hull cross-section, in m⁴, about transverse and vertical axis respectively, as defined in **Ch 5, Sec 1.**

3. Hot spot mean stress

3.1 Mean stress according to the direct method

3.1.1

The structural hot spot mean stress, in N/mm², in load case "*i*" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{mean,i(k)} = \frac{\sigma_{W,i1(k)} + \sigma_{W,i2(k)}}{2}$$

3.2 Mean stress according to the superimposition method

3.2.1 Hot spot mean stresses

The structural hot spot mean stress, in N/mm^2, in load case "i" for loading condition "(k)" is to be obtained from the following formula:

$$\sigma_{mean,\,i(k)} = \sigma_{GS,\,(k)} + \frac{\sigma_{LW,\,i1(k)} + \sigma_{LW,\,i2(k)}}{2}$$

where:

$\sigma_{GS,(k)}$: Hot spot mean stress, in N/mm^2, due to still water hull girder moment in loading condition "(k)" obtained according to **[3.2.2].**

$\sigma_{LW,i1(k)}$, $\sigma_{LW,i2(k)}$: As defined in **2.2.1**

3.2.2 Stress due to still water hull girder moment

The hot spot stress, in N/mm^2, due to still water bending moment in loading condition "(k)" is to be obtained from the following formula:

$$\sigma_{GS,\,(k)} = \frac{M_{S,\,(k)}\,(z-N)}{I_Y}\,10^{-3}$$

where:

$M_{S,(k)}$: Still water vertical bending moment, in kN.m, depending on the loading condition defined in **Ch 4, Sec 3, [2.2]**. If the design still water bending moments are not defined at a preliminary design stage, still water bending moment in each loading condition may be obtained from the following formulae:

homogeneous condition ; $M_{S,(1)} = -0.5F_{MS}M_{SW,S}$

alternate condition ; $M_{S,(2)} = F_{MS}M_{SW,H}$

normal ballast condition ; $M_{S,(3)} = F_{MS}M_{SW,H}$

heavy ballast condition ;

$$M_{S,(4)} = \begin{cases} 2.66\dfrac{x}{L}M_{SW,H} & ; \quad 0 < x \le 0.15L \\ 2.66\left(0.3-\dfrac{x}{L}\right)M_{SW,H} & ; \quad 0.15L < x \le 0.3L \\ -3.5\left(\dfrac{x}{L}-0.3\right)M_{SW,S} & ; \quad 0.3L < x \le 0.5L \\ -3.5\left(0.7-\dfrac{x}{L}\right)M_{SW,S} & ; \quad 0.5L < x \le 0.7L \\ 2.66\left(\dfrac{x}{L}-0.7\right)M_{SW,H} & ; \quad 0.7L < x \le 0.85L \\ 2.66\left(1-\dfrac{x}{L}\right)M_{SW,H} & ; \quad 0.85L < x \le L \end{cases}$$

$M_{SW,H}$, $M_{SW,S}$: Permissible still water bending moment, in kN.m, in hogging and sagging conditions

F_{MS} : Distribution factor defined in **Ch 4, Sec 3, Fig 2**

Section 4 – STRESS ASSESSMENT OF STIFFENERS

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

i : Suffix which denotes load case "H", "F", "R" or "P" specified in **Ch 4, Sec 4**
"i1" denotes load case "H1", "F1", "R1" or "P1" and "i2" denotes load case "H2", "F2", "R2" or "P2"

(k) : Suffix which denotes loading condition, "homogeneous condition", "alternate condition", "normal ballast condition" or "heavy ballast condition" as defined in **Sec 1, Table 2**

$\Delta\sigma_{W,i(k)}$: Hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)"

$\sigma_{mean,i(k)}$: Structural hot spot mean stress, in N/mm^2, in load case "i" of loading condition "(k)"

1. General

1.1 Application

1.1.1

Hot spot stress ranges and structural hot spot mean stresses of longitudinal stiffeners are to be assessed in line with the requirements of this Section.

1.1.2

The hot spot stress ranges and structural hot spot mean stresses of longitudinal stiffeners are to be evaluated at the face plate of the longitudinal considering the type of longitudinal end connection and the following locations.

(1) Transverse webs or floors other than those at transverse bulkhead of cargo hold or in way of stools, such that additional hot spot stress due to the relative displacement may not be considered. These longitudinal end connections are defined in **Table 1.** When transverse webs or floors are watertight, the coefficients K_{gl} and K_{gh} as defined in **Table 2** are to be considered instead of those defined in **Table 1.**

(2) Transverse webs or floors at transverse bulkhead of cargo hold in way of stools, such that additional hot spot stress due to the relative displacement should be considered. These longitudinal end connections are defined in **Table 2.** When transverse webs or floors at transverse bulkhead of cargo hold or in way of stools are not watertight, the coefficients K_{gl} and K_{gh} as defined in **Table 1** are to be considered instead of those defined in **Table 2.**

2. Hot spot stress range

2.1 Stress range obtained by the direct method

2.1.1

Hot spot stress ranges, in N/mm^2, calculated with direct calculation for each load case "H", "F", "R" and "P" of each loading condition, are to be obtained according to **Sec 3, [2.1].**

2.2 Stress range according to the superimposition method

2.2.1

The hot spot stress ranges, in N/mm^2, for each load case "H", "F", "R" and "P" of each loading condition according to the superimposition method are to be obtained according to **Sec 3, [2.2].**

2.3 Stress range according to the simplified procedure

2.3.1 Hot spot stress ranges

The hot spot stress range, in N/mm^2, due to dynamic loads in load case "*i*" of loading condition "(*k*)" is to be obtained from the following formula:

$$\Delta\sigma_{W,i(k)} = \left|\left(\sigma_{GW,i1(k)} + \sigma_{W1,i1(k)} - \sigma_{W2,i1(k)} + \sigma_{d,i1(k)}\right) - \left(\sigma_{GW,i2(k)} + \sigma_{W1,i2(k)} - \sigma_{W2,i2(k)} + \sigma_{d,i2(k)}\right)\right|$$

where

$\sigma_{GW,i1(k)}$, $\sigma_{GW,i2(k)}$: Stress due to hull girder moment, defined in **[2.3.2]**

$\sigma_{W1,i1(k)}$, $\sigma_{W1,i2(k)}$: Stress $\sigma_{LW,ij(k)}$, $\sigma_{CW,ij(k)}$ and $\sigma_{LCW,ij(k)}$ due to hydrodynamic or inertial pressure when the pressure is applied on the same side as the ordinary stiffener depending on the considered case

$\sigma_{W2,i1(k)}$, $\sigma_{W2,i2(k)}$: Stress $\sigma_{LW,ij(k)}$, $\sigma_{CW,ij(k)}$ and $\sigma_{LCW,ij(k)}$ due to hydrodynamic or inertial pressure when the pressure is applied on the side opposite to the stiffener depending on the considered case

$\sigma_{LW,i1(k)}$, $\sigma_{LW,i2(k)}$: Stresses due to wave pressure, defined in **[2.3.3]**

$\sigma_{CW,i1(k)}$, $\sigma_{CW,i2(k)}$: Stresses due to liquid pressure, defined in **[2.3.4]**

$\sigma_{LCW,i1(k)}$, $\sigma_{LCW,i2(k)}$: Stresses due to dry bulk cargo pressure, defined in **[2.3.5]**

$\sigma_{d,i1(k)}$, $\sigma_{d,i2(k)}$: Stress due to relative displacement of transverse bulkhead, or floor in way of stools, defined in **[2.3.6].**

2.3.2 Stress due to hull girder moments

The hull girder hot spot stress, in N/mm^2, in load case "*i*1" and "*i*2" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{GW,ij(k)} = K_{gh} \cdot \left(C_{WV,ij}\,\sigma_{WV,ij} - C_{WH,ij}\,\sigma_{WH,(k)}\right) \qquad (j = 1, 2)$$

where:

K_{gh} : Geometrical stress concentration factor for nominal hull girder stress. K_{gh} is given in **Table 1** and **Table 2** for the longitudinal end connection specified in **[1.1.2]**(1) and **[1.1.2]**(2), respectively.
The stress concentration factor can be evaluated directly by the FE analysis.

$C_{WV,i1}$, $C_{WV,i2}$, $C_{WH,i1}$, $C_{WH,i2}$: Load combination factors for each load case defined in **Ch 4, Sec 4, [2.2]**

$\sigma_{WV,i1}$, $\sigma_{WV,i2}$, $\sigma_{WH,(k)}$: Nominal hull girder stresses, in N/mm^2, defined in **Sec 3, [2.2.2]**

2.3.3 Stress due to wave pressure

The hot spot stress, in N/mm^2, due to the wave pressure in load case "*i*1" and "*i*2" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{LW,ij(k)} = \frac{K_{gl} K_s p_{CW,ij(k)}\, s\ell^2 \left(1 - \dfrac{6x_f}{\ell} + \dfrac{6x_f^{\,2}}{\ell^2}\right)}{12w} 10^3 \qquad (j = 1, 2)$$

$$p_{CW,i1(k)} = \begin{cases} 2C_{NE,i1(k)}\, p_{W,i1(k)} & ; C_{NE,i1(k)} < 0.5 \\ p_{w,i1(k)} & ; C_{NE,i1(k)} \geq 0.5 \end{cases}$$

$$p_{CW,i2(k)} = \begin{cases} 0 & ; C_{NE,i2(k)} < 0.5 \\ (2C_{NE,i2(k)} - 1)\, p_{W,i2(k)} & ; C_{NE,i2(k)} \geq 0.5 \end{cases}$$

where:

$p_{W,ij(k)}$: Hydrodynamic pressure, in kN/m^2, specified in **Ch 4, Sec 5, [1.3], [1.4]** and **[1.5]**, with f_p = 0.5, in load case "i1" and "i2" for loading condition "(k)". When the location of the considered member is above the waterline, the hydrodynamic pressure is to be taken as the pressure at waterline.

K_{gl} : Geometrical stress concentration factor for stress due to lateral pressure. K_{gl} is given in **Table 1** and **Table 2** for the longitudinal end connection specified in **[1.1.2]**(1) and **[1.1.2]**(2), respectively. The stress concentration factor can be evaluated directly by the FE analysis.

K_s : Geometrical stress concentration factor due to stiffener geometry

$$K_s = 1 + \left[\frac{t_f(a^2 - b^2)}{2w_b}\right]\left[1 - \frac{b}{b_f}\left(1 + \frac{w_b}{w_a}\right)\right]10^{-3}$$

a, b : Eccentricity, in mm, of the face plate as defined in **Fig 1**. For angle profile, "b" is to be taken as half the net actual thickness of the web.

t_f, b_f : Thickness and breadth of face plate, in mm, respectively, as defined in **Fig 1**

w_a, w_b : Net section modulus in A and B respectively (see **Fig 1**), in cm^3, of the stiffener about the neutral axis parallel to Z axis without attached plating.

$C_{NE,ij(k)}$: Correction factor for the non linearity of the wave pressure range in load case "i1" and "i2" of loading condition "(k)"

$$C_{NE,ij(k)} = \begin{cases} \exp\left[-\left(\dfrac{z - T_{LC(k)} + \dfrac{|p_{W,ij(k),WL}|}{\rho g}}{\dfrac{|p_{W,ij(k),WL}|}{\rho g}(-\ln 0.5)^{-1/2.5}}\right)^{2.5}\right] & \text{for} \quad z > T_{LC(k)} - \dfrac{|p_{W,ij(k),WL}|}{\rho g} \\ 1.0 & \text{for} \quad z \le T_{LC(k)} - \dfrac{|p_{W,ij(k),WL}|}{\rho g} \end{cases}$$

$T_{LC(k)}$: Draught, in m, of the considered loading condition "(k)"

$p_{W,ij(k),WL}$: Hydrodynamic pressure, in kN/m^2, at water line in load case "i1" and "i2" of loading condition "(k)"

z : Z co-ordinate, in m, of the point considered

s : Stiffener spacing, in m

ℓ : Span, in m, to be measured as shown in **Fig 2**. The ends of the span are to be taken at points where the depth of the end bracket, measured from the face plate of the stiffener is equal to half the depth of the stiffener

x_f : Distance, in m, to the hot spot from the closest end of the span ℓ (see **Fig 2**)

w : Net section modulus, in cm^3, of the considered stiffener. The section modulus w is to be calculated considering an effective breadth s_e, in m, of attached plating obtained from the following formulae:

$$s_e = \begin{cases} 0.67s \cdot \sin\left[\dfrac{\pi}{6}\left(\dfrac{\ell(1 - 1/\sqrt{3})}{2s}\right)\right] & \text{for} \quad \dfrac{\ell}{s} \le \dfrac{6}{1 - 1/\sqrt{3}} \\ 0.67s & \text{for} \quad \dfrac{\ell}{s} > \dfrac{6}{1 - 1/\sqrt{3}} \end{cases}$$

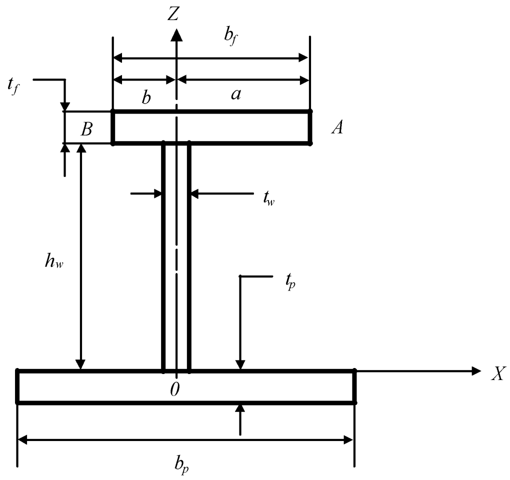

Fig 1: Sectional parameters of a stiffener

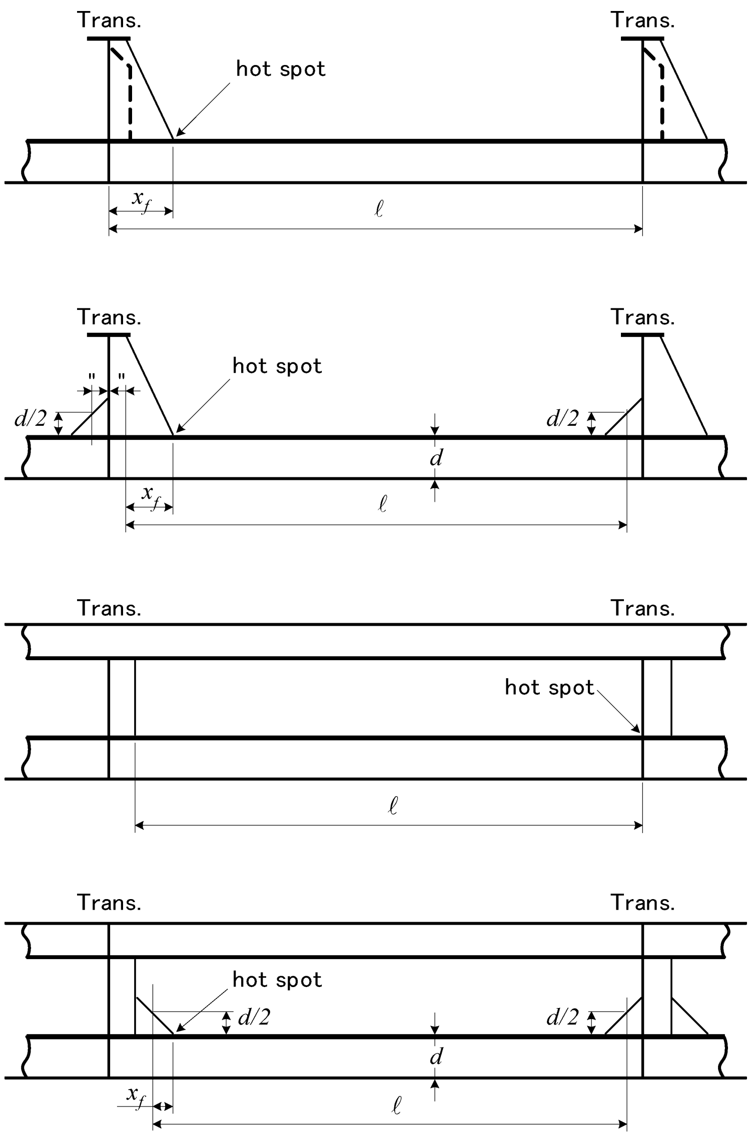

Fig 2: Span and hot spot of longitudinal stiffeners

2.3.4 Stress due to liquid pressure

The hot spot stress, in N/mm², due to the liquid pressure in load case "i1" and "i2" for loading condition "(k)" is to be obtained from the following formula:

$$\sigma_{CW,ij(k)} = \frac{K_{gl} K_s C_{NI,ij(k)} p_{BW,ij(k)} s \ell^2 \left(1 - \frac{6x_f}{\ell} + \frac{6x_f^{\,2}}{\ell^2}\right)}{12w} \cdot 10^3 \qquad (j = 1, 2)$$

where:

$p_{BW,ij(k)}$: Inertial pressure, in kN/m², due to liquid specified in **Ch 4, Sec 6, [2.2]**, with $f_p = 0.5$, in load case "i1" and "i2" for loading condition "(k)". Where the considered location is located in fuel oil, other oil or fresh water tanks, no inertial pressure is considered for the tank top longitudinals and when the location of the considered member is above the liquid surface in static and upright condition, the inertial pressure is to be taken at the liquid surface line.

$C_{NI,ij(k)}$: Correction factor for the non linearity of the inertial pressure range due to liquid in load case "i1" and "i2" for loading condition "(k)"

$$C_{NI,ij(k)} = \begin{cases} \exp\left[-\left(\dfrac{z - z_{SF} + \dfrac{|p_{BW,ij(k),SF}|}{\rho g}}{\dfrac{|p_{BW,ij(k),SF}|}{\rho g}(-\ln 0.5)^{-1/2.5}}\right)^{2.5}\right] & \text{for } z > z_{SF} - \dfrac{|p_{BW,ij(k),SF}|}{\rho g} \\ 1.0 & \text{for } z \le z_{SF} - \dfrac{|p_{BW,ij(k),SF}|}{\rho g} \end{cases}$$

z_{SF} : Z co-ordinate, in m, of the liquid surface. In general, it is taken equal to "z_{TOP}" defined in **Ch 4, Sec 6.** If the considered location is located in fuel oil, other oil or fresh water tanks, it may be taken as the distance to the half height of the tank.

z : Z co-ordinate, in m, of the point considered

$p_{BW,ij(k),SF}$: Inertial pressure due to liquid, in kN/m², taken at the liquid surface in load case "i1" and "i2" for loading condition "(k)". In calculating the inertial pressure according to **Ch 4, Sec 6, [2.2.1]**, x and y coordinates of the reference point are to be taken as liquid surface instead of tank top.

$K_{gh}K_s$: The stress concentration factor defined in **[2.3.3]**

2.3.5 Stress due to dry bulk cargo pressure

The hot spot stress, in N/mm², due to the dry bulk cargo pressure in load case "i1" and "i2" for loading condition "(k)" is to be obtained from the following formula:

$$\sigma_{LCW,ij(k)} = \frac{K_{gl} K_s p_{CW,ij(k)} s \ell^2 \left(1 - \frac{6x_f}{\ell} + \frac{6x_f^{\,2}}{\ell^2}\right)}{12w} 10^3 \qquad (j = 1, 2)$$

where:

$p_{CW,ij(k)}$: Inertial pressure, in kN/m², due to dry bulk cargo specified in **Ch 4, Sec 6 [1.3]**, with f_p = 0.5, in load case "i1" and "i2" for loading condition "(k)"

2.3.6 Stress due to relative displacement of transverse bulkhead or floor in way of transverse bulkhead or stool

For longitudinal end connection specified in **[1.1.2]**(2), the additional hot spot stress, in N/mm^2, due to the relative displacement in the direction perpendicular to the attached plate between the transverse bulkhead or floor in way of stools and the adjacent transverse web or floor in load case "*i*1" and "*i*2" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{d,ij(k)} = \begin{cases} K_{dF-a}\sigma_{dF-a,ij(k)} + K_{dA-a}\sigma_{dA-a,ij(k)} & \text{for point "}a\text{"} \\ K_{dF-f}\sigma_{dF-f,ij(k)} + K_{dA-f}\sigma_{dA-f,ij(k)} & \text{for point "}f\text{"} \end{cases} \qquad (j=1,2)$$

where:

a, *f* : Suffix which denotes the location considered as indicated in **Table 2.**

A, *F* : Suffix which denotes the direction, forward (*F*) and after ward (*A*), of the transverse web or floor where the relative displacement is occurred as indicated in **Table 2**. (see **Fig 3**)

$\sigma_{dF-a,ij(k)}$, $\sigma_{dA-a,ij(k)}$, $\sigma_{dF-f,ij(k)}$, $\sigma_{dA-f,ij(k)}$: Additional stress at point "*a*" and "*f*", in N/mm^2, due to the relative displacement between the transverse bulkhead or floors in way of stools and the forward (*F*) and after ward (*A*) transverse web or floor respectively in load case "*i*1" and "*i*2" for loading condition "(*k*)"

$$\sigma_{dF-a,ij(k)} = \frac{3.9\delta_{F,ij(k)} E I_A I_F}{w_A \ell_F (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fA}|}{\ell_A}\right) 10^{-5}$$

$$\sigma_{dA-a,ij(k)} = \left[\frac{3.9\delta_{A,ij(k)} E I_A I_F}{w_A \ell_A (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fA}|}{\ell_A}\right) - \frac{0.9\delta_{A,ij(k)} E I_A |x_{fA}|}{w_A \ell_A^{\,3}}\right] 10^{-5}$$

$$\sigma_{dF-f,ij(k)} = \left[\frac{3.9\delta_{F,ij(k)} E I_A I_F}{w_F \ell_F (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fF}|}{\ell_F}\right) - \frac{0.9\delta_{F,ij(k)} E I_F |x_{fF}|}{w_F \ell_F^{\,3}}\right] 10^{-5}$$

$$\sigma_{dA-f,ij(k)} = \frac{3.9\delta_{A,ij(k)} E I_A I_F}{w_F \ell_A (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fF}|}{\ell_F}\right) 10^{-5}$$

$\delta_{F,ij(k)}$, $\delta_{A,ij(k)}$: Relative displacement, in mm, in the direction perpendicular to the attached plate between the transverse bulkhead or floor in way of stools and the forward (*F*) and afterward (*A*) transverse web or floor in load case "*i*1" and "*i*2" for loading condition "(*k*)" (see **Fig 3**)

(a) For longitudinals penetrating floors in way of stools

Relative displacement is defined as the displacement of the longitudinal in relation to the line passing through the stiffener end connection at the base of the stool measured at the first floor forward (*F*) or afterward (*A*) of the stool.

(b) For longitudinals other than (a)

Relative displacement is defined as the displacement of the longitudinal in relation to its original position measured at the first forward (*F*) or afterward (*A*) of the transverse bulkhead.

Where the stress of the face of longitudinal at the assessment point due to relative displacement is tension, the sign of the relative displacement is positive.

I_F, I_A : Net moment of inertia, in cm4, of forward (*F*) and afterward (*A*) longitudinal

K_{dF-a}, K_{dA-a}, K_{dF-f}, K_{dA-f} : Stress concentration factor for stiffener end connection at point "*a*" and "*f*" subject to relative displacement between the transverse bulkhead and the forward (*F*) and afterward (A) transverse web or floors in way of stool respectively as defined in **Table 2**. The stress concentration can be evaluated directly by the FE analysis when the detail of end connection is not defined in **Table 2.**

ℓ_F, ℓ_A : Span, in m, of forward (F) and afterward (A) longitudinal to be measured as shown in **Fig 2**

x_{fF}, x_{fA} : Distance, in m, to the hot spot from the closest end of ℓ_F and ℓ_A respectively (see **Fig 2**).

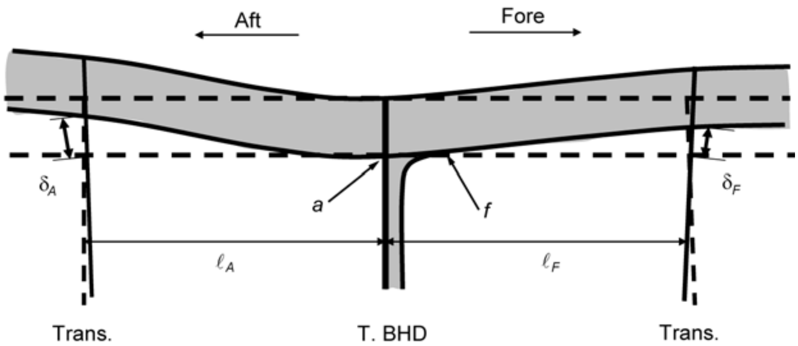

Fig 3: Definition of the relative displacement (Example of the side longitudinal)

3. Hot spot mean stress

3.1 Mean stress according to the direct method

3.1.1

The structural hot spot mean stress, in N/mm^2, in each loading condition calculated with the direct method is to be obtained according to **Sec 3, [3.1].**

3.2 Mean stress according to the superimposition method

3.2.1

The structural hot spot mean stress, in N/mm^2, in each loading condition calculated with the superimposition method is to be obtained according to **Sec 3, [3.2].**

3.3 Mean stress according to the simplified procedure

3.3.1 Hot spot mean stresses

The structural hot spot mean stress, in N/mm^2, in loading condition "(k)" regardless of load case "i" is to be obtained from the following formula:

$$\sigma_{mean,(k)} = \sigma_{GS,(k)} + \sigma_{S1,(k)} - \sigma_{S2,(k)} + \sigma_{dS,(k)}$$

where

$\sigma_{GS,(k)}$: Stress due to still water hull girder moment, defined in **[3.3.2]**

$\sigma_{S1,(k)}$: Stress due to static pressure when the pressure is applied on the same side as the ordinary stiffener depending on the considered case, with consideration of the stresses defined in **[3.3.3]** to **[3.3.5]**

$\sigma_{S2,(k)}$: Stress due to static pressure when the pressure is applied on the side opposite to the stiffener depending on the considered case

$\sigma_{dS,(k)}$: Stress due to relative displacement of transverse bulkhead in still water, defined in **[3.3.6]**.

3.3.2 Stress due to still water hull girder moment

The hot spot stress due to still water bending moment, in N/mm^2, in loading condition "(k)" is to be obtained with the following formula:

$$\sigma_{GS,(k)} = K_{gh} \frac{M_{S,(k)}(z-N)}{I_Y} 10^{-3}$$

where:

$M_{S,(k)}$: Still water vertical bending moment, in kN.m, defined in **Sec 3, [3.2.2].**

3.3.3 Stress due to hydrostatic and hydrodynamic pressure

The hot spot stress due to hydrostatic and hydrodynamic pressure, in N/mm^2, in loading condition "(k)" is to be obtained with the following formula:

$$\sigma_{LS,(k)} = \frac{K_{gl}K_s\left\{p_{s,(k)} + \frac{p_{CW,i1(k)}+p_{CW,i2(k)}}{2}\right\}s\ell^2\left(1-\frac{6x_f}{\ell}+\frac{6x_f^2}{\ell^2}\right)}{12w} 10^3$$

where:

$p_{S,(k)}$: Hydrostatic pressure, in kN/m^2, in loading condition "(k)" specified in **Ch 4, Sec 5, [1.2].**

$p_{CW,ij(k)}$: Corrected hydrodynamic pressure, in kN/m^2, according to **[2.3.3]**, with $f_p = 0.5$, in load case "i1" and "i2" for loading condition "(k)"

i : Suffix which denotes the load case specified in **Sec 2 [2.1.1]**, when calculating the mean stress, "I" is to be used.

3.3.4 Stress due to liquid pressure in still water

The structural hot spot mean stress due to liquid pressure in still water, in N/mm^2, in loading condition "(k)" is to be obtained with the following formula:

$$\sigma_{CS,(k)} = \frac{K_{gl}K_s p_{CS,(k)} s\ell^2\left(1-\frac{6x_f}{\ell}+\frac{6x_f^2}{\ell^2}\right)}{12w} 10^3$$

where:

$p_{CS,(k)}$: Liquid pressure in still water, in kN/m^2, in loading condition "(k)" specified in **Ch 4, Sec 6 [2.1].** Where the considered location is located in fuel oil, other oil or fresh water tanks, d_{AP} and P_{PV} defined in **Ch 4, Sec 6** are to be taken equal to 0 and z_{TOP} specified in **Ch 4, Sec 6, [2.1]** is to be takene qual to z_{SF} specified in **[2.3.4]**

3.3.5 Stress due to dry bulk cargo pressure in still water

The structural hot spot mean stress due to dry bulk cargo pressure in still water, in N/mm^2, in loading condition "(k)" is to be obtained with the following formula:

$$\sigma_{LCS,(k)} = \frac{K_{gl} K_s p_{CS,(k)} s \ell^2 \left(1 - \frac{6x_f}{\ell} + \frac{6{x_f}^2}{\ell^2}\right)}{12w} 10^3$$

where:

$p_{CS,(k)}$: Dry bulk cargo pressure in still water, in kN/m², in loading condition "(k)" specified in **Ch 4, Sec 6, [1.2]**

3.3.6 Stress due to relative displacement of transverse bulkhead in still water

The additional hot spot mean stress, in N/mm², due to the relative displacement in the transverse direction between the transverse bulkhead and the adjacent transverse web or floor in loading condition "(k)", is to be obtained with the following formula:

$$\sigma_{dS,(k)} = \begin{cases} K_{dF-a}\sigma_{dSF-a,(k)} + K_{dA-a}\sigma_{dSA-a,(k)} & \text{for point "}a\text{"} \\ K_{dF-f}\sigma_{dSF-f,(k)} + K_{dA-f}\sigma_{dSA-f,(k)} & \text{for point "}f\text{"} \end{cases}$$

where:

$\sigma_{dSF-a,(k)}$, $\sigma_{dSA-a,(k)}$, $\sigma_{dSF-f,(k)}$, $\sigma_{dSA-f,(k)}$: Additional stress at point "a" and "f", in N/mm², due to the relative displacement between the transverse bulkhead and the forward (F) and afterward (A) transverse web or floor respectively in loading condition (k)

$$\sigma_{dSF-a,(k)} = \frac{3.9\delta_{SF,(k)} E I_A I_F}{w_A \ell_F (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fA}|}{\ell_A}\right) 10^{-5}$$

$$\sigma_{dSA-a,(k)} = \left[\frac{3.9\delta_{SA,(k)} E I_A I_F}{w_A \ell_A (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fA}|}{\ell_A}\right) - \frac{0.9\delta_{SA,(k)} E I_A |x_{fA}|}{w_A {\ell_A}^3}\right] 10^{-5}$$

$$\sigma_{dSF-f,(k)} = \left[\frac{3.9\delta_{SF,(k)} E I_A I_F}{w_F \ell_F (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fF}|}{\ell_F}\right) - \frac{0.9\delta_{SF,(k)} E I_F |x_{fF}|}{w_F {\ell_F}^3}\right] 10^{-5}$$

$$\sigma_{dSA-f,(k)} = \frac{3.9\delta_{SA,(k)} E I_A I_F}{w_F \ell_A (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fF}|}{\ell_F}\right) 10^{-5}$$

$\delta_{SF,(k)}$, $\delta_{SA,(k)}$: Relative displacement, in mm, in still water in the transverse direction between the transverse bulkhead and the forward (F) and afterward (A) transverse web or floor respectively in loading condition (k)

Section 5 – STRESS ASSESSMENT OF HATCH CORNERS

1. General

1.1 Application

1.1.1

Hot spot stress ranges and structural hot spot mean stresses of hatch corners based on the simplified procedure are to be assessed according to the requirements of this Section.

2. Nominal stress range

2.1 Nominal stress range due to wave torsional moment

2.1.1

The nominal stress range, in N/mm^2, due to cross deck bending induced by wave torsion moments is to be obtained from the following formula:

$$\Delta\sigma_{WT} = \frac{2}{1000} F_S F_L \frac{Q \cdot B_H}{W_Q}$$

where:

$$Q = 1000u \Big/ \left(\frac{(B_H + b_s)}{12EI_Q} + \frac{2.6B_H}{EA_Q} \right)$$

u : Displacement of hatch corner in longitudinal direction, in m, taken equal to:

$$u = \frac{31.2}{1000} \frac{M_{WT}\,\omega}{I_T E\ DOC}$$

DOC : Deck opening coefficient, taken equal to:

$$DOC = \frac{L_C B}{\sum_{i=1}^{n} L_{H,i} B_{H,i}}$$

M_{WT} : Maximum wave torsional moment, in kN.m, defined in **Ch 4, Sec 3, [3.4.1]**, with $f_p = 0.5$

F_S : Stress correction factor, taken equal to:

$F_s = 5$

F_L : Correction factor for longitudinal position of hatch corner, taken equal to:

$F_L = 1.75\frac{x}{L}$ for $0.57 \le x/L \le 0.85$

$F_L = 1.0$ for $x/L < 0.57$ and $x/L > 0.85$

B_H : Breadth of hatch opening, in m

W_Q : Section modulus of the cross deck about z-axis, in m^3, including upper stool, near hatch corner (see **Fig 2**)

I_Q : Moment of inertia of the cross deck about z-axis, in m^4, including upper stool, near the hatch corner (see **Fig 2**)

A_Q : Effective shear area of the whole section of the cross deck, in m^2, including upper stool, near the hatch corner (see **Fig 2**). For the determination of the effective shear area the consideration of only the plate elements is sufficient, and the stiffeners can be neglected.

b_S : Breadth of remaining deck strip on one side, in m, beside the hatch opening

I_T : Torsion moment of inertia of ships cross section, in m^4, calculated within cross deck area by neglecting upper and lower stool of the bulkhead (see **Fig 1**). It may be calculated according to **App 1**

ω : Sector coordinate, in m^2, calculated at the same cross section as I_T and at the Y and Z location of the hatch corner (see **Fig 1**) It may be calculated according to **App 1**

L_C : Length of cargo area, in m, being the distance between engine room bulkhead and collision bulkhead

$B_{H,i}$: Breadth of hatch opening of hatch i, in m

$L_{H,i}$: Length of hatch opening of hatch i, in m

n : Number of hatches.

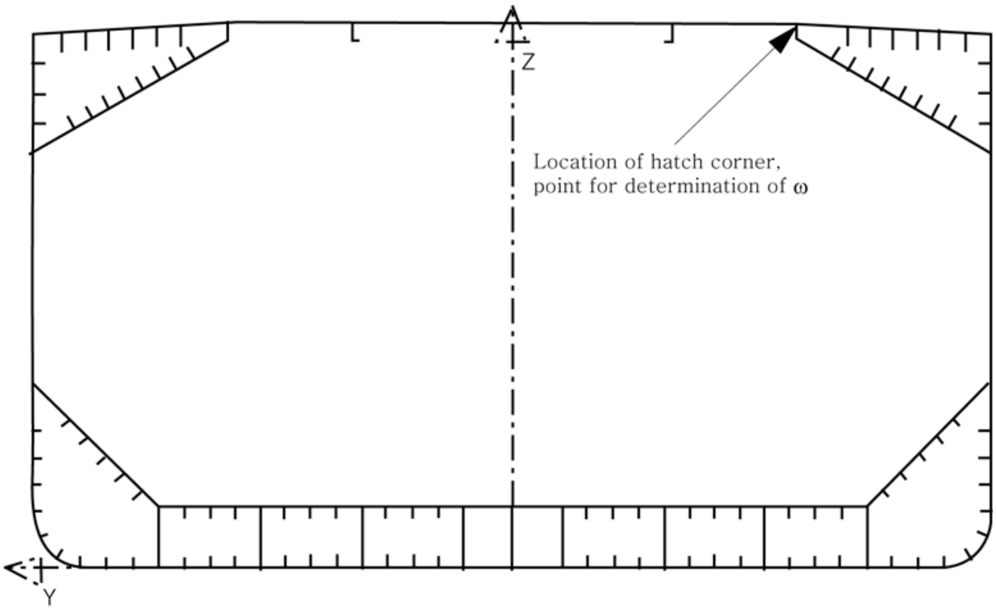

Fig 1: Cross section for determination of I_T and ω

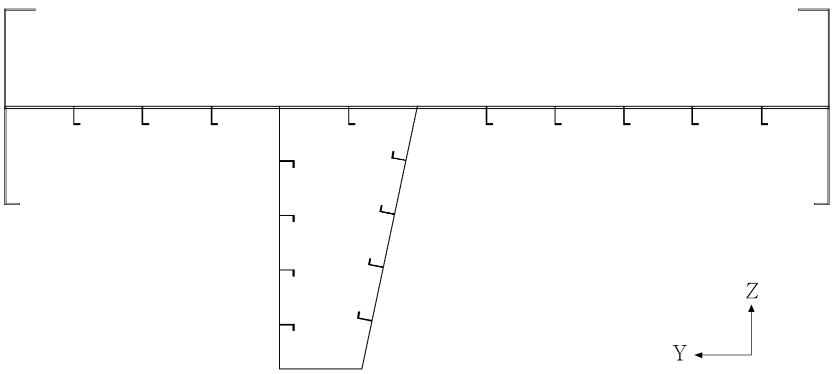

Fig 2: Elements to be considered for the determination of A_Q, W_Q and I_Q

2.2 Nominal mean stress

2.2.1

The mean stress due to still water bending moment within the cross deck is set to 0.

3. Hot spot stress

3.1 Hot spot stress range

3.1.1

The hot spot stress range, in N/mm^2, is to be obtained from the following formula:

$$\Delta\sigma_W = K_{gh} \cdot \Delta\sigma_{WT}$$

where:

K_{gh} : Stress concentration factor for the hatch corner, taken equal to:

$$K_{gh} = \frac{r_a + 2r_b}{3r_a}\left\{1 + \left(\frac{2b}{1.23\ell_{CD} + 1.6b}\frac{0.22\ell_{CD}}{r_a}\right)^{0.65}\right\}$$, to be taken not less than 1.0

r_a : Radius, in m, in major axis

r_b : Radius, in m, in minor axis (if the shape of corner is a circular arc, r_b is to be equal to r_a)

ℓ_{CD} : Length of cross deck, in m, in longitudinal direction

b : Distance, in m, from the edge of hatch opening to the ship's side.

Appendix 1 – CROSS SECTIONAL PROPERTIES FOR TORSION

1. Calculation Formulae

1.1 Torsion Function Φ

1.1.1

For any partial area of closed cells the following geometric figures and ratios have to be computed:

$$A_y = \frac{1}{2}(z_i + z_k)(y_k - y_i)$$

$$l = \sqrt{(y_k - y_i)^2 + (z_k - z_i)^2}$$

$$\frac{s}{t} = \frac{\ell}{t}$$

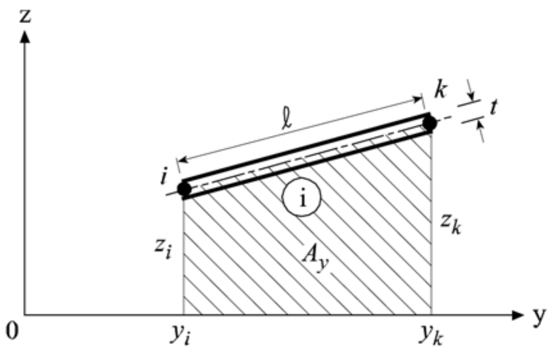

Fig 1:

The following three versions of algorithms may be applied depending on the type of cross section:

Version A: Asymmetric open cross sections as shown in **Fig 2**

Version B: Symmetric cross sections with particular closed cells (closed cells without shared walls) as shown in **Fig 3**. In this case the torsion function can be calculated for each cell separately.

$$\Phi_0 = \frac{2\sum_{Cell\,0} A_y}{\sum_{Cell\,0} \frac{s}{t}} \quad ; \quad \Phi_2 = \frac{2\sum_{Cell\,2} A_y}{\sum_{Cell\,2} \frac{s}{t}}$$

Version C: Symmetric cross sections with multiple closed cells (closed cells with shared walls) as shown in **Fig 4**. In this case the torsion function for each cell i can be calculated by solving a linear system of equations considering the shared walls.

$$\Phi_0 \sum_{Cell\,0} \frac{s}{t} + \Phi_1 \left(\frac{s}{t}\right)_{Common\,Wall} = 2A_{Cell0}$$

$$\Phi_1 \sum_{Cell\,1} \frac{s}{t} + \Phi_0 \left(\frac{s}{t}\right)_{Common\,Wall} = 2A_{Cell1}$$

From this system of equations the torsion functions Φ_0 and Φ_1 can be derived.

1.2 Co-ordinate system, running coordinate s

1.2.1

A 2-D cartesian co-ordinate system is to be used. The choice of the reference point O (origin of co-ordinate system) is free, but for symmetric cross sections it is advantageous to define the origin at the line of symmetry of the cross section. The running co-ordinate s starts within symmetric cross sections at the intersection of the line of symmetry with the cross section geometry, e.g. in hull cross sections at the intersection of centreline and bottom shell or double-bottom as indicated by '0' in **Fig 2** to **Fig 4.** The orientation of s as well as the direction of integration within closed cells is to be considered with respect to the algebraic signs and the assembly of the system of equations for the torsion function.

1.3 Computation of several properties for each part of the cross section

1.3.1

ω_i = ω_k of the preceding partial area or of the preceding point of bifurcation. (to be set equal to zero at the beginning of the computation)

ω_k = $\omega_i + y_i z_k - y_k z_i - \Phi \dfrac{\ell_i}{t_i}$, with $\Phi \dfrac{\ell_i}{t_i}$ within closed cells

l = $\sqrt{(y_k - y_i)^2 + (z_k - z_i)^2}$

			Summation
A	=	ℓt	$\sum A$
S_y	=	$A/2 (z_i + z_k)$	$\sum S_y$
S_z	=	$A/2 (y_i + y_k)$	$\sum S_z$
S_ω	=	$A/2 (\omega_i + \omega_k)$	$\sum S_\omega$
I_y	=	$A/3 \left(z_i^2 + z_i z_k + z_k^2\right)$	$\sum I_y$
I_z	=	$A/3 \left(y_i^2 + y_i y_k + y_k^2\right)$	$\sum I_y$
I_{yz}	=	$A/6 [(2y_k + y_i)z_k + (2y_i + y_k)z_i]$	$\sum I_{yz}$
I_ω	=	$A/3 \left(\omega_i^2 + \omega_i \omega_k + \omega_k^2\right)$	$\sum I_\omega$
$I_{\omega y}$	=	$A/6 [(2y_k + y_i)\omega_k + (2y_i + y_k)\omega_i]$	$\sum I_{\omega y}$
$I_{\omega z}$	=	$A/6 [(2z_k + z_i)\omega_k + (2z_i + z_k)\omega_i]$	$\sum I_{\omega z}$
$s t^3$	=	ℓt^3	$\sum s \cdot t^3$

1.4 Computation of cross sectional properties for the entire cross section

Asymmetric cross section:			Symmetric cross section (only half of the section is modeled)		
A	=	$\sum A$	A	=	$2\sum A$
y_s	=	$\frac{\sum S_z}{\sum A}$	y_s	=	$\frac{\sum S_z}{\sum A}$
z_s	=	$\frac{\sum S_y}{\sum A}$	z_s	=	$\frac{\sum S_y}{\sum A}$
I_y	=	$\sum I_y - \sum A z_s^2$	I_y	=	$2\left(\sum I_y - \sum A z_s^2\right)$
I_z	=	$\sum I_z - \sum A y_s^2$	I_z	=	$2\left(\sum I_z - \sum A y_s^2\right)$
I_{yz}	=	$\sum I_{yz} - \sum A y_s z_s$			
I_T	=	$\sum \frac{s t^3}{3} + \sum_{Cell\ i}\left(2 A_{yi} \Phi_i\right)$	I_T	=	$2\left[\sum \frac{s t^3}{3} + \sum_{Cell\ i}\left(2 A_{yi} \Phi_i\right)\right]$
ω_0	=	$\frac{\sum S_\omega}{\sum A}$			
$I_{\omega y}$	=	$\sum I_{\omega y} - \sum A y_s \omega_0$	$I_{\omega y}$	=	$2\sum I_{\omega y}$
$I_{\omega z}$	=	$\sum I_{\omega z} - \sum A z_s \omega_0$			
y_M	=	$\frac{I_{\omega z} I_z - I_{\omega y} I_{yz}}{I_y I_z - I_{yz}^2}$			
z_M	=	$\frac{I_{\omega z} I_{yz} - I_{\omega y} I_y}{I_y I_z - I_{yz}^2}$	z_M	=	$-\frac{I_{\omega y}}{I_z}$
I_ω	=	$\sum I_\omega - \sum A \omega_0^2 + z_M I_{\omega y} - y_M I_{\omega z}$	I_ω	=	$2\sum I_\omega + z_M I_{\omega y}$

I_y, I_z, I_{yz} are to be computed with relation to the centre of gravity.

S_x, S_y, S_ω, I_ω, $I_{\omega y}$ and $I_{\omega z}$ are to be computed with relation to shear centre M

The sector-coordinate ω has to be transformed with respect to the location of the shear centre M. For cross sections of type A, ω_0 is to be added to each ω_i and ω_k as defined in **[1.3]**
For cross sections of type B and C, $\Delta\omega$ can be calculated as follows:

$$\Delta\omega_i = z_M y_i$$

where:

ω_0 : Calculated sector co-ordinate with respect to the centre of the coordinate system (O) selected for the calculation according to the formulae for ω_k given in **[1.3]**

ω : Transformed sector co-ordinate with respect to shear centre M

y_M, z_M : Distance between shear centre M and centre of the coordinate system B.

The transformed values of ω can be obtained by adding $\Delta\omega$ to the values of ω_0 obtained according to the formulae in **[1.3].**

The transformed value for ω is to be equal to zero at intersections of the cross section with the line of symmetry (centreline for ship-sections).

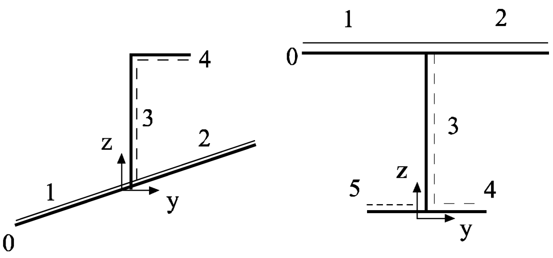

Fig 2: Cross sections of type A

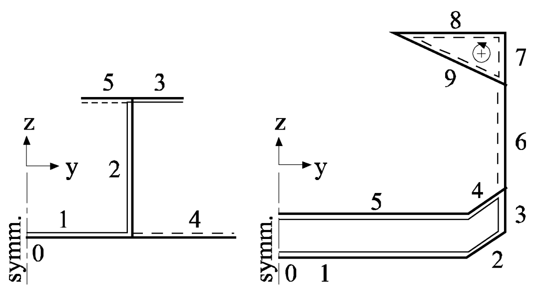

Fig 3: Cross sections of type B

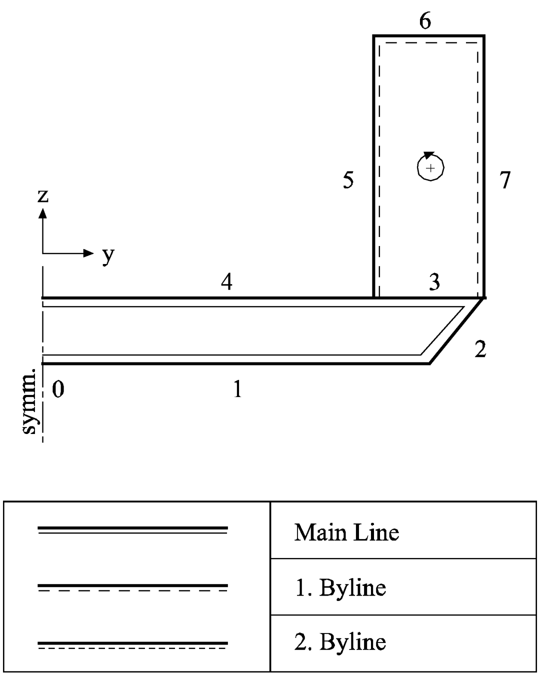

Fig 4: Cross section of type C

Designation of line types (numbers at particular parts of cross sections) gives the order of the particular parts for the calculation and therefore the direction of the running coordinate s.

2. Example calculation for a single side hull cross section

2.1 Cross section data

2.1.1

The cross section is shown in **Fig 5.** The co-ordinates of the node-points marked by filled black circles in **Fig 5** are given in the **Table 1**, where the plate thicknesses and the line segments (marked by circles in **Fig 5**) of the cross section are given in **Table 2.**

Table 1: Node-coordinates of cross-section

Node number	Y Coordinate	Z Coordinate
0	0.00	0.00
1	14.42	0.00
2	16.13	1.72
3	16.13	6.11
4	11.70	1.68
5	0.00	1.68
6	16.13	14.15
7	16.13	19.6
8	7.50	20.25
9	7.50	19.63
10	0.00	20.25

2.2 Determination of the torsion function Φ

2.2.1

The first step is to build a linear system of equation for the determination of the torsion function Φ of each closed cell. The cross section and the cells are shown in **Fig 5.**

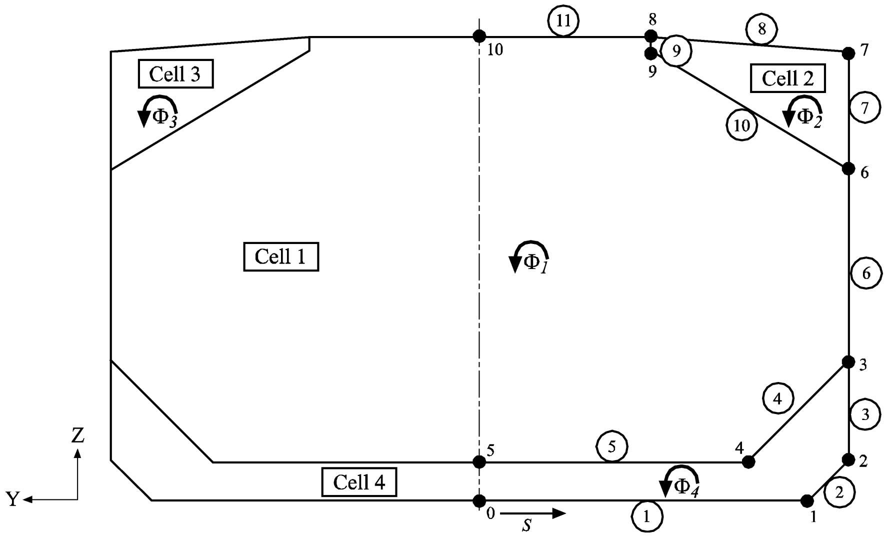

Fig 5: Single side hull cross section

Table 2: Dimensions and nodes of line segments of the cross section

Line-No.	Node i	Node k	y_i	z_i	y_k	z_k	Length	Thickness
1	0	1	0.00	0.00	14.42	0.00	14.42	0.017
2	1	2	14.42	0.00	16.13	1.72	2.43	0.017
3	2	3	16.13	1.72	16.13	6.11	4.39	0.018
4	3	4	16.13	6.11	11.70	1.68	6.26	0.019
5	4	5	11.70	1.68	0.00	1.68	11.70	0.021
6	3	6	16.13	6.11	16.13	14.15	8.04	0.018
7	6	7	16.13	14.15	16.13	19.6	5.45	0.021
8	7	8	16.13	19.60	7.50	20.25	8.65	0.024
9	8	9	7.50	20.25	7.50	19.63	0.62	0.024
10	9	6	7.50	19.63	16.13	14.15	10.22	0.015
11	8	10	7.50	20.25	0.00	20.25	7.50	0.012

Under consideration of the 4 cells (marked by rectangles in **Fig 5**) of the cross section, the following system of equation for the determination of the torsion function Φ can be developed. It should be noted that the direction of the rotation is to be considered (the rotation directions for the torsion functions Φ_i should point in the same direction for all Φ_i to build up the system of equations).

$$\begin{array}{lllll}
\sum_{1}\frac{s}{t}\Phi_1 & -\sum_{1-2}\frac{s}{t}\Phi_2 & -\sum_{1-3}\frac{s}{t}\Phi_3 & -\sum_{1-4}\frac{s}{t}\Phi_4 & = 2\sum_{1}A \\
-\sum_{1-2}\frac{s}{t}\Phi_1 & +\sum_{2}\frac{s}{t}\Phi_2 & & & = 2\sum_{2}A \\
-\sum_{1-3}\frac{s}{t}\Phi_1 & & +\sum_{3}\frac{s}{t}\Phi_3 & & = 2\sum_{3}A \\
-\sum_{1-4}\frac{s}{t}\Phi_1 & & & +\sum_{4}\frac{s}{t}\Phi_4 & = 2\sum_{4}A
\end{array}$$

The coefficients of the matrix can be calculated as follows:

$$\sum_{1}\frac{s}{t} = \frac{2\cdot 11700}{21} + \frac{2\cdot 6265}{19} + \frac{2\cdot 8040}{18} + \frac{2\cdot 10223}{15} + \frac{2\cdot 620}{24} + \frac{2\cdot 7500}{12} = 5331.81$$

$$\sum_{2}\frac{s}{t} = \frac{10223}{15} + \frac{5450}{21} + \frac{620}{24} + \frac{8654}{24} = 1327.48$$

$$\sum_{3}\frac{s}{t} = 1327.48$$

$$\sum_{4}\frac{s}{t} = \frac{2\cdot 14420}{17} + \frac{2\cdot 11700}{21} + \frac{2\cdot 6265}{19} + \frac{2\cdot 2425}{17} + \frac{2\cdot 4390}{18} = 4243.34$$

$$\sum_{1-2}\frac{s}{t} = \frac{10223}{15} + \frac{620}{24} = 707.36$$

$$\sum_{1-3}\frac{s}{t} = 707.36$$

$$\sum_{1-4}\frac{s}{t} = \frac{2\cdot 11700}{21} + \frac{2\cdot 6265}{19} = 1773.76$$

The areas of the cells can be calculated as follows:

$$2\sum_1 A = 2\cdot 2\cdot 260.72 = 1042.90 \quad m^2$$
$$2\sum_2 A = 2\cdot 26.19 = 52.38 \quad m^2$$
$$2\sum_3 A = 52.38 \quad m^2$$
$$2\sum_4 A = 2\cdot 2\cdot 35.44 = 141.76 \quad m^2$$

With these results the coefficient matrix will become:

$$\begin{array}{lllllll}
5331.81\Phi_1 & -707.360\Phi_2 & -707.36\Phi_3 & -1773.76\Phi_4 & = & 1042.90 \\
-707.36\Phi_1 & +1327.48\Phi_2 & & & = & 52.38 \\
-707.36\Phi_1 & & +1327.48\Phi_3 & & = & 52.38 \\
-1773.76\Phi_1 & & & +4243.34\Phi_4 & = & 141.76
\end{array}$$

The solution of this system gives:

$$\Phi_1 = 0.3018$$
$$\Phi_2 = 0.2003$$
$$\Phi_3 = 0.2003$$
$$\Phi_4 = 0.1596$$

2.3 Determination of the line-segment properties

2.3.1

The next step is the determination of ω_k according to the formulae given in **[1.3].** '*s*' starts at point 0 (**Fig 5**) with $\omega_i = 0$ and follows the path from point 0 to point 1, 2, 3, 4 up to point 5. It is to be noted, that the term $\Phi(\ell_i/t_i)$ is for the line segments 1 to 3 (between points 0 and 3) calculated as $\Phi_4(\ell_{1...3}/t_{1...3})$ where for the line segments 4 and 5 this term becomes $(\Phi_4 - \Phi_1)(\ell_{4...5}/t_{4...5})$ because line segments 4 and 5 are shared walls of cell 4 and cell 1. The rotation direction for the torsion functions together with the direction of integration (direction of path, which one follows for the calculation) determines the algebraic sign within this term.
For the line segment 6 ω_i has to be set to the value at point 3 and $\Phi(\ell_i/t_i) = \Phi_1(\ell_6/t_6)$. '*s*' follows now the path from point 6 to point 7, 8, 9 back to point 6. The shared wall between cell 2 and cell 1 has to be considered for the terms which include the torsion function Φ. For the line segment 11 between point 8 and 10, ω_i has to be set to the value at point 8.
The other properties of the line segments can be calculated by the formulas given in **[1.3].**

2.4 Determination of cross-section properties

2.4.1

After the summation of the line-segment properties, the cross section properties can be calculated as described in **[1.4].**
The sector coordinate has to be transformed with respect to the shear centre as described in **[1.4]**
The result of the calculations gives the sector co-ordinates, as indicated in **Table 3.**

Table 3: Sector co-ordinates for the cross section of Fig 5

Point i	$\omega_{O,i}$	$\Delta\omega_i$	ω_i
0	0.00	0.00	0.00
1	-135.97	84.99	-50.98
2	-134.04	95.07	-38.97
3	-102.32	95.07	-7.25
4	-99.49	68.96	-30.53
5	-0.06	0.00	-0.06
6	-108.20	95.07	-13.13
7	-72.30	95.07	22.77
8	35.07	44.21	79.27
9	33.08	44.21	77.28
10	-2.75	0.00	-2.75

2.5 Notes

2.5.1

For single side bulk carrier, the hull cross section normally can be simplified in a section with four boxes (cell 1 cargo hold, cell 2 and 3 wing tanks and cell 4 hopper tanks and double bottom as shown in the calculation example) whereas the cross section of a double side bulk carrier can be simplified to a cross section with two closed cells only (cell 1 cargo hold, cell 2 double hull). For the plate thickness of the line elements with variable thicknesses an equivalent plate thickness can be used calculated by the following formulae:

$$t_{eq} = \frac{t_1\ell_1 + t_2\ell_2 + \ldots + t_i\ell_i + \ldots + t_k\ell_k}{\sum_{i=1}^{k}\ell_i}$$

Due to the simplifications, the value of the sector co-ordinate ω can differ from 0 at the intersections between the cross section and centreline. The difference between the value of the sector co-ordinate ω and the value of the torsional moment of inertia I_T for the simplified cross section is in normal cases less than 3 % compared to the values of the original cross section. ⚓

Chapter 9

Other Structures

Section 1 – FORE PART

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

L_2 : Rule length L, but to be taken not greater than 300 m

T_B : Minimum ballast draught, in m, for normal ballast conditions

k : Material factor, defined in **Ch 3, Sec 1, [2.2]**

m : Coefficient taken equal to:

m = 10 for vertical stiffeners

m = 12 for other stiffeners

τ_a : Allowable shear stress, in N/mm², takene qual to:

$$\tau_a = \frac{R_Y}{\sqrt{3}}$$

s : Spacing, in m, of ordinary stiffeners, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffeners, measured along the chord between the supporting members, see **Ch 3, Sec 6, [4.2]**

c_a : Aspect ratio of the plate panel, equal to:

$$c_a = 1.21\sqrt{1 + 0.33\left(\frac{s}{\ell}\right)^2} - 0.69\frac{s}{\ell}$$, to be taken not greater than 1.0

c_r : Coefficient of curvature of the panel, equal to:

$$c_r = 1 - 0.5\frac{s}{r}$$, to be taken not less than 0.4

r : Radius of curvature, in m.

1.1 Application

1.1.1

The requirement of this Section apply to:

- the structures located forward of the collision bulkhead, i.e.:
  - the fore peak structures
  - the stem
- the reinforcements of the bow flare area, according to **[4.1]**
- the reinforcements of the flat bottom forward area, according to **[5.1].**

1.2 Net thicknesses

1.2.1

As specified in **Ch 3, Sec 2**, all thicknesses referred to in this Section are net, i.e. they do not include any corrosion addition. The gross thicknesses are to be obtained as specified in **Ch 3, Sec 2, [3].**

2. Arrangement

2.1 Structural arrangement principles

2.1.1 General

Scantlings of the shell envelope, upper deck and inner bottom, if any, are to be tapered towards the forward end. Special consideration is to be paid to the structural continuity of major longitudinal members in order to avoid abrupt changes in section.
Structures within the fore peak, such as platforms, decks, horizontal ring frames or side stringers are to be scarphed into the structure aft into the cargo hold.
Where inner hull structures terminate at the collision bulkhead, the structural continuity is to be ensured forward of the collision bulkhead by adequate structure with tapering brackets.
Longitudinal stiffeners of deck, bottom and side shell are to be extended as far forward as practicable.
All shell frames and tank boundary stiffeners are to be continuous, or are to be bracketed tat their ends. Where the brackets are provided to ensure the structural continuity from the forward end to $0.15\,L$ behind fore perpendicular, flanged brackets have to be used.

2.1.2 Structures in tanks

Where peaks are used as tanks, stringer plates are to be flanged or face bars are to be fitted at their inner edges. Stringers are to be effectively fitted to the collision bulkhead so that the forces can be properly transmitted.

2.2 Tripping brackets

2.2.1

For peaks or other tanks forward of the collision bulkhead transversely framed, tripping brackets vertically spaced not more than 2.6 m are to be fitted, according to **Fig 1**, between primary supporting members, decks and/or platforms

The as-built thickness of the tripping brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.

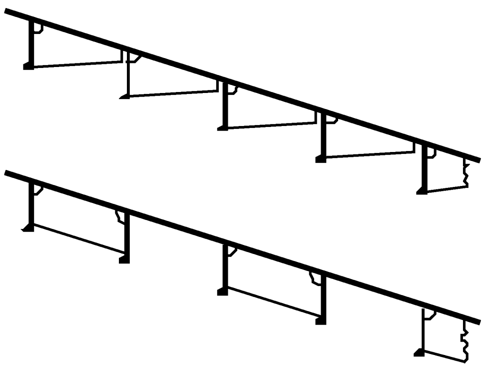

Fig 1: Tripping brackets

2.3 Floors and bottom girders

2.3.1

Where no centreline bulkhead is provided, a centre bottom girder is to be fitted.
In general, the minimum depth of the floor at the centerline and center girders is to be not less than the required depth of the double bottom of the foremost cargo hold.

2.3.2

In case of transverse framing, solid floors are to be fitted at every frame.
In case of the longitudinal framing, the spacing of solid floors is not to be greater than 3.5 m or four transverse frame spaces, whichever is the smaller.

2.3.3

In case of transverse framing, the spacing of bottom girders is not to exceed 2.5 m
In case of longitudinal framing, the spacing of bottom girders is not to exceed 3.5 m.

3. Load model

3.1 Load point

3.1.1

Unless otherwise specified, lateral pressure is to be calculated at load points according to:

- **Ch 6, Sec 1, [1.5]**, for plating
- **Ch 6, Sec 2, [1.4]**, for stiffeners.

3.2 Pressure in bow area

3.2.1 Lateral pressure in intact conditions

The pressure in bow area, in $\mathrm{kN/m^2}$, is to be taken equal to $(p_S + p_W)$.

where:

p_S, p_W : Hydrostatic and hydrodynamic pressures according to **Ch 4, Sec 5** or internal still water and inertial pressures according to **Ch 4, Sec 6, [2]** to be considered among load cases H, F, R and P.

3.2.2 Lateral pressure in testing conditions

The lateral pressure p_T in testing conditions is taken equal to:

- $p_T = p_{ST} - p_S$ for bottom shell plating and side shell plating
- $p_T = p_{ST}$ otherwise

where:

p_{ST} : Testing pressure defined in **Ch 4, Sec 6, [4]**

p_S : Pressure taken equal to:

- if the testing is carried out afloat: hydrostatic pressure defined in **Ch 4, Sec 5, [1]** for the draught T_1, defined by the Designer, at which the testing is carried out. If T_1 is not defined, the testing is considered as being not carried out afloat
- if the testing is not carried out afloat: $p_S = 0$

3.2.3 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering separately:

- the still water and wave external sea pressures
- the still water and wave internal pressure considering the compartment adjacent to the outer shell as being loaded. If the compartment adjacent to the outer shell is intended to carry liquids, this still water and wave internal pressures are to be reduced from the corresponding still water and wave external sea pressures.

3.2.4 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

3.3 Bow flare area pressure

3.3.1

The bow pressure p_{FB}, in kN/m^2, is to be obtained according to **Ch 4, Sec 5, [4.1].**

3.4 Bottom slamming pressure

3.4.1

The bottom slamming pressure p_{SL}, in kN/m^2, in the flat bottom forward is to be obtained according to **Ch 4, Sec 5, [4.2].**

4. Scantlings

4.1 Bow flare reinforcement

4.1.1

The bow flare area to be reinforced is that extending forward of $0.9\,L$ from the aft end and above the normal ballast waterline according to the applicable requirements in **[4.2]** to **[4.4].**

4.2 Plating

4.2.1

The net thickness of plating are to be not less than those obtained from the formulae in **Table 1** and **Table 2.**

Table 1: Net minimum thickness of plating

Minimum net thickness, in mm	
Bottom,	$5.5 + 0.03\,L$
Side	$0.85\,L^{1/2}$
Inner bottom	$5.5 + 0.03\,L$
Strength deck	$4.5 + 0.02\,L$
Platform and wash bulkhead	6.5

Table 2: Net thickness of plating

Net thickness, in mm	
Intact conditions	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_S + p_W}{0.9 R_Y}}$
Bow flare area	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_{FB}}{0.9 R_Y}}$
Testing conditions	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_T}{1.05 R_Y}}$

4.3 Ordinary stiffeners

4.3.1 General

The requirements of this sub-article apply to ordinary stiffeners considered as clamped at both ends. For other boundary conditions, the yielding check is to be considered on a case by case basis.

4.3.2

The net dimensions of ordinary stiffeners are to comply with the requirements in **Ch 6, Sec 2, [2.3]**

4.3.3

The net thickness of the web of ordinary stiffeners, in mm, is to be not less than the greater of:

- $t = 3.0 + 0.015 L_2$
- 40 % of the net required thickness of the attached plating, to be determined according to **[4.2]** and **[5.2].**

The net dimensions of ordinary stiffeners are to comply with the requirement in **Ch 6 Sec 2, [2.2.2]** and **[2.3].**

4.3.4

The net scantlings of single-span ordinary stiffeners are to be not less than those obtained from the formulae in **Table 3.**

Table 3: Net scantlings of single span ordinary stiffeners

Stiffener type	Net section modulus w, in cm^3	Net sectional shear area A_{sh}, in cm^2
Single span ordinary stiffeners subjected to lateral pressure	$w = \frac{(p_S + p_W) s \ell^2}{0.9 m R_Y} 10^3$	$A_{sh} = \frac{5 (p_S + p_W) s \ell}{\tau_a \sin \phi}$
Single span ordinary stiffeners located in bow flare area	$w = \frac{p_{FB} s \ell^2}{0.9 m R_Y} 10^3$	$A_{sh} = \frac{5 p_{FB} s \ell}{\tau_a \sin \phi}$
Single span ordinary stiffeners subjected to testing pressure	$w = \frac{p_T s \ell^2}{1.05 m R_Y} 10^3$	$A_{sh} = \frac{5 p_T s \ell}{1.05 \tau_a \sin \phi}$
where: ϕ : Angle, in deg, between the stiffener web and the shell plate, measured at the middle of the stiffener span; the correction is to be applied when ϕ is less than 75.		

4.3.5

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to comply with the formulae in **Table 4.**

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to be determined by a direct calculation taking into account:

- the distribution of still water and wave pressure and forces, if any
- the number and position of intermediate supports (decks, girders, etc.)
- the condition of fixity at the ends of the stiffener and at intermediate supports
- the geometrical characteristics of the stiffener on the intermediate spans.

Table 4: Checking criteria for multi-span ordinary stiffeners

Condition	Intact	Testing
Normal stress	$\sigma \le 0.9R_Y$	$\sigma \le 1.05R_Y$
Shear stress	$\tau \le \tau_a$	$\tau \le 1.05\tau_a$

4.4 Primary supporting members

4.4.1 Minimum thickness

The net thickness of the web of primary supporting members, in mm, is to be not less than that obtained from the following formula:

$$t = 0.7\sqrt{L_2}$$

4.4.2 Side transverses

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side transverses are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

In addition, the net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side transverses located within the bow flare area are to be not less than the values obtained from the following formulae:

$$w = \frac{p_{FB}s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5p_{FB}s\ell}{\tau_a \sin\phi}$$

4.4.3 Side girders

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side girders are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

In addition, the net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side girders located within the bow flare area are to be not less than the values obtained from the following formulae:

$$w = \frac{p_{FB} s \ell^2}{0.9 m R_Y} 10^3$$

$$A_{sh} = \frac{5 p_{FB} s \ell}{\tau_a \sin\phi}$$

4.4.4 Deck primary supporting members

Scantlings of deck primary supporting members are to be in accordance with **Ch 6, Sec 4**, considering the loads in **[3.2]** and **[3.3].**

5. Strengthening of flat bottom forward area

5.1 Application

5.1.1

The flat bottom forward area to be reinforced is the flat part of the ship's bottom extending forward of $0.2V\sqrt{L}$ from the fore perpendicular end, up to a height of $0.05T_B$ or 0.3 m above base line, whichever is the smaller.

5.2 Bottom plating

5.2.1

The net thickness, in mm, of the flat bottom forward area, is not to be less than:

$$t = 15.8 C_a C_r s \sqrt{\frac{C_s p_{SL}}{R_{eH}}}$$

where:

C_s : Coefficient relating to load patch of impact pressure, taken equal to:

$C_s = 1.0$ where no intermediate longitudinals is provided between or dinary stiffeners

$C_s = 1.3$ where intermediate longitudinals are provided between ordinary stiffeners.

5.2.2

For ships with a rise of floor the strengthened plating must at least extend to the bilge curvature.

5.3 Ordinary stiffeners

5.3.1

The net section modulus, in cm^3, of transverse or longitudinal ordinary stiffeners of the flat bottom forward area is not to be less than:

$$w = \frac{C_s p_{SL} s \ell^2}{16 R_{eH}} 10^3$$

where:

C_s : Coefficient defined in **[5.2.1].**

5.3.2

The net shear area, in cm^2, of transverse or longitudinal ordinary stiffeners of the flat bottom forward area is not to be less than:

$$A = \frac{5\sqrt{3} p_{SL} s(\ell - 0.5s)}{R_{eH} \sin\phi}$$

The area of the welded connection has to be at least twice this value.

5.4 Primary supporting members

5.4.1

The net thickness of girders in double bottom forward area, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$$t_1 = \frac{c_A p_{SL} S\ell}{2(d_0 - d_1)\tau_a}$$

$$t_2 = 1.75 \sqrt[3]{\frac{H^2 a^2 \tau_a}{C_1'} t_1}$$

$$t_3 = \frac{C_1'' a}{\sqrt{k}}$$

where:

c_A : Coefficient taken equal to:
$c_A = 3/A$, with $0.3 \le c_A \le 1.0$

A : Loaded area, in m^2, between the supports of the structure considered, obtained from the following formula:
$A = S\ell$

p_{SL} : As defined in **[3.4]**

S : Spacing of centre or side girders under consideration, in m

ℓ : Span of centre or side girders between floors under consideration, in m

d_0 : Depth of the centre or side girder under consideration, in m

d_1 : Depth of the opening, if any, at the point under consideration, in m

H : Value obtained from the following formulae:

(a) Where the girder is provided with an unreinforced opening : $H = 1 + 0.5\dfrac{\phi}{\alpha}$

(b) In other cases: $H = 1.0$

ϕ : Major diameter of the openings, in m

α : The greater of a or S_1, in m.

a : Depth of girders at the point under consideration, in m, Where, however, if horizontal stiffeners are fitted on the girder, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance between the horizontal stiffeners under consideration

S_1 : Spacing, in m, of vertical ordinary stiffeners or floors

C_1' : Coefficient obtained from **Table 5** depending on S_1/a. For intermediate values of S_1/a, C_1' is to be determined by linear interpolation.

C_1'' : Coefficient obtained from **Table 6** depending on S_1/a. For intermediate values of S_1/a, C_1'' is to be obtained by linear interpolation.

Table 5: Coefficient C_1'

S_1/a	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C_1'	64	38	25	19	15	12	10	9	8	7

Table 6: Coefficient C_1''

S_1/a		0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4	1.6 and over
C_1''	Centre girder	4.4	5.4	6.3	7.1	7.7	8.2	8.6	8.9	9.3	9.6	9.7
	Side girder	3.6	4.4	5.1	5.8	6.3	6.7	7.0	7.3	7.6	7.9	8.0

5.4.2 Floors

The net thickness of floors in double bottom forward area, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$$t_1 = \frac{c_A p_{SL} S\ell}{2(d_0 - d_1)\tau_a}$$

$$t_2 = 1.75 \cdot \sqrt[3]{\frac{H^2 a^2 \tau_a}{C_2'} t_1}$$

$$t_3 = \frac{8.5 S_2}{\sqrt{k}}$$

where :

c_A : Coefficient taken equal to:

$c_A = 3/A$, with $0.3 \le c_A \le 1.0$

A : Loaded area, in m^2, between the supports of the structure considered, obtained from the following formula:

$A = S\ell$

p_{SL} : As defined in **[3.4]**

S : Spacing of floors under consideration, in m

ℓ : Span of floors between centre girder and side girder or side girders under consideration, in m

d_0 : Depth of the solid floor at the point under consideration in m

d_1 : Depth of the opening, if any, at the point under consideration in m

H : Value obtained from the following formulae:

a) Where openings with reinforcement or no opening are provided on solid floors:

1) Where slots without reinforcement are provided:

$H = \sqrt{4.0\frac{d_2}{S_1} - 1.0}$, without being taken less than 1.0

2) Where slots with reinforcement are provided: $H = 1.0$

b) Where openings without reinforcement are provided on solid floors:

1) Where slots without reinforcement are provided:

$H = \left(1 + 0.5\frac{\phi}{d_0}\right)\sqrt{4.0\frac{d_2}{S_1} - 1.0}$, without being taken less than $1 + 0.5\frac{\phi}{d_0}$

2) Where slots with reinforcement are provided:

$H = 1 + 0.5\frac{\phi}{d_0}$

d_2 : Depth of slots without reinforcement provided at the upper and lower parts of solid floors, in m, whichever is greater

S_1 : Spacing, in m, of vertical ordinary stiffeners or girders

ϕ : Major diameter of the openings, in m.

a : Depth of the solid floor at the point under consideration, in m, Where, however, if horizontal stiffeners are fitted on the floor, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or the inner bottom plating or the distance between the horizontal stiffeners under consideration

S_2 : The smaller of S_1 or a, in m

C_2' : Coefficient given in **Table 7** depending on S_1/d_0. For intermediate values of S_1/d_0, C_2' is to be determined by linear interpolation.

Table 7: Coefficient C_2'

S_1/d_0	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C_2'	64	38	25	19	15	12	10	9	8	7

6. Stem

6.1 Bar stem

6.1.1

The gross cross sectional area, in cm^2, of a bar stem below the load waterline is not to be less than:

$A_b = 1.25L$

6.1.2

Starting from the load waterline, the cross sectional area of the bar stem may be reduced towards the upper end to $0.75 A_b$.

6.2 Plate stem and bulbous bows

6.2.1

The gross thickness, in mm, is not to be less than the values obtained from the following formula:

$t = (0.6 + 0.4 s_B)(0.08L + 6)\sqrt{k}$, without being taken greater than $22\sqrt{k}$

where:

s_B : Spacing, in m, between horizontal stringers (partial or not), breasthooks, or equivalent horizontal stiffening members.

The gross plate thickness is to be not less than the net thickness, obtained according to **[4.2]**, plus the corrosion addition t_C as defined in **Ch 3, Sec 3.**
Scantlings of the ordinary stiffeners are to be determined according to **[4.3].**

6.2.2

Starting from 0.6 m above the load waterline up to $T+C$, the gross thickness may gradually be reduced to 0.8 t, where t is the gross thickness defined in **[6.2.1].**

6.2.3

Plate stems and bulbous bows must be stiffened by breasthooks and/or frames.

7. Forecastle

7.1 General

7.1.1

An enclosed forecastle is to be fitted on the freeboard deck.
The aft bulkhead of the enclosed forecastle is to be fitted in way or aft of the forward bulkhead of the foremost hold, as shown in **Fig 2.**
However, if this requirement hinders hatch cover operation, the aft bulkhead of forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7 % of ship length for freeboard as specified in **Ch 1, Sec 4, [3.2]** abaft the fore side of stem.

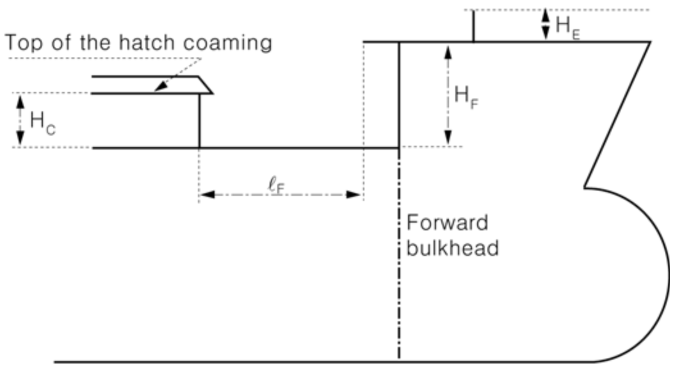

Figure 2: Forecastle

7.1.2

The forecastle height H_F above the main deck is to be not less than the greater of the following values:

- the standard height of a superstructure as specified in **Ch 1, Sec 4, [3.18]**
- $H_C + 0.5$ m, where H_C is the height of the forward transverse hatch coaming of the foremost cargo hold, i.e. cargo hold No.1.

7.1.3

All points of the aft edge of the forecastle deck are to be located at a distance less than or equal to ℓ_F:

$$\ell_F = 5\sqrt{H_F - H_C}$$

from the hatch coaming plate in order to apply the reduced loading to the No.1 forward transverse hatch coaming and No.1 hatch cover in applying **Ch 9, Sec 5, [6.2.2]** and **Ch 9, Sec 5, [7.3.8].**

7.1.4

A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centreline is not less than H_B /tan20° forward of the aft edge of the forecastle deck, where H_B is the height of the breakwater above the forecastle (see **Fig 2**).

Section 2 – AFT PART

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

L_1 : Rule length L, but to be taken not greater than 200 m

L_2 : Rule length L, but to be taken not greater than 300 m

k : Material factor, defined in **Ch 3, Sec 1, [2.2]**

z_{TOP} : Z co-ordinate, in m, of the top of the tank

m : Coefficient taken equal to:

m = 10 for vertical stiffeners

m = 12 for other stiffeners

τ_a : Allowable shear stress, in N/mm^2, taken equal to:

$$\tau_a = \frac{R_Y}{\sqrt{3}}$$

s : Spacing, in m, of ordinary stiffeners, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffeners, measured along the chord between the supporting members, see **Ch 3, Sec 6, [4.2]**

c_a : Aspect ratio of the plate panel, equal to:

$$c_a = 1.21\sqrt{1+0.33\left(\frac{s}{\ell}\right)^2} - 0.69\frac{s}{\ell}$$, to be taken not greater than 1.0

c_r : Coefficient of curvature of the panel, equal to:

$$c_r = 1 - 0.5\frac{s}{r}$$, to be taken not less than 0.4

r : Radius of curvature, in m.

1. General

1.1 Introduction

1.1.1

The requirements of this Section apply for the scantlings of structures located aft of the aft peak bulkhead and for the reinforcements of the flat bottom aft area.

1.1.2

Aft peak structures which form the boundary of spaces not intended to carry liquids, and which do not belong to the outer shell, are to be subjected to lateral pressure in flooding conditions. Their scantlings are to be determined according to the relevant criteria in Ch 6.

1.2 Connections of the aft part with structures located fore of the aft peak bulkhead

1.2.1 Tapering

Adequate tapering is to be ensured between the scantlings in the aft part and those fore of the aft peak bulkhead. The tapering is to be such that the scantling requirements for both areas are fulfilled.

1.3 Net scantlings

1.3.1

As specified in **Ch 3, Sec 2**, all thicknesses referred to in this Section are net, i.e. they do not include any corrosion addition. The gross thicknesses are to be obtained as specified in **Ch 3, Sec 2, [3].**

2. Load model

2.1 Load point

2.1.1

Unless otherwise specified, lateral pressure is to be calculated at load points according to:

- **Ch 6, Sec 1, [1.5]**, for plating
- **Ch 6, Sec 2, [1.4]**, for stiffeners.

2.2 Lateral pressures

2.2.1 Lateral pressure in intact conditions

The aft part lateral pressure in intact conditions, in kN/m^2, is to be taken equal to $(p_S + p_W)$.

where:

p_S, p_W : Hydrostatic and hydrodynamic pressures according to **Ch 4, Sec 5**, or internal still water and inertial pressures according to **Ch 4, Sec 6, [2]**, to be considered among load cases H, F, R and P.

2.2.2 Lateral pressure in testing conditions

The lateral pressure p_T in testing conditions is taken equal to:

- $p_T = p_{ST} - p_S$ for bottom shell plating and side shell plating
- $p_T = p_{ST}$ otherwise

where:

p_{ST} : Testing pressure defined in **Ch 4, Sec 6, [4]**

p_S : Pressure taken equal to:

- if the testing is carried out afloat: hydrostatic pressure defined in **Ch 4, Sec 5, [1]** for the draught T_1, defined by the Designer, at which the testing is carried out. If T_1 is not defined, the testing is considered as being not carried out afloat.
- if the testing is not carried out afloat: $p_S = 0$

2.2.3 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering separately:

- the still water and wave external sea pressures
- the still water and wave internal pressure considering the compartment adjacent to the outer shell as being loaded. If the compartment adjacent to the outer shell is intended to carry liquids, this still water and wave internal pressures are to be reduced from the corresponding still water and wave external sea pressures.

2.2.4 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

3. Aft peak

3.1 Arrangement

3.1.1 General

The aft peak is, in general, to be transversely framed.

3.1.2 Floors

Solid floors are to be fitted at every frame spacing.
The floor height is to be adequate in relation to the shape of the hull. Where a sterntube is fitted, the floor height is to extend at least above the sterntube. Where the hull lines do not allow such extension, plates of suitable height with upper and lower edges stiffened and securely fastened to the frames are to be fitted above the sterntube.
In way of and near the rudder post, propeller post and rudder horn, floors are to be extended up to the peak tank top and are to be increased in thickness; the increase will be considered by the Society on a case by case basis, depending on the arrangement proposed.
Floors are to be provided with stiffeners located at intervals not exceeding 800 mm.

3.1.3 Side frames

Side frames are to be extended up to a deck located above the full load waterline.
Side frames are to be supported by one of the following types of structure:

- non-tight platforms, to be fitted with openings having a total area not less than 10 % of the area of the platforms
- side girders supported by side primary supporting members connected to deck transverses.

3.1.4 Platforms and side girders

Platforms and side girders within the peak are to be arranged in line with those located in the area immediately forward.
Where this arrangement is not possible due to the shape of the hull and access needs, structural continuity between the peak and the structures of the area immediately forward is to be ensured by adopting wide tapering brackets.
Where the aft peak is adjacent to a machinery space whose side is longitudinally framed, the side girders in the aft peak are to be fitted with tapering brackets.

3.1.5 Longitudinal bulkheads

A longitudinal non-tight bulkhead is to be fitted on the centreline of the ship, in general in the upper part of the peak, and stiffened at each frame spacing.
Where either the stern overhang is very large or the maximum breadth of the space divided by watertight and wash bulkheads is greater than 20 m, additional longitudinal wash bulkheads may be required.

4. Scantlings

4.1 Plating

4.1.1

The net thickness of plating are to be not less than those obtained from the formulae in **Table 1** and **Table 2.**

Table 1: Net minimum thickness of plating

Minimum net thickness, in mm	
Bottom	$5.5 + 0.03L$
Side and transom	$0.85L^{1/2}$
Inner bottom	$5.5 + 0.03L$
Strength deck	$4.5 + 0.02L$
Platform and wash bulkhead	6.5

Table 2: Net thickness of plating

Net thickness, in mm	
Intact conditions	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_S + p_W}{0.9R_Y}}$
Testing conditions	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_T}{1.05R_Y}}$

4.2 Ordinary stiffeners

4.2.1 General

The requirements of this sub-articleapply to ordinary stiffeners considered as clamped at both ends. For other boundary conditions, the yielding check is to be considered on a case by case basis.

4.2.2

The net dimensions of ordinary stiffeners are to comply with the requirements in **Ch 6, Sec 2, [2.3].**

4.2.3

The net thickness of the web of ordinary stiffeners, in mm, is to be not less than the greater of:

- $t = 3.0 + 0.015L_2$
- 40 % of the net required thickness of the attached plating, to be determined according to **[4.1].**

The net dimensions of ordinary stiffeners are to comply with the requirement in **Ch 6, Sec 2, [2.2.2]** and **[2.3].**

4.2.4

The net scantlings of single-span ordinary stiffeners are to be not less than those obtained from the formulae in **Table 3.**

Table 3: Net scantlings of single span ordinary stiffeners

Stiffener type	Net section modulus w, in cm^3	Net sectional shear area A_{sh}, in cm^2
Single span ordinary stiffeners subjected to lateral pressure	$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$	$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$
Single span ordinary stiffeners subjected to testing pressure	$w = \frac{p_T s\ell^2}{1.05mR_Y}10^3$	$A_{sh} = \frac{5 p_T s\ell}{1.05\tau_a \sin\phi}$
where: ϕ : Angle, in deg, between the stiffener web and the shell plate, measured at the middle of the stiffener span; the correction is to be applied when ϕ is less than 75.		

4.2.5

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to comply with the formulae in **Table 4.**
The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to be determined by a direct calculation taking into account:

- the distribution of still water and wave pressure and forces, if any
- the number and position of intermediate supports (decks, girders, etc.)
- the condition of fixity at the ends of the stiffener and at intermediate supports
- the geometrical characteristics of the stiffener on the intermediate spans.

Table 4: Checking criteria for multi-span ordinary stiffeners

Condition	Intact	Testing
Normal stress	$\sigma \le 0.9R_Y$	$\sigma \le 1.05R_Y$
Shear stress	$\tau \le \tau_a$	$\tau \le 1.05\tau_a$

4.3 Primary supporting members

4.3.1 Floors

The net thickness of floors is to be not less than that obtained, in mm, from the following formula:

$$t = 0.7\sqrt{L_2}$$

4.3.2 Side transverses

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side transverses are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

4.3.3 Side girders

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side girders are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

4.3.4 Deck primary supporting members

Scantlings of deck primary supporting members are to be in accordance with **Ch 6, Sec 4**, considering the loads in **[2.2].**

5. Connection of hull structures with the rudder horn

5.1 Connection of aft peak structures with the rudder horn

5.1.1 General

The requirement of this sub-article apply to the connection between peak structure and rudder horn where the stern-frame is of an open type and is fitted with the rudder horn.

5.1.2 Rudder horn

Horn design is to be such as to enable sufficient access for welding and inspection.
The scantlings of the rudder horn, which are to comply with **Ch 10, Sec 1, [9.2]**, may be gradually tapered inside the hull.
Connections by slot welds are not acceptable.

5.1.3 Hull structures

The vertical extension of hull structure to support the rudder horn between the horn intersection with the shell and the peak tank top is in accordance with the requirements of **Ch 10, Sec 1, [9.2.6]** and **[9.2.7].**
The thickness ofthe structures adjacent to the rudder horn, such as shell plating, floors, platforms and side girders, the centreline bulkhead and any other structures, is to be adequately increased in relation to the horn scantlings.

5.2 Structural arrangement above the aft peak

5.2.1 Side transverses

Where a rudder horn is fitted, side transverses, connected to deck beams, are to be arranged between the platform forming the peak tank top and the weather deck.
The side transverse spacing is to be not greater than:

- 2 frame spacings in way of the horn
- 4 frame spacings for and aft of the rudder horn
- 6 frame spacings in the area close to the aft peak bulkhead.

The side transverses are to be fitted with end brackets and located within the poop. Where there is no poop, the scantlings of side transverses below the weather deck are to be adequately increased with respect to those obtained from the formulae in **[4.3.2].**

5.2.2 Side girders

Where the depth from the peak tank top to the weather deck is greater than 2.6 m and the side is transversely framed, one or more side girders are to be fitted, preferably in line with similar structures existing forward.

6. Sternframes

6.1 General

6.1.1

Sternframes may be made of cast or forged steel, with a hollow section, or fabricated from plate.

6.1.2

Cast steel and fabricated sternframes are to be strengthened by adequately spaced horizontal plates.
Abrupt changes of section are to be avoided in castings; all sections are to have adequate tapering radius.

6.2 Connections

6.2.1 Connection with hull structure

Sternframes are to be effectively attached to the aft structure and the lower part of the sternframe is to be extended forward of the propeller post to a length not less than $1500 + 6L$ mm, in order to provide an effective connection with the keel. However, the sternframe need not extend beyond the aft peak bulkhead.
The net thickness of shell plating connected with the sternframe is to be not less than that obtained, in mm, from the following formula:

$$t = 8.5 + 0.045L$$

6.2.2 Connection with the keel

The thickness of the lower part of the sternframes is to be gradually tapered to that of the solid bar keel or keel plate.
Where a keel plate is fitted, the lower part of the sternframe is to be so designed as to ensure an effective connection with the keel.

6.2.3 Connection with transom floors

Rudder posts and propeller posts are to be connected with transom floors having height not less than that of the double bottom and net thickness not less than that obtained, in mm, from the following formula:

$$t = 9 + 0.023L_1$$

6.2.4 Connection with centre keelson

Where the sternframe is made of cast steel, the lower part of the sternframe is to be fitted, as far as practicable, with a longitudinal web for connection with the centre keelson.

6.3 Propeller posts

6.3.1 Gross scantlings

With reference to **Ch 3, Sec 2**, all scantlings and dimensions referred to in **[6.3.2]** to **[6.3.4]** are gross, i.e. they include the margins for corrosion.

6.3.2 Gross scantlings of propeller posts

The gross scantlings of propeller posts are to be not less than those obtained from the formulae in **Table 5** for single screw ships and **Table 6** for twin screw ships.
Scantlings and proportions of the propeller post which differ from those above may be considered acceptable provided that the section modulus of the propeller post section about its longitudinal axis is not less than that calculated with the propeller post scantlings in **Table 5** or **Table 6** as applicable.

6.3.3 Section modulus below the propeller shaft bossing

In the case of a propeller post without a sole piece, the section modulus of the propeller post may be gradually reduced below the propeller shaft bossing down to 85 % of the value calculated with the scantlings in **Table 5** or **Table 6** as applicable.
In any case, the thicknesses of the propeller posts are to be not less than those obtained from the formulae in the tables.

6.3.4 Welding of fabricated propeller post with the propeller shaft bossing

Welding of a fabricated propeller post with the propeller shaft bossing is to be in accordance with **Ch 11, Sec 2.**

6.4 Propeller shaft bossing

6.4.1

In single screw ships, the thickness of the propeller shaft bossing, included in the propeller post, is to be not less than 60 % of the dimension b required in **[6.3.2]** for bar propeller posts with a rectangular section.

Table 5: Single screw ships - Gross scantlings of propeller posts

Gross scantlings of propeller posts, in mm	Fabricated propeller post	Cast propeller post	Bar propeller post, cast or forged, having rectangular section
			a	$50\,L^{1/2}$	$33\,L^{1/2}$	$10\sqrt{7.2L-256}$
b	$35\,L^{1/2}$	$23\,L^{1/2}$	$10\sqrt{4.6L-164}$
t_1 (1)	$2.5\,L^{1/2}$	$3.2\,L^{1/2}$ to be taken not less than 19 mm	-
t_2 (1)	-	$4.4\,L^{1/2}$ to be taken not less than 19 mm	-
t_D	$1.3\,L^{1/2}$	$2.0\,L^{1/2}$	-
R	-	$50\,L^{1/2}$	-

(1) Propeller post thicknesses t_1, and t_2 are, in any case, to be not less than $(0.05\,L + 9.5)$ mm.

Table 6: Twin screw ships – Gross scantlings of propeller posts

Gross scantlings of propeller posts, in mm	Fabricated propeller post 	Cast propeller post 	Bar propeller post, cast or forged, having rectangular section a	$25\,L^{1/2}$	$12.5\,L^{1/2}$	$2.4L+6$
b	$25\,L^{1/2}$	$25\,L^{1/2}$	$0.8L+2$
t_1 (1)	$2.5\,L^{1/2}$	$2.5\,L^{1/2}$	-
t_2 (1)	$3.2\,L^{1/2}$	$3.2\,L^{1/2}$	-
t_3	-	$4.4\,L^{1/2}$	-
t_D	$1.3\,L^{1/2}$	$2.0\,L^{1/2}$	-

(1) Propeller post thicknesses t_1, t_2 and t_3 are, in any case, to be not less than $(0.05\,L + 9.5)$ mm.

6.5 Sterntubes

6.5.1 Sterntubes

The sterntube thickness is considered by the Society on a case by case basis. In no case, however, may it be less than the thickness of the side plating adjacent to the stern-frame.

Where the materials adopted for the sterntube and the plating adjacent to the sternframe are different, the sterntube thickness is to be at least equivalent to that of the plating.

Section 3 - MACHINERY SPACE

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

k : Material factor, defined in **Ch 3, Sec 1, [2.2]**

P : Maximum continuous rating, in kW, of the engine

n_r : Number of revolutions per minute of the engine shaft at power equal to P

L_E : Effective length, in m, of the engine foundation plate required for bolting the engine to the seating, as specified by the engine manufacturer.

1. General

1.1 Application

1.1.1

The requirements of this Section apply for the arrangement and scantling of machinery space structures as regards general strength. It is no substitute to machinery manufacturer's requirements that have to be dealt with at Shipyard diligence.

1.2 Scantlings

1.2.1 Net scantlings

As specified in **Ch 3, Sec 2** all scantlings referred to in this Section are net, i.e. they do not include any margin for corrosion.
The gross scantlings are obtained as specified in **Ch 3, Sec 2, [3.1].**

1.2.2 General

Unless otherwise specified in this Section, the scantlings of plating, ordinary stiffeners and primary supporting members in the machinery space are to be determined according to the relevant criteria in **Ch 6.** In addition, the minimum thickness requirements specified in this Section apply.

1.2.3 Primary supporting members

The Designer may propose arrangements and scantlings alternative to the requirements of this Section, on the basis of direct calculations which are to be submitted to the Society for examination on a case by case basis.
The Society may also require such direct calculations to be carried out whenever deemed necessary.

1.3 Connections of the machinery space with structures located aft and forward

1.3.1 Tapering

Adequate tapering is to be ensured between the scantlings in the machinery space and those aft and forward. The tapering is to be such that the scantling requirements for all areas are fulfilled.

1.3.2 Transition zone between engine room and cargo area

In the transition zone between the engine room and the aftermost cargo hold due consideration is to be given to the proper tapering of major longitudinal members within the engine room such as flats, decks, horizontal rings or side stringers into the cargo hold, and for longitudinal bulkheads (inner skin, upper and lower wing tank) into the engine room.

Where such structure is in line with longitudinal members aft or forward of the cargo hold bulkhead, adequate tapering is to be achieved by fitting large tapering brackets inside the wing tanks or engine room.

1.3.3 Deck discontinuities

Decks which are interrupted in the machinery space are to be tapered on the side by means of horizontal brackets.

2. Double bottom

2.1 Arrangement

2.1.1 General

Where the machinery space is immediately forward of the after peak, the double bottom is to be transversely framed. In all other cases it may be transversely or longitudinally framed.

2.1.2 Double bottom height

The double bottom height at the centreline, irrespective of the location of the machinery space, is to be not less than the value defined in **Ch 3, Sec 6, [6.1].** This depth may need to be considerably increased in relation to the type and depth of main machinery seatings.
The above height is to be increased by the Shipyard where the machinery space is very large and where there is a considerable variation in draught between light ballast and full load conditions.
Where the double bottom height in the machinery space differs from that in adjacent spaces, structural continuity of longitudinal members is to be ensured by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the sloped inner bottom are to be located in way of floors.

2.1.3 Centre bottom girder

In general, the centre bottom girder may not be provided with holes. In any case, in way of any openings for manholes on the centre girder, permitted only where absolutely necessary for double bottom access and maintenance, local strengthening is to be arranged.

2.1.4 Side bottom girders

In the machinery space the number of side bottom girders is to be adequately increased, with respect to the adjacent areas, to ensure adequate rigidity of the structure. The side bottom girders are to be a continuation of any bottom longitudinals in the areas adjacent to the machinery space and are generally to have a spacing not greater than 3 times that of longitudinals and in no case greater than 3 m.

2.1.5 Side bottom girders in way of machinery seatings

Additional side bottom girders are to be fitted in way of machinery seatings.
Side bottom girders arranged in way of main machinery seatings are to extend for the full length of the machinery space.
Bottom girders are to extend as far aft as practicable in relation to the shape of the bottom and are to be supported by floors and side primary supporting members at the ends.
Forward of the machinery space forward bulkhead, the bottom girders are to be tapered for at least three frame spaces and are to be effectively connected to the hull structure.

2.1.6 Floors in longitudinally framed double bottom

Where the double bottom is longitudinally framed, the floor spacing is to be not greater than:

- 1 frame spacing in way of the main engine and thrust bearing
- 2 frame spacings in other areas of the machinery space.

Additional floors are to be fitted in way of other important machinery.

2.1.7 Floors in transversely framed double bottom

Where the double bottom in the machinery space is transversely framed, floors are to be arranged at every frame.
Furthermore, additional floors are to be fitted in way of boiler foundations or other important machinery.

2.1.8 Floors stiffeners

In addition to the requirements in **Ch 3, Sec 6**, floors are to have web stiffeners sniped at the ends and spaced not more than approximately 1 m apart.
The section modulus of web stiffeners is to be not less than 1.2 times that required in **Ch 6, Sec 2, [4.1.2].**

2.1.9 Manholes and wells

The number and size of manholes in floors located in way of seatings and adjacent areas are to be kept to the minimum necessary for double bottom access and maintenance.
The depth of manholes is generally to be not greater than 40 % of the floor local depth, and in no case greater than 750 mm, and their width is to be equal to approximately 400 mm.
In general, manhole edges are to be stiffened with flanges; failing this, the floor plate is to be adequately stiffened with flat bars at manhole sides.
Manholes with perforated portable plates are to be fitted in the inner bottom in the vicinity of wells arranged close to the aft bulkhead of the engine room.
Drainage of the tunnel is to be arranged through a well located at the aft end of the tunnel.

2.2 Minimum thicknesses

2.2.1

The net thicknesses of inner bottom, floor and girder webs are to be not less than the values given in **Table 1.**

Table 1: Double bottom – Minimum net thicknesses of inner bottom, floor and girder webs

Element	Minimum net thickness, in mm
Inner bottom	$6.6 + 0.024 L$ The Society may require the thickness of the inner bottom in way of the machinery seatings and on the main thrust blocks to be increased, on a case by case basis.
Margin plate	$0.9 L^{1/2} + 1$
Centre girder	$1.55 L^{1/2} + 3.5$
Floors and side girders	$1.7 L^{1/2} + 1$
Girder bounding a duct keel	$0.8 L^{1/2} + 2.5$, to be taken not less than that required for the centre girder.

3. Side

3.1 Arrangement

3.1.1 General

The type of side framing in machinery spaces is generally to be the same as that adopted in the adjacent areas.

3.1.2 Extension of the hull longitudinal structure within the machinery space

In ships where the machinery space is located aft and where the side is longitudinally framed, the longitudinal structure is preferably to extend for the full length of the machinery space.
In any event, the longitudinal structure is to be maintained for at least 0.3 times the length of the machinery space, calculated from the forward bulkhead of the latter, and abrupt structural discontinuities between longitudinally and transversely framed structures are to be avoided.

3.1.3 Side transverses

Side transverses are to be aligned with floors. One is preferably to be located in way of the forward end and another in way of the after end of the machinery casing.
For a longitudinally framed side, the side transverse spacing is to be not greater than 4 frame spacings.
For a transversely framed side, the side transverse spacing is to be not greater than 5 frame spaces. The web height is to be not less than twice that of adjacent frames and the section modulus is to be not less than four times that of adjacent frames.
Side transverse spacing greater than that above may be accepted provided that the scantlings of ordinary frames are increased, according to the Society’s requirements to be defined on a case by case basis.

4. Platforms

4.1 Arrangement

4.1.1 General

The location and extension of platforms in machinery spaces are to be arranged so as to be a continuation of the structure of side longitudinals, as well as of platforms and side girders located in the adjacent hull areas.

4.1.2 Platform transverses

In general, platform transverses are to be arranged in way of side or longitudinal bulkhead transverses.
For longitudinally framed platforms, the spacing of platform transverses is to be not greater than 4 frame spacings.

4.2 Minimum thicknesses

4.2.1

The net thickness of platforms is to be not less than 6.5 mm.

5. Pillaring

5.1 Arrangement

5.1.1 General

The pillaring arrangement in machinery spaces is to account both for the concentrated loads transmitted by machinery and superstructures and for the position of main machinery and auxiliary engines.

5.1.2 Pillars

Pillars are to be arranged in the following positions:

- in way of machinery casing corners and corners of large openings on platforms; alternatively, two pillars may be fitted on the centreline (one at each end of the opening)
- in way of the intersection of platform transverses and girders
- in way of transverse and longitudinal bulkheads of the superstructure.

In general, pillars are to be fitted with brackets at their ends.

5.1.3 Pillar bulkheads

In general, pillar bulkheads, fitted in 'tween decks below the upper deck, are to be located in way of load-bearing bulkheads in the superstructures.
Longitudinal pillar bulkheads are to be a continuation of main longitudinal hull structures in the adjacent spaces forward and aft of the machinery space.
Pillar bulkhead scantlings are to be not less than those required in **[6.3]** for machinery casing bulkheads.

6. Machinery casing

6.1 Arrangement

6.1.1 Ordinary stiffener spacing

Ordinary stiffeners are to be located:

- at each frame, in longitudinal bulkheads
- at a distance of about 750 mm, in transverse bulkheads.

The ordinary stiffener spacing in portions of casings that are particularly exposed to wave action is considered by the Society on a case by case basis.

6.2 Openings

6.2.1 General

All machinery space openings, which are to comply with the requirements in **Sec 6, [6]**, are to be enclosed in a steel casing leading to the highest open deck. Casings are to be reinforced at the ends by deck beams and girders associated to pillars.
In the case of large openings, the arrangement of cross-ties as a continuation of deck beams may be required.
Skylights, where fitted with openings for light and air, are to have coamings of a height not less than:

- 900 mm, if in position 1
- 760 mm, if in position 2.

6.2.2 Access doors

Access doors to casings are to comply with **Sec 6, [6.2].**

6.3 Scantlings

6.3.1 Plating and ordinary stiffeners

The net scantlings of plating and ordinary stiffeners are to be not less than those obtained according to the applicable requirements in **Ch 9, Sec 4.**

6.3.2 Minimum thicknesses

The net thickness of bulkheads is to be not less than:

- 5.5 mm for bulkheads in way of cargo holds
- 4 mm for bulkheads in way of accommodation spaces.

7. Main machinery seating

7.1 Arrangement

7.1.1 General

The scantlings of main machinery seatings and thrust bearings are to be adequate in relation to the weight and power of engines and the static and dynamic forces transmitted by the propulsive installation.

7.1.2 Seating supporting structure

Transverse and longitudinal members supporting the seatings are to be located in line with floors and double or single bottom girders, respectively.
They are to be so arranged as to avoid discontinuity and ensure sufficient accessibility for welding of joints and for surveys and maintenance.

7.1.3 Seatings included in the double bottom structure

Where high-power internal combustion engines or turbines are fitted, seatings are to be integral with the double bottom structure. Girders supporting the bedplates in way of seatings are to be aligned with double bottom girders and are to be extended aft in order to form girders for thrust blocks.
The girders in way of seatings are to be continuous from the bedplates to the bottom shell.

7.1.4 Seatings above the double bottom plating

Where the seatings are situated above the double bottom plating, the girders in way of seatings are to be fitted with flanged brackets, generally located at each frame and extending towards both the centre of the ship and the sides.
The extension of the seatings above the double bottom plating is to be limited as far as practicable while ensuring adequate spaces for the fitting of bedplate bolts. Bolt holes are to be located such that they do not interfere with seating structures.

7.1.5 Seatings in a single bottom structure

For ships having a single bottom structure within the machinery space, seatings are to be located above the floors and to be adequately connected to the latter and to the girders located below.

7.1.6 Number of girders in way of machinery seatings

At least two girders are to be fitted in way of main machinery seatings.
One girder may be fitted only where the following three formulae are complied with:
$L < 150$ m
$P < 7100$ kW
$P < 2.3\, n_r L_E$

7.2 Minimum scantlings

7.2.1

The net scantlings of the structural elements in way of the internal combustion engine seatings are to be obtained from the formulae in **Table 2**. However, the net cross-sectional area of each bedplate of the seatings may be determined by the engine manufacturers, provided the information regarding permissible foundation stiffness considering the engine characteristics and engine room arrangement, etc.

Table 2: Minimum scantlings of the structural elements in way of machinery seatings

Scantling minimum value	Scantling minimum value
Net cross-sectional area, in cm^2, of each bedplate of the seatings	$40+70\frac{P}{n_r L_E}$
Bedplate net thickness, in mm	Bedplates supported by two or more girders: $\sqrt{240+175\frac{P}{n_r L_E}}$ Bedplates supported by one girder: $5+\sqrt{240+175\frac{P}{n_r L_E}}$
Total web net thickness, in mm, of girders fitted in way of machinery seatings	Bedplates supported by two or more girders: $\sqrt{320+215\frac{P}{n_r L_E}}$ Bedplates supported by one girder: $\sqrt{95+65\frac{P}{n_r L_E}}$
Web net thickness, in mm, of floors fitted in way of machinery seatings	$\sqrt{55+40\frac{P}{n_r L_E}}$

Section 4 - SUPERSTRUCTURES AND DECKHOUSES

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

L_2 : Rule length L, but to be taken not greater than 300 m

p_D : Lateral pressure for decks, in kN/m^2, as defined in **[3.2.1]**

p_{SI} : Lateral pressure for sides of superstructures, in kN/m^2, as defined in **[3.2.3]**

k : Material factor, defined in **Ch 3, Sec 1, [2.2]**

s : Spacing, in m, of ordinary stiffeners, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffeners, measured between the supporting members, see **Ch 3, Sec 6, [4.2]**

c : Coefficient taken equal to:

$c = 0.75$ for beams, girders and transverses which are simply supported on one or both ends

$c = 0.55$ in othe rcases

m_a : Coefficient taken equal to:

$$m_a = 0.204\frac{s}{\ell}\left[4-\left(\frac{s}{\ell}\right)^2\right], \text{ with } \frac{s}{\ell}\le 1$$

1. General

1.1 Definitions

1.1.1 Superstructure

See **Ch 1, Sec 4, [3.12.1]**

1.1.2 Deckhouse

See **Ch 1, Sec 4, [3.15.1]**

1.1.3 Long deckhouse

A long deckhouse is a deckhouse the length of which within $0.4L$ amidships exceeds $0.2L$. The strength of along deckhouse is to be specially considered.

1.1.4 Short deckhouse

A short deckhouse is a deckhouse not covered by the definition given in **[1.1.3].**

1.1.5 Non-effective superstructure

For the purpose of this section, all superstructures being located beyond $0.4L$ amidships or having a length of less than $0.15L$ are considered as non-effective superstructures.

1.1.6 Insulated funnel

Scantlings of insulated funnels are to be determined as for deckhouses.

1.1.7 Effective superstructure

Effective superstructure is a superstructure not covered by the definition given in **[1.1.5]**

1.2 Gross scantlings

1.2.1

With reference to **Ch 3, Sec 2**, all scantlings and dimensions referred to in **[4]** and **[5]** are gross, i.e. they include the margins for corrosion.

2. Arrangement

2.1 Strengthening at the ends of superstructures

2.1.1

In way of end bulkheads of superstructures located within $0.4\,L$ amidships, the thickness of the strength deck in a breadth of $0.1\,B$ from the shell, the thickness of the sheerstrake, and the thickness of the superstructure side plating are to be increased by the percentage of strengthening specified in **Table 1.** The strengthening is to be extended over a region from 4 frame spacings abaft the end bulkhead to 4 frame spacings forward of the end bulkhead.

Table 1: Percentage of strengthening

Type of superstructure	Strength deck and sheerstrake	Side plating of superstructure
Effective	30 %	20 %
Non-effective	20 %	10 %

2.1.2

Under strength decks in way of $0.6\,L$ amidships, girders are to be fitted in alignment with longitudinal walls, which are to extend at least over three frame spacings beyond the end points of the longitudinal walls. The girders are to overlap with the longitudinal walls by at least two frame spacings.

2.2 Attachment of stiffening members

2.2.1 Attachment of deck beams

Transverse deck beams are to be connected to the frames by brackets according to **Ch 3, Sec 6.**
Deck beams crossing longitudinal walls and girders may be attached to the stiffeners of longitudinal walls and the webs of girders respectively by welding without brackets.

2.2.2 Attachment of deck girders and transverses

End attachments of girders at bulkheads are to be so dimensioned that the bending moments and shear forces can be transferred. Bulkhead stiffeners under girders are to be sufficiently dimensioned to support the girders.
Face plates are to be stiffened by tripping brackets according to **Ch 3, Sec 6.** At girders of symmetrical section, they are to be arranged alternately on both sides of the web.

2.2.3 End attachment of superstructure frames

Superstructure frames are to be connected to the main frames below, or to the deck. The end attachment may be carried out in accordance with **Fig 1.**

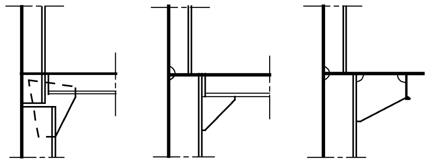

Fig 1: End attachment of superstructure frames

2.3 Transverse structure of superstructures and deckhouses

2.3.1

The transverse structure of superstructures and deckhouses is to be sufficiently dimensioned by a suitable arrangement of end bulkheads, web frames, steel walls of cabins and casings, or by other measures.

2.4 Openings in enclosed superstructures

2.4.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 12(1))
All access openings in bulkheads at ends of enclosed superstructures are to be fitted with weathertight doors permanently attached to the bulkhead, and framed, stiffened and fitted so that the whole structure is of equivalent strength to the un-pierced bulkhead. The doors are to be so arranged that they can be operated from both sides of the bulkhead.

2.4.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 12(3))
The height of the sills of access openings in bulkheads at ends of enclosed superstructures shall be at least 380 mm above the deck.

2.4.3

Any opening in a superstructure deck or in a deckhouse deck directly above the freeboard deck (deckhouse surrounding companionways), is to be protected by efficient weathertight closures.

3. Load model

3.1 Load calculation point

3.1.1

Unless otherwise specified, lateral pressure is to be calculated at load calculation points defined in:
- **Ch 6, Sec 1, [1.5]**, for plating
- **Ch 6, Sec2, [1.4]** for ordinary stiffeners and primary supporting members.

3.2 Loads

3.2.1 Lateral pressure for decks

The lateral pressure for decks of superstructures and deckhouses, in kN/m^2, is to be taken equal to:
- the external pressure p_D defined in **Ch 4, Sec 5, [2.1]** for exposed decks,
- 5 kN/m^2 for unexposed decks.

3.2.2 Lateral pressure for exposed wheel house top

The lateral pressure p for exposed wheel house tops, in kN/m^2, is to be obtained according to **Ch 4, Sec 5, [3.2].**

3.2.3 Lateral pressure for sides of superstructures

The lateral pressure p_{SI} for sides of superstructures, in kN/m^2, is to be obtained according to **Ch 4, Sec 5, [3.3].**

4. Scantlings

4.1 Side plating of non-effective superstructures

4.1.1

The gross thickness, in mm, of the side plating of non-effective superstructures is not to be less than the greater of the following values:

$$t = 1.21 s\sqrt{k p_{SI}} + 1.5$$

$$t = 0.8\sqrt{kL}$$

4.2 Deck plating of non-effective superstructures

4.2.1

The gross thickness, in mm, of deck plating of non-effective superstructures is not to be less than the greater of the following values:

$$t = 1.21 s\sqrt{k p_D} + 1.5$$

$$t = (5.5 + 0.02L)\sqrt{k}$$

where L is not to be taken greater than 200 m.

4.2.2

Where additional superstructures are arranged on non-effective superstructures located on the freeboard deck, the gross thickness required by **[4.2.1]** may be reduced by 10 %.

4.2.3

Where plated decks are protected by sheathing, the gross thickness of the deck plating according to **[4.2.1]** and **[4.2.2]** may be reduced by 1.5 mm. However, such deck plating is not to be less than 5 mm. Where a sheathing other than wood is used, attention is to be paid that the sheathing does not affect the steel. The sheathing is to be effectively fitted to the deck.

4.3 Deck beams and supporting deck structure

4.3.1 Transverse deck beams and deck longitudinal ordinary stiffeners

The section modulus w, in cm^3, and the shear area A_{sh}, in cm^2, of transverse deck beams and of deck longitudinal ordinary stiffeners are not to be less than the values obtained from the following formulae:

$$w = c k p_D s \ell^2$$

$$A_{sh} = 0.05(1 - 0.817 m_a) k p_D s \ell$$

4.3.2 Deck girders and transverses

The section modulus w, in cm^3, and the shear area A_{sh}, in cm^2, of deck girders and transverses are not to be less than the values obtained from the following formulae:

$$w = ckp_D e\ell^2$$

$$A_{sh} = 0.05kp_D e\ell$$

where:

e : Width of loaded area, in m, of the unsupported adjacent plate fields, measured from each mid of plate field to mid of opposite plate filed.

The girder depth is not to be less than $\ell/25$. The web depth of girders scalloped for continuous deck beams is to be at least 1.5 times the depth of the deck beams.
Where a girder does not have the same section modulus throughout all girder fields, the greater scantlings are to be maintained above the supports and are to be reduced gradually to the smaller scantlings.

4.4 Superstructure frames

4.4.1 Section modulus and shear area

The section modulus w, in cm^3, and the shear area A_{sh}, in cm^2, of the superstructure frames are not to be less than the values obtained from the following formulae:

$$w = 0.55kp_{SI}s\ell^2$$

$$A_{sh} = 0.05(1 - 0.817m_a)kp_{SI}s\ell$$

4.4.2

Where frames are supported by a longitudinally framed deck, the frames fitted between web frames are to be connected to the adjacent longitudinal ordinary stiffeners by brackets. The scantlings of the brackets are to be determined in accordance with **Ch 3, Sec 6** on the basis of the section modulus of the frames.

4.4.3

Where further superstructures or deckhouses are arranged on the superstructures, strengthening of the frames of the space below may be required.

4.5 Decks of short deckhouses

4.5.1 Plating

The thickness, in mm, of weather deck of short deckhouses and is not to be less than:

$$t = 8s\sqrt{k} + 1.5$$

For weather decks of short deckhouses protected by sheathing and for decks within deckhouses, the gross thickness may be reduced by 1.5mm. However, such deck plating is not to be less than 5 mm.

4.5.2 Deck beams

The scantlings of deck beams and supporting deck structure are to be determined according to **[4.3].**

5. End bulkheads of superstructure and deckhouse

5.1 Application

5.1.1

The requirements in **[5.2]** and **[5.3]** apply to end bulkhead of superstructure and deckhouse forming the only protection for openings, as required by ILLC as amended, and for accommodations.

5.2 Loads

5.2.1

The design load p_A, in kN/m^2, for determining the scantlings is to be obtained according to **Ch 4, Sec 5, [3.4].**

5.3 Scantlings

5.3.1 Stiffeners

The section modulus w, in cm^3, of the stiffeners is not to be less than the value obtained from the following formula:

$$w = 0.35 k p_A s \ell^2$$

This requirement assume the webs of lowest tier stiffeners to be efficiently welded to the decks. Scantlings for other types of end connections may be specially considered.
The section modulus of deckhouse side stiffeners needs not to be greater than that of side frames on the deck situated directly below; taking account of spacing s and span ℓ.

5.3.2 Plate thickness

The gross thickness of the plating, in mm, is not to be less than the greater of the values obtained from the following formulae:

$$t = 0.9 s \sqrt{k p_A} + 1.5$$

$$t_{min} = \left(5.0 + \frac{L_2}{100}\right)\sqrt{k}$$, for the lowest tier

$$t_{min} = \left(4.0 + \frac{L_2}{100}\right)\sqrt{k}$$, for the upper tiers, without being less than 5.0 mm.

Section 5 - HATCH COVERS

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

p_S : Still water pressure, in kN/m^2, defined in **[4.1]**

p_W : Wave pressure, in kN/m^2, defined in **[4.1]**

p_C : Pressure acting on the hatch coaming, in kN/m^2, defined in **[6.2]**

F_S, F_W : Coefficients taken equal to:

F_S = 0 and F_W = 0.9 for ballast water loads on hatch covers of the ballast hold

F_S = 1.0 and F_W = 1.0 in other cases

s : Length, in m, of the shorter side of the elementary plate panel

ℓ : Length, in m, of the longer side of the elementary plate panel

b_p : Effective width, in m, of the plating attached to the ordinary stiffener or primary supporting member, defined in **[3]**

w : Net section modulus, in cm^3, of the ordinary stiffener or primary supporting member, with an attached plating of width b_p

A_{sh} : Net shear sectional area, in cm^2, of the ordinary stiffener or primary supporting member

m : Boundary coefficient for ordinary stiffeners and primary supporting members, taken equal to:

m = 8, in the case of ordinary stiffeners and primary supporting members simply supported at both ends or supported at one end and clamped at the other end

m = 12, in the case of ordinary stiffeners and primary supporting members clamped at both ends

t_C : Total corrosion addition, in mm, defined in **[1.4]**

σ_a , τ_a : Allowable stresses, in N/mm^2, defined in **[1.5]**

1. General

1.1 Application

1.1.1

The requirements in **[1]** to **[8]** apply to steel hatch covers in positions 1 and 2 on weather decks, defined in **Ch 1, Sec 4, [3.20].**
The requirements in **[9]** apply to steel hatch covers of small hatches fitted on the exposed fore deck over the forward 0.25 L.

1.2 Materials

1.2.1 Steel

The formulae for scantlings given in **[5]** are applicable to steel hatch covers.
Materials used for the construction of steel hatch covers are to comply with the applicable requirements of the Society.

1.2.2 Other materials

The use of materials other than steel is considered by the Society on a case by case basis, by checking that criteria adopted for scantlings are such as to ensure strength and stiffness equivalent to those of steel hatch covers.

1.3 Net scantlings

1.3.1

All scantlings referred to in this Section, except otherwise specified, are net, i.e. they do not include any margin for corrosion.
When calculating the stresses σ and τ in **[5.3]** and **[5.4]**, the net scantlings are to be used.
The gross scantlings are obtained as specified in **Ch 3, Sec 2.**
The corrosion additions are given in **[1.4].**

1.4 Corrosion additions

1.4.1

The total corrosion addition for both sides to be considered for the plating and internal members of hatch covers is equal to the value specified in **Table 1.**
The corrosion addition for hatch coamings and coaming stays is defined according to **Ch 3, Sec 3.**

Table 1: Corrosion addition t_C for hatch covers

Corrosion addition t_C, in mm, for both sides	
Plating and stiffeners of single skin hatch cover	2.0
Top and bottom plating of double skin hatch cover	2.0
Internal structures of double skin hatch cover	1.5

1.5.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 15(6) and 16(5))
The allowable stresses σ_a and τ_a, in N/mm^2, are to be obtained from **Table 2.**

Table 2: Allowable stresses, in N/mm^2

Members of	Subjected to	σ_a, in N/mm^2	τ_a, in N/mm^2
Weathertight hatch cover	External pressure, as defined in Ch 4, Sec 5, [5.2.1]	0.80 R_{eH}	0.46 R_{eH}
Pontoon hatch cover		0.68 R_{eH}	0.39 R_{eH}
Weathertight hatch cover and pontoon hatch cover	Other loads, as defined in Ch 4, Sec 5, [5.1.1] and Ch 4, Sec 6, [2]	0.90 R_{eH}	0.51 R_{eH}

2. Arrangements

2.1 Height of hatch coamings

2.1.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 14 (1, 1))
The height above the deck of hatch coamings is to be not less than:

- *600 mm in position 1*
- *450 mm in position 2.*

2.1.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 14 (1, 2))
The height of hatch coamings in positions 1 and 2 closed by steel covers provided with gaskets and se-

curing devices may be reduced with respect to the above values or the coamings may be omitted entirely, on condition that the Administration is satisfied that the safety of the ship is not thereby impaired in any sea conditions.
In such cases the scantlings of the covers, their gasketing, their securing arrangements and the drainage of recesses in the deck are considered by the Society on a case by case basis.

2.1.3

Regardless of the type of closing arrangement adopted, the coamings may have reduced height or be omitted in way of openings in closed superstructures.

2.2 Hatch covers

2.2.1

Hatch covers on exposed decks are to be weathertight.
Hatch covers in closed superstructures need not be weathertight.
However, hatch covers fitted in way of ballast tanks, fuel oil tanks or other tanks are to be watertight.

2.2.2

The ordinary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

2.2.3

The spacing of primary supporting members parallel to the direction of ordinary stiffeners is to be not greater than 1/3 of the span of primary supporting members.

2.2.4

The breadth of the primary supporting member face plate is to be not less than 40 % of their depth for laterally unsupported spans greater than 3 m. Tripping brackets attached to the face plate may be considered as a lateral support for primary supporting members.
The face plate outstand is not to exceed 15 times the gross face plate thickness.

2.2.5

Efficient retaining arrangements are to be provided to prevent translation of the hatch cover under the action of the longitudinal and transverse forces exerted by cargoes on the cover, if any. These retaining arrangements are to be located in way of the hatch coaming side brackets.

2.2.6

The width of each bearing surface for hatch covers is to be at least 65 mm.

2.3 Hatch coamings

2.3.1

Coamings, stiffeners and brackets are to be capable of withstanding the local forces in way of the clamping devices and handling facilities necessary for securing and moving the hatch covers as well as those due to cargo stowed on the latter.

2.3.2

Special attention is to be paid to the strength of the fore transverse coaming of the forward hatch and to the scantlings of the closing devices of the hatch cover on this coaming.

2.3.3

Longitudinal coamings are to be extended at least to the lower edge of deck beams.

- where they are not part of continuous deck girders, the lower edge of longitudinal coamings are to extend for at least two frame spaces beyond the end of the openings.
- where longitudinal coamings are part of deck girders, their scantlings are to be as required in **Ch 6, Sec 4.**

2.3.4

A web frame or a similar structure is to be provided below the deck in line with the transverse coaming. Transverse coamings are to extend below the deck and to be connected with the web frames.

2.4 Small hatchways

2.4.1

The height of small hatchway coamings is to be not less than 600 mm if located in position 1 and 450 mm if located in position 2.
Where the closing appliances are in the form of hinged steel covers secured weathertight by gaskets and swing bolts, the height of the coamings may be reduced or the coamings may be omitted altogether.

2.4.2

Small hatch covers are to have strength equivalent to that required for main hatchways and are to be of steel, weathertight and generally hinged.
Securing arrangements and stiffening of hatch cover edges are to be such that weathertightness can be maintained in any sea condition.
At least one securing device is to be fitted at each side. Circular hole hinges are considered equivalent to securing devices.

2.4.3

Hold accesses located on the weather deck are to be provided with weathertight metallic hatch covers, unless they are protected by a closed superstructure. The same applies to accesses located on the forecastle deck and leading directly to a dry cargo hold through a trunk.

2.4.4

Accesses to cofferdams and ballast tanks are to be manholes fitted with watertight covers fixed with bolts which are sufficiently closely spaced.

2.4.5

Hatchways of special design are considered by the Society on a case by case basis.

3. Width of attached plating

3.1 Ordinary stiffeners

3.1.1

The width of the attached plating to be considered for the check of ordinary stiffeners is to be obtained, in m, from the following formulae:

- where the attached plating extends on both sides of the stiffener:

$$b_p = s$$

- where the attached plating extends on one side of the stiffener:

$$b_p = 0.5s$$

3.2 Primary supporting members

3.2.1

The effective width of the attached plating to be considered for the yielding and buckling checks of primary supporting members analysed through isolated beam or grillage model is to be obtained, in m, from the following formulae:

- where the plating extends on both sides of the primary supporting member:

$$b_p = b_{p,1} + b_{p,2}$$

- where the plating extends on one side of the primary supporting member:

$$b_p = b_{p,1}$$

where:

$$b_{p,1} = \min(0.165\ell_p \, , \, S_{p,1})$$

$$b_{p,2} = \min(0.165\ell_p \, , \, S_{p,2})$$

ℓ_p : Span, in m, of the considered primary supporting member

$S_{p,1}$, $S_{p,2}$: Half distance, in m, between the considered primary supporting member and the adjacent ones, $S_{p,1}$ for one side, $S_{p,2}$ for the other side.

When a isolated beam or a grillage analysis is used, the areas of ordinary stiffeners are not to be included in the attached plating of the primary members.

4. Load model

4.1 Lateral pressures and forces

4.1.1 General

The lateral pressures and forces to be considered as acting on hatch covers are indicated in **[4.1.2]** to **[4.1.6]**. When two or more panels are connected by hinges, each individual panel is to be considered separately.
In any case, the sea pressures defined in **[4.1.2]** are to be considered for hatch covers located on exposed decks.
Additionally, when the hatch cover is intended to carry uniform cargoes, special cargoes or containers, the pressures and forces defined in **[4.1.3]** to **[4.1.6]** are to be considered independently from the sea pressures.

4.1.2 Sea pressures

The still water and wave lateral pressures are to be considered and are to be taken equal to:

- still water pressure: $p_s = 0$
- wave pressure p_W, as defined in **Ch 4, Sec 5 [5.2].**

4.1.3 Internal pressures due ballast water

If applicable, the static and dynamic lateral pressures are to be considered and are defined in **Ch 4, Sec 6, [2].**

4.1.4 Pressures due to uniform cargoes

If applicable, the static and dynamic pressures are to be considered and are defined in **Ch 4, Sec 5, [2.4.1]**

4.1.5 Pressures or forces due to special cargoes

In the case of carriage on the hatch covers of special cargoes (e.g. pipes, etc.) which may temporarily retain water during navigation, the lateral pressures or forces to be applied are considered by the Society on a case by case basis.

4.1.6 Forces due to containers

In the case of carriage of containers on the hatch covers, the concentrated forces under the containers corners are to be determined in accordance with the applicable requirements of the Society.

4.2 Load point

4.2.1 Wave lateral pressure for hatch covers on exposed decks

The wave lateral pressure to be considered as acting on each hatch cover is to be calculated at a point located:

- longitudinally, at the hatch cover mid-length
- transversely, on the longitudinal plane of symmetry of the ship
- vertically, at the top of the hatch cover.

4.2.2 Lateral pressures other than the wave pressure

The lateral pressure is to be calculated:

- in way of the geometrical centre of gravity of the plate panel, for plating
- at mid-span, for ordinary stiffeners and primary supporting members.

5. Strength check

5.1 General

5.1.1 Application

The strength check is applicable to rectangular hatch covers subjected to a uniform pressure, designed with primary supporting members arranged in one direction or as a grillage of longitudinal and transverse primary supporting members.
In the latter case, the stresses in the primary supporting members are to be determined by a grillage or a finite element analysis.
It is to be checked that stresses induced by concentrated loads are in accordance with the criteria in **[5.4.4].**

5.1.2 Hatch covers supporting containers

The scantlings of hatch covers supporting containers are to comply with the applicable provisions of the Society.

5.1.3 Hatch covers subjected to special cargoes

For hatch covers supporting special cargoes, ordinary stiffeners and primary supporting members are generally to be checked by direct calculations, taking into account the stiffener arrangements and their relative inertia. It is to be checked that stresses induced by special cargoes are in accordance with the criteria in **[5.4.4].**

5.1.4 Covers of small hatchways

The gross thickness of covers is to be not less than 8 mm. This thickness is to be increased or an efficient stiffening fitted to the Society's satisfaction where the greatest horizontal dimension of the cover exceeds 0.6 m.

5.2 Plating

5.2.1 Net thickness

The net thickness of steel hatch cover top plating, in mm, is to be not less than the value obtained from the following formula:

$$t = 15.8 F_p s \sqrt{\frac{F_S p_S + F_W p_W}{0.95 R_{eH}}}$$

where:

F_p : Factor for combined membrane and bending response, equal to:

$F_p = 1.5$ in general

$F_p = 1.9\sigma/\sigma_a$, for $\sigma \geq 0.8\sigma_a$ for the attached plating of primary supporting members

σ : Normal stress, in N/mm^2, in the attached plating of primary supporting members, calculated according to **[5.4.3]** or determined through a grillage analysis or a finite element analysis, as the case may be.

5.2.2 Minimum net thickness

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 16 (5, c))
In addition to **[5.2.1]**, the net thickness, in mm, of the plating forming the top of the hatch cover is to be not less than the greater of the following values:

$$t = 10s$$

$$t = 6$$

5.2.3 Critical buckling stress check

The compressive stress σ in the hatch cover plating, induced by the bending of primary supporting members, parallel to the direction of ordinary stiffeners is to comply with the following formula:

$$\sigma \leq \frac{0.88}{S}\sigma_{C1}$$

where:

S : Safety factor defined in **Ch 6, Sec 3**

σ_{C1} : Critical buckling stress, in N/mm^2, taken equal to:

$$\sigma_{C1} = \sigma_{E1} \quad \text{for} \quad \sigma_{E1} \leq \frac{R_{eH}}{2}$$

$$\sigma_{C1} = R_{eH}\left(1 - \frac{R_{eH}}{4\sigma_{E1}}\right) \quad \text{for} \quad \sigma_{E1} > \frac{R_{eH}}{2}$$

$$\sigma_{E1} = 3.6\, E\left(\frac{t}{1000s}\right)^2$$

t : Net thickness, in mm, of plate panel

The compressive stress σ in the hatch cover plating, induced by the bending of primary supporting members, perpendicular to the direction of ordinary stiffeners is to comply with the following formula:

$$\sigma \le \frac{0.88}{S}\sigma_{C2}$$

where:

S : Safety factor defined in **Ch 6, Sec 3**

σ_{C2} : Critical buckling stress, in N/mm^2, taken equal to:

$$\sigma_{C2} = \sigma_{E2} \quad \text{for} \quad \sigma_{E2} \le \frac{R_{eH}}{2}$$

$$\sigma_{C2} = R_{eH}\left(1 - \frac{R_{eH}}{4\sigma_{E2}}\right) \quad \text{for} \quad \sigma_{E2} > \frac{R_{eH}}{2}$$

$$\sigma_{E2} = 0.9\, m\, E\left(\frac{t}{1000 s_s}\right)^2$$

m : Coefficient taken equal to:

$$m = c\left[1 + \left(\frac{s_s}{\ell_s}\right)^2\right]^2 \frac{2.1}{\psi + 1.1}$$

t : Net thickness, in mm, of plate panel

s_s : Length, in m, of the shorter side of the plate panel

ℓ_s : Length, in m, of the longer side of the plate panel

Ψ : Ratio between smallest and largest compressive stress

c : Coefficient taken equal to:

c = 1.3 when plating is stiffened by primary supporting members

c = 1.21 when plating is stiffened by ordinary stiffeners of angle or Ttype

c = 1.1 when plating is stiffened by ordinary stiffeners of bulb type

c = 1.05 when plating is stiffened by flat bar.

c = 1.30 when plating is stiffened by ordinary stiffeners of U type. The higher c value but not greater than 2.0 may be taken if it is verified by buckling strength check of panel using non-linear FEA and deemed appropriate by the Society.

An averaged value of c is to be used for plate panels having different edge stiffeners.

The bi-axial compression stress in the hatch cover plating, when calculated by means of finite element analysis, is to comply with the requirements in **Ch 6, Sec 3.**

5.3 Ordinary stiffeners

5.3.1

For flat bar ordinary stiffeners, the ratio h_w/t_w is to comply with the following formula:

$$\frac{h_w}{t_w} \le 15\sqrt{\frac{235}{R_{eH}}}$$

5.3.2 Minimum net thickness of web

The web net thickness of the ordinary stiffener, in mm, is to be not less than 4 mm.

5.3.3 Net section modulus and net shear sectional area

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of an ordinary stiffener subject to lateral pressure are to be not less than the values obtained from the following formulae:

$$w = \frac{(F_S p_S + F_W p_W) s \ell_s^2}{m \sigma_a} 10^3$$

$$A_{sh} = \frac{5(F_S p_S + F_W p_W) s \ell_s}{\tau_a}$$

where:

ℓ_s : Ordinary stiffener span, in m, to be taken as the spacing, in m, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all ordinary stiffener spans, the ordinary stiffener span may be reduced by an amount equal to 2/3 of the minimum brackets arm length, but not greater than 10 % of the gross span, for each bracket.

5.3.4 Critical buckling stress check

The compressive stress s in the face plate of ordinary stiffeners, induced by the bending of primary supporting members, parallel to the direction of ordinary stiffeners is to comply with the following formula:

$$\sigma \le \frac{0.88 \sigma_{CS}}{S}$$

where:

S : Safety factor defined in **Ch 6, Sec 3**

σ_{CS} : Critical buckling stress, in N/mm^2, taken equal to:

$$\sigma_{CS} = \sigma_{ES} \quad \text{for} \quad \sigma_{ES} \le \frac{R_{eH}}{2}$$

$$\sigma_{CS} = R_{eH}\left(1 - \frac{R_{eH}}{4\sigma_{ES}}\right) \quad \text{for} \quad \sigma_{ES} > \frac{R_{eH}}{2}$$

$$\sigma_{ES} = \min(\sigma_{E3}, \sigma_{E4})$$

$$\sigma_{E3} = 0.001 \frac{E I_a}{A \ell^2}$$

I_a : Moment of inertia, in cm^4, of the ordinary stiffener, including a face plate equal to spacing of ordinary stiffeners

A : Cross-sectional area, in cm^2, of the ordinary stiffener, including a face plate equal to spacing of ordinary stiffeners

ℓ : Span, in m, of the ordinary stiffener

$$\sigma_{E4} = \frac{\pi^2 E I_w}{10^4 I_p \ell^2}\left(m^2 + \frac{K}{m^2}\right) + 0.385 E \frac{I_t}{I_p}$$

$$K = \frac{C \ell^4}{\pi^4 E I_w} 10^6$$

m : Number of half waves, given in **Table 3.**

Table 3: Number of half waves

	$0 < K < 4$	$4 < K < 36$	$36 < K < 144$	$(m-1)^2m^2 < K \le m^2(m+1)^2$
m	1	2	3	m

I_w : Sectorial moment of inertia, in cm^6, of the ordinary stiffener about its connection with the plating, taken equal to:

$$I_w = \frac{h_w^3 t_w^3}{36} 10^{-6}$$ for flat bar ordinary stiffeners

$$I_w = \frac{t_f b_f^3 h_w^2}{12} 10^{-6}$$ for "Tee" ordinary stiffeners

$$I_w = \frac{b_f^3 h_w^2}{12(b_f + h_w)^2}\left[t_f\left(b_f^2 + 2 b_f h_w + 4 h_w^2\right) + 3 t_w b_f h_w\right]10^{-6}$$ for angles and bulb ordinary stiffeners

I_p : Polar moment of inertia, in cm^4, of the ordinary stiffener about its connection with the plating, taken equal to:

$$I_t = \frac{h_w^3 t_w}{3} 10^{-4}$$ for flat bar ordinary stiffeners

$$I_p = \left(\frac{h_w^3 t_w}{3} + h_w^2 b_f t_f\right) 10^{-4}$$ for flanged ordinary stiffeners

I_t : St Venant's moment of inertia, in cm^4, of the ordinary stiffener without face plate, taken equal to:

$$I_t = \frac{h_w t_w^3}{3} 10^{-4}$$ for flat bar ordinary stiffeners

$$I_t = \frac{1}{3}\left[h_w t_w^3 + b_f t_f^3 \left(1 - 0.63\frac{t_f}{b_f}\right)\right] 10^{-4}$$ for flanged ordinary stiffeners

C : Spring stiffness exerted by the hatch cover top plating, taken equal to:

$$C = \frac{k_p E t_p^3}{3s\left(1 + \dfrac{1.33 k_p h_w t_p^3}{1000 s t_w^3}\right)} 10^{-3}$$

$k_p = 1 - \eta_p$, to be taken not less than zero; for flanged ordinary stiffeners, k_p need not be taken less than 0.1

$$\eta_p = \frac{\sigma}{\sigma_{E1}}$$

σ_{E1} : As defined in **[5.2.3]**

t_p : Net thickness, in mm, of the hatch cover plate panel.

5.4 Primary supporting members

5.4.1 Application

The requirements in **[5.4.3]** to **[5.4.5]** apply to primary supporting members which may be analysed through isolated beam models.

Primary supporting members whose arrangement is of a grillage type and which cannot be analysed through isolated beam models are to be checked by direct calculations, using the checking criteria in **[5.4.4]**.

5.4.2 Minimum net thickness of web

The web net thickness of primary supporting members, in mm, is to be not less than 6 mm.

5.4.3 Normal and shear stress for isolated beam

In case that grillage analysis or finite element analysis are not carried out, according to the requirements in **[5.1.1]**, the maximum normal stress σ and shear stress τ in the primary supporting members are to be obtained, in N/mm^2, from the following formulae:

$$\sigma = \frac{s(F_S p_S + F_W p_W)\ell_m^2}{mW} 10^3$$

$$\tau = \frac{5s(F_S p_S + F_W p_W)\ell_m}{A_{sh}}$$

where:

ℓ_m : Span of the primary supporting member.

5.4.4 Checking criteria

The normal stress s and the shear stress τ, calculated according to **[5.4.3]** or determined through a grillage analysis or finite element analysis, as the case may be, are to comply with the following formulae:

$$\sigma \le \sigma_a$$

$$\tau \le \tau_a$$

5.4.5 Deflection limit

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 15 (6) and 16 (5, b))

The net moment of inertia of a primary supporting member, when loaded by sea pressure, is to be such that the deflection does not exceed $\mu\ell_{max}$, where:

μ : Coefficient taken equal to:

μ = 0.0056 for weathertight hatch covers

μ = 0.0044 for pontoon hatch covers

ℓ_{max} : Greatest span, in m, of primary supporting members.

5.4.6 Critical buckling stress check of the web panels of the primary supporting members.

The shear stress τ in the web panels of the primary supporting members, calculated according to **[5.4.3]** or determined through a grillage analysis or a finite element analysis, as the case may be, is to comply with the following formula:

$$\tau \le \frac{0.88\tau_C}{S}$$

where:

S : Safety factor defined in **Ch 6, Sec 3**

τ_C : Critical shear buckling stress, in N/mm^2, taken equal to:

$$\tau_C = \tau_E \quad \text{for} \quad \tau_E \le \frac{R_{eH}}{2\sqrt{3}}$$

$$\tau_C = \frac{R_{eH}}{\sqrt{3}}\left(1 - \frac{R_{eH}}{4\sqrt{3}\tau_E}\right) \quad \text{for} \quad \tau_E > \frac{R_{eH}}{2\sqrt{3}}$$

$$\tau_E = 0.9 k_t E \left(\frac{t_{pr,n}}{1000d}\right)^2$$

$$k_t = 5.35 + 4.0\left(\frac{a}{d}\right)^2$$

$t_{pr,n}$: Net thickness, in mm, of web of primary supporting member

a : Greater dimension, in m, of web panel of primary supporting member

d : Smaller dimension, in m, of web panel of primary supporting member.

For primary supporting members parallel to the direction of ordinary stiffeners, τ_C is to be calculated by considering the actual dimensions of the panels.
For primary supporting members perpendicular to the direction of ordinary stiffeners or for hatch covers built without ordinary stiffeners, a presumed square panel of dimension d is to be taken for the determination of the stress τ_C, where d is the smaller dimension, in m, of web panel of the primary supporting member. the In such a case, the average shear stress τ between the values calculated at the ends of this panel is to be considered.

5.4.7

For buckling stiffeners on webs of primary supporting members, the ratio h_w/t_w is to comply with the following formula:

$$\frac{h_w}{t_w} \le 15\sqrt{\frac{235}{R_{eH}}}$$

5.5 Ordinary stiffeners and primary supporting members of variable cross-section

5.5.1

The net section modulus of ordinary stiffeners and primary supporting members with a variable cross-section is to be not less than the greater of the value obtained, in cm^3, from the following formulae:

$$w = w_{CS}$$

$$w = \left(1 + \frac{3.2\alpha - \psi - 0.8}{7\psi + 0.4}\right) w_{CS}$$

where:

w_{CS} : Net section modulus, in cm^3, for a constant cross-section, complying with the checking criteria in **[5.4.4]**

α : Coefficient taken equal to:

$$\alpha = \frac{\ell_1}{\ell_0}$$

Ψ : Coefficient taken equal to:

$$\psi = \frac{w_1}{w_0}$$

ℓ_1 : Length of the variable section part, in m (see **Fig 1**)

ℓ_0 : Span measured, in m, between end supports (see **Fig 1**)

w_1 : Net section modulus at end, in cm^3 (see **Fig 1**)

w_0 : Net section modulus at mid-span, in cm^3 (see **Fig 1**).

Moreover, the net moment of inertia of ordinary stiffeners and primary supporting members with a variable cross-section is to be not less than the greater of the values obtained, in cm^4, from the following formulae:

$$I = I_{CS}$$

$$I = \left[1 + 8\alpha^3\left(\frac{1-\varphi}{0.2 + 3\sqrt{\varphi}}\right)\right] I_{CS}$$

where:

I_{CS} : Net moment of inertia with a constant cross-section, in cm^4, complying with **[5.4.5]**

φ : Coefficient taken equal to:

$$\varphi = \frac{I_1}{I_0}$$

I_1 : Net moment of inertia at end, in cm^4 (see **Fig 1**)

I_0 : Net moment of inertia at mid-span, in cm^4 (see **Fig 1**).

The use of these formulae is limited to the determination of the strength of ordinary stiffeners and primary supporting members in which abrupt changes in the cross-section do not occur along their length.

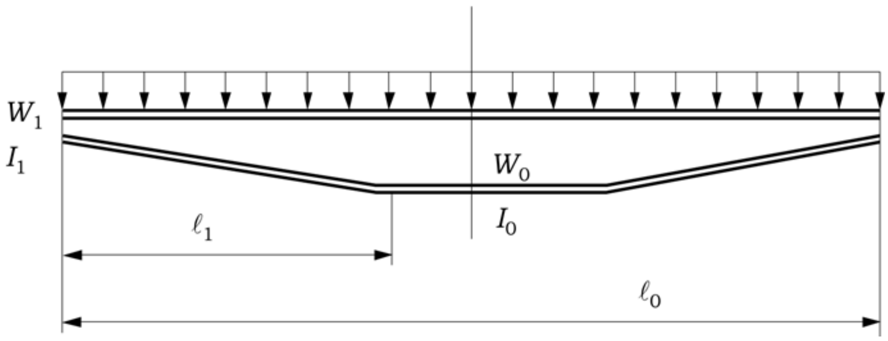

Fig 1: Variable cross-section stiffener

6. Hatch coamings

6.1 Stiffening

6.1.1

The ordinary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

6.1.2

Coamings are to be stiffened on their upper edges with a stiffener suitably shaped to fit the hatch cover closing appliances.

Moreover, when covers are fitted with tarpaulins, an angle or a bulb section is to be fitted all around coamings of more than 3 m in length or 600 mm in height; this stiffener is to be fitted at approximately 250 mm below the upper edge. The width of the horizontal flange of the angle is not to be less than 180 mm.

6.1.3

Where hatch covers are fitted with tarpaulins, coamings are to be strengthened by brackets or stays with a spacing not greater than 3 m.
Where the height of the coaming exceeds 900 mm, additional strengthening may be required.
However, reductions may be granted for transverse coamings in protected areas.

6.1.4

When two hatches are close to each other, underdeck stiffeners are to be fitted to connect the longitudinal coamings with a view to maintaining the continuity of their strength.
Similar stiffening is to be provided over 2 frame spacings at ends of hatches exceeding 9 frame spacings in length.
In some cases, the Society may require the continuity of coamings to be maintained above the deck.

6.1.5

Where watertight metallic hatch covers are fitted, other arrangements of equivalent strength may be adopted.

6.2 Load model

6.2.1

The lateral pressure p_C to be considered as acting on the hatch coamings is defined in **[6.2.2]** and **[6.2.3].**

6.2.2

The wave lateral pressure p_C, in $\mathrm{kN/m^2}$, on the No 1 forward transverse hatch coaming is to be taken equal to:

- p_C = 220, when a forecastle is fitted in accordance with **Sec 1, [7.1]**
- p_C = 290, in the other cases.

6.2.3

The wave lateral pressure p_C, in $\mathrm{kN/m^2}$, on the hatch coamings other than the No 1 forward transverse hatch coaming is to be taken equal to:

- p_C = 220

6.2.4

For cargo holds intended for the carriage of liquid cargoes, the liquid internal pressures applied on hatch coaming is also to be determined according to **Ch 4, Sec 6.**

6.3 Scantlings

6.3.1 Plating

The net thickness of the hatch coaming plate is to be not less than the greater value obtained, in mm, from the following formulae:

$$t = 15.98 s \sqrt{\frac{p_C}{0.95 R_{eH}}}$$

t = 9.5

6.3.2 Ordinary stiffeners

The net section modulus of the longitudinal or transverse ordinary stiffeners of hatch coamings is to be not less than the value obtained, in cm^3, from the following formula:

$$w = 1.21 \frac{p_C s \ell^2 10^3}{m c_p R_{eH}}$$

where:

m : Coefficient taken equal to:

m = 16 in general

m = 12 for the end span of stiffeners sniped at the coaming corners

c_p : Ratio of the plastic section modulus to the elastic section modulus of the ordinary stiffeners with an attached plate breadth, in mm, equal to $40t$, where t is the plate net thickness.

c_p = 1.16 in the absence of more precise evaluation.

6.3.3 Coaming stays

The net section modulus w, in cm^3, and the net thickness t_w, in mm, of the coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (examples shown in **Fig 2** and **Fig 3**) are to be not less than the values obtained from the following formulae at the connection with deck:

$$w = \frac{s_C p_C H_C^2 10^3}{1.9 R_{eH}}$$

$$t_w = \frac{s_C p_C H_C 10^3}{0.5 h R_{eH}}$$

where:

H_C : Stay height, in m

s_C : Stay spacing, in m

h : Stay depth, in mm, at the connection with deck.

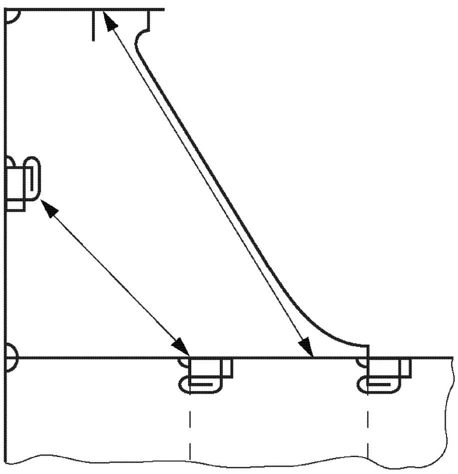

Fig 2: Coaming stay: example1

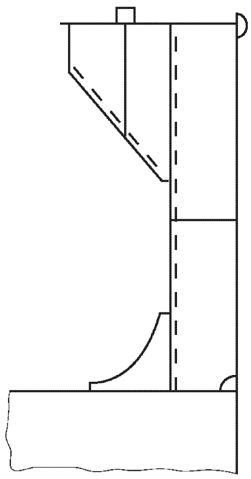

Fig 3: Coaming stay: example 2

For calculating the section modulus of coaming stays, their face plate area may be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it.
For other designs of coaming stays, such as, for example, those shown in **Fig 4** and **Fig 5**, the stress levels determined through a grillage analysis or finite element analysis, as the case may be, apply and are to be checked at the highest stressed locations. The stress levels are to comply with the following formulae:

$\sigma \le 0.95 R_{eH}$

$\tau \le 0.5 R_{eH}$

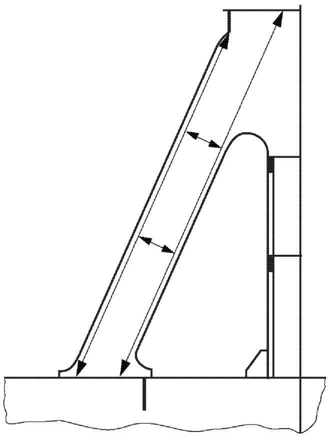

Fig 4: Coaming stay: example 3

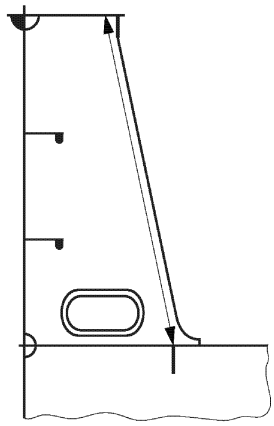

Fig 5: Coaming stay: example 4

6.3.4 Local details

The design of local details is to comply with the requirements in this section for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below.
Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.
The normal stress σ and the shear stress τ, in $\mathrm{N/mm^2}$, induced in the underdeck structures by the loads transmitted by stays are to comply with the following formulae:

$\sigma \le 0.95 R_{eH}$

$\tau \le 0.5 R_{eH}$

Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the Society's requirements.
Double continuous fillet welding is to be adopted for the connections of stay webs with deck plating and the weld throat thickness is to be not less than $0.44\,t_w$, where t_w is the gross thickness of the stay web.
Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15 % of the stay width.

6.3.5 Coamings of small hatchways

The gross thickness of coaming plate is to be not less than the lesser of the following values:

- the gross thickness for the deck inside line of openings calculated for that position, assuming as spacing of stiffeners the lesser of the values of the height of the coaming and the distance between its stiffeners, if any, or
- 10 mm.

Coamings are to be suitably strengthened where their height exceeds 0.8 m or their greatest horizontal dimension exceeds 1.2 m, unless their shape ensures an adequate rigidity.

7. Weathertightness, closing arrangement, securing devices and stoppers

7.1 Weathertightness

7.1.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 16 (1))
Where the hatchway is exposed, the weathertightness is to be ensured by gaskets and clamping devices sufficient in number and quality.
Weathertightness may also be ensured means of tarpaulins.

7.1.2

In general, a minimum of two securing devices or equivalent is to be provided on each side of the hatch cover.

7.2 Gaskets

7.2.1

The weight of hatch covers and any cargo stowed thereon, together with inertia forces generated by ship motions, are to be transmitted to the ship's structure through steel to steel contact.
This may be achieved by continuous steel to steel contact of the hatch cover skirt plate with the ship's structure or by means of defined bearing pads.

7.2.2

The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements.
Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and to be made of a corrosion-resistant material.

7.2.3

The gasket and the securing arrangements are to maintain their efficiency when subjected to large relative movements between the hatch cover and the ship's structure or between hatch cover elements.
If necessary, suitable devices are to be fitted to limit such movements.

7.2.4

The gasket material is to be of a quality suitable for all environmental conditions likely to be encountered by the ship, and is to be compatible with the cargoes transported.
The material and form of gasket selected are to be considered in conjunction with the type of hatch cover, the securing arrangement and the expected relative movement between the hatch cover and the ship's structure.
The gasket is to be effectively secured to the hatch cover.

7.2.5

Coamings and steel parts of hatch covers in contact with gaskets are to have no sharp edges.

7.2.6

Metallic contact is required for an earthing connection between the hatch cover and the hull structures. If necessary, this is to be achieved by means of a special connection for the purpose.

7.3 Closing arrangement, securing devices and stoppers

7.3.1 General

Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.
The securing and stop arrangements are to be fitted using appropriate means which cannot be easily removed.
In addition to the requirements above, all hatch covers, and in particular those carrying deck cargo, are to be effectively secured against horizontal shifting due to the horizontal forces resulting from ship motions.
Towards the ends of the ship, vertical acceleration forces may exceed the gravity force. The resulting lifting forces are to be considered when dimensioning the securing devices according to **[7.3.5]** to **[7.3.7].** Lifting forces from cargo secured on the hatch cover during rolling are also to be taken into account.
Hatch coamings and supporting structure are to be adequately stiffened to accommodate the loading from hatch covers.
Hatch covers provided with special sealing devices, insulated hatch covers, flush hatch covers and those having coamings of a reduced height (see **[2.1]**) are considered by the Society on a case by case basis.
In the case of hatch covers carrying containers, the scantlings of the closing devices are to take into account the possible upward vertical forces transmitted by the containers.

7.3.2 Arrangements

The securing and stopping devices are to be arranged so as to ensure sufficient compression on gaskets between hatch covers and coamings and between adjacent hatch covers.
Arrangement and spacing are to be determined with due attention to the effectiveness for weathertightness, depending on the type and the size of the hatch cover, as well as on the stiffness of the hatch cover edges between the securing devices.
At cross-joints of multipanel covers, (male/female) vertical guides are to be fitted to prevent excessive relative vertical deflections between loaded/unloaded panels.
The location of stoppers is to be compatible with the relative movements between hatch covers and the ship's structure in order to prevent damage to them. The number of stoppers is to be as small as possible.

7.3.3 Spacing

The spacing of the securing arrangements is to be generally not greater than 6 m.

7.3.4 Construction

Securing arrangements with reduced scantlings may be accepted provided it can be demonstrated that the possibility of water reaching the deck is negligible.
Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or hatch covers.
Individual securing devices on each hatch cover are to have approximately the same stiffness characteristics.

7.3.5 Area of securing devices

The net cross area of each securing device is to be not less than the value obtained, in cm^2, from the following formula:

$$A = 1.4 S_S \left(\frac{235}{R_{eH}} \right)^{\alpha}$$

where:

S_S : Spacing, in m, of securing devices

α : Coefficient taken equal to:

$\alpha = 0.75$ for $R_{eH} > 235\ N/mm^2$

$\alpha = 1.0$ for $R_{eH} \leq 235\ N/mm^2$

In the above calculations, R_{eH} may not be taken greater than 0.7 R_m.
Between hatch cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by securing devices. For packing line pressures exceeding 5 N/mm, the net cross area A is to be increased in direct proportion. The packing line pressure is to be specified.
In the case of securing arrangements which are particularly stressed due to the unusual width of the hatchway, the net cross area A of the above securing arrangements is to be determined through direct calculations.

7.3.6 Inertia of edges elements

The hatch cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices.
The moment of inertia of edge elements is to be not less than the value obtained, in cm^4, from the following formula:

$$I = 6 p_L S_S^4$$

where:

p_L : Packing line pressure, in N/mm, to be taken not less than 5

S_S : Spacing, in m, of securing devices.

7.3.7 Diameter of rods or bolts

Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

7.3.8 Stoppers

Hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m^2.
With the exclusion of No 1 hatch cover, hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.
No 1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m^2. This pressure may be reduced to 175 kN/m^2 if a forecastle is fitted in accordance with **Sec 1, [7.1].**
The equivalent stress in stoppers, their supporting structures and calculated in the throat of the stopper welds is to be equal to or less than the allowable value, equal to 0.8 R_{eH}.

7.4 Tarpaulins

7.4.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 15 (11))
Where weathertightness of hatch covers is ensured by means of tarpaulins, at least two layers of tarpaulins are to be fitted.
Tarpaulins are to be free from jute and waterproof and are to have adequate characteristics of strength and resistance to atmospheric agents and high and low temperatures.
The mass per unit surface of tarpaulins made of vegetable fibres, before the waterproofing treatment, is to be not less than:

- 0.65 kg/m^2 for waterproofing by tarring
- 0.60 kg/m^2 for waterproofing by chemical dressing
- 0.55 kg/m^2 for waterproofing by dressing with black oil.

In addition to tarpaulins made of vegetable fibres, those of synthetic fabrics or plastic laminates may be accepted by the Society provided their qualities, as regards strength, waterproofing and resistance to high and low temperatures, are equivalent to those of tarpaulins made of vegetable fibres.

7.5 Cleats

7.5.1

Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

7.5.2

Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

7.6 Wedges

7.6.1 Wedges

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 15 (10))
Wedges are to be of tough wood, generally not more than 200 mm in length and 50 mm in width. They are generally to be tapered not more than 1 in 6 and their thickness is to be not less than 13 mm.

8. Drainage

8.1 Arrangement

8.1.1

Drainage is to be arranged inside the line of gaskets by means of a gutter bar or vertical extension of the hatch side and end coaming.

8.1.2

Drain openings are to be arranged at the ends of drain channels and are to be provided with efficient means for preventing ingress of water from outside, such as non-return valves or equivalent.

8.1.3

Cross-joints of multi-panel hatch covers are to be arranged with drainage of water from the space above the gasket and a drainage channel below the gasket.

8.1.4

If a continuous outer steel contact is arranged between the cover and the ship's structure, drainage from the space between the steel contact and the gasket is also to be provided.

9. Small hatches fitted on the exposed fore deck

9.1 Application

9.1.1

The requirements of this article apply to steel covers of small hatches fitted on the exposed fore deck over the forward $0.25\,L$, where the height of the exposed deck in way of the hatch is less than $0.1\,L$ or 22 m above the summer load waterline, whichever is the lesser.
Small hatches are hatches designed for access to spaces below the deck and are capable to be closed weather-tight or watertight, as applicable. Their opening is generally equal to or less than $2.5\ \mathrm{m}^2$.

9.1.2

Small hatches designed for use of emergency escape are to comply with the requirements of this article with exception of **[9.4.1]** a) and b), **[9.4.3]** and **[9.5.1].**

9.2 Strength

9.2.1

For small rectangular steel hatch covers, the gross plate thickness, stiffener arrangement and scantlings are to be not less than those obtained, in mm, from **Table 4** and **Fig 6.**
Ordinary stiffeners, where fitted, are to be aligned with the metal-to-metal contact points, required in **[9.3.1]** (see also **Fig 6**).
Primary stiffeners are to be continuous.
All stiffeners are to be welded to the inner edge stiffener (see **Fig 7**).

Table 4: Gross scantlings for small steel hatch covers on the fore deck

Nominal size (mm × mm)	Cover plate thickness (mm)	Primary stiffeners	Ordinary stiffeners
		Flat bar (mm × mm); number	
630 × 630	8	-	-
630 × 830	8	100 × 8 ; 1	-
830 × 630	8	100 × 8 ; 1	-
830 × 830	8	100 × 10 ; 1	-
1030 × 1030	8	120 × 12 ; 1	80 × 8 ; 2
1330 × 1330	8	150 × 12 ; 2	100 × 10 ; 2

9.2.2

The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, generally not more than 170 to 190 mm from the upper edge of the coamings.

9.2.3

For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement are to comply with **[5.2].**

9.2.4

For small hatch covers constructed of materials other than steel, the required scantlings are to provide equivalent strength.

9.3 Weathertightness

9.3.1

The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with **Fig 6** and a sufficient capacity to withstand the bearing force.

9.4 Primary securing devices

9.4.1

Small hatches located on exposed fore deck are to be fitted with primary securing devices such their hatch covers can be secured in place and weather-tight by means of a mechanism employing any one of the following methods:

a) butterfly nuts tightening onto forks (clamps)

b) quick acting cleats

c) central locking device.

Dogs (twist tightening handles) with wedges are not acceptable.

9.4.2

The primary securing method is to be designed and manufactured such that the designed compression pressure is achieved by one person without the need of any tools.

9.4.3

For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimize the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is to be not less than 16 mm. An example arrangement is shown in **Fig 7.**

9.4.4

For small hatch covers located on the exposed deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green seas will cause the cover to close, which means that the hinges are normally to be located on the fore edge.

9.4.5

On small hatches located between the main hatches, for example between Nos. 1 and 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

9.5 Secondary securing devices

9.5.1

Small hatches on the fore deck are to be fitted with an independent secondary securing device e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

Section 6 – ARRANGEMENT OF HULL AND SUPERSTRUCTURE OPENINGS

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

p : Lateral pressure for glasses, in kN/m^2, defined in **[3.3.2].**

1. General

1.1 Application

1.1.1

The requirements of this Section apply to the arrangement of hull and superstructure openings excluding hatchways, for which the requirements in **Ch 9, Sec 5** apply.

1.2 Definitions

1.2.1 Standard height of superstructure

The standard height of superstructure is that defined in **Ch 1, Sec 4.**

1.2.2 Standard sheer

The standard sheer is that defined according to the International Load Line Convention, as amended.

1.2.3 Exposed zones

Exposed zones are the boundaries of superstructures or deckhouses set in from the ship's side at a distance equal to or less than 0.04 *B*.

1.2.4 Unexposed zones

Unexposed zones are the boundaries of deckhouses set in from the ship's side at a distance greater than 0.04 *B*.

2. External openings

2.1 General

2.1.1

Ref. SOLAS Reg.II-1/25-10 .1
All external openings leading to compartments assumed intact in the damage analysis, which are below the final damage waterline, are required to be watertight.

2.1.2

Ref. SOLAS Reg.II-1/25-10 .2
External openings required to be watertight in accordance with [2.1.1] are to be of sufficient strength and, except for cargo hatch covers, are to be fitted with indicators on the bridge.

2.1.3

No openings, be they permanent openings or temporary openings such as shell doors, windows or ports, are allowed on the side shell between the embarkation station of the marine evacuation system and the waterline in the lightest seagoing condition. Windows and side scuttles of the non-opening type are allowed if the Society's applicable criteria for fire integrity are complied with.

2.1.4

Ref. SOLAS Reg.II-1/25-10 .5
Other closing appliances which are kept permanently closed at sea to ensure the watertight integrity of external openings are to be provided with a notice affixed to each appliance to the effect that it is to be kept closed. Manholes fitted with closely bolted covers need not be so marked.

2.2 Gangway, cargo and coaling ports

2.2.1

Ref. SOLAS Reg.II-1/17-1 & Reg.II-1/17.10.1 & .10.2 and ILLC, as amended (Resolution MSC.143(77) Reg. 21(2))
Gangway, cargo and coaling ports fitted below the freeboard deck are to be of sufficient strength. They are to be effectively closed and secured watertight before the ship leaves port, and to be kept closed during navigation.
Such ports are in no case to be so fitted as to have their lowest point below the deepest subdivision load line.
Unless otherwise permitted by the Society, the lower edge of openings is not to be below a line drawn parallel to the freeboard deck at side, which is at its lowest point at least 230 mm above the upper edge of the uppermost load line.

3. Side scuttles, windows and skylights

3.1 General

3.1.1 Application

The requirements in **[3.1]** to **[3.4]** apply to side scuttles and rectangular windows providing light and air, located in positions which are exposed to the action of sea and/or bad weather.

3.1.2 Side scuttle definition

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(2))
Side scuttles are round or oval openings with an area not exceeding 0.16 m^2*. Round or oval openings having areas exceeding 0.16* m^2 *are to be treated as windows.*

3.1.3 Window definition

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(3))
Windows are rectangular openings generally, having a radius at each corner relative to the window size in accordance with recognised national or international standards, and round or oval openings with an area exceeding 0.16 m^2.

3.1.4 Number of openings in the shell plating

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .1
The number of openings in the shell plating are to be reduced to the minimum compatible with the design and proper working of the ship.

3.1.5 Material and scantlings

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(1))
Side scuttles and windows together with their glasses, deadlights and storm covers, if fitted, are to be of approved design and substantial construction in accordance with, or equivalent to, recognised national or

international standards.
Non-metallic frames are not acceptable. The use of ordinary cast iron is prohibited for side scuttles below the freeboard deck.

3.1.6 Means of closing and opening

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .2
The arrangement and efficiency of the means for closing any opening in the shell plating are to be consistent with its intended purpose and the position in which it is fitted is to be generally to the satisfaction of the Society.

3.1.7 Opening of side scuttles

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .3.2
All side scuttles, the sills of which are below the freeboard deck, are to be of such construction as to prevent effectively any person opening them without the consent of the Master of the ship.

3.2 Opening arrangement

3.2.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(5))
Side scuttles are not be fitted in such a position that their sills are below a line drawn parallel to the freeboard deck at side and having its lowest point 0.025 B or 0.5 m, whichever is the greater distance, above the summer load waterline (or timber summer load waterline if assigned).

3.2.2 Side scuttles below (1.4 + 0.025*B*) m above the water

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .3.3.1 and .3.3.3
Where in 'tween decks the sills of any of the side scuttles are below a line drawn parallel to the freeboard deck at side and having its lowest point 1.4 + 0.025 B m above the water when the ship departs from any port, all the side scuttles in that 'tween decks are to be closed watertight and locked before the ship leaves port, and they may not be opened before the ship arrives at the next port. In the application of this requirement, the appropriate allowance for fresh water may be made when applicable.
For any ship that has one or more side scuttles so placed that the above requirements apply when it is floating at its deepest subdivision load line, the Society may indicate the limiting mean draught at which these side scuttles are to have their sills above the line drawn parallel to the freeboard deck at side, and having its lowest point 1.4 + 0.025 B above the waterline corresponding to the limiting mean draught, and at which it is therefore permissible to depart from port without previously closing and locking them and to open them at sea under the responsibility of the Master during the voyage to the next port. In tropical zones as defined in the International Convention on Load Lines in force, this limiting draught may be increased by 0.3 m.

3.2.3 Cargo spaces

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .6.1 to .6.3
No side scuttles may be fitted in any spaces which are appropriated exclusively for the carriage of cargo or coal.
Side scuttles may, however, be fitted in spaces appropriated alternatively for the carriage of cargo or passengers, but they are to be of such construction as to prevent effectively any person opening them or their deadlights without the consent of the Master.
If cargo is carried in such spaces, the side scuttles and their deadlights are to be closed watertight and locked before the cargo is shipped. The Society, at its discretion, may prescribe that the time of closing and locking is to be recorded in a log book.

3.2.4 Non-opening type side scuttles

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(6))
Side scuttles are to be of the non-opening type where they become immersed by any intermediate stage

of flooding or the final equilibrium waterline in any required damage case for ships subject to damage stability regulations.

3.2.5 Manholes and flush scuttles

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18(1))
Manholes and flush scuttles in positions 1 or 2, or within superstructures other than enclosed superstructures, are to be closed by substantial covers capable of being made watertight. Unless secured by closely spaced bolts, the covers are to be permanently attached.

3.2.6 Automatic ventilating scuttles

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .7
Automatic ventilating side scuttles, fitted in the shell plating below the freeboard deck, are considered by the Society on a case by case basis.

3.2.7 Window arrangement

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(7))
Windows are not to be fitted below the freeboard deck, in first tier end bulkheads or sides of enclosed superstructures and in first tier deckhouses considered buoyant in the stability calculations or protecting openings leading below.

3.2.8 Skylights

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(12))
Fixed or opening skylights are to have glass thickness appropriate to their size and position as required for side scuttles and windows. Skylight glasses in any position are to be protected from mechanical damage and, where fitted in positions 1 or 2, to be provided with permanently attached robust deadlights or storm covers.

3.3 Glasses

3.3.1 General

In general, toughened glasses with frames of special type are to be used in compliance with, or equivalent to, recognised national or international standards. The use of clear plate glasses is considered by the Society on a case by case basis.

3.3.2 Design loads

The design load is to be determined in accordance with the applicable requirements of **Ch 9, Sec 4.**

3.3.3 Materials

Toughened glasses are to be in accordance with ISO 1095 for side scuttles and ISO 3254 for windows.

3.3.4 Thickness of toughened glasses in side scuttles

The thickness of toughened glasses in side scuttles is to be not less than that obtained, in mm, from the following formula:

$$t = \frac{d}{358}\sqrt{p}$$

where:

d : Side scuttle diameter, in mm.

3.3.5 Thickness of toughened glasses in rectangular windows

The thickness of toughened glasses in rectangular windows is to be not less than that obtained, in mm, from the following formula:

$$t = \frac{b}{200}\sqrt{\beta p}$$

where:

β : Coefficient defined in **Table 1**. β is to be obtained by linear interpolation for intermediate values of a/b

a : Length, in mm, of the longer side of the window

b : Length, in mm, of the shorter side of the window.

Table 1: Coefficient β

a/b	β
1.0	0.284
1.5	0.475
2.0	0.608
2.5	0.684
3.0	0.716
3.5	0.734
$\geq$ 4.0	0.750

The Society may require both limitations on the size of rectangular windows and the use of glasses of increased thickness in way of front bulkheads which are particularly exposed to heavy sea.

3.4 Deadlight arrangement

3.4.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(4))
Side scuttles to the following spaces are to be fitted with hinged inside deadlights:

- *spaces below freeboard deck*
- *spaces within the first tier of enclosed superstructures*
- *first tier deckhouses on the freeboard deck protecting openings leading below or considered buoyant in stability calculations.*

Deadlights are to be capable of being closed and secured watertight if fitted below the freeboard deck and weathertight if fitted above.

3.4.2 Openings at the side shell in the second tier

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(8))
Side scuttles and windows at the side shell in the second tier are to be provided with efficient, hinged inside deadlights capable of being closed and secured weathertight, if the superstructure protects direct access to an opening leading below or is considered buoyant in the stability calculations.

3.4.3 Openings set inboard in the second tier

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(9) and .23(10))

Side scuttles and windows in side bulkheads set inboard from the side shell in the second tier which protect direct access below to spaces listed in [3.4.1], are to be provided with either hinged inside deadlights or, where they are accessible, permanently attached external storm covers of approved design and substantial constructioncapableofbeingclosedandsecuredweathertight.
Cabin bulkheads and doors in the second tier and above separating side scuttles and windows from a direct access leading below or the second tier considered buoyant in the stability calculations may be accepted in place of deadlights or storm covers fitted to the side scuttles and windows.
Note 1: Deadlights in accordance with recognised standards are fitted to the inside of windows and side scuttles, while storm covers of comparable specifications to deadlights are fitted to the outside of windows, where accessible, and may be hinged or portable.

3.4.4 Deckhouses on superstructures of less than standard height

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(11))
Deckhouses situated on a raised quarter deck or on the deck of a superstructure of less than standard height may be regarded as being in the second tier as far as the requirements for deadlights are concerned, provided the height of the raised quarterdeck or superstructure is equal to or greater than the standard quarter deck height.

3.4.5 Openings protected by a deckhouse

Where an opening in a superstructure deck or in the top of a deckhouse on the freeboard deck which gives access to a space below the freeboard deck or to a space within an enclosed superstructure is protected by a deckhouse, then it is considered that only those side scuttles fitted in spaces which give direct access to an open stairway need to be fitted with deadlights.

4. Discharges

4.1 Arrangement of discharges

4.1.1 Inlets and discharges

Ref. SOLAS Reg.II-1/17-1 & Reg.II-1/17 .9.1
All inlets and discharges in the shell plating are to be fitted with efficient and accessible arrangements for preventing the accidental admission of water into the ship.

4.1.2 Inboard opening of ash-shoot, rubbish-shoot, etc.

Ref. SOLAS Reg.II-1/17-1 & Reg.II-1/17 .11.1 and .11.2
The inboard opening of each ash-shoot, rubbish-shoot, etc. is to be fitted with an efficient cover.
If the inboard opening is situated below the freeboard deck, the cover is to be watertight, and in addition an automatic non-return valve is to be fitted in the shoot in an easily accessible position above the deepest subdivision load line. When the shoot is not in use, both the cover and the valve are to be kept closed and secured.

4.2 Arrangement of garbage chutes

4.2.1 Inboard end above the waterline

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(1, b))
The inboard end is to be located above the waterline formed by an 8.5° heel, to port or starboard, at a draft corresponding to the assigned summer freeboard, but not less than 1000 mm above the summer load waterline.
Where the inboard end of the garbage chute exceeds 0.01 L above the summer load waterline, valve control from the freeboard deck is not required, provided the inboard gate valve is always accessible under service conditions.

4.2.2 Inboard end below the waterline

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(4))
Where the inboard end of a garbage chute is below the waterline corresponding to the deepest draught after damage in a ship of more than 100 m in length, then:

- *the inboard end hinged cover/valve is to be watertight*
- *the valve is to be a screw-down non-return valve fitted in an easily accessible position above the deepest subdivision load line*
- *the screw-down non-return valve is to be controlled from a position above the freeboard deck and provided with open/shut indicators. The valve control is to be clearly marked: «Keep closed when not in use».*

4.2.3 Gate valves

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(1, a))
For garbage chutes, two gate valves controlled from the working deck of the chute may be accepted instead of a non-return valve with a positive means of closing it from a position above the freeboard deck. In addition, the lower gate valve is to be controlled from a position above the freeboard deck. An interlock system between the two valves is to be arranged.
The distance between the two gate valves is to be adequate to allow the smooth operation of the interlock system.

4.2.4 Hinged cover and discharge flap

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(1, c))
The upper and lower gate valves, as required in [4.2.3], may be replaced by a hinged weathertight cover at the inboard end of the chute together with a discharge flap.
The cover and discharge flap are to be arranged with an interlock so that the flap cannot be operated until the hopper cover is closed.

4.2.5 Marking of valve and hinged cover

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(3))
The controls for the gate valves and/or hinged covers are to be clearly marked: «Keep closed when not in use».

4.3 Scantlings of garbage chutes

4.3.1 Material

The chute is to be constructed of steel. Other equivalent materials are considered by the Society on a case by case basis.

4.3.2 Wall thickness

The wall thickness of the chute up to and including the cover is to be not less than that obtained, in mm, from **Table 2.**

Table 2: Wall thickness of garbage chutes

External diameter d, in mm	Thickness, in mm
$d \leq 80$	7.0
$80 < d < 180$	$7.0 + 0.03(d - 80)$
$180 \leq d \leq 220$	$10.0 + 0.063(d - 180)$
$d > 220$	12.5

5. Freeing ports

5.1 General provisions

5.1.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (1, a) and Reg.3 (15))
Where bulwarks on the weather portions of freeboard or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of water and for draining them.
A well is any area on the deck exposed to the weather, where water may be entrapped. Wells are considered to be deck areas bounded on four sides by deck structures; however, depending on their configuration, deck areas bounded on three or even two sides by deck structures may be deemed wells.

5.1.2 Freeing port areas

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24)
The minimum required freeing port areas in bulwarks on the freeboard deck are specified in Table 3.

Table 3: Freeing port area in bulwark located on freeboard deck

Ship types or ship particulars	Area A of freeing ports, in m^2	Applicable requirement
Type B-100	$0.33\,\ell_B h_B$	[5.5.2]
Type B-60	$0.25\,\ell_B h_B$	[5.5.1]
Ships fitted with a trunk included in freeboard calculation and/ or breadth ≥ 0.6 B	$0.33\,\ell_B h_B$	[5.3.1]
Ships fitted with a trunk not included in freeboard calculation and/or continuous or substantially continuous hatch coamings	A_2	[5.3.1]
Ships fitted with non-continuous trunk and/or hatch coamings	A_3	[5.3.2]
Ships fitted with open superstructure	A_S for superstructures	[5.4.2]
	A_W for wells	[5.4.3]
Other ships	A_1	[5.2.1]

where:
ℓ_B : Length, in m, of bulwark in a well at one side of the ship
h_B : Mean height, in m, of bulwark in a well of length ℓ_B.

5.1.3 Freeing port arrangement

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (5))
Where a sheer is provided, two thirds of the freeing port area required is to be provided in the half of the well nearer the lowest point of the sheer curve.
One third of the freeing port area required is to be evenly spread along the remaining length of the well. With zero or little sheer on the exposed freeboard deck or an exposed superstructure deck the freeing port area is to be evenly spread along the length of the well.
However, bulwarks may not have substantial openings or accesses near the breaks of superstructures, unless they are effectively detached from the superstructure sides.

5.1.4 Freeing port positioning

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (5) and 24 (6))
The lower edge of freeing ports is to be as near the deck as practicable.

All the openings in the bulwark are to be protected by rails or bars spaced approximately 230 mm apart.

5.1.5 Freeing port closures

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (6))
If shutters or closures are fitted to freeing ports, ample clearance is to be provided to prevent jamming. Hinges are to have pins or bearings of non-corrodible material. If shutters are fitted with securing appliances, these appliances are to be of approved construction.

5.2 Freeing port area in a well not adjacent to a trunk or hatchways

5.2.1 Freeing port area

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (1, b and c))
Where the sheer in way of the well is standard or greater than the standard, the freeing port area on each side of the ship for each well is to be not less than that obtained, in m^2*, in Table 4.*
In ships with no sheer, the above area is to be increased by 50 %. Where the sheer is less than the standard, the percentage of increase is to be obtained by linear interpolation.

Table 4: Freeing port area in a well not adjacent to a trunk or hatchways

Location	Area A_1 of freeing ports, in m^2	
	$\ell_B \le 20$	$\ell_B > 20$
Freeboard deck and raised quarterdecks	$0.7 + 0.035\,\ell_B + A_C$	$0.07\,\ell_B + A_C$
Superstructure decks	$0.35 + 0.0175\,\ell_B + 0.5A_C$	$0.035\,\ell_B + 0.5A_C$

where:
ℓ_B : Length, in m, of bulwark in the well, but need in no case to be taken as greater than $0.7\,L_{LL}$
A_C : Area, in m^2, to be taken, with its sign, equal to:

$$A_C = \frac{\ell_B}{25}(h_B - 1.2) \quad \text{for} \quad h_B > 1.2$$
$$A_C = 0 \quad \text{for} \quad 0.9 \le h_B \le 1.2$$
$$A_C = \frac{\ell_B}{25}(h_B - 0.9) \quad \text{for} \quad h_B < 0.9$$

h_B : Mean height, in m, of the bulwark in a well of length ℓ_B.

5.2.2 Minimum freeing port area for a deckhouse having breadth not less than 0.8 *B*

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (1, d))
Where a flush deck ship is fitted amidships with a deckhouse having breadth not less than 0.8 B and the width of the passageways along the side of the ship less than 1.5 m, the freeing port area is to be calculated for two separate wells, before and abaft the deckhouse. For each of these wells, the freeing port area is to be obtained from Table 4, where ℓ_B *is to be taken equal to the actual length of the well considered.*

5.2.3 Minimum freeing port area for screen bulkhead

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (1, e))
Where a screen bulkhead is fitted across the full breadth of the ship at the fore end of a midship deckhouse, the weather deck is to be considered as divided into two wells, irrespective of the width of the deckhouse, and the freeing port area is to be obtained in accordance with [5.1.2].

5.3 Freeing port area in a well contiguous to a trunk or hatchways

5.3.1 Freeing area for continuous trunk or continuous hatchway coaming

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (2))
Where the ship is fitted with a continuous trunk not included in the calculation of freeboard or where continuous or substantially continuous hatchway side coamings are fitted between detached superstructures, the freeing port area is to be not less than that obtained, in m^2*, from Table 5.*

Table 5: Freeing port area in a well contiguous to a continuous trunk or hatchway

Breadth B_H, in m, of hatchway or trunk	Area A_2 of freeing ports, in m^2
$B_H \leq 0.4\,B$	$0.2\,\ell_B h_B$
$0.4B < B_H < 0.75\,B$	$\left[0.2 - 0.286\left(\frac{B_H}{B} - 0.4\right)\right]\ell_B h_B$
$B_H \geq 0.75\,B$	$0.1\,\ell_B h_B$
where: ℓ_B : Length, in m, of bulwark in a well at one side of the ship h_B : Mean height, in m, of bulwark in a well of length ℓ_B.	

Where the ship is fitted with a continuous trunk having breadth not less than $0.6\,B$, included in the calculation of freeboard, and where open rails on the weather parts of the freeboard deck in way of the trunk for at least half the length of these exposed parts are not fitted, the freeing port area in the well contiguous to the trunk is to be not less than 33 % of the total area of the bulwarks.

5.3.2 Freeing area for non-continuous trunk or hatchway coaming

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (3))
Where the free flow of water across the deck of the ship is impeded due to the presence of a non-continuous trunk, hatchway coaming or deckhouse in the whole length of the well considered, the freeing port area in the bulwark of this well is to be not less than that obtained, in m^2*, from Table 6.*

Table 6: Freeing port area in a well contiguous to a non-continuous trunk or hatchway

Free flow area f_P, in m^2	Freeing port area A_3, in m^2
$f_P \leq A_1$	A_2
$A_1 < f_P < A_2$	$A_1 + A_2 - f_P$
$f_P \geq A_2$	A_1
where: f_P : Free flow area on deck, equal to the net area of gaps between hatchways, and between hatchways and superstructures and deckhouses up to the actual height of the bulwark A_1 : Area of freeing ports, in m^2, to be obtained from **Table 4** A_2 : Area of freeing ports, in m^2, to be obtained from **Table 5**.	

5.4 Freeing port area in an open space within superstructures

5.4.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (4))
In ships having superstructures on the freeboard or superstructure decks, which are open at either or

both ends to wells formed by bulwarks on the open decks, adequate provision for freeing the open spaces within the superstructures is to be provided.

5.4.2 Freeing port area for open superstructures

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (4))
The freeing port area on each side of the ship for the open superstructure is to be not less than that obtained, in m^2*, from the following formula:*

$$A_S = A_1 C_{SH}\left[1-\left(\frac{\ell_W}{\ell_T}\right)^2\right]\left(\frac{b_0 h_s}{2\ell_T h_W}\right)$$

where:

ℓ_T : *Total well length, in m, to be taken equal to:*
$\ell_T = \ell_W + \ell_S$

ℓ_W : *Length, in m, of the open deck enclosed by bulwarks*

ℓ_S : *Length, in m, of the common space within the open superstructures*

A_1 : *Freeing port area, in* m^2*, required for an open well of length* ℓ_T*, in accordance with Table 4, where* A_C *is to be taken equal to zero*

C_{SH} : *Coefficient which accounts for the absence of sheer, if applicable, to be taken equal to:*
C_{SH} = *1.0 in the case of standard sheer or sheer greater than standard sheer*
C_{SH} = *1.5 in the case of no sheer*

b_0 : *Breadth, in m, of the openings in the end bulkhead of enclosed superstructures*

h_S : *Standard superstructure height, in m, defined in [1.2.1]*

h_W : *Distance, in m, of the well deck above the freeboard deck.*

5.4.3 Freeing port area for open well

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (4))
The freeing port area on each side of the ship for the open well is to be not less than that obtained, in m^2*, from the following formula:*

$$A_W = A_1 c_{SH}\left(\frac{h_S}{2h_W}\right)$$

A_1 : *Freeing port area, in* m^2*, required for an open well of length* ℓ_W*, in accordance with* ***Table 4***

c_{SH}, h_S, h_W, ℓ_W : *Defined in* ***[5.4.2].***

The resulting freeing port areas for the open superstructure A_S *and for the open well* A_W *are to be provided along each side of the open space covered by the open superstructure and each side of the open well, respectively.*

5.5 Freeing port area in bulwarks of the freeboard deck for ships of types B-100 and B-60

5.5.1 Freeing arrangement for type B-60

For type B-60 ships, the freeing port area in the lower part of the bulwarks of the freeboard deck is to be not less than 25 % of the total area of the bulwarks in the well considered.
The upper edge of the sheer strake is to be kept as low as possible.

5.5.2 Freeing arrangement for type B-100 ships with trunks

For type B-100 ships, open rails are to be fitted on the weather parts of the freeboard deck in way of the trunk for at least half the length of these exposed parts.
Alternatively, if a continuous bulwark is fitted, the freeing port area in the lower part of the bulwarks of the freeboard deck is to be not less than 33 % of the total area of the bulwarks in the well considered.

6. Machinery space openings

6.1 Engine room skylights

6.1.1

Engine room skylights in positions 1 or 2 are to be properly framed, securely attached to the deck and efficiently enclosed by steel casings of suitable strength. Where the casings are not protected by other structures, their strength will be considered by the Society on a case by case basis.

6.2 Closing devices

6.2.1 Machinery casings

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (1)and 12 (1))
Openings in machinery space casings in positions 1 or 2 are to be fitted with doors of steel or other equivalent materials, permanently and strongly attached to the bulkhead, and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead and weathertight when closed. The doors are to be capable of being operated from both sides and generally to open outwards to give additional protection against wave impact.
Other openings in such casings are to be fitted with equivalent covers, permanently attached in their proper position.

6.2.2 Height of the sill of the door

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (1 and 2))
The height of the sill of the door is to be not less than:

- *600 mm above the deck if in position 1*
- *380 mm above the deck if in position 2*
- *230 mm in all other cases.*

6.2.3 Double doors

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (1 and 2))
Where casings are not protected by other structures, double doors (i.e. inner and outer doors) are required for ships assigned freeboard less than that based on Table B of the International Load Line Convention, as amended. An inner sill of 230 mm in conjunction with the outer sill of 600 mm is to be provided.

6.2.4 Fiddly openings

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (5))
Fiddly openings are to be fitted with strong covers of steel or other equivalent material permanently attached in their proper positions and capable of being secured weathertight.

6.3 Coamings

6.3.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (3))
Coamings of any fiddly, funnel or machinery space ventilator in an exposed position on the freeboard

deck or superstructure deck are to be as high above the deck as is reasonable and practicable.
In general, ventilators necessary to continuously supply the machinery space and, on demand, the emergency generator room are to have coamings whose height is in compliance with [8.1.3], but need not be fitted with weathertight closing appliances.

6.3.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (4))
Where, due to the ship's size and arrangement, this is not practicable, lesser heights for machinery space and emergency generator room ventilator coamings, fitted with weathertight closing appliances in accordance with [8.1.2], may be permitted by the Society in combination with other suitable arrangements to ensure an uninterrupted, adequate supply of ventilation to these spaces.

7. Companionway

7.1 General

7.1.1 Openings in freeboard deck

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (2))
Openings in freeboard deck other than hatchways, machinery space openings, manholes and flush scuttles are to be protected by an enclosed superstructure or by a deckhouse or companionway of equivalent strength and weathertightness.

7.1.2 Openings in superstructures

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (2))
Openings in an exposed superstructure deck or in the top of a deckhouse on the freeboard deck which give access to a space below the freeboard deck or a space within an enclosed superstructure are to be protected by an efficient deckhouse or companionway.

7.1.3 Openings in superstructures having height less than standard height

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (3))
Openings in the top of a deckhouse on a raised quarterdeck or superstructure of less than standard height, having a height equal to or greater than the standard quarterdeck height are to be provided with an acceptable means of closing but need not be protected by an efficient deckhouse or companionway provided the height of the deckhouse is at least the height of the superstructure. Openings in the top of the deckhouse on a deckhouse of less than a standard superstructure height may be treated in a similar manner.

7.2 Scantlings

7.2.1

Companionways on exposed decks protecting openings leading into enclosed spaces are to be of steel and strongly attached to the deck and are to have adequate scantlings.

7.3 Closing devices

7.3.1 Doors

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (2))
Doorways in deckhouses or companionways leading to or giving access to spaces below the freeboard deck or to enclosed superstructures are to be fitted with weathertight doors. The doors are to be made of steel, to be capable of being operated from both sides and generally to open outwards to give additional protection against wave impact.
Alternatively, if stairways within a deckhouse are enclosed within properly constructed companionways

fitted with weathertight doors, the external door need not be weathertight.
Where the closing appliances of access openings in superstructures and deckhouses are not weathertight, interior deck openings are to be considered exposed, i.e. situated in the open deck.

7.3.2 Height of sills

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (4 to 6))
The height above the deck of sills to the doorways in companionways is to be not less than:

- *600 mm in position 1*
- *380 mm in position 2.*

Where access is provided from the deck above as an alternative to access from the freeboard deck, the height of the sills into the bridge or poop is to be 380 mm. This also applies to deckhouses on the freeboard deck.
Where access is not provided from above, the height of the sills to doorways in deckhouses on the freeboard deck is to be 600 mm.

8. Ventilators

8.1 Closing appliances

8.1.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (4))
Ventilator openings are to be provided with efficient weathertight closing appliances of steel or other equivalent material.

8.1.2 Closing appliance exemption

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (3))
Ventilators need not be fitted with closing appliances, unless specifically required by the Society, if the coamings extend for more than:

- *4.5 m above the deck in position 1*
- *2.3 m above the deck in position 2.*

8.1.3 Closing appliances for ships of not more than 100 m in length

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (4))
In ships of not more than 100 m in length, the closing appliances are to be permanently attached to the ventilator coamings.

8.1.4 Closing appliances for ships of more than 100 m in length

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (4))
Where, in ships of more than 100 m in length, the closing appliances are not permanently attached, they are to be conveniently stowed near the ventilators to which they are to be fitted.

8.1.5 Ventilation of machinery spaces and emergency generator room

In order to satisfactorily ensure, in all weather conditions:

- the continuous ventilation of machinery spaces,
- and, when necessary, the immediate ventilation of the emergency generator room,

the ventilators serving such spaces are to comply with **[8.1.2]**, i.e. their openings are to be so located that they do not require closing appliances.

8.1.6 Reduced height of ventilator coamings for machinery spaces and emergency generator room

Where, due to the ship's size and arrangement, the requirements in [8.1.5] are not practicable, lesser heights may be accepted for machinery space and emergency generator room ventilator coamings fitted with weathertight closing appliances in accordance with [8.1.1], [8.1.3] and [8.1.4] in combination with other suitable arrangements, such as separators fitted with drains, to ensure an uninterrupted, adequate supply of ventilation to these spaces.

8.1.7 Closing arrangements of ventilators led overboard or through enclosed superstructures

Closing arrangements of ventilators led overboard to the ship side or through enclosed superstructures are considered by the Society on a case by case basis. If such ventilators are led overboard more than 4.5 m above the freeboard deck, closing appliances may be omitted provided that satisfactory baffles and drainage arrangements are fitted.

8.2 Coamings

8.2.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (1 and 2))
Ventilators in positions 1 or 2 to spaces below freeboard decks or decks of enclosed superstructures are to have coamings of steel or other equivalent material, substantially constructed and efficiently connected to the deck.
Ventilators passing through superstructures other than enclosed superstructures are to have substantially constructed coamings of steel or other equivalent material at the freeboard deck.

8.2.2 Scantlings

The scantlings of ventilator coamings exposed to the weather are to be not less than those obtained from **Table 7.**
In exposed locations or for the purpose of compliance with buoyancy calculations, the height of coamings may be required to be increased to the satisfaction of the Society.

Table 7: Scantlings of ventilator coamings

Feature	Scantlings
Height of the coaming, in mm, above the deck	h = 900 in position 1 h = 760 in position 2
Thickness of the coaming, in mm(1)	$t = 5.5 + 0.01 d_V$ with $7.5 \le t \le 10$
Support	If $h > 900$ mm, the coaming is to be suitably stiffened or supported by stays.

where:
d_V : External diameter of the ventilator, in mm.
(1) Where the height of the ventilator exceeds the height h, the thickness of the coaming may be gradually reduced, above that height, to a minimum of 6.5 mm.

9. Tank cleaning openings

9.1 General

9.1.1

Ullage plugs, sighting ports and tank cleaning openings may not be arranged in enclosed spaces. ⚓

Chapter 10

Hull Outfitting

Section 1 - RUDDER AND MANOEUVRING ARRANGEMENT

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

C_R : Rudder force, in N

Q_R : Rudder torque, in N.m

A : Total movable area of the rudder, in m^2, measured at the mid-plane of the rudder
For nozzle rudders, A is not to be taken less than 1.35 times the projected area of the nozzle.

A_t : Area equal to A + area of a rudder horn, if any, in m^2

A_f : Portion of rudder area located ahead of the rudder stock axis, in m^2

b : Mean height of rudder area, in m

c : Mean breadth of rudder area, in m, see **Fig 1**

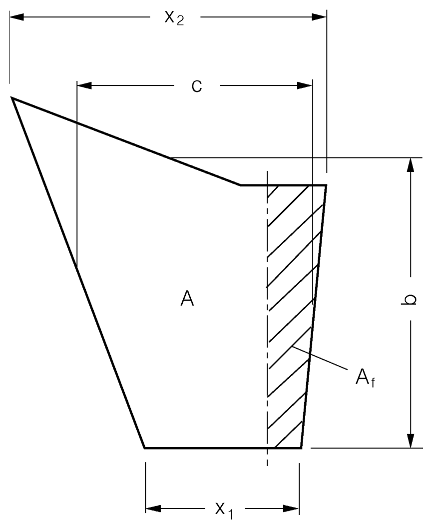
Λ : Aspect ratio of rudder area At, taken equal to:

$$\Lambda = \frac{b^2}{A_t}$$

V_0 : Maximum ahead speed, in knots, as defined in **Ch 1, Sec 4.** If this speed is less than 10, V_0 is to be replaced by:

$$V_{min} = \frac{(V_0 + 20)}{3}$$

V_a : Maximum astern speed, in knots, to be taken not less than 0.5 V_0. For greater astern speeds special evaluation of rudder force and torque as a function of the rudder angle may be required. If no limitations for the rudder angle at astern condition is stipulated, the factor k_2 is not to be taken less than given in **Table 1** for astern condition.



$$c = \frac{x_1 + x_2}{2} \qquad b = \frac{A}{c}$$

Fig 1: Dimensions of rudder

1. General

1.1 Manoeuvring arrangement

1.1.1

The manoeuvring arrangement includes all parts from the rudder and steering gear to the steering position necessary for steering the ship.

1.1.2

Rudder stock, rudder coupling, rudder bearings and the rudder body are dealt with in this Section. The steering gear is to comply with the appropriate Rules of the Society.

1.1.3

The steering gear compartment shall be readily accessible and, as far as practicable, separated from the machinery space.

Note: Concerning the use of non-magnetisable material in the wheel house in way of a magnetic compass, the requirements of the national Administration concerned are to be observed.

1.2 Structural details

1.2.1

Effective means are to be provided for supporting the weight of the rudder body without excessive bearing pressure, e.g. by a rudder carrier attached to the upper part of the rudder stock. The hull structure in way of the rudder carrier is to be suitably strengthened.

1.2.2

Suitable arrangements are to be provided to prevent the rudder from lifting.

1.2.3

Connections of rudder blade structure with solid parts in forged or cast steel, which are used as rudder stock housing, are to be suitably designed to avoid any excessive stress concentration at these areas.

1.2.4

The rudder stock is to be carried through the hull either enclosed in a watertight trunk, or glands are to be fitted above the deepest load waterline, to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If the top of the rudder trunk is below the deepest waterline two separate stuffing boxes are to be provided.

1.3 (void)

1.4 Materials

1.4.1

For materials for rudder stock, pintles, coupling bolts etc. refer to the Society’s Rules for Materials.

1.4.2

In general, materials having R_{eH} of less than 200 $\mathrm{N/mm^2}$ and R_m of less than 400 $\mathrm{N/mm^2}$ or more than 900 $\mathrm{N/mm^2}$ are not to be used for rudder stocks, pintles, keys and bolts. The requirements of this

Section are based on a with R_{eH} of 235 N/mm^2. If material is used having a R_{eH} differing from 235 N/mm^2, the material factor k_r is to be determined as follows:

$$k_r = \left(\frac{235}{R_{eH}}\right)^{0.75} \quad \text{for} \quad R_{eH} > 235$$

$$k_r = \frac{235}{R_{eH}} \quad \text{for} \quad R_{eH} \le 235$$

where:

R_{eH} : Minimum yield stress of material used, in N/mm^2. R_{eH} is not to betaken greater than 0.7 R_m or 450 N/mm^2, whichever is less.

1.4.3

Before significant reductions in rudder stock diameter due to the application of steels with R_{eH} exceeding 235 N/mm^2 are accepted, the Society may require the evaluation of the elastic rudder stock deflections. Large deflections should be avoided in order to avoid excessive edge pressures in way of bearings.

1.4.4

The permissible stresses given in **[5.1]** are applicable for normal strength steel. When higher strength steels are used, higher values may be used for the permissible stresses, on a case by case basis.

2. Rudder force and torque

2.1 Rudder force and torque for normal rudders

2.1.1

The rudder force is to be determined, in N, according to the following formula:

$$C_R = 132\, A V^2 \kappa_1 \kappa_2 \kappa_3 \kappa_t$$

where:

V : V_0 for ahead condition
V_a for astern condition

k_1 : Coefficient, depending on the aspect ratio Λ, taken equal to:
$\kappa_1 = (\Lambda + 2)/3$, where Λ need not be taken greater than 2

k_2 : Coefficient, depending on the type of the rudder and the rudder profile according to **Table 1**

Table 1: Coefficient k_2

Profile / type of rudder	k_2	
	Ahead	Astern
NACA-00 series Göttingen profiles	1.10	0.80
Flat side profiles	1.10	0.90
Mixed profiles (e.g. HSVA)	1.21	0.90
Hollow profiles	1.35	0.90
High lift rudders	1.70	to be specially considered; if not known: 1.30
Fish tail	1.40	0.80
Single plate	1.00	1.00

k_3 : Coefficient, depending on the location of the rudder, taken equal to:

k_3 = 0.80 for rudders outside the propeller jet

k_3 = 1.00 elsewhere, including also rudders within the propeller jet

k_3 = 1.15 for rudders aft of the propeller nozzle

k_t : Coefficient equal to 1.0 for rudders behind propeller. Where a thrust coefficient $C_{Th} > 1.0$, the Society may consider a coefficient k_t different from 1.0, on a case by case basis.

2.1.2

The rudder torque, in Nm, is to be determined by the following formula:

$$Q_R = C_R \cdot r$$

where:

r : Lever of the force C_R, in m, taken equal to:

$r = c(\alpha - k_{bc})$, without being less than 0.1 c for ahead condition

α : Coefficient taken equal to:

α = 0.33 for ahead condition

α = 0.66 for astern condition (general)

α = 0.75 for astern condition (hollow profiles)

For parts of a rudder behind a fixed structure such as a rudder horn:

α = 0.25 for ahead condition

α = 0.55 for astern condition

For high lift rudders is to be specially considered. If not known, $\alpha = 0.40$ may be used for the ahead condition

k_{bc} : Balance factor as follows:

$$k_{bc} = \frac{A_f}{A}$$

$k_{bc} = 0.08$ for unbalanced rudders

2.1.3

Effects of the provided type of rudder/profile on choice and operation of the steering gear are to be observed.

2.2 Rudder force and torque for rudder blades with cut-outs (semi-spade rudders)

2.2.1

The total rudder force C_R is to be calculated according to **[2.1.1]**. The pressure distribution over the rudder area, upon which the determination of rudder torque and rudder blade strength are to be based, is to be obtained as follows:

- the rudder area may be divided into two rectangular or trapezoidal parts with areas A_1 and A_2, see **Fig 2.**
- the resulting force, in N, of each part may be taken as:

$$C_{R1} = C_R \frac{A_1}{A}$$

$$C_{R2} = C_R \frac{A_2}{A}$$

2.2.2

The resulting torque, in N.m, of each part is to be taken as:

$$Q_{R1} = C_{R1} \cdot r_1$$

$$Q_{R2} = C_{R2} \cdot r_2$$

where:

$r_1 = c_1(\alpha - k_{b1})$, in m

$r_2 = c_2(\alpha - k_{b2})$, in m

$$k_{b1} = \frac{A_{1f}}{A_1}$$

$$k_{b2} = \frac{A_{2f}}{A_2}$$

A_{1f}, A_{2f} : As defined in **Fig 2**

$$c_1 = \frac{A_1}{b_1}$$

$$c_2 = \frac{A_2}{b_2}$$

b_1, b_2 : Mean heights of the partial rudder areas A_1 and A_2 (see **Fig 2**).

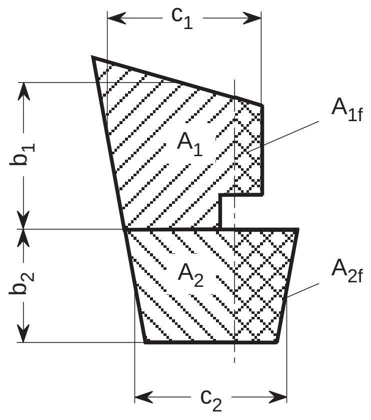


Fig 2: Areas A_1 and A_2

2.2.3

The total rudder torque, in N.m, is to be determined according to the following formulae:

$Q_R = Q_{R1} + Q_{R2}$, without being less than $Q_{R\min} = C_R \cdot r_{1,2\min}$

where:

$r_{1,2\min} = \frac{0.1}{A}(c_1 \cdot A_1 + c_2 \cdot A_2)$, in m.

3. Scantlings of the rudder stock

3.1 Rudder stock diameter

3.1.1

The diameter of the rudder stock, in mm, for transmitting the rudder torque is not to be less than:

$$D_t = 4.2\sqrt[3]{Q_R \cdot k_r}$$

where:

Q_R : As defined in **[2.1.2], [2.2.2]** and **[2.2.3]**

The related torsional stress, in N/mm^2, is:

$$\tau_t = \frac{68}{k_r}$$

where:

k_r : As defined in **[1.4.2]** and **[1.4.3].**

3.1.2

The diameter of the rudder stock determined according to **[3.1.1]** is decisive for the steering gear, the stopper and the locking device.

3.1.3

In case of mechanical steering gear the diameter of the rudder stock in its upper part which is only intended for transmission of the torsional moment from the auxiliary steering gear may be 0.9 D_t. The length of the edge of the quadrangle for the auxiliary tiller must not be less than 0.77 Dt and the height not less than 0.8 Dt.

3.1.4

The rudder stock is to be secured against axial sliding. The degree of the permissible axial clearance depends on the construction of the steering engine and on the bearing.

3.2 Strengthening of rudder stock

3.2.1

If the rudder is so arranged that additional bending stresses occur in the rudder stock, the stock diameter has to be suitably increased. The increased diameter is, where applicable, decisive for the scantlings of the coupling.
For the increased rudder stock diameter the equivalent stress of bending and torsion, in N/mm^2, is not to exceed the following value:

$$\sigma_v = \sqrt{\sigma_b^2 + 3\tau^2} \le \frac{118}{k_r}$$

where:

σ_b : Bending stress, in N/mm^2, equal to:

$$\sigma_b = \frac{10.2 M_b}{D_1^3}$$

M_b : Bending moment at the neck bearing, in N.m

τ : Torsional stress, in N/mm^2, equal to:

$$\tau = \frac{5.1 Q_R}{D_1^3}$$

D_1 : Increased rudder stock diameter, in cm, equal to:

$$D_1 = 0.1 D_t \sqrt[6]{1 + \frac{4}{3}\left(\frac{M_b}{Q_R}\right)^2}$$

Q_R : As defined in **[2.1.2], [2.2.2]** and **[2.2.3]**

D_t : As defined in **[3.1.1].**

Note: Where a double-piston steering gear is fitted, additional bending moments may be transmitted from the steering gear into the rudder stock. These additional bending moments are to be taken into account for determining the rudder stock diameter.

3.3 Analysis

3.3.1 General

The bending moments, shear forces and support forces for the system rudder stock are to be obtained from **[3.3.2]** and **[3.3.3]**, for rudder types as shown in **Fig 3** to **Fig 7.**

3.3.2 Data for the analysis

ℓ_{10} ,.., ℓ_{50} : Lengths, in m, of the individual girders of the system

I_{10} ,.., I_{50} : Moments of inertia of these girders, in cm^4

For rudders supported by a sole piece the length ℓ_{20} is the distance between lower edge of rudder body and centre of sole piece, and I_{20} is the moment of inertia of the pintle in the sole piece.
Load on rudder body, in kN/m, (general):

$$p_R = \frac{C_R}{\ell_{10} \cdot 10^3}$$

Load on semi-spade rudders, in kN/m:

$$p_{R10} = \frac{C_{R2}}{\ell_{10} \cdot 10^3}$$

$$p_{R20} = \frac{C_{R1}}{\ell_{20} \cdot 10^3}$$

C_R, C_{R1}, C_{R2} : As defined in **[2.1]** and **[2.2]**

Z : Spring constant, in kN/m, of support in the sole piece or rudder horn respectively:

for the support in the sole piece (see **Fig 3**):

$$Z = \frac{6.18 \cdot I_{50}}{\ell_{50}^3}$$

for the support in the rudder horn (see **Fig 4**):

$$Z = \frac{1}{f_b + f_t}$$

f_b : Unit displacement of rudder horn, in m/kN, due to a unit force of 1 kN acting in the centre of support

$$f_b = \frac{1.3 d^3 10^8}{3 E I_n}$$

$$f_b = 0.21 \frac{d^3}{I_n} \text{ (guidance value for steel)}$$

I_n : Moment of inertia of rudder horn, in cm^4, around the x-axis at $d/2$ (see **Fig 4**)

f_t : Unit displacement due to a torsional moment of the amount 1, in m/kN

$$f_t = \frac{d e^2}{G J_t}$$

$$f_t = \frac{d e^2 \sum u_i / t_i}{3.14 \cdot 10^8 F_T^2} \text{ for steel}$$

G : Modulus of rigity, $\mathrm{kN/m^2}$:

$G = 7.92 \cdot 10^7$ for steel

J_t : Torsional moment of inertia, in m^4

F_T : Mean sectional area of rudder horn, in m^2

u_i : Breadth, in mm, of the individual plates forming the mean horn sectional area

t_i : Plate thickness of individual plate having breadth u_i, in mm

e, d : Distances, in m, according to **Fig 4**

K_{11}, K_{22}, K_{12} : Rudder horn compliance constants calculated for rudder horn with 2-conjugate elastic supports (**Fig 5**). The 2-conjugate elastic supports are defined in terms of horizontal displacements, y_i, by the following equations:

at the lower rudder horn bearing:

$y_1 = - K_{12} B_2 - K_{22} B_1$

at the upper rudder horn bearing:

$y_2 = - K_{11} B_2 - K_{12} B_1$

where

y_1, y_2 : Horizontal displacements, in m, at the lower and upper rudder horn bearings, respectively

B_1, B_2 : Horizontal support forces, in kN, at the lower and upper rudder horn bearings, respectively

K_{11}, K_{22}, K_{12} : Obtained, in m/kN, from the following formulae:

$$K_{11} = 1.3 \cdot \frac{\lambda^3}{3EJ_{1h}} + \frac{e^2 \lambda}{GJ_{th}}$$

$$K_{12} = 1.3 \cdot \left[\frac{\lambda^3}{3EJ_{1h}} + \frac{\lambda^2 \cdot (d - \lambda)}{2EJ_{1h}} \right] + \frac{e^2 \cdot \lambda}{GJ_{th}}$$

$$K_{22} = 1.3 \cdot \left[\frac{\lambda^3}{3EJ_{1h}} + \frac{\lambda^2 \cdot (d - \lambda)}{EJ_{1h}} + \frac{\lambda \cdot (d - \lambda)^2}{EJ_{1h}} + \frac{(d - \lambda)^3}{3EJ_{2h}} \right] + \frac{e^2 \cdot d}{GJ_{th}}$$

d : Height of the rudder horn, in m, defined in **Fig 5**. This value is measured downwards from the upper rudder horn end, at the point of curvature transition, till the mid-line of the lower rudder horn pintle

λ : Length, in m, as defined in **Fig 5**. This length is measured downwards from the upper rudder hornend, at the point of curvature transition, till the mid-line of the upper rudder horn bearing. For $\lambda = 0$, the above formulae converge to those of spring constant Z for a rudder horn with 1-elastic support, and assuming a hollow cross section for this part

e : Rudder-horn torsion lever, in m, as defined in **Fig 5** (value taken at $z = d/2$)

J_{1h} : Moment of inertia of rudder horn about the x axis, in m^4, for the region above the upper rudder horn bearing. Note that J_{1h} is an average value over the length (see **Fig 5**)

J_{2h} : Moment of inertia of rudder horn about the x axis, in m4, for the region between the upper and lower rudder horn bearings. Note that J_{2h} is an average value over the length $d - \lambda$ (see **Fig 5**)

J_{th} : Torsional stiffness factor of the rudder horn, in m^4
For any thin wall closed section

$$J_{th} = \frac{4F_T^2}{\sum_i \frac{u_i}{t_i}}$$

F_T : Mean of areas enclosed by outer and inner boundaries of the thin walled section of rudder horn, in m^2

u_i : Length, in mm, of the individual plates forming the mean horn sectional area

t_i : Thickness, in mm, of the individual plates mentioned above.

Note that the J_{th} value is taken as an average value, valid over the rudder horn height.

3.3.3 Moments and forces to be evaluated

a) The bending moment M_R and the shear force Q_1 in the rudder body, the bending moment M_b in the neck bearing and the support forces B_1, B_2, B_3 are to be evaluated.
The so evaluated moments and forces are to be used for the stress analyses required by **[3.2]**, **[5]**, **[9.1]** and **[9.2]**

b) For spade rudders (see **Fig 6**) the moments, in N.m, and forces, in N, may be determined by the following formulae:

$$M_b = C_R \left(\ell_{20} + \frac{\ell_{10}(2x_1 + x_2)}{3(x_1 + x_2)} \right)$$

$$B_3 = \frac{M_b}{\ell_{30}}$$

$$B_2 = C_R + B_3$$

c) For spade rudders with rudders trunks (see **Fig 7**) the moments, in N.m, and forces, in N, may be determined by the following formulae:

M_R is the greatest of the following values:

$M_R = C_{R2}(\ell_{10} - CG_{2Z})$

$M_R = C_{R1}(CG_{1Z} - \ell_{10})$

where

C_{R1} : Rudder force over the rudder blade area A_1

C_{R2} : Rudder force over the rudder blade area A_2

CG_{1Z} : Vertical position of the centre of gravity of the rudder blade area A_1

CG_{2Z} : Vertical position of the centre of gravity of the rudder blade area A_2

$M_B = C_{R2}(\ell_{10} - CG_{2Z})$

$B_3 = (M_B + M_{CR1})/(\ell_{20} + \ell_{30})$

$B_2 = C_R + B_3$

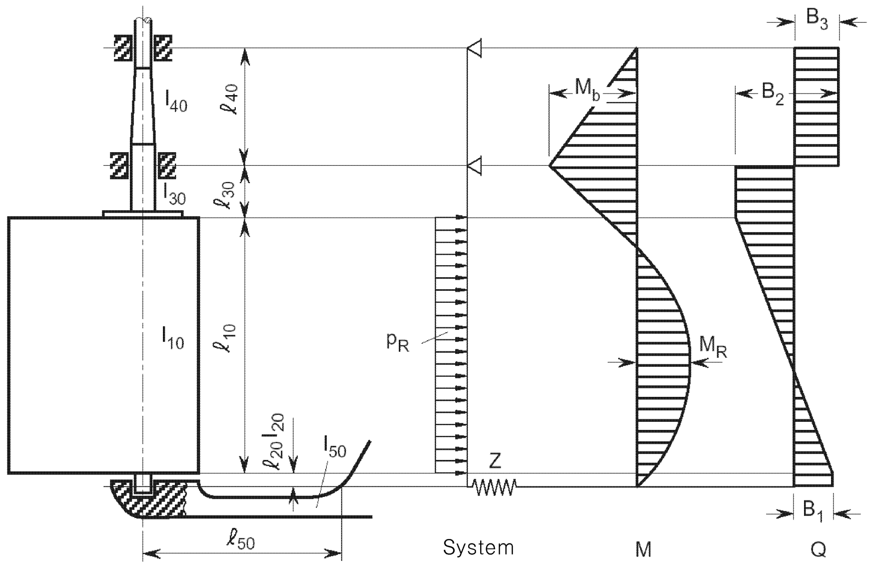

Fig 3: Rudder supported by sole piece

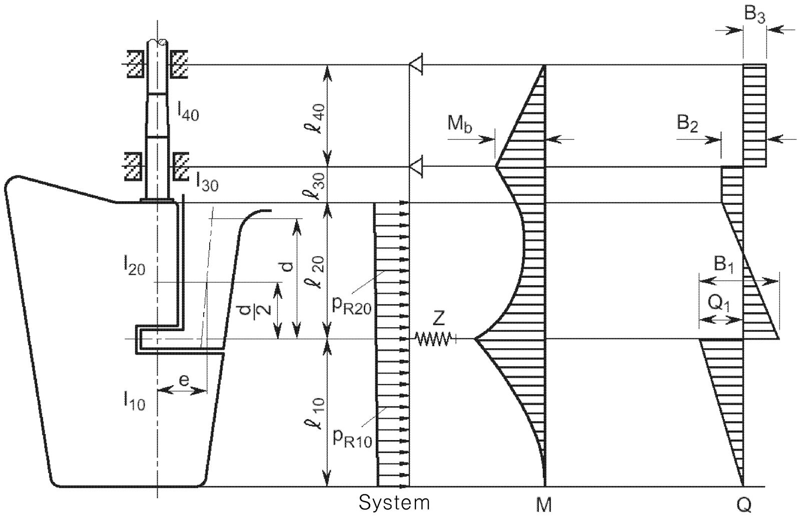

Fig 4: Semi-spade rudder (with 1-elastic support)

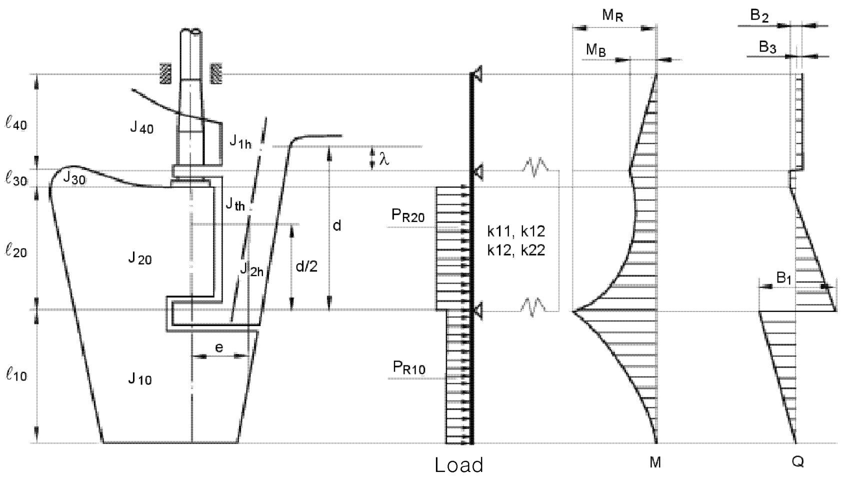

Fig 5: Semi-spade rudder (with 2-conjugate elastic supports)

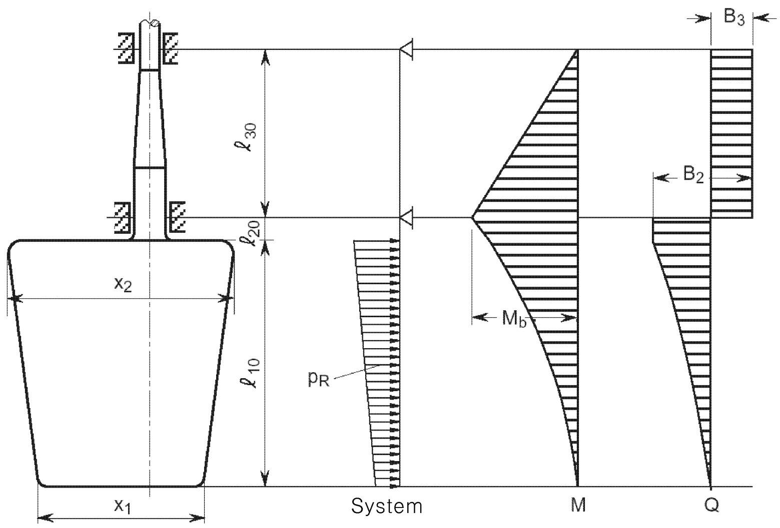

Fig 6: Spade rudder

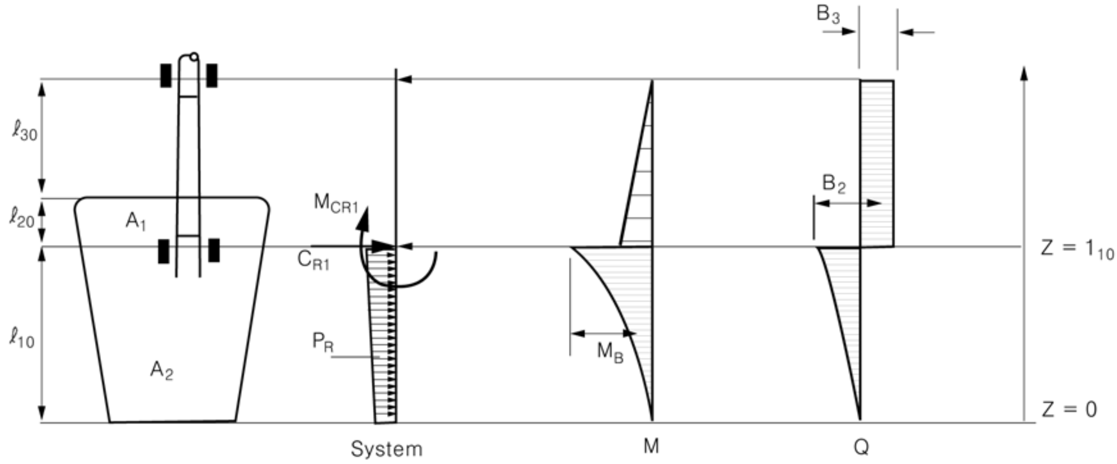

Fig 7: Spade rudders with rudder trunks

3.4 Rudder trunk

3.4.1

Where the rudder stock is arranged in a trunk in such a way that the trunk is stressed by forces due to rudder action, the scantlings of the trunk are to be as such that the equivalent stress due to bending and shear does not exceed $0.35R_{eH}$ of the material used.

3.4.2

In case where the rudder stock is fitted with a rudder trunk welded in such a way the rudder trunk is loaded by the pressure induced on the rudder blade, as given in **[2.1.1]**, the bending stress in the rudder trunk, in $\mathrm{N/mm^2}$, is to be in compliance with the following formula:

$\sigma \leq 80/k$

where the material factor k for the rudder trunk is not to be taken less than 0.7.

For the calculation of the bending stress, the span to be considered is the distance between the mid-height of the lower rudder stock bearing and the point where the trunk is clamped into the shell or the bottom of the skeg.

3.4.3

The steel used for the rudder trunk is to be of weldable quality, with a carbon content not exceeding 0.23 % on ladle analysis and a carbon equivalent CEQ not exceeding 0.41.

3.4.4

The weld at the connection between the rudder trunk and the shell or the bottom of the skeg is to be full penetration.
The fillet shoulder radius r, in mm, is to be as large as practicable and to comply with the following formulae:

$r = 60$ when $\sigma \geq 40/k$ $\mathrm{N/mm^2}$

$r = 0.1\,D_l$, without being less than 30, when $\sigma < 40/k$ $\mathrm{N/mm^2}$

where D_l is defined in **[3.2.1]**.

The radius may be obtained by grinding. If disk grinding is carried out, score marks are to be avoided in the direction of the weld.
The radius is to be checked with a template for accuracy. Four profiles at least are to be checked. A report is to be submitted to the Surveyor.

3.4.5

Before welding is started, a detailed welding procedure specification is to be submitted to the Society covering the weld preparation, welding positions, welding parameters, welding consumables, preheating, post weld heat treatment and inspection procedures. This welding procedure is to be supported by approval tests in accordance with the applicable requirements of materials and welding sections of the rules. The manufacturer is to maintain records of welding, subsequent heat treatment and inspections traceable to the welds. These records are to be submitted to the Surveyor.

3.4.6

Non destructive tests are to be conducted at least 24 hours after completion of the welding. The welds are to be 100 % magnetic particle tested and 100 % ultrasonic tested. The welds are to be free from cracks, lack of fusion and incomplete penetration. The non destructive tests reports are to be handed over to the Surveyor.

3.4.7

Rudder trunks in materials other than steel are to be specially considered by the Society.

3.4.8

The thickness of the shell or of the bottom plate is to be compatible with the trunk thickness.

4. Rudder couplings

4.1 General

4.1.1

The couplings are to be designed in such a way as to enable them to transmit the full torque of the rudder stock.

4.1.2

The distance of the bolt axis from the edges of the flange is not to be less than 1.2 times the diameter of the bolt. In horizontal couplings, at least 2 bolts are to be arranged forward of the stock axis.

4.1.3

The coupling bolts are to be fitted bolts. The bolts and nuts are to be effectively secured against loosening.

4.1.4

For spade rudders, horizontal couplings according to **[4.2]** are permitted only where the required thickness of the coupling flanges t_f is less than 50 mm, otherwise cone coupling according to **[4.4]** or **[4.5]**, as applicable, is to be applied. For spade rudders of the high lift type, only cone coupling according to **[4.4]** or **[4.5]**, as applicable, is permitted.

4.2 Horizontal couplings

4.2.1

The diameter of coupling bolts, in mm, is not to be less than:

$$d_b = 0.62\sqrt{\frac{D^3 \cdot k_b}{k_r \cdot n \cdot e}}$$

where:

D : Rudder stock diameter according to **[6]**, in mm

n : Total number of bolts, which is not to be less than 6

e : Mean distance of the bolt axes from the centre of bolt system, in mm

kr : Material factor for the rudder stock as defined in **[1.4.2]**

kb : Material factor for the bolts, obtained according to **[1.4.2].**

4.2.2

The thickness of the coupling flanges, in mm, is not to be less than determined by the following formulae:

$$t_f = 0.62\sqrt{\frac{D^3 \cdot k_f}{k_r \cdot n \cdot e}}$$, without being less than $0.9 d_b$

where:

k_f : Material factor for the coupling flanges, obtained according to **[1.4.2]**

The thickness of the coupling flanges clear of the bolt holes is not to be less than $0.65 t_f$.

The width of material outside the bolt holes is not to be less than $0.67 d_b$.

4.2.3

The coupling flanges are to be equipped with a fitted key according to DIN6885 or equivalent standard for relieving the bolts.
The fitted key may be dispensed with if the diameter of the bolts is increased by 10 %.

4.2.4

Horizontal coupling flanges are to be either forged together with the rudder stock or welded to the rudder stock, according to **[10.1.3].**

4.2.5

For the connection of the coupling flanges with the rudder body, see also **[10].**

4.3 Vertical couplings

4.3.1

The diameter of the coupling bolts, in mm, is not to be less than:

$$d_b = \frac{0.81 \cdot D}{\sqrt{n}}\sqrt{\frac{k_b}{k_r}}$$

where:

D, k_b, k_r, n are defined in **[4.2.1]**, where n is not to be less than 8.

4.3.2

The first moment of area of the bolts, in cm^3, about the centre of the coupling is not to be less than:

$$S = 0.00043 D^3$$

4.3.2

The thickness of the coupling flanges, in mm, is not to be less than $t_f = d_b$
The width of material outside the bolt holes is not to be less than $0.67 d_b$.

4.4 Cone couplings with key

4.4.1

Cone couplings should have a taper c on diameter of 1:8 to 1:12, where $c = (d_0 - d_u)/l$ (see **Fig 8**).
The cone shapes are to fit very exact. The nut is to be carefully secured, e.g. by a securing plate as shown in **Fig 8.**

4.4.2

The coupling length ℓ is to be, in general, not less than $1.5 d_0$.

4.4.3

For couplings between stock and rudder a key is to be provided, the shear area of which, in cm^2, is not to be less than:

$$a_s = \frac{17.55 Q_F}{d_k R_{eH1}}$$

where:

Q_F : Design yield moment of rudder stock, in Nm according to **[6]**

d_k : Diameter of the conical part of the rudder stock, in mm, at the key

R_{eH1} : Minimum yield stress of the key material, in N/mm^2

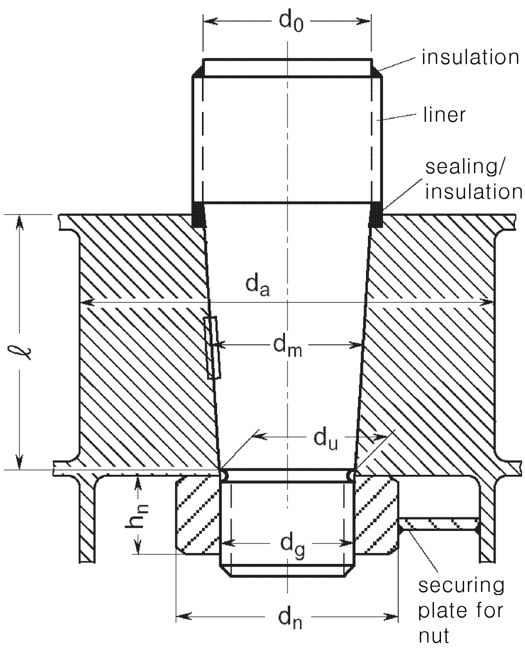

Fig 8: Cone coupling with key

4.4.4

The effective surface area, in cm^2, of the key (without rounded edges) between key and rudder stock or cone coupling is not to be less than:

$$a_k = \frac{5Q_F}{d_k R_{eH2}}$$

where:

R_{eH2} : Minimum yield stress of the key, stock or coupling material, in N/mm^2, whichever is less.

4.4.5

The dimensions of the slugging nut are to be as follows (see **Fig 8**):

- height: $h_n = 0.6\, d_g$
- outer diameter, the greater value of: $d_n = 1.2\, d_u$ or $d_n = 1.5\, d_g$
- external thread diameter: $d_g = 0.65\, d_0$

4.4.6

It is to be proved that 50 % of the design yield moment will be solely transmitted by friction in the cone couplings. This can be done by calculating the required push-up pressure and push-up length according to **[4.5.3]** for a torsional moment $Q'_F = 0.5 \cdot Q_F$.

4.5 Cone couplings with special arrangements for mounting and dismounting the couplings

4.5.1

Where the stock diameter exceeds 200 mm, the press fit is recommended to be effected by a hydraulic pressure connection. In such cases the cone is to be more slender, $c \approx 1:12$ to $c \approx 1:20$.

4.5.2

In case of hydraulic pressure connections the nut is to be effectively secured against the rudder stock or the pintle. A securing plate for securing the nut against the rudder body is not to be provided (see **Fig 9**).

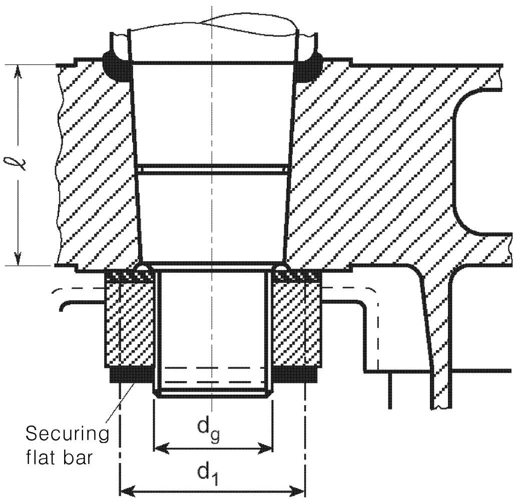

Fig 9: Cone coupling without key

Note: A securing flat bar will be regarded as an effective securing device of the nut, if its shear area, in mm^2, is not less than:

$$A_s = \frac{P_s \cdot \sqrt{3}}{R_{eH}}$$

where:

P_s : Shear force, in N, as follows:

$$p_s = \frac{P_e}{2}\mu_1\left(\frac{d_1}{d_g} - 0.6\right)$$

P_e : Push-up force according to [4.5.3], in N

μ_1 : Frictional coefficient between nut and rudder body, normally $\mu_1 = 0.3$

d_1 : Mean diameter of the frictional area between nut and rudder body

d_g : Thread diameter of the nut

R_{eH} : Minimum yield stress, in N/mm^2, of the securing flat bar material.

4.5.3 Push-up pressure and push-up length

For the safe transmission of the torsional moment by the coupling between rudder stock and rudder body the push-up length and the push-up pressure are to be determined according to **[4.5.4]** and **[4.5.5].**

4.5.4 Push-up pressure

The push-up pressure is not to be less than the greater of the two following values:

$$p_{req1} = \frac{2Q_F}{d_m^2 \, \ell \, \pi \, \mu_0} 10^3$$

$$p_{req2} = \frac{6 \cdot M_b}{\ell^2 \, d_m} 10^3$$

where:

Q_F : Design yield moment of rudder stock according to **[6]**, in N.m

d_m : Mean cone diameter, in mm

ℓ : Cone length, in mm

μ_0 : Frictional coefficient, equal to about 0.15

M_b : Bending moment in the cone coupling (e.g. in case of spade rudders), in N.m

It has to be proved that the push-up pressure does not exceed the permissible surface pressure in the cone. The permissible surface pressure is to be determined by the following formula:

$$p_{perm} = \frac{0.8 R_{eH}\left(1 - \alpha^2\right)}{\sqrt{3 + \alpha^4}}$$

where:

R_{eH} : Minimum yield stress, in N/mm^2, of the material of the gudgeon

$$\alpha = \frac{d_m}{d_a}$$

d_m : Diameter, in mm, as defined in **Fig 8**

d_a : Outer diameter of the gudgeon (see **Fig 8**), in mm, to be not less than 1.5 d_m.

4.5.5 Push-up length

The push-up length, in mm, is not to be less than:

$$\Delta\ell_1 = \frac{p_{req} d_m}{E\left(\frac{1-\alpha^2}{2}\right)c} + \frac{0.8R_{tm}}{c}$$

where:

R_{tm} : Mean roughness, in mm , taken equal to about 0.01

c : Taper on diameter according to **[4.5.1]**

The push-up length, in mm, is, however, not to be taken greater than:

$$\Delta\ell_2 = \frac{1.6\,R_{eH}\,d_m}{E\,c\sqrt{3+\alpha^4}} + \frac{0.8R_{tm}}{c}$$

Note: In case of hydraulic pressure connections the required push-up force P_e for the cone, in N, may be determined by the following formula:

$$P_e = p_{req} \cdot d_m \cdot \pi \cdot \ell\left(\frac{c}{2} + 0.02\right)$$

The value 0.02 is a reference for the friction coefficient using oil pressure. It varies and depends on the mechanical treatment and roughness of the details to be fixed.
Where due to the fitting procedure a partial push-up effect caused by the rudder weight is given, this may be taken into account when fixing the required push-up length, subject to approval by the Society.

4.5.6 Push-up pressure for pintle bearings

The required push-up pressure for pintle bearings, in N/mm^2, is to be determined by the following formula:

$$p_{req} = 0.4\frac{B_1 \cdot d_0}{d_m^2 \cdot \ell}$$

where:

B_1 : Supporting force in the pintle bearing, in N (see **Fig 4**)

d_m, ℓ : As defined in **[4.5.3]**

d_0 : Pintle diameter, in mm, according to **Fig 8.**

5. Rudder body, rudder bearings

5.1 Strength of rudder body

5.1.1

The rudder body is to be stiffened by horizontal and vertical webs in such a manner that the rudder body will be effective as a beam. The rudder should be additionally stiffened at the aft edge.

5.1.2

The strength of the rudder body is to be proved by direct calculation according to **[3.3]**

5.1.3

For rudder bodies without cut-outs the permissible stress are limited to:

- bending stress, in N/mm², due to M_R defined in **[3.3.3]**:
  $\sigma_b = 110$
- shear stress, in N, due to Q_1 defined in **[3.3.3]**:
  $\tau_t = 50$
- equivalent stress due to bending and shear:
  $\sigma_v = \sqrt{\sigma_b^2 + 3\tau^2} = 120$

In case of openings in the rudder plating for access to cone coupling or pintle nut the permissible stresses according to **[5.1.4]** apply. Smaller permissible stress values may be required if the corner radii are less than 0.15 h_0, where h_0 is the height of opening.

5.1.4

In rudder bodies with cut-outs (semi-spade rudders) the following stress values are not to be exceeded:

- bending stress, N/mm², due to M_R:
  $\sigma_b = 90$
- shear stress, N/mm², due to Q_1:
  $\tau = 50$
- torsional stress, N/mm²,due to M_t:
  $\tau_t = 50$
- equivalent stress, in N/mm², due to bending and shear and equivalent stress due to bending and torsion:

$$\sigma_{v1} = \sqrt{\sigma_b^2 + 3\tau^2} = 120$$

$$\sigma_{v2} = \sqrt{\sigma_b^2 + 3\tau_t^2} = 100$$

where:

$M_R = C_{R2} \cdot f_1 + B_1 \frac{f_2}{2}$, in N.m

$Q_1 = C_{R2}$, in N

f_1, f_2 : As defined in **Fig 10**

τ_t : Torsional stress, in N/mm², taken equal to:

$$\tau_t = \frac{M_t}{2 \ell h t}$$

$M_t = C_{R2} e$, in N.m

C_{R2} : Partial rudder force, in N, of the partial rudder area A_2 below the cross section under consideration

e : Lever for torsional moment, in m (horizontal distance between the centre of pressure of area A_2 and the centre line a-a of the effective cross sectional area under consideration, see **Fig 10.** The centre of pressure is to be assumed at 0.33 c_2 aft of the forward edge of area A_2, where c_2 is the mean breadth of area A_2).

h, ℓ, t : Dimensions, in cm, as defined in **Fig 10.**

The distance ℓ between the vertical webs should not exceed 1.2 h.
The radii in the rudder plating are not to be less than 4times the plate thickness, but in no case less than 50 mm.

Note: It is recommended to keep the natural frequency of the fully immersed rudder and of local structural components at least 10above the exciting frequency of the propeller (number of revolutions × number of blades) or if relevant above higher order.

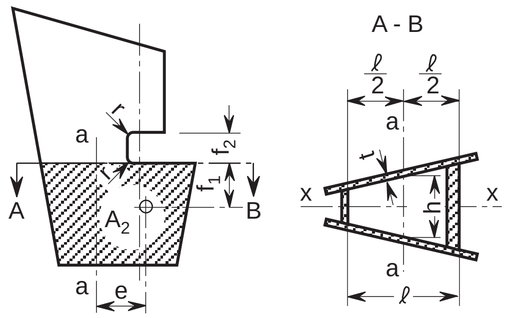

Fig 10: Geometry of rudder

5.2 Rudder plating

5.2.1

The thickness of the rudder plating, in mm, is to be determined according to the following formula:

$$t_P = 1.74 a \beta \sqrt{p_R k} + 2.5$$

where:

$p_R = 10 \cdot T + \dfrac{C_R}{10^3 \cdot A}$, in $\mathrm{kN/m^2}$

a : Smaller unsupported width of a plate panel, in m.

$\beta = \sqrt{1.1 - 0.5\left(\dfrac{a}{b}\right)^2}$ max, 1.00, if $\dfrac{b}{a} \geq 2.5$

b : greatest unsupported width of a plate panel, in m.

However, the thickness is to be not less than the thickness of the shell plating at aft part according to **Ch 9, Sec 2.**
Regarding dimensions and welding, **[10.1.1]** is to be comply with.

5.2.2

For connecting the side plating of the rudder to the webs tenon welding is not to be used. Where application of fillet welding is not practicable, the side plating is to be connected by means of slot welding to flat bars which are welded to the webs.

5.2.3

The thickness of the webs, in mm, is not to be less than 70 % of the thickness of the rudder plating according to **[5.2.1]**, but not less than:

$$t_{\min} = 8\sqrt{k}$$

Webs exposed to seawater are to be dimensioned according to **[5.2.1].**

5.3 Connections of rudder blade structure with solid parts in forged or cast steel

5.3.1 General

Solid parts in forged or cast steel which ensure the housing of the rudder stock or of the pintle are in general to be connected to the rudder structure by means of two horizontal web plates and two vertical web plates.

5.3.2 Minimum section modulus of the connection with the rudder stock housing

The section modulus of the cross-section of the structure of the rudder blade which is connected with the solid part where the rudder stock is housed, which is made by vertical web plates and rudder plating, is to be not less than that obtained, in cm^3, from the following formula:

$$w_S = c_S\, d_1^3 \left(\frac{H_E - H_X}{H_E}\right)^2 \frac{k}{k_1} 10^{-4}$$

where:

c_S : Coefficient, to be taken equal to:

c_S = 1.0 if there is no opening in the rudder plating or if such openings are closed by a full penetration welded plate

c_S = 1.5 if there is an opening in the considered cross-section of the rudder

D_1 : Rudder stock diameter, in mm, defined in **[3.2.1]**

H_E : Vertical distance, in m, between the lower edge of the rudder blade and the upper edge of the solid part

H_X : Vertical distance, in m, between the considered cross-section and the upper edge of the solid part

k, k_1 : Material factors, defined for the rudder blade plating and the rudder stock, respectively.

5.3.3 Calculation of the actual section modulus of the connection with the rudder stock housing

The actual section modulus of the cross-section of the structure of the rudder blade which is connected with the solid part where the rudder stock is housed is to be calculated with respect to the symmetrical axis of the rudder.

The breadth of the rudder plating to be considered for the calculation of this actual section modulus is to be not greater than that obtained, in m, from the following formula:

$$b = s_V + 2\frac{H_X}{m}$$

where:

s_V : Spacing, in m, between the two vertical webs (see **Fig 11**)

H_X : Distance defined in **[5.3.2]**

m : Coefficient to be taken, in general, equal to 3.

Where openings for access to the rudder stock nut are not closed by a full penetration welded plate, they are to be deducted (see **Fig 11**).

5.3.4 Thickness of horizontal web plates

In the vicinity of the solid parts, the thickness of the horizontal web plates, as well as that of the rudder blade plating between these webs, is to be not less than the greater of the values obtained, in mm, from the following formulae:

$$t_H = 1.2\, t_P$$

$$t_H = 0.045 \frac{d_S^2}{s_H}$$

where:

t_P : Defined in **[5.2.1]**

d_S : Diameter, in mm, to be taken equal to:

$d_S = D_1$ for the solid part connected to the rudder stock

$d_S = d_a$ for the solid part connected to the pintle

D_1 : Rudder stock diameter, in mm, defined in **[3.2.1]**

d_a : Pintle diameter, in mm, defined in **[5.5.1]**

s_H : Spacing, in mm, between the two horizontal web plates.

Different thickness may be accepted when justified on the basis of direct calculations submitted to the Society for approval.

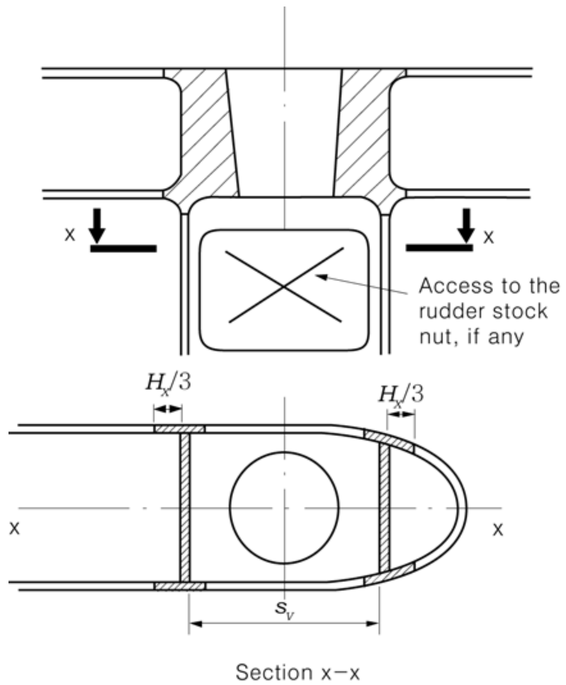

Fig 11: Cross-section of the connection between rudder blade structure and rudder stock housing

5.3.5 Thickness of side plating and vertical web plates welded to the solid part

The thickness of the vertical web plates welded to the solid part where the rudder stock is housed as well as the thickness of the rudder side plating under this solid part is to be not less than the values obtained, in mm, from **Table 2.**

Table 2: Thickness of side plating and vertical web plates

Type of rudder	Thickness of vertical web plates, in mm		Thickness of rudder plating, in mm	
	Rudder blade without opening	At opening boundary	Rudder blade without opening	Area with opening
Rudder supported by sole piece (**Fig 3**)	1.2 t_P	1.6 t_P	1.2 t_P	1.4 t_P
Semi-spade and spade rudders (**Fig 4** to **Fig 7**)	1.4 t_P	2.0 t_P	1.3 t_P	1.6 t_P
t_P : Defined in [5.2.1]				

5.3.6 Solid part protrusions

The solid parts are to be provided with protrusions. Vertical and horizontal web plates of the rudder are to be butt welded to these protrusions.
These protrusions are not required when the web plate thickness is less than:

- 10 mm for web plates welded to the solid part on which the lower pintle of a semi-spade rudder is housed and for vertical web plates welded to the solid part of the rudder stock coupling of spade rudders
- 20 mm for the other web plates.

5.3.7

If the torque is transmitted by a prolonged shaft extended into the rudder, the latter must have the diameter D_t or D_l, whichever is greater, at the upper 10% of the intersection length. Downwards it may be tapered to 0.6 D_t, in spade rudders to 0.4 times the strengthened diameter, if sufficient support is provided for.

5.4 Rudder bearings

5.4.1

In way of bearings liners and bushes are to be fitted.
Their minimum thickness is equal to:

- t_{min} = 8 mm for metallic materials and synthetic material
- t_{min} = 22 mm for lignum material

Where in case of small ships bushes are not fitted, the rudder stock is to be suitably increased in diameter in way of bearings enabling the stock to be re-machined later.

5.4.2

An adequate lubrication is to be provided.

5.4.3

The bearing forces result from the direct calculation mentioned in **[3.3]**. As a first approximation the bearing force may be determined without taking account of the elastic supports. This can be done as follows:

- normal rudder with two supports:

  The rudder force C_R is to be distributed to the supports according to their vertical distances from the centre of gravity of the rudder area.
- semi-spade rudders:

  support force in the rudder horn, in N:

$$B_1 = C_R \frac{b}{c}$$

support force in the neck bearing, in N:

$B_2 = C_R - B_1$

For b and c see **Fig 14.**

5.4.4

The projected bearing surface A_b ("bearing height" × "external diameter of liner"), in mm^2, is not to be less than

$$A_b = \frac{B}{q}$$

where:

B : Support force, in N

q : Permissible surface pressure according to **Table 3.**

5.4.5

Stainless and wear resistant steels, bronze and hot-pressed bronze-graphit materials have a considerable difference in potential to non-alloyed steel. Respective preventive measures are required.

5.4.6

The bearing height is to be equal to the bearing diameter, however, is not to exceed 1.2 times the bearing diameter. Where the bearing depth is less than the bearing diameter, higher specific surface pressures may be allowed.

Table 3: Surface pressure *q* of bearing materials

Bearing material	q, in N/mm^2
Lignum vitae	2.5
White metal, oil lubricated	4.5
Synthetic material(1)	5.5
Steel(2), bronze and hot-pressed bronze-graphite materials	7.0

(1) Synthetic materials to be of approved type.
Surface pressures exceeding 5.5 N/mm^2 may be accepted in accordance with bearing manufacturer's specification and tests, but in no case more than 10 N/mm^2.
(2) Stainless and wear resistant steel in an approved combination with stock liner. Higher surface pressures than 7 N/mm^2 may be accepted if verified by tests.

The wall thickness of pintle bearings in sole piece and rudder horn is to be approximately equal to one fourth of the pintle diameter.

5.5 Pintles

5.5.1

Pintles are to have scantlings complying with the conditions given in **[4.4]** and **[4.6].** The pintle diameter, in mm, is not to be less than:

$$d_a = 0.35\sqrt{B_1 k_r}$$

where:

B_1 : Support force, in N

k_r : Material factor defined in **[1.4.2].**

5.5.2

The thickness of any liner or bush, in mm, is neither to be less than:

$$t = 0.01\sqrt{B_1}$$

nor than the minimum thickness defined in **[5.4.1].**

5.5.3

Where pintles are of conical shape, the taper on diameter is to comply with the following:

- 1:8 to 1:12, if keyed by slugging nut
- 1:12 to 1:20, if mounted with oil injection and hydraulic nut

5.5.4

The pintles are to be arranged in such a manner as to prevent unintentional loosening and falling out. For nuts and threads the requirements of **[4.4.5]** and **[4.5.2]** apply accordingly.

5.6 Criteria for bearing clearances

5.6.1

For metallic bearing material the bearing clearance, in mm, is to be not less:

$$\frac{d_b}{1000} + 1.0$$

where:

d_b : Inner diameter of bush, in mm.

5.6.2

If non-metallic bearing material is applied, the bearing clearance is to be specially determined considering the material's swelling and thermal expansion properties.

5.6.3

The clearance is not to be taken less than 1.5 mm on diameter. In case of self lubricating bushes going down below this value can be agreed to on the basis of the manufacturer's specification.

6. Design yield moment of rudder stock

6.1 General

6.1.1

The design yield moment of the rudder stock is to be determined by the following formula:

$$Q_F = 0.02664 \frac{D_t^3}{k_r}$$

D_t : Stock diameter, in mm, according to **[3.1]**.

Where the actual diameter D_{ta} is greater than the calculated diameter D_t, the diameter D_{ta} is to be used. However, D_{ta} applied to the above formula need not be taken greater than 1.145 D_t.

7. Stopper, locking device

7.1 Stopper

7.1.1

The motions of quadrants or tillers are to be limited on either side by stoppers. The stoppers and their foundations connected to the ship's hull are to be of strong construction so that the yield point of the applied materials is not exceeded at the design yield moment of the rudder stock.

7.2 Locking device

7.2.1

Each steering gear is to be provided with a locking device in order to keep the rudder fixed at any position. This device as well as the foundation in the ship's hull are to be of strong construction so that the yield point of the applied materials is not exceeded at the design yield moment of the rudder stock as specified in **[6]**. Where the ship's speed exceeds 12 knots, the design yield moment need only be calculated for a stock diameter based on a speed $V_0 = 12$ knots.

7.3

7.3.1

Regarding stopper and locking device see also the applicable requirements of the Society's Rules for Machinery Installations.

8. Propeller nozzles

8.1 General

8.1.1

The following requirements are applicable to propeller nozzles having an inner diameter of up to 5 m. Nozzles with larger diameters will be specially considered.

8.1.2

Special attention is to be given to the support of fixed nozzles at the hull structure.

8.2 Design pressure

8.2.1

The design pressure for propeller nozzles, in kN/m^2, is to be determined by the following formula:

$$p_d = c \cdot p_{d0}$$

$$p_{d0} = \varepsilon \frac{N}{Ap}$$

where:

N : Maximum shaft power, in kW

A_p : Propeller disc area, in m^2, taken equal to:

$$A_p = D^2 \frac{\pi}{4}$$

D : Propeller diameter, in m

ε : Factor obtained from the following formula:

$\varepsilon = 0.21 - 2 \cdot 10^{-4} \frac{N}{A_p}$, without being taken less than 0.1

c : Coefficient taken equal to (see **Fig 12**):

c = 1.0 in zone 2 (propeller zone)

c = 0.5 in zones 1 and 3

c = 0.35 in zone 4.

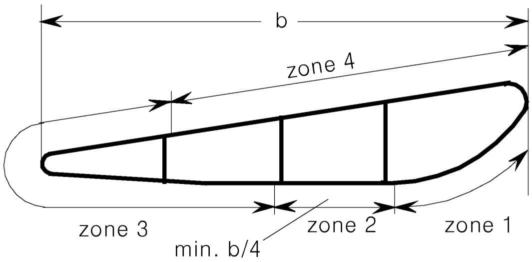

Fig 12: Zones of propeller nozzle

8.3 Plate thickness

8.3.1

The thickness of the nozzle shell plating, in mm, is not to be less than:

$t = t_0 + t_k$, without being taken less than 7.5

where:

t_0 : Thickness, in mm, obtained from the following formula:

$$t_0 = 5a\sqrt{p_d}$$

a : Spacing of ring stiffeners, in m

t_k : Corrosion allowance, in mm, taken equal to:

$t_k = 1.5$ if $t_0 \le 10$

$t_k = \min\left[0.1\left(\frac{t_0}{\sqrt{k}} + 0.5\right), 3.0\right]$ if $t_0 > 10$

8.3.2

The web thickness of the internal stiffening rings is not to be less than the nozzle plating for zone 3, however, in no case be less than 7.5 mm.

8.4 Section modulus

8.4.1

The section modulus of the cross section shown in **Fig 12** around its neutral axis, in cm^3, is not to be less than:

$$w = n d^2 b V_0^2$$

where:

d : Inner diameter of nozzle, in m

b : Length of nozzle, in m

n : Coefficient taken equal to:

$n = 1.0$, for rudder nozzles

$n = 0.7$, for fixed nozzles.

8.5 Welding

8.5.1

The inner and outer nozzle shell plating is to be welded to the internal stiffening rings as far as practicable by double continuous welds. Plug welding is only permissible for the outer nozzle plating.

9. Rudder horn and sole piece scantlings

9.1 Sole piece

9.1.1

The section modulus of the sole piece related to the z-axis, in cm^3, is not to be less than:

$$W_z = \frac{B_1 \cdot x \cdot k}{80}$$

where:

B1 : As defined in **[3.3]**. For rudders with two supports the support force is approximately $B_1 = C_R/2$, when the elasticity of the sole piece is ignored.

x : Distance, in m, of the respective cross section from the rudder axis, with:

$x_{min} = 0.5 \ell_{50}$

$x_{max} = \ell_{50}$

ℓ_{50} : As defined in **Fig 13** and **[3.3.2].**

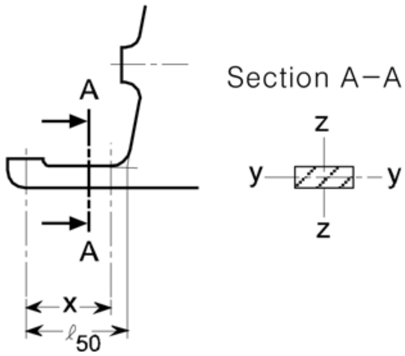

Fig 13: Sole piece

9.1.2

The section modulus related to the y-axis is not to be less than:

- where no rudder post or rudder axle is fitted

$$W_y = \frac{W_z}{2}$$

- where a rudder post or rudder axle is fitted

$$W_y = \frac{W_z}{3}$$

9.1.3

The sectional area, in mm^2, at the location $x = \ell_{50}$ is not to be less than:

$$A_s = \frac{B_1}{48} k$$

9.1.4

The equivalent stress taking into account bending and shear stresses, in N/mm^2, at any location within the length ℓ_{50} is not to exceed:

$$\sigma_v = \sqrt{\sigma_b^2 + 3\tau^2} = \frac{115}{k}$$

where:

$$\sigma_b = \frac{B_1 x}{W_z}$$

$$\tau = \frac{B_1}{A_s}$$

9.2 Rudder horn of semi spade rudders (case of 1-elastic support)

9.2.1

The distribution of the bending moment, in N.m, shear force, in N, and torsional moment, in N.m, is to be determined according to the following formulae:

- bending moment: $M_b = B_1 z$

$$M_{b\max} = B_1 d$$

- shear force: $Q = B_1$
- torsional moment: $M_T = B_1 e_{(z)}$

For determining preliminary scantlings the flexibility of the rudder horn may be ignored and the supporting force B_1, in N, be calculated according to the following formula:

$$B_1 = C_R \frac{b}{c}$$

where b, c, d, $e_{(z)}$ and z are defined in **Fig 14** and **Fig 15.**

b results from the position of the centre of gravity of the rudder area.

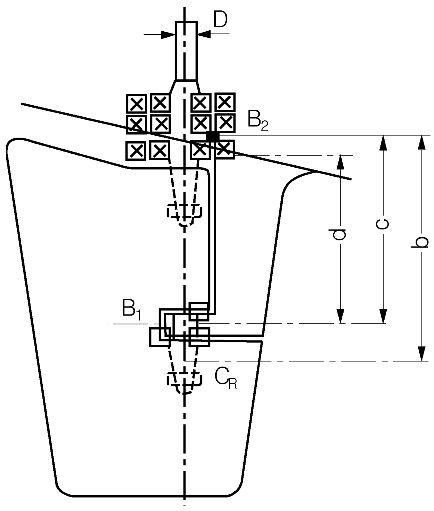

Fig 14: Dimensions of rudder horn

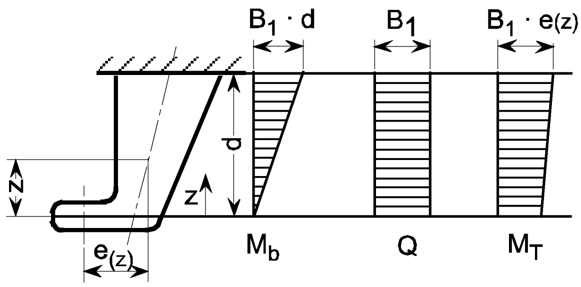

Fig 15: Rudder horn loads

9.2.2

The section modulus of the rudder horn in transverse direction related to the horizontal x-axis is at any location z, in cm^3, not to be less than:

$$W_x = \frac{M_b k}{67}$$

9.2.3

At no cross section of the rudder horn the shear stress, in N/mm^2, due to the shear force Q is to exceed the value:

$$\tau = \frac{48}{k}$$

The shear stress, in N/mm^2, is to be determined by the following formula:

$$\tau = \frac{B_1}{A_h}$$

where:

A_h : Effective shear area of the rudder horn, in mm^2, in y

9.2.4

The equivalent stress, in N/mm^2, at any location zof the rudder horn is not to exceed the following value:

$$\sigma_v = \sqrt{\sigma_b^2 + 3\left(\tau^2 + \tau_T^2\right)} = \frac{120}{k}$$

where:

$$\sigma_b = \frac{M_b}{W_x}$$

$$\tau_T = \frac{M_T}{2 A_T t_h} 10^3$$

A_T : Sectional area, in mm^2, enclosed by the rudder horn at the location considered

t_h : Thickness of the rudder horn plating, in mm.

9.2.5

When determining the thickness of the rudder horn plating the provisions of **[5.2]** to **[5.4]** are to be complied with. The thickness, in mm, is, however, not to be less than $2.4\sqrt{LK}$.

9.2.6

The rudder horn plating is to be effectively connected to the aft ship structure, e.g. by connecting the plating to longitudinal girders, in order to achieve a proper transmission of forces, see **Fig 16.**

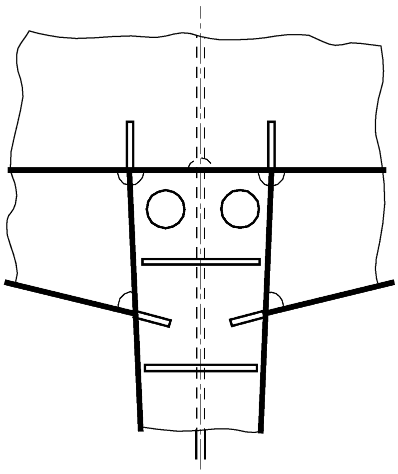

Fig 16: Connection of rudder horn to aft ship structure

9.2.7

Transverse webs of the rudder horn are to be led into the hull up to the next deck in a sufficient number and must be of adequate thickness.

9.2.8

Strengthened plate floors are to be fitted in line with the transverse webs in order to achieve a sufficient connection with the hull. The thickness of these plate floors is to be increased by 50 % above the bottom thickness determined according to **Ch 6, Sec 1** or **Ch 9, Sec 2.**

9.2.9

The centre line bulkhead (wash-bulkhead) in the after peak is to be connected to the rudder horn.

9.2.10

Where the transition between rudder horn and shell is curved, about 50 % of the required total section modulus of the rudder horn is to be formed by the webs in a section A-A located in the centre of the transition zone, i.e. 0.7 r above the beginning of the transition zone (See **Fig 17**).

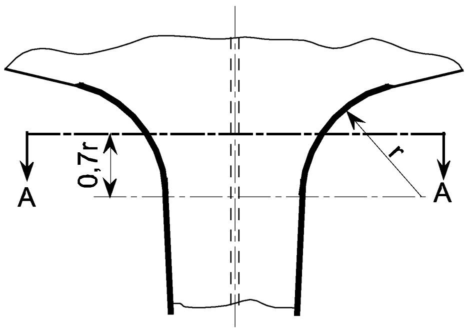

Fig 17: Transition between rudder horn and shell

9.3 Rudder horn of semi spade rudders (case of 2-conjugate elastic supports)

9.3.1 Bending moment

The bending moment acting on the generic section of the rudder horn is to be obtained, in N.m, from the following formulae:

- between the lower and upper supports provided by the rudder horn:
  $$M_H = F_{A1}\, z$$
- above the rudder horn upper-support:
  $$M_H = F_{A1}\, z + F_{A2}\,(z - d_{lu})$$

where:

F_{A1} : Support force at the rudder horn lower-support, in N, to be obtained according to **Fig 5**, and taken equal to B_1

F_{A2} : Support force at the rudder horn upper-support, in N, to be obtained according to **Fig 5**, and taken equal to B_2

z : Distance, in m, defined in **Fig 19**, to be taken less than the distance d, in m, defined in the same figure

d_{lu} : Distance, in m, between the rudder-horn lower and upper bearings (according to **Fig 18,** $d_{lu} = d - \lambda$).

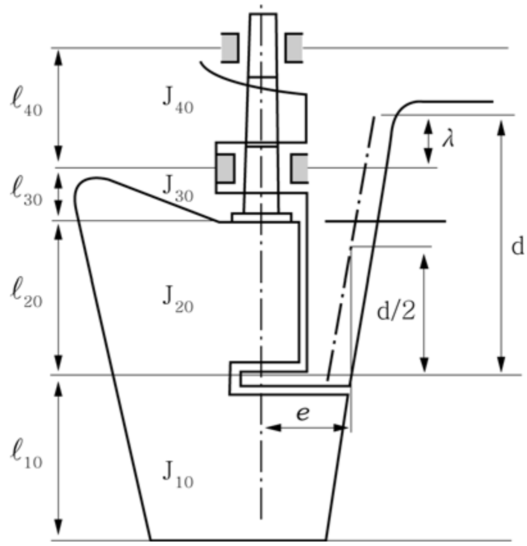

Fig 18: Geometrical parameters for the calculation of the bending moment in rudder horn

9.3.2 Shear force

The shear force Q_H acting on the generic section of the rudder horn is to be obtained, in N, from the following formulae:

- between the lower and upper rudder horn bearings:

$$Q_H = F_{A1}$$

- above the rudder horn upper-bearing:

$$Q_H = F_{A1} + F_{A2}$$

where:

F_{A1}, F_{A2} : Support forces, in N.

9.3.3 Torque

The torque acting on the generic section of the rudder horn is to be obtained, in N.m, from the following formulae:

- between the lower and upper rudder horn bearings:

$$M_T = F_{A1}\, e_{(z)}$$

- above the rudder horn upper-bearing:

$$M_T = F_{A1}\, e_{(z)} + F_{A2}\, e_{(z)}$$

where:

F_{A1}, F_{A2} : Support forces, in N

$e_{(z)}$: Torsion lever, in m, defined in **Fig 19.**

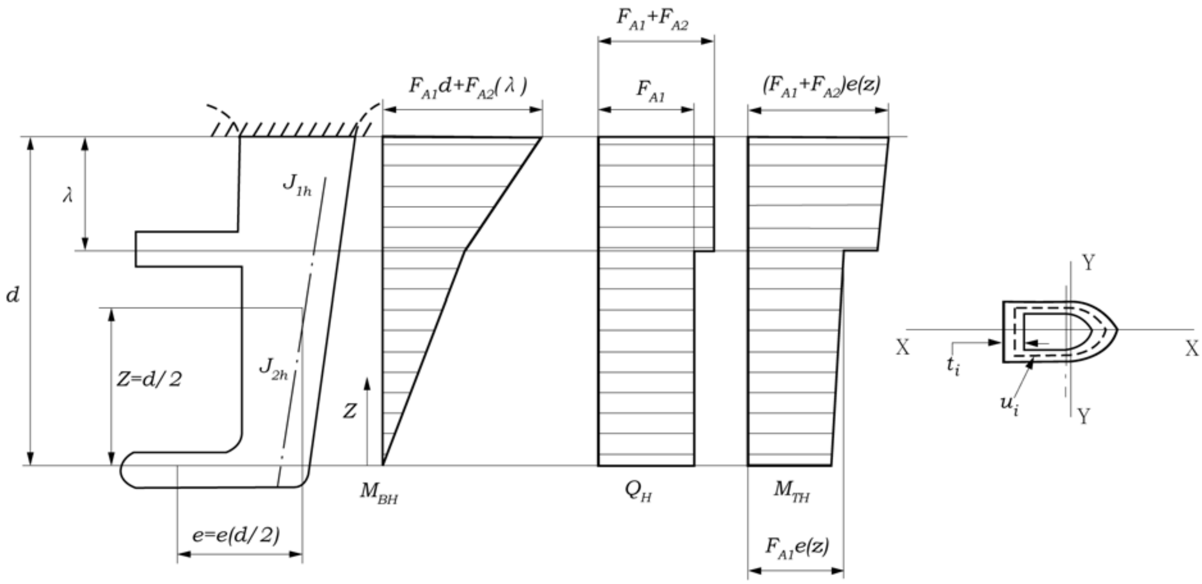

Fig 19: Geometry of rudder horn

9.3.4 Shear stress calculation

a) For a generic section of the rudder horn, located between its lower and upper bearings, the following stresses are to be calculated:

τ_S : Shear stress, in N/mm^2, to be obtained from the following formula:

$$\tau_s = \frac{F_{A1}}{A_H}$$

τ_T : Torsional stress, in N/mm^2, to be obtained for hollow rudder horn from the following formula:

$$\tau_T = \frac{M_T 10^3}{2F_T t_H}$$

For solid rudder horn, τ_T is to be considered by the Society on a case by case basis

b) For a generic section of the rudder horn, located in the region above its upper bearing, the following stresses are to be calculated:

τ_S : Shear stress, in N/mm^2, to be obtained from the following formula:

$$\tau_s = \frac{F_{A1} + F_{A2}}{A_H}$$

τ_T : Torsional stress, in N/mm^2, to be obtained for hollow rudder horn from the following formula:

$$\tau_T = \frac{M_T 10^3}{2F_T t_H}$$

For solid rudder horn, τ_T is to be considered by the Society on a case by case basis

where:

F_{A1}, F_{A2} : Support forces, in N

A_H : Effective shear sectional area of the rudder horn, in mm^2, in y-direction

M_T : Torque, in N.m

F_T : Mean of areas enclosed by outer and inner boundaries of the thin walled section of rudder horn, in m^2

t_H : Plate thickness of rudder horn, in mm. For a given cross section of the rudder horn, the maximum value of τ_T is obtained at the minimum value of t_H.

9.3.5 Bending stress calculation

For the generic section of the rudder horn within the length d, defined in **Fig 14**, the following stresses are to be calculated:

σ_B : Bending stress, in N/mm^2, to be obtained from the following formula:

$$\sigma_B = \frac{M_H}{W_X}$$

M_H : Bending moment at the section considered, in N.m

W_X : Section modulus, in cm3, around the X-axis (see **Fig 19**).

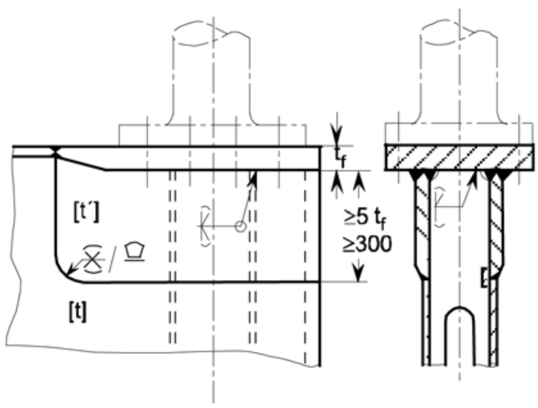
9.3.6 General remarks

Requirements **[9.2.5]** to **[9.2.10]** also apply to rudder horn with 2-conjugate elastic supports.

10. Rudder coupling flanges

10.1.1

Unless forged or cast steel flanges with integrally forged or cast welding flanges are used, horizontal rudder coupling flanges are to be joined to the rudder body by plates of graduated thickness and full penetration single or double-bevel welds as prescribed in **Ch 11, Sec 1** (see **Fig 20**).



t = thickness of rudder plating, in mm

t_f = actual flange thickness in mm

$t' = \frac{t_f}{3} + 5$ (mm) where, $t_f < 50$ mm

$t' = 3\sqrt{t_f}$ (mm) where, $t_f \geq 50$ mm

Fig 20: Horizontal rudder coupling flanges

10.1.2

Allowance is to be made for the reduced strength of the coupling flange in the thickness direction. In case of doubt, proof by calculation of the adequacy of the welded connection shall be produced.

10.1.3

The welded joint between the rudder stock (with thickened collar, see **Ch 11, Sec 2**) and the flange is to be made in accordance with **Fig 21.**

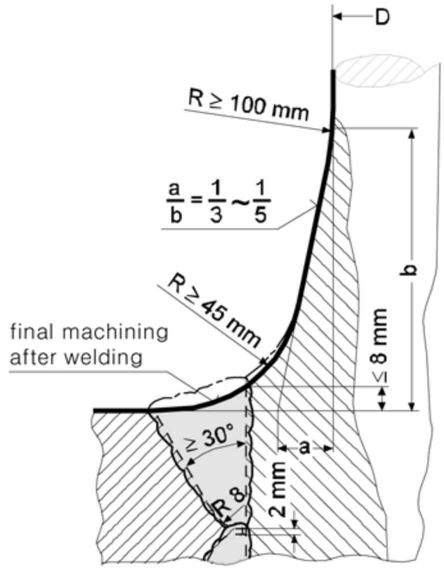


Fig 21: Welded joint between rudder stock and coupling flange

11. Azimuth propulsion system

11.1 General

11.1.1 Arrangement

The azimuth propulsion system is constituted by the following sub-systems (see **Fig 22**):

- the steering unit
- the bearing
- the hull supports
- the rudder part of the system
- the pod, which contains the electric motor in the case of a podded propulsion system.

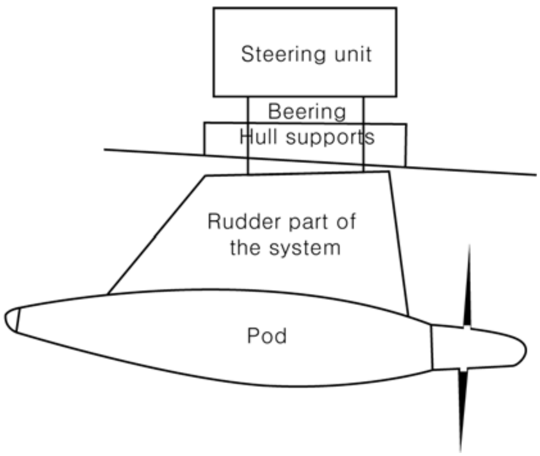

Fig 22: Azimuth propulsion system

11.1.2 Application

The requirements of this Article apply to the scantlings of the hull supports, the rudder part and the pod.

The steering unit and the bearing are to comply with the relevant requirements of the Society's Rules.

11.1.3 Operating conditions

The maximum angle at which the azimuth propulsion system can be oriented on each side when the ship navigates at its maximum speed is to be specified by the Designer. Such maximum angle is generally to be less than 35° on each side.
In general, orientations greater than this maximum angle may be considered by the Society for azimuth propulsion systems during manoeuvres, provided that the orientation values together with the relevant speed values are submitted to the Society for approval.

11.2 Arrangement

11.2.1 Plans to be submitted

In addition to the plans showing the structural arrangement of the pod and the rudder part of the system, the plans showing the arrangement of the azimuth propulsion system supports are to be submitted to the Society for approval. The scantlings of the supports and the maximum loads which act on the supports are to be specified in these drawings.

11.2.2 Locking device

The azimuth propulsion system is to be mechanically lockable in a fixed position, in order to avoid rotations of the system and propulsion in undesirable directions in the event of damage.

11.3 Design loads

11.3.1

The lateral pressure to be considered for scantling of plating and ordinary stiffeners of the azimuth propulsion system is to be determined for an orientation of the system equal to the maximum angle at which the azimuth propulsion system can be oriented on each side when the ship navigates at its maximum speed.

- The total force which acts on the azimuth propulsion system is to be obtained by integrating the lateral pressure on the external surface of the system.
- The calculations of lateral pressure and total force are to be submitted to the Society for information.

11.4 Plating

11.4.1 Plating of the rudder part of the azimuth propulsion system

The thickness of plating of the rudder part of the azimuth propulsion system is to be not less than that obtained, in mm, from the formulae in **[5.2.1]**, in which the term C_R/A is to be replaced by the lateral pressure calculated according to **[11.3].**

11.4.2 Plating of the pod

The thickness of plating of the pod is to be not less than that obtained, in mm, from the formulae in **Ch 6, Sec 1** or **Ch 9, Sec 2**, where the lateral pressure is to be calculated according to **[11.3].**

11.4.3 Webs

The thickness of webs of the rudder part of the azimuth propulsion system is to be determined according to **[5.2.3]**, where the lateral pressure is to be calculated according to **[11.3].**

11.5 Ordinary stiffeners

11.5.1 Ordinary stiffeners of the pod

The scantlings of ordinary stiffeners of the pod are to be not less than those obtained from the formulae in **Ch 6, Sec 2** or **Ch 9, Sec 2**, where the lateral pressure is to be calculated according to **[11.3].**

11.6 Primary supporting members

11.6.1 Analysis criteria

The scantlings of primary supporting members of the azimuth propulsion system are to be obtained by the Designer through direct calculations, to be carried out according to the following requirements:

- the structural model is to include the pod, the rudder part of the azimuth propulsion system, the bearing and the hull supports
- the boundary conditions are to represent the connections of the azimuth propulsion system to the hull structures
- the loads to be applied are those defined in **[11.6.2].**
- The direct calculation analyses (structural model, load and stress calculation, strength checks) carried out by the Designer are to be submitted to the Society for information.

11.6.2 Loads

The following loads are to be considered by the Designer in the direct calculation of the primary supporting members of the azimuth propulsion system:

- gravity loads
- buoyancy
- maximum loads calculated for an orientation of the system equal to the maximum angle at which the azimuth propulsion system can be oriented on each side when the ship navigates at its maximum speed
- maximum loads calculated for the possible orientations of the system greater than the maximum angle at the relevant speed (see **[11.1.3]**)
- maximum loads calculated for the crash stop of the ship obtained through inversion of the propeller rotation
- maximum loads calculated for the crash stop of the ship obtained through a 180° rotation of the pod.

11.6.3 Strength check

It is to be checked that the Von Mises equivalent stress σ_E in primary supporting members, calculated, in $\mathrm{N/mm^2}$, for the load cases defined in **[11.6.2]**, is in compliance with the following formula:

$$\sigma_E \le \sigma_{ALL}$$

where:

σ_{ALL} : Allowable stress, in $\mathrm{N/mm^2}$, to be taken equal to the lesser of the following values:

$\sigma_{ALL} = 0.275\, R_m$

$\sigma_{ALL} = 0.55\, R_{eH}$

11.7 Hull supports of the azimuth propulsion system

11.7.1 Analysis criteria

The scantlings of hull supports of the azimuth propulsion system are to be obtained by the Designer through direct calculations, to be carried out in accordance with the requirements in **[11.6.1].**

11.7.2 Loads

The loads to be considered in the direct calculation of the hull supports of the azimuth propulsion system are those specified in **[11.6.2].**

11.7.3 Strength check

It is to be checked that the Von Mises equivalent stress σ_E in hull supports, in N/mm^2, calculated for the load cases defined in **[11.6.2]**, is in compliance with the following formula:

$$\sigma_E \leq \sigma_{ALL}$$

where:

σ_{ALL} : Allowable stress, in N/mm^2, equal to $65/k_r$

k_r : Material factor, defined in **[1.4.2]**

Values of σ_E greater than σ_{ALL} may be accepted by the Society on a case by case basis, depending on the localisation of σ_E and on the type of direct calculation analysis.

Section 2 – BULWARKS AND GUARD RAILS

1. General

1.1 Introduction

1.1.1

The requirements of this Section apply to the arrangement of bulwarks and guard rails provided at boundaries of the freeboard deck, superstructure decks and tops of the first tier of deckhouses located on the freeboard deck.

1.2 General

1.2.1

Efficient bulwarks or guard rails are to be fitted at the boundaries of all exposed parts of the freeboard deck and superstructure decks directly attached to the freeboard deck, as well as the first tier of deckhouses fitted on the freeboard deck and the superstructure ends.

1.2.2

The height of the bulwarks or guard rails is to be at least 1 m from the deck. However, where their height would interfere with the normal operation of the ship, a lesser height may be accepted, if adequate protection is provided and subject to any applicable statutory requirement.

1.2.3

Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed parts of the freeboard deck.

1.2.4

In type B-100 ships, open rails on the weather parts of the freeboard deck for at least half the length of the exposed parts are to be fitted.
Alternatively, freeing ports complying with **Ch 9, Sec 6, [5.5.2]** are to be fitted.

1.2.5

In ships with bulwarks and trunks of breadth not less than $0.6\,B$, which are included in the calculation of freeboard, open rails on the weather parts of the freeboard deck in way of the trunk for at least half the length of the exposed parts are to be fitted.
Alternatively, freeing ports complying with **Ch 9, Sec 6, [5.3.1]** are to be fitted.

1.2.6

In ships having superstructures which are open at either or both ends, adequate provision for freeing the space within such superstructures is to be provided.

1.2.7

The freeing port area in the lower part of the bulwarks is to be in compliance with the applicable requirements of **Ch 9, Sec 6, [5].**

2. Bulwarks

2.1 General

2.1.1

As a rule, plate bulwarks are to be stiffened at the upper edge by a suitable bar and supported either by stays or plate brackets spaced not more than 2.0 m apart.
The free edge of the stay or the plate bracket is to be stiffened.
Stay and brackets of bulwarks are to be aligned with the beams located below or are to be connected to them by means of local transverse stiffeners.
As an alternative, the lower end of the stay and bracket may be supported by a longitudinal stiffener.

2.1.2

In type B-60 and B-100 ships, the spacing forward of 0.07 L from the fore end of brackets and stays is to be not greater than 1.2 m.

2.1.3

Where bulwarks are cut completely, the scantlings of stays or brackets are to be increased with respect to those given in **[2.2].**

2.1.4

As a rule, bulwarks are not to be connected either to the upper edge of the sheerstrake plate or to the stringer plate.
Failing this, the detail of the connection will be examined by the Society.

2.2 Scantlings

2.2.1

The gross thickness of bulwarks on the freeboard deck not exceeding 1 m in height is to be not less than 6.5 mm.
Where the height of the bulwark is equal to or greater than 1.8 m, its thickness is to be equal to that calculated for the side of a superstructure situated in the same location as the bulwark.
For bulwarks between 1 m and 1.8 m in height, their thickness is to be calculated by linear interpolation.

2.2.2

Bulwark plating and stays are to be adequately strengthened in way of eye plates used for shrouds or other tackles in use for cargo gear operation, as well as in way of hawser holes or fairleads provided for mooring or towing.

2.2.3

At the ends of partial superstructures and for the distance over which their side plating is tapered into the bulwark, the latter is to have the same thickness as the side plating. Where openings are cut in the bulwark at these positions, adequate compensation is to be provided either by increasing the thickness of the plating or by other suitable means.

2.2.4

The gross section modulus of stays in way of the lower part of the bulwark is to be not less than the value obtained, in cm^3, from the following formula:

$$w = 77 s h_B^2$$

where:

s : Spacing of stays, in m

hB : Height of bulwark, in m, measured from the top of the deck plating to the upper edge.

The actual section of the connection between stays and deck structures is to be taken into account when calculating the above section modulus.
To this end, the bulb or face plate of the stay may be taken into account only where welded to the deck; in this case the beam located below is to be connected by double continuous welding.
For stays with strengthening members not connected to the deck, the calculation of the required section modulus is considered by the Society on a case by case basis.
At the ends of the ship, where the bulwark is connected to the sheerstrake, an attached plating having a width not exceeding 600 mm may also be included in the calculation of the actual gross section modulus of stays.

2.2.5

Openings in bulwarks are to be arranged so that the protection of the crew is to be at least equivalent to that provided by the horizontal courses in **[3.1.2].**
For this purpose, vertical rails or bars spaced approximately 230 mm apart may be accepted in lieu of rails or bars arranged horizontally.

2.2.6

In the case of ships intended for the carriage of timber deck cargoes, the specific provisions of the free-board regulations are to be complied with.

3. Guard rails

3.1 General

3.1.1

Where guard rails are provided, the upper edge of sheerstrake is to be kept as low as possible.

3.1.2

The opening below the lowest course is to be not more than 230 mm. The other courses are to be not more than 380 mm apart.

3.1.3

In the case of ships with rounded gunwales or sheerstrake, the stanchions are to be placed on the flat part of the deck.

3.1.4

Fixed, removable or hinged stanchions are to be fitted about 1.5 m apart. At least every third stanchion is to be supported by a bracket or stay.
Removable or hinged stanchions are to be capable of being locked in the upright position.

3.1.5

Wire ropes may only be accepted in lieu of guard rails in special circumstances and then only in limited lengths. Wires are to be made taut by means of turnbuckles.

3.1.6

Chains may only be accepted in short lengths in lieu of guard rails if they are fitted between two fixed stanchions and/or bulwarks.

Section 3 - EQUIPMENT

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**
EN : Equipment number defined in **[2.1]**

1. General

1.1 General

1.1.1

The requirements in this Section apply to temporary mooring of a ship within or near harbour, or in a sheltered area, when the ship is awaiting a berth, the tide, etc..
Therefore, the equipment complying with the requirements in this Section is not intended for holding a ship off fully exposed coasts in rough weather or for stopping a ship which is moving or drifting.

1.1.2

The equipment complying with the requirements in this Section is intended for holding a ship in good holding ground, where the conditions are such as to avoid dragging of the anchor. In poor holding ground the holding power of the anchors is to be significantly reduced.

1.1.3

The equipment number *EN* formula for anchoring equipment required here under is based on an assumed current speed of 2.5 m/s, wind speed of 25 m/s and a scope of chain cable between 6 and 10, the scope being the ratio between length of chain paid out and water depth.

1.1.4

It is assumed that under normal circumstances a ship will use one anchor only.

2. Equipment number

2.1 Equipment number

2.1.1 General

All ships are to be provided with equipment in anchors and chain cables (or ropes according to **[3.3.5]**), to be obtained from Table 1, based on their equipment number *EN*.
In general, stockless anchors are to be adopted.
For ships with *EN* greater than 16000, the determination of the equipment will be considered by the Society on a case by case basis.

Table 1: Equipment

Equipment number EN $A < EN \le B$		Stockless anchors		Stud link chain cables for anchors			
		N (1)	Mass per anchor, in kg	Total length, in m	Diameter, in mm

(1) See **[3.2.4]**.							

2.1.2 Equipment number

The equipment number EN is to be obtained from the following formula:

$$EN = \Delta^{2/3} + 2hB + 0.1A$$

where:

Δ : Moulded displacement of the ship, in t, to the summer load waterline

h : Effective height, in m, from the summer load waterline to the top of the uppermost house, to be obtained in accordance with the following formula:

$h = a + \Sigma h_n$

When calculating h, sheer and trim are to be disregarded

a : Freeboard amidships from the summer load waterline to the upper deck, in m

h_n : Height, in m, at the centreline of tier "n" of superstructures or deckhouses having a breadth greater than $B/4$. Where a house having a breadth greater than $B/4$ is above a house with a breadth of $B/4$ or less, the upper house is to be included and the lower ignored

A : Area, in m^2, in profile view, of the parts of the hull, superstructures and houses above the summer load waterline which are within the length L and also have a breadth greater than $B/4$

Fixed screens or bulwarks 1.5 m or more in height are to be regarded as parts of houses when determining h and A. In particular, the hatched area shown in **Fig 1** is to be included.
The height of hatch coamings and that of any deck cargo, such as containers, may be disregarded when determining h and A.

3. Equipment

3.1 General

3.1.1

All anchoring equipment, towing bitts, mooring bollards, fairlead cleats and eyebolts are to be so constructed and attached to the hull that, in use up to design loads, the integrity of the ship will not be impaired.

3.1.2

The anchoring arrangement is to be such as to prevent the cable from being damaged and fouled. Adequate arrangement is to be provided to secure the anchor under all operational conditions.

3.2 Anchors

3.2.1 General

The scantlings of anchors are to be in compliance with the following requirements.
Anchors are to be constructed and tested in compliance with approved plans.

3.2.2 Ordinary anchors

The required mass for each anchor is to be obtained from **Table 1.**
The individual mass of a main anchor may differ by ±7 % from the mass required for each anchor, provided that the total mass of anchors is not less than the total mass required in **Table 1.**
The mass of the head of an ordinary stockless anchor, including pins and accessories, is to be not less than 60 % of the total mass of the anchor.
Where a stock anchor is provided, the mass of the anchor, excluding the stock, is to be not less than 80 % of the mass required in **Table 1** for a stockless anchor. The mass of the stock is to be not less than 25 % of the mass of the anchor without the stock but including the connecting shackle.

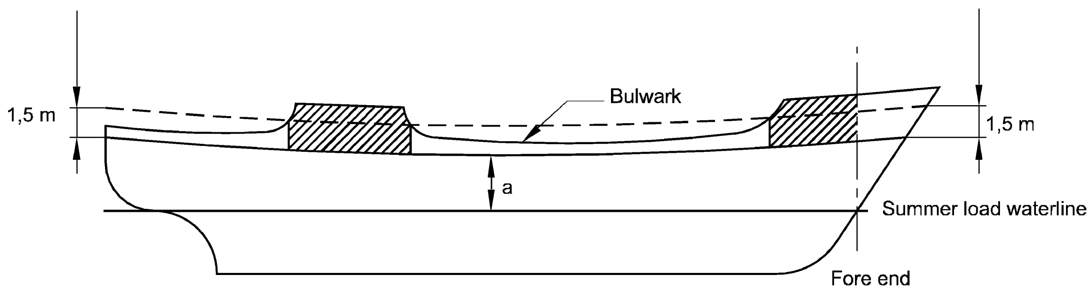

Fig 1: Effective area of bulwarks or fixed screen to be included in the equipment number

3.2.3 High and very high holding power anchors

High holding power (HHP) and very high holding power (VHHP) anchors, i.e. anchors for which a holding power higher than that of ordinary anchors has been proved according to the applicable requirements of the Society's Rules for Materials, do not require prior adjustment or special placement on the sea

bottom.
Where HHP or VHHP anchors are used as bower anchors, the mass of each anchor is to be not less than 75 % or 50 %, respectively, of that required for ordinary stockless anchors in **Table 1.**
The mass of VHHP anchors is to be, in general, less than or equal to 1500 kg.

3.2.4 Third anchor

Where three anchors are provided, two are to be connected to their own chain cables and positioned on board always ready for use.
The third anchor is intended as a spare and is not required for the purpose of classification.

3.2.5 Test for high holding power anchors approval

For approval and/or acceptance as a HHP anchor, comparative tests are to be performed on various types of sea bottom.
Such tests are to show that the holding power of the HHP anchor is at least twice the holding power of an ordinary stockless anchor of the same mass.
For approval and/or acceptance as a HHP anchor of a whole range of mass, such tests are to be carried out on anchors whose sizes are, as far as possible, representative of the full range of masses proposed. In this case, at least two anchors of different sizes are to be tested. The mass of the maximum size to be approved is to be not greater than 10 times the maximum size tested. The mass of the smallest is to be not less than 0.1 times the minimum size tested.

3.2.6 Test for very high holding power anchors approval

For approval and/or acceptance as a VHHP anchor, comparative tests are to be performed at least on three types of sea bottom: soft mud or silt, sand or gravel and hard clay or similar compounded material. Such tests are to show that the holding power of the VHHP anchor is to be at least four times the holding power of an ordinary stockless anchor of the same mass or at least twice the holding power of a previously approved HHP anchor of the same mass. The holding power test load is to be less than or equal to the proof load of the anchor, specified in the applicable requirements of the Society’s Rules for Materials.
For approval and/or acceptance as a VHHP anchor of a whole range of mass, such tests are to be carried out on anchors whose sizes are, as far as possible, representative of the full range of masses proposed. In this case, at least three anchors of different sizes are to be tested, relevant to the bottom, middle and top of the mass range.

3.2.7 Specification for test on high holding power and very high holding power anchors

Tests are generally to be carried out from a tug. Shore based tests may be accepted by the Society on a case by case basis.
Alternatively, sea trials by comparison with a previous approved anchor of the same type (HHP or VHHP) of the one to be tested may be accepted by the Society on a case by case basis.
For each series of sizes, the two anchors selected for testing (ordinary stockless and HHP anchors for testing HHP anchors, ordinary stockless and VHHP anchors or, when ordinary stockless anchors are not available, HHP and VHHP anchors for testing VHHP anchors) are to have the same mass.
The length of chain cable connected to each anchor, having a diameter appropriate to its mass, is to be such that the pull on the shank remains practically horizontal. For this purpose a value of the ratio between the length of the chain cable paid out and the water depth equal to 10 is considered normal. A lower value of this ratio may be accepted by the Society on a case by case basis.
Three tests are to be carried out for each anchor and type of sea bottom.
The pull is to be measured by dynamometer; measurements based on the RPM/bollard pull curve of tug may, however, be accepted instead of dynamometer readings.
Note is to be taken where possible of the stability of the anchor and its ease of breaking out.

3.3 Chain cables for anchors

3.3.1 Material

The chain cables are classified as grade 1, 2 or 3 depending on the type of steel used and its manufacture.
The characteristics of the steel used and the method of manufacture of chain cables are to be approved by the Society for each manufacturer. The material from which chain cables are manufactured and the completed chain cables themselves are to be tested in accordance with the applicable requirements of the Society's Rules for Materials.
Chain cables made of grade 1 may not be used with high holding power and very high holding power anchors.

3.3.2 Scantlings of stud link chain cables

The mass and geometry of stud link chain cables, including the links, are to be in compliance with the requirements in the applicable requirements of the Society's Rules for Materials.
The diameter of stud link chain cables is to be not less than the value in **Table 1.**

3.3.3 Studless link chain cables

For ships with *EN* less than 90, studless short link chain cables may be accepted by the Society as an alternative to stud link chain cables, provided that the equivalence in strength is based on proof load, defined in the applicable requirements of the Society's Rules for Materials and that the steel grade of the studless chain is equivalent to the steel grade of the stud chains it replaces, as defined in **[3.3.1].**

3.3.4 Chain cable arrangement

Chain cables are to be made by lengths of 27.5 m each, joined together by Dee or lugless shackles.
The total length of chain cable, required in **Table 1**, is to be divided in approximately equal parts between the two anchors ready for use.
Where different arrangements are provided, they are considered by the Society on a case by case basis.
Where the ship may anchor in areas with current speed greater than 2.5 m/s, the Society may require a length of heavier chain cable to be fitted between the anchor and the rest of the chain in order to enhance anchor bedding.

3.3.5 Wire ropes

As an alternative to the stud link or short link chain cables mentioned, wire ropes may be used in the following cases:

- wire ropes for both the anchors, for ship length less than 30 m
- wire rope for one of the two anchors, for ship length between 30 m and 40 m.

The wire ropes above are to have a total length equal to 1.5 times the corresponding required length of stud link chain cables, obtained from **Table 1**, and a minimum breaking load equal to that given for the corresponding stud link chain cable (see **[3.3.2]**).
A short length of chain cable is to be fitted between the wire rope and the anchor, having a length equal to 12.5 m or the distance from the anchor in the stowed position to the winch, whichever is the lesser.

3.4 Attachment pieces

3.4.1 General

Where the lengths of chain cable are joined to each other by means of shackles of the ordinary Dee type, the anchor may be attached directly to the end link of the first length of chain cable by a Dee type end shackle.
A detachable open link in two parts riveted together may be used in lieu of the ordinary Dee type end shackle; in such case the open end link with increased diameter, defined in **[3.4.2]**, is to be omitted.
Where the various lengths of chain cable are joined by means of lugless shackles and therefore no spe-

cial end and increased diameter links are provided, the anchor may be attached to the first length of chain cable by a special pear-shaped lugless end shackle or by fitting an attachment piece.

3.4.2 Scantlings

The diameters of the attachment pieces, in mm, are to be not less than the values indicated in **Table 2.** Attachment pieces may incorporate the following items between the increased diameter stud link and the open end link:

- swivel, having a diameter equal to 1.2 *d*
- increased stud link, having a diameter equal to 1.1 *d*

Where different compositions are provided, they will be considered by the Society on a case by case basis.

Table 2: Diameters of attachment pieces

Attachment piece	Diameter, in mm
End shackle	1.4 *d*
Open end link	1.2 *d*
Increased stud link	1.1 *d*
Common stud link	*d*
Lugless shackle	*d*
where: *d* : Diameter, in mm, of the common link.	

3.4.3 Material

Attachment pieces, joining shackles and end shackles are to be of such material and design as to provide strength equivalent to that of the attached chain cable, and are to be tested in accordance with the applicable requirements of the applicable requirements of the Society's Rules for Materials.

3.4.4 Spare attachment pieces

A spare pear-shaped lugless end shackle or a spare attachment piece is to be provided for use when the spare anchor is fitted in place.

3.5 Towlines and mooring lines

3.5.1 General

The towlines having the characteristics defined in **Table 3** are intended as those belonging to the ship to be towed by a tug or another ship.

3.5.2 Materials

Towlines and mooring lines may be of wire, natural or synthetic fibre or a mixture of wire and fibre. The breaking loads defined in **Table 3** refer to steel wires or natural fibre ropes.
Steel wires and fibre ropes are to be tested in accordance with the applicable requirements in the applicable requirements of the Society's Rules for Materials.

3.5.3 Steel wires

Steel wires are to be made of flexible galvanised steel and are to be of types defined in **Table 4.**
Where the wire is wound on the winch drum, steel wires to be used with mooring winches may be constructed with an independent metal core instead of a fibre core. In general such wires are to have

not less than 186 threads in addition to the metallic core.

Table 3: Towlines and mooring lines

Equipment number EN $A < EN \leq B$		Towline(1)		Mooring lines

14600	16000			21	200	735

(1) The towline is not compulsory. It is recommended for ships having length not greater than 180 m.
(2) See **[3.5.4]**.

Table 4: Steel wire composition

Breaking load BL, in kN	Steel wire components		
	Number of threads	Ultimate tensile strength of threads, in N/mm^2	Composition of wire
$BL < 216$	72	1420 ÷ 1570	6 strands with 7-fibre core
$216 < BL < 490$	144	1570 ÷ 1770	6 strands with 7-fibre core
$BL > 490$	216 or 222	1770 ÷ 1960	6 strands with 1-fibre core

3.5.4 Number of mooring lines

When the breaking load of each mooring line is greater than 490 kN, either a greater number of mooring lines than those required in **Table 3** having lower strength, or a lower number of mooring lines than those required in **Table 3** having greater strength may be used, provided the total breaking load of all lines aboard the ship is greater than the value defined in **Table 3.**
In any case, the number of lines is to be not less than 6 and the breaking load of each line is to be greater than 490 kN.

3.5.5 Length of mooring lines

The length of individual mooring lines may be reduced by up to 7 % of the length defined in **Table 3**, provided that the total length of mooring lines is greater than that obtained by adding the lengths of the individual lines defined in **Table 3.**

3.5.6 Equivalence between the breaking loads of synthetic and natural fibre ropes

Generally, fibre ropes are to be made of polyamide or other equivalent synthetic fibres.
The equivalence between the breaking loads of synthetic fibre ropes B_{LS} and of natural fibre ropes B_{LN} is to be obtained, in kN, from the following formula:

$$B_{LS} = 7.4\delta (B_{LN})^{8/9}$$

where:

δ : Elongation to breaking of the synthetic fibre rope, to be assumed not less than 30 %.

3.6 Hawse pipes

3.6.1

Hawse pipes are to be built according to sound marine practice.
Their position and slope are to be so arranged as to create an easy lead for the chain cables and efficient housing for the anchors, where the latter are of the retractable type, avoiding damage to the hull during these operations.
For this purpose chafing lips of suitable form with ample lay-up and radius adequate to the size of the chain cable are to be provided at the shell and deck. The shell plating in way of the hawse pipes is to be reinforced as necessary.

3.6.2

In order to obtain an easy lead of the chain cables, the hawse pipes may be provided with rollers. These rollers are to have a nominal diameter not less than 10 times the size of the chain cable where they are provided with full imprints, and not less than 12 times its size where provided with partial imprints only.

3.6.3

All mooring units and accessories, such as timbler, riding and trip stoppers are to be securely fastened to the Surveyor’s satisfaction.

3.7 Windlass

3.7.1 General

The windlass, which is generally single, is to be power driven and suitable for the size of chain cable and the mass of the anchors.
The windlass is to be fitted in a suitable position in order to ensure an easy lead of the chain cables to and through the hawse pipes. The deck in way of the windlass is to be suitably reinforced.

3.7.2 Assumptions for the calculation of the continuous duty pull

The calculation of the continuous duty pull P_C that the windlass unit prime mover is to be able to supply is based on the following assumptions:

- ordinary stockless anchors
- wind force equal to 6 on Beaufort Scale
- water current velocity 3 knots
- anchorage depth 100 m
- P_C includes the influences of buoyancy and hawse pipe efficiency; the latter is assumed equal to 70 %
- the anchor masses assumed are those defined in the applicable requirements of the Society's Rules for Materials, excluding tolerances
- only one anchor is assumed to be raised at a time.

Owing to the buoyancy, the chain masses assumed are smaller than those defined in the applicable requirements of the Society's Rules for Materials, and are obtained, per unit length of the chain cable, in kg/m, from the following formula:

$$m_L = 0.0218\, d^2$$

where d is the chain cable diameter, in mm.

3.7.3 Calculation of the continuous duty pull

According to the assumptions in **[3.7.2]**, the windlass unit prime mover is to be able to supply for a least 30 minutes a continuous duty pull P_C to be obtained,i n kN, from **Table 5.**

Table 5: Continuous duty pull

Material of chain cables	Continuous duty pull, in kN
Mild steel	$P_C = 0.0375\, d^2$
High tensile strength steel	$P_C = 0.0425\, d^2$
Very high tensile strength steel	$P_C = 0.0475\, d^2$
where: d : Chain cable diameter, in mm.	

3.7.4 Temporary overload capacity

The windlass unit prime mover is to provide the necessary temporary overload capacity for breaking out the anchor.
The temporary overload capacity, or short term pull, is to be not less than 1.5 times the continuous duty pull P_C and it is to be provided for at least two minutes.
The speed in this overload period may be lower than the nominal speed specified in **[3.7.5].**

3.7.5 Nominal hoisting speed

The nominal speed of the chain cable when hoisting the anchor and cable, to be assumed as an average speed, is to be not less than 0.15 m/s.
The speed is to be measured over two shots of chain cable during the entire trip; the trial is to commence with 3 shots (82.5 m) of chain fully submerged.

3.7.6 Windlass brake

A windlass brake is to be provided having sufficient capacity to stop the anchor and chain cable when

paying out the latter with safety, in the event of failure of the power supply to the prime mover. Windlasses not actuated by steam are also to be provided with a non-return device.
A windlass with brakes applied and the cable lifter declutched is to be able to withstand a pull of 45 % of the breaking load of the chain without any permanent deformation of the stressed parts or brake slip.

3.7.7 Chain stoppers

Where a chain stopper is fitted, it is to be able to withstand a pull of 80 % of the breaking load of the chain.
Where a chain stopper is not fitted, the windlass is to be able to withstand a pull of 80 % of the breaking load of the chain without any permanent deformation of the stressed part or brake slip.

3.7.8 Green sea loads

Where the height of the exposed deck in way of the item is less than 0.1 L or 22 m above the summer load waterline, whichever is the lesser, the securing devices of windlasses located within the forward quarter length of the ship are to resist green sea forces.
The green sea pressure and associated areas are to be taken equal to (see **Fig 2**):

- 200 $\mathrm{kN/m^2}$ normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction
- 150 $\mathrm{kN/m^2}$ parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of f times the projected area in this direction,

where:

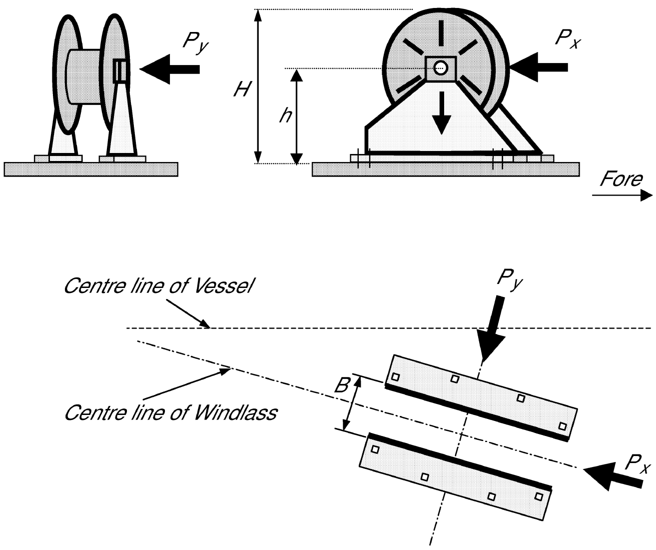
f : Coefficient taken equal to

$$f = 1 + \frac{B}{H}$$, but not greater than 2.5

B : Width of windlass measured parallel to the shaft axis,

H : Overall height of windlass.

Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.



Note: Py to be examined from both inboard and outboard directions separately - see [3.7.8]. The sign convention for y i is reversed when Py is from the opposite direction as shown.

Fig 2: Direction of forces and weight

3.7.9 Forces in the securing devices of windlasses due to green sea loads

Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated by considering the green sea loads specified in **[3.7.8].**
The windlass is supported by N bolt groups, each containing one or more bolts (see also **Fig 3**).
The axial force R_i in bolt group (or bolt) i, positive in tension, is to be obtained, in kN, from the following formulae:

- $R_{xi} = P_x h_{xi} A_i / I_x$
- $R_{yi} = P_y h_{yi} A_i / I_y$
- $R_i = R_{xi} + R_{yi} - R_{si}$

where:

P_x : Force, in kN, acting normal to the shaft axis

P_y : Force, in kN, acting parallel to the shaft axis, either inboard or outboard, whichever gives the greater force in bolt group i

h : Shaft height, in cm, above the windlass mounting

x_i, y_i : X and Y co-ordinates, in cm, of bolt group i from the centroid of all N bolt groups, positive in the direction opposite to that of the applied force

A_i : Cross-sectional area, in cm^2, of all bolts in group I

I_x, I_y : Inertias, for N boltg roups, equal to:

$$I_x = \sum A_i x_i^2$$

$$I_y = \sum A_i y_i^2$$

R_{si} : Static reaction force, in kN, at bolt group i, due to weight of windlass.

Shear forces F_{xi}, F_{yi} applied to the bolt group i, and the resultant combined force F_i are to be obtained, in kN, from the following formulae:

- $F_{xi} = (P_x - \alpha g M)/N$
- $F_{yi} = (P_y - \alpha g M)/N$
- $F_i = (F_{xi}{}^2 + F_{yi}{}^2)^{0,5}$

where:

α : Coefficient of friction, to be taken equal to 0.5

M : Mass, in t, of windlass

N : Number of bolt groups.

Axial tensile and compressive forces and lateral forces calculated according to these requirements are also to be considered in the design of the supporting structure.

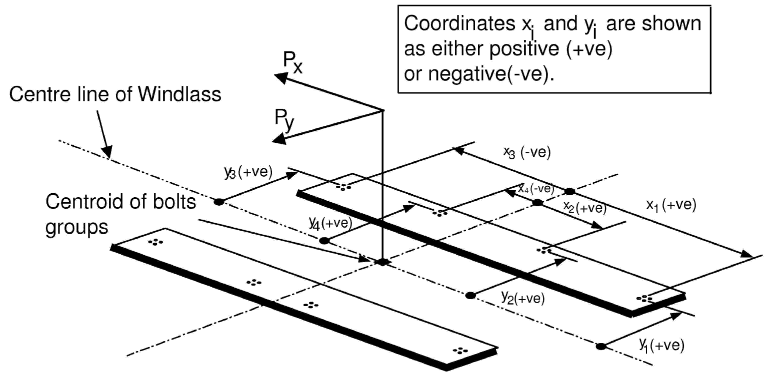


Fig 3: Sign convention

3.7.10 Strength criteria for windlass subject to anchor and chain loads

The stresses on the parts of the windlass, its frame and stopper are to be less than the yield stress of the material used.
For the calculation of the above stresses, special attention is to be paid to:

- stress concentrations in keyways and other stress raisers
- dynamic effects due to sudden starting or stopping of the prime mover or anchor chain
- calculation methods and approximation.

3.7.11 Strength criteria for securing devices of windlass

Tensile axial stresses in the individual bolts in each bolt group *i* are to be calculated according to the requirements specified in **[3.7.9]**. The horizontal forces F_{xi} and F_{yi}, to be calculated according to the requirements specified in **[3.7.9]**, are normally to be reacted by shear chocks.
Where "fitted" bolts are designed to support these shear forces in one or both directions, the equivalent Von Mises stress σ, in $\mathrm{N/mm^2}$, in the individual boltis to comply with following formula:

$$\sigma \leq 0.5\sigma_{BPL}$$

where σ_{BPL} is the stress in the bolt considered as being loaded by the proof load.
Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations.

3.7.12 Connection with deck

The windlass, its frame and the stoppers are to be efficiently bedded to the deck.

3.8 Chain stoppers

3.8.1

A chain stopper is generally to be fitted between the windlass and the hawse pipe in order to relieve the windlass of the pull of the chain cable when the ship is at anchor. A chain stopper is to be capable of withstanding a pull of 80 % of the breaking load of the chain cable. The deck at the chain stopper is to be suitably reinforced.
For the same purpose, a piece of chain cable may be used with a rigging screw capable of supporting the weight of the anchor when housed in the hawse pipe or a chain tensioner. Such arrangements are not to be considered as chain stoppers.

3.8.2

Where the windlass is at a distance from the hawse pipes and no chain stoppers are fitted, suitable arrangements are to be provided to lead the chain cables to the windlass.

3.9 Chain locker

3.9.1

The capacity of the chain locker is to be adequate to stow all chain cable equipment and provide an easy direct lead to the windlass.

3.9.2

Where two chains are used, the chain lockers are to be divided into two compartments, each capable of housing the full length of one line.

3.9.3

The inboard ends of chain cables are to be secured to suitably reinforced attachments in the structure by means of end shackles, whether or not associated with attachment pieces.
Generally, such attachments are to be able to withstand a force not less than 15 % of the breaking load of the chain cable.
In an emergency, the attachments are to be easily released from outside the chain locker.

3.9.4

Where the chain locker is arranged aft of the collision bulkhead, its boundary bulkheads are to be watertight and a drainage system is to be provided.

3.10 Fairleads and bollards

3.10.1

Fairleads and bollards of suitable size and design are to be fitted for towing, mooring and warping operations. ⚓

Chapter 11

Construction and Testing

Section 1 - CONSTRUCTION

1. Structural details

1.1 Cut-outs, plate edges

1.1.1

The free edges (cut surfaces) of cut-outs, hatch corners, etc. are to be properly prepared and are to be free from notches. As a general rule, cutting draglines, etc. are not to be welded out, but are to be smoothly ground. All edges are to be broken or in cases of highly stressed parts, be rounded off.
Free edges on flame or machine cut plates or flanges are not to be sharp cornered and are to be finished off as laid down in above. This also applies to cutting drag lines, etc., in particular to the upper edge of shear strake and analogously to weld joints, changes in sectional areas or similar discontinuities.

1.1.2

The hatch opening corners are to be machine cut.

1.2 Cold forming

1.2.1

For cold forming (bending, flanging, beading) of corrugated bulkhead the inside bending radius is to be not less than $2\,t$ (t = as-built thickness).
In order to prevent cracking, flame cutting flash or sheering burrs are to be removed before cold forming. After cold forming all structural components and, in particular, the ends of bends (plate edges) are to be examined for cracks. Except in cases where edge cracks are negligible, all cracked components are to be rejected. Repair welding is not permissible.

1.3 Assembly, alignment

1.3.1

The use of excessive force is to be avoided during the assembly of individual structural components or during the erection of sections. As far as possible, major distortions of individual structural components are to be corrected before further assembly.
Structural members are to be aligned following the IACS recommendation No.47 provisions given in Table 1 or according to the requirements of a recognised fabrication standard that has been accepted by the Classification Society. In the case of critical components, control drillings are to be made where necessary, which are then to be welded up again on completion.
After completion of welding, straightening and aligning are to be carried out in such a manner that the material properties are not influenced significantly. In case of doubt, the Society may require a procedure test or a working test to be carried out.

Table 1: Alignment (t, t_1 and t_2: as-built thickness)

Detail	Standard	Limit	Remarks
Alignment of butt welds 		$a \le 0.15t$ strength member $a \le 0.2t$ other but maximum 4.0 mm	t is the lesser plate thickness
Alignment of fillet welds 		Strength member and higher stress member: $a \le t_1/3$ Other: $a \le t_1/2$	Alternatively, heel line can be used to check the alignment. Where t_3 is less than t_1, then t_3 should be substituted for t_1.
Alignment of fillet welds 		Strength member and higher stress member: $a \le t_1/3$ Other: $a \le t_1/2$	Alternatively, heel line can be used to check the alignment. Where t_3 is less than t_1, then t_3 should be substitute for t_1.
Note: “strength” means the following elements: strength deck, inner bottom, bottom, lower stool, lower part of transverse bulkhead, bilge hopper and side frames of single side bulk carriers.			

Detail	Standard	Limit	Remarks
Alignment of face plates of T longitudinal 	Strength member $a \leq 0.04b$	a = 8.0 mm	
Alignment of height of T-bar, L-angle bar or bulb 	Strength member $a \leq 0.15t$ Other $a \leq 0.2t$	a = 3.0 mm	
Alignment of panel stiffener 	$d \leq L/50$		
Note: "strength" means the following elements: strength deck, inner bottom, bottom, lower stool, lower part of transverse bulkhead, bilge hopper and side frames of single side bulk carriers.			

Section 2 – WELDING

1. General

1.1 Application

1.1.1

The requirements of this Section apply to the preparation, execution and inspection of welded connections in hull structures.

1.1.2

Welding of hull parts is to be carried out by approved welders only.

1.1.3

Welding procedures and welding consumables approved for the types of connection and parent material in question are to be used.

1.1.4

Welding of connections is to be executed according to the approved plans.

1.1.5

The quality standard adopted by the shipyard is to be submitted to the Society and it applies to all welded connections unless otherwise specified on a case by case basis.

1.1.6

Completed weld joints are to be to the satisfaction of the attending Surveyor.

1.1.7

Non destructive examination (NDE) for weld is to be carried out at the position indicated by the test plan in order to ensure that the welds are free from cracks and internal harmful imperfections and defects.

1.2 Welding consumables and procedures

1.2.1

Welding consumables adopted are to be approved by the Society. The requirements for the approval of welding consumables are given in the Society's Rules or guide for welding.

1.2.2

The welding procedures adopted are to be approved by the Society. The requirements for the approval of welding procedures are given in the Society's Rules or guide for welding.

1.2.3

Suitable welding consumables are to be selected depending on the kind and grade of materials. The requirements of the selection of welding consumables are given in the Society's Rules or guide for welding.

1.3 Welders and NDE operators

1.3.1 Welders

Manual and semi-automatic welding is to be performed by welders certified by the Society as specified in the Society's Rules or guide for welding.

1.3.2 Automatic welding operators

Personnel manning automatic welding machines and equipment are to be competent and sufficiently trained and certified by the Society as specified in the Society's Rules or guide for welding.

1.3.3 NDE operator

NDE is to be carried out by qualified personnel certified by the Society or by recognized bodies in compliance with appropriate standards.

1.4 Documentation to be submitted

1.4.1

The welding application plan to be submitted for approval has to contain the necessary data relevant to the fabrication by welding of the structures, kinds of welding procedure applied, welding position, etc.

1.4.2

The NDE plan to be submitted for approval has to contain the necessary data relevant to the locations and number of examinations, welding procedure(s) applied, method of NDE applied, etc.

2. Types of welded connections

2.1 General

2.1.1

The type of welded connections and the edge preparation are to be appropriate to the welding procedure adopted.

2.2 Butt welding

2.2.1 General

Butt connections of plating are to be full penetration, welded on both sides except where special welding procedures approved by the Society is applied.

2.2.2 Welding of plates with different thicknesses

In the case of welding of plates with a difference in as-built thickness equal to or greater than 4 mm, the thicker plate is normally to be tapered. The taper has to have a length of not less than 3 times the difference in as-built thickness.

2.2.3 Edge preparation, root gap

Edge preparations and root gaps are to be in accordance with the adopted welding procedure and relevant bevel preparation.

2.3 Tee or cross joints

2.3.1 General

The connections of primary supporting members and stiffener webs to plating as well as plating abutting on another plating, are to be made by fillet welding or deep penetration weld, as shown in **Fig 1.**

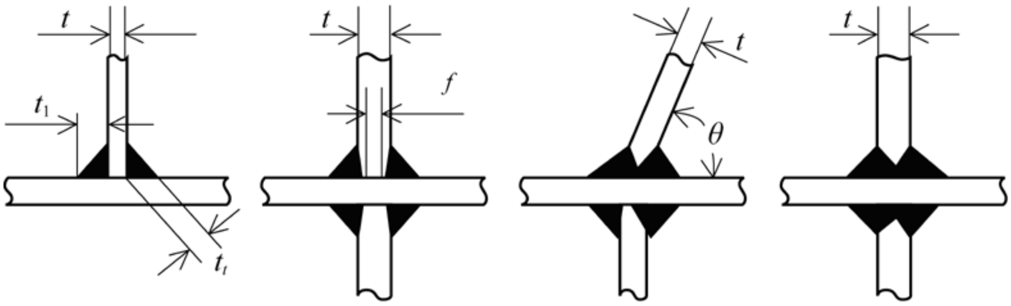

Fig 1: Tee or cross joints

t	:	As-built thickness of abutting plate, in mm
f	:	Unwelded root face, in mm, taken as $f \le t/3$
t_ℓ	:	Leg length of the fillet weld, in mm
t_t	:	Throat thickness, in mm.

2.4 Full penetration welds

2.4.1 Application

Full penetration welds are to be used in the following connections:

- rudder horns and shaft brackets to shell structure
- rudder side plating to rudder stock connection areas
- vertical corrugated bulkhead to inner bottom plating that are situated in the cargo area and arranged without transverse lower stool
- vertical corrugated bulkhead to top plating of transverse lower stool
- pillars to plating member, in case the stress acting on the pillar is tension (i.e. engine room, fore peak and deckhouses)
- edge reinforcement or pipe penetrations both to strength deck, sheer strake and bottom plating within $0.6\,L$ amidships, when the dimension of the opening exceeds 300 mm
- abutting plate panels forming boundaries to sea below summer load waterline.

2.4.2

In case where shedder plates are fitted at the lower end of corrugated bulkhead, the shedder plates are to be welded to the corrugation and the top plate of the transverse lower stool by one side penetration welds or equivalent.

2.4.3

The transverse lower stool side plating is to be connected to the transverse lower stool top plating and the inner bottom plating by full penetration welds. Deep penetration welds may be accepted.

2.4.4

The supporting floors are to be connected to the inner bottom plating by full penetration welds. Deep penetration welds may be accepted.

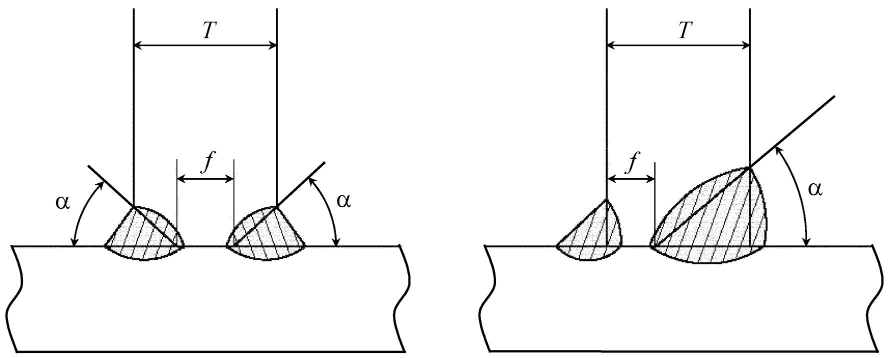
2.4.5

Generally, adequate groove angle between 40 and 60 degrees and root opening is to be taken and if necessary back gouging for both side welding is required.

2.5 Deep penetration weld

2.5.1

Deep penetration weld is defined as **Fig 2.**



- Root face (f) : 3 mm to T/3 mm
- Groove angle (α) : 40° to 60°

Fig 2: Deep penetration weld

2.6 Fillet welds

2.6.1 Kinds and size of fillet welds and their applications

Kinds and size of fillet welds for as-built thickness of abutting plating up to 50 mm are classed into 5 categories as given in **Table 1** and their application to hull construction is to be as required by **Table 2.** In addition, for zones "*a*" and "*b*" of side frames as shown in **Ch 3, Sec 6, Fig 19**, the weld throats are to be respectively 0.44 t and 0.4 t, where t is as-built thickness of the thinner of two connected members.

Table 1: Categories of fillet welds

Category	Kinds of fillet welds	As-built thickness of abutting plate, t, in mm(1)	Leg length of fillet weld, in mm(2)	Length of fillet welds, in mm	Pitch, in mm
F0	Double continuous weld	t	0.7 t	-	-
F1	Double continuous weld	$t \le 10$	0.5 t + 1.0	-	-
		$10 \le t < 20$	0.4 t + 2.0	-	-
		$20 \le t$	0.3 t + 4.0	-	-
F2	Double continuous weld	$t \le 10$	0.4 t + 1.0	-	-
		$10 \le t < 20$	0.3 t + 2.0	-	-
		$20 \le t$	0.2 t + 4.0	-	-
F3	Double continuous weld	$t \le 10$	0.3 t + 1.0	-	-
		$10 \le t < 20$	0.2 t + 2.0		
		$20 \le t$	0.1 t + 4.0		
F4	Intermittent weld	$t \le 10$	0.5 t + 1.0	75	300
		$10 \le t < 20$	0.4 t + 2.0		
		$20 \le t$	0.3 t + 4.0		

(1) t is as-built thickness of the abutting plate, in mm. In case of cross joint as specified in **Fig 1**, t is the thinner thickness of the continuous member and the abutting plate, to be considered independently for each abutting plate.

(2) Leg length of fillet welds is made fine adjustments corresponding to the corrosion addition t_c specified in **Ch 3, Sec 3, Table 1** as follows:

+1.0mm	for $t_c > 5$
+0.5mm	for $5 \ge t_c > 4$
+0.0mm	for $4 \ge t_c > 3$
-0.5mm	for $t_c \le 3$

(3) Leg length is rounded to the nearest half millimetre.

Table 2: Application of fillet welds

Hull area	Connection: Of		Connection: To		Category
General, unless otherwise specified in the table(1)	Watertight plate		Boundary plating		F1
	Brackets at ends of members				F1
	Ordinary stiffener and collar plates		Deep tank bulkheads		F3
			Web of primary supporting members and collar plates		F2
	Web of ordinary stiffener		Plating (Except deep tank bulkhead)		F4
			Face plates of built-up stiffeners	At ends (15 % of span)	F2
				Elsewhere	F4
	End of primary supporting members and ordinary stiffeners without brackets		Deck plate, shell plate, inner bottom plate, bulkhead plate		F0
	End of primary supporting members and ordinary stiffeners with brackets		Deck plate, shell plate, inner bottom plate, bulkhead plate		F1
Bottom and double bottom	Ordinary stiffener		Bottom and inner bottom plating		F3
	Center girder		Shell plates in strengthened bottom forward		F1
			Inner bottom plate and shell plate except the above		F2
	Side girder including intercostal plate		Bottom and inner bottom plating		F3
	Floor		Shell plates and inner bottom plates	At ends, on a length equal to two frame spaces	F2
			Center girder and side girders in way of hopper tanks		F2
			Elsewhere		F3
	Bracket on center girder		Center girder, inner bottom and shell plates		F2
	Web stiffener		Floor and girder		F3
Side and inner side in double side structure	Web of primary supporting members		Side plating, inner side plating and web of primary supporting members		F2
Side frame of single side structure	Side frame and end bracket		Side shell plate		See **Ch 3, Sec 6, Fig 19**
	Tripping bracket		Side shell plate and side frame		F1
Deck	Strength deck	$t \geq 13$	Side shell plating within 0.6 L midship		Deep penetration
			Elsewhere		F1
		$t < 13$	Side shell plating		F1
	Other deck		Side shell plating		F2
			Ordinary stiffeners		F4
	Ordinary stiffener and intercostal girder		Deck plating		F3
	Hatch coamings		Deck plating	At corners of hatchways for 15 % of the hatch length	F1
				Elsewhere	F2
	Web stiffeners		Coaming webs		F4

Hull area	Connection Of	Connection To		Category
Bulkheads	Non-watertight bulkhead structure	Boundaries	Swash bulkheads	F3
	Ordinary stiffener	Bulkhead plating	At ends (25 % of span), where no end brackets are fitted	F1
Primary supporting members(1)	Web plate	Shell plating, deck plating, inner bottom plating, bulkhead	At end (15 % of span)	F1
			Elsewhere	F2
		Face plate	In tanks, and located within 0.125 L from fore peak	F2
			Face area exceeds 65 cm^2	F2
			Elsewhere	F3
After peak	Internal members	Boundaries and each other		F2
Seating	Girder and bracket	Bed plate	In way of main engine, thrust bearing, boiler bearers and main generator engines	F1
		Girder plate	In way of main engine and thrust bearing	F1
		Inner bottom plate and shell	In way of main engine and thrust bearing	F2
Super-structure and deck houses	External bulkhead	Deck		F1
	Ordinary stiffeners	Side wall and deck plate	At end (15 % of span)	F3
			Elsewhere	F4(2)
	End section of ordinary stiffener and Primary supporting member	Without brackets	Side wall and web of primary supporting members	F1
		With bracket		F2
Pillar	Pillar	Heel and head		F1
Ventilator	Coaming	Deck		F1
Rudder	Rudder frame	Vertical frames forming main piece		F1
		Rudder plate		F3
		Rudder frames except above		F2

(1) For Hatch cover, weld sizes F1, F2 and F3 instead of F0, F1 and F2, respectively, are to be used.
(2) Where the one side continuous welding is applied, the weld size F3 is to be applied.
(3) The interior bulkheads are not included in this category. The welding of the interior bulkheads is to be subjected to the discretion of the Society.

2.6.2 Intermittent welds

Where double continuous fillet welds in lieu of intermittent welds are applied, leg length of fillet welds is to be of category F3.

2.6.3 Size of fillet weld for abutting plating with small angle

Where the angle between an abutting plate and the connected plate is not 90 degrees as shown in **Fig 3**, the size of fillet welds for the side of larger angle is to be increased in accordance with the following formula:

$$t_\ell{}' = t_\ell \frac{1}{\sqrt{2}\sin\left(\frac{\varphi}{2}\right)}$$

where:

t_ℓ : Leg length of the fillet weld, in mm, as defined in **[2.3.1]**

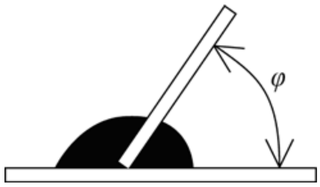


Fig 3: Connecting angle

2.6.4 Deep penetration welds

The leg length of fillet welds of deep penetration type may be reduced by 15 % of that required in **Table 1**, depending on the welding procedure test.

2.7 Lap joint welds

2.7.1 General

Lap joint welds may be adopted in very specific cases subject to the approval of the Society. Lap joint welds may be adopted for the followings:

- peripheral connections of doublers
- internal structural elements subject to very low stresses.

2.7.2 Fillet welds

Lap joints are to have the fillet size of category F1.

2.8 Slot welds

2.8.1 General

Slot welds may be adopted in very specific cases subject to the approval of the Society. However, slot welds of doublers on the outer shell and strength deck are not permitted within $0.6L$ amidships.

2.8.2 Size of fillet welds

The slot welds are to have adequate shape to permit a thoroughly fused bead to be applied all around the bottom edge of the opening. The size of fillet welds is to be category F1 and spacing of slots is to be as determined by the Society on a case by case basis.

3. Connection details

3.1 Bilge keel connection

3.1.1

The intermediate flat, through which the bilge keel is connected to the shell, according to **Ch 3, Sec 6, [6.5.2]**, is to be welded to bilge plating and bilge keel.

3.1.2

The butt welds of the intermediate flat and bilge keel are to be full penetration and shifted from the shell butts.
The butt welds of the bilge plating and those of the intermediate flat are to be flush in way of cross-

ing, respectively, with the intermediate flat and with the bilge keel.

3.1.3

Along the longitudinal edges, the intermediate flat is to be continuously fillet welded with a throat thickness "*a*" of 0.3 times its thickness. At the ends of intermediate flat, the throat thickness "*a*" at the end faces is to be increased to 0.5 times the intermediate flat thickness but is to be less than the bilge plating thickness (see **Fig 4**).
The welded transition at the end faces of the doubling plates to the plating should form with the latter an angle of 45° or less.

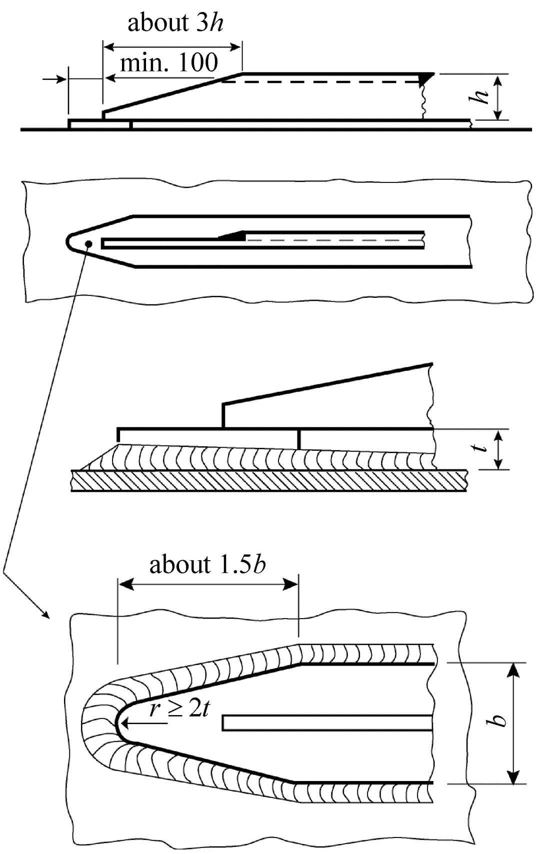

Fig 4: Bilge keel welding arrangement

Section 3 – TESTING OF COMPARTMENTS

1. General

1.1 Definitions

1.1.1 Shop primer

Shop primer is a thin coating applied after surface preparations and prior to fabrication as a protection against corrosion during fabrication.

1.1.2 Protective coating

Protective coating is a final coating protecting the structure from corrosion.

1.1.3 Structural testing

Structural testing is a hydrostatic test carried out to demonstrate the tightness of the tanks and the structural adequacy of the design. Where practical limitations prevail and hydrostatic testing is not feasible (for example when it is difficult, in practice, to apply the required head at the top of tank), hydropneumatic testing may be carried out instead. When hydropneumatic testing is performed, the conditions should simulate, as far as practicable, the actual loading of the tank.

1.1.4 Hydropneumatic testing

Hydropneumatic testing is a combination of hydrostatic and air testing, consisting in filling the tank with water up to its top and applying an additional air pressure. The value of additional air pressure is at the discretion of the Society, but is to be at least as defined in **[2.2].**

1.1.5 Leak testing

Leak testing is an air or other medium test carried out to demonstrate the tightness of the structure.

1.1.6 Hose testing

Hose testing is carried out to demonstrate the tightness of structural items not subjected to hydrostatic or leak testing and to other compartments which contribute to the watertight integrity of the hull.

1.2 Application

1.2.1

The following requirements determine the testing conditions for:

- tanks, including independent tanks,
- watertight or weathertight structures.

1.2.2

The purpose of these tests is to check the tightness and/or the strength of structural elements at time of ship construction and on the occasion of major repairs.

1.2.3

Tests are to be carried out in the presence of the Surveyor at a stage sufficiently close to completion so that any subsequent work not impair the strength and tightness of the structure.

2. Testing methods

2.1 Structural testing

2.1.1

Structural testing may be carried out after application of the shop primer.

2.1.2

Structural testing may be carried out after the protective coating has been applied, provided that one of the following two conditions is satisfied:

- all the welds are completed and carefully inspected visually to the satisfaction of the Surveyor prior to the application of the protective coating,
- leak testing is carried out prior to the application of the protective coating.

2.1.3

In absence of leak testing, protective coating should be applied after the structural testing of:

- all erection welds, both manual and automatic,
- all manual fillet weld connections on tank boundaries and manual penetration welds.

2.2 Leak testing

2.2.1

Where leak testing is carried out, in accordance with **Table 1**, an air pressure of 0.15×10^5 Pa is to be applied during the test.

2.2.2

Prior to inspection, it is recommended that the air pressure in the tank is raised to 0.20×10^5 Pa and kept at this level for about 1 hour to reach a stabilized state, with a minimum number of personnel in the vicinity of the tank, and then lowered to the test pressure.

2.2.3

The Society may accept that the test is conducted after the pressure has reached a stabilized state at 0.20×10^5 Pa, without lowering pressure, provided they are satisfied of the safety of the personnel involved in the test.

2.2.4

Welds are to be coated with an efficient indicating liquid.

2.2.5

A U-tube filled with water up to a height corresponding to the test pressure is to be fitted to avoid overpressure of the compartment tested and verify the test pressure. The U-tube should have a cross section larger than that of the pipe supplying air.
In addition, test pressure is also to be verified by means of one master pressure gauge. The Society may accept alternative means which are considered to equivalently reliable.

2.2.6

Leak testing is to be carried out, prior to the application of protective coating, on all fillet weld connections on tank boundaries, penetrations and erection welds on tank boundaries excepting welds may be automatic processes. Selected locations of automatic erection welds and pre-erection manual or automatic welds may be required to be similarly tested at the discretion of the Surveyor taking account of the quality control procedures operating in the shipyard. For other welds, leak testing may be carried out, after the protective coating has been applied, provided that these welds were carefully inspected visually to the satisfaction of the Surveyor.

2.2.7

Any other recognized method may be accepted to the satisfaction of the Surveyor.

2.3 Hose testing

2.3.1

When hose testing is required to verify the tightness of the structures, as defined in **Table 1**, the minimum pressure in the hose, at least equal to 0.20×10^5 Pa, is to be applied at a maximum distance of 1.5 m. The nozzle diameter is not to be less than 12 mm.

2.4 Hydropneumatic testing

2.4.1

When hydropneumatic testing is performed, the same safety precautions as for leak testing are to be adopted.

2.5 Other testing methods

2.5.1

Other testing methods may be accepted, at the discretion of the Society, based upon equivalency considerations.

3. Testing requirements

3.1 General

3.1.1

General testing requirements for testing are given in **Table 1.** ⚓

Table 1: General testing requirements

Item number	Structural to be tested	Type of testing	Structural test pressure	Remarks
1	Double bottom tanks	Structural testing (1)	The greater of the following: • head of water up to the top of overflow • head of water up to the bulkhead deck	Tank boundaries tested from at least one side
2	Double side tanks	Structural testing (1)	The greater of the following: • head of water up to the top of overflow • 2.4 m head of water above highest point of tank	Tank boundaries tested from at least one side
3	Tank bulkheads, deep tanks	Structural testing (1)	The greater of the following: (2) • head of water up to the top of overflow • 2.4 m head of water above highest point of tank • setting pressure of the safety relief valves, where relevant	Tank boundaries tested from at least one side
	Fuel oil tanks	Structural testing		
4	Ballast holds	Structural testing (1)	The greater of the following: • head of water up to the top of overflow • 0.90 m head of water above top of hatch	
5	Fore peak and after peak used as tank	Structural testing	The greater of the following: • head of water up to the top of overflow • 2.4 m head of water above highest point of tank	Tank of the after peak carried out after the stern tube has been fitted
	Fore peak not used as tank	Refer to SOLAS Ch II.1 Reg.14		
	Aft peak not used as tank	Leak testing		
6	Cofferdams	Structural testing (3)	The greater of the following: • head of water up to the top of overflow • 2.4 m head of water above highest point of tank	
7	Watertight bulkheads	Refer to SOLAS Ch II.1 Reg.14 (4)		
8	Watertight doors below freeboard or bulkhead deck	Refer to SOLAS Ch II.1 Reg.18		
9	Double plate rudder	Leak testing		
10	Shaft tunnel clear of deep tanks	Hose testing		
11	Shell doors	Hose testing		

12	Watertight hatchcovers of tanks	Hose testing		
13	Watertight hatchcovers and closing appliances	Hose testing		
14	Chain locker, located aft of collision bulkhead	Structural testing	Head of water up to the top	
15	Independent tanks	Structural testing	Head of water up to the top of overflow, but not less than 0.9 m	
16	Ballast ducts	Structural testing	Ballast pump maximum pressure	

(1) Leak or hydropneumatic testing may be accepted under the conditions specified in **[2.2]**, provided that at least one tank for each type is structurally tested, to be selected in connection with the approval of the design. In general, structural testing need not be repeated for subsequent vessels of series of identical newbuildings. This relaxation does not apply to cargo space boundaries in tankers and combination carriers and tanks for segregated cargoes or pollutants. If the structural test reveals weakness or severe faults not detected by the leak test, all tanks are to be structurally tested.

(2) Where applicable, the highest point of tank is to be measured to the deck and excluding hatches. In holds for liquid cargo or ballast with large hatch covers, the highest point of tanks is to be taken at the top of hatch.

(3) Leak or hydropneumatic testing may be accepted under the conditions specified in **[2.2]** when, at the Society discretion, the latter is considered significant also in relation to the construction techniques and the welding procedures adopted.

(4) When hose test cannot be performed without damaging possible outfitting (machinery, cables, switchboards, insulation, etc.) already installed, it may be replaced, at the Society discretion, by a careful visual inspection of all the crossings and weld joints; where necessary, dye penetrant test or ultrasonic test may be required.

Chapter 12

Additional Class Notations

Section 1 – GRAB ADDITIONAL CLASS NOTATION

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

M_{GR} : Mass of unladen grab, in tons

s : Spacing, in m, of ordinary stiffeners, measured at mid-span

1. Basic concepts

1.1 Application

1.1.1

The additional class notation GRAB [X] is assigned, in accordance with **Ch 1, Sec 1, [3.2]**, to ships with holds designed for loading/unloading by grabs having a maximum specific weight up to [X] tons, in compliance with the requirements of this Section.

1.1.2

It is to be noted that this additional class notation does not negate the use of heavier grabs, but the owner and operators are to be made aware of the increased risk of local damage and possible early renewal of inner bottom plating if heavier grabs are used regularly or occasionally to discharge cargo.

2. Scantlings

2.1 Plating

2.1.1

The net thickness of plating of inner bottom, hopper tank sloping plate, transverse lower stool, transverse bulkhead plating and inner hull up to a height of 3.0 m above the lowest point of the inner bottom, excluding bilge wells, is to be taken as the greater of the following values:

- t , as obtained according to requirements in **Ch 6** and **Ch 7**
- t_{GR} , as defined in **[2.1.2]** and **[2.1.3].**

2.1.2

The net thickness t_{GR}, in mm, of the inner bottom plating is to be obtained from the following formula:

$$t_{GR} = 0.28(M_{GR} + 50)\sqrt{sk}$$

2.1.3

The net thickness t_{GR}, in mm, of hopper tank sloping plate, transverse lower stool, transverse bulkhead plating and inner hull up to a height of 3.0 m above the lowest point of the inner bottom, excluding bilge wells, is to be obtained from the following formula:

$$t_{GR} = 0.28(M_{GR} + 42)\sqrt{sk}$$ ⚓

Chapter 13

Ships in Operation, Renewal Criteria

Section 1 – MAINTENANCE OF CLASS

1. General

1.1 Application

1.1.1

The survey requirements for the maintenance of class of bulk carriers are given in UR Z10.2 for single side skin bulk carriers and UR Z10.5 for double side skin bulk carriers.
Thickness measurements are a major part of surveys to be carried out for the maintenance of class, and the analysis of these measurements is a prominent factor in the determination and extent of the repairs and renewals of the ship's structure.

1.1.2

This Chapter is intended to provide Owners, companies performing thickness measurements and Society's Surveyors with a uniform procedure in order to fulfil rule requirements for thickness measurements. In particular, it will enable all the above-mentioned parties to carry out:

- the planning and preparation
- the determination of extent and location
- the analysis

of the thickness measurements.

1.1.3

This Chapter also takes into account specific requirements for thickness measurements relevant to close-up surveys within the scope of the Enhanced Survey Program (ESP) of single side skin bulk carriers and double side skin bulk carriers.

1.2 Definitions

1.2.1 Local corrosion

Local corrosion is pitting corrosion, grooving, edge corrosion, necking effect or other corrosions of very local aspect.

1.2.2 Substantial corrosion

Substantial corrosion is an extent of corrosion such that assessment of the corrosion pattern indicates gauged (or measured) thickness between $t_{renewal}$ and $t_{renewal} + t_{reserve}$.

Section 2 - THICKNESS MEASUREMENTS AND ACCEPTANCE CRITERIA

Symbols

For symbols not defined in this Section, refer to **Ch 1, Sec 4.**

$t_{renewal}$: Renewal thickness; Minimum allowable thickness, in mm, below which renewal of structural members is to be carried out

$t_{renewal} = t_{as\_built} - t_C - t_{voluntary\_addition}$

$t_{reserve}$: Reserve thickness; Thickness, in mm, to account for anticipated thickness diminution that may occur during a survey interval of 2.5 year. ($t_{reserve}$ = 0.5 mm)

t_C : Corrosion addition, in mm, defined in **Ch 3, Sec 3**

t_{as_built} : As built thickness, in mm, including $t_{voluntary\_addition}$,if any

$t_{voluntary\_addition}$: Voluntary thickness addition; Thickness, in mm, voluntarily added as the Owner's extra margin for corrosion wastage in addition to t_C

t_{gauged} : Gauged thickness, in mm, on one item, i.e average thickness on one item using the various measurements taken on this same item during periodical ship's in service surveys.

1. Application

1.1 General

1.1.1

This section provides the following information:

- references to rule requirements and some additional information on the extent of the thickness measurements to be performed during surveys (see **[2.1]** and **[2.2]**)
- locations of the measurements for the main parts of the ship (see **[2.3]**)
- how to apply the acceptance criteria (see **[3]**).

Tables are also given to detail the above items. The sketches are given as an example to illustrate the requirements.

2. Rule requirements for the extent of measurements and the determination of locations

2.1 General

2.1.1

For the maintenance of class, thickness measurements are required during intermediate and class renewal surveys and may be required during annual surveys.
Table 1 gives the references to the minimum requirements for thickness measurements related to the different types of surveys.

Table 1: References to rule requirements related to thickness measurements

Class renewal survey	Intermediate survey	Annual survey
<u>**Outside the cargo length area:**</u> UR Z7: • systematic measurements and suspect areas. • where substantial corrosion is found, the extent of thickness measurements may be increased to the Surveyor's satisfaction.	<u>**Outside the cargo length area:**</u> UR Z7: • thickness measurements to be taken if deemed necessary by the Surveyor. • where substantial corrosion is found, the extent of thickness measurements may be increased to the Surveyor's satisfaction.	<u>**Outside the cargo length area:**</u> UR Z7: • areas of substantial corrosion identified at previous class renewal or intermediate surveys; • where substantial corrosion is found, the extent of thickness measurements may be increased to the Surveyor's satisfaction.
<u>**Within the cargo length area:**</u> a) single side skin bulk carriers: UR Z10.2: • planning and general requirements • measurements of elements subjected to close-up survey • extent of systematic thickness measurements • according to the different locations, where substantial corrosion is found b) double side skin bulk carriers: UR Z10.5: • planning and general requirements • measurements of elements subjected to close-up survey • extent of systematic thickness measurements • according to the different locations, where substantial corrosion is found	<u>**Within the cargo length area:**</u> a) single side skin bulk carriers: UR Z10.2: *Ships 10 years of age or less:* • for cargo holds • for salt ballast tanks • according to the different locations, where substantial corrosion is found *Ships over 10 years of age:* • see references given for class renewal survey • according to the different locations, where substantial corrosion is found b) double side skin bulk carriers: UR Z10.5: *Ships 10 years of age or less:* • for cargo holds • for salt ballast tanks • according to the different locations, where substantial corrosion is found *Ships over 10 years of age:* • see references given for class renewal survey • according to the different locations, where substantial corrosion is found	<u>**Within the cargo length area:**</u> a) single side skin bulk carriers: UR Z10.2: • for cargo holds and when deemed necessary by the Surveyor • for salt ballast tanks and when deemed necessary by the Surveyor • according to the different locations, where substantial corrosion is found b) double side skin bulk carriers: UR Z10.5: • for cargo holds and when deemed necessary by the Surveyor • for salt ballast tanks and when deemed necessary by the Surveyor • according to the different locations, where substantial corrosion is found

2.2 Class renewal survey

2.2.1

The thickness measurements required by the Rules consist of:

- systematic thickness measurements in order to assess the global and local strength of the ship
- thickness measurements as indicated in the program of close-up survey
- measurements of elements considered as suspect areas
- additional measurements on areas determined as affected by substantial corrosion.

2.2.2

For the determination of close-up surveys and relevant thickness measurements as well as the areas considered as suspect areas, reference is to be made to the relevant Sections of the following IACS Unified Requirements:

- for the hull structure and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces, fuel oil tanks within the cargo length area and all ballast tanks:
  - UR Z10.2 “Hull surveys of single skin bulk carriers”
  - UR Z10.5 “Hull surveys of double skin bulk carriers”
- for the remainder of the ship outside the cargo length area:
  - UR Z7.

2.3 Number and locations of measurements

2.3.1 Number of measurements

Considering the extent of thickness measurements as required by the Rules and indicated in **[2.1]** and **[2.2]**, the locations of the points to be measured are given for the most important items of the structure.

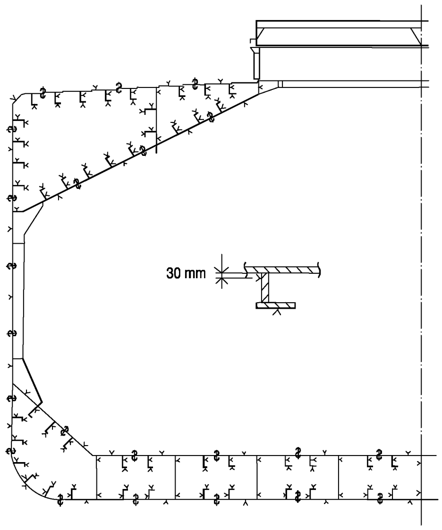
2.3.2 Locations of measurements

Table 2 provides explanations and/or interpretations for the application of those requirements indicated in the Rules which refer to both systematic thickness measurements related to the calculation of global hull girder strength and specific measurements connected to close-up surveys.
Fig 1 to **Fig 5** are provided to facilitate the explanations and/or interpretations given in **Table 2**, to show typical arrangements of single side skin bulk carriers and double side skin bulk carriers.

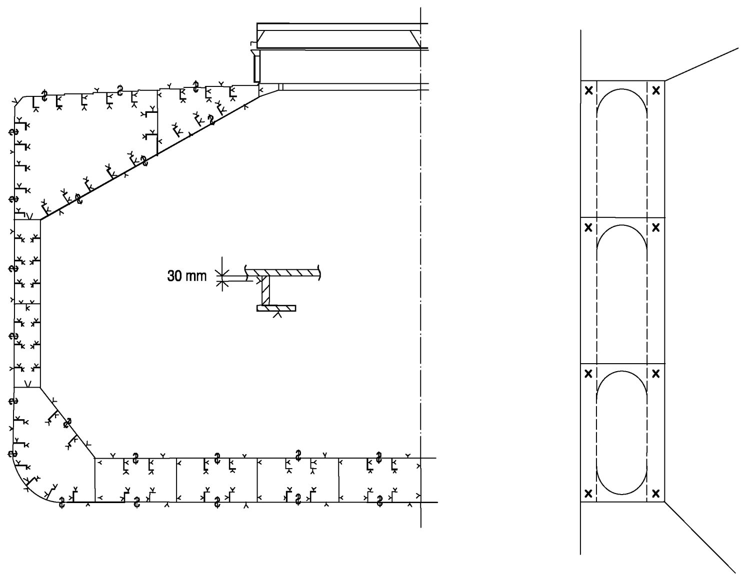
Table 2: Interpretations of rule requirements for the locations and number of points to be measured

Item	Interpretation	Figure reference
Selected plates on deck, tank top, bottom, double bottom and wind-and-water area	«Selected» means at least a single point on one out of three plates, to be chosen on representative areas of average corrosion	
All deck, tank top and bottom plates and wind-and-water strakes	At least two points on each plate to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion	
Transverse section	Single side skin bulk carrier: A transverse section includes all longitudinal members such as plating, longitudinals and girders at the deck, side, bottom; inner bottom and hopper side plating, longitudinal bulkhead and bottom plating in top wing tanks. Double side skin bulk carrier: A transverse section includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom, hopper sides, inner sides and top wing inner sides.	Fig 1 for single and double side skin bulk carriers
Cargo hold hatch covers and coamings		Fig 2
Selected internal structure such as floors and longitudinals, transverse frames, web frames, deck beams, girders	The internal structural items to be measured in each space internally surveyed are to be at least 10% outside the cargo length area	

Item	Interpretation	Figure reference
Transverse section of deck plating outside line of cargo hatch openings	Two single points on each deck plate (to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion) between the ship sides and hatch coamings in the transverse section concerned	
Selected areas of all deck plating inside line of hatch openings	«Selected» means at least a single point on one out of three plates, to be chosen on representative areas of average corrosion «All deck plating» means at least two points on each plate to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion	Extent of areas is shown in UR Z10.2 for single side skin bulk carriers and UR Z10.5 for double side skin bulk carriers
Selected side shell frames in cargo holds for single side skin bulk carriers	25 % of frames: one out of four frames should preferably be chosen throughout the cargo hold length on each side «Selected frames» means at least 3 frames on each side of cargo holds	Extent of areas is shown in UR Z10.2 for single side skin bulk carriers. Locations of points are given in **Fig 3** for single side skin bulk carriers
Transverse frame in double skin tank		**Fig 1**
Transverse bulkheads in cargo holds	Includes bulkhead plating, stiffeners and girders, including internal structure of upper and lower stools, where fitted. Two selected bulkheads: one is to be the bulkhead between the two foremost cargo holds and the second may be chosen in other positions	Areas of measurements are shown in UR Z10.2 for single side skin bulk carriers and UR Z10.5 for double side skin bulk carriers. Locations of points are given in **Fig 4.**
One transverse bulkhead in each cargo hold	This means that the close-up survey and related thickness measurements are to be performed on one side of the bulkhead; the side is to be chosen based on the outcome of the overall survey of both sides. In the event of doubt, the Surveyor may also require (possibly partial) close-up survey on the other side	Areas of measurements are shown in UR Z10.2 for single side skin bulk carriers and UR Z10.5 for double side skin bulk carriers. Locations of points are given in **Fig 4.**
Transverse bulkheads in one topside/side ballast tank	The ballast tank is to be chosen based on the history of ballasting among those prone to have the most severe conditions	Locations of points are given in **Fig 5.**
Transverse webs in ballast tanks	One of the representative tanks of each type (i.e. topside or hopper or side tank) is to be chosen in the forward part	Extent of areas is shown in UR Z10.2 for single side skin bulk carriers and in UR Z10.5 for double side skin bulk carriers. Locations of points are given in **Fig 3.**



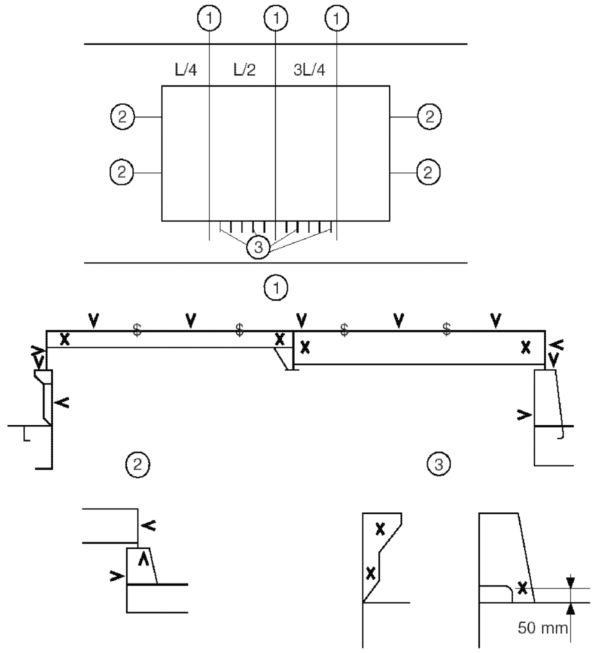
Single side bulk carriers



Double side bulk carrier

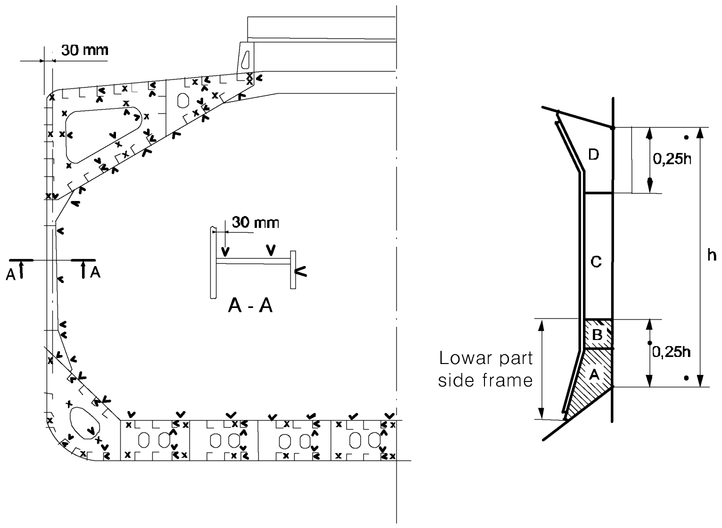
Note : Measurements are to be taken on both port and starboard sides of the selected transverse section.

Fig 1: Transverse section of bulk carrier



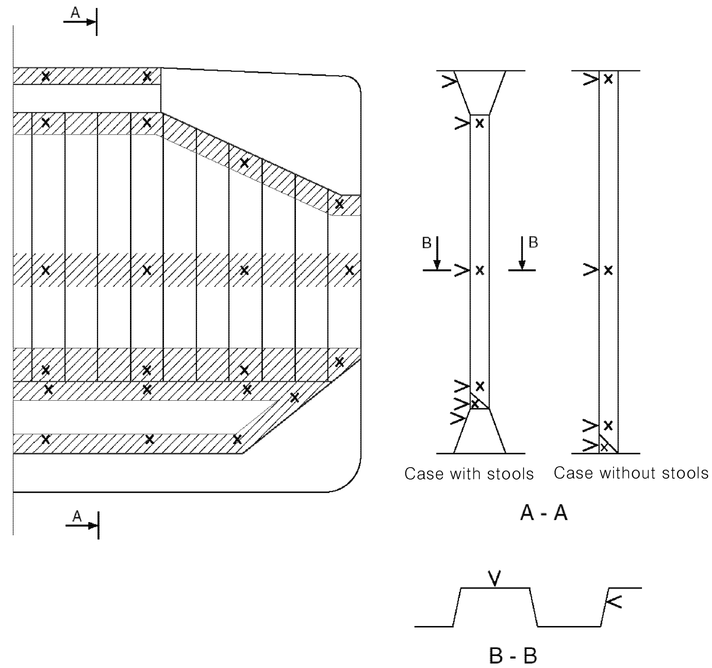
Notes :
1. Three sections at L/4, L/2, 3L/4 of hatch cover length, including:
   - one measurement of each hatch cover plate and skirt plate
   - measurements of adjacent beams and stiffeners
   - one measurement of coaming plates and coaming flange, each side
2. Measurements of both ends of hatch cover skirt plate, coaming plate and coaming flange
3. One measurement of one out of three hatch coaming brackets and bars, on both sides and both ends

Fig 2: Locations of measurements on hatch covers and coamings



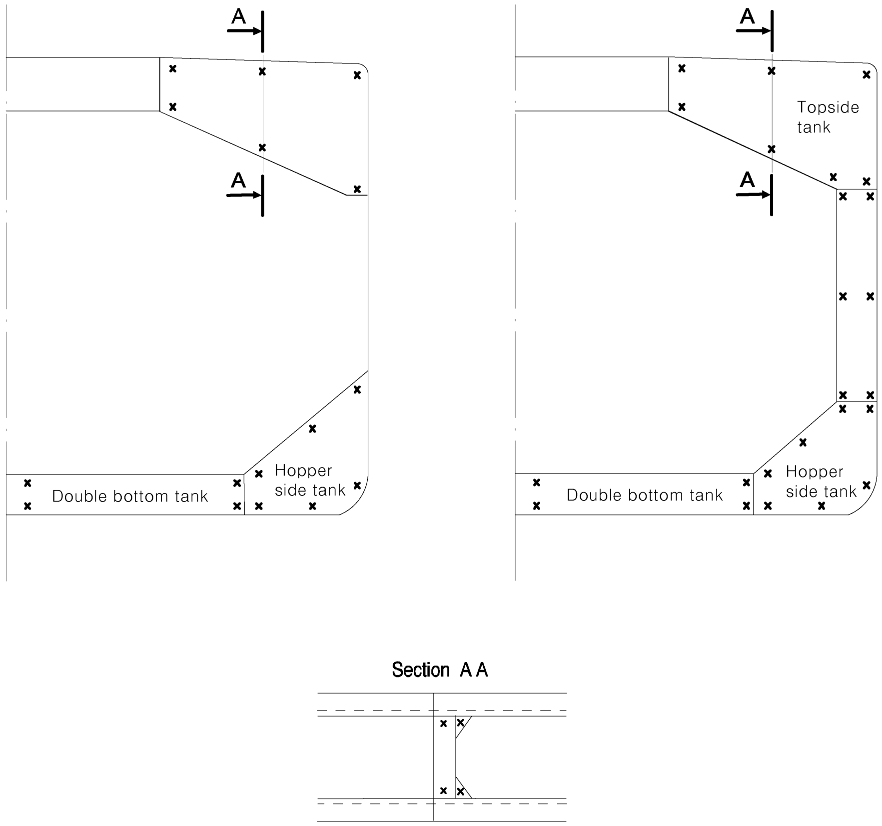
Note : The gauging pattern for web plating is to be a three point pattern for zones A, C and D, and a two point pattern for zone B (see figure). The gauging report is to reflect the average reading. The average reading is to be compared with the allowable thickness. If the web plating has general corrosion then this pattern is to be expanded to a five point pattern.

Fig 3: Locations of measurements on structural members in cargo holds and ballast tanks of single side skin bulk carriers



Note : Measurements to be taken in each shaded area as per views A-A and B-B

Fig 4: Locations of measurements on cargo hold transverse bulkheads



Note : Measurements to be taken in each vertical section as per view A-A

Fig 5: Locations of measurements on transverse bulkheads of topside, hopper, double hull and double bottom tanks

3. Acceptance Criteria

3.1 Definitions

3.1.1 Deck zone

The deck zone includes all the following items contributing to the hull girder strength above the horizontal strake of the topside tank or above the level corresponding to $0.9\,D$ above the base line if there is no topside tank:

- strength deck plating
- deck stringer
- sheer strake
- side shell plating
- top side tank sloped plating, including horizontal and vertical strakes
- longitudinal stiffeners connected to the above mentioned platings.

3.1.2 Bottom zone

The bottom zone includes the following items contributing to the hull girder strength up to the upper level of the hopper sloping plating or up to the inner bottom plating if there is no hopper tank:

- keel plate
- bottom plating
- bilge plate
- bottom girders
- inner bottom plating
- hopper tank sloping plating
- side shell plating
- longitudinal stiffeners connected to the above mentioned platings.

3.1.3 Neutral axis zone

The neutral axis zone includes the plating only of the items between the deck zone and the bottom zone, as for example:

- side shell plating
- inner hull plating, if any

3.2 Local strength criteria

3.2.1 Items for the local strength criteria

The items to be considered for the local strength criteria are those of the deck zone, the bottom zone and the neutral axis zone, as defined in **[3.1]**, and the additional following items:

- hatch coaming plating
- hatch coaming brackets
- hatch cover top plating
- hatch cover skirt plating
- hatch cover stiffeners
- transverse bulkheads plating
- transverse bulkheads stiffener web
- transverse bulkheads stiffener flange
- side shell frames web
- side shell frames flange

- side shell frames brackets
- web of topside and hopper tank web frames
- flange of topside and hopper tank web frames
- floors plating and stiffeners
- forward and aft peak bulkheads plating
- forward and aft peak bulkheads stiffener web
- forward and aft peak bulkheads stiffener flange
- stringers and girders.

3.2.2 Renewal thickness for corrosion other than local corrosion

For each item, steel renewal is required when the gauged thickness t_{gauged} is less than the renewal thickness, as specified in the following formula:

$$t_{gauged} < t_{renewal}$$

Where the gauged thickness t_{gauged} issuchas:

$$t_{renewal} < t_{gauged} < t_{renewal} + t_{reserve}$$

coating applied in accordance with the coating manufacturer's requirements or annual gauging may be adopted as an alternative to the steel renewal. The coating is to be maintained in good condition.

3.2.3 Renewal thickness for local corrosion

If pitting intensity in an area where coating is required, according to **Ch 3, Sec 5**, is higher than 15 % (see **Fig 6**), thickness measurements are to be performed to check the extent of pitting corrosion. The 15 % is based on pitting or grooving on only one side of a plate.
In cases where pitting is exceeding 15 %, as defined above, an area of 300 mm or more, at the most pitted part of the plate, is to be cleaned to bare metal and the thickness is to be measured in way of the five deepest pits within the cleaned area. The least thickness measured in way of any of these pits is to be taken as the thickness to be recorded.
The minimum remaining thickness in pits, grooves or other local areas as defined in **Ch 13, Sec 1, [1.2.1]** is to be greater than:

- 75 % of the as-built thickness, in the frame and end brackets webs and flanges
- 70 % of the as-built thickness, in the side shell, hopper tank and topside tank plating attached to the each side frame, over a width up to 30 mm from each side of it,

without being greater than $t_{renewal}$.

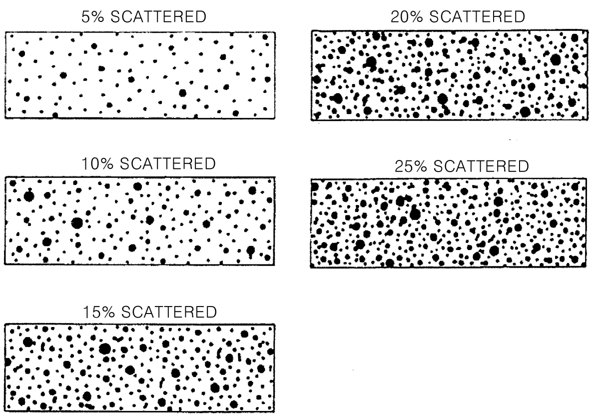


Fig 6: Pitting intensity diagrams (from 5 % to 25 % intensity)

3.3 Global strength criteria

3.3.1 Items for the global strength criteria

The items to be considered for the global strength criteria are those of the deck zone, the bottom zone and the neutral axis zone, as defined in **[3.1].**

3.3.2 Renewal thickness

The global strength criteria is defined by the assessment of the bottom zone, deck zone and neutral axis zone, as detailed below.

a) bottom zone and deck zone:

The current hull girder section modulus determined with the thickness measurements is not to be less than 90 % of the section modulus calculated according to **Ch 5, Sec 1** with the gross offered thicknesses.

Alternatively, the current sectional areas of the bottom zone and of the deck zone which are the sum of the gauged items area of the considered zones, are not to be less than 90 % of the sectional area of the corresponding zones determined with the gross offered thicknesses.

b) neutral axis zone:

The current sectional area of the neutral axis zone, which is the sum of the gauged platings area of this zone, is not to be less than 85% of the gross offered sectional area of the neutral axis zone.

If the actual wastage of all items, of a given transverse section, which contribute to the hull girder strength is less than 10 % for the deck and bottom zones and 15 % for the neutral axis zone, the global strength criteria of this transverse section is automatically satisfied and its checking is no more required. ⚓

Rules for the Classification of Steel Ships

Part 12

Common Structural Rules for Double Hull Oil Tankers

RA-12-E

KOREAN REGISTER OF SHIPPING

COMMON STRUCTURAL RULES FOR DOUBLE HULL OIL TANKERS

Foreword

1. This version of the Rules is effective as of 1st July 2010.

2. This version incorporates changes made to the 1 July 2008 consolidated edition.

2.1 Note that changes included in Rule Change Notice 1 to the 1 July 2008 consolidated edition are effective from 1 February 2010.

3. The Rules contain two parts, one part that is for information and does not constitute specific requirements and one part giving structural rules for double hull oil tankers of 150 m or greater. Subjects for information are given in *Section 1 - Introduction* and *Section 2 - Rule Principles*. Specific rule requirements are given in *Section 3* to *12* and the Appendices.

4. The following table provides a revision history of the Rules.

	Amendment Type / No.	Approval Date	Effective Date*	Reference Rule Edition
1	Corrigenda 1	7 Apr 2006	1 Apr 2006	1 Jan 2006 edition
2	Corrigenda 2	27 July 2006	1 Apr 2006	1 Jan 2006 edition
3	Rule Change Notice 1	29 Sept 2006	1 Apr 2007	1 Jan 2006 edition
4	Corrigenda 3	19 Nov 2007	1 Apr 2006	1 Jan 2006 edition
5	Rule Change Notice 2	25 Feb 2008	1 July 2008	1 Jan 2006 edition
6	Corrigenda 1 (1 July 2008 consolidated edition)	2 July 2008	1 July 2008	1 July 2008 consolidated edition
7	Rule Change Notice 1 (1 July 2008 consolidated edition)	11 Nov 2009 (Amended version)[1]	1 Feb 2010	1 July 2008 consolidated edition

	Amendment Type / No.	Approval Date	Effective Date*	Reference Rule Edition
8	Rule Change Notice 2 (1 July 2008 consolidated edition)	12 Apr 2010	1 July 2010	1 July 2008 consolidated edition

* For effective date, refer to the implementation statements of relevant Corrigenda / Rule Changes.

1) RCN 1 to July 2008 edition was originally approved on 28 January 2009, however following input from industry, IACS Council decided to postpone the original implementation date of 1 July 2009 until such time as a technical study was completed.

   In November 2009, following further technical review, IACS Council agreed an amended version of RCN 1 to enter into force on 1 February 2010.

Note: When the word '(void)' appears in the text, it means that the concerned part has been deleted. This is to keep the numbering of the remainder unchanged.

Table of Contents

Section 1

Introduction

1 Introduction to Common Structural Rules for Oil Tankers

1.1 General

1.1.1 Applicability

1.1.1.1 These Rules apply to double hull oil tankers of 150 m length, *L*, and upward classed with the Society and contracted for construction[(1)] on or after 1 April 2006. The definition of the rule length, *L*, is given in **Sec 4/1.1.1.1.**

1.1.1.2 Generally, for double hull tankers of less than 150 m in length, *L*, the Rules of the individual Classification Society are to be applied.

1.1.1.3 Ships contracted for construction before the effective date of these Rules are to comply with the Rules of the individual Classification Society.

Note
The "contracted for construction" date means the date on which the contract to build the vessel is signed between the prospective owner and the shipbuilder. For further details regarding the date of "contracted for construction", see IACS Procedural Requirement (PR) No.29.

1.2 Application of Individual Classification Rules

1.2.1 Regions of the ship which these Rules do not cover

1.2.1.1 For regions of the structure which these Rules do not cover, the relevant requirements of the individual Classification Society's Rules are to be applied.

1.3 Guidance on Rule Structure

1.3.1 Framework

1.3.1.1 The Rules are structured in Sections giving instructions for detailed application and requirements which are applied in order to satisfy the Rule objectives. The acceptable procedures for the structural analysis required by the Rules are given in the Appendices.

1.3.2 Numbering and cross-references

1.3.2.1 The system for numbering of Sections and Sub-Sections is given in **Table 1.1.1.**

Table 1.1.1
Section Numbering

Order	Levels	Example
1	Section name (displayed in the header)	Section 1 - Introduction
2	Sub-Section	1 Introduction To The Common Structural⋯
3	Sub-Section 2	1.1 General

Rule Principles

1 Introduction

1.1 Rule Principles

1.1.1 Rule objectives

1.1.1.1 The objectives of the Rules are to establish requirements to reduce the risks of structural failure in order to help improve the safety of life, environment and property and to provide adequate durability of the hull structure for the design life.

1.1.2 General

1.1.2.1 The sub-sections contain:

(a) the General Assumptions; pertaining to the design, construction and operation of the ship and gives information on the responsibilities of Classification Societies, builders and owners

(b) the Design Basis; which specifies the premises that the design principles of the Rules are based on, in terms of design parameters and assumptions about the ship operation

(c) the Design Principles; which define the fundamental principles used for the structural requirements in the Rules with respect to loads, structural capacity and assessment criteria

(d) the Application of the Design Principles; which describes how the design principles and methods are applied and what criteria are used to demonstrate that the structure meets the objective.

2 General Assumptions

2.1 General

2.1.1 International and national regulations

2.1.1.1 Ships are to be designed, constructed and operated in compliance with the regulatory framework prescribed internationally by the International Maritime Organization and implemented by National Administrations.

2.1.1.2 The Rules are based on the assumptions that all applicable statutory requirements are complied with.

2.1.1.3 The Rules incorporate the IACS unified requirements as shown in **Table 2.2.1.**

2.1.2 Classification Societies

2.1.2.1 Classification Societies develop and publish the standards for the hull structure and essential engineering systems. Classification Societies verify compliance with the classification requirements and the applicable international regulations when authorised by a National Administration during design, construction and operation of a ship.

Table 2.2.1
IACS Unified Requirements Applicable to Oil Tankers

Number	Title
A1	*Equipment*
A2	*Shipboard fittings and supporting hull structures associated with towing and mooring on conventional vessels*
S1	*Requirements for Loading Conditions, Loading Manuals and Loading Instruments*
S2	*Definitions of ship's length* L *and block coefficient* C_b
S3	*Strength of end bulkheads of superstructures and deckhouses*
S4	*Criteria for use of high tensile steel with yield points of 315* $\mathrm{N/mm^2}$ *and 355* $\mathrm{N/mm^2}$ *(with respect to longitudinal strength)*
S5	*Calculation of midship section moduli for conventional ship for ship's scantlings*
S6	*Use of steel grades for various hull members - ships of 90 m in length and above*
S7	*Minimum longitudinal strength Standards*
S11	*Longitudinal strength Standard*
S13	*Strength of bottom forward in oil tankers*
S14	*Testing procedures of Watertight Compartments*
S26	*Strength and securing of Small Hatches on the Exposed Fore Deck*
S27	*Strength Requirements for Fore Deck Fittings and Arrangements*

2.1.3 Responsibilities of Classification Societies, builders and owners

2.1.3.1 These Rules address the hull structural aspects of classification and do not include requirements related to the verification of compliance with the Rules during construction and operation. The verification of compliance with these Rules is the responsibility of all parties and requires that proper care and conduct is shown by all parties involved in its implementation. These responsibilities include:

(a) general aspects:

- relevant information and documentation involved in the design, construction and operation is to be communicated between all parties in a clear and efficient manner. The builder is responsible for providing design documentation according to requirements specified in the Rules. Other requirements for information and documentation are specified by the requirements and approval procedures of the individual Classification Societies
- quality systems are applied to the design, construction, operation and maintenance activities to assist compliance with the requirements of the Rules.

(b) design aspects:

- it is the responsibility of the owner to specify the intended use of the ship, and the responsibility of the builder to ensure that the operational capability of the design fulfils the owner's requirements as well as the structural requirements given in the Rules
- the builder shall identify and document the operational limits for the ship so that the ship can be safely and efficiently operated within these limits
- verification of the design is performed by the builder to check compliance with provisions contained in the Rules in addition to national and international regulations
- the design is performed by appropriately qualified, competent and experienced personnel
- the classification society is responsible for a technical appraisal of the design plans and related documents for a ship to verify compliance with the appropriate classification rules.

(c) construction aspects:

- the builder is responsible for ensuring that adequate supervision and quality control is provided during the construction
- construction is to be carried out by qualified and experienced personnel
- workmanship, including alignment and tolerances, is to be in accordance with acceptable shipbuilding standards
- the Classification Society is responsible for surveying to verify that the construction and quality control are in accordance with the plans and procedures.

(d) operational aspects:

- the owner is to ensure that the operations personnel are aware of, and comply with, the operational limitations of the ship
- the owner is to provide operations personnel with sufficient training such that the ship is properly handled to ensure that the loads and resulting stresses imposed on the structure are minimised
- the owner is to ensure that the ship is maintained in good condition and in accordance with the Classification Society survey scheme and also in accordance with the international and national regulations and requirements
- the Classification Society is responsible for surveying to verify that the vessel maintains its condition of class in accordance with the Classification Society survey scheme.

3 Design Basis

3.1 General

3.1.1 The design basis

3.1.1.1 This Sub-Section specifies the design parameters and the assumptions about the ship operation that are used as the basis of the design principles of the Rules.

3.1.1.2 The Rules are applicable for ships in compliance with the specified design basis. Special consideration will be given to deviations from this design basis.

3.1.1.3 The design basis used for the design of each ship is to be documented and submitted to the Classification Society as part of the design review and approval. All deviations from the design basis are to be formally advised to the Classification Society.

3.1.2 Arrangement and layout

3.1.2.1 The Rules cover typical double hull tankers of greater than or equal to 150 m in length and with arrangements as follows:

(a) engine room and deck house located aft of the cargo tank region, and

(b) in addition to the inner skin two longitudinal oil-tight bulkheads with no centreline longitudinal bulkhead, or

(c) in addition to the inner skin one centreline longitudinal oil-tight bulkhead.

3.1.2.2 The ship's structure is assumed to be:

(a) constructed of welded steel structures

(b) composed of stiffened plate panels

(c) longitudinally framed with full transverse bulkheads and intermediate web frames.

3.1.2.3 The typical arrangements covered by the Rules are shown in **Fig 2.3.1** and assume that the structural arrangements include:

(a) narrow double side structure and double bottom structure with breadth/depth in accordance with statutory requirements

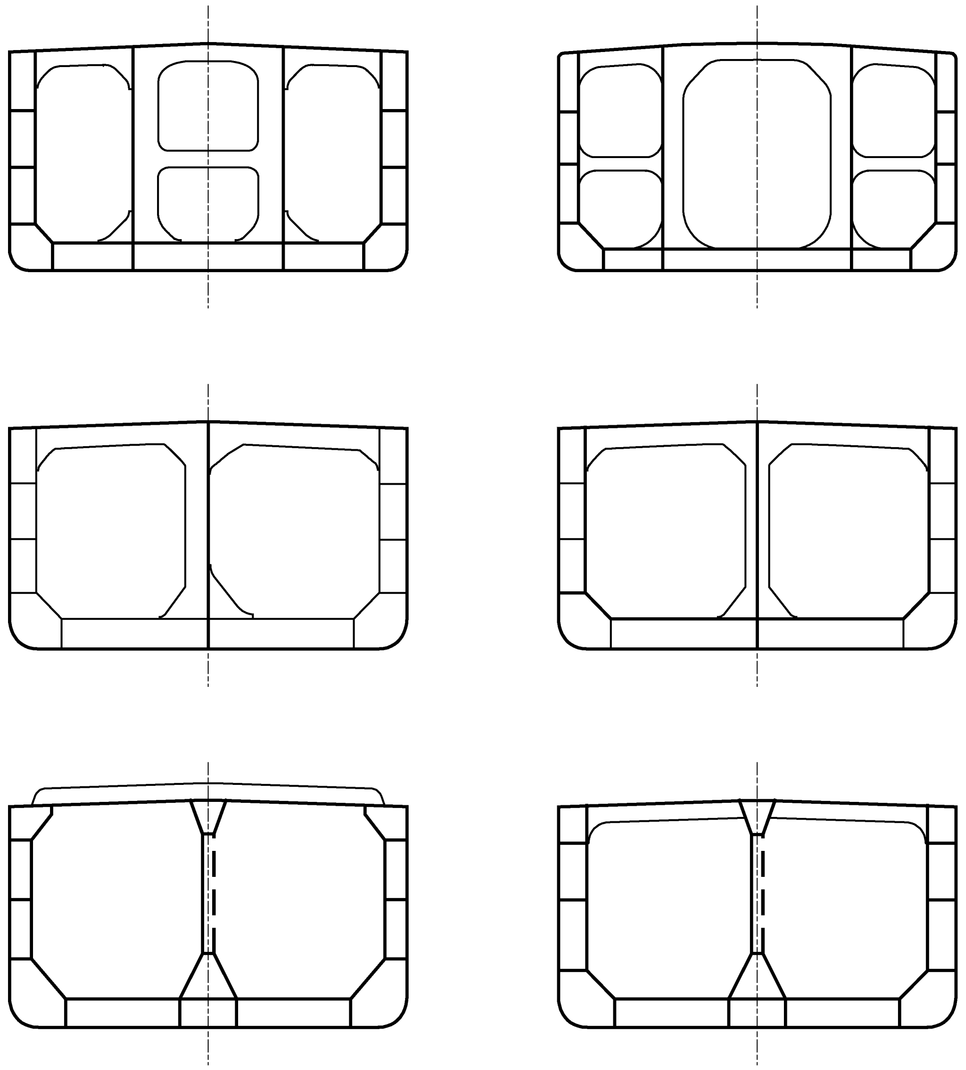
(b) single deck ships

(c) side longitudinal, centreline longitudinal or transverse bulkheads of plane, corrugated or double skin construction

(d) the number and location of bulkheads are arranged to comply with the statutory requirements

The cross sections shown in **Fig 2.3.1** are typical examples only and other variations of cross tie and web frame arrangements are also covered.

Fig 2.3.1
Typical Arrangements of Double Hull Tankers



3.1.2.4 The Rules assume the following hull form with respect to environmental loading:

(a) full form ship with block coefficient (C_b) greater than 0.7

(b) the ship length breadth ratio (L/B) greater than 5

(c) ship breadth depth ratio (B/D) less than 2.5

(d) the metacentric height (GM) not greater than $0.12B$ for homogeneously full load conditions, and $0.33B$ for ballast conditions.

3.1.3 Design life

3.1.3.1 A nominal design life of 25 years is assumed for selecting appropriate ship design parameters. The specified design life is the nominal period that the ship is assumed to be exposed to operating conditions. However, the ship's actual service life may be longer or shorter depending on the actual operating conditions and maintenance of the ship throughout its life cycle.

3.1.4 Design speed

3.1.4.1 The design maximum service speed is to be specified by the designer. The Rules assume that the ship is able to operate at this service speed on a continuous basis, but this does not relieve the responsibilities of the owner and personnel to properly handle the ship and reduce speed or change heading in severe weather, see **2.1.3.1(d)**

3.1.5 Operating conditions

3.1.5.1 The ship is to be capable of carrying the intended cargo with the necessary flexibility in operation to fulfil its design role. Specification of cargo loading conditions as required by the Rules and any additional cargo loading conditions required by the owner are the responsibility of the designer.

3.1.5.2 The Rules assume the following:

(a) a minimum set of specified loading conditions as defined in the Rules are examined. These are to include both seagoing and harbour loading conditions

(b) in addition to the minimum set of specified loading conditions, all relevant additional loading conditions covering the intended ship's service which result in increased still water shear force, bending moments or increased local static loadings are to be submitted for review

(c) the Trim and Stability Booklet, Loading Manual and loading computer systems specify the operational limitations to the ship and these comply with the appropriate statutory and classification requirements

(d) all cargo tanks are from a local strength point of view including sloshing designed for unrestricted filling for a cargo density as specified in **3.1.8**. Limitations to loading patterns resulting in full or empty adjacent tanks as specified in the Rules and the Loading Manual do however apply for primary support members and hull girder shear force and bending moments

3.1.6 Operating draughts

3.1.6.1 The design operating draughts are to be specified by the designer and are to be used to derive the appropriate structural scantlings. All operational loading conditions in the Loading Manual are to comply with the specified design operating draughts. The following design operating draughts are as a minimum to be considered:

(a) the maximum and minimum mean operational draughts

(b) maximum scantling draught for the assessment of structure

(c) minimum draughts forward for the assessment of bottom slamming, with and without ballast tanks in way filled

(d) maximum mean draught for a condition with all cargo tanks abreast empty

(e) maximum mean draught for a condition with empty centre or wing cargo tank.

3.1.7 External environment

3.1.7.1 To cover worldwide trading operations and also to deal with the uncertainty in the future trading pattern of the ship and the corresponding wave conditions that will be encountered, a severe wave environment is used for the design assessment. The rule requirements are based on a ship trading in the North Atlantic wave environment for its entire design life.

3.1.7.2 The effects of wind and current on the structure are considered to be negligible and hence are not explicitly included.

3.1.7.3 The Rules do not include the effects of ice.

3.1.7.4 The Rules assume that the structural assessment of hull strength members is valid for the following design temperatures:

(a) lowest daily mean temperature in air is -10 °C

(b) lowest daily mean temperature in sea water is 0 °C

Ships operating for long periods in areas with lower daily mean air temperature may be subject to additional requirements as specified by the individual Classification Society.

3.1.8 Internal environment (cargo and water ballast tanks)

3.1.8.1 A specific gravity (SG) of 1.025, or a higher value if specified by the designer, is to be used for oil cargoes for the strength assessment of cargo tank structures.

3.1.8.2 For the fatigue assessment of cargo tank structures, a representative mean cargo density throughout the ship's life is to be used. The representative mean density is to be taken as 0.9 tonnes/m^3 or the cargo density from the homogeneous full load condition at the full load design draught T_{full}, if this is higher.

3.1.8.3 A SG of 1.025 is to be used for water ballast.

3.1.8.4 The Rules are based on the following design temperatures for the cargo:
(a) maximum cargo temperature is 80 °C
(b) minimum cargo temperature is 0 °C.

3.1.8.5 The design aspects and assumption upon which corrosion additions in the Rules are specified areas follows:
(a) the corrosion additions are based on a combination of experience and a statistical evaluation of historical corrosion measurements. The corrosion additions are based on the carriage of a mixture of crude and other oil products with various degrees of corrosive properties
(b) the corrosion additions are based on the design life, see **3.1.3.1**
(c) ballast tanks are coated. Requirements for coating application and maintenance are excluded from the Rules.

3.1.8.6 The values for corrosion additons and wastage allowance are specified in **Sec 6/3** and **Sec 12** respectively.

3.1.9 Structural construction and inspection

3.1.9.1 The structural requirements included in the Rules are developed with the assumption that construction and repair will follow acceptable shipbuilding and repair standards and tolerances. The Rules may require that additional attention is paid during construction and repair of critical areas of the structure.

3.1.9.2 Tank strength and tightness testing are to be carried out as a part of the verification scheme.

3.1.9.3 The Rules define the renewal criteria for the individual structural items. The structural requirements included are developed on the assumption that the structure will be subject to periodical survey in accordance with individual Classification Society Rules and Regulations. All structural elements are to be arranged to allow access for inspection, see **Sec 5/5**. It is assumed that close-up inspection of the critical areas will be carried out on a regular basis.

3.1.10 Owner's extras

3.1.10.1 Owner's specification of requirements above the general classification or statutory requirements may affect the structural design. Owner's extras may include requirements for:
(a) vibration analysis
(b) maximum percentage of high strength steel
(c) additional scantling dimensions above that required by the Rules
(d) additional design margin on the loads specified by the Rules, etc
(e) improved fatigue resistance, in the form of a specified increase in design fatigue life or equivalent
(f) combinations of cargo loading patterns and draughts exceeding the Rule specified conditions
(g) higher cargo density for fatigue evaluation for ships intended to carry high density cargo in part load conditions on a regular basis.

Owner's extras are not covered by these Rules. Owner's extras that may affect the structural design are to be clearly specified in the design documentation.

4 Design Principles

4.1 Overall Principles

4.1.1 Introduction

4.1.1.1 This Sub-Section defines the underlying design principles of the Rules in terms of loads, structural capacity models and assessment criteria and also construction and in-service aspects.

4.1.2 General

4.1.2.1 The Rules are based on the following overall principles:

(a) the safety of the structure can be demonstrated by addressing the potential structural failure mode(s) when the vessel is subjected to operational loads and environmental loads/conditions

(b) the design complies with the design basis, see **Sec 3**

(c) the structural requirements are based on a consistent set of loads that represent typical worst possible loading scenarios

(d) the structural requirements with respect to loads, capacity models and assessment criteria are presented in a modular format so that each component of the requirement is clearly identified

4.1.2.2 The ship's structure is designed such that:

(a) it has inherent redundancy. The ship's structure works in a hierarchical manner and, as such, failure of structural elements lower down in the hierarchy should not result in immediate consequential failure of elements higher up in the hierarchy

(b) permanent deformations are minimised. Permanent deformations of local panel or individual stiffened plate members may be acceptable provided that this does not affect the structural integrity, containment integrity or the performance of structural or other systems

(c) the incidence of in-service cracking is minimised, particularly in locations which; affect the structural integrity or containment integrity, affect the performance of structural or other systems or are difficult to inspect and repair

(d) it has adequate structural redundancy to survive in the event that the structure is accidentally damaged; for example, minor impact leading to flooding of any compartment.

4.2 Loads

4.2.1 Load scenarios

4.2.1.1 The loads used for assessment of the structure covers the load scenarios encountered by the ship during operation at sea and in harbour.

4.2.2 Design load combinations

4.2.2.1 Design load combinations combine local and global load components to represent identified load scenarios. The design load combinations should be sufficiently severe and varied so as to encompass all scenarios that can reasonably occur during normal operation.

4.2.2.2 The design load combinations for the hull and structural members consider the most unfavourable combination of load effects in order to maintain a consistent safety level for all combinations.

4.2.2.3 The design load combinations are based on one of the following combinations of static and dynamic loads depending on the type of load and the load scenario being considered:

(a) Static design load combinations (S)

covers application of all relevant static loads and typically covers load scenarios in harbour, tank testing or similar operations

(b) Static plus Dynamic design load combination (S+D)

covers application of all relevant static loads plus a realistic combination of simultaneously occurring dynamic load components and typically covers load scenarios for seagoing operations

(c) Impact design load combination

covers application of impact loads such as bottom slamming and bow impact encountered during seagoing operation. It is usually sufficient to ignore other static and dynamic load components in association with an impact load event.

(d) Sloshing design load combination

covers application of sloshing loads encountered during seagoing operations

(e) Fatigue design load

covers application of all relevant dynamic loads

(f) Accidental design load combination (A)

covers application of accidental loads where these loads are not considered as occurring during normal operations

4.2.3 Load categorisation

4.2.3.1 The design load combinations are composed of many different types of loads, which are categorised as shown in **Table 2.4.1.**

Table 2.4.1
Load Categorisations

Operational Loads	Lightship weight	Steel weight and outfit Machinery and permanent equipment
	Buoyancy loads	Buoyancy of the ship
	Variable loads	Cargo Ballast water Stores and consumables Personnel Temporary equipment
	Other loads	Tug and berthing loads Towing loads Anchor and mooring loads Lifting appliance loads
Environmental loads	Cyclic loading due to wave action including inertia loads	Dynamic wave pressures
		Dynamic loads and dynamic tank pressures due to ship accelerations
	Impact loads or resonant loads	Wave impacts Bottom slamming Liquid sloshing in tanks Green sea loads
Accidental loads		Flooding of compartments
Deformation loads		Thermal loads Deformations due to construction

4.2.3.2 Operational loads generally are static loads. They are grouped into lightship weight, buoyancy loads, variable loads and other loads. The operational loads occur as a consequence of the operation and handling of the ship.

4.2.3.3 Environmental loads are dynamic loads due to external influences. The environmental loads covered by the Rules are loads due to wave action.

4.2.3.4 Accidental loads include loads that result as a consequence of an accident or operational mishandling of the ship. The accidental loads covered by the Rules are increased tank pressures due to flooding of compartments.

4.2.3.5 Deformation loads are caused by thermal loads and residual stresses. The load effects from deformation loads are not covered by the Rules.

4.2.4 Characteristic load values

4.2.4.1 The characteristic values of the load components that are applied in the Rules are dependant on the design load combination being considered. The characteristic loads are typical values and are given by:

(a) for operational loads the characteristic loads are the expected or specified values

(b) for environmental loads the characteristic load is typically a load value which has a low probability of occurrence, i.e. an ‘extreme’ value.

4.2.5 Operational loads

4.2.5.1 The characteristic values of the static sea pressure on the hull due to the buoyancy are based on the draught at the loading condition under consideration.

4.2.5.2 The characteristic values of the static tank pressure are based on the filling height and the specific gravity of the cargo/ballast, and include allowances for possible overpressure due to the height of air pipes, pressure relief valve settings and capacity of pumps.

4.2.5.3 The characteristic values of the loads due to personnel, stores and consumables, temporary equipment and permanent equipment are based on specified values.

4.2.5.4 The characteristic values for tug, berthing, towing and mooring loads are based on specified values.

4.2.6 Environmental loads

4.2.6.1 The Rule formulations for wave loads, as given in **Sec 7/3**, are based on the envelope values calculated in accordance with **4.2.6.2** and calibrated with feedback from service experience and model tests.

4.2.6.2 The general principles for the derivation of the wave load values are:

(a) the application of load values is consistent for all similar load scenarios

(b) the characteristic load value is selected to suit the purpose of the application of the load and the selected structural assessment method, e.g. for strength assessment the expected lifetime maximum load is applied while for fatigue assessment an average value representing the expected load history is applied

(c) load calculations are performed using 3-D linear hydrodynamic computational tools. The effects of speed are considered

(d) the derivation of characteristic wave loads is based on a long term statistical approach which includes representation of the wave environment (North Atlantic scatter diagram), probability of ship/wave heading and probability of load value exceedance based on IACS Rec.34. All of which result in envelope values

(e) non-linear effects are considered for the expected lifetime maximum loads.

4.2.6.3 The combination of dynamic loads considers all simultaneously occurring dynamic load components. In deriving the simultaneously occurring loads, one particular load component is maximised or minimised and the relative magnitude of all simultaneously occurring dynamic load components is specified by the application of dynamic load combination factors (DLCF) based on the envelope load value. These dynamic load combination factors are based on the application of the equivalent design wave approach and are given as tabulated values.

4.2.6.4 The formulations of the load values for bottom slamming, bow impact loads and green sea loads take account of the following factors:

(a) vessel draught

(b) hull form

(c) heading
(d) forward speed
(e) location of deck houses/superstructure
(f) geometry of structural elements.

4.2.6.5 A slamming impact load results in a transient dynamic response in the structure. The formulation of the impact loads considers the impact load as an equivalent static load acting on the associated exposed hull surface.

4.2.6.6 The effect of green water on the deck structure along the entire vessel's length is considered. The green water loads on fore and parallel mid bodies of a ship are determined based on model tests, ship motion analysis and service experience. The green sea loads for the aft body are consistent with the derivation for the fore and mid body green sea loads.

4.2.7 Accidental loads

4.2.7.1 The accidental load scenarios cover loads acting on local structure as a consequence of flooding in accordance with the assumptions made in IMO regulations. This relates to the assessment of the watertight subdivision boundaries.

4.2.7.2 Only static loads corresponding to the draught in the flooded condition are considered.

4.2.8 Deformation loads

4.2.8.1 Thermal loads within the limits specified by the design basis are considered negligible. It is assumed that care is taken to account for, and allow for, expected thermal expansion.

4.3 Structural Capacity Assessment

4.3.1 General

4.3.1.1 The basic principle in structural design is to apply the defined design loads, identify possible failure modes and employ appropriate capacity models to determine the required structural scantlings.

4.3.2 Capacity models for strength

4.3.2.1 The strength assessment method is to be capable of analysing the failure mode in question to the required degree of accuracy. Several assessment methods may be applicable, even for the same failure modes.

4.3.2.2 The following aspects are the basis for selection of strength capacity models:
(a) whether the structural member is also assessed at a higher level in the hierarchy and/or at a later stage by more accurate methods or by more accurate response calculations
(b) simplified capacity models where some of the stress components are neglected are to always give conservative results
(c) appropriate methodology to assess the failure mode
(d) probability level of the load
(e) capability of response calculations to represent the physical behaviour of the structure up to the given load level
(f) complexity of structure
(g) complexity of loads
(h) criticality of the structural member. This will primarily have an impact on the assessment criteria, but needs to be considered in conjunction with selection of the appropriate methodology for structural assessment.

4.3.2.3 The structural capacity assessment methods are in either a prescriptive format or require the use of more advanced calculations such as finite element analysis methods.

4.3.2.4 The formulae used to determine stresses, deformations and capacity are appropriate for the selected capacity assessment method and the type and magnitude of the design load set.

4.3.3 Capacity models for fatigue

4.3.3.1 The fatigue assessment method provides Rule requirements to safeguard structural details against fatigue failure.

4.3.3.2 The fatigue capacity model is based on a linear cumulative damage summation (Palmgren - Miner's rule) in combination with S-N curves, a characteristic stress range and an assumed long-term stress distribution curve.

4.3.3.3 The fatigue capacity assessment models are in either a prescriptive format or require the use of more advanced calculations such as finite element analysis methods. These methods account for the combined effects of global and local dynamic loads.

4.3.4 Net thickness approach

4.3.4.1 The philosophy behind the net thickness approach is to:

(a) provide a direct link between the thickness used for strength calculations during the new building stage and the minimum thickness accepted during the operational phase

(b) enable the status of the structure with respect to corrosion to be clearly ascertained throughout the life of the ship.

4.3.4.2 The net thickness approach distinguishes between local and global corrosion. Local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener. Global corrosion is defined as the overall average corrosion of larger areas such as primary support members and the hull girder. Both the local and overall corrosion are used as a basis for the new building review and are to be confirmed during operation of the vessel.

4.3.4.3 The net thickness approach for the local corrosion is shown in **Fig 2.4.1(a)** and is in terms of new building thicknesses, given by:

(a) the local strength requirements are given by the net thickness ($t_{net\text{-}req}$) after rounding

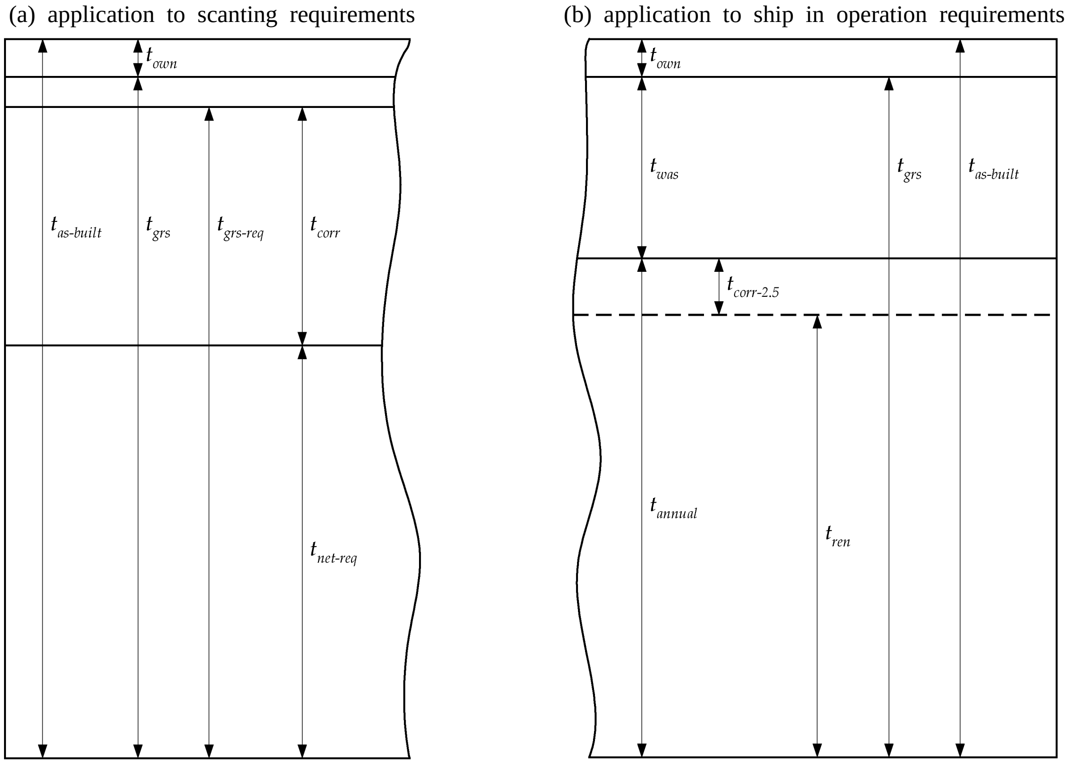
(b) the required gross thickness ($t_{grs\text{-}req}$) is given by adding the corrosion addition (t_{corr}) to the required rounded net thickness ($t_{net\text{-}req}$)

(c) the gross thickness (t_{grs}) is the actual thickness selected by the designer to fulfil the gross required thickness ($t_{grs\text{-}req}$) and is to be equal or greater than the required gross thickness ($t_{grs\text{-}req}$)

(d) the as built thickness is equal to the gross thickness (t_{grs}) plus any additional owners extra margin (t_{own})

(e) any additional thicknesses specified by the owner, as owners extra margin (t_{own}) are not to be included in the assessment of the required gross thickness ($t_{grs\text{-}req}$).

Fig 2.4.1
Net Thickness Approach for Local Wastage



4.3.4.4 The net thickness approach for determining the local renewal thickness during the ship in operation phase is shown in **Fig 2.4.1(b)** and is given by:

(a) the thickness at which annual surveys are required, t_{annual}, is obtained by subtracting the total wastage allowance (t_{was}) and the owners extra margin (t_{own}) from the as-built thickness ($t_{as\text{-}built}$)

(b) thickness at which renewal is required, t_{ren}, is obtained by subtracting the total wastage allowance (t_{was}), the thickness $t_{corr\text{-}2.5}$ and the owners extra margin (t_{own}) from the as-built thickness ($t_{as\text{-}built}$). Where $t_{corr\text{-}2.5}$ is the wastage allowance in reserve for corrosion occurring in the two and half years between Intermediate and Special surveys

(c) the total wastage allowance given is the rule specified wastage allowance (t_{was}) plus the wastage allowance in reserve ($t_{corr\text{-}2.5}$) plus any additional owners extra margin (t_{own})

(d) the rule specified wastage allowance (t_{was}) available before annual surveys are required is obtained by deducting the thickness $t_{corr\text{-}2.5}$ from the corrosion addition (t_{corr}).

The approach calls for a general 2.5 year survey interval when the gauged thickness is greater than the "thickness at which annual surveys are required" (t_{annual}), and a 1 year survey interval when the gauged thickness is less than the "thickness at which annual surveys are required" (t_{annual}).

4.3.4.5 The overall average corrosion for primary support members and the hull girder cross-section is given by deducting half the local corrosion addition (0.5 t_{corr}) from all structural elements comprising the respective cross-sections.

4.3.4.6 The assessment of local scantlings is performed based on the hull girder stresses given by the net hull girder properties, e.g. based on a global overall average corrosion of the hull girder, and the local stresses based on the net thickness of the local member under consideration, e.g. based on full local corrosion. It is assumed that the structure may corrode locally to the maximum allowed and that the hull girder may reduce to the maximum allowed overall hull girder corrosion.

4.3.4.7 The assessment of global (hull girder and primary support member) scantlings is based on the overall global corrosion, e.g. half the full local corrosion for all structural members simultaneously. The assumption is that the full local corrosion will not occur globally and hence a lesser average value of assumed corrosion is appropriate. Individual structural elements may corrode to the maximum corrosion addition and this is taken into account in the buckling assessment.

4.3.4.8 As fatigue is an accumulative assessment the scantlings and stresses used for the assessment are to be taken as the representative mean value over the design life. The mean corrosion over the design life is given as half the corrosion assumed for scantling strength assessment. Local stresses are thus calculated based on half the full local corrosion addition and hull girder stresses are calculated based on half the overall global corrosion. Half the global overall corrosion is found by deduction of one quarter of the full local corrosion addition of all structural elements simultaneously.

4.3.4.9 The actual amount of wastage allowed in service is taken as:

(a) locally: the full corrosion addition less an amount for typical wastage between the survey periods

(b) globally: the full global overall corrosion addition less an amount for typical wastage between the survey periods. The global wastage is monitored in service by evaluating the current global characteristics of the vessel.

4.3.5 Intact structure

4.3.5.1 All strength calculations are based on the assumption that the structure is intact. The residual strength of the ship in a structurally damaged condition is not assessed.

4.3.5.2 No benefit is given in the assessment of structural capability for the presence of coatings or similar corrosion protection systems.

4.4 Materials and Welding

4.4.1 Materials

4.4.1.1 The Rule requirements associated with the selection of materials for structural components is based on the location, design temperature (see **3.1.7.4** and **3.1.8.4**), membrane, through thickness forces and criticality of the component. The requirements comply with **IACS UR S6**.

4.4.1.2 The Rule requirements are based on the assumption that the material is manufactured in accordance with the allowable under thickness rolling tolerances specified in **IACS UR W13**.

4.4.2 Welding

4.4.2.1 The Rule requirements for weld type, size and materials are based on the following considerations:

(a) joint type

(b) criticality of the joint

(c) magnitude, type and direction of the stresses in the joint

(d) material properties of the parent and weld material

(e) weld gap size.

4.5 Assessment/Acceptance Criteria

4.5.1 Design methods

4.5.1.1 The criteria for the assessment of the scantlings are based on one of the following design methods:

(a) Working Stress Design (WSD) method, also known as the permissible or allowable stress method

(b) Partial safety Factor (PF) method, also known as Load and Resistance Factor Design (LRFD).

4.5.1.2 For both WSD and PF, two design assessment conditions and corresponding acceptance criteria are given. These conditions are associated with the probability level of the combined loads, A and B:

(a) condition A is applicable to design load combinations based on 'expected' characteristic load values, typically covered by the static design load combinations

(b) condition B is applicable to design load combinations based on 'extreme' characteristic load values, typically covered by the static + dynamic load combinations.

4.5.1.3 The WSD method has the following composition:

$$W_{stat} \le \eta_1 R \quad \text{for condition A}$$

$$W_{stat} + W_{dyn} \le \eta_2 R \quad \text{for condition B}$$

Where:

W_{stat} simultaneously occurring static loads (or load effects in terms of stresses)

W_{dyn} simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components

R characteristic structural capacity (e.g. yield stress or buckling capacity)

η_i permissible utilisation factor (resistance factor). The utilisation factor includes consideration of uncertainties in loads, structural capacity and the consequence of failure

4.5.1.4 The PF method has the following composition:

$$\gamma_{stat-1} W_{stat} + \gamma_{dyn-1} W_{dyn} \le \frac{R}{\gamma_R} \quad \text{for condition A}$$

$$\gamma_{stat-2} W_{stat} + \gamma_{dyn-2} W_{dyn} \le \frac{R}{\gamma_R} \quad \text{for condition B}$$

Where:

γ_{stat-i} partial safety factor that accounts for the uncertainties related to static loads

W_{stat} simultaneously occurring static loads (or load effects in terms of stresses)

γ_{dyn-i} partial safety factor that accounts for the uncertainties related to dynamic loads

W_{dyn} simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components

R characteristic structural capacity (e.g. yield stress, ultimate hull girder stress)

γ_R partial safety factor that accounts for the uncertainties related to structural capacity

4.5.1.5 The acceptance criteria for both the WSD method and PF method are calibrated for the various requirements such that consistent and acceptable safety level for all combinations of static and dynamic load effects are achieved.

4.6 Principle of Safety Equivalence

4.6.1 General

4.6.1.1 Novel designs deviating from the design basis or structural arrangements covered by the Rules will be subject to special consideration. The principle of equivalence is to be applied to the novel design, hence it must be demonstrated that the structural safety of the novel design is at least equivalent to that intended by the Rules.

4.6.1.2 The principle of equivalence may be applied to alternative calculation methods.

4.6.1.3 A systematic review process was undertaken in developing these Rules. This identified and evaluated the likely consequences of hazards due to operational and environmental influences on tanker structural configurations and arrangements covered by these Rules. For novel designs, dependent on the nature of the deviation, it may be necessary to conduct an independent systematic review to document equivalence with the Rules.

5 Application of Principles

5.1 Overview of the Application of Principles

5.1.1 General

5.1.1.1 This Sub-Section shows how the design principles described in **Sec 4** have been applied in the development of the rule requirements.

5.2 Structural Design Process

5.2.1 Overview of the structural design process

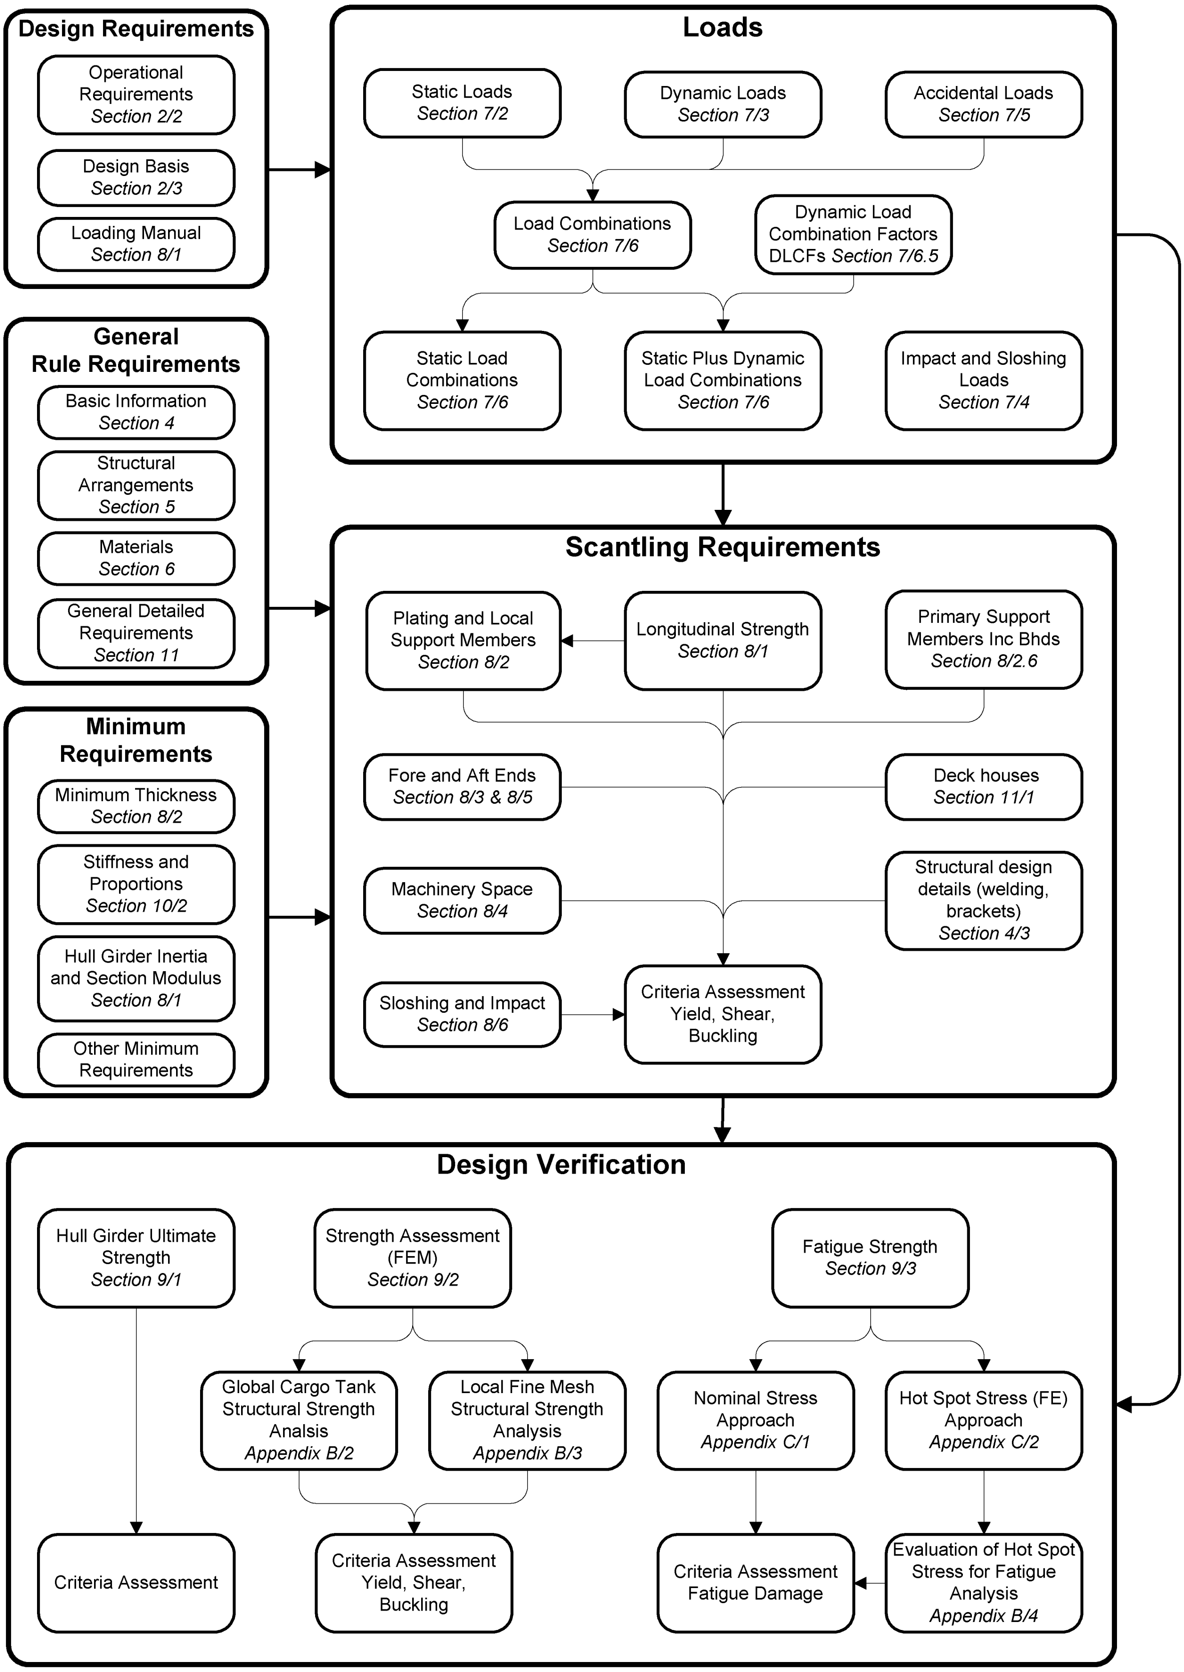
5.2.1.1 An overview of the structural design process applied in the Rules is shown in **Fig 2.5.1.**

5.2.1.2 The strength and acceptable safety of the hull and the structural elements is verified through the application of the following Rule requirements:

(a) prescriptive scantling requirements
- minimum requirements
- load-capacity based requirements

(b) design verification requirements based on load-capacity methods
- hull girder ultimate strength
- strength assessment using the Finite Element (FE) analysis
- fatigue assessment

Fig 2.5.1
Overview of Structural Design Process



5.3 Minimum Requirements

5.3.1 General

5.3.1.1 The minimum requirements are usually in one of the following forms:

(a) minimum thickness, which is independent of the yield stress, these are based on service experience and are usually expressed in the following format:

$t = A + BL$

Where:

A, B constants

L rule length, as defined in **Sec 4/1.1.1.1**

(b) minimum stiffness and proportion, which are based on prescriptive buckling requirements

5.4 Load-capacity Based Requirements

5.4.1 General

5.4.1.1 In general, the Working Stress Design (WSD) method is applied in the requirements, except for the hull girder ultimate strength criteria where the Partial safety Factor (PF) method is applied. The partial safety factor format is applied for this highly critical failure mode to better account for uncertainties related to static loads, dynamic loads and capacity formulations.

5.4.1.2 The identified load scenarios are addressed by the Rules in terms of design loads, design format and acceptance criteria set, as given in **Table 2.5.3.** The table is schematic and only intended to give an overview.

5.4.1.3 The load scenarios addressed by the rules cover operations such as seagoing conditions, loading and unloading, tank testing conditions, ballast water exchange situations, special operations in harbour (e.g. propeller inspection afloat condition) and accidental flooding.

5.4.1.4 The design load combinations that represent the identified load scenarios are given in **Sec 7/6** and are denoted by S (static loads), S+D (static+dynamic loads), and A (accidental loads). In addition, the Rules address impact loads and sloshing loads as given in **Sec 7/4** and fatigue loads as given in **Sec 7/3.**

5.4.1.5 For the strength requirements, the considered loads cover the most severe operational loads that occur, hence the cargo tank finite element analysis and load-capacity based scantling requirements are based on rule loading conditions which simulate the worst possible loading conditions within the operating limits of the vessel.

5.4.1.6 For the fatigue requirements the considered loads cover an expected load history and representative loading conditions covering the ships' intended service are applied.

5.4.1.7 The acceptance criteria are categorised into three acceptance criteria sets. These are explained below and shown in **Tables 2.5.2** and **2.5.3.** The specific acceptance criteria set that is applied in the WSD rule requirements is dependent on the probability level of the characteristic combined load.

5.4.1.8 The acceptance criteria set AC1 is applied when the combined characteristic loads are frequently occurring, typically for the static design load combinations, but also applied for the sloshing design loads. This means that the loads occur on a frequent or regular basis. The allowable stress for a frequent load is lower than for an extreme load to take into account effects of:

(a) repeated yield

(b) allowance for some dynamics

(c) margins for operational mistakes.

5.4.1.9 The acceptance criteria set AC2 is typically applied when the combined characteristic loads are extreme values, e.g. typically for the static+dynamic design load combinations. High utilisation (η_i in **Table 2.5.1**) of the structural capacity (R_i in **Table 2.5.1**) is allowed in such cases because the considered loads are extreme loads with a low probability of occurrence.

5.4.1.10 The acceptance criteria set AC3 is typically applied for capacity formulations based on the plastic collapse models such as those that are applied to address bottom slamming and bow impact loads.

Table 2.5.1
Load Scenarios and Corresponding Rule Requirements

Load Scenarios		Rule Requirements			
Operation	Loads (that the vessel is exposed to and is to withstand)	Design Load Combination (specified in **Sec 7/6**) Ref. no	Notation	Design Format (specified in **Sec 8** and **9**) see Note 1	Acceptance Criteria Set (specified in **Sec 8** and **9**)
Seagoing operations					
Transit	Static and dynamic loads in heavy weather	1	S + D	1. $S_G + S_L + D_G + D_L \leq \eta_2 R_1$	AC2
				2. $\gamma_S S_G + \gamma_D D_G \leq R_2 / \gamma_{R2}$	AC2
	Impact loads in heavy weather	2	Impact	$S_L + D_{imp} \leq \eta_3 R_p$	AC3
	Internal sloshing loads	3	Sloshing	$S_L + D_{slh} \leq \eta_1 R_1$	AC1
	Cyclic wave loads	4	Fatigue	$DM \leq \sum \eta_i / N_i$	-
BWE by flow through or sequential methods	Static and dynamic loads in heavy weather	5	S + D	$S_G + S_L + D_G + D_L \leq \eta_2 R_1$	AC2
Harbour and sheltered operations					
Loading, unloading and ballasting	Typical maximum loads during loading, unloading and ballasting operations	6	S	$S_G + S_L \leq \eta_1 R_1$	AC1
Tank testing	Typical maximum loads during tank testing operations	7	S	$S_G + S_{L1} \leq \eta_1 R_1$	AC1
Special conditions in harbour	Typical maximum loads during special operations in harbour, e.g. propeller inspection afloat or dry-docking loading conditions	8	S	$S_G + S_L \leq \eta_1 R_1$	AC1
Accidental condition					
Accidental flooding	Typically maximum loads on internal watertight subdivision structure due to accidental flooding	9	A	for water tight boundaries 1. $S_L \leq \eta_2 R_1$	AC2
				for collision bulkhead 2. $S_L \leq \eta_1 R_1$	AC1
Note 1. The symbols defined in this column are defined in the text of **5.4**					
Where: D_G dynamic global load D_L dynamic local load D_M cumulative fatigue damage ratio S_G static global load S_L static local load R_i structural capacity					

5.4.2 Design loads for scantling requirements and strength assessment (FEM)

5.4.2.1 The structural assessment of compartment boundaries, e.g. bulkheads, is based on the worst possible loading, hence conditions are assessed with a full tank on one side and an empty tank on the other side. The situation with the tank content reversed is also considered. Similarly the shell envelope is assessed for conditions at the deepest draught without internal filling and at the lowest draught with internal filling.

5.4.2.2 The standard loading patterns to be used in the strength assessment (FEM) are given in **Appendix B**, **Tables B.2.3** and **B.2.4** for tankers with two oil-tight longitudinal bulkheads and one centreline oil-tight longitudinal bulkhead respectively. The corresponding information for the scantling requirements is given in **Sec 8.**

5.4.2.3 To ensure consistency of approach, standardised rule values for parameters such as GM, R_{roll}, T_{sc} and C_b. are applied to calculate the rule load values.

5.4.2.4 The probability level of the dynamic global and local loads (D_G, D_L and D_{imp} in **Table 2.5.1**) is 10^{-8} and are derived using the long term statistical approach specified in **4.2.6.2.**

5.4.2.5 The probability level of the sloshing loads (D_{slh} in **Table 2.5.1**) is 10^{-4} which is a load that occurs frequently.

5.4.2.6 The design load combinations corresponding to the identified load scenarios produce realistic design load sets suitable for the design and verification of the structural capability. Design load sets apply all the applicable simultaneously acting static and dynamic local load components (S_L and D_L in **Table 2.5.1**, which are usually pressure load components) and static and dynamic global load components (S_G and D_G in **Table 2.5.1**, which is usually hull girder bending moment) for the design of a particular or group of structural members. The relevant design load sets for the scantling requirements are given in **Sec 8/2** to **8/5.** The design load sets for the Finite Element analysis are referred to as load cases and are given in **Appendix B.**

5.4.2.7 The simultaneously occurring dynamic loads are specified by applying a dynamic load combination factor to the envelope dynamic load values given in **Sec 7/3.** The dynamic load combination factors that define the dynamic load cases are given in **Sec 7/6.4** for the structural strength assessment (FE) and in **Sec 7/6.5** for the scantling requirements.

5.4.2.8 The dynamic load combination factors have been derived using the equivalent design wave approach to provide realistic simultaneously occurring dynamic loads components suitable for structural assessment.

5.4.2.9 For the determination of design loads for the hull girder ultimate strength requirement given in **Sec 9/1**, the operational loads (i.e. ship loading conditions)and the environmental loads (i.e. hull girder wave bending moments) are maximised for sagging conditions for seagoing conditions. The characteristic value for the still water hull girder sagging bending moments M_{sw} is based on the maximum value from the seagoing conditions specified in **Sec 8/1.** The characteristic value for the wave hull girder sagging bending moments M_{WV} is given in **Sec 7/3.**

5.4.3 Design loads for fatigue requirements

5.4.3.1 For the fatigue requirements given in **Sec 9/3** and **Appendix C**, the load assessment is based on the expected load history and an average approach is applied. The expected load history for the design life is characterised by the 10^{-4} probability level of the dynamic load value, the load history for each structural member is represented by Weibull probability distributions of the corresponding stresses.

5.4.3.2 The considered wave-induced loads include:

(a) hull girder loads (i.e., vertical and horizontal bending moments)

(b) dynamic wave pressures

(c) dynamic tank pressures.

5.4.3.3 The fatigue analysis is calculated for two representative loading conditions covering the ship’s intended operation. These two conditions are:

(a) full load homogeneous conditions at design draught

(b) normal ballast condition.

The proportion of the ship's sailing life in the full load condition is 50 % and in ballast 50 %. It is assumed that 15 % of the ships' life is in harbour/sheltered water. It is consequently assumed that the ship will be sailing in open waters in full load condition for 42.5 % of the ship's life and in the ballast condition for 42.5 % of the ship's life.

5.4.3.4 The load values are based on actual parameters corresponding to the applied loading conditions, e.g. *GM*, C_b, etc., and the applicable draughts at amidships is used. The actual values are taken from specified loading conditions in the loading manual.

5.4.3.5 The simultaneously occurring dynamic loads are accounted for by combination of stresses due to the various dynamic load components. The stress combination procedure is given in **Appendix C.**

5.4.3.6 Still water loads and static sea and tank pressures from the actual loading conditions are used to determine the mean stress effect.

5.4.4 Structural response analysis

5.4.4.1 In general, the following approaches are applied for determination of the structural response to the applied design load combinations

(a) Beam theory
- used for prescriptive requirements

(b) FE analysis
- coarse mesh for cargo hold model
- fine mesh for local models
- very fine mesh for fatigue assessment

5.4.5 Structural capacity assessment

5.4.5.1 The considered failure modes in the Rules are yield (plastic deformation), buckling, brittle fracture and fatigue. Structural failure due to yield and buckling is primarily controlled by the strength requirements, brittle fracture is primarily controlled by the requirements for material selection and welding, and fatigue failure is primarily controlled by the high cycle fatigue requirements.

5.4.5.2 Generally, the capacity models applied in the prescriptive rules, i.e., the scantling requirements in **Sec 8**, are based on simple beam theory and include elastic yield and plastic capacity models. The buckling capacity is assessed using simplified buckling capacity models or by a more theoretical non-linear analysis procedure.

5.4.5.3 The design verification requirements are based on a linear elastic finite element analysis, a detailed prescriptive fatigue assessment procedure and a simplified ultimate strength assessment procedure. There is also a finite element based fatigue assessment procedure for some structural members, such as the hopper knuckle.

5.4.5.4 The application of the net thickness approach to assess the structural capacity is specified in **Sec 6/3.3.**

5.4.6 Acceptance criteria

5.4.6.1 The acceptance criteria applied in the working stress design requirements are given as acceptance criteria sets shown in **Tables 2.5.2** and **2.5.3.** There are slight variations within each set depending on the relative contribution of local and global loads, static and dynamic loads and the structural member being considered. The specific acceptance criteria are given in the detailed rule requirements in **Sec 8** and **9/2.**

Table 2.5.2
Principal Acceptance Criteria – Rule Requirements

	Plate panels and Local Support Members		Primary Support Members		Hull girder members	
Acceptance criteria set	Yield	Buckling	Yield	Buckling	Yield	Buckling
AC1:	70-80 % of yield stress	Control of stiffness and proportions. Usage factor typically 0.8	70-75 % of yield stress	Control of stiffness and proportions. Pillar buckling	75 % of yield stress	NA
AC2:	90-100 % of yield stress	Control of stiffness and proportions. Usage factor typically 1.0	85 % of yield stress	Control of stiffness and proportions. Pillar buckling	90-100 % of yield stress	Usage factor typically 0.9
AC3:	Plastic criteria	Control of stiffness and proportions	Plastic criteria	Control of stiffness and proportions	NA	NA

Table 2.5.3
Principal Acceptance Criteria – Design Verification – FE Analysis

	Global cargo tank analysis		Local fine mesh analysis
Acceptance criteria set	Yield	Buckling	Yield
AC1:	60-80 % of yield stress	Control of stiffness and proportions. Usage factor typically 0.8	local mesh as 136 % of yield stress averaged stresses as global analysis
AC2:	80-100 % of yield stress	Control of stiffness and proportions. Usage factor typically 1.0	local mesh as 170 % of yield stress averaged stresses as global analysis

5.4.6.2 The purpose of applying different sets is to achieve a consistent and acceptable safety level for all combinations of static and dynamic loads and to account for different capacity models.

5.5 Materials

5.5.1 General

5.5.1.1 Higher material properties are selected for highly critical structural elements which are subjected to high loads in order to reduce the risk of propagation of brittle fracture.

5.6 Application of Rule Requirements

5.6.1 Minimum requirements

5.6.1.1 These specify the minimum scantling requirements which are to be applied irrespective of all other requirements, hence thickness below the minimum are not allowed.

5.6.2 Load based prescriptive requirements

5.6.2.1 These provide scantling requirements for all plating, local support members, most primary support members and the hull girder and cover all structural elements including deckhouses, foundations for deck equipment, etc.

5.6.2.2 In general, these requirements explicitly control one particular failure mode and hence several requirements may be applied to assess one particular structural member.

5.6.3 Design verification – hull girder ultimate strength

5.6.3.1 The requirements for the ultimate strength of the hull girder are based on a Partial safety Factor (PF) method, see **4.5.** A safety factor is assigned to each of the basic variables, the still water bending moment, wave bending moment and ultimate capacity. The safety factors were determined using a structural reliability assessment approach, the long term load history distribution of the wave bending moment was derived using ship motion analysis techniques suitable for determining extreme wave bending moments.

5.6.3.2 The purpose of the hull girder ultimate strength verification is to demonstrate that one of most critical failure modes of a double hull tanker is controlled.

5.6.4 Design verification – global finite element analysis

5.6.4.1 The global finite element analysis is used to verify the scantlings given by the load-capacity based prescriptive requirements. The analysis is required because the prescriptive requirements do not take into account the complex interactions between the ship's structural components, complex local structural geometry, change in thicknesses and member section properties as well as the complex load regime with sufficient accuracy. Hence the global finite element analysis is necessary to verify the proposed scantlings.

5.6.4.2 A linear elastic three dimensional finite element analysis of the cargo region (a FE model length of three tanks is required) is carried out to assess and verify the structural response of the proposed hull girder and primary support members and assist in specifying the scantling requirements for the primary support members. The purpose with the finite element analysis is to verify that the stresses and buckling capability of the primary support members are within acceptable limits for the applied design loads.

5.6.5 Design verification – fatigue assessment

5.6.5.1 The fatigue assessment is required to verify that the fatigue life of critical structural details is adequate. A prescriptive fatigue requirement is applied to details such as end connections of longitudinal stiffeners using an SN curve approach based on geometric details, i.e. Class F, F2, etc. A hot spot fatigue assessment procedure using finite element analysis is applied to details such as the hopper knuckle. In both cases, the fatigue assessment method is based on the Palmgren-Miner linear damage model.

5.6.6 Relationship between the prescriptive scantling requirements and the strength assessment (FEM)

5.6.6.1 The prescriptive minimum requirements define the minimum acceptable scantlings. These may not to be reduced by any form of alternative calculations such as load-capacity prescriptive requirements or strength analysis such as FEM.

5.6.6.2 The section modulus and/or shear area of a primary support member and/or the cross sectional area of a primary support member cross tie may be reduced to 85% of the prescriptive requirements provided that the reduced scantlings comply with the strength assessment (FEM).

5.6.6.3 The philosophy is that a coarse approach should be more conservative than a detailed approach. Hence, the prescriptive requirements are generally more conservative than the corresponding requirements based on strength assessment (FEM).

Section 3

Rule Application

1 Notations

1.1 Notations

1.1.1 General

1.1.1.1 Ships fully complying with the requirements of these Rules and the specific requirements of the assigning Classification Society relating to construction, survey and equipment will be eligible to be assigned with character symbols and a ship type notation appropriate to the assigning Classification Society.

1.1.1.2 In addition to **1.1.1.1**, ships fully complying with the requirements of these Rules will also be assigned the notation CSR.

2 Documentation, Plans and Data Requirements

2.1 Documentation and Data Requirements

2.1.1 Loading information

2.1.1.1 Loading guidance information containing sufficient information to enable the master of the ship to maintain the ship within the stipulated operational limitations is to be provided onboard the ship. The loading guidance information is to include an approved loading manual and loading computer system complying with the requirements given in **Sec 8/1.1.2** and **8/1.1.3** respectively.

2.1.2 Submission of calculation data and results

2.1.2.1 Where calculations have been carried out in accordance with the procedures given in the Appendices of these Rules, one copy of the following supporting information is to be submitted as applicable:

(a) reference to the calculation procedure and technical program used
(b) a description of the structural modelling
(c) a summary of the analysis parameters including properties and boundary conditions
(d) details of the loading conditions and the means of applying loads
(e) a comprehensive summary of calculation results
(f) sample calculations where appropriate.

2.1.2.2 In general, submission of large volumes of input and output data associated with programs, such as finite element analysis, will not be required.

2.1.2.3 The responsibility for error free specification and input of program data and the subsequent correct transposal of output resides with the designer.

2.1.3 Use of computer software for rule calculations

2.1.3.1 In general, any rule computation program recognised by the Classification Society may be employed to determine scantlings according to these Rules provided the implementation given in **5.1** is complied with.

2.1.3.2 A computer program that has been demonstrated to produce reliable results to the satisfaction of the Classification Society is regarded as a recognised program. Where the computer programs employed are not supplied or recognised by the Classification Society, full particulars of the computer program, including example calculation output, are to be submitted. It is recommended that the designers consult the Classification Society on the suitability of the computer programs intended to be used prior to the commencement of any analysis work.

2.2 Submission of Plans and Supporting Calculations

2.2.1 General

2.2.1.1 In general, the main categories and lists of information required are given in **2.2.2.** Additional requirements for some items are also given in subsequent sections as applicable.

2.2.1.2 Plans are generally to be submitted in triplicate, but one copy only is necessary for supporting documents and calculations. Additional copies may be required according to the individual Classification Society requirements.

2.2.1.3 Plans are to contain all necessary information to fully define the structure, including construction details, materials, welding and loads imposed on the structure by equipment and systems as appropriate.

2.2.1.4 Plans are to include information related to the renewal thickness as specified in **Sec 12.**

2.2.2 Plans and supporting calculations

2.2.2.1 In general, plans covering the following items are to be submitted:

(a) main scantling plans:
- midship sections showing longitudinal and transverse structural members
- construction profiles/plans showing all main longitudinal structural elements along the ships length including decks, inner bottom, bulkheads, double side stringers and double bottom girders
- shell expansion
- main oil-tight and watertight transverse bulkheads including primary support members

(b) loading guidance information:
- preliminary loading manual
- final loading manual
- details of the design basis, see **Sec 8/1.1.2**
- test conditions for the loading instrument

(c) detailed construction plans:
- cargo tank construction plans showing the variations in detail arrangements and scantlings of double bottom floors, double side webs and other transverse primary support members
- fore end
- aft end
- engine room construction including the engine and thrust bearing seating
- deckhouses and superstructures

(d) detail design plans except where the information is already included on plans listed in **(a)** and **(c)**:
- sternframe
- hull penetration plans
- welding
- bilge keels
- booklet of standard design details
- anchoring and mooring equipment
- pillar and girder support arrangements for decks
- access arrangements through double bottom and side skin spaces in the cargo tank region
- details and arrangements of openings and attachments to the hull structure for means of access for inspection purposes

(e) plans detailing support structures except where the information is already included on plans listed in **(a)** to **(d)**:
- anchoring windlass and chain stopper
- mooring winches
- masts, derrick posts or cranes
- emergency towing equipment
- other deck equipment or fittings

2.2.2.2 The following supporting documents are to be submitted:

(a) general arrangement

(b) capacity plan

(c) lines plan or equivalent

(d) dry-docking plan, where developed

(e) freeboard plan or equivalent, showing freeboards and items relative to the conditions of assignment

2.2.2.3 The following supporting calculations are to be submitted:
(a) calculation of the equipment number.

2.2.2.4 Plans of items not covered by these Rules are to be submitted according to the individual Classification Society requirements.

2.2.3 Plans to be supplied onboard the ship

2.2.3.1 One copy of the following plans indicating the new-building and renewal thickness for each structural item:
(a) main scantling plans as given in **2.2.2.1(a)**
(b) one copy of the final approved loading manual, see **2.1.1**
(c) one copy of the final loading instrument test conditions, see **Sec 8/1.1.3**
(d) detailed construction plans as given in **2.2.2.1(c)**
(e) welding
(f) details of the extent and location of higher tensile steel together with details of the specification and mechanical properties, and any recommendations for welding, working and treatment of these steels
(g) details and information on use of special materials, such as aluminium alloy, used in the hull construction.
(h) towing and mooring arrangements plan, see **Sec 11/3.1.6.16**

3 Scope of Approval

3.1 General

3.1.1 Rule application

3.1.1.1 Further to the information contained in **Sec 1/1.1.2** and **Sec 1/1.2.1**, the Rules cover the scantling requirements for the classification of new double hull tankers of 150 m or greater in length.

3.1.1.2 The attention of owners, designers, and builders is directed to the regulations of international, national, canal, and other authorities dealing with those requirements which may affect structural aspects, in addition to or in excess of the classification requirements.

3.1.1.3 Other aspects of the structural design not covered by these Rules are to be addressed using the rules of the individual Classification Society.

3.2 Classification

3.2.1 General

3.2.1.1 The documentation, plans and data requirements specified in **Sec 2** are to be submitted. Each in dividual Classification Society will review such documentation to verify compliance with the requirements.

3.2.1.2 An appropriate term to indicate that the plans, reports or documents have been reviewed for compliance with these Rules will be used according to the procedures of the individual Classification Society.

3.3 Requirements of National and International Regulations

3.3.1 Responsibility

3.3.1.1 It is the responsibility of the designer to ensure that the design complies with the current National and International regulations applicable to the vessel.

3.3.1.2 Classification Societies are not responsible for assessing compliance with International and National regulations as part of the general classification approval process. However, a Classification Society may enter into an agreement under which they are explicitly instructed to review and approve a vessel design for compliance with specified regulations. This approval may be accepted as proof of compliance on behalf of a Flag Administration provided the Classification Society has been designated as a suitable recognised by that Flag Administration in accordance with SOLAS Regulations XI/1.

3.3.2 Review procedure

3.3.2.1 When compliance is reviewed by the Flag Administration, the vessel is to be issued with certificates indicating compliance with National and International regulations by the Flag Administration. For ships with arrangements and equipment that are required to comply with the following requirements, and applicable amendments thereto, and where not issued by the Flag Administration, the applicable convention certificates are to be issued by the Classification Society or by an IACS member when authorised:

(a) International Convention on Load Lines, 1966

(b) International Convention for the Safety of Life at Sea, 1974, and its Protocol of 1978

(c) International Convention for the Prevention of Pollution from Ships, 1973, and as modified by the Protocol of 1978 relating thereto.

For dual class ships, convention certificates may be issued by either Classification Society with which the ship is classed, provided this is recognised in a formal dual class agreement with the Classification Societies classing the ship and that both societies are authorised by the Flag Administration.

4 Equivalence Procedure

4.1 General

4.1.1 Rule applications

4.1.1.1 These Rules apply in general to double hull oil tankers of normal form, proportions, speed and structural arrangements. Relevant design parameters defining the assumptions made are given in **Sec 2/3.**

4.1.1.2 The Rules are applicable to steel ships of welded construction. Other materials for use in hull construction will be specially considered.

4.1.1.3 Special consideration will be given to the application of the Rules incorporating design parameters which are outside the design basis of **Sec 2/3**, for example:

(a) increased fatigue life

(b) increased corrosion additions

(c) increased cargo density.

4.1.2 Novel designs

4.1.2.1 Ships of novel design, i.e. those of unusual form, proportions, speed and structural arrangements outside those reflected in **Sec 2/3.1.2** of these Rules will be specially considered according to the contents of this sub-section.

4.1.2.2 Information is be submitted to the Classification Society to demonstrate that the structural safety of the novel design is at least equivalent to that intended by the Rules.

4.1.2.3 In such cases, the Classification Society is to be contacted at an early stage in the design process to establish the applicability of the Rules and additional information required for submission.

4.1.2.4 Dependent on the nature of the deviation, a systematic review may be required to document equivalence with the Rules.

4.1.3 Alternative calculation methods

4.1.3.1 Where indicated in specific sections of the Rules, alternative calculation methods to those shown in the Rules may be accepted provided it is demonstrated that the scantlings and arrangements are of at least equivalent strength to those derived using the Rule calculation method.

5 Calculation and Evaluation of Scantling Requirements

5.1 Determination of Scantling Requirements for Plates

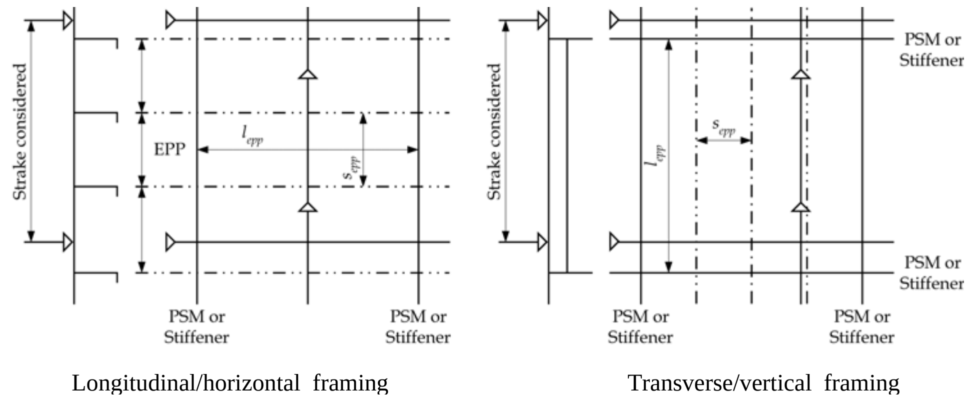
5.1.1 Determination of scantlings of plate strakes – idealisation of plate panels

5.1.1.1 Scantlings of plate strakes are to be derived based on the idealisation of the as-built structure as a series of Elementary Plate Panels (EPP).

5.1.1.2 An EPP is the unstiffened part of the plating between stiffeners. The plate panel length, l_{epp}, and breadth, s_{epp}, of the EPP are defined in relation to the longest and shortest plate edges respectively, as shown in **Fig 3.5.1.**

5.1.1.3 For strength assessment, the idealisation of EPP may be different and take into account the mesh arrangement in the FEM model.

Fig 3.5.1
Elementary Plate Panel Definition



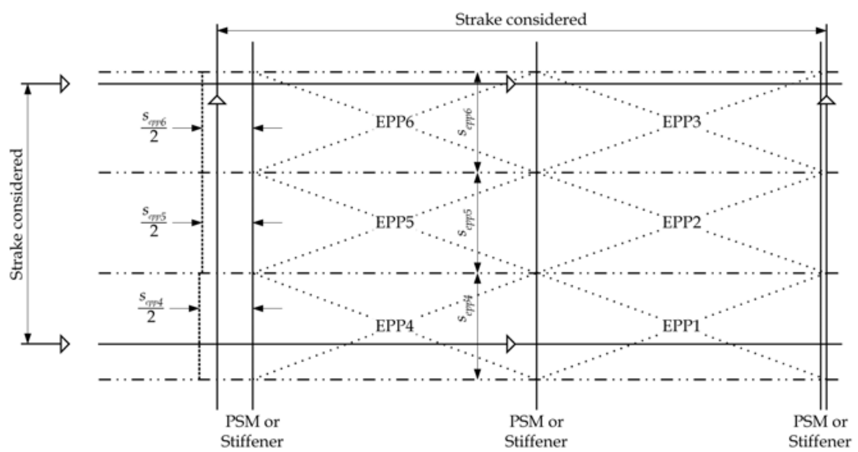
5.1.1.4 The required scantling of a plate strake is to be taken as the greatest value required for each EPP within that strake as given by:

(a) an EPP positioned entirely within the strake boundaries, e.g. EPP2 in **Fig 3.5.2**

(b) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the long edge of the EPP, e.g. EPP1, 3, 4 and 6 in **Fig 3.5.2**

(c) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the short edge of the EPP within more than half the EPP breadth, sepp, from the edge, e.g. EPP1 and EPP2 in **Fig 3.5.3(a).**

Fig 3.5.2
Determining Elementary Plate Panels for a Strake



5.1.2 Determination of scantlings of elementary plate panels for scantling requirements

5.1.2.1 The required scantling of each elementary plate panel is to be calculated based on a Load Calculation Point (LCP) defined as:

(a) for longitudinal framing, at the mid length of the EPP measured along the global x-axis at its lower edge. For horizontal plating the load calculation point is to be taken at the outboard y-value of the EPP. See **Fig 3.5.3(a)**

(b) for transverse framing, at the mid length of the EPP measured along the global x-axis at the lower edge of strake. For horizontal plating the load calculation point is to be taken at the outboard y-value of the EPP. See **Fig 3.5.3(b)**

(c) for horizontal framing on vertical transverse structure, at the lower edge of the elementary plate panel at the point of outboard y-value of the EPP. See **Fig 3.5.3(c)**

(d) for vertical framing on vertical transverse structure, at the greatest y-value of the lower edge of the EPP or at the lower edge of strake. See **Fig 3.5.3(d)**

5.1.2.2 Both the local pressure and hull girder stress used for the calculation of the local scantling requirements are to be taken at the LCP.

5.1.3 Determination of scantlings of elementary plate panels for hull girder strength

5.1.3.1 The required scantlings of the elementary plate panels are to satisfy the hull girder bending and hull girder shear requirements of **Sec 8/1.**

5.1.3.2 The required thickness of each elementary plate panel, with respect to buckling, is to be calculated based on stresses taken at the mid length of the EPP measured along the global x-axis.

5.1.3.3 The buckling evaluation is to be calculated using the stress distribution across the width of the panel defined with a reference stress taken at the edge with maximum stress and reduced stress at the other edge given as a fraction, Ψ, defined in **Table 10.3.1**, of the reference stress.

5.1.3.4 The required scantling of a plate strake is to be taken as the greatest value required for each EPP within that strake as given by:

(a) an EPP positioned entirely within the strake boundaries, e.g. EPP2 in **Fig 3.5.2**

(b) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the long edge of the EPP, e.g. EPP1, 3, 4 and 6 in **Fig 3.5.2**

(c) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the short edge of the EPP within more than half the EPP breadth, S_{epp}, from the edge, e.g. EPP1 and 2 in **Fig 3.5.3(a).**

5.1.4 Determination of scantlings of elementary plate panels for FEM strength assessment

5.1.4.1 The required scantlings of elementary plate panels are to be derived from the plate mesh element with maximum utilisation, see **Sec 9/2.**

Fig 3.5.3
Example of Load Calculation Point for Typical Structural Configurations

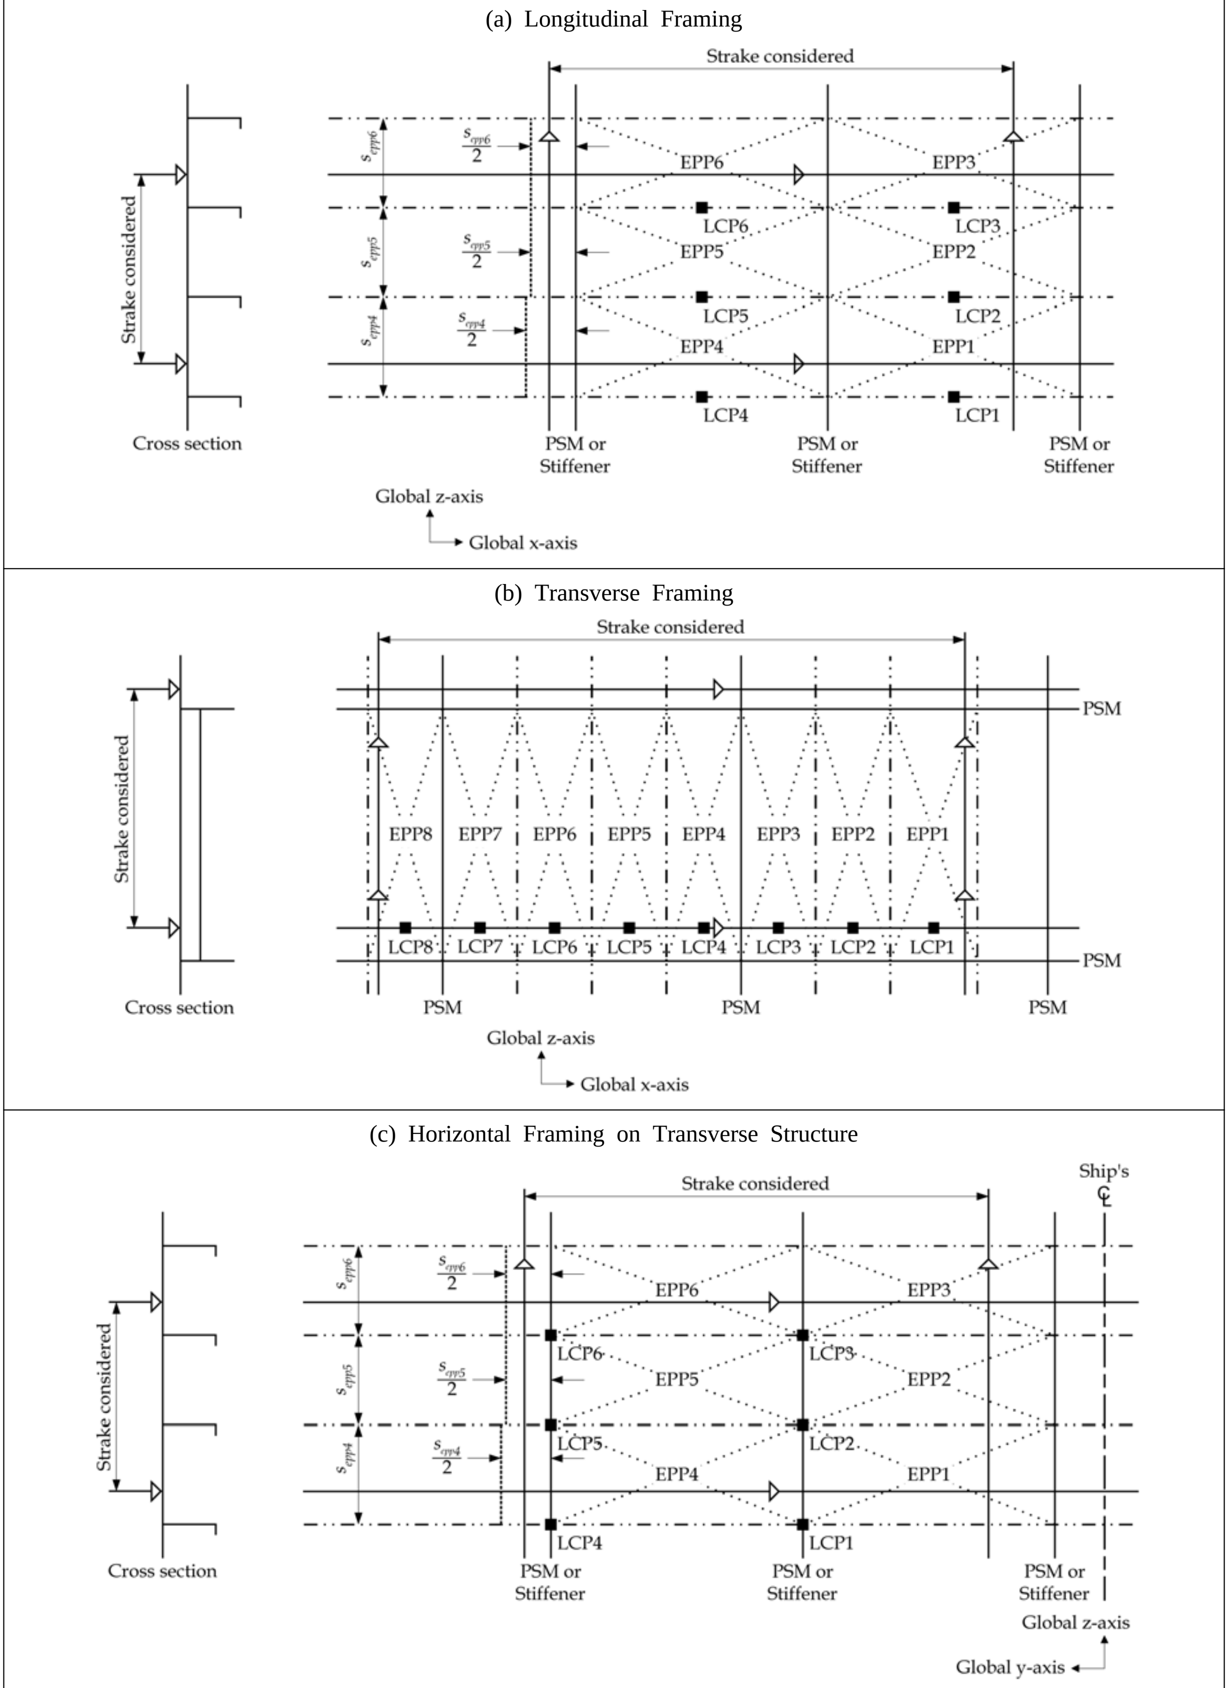


Fig 3.5.3 (Continued)
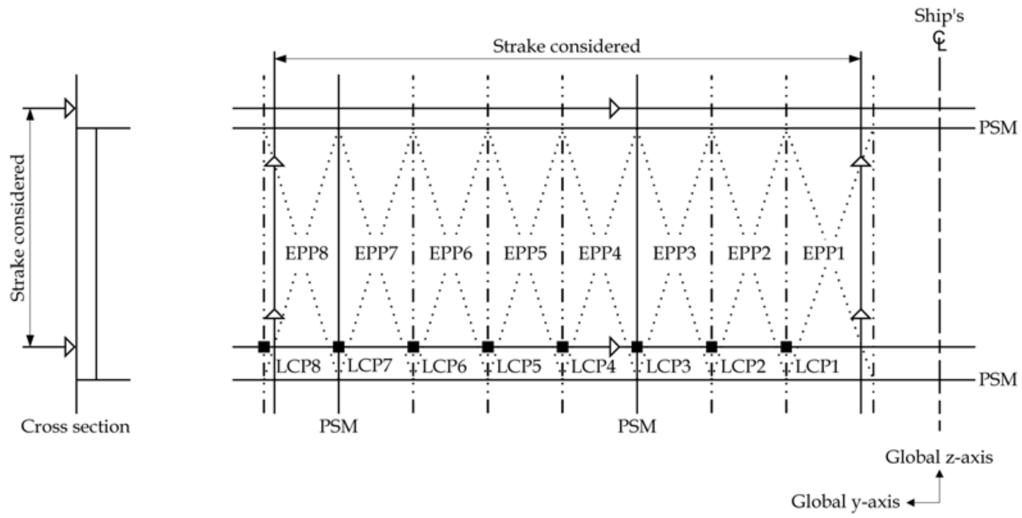
Example of Load Calculation Point for Typical Structural Configurations

(d) Vertical Framing on Transverse Structure



5.2 Determination of Scantlings of Stiffeners

5.2.1 Determination of scantlings of stiffeners – idealisation of stiffeners

5.2.1.1 Scantlings of individual stiffeners are to be derived based on the idealisation of the as-built structure as a series of stiffened panels.

5.2.1.2 A stiffened panel consists of a single idealised stiffener profile and effective plate flange supporting a boundary of one or more elementary plate panels. The arrangement of stiffened panels is based on the idealisation of the structure according to the elementary plate panel definition in **5.1.1.**

5.2.1.3 Scantlings of stiffeners based on requirements in **Sec 8** may be decided based on the concept of grouping designated sequentially placed stiffeners of equal scantlings.The scantling of the group is to be taken as the greater of the following:

(a) the average of the required scantling of all stiffeners within a group

(b) 90 % of the maximum scantling required for any one stiffener within the group.

The concept of grouping is not applicable to fatigue requirements as given in **Sec 9/3** and **Appendix C.**

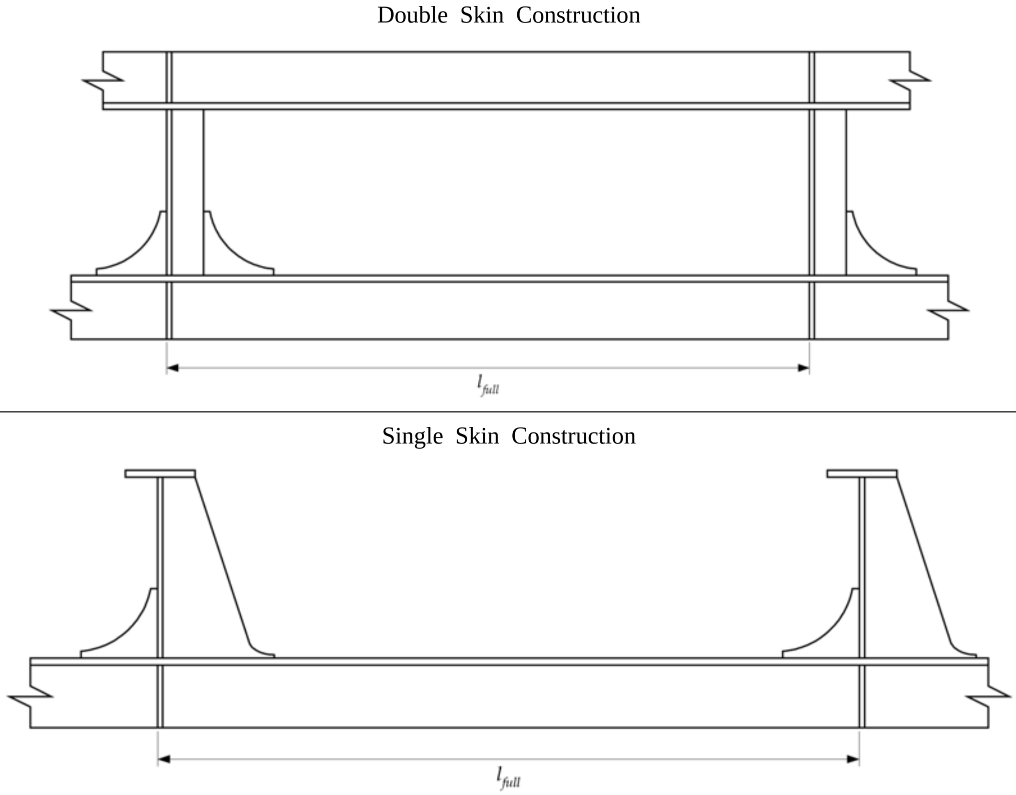
5.2.2 Determination of scantlings of stiffened panels for scantling requirements and fatigue

5.2.2.1 The required scantling of a stiffened panel is to be based on a pressure load calculation point defined as:

(a) mid point of the overall span, l_{full}, of the stiffener between primary support members, see **Fig 3.5.4**

(b) at the connection of the stiffener to the plating.

Fig 3.5.4
Definition of Overall Span of Stiffeners, l_{full}



5.2.2.2 For longitudinal and horizontal framing the design pressure is to be taken as the pressure at the mid point of the overall span.

5.2.2.3 For transverse and vertical framing the design pressure is to be taken as the greater of the following:

P_{ms} kN/m^2

$$\frac{(P_{end-1}+P_{end-2})}{2} \quad \text{kN/m}^2$$

Where:

P_{ms} calculated pressure at mid point of overall span, l_{full}, in kN/m^2

P_{end-1} calculated pressure at 1st end of overall span, in kN/m^2

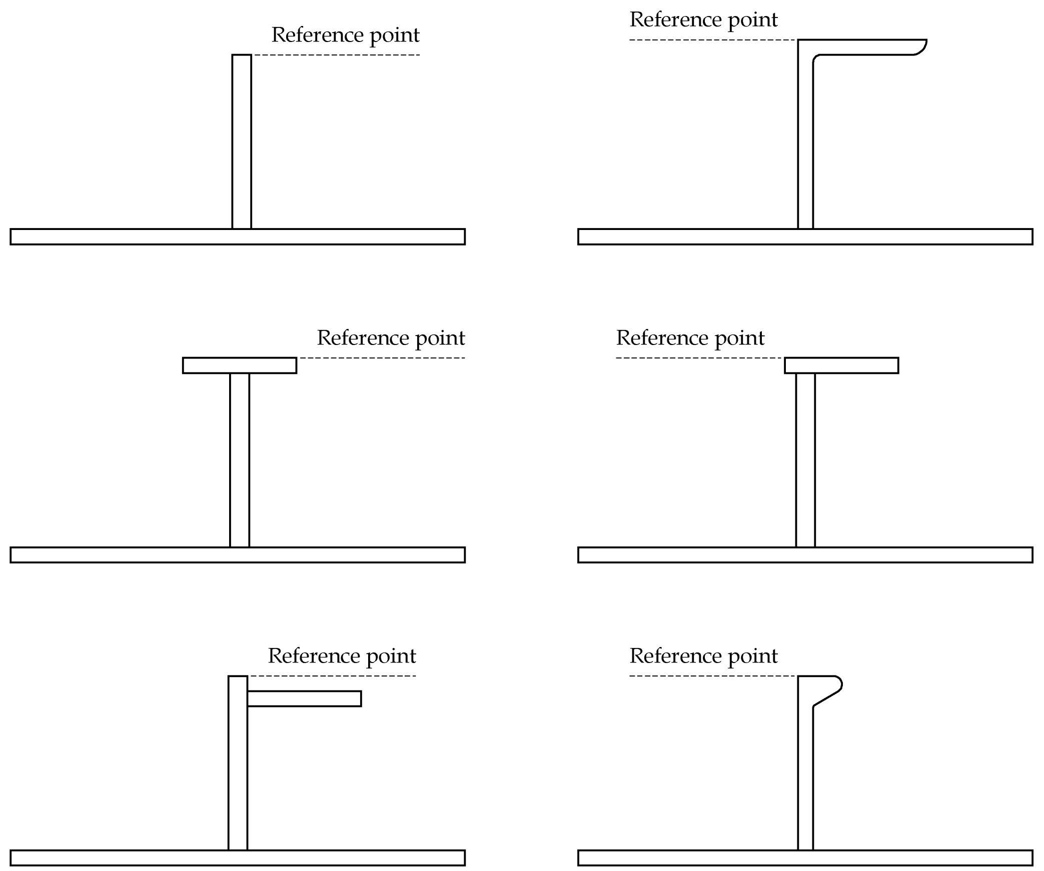
P_{end-2} calculated pressure at 2nd end of overall span, in kN/m^2

l_{full} overall span, in m, see **Fig 3.5.4**

5.2.2.4 The section modulus requirements given in these Rules relate to the reference point giving the minimum section modulus. In general, this will be on the outer surface of the faceplate. The reference point for calculation of section modulus for typical profiles is shown in **Fig 3.5.5.**

5.2.2.5 The hull girder stress used for calculation of local scantling requirements for stiffeners is to be taken at the reference point as shown in **Fig 3.5.5**

Fig 3.5.5
Reference Point for Calculation of Section Modulus and Hull Girder Stress for Local Scantling Assessment



5.2.3 Determination of scantlings of stiffened panels for hull girder buckling strength

5.2.3.1 The required scantling of a stiffened panel, with respect to buckling, is to be based on the axial stress calculated at the attachment point of the stiffener to the plate and at the mid length of the stiffener measured along the global x-axis.

5.2.3.2 The required scantling as given in **5.2.3.1** applies to stiffeners outside of a distance s from the support, where s is the stiffener spacing.

5.2.4 Determination of scantlings of stiffened panels for FEM strength assessment

5.2.4.1 The required scantlings of the stiffened panel are to be based on the derivation of applied stresses in accordance with **Sec 9/2.**

5.2.5 Shear area requirements of stiffeners

5.2.5.1 Requirements for the shear area and/or web thickness of stiffeners are given in **Sec 8.**

5.2.5.2 The requirements in **Sec 8** are to be calculated based on the load point defined in **5.2.2** and the effective span as given in **Sec 4/2.1.2.**

5.2.5.3 The requirements in **Sec 8** are to be evaluated against the actual shear area of the stiffener, based on the effective shear height of the stiffener as given in **Sec 4/2.4.2** and based on the specified minimum yield of the stiffener.

5.2.5.4 The effect of brackets may be included in the calculation of the effective span, but no part of the bracket is to be included in the calculation of the actual shear area.

5.2.6 Bending requirements of stiffeners

5.2.6.1 Requirements for the section modulus and moment of inertia of stiffeners are given in **Sec 8.**

5.2.6.2 The requirements in **Sec 8** are to be calculated based on the load point defined in **5.2.1** and the effective span as given in **Sec 4/2.1.1.**

5.2.6.3 The requirements in **Sec 8** are to be evaluated against the actual section modulus/moment of inertia of the stiffener. The stiffener web and flanges are to be included in the calculation of actual sectional properties.

5.2.6.4 The effect of brackets may be included in the calculation of the effective span, but no part of the bracket is to be included in the calculation of section modulus/moment of inertia.

5.2.6.5 When the stiffener is of a higher strength material than the attached plate, the yield stress used for the calculation of the section modulus requirements in **Sec 8** is in general not to be greater than 1.35 times the minimum specified yield stress of the attached plate. If the yield stress of the stiffener exceeds this limitation the following criterion is to be satisfied:

$$\sigma_{yd-stf} \leq \left(\sigma_{yd-plt} - |\sigma_{hg}|\right) \frac{Z_{net-plt}}{Z_{net}} + |\sigma_{hg}| \qquad \text{N/mm}^2$$

Where:

σ_{yd-stf} specified minimum yield stress of the material of the stiffener, in N/mm^2

σ_{yd-plt} specified minimum yield stress of the material of the attached plate, in N/mm^2

σ_{hg} maximum hull girder stress of sagging and hogging (S+D), in N/mm^2, as defined in **Table 8.2.5** and **Table 8.4.3** for stiffeners in cargo tank region and machinery spaces respectively and not to be taken as less than 0.4 σ_{yd-plt}

Z_{net} net section modulus, in way of face plate/free edge of the stiffener, in cm^3

$Z_{net-plt}$ net section modulus, in way of the attached plate of stiffener, in cm^3

5.2.7 Evaluation of slanted stiffeners

5.2.7.1 The shear area and section modulus requirements for local support members are valid about an axis parallel to the plate flange. If the angle φ_w between the stiffener web and the attached plating is less than 75 degrees, see **Fig 4.2.14**, then the actual shear area and section modulus is to be adjusted in accordance with **Sec 4/2.4.2** and **2.4.3.** The angle between the stiffener web, φ_w, and the attached plating is not to be less than 50 degrees.

5.3 Calculation and Evaluation of Scantling Requirements for Primary Support Members

5.3.1 Load application point for primary support members

5.3.1.1 The design pressure for primary support members is generally taken at the mid point of the load area. The design pressures for the primary support members are defined for individual members as given in **Sec 8.**

5.3.2 Shear requirements of primary support members

5.3.2.1 Requirements for shear area and/or web thickness of primary support members are given in **Sec 8.**

5.3.2.2 These requirements are to be calculated based on the load point defined in **5.3.1** and the effective span as given in **Sec 4/2.1.5.**

5.3.2.3 These requirements are to be evaluated against the actual shear area and the specified minimum yield of the web plate of the primary support member. The actual shear area of the primary support member is defined in **Sec 4/2.5.1.** The effect of brackets may be included in the calculation of effective span, but are not to be included in the calculation of actual shear area.

5.3.3 Bending requirements of primary support members

5.3.3.1 Requirements for section modulus and moment of inertia of primary support members are given in **Sec 8** and **Sec 10**, respectively.

5.3.3.2 These requirements are to be calculated based on the load point defined in **5.3.1** and the effective span as given in **Sec 4/2.1.4.**

5.3.3.3 These requirements are to be evaluated against the actual section modulus/moment of inertia of the primary support member. Web and flanges are included in the calculation of actual sectional properties. The effect of brackets may be included in calculation of effective span, but are not to be included in the calculation of section modulus/moment of inertia.

5.3.3.4 Where it is impracticable to fit a primary support member with the required web depth, then it is permissible to fit a member with reduced depth provided that the fitted member has equivalent moment of inertia or deflection to the required member. The required equivalent moment of inertia is to be based on an equivalent section given by the effective width of plating at mid span with required plate thickness, web of required depth and thickness and face plate of sufficient width and thickness to satisfy the required mild steel section modulus. All other rule requirements, such as minimum thicknesses, slenderness ratio, section modulus and shear area, are to be satisfied for the member of reduced depth. The equivalent moment of inertia may be also demonstrated by an equivalent member having the same deflection as the required member.

5.4 Rounding of Calculated Thickness

5.4.1 Required gross thickness

5.4.1.1 The minimum required gross thickness of any member to be fitted at the new-building stage, exclusive of any owners’ extras, is to be taken as the rounded net thickness required plus the appropriate corrosion addition.

5.4.1.2 The required net thickness is given by rounding the calculated net thickness to the nearest half millimetre. For example:

(a) for $10.75 \leq t_{calc\text{-}net} < 11.25$ mm the Rule required thickness is 11 mm

(b) for $11.25 \leq t_{calc\text{-}net} < 11.75$ mm the Rule required thickness is 11.5 mm.

Section 4

Basic Information

1 Definitions

1.1 Principal Particulars

1.1.1 *L*, rule length

1.1.1.1 *L*, the rule length, is the distance on the waterline at the scantling draught, from the forward side of the stem to the centreline of the rudder stock, in metres. *L* is not to be less than 96 %, and need not be greater than 97 %, of the extreme length on the summer load waterline. In ships with an unusual stern and bow arrangement the length, *L,* will be specially considered.

1.1.2 L_L, load line length

1.1.2.1 L_L, the load line length is defined in the International Convention on Load Lines.

1.1.3 Moulded breadth

1.1.3.1 *B*, the moulded breadth, is the maximum breadth of the ship, measured amidships to the moulded line of the frame, in metres.

1.1.4 Moulded depth

1.1.4.1 *D*, the moulded depth, is the vertical distance, in metres, amidships, from the moulded baseline to the moulded deck line of the uppermost continuous deck measured at deck at side. On vessels with a rounded gunwale, *D* is to be measured to the continuation of the moulded deck line.

1.1.5 Draughts

1.1.5.1 *T*, the draught in metres, is the summer load line draught for the ship in operation, measured from the moulded base line at amidships. Note this may be less than the maximum permissible summer load waterline draught.

1.1.5.2 T_{bal}, is the minimum design ballast draught, in metres, at which the strength requirements for the scantlings of the ship are met. The minimum design ballast draught is not to be greater than the minimum draught of ballast conditions including ballast water exchange operation, measured from the moulded base line at amidships, for any ballast loading condition in the loading manual including both departure and arrival conditions.

1.1.5.3 T_{bal-n}, the normal ballast draught in metres, is the draught at departure given for the normal ballast condition in the loading manual, measured from the moulded base line at amidships, see **Sec 8/1.1.2.3**. The normal ballast condition is the ballast condition in compliance with condition specified in **Sec 8/1.1.2.2 a).**

1.1.5.4 T_{full}, the full load design draught in metres, is the draught at departure given for the homogeneous full load condition in the loading manual, measured from the moulded base line at amidships, see **Sec 8/1.1.2.3.**

1.1.5.5 T_{sc}, is the maximum design draught, in metres, at which the strength requirements for the scantlings of the ship are met.

1.1.6 Amidships

1.1.6.1 Amidships is to be taken as the middle of the rule length, *L*.

1.1.7 Moulded displacement

1.1.7.1 Δ, the moulded displacement, in tonnes, corresponding to the underwater volume of the ship, at draught T_{sc}, in sea water with a density of 1.025 t/m^3.

1.1.8 Maximum service speed

1.1.8.1 *V*, the maximum ahead service speed, in knots, means the greatest speed which the ship is designed to maintain in service at her deepest sea-going draught at the maximum propeller RPM and corresponding engine MCR (Maximum Continuous Rating).

1.1.9 Block coefficient

1.1.9.1 C_b, the block coefficient at the scantling draught, is defined as:

$$C_b = \frac{\nabla}{L B_{WL} T_{sc}}$$

Where:

∇ moulded displacement volume at the scantling draught, in m^3

L rule length, as defined in **1.1.1.1**

B_{WL} moulded breadth measured amidships, in m, at the scantling draught waterline

T_{sc} scantling draught, as defined in **1.1.5.5**

1.1.9.2 C_{b-LC}, the block coefficient at considered loading condition, is defined as:

$$C_{b-LC} = \frac{\nabla_{LC}}{L B_{WL} T_{LC}}$$

Where:

∇_{LC} moulded displacement volume at the T_{LC}, in m^3

L rule length, as defined in **1.1.1.1**

B_{WL} moulded breadth measured amidships, in m, at the T_{LC}

T_{LC} draught at amidships, in m, in the loading condition being considered.

1.1.10 Length between perpendiculars

1.1.10.1 L_{pp}, the length between perpendiculars, is the distance, in metres, on the scantling draught waterline from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post.

1.1.11 The forward perpendicular

1.1.11.1 F.P., the forward perpendicular, is the perpendicular at the intersection of the scantling draught waterline with the fore side of the stem. The F.P. is the forward end of the rule length, L.

1.1.12 The aft perpendicular

1.1.12.1 A.P., the aft perpendicular, is the perpendicular at the aft end of the rule length, L, measured from the F.P.

1.1.13 Load line block coefficient

1.1.13.1 C_{bL}, the load line block coefficient, is defined in the International Convention on Load Lines as follows:

$$C_{bL} = \frac{\nabla_L}{L_L B T_L}$$

Where:

∇_L moulded displacement volume at the moulded draught, T_L, in m^3

L_L load line length, as defined in **1.1.2.1**

B moulded breadth, in m, as defined in **1.1.3.1**

T_L the moulded draught measured to the waterline at 85 per cent of the least moulded depth, in m

1.1.14 Deadweight

1.1.14.1 DWT, is the deadweight of the ship, in tonnes, floating in water with a specific gravity of 1.025, at the summer load line draught.

1.2 Position 1 and Position 2

1.2.1 Position 1

1.2.1.1 Position 1 is defined as any location upon exposed freeboard and raised quarterdecks, and exposed superstructure decks within the forward 0.25 L_L.

1.2.2 Position 2

1.2.2.1 Position 2 is defined as any location upon exposed superstructure decks abaft the forward 0.25 L_L.

1.3 Type 'A' and Type 'B' Freeboard Ships

1.3.1 ICLL definition

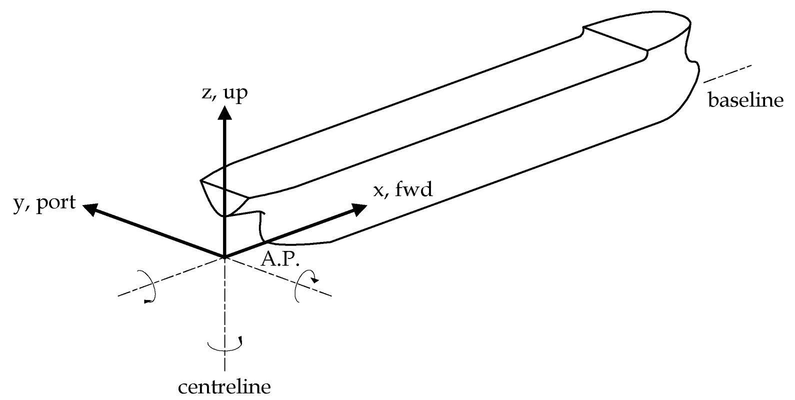
1.3.1.1 A Type 'A' or Type 'B' freeboard ship is as defined in the International Convention on Load Lines.

1.4 Coordinate System

1.4.1 Origin and orientation

1.4.1.1 The coordinate system used within these Rules is shown in **Fig 4.1.1.** Motions and displacements are considered positive in the forward, up and to port direction. Angular motions are considered positive in the clockwise direction about the x, y or z axis.

Fig 4.1.1
Coordinate System



1.5 Naming Convention

1.5.1 Bulkhead nomenclature

1.5.1.1 **Fig 4.1.2, 4.1.3** and **4.1.4** show the common structural nomenclature used within these Rules.

Fig 4.1.2
Corrugated Transverse Bulkhead Nomenclature

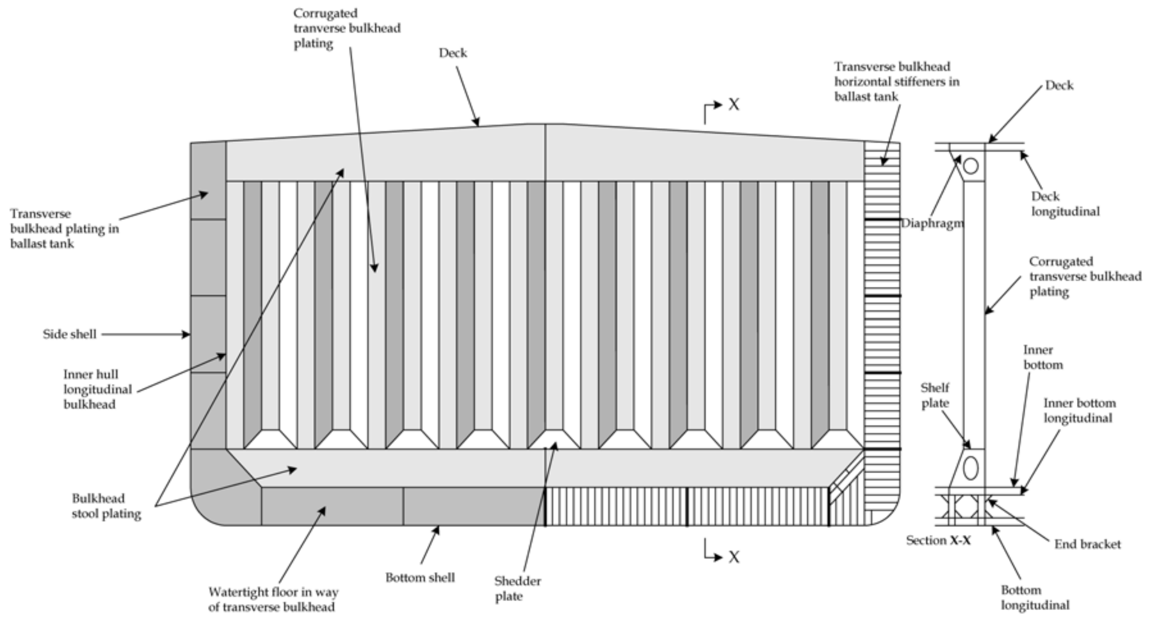


Fig 4.1.3
Flat Transverse Bulkhead Nomenclature

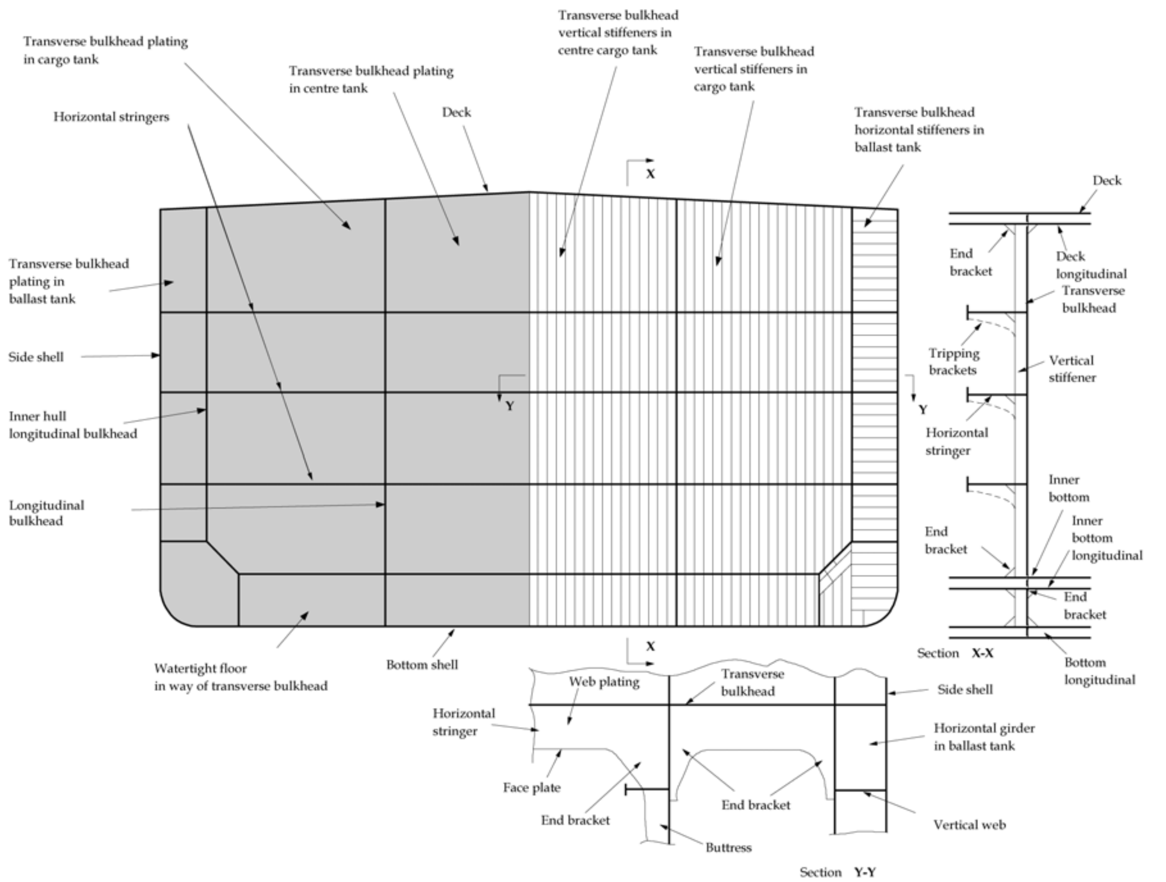

Fig 4.1.4
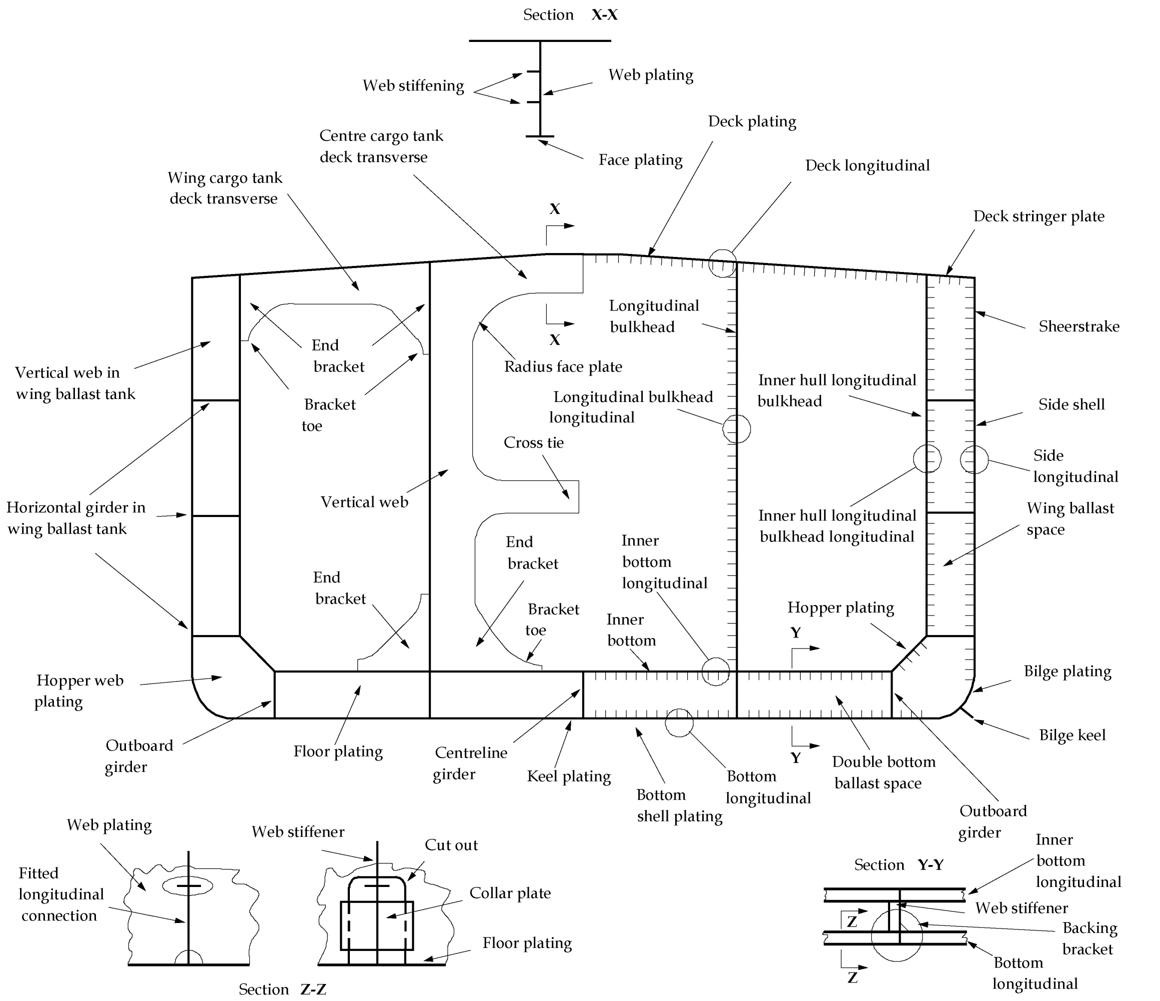
Mid Cargo Hold Transverse Section



1.6 Symbols

1.6.1 General

1.6.1.1 The symbols and subscripts used within these Rules are defined locally. The principal particulars, as defined in **1.1**, may be referred to within text without reference.

1.7 Units

1.7.1 General

1.7.1.1 The following units are used within these Rules. The units to be used within equations are given locally.

(a) General:

• dimensions/distances	m
• primary spacings	m
• secondary spacings	mm
• area	m^2
• volume	m^3
• mass	t

• velocity	m/s
• acceleration	m/s^2

(b) Hull girder properties:

• dimensions	m
• area	m^2
• section modulus	m^3
• moment of inertia	m^4
• moment of area	m^3

(c) Stiffener properties:

• dimensions	mm
• area	cm^2
• section modulus	cm^3
• inertia	cm^4
• length/effective length	m
• span	m

(d) Plating dimensions:

• breadth	mm
• length	m
• thickness	mm

(e) Loads:

• pressures	kN/m^2
• loads	kN
• bending moment	kNm
• shear force	kN

(f) Miscellaneous:

• yield strength	N/mm^2
• stress	N/mm^2
• deflections	mm
• modulus of elasticity	N/mm^2
• density	t/m^3
• displacement	t
• angle	deg
• calculated angle	rad
• period	s
• frequency	Hz
• ship speed	knots

1.8 Glossary

1.8.1 Definitions of terms

1.8.1.1 The terms in **Table4.1.1** are used within these Rules to describe the items which their respective definitions describe.

Table 4.1.1
Definitions of Terms

Terms	Definition
Accommodation deck	A deck used primarily for the accommodation of the crew
Accommodation ladder	A portable set of steps on a ship’s side for people boarding from small boats or from a pier
Aft peak	The area aft of the aft peak bulkhead
Aft peak bulkhead	The first main transverse watertight bulkhead forward of the stern
Aft peak tank	The compartment in the narrow part of the stern aft of the aft peak bulkhead
Anchor	a device which is attached to anchor chain at one end and lowered into the sea bed to hold a ship in position; it is designed to grip the bottom when it is dragged by the ship trying to float away under the influence of wind and current; usually made of heavy casting or casting
Ballast tank	A compartment used for the storage of water ballast
Bay	The area between adjacent transverse frames or transverse bulkheads
Bilge keel	A piece of plate set perpendicular to a ship’s shell along the bilges to reduce the rolling motion
Bilge plating	The area of curved plating between the bottom shell and side shell. To be taken as follows: From the start of the curvature at the lower turn of bilge on the bottom to the lesser of, the end of curvature at the upper turn of the bilge on the side shell or 0.2 D above the baseline/local centreline elevation
Bilge strake	The lower strake of bilge plating
Boss	The boss of propeller is the central part to which propeller blades are attached and through which the shaft end passes
Bottom shell	The shell envelope plating forming the predominantly flat bottom portion of the shell envelope including the keel plate
Bow	The structural arrangement and form of the forward end of the ship
Bower Anchor	An anchor carried at the bow of the ship
Bracket	An extra structural component used to increase the strength of a joint between two structural members
Bracket toe	The narrow end of a tapered bracket
Breakwater	Inclined and stiffened plate structure on a weather deck to break and deflect the flow of water coming over the bow
Breast hook	A triangular plate bracket joining port and starboard side structural members at the stem
Bridge	An elevated superstructure having a clear view forward and at each side, and from which a ship is steered
Bulb profile	A stiffener utilising an increase in steel mass on the outer end of the web instead of a separate flange
Bulkhead	A structural partition wall sub-dividing the interior of the ship into compartments
Bulkhead deck	The uppermost continuous deck to which transverse watertight bulkheads and shell are carried
Bulkhead stool	The lower or upper base of a corrugated bulkhead
Terms	Definition
Bulkhead structure	The transverse or longitudinal bulkhead plating with stiffeners and girders

Table 4.1.1
Definitions of Terms

Terms	Definition
Bulwark	The vertical plating immediately above the upper edge of the ship's side surrounding the exposed deck(s)
Bunker	A compartment for the storage of fuel oil used by the ship's machinery
Cable	A rope or chain attached to the anchor
Camber	The upward rise of the weather deck from both sides towards the centreline of the ship
Cargo tank bulkhead	A boundary bulkhead separating cargo tanks
Cargo area	The part of the ship that contains cargo tanks and cargo/slop tanks and adjacent areas including ballast tanks, fuel tanks, cofferdams, void spaces and also including deck areas throughout the entire length and breadth of the part of the ship over the mentioned spaces. It includes the collision bulkhead and the transverse bulkhead at the aft end of the cargo block.
Carlings	A stiffening member used to supplement the regular stiffening arrangement
Casing	The covering or bulkhead around or about any space for protection
Cellular construction	A structural arrangement where there are two closely spaced boundaries and internal diaphragm plates arranged in such a manner to create small compartments
Centreline girder	A longitudinal member located on the centreline of the ship
Chain	Connected metal rings or links used for holding anchor, fastening timber cargoes, etc.
Chain locker	A compartment usually at the forward end of a ship which is used to store the anchor chain
Chain pipe	A section of pipe through which the anchor chain enters or leaves the chain locker
Chain stopper	A device for securing the chain cable when riding at anchor as well as securing the anchor in the housed position in the hawse pipe, thereby relieving the strain on the windlass
Coaming	The vertical boundary structure of a hatch or skylight
Cofferdams	The spaces between two bulkheads or decks primarily designed as a safeguard against leakage of oil from one compartment to another
Collar plate	A patch used to, partly or completely, close a hole cut for a longitudinal stiffener passing through a transverse web
Collision bulkhead	The foremost main transverse watertight bulkhead
Companionway	A weathertight entrance leading from a ship's deck to spaces below
Compartment	An internal space bounded by bulkheads or plating
Confined space	A space identified by one of the following characteristics: limited openings for entry and exit, unfavourable natural ventilation or not designed for continuous worker occupancy
Corrugated bulkhead	A bulkhead comprised of plating arranged in a corrugated fashion
Cross ties	Large transverse structural members joining longitudinal bulkheads and used to support them against hydrostatic and hydrodynamic loads
Deck	A horizontal structure element that defines the upper or lower boundary of a compartment
